At the UN, an NGO is any organization that has been granted consultative status by ECOSOC or, by extension, any organization that may be eligible for consultative status. In the early years of the UN, various criteria were adopted by the council to establish which organizations would be accredited and what participation rights they would have. The initial decisions were reviewed and consolidated into an NGO Statute by ECOSOC Resolution 288 B (X) of February 27, 1950. It was revised by Resolution 1296 (XLIV) of May 23, 1968, and again by Resolution 1996/31 of July 25, 1996. Most of the text of the current statute has remained unchanged since the first resolutions in 1946. The implied assumption in 1945 was that ECOSOC would accredit a small number of large, well-established global organizations. In particular, for 50 years, very few exceptions were made to the rule than only international NGOs rather than national NGOs should be accepted. Despite this restriction, it was soon apparent that many more NGOs than were initially expected would wish to participate in the UN's work. The numbers increased steadily from 197 in 1950, to 334 in

1960, and 419 in 1970. They then increased more substantially in the 1970s, reaching 608 in 1980 and 893 in 1990, and increased even more after 1990 to 1,995 in 2000 and 3,413 in 2010. As practice has evolved, it has become apparent that the official criteria are not applied and conversely some criteria not in the statute are consistently applied. Thus, with very few exceptions, any private organization will gain consultative status provided that it is not a commercial company, it does not use or advocate the use of violence, and it does not violate the diplomatic norm of noninterference in the internal affairs of individual countries. This norm finds one expression in not accepting a political party for accreditation as an NGO. The restrictions on companies and political parties do not prevent non–profit-making international associations representing commercial interests or international federations of political parties from being accepted.

The norm of noninterference was, until the 1970s, a severe restriction on the discussion of human rights in all bodies of the UN. A second expression of this norm was added to the NGO statute in 1968: Human rights NGOs "should have a general international concern with this matter, not restricted to the interests of a particular group of persons, a single nationality or the situation in a single State or restricted group of States" (ECOSOC Resolution 1296, para. 17). In 1996, this text was replaced by a more vague, general assertion that they should act "in accordance with the spirit of the Charter of the United Nations, the Universal Declaration of Human Rights and the Vienna Declaration and Programme of Action." Despite this change, the 1968 principles are still invoked when any government attempts to block the accreditation of an NGO that is critical of their human rights record. As a result, the Indian government has been able to block the World Sikh Congress, and the Chinese government has blocked any NGO that focuses on Tibet. Nevertheless, such governments cannot prevent criticism in the UN from the large global human rights NGOs, who have consultative status. The accreditation of human rights NGOs has often been a matter of great controversy; even when they are initially rejected, however, they do eventually win a vote in their favor in ECOSOC, provided they conform to the statute, including the discarded text from 1968.

In all versions of the statute, there have been two vague general clauses specifying that an NGO must be concerned with questions within the competence of ECOSOC, and its aims "shall be in conformity with the spirit, purposes and principles" of the UN Charter. This might have been a basis for a process of prohibiting access to certain types of NGOs on specific political grounds. The only field in which such censorship has been applied is in the field of human sexuality. The International Planned Parenthood Federation was not able to gain access to the UN system until the mid-1960s, a decade after it was founded. Human Life International, an antiabortion organization, was rejected on the technical grounds that it was hostile to UNICEF, but a few antiabortion NGOs have now been accepted. Most dramatically of all, a special session of ECOSOC was convened in 1994 solely for the purpose of withdrawing consultative status from the International Lesbian and Gay Association, when it became public that one of their constituent organizations promoted pedophilia.

Since 1945, there has been a slow but consistent expansion in the role of NGOs in policy making within the UN system, to the point where the outcomes in all areas of multilateral diplomacy, including security questions, can no longer be explained without analyzing the influence exercised by NGOs. They have also greatly increased their status in international law, to the point where it can be argued that those with ECOSOC consultative status have international legal personality. Their most significant impact has been in the creation of the Internet. NGOs made two essential contributions to the conversion of communications technology from disparate unconnected private networks to the contemporary Internet as a global public communications system. In the 1980s, they established the first Internet service providers and linked them together to provide global coverage. Also, they were the first to create gateways to link all the diverse networks to each other.

In popular discourse, an NGO is often presumed to be a voluntary organization acting in the public interest. Sometimes, distinctions are made between operational NGOs, which raise money and spend it on projects to assist the needy and the vulnerable, and campaigning NGOs, which seek to articulate the concerns of disempowered and marginalized people. Such an approach brings to mind

NGOs concerned with development, humanitarian relief, women's rights, human rights, peace, and environmental questions. However, it is confusing and misleading to conceptualize NGOs in such a restricted manner. All these fields of global politics are also influenced by other NGOs that would not be primarily identified either as operational or campaigning NGOs in such fields. At the UN, the 3,000-plus organizations that have consultative status as NGOs include religious bodies, trade unions, business groups, scientific and technical bodies, professional associations, youth organizations, and parliamentarians. Many of these also make their own specialist contributions on global issues. Some, such as religious bodies (also calling themselves faith communities) and trade unions, actively object to being called NGOs. Nevertheless, within the UN, all legitimate nonstate actors gain access through becoming accredited as NGOs.

In the domestic politics of individual countries, NGOs are more commonly referred to as interest groups, pressure groups, lobbies, or private voluntary organizations. However, as noted above, the term *NGO* may still be used to refer to a more limited range of public interest groups and/or groups that engage in transnational activities. NGOs vary greatly in the geographical scope of their structure and their activities. Some may be highly local, community groups in which all those involved know each other personally. Others are organized in individual towns or cities, within a larger area, or over a whole country, while some cover a continent or have a presence throughout the world. The scope of their structure does not necessarily relate to the scope of their activities. Local groups may be completely parochial, or they may concern themselves with issues affecting the other side of the world—for example, when a small community decides to raise money for the victims of an earthquake. National NGOs often have a minimal organizational structure outside their home country but engage in extensive transnational cooperation with other NGOs around the world. One of the most important features of NGOs is that many of them break down the distinction between domestic and international politics by simultaneously operating at both levels. Initially, local and national NGOs could influence global politics only through the membership of international NGOs. With the expansion of global communications, in particular the development of the World Wide Web since 1993, any NGO can now easily have a transnational impact. In addition, the only major amendment to the UN's NGO statute was the decision in 1996 to allow accreditation to national NGOs. The prime reason for this decision was to encourage participation by NGOs from developing countries.

There is great variety in the structures of NGOs. Some decide policy through democratic processes open to all their members, but others rely on supporters who merely have an indirect influence on policy, by increasing or reducing their level of support; some are formed by individual people, but some consist of separate independent NGOs who form an umbrella organization to cooperate; some relate to members and/or supporters directly through a centralized structure, but others have complex hierarchies or a federal structure. NGOs also have a diverse range of political roles. Some are altruistic, but others represent the interests of their members; some have charitable status and obtain tax concessions from governments, but others are not eligible; some represent a very small number of people, but others have an active membership measured in millions; some are highly specialized, but others are concerned with issues that affect a wide range of social, political, and economic questions; some have no public profile, but others obtain regular media coverage; some have no desire to engage in politics, but others are campaigning organizations; some are insiders in government policy making, but others are outsiders, concentrating on mass mobilization; some are progressive or Left wing, some identify themselves as being apolitical, and some are Right wing. It is impossible for any individual to support all NGOs, except by arbitrarily defining some as not being true NGOs. There is no such thing as a typical NGO.

NONLINEAR MODELS

In political science, as in many other disciplines, linear regression is the workhorse tool for statistical analysis. It is easy to interpret, and under many conditions the estimates it provides are unbiased and efficient. Unfortunately, many of the theories in the social sciences imply a nonlinear relationship between variables. In those cases, it is inappropriate to use a classic linear regression model because, at a minimum, one of the assumptions of the model would be violated.

This entry discusses two types of linear models: first, those that through a relatively simple process can be transformed in a way that allows running of a classical linear regression model; second, those that are essentially nonlinear, for which a transformation is not possible. In that situation, nonlinear least squares estimation is necessary.

The linear regression model specifies a linear relationship between a *response*—or dependent—variable and an *explanatory*—or independent—variable. It is assumed that a vector of response variables, y, can be approximated by a linear function of the vector of explanatory variables X_i:

$$\mathrm{y} = \mathrm{X}\beta + \varepsilon, \tag{1}$$

which can be expressed more generally as

$$\mathrm{y} = F(\mathrm{X}) + \varepsilon. \tag{2}$$

While in the linear model F is a linear function and the error is additive, in nonlinear models F can take other functional forms such as exponential, logistic, or other, more complicated forms, though the setup still assumes that the error is additive.

It is perhaps easier to understand the difference between linear and nonlinear models if we think of a regression model, in scalar form, with only one explanatory variable and no disturbance:

$$\mathrm{y} = \alpha + \beta x. \tag{3}$$

The marginal effect of the explanatory variable, x, on the response variable, y, or, in other words, the effect of a one-unit increase of x in y, can be estimated by taking the partial derivative with respect to x:

$$\frac{dy}{dx} = \beta. \tag{4}$$

In the classical linear model, when x increases by one unit, the effect on y is always a constant, β, regardless of the current level of x. In contrast, in a nonlinear model, the marginal impact of the explanatory variable, x, on the response variable, y, is dependent on the level of x. In other words, β is not necessarily a constant, but instead dy/dx is a function of x.

A more complicated model has y as a nonadditive function of the independent variables and the disturbances, that is,

$$\mathrm{y} = F(\mathrm{X}, \varepsilon). \tag{5}$$

While in general this can cause problems, there are some cases where this can be transformed away. For example, if we assume that the response function that describes y is,

$$\mathrm{y} = \exp(\alpha + \beta x + \varepsilon), \tag{6}$$

we can linearize the model by first taking the logarithms obtaining a linear response function and rewrite the equation such that

$$\ln\left(\frac{y}{1-y}\right) = \alpha + \beta x + \varepsilon. \tag{7}$$

The response variable is now ln $(y/(1 - y)$, a quantity known as the *logit*, and the response function is linear. Note here that y is continuous; if it is binary, the standard logit model is not the same. The procedure is similar for other transformations that fall in the category of generalized linear models.

However, there are some models for which slightly more complicated procedures are necessary to make the linear model appropriate. One of the most common is the Box-Cox transformation, where transformations are indexed by λ, an unknown parameter, and all the parameters in the model are estimated by standard methods of inference. The transformation is

$$y^{\lambda} = \frac{y^{\lambda} - 1}{\lambda} \tag{8}$$

when $\lambda \neq 0$ and

$$y^{\lambda} = \ln(y) \tag{9}$$

when $\lambda = 0$. It is assumed that for each λ, y^{λ} is a monotonic function of y over the admissible range and that for some unknown λ, the transformed observations, y^{λ}, satisfy the linear model assumptions.

The Box-Cox transformation can also be used to discriminate among alternative functional forms (log linear, quadratic, etc.). The process works by estimating the values of the transformation parameters. If λ is one, a linear model is appropriate. If it is near zero, a logarithmic model is appropriate. And if it is near two, a quadratic model is appropriate. Thus, analysts no longer have to prespecify the nature of the nonlinear transformation since the Box-Cox model can be estimated using nonlinear squares.

Unfortunately, some of our theories lead us to models that cannot be made linear in parameters. In this case, it is appropriate to use nonlinear least squares (NLS) regression. With the exception of linearity, all the other assumptions of ordinary least squares (OLS) regression apply. Conceptually, the process is the same: to find the values of parameters that minimize the sum of squared residuals. Numerically, the process is much more intensive. If we assume the same model notation from Equation 1, then

$$\varepsilon = \mathrm{y} - \mathrm{X}\beta. \tag{10}$$

We estimate β by finding the $\hat{\beta}$ values that minimize the sum-of-squares residuals:

$$S = \sum(y - \mathrm{X}\hat{\beta}). \tag{11}$$

For any estimate of β, Equation 2 allows the calculation of a residual, and we can minimize the sum of squared residuals. While the maximization process is more complicated than for linear regression, the underlying process is similar, and the estimated coefficients have similar properties. In particular, they are consistent and asymptotically normal, so the usual testing procedures apply. This process is a part of most statistical packages used by social scientists.

There are some caveats about NLS. First, it is possible to get similarly good fits with very different-looking functions. Also, different models will produce different predictions when extrapolating, and multiple minima are possible.

As a general conclusion, for real-world data it is hard to believe that linear specifications can characterize the relationships between all variables in political science studies. However, through the transformation of variables—either to a generalized linear model or a Box-Cox transformation—or by using modified modeling strategies such as nonlinear least squares regression, it is possible to test many of the theories that do not easily fit a linear model.

NONPARAMETRIC METHODS

Nonparametric methods are a class of statistical techniques that use minimal assumptions for both testing and estimation. Here, standard statistical assumptions are often replaced with computationally intensive calculations. Nonparametric methods provide a valuable alternative to classical parametric techniques. They are often called weak assumption statistics because the assumptions required for validity are quite general compared with classical parametric techniques. In many cases, even the weak assumptions made can be further relaxed. As such, conclusions based on nonparametric techniques need not be tempered by qualifying statements about the underlying assumptions. Other advantages are that they (a) are often easy to understand and apply, (b) are especially good for small samples, (c) are frequently appropriate for discrete data, and (d) may be robust with incomplete or imprecise data. Nonparametric techniques date back to 1710 when John Arbuthnott introduced the sign test. More widespread development of nonparametric techniques did not occur until the 1940s when Frank Wilcoxon developed rank-based tests. Nonparametric statistical techniques come in many different forms. Below, three different types of nonparametric techniques are highlighted. The first is the bootstrap, a method for replacing distributional assumptions in statistical tests. The second is an example of a classical nonparametric test. The final technique is that of nonparametric regression.

Bootstrap

The bootstrap relies on resampling. While it has many applications, it is often used when errors in a regression model are nonnormal. Assume that one estimates the following simple regression model:

$$y = \alpha + \beta x + \varepsilon.$$

In this model, we assume that the errors, ε, follow a normal distribution. We can relax this assumption using the bootstrap. The bootstrap simulates the sampling distribution for β through sampling from the original data with replacement. In short, we treat the sample as the population and then sample from it. For example, assume that the sample size for this regression model is 100 cases. For the bootstrap, we would take a random sample of size 100 with replacement from the original data. Since we sample with replacement, some data points will appear in this sample more than once. We then reestimate the original model using this new sample and save the new estimate of β. We repeat this process a large number of times. Typically, we would resample and estimate the model from 1,000 to 5,000 times. This results in 1,000 to 5,000 estimates of β. This new set of β estimates serves as an empirical sampling distribution for this parameter. Percentiles of this distribution can serve as confidence intervals for the parameter. With minor adjustments, one can also calculate a p value to test hypotheses about β. The bootstrap is nonparametric since we use an empirical estimate for the sampling distribution instead of assuming that the test statistic is from a t distribution. One strength of the bootstrap stems from the fact that this basic algorithm can be used to provide inferences for a wide class of statistics.

Classical Nonparametric Test

Another common nonparametric technique is the rank-sum test, which is an alternative to the classical two-sample t test of location. Consider an experiment where we select seven students to play a divide-the-dollar game with a computer program. Three of the students are randomly chosen to receive the treatment, a prime expected to make them more altruistic. If the treatment is effective, we would expect that the students who receive it would give away more of their money. If the treatment is without effect, we would expect no such difference across the two sets of students. Relying on the classical parametric techniques, we might translate these expectations into a t test, comparing the mean difference we observe with a null of no mean difference. We would then calculate a p value using the critical value from a t distribution with five degrees of freedom. For this inference, we must assume that the test statistic follows a parametric t distribution—a distribution that can be characterized with parameters for the mean, variance, and other higher moments. As an alternative, we can use the nonparametric rank-sum test to derive the test from the randomization of treatment assignment and avoid the parametric assumption.

Our expectation, again, is that treated students should give away more than nontreated students. The best evidence that the prime increases altruistic behavior would be obtained if the three students who received the treatment rank 1, 2, and 3 in terms of the amount given away. So we might ask: What is the probability that the three students in the treatment group would happen to rank 1, 2, and 3 in terms of the amount given away if the null hypothesis were true? To develop a probability statement about this hypothesis that hinges on the composition of the treatment and control groups—the feature that was assigned by a random process—we turn to basic combinatorics. Knowing that the number of ways of selecting r objects from a set of n is $n!/[r!(n - r)!]$ tells us that there are 35 ways to select three students from a set of seven. If the treatment had no effect, and simple chance were the only factor governing which students were in the control group and which were in the treatment group, then each of these 35 combinations would be equally likely. Since only one of the 35 outcomes is congruent with ranks of 1, 2, and 3 in the treatment group, this tells us that there is a 1/35 or approximately a 0.0286 chance that we would observe the best evidence case if the null were true. That is, if the treatment has no effect, the chance that random assignment will produce this exact outcome is 1/35. This p value indicates that the best evidence outcome indeed enables us to be fairly confident that the prime has an effect on student behavior in our divide-the-dollar game.

We can make this approach to hypothesis testing more general by introducing a summary statistic that enables us to translate ranks into a single measurement of the outcome among the treatment subjects. One possible statistic for this purpose is the sum of the ranks of the treated subjects. This statistic will be lower if the treated subjects are generally higher in their giving than the control subjects and higher if they are not. The subjects could just as easily be ranked in the opposite manner, and then higher rank sums would be associated with higher amounts given. Using this statistic, we can answer the question of what the chance is of observing an outcome of a specific degree (or smaller/larger) among the treatment subjects if the treatment actually has no effect. For example, suppose the outcome we observed among the treated subjects was the ranks 1, 2, and 7. Our summary statistic would be 10 (= 1 + 2 + 7). This seems close to the best evidence outcome we just considered, where the sum of the ranks would be 1 + 2 + 3 = 6, but is it close enough to be convincing evidence of a treatment effect? To answer this question, we work out the probability of observing a rank sum of the same amount or less than the one we obtained under the null hypothesis—that the treatment had no effect on giving—by returning to our enumeration of all 35 possible combinations of the three ranks and calculating the rank sum for each combination. Four of the 35 possible rank combinations produce a sum of 10, 3 more produce a sum of 9, 2 result in a sum of 8, 1 set sums to 7, and another to 6. Thus, if the treatment had no effect, the chance of observing an outcome like the one we did or smaller would be $p = 11/35$ or approximately 0.314. Put another way, if the prime has no effect, we could expect to see a value for the summed ranks as low as or lower than the one we observed 31 out of every 100 times we randomly assigned the treatment to these particular subjects. Using the traditional threshold of .05, the p value we calculated would not allow us to reject the null hypothesis; the observed outcome did not provide sufficient evidence that the prime had an effect on the behavior of our subjects. This demonstrates the logic of the rank-sum test and nonparametric methods more generally, where we are able to test a hypothesis about a treatment effect without the parametric assumption necessary for the t test.

Nonparametric Regression

Smoothed regression is a common nonparametric estimation technique. This approach to regression is based on the belief that standard parametric regression models are often misspecified due to an incorrect functional form. Smoothing and nonparametric regression are generally interchangeable terms for a set of statistical techniques used to summarize bivariate relationships in scatterplots. With more commonly used parametric statistical techniques, the relationship between two variables, x and y, is summarized with a parameter such as a regression coefficient. With nonparametric regression, there is no single parameter; instead, the statistical relationship between x and y is summarized with a line drawing. Given that there is no single parameter produced by the statistical model, these models are nonparametric. A more specific comparison between the parametric and nonparametric approaches to regression clarifies the differences between these methods.

Assume that we have y and x, two continuous variables, and we wish to estimate the mean of y conditional on the regressor x. We can write this relationship formally as

$$y|x = f(x) + \varepsilon.$$

The term f refers to the functional form for the relationship between y and x, and we assume that f is some function that is smooth. The familiar linear functional form is a special case where the following is true:

$$f = \alpha + \beta x.$$

Since a linear relationship is a smooth function, it is a part of the family of smooth functions that comprise f. The linear regression model is parametric because the parameter β summarizes the statistical dependence between x and y.

With nonparametric regression, we estimate the functional form f from the data. Therefore, the a priori assumption of linearity is replaced with the much weaker assumption of a smooth population function. The usual parametric estimate is considered global since a single parameter, β, based on all the data summarizes the statistical relationship. There are a number of methods for estimating nonparametric regression models. All of these methods use a series of local estimates, estimates based on a subset of the entire sample, to form a nonparametric estimate.

The following provides a simple example of one method for estimating nonparametric regression models. Say we are interested in estimating the association between incumbent vote share and incumbent spending. We suspect that the relationship is nonlinear and thus the usual linear regression model will be misspecified since the functional form is incorrect. One form of nonparametric regression we might use is the moving average smoother. First, the data must be sorted according to x—here incumbent spending. We can obtain the nonparametric estimate by calculating the mean of the incumbent vote share within ordered intervals of spending. That is, we calculate the average incumbent vote share for a small range of x, perhaps the first 5% of the data. We repeat this across the range of incumbent spending. Once this process is complete we have a series of local averages.

Plotting these local averages in a line graph summarizes the statistical dependence between incumbent vote share and incumbent spending. These local averages may increase linearly. If so, the nonparametric estimate is nearly equivalent to an ordinary least squares estimate. What is important is, however, that these local averages are not constrained to be linear and can produce a highly nonlinear statistical estimate. Matching estimators, which have gained popularity as of late, are another form of nonparametric regression.

The local estimator need not be based on the mean. Least squares regression can replace the mean as the local estimator. Here, the predicted value from a regression model becomes the local point estimate. Nonparametric regression methods such as LOESS and LOWESS are based on local regression models. Basing the local estimate on a regression model produces a nonparametric estimate with less bias. Splines are another frequently used form of nonparametric estimators based on a series of joined local regression estimates.

Due to the weak assumptions needed for nonparametric tests, they are less efficient than classical parametric tests if the assumptions for the parametric tests hold. For example, the rank test will be less efficient than a t test if the data are normal. However, if the data are nonnormal, the nonparametric alternative will be more powerful. Nonparametric tests are common in the statistical literature on causal inference. For example, nonparametric statistics are critical to the development of sensitivity analyses for matching estimators. In the causal inference literature, close attention is paid to statistical assumptions, and the goal is to weaken assumptions where possible. Nonparametric statistics allow this to a great extent.

NONSTATE ACTORS

The phrase *nonstate actors* arose in the study of world politics during the 1970s in the context of a transnationalist critique of the then prevailing realist orthodoxy. Realist theory of international relations holds that only states are and can be actors in politics beyond the national realm. In contrast, transnationalist analysis argues that other entities besides states—such as business enterprises, mass media organizations, civil society associations, and political parties—can also operate as actors in world politics.

An *actor* is a behavioral unit that can engage and influence its situation. A social actor can be either an individual person or a group of people assembled in a formal or informal collective body. Realism maintains that only one kind of actor—the state (i.e., a national-territorial government)—can affect relations between and among countries. Transnationalism affirms that multiple types of agents, including a variety of nonstate actors, can shape world politics. Some scholars therefore draw a distinction between international relations (among states) and transnational relations (involving a plurality of actors, both state and nonstate).

Realism and Transnationalism

From a realist perspective, nongovernmental bodies are always subject to state power in world politics. Hence, on a realist premise, business corporations cannot operate outside their base country except insofar as home and host states permit them to do so. Companies such as Coca-Cola, LUKOIL, and Microsoft would, on a realist understanding, always be subject to the full control of national governments. Likewise, for realists, civil society associations such as the human rights organization Amnesty International, the ecological lobby Greenpeace, and the religious movement Al Qaeda have no impact on world politics except when states allow it. Indeed, some realist analyses suggest that nonstate entities operate wholly and solely as tools of state policy. Thus, for example, a realist could argue that the humanitarian relief agency World Vision only acts inasmuch as it serves the interests of donor states in the Global North and recipient states in the Global South.

The realist (or "statist") approach to action in world politics has never gained acceptance by all scholars. For example, from Karl Marx onward, historical materialists have maintained that states serve capital rather than the other way around and that workers need to unite across borders in order to achieve social transformation. Liberal internationalists, too, suggested already in the 19th and early 20th centuries that citizen movements (e.g., of feminists, pacifists, religious revivalists) could affect the course of interstate relations. In the 1920s and 1930s, political and sociological research on world affairs regularly considered nongovernmental as well as governmental actors.

Between the 1940s and the 1960s, however, most students of international relations took the realist position that nonstate actors play no autonomous role in world politics. In the context of World War II and the subsequent Cold War, it appeared—particularly to scholars in North America and Western Europe—that world affairs were reducible to state action. After all, entire societies were subordinated to state direction in World War II. Similarly, both sides in the Cold War marshaled their respective business sectors, mass media, political parties, and civil societies in the bipolar struggle.

Yet even during this period of heightened interstate conflict, it was not always evident that states were the sole actors in world politics. For example, many anticolonial movements at this time successfully exploited transnational links to promote their causes. Likewise, the continued global expansion of major oil corporations in the third quarter of the 20th century was not merely a reflection of state policy. Indeed, then as now, firms sometimes used states to further their investments abroad. For instance, the U.S. government intervention in Guatemala in 1954 came largely at the behest of the United Fruit Company.

Such circumstances where nonstate entities exercised influence in world politics became increasingly visible as colonial empires receded and Cold War tensions eased. From the early 1970s, a number of scholars began to assert that the realist conception of actors was overly narrow. The term *transnational relations* gained popularity as a description of a situation where plural actors engage in world politics. Similarly, researchers who have since the 1980s adopted concepts of "global politics" and "globalization" usually argue that nonstate players figure importantly in world affairs.

Today, in the early 21st century, it seems incontrovertible that nonstate entities in world politics can have powers beyond those of national governments. Many companies, media organizations, civil society associations, political parties, and individuals can act on the world stage at least partly in their own right. If the statist premises of realist theory were questionable even at the height of the Cold War, they are certainly unsustainable in current world politics.

Types of Nonstate Actors

According to the *World Investment Report 2008*, transnational corporations (TNCs) now number 79,000 (as against around 200 states). Between them, these companies own some 790,000 subsidiaries outside their base country. TNCs collectively hold about US$15 trillion in foreign direct investment (FDI) and generate annual sales of US$31 trillion. The largest TNCs have a yearly turnover that exceeds the GDP of a majority of countries. A substantial proportion of cross-border commerce (estimates range from a quarter to a third of the total) involves intrafirm trade within TNCs. In the light of this significance of TNCs, all states now, to one degree or another, adjust their policies on regulation and taxation with a view to attracting and retaining FDI. States also struggle to monitor—let alone manage—the several trillion dollars' worth of liquid financial flows that banks, securities firms, and hedge funds move (mostly electronically) around the globe each day. Moreover, some transnational companies are illicit traffickers of goods and people, and they make it their business to evade state laws altogether.

Mass media outlets, too, figure as important nonstate players in contemporary world politics. News agencies, such as Reuters and Inter Press Service, shape much of the information on world affairs that circulates in contemporary society. Certain newspapers and magazines, such as the *Financial Times* and *Cosmopolitan*, are distributed across the planet. World service radio stations have broadcast intercontinentally from the 1930s, while satellite television operators have, since their launch in the 1960s, reached hundreds of millions of households. Starting in 1992, the suitably named World Wide Web has offered a platform for countless online global information providers. Although states—and particularly stronger states—can exert substantial influence over transnationally operating mass media, it is hardly credible to argue on realist lines that CNN and YouTube are wholly subject to state control and nothing more than tools of foreign policy.

Likewise, civil society constitutes an important sphere of nonstate actors in world politics. Civil society organizations (CSOs) are associations of citizens that seek, from outside political parties, to shape the rules that govern society. Many CSOs are formally organized, legally registered, and professionally staffed advocacy bodies. Examples include business forums like the International Chamber of Commerce, consumer groups like Consumers International, democracy promoters like the Open Society Institute, development supporters like Oxfam, environmental activists like Friends of the Earth, faith assemblies like the Roman Catholic Church, farmer lobbies like Vía Campesina, health action networks like Médecins Sans Frontières, human rights advocates like the International Lesbian and Gay Association, labor unions like Public Services International, philanthropic foundations like the Rockefeller Brothers Fund, and think tanks like the Club of Rome. Other civil society initiatives in world politics take shape as informal social movements, for instance, of anarchists, diaspora networks, indigenous peoples, peasants, religious revivalists, street vendors, and youth. Indeed, some of the more prominent civil society actions in recent world politics have been ephemeral public demonstrations. Examples include street protests at the Ministerial Conference of the World Trade Organization in Seattle in 1999 and across the globe on February 15, 2003, against the impending U.S. invasion of Iraq.

In contrast to CSOs, who aim to influence politics from positions outside official circles, political parties have as their overriding goal the occupation of public office. Although these actors have traditionally centered their efforts on capturing state power (locally, provincially, and nationally), over recent decades, they have also held seats in several suprastate regional assemblies in Africa, Europe, and Latin America. Moreover, political parties with broadly shared visions have formed global associations such as the Socialist International (with origins in 1889), the Trotskyist Fourth International (founded in 1938), the Liberal International (created in 1947), the International Democrat Union (1983), and the Global Green Network (2001).

Other nonstate actors with influence in world politics operate as individuals rather than collective agents. For example, some persons such as Mahatma Gandhi, Che Guevara, and Wangari Maathai have shaped world affairs as charismatic visionaries from outside states. In addition, so-called celebrity diplomacy has figured with considerable prominence in several contemporary global campaigns regarding ecology, human rights, and poverty. Out of the limelight, countless other nonstate individuals have affected world politics as artists, athletes, bloggers, carers, entertainers, mercenaries, migrants, patients, pilgrims, programmers, scholars, terrorists, and tourists.

As the example of mercenaries indicates, nonstate actors can in some instances complement or even rival states in the execution of governance functions in world affairs. It is often assumed that governance (i.e., the formulation and implementation of societal rules) occurs only through the public sector of governments and intergovernmental agencies. However, in contemporary world politics, many regulatory processes are conducted at least partly through nonstate bodies. The many instances of private transnational governance include the International Court of Arbitration of the International Chamber of Commerce (for settlement of disputes involving TNCs), the Wolfsberg Group (for guidelines to prevent money laundering), and the Forestry Stewardship Council (for certification of sustainable logging).

In numerous other cases, governance of world affairs transpires through multistakeholder combinations of state and nonstate actors. Thus, for example, the International Labour Organization (ILO) has since 1920 operated as a triangular collaboration among governments, employer federations, and trade unions. More recently, created multistakeholder governance bodies include the Global Reporting Initiative (GRI, for corporate social responsibility schemes), the Internet Corporation for Assigned Names and Numbers (ICANN, for the regulation of domain names), and the Global Fund to Fight AIDS, Tuberculosis and Malaria. In addition, most major interstate gatherings (such as United Nations conferences and Group of Eight summits) are nowadays accompanied by parallel meetings of nonstate actors.

The Future of Nonstate Actors

To be sure, nothing in the preceding discussion points to an approaching irrelevance of states in world politics. Especially from the 1970s to the 1990s, certain transnationalists and globalists have suggested that the proliferation and growth of nonstate actors entail a decline or even a demise of the state. Yet the situation is clearly not a zero-sum game. As the example of multistakeholder forums illustrates, states and nonstate actors are often in relationships of cooperation and mutual reinforcement. Indeed, many states have expanded and gained increased capacities at the same time that nonstate actors have grown and become more prominent. Bigger states in particular continue to be great powers in world affairs. Although some analysts have highlighted the prospect of so-called failed states, thus far only a handful of countries have even temporarily experienced a comprehensive state collapse. On the whole, states remain highly robust in a world that is also populated by nonstate actors.

Hence the issue is less whether nonstate entities matter in world politics and whether states will survive but more how and why state and nonstate bodies interact in the ways that they do. Dispensing with unrealistic statism, as the above discussion has done, is rather straightforward. However, determining more precisely how and why nonstate actors are relevant in world affairs is more problematic and controversial. Widely divergent answers to this question are available, depending on whether one adopts a liberalist, constructivist, Marxist, feminist, poststructuralist, or other theoretical perspective on world politics. In particular, the different approaches relate actors (both state and nonstate) to contrasting conceptions of social structure and structural power. However, debates about agent–structure relations go beyond the scope of the present entry. Suffice it to say here that establishing that nonstate actors matter is only one step in a much larger endeavor of building knowledge of world politics.

NORMATIVE POLITICAL THEORY

Political theory deals with the creation of good governing institutions according to some principle and the assessment of what the institutions do. Virtually by definition, assessment of institutions requires resolving issues in political theory and more or less simultaneously issues in social science. Although in our time the two streams seldom merge, both are essential to the task of political theory. Normative political theory offers a framework for the evaluative component of this assessment. This entry first reviews the modern origins of normative political theory and its explanatory basis and then examines its main issues: equality, civil society, civil liberties, justice, democracy, and constitutionalism. Because these issues are often discussed in substantial isolation from each other or with the principal focus on one major issue, as in John Rawls's book *A Theory of Justice*, one might conclude that there is no general normative theory that covers all of these. Most of them are often used purely descriptively without any normative weight. For example, democracy is a form of government that can be well described; or rather, it is several different forms, each of which can be described independently of its normative justification.

One could consider normative political thought in the classical era of Plato and Aristotle; in the medieval thought of Aquinas, Marsilius of Padua, and others; or in modern thought from Thomas Hobbes to the present. However, because of space limitations, this entry focuses on modern thought, which is the most relevant to an understanding of contemporary politics. Normative political theory must be empirically grounded if it is to have any bearing on the study of politics and political science; although classical and medieval theories may have been somewhat grounded in their own time, they are far less so today.

There are two overriding concerns in contemporary political theory: (1) that citizens be formally equal in various ways and (2) that government and collective decision making be democratic. These concerns are essentially modern. There is virtually universal agreement on these two normative positions, with one major exception: that the supposition of equality may not apply to economic status or resources, as is centrally at issue in theories of distributive justice and in economic libertarianism. There is, however, strong agreement that citizens should be formally equal in politics, as in the slogan "One person, one vote." John Stuart Mill argued that more intellectually and educationally qualified citizens should have extra votes; however, virtually no political or democratic theorist would defend this view today.

There are further normative commitments, many of which are social libertarian constraints on government actions. Articulate social libertarianism, such as that of Mill, however, is on the wane, especially in the United States, whose constitution can rightly be characterized as one of the truly great social libertarian documents and one that has had a massive impact around the world. Social libertarianism was earlier very nearly the American creed, although it never dominated any major political party, other than perhaps the Republican Party with William Howard Taft and later Robert Taft. Its popular decline in the United States today is not reflected in the writings of political theorists.

The modern era of political theory continues to contribute to the growth of explanatory political science as well as normative political theory. Indeed, because of the issues it must address, it must take into account the social science enterprise of explanation. In the struggle to master more or less normative issues, especially church–state relations, there is no well-defined boundary between normative and causal explanatory issues.

Starting the discussion of modern theory with Hobbes has an analytic point, not merely a historical one. Hobbes is the first major theorist who deliberately and systematically assumes that we are motivated primarily by our individual interests. He is committed to the centrality of individualism and self-interest. Contrary to many common views, he assumes that the only values of concern are individual interests and that there are no collective interests other than those that can be seen as aggregations of individual interests. This individualism has since been the basis of many arguments and counterarguments, to such an extent that the pros and cons of the individualist vision often dominate discussion in political theory. No one, therefore, can fully understand any major contemporary position in normative political theory without addressing individualism. Rawls shares this view, although he phrases the assumption in his own distinctive way. He supposes that we are "mutually disinterested" in the welfare of each other. The main point of this claim is to rule out envy over others' shares of the collective provision.

Although the religious vision of politics has been important in the past, today this perspective is found mainly in Islam and in the Catholic, not the Aristotelian, half of the natural-law tradition.

Ironically, the classical era arguably has greater relevance to contemporary thought than does medieval thought because the former is de facto secular and in it there is presumed to be no higher authority than man. Hobbes dismisses reliance on supernatural inspiration, arguing that faith comes by hearing—that is to say, by being taught. In a sentence, he convincingly dismisses several centuries of political theorizing. Political theory had to begin almost de novo after leaving religious justifications behind. Although there are forerunners, we may take Hobbes as the de novo creative thinker who puts us on the path to modern political theory.

Normative political theory is in some respects an odd endeavor in that it is often carried on at the strictly theoretical level with little or no serious reference to our political experience, as for example in Plato's *Republic*. Some authors refer to their work as "ideal theory." This is apparently meant to be a defense of their approach. At its strongest, they can say that their position is aspirational. For example, one could concede that widespread egalitarian dispositions are not likely in our world at this time but still hold that egalitarian theorists should push our understanding of how to make egalitarianism work and how to refine the theory.

Modern Beginnings

Let us begin with two giants of social theory in the modern era: Thomas Hobbes and David Hume. Both Hobbes and Hume think that humans are primarily motivated by *self-interest*. Hume states this view with characteristic force in his *Treatise on Human Nature*: "Nothing is more certain, than that men are, in a great measure, governed by interest, and that even when they extend their concern beyond themselves, 'tis not to any great distance" (Pt. 2, sec. 7). This is Hume's dominant claim about human nature in the *Treatise*. Holding this view seemingly must make his program to explain moral or mutually beneficial outcomes in the world of human and institutional action implausible. But that is his extraordinary program—to explain why it is that a large collection of substantially self-interested people could achieve justice and other good social results, all without a primary or a religious commitment to acting morally.

Some moralists in Hume's time assumed that moral views, moral character, and moral commitments were God-given. Hume, however, believed that our nature is not fundamentally moral; he further doubts all arguments for the truth of religious claims. Book 3 of Hume's *Treatise* attempts to explain how we can act as though we were moral and how we can establish social rules, norms, and laws evidently without the necessary moral commitment to their working. A clue to his argument is that if we had characters such as the religious, moralistic, and pure-reason schools of thought suppose, we would not be much concerned with law because we would be well-ordered without its additional incentives. Hume argues that debate over law and moral issues is essentially proof that these visions are wrong and that we need tougher analysis.

Both Hobbes and Hume enunciate *laws of nature*, by which they both mean essentially sociological conclusions by which we must abide if we are to prosper. For example, both theorists hold that it is a law of nature that we should keep our promises (Hobbes more often speaks of covenants and contracts). Hobbes and, more clearly, Hume argue that it us in our interest to keep our promises. Why? Because if we do not, we will find it difficult to develop cooperative, promising relations with people whose cooperation would occasionally serve us well.

Both philosophers focus on the problem of *social order*, without which there will be turmoil, anarchy, and even violence, leading to a world in which all will be relatively destitute. Hume bases his own theory of social order on spontaneous coordination over centuries of social development. In essence, he invents and applies one of the greatest and most powerful theories in all of social theory: his theory of convention.

The most important difference between Hobbes and Hume is in how a sovereign is empowered ab initio. Hobbes recognizes that this is a difficult problem for him and his hypothetical account of the creation of government by collective agreement, or a "social contract." In his discussion of the metaphor of the social contract, Hobbes does not address the issue of how individuals would transfer their power as physical selves to an all-powerful sovereign. Hume is notoriously hostile to the idea of a social contract, which he thinks is a philosopher's perversely unrealistic, false, and implausible device. Hobbes himself soon abandons his own social contract.

Explanatory Theory

Hobbes does not present a general moral theory. He sees himself as the scientist of social order. John Locke, writing after Hobbes, assumes that people have natural rights, especially a right to own the property (land) with which they have mixed their labor. This intuitionist vision has had an enormous impact ever since, as in the work of Robert Nozick, although it has been repeatedly dismissed as ungrounded and irrelevant. It is a rare instance of intuitionism in political theory, although intuitionism is a major part of moral theory. On this score, political theory is far more solidly grounded. This account, however, cannot readily generalize into a fuller moral theory. Moreover, in a view that most of us might share, Hobbes and Hume reject any notion of property or ownership if there is no state to define and regulate them. Indeed, it is only by law that property is defined. In Locke's vision, when you mix your labor with a bit of unowned land, it becomes yours even before there is a state to define ownership. The idea of mixing one's labor may long predate Locke's account. In old English property law, when you sell your land to me, I must shovel some of its soil as though symbolically to acknowledge its being transformed into my property. Locke's theory elevates this odd English legal practice from a mere custom to the status of a moral principle. If the land has no prior owner, you may appropriate it according to the laws of the nation of which it is a part.

One of the great strengths of political philosophers such as Hobbes, Hume, Mill, and Rawls is that they take seriously and try to understand the world to which their theories are to apply, although Rawls largely passes on the burden of understanding the political and institutional world to others who, one hopes, wish to apply his theory of justice. Those others would have to include social scientists with deep understandings of institutions, how they work, and what they can be expected to accomplish. So far, those others have primarily been moral philosophers who focus almost exclusively on the moral aspects of Rawls's theory and claims rather than on the workability of the theory as a system of justice.

Rawls recognizes that institutional analysis is based on a normative theory. He supposes that relevant institutions will manage redistribution and inculcate a commitment to justice in the population. But these institutions must first be designed. There is a circular quality to this hope because without the widespread commitment to a just distribution, relevant institutions are unlikely to arise or be created. What set of just institutions could push, say, the U.S. Congress or the British Parliament aside? Is there a living Republican or Tory in government who would support policies of redistribution at such a level as to achieve a high degree of equality in American or British society? Some revolutionary movements would achieve near equality by impoverishing everyone, as Winstanley and the Diggers argued for England in their time. So far, no one has proposed a serious way to achieve greater equality without massive negative trade-offs. The workability of Rawls's theory is therefore deeply in question. Suppose that the leadership of an advanced democratic industrial state tried to implement Rawls's theory of justice. Is there any chance at all that it would significantly advance the society toward justice as fairness? If this empirical question cannot be answered, the enterprise is in default.

Hobbes tries to ground his theory in an account of how individuals act and an explanation of why they act this way, and he assertively sees himself as a scientist. He uses his account of human incentives to explain how the world works. This is an astonishingly grand move on his part. On the other hand, he sets himself a very restricted purpose—to ground social order and then to leave individuals to make their own "investments" in their own prosperity once there is order. Stylized brief readings of Hobbes restrict his concern to survival, thereby trivializing his theory. In fact, he gives far more space to order as the necessary enabler of individual prosperity through protecting individuals' efforts on their own behalf against plundering and theft. In this vision, he foreshadows the later economic arguments of Adam Smith and others. His draconian dictator reduces the risks of planting our gardens or otherwise investing for our future. Even today, we might see Hobbes's concern for order as an incontrovertible element of good government. People in the North Atlantic community, however, can typically take such an order for granted and may assume rather than explain it.

Equality and Inequality

It is commonly presumed that equality is prima facie preferable to inequality (this is, of course, a moral claim) but that it should be balanced against other considerations that may causally trade-off with it (an explanatory or causal claim). Moral and explanatory theories therefore come sharply together in the analysis of distributive justice and egalitarianism. There are at least five standard arguments about the interaction between inequality and trade-offs with production. In some of these, inequality enhances production, either because unequal incentives (such as higher salaries) or unequal power (as in hierarchy) is needed to organize the production of beneficial goods, both personal and collective. These two arguments generalize to macrolevel arguments about the organization of society:

1. Equality entails reduced incentives to those who are especially productive and leads to a trade-off between equality and efficiency of production and therefore lower average welfare.

2. Hierarchy, and likely therefore inequality, is virtually necessary for achieving many desirable social goals.

3. Those who have greater resources than others can be trailblazers who support innovations that eventually benefit almost everyone.

These three relationships all involve direct trade-offs through increasing the overall welfare at the price of reduced equality, or vice versa. There are also trade-offs of greater equality with other considerations. Two that are well argued in extensive literatures are as follows:

4. The political power to attempt to achieve equality entails the power to do much else, including very undesirable things such as suppression of thought and dissent. In 1934, Joseph Stalin declared that socialist realism, a gross misnomer, was the only legitimate style for artists. After not

enjoying a performance of Shostakovich's music, he banned the gloriously patriotic composer for a while. Stalin's tastes ruled. Many artists died or ended in the Gulag, and many of the great painters and poets of the era were suppressed. The effort to achieve equality has often gone badly awry in similar ways even in supposedly humane places, such as Tanzania under its founding prime minister, Julius Nyerere. Nyerere's program of African socialism included an economic policy, *ujamaa*, that called for the collectivization of farms and forced relocation. Although the intention was to foster economic equality, the policy exacerbated poverty and proved to be unviable.

5. Equality in a single society requires autarky and risks the selective emigration of the especially productive individuals to nations where they can thrive better. The emigration is likely to be economically crippling for the society being abandoned, as it was in the former East Germany and Czechoslovakia under Soviet hegemony. In both these nations, as also in politically liberal India, deliberate policies of autarky hampered economic development. When India ended autarkic control of its economy in 1991, its economy exploded into very rapid growth. China's economy has similarly boomed since it turned to economic liberalism while maintaining political autocracy.

With respect to the first three arguments, inequality de facto can typically benefit people other than merely those who are better-off. The negative side of inequality in the last two cases comes from the side effects of attempting to achieve equality and not from a direct trade-off between equality and welfare. But these patterns are all potentially relevant for the institutional structures for achieving distributive justice. The last two are at the institutional or societal level and should therefore be especially interesting to political scientists. They are at the normative core of political theory.

Each of these relationships involves a trade-off of equality for something else: productivity, successful organization, freedom of expression, economic viability, or innovation. All of these involve productivity in some way. In each of the five cases, although there might be disagreements about the scale of the trade-off of equality that we should bear, there is not likely to be disagreement that some trade-off is desirable or even almost logically necessary. These issues are especially important in the microcontexts of differential power of groups, such as those defined by gender and ethnicity, and in the macrocontexts of national and developing economies.

Civil Society

It is a broadly held view that democracy and liberalism require civil society. Discussions of civil society are both normative and causal. The normative claims are that we will be better people and that we will constitute better polities or societies if we have civil society. This sometimes sounds like nothing more than a definitional claim, but it is also sometimes a causal claim, such as those John Stuart Mill, Carole Pateman, and others make for a connection between liberal democracy and personal autonomy and development. But the most challenging and potentially interesting of the claims of exponents of civil society is the grand causal claim that we need it if we are to cohere politically and socially. This is often accompanied by the claim that we need broad trust in government if government is to serve us well.

Against these theses, there is a long tradition of distrust in government, especially in the United States. Why distrust? Because the experiences both of England for centuries before the U.S. Constitution and of the 13 states during their brief union under the Articles of Confederation were rent by government attempts to control the economy in often destructive ways. Often there were identifiable beneficiaries of the controls. Hence, given the power to intervene, one can be fairly sure that governments will often do so. The straightforward incentives of government agents are to arrange benefits for themselves through impositions on others. Such incentives are a recipe for distrust in the sense that those on the wrong end of the interventions can see that their own interests are sacrificed for those of others merely because someone has the power to intervene. Distrust is therefore not merely a theoretical stance; it is a clear response to experience. One need not have a theory of why any kind of government exceeds its bounds when one has extensive evidence that it does. In the 20th century, technological innovations radically increased the scope of governmental excess to include massive, murderous brutality.

Even before James Madison's arguments for the U.S. Constitution, the recognition that governments were prone to abusing people in various ways was a central part of the development of liberal thought, especially in the work of Locke, Hume, and Smith. The original contributions of Madison to this long tradition were, first, to create a government that was self-regulated so that it could not easily overreach its authority and, second, to give that government very little authority while also diminishing the authority of the individual states. In Madison's view, the states were the principal threat to individual liberty, both economic and social.

Civil Liberties

Liberty is the antithesis (and victim) of despotism. Securing civil liberties is the main point of constitutionalism and of court review of legislative and administrative acts. Historically, the defining issue in civil liberties in the nascent United States was the separation of church and state. One might even say that religion was the most important issue in English and U.S. political history and remains among the most important today, although apparently more in the United States than in the United Kingdom. England slowly followed the American solution despite having a state church that now has virtually no political role. The issue is perhaps most often cast as theoretical or normative. The principal issue on the ground for several centuries was, however, pragmatic. It was how to stop interference in politics and governance from the clergy, the church, and especially the Pope, all of whom acted as though they were hierarchically superior to secular political leaders, whom they even thought they had the God-given right to remove or force from office. Many English citizens and leaders long wanted such religious interference out of politics, and many were eventually willing to change their religious commitment in order to force the Catholic Church out of the political life of England.

Many thinkers also address the abuse of individuals by the church in its efforts to impose particular beliefs. Hobbes and Locke suppose that such efforts cannot succeed because they think that beliefs are not subject to choice, so that it is pointless to punish "wrong" beliefs. Hume would go further to say there is no way to establish the truth of religious views. In any case, punishing beliefs as wrong is an epistemological sin. If you have not chosen your Catholic or Protestant beliefs, you cannot sensibly be held responsible for them.

If they are politically empowered, conflicting religious views get in the way of social order, as in the European wars of religion. They also complicate constitutional arrangements, as Madison and Thomas Jefferson recognized. With a multiplicity of religions seeking special status, the only sensible move is to deny recognition to all sects. This is both normatively and pragmatically a compelling move. In the views of Hobbes, Locke, and many others, it is also epistemologically compelling. Reaction to centuries of brutal treatment of people for holding wrong beliefs is one of the fundamental causes of the rise of liberalism, along with reaction to the frequent arrogance and arbitrariness of government officials, especially monarchs.

John Locke and Samuel von Pufendorf largely address theoretical issues of religion and governance, as opposed to pragmatic issues of actual problems on the ground. Many English thinkers before and after them have been far more concerned with the latter, especially with papal and clerical interference in domestic politics. After much bloodshed, the church was subdued enough to be transformed into the far less intrusive Anglican church. The first major move, on largely pragmatic grounds, to take government out of religious hands altogether was the separation of state and church implied in the First Amendment to the U.S. Constitution. French constitutional provisions were even stronger after the revolution and have led to banning the hijab in public facilities, such as schools, and even in public. These policies have overwhelming support in France, in part because overt religious display is severely contentious and has been since the revolution, which was as anti-Catholic as anti-aristocratic.

Nations in which a particular religion is given substantial political influence generally tend to be illiberal, as in the cases of Iran under the ayatollahs and Saudi Arabia under Wahabbist hegemony. In the latter, possessing a Bible is a capital offense. Under both these regimes, the harshest principles of sharia law are imposed.

The substantial separation of church and state seems to be a necessary step for creating a liberal society. This is likely not a theoretical but only a pragmatic claim, but it fits the contemporary situation in many nations. Again, philosophy must be informed by causal understandings if it is to be relevant to contemporary debate on theory or practice.

There is another pragmatic objection to state sanction of individual beliefs. The multiplicity of faiths in the United States and many other nations makes establishment of a state religion very conflictive, although this is not an issue for Locke, who would establish a state church but would not punish those who do not follow its beliefs. As though the issue were strictly a matter of normative theory, too much of what is written today still neglects pragmatic objections to state involvement in religion, especially Madison.

Given all the debate in the United States surrounding the Establishment Clause of the First Amendment, debate that suggests that this is a severely fraught issue, it is remarkable that there was apparently no constitutional test of any law on religious grounds for nearly a century after the adoption of the constitution. The case that finally went to the Supreme Court to test the meaning and scope of the principle of the separation of church and state was *Reynolds v. United States* (1879), in which the court allowed the constitutionality of laws that penalized bigamy even for those men who claimed that multiple marriages were part of their Mormon religious duty. The court quoted Jefferson as holding that "the legitimate powers of the government reach actions only, and not beliefs." Hence, the government could regulate behavior, including behavior motivated and even supposedly required by religious beliefs. This position is causally consonant with the view of Hobbes that the state can act against behavior but that it should not attempt to "correct" beliefs, which one perhaps cannot even know a person has and which one cannot force the person to change, even under threat from the Grand Inquisitor.

The constitutional protection of positive individual rights, perhaps of the freedom of religion foremost, has changed over the centuries, and therefore, the legal conception of the content of religion has changed and broadened. Naturally, this has been especially true after *Reynolds*. For example, the doctrine of separation of church and state stands uneasily behind conscientious objection to military service. It is argued that one's religious commitment to pacifism or objecting to killing on the battlefield is violated by requirements to serve in the military. Proof of one's religious beliefs on this issue is prima facie demonstrated by membership in a church that has long preached pacifism, such as the Quakers and Jehovah's Witnesses, but the idea has been broadened to include nonreligious moral objections.

Distributive Justice

Hume famously, if too easily, dismisses the quest for "exact" equality. As Brian Barry argues in *Theories of Justice*, Rawls treats fairness as perhaps a secondary concern with welfare and its enhancement, as in his difference principle, which allows inequalities if they are produced by institutions that enhance the welfare of the worst-off class of people. Indeed, the issues in equality and its trade-offs with efficiency are at the core of Rawls's theory. Thus, there are two parts of the theory: fairness and mutual advantage. The authors of the U.S. Constitution (1787) were worried that democracy would bring the majority, who were poor farmers, to power and that they would confiscate or tax away property to redistribute its value to themselves. In the most advanced nations, to which Rawls supposes his theory applies, there are virtually no remaining subsistence farmers, who a century ago still defined poverty for most people in many societies.

Recall Rawls's theory of mutual disinterest in each other's welfare. If the best distribution we can manage gives me fewer resources than it gives you, I am not concerned that you have done better than I have. If that is not true, we might degenerate into caring about how each of us ranks rather than our welfare per se.

If Rawls's preferred social organization is to be achieved voluntarily rather than by forceful imposition, it seems implausible that anyone now living will see any significant progress toward it. Therefore, his theory seems at best to be an ideal theory in our time, and we can be morally certain that we will not see it put to work. Voluntary moves toward just distributions face a grand instance of the logic of collective action. The logic of collective action is devastating for the voluntary achievement of any large-scale provision. As Hume says, it is impossible that people would contribute to a massive collective provision. *Impossible* is too strong a term, but only just barely so. That logic coupled with strong leanings toward self-interest implies that Rawls's theory could be put into effect only through coercion or through radically altering human nature to override self-interest.

Representative Democracy

Democracy has taken many forms from its earliest rise as direct democracy with all citizens in the same forum, making decisions together. In contemporary societies, this is of course not feasible for national governance. Hence, the basic form that democracy must take is *representative* democracy, which is a new invention to handle large societies. Strictly speaking, only direct, face-to-face democracy is republican. The most important theorists of representative democracy are John Stuart Mill and Bernard Manin. Any ideal version of republicanism is doomed under modern conditions. Large size requires representative government with representatives who cannot possibly represent all of the diverse elements of their constituencies; frequent, short parliaments are desirable for republican values, with state and local elections every year. But all of this is impractical in our geographic and demographic conditions. Unfortunately, in a representative system, a strong parliament meeting frequently exacerbates the separation of the parliamentarians from the people, and representatives may come to resemble the rulers rather than the ruled.

Democratic practice is not without major flaws and serious failings. Briefly, let us consider a few problems in the working of representative democracy: First, deliberative democracy makes demands that go well beyond what is possible and at its worst descends to yelling and name calling when activists mobilize crowds to vent their ire at their opponents and elected officials. At its best, significant participation and deliberation beyond voting and talking with associates is restricted to proportionately very few people. Second, Anthony Downs argues convincingly that individuals generally have no interest in going to the trouble of voting. There is a vast literature both for and against his claims. Third, issues of equality and inequality suggest that the egalitarian core principle of democracy—one person, one vote—is de facto violated by massive spending and by differential mobilization, as in the antidemocratic disruptions of vote counting in Florida's presidential election in 2000.

Finally, pause a moment to consider the perversion of the role of governors, as argued by John Calhoun. After leaving the national political stage a decade before the U.S. Civil War, Calhoun wrote *A Disquisition on Government*, which was an analysis of forces distorting the U.S. political system. In it, he stated that "those who exercise power and those subject to its exercise—the rulers and the ruled—stand in antagonistic relations to each other." Calhoun described the rulers and the ruled as two hostile classes: "The advantages of possessing the control of the powers of government, and, thereby, of its honors and emoluments, are, of themselves, exclusive of all other considerations, ample to divide [any] community into two great hostile parties." The division here is not only one of status but also one of emoluments. In essence, Calhoun argues that political officeholders are separated from the rest of the community; they are a class apart. The supposed trustee becomes independent from the persons reposing their trust. The creature is stronger than the creator; hence, we suffer a lack of confidence in the representative system.

Constitutionalism

The mechanical point of a constitution is to establish institutions of governance and to protect citizens from arbitrary state intrusions. In any given context, institutions could take many forms. Without prior order, a constitution cannot likely be made to work; indeed, without order, it might even be hard to engage some political body to write a constitution, although one might be promulgated by a current government, even an autocratic government. Having a prior history of successful government might be the best predictor of constitutional success. For example, the 13 American colonies had working governments and even, in some cases, articulate constitutions before the federal constitution of 1787. This prior experience, as well as the experience of living under a relatively orderly English government, enabled the constitutionalists of 1787 to write their constitution in relative quiet.

The main focuses of constitutionalism are to enable government and to constrain it. These purposes sound contradictory, and they commonly are. Why create government to constrain government? As odd as the question sounds, it is easy to answer, so easy that its answers were likely taken for granted by the authors of the U.S. Constitution in 1787 and by its ratifiers in subsequent state conventions. In this particular case, the federal constitution was needed to override state constitutions, especially in economic policy, with free trade among the states and exclusive federal regulation and taxing of international trade. Thereby, the constitution established a nation. In many other cases, extant governments have been altered or replaced by newly created constitutions. Many of these extant governments were autocracies, usually monarchical or military.

The main constraint on government action from a strong constitution is the rule of law. The rule of law against arbitrary government is the high dogma of 17th-century English constitutionalists. It essentially involves limitations on the exercise of official power. This is now often seen as the main point of a constitution and the central principle of Anglo-American law. Nonarbitrariness implies equal treatment, in part by blocking arbitrary action by monarchs and political office holders. It appears that the rule of law does not require a written constitution, because England has none and yet its rulers have generally followed the liberal principle. Moreover, from the earliest times, Saxons in Germany lived under an unwritten "constitution" of liberty, a fact that distinguishes English political developments.

There are two general strategic approaches to constitutionalism, treating the issue as primarily one of contracting or one of coordinating. That there could be varied forms that the constitution for a particular society could take already suggests that the problem is at least partly one of coordination. With only modest changes, the very brief and often vague U.S. Constitution or the massively detailed Indian Constitution might both work in the sense that they define institutions that, when put in place, successfully govern their societies.

Perhaps the dominant school of thought on how government may be morally justified has been contractarianism, to which an enormous array of philosophers have contributed, including classical thinkers as well as Thomas Hobbes, John Locke, Jean-Jacques Rousseau, Immanuel Kant, and countless others. There are subtle variations in contractarian arguments, but essentially they rely on a claim of consent that obligates us to obey the government to which we have consented. This is commonly framed as a moral argument. We are morally obligated by our prior consent. This is perhaps most clearly asserted by Locke, who is likely the most influential proponent of the social contract in the Anglo-Saxon world. Hobbes holds more simply that we collectively agree on election of a tyrant or dictator to coerce us into decent behavior. His is not an argument from ostensibly moral consent but from rational, self-interested consent. After taking this limited step of establishing government, there is no further project for the contractors to take on, and they have no further role in governing themselves.

Calling this contract theory can be seen as a grand instance of persuasive definition. If you and I contract legally, we commonly are morally bound to perform, unless we both agree not to do so. Hume mercilessly demolishes the implicit historical arguments of the development from a state of nature to a contracted government, as Hobbes posits while saying that such a state probably never existed. Hume notes simply that if we had contracted for or consented to our government, we would remember the event. Evidently none of us does remember, nor is there much of a record of our forebears having agreed. Worse still, many of us can hardly understand the contractarian claim. Contemporary constitutions are generally written by committees and voted into effect by some far less than unanimous part of the national population. Opponents of contractarians would argue that the masses cannot be morally obligated by such a process.

Having demolished the going theory in his time, Hume offers an alternative account, stating that government arises by convention. There was no start date, and there was most surely no conference room agreement. Our government evolves over time and may become dramatically different in form from one generation to the next. The form of the government is generally an unintended consequence of the disparate interests and inputs of the citizens, as portrayed in Charles McIlwain's history of constitutionalism.

In this view, the "contract" in the social contract is generally seen as morally binding by analogy with a standard ordinary contract agreed to by the parties and backed by the law. Coordination as in Hume's theory is not morally binding; either it works or it does not. If there is a coordination convention, it might be immoral not to comply with it. For example, not driving on the right when there is a convention of driving on the right would be murderous and immoral as well as stupid. If I go to Australia, I will do my best to follow the Australian driving convention. But this choice does not turn on any prior agreement. My connection with the coordination is not a moral but a rational, self-interested commitment. We all act from our own interest by driving right in North America; without agreement or negotiation, we create a beneficial order for all. Similarly, Hume's convention account of the state is not normative, and any state that arises by convention is neither right nor wrong in principle. In Hume's vision, this is a plus. It is his great, persuasive move: creating collective benefits and good institutions from the self-interested motivations of individuals. Prior theorists almost uniformly think that self-interest is an obstacle to good government and social cooperation. In contrast, Hume sees it as central to the explanation of achieving good government.

In sum, a reason for or an appeal of social contractarianism is that it seemingly yields a moral reason to comply with its dictates. As François Guizot says, the hypothesis "of a primitive contract, as the only legitimate source of social law, rests upon an assumption that is necessarily false and impossible" (Pt. 1, Lecture 4). Unfortunately, on this issue, the theory fails. Its failure seems to be a source of nostalgia for many theorists who would like contractarianism to work and to cohere. Alas, it does neither. The vision of general consent is sweet but contrary to the possibilities of human nature in a world of scarcity of both status and goods. Again, Guizot states that the "necessary coexistence of society and government shows the absurdity of the hypothesis of the social contract" (Pt. 1, Lecture 6). It is astonishing that this cooperative vision is most famously argued by the nearly antisocial Rousseau. Guizot, who has done the massive work of cataloging the complicated, back-and-forth development, over more than a millennium, of constitutionalism and representative government in Europe, seems morally offended by the simplistic claims for a social contract as the standard of the right.

Conclusion

We have only three major, broadly developed normative schools of thought on this question: the liberal, utilitarian, and egalitarian schools. There is also a developing fairness school that has been classified as a theory only recently in the Rawlsian theory of distributive justice. We have yet to see how it will stand the test of time. Rawls's followers often seem far more to fragment than to develop the theory. As noted above, what the theory most needs now is social-scientific analysis of institutions.

Utilitarianism is a general moral and political theory—in fact, the only one, Rawls says. Liberalism is a richly developed political theory that can live with almost any extant major moral theory; indeed, many of the great liberal writers, such as Mill, Hume, and Smith, generally brought individual morality and political theory together. In this combination seemingly across the two levels, utilitarianism and liberalism are especially richly developed. Many other, often ad hoc, arguments do not catch on to become genuine schools of thought. At its height, in the work of John Stuart Mill, Henry Sidgwick, and Leonard T. Hobhouse, liberalism was generally seen as at one with utilitarianism. Libertarianism is a limited version of liberalism, which has many followers, such as Nozick. Alternative approaches make little headway. For example, variants of Kantian liberalism, as in the Victorian writings of Thomas Hill Green, have virtually no strong contributors today. The extraordinarily deep moral vision of Kant and his school does not readily carry over to the study of political institutions, which seem not to interest most Kantians. Marxism is a partial political theory that still has many proponents, but its main focus has been economic, and its economic theory largely fails. It has essentially no moral theory adjunct; indeed, many Marxists reject standard views of morality, as though to say that all social relations are caused by natural forces, not by choices of free agents. Hence, in their view, choice and morality are not relevant to our explanations.

It would hardly make sense to discuss some problems in our social world without the use of at least verbal game theory, strategic analysis, or economic models. Debates over how a constitution comes into being or how it works once it is enacted are unlikely to be fruitful without the clarity of the game-theoretic argument for dividing the two main positions on this issue into contract and coordination. Hume had a nearly miraculous gift for grasping strategic interactions entirely verbally. Thomas Schelling says he is not a game theorist, meaning one who contributes to the theory. Rather, he is a practitioner, using game structures to help clarify patterns of social interaction. Political theory needs such practitioners.

The beginnings of liberalism and liberal society are in the resolution of the dreadful conflict between civil order and religious beliefs. The church's pervasive meddling in English politics provoked arguments that became general claims for further attaining civil liberties. Monarchs in England fought off the church, but they could not indefinitely fight off their own citizens. English history then informed debates in Philadelphia in 1787. Had the Church followed its own ideology, its minions would have rendered unto Caesar what was Caesar's. Instead, they hastened the growth of liberty and liberalism, which went far toward destroying the Church. The ultimate move was the separation of church and state, which we might justly call the necessary constitutional liberty.

NORMATIVE THEORY IN INTERNATIONAL RELATIONS

The theory of international relations (IR) is subdivided into an analytical field, which describes and explains international events, and a normative field, which prescribes conduct and formulates moral judgments. This second field aims at producing ideals regarding what IR ought to be.

This entry first reviews the evolution of normative theory as technological advances and the emergence of nation-states created the need for new norms to govern IR. During the past 3 decades, norms in IR have undergone a second period of expansion, as a result of increased interest on the part of academics, along with factors outside academia, including globalization, the end of bipolarity, and terrorist attacks. After exploring this development, the entry examines the dilemmas associated with war, including the question of how to define war and issues related to decisions in the aftermath of war. Is a military intervention necessary to protect victims of genocide? Should innocents be killed in the name of political community? Should soldiers' duties end after victory? Next, problems arising in the context of global justice are discussed, with a focus on corrective, distributive, and environmental justice. The origin, the nature, and the extent of obligations in humanitarian law and in social redistribution are discussed, as well as new realms such as protection of the environment and the use of international sanctions. The entry concludes with a look at the possibility of a global world order in which national identities can be transcended in a postnational, global community characterized by cosmopolitan democracy. There are various conceptions of the global political order regarding the creation of a cosmopolitan democracy: Is the disjunction between modern liberty (focused on the private sphere) and the republican public sphere in democratic states even greater in a cosmopolitan democracy? Is the political unity of the world possible despite the plurality of cultures and of ways of life?

In taking a philosophical approach to IR, normative IR plays several roles. The first function of normative theory is to argue for epistemological transparency. Any scientific theory expresses the more or less hidden normative preferences of the analyst, and this can give rise to the development of ideologies in the public sphere. For many, this first function often leads to a deadlock. The second function of normative theory, which this entry explores, is related to orientation. The philosopher Immanuel Kant, to illustrate what he means by "orientation in thinking," uses spatial indicators—the north, the south, the east, and then the west. Afterward, the same reasoning is applied to the world of logic. Orientation in thinking means to come of age, to be able to judge by oneself, to use one's common sense to make the right choice. To achieve this, shadow zones or *fault lines* have to be identified. This is a major purpose of political theory, according to John Dunn (1996). He insists that political theory should consist in indicating "a series of sharp, and as yet very poorly recognized disjunctions" (p. 33). The issues discussed in this entry reveal points of tension between the universal and the particular and among liberals, communitarians, socialists, and pragmatists, with the aim of finding the right relationship among them.

The Resurgence of Normative Theory

In the 1960s, Stanley Hoffmann insisted that political philosophy was in a lamentable state. According to him, this weakness was the result of philosophers' difficulties in applying their ideals at the international level. Martin Wight emphasizes the same issue when he distinguishes between a theory of good life (*inside* political entities) and a theory of survival (*between* political entities). Today, the situation is quite different for philosophy, which appears as an "old thought" in IR.

An Old Thought

The term *international* was first used by Jeremy Bentham in 1789. However, modern philosophies of IR were born in the Renaissance under the influence of two processes. The first corresponds to the transition from feudalism to the sovereign state. The question of resort to force became of great interest. Private wars conducted without the endorsement of the monarch were forbidden, and at the same time potentas was transferred from the Church to temporal power (through the creation of an interstate Law of War). The principle of sovereignty was built against foreign powers (the Pope and the Emperor), and rules were set up to implement a legitimate practice of war between states. The second process is related to the "great discoverers." Galileo's telescope, Copernicus's astronomical system, and Columbus's explorations led to a much broader understanding of human beings and their world. With this new recognition of human diversity came questions about the relationships among people. The entry into modernity was marked by a new awareness that the time of autarky was over.

Nevertheless, philosophy did exist before the construction of modern states. Even in ancient and medieval times, philosophers considered how to define otherness through the boundaries of churches, cities, and communities. Stoicism defended a moral universalism that transcended ethnic differences. In the Middle Ages, the concept of empire involved a pacific function that was theologically justified. Civic humanism, which first appeared in the Italian peninsula, would become one of the sources of foreign policies even in Great Britain and the United States. Thus, foreign relations came to be theorized by normative discourses, which reveal different ways of considering the boundaries between inside and outside.

With modernity and the rise of the nation-state, relations between states become a more complex issue that became visible through the constitution of political science as a new discipline. In 1919, the birth of IR as a science brought back these normative orientations. The first debate opposed liberals and realists. Liberals promoted not only Aufklärung but also "*doux commerce*" (Baron de Montesquieu), historical progress through education, and the peaceful virtues of democracy. These were the target of realists' criticism, which stressed the role of the sovereign states and their competition and overshadowed biological and spiritual factors. However, the moral dimension of liberal thought was acknowledged by Hans Morgenthau himself, who is known as the father of an approach that separates morality from politics. As observers and judges, political scientists have to denounce wrong choices (as Morgenthau did during the Vietnam War). As practitioner, the statesman must adopt an ethic of "lesser evil," which breaks with an idealist perspective without opting for an ethic that claims the absolute good, which is inaccessible. Contrary to the English school (Martin Wight), the major part of the following generation was strongly influenced by positivism, which was at its peak from the 1980s; the behavioralist moment has departed from these normative trends.

Intra-Academic Factors in the Resurgence of Normative Theory

The first intra-academic factor in favor of the development of normative theory lies at the heart of Western political theory. John Rawls's opus magnus, *A Theory of Justice* (1971), gave to normative theory a second birth. Although Rawls did not directly tackle the issue of international justice in this early work, several commentators did, thus generating a broad consideration of the idea of global distributive justice.

The second factor lies within IR itself. In the 1980s, critics of new research on scientific realism (structural realism and neorealism) or liberalism broadened the basis of their critique and questioned the scientific authority of these works by means of philosophy. The return of norms, narrowly speaking (rules of international law) and in the wider sense (standards of conduct for public and private actors), is one of their best arguments. These approaches tended to explain the nature of international norms (their origin, implementation, and national integration and change) as well as their impact on states' behavior. But above all, they produced an ethical discourse on what global regulation ought to be that nourishes several sectors of the field—for example, humanitarian interventions and strategic cultures. This is why they deserve the designation of *ideational turn*. Such tendencies can be considered as a return to the origin of the field, as the first interparadigmatic debate between liberals and realists was taking into consideration the issue of norms.

Extra-Academic Factors in the Resurgence of Normative Theory

Three extra-academic factors are especially noteworthy in the resurgence of normative IR. First, the process of globalization became stronger. If the abolition of distances originates from the first phase of modernity (the Renaissance), wars and development in communication technologies have strengthened this process. In this regard, globalization is characterized by a density of networks, a greater velocity of information flows, and a complex interdependence that favors transnational participation. In such a context, at what level must the accurate meaning of political action be defined—at the national level or beyond?

Furthermore, the end of bipolarity, which had structured identities since 1917, strengthened the already existing uncertainties regarding the identity of human beings, and the delineation between self and other became increasingly ambiguous. David Boucher (1997) sums up this situation in his famous question "Who am I?" and adds, "the consequent politics of recognition, inclusion and exclusion bring into focus not only politics of the nation, state and cosmopolitanism, but also of gender, race, religion and ethnicity" (p. 173).

Finally, terrorist attacks brought a new urgency to normative IR. When an unpredictable event happens and seems to brutally interrupt the political and social processes, reflection is needed to find out to what extent "the thread of tradition has been broken," to use Hannah Arendt's expression. The attacks of September 11, 2001, as well as the terrorist assaults in Bali and Mombasa (2002) and Madrid (2004) are evidence of such a breakdown. Of course, it would be presumptuous to consider that the attacks in the United States have had the same consequences that Nazism and the Holocaust had on a whole generation of intellectuals, such as Theodor Adorno and Hannah Arendt. However, the global media coverage of these events has confronted both analysts and citizens with something tragic that calls for a meaning. In Robert Keohane's view, the 9/11 attacks reemphasized the importance of integrating normative issues into political philosophy and research on IR. Keohane emphasizes that a basic function of a liberal state is to protect its citizens from the fear of cruelty and that helping people come to terms with terrorism is part of that task.

Dilemmas of War

Contrary to pessimistic expectations, the bipolar system of the Cold War era ended without military struggle. However, the collective euphoria vanished, and fears regarding the feasibility of setting up a peaceful world order have appeared. Today, irregular wars, civil wars that evolved into ethnic cleansing, and increasing military interventions outside the United Nations (UN) Security Council's authorization all indicate a need for moral judgments. Thomas Hobbes's world is coming back, whereas it seemed that we were living in Kant's. But is war still the *ultima ratio legem* between political communities? We can distinguish three kinds of dilemmas regarding the nature, the justification, and the termination of war.

Defining War

Modernity draws on a specific definition of war: a struggle between enemies conceived as political entities. For example, Jean-Jacques Rousseau gives a definition of war in his *Social Contract*: It is "a relation, not between man and man, but between state and state, and individuals are enemies only accidentally, not as men, nor even as citizens, but as soldiers" (Book 1, chap. 4). This definition is the opposite of current conceptions of war, which go far beyond its first usage. Today, one speaks of a war against terrorism, war against poverty, or war between civilizations. First, the number of violent actors has increased. The state is not the unique gladiator anymore. Moreover, some states, and even intergovernmental institutions, call on private military societies to provide security. Such a practice is ambiguous: Do private actors benefit from a right to kill? Several libertarians subscribe to this possibility and are delighted to see that security is becoming a good, among others. They stand in opposition not only to classical liberals but also to radical anarcho-capitalists, who agree with Adam Smith on this point—that wealth alone cannot ensure peace because harmony of interests between states cannot be achieved. However, in Milton Friedman's opinion, states must develop their own defense posture in the nuclear era.

In addition, Clausewitzian logic, which subordinates the military to politics, would also be called into question. New actors would put aside negotiations and compromises and instead advocate an apocalyptic rhetoric. States, particularly Western states, would also resort to a new approach to war. They would act not to restrain their enemies' will but to socialize them by punishing them, with the aim of changing their values. These post-bipolar interventions are known as *policing wars*. The "war against terrorism" as well, which critics have called a false expression at a conceptual and an operational level alike, fits in with this logic of a "postnational war." The underlying goal would consist in achieving a global political homogeneity on the basis of the dominant parties' values. This debate on the nature of war has taken a critical aspect across the Atlantic with the multinational military campaign known as Operation Iraqi Freedom. Because this strategic action originated in a neoconservative ideology, some analysts have pointed out the influence of Leo Strauss. Such interpretation is based, however, on a misunderstanding of Strauss. His assessment of modern liberal democracy, especially in the United States, is deeply pessimistic, and this frame of mind is the opposite of the current neoconservatives' optimistic and demiurgic mood.

Justifying War

When is a military intervention justified? Is it moral to resort to force in order to protect populations that are victims of oppression? A tension appears between the principle of noninterference in the internal affairs of a sovereign state and the principle of protection of human rights. This tension is all the more acute when resort to force in the name of universal values happens to be selective; for instance, the type of international intervention considered in Bosnia will not be considered for Chechnya. How can the dilemma between universal principles and specific cases be resolved? Does the just war tradition, which refuses to separate ethics from politics, still provide accurate orientations?

Elaborated by Saint Augustine, the doctrine of just war sets up criteria regarding the beginning and the progress of military interventions: (a) *justa causa* (intervention should aim at protecting life), (b) *auctoritas principi* (only duly constituted authorities may wage war), and (c) *recta intentio* (rules of law must be observed). To adapt it to the 20th century, Michael Walzer undertook a revision of just war theory. First, he refocused *justa causa* on self-determination and resistance to aggression (against the territorial integrity and political sovereignty of an independent state). The highest purpose of a state—or of a community threatened by a metropolitan government—is to defend a territory and a way of life (shared values). Thus, Walzer subscribes to the British utilitarian ideals of the beginning of the 19th century, according to which democracy cannot be imposed from outside but arises out of particular experiences. Moreover, when a community is threatened and has no power to struggle, as in Kosovo in 1999, military intervention is required. This is the only type of just war acknowledged by Walzer. Humanitarian intervention should be a form of mutual help that occurs only after the identification of an "unbearable" aggression and sufficient inadequacies in self-defense.

Second, Walzer argues that only a "supreme emergency exemption" can justify aggression that violates moral norms such as the principle of discrimination between civilians and combatants. The best example of such justifiable but immoral action ("dirty hands") remains Winston Churchill's decision to bomb German towns in 1940 to 1941 in order to create intolerable conditions for the population. Neither absolutist nor utilitarian moral theories can explain such cases. Absolutist theories hold that moral rules or principles do not admit of any exceptions; hence, there can be no justification in the name of "innocent victims." Utilitarian theories deny the relevance of innocence applied to a part of a population as long as the consequences of an act can benefit the greatest number. Both approaches reveal weaknesses. The real question is "How can we support criminal acts decided on by leaders without forgetting the ethical issues?" As long as the action is taken by duly elected political leaders and the survival of the community is at stake, such actions can be endorsed. However, this limits the application of the emergency exemption; it cannot be applied to terrorist practices and can be used only by duly elected political leaders. Even though terrorist movements may claim to be acting in the name of *justa causa*, they cannot endorse any legitimate authority or assume responsibility for actions that are morally unjustified. Thus, states have the monopoly on "dirty hands." This pro-state bias is one of the major criticisms formulated against this theory. Critics argue that Walzer is applying a double standard, denying to terrorists what is acceptable when done by political leaders. Thus, critics have questioned whether such an approach is based on too much confidence in the moral rectitude of our leaders.

After 9/11, just war and its underlying moral dilemmas reappeared at two different levels. The first one regards the interpretation of Operation Iraqi Freedom: Was this a humanitarian intervention to end a tyrannical form of government? Several analyses challenge this view on the ground that humanitarian interventions cannot be carried out to change the nature of a regime but only when great atrocities are committed. Beyond the question of the support brought by the other democratic states (desirable but not mandatory for those who hold that intervention to end tyranny is acceptable, necessary for those who believe that it is justified only in the case of great atrocities), what is called into question here is the goal of such intervention. Several interpreters have disagreed with the rhetoric of a crusade or crusading spirit to justify the Iraqi operation, invoking one of the main features of just war theory. The case of Iraq promotes in-depth discussion on the ethical aspects of the resort to force against an indirect threat. International law distinguishes between preemptive and preventive war. In moral philosophy, there is a similar debate on preventive war and anticipatory attack. According to Walzer, anticipatory attack would be morally acceptable only if three cumulative elements are present: (1) an intent to cause harm by a "determined enemy" (whether in the present or in the past), (2) a degree of active preparation that turns this intent into a positive danger (e.g., building up offensive forces along the border), (3) and a situation in which waiting or doing anything other than fighting increases the risk of being attacked. Preventive war, on the contrary, is based on speculative arguments and is aimed at maintaining a balance of power. It cannot, therefore, rely on moral values.

The second level concerns the possibility of applying just war theory to the fight against terrorism. In the Augustinian tradition, some thinkers define terrorist actions as acts of war that justify resort to force against their authors. Again, the "dirty hands" issue arises. When a terrorist refuses to reveal information about an attack against a civilian population, the use of torture has been approved according to the paradigm of the "ticking bomb." It stands for an extreme case where torture is justified so as to prevent harm to citizens. This argument is consequentialist in its appeal to the prevention of an imminent catastrophe and its application of the principle of cost–benefit analysis. Such a procedure must be visible, and those responsible must be held accountable to minimize the frequency and the severity of the practice. However, despite these measures of control, the practice of "dirty hands" can be excessive or may favor double standards (discriminatory interpretation of torture by the actor).

The deployment of armed forces abroad and the struggle against terrorism in the name of just war are not instances of actions taken in accordance with consensual principles. Are we required to think on a "case-by-case" basis? Pragmatism argues that we must do so.

Ending War

Kant argues that victory is not synonymous with moral superiority. Military victory changes the balance of power but not one's moral commitment. Kant adopts a symmetric reasoning: If rules of *jus bellum* are not respected at the beginning of a war, they will not be respected after the war either. However, just war theory is rather silent with respect to the end of war. What does the post-conflict situation require from the winner, and what kind of dilemmas are highlighted here?

Once a war has ended, five principles should be applied to avoid grievances leading to acts of revenge:

1. the proportionality (the fairness of the terms of a treaty) and the publication of peace agreements;
2. the recognition of civil rights;
3. discrimination among leaders, soldiers, and civilians when imposing sanctions;
4. compensation (financial restitution, material reconstruction, etc.); and
5. civil and military rehabilitation (demilitarization and disarmament, police and judicial retraining, and human rights education).

However, can these obligations guarantee a just peace and renew the reflection on positive peace? A just peace implies a “thin” recognition of the other, conceived as an autonomous entity from a liberal standpoint; a “thick” recognition of the cultural identity of the other; the renunciation of armed violence; and the establishment of rules, rights, and duties and their formalization in a legal document. The point is to create a new common language between different communities. Liberals have criticized this idea because they define peace in strictly legal terms. In other words, peace can only have a legal dimension in the framework of the existing international rules. This restrictive definition is grounded in the “cultural neutrality” of liberalism in the public sphere. Identity is therefore a concept that belongs to private life and is not acknowledged in the framework of diplomatic negotiations.

The danger of neocolonialism represents a second dilemma if the change of political system becomes the goal of the post–World War II era. Historical examples (the Japanese and the German experience) as well as consequentialist arguments (a government’s change is the best way to ensure security) may rule out this danger. However, this danger will always exist. The imposition of democracy by force appears to be a revolutionary practice, all the more dangerous since it is based on a strategy of exportation that excludes any other way of implementing democracy.

Dilemmas of Global Justice

According to the Greco-Roman tradition, both corrective and distributive justice can flourish only inside political entities. By integrating *jus post-bellum*, the just war theory has opened a new perspective in favor of international corrective justice, as the creation of the International Criminal Court (ICC) shows. The road to global justice gets wider as other directions (e.g., environment, sanctions) are being explored. Unfortunately, none of them have elaborated their own theory of justice.

Corrective Justice

The 20th century underwent two World Wars, colonial wars, and a good deal of civil warfare. Perhaps the main consequence of this consists in the development of public international law to regulate the relationships between states (the Geneva Convention) and, after conflicts, to judge those responsible (e.g., the Nuremberg and Tokyo trials, ad hoc tribunals, and the ICC). This process bears out Kantian views according to which the painful experience of war arouses the need for unity relying on a morally grounded system. In the opinion of the first president of the Criminal Court for the former Yugoslavia, Antonio Cassese, it is more and more shameful not to be involved in this corrective justice effort. However, this trend has been called into question. Behind this kind of justice lies a paradox that the German jurist Carl Schmitt was the first to criticize.

Modernity produced a *Jus Publicum Europaeum*, a set of European rules produced in the 16th century to put an end to the wars of the Middle Ages and regulate the resort to force. This transformation created a new humanized “nomos of earth”; that is, a permanent principle of space distribution that usually consists in seizing, dividing, and exploiting territories. Modernity does allow hostility in the acquisition of new territory, but this practice must be regulated. Thus, within the new international law of the 20th century, war becomes illegal as a method for resolving the competition among states. The enemy becomes a criminal: On the one hand, no negotiations can take place with him; on the other hand, he must be punished. The relation that Carl Schmitt sees is the exact opposite of the league of states described by Kant. This change within the law has given rise to total wars; the denial of hostility is the root of absolute hostility. The goal of war is not to fight an enemy but to annihilate it under the assumption that the enemy is guilty. In this view, Schmitt sees a correlation between the criminalization of the enemy and the increasing resort to depersonalized aerial wars, which leads to the suppression of the Other. Corrective justice becomes, therefore, an ideology that promotes inhumanity on behalf of humanity.

Distributive Justice

According to Dunn (1996), a sharp contrast can be seen

> between a world of mutually recognizing Nation States and conscientious agencies of putative international beneficience, created, funded and defended by those states, and a world of brutally unequal suffering and enjoyment in which vast masses of the poor have little, if any, prospect of a happier existence even for their children's children. (p. 33)

Two bridges are conceived to fill up this gap and establish new transnational obligations toward the weakest states. The first one was conceived after the 1972 food crisis in Bangladesh by proponents of utilitarianism, who argued that responsibility is based not only on moral considerations but also on utilitarian ones. Passivity toward the pain of another moral agent involves a responsibility, which is identical to the pain we would feel if we had caused it ourselves. The pain of other moral agents creates a responsibility among others. This moral postulate is criticized because of its excessive requirements, which go far beyond "agent-centered prerogatives" and free consent. Yet such minimalist reactions define international aid as a question of charity rather than of justice. Other political analysts hold intermediary views and draw on Kant's concept of imperfect obligation: Helping people in foreign countries does not depend on an agent's arbitrary will, even though these agents decide the moment and conditions of its application. Once again, this third option entails imperfections: The decision to act is most of all individual here; hence, it will not necessarily meet the emergency. To tackle such issues, decisions must be taken by several actors.

The second bridge is proposed by left Rawlsians. They intend to overcome a weakness within the first postulate, which does not allow moral agents to meet each other (e.g., those who give and those who get). The ground of the argument here is the application of the entire Rawlsian theory at the international level. In this view, states find themselves in an "original position" from which they must determine principles of justice between states in the same way that individuals are to choose principles of justice independently of their specific position in society (i.e., independent of whether states are rich, poor, etc.). However, the framework used in the theory of justice is too narrow and needs to be enlarged to include public actors. Moreover, the two Rawlsian principles of maximal equal freedom and the differences that would be allowed by individuals behind a "veil of ignorance" are transferred to the international level. This extension is demanded by the historical context and brings out the development of constraining institutional mechanisms. In light of the unfair economical inequalities to which they contribute, well-off states have to subscribe to a consequentialist posture that compels them to set up new rules, especially in the field of taxation.

These two last perspectives, both of which are part of the cosmopolitan standpoint, meet the same challenge: Can distributive justice emerge outside a specific political framework? Liberals and communitarians are cautious, and their answer is "No." Rawls attacks these views as misinterpretations: Distributive justice as defined in Rawls's *A Theory of Justice* must be experienced inside society; its setting cannot be global. Some communitarians share this point of view. They insist on the idea of *affective proximity*. No moral relationship can develop between agents without this element. They also stress that each mode of distribution depends on the community's identity. Therefore, international redistribution does not result from any obligation but relies on the goodwill of rich people.

New Frontiers

Global justice enlarges its boundaries in three directions. The first means to integrate new dimensions, such as environmental justice, which is based on the "ecological footprint" principle. In this view, each of us leaves a footprint in the environment that is determined by the amount of resources we require and the pollution we contribute. This footprint may be very large in the case of armed conflict, which is often very destructive of the environment. Understanding our moral obligation to the environment requires both deontological and consequentialist approaches. It strengthens Hans Jonas's "responsibility principle" regarding future environmental degradation and natural disasters resulting from the development of new techniques. Such a principle draws on a "heuristic of fear," which conveys moral awareness of anticipated human threats to the environment. Nevertheless, one source of environmental justice—political romanticism that promotes a "return to nature"—remains a major issue. Indeed, this doctrine is restricted to the damages caused by *human beings* only. Thus, this anthropocentrist bias tends to emphasize human pain resulting from environmental degradation.

The second direction relies on a post-bipolar trend: the increasing use of sanctions against states and transnational actors. Must we resort to sanctions, such as embargos, to compel agents to respect the rules of international law? Sanctions represent a third way, which lies between not responding to violence and launching a military intervention. Morality speaks in favor of sanctions. According to Woodrow Wilson, a sanction embodies a virtuous foreign policy. It is the ideal tool for the censor, and it can have a deadly impact on the target. However, its detractors put forward three arguments based on classical moral doctrines. First, sanctions call into question the discrimination principle of just war theory because they cause pain (physically and psychologically) to innocents. Second, civilians are transformed into a means of exerting pressure to shape political decisions, which contradicts the deontological ethic because such pressure is coercive. Third, sanctions cause damages to humans while not achieving their political goals, which is incompatible with utilitarian logic. All these critics benefit from a large audience, which leads today to an "abolitionist" standpoint with respect to sanctions. Most of all, they express the vivacity of contemporary ethical reflections regarding international punishment measures.

The third dimension of the current analysis aims at enlarging the boundaries between caution and cosmopolitanism. Could these two postures meet regarding the concept of negative obligations? That is the aim of the "no-harm" proponents. In IR, "Do no harm or cause prejudice" provides the basis for a moral consensus between cultures. These statements echo Judith Shklar's "liberalism of fear," which also involves universal features, as each of us can share an emotion that paralyzes the whole being in the face of cruelty. The do-no-harm principle is criticized because it is sometimes considered incomplete. It lacks positive obligations, such as the duty to rescue. Several of its defenders emphasize that no harm is a first step to building benevolence (positivity is therefore delayed but not ruled out). Besides, the fact of being aware of the vulnerability of "distant foreigners" helps develop an attachment to humanity. Thus, cosmopolitanism sets up a link between the principle of justice and the implementation of a world community, as discussed in the following section.

Dilemmas of Global Political Order

Political theory of IR deals with the emergence of a world community: how a political community becomes more and more inclusive. Can it eventually embody the whole of humanity? As such, the very idea of a world community calls into question the Westphalian order as well as the international order defined by Hobbes. This theory also conveys to us a universalism that transcends the diversity of cultural expressions.

Universum/Pluriversum: Two Emblematic Dualities

When refering to a *civitas gentium maxima* in the 18th century, Christian Wolf had in mind a fiction gathering all human beings inside the same political unit. Three centuries later, his dream remains attractive. This emergence of a concrete world community gives rise to two main philosophical debates.

Kojève/Strauss

After Georg Hegel, Alexandre Kojève describes the "end of history," which means the end of politics, defined as a state of conflictual interaction between states. A universal and homogeneous state emerges, and individual states become its federated components. Public international law becomes domestic law for members who share the same way of being and thinking. The wise man is involved in this centralization process. He becomes the prince's advisor because, historically, thinking is synonymous with improving efficiency. Leo Strauss challenges this idea in two ways. First, he tries to keep philosophy apart from history, especially from the instrumentalist deviation of political leaders. Indeed, the rulers of the universal state may attempt to provide wisdom to all and practice tyranny. Second, the idea of the universal state meets with two obstacles: (1) the irreducible plurality of *political systems* (they arise out of specific morals that cannot be imported) and (2) that an *ideal system* is not achievable at the world level (it remains a regulating idea).

Schmitt/Kelsen

These two lawyers often disagree regarding constitutional issues in modern states. They also have opposite views regarding IR. Hans Kelsen criticizes the "dogma of sovereignty," a concept doomed to be overshadowed by the history of justice. Kelsen's normativism draws a parallel between relationships among states and interindividual relationships. The creation of a third party in primitive tribes and of courts of law in states allowed the solving of disputes between individuals. These procedures stand for the foundation of the community. Likewise, the creation of international criminal justice mechanisms is the mainspring of the international community. The project proposed by Kelsen to the UN, therefore, gives precedence to a jurisdiction and not to the Security Council. Carl Schmitt states that such ideas draw on an Anglo-Saxon (belonging to English-speaking countries) framework that calls into question the *jus publicum Europaeum*. Theologically, the "one world" embodies the Antichrist. Indeed, *universum* means to achieve what cannot be achieved from a human standpoint. The Tower of Babel is an illusion, and we have to get rid of it. It is an expression of the secularization of the mind often pointed out by Carl Schmitt. Through *universum*, human beings try to put themselves in God's place. At a political level, Schmitt contends that it is impossible to create a federal state at a world level. Such federal state lacks the most important feature of a state: homogeneity. Moreover, this project of unity forgets the underlying elements of politics: the struggle for power between small unities (empires in the 20th century).

These two approaches have nourished debates among political scientists and have given rise to a wide range of reactions, (e.g., Arendt). They also show how political views on universal and plurality can be different inside the same culture. These debates are still going on, especially regarding the idea of cosmopolitan democracy.

A Cosmopolitan Democracy

Cosmopolitan democracy's program aims at reactualizing our understanding of Kant by inviting us to go beyond it. The Kantian project of perpetual peace consists of three articles. First, a civil constitution must be republican. Contrary to despotism, which imposes its political ideas and conception of happiness on everyone, the republic is synonymous with separation of powers, protection of freedom, and guarantees of peace, thanks to the general will of the people. The second article aims at implementing a peace treaty between states (mutual nonagression through institutional means). Such a treaty does not lead to the creation of a supranational state but rather to the recognition by each state of the sovereignty of the others: in other words, a confederation of free states. The third and last article introduces the idea of a cosmopolitan law based on universal hospitality. Thus, Kant insists that foreigners have the right to be treated without hostility in another state.

In Jürgen Habermas's view, this project is contradictory, inconsequential, and inadequate. If Kant intends to create a cosmopolitan state, he does not call into question states' autonomy. Kant does not foresee the adoption of a constitution that would make rules legally binding. The inconsistency of the Kantian position results from the lack of coherence between the cosmopolitan state and the confederal architecture. Ultimately, the nature of the latter is quite different from what Kant had first in mind: a world citizenship. Individuals keep depending on the state. Kant does not remain faithful to his individualistic and liberal philosophy. Finally, according to Habermas, Kant's views are inadequate because they are mainly the expression of the conceptual and political reality of the 18th century.

Habermas revises this project in three ways: (1) he conducts a criticism of the nation-state, (2) he draws on the creation of a postnational identity, and (3) he transfers this identity to the global level. The nation-state is condemned as a political organization. It is unadapted to the globalization process and is a source of bloody conflicts. Moreover, the link between republic and nation is more sociopsychological than conceptual. It arises out of a historical process (a catalyst) and the individual's mentality (sacrifice to protect the homeland).

Habermas explores the link between republic and nationality. He compares the liberty of the state with individual freedom. The latter is a right that is separate from the national conscience, as modern natural law suggests it. This separation allows the formation of a new supranational identity that articulates national identity (culture without any political dimension) and constitutional patriotism (universalization of human rights and democracy). Habermas contends to transform this identity into an association of free and equal cosmopolitans. An ethics of discussion is developed beyond borders thanks to intersubjectivity. This ethics is based on concrete situations (to see and to manage the state of unequality and/or distress experienced by individuals). Influenced by these views, David Held aims at strengthening a "robust political cosmopolitism" grounded on a multiscalar democracy, which occurs at two levels: decision taking on the one hand, citizenship on the other. So as to be legitimized but also efficient, public decisions must be taken at the more adapted level. Three criteria allow verification of (1) *expanse* (to assess the field of individuals whose life expectancy and chance of survival are affected by public choices), (2) *intensity* (to measure the impact of a public policy on a given group), and (3) *compared efficiency* (to determine the necessity of a regional or world intervention compared with an intervention at a local level). A concept of "differentiated sovereignty" emerges from Held's thought. The subsidiary principle must be called on to determine what level is the most accurate. Held also introduces the idea of a multilevel citizenship that relies not solely on territorial community. Voting is no longer the unique expression of citizenship. To carry weight on decisions and to practice accountability, for instance, are other ways of exerting citizenship. Therefore, Held's cosmopolitanism maintains the nation-state but invites going beyond it through new public commitments.

Reserves and Alternative Conceptions

Several criticisms have been formulated against this cosmopolitan democracy. These criticisms have not been limited to the utopian features underlying the latter and come from pluralistic traditions (liberal, communitarian, or socialist). From a practical standpoint, the deliberative activity characteristic of democracy arose out of a common political culture that has developed over time and has required many sacrifices. Considered in the light of the national construction process of the 19th century, it appears that a political culture results from the political institutions that produce culture and not the reverse. Outside this framework, citizenship is fragile and appears as an abstraction. In the second case, cosmopolitism would hide imperial temptations.

Ontologically, society is synonymous with plurality. Rawls holds this view when he analyzes the extension of the justice principle outside liberal societies. He challenges the idea of a unity of the world. There will always be different peoples (e.g., liberal people, decent people), and rogue states will always exist. Therefore, a law of peoples could be implemented but not cosmopolitism itself.

Alternative conceptions draw on other frameworks. Thus, Walzer claims a pluralism of high density that controls states' action through three kind of agents—international institutions, nongovernmental organizations, and regional unions. This order is midway between a unified world state (unrealistic and dangerous in case of authoritarian deviation) and a state of savage international anarchy (as much a threat as the unification of the world). Departing from this conception, Amitaï Etzioni states that the international order must be built on persuasion. In his opinion, the world dynamic will achieve what he calls a "community of communities," which is a source of order. Only imagined until now, this global community is likely to be effective. Indeed, states are adopting a new logic of responsibility and new diplomatic practices, which favor a transnational moral dialogue between individuals. Ultimately, global safety authorities are called on: They share not only moral values and costs but also the power to struggle against traditional and nontraditional threats. However, such a trend has to cope with the U.S. leadership—often tempted by imperial adventures—and with the lack of power of the UN, characterized by Etzioni as the "old regime."

Republicanism is at the source of another trend. The very idea of the republic challenges that of *dominium* (to possess the subjects' or citizens' bodies as the feudal lord did) and of *imperium* (the power of authority that relied on force). The republic aims at achieving civic liberty and at developing participation in the public sphere. This political model was associated with a defensive foreign policy by Abbé de Saint-Pierre, Montesquieu, and Rousseau in their description of a confederation of small republics. Too large, and republics are exposed to domestic discords. Too small, and they are threatened by their powerful neighbors. How can republics maintain their political unity? Through the restriction of their territory and the reinforcement of their military capacities, which are the main advantages of these confederations. Their foreign policies are reactive rather than aggressive. Thus, this ideal remains very close to the autarky of the Ancients. Moreover in Rousseau's opinion, its transfer outside a specific setting—the Helvetic confederation—remains hazardous. Nevertheless, republicanism is still a source of inspiration today. In an economic globalization context, its critique of liberalism creates new interest. Overall, republicanism promotes values of public virtue and civic conscience that minimize the arbitrary exercise of power and the impacts on foreign policy, which becomes nondominating. Thus, a global civic republicanism could provide new rules for interstate cooperation.

Conclusion

Fault lines regarding war, justice, or global order nourish many debates. Nevertheless, two main trends have appeared: The first claims to revise major political and ethical issues, while the second aims to create new ideas regarding current challenges. Nowadays, a third trend consists in decentering our philosophical standpoint by integrating ideas from non-Western cultures. But all these inquiries share the same questions and challenges: What is humanity? Does it stand for an idea that is becoming a norm, a set of concrete rules, or an ideal that influences action? Is it a source of bestiality or an appeal to mutual kindness? A group called to build a world political culture or a reduced community that must remain particular? Normative theories of IR will continue to provide different answers. Thus, these debates should not be tackled by Greek "garden philosophers," withdrawn into the private sphere, but by philosophers open to the public sphere, who get to the heart of contemporary issues.

O

OLIGARCHY

The concept of oligarchy repeatedly appears in political and common discourse from ancient Greece and up through modern times. Practically all reference sources provide similar definitions of oligarchy—rule of the few in their own interests and not in the interest of the majority or the public good. Etymology confirms this connotation: *oligos* = few, *arche* = rule (ancient Greek). From Aristotle comes the initial meaning of oligarchy—it is a "degeneration" of aristocracy as the form of rule; oligarchy is an "incorrect" and "spoilt" aristocracy when the few rule exclusively in their own interests. The notion of oligarchy can be found in the writings of Plato, Polybius, and their contemporaries and later in Niccolò Machiavelli. It has been used in modern social science by Moisei Ostrogorsky, Vilfredo Pareto, Gaetano Mosca, Robert Michels, and others. The term *oligarchy* is applied in political and nonpolitical contexts—political regimes and political parties, trade unions, church organizations, educational establishments. This entry presents the contemporary and classic meanings of the concept, the main existing theory, and its further development in post-Communist countries.

Who Are the "Few"?

From today's point of view, one can say that the "few" who, according to the logic of the notion, form the backbone of oligarchy may actually represent very different groups—slave owners, landlords, nobility, the rich and wealthy, the top brass of any kind, party bureaucracy, and so on. *Rule of the rich and wealthy* ("plutocracy") may be only one of the meanings of the notion of oligarchy. In economic science, the closest analogue of oligarchy is oligopoly: a situation in which only a few large-scale "players" dominate an economy and are practically independent of others who cannot compete with them on an equal footing.

Oligarchic rule is not necessarily dictatorship and arbitrariness. While one of the major characteristics of oligarchy is nonaccountability of power, it may in a way rely on law (i.e., be legal); however, this law is in the interests of the few. Similar to monarchies, oligarchic regimes may even be considered by some as legitimate, although their legitimacy does not rest on popular consent and support. An oligarchic regime, unlike personal dictatorship, may be partly predictable; it defines the limits of the politically permissible and the forbidden in terms of the critique and opposition. It is usually said that the oligarchs "rule but not manage"—they would seldom occupy official positions in government, but their opinion is crucial because of their power and influence (economic and other). There may be internal tensions and conflicts within the oligarchic system; this points to the importance for the oligarchs of the existence of an external arbiter who is accepted as such by them.

The term *oligarchy* is used widely today: however, more likely not as an analytical concept but as a descriptive image. From the point of view of modern political science, it is a relatively vague and amorphous notion with clear negative evaluative connotations. Many critics consider the notion of oligarchy to be too reductive or even too poor for effective political analysis, with insufficient theoretical base.

In modern social science and historical literature, this notion is often used to describe very different historical and political phenomena—such as medieval oligarchy in China; the Venice republic in the 13th to 16th centuries, ruled by a few patrician families; England from the Glorious Revolution until the middle of the 19th century, with the Magna Carta guaranteeing the rights of the nobility (i.e., the rights of the oligarchy); colonial America until the 1776 revolution as a combination of democratic and oligarchic elements; the Meiji Restoration in Japan, and so on. Some authors apply the notion of oligarchy to the political regime in the former USSR after Stalin (and especially under Brezhnev's so-called collective leadership), which was no longer a personal dictatorship but the rule of the privileged "nomenclatura." South Africa under the apartheid system provides an example of racial oligarchy based on the rule of the White minority—about 20% of the population. In Latin America, various military-latifundist political regimes are often described as oligarchic. Some neo-Marxists argue that the majority of Western democracies, especially the United States, are actually "oligarchic democracies" (or "representative oligarchies") where "big money" de facto determines the outcome of elections.

There are impressive case studies of political dynamics in various countries of Southeast Asia (Indonesia, Thailand, Malaysia, Singapore, the Philippines, Hong Kong, South Korea) that demonstrate how oligarchic systems based on the economic power of several dozen families or corporate clans adapt to political change and economic reforms and reproduce themselves within a new context. The case of Indonesia after the collapse of Suharto's New Order at the end of the 1990s may be a good example of the survival and reproduction of some basic structures of the oligarchic system of rule and power relationships irrespective of the ongoing reforms. Some research has registered oligarchic trends in a variety of large-scale organizations—such as political parties, trade unions, professional associations, educational systems, and clerical organizations.

The Existing Theories

To the extent that a "theory of oligarchy" exists, its classic form is that of Michels (1876–1936). In his analysis of the formation and evolution of the Social Democratic Party of Germany, he formulated the so-called iron law of oligarchy: "Who says organization, says oligarchy." According to Michels, oligarchy is an unavoidable consequence of the functioning of all and sundry large social and political organizations. His logic is as follows: For effective management of any large organization, a professional bureaucratic elite with special managerial competencies is needed; this elite acquires specific social status and interests and becomes estranged from the rank-and-file members and nonaccountable to them; this elite believes that it knows better what is good and what is bad for the masses. Even when elected, the bureaucratic elite will try to keep its position or will pass it only to other elites (the influence of Mosca and particularly Pareto with his "circulation of elites" is obvious here). Michels argues that even democratic organizations eventually degenerate into oligarchy since they cannot exist without bureaucratic structures of management that eventually turn oligarchic. This thesis actually questions the basic principle of democratic representation, since, according to Michels, any elected representative will sooner or later turn into a master estranged from the electors.

For Michels, the roots of the emergence of oligarchy are not in personal psychological motivation or ill will but in general organizational logic and managerial technology: Professionalism of management and administration requires specific skills; those who acquire them become estranged from the masses and strive for preservation of their status. Thus, according to Michels, any organization, due to its internal logic, will sooner or later degenerate into oligarchy.

Some of Michels's ideas were further developed by Maurice Duverger, who used a comparative approach to the analysis of different political parties in order to confirm the generic logic of "oligarchic degeneration"—leadership in all parties eventually becomes oligarchic; an isolated and closed "ruling strata" of professional bureaucrats emerges and tends to reproduce itself, irrespective of the ideological or political nature of the organization.

Today's academic community responds to Michels's theoretical heritage somewhat ambiguously. Some empirical research of large organizations seems to confirm his idea of oligarchic degeneration; other studies do not. However, even some empirically proved exceptions undermine the universal nature of the declared "iron law of oligarchy." It is hardly possible to falsify this "law," since it is based on the probabilistic assumption that any organization would "eventually" turn into oligarchy. Furthermore, today's criticism of Michels's theory underlines other vulnerable points, such as the amorphous nature of the notion of the "few" as a definition of the group of oligarchic leaders and the vagueness of the concept of "oligarchic tendencies" and its insufficiency for effective political analysis. Conceptual reevaluation of Michels in recent decades contributed to the growing interest in the theories of organizations, organizational logic, and organizational behavior and in the detailed analysis of mechanisms of influence, leadership, and submission.

The Theory Updated in the Postcommunist Era

The notion of oligarchy has acquired new circulation and popularity in the early 1990s as applied to a description of economic and political dynamics in Russia and some other post–Soviet Union countries. Its connotation became not simply negative but even pejorative and abusive: History's largest predatory privatization of state property ("grabization") in Russia was made possible only through governmental channels because of the "appointments" of a few new oligarchs by President Boris Yeltsin's "clan" (the so-called family) and their merging with state power. The outcome of this process was the emergence in Russia of "oligarchic capitalism"—a common noun for the fusion of superbig capital with the machinery of the state. The peculiarity of the situation in Russia is emphasized by the fact that state power itself has created the opportunity for the oligarchic system to emerge, since it was the state that had given out its former property to a few "confidants," counting on their subsequent financial support. This support, indeed, became one of the important factors for the reelection of Yeltsin in 1996. Thus, the emergence of oligarchic capitalism in Russia is often perceived as very specific: In the Russian case, you have not the supremacy of big capital over state power but the other way around—state power is creating the superbig private owners for the sake of its reproduction. Some analysts argue that the oligarchic system of patronage and clientelism in Russia at the federal and regional levels was created by the regime itself for the main purpose of securing financial support for its reproduction in democratic, even imitative, forms. Also, this was made possible in Russia during a period of economic recession, not during a time of economic growth, as in other contemporary cases of oligarchy coming into being. Various researches stress the absence of formal institutions and the informal character of ties between Russian oligarchs and state power. They also point to the fragmentary nature of Russian oligarchy with different and often conflicting interests, its noninstitutionalized character, and other aspects.

At the end of the 1990s, some political analysts even started to talk about the danger of the "oligarchic coup" in Russia. At least an important part of the massive support for Vladimir Putin in Russia in the early 2000s came from his "antioligarchic" rhetoric. However, many observers argue that the outcome of Putin's so-called antioligarchic revolution was the replacement of Yeltsin-era oligarchs by new ones—largely originating from the security services and other "power" structures (so-called *silogarchs*—from the Russian word *sila* = power—or *securocrats*, i.e., coming from various security agencies). Some argue that the paradigm of "oligarchic capitalism" that emerged under Boris Yeltsin is reproduced in Russia under Vladimir Putin and Dmitry Medvedev. Be that as it may, one should note that this concept of "oligarchic capitalism" with reference to Russia and some other post-Soviet countries needs further theoretical and experimental study.

ONE-PARTY DOMINANCE

There is no consensus on what constitutes one-party dominance, but two features stand out. First, a party becomes dominant when, over time, it is much more successful in elections, in parliament, and in the government than any other party. How such success is measured and for how long the party needs to be successful in order to qualify as a dominant party is debated. The threshold for time ranges from two elections won in a row to never losing a single election. The threshold for electoral success ranges from a plurality of votes to a supermajority of seats. Second, it matters how dominance is established. Does the ruling party enjoy genuine support in the population, or does it maintain its hold on power through nondemocratic means? In other words, we need to distinguish between dominant parties and dominant *authoritarian* parties. In the classic definition of the Italian political scientist Giovanni Sartori, a dominant-party system exists when the same party wins at least three consecutive elections that are free, fair, and competitive. The dominant party needs to gain an absolute majority in parliament and govern alone. In case of a presidential system of government, the dominant party also needs to win the presidential elections. If the elections were not free, fair, or competitive, we are dealing with a dominant-authoritarian-party system.

Clearly, there are not many parties that manage to govern alone with a parliamentary majority behind them for more than 12 years. The classic case is the Liberal Democratic Party in Japan, which has governed for almost the entire period after World War II. The Christian Democrats in Italy were the dominant force for 4 decades, always being in the government until the Second Republic ended in corruption scandals. However, these were coalition governments, so Italy is not a pure case of one-party dominance. Neither is Sweden, because the Socialists often had to form a minority government. The Canadian Liberals, although in power most of the time at the federal level, nonetheless lost at regular intervals. There are more cases of dominance at the regional level, for example, the Democratic South in the United States in the first half of the 20th century or the position of the Christian Social Union in Bavaria. Unfortunately, there are not many studies of subnational one-party dominance.

Even this brief overview of the best known examples of dominant parties suggests that one-party dominance is uncommon, and sustained one-party dominance is even more rare. In comparison, it is easier for dominant authoritarian parties to prolong their rule. The classic case is the Institutional Revolutionary Party in Mexico, which managed to stay in power for most of the 20th century. When a dominant authoritarian party loses an election, it amounts to a democratic transition. Other recent examples are the Kuomintang in Taiwan and Kenya African National Union in Kenya.

The global spread of democracy since the mid-1970s has resulted in a proliferation of dominant parties, especially in Africa. Paradoxically, the (re)introduction of multiparty elections in sub-Saharan Africa has resulted in the dominance of dominant-party systems. The emblematic case is South Africa, where the African National Congress (ANC) has won all four elections since the end of apartheid with overwhelming victories, even to the point where it could change the constitution by itself. This has led observers to worry about the effect of one-party dominance on the prospects of democratic consolidation. Even in mature democracies, there are indications that domination by one party and the resulting lack of political competitiveness has consequences for the quality of democracy. The dominant parties of Japan and Italy are/were notorious for their factionalism and corruption. If parties are in power for so long, the lines between party and state are blurred, complacency replaces responsiveness, and infighting overshadows competition with the often fragmented and powerless opposition. If this is true for mature democracies (there is in fact little systematic evidence to support these accusations), how much more damaging will the effects of one-party dominance be for new democracies?

However, while dominant-party systems exhibit a low level of competitiveness, they do not necessarily lack political competition, understood as potential competitiveness, and the frequent talk about dominant parties as "de facto one-party states" is often misleading. It is too simple to equate one-party dominance with lack of democracy as done by scholars who use election outcomes to measure democracy. The ruling party in Botswana, in power since independence, has never lost an election. One influential measure of democracy takes this lack of alternation in government as proof that the election results were manipulated by a nondemocratic regime. It considers dominant parties as undemocratic until they lose power. This coding scheme puts the ANC in South Africa and Robert Mugabe's Zimbabwe African National Union–Patriotic Front in Zimbabwe in the same category. Clearly, such a measure fails to distinguish between dominant parties and dominant *authoritarian* parties. While the ANC may be voted out of power at the next elections, Mugabe has shown that he will hang on to power by any means necessary.

There is some confusion about dominant parties and dominant-party *systems*. There is no doubt that the Italian Christian Democrats constituted a dominant party in the loose sense of a party that outdistances all others in popular support. However, Italy did not have a dominant-party *system*. The pattern of interactions between the political parties was shaped by the rivalry between the Christian Democrats and the Communists, who were regarded as an antisystem party. The Italian Communists always came in second place and were never invited to join the government but because of their sheer size forced other parties to form a coalition. The party system therefore has been characterized as "polarized pluralism." Likewise, even if the British Conservatives or Labour Party manage to win three elections in a row, as they have both done in the past 30 years, this does not change the character of the British two-party system. The key question, which has been insufficiently acknowledged and explored, is to what extent dominant parties create a dominant-party system. In other words: When and how do dominant parties come to shape the pattern of political competition?

No unified theory explains the emergence and longevity of dominant parties, but partial explanations have been offered, often tightly bound to a particular case or class of cases. First, access to state resources plays a role. This theory is especially helpful to explain the continued success of dominant authoritarian parties, such as the Institutional Revolutionary Party in Mexico. Second, dominant parties may benefit from positioning themselves on key social cleavages. The ANC in South Africa would be a case in point. Third, political institutions, especially the electoral system, have an effect. The Liberal Democratic Party in Japan benefited from an unusual electoral system called the single nontransferable vote. Against this, dominant parties have thrived in a variety of electoral systems, from proportional representation (the ANC in South Africa and the SWAPO Party in Namibia) to plurality (the Botswana Democratic Party in Botswana). Fourth, there may be something special about dominant parties—an aura of invincibility, the sense of inevitably, an association with an epoch—that is hard to capture empirically but easily recognized by those familiar with the cases.

There is growing pluriformity in approaches to conceptualizing, measuring, and explaining one-party dominance. On the one hand, this analytical diversity may be regarded as disappointing after decades of theorizing and research on one-party dominance. On the other hand, the growing literature on this subject attests to the continuous development of our thinking and even a new vitality in the study of dominant parties. A particularly interesting development is the use of voting power indexes to measure the extent of dominance, especially when combined with the classic typologies. This innovation has the potential of bridging the divide between quantitative and qualitative research on dominant parties and dominant-party systems.

OPPOSITION

The term *opposition* comes from the Latin word *opponere*, meaning to put something in front of something else. An actor's opponents are those who want to block his way. Such a conflicting situation may be a game with established rules in which the opponent accepts defeat. Some opponents may, however, try to end the game and set up new rules that work for their (exclusive) advantage. When the rules of game allow everyone to enter and to compete under fair conditions, players with limited skill may lose repeatedly or be excluded for not abiding by the rules. In other cases, games may exclude players arbitrarily, or the rules may be unfair.

Against this background, we can distinguish four types of fighting against a competitor:

1. *Opposition* refers to those trying to defeat a so far victorious competitor but following all rules of the game.
2. *Extremists* are those wanting to overthrow a fair and inclusive game.
3. *Members of resistance* are those trying to overthrow an unfair or exclusive game in order to establish a fair and inclusive one.
4. *Rebels* are those fighting for victory in an unfair or exclusive game without desiring to replace it by an inclusive and fair one.

When "game" is understood as a polity and "rules of the game" as a constitution or set of laws, then opposition is a generic concept for those engaging in politics to fight against unwelcome policies and politicians and accepting the constitution and laws even in spite of possible defeat. This entry analyzes the context and the actors of opposition; it also discusses Robert Dahl's analytic framework, the functions of opposition, and finally, the most recent research developments.

Contexts

It is not self-evident that one should fight for political goals while accepting defeat. Regimes with a loyal opposition are, therefore, an exception. Certainly political dissent and nonviolent opposition were common in Democratic Athens, in Republican Rome, in some republics of medieval Italy, and within European Estate assemblies. But most of that disappeared with the advent of strong monarchic power.

The exception was England. First, the principle of "king in parliament" allowed even conflicts between the Crown and parliament to be understood as competition for the best of one single "body politic." Second, the decline of monarchic power due to the civil war, the Glorious Revolution, and the specific relations of Sir Robert Walpole (1676–1745) with the two first kings of the Hanoverian dynasty led to the emergence of the new role of a "prime minister" with a personal power base in parliament. Patronage and benefits for allies were the central means to create support for the prime minister. Such "government by corruption" made parliament split: One side benefited from "their" prime minister and his policies; the other side advocated different policies and hoped to be part of the spoils system under a new prime minister.

In this situation, Walpole's political adversary Henry St. John 1st Viscount Bolingbroke

(1678–1751) presented a first theory of political opposition that was very influential. According to this theory, opposition serves liberty and the common good by continually criticizing selfish or incompetent politics of the government; opposing the government does not mean disloyalty to the Crown or the constitution but only the desire to replace bad policies or politicians with better ones. Actually it has been one of the most important inventions in human history to implement, and to acknowledge, the practice of a legitimate and loyal opposition. Unfortunately, the concept was subsequently narrowed to a form of parliamentary activity and did not encompass phenomena such as political pluralism and separation of power. Moreover, it was put in the context of "ethically better alternatives," claiming counterfactually a superior moral status for oppositional parties.

Who Is "the Opposition"?

Under the assumption that opposition proper is "parliamentary opposition," typologies were created that distinguish parliamentary, extraparliamentary, and antiparliamentary opposition. But any split between opposition inside and outside parliament is artificial, and there is not even a clear line between the governing majority and the opposition in presidential systems. One more realistic typology was suggested by Philip Norton (2008). According to him, "the Opposition" means either the principle of opposition or the largest oppositional party in a parliamentary system. Opposition parties are, in a parliamentary system, parties that expressly do not support the government. Opposition covers different forms of conflicting relationships between the legislative and executive branches of government. Among them, as also noted by Norton, five "modes" can be distinguished, according to Anthony King (1976). In the *opposition* mode, cohesive parliamentary parties confront a governing party or coalition. In the *intraparty* mode, it comes to opposition within a (governing) party; that is, "faction building." In the *nonparty* mode, parliamentarians cooperate outside party contexts, which allows for majority building while ignoring party lines. In the *cross-party* mode, governing and oppositional parties cooperate on some issues while disagreeing on others. *Extraparliamentary opposition* means all forms of political dissent and government-opposing activities outside (a chamber of) parliament.

The last category is, however, quite overcrowded. First, there are extraparliamentary party structures. These cannot reasonably be detached from parliamentary party groups, because local and regional party organizations are often led by members of parliament and work, throughout the country, as their combat groups. Second, there may be "higher houses" that act as a "second opposition," in particular, if elections to them are used for expressing dissatisfaction with the government. Third, constitutional courts perform like an opposition if oppositional parties get them ruling on politically controversial issues. Fourth, actors from other levels of government may impede, or veto, a cabinet's policy making in federal systems. This gives even small parties with regional strongholds significant oppositional power at a superior level of government. Fifth, nongovernmental organizations can accumulate and exert very significant oppositional power in liberal societies. Sixth, there is even potential for oppositional power within the executive branch of government if it comes to implement policy programs that are not regarded as administrable by civil servants.

Dahl's Analytic Framework

Contemporary opposition theory started with Dahl (1966). Coining the concept of *polyarchy,* he put legitimate opposition, together with free political participation, at the center of liberal democracy. None of his analytical categories is restricted to parliamentary opposition (see Dahl, 1966, pp. 332–386). Going by his concept, the following questions must be asked to determine the nature of opposition:

1. How cohesively, or organizationally concentrated, do oppositional groups act?
2. How much loss of governmental power can be effectuated by how much increase in oppositional power?
3. What sites are available for encounters between the opposition and government? How fair is competition in which arena, and how important is which site for actual power politics?
4. How identifiable are, depending on those factors, oppositional groups in a political system?

5. What are the goals of which oppositional groups?
6. What are their strategies?

In addition, five "primary conditions" are claimed to explain which patterns of opposition will emerge:

1. constitutional structure and the electoral system;
2. widely shared cultural premises, in particular about cooperation and problem solving;
3. specific subcultures in a given society and its political culture (inclined toward violence and secession or toward proportional share of public goods);
4. the record of grievances against the government, out of which people learn about the regime's responsiveness; and
5. the kind or extent of social and economic differences/cleavages in which the party system is rooted.

Two more specific factors intervene: a society's individual pattern of cleavage, conflict, and agreement in attitudes and opinions and its extent of polarization. These primary conditions vary independently from each other, but not beyond certain limits; they may reinforce each other; and a big change in one of them will likely make an existing pattern of opposition change as well.

Based on similar considerations, Heinrich Oberreuter (1975, p. 20) has suggested a parsimonious typology of oppositional behavior patterns: issue-oriented ad hoc opposition, cooperative opposition, and competitive opposition, all of them possible inside or outside parliament.

Oppositional Functions

A function is a service rendered by a system for its environment. Criticism of a government's programs, policies, and actors is the first service of the opposition for its regime: Issues are brought to public attention, incentives for policy learning are set, and otherwise neglected problems are put on the agenda. The next function is control, unfolded both as scrutiny of single measures and as checking the government's general course. Effective control depends on the government's responsibility before parliament and makes rational politicians avoid actions that might otherwise be undertaken. Offering alternatives encompasses different programs, policies, and persons to citizens and voters, thereby establishing pluralism. In this perspective, integration allows even those whose positions and leaders are minoritarian to identify with the polity and have the chance to become influential in the future. Without these advantages produced by an influential opposition, political systems will work less well than those with a legitimate and loyal opposition.

Research on Opposition

A straightforward framework such as Dahl's should have inspired a large body of comparative empirical research, providing us with reliable knowledge on how to establish effective opposition as a means for better governance. However, as Klaus von Beyme (1987) has shown, research on opposition was scarce for a long while, although "protest movements" (oppositional), "new social movements," or minorities struggling for a better legal or social status have attracted much scholarly attention. In the 1960s and later, one reason for such neglect was the revival of the mistaken thesis of "declining parliamentary power," in the perspective of which parliamentary opposition becomes uninteresting as well (pp. 30–31). As recalled by Ludger Helms (2008, p. 8), the "governance turn" in comparative politics came next, with its focus on cooperative and corporatist forms of interaction between state and society. In this perspective, opposition looks rather negligible. Finally, confining opposition to parliamentary opposition deprives this concept of comparative power beyond parliamentary systems of government. For all these reasons, a more comprehensive theory of opposition should be worked out, and broad-scope comparative empirical research on opposition, seen as an element of pluralism, division of power, and good governance, should be encouraged.

ORGANIZATION THEORY

Organization theory is a field of study in which the phenomena of interest are related to organizations and organizing. The general aim is to understand what determines organizational forms and processes and the consequences of different types and aspects of organizational forms and processes. It is somewhat contested whether organization theory should be regarded as an academic discipline in its own right, since it draws heavily on concepts and ways of thinking from disciplines such as anthropology, economics, political science, psychology, and sociology. Nevertheless, organization theory may also contribute to the development of political science and other disciplines. In North America, a distinction is often made between organizational behavior and organization theory, roughly corresponding to an exploration of micro- and macro-organizational phenomena, respectively. Elsewhere, a broad notion of organization theory is more common, and it is also adopted here. Thus, organization theory is seen as the academic field (or discipline) specializing in the study of organizational phenomena (both micro and macro) and used as a synonym for organization studies. After a brief overview of the development of organization theory as an academic field, this entry reviews some important phenomena and relationships being examined in contemporary organization theory. Some notes on the relationship between organization theory and political science are then made, and finally some thoughts on future developments are offered.

Historical Development

The design and management of specific types of organizations have been practiced for several thousands of years and studied for a couple of centuries. Nevertheless, generalizations about organizations and the development of organization theory as an academic field are restricted to the post–World War II period. The actual phrase *organization theory* was most actively promoted by Herbert Simon from 1950 onward, being seen as a broad category that included many existing approaches, such as scientific management and industrial psychology. However, while organizations in these approaches were primarily seen as settings within which work was carried out, they were now seen as units of interest in their own right and analyzed as distinctive social systems and collective actors.

In what has retrospectively become known as classical organization theory, the emphasis was on universal principles of administration and management that could lead to goal achievement. While produced about a hundred years ago, elements of contributions from people such as Frederick Taylor on scientific management, Herbert Fayol on administrative theory, and Max Weber on the theory of bureaucracy are still evident in today's organizations. However, since the 1950s, this rational- and closed-systems perspective on organizations has been supplemented by other types of perspectives. While classical organization theory indicated that there is one best way of organizational design and practice, contingency theory from the 1960s onward suggests that this depends on the characteristics of each situation. Thus, according to this kind of rational- and open-systems perspective, variations in the environments, tasks, and technologies of organizations imply variations in organizational forms and processes.

The human relations approach from the 1930s onward represented a natural-systems perspective, where the emphasis was not primarily on achieving goals but on organizational survival. Here, too, since the 1960s, characteristics of the environments of organizations have become increasingly important, representing a turn from closed- to open-systems perspectives. Moreover, in this latest period, social constructionist approaches have become more prominent. According to these approaches, the organization and its forms and processes do not exist as objects separate from people but are created and maintained as organizational members talk about what they think is happening and what needs to be done. Recently, postmodern approaches have also become popular among some organizational researchers; for example, in the study of language games and discourses involving organizations and organizing.

Phenomena and Relationships

Contemporary organization theory is characterized by a large variety of units of analysis, perspectives, and themes. Many researchers examine individual organizations, for example, how different organizational aspects affect performance. Some focus on organizations in a certain field, examining how they interact and affect each other. Moreover, population ecologists examine the dynamics of entire populations of organizations. In conferences, books, and journals in the field, there is a lively debate on the strengths and weaknesses of the various theoretical positions and the relevance of the various topics. Despite some disagreements, the phenomena and relationships reviewed here are commonly regarded as being among the most important ones.

Organizational Structure

The importance of structure for organizational behavior has been a central topic in the study of organizations throughout the history of this academic field. Questions such as how a given structure may constrain and enable instrumental rational action in and by organizations, and how it is possible to affect actual organizational behavior indirectly by structural design, have been discussed for a long time and remain highly relevant. According to the structural-instrumental perspective, organizations are regarded as tools for achieving certain goals. From this perspective, it is assumed that organizations and their members act with instrumental rationality in carrying out tasks and that the organizational structure is designed in accordance with means–ends assessments.

The formal structure of an organization consists of positions and rules that determine who shall or can do what and define how various tasks should be executed. Organizations are composed of a set of positions and subordinated units and can themselves fall under other larger units. In addition, organizational units can be divided up and coordinated in different ways. Vertical specialization concerns whether and how they consist of subordinate bodies, as well as how they are related to superior bodies. Horizontal specialization refers to how different tasks are thought to be allocated on a certain level by means of organizational structure. Thus, organizations may be based on certain principles of specialization, such as purpose, process, clientele, or geography. Through the superior–subordinate relationship between different levels in a hierarchy, there will be a great degree of vertical coordination within and between organizations. Hierarchy can also involve vertical specialization, in that different types of tasks are assigned to different levels in the organization or to organizations at different levels. Routines can constitute a form of coordination both vertically and horizontally. Procedural rules can be used as tools within an organization, but they can also be used to coordinate activities in a way that cuts across organizations.

A bureaucratic organizational form, as Max Weber described it, is marked by a high extent of hierarchy, horizontal specialization, and routines. Many types of organizational forms can be thought of as an alternative or as supplementary to a bureaucratic organizational form. At one extreme is a completely flat structure, that is, an organization without hierarchical ordering but with several positions and subunits at the same level. In a collegial structure, a board of directors or an advisory council can be set up instead of, or in addition to, the top leadership in the hierarchy. Another alternative is a matrix structure. Here, a position or subunit is subordinated to several superior units simultaneously. These superior units usually operate according to different principles of specialization. In addition to arrangements such as these, which are without time limitations, organizations may have temporary arrangements that extend beyond the bounds of bureaucratic organizational forms, such as task forces and project organizations. Boards of directors, advisory councils, task forces, and project organizations are all various forms of network structure that supplement the bureaucratic organizational form. This is not merely the case within individual organizations but also applies to relationships between organizations.

Organizational Culture

Organizational culture is concerned with the informal norms and values that are important for the activities of organizations. The emphasis is not on goals but on informal norms, values, and identities that develop gradually. The classic distinction made by Philip Selznick is between the organization, as an instrument for achieving goals, and the institution, whereby an organization, through the process of institutionalization, is "infused with value beyond the technical requirements of the task at hand" (1957, p. 17). Thus, in addition to solving tasks in an instrumental sense, an organization has then become a value-bearing institution with its own distinct identities and opinions about what the relevant problems and solutions are. This makes for a more complex organization, less flexible or adaptable to new demands but also one equipped with new and necessary qualities that will potentially help the organization to solve tasks more expediently and function well as a socially integrated unit. Thus, the organizational culture demarcates organizations from one another and, through mechanisms of socialization, strengthens cohesion and commitment among its members. Culture provides members of the organization with a sense of belonging to a community with a shared goal and mission.

Organizational Environments

In the study of organizations and the development of open-systems perspectives, a distinction is commonly made between technical and institutional environments. Technical environments can be defined either broadly as all aspects of the environment potentially relevant to goal setting and goal achievement or more narrowly as the sources for inputs and markets for outputs, competitors, and regulators. In the academic literature, several dimensions of technical environments affecting organizational uncertainty and dependence have been proposed and examined—for example, the degree of homogeneity/heterogeneity, the degree of stability/variability, and the degree of concentration/dispersion.

The technical environments of an organization are to a large extent determined by the type of tasks it performs. As with the case for the other aspects, the existing tasks may constrain and enable what an organization and its members are doing, and over time, tasks may be changed as a result of purposeful action.

Since the 1970s, an emphasis on what has been called the institutional environments has been added, stressing the importance of the symbolic aspects of environments. Institutional environments are characterized by the development of socially created norms to which individual organizations must conform in order to receive legitimacy and support. Thus, in institutional environments, organizations are rewarded for using what is seen as correct organizational forms and processes and not for the quantity and quality of their outputs, as in technical environments.

Organizational Decision Making

Studies of decision-making behavior within and by organizations have traditionally emphasized purposeful choice in accordance with a logic of consequences. According to this logic of action, organizations and their members are seen as assessing their existing goals, the alternatives for actions, and the future consequences in relation to the goals that might follow from each alternative. The concept of full instrumental rationality refers to an organization's having clear and consistent goals, a full overview of all the alternatives, and full insight into the consequences that these alternatives will bring in relation to its goals. From this, it often follows that the organization chooses the alternative that gives the maximal degree of goal achievement. Even so, many empirical studies of how organizations act show that this is realistic only to a certain degree. This is expressed through the concept of *bounded rationality,* which implies that an organization's goals are diffuse, inconsistent, or unstable and that the problems it faces are complex. The concept also includes the idea that an organization has incomplete information about alternatives and consequences. From this, it follows that the organization chooses an alternative that yields a satisfactory degree of goal achievement.

Moreover, different individuals or groups within an organization can be committed to different goals and interests, and the organization or its individual parts must relate to other organizations that may have other goals and interests. Thus, organizations can be understood as coalitions. Every actor acts in a purposeful way, is motivated by interests, and can also enter into coalitions with actors outside the organization, who, according to their interests, act in similar ways. Interest distribution may be rooted in formal structures within and between organizations—for example, related to actors carrying out specialized tasks. Their resources for articulating their own interests may also be rooted in the formal structure, such as through superordination or subordination of actors and through horizontal coordination.

Conflicts of interest within and between organizations can be dealt with in different ways. First, a dominant coalition can choose between relevant alternatives of action and assert its own goals and interests. Second, the actors can negotiate a compromise between different interests, which in turn provides the basis for purposeful choice based on knowledge about alternatives and consequences. Third, the competing goals can be addressed sequentially, so as not to come into conflict with one another. Fourth, goals in different parts of an organization, or in different organizations, do not need to be viewed vis-à-vis each other but can be addressed independently. Conflicts of interest can also be dealt with by actors who come to an agreement on means.

More radical modifications of purposeful choice in organizational decision making are introduced in the garbage can model. Here, decisions are to a large extent seen as being produced by temporal linkages. Thus, time and attention are limited resources, and the arrival and coupling of independent, exogenous streams of problems, solutions, decision makers, and opportunities for choice are important for determining how decisions are made and interpreted.

The importance of organizational culture for decision making is related to its impact on what is seen as appropriate behavior in and by organizations. Over time, organizations develop distinctive identities. Faced with a new situation, they have to recognize the nature of that situation and find a rule for action that is consistent with their identity. Organizational culture entails a relatively consistent set of rules and identities, so such links are simple to make. What makes an action appropriate in a certain organization may be highly divergent from what is found in other organizations, depending on how an organizational culture has evolved and what its dominant informal norms and values are.

Organizational Change

In the academic literature on organizational change, a distinction is often made between change through adaptation and through selection and between the transformation and evolution of organizations. To a large extent, the perspectives on change being employed reflect the various theoretical positions for the study of organizations in general.

Most students of organizational change examine how individual organizations adapt in response to changing circumstances, but these adaptations may take different forms. For example, contingency theory focuses on the alignment between various situational features (e.g., technical environment) and structural features (e.g., horizontal and vertical specialization). Thus, organizational change is expected if changes in the technical environments imply a misalignment with organizational structure. Rational adaptation is also emphasized in purposeful action approaches where organizations are seen as having some capacity to handle their dependency on environments or even change the environments. Moreover, approaches that emphasize the importance of institutional environments focus on how organizations adapt their structures to prevailing normatively endorsed modes of organizing. This also leads to a large extent of isomorphism in an organizational field. On the other hand, there may be a decoupling between organizational structures and organizational activities, where changes in organizational structures reflect the myths embedded in the institutional environments and are not meant to affect organizational activities.

Organizational change through selection is most central in *population ecology* theory. Here, the focus is on the development of organizational forms at the population level. While variation through the birth of new organizational forms may happen by chance, those that survive are selected by the environment, based on their ability to compete with others in a niche. Finally, retention refers to the forces that maintain and perpetuate certain organizational forms.

While some researchers applying rational-systems perspectives analyze whether and how change agents can accomplish radical transformations of organizations, others emphasize the evolutionary and incremental character of structural change due to bounded rationality or organizations as coalitions. Some also combine purposeful transformation and evolution of organizational structure through ideas of punctuated equilibrium, where long periods of convergent change are interrupted by short periods of abrupt divergent change. Stability and evolution of organization are also focused on by researchers emphasizing the importance of organizational culture and appropriate behavior. When an attempt is made to introduce new organizational solutions, they will often be revealed as incompatible and unsuitable. Thus, if they are seen as clashing with the values an organization cares about and is committed to, they risk being rejected. Here, too, there may be a combination of transformation and evolution through ideas of punctuated equilibrium, where long periods of stability are interrupted by abrupt change in the case of major critical events.

Organization Theory and Political Science

Many of the most prominent early scholars in organization theory came from political science, and many of the earliest studies of organizations were studies of public administration. Thus, ideas of bounded rationality, pluralistic competition, muddling through, cooptation, resource dependence, garbage can decision processes, and loose coupling all emerged from studies of organizations in the public sector. However, from the 1960s onward, political science and organization theory were mainly characterized by parallel agendas but mutual disregard. This may be related to developments in the study of organizations: Most scholars in organization theory were located in business schools, and most research was on private sector organizations. It may also be related to developments in political science and the study of public administration, where other topics and perspectives became more prominent.

Nevertheless, in recent years, there are some tendencies toward rediscovering a lost tradition in public administration that combines three commitments: (1) understanding administrative practice, (2) contributing to a general understanding of organizations, and (3) illuminating political philosophy. Moreover, it may be argued that an organization theory for the public sector should be delimited from general organization theory. First, an organization theory for the public sector should contribute to clarifying the key organizational forms that exist within public administration, as well as those that exist between the public administration and various groups in society. Second, an organization theory of this kind should help clarify the types of selection different organizations make. This means the extent to which they attend to, are neutral toward, or opposed to values, situations, or interests within society. Third, it should help explain the existence of different forms of organization, with an emphasis on examining to what extent such forms are determined by public policy. Seen from the vantage point of an organization theory rooted in political science, it is not enough to concentrate attention on economy and efficiency. The way the public sector operates must be described, analyzed, and evaluated from a democratic-political vantage point. This means directing the focus toward the sector's basis of values, knowledge, and power.

Future Development

The academic field of organization theory is embedded in its times. Just as the significant features of the field have been molded by certain critical events, future developments will also be affected by coming events. This makes it a bit difficult to formulate expectations of what will happen.

Nevertheless, based on recent trends in organization theory and actual organizational forms and processes, some ideas on future developments may be presented. First, the increase of networks, public–private partnerships, and other organizational forms crossing the boundaries between the public and private sectors may stimulate an understanding of organizations and organizing beyond markets and hierarchies. Second, the global spread of certain organizational forms—in public sector organizations related to new public management or post–new public management doctrines—may stimulate an understanding of the adaptation of these forms across countries and policy areas. Third, the development of more complex organizational forms may stimulate the development of more complex theories of how organizations change and of the consequences of organizational change. Thus, there may be a mutual interplay of structural, cultural, and environmental features and also a two-way dynamic between organizational forms and actions. Fourth, there may be a two-way relationship between the development of organization theory and the development of new organizational forms as well as the popular understandings of organizations and organizing.

Summing up, this means that organization theory and political science may benefit from increased cross-fertilization. Empirical studies of decision making and change in public sector organizations will provide some observations and theoretical ideas that may be useful to students of politics. Increased attention toward organizations from students of politics is also likely to change organization theory. By focusing on organizational characteristics of parliaments, public administration, political parties, interest organizations, and social movements, as well as on themes such as conflict, power, justice, and equality and the development of norms, goals, and meanings, the academic field of organization theory may expand in ways that are relevant for political scientists.

ORIENTALISM

The word *orientalism* has several meanings. Specifically, it is the science that has for its subject matter "Oriental" languages and civilizations and, by extension, the taste for Oriental objects and arts, as well as their use in Western artistic fields, particularly decoration, painting, and music. Orientalism was born in the 18th century, although the word was not commonly used before the 19th century. In the current, postcolonial era, the term *orientalism* and the concept of the Oriental have taken on pejorative connotations, especially among people of Asian and Middle Eastern descent. Recent scholarship, perhaps most notably that of the late Edward Said, points out the social psychological function of "Oriental" as a label whose use tacitly assumes the absolute primacy of a Eurocentric perspective, thereby categorically objectifying what is not European, rendering it exotic and essentially "other." This entry examines the history of this concept, the different kinds of orientalism that must be taken into account, and the debates that have taken place around this concept.

Origins of Orientalism

Orientalism originated as the extension of Renaissance humanism to Oriental fields, which were then Turkish, Arabic, and Persian. Its aim was to constitute a universal literature by merging European and Oriental contributions. Its tremendous success was the translation of *One Thousand and One Nights* at the beginning of the 18th century, thus creating the Oriental literary genre. Meanwhile, Catholic missionaries created the first sinology, while travelers described the power and organization of large bureaucratic Oriental states under the name of despotism.

The great novelty of the 18th century was a willingness to accept the possibility of a comparative universal history of all human societies. The Orientalists of the Enlightenment were first and foremost philologists and scholars, but their works were taken up and popularized by philosophers. The advent of social sciences at the end of the century introduced an increasingly critical aspect of Oriental realities. While they had a scientific foundation, they were also useful in legitimizing the calling into question of an Oriental despotism, which from then on was defined as a source of powerlessness and decadence.

Comparative studies were linked to the appearance of the idea of progress. It turned the past of Europe and of the East into landmarks according to which one could define the movement of history. After 1750, the East was defined as a sort of "past in the present" insofar as it showed a bygone state of society compared with the new realities of Europe. As early as 1780, it was said that Europe was the future of the East. The former was now able to take over or dominate the big "Oriental" countries from the Mediterranean to India and soon to China and Japan. Its expansion was justified as being either a liberation or an improvement in the lot of the peoples subjected to Oriental despotism.

While the "practical" orientalism of the "dragomans"—translators and interpreters of Oriental realities—already existed, European expansion implied the management of Oriental populations and thus the constitution of a corpus of linguistic, legal, and social knowledge, crucial for European civil and military administrators.

Types of Orientalism

Classical Orientalism

At the beginning of the 19th century, orientalism was divided into several distinct but closely intertwined types. The first one was "classical" orientalism, gathering scholarly, philological, and archaeological knowledge about ancient Oriental societies. It was the product of several phenomenal discoveries of lost languages and civilizations—deciphering Egyptian hieroglyphs and cuneiform; the archaeological discovery of Assyria, Sumer, and the Hittites; learning of Sanskrit; and the birth of modern sinology and then of Japan studies.

Universal history was endowed with a few more millennia. More than ever, the medieval idea of Egypt and the Near East as the birthplace of human culture prevailed. The history of human progress had several versions. According to the first one, the arts and sciences were born in Egypt; moved to the Near East, then to Greece and to Rome, and from there to the Arabs; and ended up in Europe. The second version started from the discovery of a kinship between European and Indian languages that served to define the presence of a group of peoples called Indo-German, Aryan, or Indo-European. Simultaneously, the existence of a "Semitic" group was constructed, followed by that of a "Touranian" group. Those definitions quickly took on a racial nature since language was supposed to contain a whole definition of the world. The opposition between Semites and Indo-Europeans was thus used to explain both the history of religions and the superiority of modern Europe.

Though the peoples of the Far East were not included in this pattern of analysis, the existence of two large cultural areas was recognized—India and China—and within them, so was the existence of distinct national personalities. Thus, Vietnam was part of the Chinese sphere of civilization, and Cambodia was part of the Hindu one, but each had its respective specific identity. In the same way, French Orientalists discovered the wonders of Angkor and gave to Cambodians a sense of historical continuity that they did not have before.

Modern Orientalism

The second type is modern orientalism, studying existing Oriental civilizations. Their precariousness was known, hence the necessity of describing them before their potential destruction caused by modernization/Westernization. Scholars rushed to take stock of the large corpus of texts already defined by those involved as "classics" and to turn them into the first printed scientific editions. If those texts were already known, they were given a more precise historical context, particularly thanks to philology and archaeology. This heritage-oriented form of orientalism ended in the setting up of museums for Oriental objects, first in Western countries and then in the countries where the works originated.

By successive waves, the Oriental literary and artistic heritage was massively introduced into 19th-century European and Western culture. It was one of the prime movers of major aesthetic transformations and artistic revolutions. The same applied a little later to the arts of Black Africa. Thus, artistic modernity will largely claim an Oriental element for itself.

Practical Orientalism

The third type is the practical orientalism of colonial administrators. If the latter presented themselves as the modernizers of the societies they dominated, they also sought to unify the traditional legal systems by resorting to the ancient sources, considered as the most authentic. Thus, the French limited the field of common laws and undertook the codification of a "Muslim" law that had never existed as such. In India, the British systematically used Sanskrit sources, which had been largely forgotten or neglected. More generally, practical Orientalists, for administrative convenience, tended to freeze realities that otherwise would have been naturally subject to continuing change, particularly religious and ethnic definitions. To do this, they relied on the works of modern Orientalists, while defining their superiority over the peoples they administered through the racial discourse stemming from classical orientalists.

This racial, philology-based discourse, also called linguistic ethnology, was first used to understand the origins of Europe and of Christianity. It was then used as a classifying tool so as to define the different ethnic groups as they were being reviewed—hence the quasi-indefinite extension of the Semitic group toward Black Africa and of the Touranian group toward Eastern Asia. A complete correspondence was established between linguistic subgroups and cultural entities, by finally endowing them with a history of their own. The prevailing scientism of the late 19th century added to it the measures established by physical anthropology, particularly by craniology. Some of the premises of craniology were pseudoscientific, making a simple equation between measures of cranial capacity and "intelligence," with departures from cranial measurements of Europeans taken as evidence of racial primitivism or inferiority.

The racial discourse claimed to have a universal impact. It was first applied to Europe even if it was secondarily used to lay the foundations of the legitimacy of Western superiority over the rest of the world.

Nineteenth-century orientalism has since been reproached as having an "essentialist" vision of Oriental peoples, considered as unable to really change. By definition, orientalism is a "culturalist" approach, because it is founded on the literary and artistic heritage of the societies involved. At the same time, it sought to give the latter a meaning by striving to historicize the contents of this heritage, thus redefining the historical paths of the societies involved. More often than not, those paths were defined along criteria borrowed from European history—religious tolerance, promotion of sciences, and so on. At the same time, it was also necessary to determine the causes of the "backwardness of the East" and European superiority, that is to say, contemporary deficits. The usual pattern was a combination of past golden age and present failings.

However absorbed in attaining a mastery of modern knowledge, the 19th-century Orientalist was also a creature of dialogue, constantly in contact with his informants, who were Oriental learned men, his partners in the reading of the ancient texts. He was the one who introduced and accompanied the "modernist" representatives of Oriental societies, particularly in the latter's travels in the West.

Current Issues

Facing the social sciences, Orientalists can hardly hide their uneasiness. They have the feeling that concepts that were elaborated to fit Western realities are almost mechanically applied without taking heed of Oriental specificities. Indeed, Orientalists tend to reproduce rather than criticize the discourses that Orientals make about themselves, which is inevitable in any culturalist approach.

While Orientalists have given all the required justifications to colonial expansion, they have also provided the arms to fight it. It is by starting from historical definitions produced by orientalism that Oriental nationalisms were constructed. Nationalisms, be they Arab, Indian, Turkish, Persian, or Indochinese, have largely borrowed their historical and national discourses from European Orientalists. The ancient golden ages were turned into hopes of renewal, and current failings served as the basis of governmental programs.

In the 20th century, the role of Orientalists constantly diminished. While classical orientalism still lived, it was mainly about heritage, and public access was largely limited to exhibitions, touristic travels, and translations of masterpieces of ancient literature. Today, many of its missions have been taken up by academics of the countries involved, and Westerners are only partners, even if they have sometimes kept a training function. The most burning issue is the demand that museums and similar institutions in Western countries return objects of cultural significance to their countries of origin.

Modern orientalism is caught in a contradictory position. It continues its work of reassessment of historical paths, particularly that of the times directly preceding European domination, no longer defined as decadent. Historians broaden their concerns to economic and social fields and also integrate the research of anthropology and social sciences. It is no longer possible to talk about a purely philological and textual orientalism.

Decolonized countries were initially plunged into a premature and turbulent modernity, often with Marxist overtones. Orientalists had to reconsider their categories of analysis to be able to interpret these revolutionary ruptures. Newly independent nations came to see the moment of independence as the end of a long history and the promise of a new future.

A few years later, the majority discourses of the countries involved have shifted toward the defense of a largely imaginary cultural authenticity, with a discourse about the superiority of the endogenous over the exogenous, the restoration of Islamic, Indian, or Asian values. Islamist movements, through their willingness to go back to their roots, have reinvested fields that were formerly those of Islamologists. Often, Orientalists are faced with reified categories of their own knowledge, which they had judged to be obsolete and had abandoned. Faced with Orientals who themselves resort to essentialism, they tend either to remain silent or to practice contextualism so as to reject any continuity between the past and the present time. The word *orientalism* has become the equivalent of an insult. In its turn, it has become an ahistorical essence and a polemical accusation.

Practical orientalism disappeared with colonial administrators. It is not certain whether the experts working for the states and nongovernmental organizations as well as those responsible for development have a better knowledge of the societies involved. Globalization seems to bring peoples together, but the progress of communications reduces long-term stays and "immersions" "on the spot." International English and its impoverished vocabulary are not the equivalent of the former knowledge of "indigenous" languages.

In its lasting existence, orientalism has claimed to be a tool in the constitution of the universal. Comparative studies introduced the delicate question of the interpretation of what is different. Of course, Orientalists have served politicians, but they have also significantly shaped our vision of our globalized universe.

P

Pacifism

Pacifism is both a political doctrine aimed at promoting or preserving peace and a political behavior adopted by opponents of violence and particularly of war as a means of settling disputes. The belief that violence is unacceptable and should be avoided has presumably existed throughout history and has been theorized over the past 2 millennia by diverse political, philosophical, and theological thinkers. Organized political opposition to violence has existed since the generalization of conscription during the 19th century and took place during both World Wars. The elaboration of the concept of pacifism dates back to the beginning of the 20th century and encompasses a variety of political thoughts and attitudes.

Pacifists differ on issues such as the inevitability and, more generally, the causes of war; the acceptability of violence as a suitable means toward peace; how to prevent war and resolve conflicts; and the very definition and conditions of peace itself. Those described as unconditional or absolute pacifists are committed to a principled rejection of violence, considered as deontologically wrong. Relative, conditional, contingent, or pragmatic pacifists—sometimes called pacificists—adopt a consequentialist view of pacifism; they consider violence to be counterproductive but believe that as a last resort, force is occasionally justified to advance the cause of peace. Besides the diversity of pacifist conceptions and behaviors, their historical evolutions, and their mutual influences and intricacies, one can distinguish between thinkers who concentrate on the individual and conceive pacifism as an appeal to people's sense of fundamental human values and virtues and those who focus on pacifism as a goal for systemic, societal change, be it at a national, regional, or global level.

The Appeal to Individual Morality

According to thinkers privileging an individual conception of peace, violence and war are inherent to human nature but are morally wrong and can be reduced by promoting individual virtues and morality. This conception is shared by many political and religious thinkers.

Major religions advocate peace and mutual respect among human beings. However, both historical circumstances and religious exclusiveness have exacerbated tensions between and within religious communities and greatly influenced theological dogmas. No religion has been exempted from violence justified by religious purpose, and their positions range from absolute pacifism and nonviolence to just and even holy war.

All dharmic religions promote nonviolence (*ahimsa*), embodied by Gandhi, but to different extents. Buddhism and Jainism condemn killing in any form, be it human or not, and Buddhism defends nonresistance through tolerance to the enemy. Hinduism—and later Sikhism—justify war in defense of good, justice, and righteousness. When order and law have failed to maintain peace and security, just war (*dharma yuddha*) is to be waged against those responsible, either Hindus or non-Hindus, in order to maintain peace and security within cosmic order. Warriors must belong to specific castes devoted to military action and have to respect the laws of war designed to ensure that warfare is conducted in a fair way. The use of weapons that cause unnecessary pain is prohibited, civilians shall not be harmed, and territory shall not be annexed.

Taoist religions do not rely on an absolute precept of nonviolence but rather consider violence to be a form of weakness that induces more violence and is thus counterproductive. Inaction (*wu wei*) is hence privileged, and if conflict cannot be avoided, one should try to resolve it without a direct confrontation. War can, however, be justified in self-defense or when a morally evil leader must be punished to deliver oppressed and exploited people.

Abrahamic religions praise peace while providing ambiguous answers to the question of violence, and they have developed the concept of just war as a major issue. The Hebrew Bible conveys an omnipresent violence sent by God and addressed in rituals and laws, as well as longings for peace. Judaism is committed to the ideal of peace and well-being (*shalom*) and provides containment rules such as the *lex talionis* of "an eye for an eye," which aims at preventing escalation of violence, and prohibits murder ("You shall not kill," Exodus 20:13). However, God sanctions and even commands holy wars (*milhemet mitzvah*) that shall lead to the annihilation of the enemy of the people of Israel (*herem*). Violence and war thus remain suitable options for self-defense and survival but should not be engaged in for proselytizing, revenge, or unprovoked aggression.

The New Testament emphasizes individual morality and relates the teachings of Jesus, such as those typified by the Sermon on the Mount ("Blessed are the peacemakers, for they shall be called sons of God," Matthew 5:9). Early Christianity promoted nonviolent resistance and martyrdom until it became the official religion of the Roman Empire under Emperor Constantine. Theologians such as Saint Augustine and later Francisco de Vitoria developed the just war theory, which establishes the right to wage war in certain circumstances (*jus ad bellum*) and specifies acceptable forms of warfare (*jus in bello*). If defensive wars are just wars by nature, offensive wars can be considered so if they are waged by legitimate authorities, for the righting of wrongs, and with common good intentions. This doctrine has been used to justify holy wars conducted to recover the Holy Land from Muslim domination during the Reconquista and the Crusades, persecutions of heretics during the Protestant Reformation, and imperial conquests. It has been contested by many reformed churches such as Brethren, Anabaptists, and Quakers, who advocate unconditional pacifism through conscientious objection and nonresistance. Over the past decades, the Roman Catholic Church has narrowed just war doctrine to the legitimation of defensive wars and the promotion of the right to interfere in case of human rights violations, but some theologians commend absolute pacifism on the grounds that modern technology, including nuclear weapons, prevents proportionate confrontations and generates intolerable casualties.

The Koran rests on the notion of effort (jihad). All Muslims must spiritually fight to overcome self-centeredness (*jihad akbar*, or greater jihad). They also have to extend the Islamic community through preaching and education, but holy war for, or in defense of, Islam (*jihad bis-saif*) must be carried out according to strict rules and is not recognized by some Muslim movements such as Sufism. Believers shall make every effort to ending conflict, including restorative justice and peacemaking (*sulh*).

The significance of individual morality in preserving and defending peace is shared by many Western political thinkers, but most of them, from Plato to Aristotle or later Kant and Baron de Montesquieu, include it in a broader reflection on natural law, society, state, or humanity. Writers such as Henry Thoreau, Leo Tolstoy, and Romain Rolland laud individual nonviolence. Psychoanalysts like Sigmund Freud urge that aggressiveness be channeled through the development of emotional and most of all cultural links between individuals. Some absolute pacifists condemn all kinds of taking of life, including capital punishment, euthanasia, abortion, meat eating, animal cruelty, or killing in self-defense. On the other hand, philosophers such as Niccolò Machiavelli, Thomas Hobbes, and Jean-Jacques Rousseau argue that war can sometimes be useful, and a few glorify it as a potential for exalting either the individual (Friedrich Nietzsche) or the nation and/or the state (Johann Gottlieb Fichte, Georg Wilhelm Friedrich Hegel).

The Need for Systemic Change

Many thinkers conceive of pacifism at a more systemic level and insist on the necessity of transforming society at various levels to alleviate or eliminate violence. They differ on the means to be used for such a transformation, with proposals ranging from free trade to political regime, federalism, international law, collective security, disarmament, class solidarity, or social mobilizations.

In opposition to mercantilists who argue that war can be necessary for the consolidation of states, utilitarian philosophers such as David Hume or Jeremy Bentham insist on the cost of war and associate virtue and interest to show how free trade is useful both for stimulating economic health and for pacifying behaviors, as exchanges promote a shared belonging to the same community.

As political systems, empires can ensure an enduring peace but are not considered to be pacifist political systems because they maintain a domination of their subjects. Kant grounds his project for a "perpetual peace" on three levels of action, as peace occurs from a moral individual choice, best guaranteed by a republican regime, which represents and respects people's choice, and at a more global level by a federation of republican states on a cosmopolitan basis.

This insistence on political regimes is shared by later advocates of the democratic peace theory, according to which democracies do not go to war with one another, unlike potentially warlike autocratic regimes driven by dynastic ambitions or power politics. However, some elitist thinkers regard democracies as potentially bellicose because their use of conscription and the irrationality of the masses can support nationalism and thus go beyond their recognition of a people's right to self-determination. Federalism is also seen by numerous political thinkers as an answer for preserving and promoting regional or universal peace through a federation of states that share executive, legislative, and judicial powers and in some cases a common army, giving rise to contemporary reflections that could ultimately lead to regional integration.

International law extends the just law doctrines of *jus ad bellum* and *jus in bello* to establish common rules to prevent, reduce, or judge violence between international actors. Since the end of the 19th century, various strategies have been tested, such as arbitration, conciliation, mediation, treaties (e.g., the Briand-Kellogg Pact, signed in 1928, which forbids war), or international courts (e.g., the International Criminal Court). Pacifist associations from various countries actively supported the creation of the League of Nations (1919) and of the United Nations (1945), based on the principle of collective security, and incomplete disarmament initiatives.

Claims for solidarity among the people across state boundaries spread among leftist workers movements and trade unions throughout the 19th century. For most of them, war mainly constrains the working classes and benefits the dominant classes. Their pacifism therefore associates internationalism with antimilitarism, since they advocate general strike against militarism as conveyed by the lyrics of *The Internationale* anthem, written in 1871 ("The kings make us drunk with their fumes / Peace among ourselves, war to the tyrants! / Let the armies go on strike / Guns in the air, and break ranks"). However, Marxists believe that peace is a remote goal, as the working-class mobilization for a classless society will abolish war through the decline of the state, but only through the use of violence.

Since 1945, social mobilizations have developed new arguments for peace on the grounds of the existence of a nuclear threat endangering the very existence of humanity, be it through political mobilizations, some of them led by communist internationalism (World Peace Council) during the Cold War, or the creation of environmental nongovernmental organizations concerned with broader ecological purposes.

Rejection of violence may be considered as one of the most commonly shared political ideas throughout history, though it takes widely different shapes, which make its identification complex and probably contributes to its not playing a major role within political theory.

PANEL

See Time-Series Cross-Section Data and Methods

PANEL DATA ANALYSIS

Panel data consist of a cross-section of "individuals" for which there are repeated observations over time. Individuals can be any cross-sectional unit of analysis, such as states, dyads, or survey respondents. Panel data sets are typically dichotomized between long panels, which have many measurement occasions relative to the size of the cross section, and short panels, which have many individuals in the cross section relative to the number of repeated measurement occasions, or "waves." In general, the methods associated with the term *panel data analysis* or *longitudinal analysis* focus on short panels, while methods under the *time-series cross section* umbrella focus more on analyzing long panels. The key advantage of panel data is that such data offer the opportunity to better evaluate causal propositions than strictly cross-sectional data. Whereas cross-sectional data only allow the researcher to observe covariances, panel data further allow the researcher to observe whether a change in an input precedes a change in the outcome. In other words, since panel data consist of the same individuals over time, the analyst can observe a shift in responses as a reaction to an input. One example would be an evaluation of whether a state's present behavior responds to the prior behavior of its neighbors. Another example might be using a survey panel, such as those often incorporated into the American National Election Studies, to assess how partisan strength influences campaign interest over time. Panel data have a number of features that can pose challenges to analysts. These issues include unit effects, serial correlation, heteroskedasticity, and contemporaneous correlation. Panels also have special problems of missingness. The remainder of this entry focuses on these issues and some remedies for each.

Unit Effects

Whenever individuals' mean responses differ, unit effects are present in the data. Unit effects can pose serious problems for inference as failure to account for them in some way can produce bias in estimates akin to omitted variable bias. If the mean response varies cross-sectionally via unobserved unique means, but this difference is not modeled (and thereby left in the error term), then any cross-sectionally varying covariate will correlate with the error term. Such a situation produces endogeneity bias, that is, the independent variable is correlated with the error term in the model's coefficients.

In the econometric tradition, two approaches are widely used to handle unit effects. One is the fixed-effects model, typically estimated with least squares dummy variables (LSDV). This approach estimates the desired model using ordinary least squares (OLS), including dummy variables for each individual, save a reference individual. This approach has the advantage of being computationally simple and accounting for a known source of variance in the model specification. However, individual dummies are perfectly collinear with any variable that varies only cross-sectionally. Hence, LSDV precludes the inclusion of time-invariant variables in a model. An alternative that does allow time-invariant covariates is a generalized least squares (GLS) model with a compound symmetry covariance structure, known as a random-effects model. This model recognizes that repeated observations will covary, so the estimator accounts for this structure by including a term that forces all repeated observations to correlate at a constant level with each other.

It should be noted that the terms *fixed* and *random effects* have multiple meanings. Econometricians typically call a LSDV model a fixed-effects model and a GLS compound symmetry model a random-effects model. These terms take a different meaning when analyzing data from the view of hierarchical modeling. Specifically, a fixed effect refers to any model quantity estimated in the fitting of a model (i.e., obtained via least squares or maximum likelihood), while a random effect refers to any parameter that is unique to the individual but can be predicted separately. Mixed-effects models contain both fixed and random effects. Confusion can arise because a random-effects model is a special case of a mixed-effects model. For example, the general form of a linear mixed-effects model is

$$Y_{ij} = \boldsymbol{X}'_{ij}\beta + Z'_{ij}\boldsymbol{b}_i + e_{ij},$$

where Y_{ij} is the response value for individual i at time j, $\boldsymbol{X}_{ij}$ is the vector of all covariate values for individual i at time j, β is a vector of fixed effects—coefficients that apply to all individuals, Z_{ij} is a subset of X that may include any time-varying covariate or a constant, $\boldsymbol{b}_i$ is a vector of random effects for individual i, and e_{ij} is the error term for individual i at time j. One special case would be a model in which there is only a random intercept, which becomes

$$Y_{ij} = \boldsymbol{X}'_{ij}\beta + \boldsymbol{b}_i + e_{ij}.$$

Each $\boldsymbol{b}_i$ is not estimated directly in the fitting of the model but can be predicted using empirical Bayes techniques. By decomposing the unexplained variance into $\boldsymbol{b}_i$ and e_{ij}, which are independent of each other, the model successfully accounts for differences in the mean responses for individuals and the necessary correlation among observations. Hence, the random-effects model is seen as a special case of the more general mixed-effects model.

There are several practical considerations when deciding how to control for unit effects in a longitudinal model. Again, fixed-effects models cannot include time-invariant covariates. Further, when the number of individuals is large, especially relative to the number of waves, then estimating a LSDV model is inefficient. An alternative fixed-effects estimator to LSDV is the within estimator, wherein the outcome variable and the covariates are all rescaled as deviations from an individual's mean of the variable. The within estimator avoids the inefficiency of estimating unique intercepts for each individual and yields the same coefficient estimates at LSDV; however, just like LSDV, it cannot accommodate time-invariant covariates.

The model of random effects for units allows for time-invariant covariates and avoids the inefficiency problem that could emerge from LSDV. Hence, with especially short panels or any model for which the effects of time-invariant covariates are to be estimated, random-effects models are probably the most practical option. However, this model assumes that unit effects are independent of all covariates. If the unit effects are correlated with any of the input variables, then the random-effects model is biased and inconsistent. Whether or not independent unit effects is a fair assumption can be evaluated with a Hausman test, under which the null hypothesis is that the unit effects are independent, implying that a random-effects model is consistent. Rejection of this null hypothesis implies that the random-effects model has problems of endogeneity bias. As a final, practical point on random-effects models, GLS models such as this require the analyst to specify how the errors of the model are correlated. However, the true correlation between the errors of individuals' repeated measurements is unknown, so feasible GLS must be used. Feasible GLS (FGLS) is estimated with a multistep procedure whereby residuals of an initial model are used to estimate the correlation of errors, which is then inserted into a GLS estimator. For instance, the Cochrane-Orcutt FGLS estimator repeats this iterative process until the estimate of correlation of errors ceases to improve. All of this suggests that analysts must carefully weigh the structure of their data and the goals of their model when choosing how best to handle unit effects.

Serial Correlation, Heteroskedasticity, and Contemporaneous Correlation

Serial correlation refers to the fact that repeated observations on the same individual are highly correlated. In general, this correlation tends to be large and positive but diminishes as the time between measurements increases. Serial correlation violates the OLS assumption of uncorrelated errors. The solutions to this problem resemble the fixes for unit effects. One solution is to include a lagged response as a covariate, as this term often accounts for serial correlation and makes the remaining errors independent. Lagged outcome variables are more commonly used for long panels because the first wave of observations cannot be modeled with this approach, which is more costly when repeated observations are scarce. (It should be noted that while many argue that a lagged response most effectively accounts for unit effects and serial correlation, others maintain that an endogeneity bias can occur if the lagged term does not filter all of the serial correlation.) Another solution is to estimate a GLS model that includes a covariance pattern matrix, which estimates the covariances between each pair of time waves: The matrix may be unstructured or defined by a clear pattern, such as first-order autoregressive. Finally, mixed-effects models produce correlation matrices based on the variances and covariances of the random effects. Thus, a pattern of correlation can also be captured by random effects. It should be noted that in particularly short panels (e.g., three waves), serial correlation can be hard to account for with any of these methods: A lagged dependent variable costs one wave of data, covariance pattern matrices more complex than a simple random-effects model can be difficult to estimate, and very short panels do not allow for a lot of random parameters.

The methods for covariance patterns and random effects also can be incorporated into the general linear model framework, which means that remedies for unit effects and serial correlation also can be used for limited dependent variables (e.g., counts or binary outcomes). Marginal models, estimated with the generalized estimating equations, require the analyst to specify how repeated observations are associated and thereby resemble the covariance pattern GLS model for continuous outcomes. General linear mixed-effects models incorporate random effects into the specification and account for the correlation of repeated observations through the random effects.

Heteroskedasticity can be present in panel data if the unmodeled variance in outcomes differs from one individual to the next. This problem can be addressed through a GLS estimator that allows for unique variances among individuals, in addition to the correlation pattern. Contemporaneous correlation arises when individuals have similar errors at particular times. This may arise because some time-dependent factor is simultaneously influencing all individuals. In the presence of contemporaneous correlation, the error variance of linear coefficient estimates increases relative to the estimates of coefficients when Gauss-Markov assumptions hold. Regular standard errors do not account for this inefficiency, however. Rather, panel-corrected standard errors will better account for the larger error variance, thereby making statistical inference on coefficient estimates less prone to Type I errors (rejecting the null hypothesis when it is true).

Missing Data

With panel data, a key concern is that measuring each individual at every wave of observations may not be possible. One reason for this may be censoring that arises from the structure of the study. For example, if different individuals were recruited to participate in a study with staggered start times, but the study ended simultaneously for all, then late joiners would have fewer repeated observations. In this situation, the nonobservance of later waves for late joiners would be missing completely at random (MCAR), as qualities of the individuals had no bearing on how often they were observed. In this case, as with any panel data with observations MCAR, the data could be analyzed by complete-case analysis (analyzing only cases for which all waves are observed) or available-data analysis (i.e., methods that do not require response vectors of equal length).

Another, more serious cause of missing data in panels is attrition (also called dropout or panel mortality). Individuals who are part of the study may choose not to participate after a few observations, or the researcher may lose track of individuals and be unable to reach them for further study. Dropout specifically refers to the situation where, once an individual goes unobserved in one wave, he or she is not observed in any future wave. Whereas data that are missing due to censoring are nearly always MCAR, data missing due to dropout may not fit this criterion. If the data are at least missing at random (MAR, meaning that the probability of missingness is conditional only on observable information), then imputation methods can yield unbiased estimates of model quantities. Many studies impute missing values from dropout by assuming all missing values of a response are equal to the last observed value. This method assumes, however, that the responses would not have changed since dropout, which is usually unrealistic.

A better alternative is multiple random imputation. One technique for multiple random imputation is to model the probability of missingness and match missing observations with observed observations that have similar probabilities of being missing, randomly drawing several observations with similar probabilities of being missing to impute the missing value. A second technique for multiple random imputation is to model the value of an observation at a particular time with the observed data and impute a value for the missing observation that is computed with known information about the subject plus a random disturbance. For individuals who later return to the study, observations at later waves—as well as early waves—should be used to impute missing middle values.

As a final consideration for attrition, a researcher may choose to refresh the sample by adding new observations toward the end of the study, these new observations being called a refreshment sample. Though this strategy does not directly remedy the problem of uneven panels, it does prevent the sample size from shrinking too much when constructing an overall response profile. Furthermore, refreshment allows the researcher to diagnose the severity of panel effects. This can be done by comparing variable means from the refreshment samples with the means of those still in the panel at a given wave to see how dropout is influencing the makeup of the sample. Furthermore, the process of being part of a panel study may influence an individual's response over time, a process called panel conditioning. Refreshment samples allow for the possibility of adjusting for panel effects through techniques such as fractional pooling or two-stage auxiliary instrumental variables.

PARADIGMS IN POLITICAL SCIENCE

A paradigm is a constellation of scientific theories, values, and methods shared by the members of the scientific community, forging a disciplinary matrix and excluding any other theory. The word is of Greek origin and emerged in philosophical literature in the 15th century. The concept of a paradigm was formulated by Thomas Kuhn in his book *The Structure of Scientific Revolutions* (1962). Today, this concept is accepted in the history of natural sciences and in the sociology of science. It is also frequently used in political science as in all social sciences in spite of the fact that Kuhn explained in the preface of his book that its use is not justified in the social sciences. In 1965, three years after the publication of *The Structure of Scientific Revolutions*, the American Political Science Association (APSA) president, David Truman, thought that the paradigmatic explanation of scientific progress was not applicable to political science. Since then, the concept of a paradigm has nonetheless seduced many political scientists but much less so among comparativists than among other scholars. The word has even spread to mass media. Today it may be too late to expel this word from the lexicon, but it can be specified. The basic question is the following: In political science, are there sudden overturnings, scientific breakthroughs involving a tabula rasa, comparable with those engendered by Nicolaus Copernicus, Isaac Newton, Charles Darwin, or Louis Pasteur? For the following reasons, the answer to such a question cannot be affirmative. What is involved here is the identity of political science as a science focusing on social diversity, social change, and cumulative growth and knowledge.

In all sciences, the extent of the innovation that any individual can produce is necessarily limited, for each individual must employ in research the tools that he or she acquires and cannot in his or her own lifetime replace them all (Kuhn, 1970). Progress does not arise in a vacuum but develops out of the scientific patrimony. It is difficult to find in the social sciences a virgin domain. Every decade that passes adds layer on layer to the patrimony. New explanations supersede older interpretations. Many examples of cumulative progress can be given. Even giants rely on patrimony. Karl Marx refers to Adam Smith in his *Theory of Surplus Value*. In this book, he draws on the work of his predecessor in more than one page out of every six. Ralf Dahrendorf cites Marx 160 times in his book *Society and Democracy in Germany*. Max Weber does not cite Marx, but many of his writings were in response to the thesis of his predecessor. He once noted that he could not have accomplished crucial parts of his work without the contributions of Marx and Friedrich Nietzsche. Darwin had recognized his debt to Thomas Robert Malthus; John Maynard Keynes would not have been able to write one of the most famous books of the 20th century without the incremental advances achieved by several generations of economists. The theory of development consists of a long chain of accumulated contributions in several disciplines. The literature on elites is a good example, among others, of cumulative knowledge. Many contributions emphasize the sedimentation of layers of knowledge. The work of Gaetano Mosca and Vilfredo Pareto on elitism has become consolidated groundwork, and since then, important books have built an impressive patrimony.

The scope of social sciences is rarely the discovery of laws with universal validity; rather, it is the explanation of social diversity. In the social sciences, truth is not universal, it is contextual and plural. Social scientists do not make inventions and rarely make discoveries; what they do best is to observe regularities and exceptions (anomalies). It is for this reason that the most imaginative strategy in the social sciences is the comparative method. The patrimony is common property. Although every concept or theory or method has its creators and developers, they do not need to be cited every time the term is used. Even the identity of the originator may disappear into anonymity. We do not, and cannot, remember who used terms such as *role*, *revolution*, or *social mobility* for the first time. Given such a patrimony, scholars today can start their research at a much higher level than did their predecessors. Graduate students today know more than the founders of their field—even if they do not have the same capabilities of their forebears. Knowledge is largely acquired by accumulation.

Because the patrimony of political science results from progressively accumulated knowledge rather than from revolutionary leaps or bounds, because the discipline is deeply divided in specialties and in schools, and because one of its most productive research strategies is the comparative method, the mainstream of the discipline of political science cannot be labeled as paradigmatic. Other expressions are available: general framework, basic theories, encompassing synthesis, lasting postulates, and so on. None of the major trends in contemporary political science has the pretention of flying the paradigmatic flag. Many schools were and are innovative and seminal, but they directly contradict the concept of a paradigm dominating the entire discipline or its prominent domains.

There is a basic incompatibility between paradigmatic monoliths and comparative analyses. All great theories, concepts, and strategies in political science implicitly reject paradigmatic assumptions (except maybe the rational theory). The history of political science is a history of multiple competitive theories and methods: plural societies, behaviorism, structural functionalism, development, dependency, the role of the state and of civil society, the changing roles of institutions, electoral cleavages, religion and politics, civil culture, nationalism, social stratification, social class, alienation, legitimacy, trust, ethnocentrism, imperialism, hegemony, the clash of civilizations, and so on. The thesaurus of the disciplines is impermeable to paradigmatic oversimplifications. The Kuhnian overview of the history of astronomy, physics, or biology cannot be extrapolated to the social sciences, according to Mattei Dogan and Robert Pahre (1990).

The borrowing and lending of concepts, theories, and methods from one discipline to another of the social sciences over generations also shows the continuous accumulation of knowledge. Using various encyclopedias and dictionaries, it is possible to compile an inventory of more than 200 concepts that political science "imported."

- *From sociology:* accommodation, aggregate, assimilation, elite circulation, clique, cohesion, collective behavior, hierarchy, ideal type, individualism, legitimacy, mass media, mass society, militarism, nationalism, pattern variables, Protestant ethic, secular, segregation, social class, social control, social integration, social structure, socialization, status inconsistency, working class, *gemeinschaft*, *gesellschaft*
- *From psychology:* affect, alienation, ambivalence, aspiration, attitude, behavior, consciousness, dependency, empathy, personality, social movement, stereotype, gestalt
- *From economics:* allocation of resources, cartel, corporatism, diminishing returns, industrial revolution, industrialization, liberalism, mercantilism, gross national product, scarcity, undeveloped areas
- *From philosophy and Greek writers:* anarchism, aristocracy, consensus, democracy, faction, freedom, general will, idealism, monarchy, oligarchy, phratry, pluralism, tyranny, value, weltanschauung
- *From anthropology:* acculturation, affinity, caste, nepotism, patriarchy, plural society, rites of passage
- *From theology:* anomie, charisma
- *From journalists and politicians:* imperialism, internationalism, isolationism, the Left and the Right, lobbying, neutralism, nihilism, patronage, plebiscite, propaganda, socialism, syndicalism

In the process of adoption and adaptation the semantic meaning of many concepts has changed. Many concepts have multiple origins. Authoritarianism has two roots, one psychological and one ideological. It is often inadvertently interchangeable with despotism, autocracy, absolutism, dictatorship, and so on. Authority has been analyzed from different disciplinary perspectives by Bronislaw Malinowski, Max Weber, Talcott Parsons, Harold Lasswell, Abraham Kaplan, Bertrand de Jouvenel, and Carl Friedrich, among others. The concept of culture (civic, political, and national) has many variants: cultural convergence, cultural configuration, cultural evolution, cultural integration, cultural lag, cultural parallelism, cultural pluralism, cultural relativity, cultural system, postmaterialist culture. In the past 2 decades, political scientists have been very productive in this subfield.

Paradigms do not dialogue, they are mortal enemies; new ones replace old ones entirely. Introductory textbooks in physics or chemistry published 40 years ago rest now in the cemetery of books. On the contrary, in political science, dozens of books published long ago are still inspiring contemporary scholars: Max Weber, Karl Marx, Adam Smith, Vilfredo Pareto, Anthony Downs, Kenneth J. Arrow, Harold Lasswell, John Stuart Mill, Joseph Schumpeter, and many others, even Aristotle and Machiavelli, are still preeminent in the patrimony of political science, which advances by a process of accumulation of work within subfields and develops out of the patrimony by the scientist's own insights. The history of political science is not a history of breakthrough discoveries as in physics or chemistry. It is an uninterrupted chain of advances, with many competitive schools, controversies, temporary syntheses, predecessors and successors, and methodological disputes.

PARLIAMENTARY SYSTEMS

Parliamentary government is a form of government where the executive derives its political legitimacy from the parliamentary representative body. From a historical point of view, it is a European invention and continues to be the most common form of government on this continent. Outside Europe, its diffusion has been limited, and presidential or semipresidential forms have often been preferred. This entry discusses the origins of parliamentary systems, the various forms they take, and current problems with respect to this form of government.

The Origins of Parliamentary Government

Parliamentary government is one of the possible solutions to a crucial liberal and democratic problem—the problem of how to ensure both the political legitimacy of the executive and, at the same time, its accountability. The basic idea behind this form of government is that the parliamentary institution, as the highest representative body of the political community, should hold the keys to the life of the executive. This constitutional idea is essentially implemented by giving the parliament the power to express a vote of no confidence in the executive if it does not approve its behavior and by obligating the executive to resign when faced with such a manifestation of political distrust.

The origins of this principle and of the institutional mechanisms used to implement it can be easily detected in European history of the past 2 centuries. Within the framework of limited monarchical government, that is, a political condition whereby the monarchy was balanced by a representative body, the increasingly strong political role of the latter has progressively produced a situation in which the executive nominated by the monarch could not survive without the political approval of the parliament. Criticisms, which the parliamentary body could not address against the king himself without getting into a situation of lèse-majesté and thus creating an unsolvable problem of political legitimacy, could be more freely directed against the government. In this case, a mutually acceptable solution could be for the king to dismiss the government, attributing to it all political responsibilities and thus preserving his own supremacy. On its side, the representative body could “obtain the head” of the prime minister and of his or her ministers while at the same leaving the authority of the king untouched. In this way, the executive, while originally chosen by the monarch and deriving from him its political legitimacy, could be gradually drawn into the sphere of the parliament until the monarchy ultimately lost every substantive political control over the executive and only retained a symbolic role.

With this transformation, the government and its components have been increasingly drawn into the sphere of electoral and party politics and have gained independence from the sphere of the court and of the state bureaucracy. The process leading to a full parliamentary control over the executive has been often difficult and nonlinear. The idea that the government should answer to elected politicians and become responsive to the opinions and passions of the populace was difficult to accept—both for the monarchy and for the state establishment that was loyal to the throne. For an extended period of time, in most European countries, the monarchs attempted to maintain some degree of political control over the formation of governments and over the selection of prime ministers and some ministers (particularly in the fields of foreign affairs and defense). They also sought to influence some of the policy decisions. On a number of occasions, they even resorted to prematurely dissolving the parliament with the purpose of obtaining a more favorable position of the representatives with regard to their preferred cabinets. This resistance has delayed but not stopped the process of parliamentarization; in some cases, however, it has led to the downfall of the monarchy and to the (permanent or temporary) adoption of republican rule (e.g., in France, Germany, Greece, Italy, Portugal, and Spain). Where the monarchy has more smoothly accepted the new developments, it has survived, although with a more limited role. In these cases, it has accompanied the consolidation of a stable parliamentary government (Belgium, the Netherlands, the Scandinavian countries, and the United Kingdom [UK] are good examples of such a development).

The Basic Features of Parliamentary Government

As previously mentioned, the crucial and defining feature of a parliamentary government is the power of the parliament to express a vote of no confidence against the government. Corresponding to this power is the duty of the government to resign after such an event. As it had already been clearly noticed by Walter Bagehot in *The English Constitution* (1867), this produces a "close union of the executive and legislative powers." The cabinet and the parliament, or more precisely the parliamentary majority, become closely interconnected. The other features of this form of government derive from the first feature. The second is that the executive does not have a fixed term of office. Its duration may coincide with a full parliamentary term, or even beyond, if a newly elected parliament continues to ensure its political support, but it may also be interrupted beforehand. The principle of collegial responsibility that typically characterizes parliamentary government is also strictly linked to the power of the parliament to express a vote of no confidence against the government. The government is a collective decision-making body and is collectively responsible in front of the parliament. This principle can, however, coexist with significant variations in the internal structure of the executive. The role and the authority of the head of the government can vary, as well as the degree of autonomy of the other ministers. In most cases, the duration of parliament is not fixed: The parliament can be dissolved before its normal conclusion and early elections can be called. This possibility is generally viewed by constitution makers as an exit strategy in situations where providing the required parliamentary support for a cabinet has proven to be a difficult task. With regard to the dissolution of parliament, it is particularly relevant to establish who has the substantive power to decide this. A further institutional feature of this form of government is that the head of state is clearly separated from the head of the government and that it mainly has a representative and procedural role rather than a governing one. Parliamentary government is, however, compatible with a variety of possibilities with regard to the selection of the head of state. Especially in Europe, a good number of parliamentary monarchies survive where the head of state is designated by the monarchical principle of inheritance within an established dynasty. In most of the other cases, when a republican solution is adopted, a president is elected by the parliament. In a few cases, a popular election takes place but, as opposed to presidential or semipresidential forms, this does not attribute to the president a governing role.

A crucial aspect of the parliamentary form is the formation of the government; unlike the presidential form of government, it is not formally decided by elections and thus requires a more complex procedure. Typically, this procedure entails the nomination of the government so that the parliament can express its support either explicitly (if a confidence vote is required at its inception) or implicitly (when such a vote is not required and support is presumed until proof of the contrary). With few exceptions, the role of nominating is in the hands of the head of state, who is called to perform this function after an election or the resignation of the government in office. Constitutional rules are usually not very specific about what the head of state (or another authority endowed with this power) should do, but it is rather obvious that the designation must be oriented toward producing a cabinet capable of obtaining the support of the parliament. Otherwise, it could later be struck by a negative vote of the representative body and thus nullified. The task of the head of state is, therefore, to find out the will of the parliamentary majority, in terms of both the composition of the majority itself and the identification of the person to lead the new government. Depending on the electoral system and the configuration of the party system in the parliament, this step may be more or less simple. In some cases, electoral results so clearly define which party or coalition of parties has won and to whom the task of cabinet leader should be assigned that the head of state has practically no need to conduct a search and can proceed immediately to the nomination of the prime minister. In other cases, especially in multiparty systems, the process is less clear. After new elections or after the fall of an existing government, it may not be immediately obvious which parliamentary majority will be formed that is able to sustain a new government. To establish which parties will compose it and which leader will be acceptable may require a long and complicated process of negotiation. The head of state will typically assist the process through consultations with the political forces until a viable solution emerges. Under special circumstances, this role of facilitator may acquire a somewhat greater political significance. When parties cannot come to an agreement, the intervention of the head of state may help guide the process by either favouring one solution or creating obstacles for another one.

Institutional Variations in Parliamentary Government

Within this general scheme, there is great space for institutional variations. With regard to parliamentary confidence in the government, it has already been mentioned that while the power of the representative assembly to express a vote of no confidence is the common and defining feature of parliamentary governments, a positive confidence vote is not always required when a new government is formed. In many cases, the support is presumed unless proven otherwise. Other aspects deserve to be noted. When the parliament is bicameral, the power to provide or to deny the confidence to the government is generally reserved to only one of the chambers—the one with the broader democratic base. Only exceptionally, as in Italy under the constitution of 1948, is the positive confidence of both chambers required for a government to survive. Given its crucial influence on the stability of the executive, the vote of no confidence has been regulated with variable degrees of restrictions. Some of these rules, such as the requirement of a temporal delay before a motion of no confidence is put to a vote, are directed at preventing parliamentary "ambushes." A more strict mechanism is the one introduced with the German Basic Law of 1949, which has since found some imitations. The so-called constructive vote of no confidence prescribes that the vote by the parliament against the government in office should simultaneously designate a new head of government (the chancellor in the German version). The purpose is to prevent negative coalitions that are only united by the purpose of bringing down a government and do not possess the willingness to unite in the formation of a new one. Differences can also be found in the process of government formation. If the normal rule is that the head of state nominates the prime minister, this duty may be transferred, as in Sweden after the constitutional reform of 1974, to the parliament's speaker. Another solution, adopted in the German Basic Law, is to have the chancellor individually elected by the parliament (in fact by the Bundestag) on the proposal of the head of state.

With regard to legislative matters, further variations may concern the powers of the government and the head of state. The head of state may have the power to send back to the legislature a piece of legislation approved by parliament (in most of the cases of governmental initiative). Governments may have, as, for instance, in Italy, the power to enact decrees that enjoy immediately the same authority as laws but that must be subsequently ratified by parliament within a given period of time. The role of the government within parliament may also vary, especially with regard to the governance of the lawmaking process. Of special interest are its agenda-setting powers and the control it has of the parliamentary calendar.

The most important dimension of variation concerns the relative power and roles of ministers and prime minister. Parliamentary governments may oscillate between an extreme where the prime minister has a dominant role in guiding the cabinet and another extreme where his or her authority is much more limited and he or she is confined to a role of mediation among powerful "cabinet barons" (Giovanni Sartori, 1994). This only partially depends on formal constitutional rules; other factors that are essentially related to the electoral and party aspects of government formation have a much greater impact, and it is these factors that now need to be examined.

The Working of Parliamentary Government

On the basis of the constitutional rules defining it, the parliamentary form of government can be interpreted as a fairly straightforward "chain of delegation and accountability" (Kaare Strøm, 2000). Through elections, citizens delegate the members of parliament; these in turn delegate the government, which then delegates the ministerial bureaucracies. Accountability runs in the opposite direction. Things, however, are a bit less simple and linear when political factors are introduced into this picture. Of crucial importance is the party variable with its two main dimensions: (1) the internal structure of parties and (2) the nature of the party system. The relationship between parliament and government can change significantly depending on these two aspects. The main reason is that the nature of the party system and the internal structure of parties have a direct bearing on the form and the cohesion of the parliamentary majority—the crucial linchpin in this form of government. The potential variations in the practical workings of the parliamentary government can be broad. At one extreme, we can find the situation, common in many countries at the origins of parliamentary government, in which parties were more or less nonexistent as organizations. In front of parliamentary aggregations with a weak degree of cohesion, the government (especially when backed by a monarch who had not yet abandoned the ambition to exert political influence) could easily manipulate majorities using the instruments of political patronage and, if needed, the threat of early elections. It is true that the government could also unexpectedly face a parliamentary ambush due to the volatility of parliamentary support. The consolidation of highly organized parties during the 20th century has deeply changed the relationship between executives and parliaments in most countries. Parties (and especially their extraparliamentary organizations and leadership) have become the crucial linchpin of this relationship. In practical terms, both the members of parliament and the executive became the delegates of parties' leaderships. Parliamentary government became truly "party government" (Richard Katz, 1986), whereby party leaders define to a large extent the policy platforms to be followed by the government and select the persons to occupy ministerial positions. In this context, the parliamentary connotation means essentially that it is the "parliamentary size" of parties resulting from their electoral performance that determines their weight in this process. Depending on the variety of party organization models, the degree of parliamentarization of the party leadership can also vary, and this also reflects on the parliamentarization of the cabinet members. The current decline of external party organizations is opening the way to a situation where the government less strictly depends on party orders and in fact influences internal party dynamics. Thus, there is more of a two-way relationship between parties and government.

The structure of the party system and electoral dynamics combine to produce other important effects. Particularly relevant is the impact that these elements can have on the relationship between the electoral and the parliamentary moment of the process of delegation. A good example is the British one. Normally, the existence of a (de facto) two-party system, combined with the fact that elections determine which party controls a parliamentary majority and the fact that the leader of a party is also in principle the candidate for head of government, produces a kind of short circuit in the process of delegation. Although voters in principle only select the members of parliament, they also determine de facto the party that will govern and its leader. A "popular investiture" of the government is thus produced and the parliament cannot do anything but ratify it. Of course, this does not detract from other aspects of the parliamentary model: The members of parliament maintain the power to renege on their support for the government (and the government knows that it must work toward maintaining this support). Electoral mandate and parliamentary support are thus combined. Changes in the configuration of the party system and electoral results may, however, negate the possibility of a one-party government "mandated" by the electoral result and thus open the way to a coalition negotiated among the parties/parliamentary groups. In fact, this happened in

2010 in the UK, and it is the "normal way" in multiparty systems. In such situations, elections are not decisive; a process of coalition making can only begin among the parties represented after the parliament is formed. In this case, the delegation from the parliament (the parties) to the government becomes more evident. The government will receive its policy mandate and derive its personal composition from this process. The relationship between the government and its supporting coalition is then crucial. The government can only last if its supporting coalition holds together. The instruments for stabilizing the majority and regulating its internal working acquire an obvious importance, according to Wolfgang Müller and Kaare Strøm (2000). Among them, the coalition agreement deserves special attention. It is a document that specifies the broad goals of the coalition, its specific policy objectives, the allocation of ministries, and the instruments and the rules for the solution of conflicts. Other instruments can also help solve coalition conflicts during the life of the cabinet, such as coalition committees—"summits" of party leaders that are held to interpret or renegotiate the original agreement.

Two further situations must be considered. The first is when a coalition is formed before the elections. The second is when the government, based on one or more parties, does not have in parliament the support of a stable coalition holding the majority of seats. The first case can be seen in some way as an intermediate situation between a single-party government and a normal coalition government. If a preelectoral coalition wins the majority required to govern, the formation of the cabinet will be much speedier than is the case with a postelectoral coalition. Most of the policy and distributional questions will have been solved in advance. Moreover, the coalition and its leader will enjoy a sort of "direct investiture" by the people. However, as with any coalition government, this one will also be faced with the problem of maintaining its cohesion. This problem may become more serious if, with the approaching of new elections, any of the coalition members fears that its participation may not be rewarded by the voters and sees its chances better served by pursuing a different political path. The second case derives from the fact that in a parliamentary government the cabinet must not necessarily rely on a supporting majority. In fact, the most important thing is that there should not be a majority against it. This enables the creation of minority governments, made up of one or more parties that do not enjoy a majority in parliament but explicitly or implicitly receive the support of other parties either in a more stable way or on an ad hoc basis. The frequency of such governments is greater than expected: This suggests that participating in a cabinet with full ministerial responsibilities is sometimes more of a cost than a benefit.

Whenever a one-party government is not possible, the formation of (preelectoral or postelectoral) coalitions is obviously a crucial aspect in the working of parliamentary government. This has generated a whole sector of studies devoted to coalitions that, starting with the pathbreaking study of William Riker (1962), have analyzed the different types of coalitions with regard to their size (minimal winning, minority, oversize, etc.) and their ideological composition (connected/unconnected). Furthermore, these studies have explored different explanations (utilitarian calculus, ideological preferences, and policy orientations) for their formation and their ends.

Advantages and Disadvantages

Is the parliamentary form of government a better or worse form than the others, in particular the presidential form? This question has recurrently been at the center of discussions and has received varying answers. This is partly explained by the different points of view adopted and by the changing criteria of evaluation. It has also been due to the lack of systematic comparative empirical evidence; only in recent times has this obstacle been gradually overcome. Governmental instability has traditionally been one of the main points of criticism for parliamentary governments. The experiences of a number of European countries between the two World Wars seemed to suggest that parliamentary cabinets tend to be unstable and weak and that heads of government may lack authority, thus creating a situation that could open the road to nondemocratic consequences. In contrast, a presidential or semipresidential form of government has often been presented as a better solution. Putting the selection of the head of the executive directly into the hands of the voters and establishing a fixed term for its duration seemed, to many scholars and observers, to be a recipe for overcoming the failures of parliamentary government. More recent contributions have retorted that parliamentary government, rather than being responsible for creating these problems, reflects a situation existing at the level of parties that would be dangerous to ignore. Moreover, it can be said that in such situations the parliamentary form of government allows a flexibility in the formation and change of governments that may reduce personalized zero-sum conflicts and open the road to compromises. On the contrary, presidential forms of government often are characterized by a rigidity that cannot easily provide alternative solutions if the adopted one fails. Whatever the conclusions of this scholarly and political debate are, it is worth noting that recently established democracies have increasingly attempted to combine elements of the parliamentary and presidential forms of government, adopting some form of semipresidentialism (or semiparliamentarianism).

PARLIAMENTS

The notion of parliament has existed for almost as long as people have gathered to debate alternative viewpoints and take associated decisions. As the complexity and formality ascribed to these gatherings increased, the institution of parliament developed. It comes under a variety of names, from the most common assembly, legislature, or parliament to more regionally specific ones such as Storting or Diet. Parliaments are institutions that bring together formally recognized members to discuss and legitimize decisions on matters affecting the community at large. The level of formality and power credited to those discussions and decisions varies, as does the level of representation. This entry first describes how the role of parliaments has changed considerably since the 19th century. The factors affecting the role and power of parliaments are considered, and the key roles performed by these institutions are identified. Each of these roles—legislation, scrutiny, and representation—is assessed, and the organization of parliaments is described. The entry concludes by outlining the main areas on which research on parliaments has focused.

The history of parliaments is intrinsically linked to that of democracy. Each wave of democratization identified by Samuel Huntington has corresponded to stages in the development of parliaments. The first wave encompasses the spread of liberalism in 19th-century Europe. With this came the creation of new parliamentary institutions, as well as the legitimization of their representative value and role in the decision-making process. As the value of representative democracy grew, parliaments became central institutions of political systems, particularly in Europe. With the 20th century came considerable changes that affected the power and role of parliaments. As democracy expanded with the emergence of newly independent countries (the second wave of democratization), so did its complexity. The changes affecting parliament were twofold. First was the development of mass parties; the expansion of the electoral franchise saw parties becoming key institutions in the representation process, acquiring an important role in the expression of policies and mediation of interests, which had been key roles of the original liberal parliaments. Second, there was an expansion of the state; the emergence of the welfare state saw legislation growing more complex, increasingly developing into a matter for the executive rather than parliament. By the mid-20th century, some parliamentary roles and powers had been transferred to other institutions. However, as the third wave of democratization started, in the 1970s, many authoritarian regimes turned to democracy, putting parliaments at the core of their transitions. Simultaneously, a wider range of parliamentary roles and powers started to be more fully recognized. This was a time when the paradigm of the decline of parliament gave way to the paradigm of the role of parliament. Besides representation and legislation, parliaments play a variety of other roles, from education to providing a safety valve, legitimation, and scrutiny. Never before have there been so many parliaments, not only at the national level but also locally, regionally, and supranationally. Since the end of the 20th century, parliaments have expanded considerably in number and in complexity.

The powers and roles of parliaments differ according to their political context—the type of political, electoral, and party systems. Being part of a parliamentary, hybrid, or presidential political system has implications for the separation of powers and the relationship between parliament and other institutions, especially the executive. Different electoral systems, and associated party systems, also affect parliaments by determining the number of parties present in parliament, the potential support base for government, the strength of party discipline, the type of representative mandate, and the parliament's organization. Indeed, some parliaments are not elected at all and are not composed of party members. Therefore, parliaments have differing powers and roles according to the characteristics of these structural variables, though all, in varying degrees, make a link between citizens and governance.

The relationship with government is one of the key dimensions to understanding parliaments. Depending on the type of political system, parliament may have different tools with which to hold government to account, such as a motion of censure that could bring the government down if approved. But the relationship with the executive goes well beyond accountability. The main focus of that relationship usually revolves around the production of legislation, but it also concerns the scrutiny of government activity. It is generally accepted in the literature that the executive dominates this relationship, due to the support ensured through party discipline and governmental legislative powers. That said, the more checks and balances the system includes, the less likely it is that the executive will dominate parliament.

The main function traditionally associated with parliaments is legislation. However, most legislation produced today has little contact with parliament. Legislation has become so complex that parliaments have little capacity to deal with the detail and extent of today's regulatory frameworks. Notwithstanding, parliaments do still hold a role in the legislative process. This role varies according to structural characteristics, as explained above, resulting in varying degrees of power in the capacity to initiate, amend, approve, and/or reject legislation. Many parliaments only have a legitimizing role of the legislative process, with little power to introduce legislation, let alone change it. They often act as the final stamp of approval, which explains why authors refer to rubber-stamp parliaments. As David Olson has famously stated, there is a general 90% rule in the legislative process, whereby the executive proposes 90% of the legislation and gets 90% of what it wants. Within the 10% leeway, many parliaments have the capacity and ability to change legislation, through formally approving amendments or informally influencing the final outcome. Occasionally, parliaments have the ability to reject government legislation. When parliament regularly rejects government legislation, the relationship between the two institutions can break down, leading to new elections (or even a regime change). Regardless of the percentage of legislation on which parliament can act, one must also consider the focus and level of legislation (primary, secondary, or delegated). Some parliaments reserve the right to legislate on specific matters, which means that the whole of the bill is introduced, discussed, and approved in parliament; while in other cases the government has areas of reserved legislation through which it can legislate without having to go through parliament. Additionally, other institutions can intervene in the legislative process, such as supranational parliaments.

Scrutiny is another of parliament's main functions. It comes under different names such as oversight or parliamentary control and expresses itself in a wide range of activities and tools. Scrutiny plays a key part in the relationship between parliament and government and has increased in importance as parliament's role in the legislative process has diminished. Scrutiny can focus on the application of legislation, on seeking information, or simply on keeping a check on governmental activity. Most parliaments have provision for asking questions of government, in writing and/or orally in the plenary chamber and/or in committee. The frequency of these questions and their response rate are key indicators to assess the effectiveness of these. Parliaments often provide for several formats for questions to the government according to the types of request and matters. Interpellations are another popular scrutiny tool. Usually more general in scope, these involve a small debate on the topic, with the participation of a wider number of representatives besides the proponent. Finally, committees of enquiry form the other main scrutiny tool used by parliaments. Despite exceptions, these tend to be set on an ad hoc basis when there is a serious matter to investigate. The ability to scrutinize and investigate government adequately depends greatly on parliament's power to request information from the government and to summon the presence of members of the government and of the public administration, as well as the degree to which the opposition can use these powers.

As a key function for most parliaments, representation takes many forms and is closely linked to the type of electoral system through which the parliament is elected. Representation can be collective, where the party's parliamentary group is the main representative entity, or individual, through members of parliament (MPs, also called deputies, legislators, or senators). The representative mandate is often linked to constituencies but can have a national basis. The strength of the link between representatives and constituencies depends on these factors. Parliaments elected through a first-past-the-post electoral system tend to encourage a more individual and constituency-based type of representation. Besides this, representatives may also follow a trustee approach to their mandate or a delegate one. In the trustee model, representatives make decisions by following their own judgment, whereas in the delegate model, MPs act foremost on behalf of a particular group. The delegate model tends to dominate today, and the debate is mainly about which group should prevail in that representation—the party, the constituency, or the nation.

With respect to their organization, parliaments can be unicameral, with only one chamber, or bicameral, with two chambers. Bicameral parliaments tend to exist in countries with a large territory, a federation, and/or great ethnic diversity. Some countries do not fall in any of these categories but have a second chamber for historical reasons. The role and powers of second chambers vary considerably, but they tend to complement the first chamber and to act as a check and balance. A key consideration is whether the second chamber is nominated, directly elected, or indirectly elected. Often, parliamentary activity is divided between the plenum—a chamber—and committees. The plenum is usually reserved for larger debates and committees for more detailed review and scrutiny. Normally, plenum debates are public, whereas committees can hold meetings behind closed doors. Today, committee work plays a considerable part in parliamentary activity. One final point to consider in parliamentary organization is the level of resources and staffing. These affect parliaments' ability to play any of their roles.

Political scientists still know little about parliaments around the world. Most research focuses on a very few case studies, normally from Western democracies, and on limited dimensions of parliamentary activity. The relationship between parliament and government, parliament's role in the legislative process, and parliamentary voting behavior constitutes the main areas of research.

PARTICIPANT OBSERVATION

Anyone doing empirical research into social activities and social reality has three basic options: (1) evaluating documents, (2) conducting a written or oral survey to gain information on the knowledge and the activities of subjects, or (3) participating in the everyday practices of the people of interest. The final method is called participant observation or ethnography. It has its roots in anthropology and ethnology; it is rarely used in political science. After a brief overview of the historical and theoretical development of participant observation, this entry demonstrates the opportunities and restrictions of participant observation as a research method in political science. It concludes with some advice on putting participant observation into practice.

Historical Development

The methodological development of participant observation dates back to the 1920s with the research of the anthropologist Bronislaw Malinowski as well as Robert Park, William Thomas, and Florian Znaniecki of the Chicago School of Sociology. Classics such as *Marienthal: The Sociography of an Unemployed Community* (1933) by Marie Jahoda and Paul Lazarsfeld or *Street Corner Society* (1943) by William Whyte indicate that participant observation has been part of the methodological instruments used in the social sciences from the start. However, in the beginning of the 1950s, such observation methods fell out of favor due to the further development of survey research and standardized statistical methods. In the 1980s, when the discussion about the usefulness of a qualitative research approach increased, interest in participant observation was revived.

In comparison with other disciplines such as sociology or education, participant observation has until now been neglected in political science. Not only has it been rarely used in political science research, but political scientists have not been involved in its methodological development. The work of Richard Fenno is one of the few exceptions. His description of his research strategy as "soaking and poking" has become standard terminology. Fenno observed members of the U.S. House of Representatives in their constituencies and inductively developed a theory of their working styles. He later also accompanied U.S. senators on their campaigns, and in several of his works, he reflected on the experiences he had while observing politicians in Washington, D.C., and in their home districts.

Theory of Scientific Observation

At the most basic level, observation orients us to our environment—it is something we do every day. It becomes *scientific* observation if it allows us to systematically examine certain assumptions with results that are repeatable and intersubjectively comprehensible. Scientific methods of observation can be divided into the following five categories:

1. covert versus open observation,
2. participant versus nonparticipant observation,
3. structured versus unstructured observation,

4. observation in the field versus laboratory observation, and
5. introspection versus external observation.

In political science, participant observation is the most common variant. In general, this type of research is conducted openly, in a natural environment, and in the form of external observation. The extent of participation can be thought of as a continuum, since it can take a variety of forms, and the influence of the observer on the field can vary. For example, as a guest in committee meetings the political scientist is a quiet listener, but as a passenger in a politician's car on the way to the next appointment he or she can also be asked for advice. Accordingly, participant observation is not to be understood only literally, since in many institutional contexts action primarily consists of verbal communication. Observing means communicating. In most cases, participant observation is therefore combined with other methods of data collection. Take, for example, the observation of a parliamentary committee. Here, observation does not only mean direct participation in the meeting for the purpose of describing its course and the actions of the legislators. Essential to the observation is researching background information on committee members or studying the agenda and the motions, informal conversations, as well as later interviews with representatives. After the meeting, the observations must be examined to determine whether they confirm previous assumptions and earlier observations or whether new hypotheses must be generated.

Participant observation is in many respects a *process*. On the one hand, the political scientist has to gain access to the field. On the other, the observation increasingly has to concentrate on those aspects that are essential to the research question. James Spradley distinguishes three phases: descriptive, focused, and selective observation. In the first phase, the researchers get their bearings and collect unspecific descriptions of the field. The complexity of the field is grasped as comprehensively as possible, and concrete research questions are developed. During focused observation, the perspective is narrowed and focused on the problems, processes, and persons that are of particular importance for the problem under investigation. At the end of the observation process, selective observation serves to find further proof and further examples for the previously found behavior.

Participant observation aims to understand its research subject from within. Through participant observation, subjective views, and interpretations (symbolic interactionism), interactive processes in which social reality is constructed (ethnomethodology) or the cultural and social rules that shape the perception and construction of social reality (structuralism) can be understood. The research principle that underlies participant observation is understanding. Typically, the starting point of participant observation is a singular case, from which one progresses to general or comparative statements. First, the individual case is reconstructed. Then, the analyses and results from other cases are checked for comparison, and finally a typology is developed. What is understood as a singular case depends on the theoretical viewpoint: subjects and their points of view, interactions, or social and cultural contexts. In all these, one message is pervasive: Reality, as it presents itself to the observer, is never a given but is constructed by the various (individual or collective) players.

Advantages and Restrictions of Participant Observation

The role of the observing political scientist is not very different from that of the ethnologist who works in alien cultures. By direct participation, the political scientist attempts to understand typical organizational conventions and the rules and everyday routines that form the cultural bases of functioning political institutions. The field researcher's aim is the understanding of political institutions from an endogenous perspective. Observations of legislators show that the social processes and rules guiding communicative processes or everyday behavior are difficult to research through interviews because something that is taken for granted often remains unconscious. If you ask politicians which rules guide their work or which strategies they pursue to achieve their goals, the answers are often nondescript. For example, many legislators are not aware of the informal rules of parliamentary business, and they have seldom reflected on "how it is done" to enforce their positions. Participant observation makes it possible to discover the behavioral patterns of everyday actions in addition to what the subject of the observation reveals.

Examining the influence of informal rules is another advantage of participant observation. Politicians are used to formulating their positions with the public in mind; this behavior comes through in interviews, from which the observer often learns more about the ideas of the politician interviewed and about how something *ought* to be rather than about his or her actual behavior and how things *are*. This is particularly true when examining sensitive areas, including informal actions, because these may be considered to be synonymous with "fiddling" and "shady deals." The combination of interviews and observations offers the advantage of being able to correlate and connect the sphere of perceptions with that of actions. The results of the observations can be contrasted and compared with those of the interviews. Participant observation makes it possible to experience social players as they actually behave in social and political reality.

Political scientists involved in field research are not immune from the danger described in ethnology as "going native": a process in which the observer loses the outside perspective of the alien in his fieldwork and adopts the views of the subjects under observation. This makes the systematic evaluation of gained insights more difficult. However, if the researcher is self-consciously aware of this problem, the closeness to the research object is of immense value. No other method allows a researcher to come so close to the object of his or her enquiry as participant observation. The research process is not clouded by theories developed beforehand, traditional views, or standardized procedures. Participant observation makes it possible to see the progress and the contradictions of political processes and, as Fenno put it, to see the world the way the agents see it.

Participant observation also has its disadvantages, and this explains why only a few political scientists use it. First, the method is highly time-consuming and therefore costly. Second, restricted access to the field limits the opportunities for scientific political field research. Third, the formalization of participant observation methodology is only possible to a limited degree. The method of participant observation is difficult to divide into systematic steps and to teach systematically. Because of this, it can be burdensome to researchers.

Advice for Conducting Practical Research

In conducting participant observations, the following recommendations may be helpful.

1. Participant observation is not about the casual collection of impressions. Therefore, the implementation of theoretical research questions has to be done carefully. An observation guideline (but not a detailed, limiting observation scheme) sensitizes the observers to the observed situation, ensures concentration on the research questions, and facilitates coordination between various researchers.

2. Restrictions to field access are an everyday occurrence for political scientists using the participant observation method, due to the fact that political decisions are often taken behind closed doors. However, sample selection should not be done with the anticipation of potential access problems. A hybrid approach is recommended here—that is, taking a random sample based on theoretical criteria that ought to be flexible enough to be extended and modified in the research process. Here, Barney Glaser's and Anselm Strauss's idea of "theoretical sampling" is instructive. The following methods may increase access to the field:

- being perseverant and obstinate;
- identifying "gatekeepers," using hierarchies and mediators to open doors;
- winning over members of institutions to function as mentors to mediate in the solution of problems that occur in the field;
- avoiding academic jargon, because politicians are not interested in the formulation of scientific theories, and instead communicating meaning by formulating the usefulness of the research results to be expected in the language of politics; and
- acting competently, sensitively, honestly, and neutrally because safe field access depends on how the researchers are perceived in the field.

3. Political scientists usually do research in contexts involving many documents and papers, so that drawing up field notes will go unnoticed. If the opportunity to write down extensive notes is not taken, one misses the chance to collect detailed

observation data, unadulterated by gaps in one's memory. To ensure data quality, explicit observation records have to be made from the notes close to the actual time of the events. If too much time is allowed to elapse, the records will be increasingly imprecise. Thus, spare time for recording data should already be set aside when planning the fieldwork. In the observation of institutional bodies, common behavioral patterns will be discovered, depending on the organizational context, from which a recording guideline can be derived, which will structure and simplify the following recording.

4. Observation by several researchers offers an opportunity to ensure the reliability of observation data. One observer compiles an initial record, which is then worked over by the second one. That way, information can be complemented, contradictions reconciled, and interpretations checked. With the help of pretests, coordination among the observers can be improved. Another possibility for validating the results is to get feedback from the persons observed in the field.

PARTICIPATION

No society, be it traditional or modern, can exist and survive without the active engagement of its members in the various domains of life that have resulted from processes of social differentiation and that, in toto, constitute societies and polities at large. This does not imply that every member of any given society has to be active in each domain. What it means, however, is that each domain encompasses individuals (the microlevel), an intermediary structure (the mesolevel) linking individuals and institutions in that domain, and systemic elements crystallized in rules and institutions regulating the particular domain in question (the macrolevel). Especially in modern times, these three levels are complemented by a fourth overarching level linking units in various ways (globalization is a particular phenomenon resulting from such linking processes). Notwithstanding the fact that presently there is an ongoing debate in political science on the shrinking role of the nation-state, the nearly 200 nation-states in existence are the major macro-units of analysis in comparative political science, whether they are considered in full or as subsets and whether the core emphasis in systematic analyses is on the micro-, the meso-, or the macrolevel or any combination of them. Below, first, a definition of various aspects of participation is provided. This is followed by a discussion of the underlying methods and theoretical concepts. The various dimensions of political participation are then discussed in greater detail. In conclusion, some of the major current developments and consequences for contemporary democracies are pointed out.

Participation refers, first, to activities by individual members of any given meso- or macro-unit of analysis. Second, in the core of participation is the action itself—that is, individual behavior—even if attitudes as the antecedents of such behavior, as obtained in survey research, may also be of interest. Third, individuals never act in a social void; therefore, to understand why people act at all and in the way they do, one has to consider the embeddedness of individuals in a context conducive to action. This context can be the institutional arrangements on the macrolevel (e.g., for voting, the electoral law in a given country) or the social environment that an individual is part of. Fourth, modern social science is not only about structure and persistence but also about dynamics and change, with obvious implications for research designs. Fifth, and returning to the concept of domains as subunits of sociopolitical systems resulting from processes of differentiation in contemporary societies, participation for the purpose of this entry is divided into a part on political participation and a—smaller—part on social participation (there are other fields worth looking at, e.g., cultural participation, but here the data situation is unsatisfactory, and to reach out beyond the two fields just alluded to would overstretch the scope of the entry).

Methodology

As mentioned above, participation of individual, collective, or institutional actors is a constituent feature of any kind of sociopolitical structures and processes, including nation-states. To study participation empirically as an individual property requires a particular set of research instruments of an obtrusive or unobtrusive nature, and among those undoubtedly the most prominent one is the representative sample survey that acquires information from individual members of any given meso- or macro-unit. These individuals need to be selected at random based on probability theory in order to permit generalizations from the sample to the population from which the sample was drawn. By now, survey research can be regarded as a well-established research methodology and does not require any elaboration here, although using this methodology comparatively is a challenge. It is not by chance that the worldwide spread of this methodology, which started in the 1950s, has helped make individual political participation one of the best researched fields in political science.

But there are other important factors conducive to this state of affairs. The first is, on the macro-level, the economic growth and modernization that have contributed to the development of a survey research industry, both academic and commercial, that is an important tool for self-observation in societies. Second, surveys in the early days of this research, especially in the academic realm, were a rare and costly resource; this is not the least of the reasons for the establishment of academic data archives. This situation did not simply improve over time as survey studies became more numerous; a more important change was the transition from one-shot cross-sectional surveys to systematic replications over time to create longitudinal databases capable of analyzing sociopolitical change, at least in the aggregate (panels that require the same individuals to be surveyed over time are a separate and more complicated issue and are therefore still quite rare). Third, starting in the 1980s, the scholarly community has conducted a broad set of comparative longitudinal academic cross-sectional surveys from which participation research has benefited enormously, such as the World Values Studies (WVS) and European Values Studies (EVS), the International Social Survey Programme (ISSP), the European Social Survey (ESS), and the Cross-National Study of Electoral Systems (CNES), data sets from which many of the current analyses and findings have originated. In addition to these academically driven surveys, other comparative surveys had already been established already in the 1970s, such as the Eurobarometer surveys funded by the European Commission, surveys that were later complemented by other Barometer surveys in Africa , South America, and Asia.

Fourth, with the establishment of social science data archives since the 1960s that now, organized in the International Federation of Data Archives (IFDO), cover large parts of the world, the collected data are increasingly becoming quickly available to the research community (in part already through the Internet) in a well-documented fashion and at little or no cost, with a major impact on research, publications, PhD dissertations, and student training in social science research methodology. Finally, as the outreach of comparative surveys covers more and more countries (e.g., the WVS, which is by now conducted in more than 70 countries), the theoretical and analytical scope of research is beginning to be extended substantially through so-called multilevel analyses that permit the systematic assessment of the impact of macrofactors on individual behavior.

Participation and Theories of Democracy

The Austrian-born sociologist Paul Lazarsfeld escaped from the threat of fascism in the 1930s to the United States and became one of the major driving forces in the development of systematic theory-guided empirical social research. In addition to his work in media studies, he became interested in elections and conducted, at Columbia University, the first major election studies in the

United States. After World War II, a group of four political scientists at the Institute for Social Research at the University of Michigan started a series of election studies that later developed into the still existing American National Election Studies (NES) project. Similar national longitudinal election study projects have come into being, especially in some parts of Europe and for studying elections to the European Parliament; these data are also freely available through the respective data archives. The Michigan scholars and their works paved the way for contextualizing them in empirical democratic theory and squared well with the variant of election-centered elite democratic theory formulated by Joseph Schumpeter in his classic book *Capitalism, Socialism and Democracy*. Basically, Schumpeter's notion was that voters' most important role was to choose, in general elections, among those elites who stood for political office. Thus, it is not by chance that research on political participation initially was very much related to the electoral process and the role citizens play in this process. In contemporary social science parlance, the key normative issues involved here for democracy are not only how responsive the political system is to the needs and requests of the people (Jan Teorell, 2006) but also which political institutions safeguard accountability for the citizens (Pippa Norris, 2007).

This clearly limited citizen role was challenged in the late 1960s and early 1970s in the wake of the anti–Vietnam War demonstrations in the United States and student protests in many parts of the democratic world. Requests for an extended political role of the citizenry became louder; they culminated, at least in Europe, in expectations about the demise of the "late-capitalist state" (Max Kaase & Kenneth Newton, 1995). Thus, liberal-elitist democratic theory was extended in scope through the notion of participatory democracy, a notion that claimed direct political channels of influence for citizens going beyond the established modes of representative, indirect participation through parties and elections. In the seminal study *Political Action*, Samuel Barnes et al. (1979) spoke of an extended repertory of political action available to citizens and coined the terms *conventional* and *unconventional political participation* to combine elitist and participatory theories of democratic political participation.

The most recent variant of thinking about democracy and democratic participation comes under the label of deliberative democracy and owes much to the work of Jürgen Habermas and his followers as advocates of domination-free discourse. Teorell (2006) sums things up when he writes that deliberation is to be considered "as a process of opinion formation rather than a procedure for decision making" (p. 791). It is not by chance that one of the few viable instrumental efforts along such lines is the concept of deliberative polls, where a representative, randomly selected group of citizens gets together for a couple of days to deliberate, with pre- and postmeasurements, on critical issues to unfold the impact of a dynamic free political discourse on improving and legitimating political decision making.

Any normative theory of democracy has to be closely linked to the notions of equal representation and general accountability; this is why the liberal-elitist theory of democracy is attractive to many in politics and in political science. Moving beyond institutionalized political participation in the electoral process creates obvious theoretical and practical problems for participatory democracy on those two accounts, and this becomes ever more visible as politics is forced to overcome national barriers and to deal with various institutionalized (e.g., the United Nations, the World Bank) or noninstitutionalized transnational institutions and networks of action (e.g., nongovernmental organizations [NGOs]). On the international level, though, the actors or institutions as units of analysis are usually quite clear and easily identifiable. The same cannot be said for those involved in deliberative discourses, not to speak of the problems of legitimating who is represented in such discourses and in relating deliberative discourses to accountable political decision making.

Recently, in an interesting reflection on problems of deliberative democracy, another facet to this debate has been added. It is argued that in deliberation, not only individuals or groups but also the full array of discourses on a particular problematic should be represented, for instance, through a Chamber of Discourses, formal or informal. Obviously, a variety of important problems is involved here, such as authorization, accountability, and criteria for selecting representatives (who, as actors, have to satisfy criteria related to discursive democracy, which cannot do without individual actors). The scholarly discussion on such ideas has at best just started; these ideas have not yet found entry into the debate on (political) participation and are, therefore, not yet represented in the empirical study of participation.

This discussion should make one thing clear: The empirical study of participation is closely linked to normative theories of democracy and has to be understood in such terms. The voluntary, free, and consequential political involvement of citizens is a minimal *conditio sine qua non* for any legitimate democratic political system, however developed it may be and however well it may satisfy the demands of particular strands of democratic theory. Needless to say, political and social participation also take place in authoritarian or totalitarian systems. But this is not the subject to be addressed in this entry, not the least because of the fact that scientific as well as commercial empirical social research in such systems, as historic examples have shown, is unlikely or even impossible when citizens cannot freely express their opinions.

Political Involvement

For political scientists as well as for all others involved directly or indirectly in the political process, interest in political matters is a given. The same can, though, not be said for all citizens even in democratic polities. Surveys such as the 2002 Round of the ESS (see Miki Kittilson, 2007), comparing the relative importance of various life domains, have demonstrated time and again that politics ranks very low compared with domains such as family, work, health, or even leisure. This makes it even more interesting to look at those who show political involvement and what consequences this has for political participation as active acts of engagement. In normative democratic theory, political involvement is the râison d'être of a citizen; nevertheless, as was pointed out, such involvement cannot be taken for granted.

Participation research concentrates on acts of participation—that is, on concrete behavior directed toward having influence on various outcomes of the political process (see below). By contrast, political involvement must be regarded as an individual psychological predisposition, and it is an empirical question to what extent and under which conditions such involvement precedes political action. In their political action study, Barnes et al. (1979) analyzed five out of the set of eight countries participating in the study and, in the concluding chapter, looked at those respondents who showed no political interest but showed a tendency to act politically anyway. This was called an expressive mode, and it was found that between 18% and 32% of the respondents fell into this category (p. 528). In their seminal study *Voice and Equality*, Sidney Verba, Kay Schlozman, and Henry Brady (1995) also emphasize the impact of political engagement—as they call it—on participation in the sense of being mutually reinforcing, although they mention that the closeness of this relationship makes it less interesting for the study of participation.

In recent empirical studies, political involvement is operationalized in similar and fairly common ways, although standardization for the empirical assessment of this concept has not yet been established. Jan Van Deth (2008) proposes, based on 19 countries in Round 1 of the ESS, looking at four separate elements of the involvement concept: (1) political interest, (2) frequency of engaging in political discussions with friends and family, (3) the personal importance of politics, and (4) the saliency of politics (politics is the most important of the seven life domains). These four indicators are obviously more or less "demanding," and it is not surprising that interest in politics is the least and saliency of politics the most demanding factor. One important finding is that the analyzed countries differ substantially in the degree of political involvement of their citizens, with Southern European countries (Greece, Spain, Italy, and Portugal) the least involved (van Deth, 2008, pp. 196–199). Such differences stimulate the search for macro and contextual factors as explanatory variables. However, "the attempts to account for cross-national differences in involvement with macro-level factors do not seem to be very promising . . . The multi-level models tested here underline the relevance of conventional individual-level factors," such as education, age, gender, and external efficacy beliefs (van Deth, 2008, pp. 204–205, 215–216).

The Citizen, Involvement, Democracy (CID) survey conducted between 1999 and 2002 in

12 European countries (Germany for historical reasons was counted as two countries: West Germany and the area of the former German Democratic Republic) addresses a whole range of sociopolitical participatory activities (Jan van Deth, José Montero, & Anders Westholm, 2007). There also the topic of political involvement is covered, although in a slightly different vein as the analysis is only based on responses to two questions on political interest and political importance. First, four ideal types of citizenship based on democratic theory are developed: a decisionist, a liberal-representative, a participatory, and a unitary type. This typology is then operationalized by cross-tabulating the two involvement items of interest and importance: low importance and low interest make for the decisionist type, low importance and medium interest make for the liberal-representative type, high importance and high interest make for the participatory type, and high importance and low interest make for the unitary type. Whether this typological approach will survive the tides of time is an open question given the fact that the two involvement items are highly correlated, thereby challenging the empirical basis of the above typology. There are nevertheless two findings worth emphasizing: Looking at country clustering, the CID study, too, finds Southern European countries to be the least politicized (Newton & Montero, 2007), and the distinction between the liberal-representative type and the participatory type in terms of antecedents and level of participatory engagement is very clear-cut.

Both involvement studies fall short on one important dimension: changes over time. This is a very interesting problematic because the postwar period can be characterized not the least through the extension of educational systems to supply more and more people with a higher level of formal education, and it is well-known from all participation studies that political and social participation is positively related to higher levels of formal education. Russell Dalton (2008) brings the concept of increasing cognitive mobilization into play. His data for four countries (France, Germany, Great Britain, and the United States) indeed point to an increasing interest in politics from the 1950s onward. However, other analyses looking at levels of political discussion (which is, of course, a more demanding activity) in Europe for the 1973 to 1991 period based on Eurobarometer data no longer show an upward trend. In fact, there is no necessary relationship between rising levels of education and higher levels of political involvement because period effects may also interfere substantially.

Political Participation

Political participation refers simply to activity that is intended to influence government action—either directly by affecting the making or implementation of public policy or indirectly by influencing the selection of people who make those policies. *Voluntary* activity means participation that is not obligatory—no one is forced to volunteer—and that receives no pay or only token financial compensation. This is an operationalization that is shared by a great deal of other, established participation studies. In this operationalization, the target of the activities covered is and remains policymakers, although by including protest activities such as participating in political demonstrations the authors extend the repertoire of activities. At this point, the scholars involved in the CID project propose an extension based on David Easton's classical notion of politics as the authoritative allocation of values. On this basis, political participation is conceptualized to also capture activities by ordinary citizens not targeted at political authorities. The innovation the study proposes is to go beyond voting, party activity, protest activity, and contacting and to include consumer participation as a new category in the form of boycotts—declining to buy certain products—and buycotts—buying certain products, although the concept of politics here appears to be ambiguous and not very precise.

In the following, the various dimensions of political participation are discussed in greater detail.

Voting

In the spirit of liberal democratic theory, encompassing participation in free, equal, and secret political elections is the core legitimating mechanism by which representatives are chosen for a limited period of time to participate, in various functions, in accountable political decision making. Given the practical importance of elections for selecting those actors with the right to legitimately exercise power and, therefore, the enormous public visibility of and interest in elections, it is not surprising that political sociology has early on studied electoral participation—election turnout and voting behavior. However, the early-20th-century studies usually concentrated on single elections, were based on aggregate voting statistics, and could, therefore, not contribute much to the understanding of why individual people voted or abstained in such elections and why they voted for a particular political party. This situation changed significantly with the establishment of the survey method, producing individual data that permitted a much better understanding of electoral participation and, as time went on, of the electoral process and its dynamics at large. Further enrichment came through international collaboration stimulated by American psephologists at the Institute for Social Research at the University of Michigan since the 1960s, which over time helped create worldwide scholarly networks with integrated theoretical approaches.

An excellent documentation of the payoffs from a longitudinal comparative study of turnout is *Voter Turnout and the Dynamics of Electoral Competition in Established Democracies since 1945* (Mark Franklin, 2004). This book addresses three major questions: (1) Why do people vote at all given that according to rational choice theory, individual votes have, for all practical purposes, no influence on the aggregate outcome of elections? (2) Is there a general decline in turnout, and, if so, what can one learn with respect to whether such a decline has happened because of changing civic virtues and political disaffection? (3) What are the major macro- and microfactors that influence variations in turnout within and across countries?

These questions cannot be answered here in any detail. A very important finding is that turnout in established democracies increased between 1950 and 1965 and then has gradually declined until the present period. André Blais (2007) calculates an 8-percentage-point decline for 106 countries and a 9-percentage-point decline for 29 established democracies. The statistically sophisticated analyses by Franklin shed a reliable light on the reasons for this decline in attributing it to three macrodevelopments: (1) changes in the size of the electorate through generational replacement with young cohorts less inclined to vote, (2) lowering of the voting age in many countries in the late 1960s, and (3) the degree and nature of party competition. These are excellent examples of processes that happen at the macrolevel of societies and then trickle down to aspects of individual behavior. This, in turn, indicates that micronotions of declining trust in institutions, decreases in the civic mindedness of citizens, and disaffection with democracy do not contribute to the observed decline.

A different story can be told with respect to differing average levels of turnout for any given country and for within-country variations over time. Regarding levels of turnout, there is a lot of path dependency in the sense that major ad hoc variations in turnout are unlikely, due to stable institutional factors such as electoral laws, registration rules, or compulsory voting. By contrast, within-country turnout changes are greatly affected, especially by the competitiveness of any given election, which makes the "every vote counts" notion more plausible. That this effect is weaker for established than for young cohorts cannot come as a surprise given the fact that socialization into politics takes time and is especially difficult for younger people, for whom a lot of other priorities such as finishing an education and starting a family take precedence. To sum up, then, to understand voting participation along the time dimension requires modeling the complex interaction of individual and systemic factors, requires a longitudinal database, and benefits most strongly from a combination of micro- and macrolevel information.

Other Dimensions of Political Participation

Research on political participation going beyond turnout and party choice started in the 1960s with *Political Participation: How and Why Do People Get Involved in Politics?* (Lester Milbrath, 1965). Milbrath conceptualized political participation in the form of a unidimensional pyramid of electorally based attitudes, with the "easier," more frequent items at the bottom and the more demanding ones toward the top. It is interesting to note that Milbrath already mentioned demonstrations but argued at the time that they "do not fit into the hierarchy of political involvement in the United States" (p. 18). In a later edition of the book, the reach has been extended to also include demonstrations.

A major step forward in the empirical analysis of political participation was a seven-nation study looking at the structure, antecedents, and consequences of political participation (Sidney Verba, Norman Nie, & Jae-On Kim, 1978). In this study, the concept of the unidimensionality of the participatory space was overcome, through factor analysis, by establishing four separate sets of activities: voting, campaign activity, (particularized) contacting of public officials, and communal activity. But this study did not yet cover the domain of protest politics; the authors state explicitly that "our concern is with activities 'within the system'—ways of influencing politics that are generally recognized as legal and legitimate" (Verba & Nie, 1972, p. 3).

The first large comparative survey study that explicitly reached out into the protest dimension was a political action study (Barnes et al., 1979) in eight Western democracies; of those, the Netherlands, (West) Germany, and the United States were revisited, in a panel study, between 1979 and 1981 (Kent Jennings & Jan van Deth, 1989). These studies were triggered by the rise in protest activities, in particular petitions and demonstrations, beginning in the mid-1960s especially in the United States, Western Europe, and Japan. In the history of state building, protest—often violent in nature—was not unusual; however, political-democratic consolidation after World War II emphasized a "civic culture" and not a strongly participatory one (Gabriel Almond & Sidney Verba, 1963) until a protest culture began to build up in the 1960s.

The political meaning of this development in the beginning was not quite clear. A great theoretical and methodological difficulty for a survey study looking at cross sections of the voting-age population was the relative scarcity of activities beyond the electoral realm at the time of the survey. This was the reason for the approach by the political action group—an approach later criticized by other scholars—to not only concentrate on concrete activities but also look at attitudes toward the behavior the group was interested in, resulting in the concept of protest potential. But the major achievement of the project was to redefine the participatory space by adding a dimension of uninstitutionalized participation, thus juxtaposing the two dimensions of conventional and unconventional participation. One of the first pertinent findings was that these two dimensions were positively correlated in all countries, thereby suggesting an increase in the political action repertoire of citizens and not the demise of liberal democracy. It is remarkable that this finding from 1974 was fully corroborated by other studies almost 3 decades later.

The second result was that the most important antecedents of protest potential were high levels of education and young age. In particular, the positive impact of education on protest attitudes squared well with the socioeconomic standard (SES) model developed by Verba and Nie (1972), which emphasized high levels of education, high income, and high social status as pertinent antecedents of political participation. Whether youthfulness was a permanent corollary of protest potential was impossible to assess at that time without the availability of longitudinal data. The second wave of the political action study (Jennings & van Deth, 1989) then corroborated the finding that education is a factor conducive to all modes of potential and real participation. However, the initial findings on the positive role of youthfulness had to be qualified in the sense that young age became less important as one moved from attitude closer to action, thereby pointing to the role of different elements in contextual mobilization. In a more recent study of participation in demonstrations in Belgium, the reduced role of youthfulness in protest participation was not confirmed, while the impact of education remained relevant. What is important to learn from the Belgian study is that the sociostructural and attitudinal participation profiles of demonstrators vary substantially depending on the event that triggered the demonstration.

The juxtaposition of conventional and unconventional participation in political action owed much to the relative scarcity of acts such as petitions, demonstrations, citizen initiatives, and boycotts at the time of the survey. However, in participation research there is now agreement that especially the term *unconventional participation* is no longer meaningful given the fact that through processes of sociopolitical change these acts have become a regular and legitimate part of citizens' action repertoires. To overcome this problem, Norris (2007) proposes to introduce a distinction "between *citizen-oriented* actions, relating mainly to elections and parties, and *cause-oriented* repertoires which focus attention upon specific issues and policy concerns" (p. 639). Edeltraud Roller and Tatjana Rudi (2008) speak of electoral and nonelectoral participation; Kaase prefers the distinction between institutionalized and noninstitutionalized forms of participation. Ronald Inglehart, already in 1977, suggested the terms of *elite-directed* action (related to elections and parties) and *elite-challenging* action. The most recent proposal for terminological innovation comes from the CID group, which, based on a factor analysis of their participation items, finds four participatory dimensions (contacting, party activity, protest activity, consumer participation) and adds voting as the fifth dimension and organizes these types in a fivefold table, distinguishing between mechanisms of influence (exit or voice) and channels of expression (representational or extrarepresentational). These are all terminological-conceptual efforts without greatly changing the dimensional structure of the participatory space known from many previous studies, except for finding a place for a new type of involvement no longer exclusively directed at political authorities: consumer participation measured as buycotts or boycotts. All in all, the famous saying by Mao Zedong, "let a hundred flowers bloom," may be good for culture; in political science, greater continuity in theoretical approaches and empirical work would certainly be of advantage, leading to a cumulative growth of knowledge.

Levels, Antecedents, and Consequences of Political Participation

One of the charms of the liberal-elitist model of democracy is its emphasis on equal participatory rights through general voting. If everyone or at least a large part of the population does indeed exercise the right to vote, it is a logical consequence that no particular individual factors can be detected that influence participation. As soon as one goes beyond the electoral realm, though, the differences between modes of action within and between countries become very large. In the CID study, for example, between 4% and 21% of the citizenry around the year 2000 engaged in at least one act of contacting, between 1% and 6% in a party-related activity, between 1% and 8% in an act of protest, and between 5% and 44% in at least one act of consumer buycott or boycott. A similar picture emerges, although with considerable differences due to the choice of indicators, with regard to both acts of participation and the countries of concern from the analysis of Round 1 of the ESS (Newton & Montero, 2007).

Concentrating first on individual-level factors, the initial SES model has now been replaced by a more sophisticated model: the civic voluntarism model (CVM). In a detailed step-by-step analysis, Verba et al. (1995) go beyond the SES model to analyze the explanatory links between SES and participation. The CVM includes the explanatory dimensions of education and language, income and time, civic skills and political engagement: "Political participation, then, is the result of political engagement *and* resources" (Verba et al., 1995, p. 354). The authors regard the CVM as a powerful instrument to predict political activity in general, and they further argue in favor of the strength and validity of the CVM because it applies to all modes of political activity and finds different weights for its predictors depending on the particular kind of activity to be explained.

As soon as one moves beyond the study of one individual country, however, one has the chance also to look at the impact of institutional (macro) variables and to study the effects of eventual interactions between micro- and macrovariables in a multilevel research design. Two such analyses are of interest here, both with data coming from the Round 1 of the ESS. In the first of these analyses, the authors have collected 22 macroproperties assessing the dimensions of political order, democratic effectiveness, wealth, government expenditure, and population and have regressed those against an encompassing composite country participation score. Of those macro indicators, rule of law (a complex measure provided by the World Bank) has turned out to be the most important variable for influencing levels of conventional political participation, whereas protest is most strongly related to a high level of economic development, according to Newton and Montero. Both findings are well in line with existing theoretical approaches to specify systemic conditions for the emergence and existence of various modes of participation.

The multilevel analysis by Roller and Rudi (2008) starts out with the individual variables of the CVM plus measures of social capital to optimally exploit the potential for the micro explanation of electoral and nonelectoral participation. This analysis first confirms the findings of Verba et al. (1995) that the CVM can be used to explain both forms of participation, although the various components of the model do not equally contribute to explain the two forms. For the multilevel analysis, three macrofactors measured by eight indicators are introduced: (1) socioeconomic modernization, (2) the electoral system, and (3) measures of social capital composed from the aggregation of individual-level indicators. The findings for electoral and nonelectoral participation regarding the impact of systemic variables are, however, disappointing: The share of the total variance explained by contextual factors for electoral participation is just 8% and for nonelectoral participation, an even lower 6%, speaking again for the power of the individual CVM model. Nevertheless, modernization has the expected effect on levels of nonelectoral participation, while political-institutional factors have an impact on levels of electoral participation. These findings square well with the theoretical expectations.

Participatory theories of democracy emphasize the right and the need for citizens to have a direct and not only an indirect say in political decision making. One aspect derived from empirical participation studies, however, has been from the beginning that, other than the vote, citizen participation is biased along the lines of the CVM model; it is the most resourceful and engaged citizens who dominate involvement in acts of participation beyond the vote. Early on this has already created concerns about the fairness of the democratic process (Verba et al., 1978; Verba & Nie, 1972). What if the citizen and group voices heard most loudly in politics are biased against the needs and preferences of the population at large? In *Voice and Equality* (Verba et al., 1995), the authors address this problematic in a very detailed fashion. They conclude,

> According to a liberal model of American democracy, the principal role of citizen participation is to transmit information to public authorities about activists' self-interested objectives. This chapter demonstrated a consistent pattern when it comes to the participatory politics of self-interest. Whether we are considering attitudes on the economy, actual economic circumstances and needs, or opinions on government efforts to assist Blacks or Latinos, the process operates to bias participatory input in the direction of the needs and the preferences of the advantaged. (p. 506)

The question to be addressed next is to what extent the reported findings for the United States also pertain to a broader array of countries. Comparing the effect of education as a proxy for the command of resources for electoral and nonelectoral participation, the findings are very much in line with those for the United States: There is almost no effect of education on electoral participation, and a substantial effect on nonelectoral participation (Roller & Rudi, 2008). Moving to the multilevel analysis, contextual variables do not add much to explain the modes of participation studied. But there is one result that challenges traditional wisdom of political science: It is majority voting and majoritarian political institutions that reduce political inequality for both modes of participation (Roller & Rudi, 2008).

There are at least two weaknesses in participation research that need to be addressed. The first—a minor one—is the increasing use of the Internet as a means of political communication and mobilization, which will require more attention now. The second, more consequential one refers to the fact that inequality of participatory input into the political system does not per se justify the conclusion that the policy output suffers systematically from a similar bias. A further necessary differentiation concerns the levels of the political system to which participatory activities are directed. What will be necessary in the future, according to Norris, will be to assess reliably the relationship between participatory input from various groups of the citizenry and the policy output created by the institutionalized policy process on the various system levels.

There is, incidentally, one aspect in the analyses reported above that permits a friendlier interpretation of the observed inequalities. Since those citizens who are politically the most active are also well embedded in social networks and are highly resourceful, their engagement may help improve the overall quality of the democratic process, a consideration leading back to aspects of deliberative democracy. This is another challenge for future research on political participation.

Changes in Preferences for Different Modes of Political Participation

While participation research in general does not suffer from a paucity of data and findings, there is one aspect that is not covered sufficiently: the longitudinal comparative study of developments in preferences for the various acts and modes of participation (one exception is turnout, but this field profits from the availability of aggregate voting statistics). There are some longitudinal data, though, that relate to items of elite-challenging actions derived from the 1974 political action study and replicated in four waves of the WVS between 1981 and 2000 (for details, see Inglehart & Catterberg, 2003). These data point to a noticeable increase over the past 3 decades in elite-challenging action in the eight political action countries and France—all Western democracies—an increase the authors attribute to an ongoing process of economic modernization. Unfortunately, the data situation does not permit an analysis of possible replacement effects between the various dimensions of political engagement. In particular, it would have been very interesting to see whether nonelectoral activities may have grown at the expense of electoral activities.

Social Participation

Other than political participation, social participation has not yet achieved the status of a well-defined social science subfield. Analogous to political participation, social participation can be defined as all activities by individual citizens in social contexts going beyond the inner circle of family and friendship relations that are not primarily directed toward influencing political outcomes. As such, social participation constitutes a core element of civil society. For a long time, in social research, the core representation of civil society was voluntary associations integrating individuals into the intermediary structures of society—the mesolevel. For example, the study of membership in organizations such as churches and trade unions was a normal part of electoral research under the assumption that social cleavages had been translated into party systems through the constant interaction of group and party elites. However, the major breakthrough in making social participation an independent field of study—even if closely related to concerns about democratic governance—came through the study *Making Democracy Work* (Robert Putnam, 1993), which looked at conditions favoring or hindering the overall administrative and economic performance of Italian regions. In pointing especially to the organizational underpinning of high economic performance through established cultural and economic groups working together in an environment of mutual trust and solidarity, Putnam employed the term *social capital* (a term already previously used by Pierre Bourdieu and, later, James Coleman) to characterize the reasons for the diversity of regional performance.

The concept of social capital became a major incentive for political science when this was related to the observation that in the United States a decline in social bonding was occurring that—recalling the Tocquevillean tradition of American democracy—was a challenge to American democracy and democracy at large. Social capital can be regarded as a macroproperty of societies in the sense of systemic capital. The concept, however, has in the meantime also been transferred to microresearch through surveys. While there is no standard operationalization in empirical research, there is agreement that social capital has three major dimensions: (1) the degree to which people trust each other, (2) the acceptance of norms of reciprocity as cultural elements of social capital, and (3) the involvement in social networks, be it through voluntary associations or through other less formal regular contacts.

With regard to longitudinal comparative data sets reliably measuring social capital, the situation is not fully satisfactory, although information accumulated from a variety of data sources indicates that a general decline in social capital cannot be observed. In another study it is argued that elite-challenging participation is at least as important a constituent of social capital as is membership in voluntary associations. Longitudinal data from the WVS for 12 postindustrial societies support the argument that there is no measurable decrease in overall organizational membership between 1980 and 2000, although within this overall category sociotropic organizations have gained in membership, whereas membership in traditional organizations (e.g., trade unions) has slightly decreased or remained constant. Particularly interesting in the context of participation research, though, is the finding that good governance is much more strongly related to the level of elite-challenging action than to the level of associational membership.

One step away from the link between social participation and social capital is taken in the context of the CID study with the new concept of small-scale democracy in the sense of the potential option for citizens to control their own, personal life situation. There, small-scale (local) democracy is considered to be an important field because it offers insights into the overall state of any given society, including aspects of democratic governance; looks at trade-offs between small-scale and large-scale democracy; and pursues questions important also in social capital and participatory theory terms to what extent involvement in small-scale democracy activities enhances a sense of identity, self-esteem, and personal skills that may have payoffs also for large-scale democracy. To answer these questions, a broad roster of incentives, actions, and action consequences for the three fields of education, health care, and working life is looked at, fields that are highly relevant for the citizens' daily lives. It will remain to be seen whether along those lines in the future a new field of systematic research will develop given the finding that involvement in the three domains is quite frequent across the CID countries. Such efforts may be encouraged by the fact that participation in small-scale democracies and in large-scale democracies, especially in the fields of contacting and consumer participation, according to the CID data, are positively correlated. Thus, the conclusion may be justified that in contemporary societies social and political participation are indeed fields related by an underlying general tendency to become involved.

PARTICIPATION, CONTENTIOUS

In the most conventional usage, *contentious participation* refers to forms of political participation that employ nonconventional, confrontational means of action in expressing collective interests, such as demonstrations, strikes, and boycotts. Contentious participation here represents an alternative to institutionalized channels of participation, such as election, interest group activities, and political parties. However, a growing number of scholars have been starting to use the concept of contentious participation to illustrate the contentious nature inherent in all forms of political action, which range from peaceful acts such as voting and lobbying to disruptive and oftentimes violent protest. This latter view highlights aspects of continuity in what have been conventionally understood to be categorically different forms of participation.

This changing interpretation of contentious participation mirrors the change in how the literature has come to understand protests and/or social movements. Previously, a social movement was commonly understood to be an action form carried out by outsiders of a political establishment—that is, those who lack power and resource and those who do not have regular access to the decision-making process. Those inside the system, many believed, would seek reform or policy change by expressing their voices through interest groups or political parties. Gradually, however, a new framework arose that drew attention to the fuzzy boundary dividing the two and to how social movements and institutionalized forms of participation are not mutually exclusive but complementary.

This latter view is predicated on the idea that, in essence, the basic principles of contentious participation and established forms of participatory institutions, such as elections, are not dissimilar. In fact, many established political parties, such as the Social Democratic parties in Western Europe, have had historical roots in social movements. Nowadays, many social movement groups employ conventional forms of action (e.g., lobbying and petitioning) in conjunction with their typical street repertoire, while many interest groups organize large public demonstrations to add leverage to their lobbying effort. They may look different on the surface, but in essence both contentious and institutionalized participation aim at getting the voices of the public to be heard and to be taken seriously by decision makers.

It seems as if there is a growing consensus over the overlap between contentious and institutionalized methods of participation. Still, it is important to note that not all societies are equipped with the same levels of institutionalized channels of participation. As a result, contentious participation may take different forms and carry different meanings across varying contexts. This is because forms of contentious participation are often mirror images of the political environment in which they operate.

Varying Contexts of Contentious Participation

In authoritarian regimes where channels of participation barely exist, any attempts at expressing a collective voice in the public arena are often driven underground. The violent forms many social movements take under these circumstances reflect the highly exclusive and repressive nature of authoritarian regimes. The risks are high, but when a social movement mobilizes significant support and grows stronger, it often leads to democratic change that opens up opportunity for more equal and broader participation. This was the case in South Africa and a number of Latin American countries in the 1980s.

Nowadays, many authoritarian regimes offer limited political space, if only because they cannot command absolute control over the flow of information and movement of people. This is particularly so in authoritarian regimes with a relatively large economy and a population that is relatively highly educated. In these contexts, ordinary people try to take advantage of the limited political spaces in various attempts to voice their concerns and influence important policies. For example, women, students, teachers, and workers in Iran have created organizations and have worked with sympathetic allies in various public sectors to defend and to proactively claim new rights since the death of the charismatic leader Khomeini in 1989, which led to small cracks within the ruling elites. In China, since the late 1990s, workers and peasants have also been taking advantage of the limited openings made available by the post-Maoist reforms, which allowed them to lodge complaints to higher level officials and stage various forms of collective action to draw the government's attention to local corruption and the hardships caused by the detrimental forces of the market economy.

In either case, participatory efforts were highly contentious but not to the extent of that of the anti-apartheid movement in South Africa. At the same time, these efforts were not submissive supplications asking the power holder for benign policies. On the contrary, they were meticulously designed campaigns to maximize the available political resources and were aimed at influencing the formation of crucial policies germane to their lives amid adverse political environments. These examples serve as the archetypes of contentious participation serving as an alternative to institutionalized channels, if only because such channels are highly limited. They also show that popular mobilization and institutionalized channels are not mutually exclusive means of political participation. This becomes more evident in Western democracies.

One of the characteristics of liberal democracy is the institutionalization of conflict through guaranteeing various rights and access points to decision making. Citizens in liberal democracies are guaranteed the rights to choose their own leaders or run for office through elections, form associations that serve as an organizational vehicle for pursuing the common interests of like-minded fellows, and have the right to freely express their opinions through various venues, including, but not limited to, publications, the media, and the Internet. Contentious forms of participation, such as demonstration, are also protected by law and are also considered legitimate means of political participation as a way to publicly express political views. With the various means of political participation available, explicitly contentious forms of participation, often the only means of participation in more restricted political systems, are but one among the many options in liberal democracies.

As a result, various forms of contentious participation are often combined with the routine working of formal institutions, and a greater overlap between contentious and institutionalized politics is observed. For example, in lobbying and petitioning their representatives in seeking their interests, many interest groups organize large public demonstrations to display their commitment and power and pressure decision makers to take their demands seriously. Likewise, radical activist groups may also adopt interest group tactics and engage in lobbying or petitioning while mobilizing thousands of people on the street. As these action patterns become instituted, solid connections between political parties and social movements often emerge. In the United States, the steady alliance between the Democratic Party and various social movements, including the civil rights movement, the women's movement, and the environmental movement, and between the Republican Party and the evangelical movement and prolife movements provide but a few examples. In many similar cases, various social groups and political parties enter an exchange relationship in which social groups provide the parties with votes and funds while the parties deliver on the policies these social groups favor.

The institutional devices and patterns of political participation in liberal democracies are meant to absorb and neutralize the potentially harmful impacts of large-scale conflicts within the institutional setting by providing various ways for disgruntled groups to express their grievances and political demands. However, the use of institutional channels does not necessarily mean that the processes are peaceful and without conflict.

Contentious Nature of Participation

Political participation is necessarily a contentious process because there are competing interests in any society and any claim made in public will bear on someone else's interest. It is extremely difficult to have a policy that everyone can agree on, and legislation often becomes a focal point of contention. The landmark U.S. Supreme Court ruling in *Roe v. Wade* acknowledging partial constitutional rights for abortion in 1973 and the subsequent contention over the issue of abortion in the United States represent a prime example. Despite the highly institutionalized court processes, the ruling was interpreted by many as a partial result of the strenuous campaigns by women activists who had voiced their demands for women's right to make decisions concerning their own bodies. This triggered a countermovement against abortion and ignited a new cycle of contention on the issue. The debate over the issue took place in various public forums and in Congress but often involved disruptive and violent clashes on the streets as well. When social groups of competing convictions make participatory efforts at the same time, the process can turn highly contentious.

Similarly, despite the original intention to channel participation in a peaceful and orderly way, elections too often become focal points of conflict, especially when many hold suspicion over the fairness of the process. This was the case in Kenya after the election in late 2007, where unprecedented violence followed accusations of a rigged election. Many nascent democracies have suffered from damaging conflicts related to elections, but contest over electoral results may also emerge in established democracies, as was the case in the United States after the presidential elections in 2000. The specific ways in which contention over electoral results materialized in the United States and in Kenya may have been different, but they both show how ostensibly peaceful participatory mechanisms may be highly contentious in nature.

Another aspect that renders the nature of participation inherently contentious lies in the nature of democratic institutions, which are inclusive and exclusive at the same time. However inclusive they are at one point in time, democratic institutions tend to favor some actors over others and leave unheard some voices. In addition, as a society moves toward progress in democratic inclusion, there will always emerge new groups that will demand serious attention. The expansion of suffrage offers a good example. The expansion of voting rights to all males in Western Europe came only as a result of unrelenting contentious challenges to the order by those who were initially excluded, namely, the workers. When it happened, it left out women, who then started to organize campaigns to claim their rights. When women were allowed suffrage in most Western democracies by the early 19th century, many found that there were serious barriers for participation among groups along the lines of race, ethnicity, and sexual orientation. Even to this day, many of these groups engage in contentious politics, calling for an end to discrimination and for full participation in many parts of the Western world and beyond. Participation invites more participation, and whenever this happens, it first takes the form of a contentious challenge to the status quo.

PARTIES

The word *party* refers to one of the oldest concepts used in political science. Depending on the era chosen to determine the beginning of scientific analysis of political facts in the modern sense—for example, if one goes back to Arthur Bentley, James Bryce, Robert Lowell, or André Siegfried, that is, to the beginning of the 20th century—the concept of party can be older than that of political science. Its use in historical, philosophical, or polemical vocabulary appeared in the 17th century with the memoirs of Cardinal de Retz in France, Viscount Bolingbroke in England, and, above all, David Hume, who in the early 18th century initiated what was to become the analysis of parties. Nonetheless, the word has been used since the Middle Ages to refer to the opposite sides in a civil war, for example, York and Lancaster during the War of the Roses, and consequently has a strong connotation of conflict. Even the etymology of the word *party* is telling: *parti* in French, *Partei* in German, *partido* in Spanish, and even *partia* in Russian and Polish and in many other languages—derived from the verb *partir*, which in medieval French meant to split into parts or divide. All European languages, including Slavic ones that use other terms, such as *strana* in Czech or *stanka* in Croat or Serbian, use words meaning "side." The idea is the same: to take sides or to choose one's side, or one's camp, in a political conflict. The definitions of the concept of party are, therefore, older and more numerous than for the concept of social class: There are more than 100 of them, provided by authors from Edmund Burke to Alan Ware, including Leon Epstein, Joseph LaPalombara, and Myron Weiner. All definitions can be grouped into three broad categories, which are sometimes combined. First of all, following Burke, parties can be defined according to the ideas that they convey. Then, following Max Weber, Robert Michels, and Maurice Duverger, one can define parties as organizations. Finally, the trend since the end of the 20th century has been to use the criterion of elections and the existence of a representative, or at least democratic, regime. A remark attributed to Max Weber—"parties are the children of democracy and universal suffrage"—is put forward to support this thesis. One should not, nevertheless, forget the classic definition given during the reign of George III by Edmund Burke: "A party is a body of men united for promoting by their joint endeavors the national interest upon some particular principle in which they are all agreed." This definition remains the best, even if the subsequent evolution of political systems has made it imprecise, as it is now incomplete. Here, we propose to use the term in the following way:

> A party is an organization of individuals engaged in collective action, in order to mobilize as many individuals as possible against other equally mobilized individuals in order to accede, either alone or in coalition, to the exercise of government functions. This engagement and this claim for power are justified by a particular conception of the national interest.

Below, this entry first discusses this definition in greater detail, next it turns to the historical origins and conceptualization of the concept in the European context, and, finally, it discusses contemporary forms of party organization and recent developments.

Definitional Elements

The above definition contains four major elements:

1. Parties are the product of a collective organized action that is permanent and continuous in time. It is therefore intended to outlive the action of its founders and continue throughout history as long as it is able to mobilize the supporters that keep it alive. As an institution, parties present characteristics common to all organizations studied by organizational theory. Parties are in the category of association-type organizations—that is, based on voluntary membership and the choice of the actors: members, militants, elected representatives, and

leaders. If membership is automatically granted on the basis of birth, family, or clan, it is not a party.

2. Any organization is structured according to an objective, which, in the case of a party, is to accede to the different functions of government: national, regional, and local. Parties can exist that are limited to one or more of these levels of government, as is often the case in Canada, for example. A political organization that does not strive for power but merely for influence is not a party.

3. Claiming power is not an end in itself; it is justified for the sake of the national interest that the party intends to defend or promote depending on the particular conception of the actors involved. Claiming power in the name of a particular conception of the national interest constitutes the raison d'être of a party and a condition sine qua non for a political organization to be a party.

4. The way to reach the objective of the party to which its organization is rationally conditioned is the mobilization of as many individuals as possible. The most frequently used means is electoral mobilization, and most parties were born with the establishment of more or less competitive representative political systems.

Democratization whether gradual (e.g., United Kingdom [UK]) or brutal (e.g., France) gave rise to the development of parties. By contrast, in authoritarian systems, nonelectoral modes of organization and mobilization exist. These can be peaceful (e.g., meetings, demonstrations, strikes, and petitions, e.g., Chartism in Great Britain, Solidarity in Poland, and the Civic Forum in former Czechoslovakia) or violent (e.g., uprisings, revolutions). The common objective shared by electoral mobilization and other forms of party mobilization is the need to appeal to the popular masses, that is, to strive for popular support, according to LaPalombara and Weiner. Partisan mobilization is carried out *against* individuals who are also organized with a view to acceding to government in the name of a different, often opposite, conception of national interest. As we have seen, *party* means "part" (division) and therefore implies conflict. Jean Blondel (1978) sees behind every party "a protracted social conflict."

As a corollary, both conflict and competition are essential:

1. It can be said that there are no parties without conflicts; they always convey either a current, active conflict of which they are agents or a past conflict of which they are witnesses, for example, the opposition between Fianna Fail and Fine Gael in Ireland, which corresponds historically to the struggle between anti-Treaty and anti–Free State Republicans in the bloody civil war of 1921 to 1922. One of the major aspects of the seminal contribution by Seymour Martin Lipset and Stein Rokkan (1967) is to have assigned to parties the function that summarizes all the others: agents of conflict and instruments of integration. The dialectic is the following: By expressing conflict, parties thus allow negotiation and contribute at the end of a more or less long evolution to pacifying political life.

2. Conflict and integration as well as the name *party*—or *part*—imply ipso facto plurality and competition between parties. The term *parties* means a system of parties and consequently that there are at least two of them. A single party is a contradiction in terms: It is impossible to be at the same time a single entity and a part. This obvious fact was stated at the beginning of the last century by Max Weber. The contradictory concept of a single party or a one-party system was nonetheless used at the time of the Cold War by eminent political scientists such as Gabriel Almond and Jean Blondel. The latter speaks of a "party of mobilization," while Almond distinguishes between parties that are "one-party pluralistic," modeled on the Institutional Revolutionary Party (Partido Revolucionario Institucional, PRI) in Mexico before democratization, and those that are "one-party revolutionary, centralizing." While contesting the logical pertinence of the concept of one-party system, Giovanni Sartori nonetheless admits this category as the first level of his seven-rank typology.

To clarify this debate, which has retained its historical pertinence, it is necessary to distinguish two totally different situations. On the one hand, there is the situation Max Weber described with the example of the Guelph party (parte Guelfa) in the medieval republic of Florence, where one party eliminated its rivals to become incorporated in the apparatus of the state—the party changes and ceases to be a political party. It then falls under some other sociological concept. Raymond Aron, a disciple of Weber, applies this approach to the cases of fascism, Nazism, and Stalinism and speaks of "monopolistic parties," which as soon as they come to power hasten to eliminate all the other parties and thus change their nature. Monopolistic parties that had changed their nature by eliminating their rivals have in most cases gone back to their original nature with the loss of power and the return to democracy. Thus today, Kuo Min Tang in Taiwan alternated in government with the independence movement, while the PRI in Mexico and the Communist Party in the Russian Federation embody the loyal opposition. Similarly, communist parties in Eastern Europe have been able to reconvert themselves.

On the other hand, there are so-called parties founded after a military or nonmilitary clique has taken over power. These are sham parties, such as those of certain totalitarian regimes formed to control the population, for example, the Popular Movement of Zaire at the time of President Mobutu (1967–1997). With the changes of regime and the return to democratic forms of power, these so-called single parties disappeared with the regimes that created them. This was not the case, however, with António de Oliveira Salazar's National Union in Portugal or the National Movement created by Francisco Franco to support his dictatorship in Spain.

History

The history of the appearance and development of parties corresponds to that of the scientific study of the phenomenon. Lipset and Rokkan note four thresholds in the evolution of a party: legitimization, incorporation, representation, and majority power. One can apply these to every party and to every stage of the party systems.

Parties were not always considered to be legitimate. As a sign of conflict in societies seeking balance and harmony, they were associated with a form of evil. Political modernity, which developed with the disintegration of the feudal order in the Renaissance, was embodied in absolutist states, and parties only emerged in times of crisis and during civil or religious wars. Even with the establishment of a representative regime, the party was first perceived as something that divides and was equated with a faction. The timing of the legitimization of parties, the very idea of a party system, depends on the country. Thus, three men of action who were also political thinkers reflect the same perplexity toward parties in three countries during three different periods: Viscount Bolingbroke in early-18th-century England, James Madison at the time of the American Revolution, and Charles de Gaulle in France in the mid-20th century. All three of them in their own way were deeply concerned about parties and their struggles and advocated national unity against all the divisions, yet they finally became involved in the struggles of the parties themselves. As a necessary evil, the party is always the party of the other, and the temptation to find other democratic paths was present for a long time but was doomed to failure. This was the case of the "era of good feelings" desired by President James Monroe after 1816 to put an end to the opposition between the Federalists and the Republican–Democrats. For the United States, the American historian Richard Hofstadter situates the turning point between 1780 and 1840, after which the idea of legitimate opposition between parties was taken for granted. In Great Britain, the phenomenon appears earlier, and the writings of Hume bear witness to this fact, but here it remains within the elite, whereas in the United States it concerned the masses. The distinction between parties and factions is the determining criterion, and it is with Hume that this was clearly established.

The origin of parties and their existence before a representative regime depends on the definition. If we retain the three proposed criteria—a particular conception of the national interest, free organization, and mobilization—the Guelphs (13th century) were a party, even if their means of action were different from those of modern parties. Their fight against the Ghibellines, however, degenerated into a struggle between factions. The Cavaliers and the Roundheads, the Whigs and the Tories were also parties. Moreover, the process is not linear, and in the oligarchy that existed in England in the 18th century, as Sir Lewis Namier remarks, during the reign of George III a large number of members of parliament (MPs) were neither Whigs nor Tories. By contrast, "parties" at the time of the Ancient

Roman republic or those evoked by Niccolò Machiavelli in Florence at the time of the Medicis, and that existed in numerous other Italian cities during the Renaissance, were factions and family clans.

When they were still badly organized, parties were discovered and studied by social scientists at first as *carriers of ideas*. Then, with the extension of the electoral franchise and civil rights, they were studied as *organizations*: James Bryce, Robert Michels, Moisey Ostrogorsky, and, above all, Max Weber laid down the foundations in the late 19th and early 20th centuries. Finally, the study of parties as the mobilization *of actors* began in the 20th century with Siegfried on electoral geography and Duverger on circles of participation in partisan activity. It branched out in many directions—militants, members, sympathizers, and voters—and was favored by the development of the various forms of sociological survey research, from opinion polls to the deep analyses of political attitudes. These divergent approaches are necessary and have to converge if one is to understand a given political party, a national system of parties, or, in a comparative manner, the classification of parties.

Raison d'Être and Identity of Parties

Devoted to the defense and the promotion of a particular conception of the national interest in Burke's sense, many 19th- and 20th-century historians likened parties to the great schools of political thought: conservatism, liberalism, socialism, Christian democracy, communism, fascism, and so on. The links between the two phenomena are obvious except that parties, agents of conflict but also instruments of integration, are led in majority governments to betray their initial ambition and adapt themselves to the constraints of the exercise of power, to become institutionalized, and to change their program and sometimes their ideology in order to become catchall parties, according to Otto Kirchheimer. One must, therefore, observe the social interests that are expressed through these ideas and justify the "particular conceptions of national interest."

Socioeconomic Bases

Duverger saw in parties the translation of two successive class struggles: the conflict between the land-owning nobility, expressed by the conservatives, and the capitalist bourgeoisie, represented by the liberals, on the one hand, and that between the bourgeoisie and the proletariat, organized by the socialists, social democrats, and labor parties, on the other. Liberals were confronted with the dilemma whether to ally themselves with their former conservative enemies against the peril represented by workers' parties or to accept alliances with the social democrats, which was the case with the so-called radical parties. Duverger notes that some Christian Democratic parties in Catholic Europe or agrarian ones in some Nordic countries remained outside these class struggles on which the dualism between left and right is founded. It is the superimposition of dualisms that generates multiparty systems. Duverger thinks that using the Anglo-American majority vote—"first past the post"—facilitates the establishment of a two-party system opposing conservative liberals and social democrats.

The same inspiration can be found in Lipset, who in *Political Man* sees in parties the expression of social classes of which, for him, there are three: (1) the upper class, supported by the Church, which is expressed in conservative parties; (2) the secular middle class, expressed in liberal parties; and (3) the working class, expressed in labor, socialist, and social-democratic parties. The right, center, and left form a democratic spectrum to which corresponds an antidemocratic, extremist spectrum, including the communist extreme left and the authoritarian monarchist, clerical, and reactionary extreme right as the expression of a refusal of change by a threatened upper class, of which António Salazar in Portugal, Miklos Horthy in Hungary, Engelbert Dollfuss in Austria, and Francisco Franco in Spain were illustrations. The originality of Lipset is to show that the middle class also engendered an extreme center with Italian fascism and German Nazism, which was opposed to the extreme left and extreme right. Today, the concept of extreme center is enlightening in the description of parties such as the Freedom Party (Freiheitliche Partei Österreichs, FPÖ) in Austria or the National Front (Front National, FN) in France and in the definition of a clear relationship between fascism and the National Alliance (Alleanza Nazionale, AN) in Italy. It is more precise and more scientific than that of populism.

Lipset attenuated his position somewhat by remarking that certain traditional parties, such as Catholic parties, combine cultural conservatism with socioeconomic reformism and that new forces such as the green parties mix cultural liberalism and anti-industrialist reaction, thus constituting a neo-bourgeois ideology.

The approach exposed in *Political Man* remains the most fruitful but leaves aside the existence of interclass parties, which are nonetheless not catch-all parties. The most fitting example was the Italian Christian Democrats (Democrazia Christiana, DC), backed by a workers' union, the Italian Confederation of Trade Unions (Confederazione Italiana Sindacati Lavoratori, CISL), but there were also certain employers grouping people with nothing in common other than the defense of the interests and values of the Catholic community. This approach included as many as nine tendencies (*correnti*) spreading from the pro-Marxist left to the traditionalist extreme right. This party, which was born out of antifascist resistance and anticommunism after World War II, broke up in an interesting way in the 1990s: The right was recovered by Silvio Berlusconi; its center right refused to join the people's freedom party People of Liberty (Il Populo della Libertà, PDL), created by Berlusconi in 2009; while its center-left and left merged with the former members of the Italian Communist Party (Partito Comunista Italiano, PCI) to found the Democratic Party in 2008. In fact, the DC met the same fate as the French Popular Republican Movement (Mouvement Républicain Populaire, MRP) 30 years earlier. The latter was also formed during the resistance and dispersed its forces to the right, the center, and the left. The Christian Democratic parties of the Benelux countries and Switzerland correspond to the same model as the Italian one. The same can be said about the German Zentrum party from 1871 to 1933 but not for the German Christian Democratic Union (Christlich Demokratische Union Deutschlands, CDU), which is no more clerical than Nicolas Sarkozy's Union for a Popular Movement (Union pour un movement populaire, UMP) in France. By contrast, in Bavaria, the Christian Social Union (Christlich-Soziale Union in Bayern, CSU) belonged to the tradition of classic, clerical conservatism, but clericalism also became contested within the party itself.

Historical Cleavages

Finally—if only to understand multiparty systems with more than six parties—it is necessary to use a multidimensional space as in the systematic model of the origin of parties in Europe set up by Lipset and Rokkan. For them, cleavages are neither ephemeral oppositions nor contingent divisions but structural effects resulting from the political translation of profound traumatic changes that affected the history of a country or a group of countries. These conflicting effects are exerted along two axes: the functional axis and the territorial-cultural axis. In the particular case of Europe, originally marked by Catholic Christianity, two revolutions—national revolutions and the Industrial Revolution—engendered four cleavages. The former broke the unity between countries born of the Reformation and those marked by the Catholic Counter-Reformation. It engendered two cleavages: (1) along the unitary center/periphery axis, opposing modernization to the resistance of the subjected cultures from the provinces and peripheral areas, and (2) along the functional axis of Church versus State, opposing the modernizing, secular elite to the defense of the interests of the Church in the fields of education and values. The Industrial Revolution generated the following cleavages: (3) along the territorial axis, primary versus secondary economy opposing landed interests to the rising class of industrial entrepreneurs, and (4) along the functional axis of employers versus owners, opposing the interests of property, capital, and business to the labor union movement, which defended the interests of wage earners.

These four cleavages are conveyed in the short term through the issues that oppose the parties and in the long term through the party systems. In Catholic and Protestant Europe on both sides of each cleavage, there arose, according to the country, families of parties that became established with the extension of suffrage and democratization. Since then, these cleavage-based party systems had become "frozen" for a considerable time. Depending on the period, one may add that a cleavage can dominate electoral parliamentary debate: Church versus State in Catholic countries in the 19th century and the primary versus secondary sector in Sweden at the same time, and the center versus periphery cleavage in the Basque country or in Ireland. However, the most important cleavage in

Western Europe since the crisis of 1929, and even before, was owners versus workers, which, apart from the two cases cited previously, forms the axis of the most frequent parliamentary constellations.

At the beginning of the 21st century, a majority of parties are based on the functional-economic owners versus workers cleavage. In other words, on the one hand, there are *parties for the defense of owners* that have formal and/or informal links with employers, companies, and the business community in general but with a much broader electoral base that includes the middle classes. This family unites former, previously opposed parties such as conservatives and liberals in Protestant countries, Switzerland, and the Benelux countries. It also includes parties of other origins from former Christian Democratic groups such as CDU/CSU in Germany or former nationalists such as UMP (this party includes former Gaullists, conservatives, and liberals), as well as new parties such as the Social Democratic Party (Partido Social Democrata, PSD) in Portugal, the post-Franco People's Party (Partido Popular) in Spain, and Forward Italy (Forza Italia), which merged with the postfascist AN to form the people's freedom party, PDL, a unified right-wing party.

On the other hand, since the 19th century, there has been a systematic development of *parties for the defense of workers*, which, historically, constitute the labor movement and maintain special links with labor unions. Their voters are salaried employees, mainly working class but also some white-collar workers and civil servants. They were born in the wake of the Industrial Revolution from the convergence of four forces: two ideologies, (1) the Jacobinism of the French Revolution and radical philosophy and (2) social Christianity in Protestant countries, and two forms of political organization, (3) the labor unions and cooperative movements and (4) the internationalism of Karl Marx, Friedrich Engels, and their disciples. The combination of these four ingredients, in variable proportions depending on the country, created three genetic models in the sense of Angelo Panebianco, which developed into four traditions that are very visible today:

1. The Labour tradition, born out of the failure of Chartism, was translated into parties of ideological and religious pluralism, dominated organically by the labor unions in which, ideologically, social Christianity is slightly more important than radicalism, whereas the Socialist International and Marxism are in minority or even marginal.

2. The social-democratic tradition, in which trade unionism emanated from the party, was born in Germany and dominated by the Socialist International and Marxism. These parties have kept a controlled and solid organization that has particularly subsisted in the Swedish Social Democratic Party (Sveriges socialdemokratiska arbetareparti, SAP) and in the Austrian SPÖ.

3. The social-democratic tradition of the French Revolution of 1848 was marked by Jacobin radicalism and the republican and anticlerical struggle. These parties from the start came up against the distrust of the anarcho-syndicalist movement, which was hostile to any collaboration with parties. The anarcho-syndicalists combined theoretical anarchism founded on the rejection of the state and electoral politics, advocating a mutual benefits system, self-management, and federalism with practical bread-and-butter reformism within companies. Moreover, the union movement was divided by a new Christian labor movement that was equally wary of party politics and a communist labor movement that would ultimately supplant anarcho-syndicalism. The socialist-democratic tradition became embodied in weaker, intellectual parties and was neither controlling the labor movement nor being controlled by it. These socialist parties—French, Italian, and Spanish—would practice ideological extremism and give more than their due to Marxism while practicing shortsighted reformism.

4. The communist tradition is, in fact, a variant of the social democracy that was implanted in France and Italy, where it failed. It is a kind of radical social democracy that has accentuated its specific features: orthodox Marxism; a centralized organization adapted to the political struggle in authoritarian regimes ("democratic centralism"); control over the unions, which had become the "driving belts"; and, above all, the primacy of the Socialist International. With the Komintern, communist parties were the only party with an international dimension, devoted for many years to the interests of the USSR and presented under Joseph Stalin as the fatherland of socialism. The social-democratic sociology of communist parties favored their

incorporation into party systems, their unofficial social democratization including membership of the Socialist International.

The PCI, the Italian Communist Party, was the first to take this path, soon to be joined with the dissolution of the former USSR by the Hungarians, Bulgarians, and Lithuanians. The development of a Marxism sui generis adapted to Italy and the West thanks to Antonio Gramsci and to the strategic intelligence and political savoir faire of its leaders—Palmiro Togliatti and Enrico Berlinguer—anxious to promote "a national path toward socialism" helped this transformation of the PCI first into the Democratic Party of the Left (Partito Democratico della Sinistra, PDS) and then into the Democrats of the Left (Democratici di Sinistra, DS) and the Democratic Party (Partito Democratico, or PD) with the gradual help of the Christian Democrats. The French Communist Party (Parti Communiste Français, PCF) remained Stalinist for a long time but was headed by leaders of no great stature—Maurice Thorez and Georges Marchais—and did not take the opportunity to return to social democracy. In the Scandinavian countries, where social democracy is strong, the extreme left is also of communist origin, with the Danish Socialist People's Party (Socialistisk Folkeparti, SF), which broke off links with Moscow in 1956, and in Sweden the Communist Party became the Left Party. The situation has been the same in Finland since the end of the Soviet Union. By contrast, the left-wing socialists in Norway are a dissident movement of the Labor Party. The case of the Left (*Die Linke*) in Germany is more ambiguous: The former Communist Party of East Germany with its strong organization merged with social-democratic dissidents from the Social Democratic Party of Germany (Sozialdemokratische Partei Deutschlands, SPD). The most original of all parties situated "on the left of the left" is the Dutch Socialist Party (Socialistische Partij, SP), an anticapitalist protest party composed of former Maoists, which can win up to 10% of the votes.

Center–Periphery Cleavages

Outside the dominant socioeconomic cleavage, the other important cleavage is center–periphery, composed of parties for territorial defense, which is divided into two opposed families. On the one hand, there are the parties of centralized state nationalism corresponding historically to a unifying, imperialistic state nationalism that is economically protectionist and that, socially, carries policies that are favorable to a protective state. One is reminded of Bismarckism in Germany, which during the Weimar Republic became the German National People's Party (Deutschnationale Volkspartei, DNVP), and of Bonapartism in France, then the republican current from which Gaullism originated. These parties, concerned about the authority of the State, are inclined to deviate toward authoritarianism and have engendered some extreme versions: the total state that identifies nation, state, and leader in fascist totalitarianism in Italy and Nazism in Germany and has been emulated by many others. These extreme-center parties are wrongly assimilated to the extreme right and characteristically attract not only voters from the working class but also leaders from left-wing parties, such as Benito Mussolini, a former socialist in charge of the newspaper *Avanti*; Jacques Doriot, a former communist deputy and the founder of the French Popular Party (Parti Populaire Français, PPF); as well as the less conventional Oswald Mosley, a former Labor MP and the founder of the British Union of Fascists. World War II, with its cortege of horror and crimes against humanity, has discredited fascism, which is no longer portrayed as such, except by marginal groups that are not considered as parties.

Nevertheless, the ideological ground has remained fertile and able to produce analogous parties that out of caution tone down their discourse. Globalization, immigration, and the crisis since the end of the 1970s have favored the rebirth of postfascism in places where a previous tradition existed: the National Front of Jean-Marie Le Pen in France, the FPÖ (heir of the Pan-Germanic nationalist current) in Austria, and in some Länder in Germany, the National Democratic Party (Nationaldemokratische Partei Deutschlands, NPD). We may add in Flanders Vlaams Belang, the new name of Vlaams Blok, heir of the pro-Nazi Flemish National Union (Vlaamsch Nationaal Verbond, VNV), which existed between the two World Wars. In other countries where there was no fascist tradition before, new movements have emerged with a similar sociology and a less articulate discourse than fascism. Their creed resides in a radical xenophobia enhanced since the beginning of the 21st century by anti-Islamism. The longest lasting case is the Danish People's Party (Dansk Folkeparti, DF), but the most spectacular is to be found in the Netherlands. The fact that the founder and leader of the DF is a woman—Pia Kjaersgaard—and her Dutch counterpart in the Pim Fortuyn List (Lijst Pim Fortuyn, LPF) was a millionaire and a militant homosexual (he was assassinated by an animal rights activist) constitutes a break with fascism. However, it is a mistake to consider them as new parties: Their organization is new, yet the issues that fuel them—xenophobia and racism—have political roots that go back to the 19th century. Whether moderate or extremist, democratic or authoritarian, state-nationalist parties are—or were—authentic catchall parties.

The historical opponents of centralism are parties for the defense of the periphery, sometimes regionalist and federalist, sometimes nationalist and separatist. They are the expression of ethnic or linguistic minorities and have a territory that is quite easily definable. Their existence is not recent and most often corresponds to countries with an imperial structure: Austria–Hungary before 1919 had many such parties. Today, the oldest party to defend the periphery is the Basque Nationalist Party (Partido Nacionalista Vasco, PNV), founded in 1895, which identified with the cause of the language, culture, and democratic traditions of the Basque country, where it is the main party. The Swedish Popular Party in Finland is also an old organization—early 20th century—that holds the monopoly of representation of the Swedish-speaking minority in Finland, and for this reason it has participated in almost all government coalitions. The Scottish National Party, founded in 1925, only managed to break through in the 1960s, when it became alternately the second or third party in Scotland. Wales also has its nationalist organization, which is less strong and has fewer seats in Westminster: Plaid Cymru. Two parties that were created after World War II enjoy a majority in their region, though they are insignificant on a national scale: the popular party of South Tyrol (South Tyrolean People's Party) in Alto Adige and the Val d'Aosta Union in Italy. In Flanders, the party defending the periphery, People's Union (Volksunie), split in two, creating the more centrist New Flemish Alliance (Nieuw-Vlaamse Alliantie, NVA) and SPIRIT, which is more social libertarian. Spain counts the largest number of parties of this type. In Euskadi as well as PNV, we must add the nationalist, left-wing Basque Solidarity (Eusko Alkartasuna, EA). In Catalonia, both the autonomist–centrist democratic convergence of Catalonia and the left-wing separatists of the Republican Left of Catalonia (Esquerra Republicana de Catalunya, ERC) can be included. Numerous Spanish regions have their autonomists. The periphery also has extremists, sometimes violent ones but that, unlike the terrorist movements of the 1970s, such as the Red Brigades, are endowed with a legal electoral voice that shows popular and even widespread support. This is the case in Northern Ireland, where the Irish Republican Army (IRA) is linked to Sinn Fein, and in the Basque country, where Basque Homeland and Freedom (Euskadi Ta Askatasuna, ETA) was related with Batasuna until the party was prohibited by the Spanish courts. In Corsica, the situation is the same, but the nationalists are only represented at the regional and local levels. There is one special case: that of Northern League (Lega Nord) in Italy, which has gone from the defense of federalist positions to the instrumentalizing of xenophobia and from enthusiastic Europeanism to staunch Euroscepticism.

Church and State Cleavage

By contrast to the center–periphery opposition, another cleavage resulting from national revolution as defined by Rokkan is the cleavage between Church and State, which used to be of prime importance but now belongs to history. The Christian Democratic parties whose role was essential for European integration are experiencing an existential crisis: The major one, in Italy, broke up and now only exists as the Center Democratic Union with a marginal role. Their area of strength is limited to the Netherlands and the Benelux countries, where the Christian Democrats have lost a great deal of electoral weight, whereas they have collapsed dramatically in Switzerland. They were and still remain the best examples of interclass, horizontal parties, that is, covering all the ground from the right to the left—from fundamentalism to progress through centrism. In fact, they reflected the sociology as much as the ideological structure of the Catholic subculture. They are not catchall parties because, even when they are nonconfessional, they embody the political will of believers and citizens steeped in Catholic culture. Christian Democratic programs as a result of a dialogue between their bourgeois, agricultural, and working-class tendencies constitute a useful compromise for setting up government coalitions with either the liberals or the social democrats. The latter explains their unparalleled longevity in government: Democrazia Christiana participated in all the coalitions of the first Italian republic, but the record is held by the Luxemburg Christian Democrats, with more than a century in power, followed closely by the Belgians and the Dutch, with almost 100 years. They are the axis both of the center–right, so-called conservative coalitions in Belgium and the Roman Blue in the Netherlands and of the so-called labor center-left coalitions in Belgium and the Roman Red in the Netherlands. Even the most conservative party in Austria, the Austrian People's Party (Österreichische Volkspartei, ÖVP), has most often participated—since 1945—in so-called Red–Black governments along with the Social Democrats in spite of its questionable alliance with the xenophobic nationalists of the FPÖ. It is interesting to note that in the Czech Republic the only noncommunist party to have lived through the Soviet era is the Czech People's Party (Československá strana lidová, CSL), which participates in all coalition governments as it used to before 1938, its foundation dating back to the Austrian–Hungarian empire.

New Cleavages

In addition to the large families of parties, there is one small one—the greens. One thesis by Thomas Poguntke claims that the greens are the embodiment of New Politics based on postmaterialist issues such as quality of life, protection of nature, and libertarian individualism—in opposition to the supporters of Old Politics, based on materialistic issues and values such as wage increases and bread-and-butter issues in general. This idea was influenced by the work of Ronald Inglehart, who developed his theory of postmaterialism based on the proposition that the generation marked by the Great Depression followed by war and reconstruction was succeeded by a generation socialized in a context of prosperity, the "affluent society" of the "golden sixties." The new post–Industrial Revolution era is said to have given rise to a new cleavage, that is, materialists versus postmaterialists, with the Greens occupying the postmaterialist side and the extreme right, the side of the materialists. The ecologists represent a new force, but the parties qualified as far right are as old as parliamentary democracy itself. In the 1980s, Lipset insisted on the importance of postmaterialism and saw, on the one hand, the emergence of a libertarian-style, neo-bourgeois ideology that divided left-wing parties upheld by intellectual circles from the more authoritarian traditionalist, materialist workers who valued morals.The postmaterialism adopted by social-democratic parties partly explains the success of extreme-center parties among workers. On the other hand, Lipset noted that the ecologists' claims such as cultural liberalism are a luxury enjoyed by well-off citizens. In the same way, Lipset remarked that the Greens combine avant-garde themes opposed to traditional values with anti-industrialist themes for the defense of nature, which take part in a revolt against modernity that he qualifies as a "backlash." Stefano Bartolini and Peter Mair noted that the Greens participated in what the two authors called intrablock mobility within the left, that is, the workers' side of the owners-versus-workers cleavage. Later events seem to have proved them right, with the experiences of the Greens in government first in Finland, then in Belgium, and finally in Germany and France in coalitions with social democrats. In France, they owe the few seats they won in parliament to electoral alliances with the socialists. However, in Belgium and Germany, local coalitions with the right have occurred since the beginning of this century. An intermediary hypothesis could be put forward, namely, that the Greens stem from a restructuring of the territorial–economic cleavage—primary sector versus secondary sector—setting the industrialized world in opposition to nature, which explains the mixture of postmodern and traditionalist features in the discourse. Concerning their closeness to the left, it can be considered as the result of their hostility to capitalism, which destroys the balance of nature.

Parties as Organizations

Parties are not biological organisms, nor do they have a lifetime association with a cleavage: They are autonomous forces. The German conservatives in the CDU are an excellent example of a change of cleavage and of realignment. It was created as a Christian Democratic Party and heir of the pre-1933 Catholic Zentrum. Its founding programs defined a third way between Marxist collectivism and liberal capitalism by a Christian socialism founded on personalism and a respect for property, the quest for the common good, and the principle of subsidiarity. The CDU and its Bavarian sister party, the CSU, had accepted anti-Nazi Protestant intellectuals from the "Confessing Church" ("Bekennende Kirche," a Protestant antifascist movement). Under pressure from the Allies, who were concerned about the Soviet threat, and fearing the Marxism displayed by the SPD of 1945 to 1946, the CDU was forced to open its doors to Protestant conservatives who were not always former members of the Resistance. In the person of Konrad Adenauer, the former mayor of Cologne, a moderate, the CDU provided itself with a leader who turned out to be a true visionary both on the question of European integration and on the future of Germany. Certain that Germany would sooner or later be reunified and that in this context Catholics who were roughly equal in number to the Protestants in the West would once again become a minority, he reoriented the CDU along a more conservative line to take the place of the old Zentrum party and the German Right, which had been discredited for its support of Nazism. The party then allied itself with and later assimilated the conservatives of Lower Saxony in the German Party (Deutsche Partei, DP); it then did the same with the party representing refugees from former German territories in the east, the League of Expellees and Deprived of Rights (Block der Heimatvertriebenen und Entrechteten, BHE). This was possible thanks to a moderate liberal program inspired by the new economic mentor of the CDU, Ludwig Erhard. This program, the social market economy, came up against the opposition of the social Christian Democrats. Adenauer won his bet, and the CDU/CSU became a party with a majority vocation, inspired by the catchall party defined by Otto Kirchheimer. As early as 1953, as Peter Merkl noted, the CDU/CSU became a conservative party dedicated to defending the interests of industry, business, and agriculture, with its popular voters (blue- and white-collar workers) taking advantage of the spin-off from prosperity. As for Christian socialism, it became a mere memory, and to many of the party leaders, it was not a pleasant one. However, the CDU was the first example of political realignment where the logic of organization took precedence over ideological considerations and program. The CDU/CSU was able to increase considerably the number of its new voters, while to a great extent keeping its traditional electorate, and was not affected by the growing secularization of society. It increased its score from 31% in the 1949 elections to 50% in 1957. For the change to be successful, the cleavage had to be followed by lasting electoral alignment as defined by V. O. Key. This requires good partisan organization. When within a party the requirements of organization—and therefore accession to power—are in contradiction to the preservation of its principles and identity, it either undergoes a refoundation or changes its identity and undergoes realignment toward an electorally more beneficial cleavage.

The organization of parties, therefore, conveys a different logic than ideas and cleavages and needs to be studied separately. The concept most commonly used to classify partisan organization is the opposition between mass parties and cadre parties. It is often attributed to Duverger, but he borrowed it from Weber and developed it. Duverger's great contribution was to distinguish between parties of inside creation and parties of outside creation, depending on whether the founders were in parliament—a typical example is that of Whigs and Tories—or were outsiders who had no access to power, not even to parliament. The groups that can exist before the organization of the party can be labor unions, associations, Masonic lodges, or leagues—including terrorist ones. The cadre parties are therefore parliamentary parties resulting from the widening of the electorate, aimed at inciting new voters to enroll on the electoral register and support the party and the electoral committees of the candidates. Mass parties are created outside the spheres of power, and their only means of access is to have the largest possible number of voluntary activists and regular financial contributors.

More than the number of members, it is the criterion of funding that distinguishes mass parties. The regularity and registration of contributions is very important in mass parties whose internal legitimacy is embodied by its members rather than its electorate. It is necessary to add a characteristic that Duverger does not mention: the stability of leadership indifferent to the vagaries of the economic situation. Thus, during the whole of the 20th century, the Swedish social democrats had only five leaders, whereas other parties had many more. The Industrial Revolution; the expansion of means of transport, communication, and propaganda leading to the development of inexpensive newspapers and enabling national electoral campaigns; and the running of centralized national bodies favored the action and development of mass parties until the 1960s. Some cadre parties adapted to their competition, often parties organized later, such as the British and Scandinavian conservatives, who were organized by penetration from the center to the periphery, becoming, according to Angelo Panebianco, electoral parties—with professionals endowed with strong leadership qualities, recruiting large numbers of members, and above all oriented toward the opinion of their potential voters. The difference with mass parties is threefold. First, and regardless of the number of members—under Harold Macmillan, the British Conservative party had almost 1 million members—the funding of the party depends on gifts from business or from rich contributors and not on the members, who sometimes do not pay their fees but are not excluded. Second, legitimacy and power belong to parliamentarians and are vested in them by the voters, whose opinions are more important than those of members. Finally, the survival of the leaders depends on their success in the general elections.

Some parties have kept a more archaic organization: a federation of electoral committees composed of local personalities, headed by a much more undisciplined parliamentary party and with a weak leadership. These less developed cadre parties are to be found in countries such as France, Spain, Portugal, and, to a lesser degree, Italy. Jean Charlot suggests calling them *partis de notables*. Originally, they were the earliest parties to be organized, which corresponds to a model of organization by diffusion, that is, they were created on the initiative of constituency committees and by becoming closer and closer ultimately became federated from the bottom up. During the 100 years from 1860 to 1960, technical development favored mass parties that in certain cases—Catholic Zentrum and social democrats in Germany; Catholic and socialist parties in Austria, Belgium, and the Netherlands; French and Italian Communists—managed, in the words of Siegmund Neumann, to "take charge of voters from the cradle to the grave." These "rigid mass parties," to use Duverger's terminology, had a very large membership involved in a network of parallel organizations for women, children, young people, cooperatives, travel agencies, sport clubs, choirs, not to mention a party press. According to Neumann, these are "social integration parties," and in Germany during the Weimar republic, they were even qualified as *Sozialghettoparteien* (social ghetto parties).

Not all mass parties reached such organizational perfection, and several were content to live off the voluntary work of their militants and are what Duverger calls "flexible mass parties." But, as Blondel remarks, not attaining a large membership is always a failure for a party. In fact, whereas parties of social integration have a strong organizational culture that generates party patriotism or the attachment of members, and even voters and are more concerned with the organization itself than the idea that it embodies, flexible mass parties are in a perpetual debate over ideas, a source of divisions, and this is unproductive from an electoral point of view. Since the 1960s and the development of political communication centered on television and now the Internet, mass parties, and especially the most powerful among them, have experienced a crisis of adaptation brought about by a decreasing membership that has hit all the large social and political organizations characterized by the omnipotence of image and entertainment, ensuring a domination of form and appearance over substance, style over ideas, and the personality of the leader over the political party. Duverger thought—rightly at the time—that cadre parties were doomed, but thanks to a ruse of history, it is the mass parties that are the dinosaurs, and hic et nunc, it is the professional electoral parties, according to Panebianco, that have the wind in their sails in Europe: They are more reactive to variations in public opinion and more personalized, and while easily disposing of leaders who fail, they are on the same wavelength as the media. As they lose more and more members, the old parties of integration tend to be reduced, to the advantage of their functionaries, to a large, permanent staff paid by the party. The latter can be qualified by the concept of "bureaucratic mass party," proposed by Panebianco.

Moreover, the increasingly high costs of election campaigns, along with the development of the media and particularly television, have provoked a change in the organization of parties. First, whatever the social organization, individuals are less engaged in long-term action but are more willing to commit themselves in a limited way to a precise objective: Parties lose members, but so do labor unions, and there are fewer practicing members of the Church. This poses a vital problem to mass parties confronted with a decrease in the number of their contributors on the one hand and with the increasing cost of electoral campaigns on the other. They resort increasingly to funding by private enterprises, as other parties did, which changes their nature. As the mass parties were often unpopular with the business community, they were driven to use practices that in some countries are considered as corrupt and condemned by law. Consequently, states not only developed their legislation on parties but also replaced or limited private funding with public funds. Last, as television does not lend itself to a deepening of political discourse or to nuances, parties are forced to put on performances, which they have done since the 19th century but now do for television. That is, they have to embody themselves in a leader, who has to build an image of a prime minister or of a president, as, for example, in France. Countries such as Belgium, the Netherlands, or Italy, which were governed by coalitions of parties and appointed their prime minister by a process of negotiation and arbitration between parties and the currents within a party, have had to resign themselves to personalization. The leading German parties were the first to go down this path by designating their candidates for the chancellery. In the UK, around 1965, the Conservative Party decided to have its leader elected by the members of parliament, whereas previously the appointment was the result of a secret process in which the outgoing leader played a substantial role. From the 1970s and 1980s, more and more parties, which until then had had their leaders elected by delegates at their congress or party conference, changed to direct election by paid-up party members. In 1995, the French Socialist Party did the same to choose its candidate for the presidential election, and so did the British Conservatives. In Italy and France, the left-wing coalition and the socialists tried to import the American system of primaries. The model setup in Italy appears to be the closest to the original, with the center, left, and extreme left taking part—but the ballot was organized privately within the offices of the parties. For the French Socialist Party, it was an internal election enlarged to accommodate members admitted for the circumstance in return for a reduced financial contribution. In both cases, the analogy with the American primaries resides in the fact that there was an internal election and even debates between the candidates. The aim was to attract the attention of the media and thus favor the campaigns of the parties concerned. This way of functioning does not correspond to the ideal of mass parties.

The distinction between professional electoral parties on the one hand and bureaucratic mass parties on the other has become blurred in numerous countries. They have become publicly financed institutions oriented toward the media and, according to Peter Mair, could even manage without members. Mair suggests that the reasons for maintaining the role of members in certain parties are of a symbolic nature. He has proposed a new mode of partisan organization, the cartel party, which since the 1970s has succeeded the hegemony of catchall parties, which had taken over from mass parties after replacing the elitist parties. The fact is that what Mair calls "parties in opinion" have taken precedence over the "central apparatus of the party" in an arena of dialogue with the "party in public office"—leader, government, parliamentary group—all by political professionals. Are there any alternatives to cartel parties? There is one in Italy—Forza Italia, devoted to the promotion and the defense of the interests of its founder, Silvio Berlusconi. Such a phenomenon was only made possible thanks to two "accidents," the deregulation of television, which opened the doors to the establishment by Berlusconi of a television empire, and the collapse of the first Italian Republic, which freed some space on the right of the political spectrum, that is, on the side of the defense of liberal capitalism.

Both the right and the democrats in Italy as well as a large number of parties in Europe are greatly influenced by the organizational models of the United States. However, the latter remain different and are based on various autonomous strata, either for the Democrats or for the Republicans. Since the seminal contribution of Key, scholars have analyzed American parties as tripartite structures: (1) the party in the electorate, (2) the party organization, and (3) the party in government. The party in the electorate refers to the loyalty and identification of the voters, and the party in government refers to public office holders from the president to local councilors; the party organization is structured in a manner defined by Sam Eldersveld (1982) as a stratarchy, which "is an organization with layers, or strata of control, rather than centralized leadership from the top down" (p. 106). American party organizations are far older than the European ones, and in spite of the decline of party identification, they still remain adapted to the various and numerous changes and evolutions affecting the practice of democratic government. This is obviously not the case in Europe, where political scientists may speak of a "crisis of parties."

PARTY FINANCE

Parties need money if they are to be able to carry out their main political functions: to run election campaigns, to maintain organizations both within the legislature and outside it, and to carry out research into future policy. Party finance is a major component of political finance. The latter includes in addition the funding of lobby groups and of other aspects of political life. Party finance includes any costs of election campaigns that are the responsibility of party organizations. Where candidates run for public office independently of parties, election campaigns too are an aspect of political finance not covered by the term *party finance*. This entry discusses problems of party finance in terms of normative democratic criteria, current research, and attempts of regulation.

Problems of Party Finance

Party finance raises problems for three main reasons. First, parties with access to disproportionately large amounts of money for their election campaigns potentially have a large advantage over poorer rivals. Insofar as high expenditure enables parties to gain votes, money may create unfair electoral advantages for parties with rich supporters. In a considerable number of countries in the Third World (including Thailand, the Philippines, and countries in Latin America), vote buying is a common feature of elections. In Nigeria, electoral officials reportedly have been bribed to falsify voting results. In countries such as the United States, money is characteristically spent on buying advertising time on television. Studies on electoral results in congressional elections in the United States and in parliamentary elections in the United Kingdom (UK) have suggested a clear link between the amount spent and the number of votes obtained.

A second problem is that parties' need for money may make them reliant on donors who demand illegitimate benefits. Typically, these consist of public contracts, licenses, or legislation favorable to the givers. The demand for donations is a major cause of political corruption, both at the national and at the local level. Major scandals concerning party funding occur so regularly that any attempt to list them will soon be outdated. Scandals not only involve justified accusations against politicians and their aides but also unfounded but nevertheless powerful allegations.

Third, those desiring to become candidates for public office may need to spend considerable sums in obtaining party nominations. Primary elections and other internal party contests can be costly for those involved. The more expensive it is to gain a party nomination the lower will be the chances for persons without private resources to embark on political careers.

It is not only the demand for resources that affects political parties; the control of money has a significant impact on the structure of power within political parties. Robert Michels stressed in his classic study of the German Social Democrats in the early 20th century that party leaders tend to gain control of the purse strings of the party and that this has the effect of centralizing power. There is no single pattern of internal control over funding. In some countries, such as the United States, central party organizations do not have an overwhelming control where it comes to raising and spending money.

Issues in the Academic Study of Party Finance

The study of party funding and of political finance generally has become an increasingly significant and popular field of political science. Members of the International Political Science Association's Research Committee on Political Finance and Political Corruption (RC 20) have carried out some of the most significant work in this field. Herbert Alexander devoted his professional life to a long series of studies of the funding of presidential and other election campaigns in the United States. Among the most significant works in the comparative study of party finance are those of Arnold Heidenheimer, Khayyam Paltiel, Karl-Heinz Nassmacher, and Kevin Casas-Zamora. Heidenheimer's pioneering study of 1963 attempted to compare the overall level of spending in a number of different countries. He then tried to explain why party politics costs so much more in some countries (e.g., the Philippines or Israel) than in others (e.g., the UK). In 2009, Nassmacher found that the pattern of high- and low-spending countries was largely unchanged. Like Casas-Zamora and Pinto-Duschinsky, he also cast doubts on the popular notion that the costs of politics have greatly risen as the result of spending by parties on modern campaigning techniques, in particular on television advertising.

However, the attempt to make reliable comparisons between the levels of spending in different countries has raised serious methodological and practical problems:

1. Though the financial accounts of parties are now published in many more countries than in the past, they often are inaccurate (works of fiction, as the French scholar Yves-Marie Doublet has called them). Moreover, accounts are drawn up in different ways, thereby making comparisons technically difficult.

2. The term *finance* needs to be considered carefully, for donations may come in the form of gifts in kind. Rather than supply money to enable a party to purchase vehicles or other forms of transport for electioneering by party leaders and candidates, donors may supply vehicles or the use of helicopters. Clearly, their value needs to be taken into account when reckoning the income and expenditures of a party.

In a large number of countries in the former Soviet Union, Africa, and elsewhere, in-kind donations to political parties come from the government. This is known in Eastern Europe as "administrative resources." Typically, the government in office employs officials supposedly to carry out public duties but actually to provide political services to the party. Office facilities, telephones, and vehicles in government ministries, in the offices of legislators, or mayors' offices are common forms of administrative resources.

The partisan use of public resources by political officeholders creates problems of research and measurement for political scientists. It also is a source of unfairness between governing parties and opposition parties. This imbalance is especially important in poor countries dependent on foreign assistance. Here the private sector of the economy frequently is very weak, and control of governmental resources is crucial.

3. Academic studies also confront the problem of definition of the term *political party*. In practice, there are "offshore islands" of parties: These are organizations that are legally independent of parties but are in practice linked to a party. An important example of organizations with such a status is the "political foundations" attached to each of the main parties in Germany. The Konrad Adenauer Foundation is "close to" the Christian Democrats, the Friedrich Ebert Foundation is "close to" the Social Democrats, and so on. Where newspapers are strongly connected to a political party, there arises the question of whether or not their incomes and expenditures are to be included in academic studies of party finance.

4. It is hard to measure the effects of expenditure on election results. In the case of spending by or on behalf of candidates for the legislature in countries that both have first-past-the-post electoral systems and require the disclosure of expenditures, it is possible to make statistical analyses of the relationship between spending and votes. The difficulties are that the official spending statistics may be incomplete or inaccurate and also that factors other than money need to be considered. For example, a local party organization with more members or more active members may raise relatively large sums of money. However, electoral success may stem from the work of the local activists rather than from the amount of money spent.

As a result of these problems, the main progress by political scientists has been in studies of party funding in single countries (e.g., Marcin Walecki's study of Poland) and in the study of political finance laws (e.g., by the Congressional Research Services of the U.S. Library of Congress and by the GRECO [Group of States Against Corruption] unit of the Council of Europe).

Regulation and Subsidy

In recent decades, there has been a strong international tendency to increase legal regulation of both party funding and public subsidies. Arguably, there has been too much law and too little enforcement. This is partly because laws themselves are loosely worded and leave loopholes that can be exploited by donors and by political parties wishing to evade them. It is partly because electoral management bodies and law enforcement bodies have neither the technical capacity nor the will to challenge powerful political figures in major political parties. Where a body separate from the electoral management body, such as an anticorruption commission, is made responsible for the enforcement of laws relating to party funding, there may be a greater chance of active enforcement.

The main types of *regulation* include (a) requirements on parties and/or donors to declare financial accounts and donations to an electoral management authority; (b) requirements about the publication of such information (including, increasingly, publication on the World Wide Web); (c) requirements for disclosure of in-kind donations and of loans to parties; (d) requirements for elected politicians to declare their personal assets; (e) bans on particular sources of donations: for example, foreign donations and donations by companies, trade unions, or public contractors; (f) limits on permitted spending by parties or by candidates on election campaigns; (g) limits on the amounts that a donor is permitted to give—regulations concerning forms of disclosure are the most common around the world; and (h) bans on or regulation of party spending on advertising on television or radio.

The main forms of *subsidy* are (a) provision of free or subsidized time on television and radio (and, more occasionally, free or subsidized newspaper advertising) for parties and candidates to convey their campaign messages to the electors, (b) direct financial subsidies to parties for election campaign expenses and/or for routine organizational expenses, (c) financial and in-kind allowances for party groups in the legislature or for individual legislators, and (d) in-kind electoral facilities for parties from public funds—for example, use of public halls for electoral meetings and/or postage for electoral communications without cost.

The most common form of subsidy is the provision of free broadcasting opportunities. More than half the countries have some form of direct public funding. Political parties debate the effects of such subsidies. One fear is that they create an incentive for rival political parties to unite in defense of their common financial privileges. In the words of Richard Katz and Peter Mair, this creates "cartel parties." Another criticism is that public funding fails to stem the demand of political parties for money and thus fails to provide a cure for corrupt funding. Public funding is popular among professional politicians—its main beneficiaries—but is generally unpopular with ordinary electors. Supporters of public funding argue that it provides greater fairness. They argue also that, combined with improved regulation, public funding does help decrease corruption even if it does not eliminate it.

International Standards

Several bodies, including the Council of Europe, have set out standards for the regulation and subsidy of political parties. Such standard-setting exercises present problems, though they may have their uses. There are essential differences of political philosophy between those who give priority to the need for fairness between parties and those whose main aim is to allow freedom of expression. Such freedom may mean allowing some parties to outspend others, thus creating a tension between the aims of freedom and fairness.

Even when the aim of transparency in party funding is considered, there are arguments in some circumstances for permitting donor privacy, especially in regimes where anyone known to give financial support to a party opposing the government may be subjected to harassment and even to violence.

PARTY IDENTIFICATION

Parliamentary and presidential elections are regularly held every 3 to 5 years, and the behavior of the electorate is characterized by a certain inertia, sometimes more and sometimes less. This inertia at the aggregate level is the consequence of decisions of individual voters whose party attachments predispose them to elect candidates of the same party in a series of elections. Various terms are used as synonyms for this general idea of party attachment, such as *partisanship*, *party closeness*, *party loyalty*, and *party identification.* This type of enduring attachment has to be distinguished from short-term party evaluations or from current party preference as the immediate, direct cause of voting behavior. Whereas party attachment is usually measured as attachment to one particular party, current party preference is sometimes operationalized as a preference order for a set of parties, from one's most to least preferred party.

As used in voting behavior research, party identification differs from the other terms because the general idea of party attachment is embedded in a special theoretical approach. Its definition is more specific, and its causes and consequences are theoretically grounded. Party identification as a theoretical concept was developed by the Michigan social psychological school of political behavior. This concept is introduced in the first section, followed by a section on an alternative, revisionist concept. In the third section, a new conceptualization in the classical spirit and new challenges are discussed. The entry concludes with a fourth section on the applicability of the concept outside the United States.

The Michigan Social Psychological Concept

Party identification was originally defined in *The American Voter* by Angus Campbell, Philip Converse, Warren Miller, and Donald Stokes (1960) as "the individual's affective orientation to an important group object in his environment" (p. 121). In U.S. politics, with its stable two-party system, the Republican and Democratic parties function as these "important group objects," offering political orientation to their supporters. Campbell et al. did not assume that this is self-evident but conceded that other groups are able to function as political reference groups as well, such as unions and religious or ethnic groups. Whether parties do indeed fulfill this orientation function for a large part of the national electorate is one of the questions that have to be answered when the original American concept is applied in other countries. The basic assumption of the Michigan approach is first of all that voters depend on such groups for political orientation, this being originally derived from reference group theory in mainstream social psychology of the 1940s and 1950s.

The classical Michigan concept of party identification became one of the cornerstones of voting research, first in the United States but to so some extent also in Europe and Japan. Its standard measure is asked in all American National Election Studies: "Generally speaking, do you think of yourself as a Republican, a Democrat, an Independent, or what?" The independents are then asked, whether they think of themselves as closer to the Republican or Democratic Party, leading to the support type of "leaners." The self-identified Republicans and Democrats are further categorized as strong or weak, depending on their answer as to whether they think of themselves as strong or not very strong Republicans or Democrats. The end result is a categorization of the American electorate into seven groups, running from strong to weak Republicans, to Independents leaning toward the Republican Party, to Independents, to the equivalent groups on the Democratic side. Much of the literature focuses on the reliability of this measurement, which combines direction and strength of attachment in one scale. Not denying the importance of the respective methodological controversy, the basic question concerns the concept validity of the directional component: Do the various measures of identification with a party measure what they are supposed to measure?

There are some easy conditions that these measures have to fulfill in cross-sectional surveys. Thus one expects that the political attitudes of party identifiers are more in line with their party than those of leaners and that party identification has a consistent impact on voting behavior. But party identification is only a predisposition to elect a Republican or a Democratic candidate, so that elections differ in terms of this impact. In the American context, with changing presidential candidate constellations, vote deviations of identifiers from their party occur more frequently than in European parliamentary systems, where under proportional representation the electorate often has only a choice between closed party lists. These deviations in the United States are seen not as a weakness but as a strength of the concept if voters return to the party they identify with in later elections.

The crucial test of concept validity is the exogenous status of party identification in relation to short-term electoral forces such as issue and candidate orientations. People become passively attached to a party during their primary political socialization in their teens, as a result of the overwhelming influence of their parents, and the ties to their party become strengthened by a continuous voting record. Thus, younger voters tend to deviate more than older ones. But in general, the inertia of the electorate in the medium term should be quite large. The theory allows only two exceptions. The first is sudden changes in critical elections when many voters reorient themselves politically, reacting to important events such as the world economic crisis in the early 1930s, and the other concerns gradual readjustments in parts of the electorate as in the U.S. South since the late 1960s. Here the successful civil rights movement led to the enfranchisement of the African American population, which voted overwhelmingly for the Democratic Party; as a result, many traditional Southern White Democrats crossed the party divide to maintain a racial divide.

The Revisionist Concept

In the U.S. context, the validity of the classical concept was well corroborated by empirical evidence collected by the Michigan school. Compared with other political attitudes, party identification proved to be more stable over time even at the individual level, as shown by long-wave panels spanning 4 years. But there remained doubts whether party identification was really the supposed unmoved mover, being stable and exogenous itself but influencing the evaluation of new political events, issues, and candidates. The finding that vote deviations from party identification weaken this predisposition and prevent it from returning to its former strength led to a slight revision of the concept. As soon as deviations are understood as more than mere episodes, the question arises as to what caused deviations in the first place. One possible answer was that there were retrospective evaluations of parties in government, rewarding them for good performance and punishing them for bad performance. Voters will remember parties' performance not only at the moment of voting but more permanently. This consideration led Morris Fiorina (1981) to the reinterpretation of party identification "as a running tally of retrospective evaluations" (p. 89). Party identification at time t influences identification at time $t + 1$; this is the aspect of continuity, but identification at $t + 1$ is also influenced by retrospective evaluations that are themselves not a simple consequence of the biased worldview of the identifiers. As a process of Bayesian updating of beliefs about parties, the affective component of the concept is downgraded in favor of cognitive content and information that is not selectively perceived to confirm one's own attitudes. To what degree this is possible is a problem that is controversially discussed in the literature.

The implications of the revisionist concept for the aggregate level of the electorate are short-term fluctuations beyond sample errors that are not compatible with the classic version. As already mentioned, the latter does not postulate complete stability either but allows rare realigning elections or gradual movements due to generational turnover or reorientations in parts of the electorate such as the U.S. South. But fluctuations over time that correlate with performance indicators of the president or with the situation of the economy are definitely excluded. Not so by revisionist theory. Time-series analyses of the proportions of Republican and Democratic identifiers were introduced as studies of macropartisanship. Building on the revisionist concept, the task was to show, on the one hand, that its ups and downs were reduced compared with the performance indicators due to the stickiness of party identification and, on the other, that they correlated with the collective memory of the performance history of the parties' presidents and of the respective economic situation. Applying an error correction model, Robert Erikson, Michael MacKuen, and James Stimson (2002) showed for the United States not only that current changes in macropartisanship are the consequences of current changes of performance indicators but that macropartisanship returns to its medium-term equilibrium and that these equilibria are themselves changing over time. They interpret this latter change as "the enduring impact of political and economic performance" (p. 132). This result did not remain unchallenged, one argument being that medium-term changes are the consequences of classical realignment processes, such as those during the Reagan administration that favored the Republican Party.

New Theoretical Foundations and New Challenges

Reference group theory being outdated in social psychology, the classic concept deserves a new theoretical foundation that keeps its content as an affective party attachment. Such a new foundation is possible with social identity theory as developed by Henri Tajfel, who stresses that people bolster their self-esteem by membership in groups that they value positively and that are emotionally significant to them. Based on these assumptions, the social identity of a person is more than a mere cognitive self-categorization. A strong motivational content should guarantee selective perception of political events in favor of the respective political ingroup, accompanied by outgroup hostility. This theory fits well with the original concept of party identification, the only problem now being which party group people have in mind when "they think of themselves as Republicans, Democrats, etc." or when they think of the party as an "important group object in their environment," the party as an organization, or other identifiers of the same party. Donald Green, Bradley Palmquist, and Eric Schickler (2002) argue for the latter interpretation and insist that it agrees best with the classic meaning. People are supposed to have an image of their fellow partisans, with whom they identify even if they have no contact whatsoever with the party organization or the party elite. Otherwise one could not explain the high percentages of regular voters who identify with parties.

This new theoretical foundation of the classical concept is important because it helps formulate adequate survey questions that tap the identity character of party identification. This is less a problem for the standard American question that qualifies well as an identity question than for the type of questions asked in some other countries. Questions asking whether one feels close to a party or whether one is an adherent of a party are less plausible as measures of identification with fellow partisans.

The identity approach is sometimes contrasted in the literature with the so-called attitudinal approach. John Bartle and Paolo Bellucci (2009) subsume the revisionist concept under this heading as well as strong party attitudes combining cognitive, emotional, and behavioral aspects of this positive—or negative—disposition toward a party as an attitude object. Indicators of the strength of an attitude are its durability and its impact on behavior or on other attitudes. These are the criteria that were also applied to check the construct validity of the classic concept. Thus, the general idea holding various versions of party identification together is its function as a political predisposition influencing short-term political preferences and evaluations. In a funnel of causality leading from background characteristics such as religion or class membership to the final vote, political predispositions enter early, being influenced themselves only by the background characteristics. A more general version of partisanship such as the revisionist concept allows for regular updating caused by new information, but it also implies higher durability than short-term political evaluations and an impact on evaluations of current political cues. Larger permissiveness concerning long-term stability means at the same time fewer challenges from the research front. Thus, it makes sense to focus on the challenges the identity approach has to cope with since it is the continuation of the demanding classic version of party identification.

From the beginning, the stability of party identification over time was the most demanding presupposition of the classic concept. Only durable identifications are able to function as unmoved movers for short-term evaluations and issue preferences. Compared with other political attitudes, party identification turned out to be indeed relatively stable in the United States, and the stability is about at the same high level as for various ethnic, religious, or social class identities. The autocorrelations of identities over panel waves can be made even higher if one takes measurement error into account. An answer to a survey question is a mixture of the true value and an error term due to inattention, lack of understanding, coding mistakes, and so on. Multiwave panel data allow the identification of these errors and therefore the computation of correlations that are not attenuated by errors. Such autocorrelations reach values well above .90 for party identification in the United States.

A new challenge in this situation is posed by competing political predispositions, which can be as stable as party identification once measurement errors are taken into account for them, too. Such competing predispositions are ideological self-categorizations or policy-relevant value orientations. These concepts are more abstract than social identifications but are often measured in mass surveys with simple questions, one item for each concept. State-of-the-art measurement would demand multiple items. There exist first results showing that issue preferences can be very stable over time if one can construct indices based on multiple items and if one takes measurement errors into account. Such results challenge the monopoly of party identification as the only promising candidate for the function of a political predisposition.

Another challenge related to this are doubts about the applicability and fruitfulness of the identity concept outside the United States. The best answer to this question can be given by acknowledging, first, the importance of political predispositions for opinion formation and voting behavior and by finding out, second, which type of predisposition has the best explanatory power in a specific country, given its political history and party system. Once more candidates for the predisposition part of the funnel of causality are available, there arises, of course, the new challenge of deciphering the mutual influences among them.

Party Identification Outside the United States

The most serious challenge of the classic or the identity concept of party identification accrues from research results on European party systems and voting behavior. After early attempts to transfer the core concept of the Michigan school to Britain, France, the Netherlands, and other European countries in the 1960s, one conclusion was that the concept, successful as it is in the United States, is less powerful or even nonapplicable in Europe. Some authors argue that it is indistinguishable from vote choice or is much less stable over time than in the United States or that there exist better alternatives that European voters can use for political orientation. Other researchers strongly disagree, coming to the opposite conclusion that, depending on certain conditions, the concept passed critical tests of construct validity.

A first condition is, of course, to come up with an equivalent question that taps the affective identification or the identity aspect. Richard Johnston (2006) compiled an overview of the questions used in various countries and found that only the questions in the English-speaking countries and in Japan fall back on the phrase whether one thinks of oneself as "Conservative, Labor, Liberal, or what," as the British question is formulated. In other countries respondents are asked whether they consider themselves as adherents of a party (Denmark, Sweden, and the Netherlands), feel close to a party (France), or lean toward a party (Germany). The identity aspect decreases in this sequence. In most countries, researchers have agreed on a standard formulation that is asked regularly in national election studies.

For the crucial validity check of stability, panel studies are necessary, and in this respect most of the early results were disappointing compared with the stability of party identification in the United States. For the Netherlands, Jacques Thomassen even reported a higher stability of the vote than of party identification and corroborated this finding, together with Martin Rosema, recently (cited in Bartle & Belluci, 2009). But taking measurement error into account and applying statistical models appropriate for the respective measurement level of the data can change the overall impression of instability. Thus, Green and Schickler (cited in Bartle & Belluci, 2009) concluded that many of the reports on the instability of party identification in Europe are grossly exaggerated. They note at the same time that the identity concept does not imply stability under all circumstances. As one would expect, the party identifications of the Italian electorate became fluid in the 1990s, due to major changes in the Italian party system. A final conclusion concerning the stability of party identification in Europe, however, is not yet reached. The answers given depend on the methods used to measure stability. Error term corrections rely on classical measurement theory, which postulates random errors in an otherwise homogeneous population. Alternatively, one can assume a heterogeneous population consisting of movers and stayers that can be tested by latent class analysis. Such analyses show substantial dynamics and a class of movers in Britain, for example, of one third to two fifths of the electorate. These results do confirm the revisionist concept that Harold Clarke, David Sanders, Marianne Stewart, and Paul Whiteley call valenced partisanship (2004, p. 211). The transition probabilities between British parties are not random but show trends parallel to the "accumulated party and party leader performance evaluations."

A condition at the macrolevel of the political system that may have an impact on partisanship, especially if some voters have multiple party identifications, is the coalition situation in a country. In some countries, there exist rather stable options for government formation. In Germany, for example, a left-wing government coalition is an option, but one can also have a grand coalition between Social Democrats and Christian Democrats, a government of the Social Democrats and the Liberals, or finally the option of a bourgeois (*bürgerlich*) government of Christian Democrats and Liberals. These types of coalition also serve as attitude objects competing with parties in their importance for the electorate.

The most discussed alternative of party identification as a political predisposition is ideology, often asked as ideological self-categorization as conservative or liberal in the United States or as left or right leaning in Europe. European voters have few problems in classifying parties as well as themselves on self-anchoring left–right scales. In some countries such as France, parties either change their names from time to time or enter and leave the party system altogether, so ideology can serve as a more stable orientation device than party identification. Both party identification and ideological self-categorization exist in France, the question being their reciprocal influences and their comparative impact on the vote. Recent research results based on panel surveys show that ideology influences the legislative vote (first round) more than party identification.

Such country-specific findings are sometimes criticized as distractions from a general theory of party identification. This critique is unjustified if the goal is to identify the conditions, especially at the macrolevel, that strengthen or dilute party identification as a political predisposition. The identity concept is based on firm theoretical grounds postulating the predispositional character of party identification, which is challenged empirically by findings on the dynamics of identification. Valenced partisanship, by contrast, is always in danger of crossing the divide between predispositions and short-term political attitudes.

PARTY LINKAGE

The concept of party linkage refers to the ways in which political parties provide linkage to the state. In democratic theory, parties link citizens to the state, but linkage theory encompasses as well how parties link specific entities such as special interests and campaign donors to the state and how they sometimes develop stronger linkages to the state for themselves alone rather than for any other entities. Depending on what kind of linkage they provide, parties contribute to participatory democracy, responsive democracy, responsive oligarchic government, or coercive authoritarian government. They may also serve as agencies of prerevolutionary linkage or of market linkage. It is often possible to find various kinds of linkage by party within the same nation-state. This entry briefly examines each form of linkage by party in turn and then examines work that helps explain why certain forms have become increasingly common while others seem to be falling into decline.

The use of the term *party linkage* is relatively new but is in fact an elaboration of the older concept of the party as a *broker* between citizens and the state, capable of aggregating specific interests, forming programs, and, when successful in electoral competition, placing representatives in office to carry them out. A similar approach conceived of parties as *transmission belts*, moving ideas through the body politic, transforming them into proposals for legislation and eventually into laws for implementation in the halls of governance.

These early metaphors, drawn from the boisterous world of industrial finance and production in the heyday of the Industrial Revolution and its aftermath, presented a uniquely positive and American point of view. It was not until after World War II that the term *linkage* was developed to extend the idea of parties as connectors to the state and to make it possible to consider the wider range of the kinds of connections that can be made by parties. The first effort to do so systematically was made in 1980 and identified four kinds of linkage by party: (1) participatory linkage, in which parties serve as agencies through which citizens can participate in government; (2) responsive linkage, in which parties serve as agencies that strive to ensure that government officials will be responsive to the views of rank-and-file voters; (3) clientelistic linkage, in which parties serve as channels for the exchange of votes for favors; and (4) coercive linkage, where parties help authoritarian governments maintain coercive control over their subjects.

Over time, research on parties as agencies of linkage has explored the applicability of this typology, often concentrating on the extent to which either participatory or responsive linkage is in fact being provided. Other studies have elaborated the typology, pointing out, for example, that parties may engage in selective linkage rather than collective linkage, may offer representative linkage to other organizations in exchange for electoral support, and may develop different forms and processes of linkage within complex and multilayered polities.

A particularly modern form of these kinds of linkage is *market linkage*. Market linkage is linkage for sale. In one sense, it is not new: Once in power, parties in government have always favored those who helped them to office and rewarded them for doing so. What makes market linkage different today is the overwhelming power of advertising and the consequent need for vast sums of money to win votes. In this form of linkage, parties link groups to the state by collecting funds and waging campaigns on behalf of the candidates selected by those groups; they seek to place their patrons' candidates in office and thus become indispensable partners in power. Ordinary citizens are encouraged to believe that they will be the beneficiaries of responsive linkage, but their hopes and needs will be attended to, if at all, only after those of the patrons have been met. Their only hope in a system where market linkage is well entrenched is to form well-financed mass movements, that is, for citizens to become patrons themselves and for movements to take the place of parties as agencies of linkage (although movements never themselves move into positions of governance as parties successful in elections do).

The forms of linkage discussed so far focus, by and large, on contemporary parties in established democracies. More recent studies examining the relationship between parties and democracy in the past as well as in nondemocratic states have revealed another form of linkage by party, *revolutionary linkage*. Such linkage takes place in nations where there is neither democratic governance nor a legal party system, and citizens who find the autocratic rule intolerable join parties that have been outlawed or are forced to go underground or else form new, embryonic parties. The linkage the party provides in such a case is not to a state per se but to an imagined one, one that is seen as embodied in the words and deeds of its leader. For the followers, linkage to a legitimate state is the dream, but linkage to a charismatic leader and his or her entourage is the presently available reward for joining the battle for liberty.

Revolutionary linkage is found throughout history, including at the present time. A period of organized struggle for liberty is found in the history of every currently democratic state except those on whom democracy has been imposed by external conquest. As a contemporary phenomenon, it appears in states where democracy has not yet been established or where it has fallen and must be fought for all over again. In the latter case, the illegal movements pursuing the dream may be parties that have been outlawed.

The six forms of linkage identified can readily be divided into those that foster democracy and those that work against it. Parties building linkage in prerevolutionary settings and those fostering participatory and responsive linkage in established democracies all offer prodemocracy forms of linkage (or at least purport to be doing so), whereas those that link only by clientelistic rewards, abetting agencies of oppression, or favoring their most generous contributors, use antidemocratic methods of creating linkage.

Recent studies of the relationship between parties and democracy suggest that the latter types of linkage are on the rise and that the former are weakening. Throughout the world, in long-established democracies, in new democracies, and in nations still only partially or not at all democratized, opportunities for participatory linkage via parties have diminished, responsive linkage has weakened, new forms of clientelistic and directive linkage have evolved, struggles for liberation via prerevolutionary linkage have been baffled and stalled, and market linkage has become ever more common.

External forces such as market globalization and the rising costs of effective campaigning with modern forms of communication, as well as stronger and more sophisticated oppression by dictatorial regimes, have provided pressure on parties to shift to (or continue to limit themselves to) the less democratic forms of linkage, and parties have responded. Recent studies of this process of de-democratization by party have identified many of the steps taken to move in this direction. (Specific examples, some of which are noted below, have been found in 46 nations, in the parties of North and Latin America, West and Eastern Europe, post-Soviet states, Asia, Africa, Oceania, and the Middle East.)

In nondictatorial regimes, the shift by parties from participatory or at least responsive linkage to less democratic forms of linkage is often difficult to isolate and identify, because the role parties play in de-democratization is frequently combined with other activities by the same parties that contribute to the maintenance of democratic forms of linkage. In such hybrid systems, parties are routinely considered accountable to a democratic electorate and may in fact still be so to a considerable extent. In addition, only a portion of a party's leadership and supporters may engage in de-democratizing behavior, and its deleterious effects on democracy may be difficult to recognize. However, certain easily recognizable de-democratizing forms of party behavior, augmenting clientelistic and market forms of linkage within established democracies, have been pointed out and have been categorized, according to whether their effect is direct or indirect, as proactive and complicit. Examples of proactive linkage-changing behavior by parties include deliberately reducing the powers of the party base, overtly sponsoring or supporting legislation or judicial decisions that eliminate regulations protecting rights of political participation, and campaigning dishonestly, with no intention of implementing the promises made to the majority of supportive voters.

Parties are *complicit* in facilitating de-democratization when they aid those who proactively seek its accomplishment by seeking other goals. There are three subtypes of complicity: unconscious, venal, and ideological. *Unconscious complicity* refers to failure to recognize the likely de-democratizing effect of the proposals one supports. A legislator who votes for a new electoral law without recognizing that the implementation of one of its clauses will lead to the effective disenfranchisement of a portion of the population provides an example of unconscious complicity. *Venal complicity* is manifest in the behavior of party representatives who accept roles and rewards for themselves and in exchange engage in no actions contrary to the wishes of those who grant such perquisites. It is also seen in the behavior of those who vote strictly according to the wishes of their largest donors (a form more difficult to identify, as such votes may in fact be in accordance with the legislator's own opinions). *Ideological complicity* takes place when a party rejects fundamental precepts of representation and accountability on principle. Extremist and racist parties preaching the exclusion of minority populations can be, without ever winning office, ideologically complicit in facilitating the shift to nondemocratic forms of linkage.

In dictatorial regimes, parties reduce the possibility of establishing democratic forms of linkage when they engage in venal complicity, accepting personal rewards for not pursuing the interests of their supporters; offer clientelistic rewards in exchange for votes; or assist the regime in tactics of oppression (coercive linkage). They may also contribute to the entrenchment of nondemocratic forms of linkage with *retreative* behavior, as when parties that support democracy disband when defeated, heavily oppressed, or outlawed, behavior that may appear thoroughly reasonable and justified but nonetheless weakens the struggle to initiate democratic governance or maintain any progress made in that direction. All these forms of behavior have been clearly identified in many states in the contemporary Arab world but have also been noted throughout the world at various points in time.

These recent efforts to combine the study of de-democratization with the study of party linkage offer new perspectives on the nature of linkage today, a rich field of study for students of party as well as students of democracy.

PARTY MANIFESTO

A party manifesto or platform is the authoritative statement of party policy at the time of a general election. Many other pamphlets and policy documents may be issued by leaders, candidates, or different party organs around this time. However, the manifesto is unique in that it is the *authoritative* statement of the party position for that election, usually endorsed by a representative conference of party members, according to recognized procedures. This has implications for its content and presentation: Otherwise, they might not have been approved as authoritative. Manifestos are not, therefore, just an arbitrarily selected policy document out of many available at that time. They are the documents that have been crafted for, and received, official approval. In the following, the significance of such documents is assessed for elections and the formation of coalitions, of party policies, and of democratic theory as a whole. In a few cases, this authoritative election statement of policy is made verbally by an authorized spokesman—party chair or leader—sometimes as a radio or TV speech (in Australia) or an interview for a leading newspaper (in Japan). In Scandinavia, the document may not be published as a whole; instead, different sections may be distributed to different groups. However, all these processes of transmission are carried out by designated spokespersons or party bodies. Fundamental programs—statements of party principle—are also approved from time to time by some parties but should not be confused with the action program or campaign platform endorsed for an election.

Usually issued as a booklet or pamphlet, the manifesto is normally presented at the beginning of the election campaign at a press conference designed to publicize its leading concerns. Not many electors read it; its influence is felt mainly through press and TV discussions where party representatives will be confronted with its statements. The manifesto thus functions as an equilibrium point around which party policy oscillates and to which it returns during the campaign.

Parties are the only organizations that issue such comprehensive medium-term programs for the whole of society. Until the middle of the postwar period, conventional wisdom was that manifestos did not count for much, as electors did not read them and parties, once elected, forgot about them and certainly did not wish to be bound by them. Were this critique true, it would constitute a devastating critique of representative democracy, defined as a political system that makes a necessary connection between popular preferences and public policy. This is because party policies as outlined in their manifestos are what voters are asked to choose between. If manifestos do not get their message through, then the expression of popular preferences in the vote will be wayward and ill informed. Similarly, if parties ignore them once they are in office, popular preferences will not shape public policy.

A more positive evaluation of manifestos has emerged over the past 30 years. The mass media need them to structure their election discussions so that their main features and concerns get through to electors. Parties too need a basis for policy coordination and innovation once they get into government, which they are generally too busy to generate once they are there. They have, therefore, to fall back on the manifesto as a readily available and authoritative basis for action.

This is true even where coalition governments are formed. Either each party has carte blanche to do as it wishes inside the ministries and policy sectors assigned to it (in which case its manifesto serves as a basis for action there) or an overall coalition agreement is developed from the constituent party manifestos. Either way, the latter feed into government policy.

These reevaluations of the role of the manifesto have come about partly through the work of the Manifesto Research Group (MRG) and its successor project, the Comparative Manifestos Project (CMP), based at the Wissenschaftszentrum, Berlin. The MRG, a grouping of about 20 mainly European political scientists, counted the (quasi) sentences of the manifestos of all significant parties in 25 countries in 56 categories covering the full range of party policy. Quasi sentences are defined as arguments or phrases that are the verbal expression of one idea or meaning. Where they do not coincide with a natural sentence, they are often marked off by bullet points, commas, or semicolons. Raw counts of these for each election manifesto are expressed as percentages to allow comparison of documents of varying lengths. These percentages can then be used to compare the policy concerns of different parties, to distinguish them ideologically, or to trace the evolution of their thinking over time.

Statistical analyses of these manifesto-derived data have also been useful for giving credibility and substance to the idea of a basic left–right division underlying democratic politics. This has emerged from several different types of analysis applied to the data. The MRG-CMP Left-Right scale contrasts policy concerns of the Left (intervention, welfare, and peace) with those of the Right (freedom, traditional values, and military strength). By subtracting the summed references to Left topics from those to Right topics, party positions and movements can be mapped across 54 countries for the postwar period (Hans-Dieter Klingemann, Andrea Volkens, Judith Bara, & Ian Budge, 2007).

Quantifying manifesto texts in this way has also been essential in establishing relationships between party election programs and subsequent government action. Emphases in the manifestos can be linked to government expenditure to see if they get carried through. The answer is clearly that they do, thus upholding the validity of election results as a guide for government action.

For a more limited range of countries, other studies have examined the extent to which specific pledges made in the manifesto are actually fulfilled by governments. Again it appears that a substantial number support the idea of a party mandate from the electorate based on the manifesto.

Manifestos and the data describing them are very important for the development of systematic political science because they are the main source of information on the preferences of the main political actors across countries and over time. The ability to measure such preferences in a fully comparable way enables political scientists to check the major theories and models of representation and party competition systematically in a way that was never conceived of before. Rational choice theories in particular, which depends crucially on assumptions about, and measurement of, preferences, can now be put directly to the test. Derived measures from the manifestos can be used to estimate government intentions and the preference of the median voter (Hee-Min Kim & Richard Fording, chap. 8, in Ian Budge, Hans-Dieter Klingemann, Andrea Volkens, Judith Bara, & Eric Tanenbaum, 2001). It is particularly useful to have the latter where direct survey evidence is lacking. Since manifestos state the party's position in its own words and from its own point of view, they provide more direct evidence on its position than experts' judgments or electors' perceptions of party positions do.

So far, the only quantified data from manifestos have been the MRG-CMP time series, based on manual coding of the documents. Because of their research importance, increasing efforts have been made to develop computerized analyses of the texts. Indeed, manifestos have become the focus and growth point for computerized analyses of political texts, not the least because the efforts of the MRG-CMP in collecting, storing, and scanning them make them easily accessible for all users. Clearly, therefore, manifestos offer a major source for political analyses of the central democratic processes, particularly for representational processes. Political parties are so crucial to these (both in organizing election choices for voters and in effecting the majority-supported preference in government) that the authoritative policy document they issue must be of central interest in studying both elections and governments. The combination of its major importance to the democratic political process and the fact that it can be relatively easily quantified using modern techniques gives it a key role in the future development of systematic political science. Central concepts and relationships that can be measured using the policy positions conveyed by manifestos in combination with other data (bracketed) include

- the median voter (party votes),
- congruence between popular preferences and government intentions (cabinet posts),
- long-term bias in government intentions compared with popular preferences, and
- the relationship between settled popular preferences and enacted government policy.

As indicated, representational processes are strongly shaped by the way parties behave in policy terms. Here again, manifestos, particularly in their quantified form, are important in systematically tracing policy movement over time and in relation to other parties. Particularly important in this regard have been the maps of left–right movement produced by the MRG-CMP published in recent years. Generally, these show little sign of party policy convergence on the center or on the median elector as predicted by some influential models of party behavior. Rather, they show parties as sticking fairly consistently to their own ideological space and thus maintaining the policy differentiation that is important in offering voters the kind of choice between alternative programs envisaged in the theory of the party mandate (Michael McDonald & Ian Budge, 2005). Some strategic or other forms of variation also occur in their positions over time. This has the effect of varying the policy options offered from election to election, another important element in democratic choice. It is paradoxical that political science, as opposed to normative political theory, has for so long neglected the systematic study of texts. Both the main inputs and the major outputs of political science are textual—reports, loans, budgets, circulars, and declarations. Central on the input side is the election program or manifesto. Perhaps the manifesto research described above will spill over into the analysis of other political texts in the not too distant future.

PARTY ORGANIZATION

To study party organizations it is essential to draw all necessary analytical suggestions from organization theory and to adapt them to the special case of parties. Of course, this is not the only way of studying political parties. Many different points of view can be adopted. But this particular way provides the opportunity to explore the different ways in which the internal rules of the game, that is, the system of organizational incentives and opportunities, influence the actions of party members at the top levels, at the grassroots levels, and at the intermediate hierarchical levels.

An innovative definition of party organization is not needed. Political parties are *formal organizations*. Therefore, we can begin with a standard definition of formal organization as

> a group of people formally constituted and endowed with an official mission, a hierarchy (more or less elaborated), as well as a structure of internal coordination, boundaries (more or less open), and some kind of task specialization (more or less developed).

A political party is a formal organization specialized in the presentation of candidates in local and/or national elections. In this perspective, the first and most important difference, according to Giovanni Sartori, is among parties operating in a competitive, namely, democratic environment and parties operating in a noncompetitive environment—that is, some modern authoritarian single-party system.

This entry investigates some aspects of the complex question of party organizations. It begins with some general suggestions about the historical evolution of political parties: their formation, their institutionalization, and path dependency effects. Next, it considers parties' organizational structures (different kinds of hierarchies, different kinds of power structure) and the linkages between a party's official goals and its organizational structure, the relations between parties' organizations and their external environment, and the causal mechanisms at work when political parties experiment with organizational changes. Finally, this entry briefly examines some typologies of parties, summarizing the most relevant features of recent developments in party organization.

Historical Evolution

In a historical-institutionalist perspective, understanding party organization requires an analytical reconstruction of each political party's origin and specific institutionalization. The features of parties' organizations depend on past history: how the organizations originated and how they consolidated. Path dependency rules explain why every organization, and political parties too, bears the mark of its origin and consolidation (institutionalization) even several decades later. Reconstructing the genetic model (Angelo Panebianco, 1988) of political parties means considering three elements:

1. *The organizational development:* The birth of a party can be due to territorial penetration or territorial diffusion, or their combination. Penetration means that a "center" organizes, controls, and directs the development of a territorial "periphery." Diffusion means that party organization is the product of the aggregation/federation of previous local groups and elites. In the first case, the party will probably become a strong, centralized organization controlled by a unified central oligarchy. In the second case, the party will be a decentralized organization with many diversified and competing groups: a stratarchy, as described by Samuel Eldersveld in 1964, in which every subgroup fights for power, making precarious and instable compromises with other subgroups.

2. *The presence or absence of an external sponsor of an institution (a church, trade unions, the Comintern) as actual founder of the party:* If an external sponsor exists, the party is its "political weapon." The external sponsor is the main center of loyalties and identifications for party followers and members as well as the source of legitimation for party leaders. Therefore, externally legitimated parties (confessional parties, labor parties, communist parties) and internally legitimated parties can be distinguished. This circumstance will influence all aspects of the future organizational developments.

3. *The presence or absence of a charismatic leader as founder of parties:* Charismatic parties have very special features. The leader holds the full

control of the party's dominant coalition. He or she is the de facto owner of the party.

The characteristics of the genetic model influence the manner of institutionalization, the process of structural consolidation of parties. Institutionalization is the process by which an organization incorporates its founder's values and aims, by which it becomes an institution—develops boundaries, an internal career system, a consolidated hierarchy, and a professionalized leadership. Two ideal types can be distinguished: strong institutionalization and weak institutionalization. Strong institutionalization means high autonomy from the environment and high interdependencies and coherence among its internal components. Weak institutionalization means low external autonomy and a low degree of internal interdependence. In the first case, the party will be a centralized, bureaucratic, organization led by a strong central oligarchy. It will hold the control of many external organizations (unions, interest groups, etc.), and it will adopt an aggressive, expansionist, policy toward the external environment.

In the second case, the party will be a decentralized organization, controlled by external groups (external organizations) and/or local notables, with a poorly developed internal administration system. It usually will be unable to develop aggressive policies toward the external environment.

Genetic model and institutionalization are related. A strong institution is mainly associated with territorial penetration and the absence of an external sponsor (with the notable exception of the communist parties in the 20th century). Weak institutionalization is mainly related to territorial diffusion and the existence of external sponsors. Finally, the presence of charismatic leaders as party founders is rarely associated with institutionalization (the *routinization of charisma*, in Max Weber's terms). Only a few charismatic parties become institutions (e.g., the Gaullist party in the French Fifth Republic). The majority of them disappear with the end of the human and political journey of the leader.

Physiognomy of Party Organizations

The official mission comprises the ideological goals, the organizational constitution, and the power structure, which are the three (related) aspects that define the physiognomy of party organizations.

The official mission of the party, its manifest ideological goals, influences both its organizational structure and its culture (and its relations with the environment too). Many formal and informal rules depend on the features of the official mission. But the official mission is also too vague an indicator of the characteristics of party organizations. Moreover, the original official mission is usually transformed during the process of institutionalization and after. Robert Michels's (1911) idea of "substitution of goals" may be exaggerated, given that a complete process of substitution of goals in a party is a rare occurrence. But usually, in the course of time, an "adaptation of goals" takes place: The goals are adjusted to the environmental circumstances, and as a consequence, they become vaguer.

Party members need to believe in those goals, and the capability of mobilization of followers by party leaders depends on their capacity to demonstrate themselves as zealous defenders of the ideological goals (as well as their capacity to distribute or promise material incentives and resources). But the role of the official mission will vary. For example, when parties are in power, there is less need of mobilizing members and followers and the official mission becomes less important. On the contrary, when parties are in the opposition, there is a greater urgency to mobilize people. In this case, the official mission, the ideological goals, will be emphatically affirmed.

The second aspect is the organizational constitution. The constitution defines the rules of the game: the distribution of formal authority in the party, the ways of coordination among the official party roles, the type of task specialization, and the organizational boundaries (who is a member and who is not). Sometimes, students of party organizations reduce the organizational analysis of parties to the description of their formal constitutions. But the constitution is only a fragment of a complex organizational whole.

The third aspect regards the power structure. In every party, there is a dominant coalition, a group of leaders who control the organization. The physiognomy of the dominant coalition is an essential defining feature of party organizations. In the case of the internally legitimated party, the dominant coalition comprises only party members.

In the case of externally legitimated parties, it includes the leaders of the external sponsor organizations: For example, the top officials of the British trade unions were, for a long time, members of the Labour Party's dominant coalition.

Moreover, the dominant coalition leaders can hold positions of authority in the party (the general secretary, the members of the party national central committee, etc.), or they can be parliamentarians. Finally, the dominant coalition, in some cases, can include not only national leaders but also regional or local leaders (e.g., the secretaries of some important local federations).

Dominant coalitions can also be classified on the basis of their levels of cohesion/division and stability/instability. Both aspects are related to the power competition within the dominant coalition. If the subgroups of the dominant coalition are not organized, if they are only tendencies, as Richard Rose put it, the level of cohesion of the dominant coalition will be high. If the subgroups are strongly organized (factions), the level of cohesion will be low, and the dominant coalition will be divided.

The level of stability/instability refers to the capacity of members and subgroups of the dominant coalition to stipulate durable compromises among them. Therefore, cohesive-stable dominant coalitions (e.g., the communist parties), divided-stable dominant coalitions (the French socialist party of the time of Jean Jaurés and Léon Blum, the Christian Democratic Union [CDU] under Konrad Adenauer), and divided-instable dominant coalitions (the Italian Christian Democracy, 1953–1993) can be distinguished.

Furthermore, dominant coalitions can be *oligarchies* (cohesive and stable, without a single prominent leader), *monocracies* (a single leader, usually of the charismatic type, controlling the dominant coalition and, by consequence, the party), or *poliarchies* (divided and instable, usually a collection of factions).

Parties and Their External Environment

Like all other formal organizations, political parties interact; that is, they exchange vital resources with their external environment. The portions of the environment that are relevant for the party are its "task environment" or domain. First of all, there is a special portion of a party's environment that the party identifies as its "hunting ground," its privileged *classe gardée*, or reserved territory; it is that portion comprising the electors of the party and from which the party draws the majority of its members. The party's official mission identifies the domain. Middle-class parties, manual workers' parties, ethno-regional parties, and confessional parties are all denominations that make reference to those portions of the social territory that the official mission identifies as the privileged *classe gardée* of the organization. Changes and transformations of the social territory usually cause changes and transformations in the party. Alternatively, the leaders can deliberately manipulate and change the original official mission of the party to enlarge or change its domain.

The traditional sociology of political parties is usually concentrated on these aspects of the relations between parties and the environment. But the identification of the *classe gardée* does not entirely cover the topic. We should examine the question of the relations among parties and environments from a different perspective. In the case of parties operating in democratic, competitive regimes, it can be useful to divide the party environment into three main (interconnected) arenas: the electoral, the parliamentary, and the interorganizational (the set of relations between the party and interest groups, unions, etc.).

Different levels of complexity and different levels of stability/turbulence can be identified in each arena. On complexity, organization theory assumes that there are isomorphic pressures: The more complex the environment, the more complex the organization becomes. An increase in the complexity of the environment forces the organization to increase its internal specialization. In a complex arena (electoral, parliamentary, or interorganizational), the party is obliged to specialize its internal offices in order to face the different external pressures and threats.

As regards stability/turbulence, organization theory predicts (ceteris paribus) more decentralization in a stable environment and more centralization in a turbulent environment. In a stable, predictable environment, there are few external dangers: Parties adapt to the environment, the different subsections of the party have stable exchanges with different portions of the environment, and concentration of power is not a necessity. In a turbulent environment, unpredictability is very high, and there are many external dangers: The organization must concentrate power at the top of the hierarchy to survive.

During the period from 1920 to 1960, the electoral arenas of Western Europe were highly stable. In consequence, party organizations too were stable or changed very slowly. By the late 1960s, the picture had changed: The European electoral arenas became more volatile and turbulent, and party organizations underwent important changes. Above all, concentration of power at the top level of the hierarchy became a necessity for all parties. For instance, the so-called personalization of party politics, the new relations between party leaders and the public, was not only brought about by the new role of the mass media but was also an aspect of power concentration processes in turbulent electoral environments. The theory predicts decadence (in the case of parties, severe, permanent, electoral losses) if the organization fails to adapt itself to the new environmental conditions.

Organizational Changes

Every organization can experience two different kinds of changes: (1) continuous, small, and incremental changes that do not modify the essential features of the organization (official mission, organizational constitution, power structure) and (2) rare and extraordinarily big transformations that happen suddenly, deeply modifying those features. The punctuated equilibrium model is a stylized representation of the process.

Major transformations of political parties are rare but do happen. The process can be broken down into three phases. The first phase is the rise of an organizational crisis. The crisis is usually the effect of environmental pressures. In the case of parties, a severe electoral defeat is the most frequent external challenge that can give rise to the organizational crisis. The second phase is a change in the composition of the dominant coalition: Old leaders are discredited and removed, and new leaders enter the coalition. There is a more or less brisk "circulation of elites." The third phase sees a simultaneous change in the organizational constitution and the official mission. The (partially) changed dominant coalition must consolidate itself. Usually, it will introduce change in the physiognomy of the organizational structure and (partially) modify the official mission. A succession of ends (partial substitution of the old goals with new ones) is a consequence of the change in the composition of the dominant coalition. The final effect of the process will be a more or less deep transformation of the relations between the party and its task environments.

Two (related) regularities can be identified: (1) the stronger the environmental pressure, that is, the more dangerous the external threat, the more severe is the organizational crisis, and (2) the more severe the organizational crisis the deeper is the change in the composition of the dominant coalition and the transformations of both the organizational structure and the official mission as well. This ideal-typical, highly stylized representation of parties' changes may be assumed as a quite useful analytical tool for empirically observing the transformations that parties sometimes experiment with.

Typologies

In his classic *Political Parties* (1951), Maurice Duverger proposed a famous classification of party organizations. In the Western historical experience, he identified four fundamental types: (1) the cadre party, (2) the mass party, (3) the cell party, and (4) the militia party. The first two types were the most important and diffuse. But Duverger's analysis was not original. It followed the classical works of Moisey Ostrogorski, Robert Michels, Max Weber, and James Bryce.

The cadre party is the traditional bourgeois party: a loose electoral organization, without party discipline, financed by notables and controlled by the parliamentary elite. The mass party is a very strong organization. It is a membership party. Its organizational "inventions" are the territorial section, the membership card, the party bureaucracy, and the periodical congresses in which the leaders are officially selected and the political strategy is approved. An "inner circle" (the general secretary, the party headquarters) controls the mass party. Usually, the parliamentarians are dependent on the inner circle. The mass party is the organization that is able to proselytize among the popular classes of the society: manual workers, peasants, and artisans.

Duverger's prophecy is well-known: The mass party would become the dominant type of party in the mature Western democracies. Like Michels 40 years earlier, Duverger was influenced by the history of the European socialist parties. Sixteen years later, Otto Kirchheimer (1966) reversed the perspective. A new form of party was emerging: the catchall party. The catchall party was different from the mass party of the past. Its communicative style was pragmatic, not ideological, and its linkages with the traditional *classe gardée* (the manual workers, the religious voters) were declining. The transformation of the mass party into a catchall party was an effect of the social and political transformations of European societies: the economic development, the rise of mass education levels, the new role of the mass media, and so on.

Party organizations were changed too. New types of professional figures slowly took over the old mass party bureaucracy: mass media experts and marketing and fund-raising specialists, among others. The traditional role of the membership, so important in the old mass party, was declining. From an organizational viewpoint, the passage from the mass party to the catchall party has been synthesized as the transformation of the bureaucratic party into the professional electoral party (Panebianco, 1988).

After Duverger and Kirchheimer, there have been many attempts to identify the recent transformations of Western parties. The cartel party model (Richard Katz & Peter Mair, 1995) is one of these. In this perspective, the most important change is with regard to the "statization" of parties, their new symbiotic relationship with state agencies and its impact on the traditional party organization. Some empirical analyses confirm that cartelization is one of the possible transformations of Western political parties (Klaus Detterbeck, 2005).

In another interpretation, the Western political parties are becoming franchise systems: A central organization provides ideological arguments and material services to a lot of autonomous subparty organizations. The franchise model implies the end of the traditional internal party hierarchy. Stratarchies are everywhere replacing the traditional oligarchies (R. Kenneth Carty, 2004).

All these attempts to analyze contemporary trends and transformations are useful, but prudence is needed. It is inaccurate to imagine (like Duverger or Kirchheimer) that some type of party organization is becoming the dominant type and that all the existing parties will imitate that type. On the contrary, a plurality of very different party organizations always coexists in democracies. As we have seen, parties are influenced by their original missions, by the personality and roles of their founding leaders, and by the crucial organizational decisions that accompanied their birth and institutionalization. After the institutionalization, path dependency processes reduce both the leaders' menu of choices and the probability of radical changes in the organization. Moreover, political parties are born in different historical moments, and all organizations are strongly influenced by the cultural models prevailing in those moments.

A second reason for prudence has to do with new political parties' organizations in the new democracies. The picture is very differentiated, and a lot of empirical and comparative work is needed to understand the features and the evolutions of these new political organizations.

In the case of Europe, there is a third prudential consideration. The European integration process exerts pressures on national party organizations, but the effect is still largely unknown.

The organizational analysis of political parties is a "structural" kind of analysis. The assumption is that the organizational structure influences the behavior of actors (leaders, members, and followers). This assumption is common to the traditional organization theory and to the most recent neo-institutional theory. In any case, despite its correctness, this perspective tells only a part of the story. One must also take into consideration the freedom of action of the organizational actors.

An organization is a system of roles equipped with incentive and punishment mechanisms that influence actors' behavior. It is also an arena in which actors compete for power, and the rules of competition depend on the arena characteristics. But "to influence" is not "to determine": In real life, different actors can react differently to the same incentives. The organizational analysis is a useful starting point, but "structures" (including organizational structures) do not substitute for social actions. A theory of action is the indispensable complement of any analysis of a party's organization.

PARTY SYSTEM FRAGMENTATION

A party system is fragmented if it contains more than two parties, none of which comes close to obtaining an absolute majority in the representative assembly. Party system fragmentation thus has two aspects: the number of parties in the system and their relative size. A pure two-party system fails to meet both of these defining criteria. A system with many parties of which one is large enough to approach an absolute majority on its own also cannot be considered fragmented. In empirical terms, fragmentation in practice refers to those parties that gain representation. Parties without official representation are often difficult to observe and document. Moreover, most theories of the causes and consequences of party system fragmentation deal with parties with seats in a representative body. If the representative assembly of a country contains many fairly small parties and no party approaching majority status, the party system of that country can be considered fragmented. Several measures are available to determine varying degrees of fragmentation; they are strongly intercorrelated and can therefore be used interchangeably. The Laakso-Taagepera Index of the Effective Number of Parties is the most widely used measure. It is calculated as follows:

$$N = 1/\sum p_i^2,$$

where N stands for the effective number of parties and p_i denotes the fraction of the seats held by each party i in the assembly. All parties are accorded some weight, but the index weights the largest parties most. Theoretically, if there are 2 parties of exactly the same size, the effective number of parties is 2.0. Three parties of equal size render the index value 3.0, 10 such parties 10.0, and so on. The party systems of the United States, Sweden, and Finland can be used as empirical illustrations. The mean value of the Laakso-Taagepera Index for the U.S. House of Representatives since 1960 is 1.9. For Sweden, with a multiparty system where the Social Democrats have held around or more than 40% of the *Riksdag* seats, the corresponding figure is 3.6. In Finland, no party normally wins more than a quarter of the parliamentary seats; the mean effective number of parties is 5.2. The three cases represent a two-party system, a moderately fragmented multiparty system, and a highly fragmented system, respectively.

The numerical aspects of party systems have always been an important factor in the comparative literature on political parties. Claims that systems with many parties were less governable than two-party systems were presented already in the 19th century. As the interwar years saw the demise of democracy in a large number of European states, the criticism against multiparty government gained in prominence. Nevertheless, it is only with the emergence of comprehensive comparative databases during recent decades that robust empirical generalizations have become possible.

The dynamics of electoral systems go a long way toward explaining why some countries have fragmented party systems while others do not. Single-member plurality (SMP) systems effectively reduce the number of parties that gain representation, while proportional (PR) list systems are conducive to fragmentation, especially when electoral districts are large. Among democratic countries with SMP systems, the mean effective number of parties since 1960 is 2.1, while the corresponding figure for democracies with PR list systems is 3.9. Countries with other electoral formulas, including mixed-member systems, usually attain values between these extremes. It is very difficult for parties other than the two largest ones to win seats in SMP systems, while proportional systems frequently allow even quite small parties to gain representation. Voters' awareness of this mechanism reinforces its effect. If voters deem it highly unlikely that a vote for a minor party will result in the party's winning a seat—as is the case in SMP systems—their propensity to vote for it becomes smaller. By the same token, a higher probability of a small party's winning representation in PR systems will mean that voters are more likely to stay with their preferred party even if it is a minor one.

The number of politically relevant social cleavages is another important determinant of party system fragmentation. In most democracies, political parties can readily be placed on a left–right scale; this scale frequently coincides with the major socioeconomic divisions in the population. These divisions may give rise to, for example, conservative, left-wing, and centrist parties. If, however, other cleavages such as religion, language, or region cut across the left–right dimension, the result may be a considerably higher degree of party system fragmentation. The effect of multiple cleavages is particularly pronounced if the electoral system permits numerous parties to gain representation. A good example of this is Belgium, where the division between French and Flemish speakers cuts right across the left–right divide and where the PR list system presents few obstacles to minor parties' gaining parliamentary seats. The mean effective number of parties in Belgium since 1960 is as high as 6.3.

The size of countries and other political units, whether measured by population or by geographic area, has an independent effect on party system fragmentation even after the effects of electoral systems, socioeconomic diversification, and cultural heterogeneity have been controlled for. This rule seems to apply at both the cross-national and the subnational levels. Large size is related to greater social distances, functional specialization, as well as organizational diversity and complexity. All these factors are conducive to greater attitudinal diversity, which in turn may enhance party system fragmentation.

Several other factors have been proposed as explanations of the variation in party system fragmentation. It has been suggested that bicameralism fosters party system fragmentation. The timing of elections at various governmental levels may also have an effect. If parliamentary, presidential, regional, and local elections are held at different points in time, the variety of issues and interests at stake in these elections may foster partly separate sets of political parties. Moreover, it has been proposed that strong presidential executives may reduce the incentive to maintain large, unified parties. On all these points, the empirical evidence cannot be considered conclusive yet.

The effects of party system fragmentation are particularly related to government formation and stability. While the winning party in a two-party system can form the postelection government based on a majority of its own, this alternative is not available in fragmented party systems. Instead, the choice must be made between a coalition of several parties or a minority cabinet. The incidence of both minority governments and coalition cabinets is positively associated with the degree of party system fragmentation; the latter association is particularly strong. Thus, although ideological and political factors naturally influence the way parties cooperate and interact with each other, the numerical criterion is an important general determinant of government type.

The internal functioning and prospects of a government are strongly affected by its type and status and are thus linked to party system fragmentation. One-party majorities are, ceteris paribus, the strongest government type. They have the necessary strength to get their agreed-on policies enacted and implemented; at the same time, they are not as frequently plagued by major internal differences like other types of governments. As fragmented systems present the choice between minority status or coalition government (or both), the combination of strength and political unity is much rarer in these systems. While internally unified, one-party minorities are at all times at the mercy of the political majority outside the government. Coalition cabinets may find it difficult to reconcile the differences between the government parties, which frequently results in government crises. Consequently, cabinets in countries with fragmented party systems tend on the whole to be more short-lived than cabinets in countries where one-party majorities are the rule.

From the point of view of the citizen, party system fragmentation creates a problem when it comes to holding parties and politicians accountable for their accomplishments and failures. When governments are coalitions of several parties, it is not easy for voters to know whom to punish or reward for government policy. All government parties tend to claim credit for popular policies, while failures or unpopular decisions are claimed to be the fault of their partners in government. In fact, alternative coalitions are not always available in fragmented systems. If attaining majority status requires the participation of several parties, the chances are that at least some of the parties from the preceding coalition will be present in the next one as well. On the other hand, fragmented party systems present the voters with a wide range of partisan choices in elections. In these systems, voters can support the parties that they genuinely prefer without risking a large number of wasted votes—that is, votes for parties that do not gain any seats at all. In terms of democratic qualities, fragmented systems tend to perform poorly on accountability but well on representativeness.

Due to their tendency toward cabinet crises and short-lived governments, fragmented systems are often claimed to be vulnerable to pressures from nondemocratic political forces. Besides the feebleness of governments as such, the fact that anti-system parties easily gain representation in fragmented systems is sometimes mentioned as a risk from the point of view of democratic viability. In connection with the economic and political crisis between the World Wars, party system fragmentation was among those factors that made it more difficult to sustain democracy in the face of pressure from extreme political movements. To be sure, examples of long-standing democratic stability despite a high degree of party system fragmentation are not difficult to find: Belgium, Denmark, Finland, and the Netherlands. Still, countries where the democratic form of government is not yet entirely consolidated would be well advised to design their electoral institutions so as to discourage excessive party fragmentation, especially if there are numerous deeply entrenched social and cultural cleavages to be overcome.

PARTY SYSTEMS

Approaches to the study of party systems are multiple, as are their definitions. In its simplest form, the party system is conceived of as a set of patterned relationships between political parties competing for power in a given political system. Such a notion assumes the existence of rules, norms, and regularities in party interactions, concerning mainly coalition-building efforts and electoral competition. This implies also that a party system is composed, as any other system, of distinguishable parts and the empirically testable quality of its "systemness." Below, some major features of such systems, for example, the kinds and numbers of parties involved, their evolution and organization over time, their social bases and dynamic processes, and their relationship to institutional aspects of electoral systems and government formation, are discussed.

An ambitious understanding of a system assumes that it displays features that do not belong to a single entity, that is, to one element alone of the system, and that the system exists only if it hinges on the patterned relationships of its component parts, hence creating systemic boundaries, clearly indicating what belongs to it and what is located outside it. A system is always composed of interacting participant units, in which the action of each and every participant affects the actions of all other participants. A systemic approach reveals how everything at the level of the system and its structural properties differs from the level of the interacting units. Systemic traits structure the interactions between parties and the games that parties play. These interactions hinge on party resources, preferences, and the constraints they face. Moreover, this implies that the interdependence of the units or their attributes is ordered, in the sense that developments are predictable and that not just anything can happen. This order tends toward self-maintenance, which supports the delineation and freezing of the boundaries of the system within which patterned relationships take place. Consequently, parties create a system only when their component parts interact in a patterned systematic way. The system works when parties within the system are dependent on each other and each party, as Giovanni Sartori's (1976) classic work puts it, "is a function (in the mathematical sense) of the other parties and reacts competitively or otherwise, to the other parties" (p. 44). In short, a party system is a system of interactions resulting from interparty competition.

Analyses of parties have been made prior to deliberations on party systems. Parties as political institutions began to draw the attention of the social sciences from the second half of the 19th century, whereas interest in party systems increased in the second half of the 20th century. Without an understanding of the ontology of parties, the systemic features of their interactions cannot be depicted.

Three aspects of party systems should be mentioned. First, behind almost every classification of a party system is the idea that they are structures of representation. Second, an equally frequent proposal submits that they are institutionalized channels of articulation. Finally, they are conceived as means of governability. In other words, the three most important functions are (1) to recruit and present candidates for public office who are likely to be accepted by voters; (2) to offer distinguishable policy packages, programmatic and ideological alternatives that take into account the preferences and values of citizens; and (3) to implement policies effectively and contribute to the overall stability of the system. The composite units of party systems are the most influential manifestation of popular organizations that articulate and press demands and deliver support to those who govern in contemporary democracies. These diverse functions offer challenges as often they are in conflict with one another. Achieving quality representation calls for a large number of parties satisfying the aspirations of even small social groups with clearly defined narrow issue profiles and specific aspirations. The more parties there are, the better the policy fit between groups of voters and their institutional representatives. At the same time, such a party system contributes to polarization, divisiveness, and ultimately to poor governability. If, in turn, we wish to achieve effective governability, we should opt for one-party dominance, with a consensus-driven, pragmatic party oriented toward the mobilization of resources to satisfy the needs of the majority. Such a solution, with a single-party monopoly, would satisfy the needs of political effectiveness but at the same time violate other important democratic values: plurality, choice, and open competition. Consequently, in reality, party systems ought to compromise on maximizing each of their basic functions and adopt more moderate, optimal solutions guaranteeing the accomplishment of different goals.

Number and Size of Parties

Descriptions of party systems rely on their widely accepted, numerous attributes. One finds a rich array of proposals concerning these attributes and their relevance and importance for party systems, depicting at the same time both the essence and the dynamics of a given party system. The most popular describe a party system with reference to the number and the size of parties considered relevant. Which parties should be considered relevant and/or successful enough for inclusion into the system is the single most important question students of party systems seek to answer. This is important because it has a direct effect on other significant systemic features, such as the relative size of parties and consequently the dominant logic and mechanisms of competition, the nature and durability of cooperation and alliances, the degree of polarization of the system, its center of ideological gravity, its stability and thus its predictability, and the way social strata and important social groups are represented in the overall political system.

Most scholars distinguish between one-party, two-party, and multiparty systems. The first type is questionable; for many it is an oxymoron, although scores of political systems of the world are still based on the existence of a single party, because other parties and representative organizations are legally forbidden. There exist, however, systems, in which one-party hegemony over a prolonged period of time is the rule, although legally opposition parties are not banned. Their permanent marginalization is determined by a combination of discriminatory practices, the harassment of citizens, and clientelistic relationships. Furthermore, several countries with clearly democratic credentials (e.g., Japan and Sweden) and a multiparty system design in reality experience a system in which one party dominates for a long period of time, even though the functioning of opposition parties is not constrained legally or in practice.

A fundamental distinction was made in the mid-20th century between two-party and multiparty systems, their causes, and consequences. The major cause was seen in the respective electoral laws: Simple plurality rules (first-past-the-post) applied in single-member districts tend to produce two-party systems, while two-round majoritarian and proportional rules favor the creation of multiparty constellations. The consequences, it was assumed, were essential as well: A two-party system was believed to create a stable political system, with moderate centripetal competition, based on clarity of responsibility and accurate attribution of accountability. Multiparty systems, by contrast, were believed to enhance extremism, centrifugal competition, limited alternation of governing parties, unclear accountability due to complex coalition formation procedures, and vague responsibility for the policies implemented.

This simple numerical criterion used in distinguishing party systems faces many problems, the crucial one being how parties should be counted. It is, and always has been, obvious that parties cannot be treated equally, mainly because of their divergent electoral support, legislative strength, and potential for entering coalitions, and the peculiarities of their social following. Scholars dealing with this problem are aware of the difficulty in finding adequate criteria by which to include or exclude parties or, alternatively, assign them a proper "weight." In the mid-1970s, a solution seemed to be found; Giovanni Sartori offered the criterion of *relevance* of parties. To be relevant, a party had to disclose its *coalition* and/or *blackmail* potential. The first feature, the coalition potential, depends on whether a party is attractive enough, because of its size or a unique, pivotal position in the space of political competition, to effectively join governmental coalitions and share executive responsibility. The second, party blackmail potential, is less obvious as it refers to a specific factor that depends on our interpretations: A party exerts blackmail potential if it can influence the behavior of other systemic and relevant parties, despite the fact that it cannot itself participate in a coalition government. This applies to systems in which sizeable parties are excluded from mainstream politics by the other parties because of alleged antisystemic features or traits pointing to their radicalism and destabilizing potential. Good examples of such parties are the former Italian Communists or the contemporary Czech/Moravian Communist Party (Komunistická Strana Čech a Moravy, KSCM). In both instances, the parties enjoyed substantial, double-digit percentages of social support but were never allowed to participate in any executive responsibility at the national level.

Irrespective of how important the relevance criterion is, Sartori's proposal still focuses on the number of parties and their respective ideological and programmatic distance as the main features of a party system. Combining these two criteria, the proposal allows us to distinguish between, what he calls, *moderate (limited) pluralism* and *polarized (extreme) pluralism*. In the first instance, a party system consists usually of three to five parties and reveals relatively little ideological distance between them. In the second case (of polarized pluralism), the party system is usually composed of six or more parties and manifests significant ideological distance between the parties. The clear virtue of this proposal is its dynamic nature. The variables used interact with each other, allowing one to predict more or less accurately the development of a system in practice. For instance, moderate pluralism not only reveals a smaller number of relevant parties and lesser ideological distance, but it is also very likely to develop a centripetal direction of systemic competition between two clearly distinguishable blocs, whereas polarized pluralism is most likely to develop centrifugal competition with various opposition parties, leading to their irresponsible behavior, poor accountability mechanisms, and destabilizing effects.

Policies, Programs, Ideological Divisions

Party systems are frequently depicted using spatial metaphors, indicative of policy or ideological dimensions and divisions: Among them the left–right dimension is the most popular one. It is precisely this aspect of party systems that distinguishes one from another: the substance of policy and the number of salient dimensions that need to be taken into account in understanding and interpreting the logic of party system structure, development, and change.

Many scholars define the party system not only by referring to the number of parties and their patterned relationship but also by indicating their belonging to, or leaning toward, a particular *party family*. The latter, in turn, is defined as a group of parties in different countries that have similar ideologies and party programs. Each country has a unique party system: a unique combination of parties, ideological and programmatic profiles, size of electoral support, and coalitions. Nevertheless, certain patterns across countries are discernable.

The description of party systems from this point of view uses the language of *social divisions*, *dimensions of competition*, *political divides*, and *cleavages*. The terminological universe is complex and blurred by the inconsistent way scholars use these notions. At this point, let us reiterate that indeed society is differentiated by many factors and that these distinctions are more or less salient and durable and/or conflicting. If in addition to this salience and durability, they are politicized, one can speak of cleavages. Cleavages are a relatively stable product of social conflicts, but not all conflicts generate cleavages; the ones that do are intense and prolonged. For cleavages to exert structuring power over political developments, party formations, their stability, and patterned interactions, political camps have to be established on the basis of strong identifications and a visionary leadership that is able both to attract public attention with the appeals of their manifesto and to maintain the effective functioning of the party organization.

Only certain social divisions become politicized, where parties represent opposite sides. Parties concentrate on divisions and policy areas that show electoral volatility, that is, where voters, for different reasons, are responsive to party appeals. Other divides are, however, frozen; that is, voters are entrapped within a social relationship where there is no room for individual rationality and free choice. In such instances, cleavage mechanisms, group membership ties, and partisanship determine party support.

One of the crucial, though still unresolved, issues is the relationship between the number of parties and the number of societal divides or cleavages. In principle, the higher the number of salient divisions, the more room there is for the existence of divergent parties. This relationship, however, is far from universal; its fluidity hinges on the extent to which these divisions overlap and on the ability of parties to simplify the multidimensionality of the space of competition by reducing its number to two or three of the most salient ones. The limited cognitive abilities of citizens to process complex information create the necessity for such simplifications, and only those parties that effectively reduce the number of articulated policy alternatives enjoy an electoral advantage. Policy simplification arises also because of certain macrosocietal processes, that is, the growing middle class and/or redistributive successes of the welfare state, which allow for the simpler, one-dimensional appeal of a party manifesto.

Another essential distinction for understanding the different modes of party competition is the one between valence and positional issues. The former concerns universally prized values or goods that most politicians and citizens agree on. The latter assumes clear differences between groups of people in policy stances and value orientations. Due to this, parties may offer divergent policies concerning some substantive issues, for example, taxes, health services, and welfare benefits. The relationship of the dominance of valence or positional modes of political competition with quality of representation and accountability as well as with clientelistic or programmatic politician–voter linkages is still vague and underscrutinized. Nevertheless, some claim that "candidate appeals play out in most instances into valence competition and only rarely as positional competition. Clientelistic accountability works mostly as valence competition among parties" (Herbert Kitschelt, 2009, p. 623).

Party System Institutionalization

The well-known saying "No parties, no democracy" has strong empirical support. So far, no example of a working modern democracy without parties exists. Contemporary global developments, since new Third Wave democracies in large numbers increased the family of democratic polities, call for more scrutiny and clear-cut indicators of what counts as a consolidated system of political parties. One of the most widely accepted proposals was introduced in the mid-1990s by scholars comparing the development of Latin American polities. Currently, the idea is widely shared by scholars focusing on other newly democratized countries and their inchoate party systems. At the most abstract level, institutionalization is a process by which organizations and procedures acquire value, stability, and consequently predictability. There are several major features of an institutionalized party system:

1. stability in interparty competition,
2. the existence of parties that have stable roots in society,
3. broad acceptance of elections and parties as legitimate institutions deciding who governs, and
4. the existence of parties as organizations governed by stable rules and structures.

A more detailed portrait of an institutionalized party system ought to emphasize the fact that the stability of interparty competition signifies relative stability and does not amount to a stagnant, frozen relationship. The stable roots of parties in society imply that some parties enjoy overproportional support from certain social strata, the labor market, and social or ethnic groups and that this support is stable from election to election. Parties differ in the extent to which voters identify with them as well as in the quality of the linkage between citizens and parties. Apart from this, parties still have to manifest firm and enduring ideological, programmatic, or policy positions for citizens to understand what they stand for. The broad acceptance of elections and the decisions taken by parties after the election (concerning, e.g., the formation of coalitions) as the only legitimate means of taking responsibility for governing and controlled access to power concerns mainly political elites and their attitudes and preferences. Finally, the stability of rules and structures points to the importance of the autonomy of parties, both from populist leaders and from other organizations or powerful groups, even those that might have historically been instrumental in their creation (e.g., the churches, trade unions, and businesses). Parties also have to be independent financially and to operate on the basis of highly routinized norms and procedures.

In short, this approach emphasizes party interactions that reveal stability, based on a well-developed connection between politicians and their voters; it also considers electoral volatility to be a fundamental indicator of the systemic nature of the party system.

There is, however, another approach to the structuring of the party system that concentrates on its most important attribute, namely, the competition for power. It comprises the core element and the main criterion for evaluating the mode of patterns of competition, that is, its open or closed nature. Whether a party system reveals stable and predictable party competition depends on several easily observable, empirical factors. *Alternation in government* is one, and it takes three forms: (1) *wholesale alternation*, when a governmental party is totally replaced by an opposition; (2) *partial alternation*, when the newly established government includes at least one party of the outgoing government; and (3) *nonalternation*, when there is no change at all. The second factor is *familiarity with government or innovation*. This could indicate the degree to which parties tend to be in government in the same configurations, which signifies *familiarity*; or their combinations are new every time, which indicates *innovation*. *Access to government* is the third crucial factor; it focuses on whether all relevant parties in the system, over a long time period, had access to executive offices or whether there are some parties permanently excluded from power. It indicates whether access to government is widely or narrowly distributed. Based on these criteria, we arrive at two fundamental types of party competition. The first is the *open* structure, where alternations of governments take place and no stable governmental coalitions exist, accompanied by a highly dispersed and easy access to governmental positions for all or most relevant parties. The second type is the *closed* structure, which is in place when the reverse pattern occurs—that is, either there are no alternations or durable coalitions remain in power, with some relevant parties being permanently excluded.

Party System Change

Analyzing system change calls for terminological precision. The first problem concerns the distinction between changes *within* the system as opposed to a change *of* the system. The second problem, related to the first, pertains to the scope and level of change; in this regard, four abstract manifestations can be distinguished: (1) incidental swings, (2) limited change, (3) general change, and (4) alternation of the system. Incidental swings are usually temporary distortions in the patterned way a party system operates; this might have to do with the occurrence of a new (small) party, a change in the polarization of the system, the appearance of new salient issues, and similar factors. The particular trait of such a change is that it is minor in its effects; it does not alter the traditional logic of party competition and coalition formation. These swings are indeed incidental and short-lived, having a negligible effect on the main actors of the system.

Limited change is prolonged or even permanent; the change is nevertheless restricted either to one area or confined to the emergence of a party that replaces another one. Sometimes a party simply disappears; nevertheless, a new one is created simultaneously, which serves as its functional equivalent. Limited change might also mean a modification in the dynamic features of the system, for instance, an increase in its net, gross, or within-block volatility. Or the system may become more polarized. Nevertheless, all these "limited" changes do not alter the previous logic and stability of the system as a whole; it still falls into the same category.

General change is more serious and relates to several aspects, that is, the fact that changes are multifaceted, deep, and prolonged and that they concern salient features of the system. Moreover, these changes indicate the destabilization of the system and problems in achieving a (new) equilibrium. Such a change can lead to a significant shift in the relative strength of parties, the shape of coalitions, their fragmentation, and their polarization. Overall, such general changes raise the question of whether the system can still be categorized as before. Finally, the alternation of the system signifies a dramatic change in most of its aspects: the party composition; its strength, alliances, and leadership; and all other mechanisms by which it was governed before the alternation occurred. Transformations of this sort may also concern the nature of parties themselves (mass to catchall or catchall to cartel). Total alternations happen rarely and are usually related to extraordinary conditions or events (wars, revolutions, a new constitution, new electoral laws, a severe economic crisis, the forming of an international alliance, and fundamental changes in social structure or similar occurrences).

Consequently, party system change may take a variety of forms, from marginal change to the alternation of essential features, necessitating its reclassification. In other words, change of the original nucleus of the party system can be seen as party system change, while marginal changes (usually) are not. Empirically, such a change signifies alternation of the direction of competition, major changes in structured alliances and cooperation, or the occurrence of a new governing formula.

Party systems also change their format due to long-term social and economic developments. The processes of dealignment or realignment of party affiliations result from structural demographic changes, accompanied by culture shifts. Previously excluded voters, new generations, and newly created sectors of the labor force come, at some point, to decide on public policies and general values as well as lifestyle preferences. These processes affect parties; their programs, policy stances, and profiles; the nature of their leadership; and ultimately the nature and format of the entire party system.

PATH DEPENDENCE

Path dependence, a highly popular concept in social science, simply refers to a dynamic pattern or continuity that evolves as a result of its own past. As a historically sensitive approach, path dependence emphasizes the role of the *timing* and *sequence* of events in the social and political world. Small, accidental, or random occurrences happening at a certain time are expected to have long-lasting, self-reproducing patterns or paths. In other words, *when* things happen in a chain of events affects *how* they take place. Below, the importance and also some of the limitations of this concept are discussed.

Although path dependence simply asserts that particular choices and events that occur in the past mold the unfolding sequence of events (i.e., history matters), any continuity or sequence of events may not constitute a path-dependent process. Path emergence, maintenance, and breaking in a path-dependent process should have specific features. Regarding path emergence, contingent, accidental, brief occurrences or nonoccurrences launch event chains. In other words, initial conditions are treated as stochastic. Otherwise, path dependence would be nonfalsifiable because one can easily link any event to an antecedent or a temporarily distant cause. As a result, any outcome might be marked as path dependent. To avoid such a problem of endless flow of causally connected events (i.e., the trap of infinite regress), the historical event that launches the path is expected to have properties of contingency.

Once historical contingencies or junctures set into motion certain patterns or sequences, they lock themselves in, leading to inertia. In other words, paths become inflexible or rigid over time, making it difficult to shift to another path or return to the initial conditions. The processes or mechanisms that reproduce a path might be rather different from the processes producing the path. Although stochastic factors start a path, certain causal mechanisms reproduce it. A highly emphasized mechanism of path reproduction is increasing returns, defined as *self-reinforcing positive feedback processes*. The idea of increasing returns suggests that the growing benefits that a certain path cultivates with its continued adoption create further incentives for path maintenance, leading to dormancy over time. Learning and coordination effects, adaptive expectations, and large setup or fixed costs constitute some sources of positive feedback processes. Thus, a path may reproduce itself even in the absence of the dynamics and factors responsible for its creation.

With respect to change, path dependence expects it to be incremental and evolutionary (i.e., path following or change within a path). Substantial, pathbreaking changes (i.e., change to a new path) rarely happen after long periods of continuity. Such major changes require critical junctures or periods (also known as branching points) in which some externally driven contingent events, such as wars, economic crises, dramatic technological developments, natural disasters, or epidemics, make the extant path less attractive to follow. Thus, critical junctures unlock the existing path or equilibrium and generate a new one, leading to a new stasis (also referred to as punctuated equilibrium).

Pólya urn process, a simplified mathematical illustration, delineates the logic of path dependence quite well. Imagine an urn containing two colored balls, one yellow and one red. Let us draw one ball and then return it to the urn with an additional ball of the same color. If we repeat this process until we fill the urn completely, which balls will be the most frequent ones in the urn? Obviously, to a great extent this depends on the outcome of the initial draws (i.e., initial conditions). If we draw the red ball in the first round, then the likelihood of drawing a red ball increases in the following draw. Over time, the distribution would settle down to a majority of red balls. In other words, the ratio will eventually reach an equilibrium (i.e., the red one). This process indicates that sequence matters. In the beginning, we cannot say with certainty which color will lock itself in. We, however, know that the results of early draws in the sequence will have a substantial impact on which of the balls will be the dominant one at the end. Thus, early developments or events not only involve a substantial degree of randomness but also produce a large, determinative impact on subsequent developments. In other words, the impact of random occurrences early in a sequence of events does not cancel out. Instead, they exert a long-lasting influence on the evolution of the sequence of events (also known as *nonergodicity*).

It is important to indicate at this point that actors may not always follow the most efficient or beneficial path. In other words, despite conventional economic models in which rational actors are assumed to make efficient decisions and maximize profits, suboptimal outcomes or paths might also lock themselves in. A classical example of path inefficiency is the story of the QWERTY keyboard layout. Although it is widely acknowledged that this keyboard is less efficient than the one developed by August Dvorak, it was able to lock itself in. Why? It is put forward that the dominance of QWERTY was simply due to a historical accident. This keyboard layout was introduced in the late 19th century, while Dvorak's simplified keyboard was initiated in the 1930s. Due to technical interrelatedness, economies of scale, and the quasi irreversibility of investment, it became difficult to switch from the previously introduced keyboard to the new one, regardless of its relative efficiency. This case, too, indicates that the timing and sequence of events matter.

The idea of path dependence is a popular yet highly questioned notion on many accounts. Several studies, for instance, draw attention to its weaknesses in dealing with change. It is observed that path dependence has a bias toward stability. Other than that, it relies on an exogenous deus ex machina to explain substantial, pathbreaking change. In other words, change is explained by exogenously induced variation. This understanding is based on the assumption that institutions have self-reinforcing features, and changes in such structures should be driven by exogenous factors and dynamics. Critiques contend that such an understanding remains limited in accounting for the timing, direction, and mechanisms of the change process. For instance, it is asserted that the source of change may also be endogenous to institutions or sometimes both endogenous and exogenous. It is further argued that path dependence underestimates the role of incremental changes. Critiques propose that minor, small changes might be quite important because they may accumulate over time and create a sudden pathbreaking change. As a remedy for such weaknesses, path dependence is advised to have a stronger sense of *agency*.

This approach is also criticized for its materialist propensity. Although path dependence acknowledges that it is not always guaranteed to reach and maintain Pareto optimality (i.e., a state in which no one can be made better off without making someone worse off), it treats the cost–benefit calculus (i.e., increasing returns, positive feedback) as the main dynamic behind the continuation or the persistence of a path. The utilitarian, materialist bias, however, substantially limits the explanatory power of path dependence because there are also several cases in the institutional world where nonmaterial factors and considerations (i.e., ideas, values, and legitimacy concerns) constitute a path. It is suggested that once successfully institutionalized (i.e., taken for granted by actors), ideas shape actors' perceptions, goals, behaviors, and consequently political outcomes. As a result, some choices will be regarded as more favorable or appropriate than others. This process, in the long run, would lock in certain actions or policies while locking out others (also referred to as *cognitive locking*). Thus, actors may maintain a certain path not because of an expected utility down the path but because of simply believing in the appropriateness of certain ideas and values. Put differently, the main mechanism of self-reinforcement or path reproduction in such ideational continuities becomes taken for granted or legitimate rather than being due to cost–benefit assessments (i.e., increasing returns).

In response to these criticisms, recent studies employing path dependence have paid more attention to incremental, endogenous changes and the role of agency in path emergence, path maintenance, and path-breaking processes. Despite its shortcomings, it is important that a researcher have path dependence in his or her tool kit. The synchronic approaches, which are concerned with the impact of variance in current variables on political outcomes, provide us a "snapshot" view of political life. For a much better understanding, however, these approaches should be complemented with diachronic approaches, which are more sensitive to historical causes or conditions, triggering particular self-reproducing sequences of events.

PATRIOTISM

As Maurizio Viroli notes, patriotism (love of country) and nationalism (loyalty to one's nation) are often taken to be synonymous. Indeed, for writers such as Ernest Geller, nationalism constitutes a distinctive expression of patriotism. Yet the origin of the concept can be traced back to the notion of *patria* in Greek and especially Roman antiquity, which links patriotism with the preservation of res publica and the protection of common liberty. It is only with the rise of nationalism in the 19th century that patriotism becomes associated with the exclusive attachment to a prepolitical, homogeneous, national community. Because of this association, patriotism has been frequently regarded as incompatible with a typically liberal commitment to universal human rights. However, recent scholarship has sought to disassociate patriotism from nationalism by emphasizing new forms of loyalty compatible with universal values, respect for human rights, and tolerance of ethnic and national differences, giving rise to concepts such as constitutional or cosmopolitan patriotism as well as contemporary restatements of the classical republican tradition.

Greek and especially Roman antiquity provide the roots for a political patriotism that conceives of political loyalty to the patria as loyalty to a political conception of the republic and is associated with the love of law and common liberty, the search for the common good, and the duty to behave justly toward one's country. This classical Roman meaning of patria reemerges in the context of the Italian city republics of the 15th century. Here, patria stands for the common liberty of the city, which can only be safeguarded by the citizens' civic spirit. For Niccolò Machiavelli, the love of common liberty enables citizens to see their private and particular interests as part of the common good and helps them to resist corruption and tyranny and, if necessary, to fight to protect and preserve the political community. While this love of the city is typically intermixed with pride in her military strength and cultural superiority, it is the political institutions and way of life of the city that form the distinctive focal point of this kind of patriotic attachment. To love the city is to be willing to sacrifice one's own good—including one's life and, if need be, one's soul—for the protection of common liberty.

In contrast to the classical republican conception of patriotism, Jean-Jacques Rousseau's "Considerations on the Government of Poland" can be seen as an early example of the link between nationalism and patriotism. Yet while Rousseau advocates the love of the nation and the celebration of national culture, he believes that national culture is valuable primarily because it helps foster loyalty to the political fatherland. Thus, Rousseau's nationalism stems from and serves his typically republican emphasis on securing citizens' loyalty to their political institutions. A more explicit link between nationalism and patriotism can be found in the work of Johann Gottfried Herder. In Herder's work, patriotism refers not to a political virtue but to a spiritual attachment to the nation. In this context, fatherland becomes synonymous with the nation and its distinct language and culture, which give it unity and coherence. Thus, instead of linking patriotism to the preservation of political liberty, Herder associates love of one's country with the preservation of a common culture and the spiritual unity of a people. While in the classical republican tradition, "fatherland" is synonymous with political institutions, for Herder, the nation is prepolitical and love of one's national culture is a natural inclination that allows a people to express their distinctive character. On this account, patriotism is associated with the exclusive attachment to one's own culture and thus stands in opposition to cosmopolitanism and cultural assimilation. Freedom is equated not with the fight against political oppression but with the preservation of a unique people and patriotic sacrifice with the desire to secure the long-term survival of the nation.

This association between patriotism and the exclusive attachment to one's nation has led critics like Martha Nussbaum to view the sentiment of patriotic pride as morally dangerous, giving rise to a chauvinism that is incompatible with cosmopolitan aspirations and the recognition of the equal moral worth of all human beings. Yet recent approaches to patriotism have sought to ground patriotism in new forms of loyalty that are compatible with universal values, respect for human rights, and tolerance of ethnic and national differences. At the heart of this renewed interest in patriotism lies the belief that to be stable, democratic societies require a strong sense of allegiance on the part of their citizens. Not only does the high degree of pluralism that characterizes contemporary societies potentially give rise to tensions and disagreements among citizens that may destabilize the polity, modern democratic states committed to a degree of equality rely on the willingness of citizens to make sacrifices for the common good, be it in terms of the everyday redistribution of income to meet welfare needs or the provision of collective goods and services such as education or health care. Hence, in the eyes of advocates of new forms of patriotism, stable democratic societies require a strong sense of solidarity.

The most prominent example of this search for new forms of solidarity is Jürgen Habermas's notion of constitutional patriotism (*Verfassungspatriotismus*), which seeks to ground the loyalty of citizens not in the idea of a prepolitical, homogeneous community but in a commitment to universal liberal principles as enshrined in the constitution of the modern liberal state. To ensure that citizens who subscribe to different cultural, ethnic, and religious forms of life can coexist in and identify with their own country on equal terms, Habermas argues that the modern constitutional state must ensure that its political culture does not favor or discriminate against any particular subculture. To achieve this, it is vital to differentiate the majority culture from a shared political culture grounded in respect for fundamental constitutional principles and basic law. On this account, membership of a nation of citizens no longer rests on an appeal to a shared language or a common ethical and cultural origin but merely reflects a shared political culture based on standard liberal constitutional principles.

Habermas's attempt to ground patriotism in an attachment to universal liberal principles is also associated with what is at times referred to as cosmopolitan patriotism, which seeks to construct a postnational identity based on the recognition of democratic values and human rights as conceptualized within a particular constitutional tradition. Such cosmopolitan patriotism is said by advocates such as Kwame Anthony Appiah to give rise to a rooted cosmopolitanism that couples attachment to one's homeland and cultural particularities with an appreciation of different places and different people and a robust respect for the equal moral worth of all human beings. Advocates of forms of constitutional patriotism often cite the United States as an example of a nonnational polity held together by an expressly political patriotism. John Schaar, for instance, refers to American patriotism as "covenanted patriotism," a form of patriotic attachment characterized by a commitment to the principles and goals set out in the founding covenant and the duty to carry on the work of the Founding Fathers. Another strand of contemporary thought appeals to the classical republican principles of love of liberty, active citizenship, and self-sacrifice for the common good in their attempt to formulate new forms of solidarity that do not depend on the idea of a prepolitical, ethically homogeneous nation. Maurizio Viroli writes in this tradition when he advocates a republican patriotism characterized by a political culture of liberty that emphasizes active citizenship and civic virtue and gives rise to a reflexive, self-critical love of country that aims to ensure that the polity lives up to its highest traditions and ideals.

However, critics of such attempts to generate new, nonexclusionary forms of solidarity have expressed doubts about the extent to which patriotic sentiments can be reconciled with a commitment to universal principles. While critics of constitutional patriotism have questioned the feasibility of Habermas's attempt to decouple the political culture from the wider majority culture, pointing to the extent to which the political culture of even as culturally diverse a society as America draws on national symbols and myths that are laden with prepolitical meanings, commentators like Margaret Canovan have argued that classical republican patriotism was much more illiberal and hostile to outsiders than modern proponents of the republican tradition suggest. According to Canovan, not only is the patriotic virtue celebrated in the classical republican tradition primarily a military virtue, the republican preoccupation with the education and socialization of citizens to systematically instill loyalty and commitment to the state is liable to be seen by many contemporary liberals as an unacceptable form of manipulation and indoctrination. Furthermore, advocates of both constitutional and modern republican patriotism typically presuppose the existence of established political boundaries and common political institutions that have their origins in the rise and consolidation of the nation-state. Thus, the extent to which patriotism can be reconciled with a commitment to universal values, respect for human rights, and tolerance of ethnic and national differences remains contested.

PAY FOR PERFORMANCE

Pay for performance (PFP; also known as merit pay or performance-related pay) involves the provision of a financial reward contingent on some indicator of individual (or less frequently, group) success. PFP has been a consistent reform in government since the 1980s and remains popular.

In an era when elected officials call for evidence-based policy and rigorous evaluations of program performance, PFP represents both an affirmation and an uncomfortable anomaly. On the one hand, it perfectly captures basic themes of the current era: Public actors should be held accountable for performance, rewarded for success, and punished for failure. At the same time, however, there is considerable evidence that PFP as implemented thus far has been ineffective. For example, the U.S. federal government has tried multiple iterations of PFP since 1978. New variations of PFP are proposed but with little effort to fix the fundamental problems that undermined the previous version.

Reasons for Failure

There are a variety of reasons why PFP systems have struggled in the public setting:

> *Attribution difficulty*: For any moderately complex task, outcomes are generally the result of group effort, and the relative contribution of a single individual is difficult to discern.
>
> *Measurement difficulty*: Attribution difficulty makes it difficult to come up with individual-level performance measures that connect well with organizational goals. As a result, PFP systems generally rely on subjective ratings of performance as determined by a supervisor. It is often unclear to employees how to do well on such scales beyond staying on the good side of their supervisor. From the supervisors' perspective, they often lack the information necessary to provide an informed assessment.
>
> *Grade inflation*: Employee ratings generally follow a fixed scale, for example, 1 is *excellent* and 5 is *below expectations*. The subjectivity of these scales, the lack of an incentive to critically differentiate between good and bad performers, and the discomfort of critically rating an individual result in the vast majority being graded as above average.
>
> *Resources:* PFP systems have generally been underfunded. It seems that although politicians argue for high risk and high reward, in practice they cannot tolerate the potential media scrutiny that might arise if public servants earn genuinely high rewards. Public service unions, generally critical of PFP systems, also work to keep the size of the rewards small in order to ensure that members do not actually lose out under new systems. As a result, the rewards associated by PFP systems are generally too small to be effective motivators.
>
> *Incorrect assumptions*: PFP systems are based on the assumption that individuals are motivated by financial rewards. But there is a substantial literature documenting the relatively high prevalence of intrinsic motivation among public sector workers. At the very least, it seems reasonable to assume that there will be heterogeneity in reward preferences among public employees and PFP systems will not be a strong motivator for many.

At a broader level, the poor record of PFP in the public sector may be the result of (a) failure to implement it properly, (b) a poor fit with the public setting, or (c) the fact that the theory simply does not work well in any setting. While some of the problems outlined above might be remedied with better implementation (e.g., better measurement systems or more resources), the nature of the public setting often makes such changes unlikely. Most public services are complex and hard to measure, and a reluctance to provide appropriate resources is tied to the political context of public services. There is also evidence that the presumed success of PFP in the private setting is overstated, which questions the basic validity of the theory behind PFP. The empirical evidence on PFP in the private setting is quite mixed, with success generally contingent on the factors—ease of measurement and attribution, resource adequacy—that make it difficult to implement in the public sector.

Costs of Pay for Performance

In addition to evidence that PFP tends to work only under some fairly specific circumstances that are unusual in the public sector, there is also evidence that it generates costs. The most obvious are the *transaction costs* involved in creating and implementing an individualized performance appraisal system.

There are also unanticipated costs. One is distrust and conflict. In a standard salary system, supervisors have limited financial rewards to offer, which reduces the potential for complaints about favoritism or abuse of power. But in PFP systems, the reliance on subjective assessments, the limited availability of rewards, and the general belief among employees that they deserve rewards create the conditions where some employees will feel that favoritism is employed and that neither appraisal systems nor pay reflect their effort. PFP systems may also create tension between employees who view themselves as competing for a limited number of rewards.

Another potential cost is the crowding-out effect, which is centered on evidence that financial incentives can undermine intrinsic motivations. As individuals lose their sense of self-determination, and find that public service performance is monetized, some may become discouraged and withdraw effort. Over time, a reliance on extrinsic incentives also creates a selection process that reinforces crowding out, as those driven by intrinsic motivation become less likely to join or stay in contexts where PFP is dominant.

The final potential cost of PFP is that it can encourage perverse behavior, in the form of gaming and goal displacement. Faced with high-powered incentives, individuals may seek to manipulate performance measures (gaming) or to improve metrics at the expense of some unmeasured but important value (goal displacement). For example, many of the studies of PFP that show positive results are set in health care settings that allowed piece-rate compensation programs, where providers were rewarded for the number of services provided. While health care providers may approve of such system, it has been criticized as creating broader social costs, since it encourages the provision of unnecessary services and increases the overall cost of health care.

As awareness of unanticipated consequences grows, the tendency to underresource PFP systems identified above may not be a weakness but an unintended protection against the type of misbehavior that is encouraged by high-powered incentives. And some have argued that lower-powered incentives are actually optimal for individuals in the public sector.

Reasons for Adoption

Given its poor record of success, why does PFP remain durable? PFP has high intuitive and symbolic appeal. It is easy to understand, is believed to be successful in the private sector, and is assumed to provide an element of risk and competition that runs contrary to the image of bureaucracies. It communicates a desire to hold inefficient bureaucrats accountable for performance. Past failures of PFP can be dismissed as implementation failures. Of course, if the primary motivation is symbolic, concern about the actual success of the system is of little consequence.

PFP may also be viewed as a means by which political principals control agents. There is some circumstantial evidence to support this argument. PFP systems are more likely to be found in Organisation for Economic Co-operation and Development (OECD) countries where there is no tradition of crossover between politics and bureaucracy, and political appointees tend to be supportive of PFP systems. But the functional utility of PFP as a means of control is limited when information asymmetry and measurement problems pervade conditions that underpin principal–agent problems in the first place.

As PFP has matured, it appears to have found greater application in performance contracts with third-party providers. In such settings, government principals do not face the same constraints in terms of civil service rules or bonus size, and so can create high-powered incentives. As with PFP systems in government, much of the success of such systems depends on the capacity to measure and specify complete contracts, with objectives that tie to reward. When contracts are incomplete, third-party providers have stronger incentives to engage in gaming and goal displacement, and fewer constraints to stop them.

As we look to the future, it is tempting to categorize PFP as an example of what H. L. Henry Mencken observed: “There is always a well-known solution to every human problem—neat, plausible, and wrong.” It is an appealing and durable idea, despite its record of failure. There will always be a market for such ideas. If the conditions are right, PFP might even work, though such conditions are not generally conducive to the public setting.

PEACE

Peace has long been understood in political science in two quite distinct ways. The dominant conception of peace has been the absence of war. The very word *peace* (and the French *paix*) derives from the Latin *pax*, meaning an agreement—a pact—to refrain from hostilities. This is sometimes characterized as "negative peace" as opposed to "positive peace," with the latter denoting not just the absence of direct violence but also the absence of indirect or structural violence, sometimes described as the presence of justice. This entry surveys the religious and normative context within which peace came to be understood, the various ways in which peace has been seen as a subject of research, and the diverse explanations offered by political science on the conditions for peace.

Given the implicit link between peace and war, peace was long understood largely through the lens of conflict and its management. During the Cold War, however, the "management" of conflict through mutually assured destruction and détente led to research on peace that meant more than just the avoidance of annihilation. This often embraced a constructivist perspective on peace, while realists tended to conceive of peace in terms of the interests of states, and idealists emphasized the role that norms and institutions could play.

Norms and Religion

Rules governing the conduct of war have existed in virtually every culture. The Aztecs, for example, developed elaborate rituals that preceded conflict, including dispatching ambassadors, providing an opportunity for a prospective foe to submit peacefully to Aztec rule. (Failure to accept three such offers was required before military operations could commence—even though the process meant abandoning all possibility of surprise and, since the ambassadors traditionally brought gifts of weapons, the opponent's military capacity was increased.) War itself, however, was typically regarded as a natural state. Early Western philosophers such as Aristotle and Plato gave relatively little thought to war as an atypical phenomenon. The seeds of what is now the just war tradition, limiting not only the conduct of war but the recourse to war itself, lay in the transformed perception of war from being the norm to being an exceptional state that required justification.

Christian theology contributed much of the content of the just war tradition but only after literal interpretations of Christ's injunction to "turn the other cheek"—on its face a doctrine of radical pacifism—could be rationalized by St. Ambrose and St. Augustine into a dualistic framework that separated inward disposition from outward action. This dualism lives on today in the principles of double-effect, right intention, and proportionality, each important to the modern legal framework for the use of force.

Religion has been significant at both ends of the spectrum of peace and war. Gandhi, among others, stuck to the utopian position of extreme nonviolence—adopted as a way of life rather than simply a tactic. Similar pacifist tendencies continue to inform much research on peace, despite some views relegating it to the margins of international affairs. At the other extreme, radical Islam has elevated the traditional Muslim notion of jihad (literally "struggle") to a holy war against all infidels and any Muslim who collaborates with them.

The role of norms in constraining or shaping behavior is a contested area of political science. Yet in the area of war and peace, the most important normative transformation of the 20th century was the outlawing of war. The Kellogg-Briand Pact of 1928 "condemn[ed] recourse to war." The United Nations (UN) Charter of 1945 more explicitly prohibited the "threat or use of force," allowing exceptions only in the case of self-defense against an armed attack or authorization by the UN Security Council to deal with a threat to or breach of "the peace." Though this manifestly did not end war, it is noteworthy that states attempted to justify virtually every use of force from 1945 under one of these exceptions.

The late 20th and early 21st centuries saw the UN Security Council expanding its understanding of "threats to international peace and security" as not merely embracing traditional interstate conflict but in some circumstances extending to internal disputes that might spill over into other states or are of such gravity in their humanitarian consequences that they warrant international intervention. This expansive interpretation of the role of supranational institutions was accompanied by the emergence of "human security" and the "responsibility to protect"—doctrines that further advanced the notion of peace as meaning much more than merely the absence of traditional interstate conflict.

Human security was an attempt to challenge traditional conceptions of security by arguing that the proper referent for security was the individual rather than the state. Building on the UN Development Programme's *Human Development Report*, first published in 1994, human security argues that conflict and deprivation are linked; addressing insecurity thus requires addressing freedom from fear as well as freedom from want. In more elaborate formulations, this is said to include protection as well as empowerment strategies. Critics of human security challenge this approach on the basis that the concept is vague and not helpful in understanding the causes of conflict or formulating responses.

Responsibility to protect (frequently abbreviated to R2P) was the product of long-standing efforts to get beyond the humanitarian intervention debates of the 1990s. First coined by an International Commission in 2001, the doctrine was later adopted unanimously by the UN General Assembly in 2005—a remarkably swift endorsement of a once controversial subject. In its watered-down form, it merely affirms that a state has the primary responsibility for protecting its population from genocide, war crimes, crimes against humanity, and ethnic cleansing. The failure of a state to act on this responsibility might be grounds for the Security Council to act, in exceptional circumstances, in the name of the international community—something the Council has already done on a handful of occasions.

Peace as a Subject of Research

Though war and peace had long been central to the study of international relations, the idea of studying peace as such gained traction only during the Cold War. This was not only driven by the unique security threats posed by nuclear weapons but also found encouragement in U.S. universities, in particular by opposition to the Vietnam War. Much early research took place in or was funded by Scandinavia: Norway's International Peace Research Institute in Oslo was founded in 1959 and began publishing the *Journal of Peace Research* in 1964; the Stockholm International Peace Research Institute was established in 1966. Peace studies became more popular in the 1980s, and today there are hundreds of such programs in universities and think tanks around the world.

The relevant literature encompasses much work on positive peace, with the dominant questions tending to remain those connected with explaining the conditions necessary to prevent conflict. As conflicts from the 1990s were increasingly internal rather than international, the distinction between positive and negative peace has to some extent been elided by the finding that half of all countries emerging from civil war fall back into it within 5 years of a peace agreement being signed. The question of resolving one conflict has therefore become linked with the question of preventing another.

This in turn led to an expansive literature on *peace building*, an imprecise term that at times is used to describe virtually all forms of international assistance to countries that have experienced or are at risk of armed conflict. *State building* (sometime rendered as *nation building* in the United States) more narrowly refers to the construction or reconstruction of institutions of governance capable of providing citizens with physical and economic security. Most often conducted as part of UN peace operations, such activities have included many quasi-governmental activities ranging from electoral assistance and technical assistance to maintain human rights and the rule of law to the actual administration of territory in Kosovo and Timor-Leste.

Explanations of the Conditions for Peace

Despite increased attention to positive peace, a disproportionate amount of the literature focuses on conditions for peace in the narrow sense of avoiding war. The most important and widely debated tends to be the democratic peace thesis, but much has also been written on economic factors and their link with conflict. The shift from international to internal conflict as a major preoccupation has reduced the prominence of strategic considerations, though the "post–post–Cold War" era and the rise of militarily powerful China and Russia may suggest a return to strategic studies and great-power politics in the near future. Finally, the growing importance attributed to asymmetric threats such as those from terrorists groups of global reach has raised the question of what "peace" means when dealing with nonstate groups that may or may not behave as rational actors.

Democratic Peace

Much quantitative energy has been spent on the democratic peace thesis, which holds that democracies are statistically less likely to go to war than states that are undemocratic. Overemphasis on this empirical argument (which has itself been contested) obscures a secondary finding in the literature that an autocratic state in the process of democratization may in fact be *more* likely to descend into conflict, especially internal conflict. The more robust explanations of what scholars such as Michael Doyle term the *liberal peace theory* link it to three pillars: republican representation, an ideological commitment to fundamental human rights, and transnational interdependence. These correspond to the arguments first made by Immanuel Kant in his 1795 essay "Perpetual Peace."

Economics

There is a long tradition of attributing economic causes to conflict. One of the most direct linkages that is often made is between the economic impositions on Germany following World War I and the planting of the seeds of World War II. Marxist theories of international relations drew more systematically on economics to explain the unfolding of historical stages, certain inevitable conflicts, influencing dependency theorists in particular. More recent work on civil wars offered counterintuitive suggestions that an abundance of natural resources may *increase* the probability and duration of conflict.

In the context of international armed conflict, economic activity in the form of cross-border economic flows has also been linked to peace—either because it raises the costs of severing those links or because it offers a more efficient path to growth than conquest. An early advocate of trade as a path to peace was the 19th-century British statesman Richard Cobden, though it has subsequently been discussed in the context of interdependence and, more recently, globalization.

The link between economics and peace is now well accepted. Since 1997, the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD) has been at the forefront of efforts to "mainstream" conflict prevention into donor development policies. What is now termed *structural prevention* (as opposed to *operational prevention*) seeks to bring development perspectives to bear on what were traditionally regarded as political and security problems.

Nevertheless, the "greed" versus "grievance" debates in the empirical literature revealed the dangers of reductive theories of conflict prevention. One-dimensional analysis has now largely given way to more nuanced accounts that acknowledge a mix of economic, political, ethnic, and security dynamics.

Strategic Studies

Though much of the focus on peace today concerns positive peace and the problem of civil wars, strategic studies was a fertile area of research in the Cold War. Doctrines such as mutual assured destruction relied on the presumed rationality of one's opponent and maintained the peace through a balance of terror.

Such perspectives enjoyed less prominence after the end of the Cold War, but with the rise of China and Russia as military powers and the potential for conflict over diminishing natural resources, such fields might experience a resurgence.

Asymmetric Threats

A phenomenon that is not new, but that has come to dominate discussion of conflict in many circles, is terrorism. The question of whether terrorist threats are appropriately addressed as a military rather than criminal matter is the subject of significant division in the literature and, indeed, the practice of states. The "war on terror" of the Bush administration in the United States was at times presented as an intergenerational conflict. Such language was subsequently dropped, among other reasons because of the difficulty of determining when such a "war" has been "won."

Conclusion

One of the most important factors affecting the study of war and peace across historical periods has been whether war or peace was in fact the "normal" state of human affairs. It is perhaps ironic that the century that rendered meaningless the formal legal category of "war"—indicating a state of affairs where two sides may lawfully use force against one another—was the bloodiest in human history. At the beginning of a century that threatens to be no less bloody, this is a disquietingly uncertain conclusion.

PEACE RESEARCH

See War and Peace

PEACEKEEPING

Theories of war try to explain why war occurs, given that it is often an inefficient way to resolve disputes. Scholars have proposed several explanations, among them the lack of information about relative capabilities or resolve and the inability of the parties to reach a credible commitment to end their dispute without resorting to violence. Some argue that, once war occurs, the only way to end it and ensure that there is no recurrence of violence is to have a decisive victory of one side as most negotiated settlements generate credible commitment problems. This is an argument of particular relevance to civil (or intrastate) wars, which are today the most common form of large-scale armed conflict. One of the striking stylized facts emerging from the literature on civil wars is that these wars last a long time, and when they end, they frequently restart. These insights from rationalist theories of interstate and intrastate war point to an important role for third parties in mediating and resolving disputes. Third-party intervention can help defuse conflicts before they become violent by providing information or external-security guarantees. When wars do occur, security guarantees to help support a transition to peace often take the form of peacekeeping. Peacekeeping is how the international community, through its multilateral organizations, can reduce the risk that conflicts will escalate.

Today, peacekeeping is the multidimensional management of a complex peace operation, usually in a post–civil war context. Peacekeeping, authorized under Chapter VI of the United Nations (UN) Charter, is designed to provide interim security and assist parties to make those institutional, material, and ideational transformations that are essential to make a peace sustainable. It was not always this way. The record of UN peacekeeping begins during the Cold War with a limited activity, monitoring the performance of a truce by two hostile parties.

Contemporary peacekeeping doctrine is embodied in the *Report of the Panel on UN Peace Operations* (2000; also known as the *Brahimi Report*) and the *Report of the Secretary-General on "No Exit Without Strategy: Security Council Decision-Making and the Closure or Transition of United Nations Peacekeeping Operations"* (2001; also known as the *"No Exit Without Strategy" Report*), which expanded on Secretary-General Boutros Boutros-Ghali's 1992 report *Agenda for Peace* and its 1995 *Supplement*. The goal of peacekeeping today is to help parties achieve sustainable peace. This goal can be achieved by addressing the underlying root causes of hostility and by enhancing local capacities for institutional change and economic development. But peacekeeping requires the cooperation of the parties, which must realize that they cannot win a quick and decisive military victory. Once the parties have reached a settlement that defines the contours of a postwar political system, there is still danger that the implementation of the peace will fail. It is at that point that international capacities—a multidimensional peacekeeping force with a UN mandate and resources to help implement the settlement—can help allay the parties' concerns by providing transparency on the peace-building process and each other's observance of the terms of the settlement, by policing violations of the settlement by noncooperative parties or spoilers, and by helping jump-start the economy and offering technical expertise in the design of transformational postwar political institutions.

These goals represent a significant expansion of the scope of UN intervention in the post-1990 world. The *Agenda for Peace* envisioned a role for the UN in preventive diplomacy, to engage the parties before they get to war; peacemaking, to help warring parties reach an agreement; peacekeeping, to help police an agreement once it is in place; peace enforcement, to convince reticent parties to stop fighting through an application of Chapter VII of the UN Charter; and postconflict reconstruction, to help parties rebuild their economies when the war ends. In the early years of UN peace operations, the UN mainly aimed to separate combatants through the establishment of a buffer zone that it policed in what is now called a traditional peacekeeping mandate. Traditional peacekeeping referred to a UN presence in the field, with the consent of all the parties concerned, as a confidence-building measure to monitor a truce while diplomats negotiated a comprehensive peace. Peacekeeping was therefore designed as an interim arrangement where there was no formal determination of aggression, and it was frequently used to monitor a truce, establish and police a buffer zone, and assist the negotiation of a peace. Typically, it involved less well-armed troops, and it often resulted in freezing conflict in time rather than helping resolve the underlying causes.

Today, following a process of evolution of UN mandates and new strategic thinking about UN intervention, the model peace operation combines elements of diplomacy, peacemaking, peacekeeping, postconflict reconstruction, and at times also peace enforcement, aiming to help build long-term foundations for stable, legitimate government (see Table 1). To do this, UN peace missions have a multidimensional role, which ranges from disarming noncooperative parties and repatriating refugees to monitoring elections and designing school curricula. Between 1987 and 1994, the Security Council quadrupled the number of resolutions it issued, tripled the peacekeeping operations it authorized, and multiplied by seven the number of economic sanctions it imposed per year. Military forces deployed in peacekeeping operations increased from fewer than 10,000 to more than 70,000. The annual peacekeeping budget skyrocketed correspondingly from $230 million to $3.6 billion in the same period, thus reaching about 3 times the UN's regular operating budget of $1.2 billion. Yet even these high costs represent a fraction of the economic costs of a failed peace or a long war. Peacekeeping is not only potentially lifesaving, but it is also cost-effective.

Table 1 Principal United Nations Peacekeeping Missions, 1947–2003

Mission	*Date*	*Peak Force Size*	*Function*
UNSCOB	1947–1952	36	Monitor violations of Greek border
UNCI	1947–1951	63	Observe Indonesian ceasefire and Dutch troop withdrawal
UNTSO	1948–present	572	Report on Arab–Israeli ceasefire and armistice violations
UNMOGIP	1949–present	102	Observe Kashmir ceasefire
UNEF 1	1956–1967	6,073	Observe, supervise troop withdrawal, and provide buffer between Israeli and Egyptian forces
UNOGIL	1958	591	Check on clandestine aid from Syria to Lebanon rebels
ONUC	1960–1964	19,828	Maintain order in the Congo, expel foreign forces, and prevent secession and outside intervention
UNSF	1962–1963	1,576	Maintain order during transfer of authority in New Guinea from Netherlands and Indonesia
UNYOM	1963–1964	189	Supervise military disengagement in Yemen
UNFICYP	1964–present	6,411	Prevent internal conflict in Cyprus and avert outside intervention
DOMREP	1965–1966	2	Report ceasefire between domestic factions
UNIPOM	1965–1966	96	Observe India–Pakistan border
UNEF II	1973–1979	6,973	Supervise ceasefire and troop disengagement and control buffer zone between Egypt and Israel
UNDOF	1974–present	1,450	Patrol Syria–Israel border
UNIFIL	1978–present	7,000	Supervise Israeli troop withdrawal, maintain order, and help restore authority of Lebanese government
UNGOMAP	1988–1990	50	Monitor Geneva Accords on Afghanistan and supervise Soviet withdrawal

Mission	*Date*	*Peak Force Size*	*Function*
UNIMOG	1988–1991	399	Supervise ceasefire and mutual withdrawal of forces by Iran and Iraq
UNAVEM I	1989–1991	70	Verify withdrawal of Cuban troops from Angola
UNTAG	1989–1990	4,493	Assist Namibia's transition to independence and ensure free and fair elections
ONUVEN	1989–1990	120	Monitor Nicaraguan elections
ONUCA	1989–1992	1,098	Verify compliance by Costa Rica, El Salvador, Guatemala, Honduras, and Nicaragua with agreement to disarm and neutralize irregular forces in the area
ONUVEH	1990–1991	260	Observe elections in Haiti
UNIKOM	1991–2003	1,440	Monitor demilitarized zone between Kuwait and Iraq, removed with the occupation of Iraq by an American-led coalition (small observer group remains but technically nonfunctioning and awaiting Security Council action)
UNAVEM II	1991–1995	476	Verify compliance with Peace Accord to end civil strife in Angola
ONUSAL	1991–1995	1,003	Monitor ceasefire and human rights agreements in El Salvador's civil war
MINURSO	1991–present	375	Conduct referendum in Western Sahara on independence or union with Morocco
UNAMIC	1991–1992	380	Assist Cambodian factions to keep ceasefire agreement
UNPROFOR	1992–1995	21,980	Encourage ceasefire in Croatia and Bosnia-Herzegovina and protect relief programs
UNTAC	1992–1993	19,500	Demobilize armed forces of Cambodian factions, supervise interim government, and conduct free elections
UNOSOM I	1992–1993	550	Monitor ceasefire between Somali parties and protect shipments of relief supplies
ONUMOZ	1992–1994	7,500	Supervise internal peace accord in Mozambique, disarm combatants, establish a nonpartisan army, hold national elections, and conduct humanitarian program
UNOMIG	1993–present	120	Verify ceasefire agreement with Abkhazia and observe CIS peacekeeping force
UNOMUR	1993–1994	100	Observer mission in Uganda–Rwanda and monitoring arms shipments
UNOSOM II	1993–1995		UN mission in Somalia and peacemaking operations

(Continued)

Table I (Continued)

Mission	*Date*	*Peak Force Size*	*Function*
UNAMIR	1993–1996	5,500	Stop the massacre of the defenseless population of Rwanda, assist refugees, and report atrocities
UNMIH	1993–1996	900	Mission in Haiti, pacification, and monitoring elections
UNOMIL	1993–1997	91	Observer group in Liberia and monitoring OAS peacekeeping
UNASOG	1994	25	Observer group in Aouzou Strip and Libya–Chad border
UNMOT	1994–2000	24	Investigate ceasefire violations and work with OSCE and CIS missions in Tajikistan
UNMIBH	1995–2002	1,584	Monitor law enforcement in Bosnia and Herzegovina
UNPREDEP	1995–1999	1,150	Preventive deployment force for the former Yugoslav Republic of Macedonia
UNCRO	1995–1996	20	Confidence restoration in Croatia
UNAVEM III	1995–1997	5,560	Angola verification in Mission of the Peace Accords (1991), the Lusaka Protocol (1994), and relevant Security Council resolutions
UNMOP	1996–2002	28	Monitor demilitarization in Prevlaka Peninsula, Croatia
UNTAES	1996–1998	5,257	Facilitate demilitarization in Eastern Slavonia (Croatia)
UNSMIH	1996–1997	1,549	Support Mission in Haiti
UNTMIH	1997	300	Transition Mission in Haiti
MINUGUA	1997	155	Verification Mission in Guatemala
MIPONUH	1997–2000	290	Civilian Police Mission in Haiti
MONUA	1997–1999	5,560	Observer Mission in Angola and a follow-on to UNAVEM III
MINURCA	1998–2000	1,350	Help maintain and enhance security and stability in the Central African Republic
UNAMSIL	1998–present	109	Observe and report to the Security Council the military conditions in Sierra Leone
MONUC	1999–present	5,537	Monitor ceasefire agreement and provide humanitarian assistance to the Democratic Republic of Congo
UNMIK Kosovo	1999–present	40,000 (KFOR)	Combine efforts in pacification of Kosovo with KFOR/NATO forces (essentially a humanitarian assistance)
UNMEE Ethiopia and Eritrea	2000–present	4,300	Monitor cessation of hostilities

Mission	*Date*	*Peak Force Size*	*Function*
UNAMA Afghanistan	2002–present	450	Work with International Security Assistance Force and provide humanitarian aid (not technically a peacekeeping mission)
UNMISET East Timor (Timor Leste)	2002–present	5,000	Transitional security for the new Timor Leste government
MINUCI	2003–present	0	Oversee implementation of Linas-Marcoussis Agreeement with ECOWAS and French troops
UNMIL	2003–present	15,000	Oversee implementation of ceasefire and peace agreement, provide police training, and assist in formation of a new restructured military

Sources: Compiled by author from data in Ziring, L., Riggs, R., & Plano, J. (2005). *The United Nations* (pp. 216–219). Belmont, CA: Wadsworth; United Nations Peacekeeping Operations, *Police, Troops and Military Observers—Contributors by Mission and Country*, UN Peacekeeping home page, December 2002; Center for International Relations, *Current UN Peace-Keeping Operations*, Zurich, Switzerland, PKO webmaster, January 1998.

The UN has a commendable record of success in multidimensional peace operations as diverse as those in Namibia (UNTAG [United Nations Transition Assistance Group]), El Salvador (ONUSAL [United Nations Observation Mission in El Salvador]), Cambodia (UNTAC [United Nations Transitional Authority in Cambodia]), Mozambique (ONUMOZ [The United Nations Operations in Mozambique]), and Eastern Slavonia (UNTAES [United Nations Transitional Authority in Eastern Slavonia, Baranja, and Western Sirmium]). Success is of course an ambiguous and contested term, and here, it implies an end to large-scale violence, undivided sovereignty for the government of the host state, and a modest degree of political openness. Using this standard, the best available evidence suggests that UN multidimensional, second-generation missions have been successful in helping countries transition from war to peace. The UN has been less successful in fighting wars, however. Enforcement operations, which draw on the authority of Charter Article 42, present a challenge for the UN, and the experiences in Bosnia and Somalia in the 1990s exposed the practical limitations that a multilateral organization such as the UN faces in peace enforcement. An international organization without an army must rely on the ongoing cooperation of troop-contributing states and donors for financing. This makes the organization too inflexible and underresourced to fight wars. The UN's comparative advantage lies with the peace-enhancing role of its multidimensional missions. On average, these have been more successful than peacekeeping missions by other agencies and smaller regional organizations. Regional organizations (with the exception of the North Atlantic Treaty Organization [NATO]) may lack the technical expertise or resources for such complex missions, or they may be perceived as biased mediators by the parties.

If political conflict reaches the level of war, and if the war causes high numbers of deaths and extensive physical and economic destruction, and if parties to the war are many and incoherent, unable to implement a negotiated peace settlement, then UN peacekeeping may help shore up support for a lasting peace that is based on a mutually acceptable compromise.

PEASANTS' MOVEMENTS

Peasants' movements have been important expressions of the formation of the modern world, and they still are. Whether resisting colonization of the commons, protesting capture of their granaries by merchants and rulers, disputing land claims, contending with centralizing states over the unequal terms of their incorporation, or joining millenarian struggles, peasants have been compelled to respond to the array of forces attending the development of capitalist property relations. Why should this not be the case today? Conventional wisdom would have it that the world's peasantries are destined to disappear in the face of competitive pressures from capital-intensive agriculture, expelling them into burgeoning urban labor forces. This development scenario embodies a modernity trope that modern civilization is centered on the city, as an escape from parochialism and the drudgery of rural life. Peasants, here understood in a wider sense as agricultural smallholders or laborers, but also including pastoralists or fishermen, are still a social force to reckon with. In the following, some of the regional and transnational forms are discussed that have gained a voice addressing major issues such as food security, ecological sustainability, and biodiversity.

While certainly the demographic composition of the world's population is now majority urban, and peasant agriculture is evidently increasingly marginal in global-market terms, each of these indicators is deeply problematic. And it has taken the rise and consolidation of a contemporary peasants' movement to underline the shortcomings of such seemingly commonsense observations. At present, there are more than 1 billion slum dwellers across the world, accounting for one in six of the world's population. While many of these seemingly redundant people do work in sweatshops at the extreme end of corporate supply chains, or recycle urban waste, they are not absorbed by the urban-industrial jobs predicted by the development paradigm. Furthermore, the displacement of peasant agriculture is largely due to the withdrawal of protections and the opening up of domestic markets to cheap, subsidized (at below production cost) foodstuffs from the cereal-exporting regions of the global North and the role of Southern states in diverting land use for agro-exporting as a condition of debt rescheduling.

The role of agro-exporting has shaped agricultural policy in a neoliberal world, where food security has been redefined from a social-contract function to a global-market function. The shortcoming of this policy shift became clear during the 2007–2008 food crisis, when governments found national food security compromised by the interruption of their food import dependence. But the transnational peasants' movement had already identified this problem, opposing neoliberal arguments for food security provided by food traders with the concept of food sovereignty, which proclaimed hunger as a problem of rights not of means. Initially, food sovereignty was defined as a territorial right to produce food premised on the notion that food is a source of nutrition first and only secondarily a trade item. This intervention underlined the vulnerability of agricultural producers to subsidy schemes favoring corporate agriculture in a highly uneven global market, maintaining that neoliberal multilateral and national policies privilege the rights of food traders and agribusiness over peasants and low-income consumers. And it made visible the dramatic dispossession of smallholders everywhere by the liberalization of agricultural trade.

The transnational peasant (pastoralist, fisherfolk, and rural workers) movement, *La Vía Campesina*, or the Peasants' Way, articulated the concept of food sovereignty in the 1996 Rome World Food Summit, proclaiming the right of nations to self-sufficiency, and respect of cultural and productive diversity, as a direct critique of the market-driven definition of food security and its unrealized claim to feed the world with Northern food surpluses. Representing millions of farmers through more than 150 organizations across more than 50 countries, *La Vía Campesina* is the prominent voice of a social force advocating for the survival of small producers claiming the right to produce staple foods, to reproduce society, and to manage local resources. In making these claims, the peasants' movement calls into question a market episteme that governs the development vision. From the movement's perspective, it is an episteme that assumes scale efficiency on questionable grounds: highly subsidized energy-intensive industrial agriculture that externalizes environmental costs (e.g., soil and genetic erosion, greenhouse gas emissions, and chemical pollution) and social impacts (e.g., displaced populations, food dependence, and pesticide contamination), supported by asymmetrical trade rules. In contrast, the United Nations (UN)–sponsored International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD) Report (2008) noted, for example, that a half-hectare plot in Thailand produces 70 species of vegetables, fruits, and herbs, improving nutrition and feeding more people than a half-hectare plot of a high-yielding rice variety, and such biodiverse farming is far less energy intensive, replenishing soil and water nutrients and cycles and sustaining farming as a culture rather than supporting a remote business. This ontological distinction is central to the vision of *La Vía Campesina*, arguably the most politicized of the peasants' movements today.

While highly diverse (respecting locally specific social and ecological projects), La Vía Campesina nevertheless has forged a historic and common politics of resistance to the commodification of land, seed, and food and to a World Trade Organization (WTO) trade regime premised on the efficiency calculus. As a transnational coalition, for example, it ranges from Brazil's Landless Workers Movement (Movimiento dos Trabalhadores Rurais Sem Terra, MST), with its emphasis on resettling displaced rural people and *favela* dwellers in landed cooperatives; through the movement of rich farmers: the Karnataka State Farmers' association (Karnataka Rajya Raita Sangha, KRRS) in India, opposed to biotechnology and global agribusiness as well as land reform, and the foundational Peasant Movement of the Philippines (Kilusang Magbubukid ng Pilipinas, KMP) in the Philippines; to the European Farmer Co-ordination (Coordination Paysanne Européenne, CPE), dedicated to preserving seed sovereignty as the basis of farmer autonomy. The coalition is dedicated to respecting the different needs and conditions of its chapters, even as it unites on global campaigns. For example, the Global Campaign for Agrarian Reform (GCAR) has directly challenged the World Bank's Market-Led Agrarian Reform (MLAR) development strategy, with some success in reshaping debates in the development institutions and maintaining pressure through land occupations, urban protests, and anti–genetically modified (anti-GM) crop activities. Networking allies such as the Food First Information and Action Network (FIAN), focusing on land rights, and the Land Research and Action Network (LRAN) constitute a combined mobilization around land and food sovereignty.

The principle of food sovereignty, while appealing to a Westphalian concept as a strategic intervention, arguably forms a vision of a different future. First, it politicizes the global food system, revealing its capture by corporations for which food is just another investment portfolio. Second, it challenges the ontology of economism, which erases the viability of small producers, physically expelling them from their territories and epistemologically removing them from history. By linking the food trade with dispossession, the peasants' movement reveals the relationship between depeasantization and the formation of a flexible surplus labor force for global industry. Third, the ontology of the food sovereignty movement encourages the revaluation of agriculture, rurality, and food as foundational to general social and ecological sustainability. And fourth, the social force leading this charge is a politicized peasantry—not simply reviving "tradition" but drawing on tacit knowledge of ecological relations and customary principles of social cooperation as the bedrock of human survival in an era of climatic and environmental emergency.

Of course, the transnational peasants' movement cannot change the world on its own. But this movement is changing the way we think about the world, and its future possibilities. By giving voice to the world's remaining peasants, the movement denaturalizes the vision of food security via agro-industrialization. This in turn resonates with growing concern over food safety, food miles, and the environmental degradation associated with energy-intensive agriculture. The peasants' movement thus connects with new social movements concerned with reconfiguring societies around reducing social distance and carbon emissions, eco-agriculture, and renaturalizing food. Here, the alternative political coordinates of the bioregion concept depends on reducing the social and physical divide between urban and rural and reconnecting social reproduction with its natural foundations. Food sovereignty, as a political slogan and platform, reasserts both the self-organizing capacity of communities of people and the centrality of agriculture to human survival.

The transnational peasants' movement is uneven and differentiated. Its strongest regions are Latin America and Southeast Asia, whereas African farmers are still developing organizational capacity. Organizations rise and fall—for example, the Central American Peasant Coalition (Asociación de Organizaciones Campesinas de Centroamérica para la Cooperación y el Desarrollo, ASOCODE) was a powerful regional coalition in the 1990s, funded by European nongovernmental organizations (NGOs) and dedicated to forming indigenous peasant networks and coordinating activities with the Central American Farmer to Farmer (Campesino a Campesino) Movement (peasant-based extension). La Vía Campesina emerged in this context, its durability depending on its political autonomy and its distrust of NGO alliances. This stemmed from the need for self-representation in an environment of skepticism toward smallholders—reinforced by the conservative, rich-farmer organization, the International Federation of Agricultural Producers, which has until now monopolized access to organizations such as the Food and Agriculture Organization (FAO) and its branch, the International Fund for Agricultural Development (IFAD). The slogan "not about us without us" became essential to the insertion of a peasant voice in global civil society, especially as neoliberal development projects impinged on peasant futures. Thus, the recent Plan Puebla-Panamá, an industrial corridor linking southern Mexico to Panama to mobilize indigenous labor, spawned two quite different peasant networks (representing various peasant unions) to negotiate or contest it, respectively: the Mesoamerican Initiative for Trade, Integration and Sustainable Development and the Mesoamerican Peasant Platform.

Farther south, in Brazil, the Movement of Small Farmers (Movimiento de Pequeños Agricultores), a peasant union, has mobilized more than 10,000 families in more than a dozen states to oppose agribusiness plantations of soy, sugar, and eucalyptus works, while the more substantial and iconic Landless Rural Workers' Movement (Movimento Dos Trabalhadores Rurais Sem Terra, MST) in Brazil has managed to settle roughly half a million peasants and landless workers on seized, unused land to produce food for Brazil's working poor and broaden the meaning of citizenship to agrarian social projects. Meanwhile, in Africa, the Network of Farmers' and Agricultural Producers' Organisations of West Africa (Reseau des Organisations Paysannes et de Producteurs Agricoles de L'Afrique de Le'Ouest, ROPPA) is developing methods of documenting flexible seed selection by farming women in West Africa as a form of drought management (with climate change), and the Agriculture Peasant and Modernisation Network–Mondial (Reseau Mondial Agricultures, Paysannes, Alimentation et Mondialisation, APM Mondial), formerly a regional network in Africa and now organizationally transnational, is developing ties with the Chinese peasantry, the last of the peasantries to be drawn into the movement.

Under pressure everywhere, peasants are self-organizing to protect their rights and, with allies, are building networks and consolidating a voice in global development fora, including demanding a reformed UN and alternative multilateral institutions such as a Convention on Food Sovereignty and Trade in Food and Agriculture and a World Commission on Sustainable Agriculture and Food Sovereignty. Today, peasants' movements are strengthening through mobilization as well as a public realization of environmental limits. In this sense, the significance of peasants' movements lies in the recentering of agriculture as a process of reterritorializing modernity—that is, reversing the marginalization of land-based culture and directing the world's attention to securing its ecological nest as a survival strategy.

PERFORMANCE

At the most general level, performance refers to two dimensions of an action: the doing of it (descriptive aspect) and how well or badly the actor is doing something (evaluative aspect). In political science literature, *political performance* is defined in broad and narrow ways, both building on the general definition outlined above. Broadly defined, political performance comprises the activities of political actors (descriptive) as well as the evaluation of these activities and their outcomes. Hence, it concerns the description of particular activities such as passing bills and spending money as well as the assessment of whether political actors make public policies (the activity), for example, in efficient ways and whether they achieve intended goals (outcomes) such as wealth or liberty. Narrowly understood, political performance is only an evaluative concept, referring to the evaluation of what political actors do and what the outcomes of their actions are. This narrow definition, dominating in scientific research, is the one adopted here. Some authors suggest a further narrowing of the concept by focusing on the evaluation of governments or, more specifically, on the evaluation of democratic governments. In this case, the terms *quality of government* or *good government* are synonyms for *political performance*. Here, such a specification is renounced in favor of a more comprehensive understanding of the concept applicable to all political actors.

This entry outlines the different theoretical and historical contexts of research on political performance, classifies criteria for evaluating political performance, discusses issues of measurement, reviews theories and research explaining political performance, and, finally, suggests future research perspectives.

Theoretical and Historical Contexts

The idea of evaluating political systems is a core concern in classical political science literature. Criteria of political performance such as liberty and equality dominated the writings of classical political theorists (e.g., Thomas Hobbes and Jean-Jacques Rousseau) in their search for good types of government. Additionally, performance criteria such as the common good and stability served as central yardsticks for scholars of comparative government, from Aristotle to Karl Loewenstein, in describing and comparing different nondemocratic and democratic regimes. This preliminary stage in the debate on political performance, however, is characterized by the fact that its protagonists did not make explicit use of the term *political performance*. Furthermore, they mainly relied on theoretical arguments and unsystematic empirical observations to assess the merits of different systems.

The first systematic theoretical and empirical work on political performance was not presented until the 1970s. At this point, two crucial obstacles had been overcome. The first obstacle concerns the availability of cross-national data. It became less of an obstacle with the collection and documentation of a wide range of social and political indicators for many independent countries of the world. First editions of several data handbooks appeared during the 1960s (e.g., *World Handbook of Political and Social Indicators*). The second obstacle concerns the deliberate avoidance of evaluation by empirically oriented political scientists. This was revised when political scientists dared to make explicit and systematic appraisals of concrete political systems on the basis of empirical data. The outset of this phase can be dated to 1971, when Harry Eckstein developed and justified theoretical criteria for evaluating political systems and when Ted Gurr with Muriel McClelland made a first systematic attempt to empirically translate and apply these criteria to a sample of democratic and nondemocratic countries. In 1978, Gabriel Almond and G. Bingham Powell developed the most influential and lasting concept of political performance emerging from this phase. In the context of systems theory, they suggested their concept of political productivity, enclosing eight different political goods: (1) system maintenance, (2) system adaptation, (3) participation, (4) compliance and support, (5) procedural justice, (6) welfare, (7) security, and (8) liberty. Additionally, they empirically studied the attainment of some of these goods in several democratic and nondemocratic countries. This first and early stage of performance research, however, provoked only a few isolated studies. These studies mainly used systems theory as a frame of reference and analyzed empirically democratic and nondemocratic systems.

In the aftermath, research on political performance advanced significantly and resulted in the establishment of an independent research area in the 1990s. At least two reasons account for this advancement—one historical, the other theoretical. Historically, the collapse of the state socialist systems in Central and Eastern Europe, resulting in the abolition of the most important alternative to democracy, turned the attention of comparative politics to quality differences within democracies, more specifically to quality differences between various types of democratic governments. Theoretically, the rise of *new institutionalism* in the 1980s, with its central premise that different institutional arrangements produce different results (institutions matter), directed the attention to political performance. Robert Putnam's *Making Democracy Work* (1993) and Arend Lijphart's *Patterns of Democracy* (1999) are among the most important and influential works in this period. Putnam suggested responsiveness and effectiveness as central criteria in evaluating the performance of democratic government; he, furthermore, introduced social capital in addition to the already existing factors explaining political performance—namely, political institutions and socioeconomic modernity. Lijphart, on the other hand, is interested in the performance of so-called majoritarian and consensus democracy. He asks which type works best, and he offers the most comprehensive empirical analysis, covering 36 democracies and 32 performance indicators categorized into four areas (macroeconomic management, control of violence, quality of government, and kinder and gentler policy areas: welfare state, environmental policy, criminal justice, and foreign aid). While these and other studies mainly focus on the policy performance of democracies, the issue of democratic quality or the quality of democracy itself gained interest since 2000. Since then, democratic criteria such as accountability, responsiveness, freedom, and equality are increasingly considered and studied empirically in the research on political performance.

Presently, political performance is an established field of research in political science. It is mainly concerned with evaluating different types of democratic governments such as majoritarian and consensus democracies or presidential and parliamentary democracies, on the one hand, and in evaluating specific democratic institutions such as electoral systems, party systems, and federalism, on the other. At first sight, this focus on evaluating political institutions seems to contradict the adopted definition of political performance referring to political actors. This definition, however, is consistent with new institutional theory. According to this theory, only actors—not political institutions—can act. Political institutions exert an influence on individual or collective actors by constituting constraints on their actions.

A Typology of Criteria of Political Performance

Normative criteria are essential for an explicit and systematic evaluation of political performance; they function as yardsticks against which the activities of political actors can be assessed. To be able to evaluate different political systems, these normative criteria should represent universal values. Furthermore, there should be consensus that these values embody legitimate obligations of political systems, which means, on the one hand, that these values guide what political actors do and, on the other hand, that citizens demand from government the attainment of these values. Finally, these universal values should be justified theoretically.

Most authors propose individual concepts of performance consisting of a list of criteria without referring to those of others. As a result, a multiplicity of heterogeneous criteria of political performance exists, and there is little convergence between the different lists proposed by different authors. With the help of a typology of performance criteria suggested by Edeltraud Roller (2005), the most important types of criteria can be identified. The typology refers to the performance of liberal democracies and is based on two dimensions:

- The first dimension distinguishes between goal-oriented and general performance. *Goal-oriented* or substantive performance aims at the attainment of particular goals such as welfare or liberty. *General* or procedural performance is independent of these particular goals; it helps promote the attainment of any particular goals. Examples are stability or efficient use of resources.
- The second dimension differentiates between systemic and democratic performance. It conceptualizes different normative expectations that exist with regard to political systems in general and with regard to democratic systems in particular. *Systemic* performance refers to achievements every political system must generate for society, such as economic growth and stability. *Democratic* performance refers to specific criteria that are to be ensured by democratic systems, such as liberty, responsiveness, and accountability.

By combining these two dimensions, four types of performance criteria can be established. Both goal-oriented and general political performance can be distinguished according to whether they are to be provided by democracies either in their function as political system in general or in their function as democratic system in particular. Examples for goal-oriented, systemic criteria are security and welfare; examples for goal-oriented, democratic criteria are liberty and equality; examples for general, systemic criteria are efficiency and stability; and examples for general, democratic criteria are accountability and participation.

Applying this typology, one-dimensional and multidimensional concepts of political performance can be distinguished. While one-dimensional concepts rely on a single type of performance criteria, multidimensional concepts combine different types of criteria. For example, Harry Eckstein suggested a one-dimensional concept of general performance valid for all political systems. It includes durability, civil order, legitimacy, and decisional efficacy. Roller's normative model of political effectiveness is also a one-dimensional concept aiming at a complete list of goal-related, systemic performance criteria. It covers international security, domestic security, wealth, socioeconomic security and socioeconomic equality, and environmental protection. Larry Diamond and Leonardo Morlino (2005) developed a two-dimensional concept of quality of democracy covering two general (rule of law and accountability) and three goal-oriented (responsiveness, liberty, and equality) criteria. Finally, Almond and Powells's concept of political productivity (1978) is a truly multidimensional concept covering all four types of criteria: (1) goal-related, systemic criteria (welfare and security); (2) goal-related, democratic criteria (liberty); (3) general, systemic criteria (system maintenance, system adaptation, compliance, and support); and (4) general, democratic criteria (participation and procedural justice).

These and other suggested concepts of political performance share the assumption that different values cannot be attained simultaneously. They assume trade-offs or conflictual relationships, meaning that one value can be attained only at the cost of another value. Trade-offs are proposed between different types of performance criteria (e.g., policy performance and democratic quality) as well as within types of performance criteria (e.g., wealth and socioeconomic equality). Authors differ, however, with respect to the proposed trade-offs. Their ideological position often determines whether specific performance criteria are seen as incompatible or mutually compatible. Irrespective of the assumed type of relationship, any assessment of performance should entail an analysis of the trade-offs between different values.

Finally, as far as the theoretical justification of performance criteria is concerned, most authors tend to select their criteria arbitrarily. If they justify them at all, they refer to different theories depending on the type of performance criteria. In the case of democratic criteria, whether goal oriented or general, normative democratic theory (e.g., liberal democracy) is used. In the case of systemic criteria, especially goal-oriented criteria such as security, wealth, and environmental protection, empirical political theories, especially theories on the development of policies or the expansion of the role of government, are used to justify performance criteria.

Measurement

The measurement of political performance necessarily requires a comparative approach. Political performance is either assessed in relation to theoretically defined normative criteria (e.g., a literacy rate of 100%) or in comparison with empirically defined maximum or minimum values (e.g., relative to the country with the best and/or the worst literacy rate). Most often, the second type of comparison is used in empirical research.

In general, the measurement of political performance raises several issues, which are discussed as follows.

Structure Versus Process

Although authors agree that political performance refers to the evaluation of the political process—that is, what political actors actually do—some authors measure political performance at the level of political structure. This is especially true in the case of democratic performance. While measures of democratic structure identify whether a democratic structure exists and is actually working in a country or not (e.g., universal suffrage and competitive elections), measures of democratic quality presuppose such a democratic structure and assess to what extent democratic performance is given (e.g., responsiveness and accountability). Obviously, there is a fundamental theoretical difference between structure and process, and valid measures of political performance should refer to the political process. Nevertheless, while the difference is clear in conceptual terms, it is rather difficult to separate between both dimensions empirically.

Outputs Versus Outcomes

Conceptually, performance does not refer to actions or efforts to reach goals, whether in the form of laws, personal spending, or state spending, but to the outcomes or actual results of these actions. Rather than using output indicators (e.g., the degree of redistribution measured on the basis of social expenditures), outcome indicators should be used (e.g., poverty rate). While outcomes are the real test as to whether the outputs have produced the intended results or not, usually they cannot be directly controlled by political actors. Hence, the question has been raised whether one can speak of political performance here at all. To avoid this problem, some authors consciously decide to use outputs rather than outcomes as measure for political performance. For example, Putnam's Index of Institutional Performance primarily measures outputs such as the number of day care centers and health expenditures rather than, say, mortality rates. This is convincing only on condition that outputs could serve as valid proxies for outcomes. But this is a much disputed assumption. In their attempts to measure performance, other scholars deliberately focus on actual results or outcomes rather than mere efforts to reach goals. For example, Roller's Index of Effectiveness of Democracies is designed as a pure measure of outcomes covering indicators such as poverty, infant mortality, and unemployment rate.

Objective Versus Subjective Measures

In principle, political performance can be measured either on the basis of objective measures (e.g., the rate of unemployment and the extent of congruence between voters' policy preferences and government's ideological stances) or on the basis of subjective evaluations of citizens (e.g., citizens' satisfaction with the functioning of democracy and citizens' perception of the degree of government's responsiveness to people's demands). Whether objective or subjective measures should be used is a theoretical decision depending on the research question. It is equally valid to ask for the quality of government on the basis of objective criteria and to ask for citizens' evaluation of the quality of government. Due to the substantial difference between both dimensions, however, objective measures of political performance cannot be used as proxies for subjective measures and vice versa.

Single Versus Composite Measures

Normally, studies on political performance are interested not only in the assessment of several specific criteria (e.g., unemployment rate and poverty) but also in the overall level of performance of political actors. The most efficient method to gauge the overall level of political performance is to construct a composite measure integrating and summarizing evaluations of several performance dimensions. The available composite measures mainly refer to policy performance. The well-known Human Development Index (HDI) of the United Nations Development Programme (UNDP) represents one example for such a measure. It subsumes three dimensions of welfare—a long and healthy life, knowledge, and a decent standard of living—and relies on four indicators (life expectancy, adult literacy rate, gross enrollment in school, and gross domestic product). It assesses the average achievements in a country in these dimensions of welfare. Roller's Index of Effectiveness of Democracies represents another composite measure aiming at the policy level. It takes a broad view, encompassing effectiveness in all domestic policy areas: domestic security policy, economic policy, social policy, and environmental policy. Each policy area is measured by a composite measure, and these four measures are integrated into an overall Index of Effectiveness. Altogether, it is composed of 14 indicators (e.g., murder and manslaughter, gross domestic product, infant mortality, emissions of sulfur oxides, etc.). Examples of composite measures aiming at general or procedural performance are the *good governance* indicators of the World Bank. These indicators cover composite measures for six performance dimensions—(1) voice and accountability, (2) political stability and absence of violence, (3) government effectiveness, (4) regulatory quality, (5) rule of law, and (6) control of corruption—and an overall composite measure comprising these six dimensions. The Worldwide Governance Indicators (WGI) are based on several hundred individual variables measuring perceptions of governance by experts and ordinary citizens as well (e.g., press freedom index, risk of political instability, quality of bureaucracy, foreign investment, violent crime, frequency of corruption, etc.). Constructing composite measures implies decisions about the techniques of standardization, weighting, and aggregation of individual values. Different statistical procedures of standardization (e.g., z-score transformation and indexing), weighting (e.g., equal and unequal), and aggregation (e.g., arithmetic mean and unobserved-components model) are used, and their relative merits are discussed intensively.

Explaining Political Performance

Research on political performance also aims to explain differences between countries and why some governments are more successful than others. National political institutions take center stage with regard to this question. This is for two different reasons, one theoretical and the other practical. Knowledge about the effect of political institutions is of theoretical interest because the idea that institutions matter is the central premise of the new institutionalism paradigm. This knowledge is also of great practical importance. If political institutions reveal a direct and unidirectional effect on political performance, recommendations can be made as to which kinds of constitutions should be implemented in new democracies (constitutional engineering) and what kind of institutional reforms should be conducted in established democracies to enhance political performance. Besides political institutions, cultural factors (e.g., social capital), socioeconomic modernity (e.g., wealth), globalization (e.g., foreign trade), and, particularly, preferences of political actors (e.g., the ideological orientation of governmental parties) are suggested as other factors explaining political performance.

Empirical research focuses on the effect of democratic institutions, either on the effect of types of democracies (e.g., majoritarian or consensus democracies, presidential or parliamentary democracies) or on the effect of specific democratic institutions (e.g., majoritarian or proportional electoral systems, federal or unitary states). The core question is whether diffusion or concentration of power results in higher levels of political performance. Numerous studies dealt with the performance of consensus and majoritarian democracies. Empirical analyses of Lijphart indicate that consensus democracies enjoy higher levels of political performance than majoritarian democracies and that these institutional settings themselves display a direct and unidirectional effect on political performance. Replications and additional studies can also show that democratic institutions indeed matter for political performance (e.g., Roller, 2005). But they matter only sometimes and to a limited degree, and their effect is less direct and less unidirectional than assumed so far. It seems that political institutions interact with other factors, especially with the preferences of political actors such as governments. Therefore, the theoretically and practically attractive hypothesis stating direct and unidirectional effects of political institutions on political performance is open to challenge.

Research Perspectives

Although we are able to now witness an established research area of political performance, its achievements are far from being solid, comprehensive, and cumulative. This is true for several reasons. First, the available studies refer to a multiplicity of heterogeneous criteria of political performance; a consensus on relevant criteria is still to evolve. Second, theoretical work and empirical work on political performance are only loosely coupled. Theoretical work focusing on the deduction and justification of criteria of performance tends to ignore the task of specifying empirical indicators that could flow from its normative criteria. In turn, empirical work tends to disregard theoretical reasoning on performance criteria. Third, empirical research is mainly devoted to the evaluation of democracies, especially to Western democracies. It rarely pays attention to the performance of Asian, African, and Latin American democracies. Fourth, systematic comparisons of contemporary democratic and nondemocratic systems are still in a very early stage.

To make progress, it might be helpful to focus on the four types of performance criteria presented above. This could open up the possibility of developing common theoretical, methodological, and empirical foundations for each of these four types, and this could provide a basis for cumulative knowledge. Additionally, one question should be investigated more in depth in future: How political institutions exert their influence on political performance and how they interact with other factors, political actors in particular. Up to now, theoretical and empirical knowledge about this central question is too provisional and incomplete.

PERFORMANCE MANAGEMENT

Performance management involves managing organizations as well as managing the entire machinery of government. More precisely, it is a process of establishing goals and regularly checking the progress made toward achieving those goals. It incorporates continual feedback and is based on the principle of management by contract rather than by command. This entry examines the concept of performance management, its theoretical context, and related developments and applications.

Conceptual Overview

Performance management includes activities to ensure that goals are being met in an effective and efficient manner; thus, it becomes a mechanism for accountability. The managerial tradition of the past several decades has focused on performance as a part of management practice in the public sector of Western countries. Governments have supported administrative reforms from old public administration rules and procedures to modern managerial models, within the framework of the new public management doctrine.

As public values, efficiency, productivity, and service orientation have become more important. Bureaucrats have been forced to transform from their traditional roles into more managerial roles and to become more concerned with performance.

Generally speaking, many ideas concerning reform have been borrowed from the private sector. Evaluation has focused more on economic issues than on political ones. Egoistic interests, competition and contracting, cost-effectiveness, and the role of customers are discussed more and more in the core of public domain.

Performance management is important in both the private and the public sectors. By using performance management, governments are searching for better performance in their public sector organizations. The use of market mechanisms in public administration is one means of increasing competition with the private sector and improving the efficiency of public services. Service delivery is expected to be more transparent and accountable. In the redefined and new governance, administrative control is transformed from traditional action controls to modern output controls.

However, performance management is currently faced with many challenges. Sometimes it is difficult to implement in the public sector due to politically unstable and multiple goals, vague outputs, and complexity of services. These challenges raise the question of whether performance management is more a myth than a reality in modernizing public organizations. Another issue is how to reform performance measurement, which should be more than simply accounting exercises. As John Halligan and Geert Bouckaert (2009) ask, is there a gap between rhetoric and practice with respect to performance management?

In the performance management debate, warnings are given about the dysfunctions and unintended consequences of performance management practices that may result in a decline rather than an improvement in the performance of organizations. According to Frank Verbeeten (2008, p. 430), such effects may include the following:

a. growth of internal bureaucracy,
b. lack of innovation,
c. reduction of system or process responsibility,
d. tunnel vision,
e. suboptimization,
f. gaming of performance measures, and
g. measure fixation.

How should we understand performance management? In performance management, targets are defined, expectations are set, processes are measured and evaluated, and, if all these are fulfilled, top management is rewarded. Performance management is both a management tool and an umbrella for a variety of different management techniques. Performance management is connected to several other management techniques, such as the stakeholder approach, a balanced scorecard, and even quality management. In national applications, performance management is called management for results or management by objectives and results. In some cases, the separate nature of steering and managing is being emphasized.

As Zoe Radnor and Mary McGuire (2004) note, the two terms *performance measurement* and *performance management* are often used interchangeably. The basic idea in performance management is measuring performance and defining aims and goals. Through the management process, strategies are selected to achieve the goals in an efficient way. Performance-related pay for groups or individuals is also used in performance management.

In the process of performance management, an agency involves its employees, as individuals and members of a group, in improving organizational effectiveness in the accomplishment of the agency mission. According to John Mwita (2000), the factors that affect performance are personal factors (e.g., motivation and commitment), leadership factors (encouragement, guidance, and support), team factors (support of colleagues), system factors (instruments of labor), and contextual factors (changes of internal and external environment).

Performance management is basically a control system as well, with both the process and the outputs being controlled. Different opinions are presented about the nature of the control function. For example, the control function is considered to be either a universal and highly general or a detailed, highly specialized function.

Theoretical Context

In public administration literature, the doctrine of performance management is referred to by several theorists, such as Amitai Etzioni, Herbert Simon, James March, and Henry Mintzberg. For instance, Max Weber's model of bureaucracy is considered as a machine organization. A bureaucratic organization is efficient, routinized, and predictable. Sometimes customer organizations, both in the public and the private sector, are designed like machines, and their employees are expected to behave as if they were components of machines. Thus, currently, key concerns in performance management are the change from measuring performance to managing performance and expanding the performance management from an economic perspective to others, such as social and citizen perspectives.

In a politico-administrative process, governance and management are broader, including different stakeholders in the democratic system, such as elected officials and citizens. Commonly shared values are based on the public interest and political accountability. If the engagement of citizens is very limited in performance processes, performance management as a system will not know what people care about in their different roles as voters, taxpayers, customers, and so on.

As Amber Wichowsky and Donald Moynihan state, in a well-functioning democracy, citizens are capable of self-governance, they are treated with equal respect and dignity, and they are responsible to their communities and participate actively in political life.

According to Paul Epstein, Lyle Wray, and Courtney Harding (2006), in a performance management process, potential citizen roles are, for instance, framing issues and setting the agenda (planning and setting goals and performance targeting), as stakeholders and collaborators (implementing policies), and as evaluators (measuring and reporting results).

Public sector leaders encounter numerous requirements in managing the performance measurement of government services. These include (a) understanding better the real nature of service delivery systems; (b) having the capability of agreeing on strategic objectives, providing incentives, and evaluating programs; and (c) collecting, analyzing, and presenting performance management data.

In the workplaces of public organizations, personnel are aware of the purposes of performance management. By measuring and managing performance, it is expected that managers and employees are learning to improve their performance. Citizens also want to know for what purposes their money is spent. Besides, in large-scale branches of administration, massive amounts of performance data are collected. Effective exploitation of performance information is a challenge because expectations might be very high. Effective ways of implementing and rational decisions on improving performance are both needed.

Development and Application

An example of the development of performance management is the system existing in Finland, which is in line with practices in other Western countries. Within the public administration establishment in Finland, reform began in the late 1980s. These public sector reforms were mainly influenced by administrative and management reforms in other Organisation for Economic Co-operation and Development (OECD) countries. Steering and budgetary systems, including laws, rules, and procedures, were reformed. New management techniques were implemented in the central, regional, and local government.

According to the definition in the Finnish *Handbook on Performance Management* (2006), performance management is an agreement-based interactive control model. Its operational core lies in the ability of the involved parties to find the appropriate balance between the available resources and the results to be attained using them. The basic idea of performance management in operations is to balance resources and targets, on the one hand, and efficiency and quality, on the other, and to ensure that the desired effects are achieved in a cost-effective manner.

In formal performance management systems, performance targets are discussed, agreed on, and set between the ministry and the subordinate agency. The performance criteria are used in setting targets and in reporting operations. If the system is to have legitimacy, the targets must be measurable, clear, and based on systematic and reliable evaluation. Performance criteria consist of policy effectiveness, operational efficiency, outputs, quality management, and management of human resources.

Another challenge for performance applications is the use of performance criteria. Performance criteria should be developed by applying incentive systems. In other words, who receives praise or criticism? If the criteria are determined for evaluating the performance of lower level public servants in their daily interactions with users of public services, the decision process will be much easier than it is for higher level officials.

In Finland, performance management is implemented through performance agreements between the ministry and the agency. The agreement is a control tool in the interaction of the parties involved. Because performance is reported, there are consequences for both good and poor performance. For instance, in the Finnish university sector, the Ministry of Education and all 20 state-run universities sign a performance agreement defining the objectives: the number of degrees to be awarded, the development projects, and the level of funding. The agreement is signed for 3 years but is reviewed in the yearly negotiations between the ministry and a single university. In line with the ministry–university negotiations, each university arranges its own performance negotiations between the rector and the faculties.

The example of Finnish universities illustrates the fundamental character of performance management. Despite the problems of measurement and implementation, this approach to management has developed as a major method for management and accountability.

PERSONALIZATION OF POLITICS

Personalization of politics refers to a shift from collective to individual actors and institutions. Its scope and degree can vary according to regime type, national and cultural environments, and the time span under consideration. However, personalization is commonly considered as an emerging trait in a number of relevant arenas: from voting behavior to governmental steering and from electoral campaigning to party organization. Most studies emphasize the role of leadership and media as the key determinants of political personalization, though it certainly partakes of the more general trend toward an individualized society. This entry discusses recent trends and major implications for contemporary democracies.

The most visible aspect of political personalization concerns the transformation of electoral campaigning, with the rise of candidate-centered politics. This transformation affects the whole consent mobilization process. The media, in the first place, have become the main intermediary channel between candidates and their constituencies. With traditional party structures losing their grip on the electorate, candidates tend to rely on old as well as new media to spell out their programs and contact potential voters, especially in large-scale elections—for governors, prime ministers, or presidents—where TV and the Internet offer invaluable shortcuts to reaching mass audiences. To best exploit the media, candidates use media language and logic, which put a premium on individual personality.

This has led to a thorough reorganization of campaign strategies and funding, with the main focus on the media image and performance of the candidates. In the wake of the famous TV debate in 1960 between U.S. presidential candidates Richard Nixon and John F. Kennedy, which was held responsible for the victory of Kennedy, the Democratic nominee, the media have become the key investment of all major electoral campaigns. Several empirical studies have questioned whether the actual impact of personalized politics fully matches the vision and aims of campaign managers and spin doctors. However, while issues have remained important and party identification still plays a role in voting behavior, it is a widespread opinion that voters, today, are more heavily influenced by the personality factor than they were 20 years ago.

Though less visible and less debated than the personalization of elections, a no less important area of political personalization is the strengthening of monocratic government. Whether in presidential, semipresidential, or parliamentary regimes, the chief executive has gained more power and authority with respect to three arenas: (1) the government as a whole, (2) the party, and (3) the wider public. Personalization in government has been described as a process of presidentialization. That is, prime ministers in old as well as new democracies are now stronger with respect to the collegial bodies they chair, performing several functions that were once the prerogative of the U.S. presidential model. Increase in prime ministerial power concerns the normative as well as the organizational sphere. With the expansion of delegated legislation and emergency regulation, a large share of legislative activity has shifted from parliament to the executive and, within the executive, to the prime ministerial office. This, in turn, has grown both in human resources and in the scope of intervention, a trend that in many ways resembles the transformation of the U.S. presidency following Franklin D. Roosevelt's reforms. Prime ministers have also gained better control over the governmental agenda and the overall decision-making process, thus taking more direct responsibility for their electoral mandate.

In only a few instances, the emerging of prime ministerial dominance is the result of outright constitutional changes. In most cases, the transformation has occurred through new rules and procedures regulating the relationship between the legislative and the executive branch, as well as through the adoption of laws providing for an overall reorganization of the prime minister's office. As a consequence, the traditional constitutional divide between presidential and parliamentary regimes has been to some extent blurred by what could be considered a silent institutional revolution.

A major contribution to this end has come from the personalization of party control. Parties have long been the stronghold of collective decision making and responsibility, largely concurring with the preeminence of legislatures as collegial bodies. In many Western democracies as well as in the Soviet bloc, the prevalent form of party rule has been oligarchic, by a system of elite cooptation. In the past 2 decades, party leadership has become more associated with individual personalities. The change has been heralded by countries as different as Margaret Thatcher's United Kingdom and Mikhail Gorbachev's Soviet Union, soon to become the format of most political regimes.

Party personalization can vary according to several factors. In old, established parties, the process is contrasted by the entrenched nomenclature. It took 12 years for Tony Blair to successfully take over the Labour party in the United Kingdom and impress his own brand on the New Labour. Helmut Kohl's primacy in the Christian Democratic Union (Christlich Demokratische Union Deutschlands, CDU) in Germany was mainly related to the extraordinary opportunities of Germany's reunification. On the whole, the German party system, also as a legacy of the Nazi era, remains a hostile environment to one-man rule. Yet whenever new parties are formed, there is a diffused tendency that they be promoted and controlled by individual leaders. The ideal-typical case is Silvio Berlusconi's Forward Italy (Forza Italia). Banking on the favorable conditions created by the collapse of the governing parties, Berlusconi immensely benefited from his corporate empire to found his own personal party. As a media tycoon and one of the wealthiest men in the world, he could rely on a highly skilled professional apparatus as well as on huge financial means to set up, within less than 6 months, a vote-generating machine.

A key aspect of Berlusconi's success was his extensive use of TV, with the new infomercial techniques he borrowed from Ross Perot's 1992 presidential campaign in the United States, thus bypassing journalists' intermediation and directly targeting his audiences. Direct appeal to the masses, together with a constant focus on charismatic leadership, is the main trait of the so-called media populism, a phenomenon strongly associated with party personalization. From Hugo Chavez's Venezuela to Vladimir Putin's Russia, political and/or economic control of the media has become a decisive factor for the rise of one-man–dominated parties with a large popular following.

The Internet, too, has greatly contributed to political personalization. While the broadcasting media, such as radio and TV, require big budgets and complex scheduling and cannot be aimed at specific population segments, creating one's own website, blog, and direct mailing system is a much easier and less costly undertaking. More and more politicians use the Internet to promote their message and interact with their constituencies on a personal basis, thus contributing to rendering party channels obsolete. In most cases, Internet personalization operates on a smaller scale than the TV-based marketing of political leadership. However, the two media can be used to feed and reinforce one another, as in Barack Obama's 2008 presidential campaign. Thanks to the web, Obama's organization reached millions of supporters with daily updates on the most controversial issues and invitations to join virtual or real-life debates, thus motivating participation and spurring donations. The money raised through the Internet was, in turn, devoted to a massive use of TV advertising.

In spite of its overwhelming presence in contemporary politics, measuring the real impact of political personalization on strictly empirical grounds is not easy. Research frameworks have been slow to adapt to a phenomenon that affects so many arenas. With a few relevant exceptions, there is a lack of comparative and longitudinal studies, the more so as the most striking trait of political personalization consists of its cutting across different disciplinary subdomains. Studies of electoral behavior rarely venture into the analysis of the transformation of party organizations, and most accounts of the rise of stronger executives only focus on the governmental institutional setting.

This is not to say that empirical investigation is not possible or necessary. The relevance of this topic looms even larger in a wider theoretical and historical perspective. In what has become the mainstream definition of political power, Max Weber distinguished three types of legitimate authority. Two types, the traditional and the charismatic, were grounded in personal resources. Yet Weber considered the third type of legal-rational authority, with its emphasis on bureaucratic procedures and collective decision making, as the pillar of modern society, both in the political and in the economic realms. Traditional and charismatic power was mainly treated as a remnant of the past, inevitably bound to be superseded by the advent of legal-rational authority. Moreover, in dealing with traditional and charismatic power, Weber's tendency was to present these two patterns as separate, occurring in different historical and cultural contexts. Quite to the contrary, one of the major characteristics of contemporary personal power is the interaction and cumulation of these two elements. The modern process of personalization of politics results, to a large extent, from the combination of patrimonial and charismatic resources. This combination becomes all the more stronger when it can use—and possibly merge into—the key central institutions of a democratic regime.

Political personalization thus appears as a mix of old and new forces. The main novelty consists in the role of the media and their natural focus on individuals and their personality. This has led to a revival of charisma in an electronic form. Media charisma may have little if any of the extraordinary gift of grace that characterized charismatic leaders in the past, with their mass religious followings. Yet on various occasions, media charisma has proved to be a key factor in the rise of powerful leaders. The comeback of personal power also reflects the resilience, in industrialized societies, of cultural traits long considered bygones. The tendency to rely once again on personal rather than collective and impersonal attributes is a sign of weaker social cohesion and increased instability. On the positive side, one may consider that the process of political personalization, today, largely falls within the routines, discourse, and boundaries of democratic politics. The nightmare of personal power getting out of control seems to belong to the past.

PILLARIZATION

Pillarization of society means the *vertical* integration of a subcultural community in a system of political representation. More often than not, this kind of integration is considered as necessary for a minority to politically participate and survive when democratization of a polity is under way or more or less completed by means of electoral rights (e.g., universal suffrage) and the establishment of a party system (at the national level). Pillarized political systems emerged in a limited number of cases only and strongly correlate with a specific type of parliamentary democracy: "consociational" systems (Arend Lijphart) in which agreements among the elites of the respective pillars bridge their divisions. In the following sections, the characteristics of such pillars as they occur in the major cases, their political relevance, and recent tendencies of depillarization are discussed.

Characteristics and Political Relevance

The term *pillar* (*verzuiling* in Dutch and Flemish and *Lager* in German) is sociologically defined as strong political-cultural submilieus based on ethnic-linguistic, religious, or similar cleavages with a strong internal organization and a relatively high level of external autonomy. Under such circumstances, you can spend much of your life within the networks of such pillars, often including schools, media, political parties, and so on. These organized submilieus are politically relevant for understanding the stability and survival of democracy in (deeply) divided societies. Lijphart mentions five criteria to measure the degree of pillarization:

1. the role of ideology (more often than not cleavage related) within the pillar,
2. the size and density of the organized network representing the pillar,
3. the (institutionalized) cohesiveness of the pillar's network,
4. the extent of "enclosure" of the pillar (or the absence of cross-cultural relations), and
5. the extent to which pillarized behavior is encouraged and directed by its elites.

The application of these criteria to West European democracies shows that there are four polities that indeed qualify as being pillarized: Austria, Belgium, the Netherlands, and Switzerland. The last is seen as the least pillarized. Others, for example, Gerhard Lehmbruch, have claimed that the Federal Republic of Germany belongs to the pillarized community, too. This is questionable because Lehmbruch focused on the organization of the German postwar party system and its ramifications for decision making at the federal level. His explanation rested more on the cleavage-related mechanisms and the complexities of organizing representation in a federation. Hence, the working of the German polity showed some of the features of a pillarized system.

Switzerland can also be considered as a borderline case. Rather than being the well-organized and cohesive pillars (as defined here), the extant cleavages in Swiss politics—religious/secular, language-cum-territory divisions, and the rural/urban divide—accounted for the development of consociational practices through the mechanisms of the party system dynamics. For example, Pascal Sciarini and Simon Hug claim that pillarization in Switzerland is weak because it only plays a role in finding amicable agreement based on cleavages and by means of proportionality on the federal level. Pillarized networks are not the main agents but rather national political parties that are in turn checked and balanced by institutional safeguards through cantonal representation and the referendum instrument.

The other cases mentioned also show differences. Belgium is complex in terms of its pillarization because it is strongly influenced by two cleavages. One is secular/religious and the other is language/territory. While the former is not more relevant than in many other (European) party systems, the latter is: Since the 1960s, this conflict is rising high on the political agenda; it has been conducive to the federalization of the Belgian state and was preceded by the bifurcation of the nationwide party system.

Austria and the Netherlands stand out as the strongest examples of politicized pillarization. This can be explained by two factors: One, the minorities are not geographically concentrated, but their "members" reside throughout the entire territory. Precisely for this reason, a socially cohesive network reinforcing the control of membership was deemed necessary. Two, only by means of elite politics and the proportional-representation (PR) electoral system—registering the relative strength of each pillar—was it feasible to establish accommodation between the pillarized communities.

Other cases of pillarization have been mentioned, but mostly defined post hoc, to explain the relative stability of the emerging political system. Examples are Czechoslovakia (1989–1993), Lebanon (during the 1960s), and Colombia.

Pillarization, as it has emerged and existed, is strongly correlated to a particular form of democracy: consociationalism. This can explain the paradox of the occurrence of stable democracies with strong political divisions between minorities. A consociational democratic system is characterized by the fact that there is no majority party but only minority parties that are by and large representing pillarized communities. In contrast to the theory of pluralism that predicts political instability under such circumstances, many (but not all) democracies appear capable of consensual and effective decision making. This paradox was solved by developing institutional mechanisms and conventions that allowed for cooperation between elites (representing the various pillars): (a) the introduction of a proportional electoral system that secured access for each pillarized party; (b) securing the autonomy of each pillar within society (often by means of basic laws, as is the case in Austria and the Netherlands, or by carefully describing the degrees of self-regulation by subnational territories, as in Germany and Switzerland as well as in Belgium of late); and (c) a careful but often complex procedure regarding the formation of government coalitions (which were often all-inclusive or at least broad in composition). These mechanisms enabled elites to find agreement and to avoid open conflict over substantial issues that directly concerned the ideology or subcultural differences that had led to pillarization. Hence, the political consequences of pillarization—that is, deep-seated conflict—could be overcome by means of elite appeasement and (often secret) agreements, proportional payoffs, and (often) depoliticization of contested policy issues.

It should be noticed, however, that consociational democracy cannot be considered as a universal recipe. Lijphart, for instance, showed that in other cases, primarily outside Western Europe, this type of democracy did not develop or last long under the same circumstances (e.g., Lebanon, Colombia, and perhaps contemporary Belgium). Furthermore, critics of the consociational model have pointed to certain flaws, namely, the fact that the minorities had to be roughly of the same size or that these subcultural groups were insufficiently organized and therefore less loyal to their political elites. Finally, the political practice often depended on other factors such as social and economic development (e.g., the effective equalization of resources across segments of the population). Finally, the question arose whether or not consociational success—that is, a stable and effective government for all communities—did in fact produce its own disappearance over time. This last argument seems to be correct, for consociationalism can be considered as a historical phenomenon for the simple reason that most pillarized political systems have indeed faded away or failed.

Depillarization

Depillarization is a sociological process that has taken place since the 1970s and is considered, first of all, as a result of modernization (e.g., in terms of developments in communication such as information and communication technologies [ICT], which impair forms of social control), secularization (e.g., de-confessionalization, which weakens the loyalty of members of a pillar), globalization (e.g., due to de-industrialization being conducive to a changing class composition), and changes in elite behavior—all resulting in less cohesiveness and relaxing organizational ties within the pillars.

Politically, this process can be observed in terms of high degrees of electoral volatility, indicating changing behavior and a willingness to vote on the basis of motives other than being a member of a pillar. It is illustrative that during the 1960s the cross-European level of electoral volatility was 8%, but in pillarized countries, this was 3.3% lower. Yet from 1990 onward, this has changed dramatically: On average, electoral volatility increased by 3 points in Europe, but in the five pillarized countries, it rose to an unprecedented level of 22.3%, a growth of 16.8% (Peter Mair, 2008).

Second, the emergence of new parties that challenge pillarized parties and are mainly nonpillarized has contributed to these developments. Examples are the Greens and right-wing parties: Both party families have become particularly strong in Austria, Belgium, the Netherlands, and Switzerland. During the 1960s, electoral support for all new parties in pillarized societies was below the cross-European average, being around 4.4%, whereas their support grew to 10% above the cross-European level in 2000. Third, the politics of accommodation as indicated inter alia by the type of government coalitions has also changed: Instead of broad coalitions, one finds more often than not minimal winning coalitions (apart from Switzerland, due to its magic formula, which is, however, under pressure), with parties included in government coalitions that had not been participating before, such as in Austria, the Netherlands, and Germany.

All this points to a process of depillarization affecting a changing profile of organizational cohesiveness, electoral representation, and traditional cleavage politics. Finally, the impact of (party) elites diminished as well. Pillarization, taken in its political-sociological meaning, seems to have faded away and with it the typical features of consociational democracy.

PLANNING

Planning is deciding about future decisions, either in the sense of defining what has to be decided or in the sense of deciding how to decide. This entry discusses alternative conceptions of planning, its place in social science theories, and some of the applications of planning in governing. After a consideration of planning as a fundamental human activity, the entry explains the rational-comprehensive model of planning and its limitations and then examines alternative approaches to planning, including procedural models, systems theory, and strategic planning. It then discusses the place of planning in social-scientific theories and some of the applications of planning to governance.

The Activity of Planning

Planning is a very common activity. We plan courses of action so that we can achieve goals. However, it is important to distinguish between the concept of decision—the choice between different courses of actions whose consequences it is possible to forecast—and the notion of planning. The latter concept, in fact, encompasses several elements, namely, that

- to reach the goal or purpose of the activity, the decision maker has to take into consideration a set (and possibly a sequence) of different decisions;
- usually there is the need to allocate scarce resources between different goals; and
- central to the notion of planning is the concept of public policy, alternatively defined as the set of actions linked to the solution of a collective problem, a program of action, or a system of goals.

Planning, then, can be defined as the attempt to secure the coherence of a set or a sequence of decisions in relation to a specific problem—that is, a public policy. Therefore, even if we often find a plan or a program—that is, a document spelling out, in more or less detail, the content of the decisions to be taken and/or the procedures to adopt to this end—planning in itself cannot be identified with the decision to approve the said document; rather, it is a continuous activity, a process through which the future actions are organized and described.

The theory and practice of planning affect a plurality of different policy fields. For instance, the first university chair of urban planning was created in Liverpool in the United Kingdom in 1909, thus recognizing the existence of a specific discipline, distinct from architecture, geography, and the social sciences. But the socialist and communist movements in the 1920 to 1940 period gave popularity to the concept and practice of economic planning—that is, the adoption by the political power of a detailed and binding blueprint of the way in which the economic life has to be organized, by prescribing the type and quantity of goods and services to be produced in a given society in a given period of time. In the years following World War II, planning became widespread and was equated with rational and "scientific" decision making. This was also a consequence of the development of new methodologies of analysis (from cost–benefit analysis to operation research and linear programming) holding the promise of being able to inform public decision making. The meteoric rise of the Planning, Programming, Budgeting System (PPBS) in the U.S. federal government in the 1960s (and the subsequent demise of the PPBS program in the U.S. military in the early 1970s) is a good example of the importance of this approach in that period. Even today, planning is sometimes still presented as the true answer to all policy problems, as the "right way" to organize the exercise of political power in public policies.

It is interesting to note that even politicians and scholars who share a common belief in the virtues of market and democracy, and consequently strongly oppose any form of socialism and planned economy, seem to advocate more planning when it comes to public policy making, possibly as a way to constrain political and administrative discretion and certainly to increase the level of coherence and predictability of governmental interventions. This basically means that the value of planning is seen as a way to improve the content of the decisions by making them more "rational."

Alternative Conceptions of Planning

The Rational-Comprehensive Model

The starting point of the whole debate on the virtues of planning in policy making and policy implementation is therefore the idea that it is possible, indeed desirable, to base all decisions on a scientific analysis of the consequences of the available alternatives. This implies the following postulates:

1. It is possible to analyze the costs and benefits of all the different courses of action open to the public decision maker.
2. It is possible in a democratic society to use intellectual abilities in order to identify a system of goals related to the public interest or the common good.

It is clear that these two elements represent the basis of what Charles Lindblom has called the rational-comprehensive or rational-synoptic model of decision making, whose ideological roots are to be traced back to the 18th-century Enlightenment and 19th-century positivist philosophy, with their faith in the reason and in the intellectual capacities of the citizens or at least of the elites.

The two aforementioned postulates, however, have been widely criticized. Starting from the first postulate, as early as 1947, Herbert Simon has pointed out how the idea that all alternatives and all their consequences are known is highly unrealistic. No decision maker (and no planner) has all the time, the information, and the cognitive abilities required by the rational model of decision making. The consequence is that the maximum that can be achieved is to strive for a limited form of rationality, organizing the decision through a sequential search of the different alternatives and choosing the solution that is considered "good enough"—that is, that meets the "satisficing" criterion. Often this implies the necessity of not taking into consideration the consequences of the preferred alternative for all the desirable goals, and therefore, it contravenes one of the basic requirements of rational planning—that is, the idea that everything should be coordinated. But even if the subjective aspect of the postulate is satisfied (i.e., the decision makers have all the relevant knowledge), one has to remember that because planning is about future decisions and behaviors, an inherent level of uncertainty exists, as external shocks can alter some basic elements and forecasts can prove radically wrong. And finally, especially in contemporary welfare states, citizens have the tendency to raise issues or problems for which there is no clear-cut solution available (e.g., drug addiction or long-term unemployment). In such cases, it is obvious that a process of rational choice is not possible and that the attempt of the planners to allocate the "right" amount of resources required for the achievement of the goals is particularly difficult.

Preferences-Guided Decision Making

These examples of intractable problems call into question the second postulate mentioned above—that it is possible to use the knowledge and the intellectual skills of the ruling elite in order to identify a set of goals able to maximize the common good. The objection here has to do with the distinction, again introduced by Lindblom, between two different views of the society: the intellectually driven society and the preferences-guided society. In the first type of society, the faith in human intellect is such that a theory of social change is shared, there is no conflict between the needs of the individuals composing the society, and therefore synoptic planning is possible and indeed necessary to secure progress. In the second type of society, the recognition of the limitation of human intellect and the fact that conflicts are not only inevitable but also valuable in securing progress makes it impossible to use the same type of approach. In the latter type of societies, the poliarchies, the solution of the collective problems can be informed by analysis but is eventually determined through the processes of social interaction, based on the preferences expressed by the members of the society. In the preferences-guided society, in which political power is shared by a plurality of actors and institutions, the basic criterion for policy choice is the agreement between the relevant actors—in Lindblom's words, the mutual adjustment between them—and therefore, planning as described above is virtually impossible. Not only is reliable knowledge about the expected and likely outcomes of the decisions absent, but even more fundamentally, there is not necessarily agreement on the very purpose(s) of the planning exercise(s)—that is, the goals and priorities to be attained through public actions. Actually, Lindblom contends that this does not mean that in the preferences-guided society there is no planning but that a different form of planning, labeled strategic planning, is needed. However, from the examples he proposes, it is apparent that the ability to unequivocally shape future choices—a basic element of the definition of planning proposed above—is drastically limited. According to his vision, policy making in pluralistic societies is necessarily incremental, each decision departing only slightly from the status quo. To steer the process of decision making in the desired direction, the "planner" can only try to anticipate the reactions of the other actors, adapting his or her own choices, possibly by adopting a piecemeal approach to complex problems. In this way, it will be possible to minimize the oppositions in the short run and reach a more advanced equilibrium from which to start the construction of the next stage of policy development. As one Dutch minister once said—and one has to remember that in the Netherlands a highly sophisticated machinery for policy planning has been in operation for a long time—the true definition of a plan is "what we can agree upon"—the task of political power consisting in the ability to pave the road toward the next plan. Therefore, even if Lindblom's strategic planning is fundamentally different from what is generally understood as planning, from its proponent point of view, it is far from being a useless exercise. This style of policy making, as shown in Lindblom's *The Intelligence of Democracy*, is not only considered more desirable from the normative point of view but also is seen as being more effective in securing progress and development than any other alternative, since it is more adaptable to the complexities of contemporary society.

Systems Theory

An even more radical critique of rational planning—albeit developed at a different and higher level of abstraction—is the one put forward by Niklas Luhmann (1995) in the context of his systems theory. Basically, says Luhmann, planning will never work as intended because "in planning the system reacts not only to the conditions that are attained, to the success or failure of planning, but also to the planning itself" (p. 470). The mere existence of planning modifies the behaviors that it was aiming to shape by establishing their premises and, therefore, is structurally unable to reach its goals. Furthermore, planning introduces a necessarily simplified model of the complexity of the system into the system itself.

Considering these devastating critiques, one could be tempted to simply give in and abandon the very idea of planning defined as the attempt to secure the coherence of a set or a sequence of decisions in relation to a public policy, following the conclusion, reached by Aaron Wildavsky already at the beginning of the 1970s that "if planning is everything, may be it's nothing." The problem, however, remains: As already pointed out, planning is a very common activity, but it is also somewhat necessary because of the need to give a meaning to the present activities by shaping future choices. Hence, several attempts have been made to propose alternative forms of planning that are able to overcome the previous objections.

Procedural Approaches to Planning

One set of ideas is linked to the possibility of focusing the planning exercises not so much on the content of the future decisions but on the way(s) in which they should be reached, by prescribing the procedures of the decision-making process. This can be done with two different purposes in mind. In the first place, and more in line with tradition, the prescribed procedures might try to force the participants to consider more carefully the likely consequences of their preferred choices through, for instance, cost–benefit analysis or similar techniques. Using such tools in a multi-actor context, it is assumed, can have the effect of decreasing the danger of negative externalities, improving policy coordination, and, in general, reaching more "rational" decisions. Unfortunately, as Fritz Scharpf (1986) remarked more than 20 years ago, the "improvement of the policy making through better meta-policy . . . is littered with the skeletons of too many practical failures of perfectly logical improvements of policy making institutions and procedures" (p. 182). The reason, he contends, quoting Wildavsky, is that "no amount of procedural innovation [is] able to exorcise the inherently political character of public policy choices" (p. 182).

Applications of Planning in Governing

The second purpose of a procedural approach to planning is more subtle. Bearing in mind the observation made by Lindblom that procedures are highly valuable in pluralistic political systems, as a way of preserving personal liberties and popular control, Melvin Webber has redefined the effectiveness of planning by saying that it does not lie in the fact that the plan gives the "right answers" to policy problems but rather in its ability to improve the process of public debate and public decision. Its purpose is therefore to help poliarchies make policy choices in an acceptable (and accepted) way. The value of planning as a set of procedural rules adapted to the problematic situations they have to tackle is therefore also an end in itself, as it enhances the democratic character of a given society. This approach has been influential in recent years—in its different versions variously labeled as communicative planning, participatory planning, collaborative planning, and deliberative planning—and has gained widespread acceptance in the urban and territorial planners community. However, even the most enthusiastic supporters of this approach cannot deny that this opening up of the planning process might actually entail the danger of powerful self-interested actors being able to influence the process away from the pursuit of common good in order to maximize their own short-term goals, thus frustrating the democratic value of the entire exercise.

Strategic Planning

At a different level, an attempt to revive the discourse on planning as a way of shaping future choice is the notion of strategic planning recently proposed in organizational theory and in territorial planning. This proposal is rather different from the one put forward by Lindblom, being basically centered on the concept of framing. Frames are, according to Donald Schon and Martin Rein, systems of meaning that organize what we know and provide conceptual coherence, direction of action, and a basis of persuasion. Strategies, therefore, are emergent social products and conscious attempts to create and discover such frames and are able to shape future actions through the persuasive power of their core concepts, as pointed out by Patsy Healey, following the work of Henry Mintzberg in organizational theory.

Planning, in its original meaning of deciding about future decisions, becomes again possible, taking into consideration both the problem of insufficient knowledge and the complexity of contemporary political systems. The clearest application of this line of reasoning is likely found in the practice of strategic planning at the metropolitan level as it emerged in the past 20 years. By and large, and with some variation across the cities, strategic plans are exercises based on the mobilization of all relevant actors in a given urban area, on the production of a shared long-term vision of the desirable future, and on an action plan for immediate action. The idea is that cities are not able to innovate and, therefore, run the risk of decline, both because they lack a clear direction and because of diffuse veto powers and a lack of trust between the relevant actors. The ability to produce a shared vision—that is, a sufficiently precise and distinctive image of the desirable future, whose value is immediately tested in the preparation of the action plan (i.e., a list of projects coherent with the vision and needing the cooperation of the main institutional, economic, and social actors)—can overcome the inertia and solve at the same time the knowledge problem (the uncertainty about consequences) and the political problem (the need to make the decision). The value of linking long-term vision with short-term projects, in fact, lies not only in testing the viability of a coherent and distinctive idea of a desirable future but also in the projects of the action plan that can represent quick wins that are able to show the value of cooperation and, therefore, to overcome distrust and increase social capital.

This reemergence of planning in the context of modern complex governance systems should not be overemphasized. These attempts are very difficult, certainly fragile because of unanticipated external shocks, and necessarily based on a segmentation of the problems either by policy sector or territorially, as in the case of urban plans. The strategic-framing approach, according to its proponents and followers, is in no way devoid of risk and uncertainty, and its practitioners should therefore act with modesty and prudence.

But the idea of the rational, comprehensive plan that is able to allocate scarce resources in the most efficient way to the relevant societal priorities has been shown as what it is, a mythological notion, impossible to achieve, dangerous in its consequences, and, if one has to follow the postmodernist school of thought, a mere way of suffocating conflict by concealing the all-pervasiveness of political power and special interests.

The Future of Planning

However, like the mythological phoenix, planning in its more top-down, synoptic, and comprehensive version is perpetually reborn from its ashes, as one can easily see in business studies, new public management discourse, and political rhetoric. Despite more than 50 years of accumulation of knowledge, and the very apparent failures of those exercises, the myth of the "intellectually driven society," to use Lindblom's terms, in which comprehensiveness and perfect coordination of policy efforts can and indeed should be achieved, continues. This possibly means that, on the one hand, the "desirable imperfections" of democracy in contemporary complex governance systems have not been fully appreciated and, on the other, that the quest for neutral guidance through science and technology is deeply embedded in modern society and cannot be exorcized by any amount of social and political inquiry.

PLURALISM

Pluralism, a term first used by Christian Wolff and Immanuel Kant, gained currency as a philosophical view of the universe in the early 20th century. American pragmatism, developed by William James, conceived the world in pluralistic rather than in monistic terms: interconnected but irreducible to unity, its parts self-governed, not a "block universe" but rather a "federal republic." Philosophical pluralism, as John Dewey had observed earlier, acknowledged the possibilities of variety, of freedom, and of change. The concept's applicability to political and cultural contexts was rapidly noticed by English and American thinkers: James's pluralistic universe could be construed as a polity where groups, possessing inherent rights not conceded by the state, elicited individual loyalties and pursued social ends. The approach came to assume central significance both for Harold Laski's pluralistic theory of the state and for Horace Kallen's vision of a commonwealth of different ethnic groups and their cultures. Pluralism offered an analytical and a normative notion that responded to the increasingly associative character of society, the rise of governmental interventionism, the lobbying activities of organized groups, the nascence of immigrant subcultures, and the maldistribution of political resources. This entry explains the concept of pluralism as it is used in political and cultural contexts. It then considers alternative conceptions that lead further into the theory of interest representation. The entry concludes with a look at the relevance of pluralism in the 21st century, particularly with respect to ethno-cultural groups and to all forms of inequality.

Positively, the concept establishes, first, the existence of a plurality of interests and corresponding social groups that, as latent centers of power, may organize into associations and, second, the transformation of this diversity into public policies through pressure exerted on each other and on governments. Normatively, the concept endorses the process of individuals turning to organization, the resulting formation of interest groups as subjects of democratic politics, and the sequence of group conflict, bargaining, and compromise that characterizes the shaping of public policies, on condition that basic rights and the principles of justice remain respected and protected.

Pluralism may thus be defined as both a descriptive and a prescriptive theory of individual participation by social association in the political process. Groups, in other words, are envisaged to operate as instruments, representing individuals rather than replacing them in the political process, thereby enhancing their chances for individual-centered democracy in a world of increasingly complex sociopolitical interaction. Political man acting through and in control of his freely established associations: That has been pluralism's normative vision.

As with every representative arrangement, however, inbuilt tensions remain between the original individual interests and eventual group (i.e., leadership) action. To the extent that such group action today has come to be treated as a substitute for individual action in reaching political outcomes, the chances for individual-centered democracy are diminished. This inference is especially relevant because political resources enter the picture as a second pivotal element. Their grossly unequal distribution skews the political process in favor of powerful minorities. More often than not, from the viewpoint of the theory and practice of democracy, noncommitted or indoctrinated citizens who are caught in a web of hierarchical organizations are indicative of a less than satisfactory reality.

Over time, pluralism has vacillated between diagnosing severe democratic deficits in the political process and accepting the ongoing results of that process. Discussions of ethno-cultural pluralism have evolved largely separately from the debate on political pluralism and have raised additional thorny problems, which are discussed below.

Political Pluralism

Borrowed from James's pragmatist philosophy, the term *pluralism* was first introduced into political science by the British Labour Party intellectual Harold Laski in a 1915 lecture delivered at Columbia University. Even before World War I, business corporations and industrial combines—the first multinationals among them—had risen to prominence, underscoring the unequal distribution of power between labor and capital. However, if continuing entrepreneurial hegemony seemed assured, a labor movement had, after bitter struggles, also emerged. Unions had been organized, and in most industrialized countries, the right to strike had been won.

Concurrently, the 19th century's rigid class structure had started to dissolve. The working class was segmenting into numerous blue- and white-collar strata—groups, in fact—differentiated by vocation and attitude, by income and education, and, again, by grossly unequal influence and control both economically and politically.

The intellectual climate seemed to be ready for a "new" political concept, reformulating the notions of freedom and democracy in a determined attempt to attain the "good society" in the context provided by organized capitalism and the large nation-state. The answer was a theory of groups and associations; of positive, interventionist government; and of industrial democracy as a complement of political democracy, which Laski put forward between 1915 and 1925.

Laski's thinking was considerably influenced by the ideas of the Fabian Society, an intellectual circle of "respectable" socialists—established, among others, by Sidney and Beatrice Webb and George Bernard Shaw—that had taken part in the formation of the British Labour Party. Another significant influence was the argument of the guild socialists ("young rebels" in the Fabian ranks, building on French anarcho-syndicalism), particularly George D. H. Cole, who held that associations sprang up in society according to the logic of functional differentiation and that self-government, consequently, was identical with functional representation on every social level. That definitely included the workplace, the factory, the enterprise; in a nutshell, it represented the control of production by worker organizations, since individuals (having, by steps, been enfranchised in the political sphere) had remained "enslaved" by industrial autocracy in the economic sector.

Like Cole, Laski remained convinced that no political democracy could be real without being underpinned by an economic democracy. His concept focused on control (rather than on ownership) of the means of production and on the enfranchisement of the citizens (blue- and white-collar employees) of the political body that was and is the modern enterprise—its proper "stakeholders," in today's parlance. Nationalizations would leave the position of these employees unchanged. What they needed was a share in the actual decision making.

It required the Great Depression of 1929 and the circumstances of the formation of the British National Government in 1931 for Laski to move more clearly in a Marxist direction, without, however, as has been erroneously suggested, "rejecting" pluralism. Rather, by combining pluralism and Marxism, he proposed in 1937 to transcend the capitalist system, envisaging not violent action but, in a term Laski (1948) was to coin during World War II, a *revolution by consent*. Only in a classless society, he now contended, could authority be "pluralistic both in form and expression" (p. xii).

Cultural Pluralism

Likewise inspired by James's philosophy, Kallen introduced the term *cultural pluralism* into the American debate in 1924. Immigrant subcultures were by then flourishing in the eastern United States, after nearly 15 million immigrants—mostly from Southern and Eastern Europe—had been admitted to the country between 1901 and 1920. Writing—not unlike Laski—between 1915 and 1924 and arguing against assimilating pressures and melting pot conformity, Kallen offered his vision of a federated republic of different nationalities. Convinced that self-government was impossible without self-realization, that the latter—in the sense of personal identity—hinged on the assertion of ethnic differences, and that society's creativity would benefit from such heterogeneous strains, he proposed granting equal treatment to each ethnocultural tradition.

Both Kallen's and Laski's agendas favored a politics of inclusion, in the sense that policy making in pluralist democracies should embrace, on an equitable basis, as many societal interests as possible. Both were rediscovered—in substance, if not through explicit recourse—after World War II. Laski's was rediscovered by the American political scientist Robert Dahl, who in his later works returned to pluralism the democratizing dimension that the British thinker had first supplied (industrial self-government—an employee-controlled economy—as the main prerequisite of a more participatory democracy). Kallen's ideas were rediscovered by a succession of theorists, such as Tariq Modood in Britain and Will Kymlicka in Canada, who supported progressing toward multicultural acceptance, avoiding both fragmentation and conformity (a plural state, informed by a "politics of recognition," as the vehicle for achieving true multicultural citizenship).

Even before Laski and Kallen, Arthur Bentley had presented an approach that essentially reduced human behavior to group action. Describing his effort as "strictly empirical," rejecting both individualism and institutionalism, Bentley in his 1908 treatise *The Process of Government* aimed at introducing the group as the central analytical category. If the immediate impact of his book was negligible, that situation would change after a considerable number of pressure group studies had been published in the United States between World War I and World War II and after the New Deal reform period had finally established organized labor and organized agriculture as political players alongside business in bargaining for political benefits. Bentley's work was resuscitated in the early 1950s by David Truman, Earl Latham, and other group theorists who judged that organized interest groups made up the principal ingredient of present-day government.

At the same time, against the backdrop of the Cold War, the need was felt for a "legitimating discourse," according to Richard Merelman, designed to explain and justify the political systems of the free world, meaning the United States and Western Europe. Stripped of most of its prescriptive implications, elevated to the status of an antitotalitarian (rather than antimonist) public philosophy, the concept of pluralism seemed to serve the purpose perfectly. The 1950s to 1970s were the heyday of the academic and political discourse on pluralist democracy.

In its entirety, the approach resembled nothing more than a modified marketplace model ("interest-group liberalism," in Theodore Lowi's designation), with the individual replaced by organizational competition. Such "liberal" pluralism, while claiming to disregard considerations of a normative kind (and thus contrasting with Laski's "radical" variety), was admittedly biased toward group leadership. It was, in fact, an elite concept, according to which leaders of associations conducted the process of organized pressure and bargaining, thereby controlling each other. Control *among* leaders, however, provided but one significant attribute of the political process. A second was control *of* leaders by means of periodic elections, holding them accountable to party or interest-group members and to the electorate at large.

Both Truman and Dahl (even in his early works) conceded that control of group leaders and access to government were determined, to a considerable extent, by income, education, and status. Cross-pressures, resulting from conflicting group loyalties, might lead to political apathy. Political resources were unequally distributed, most conspicuously between business and labor. Capitalist democracies offered extensive opportunities for "pyramiding" such resources into structures of social power and political influence.

Conceptual Alternatives

In view of these limitations, two avenues for further theorizing suggested themselves. Both were pursued from the mid-1970s. One was to unequivocally embrace "realistic" Schumpeterianism—that is, fitting groups into a model of elitist democracy where governments would explicitly privilege the organizations of capital and labor as "partners" in policy formulation and implementation over associations with weaker political resources. Group leaders would manufacture consent for policies resulting from institutionalized "interest intermediation," by which group leaders are able to reshape social interests in order to make them compatible with public policies. Group members would consequently be mobilized and controlled in a top-down process. Such conceptions of liberal (or neo-) corporatism, as they came to be labeled, were particularly developed in, and focused on, Western Europe, with Philippe Schmitter and Gerhard Lehmbruch in the forefront of neo-corporatist writers.

Consequently, the neo-corporatist school of thought has insisted that the socioeconomic attributes around which interests organize are indeed unequally distributed; that existing inequalities are further reinforced by the politics of interest associations, not the least because certain associations, particularly organized business and organized labor, are granted privileged access to governmental decision making; and that political processes typically take the form of oligarchically structured interest intermediation through bargaining among leaders.

Proponents of corporatism and liberal pluralism alike have usually conceded that, more often than not, pluralist and corporatist arrangements may be found in mixed combinations (Germany provides a typical example). Both varieties may, in fact, not perform too differently, considering what liberal pluralism had to say about bargaining among leaders and about the possible pyramiding of unequally distributed political resources.

Because trade unions typically have difficulty in gaining the support of their members on agreements, the involvement of social-democratic parties as predominant players, able to secure trade union support, has been considered a salient requirement of corporatist structures. To the extent that governments led by social-democratic parties, accepting the notion of international competitiveness as the new social and economic orthodoxy, have joined conservative administrations in attempts at mediating the consequences of globalization by the pursuit of deregulatory and privatization policies, the social-democratic/trade union alliance has been eroded.

Neo-corporatism, moreover, always remained very much a Europeanist concept. With regard to the United States, observers continued to note that because of the political strength of corporate business and the corresponding weakness of labor, no genuine interest in such an arrangement existed on the part of the American business elite.

The second conceptual alternative, according to Dahl, consisted in raising the normative question of how one might remedy the defects of pluralism. This meant conceiving pluralism in terms of a normative concept of democratic transformation as it had earlier emerged in England. Looking for possible solutions to what "authority in a good society" might be like, Dahl—ever more critical of institutional rigidity, social inequality, and political apathy—suggested a radical alternative to the present status quo. The large business corporation and the politically privileged position of corporate executives—the latter, as held by Dahl and his fellow critic Charles Lindblom, being subject to neither effective internal control by stockholders nor effective external control by governments and markets—became the major targets for the proposed participatory reforms. In a way reminiscent of Laski's earlier efforts, but more systematically, Dahl argued that control over the political body, which the modern business enterprise has in fact become, should no longer rest with investors or managers but rather with blue- and white-collar employees. Starting from the premise that unequal social resources will translate into unequal political resources, Dahl's program focused on diminishing the discretionary exercise of organizational power by the economically privileged minorities.

Ethno-Cultural Pluralism

Such radical pluralist propositions have been merging into the larger, more comprehensive debate on democratization, a spillover of democratic norms onto economy and society. The attribute "political" has thus been reconceptualized, now relating to any form of group decision making, whose democratization would be intended (as Amitai Etzioni has emphasized) to make all sectors of society more responsive to their members. As a caveat, it should be added, however, that the extent to which such visions of increased citizen competence and control might be accepted, internalized, and practiced by increasing segments of present-day consumption-oriented societies is far from clear.

On top of that, neoliberal maxims have become firmly entrenched with the progress of financial and economic globalization. Bent on cutting business regulation and welfare expenditure, and opting for the privatization of public services, governmental and market players alike have worked at reducing the size of government. The "reform" label has been put to service as a facade for such programs. Ongoing globalization has not simply diminished governance capabilities due to the pressure of multinational investors and foreign competition—it is governments themselves that have determinedly been restricting their performance. Such promarket state intervention urgently calls for institutional and attitudinal changes that would again reinforce political pluralism.

Concurrently, the migration component, which the process of globalization involves, has been further pluralizing and diversifying Western-type societies along ethno-cultural lines. Once again, the pattern of societal cleavages and linkages has been changing. The fragmentation of interests is being advanced, and traditional institutional loyalties are put in jeopardy. Socioeconomic inequalities and insecurities rank high among the factors that have been fueling the rediscovery of ethnic-based identification as a source of belonging among these increasingly multicultural populations.

When Kallen proclaimed a "democracy of nationalities" as the desired goal of cultural pluralism, he wanted individuals in every ethnic group to realize their inherent possibilities according to that group's cultural traditions rather than being discriminated against by culturally privileged majorities. Two generations later, Giovanni Sartori stressed that pluralism, because it considered diversity a pivotal value, should first and foremost focus on cultural diversity, aiming at a "cross-fertilized" rather than a "tribalized" culture. Pluralist policies should accept (recognize) the cultural, religious, and linguistic heterogeneity of different ethnic groups, without inviting further societal segmentalization.

Strategies of differentiated group treatment (e.g., affirmative action procedures in employment and education, introduction of official multilingualism, a composition of political bodies reflecting the existence of various ethnic groups) may work to reinforce cultural pluralism. However, these policies do not maintain neutrality toward ethno-cultural differences. Remaining neutral would imply that discrimination on ethnic grounds is legally prohibited while benefits are solely provided according to individual eligibility.

Most of the relevant debate has centered on the controversial question of how to balance individual against group rights. Might not any determined movement in the direction of group rights work to endanger individual autonomy and to bar individuals from opting out of their group if they wish to adopt ideas and practices running counter to their ethno-cultural heritage? To be effective, need not policies of differentiated group treatment show an awareness of the connection between economic and cultural power? A more equitable distribution of social and political resources might help individuals make meaningful choices, including the choice to exit a group perceived as confining.

A pluralist politics informed by a spirit of both political participation and social justice clearly would concede ethno-cultural groups some political standing and legal rights—but to what extent? Available options for overcoming ethnic cleavages include legal protection and public funding for the expression of cultural peculiarities, federalism as a form of self-government, and finally, group-based political representation, up to the complex arrangements of consociationalism (in which representatives of varied groups share decision-making power). However, consociational government has been shown to favor elite (group leader) predominance, arcane negotiations, and political immobilism rather than a more vibrant pluralist democracy.

Pluralism in the 21st Century

Persisting inequalities of socioeconomic (and, in addition, ethno-cultural) influence and control, equivalent to so many embedded participatory barriers, have keep resurfacing during this overview of research on pluralism and democracy. Resulting in unequal chances for the organized representation of interests and, hence, in limits to more robust redistributive and regulatory public policies, they will remain among the major issues bedeviling 21st-century democracy. As a powerful approach to inquiring into these issues, pluralism will be of continuing relevance, provided it retains the role of a critical political theory—critical, as it sporadically has been, of the status quo of concentrated economic, political, and cultural power. This, in turn, requires that two problems remain foremost among the concerns addressed by political science: first, securing broader societal participation—and thus, again, a more equitable representation of social interests—in the shaping of public policies and, second, reducing disparities in control over political resources to ensure the accessibility, accountability, and (in the final instance) legitimacy of a representative democratic government.

PLURALIST INTEREST INTERMEDIATION

Modern democracies are determined by a great number of diverse interests. That is why structures and actors that show and assert individual social interests are necessary. Nevertheless, although interests can be articulated individually, a collective and organized representation of interests, called interest intermediation, promises greater success. Because of this, organized interest intermediation plays an increasingly decisive role in the political process. It belongs to democracy "like the piston belongs to the cylinder" (Ralf Kleinfeld, 2007, p. 7), because without organized aggregation and articulation of interests, modern societies and democratic forms of government would not be able to act. Modern democracies show very different structures of interest intermediation. Corporate and pluralistic systems of interest intermediation can be distinguished. The interest of political science in this process lies, in particular, in the identification of regular patterns of interest intermediation and conflict resolution. However, before the process of interest intermediation is dealt with in more detail, the concept of interest must first be defined. This is followed by a discussion of major actors, their patterns of interaction, and the respective concepts in political science.

According to Carola Schulz (1984), interests can be defined as "action-relevant consolidations of needs which arise from the subjective perception of situations where a distinct feeling of want is present" (p. 15). For citizens' needs to find their way into the political system, they must be articulated and organized. It is exactly here that political interest intermediation applies. Since political systems are social systems that make collectively binding decisions, it is helpful to bring in a theoretical perspective from systems theory in order to illustrate the process of interest intermediation more closely. Here, the classic model developed by David Easton can serve as a basis. To be sure, Easton's model expresses a concept of democratic ideals, but it facilitates a brief representation of the procedural character of interest intermediation. For Easton, the decisive actors of the political system are the parties and interest groups, on the one hand, and government and the administration, on the other. Interactions between these actors are aimed at generating collectively binding decisions. Demands for such decisions are brought into the political system as inputs, processed where appropriate, and converted into outputs. At best, these outputs result in the fulfillment of these demands and thus enhance the legitimization of the political actors and therefore the political system itself. In turn, this may lead to new demands being brought into the political system in a feedback cycle. For this reason, Easton places both political demands and political support on the input side. In this context, politics can be defined as the process of the production and enforcement of obligatory cross-societal decisions.

Political demands are the necessary raw material for the political process. During their processing, however, problems can occur since, on the one hand, not all demands can be integrated and, on the other, not each demand for a collectively binding decision can be fulfilled. Demands can contradict each other, and a state's resources are limited. According to Easton, for demands to enter the political system at all, structural mechanisms such as parties and organized interest groups are necessary. As such, they have an intermediate function between the political system and society at large.

Actors of Political Interest Intermediation

In modern democracies, various actors apart from political parties assume the task of aggregating and articulating the interests of the population. In this way, it can be ensured that the political system remains stable and can adapt to new tasks at the same time. Modern democracies rely on highly effective forms of interest intermediation from both a normative and a functional point of view. The high complexity of political interests and social demands makes the work of specialized actors of interest intermediation indispensable. An efficient system of political interest intermediation is the central precondition for the legitimacy of collectively binding decisions. Ideally, political interest intermediation, therefore, connects the contents of politics to the will of the sovereign and facilitates political decision making by reducing complexity.

Political parties continuously fulfill the function of interest intermediation since they are the only ones to work on cross-societal problems; but associations, churches, unions, social movements, nongovernmental organizations (NGOs), and other groups also represent important interests—even more so if they succeed in representing the total interest of their organized members. While individual interest associations usually attempt to influence the political process through lobbying, social movements attempt to prevent or reverse decisions or create social change through unconventional actions. In addition, since the 1990s, in many countries, NGOs have played an increasingly stronger role in the intermediation of social interests. Similar to social movements, many NGOs claim to be committed to broader social values, but they also can be distinguished from social movements by their higher degree of organization.

The conditions of political interest intermediation have been changing more recently, however. Both exogenous and endogenous changes are responsible for this. On the one hand, the number of political-administrative actors has expanded (and thus the possibility for influence) through the formation of supranational institutions, such as the European Union. On the other hand, individualization and pluralization of social interests complicate their integration and organization. Thus, it is no surprise that a pluralization of the representations of interests can be observed, which is accompanied by a certain loss of importance of major traditional intermediate actors such as unions or employers' associations.

Political Interest Intermediation as a Subject of Political Science

If we want to abstract from the actors and analyze interest intermediation from a political science point of view, it is useful to distinguish aspects of policy, polity, and politics. Since the intermediation of interests can be regarded as a permanent political process, it falls into the procedural dimension of *politics*. Yet the basis for interest intermediation lies in the principle of a liberal political order—the *polity* dimension. In this respect, basic freedoms are the freedoms of expression and association as well as the right to vote. The *policy* dimension is equally affected by social interest intermediation since government policies are strongly influenced by the interests of society (Ulrich von Alemann, 1987).

Due to the variety and conflicting nature of interests and the scarcity of resources, a pluralist democratic political process is continuously antagonistic. Although the disputes concerning the distribution of benefits, the satisfaction of needs, or the pursuit of ideals thus mean permanent conflicts, these must, however, not be conducted in violent ways, endangering the system as a whole. This is an essential task of political interest intermediation. Thus, in political science, a conflict-regulating function is ascribed to the process of interest intermediation from which stability and legitimacy in Easton's sense can arise.

Pluralist Interest Intermediation

A general distinction in political science is made between pluralism and corporatism as the two essential strategies of political interest intermediation. The concept of pluralism regards interest articulation, aggregation, and the fulfillment of demands as a continuous process. In the long run, this dynamic process leads, in the view of the protagonists of such concepts, to the achievement and maintenance of the common good for society. Pluralism in this sense can be defined according to Philippe Schmitter (1974) as

> a system of interest representation in which the constituent units are organized into an unspecified number of multiple, voluntary, competitive, nonhierarchical, ordered and self-determined (as to type of scope of interest) categories (and), which are not subsidized, specially licensed, created or otherwise controlled in leadership selection or interest articulation by the state and which do not exercise a monopoly of representational activity within their respective categories. (p. 96)

On the one hand, Schmitter thus emphasizes the structure of interest intermediation determined by competition. On the other hand, he stresses the fact that such actors are neither supported nor controlled by the state. Pluralistic interest intermediation is, therefore, characterized by the voluntarism, spontaneity, and autonomy of the interest groups. Unlike corporatism, pluralist interest intermediation is not based on the agreed-on forms of negotiation between interest groups and the political-administrative bodies but rather on competition and conflict. From a pluralistic point of view, politics can therefore be regarded as resulting from social interests and the respective power of the mediating interest groups. In this process, the actors can compete relatively autonomously for the enforcement of their interests and take advantage of the resources available to them.

In this respect, interests that are capable of dealing with conflict and easy to organize have an advantage. This in turn leads to a decisive problem from the point of view of a normative theory of democracy: Interests that are difficult to organize and the interests of groups of lower significance have only a small chance of representation and intermediation. So, due to real existing pluralistic structures, capital and labor interests are favored in particular, and interests are not represented according to their importance for society as a whole. As opposed to the thesis of balanced interest implementation as a basis of the pluralist theory of democracy proposed by Robert Dahl, in particular, the fact remains that representation of interests in modern democracies is not balanced—and cannot be balanced due to their complexity and variety. Thus, it is not possible in the process of collective decision making for every citizen to have the same opportunity to express his or her interests. Such a representation (as complete as is possible) of interests of different social groups is, however, a condition of pluralist interest intermediation. Considerable legitimization problems can, therefore, result from the unbalanced interest representation of pluralistic structures. So the possibility exists that, on the one hand, the results of political decision making are no longer accepted and, on the other, that this disappointment can lead to the refusal of established forms of participation and intermediation mechanisms.

Here, it must be considered that the greater success of interests that are well organized is not necessarily a dysfunction of the political system but is rather the product of a pluralistic competitive democracy. The political administrative addressees of pluralistic interest intermediation have themselves the ability to guarantee, however, by means of law, a minimum of fairness in this competition for influence. Conditions of action for interest groups can be legally regulated, for instance, in the procedure of consultation in Switzerland. This procedure is part of the legislative process in which all important interest groups are to be consulted independently of their negotiating power.

For functional reasons, a corporate interest intermediation also can fulfill only a selective consideration of interests and thus perform only an inadequate representation. Here, the negotiation process is also determined by those interest groups having the strongest influence. The difference lies only in the mutual cooperation of interest organizations with the political-administrative actors. The problem of underrepresentation of certain interests, therefore, remains not only unsolved in this way but would moreover become firmly institutionalized.

The difference with regard to the pluralist interest intermediation lies rather in the enforcement of interests between the actors—which has less potential for conflict due to lack of competition. Because of this, an integrative effect for society can also be achieved by corporate interest intermediation, which is not subject to majority decisions. Furthermore, this mode of interest intermediation succeeds in providing a peaceful solution to class conflicts via collective negotiations between the state, employers, and trade unions. By contrast, the sluggishness, inflexibility, and status quo orientation of corporate interest intermediation is often criticized since it can lead to a blocking of reforms with many veto players. Corporate structures are, however, only partially possible in situations where social interests can be integrated on a high organizational level. As a result, the available corporate structures are often part of a more comprehensive pluralist system of mediation. In the literature, pluralism is usually regarded as a strategy superior to corporatism for the overcoming of socioeconomic crises and as a relative stability guarantee for democratic governments.

Since pluralism and corporatism are not only procedural strategies but are integrated into a country's political culture via the context of ideological acceptance, a concrete form of interest intermediation cannot be imposed without consideration of the political culture. Yet the guiding values of compromise and consensus anchored in the political culture, and thus also in political socialization, further complicate interest intermediation in the sense of pluralistic competition.

POLICE

The police is the institution in charge of protecting public order and repressing crime, and it is entitled to use physical force in order to meet these functions. Police institutions are the product of a long-term historical trend toward *differentiation* and *specialization*. Before the beginning of the 19th century, differentiation as a contemporary function of policing (e.g., keeping peace and combating crime and disorder) was in the hands of watchmen appointed from households or by family or tribal constables. This "private" policing occurred in several areas (e.g., China, main parts of Africa, and South America) before the Europeled colonization process. Autonomous, professional, permanent—and in most cases local—police forces arose in the wake of urban growth and urban disorders, industrial disputes and riots, and crime fears. This institutionalization process accompanies a specialization process in the countries of continental Europe, where police imposed an ensemble of norms, rules, and measures to regulate the entire urban existence, from public hygiene to passport control, from milk inspection to supervision of libraries, and so on. If not in the hands of watchmen or private forces, such as dock bosses' militia, the control of crime and disorder was only a small part of the duties of what then constituted the police. During the 19th century in continental Europe, police could specialize only in these functions because administrative law and jurisdiction regulated other aspects of social life at that time. This entry discusses the main distinctive features of police, especially in connection with the use of force; the trend toward specialization, especially with relation to efficiency; some of the most recent transformations; and the organizational differences between a central organization and a local organization.

Key Distinctive Features

From a more theoretical point of view, the police institution has two distinctive features. First, it is wholly instrumental: It is meant to perform a definite task, linked to crime and disorder, under civil supervision (i.e., the functional dimension of the police). Second, it is defined by its capacity to use physical force (i.e., the substantive dimension of the police). A crucial dimension of police relies therefore on its intimate relationship with the monopoly on physical force that Max Weber sees as the distinctive feature of the state. But this crucial dimension is at the same time oxymoronic, since (contrary to the military use of force), police force is expected to be legitimate (i.e., reasonable, proportionate, and based on consent). Robert Reiner (2000) asserts that, with respect to police action, the two terms *consent* and *force* are antagonists. The police can use force either in the context of a local breach of order (a contested arrest, an unlawful strike, or a riot) or in the context of a broader social or political breakdown resulting in great hostility against the regime in place. However, police legitimacy relies on consent from the public and/or the ruling regime.

On a more sociological level, the substantial affinity between force and the police has been questioned. Empirical evidence clearly shows that the actual use of force is rather rare. Some police officers never use physical force throughout their career. On the other hand, trying to list and rationalize all the tasks ever performed by police officers is nearly impossible. Therefore, some theorists like John-Paul Brodeur (2007) are inclined to define the police as the only public organization aimed at "doing everything." To do so, they use means that are illegal or unlawful if taken by ordinary citizens (from driving the wrong way on a one-way street to bugging phone devices).

Nevertheless, use of physical force is a central issue in police organizations because cases of abuse of force weaken the political legitimacy of the police. The beating of the African American motorist Rodney King in Los Angeles in 1991 by White police officers (and their acquittal on charges of excessive force 1 year later) led to urban riots in the United States. The death of two minority youths in France in 2005, who allegedly fled from the police into a power substation, where they were accidentally electrocuted, led to a 3-week-long period of urban unrest. Abusive arrests and stops-and-searches in London, Birmingham, and Liverpool also led to urban riots in British cities from the end of the 1970s to the mid-1980s. It is difficult to assess if substantial changes occurred as a result of these episodes of scandal and protest. Nevertheless, police organizations faced a legitimation crisis in the course of the 1970s, due to the emergence of urban disorders and/or race riots (in the United States, England, and France), on the one hand, and to the rise of property crime, on the other.

Specialization Versus Efficiency?

Contemporary evolutions of police organizations contribute to the empirical and theoretical dispute over the accurate definition of police. First, from the initial wave of modernization and professionalization (from the early 1970s onward), police institutions have experienced both an increased specialization and a commodification of the services they are expected to deliver. Both phenomena are closely linked with a legitimation crisis that occurred during the 1970s. Overspecialization has been implemented to cope with different aspects of crime and delinquency, leading police organizations to become an archipelago of diverse and isolated occupations (from drug squads to environmental crime enforcement and from juvenile delinquency units to transnational police experts). The increased use of surveillance devices and technologies has played a major role in this process. This evolution toward more segmentation into specialized operations and the increased importance of surveillance and proactive activities tend to make physical force a secondary if not purely metaphorical aspect of police work. Some analysts have underlined this phenomenon in stating that police are not violence workers but "knowledge workers," noting the massive amount of data and information police officers are expected to sort out and analyze in order to conduct their tasks.

This trend toward an overspecialization, specifically in the most diverse domains of crime fighting, has not prevented a decline of police efficiency. Therefore, police organizations have communalized a certain amount of tasks, the implementation of which may differ among nations. Since the 1990s, there has been a trend toward a kind of network policing in which diverse private and public institutions or agencies are brought together to combat and prevent crime and urban disorder. Police officers are now civil servants confronted with private and public agents in different kinds of negotiation arenas. Several labels have been employed to describe these evolutions. The notion of "problem-solving policing" was first introduced at the beginning of the 1980s to encourage the police to tackle daily local problems such as loitering or drinking in public spaces, domestic violence, noise disturbances, and so on. Thus, police institutions began to focus on broader social issues rather than solely on major crimes. Facing the difficulty of implementing internal police reforms, local or (more rarely) central governments developed programs such as community policing and neighborhood policing, aimed at integrating police organizations into larger institutional structures and, therefore, at resisting police organizations' tendency toward insularity and self-agenda. Moreover, the increasing pluralization of policing (the growth of private security forces, informal policing, vigilantism, the introduction of local police forces competing with state police forces, etc.) threatens the monopoly of the police in the prevention and repression of disorder. Network policing programs, such as community policing, provide an opportunity for the police to become an integral part of the larger institutional structures and to work collaboratively within these structures to combat crime.

Recent Transformations

Other transformations have cropped up in the course of these evolutions. The first has been the introduction of regulations and guidelines issued from the new public management perspective into police organizations during the 1990s, in the wake of the broader public policy reforms initiated by the Clinton administration in the United States and the government of Tony Blair in the United Kingdom. A major focus has been control over police officers, the stress of individual accountability, and the diffusion of "better with less" management policies. As a result, police chiefs and captains devote a major part of their time to crime and activity statistics to comply with political and public expectations. Such management systems, whose real ability to cope with crime and security has been widely discussed in the literature on policing, have been exported throughout the world and adopted by countries and cities in very different ways. As in other agencies, one effect of this management system is the development of strategies that may lead to an increase in the bureaucratic insularity of police organizations and to a further public concern with the ability of police organizations to cope with real crime.

The second trend is the rising importance of law-and-order policies in the political agenda of many Western countries. Proving one's ability to deal with crime and lead police forces tends to be a major personal asset in the political game. The fight against terrorism and international crime is vital to this trend. In combination with the gaming strategies developed within police organizations, this tendency sheds light on the fact that the police have a symbolic role that seems more and more important in today's political systems.

Central and Local Organization

Police are in fact a part of the political system, in which they help consolidate the political legitimacy and resources of the (local or national) government. One must distinguish here between regimes in which police organizations are centralized under the direct command of the government (as in France) and countries in which police forces are essentially municipal (as in United States) or regional forces (as in Germany and Great Britain), with some specialized forces devoted to federal issues (e.g., organized crime, terrorism, and intelligence). Contrary to a widespread assumption in political science, the degree of centralization of forces is not correlated to the degree of corruption of the police by political forces. The Napoleonic model in France offers a striking example of police organizations heading numerous and opulent political intelligence and antiriot sections under the immediate leadership of the Ministry of Interior, which is always devoted to the political tasks of repressing protests, preventing public disorder, and influencing or shaping the political landscape. Municipal police systems in the United States, on the other hand, are characterized by a high level of what the U.S. National Commission on Law Observance and Enforcement (the Wickersham Commission) in 1931 called "lawlessness in law enforcement," because such police forces are considered to be part of the local political system and are under the direction of the mayor or supervisors of the municipality. The wave of reform of police forces during the 1950s resulted in a high level of "professionalism"—that is, quasi-military police departments with high standards of integrity. As it appears, the nature of the political involvement of police organizations is strongly linked to the organization of the political system.

POLICY, CONSTRUCTIVIST MODELS

Social constructivists depart from the assumption that reality is what Peter Berger and Thomas Luckmann call *social reality*. To say that reality is socially constructed is to say that social reality is the product of human ways of knowing and communicating. Social constructivists, therefore, draw attention to the processes and ways through which the world is represented in language. They feel that the access we have to a reality outside human symbol systems is highly problematic. This entry describes the relevance of this perspective for understanding public policy.

Language, to take the most obvious symbol system, does not simply report facts. Things get their meanings through language, irrespective of whether they exist outside language. And the meaning of anything always exists in particular social contexts; meaning is always contextual, contingent, and historical. Since human beings always depend on their symbol systems—and the theoretical frames they build with the help of these—to make sense of the world that surrounds them, the way they interact with the world is the result of socialization and, more generally, of human history. We act toward things on the basis of the meaning they have to us. We tend to forget the contingencies of the social constructs and the forces that shaped them. Therefore, constructivists remind us that social reality is always in flux, even if the processes through which change comes about might be slow at times.

Kinds of Social Constructivism

Social constructivist thinking started from the sociology of knowledge and has spread through the social sciences. Since the 1960s, it has flourished and has been further elaborated on with the help of a wide variety of (sometimes conflicting) insights from—among others—Ferdinand de Saussure's linguistics, the phenomenology and hermeneutics of Edmund Husserl and Hans-Georg Gadamer, the poststructuralist thinking of Jacques Derrida and Michel Foucault, and the pragmatism of Richard Rorty. There are "stronger" and "weaker" forms of constructivism, differing in their theories on realities beyond the social. Strong constructivism claims that a reality beyond the socially constructed ones might exist but that it is not relevant to talk about it in terms of an objective reality because we cannot have direct, unmediated access to it; it believes in "multiple truths." A weaker form of constructivism holds on to the idea of an objective reality (of brute facts and/or of "one truth") that is within reach of human knowing. It is important to keep in mind that it is not the (material) world, as such, that is referred to when we talk about social constructions but the *perceptions* of this (material) world. Material objects, including all of nature and human artifacts, are assigned a certain place in the social process of the construction of meaning.

Social constructivism can also be situated in terms of the position of the subject who knows and the object that can be known. If one claims that the knower and knowledge are somehow separable, one takes a dualist position. Social constructivists often take a monistic position. That is, they argue that the knower and the world that the knower tries to understand are part of the same. Put differently, the findings are the result of an interaction between the knower and what there is to be known. Crucial in this interaction is the process through which the knower crafts observations into meaningful fact with the help of a theoretical framework. This leads social constructivists to suggest that there is no Archimedean point, "no view from nowhere," from which we could see the essence of the things that make up our social realities. We can only see reality from a cultural, social, political, historical, or other perspective. This is why we encounter multiple social realities, each of which is created and sustained with the help of a particular set of values and shared only by the members of a certain interpretive community.

Social Constructivist Research

Various kinds of constructivism are in use in policy science. The most well-known are frame analysis, narrative analysis, and discourse analysis. Although the levels of analysis vary, all three have a common focus on sense making and a special interest in language. Their aim is to uncover, understand, and possibly explain sense-making practices (e.g., voting and warfare), processes (e.g., crises), and institutions (e.g., agencies, governments, and nations) in political life.

Framing is the effort of drawing attention to some parts of situations while ignoring others. As such, it becomes a central part of the political act of problem setting. Problem definitions inevitably predispose certain solutions, and vice versa. Narrative analysis, often inspired by literary theory and philosophers like Mark Johnson and Alasdair MacIntyre and historians like William Whyte, starts from the idea that sense making is often done with the help of storytelling; through stories, people enact themselves and their context. In stories, *characters* who engage in *actions* in a certain *setting* can be identified. Some characters might be given the role of villains, while others are depicted as heroes, victims, or innocent bystanders. At the same time, acts are attributed to human beings or other entities. The depiction of the relevant setting, for instance, a crisis situation, also helps shape the story. The way the various elements of a story are ordered creates a *plot* that can help the audience grasp what is going on. With the help of frames and narratives, political actors describe and explain reality in conflicting ways, arguing for often opposite courses of action. In policy analysis, scholars like Emery Roe and Michel van Eeten designed and used tools (e.g., reframing problems and creating metanarratives) that help actors in the policy process to set new agendas, create understanding of other actors, and overcome conflicts and intractable policy issues.

Discourse analysts, often building on poststructuralist efforts such as that of Foucault or on post-Marxism versions developed by Ernesto Laclau and Chantal Mouffe, have engaged in critical analyses of political practices, often at a more abstract level than those using frames or narrative. A discourse can be defined as a set of ideas, concepts, or categories that is produced in certain social practices. A discourse analysis shows which discursive objects and subjects emerge in social practices and which conceptualizations are used. Consequently, what is left out in social practices also emerges. Since it is not the purpose of discourse analysis to retrieve what actors exactly meant or felt when writing or speaking but more to focus on the *effects* of texts on other texts, there is usually not much space for agency; this is called decentering of the subject. Many discourse analyses are historical, like Foucault's archaeological and genealogical studies. There are also social constructivists who have worked on metaphor analysis and category analysis—for instance, in the deconstruction of ethnicity categories in policy making.

Social Constructivist Policy Making

Social constructivism, nowadays, plays a role in various social science disciplines, such as political science, public administration, and policy studies. In public administration, it was fueled by postmodernism, which was introduced in 1988 by a group of scholars who were members of Public Administration Theory Network (PAT-Net) and published in the journal *Administrative Theory and Praxis*. Feminist thinking has also been a strong stand in constructivist thinking. The rise of social constructivism in the policy sciences can be traced to roughly the same period. While Egon Guba and Yvonna Lincoln introduced a constructivist approach to evaluation, Deborah Stone and Giandomenico Majone kicked off the "argumentative turn" in policy sciences in their books on the role of rhetoric in policy. This perspective was further elaborated on in a volume edited by Frank Fischer and John Forester and has been developing ever since.

But how does one put a social constructivist view on policy making into practice? John Dryzek was one of the first to answer that question. In a seminal contribution to the field, he opposed instrumental rationality (i.e., the belief that it is possible to find the right means to the just ends) and the related objectivism (i.e., the belief that neutral standards exist for doing so). Instrumental rationality and objectivism not only lead to Max Weber's iron cage and Jürgen Habermas's colonization of the lifeworld but are also unable to supply usable policy analyses, and they actually obstruct progress in the social sciences, in Dryzek's view. The alternative method of policy making is what Dryzek calls *discursive and democratic rationality* based on practical reason instead of on power. Participatory democracy should make this possible.

Anne Schneider and Helen Ingram think that "degenerate policy making" is the root of all evil. Degenerate policy making is the manipulation of images for the politician's personal interests. It leads to the construction and punishing/rewarding of ingroups and outgroups and to the abuse of science for political reasons. Invoking science also leads to apathy and alienation among the citizens, as the experts come to monopolize the debate. Schneider and Ingram's own approach, which they called *policy design*, is based on seven principles that should mend these faults.

Also concerned with the dysfunctional role of the expert in the policy process is Fischer. Based on John Dewey's argument, Fischer argues that the role of the expert is to help the citizen decide and not to decide in his or her place. The expert should try to design deliberative forums in which citizens, with the help of experts, can participate in constructing policy. More recent contributions to deliberative policy analysis argue for a "decentered governance" by networks of stakeholders. Those engaged in this project strive to map such policy making in all its varieties, analyzing it without looking for general laws or essences.

POLICY, DISCOURSE MODELS

Discourse analysis draws on central insights from post-Marxism, poststructuralism, and radical versions of interpretative analysis and pragmatist philosophy. Discourse analysis aims to transcend the objectivist, reductionist, and rationalist bias in mainstream social science theory by emphasizing the role of discourse in shaping social, political, and economic relations. Discourse is commonly defined as a more or less stable and well-defined system of rules, norms, and significant differences that is produced in and through political struggles and provides a contingent horizon for the construction of any meaningful subject, object, or action. Many discourse theorists have been preoccupied with developing a sophisticated theoretical framework, but a growing number of discourse analysts have become interested in applying the concepts and arguments of discourse theory in problem-driven empirical analysis, and the study of policy and policy making is at the top of the agenda.

A discourse approach to policy analysis can help us better understand the discursive conditions of possibility for formulating particular policies, and it draws our attention to the role of identity construction and the negotiation of meaning in policy implementation. In contrast to mainstream policy analysis, discourse analysis highlights the semantic, performative, and rhetorical aspects of public policy making. Moreover, it insists that policy problems, policy solutions, and governmental rationalities are discursively constructed and therefore contingent. Finally, it aims to uncover the power struggles and political conflicts that shape the discursive conditions for the formulation and implementation of public policy. Whereas discourse models inspired by the works of the German philosopher Jürgen Habermas tend to focus on the role of public deliberation and tend to see power and conflict as a source of distorted communication, discourse models inspired by the French philosopher Michel Foucault tend to view power and conflicts as constitutive of policy discourse.

Traditional approaches to policy analysis hold that interests and institutional constraints provide the key to understanding the formulation and implementation of policy. As such, it is often assumed that policy can be explained in terms of the interests of rational and resourceful actors and the institutional rules, norms, and procedures that constrain the choice of rational actors. Discourse models of policy take a different approach in arguing that interests are incomplete, ambiguous, and shaped by the contingent discourses in which they are embedded. Likewise, discourse models tend to define institutions not only as a recursively validated system of regulative and normative constraints but also as a broad set of values, symbols, rituals, forms of knowledge, codes, and vocabularies that facilitate and guide action. This means that interests cannot be taken for granted and that institutions are not only *staging* the choice and interaction of the relevant policy actors but also seem to be *scripting* their actions.

There are several important precursors to the development of a constructivist discourse approach to policy analysis. Some rational choice theorists have relaxed the classical assumptions about full information and unlimited cognitive capacities and have elaborated the traditional model of individual choice subject to institutional constraints. Douglas North, for example, has introduced the notion of "mental models" to explain the choice and action of the entrepreneurs who are responsible for constructing and changing institutions. The feasible options and their payoffs are determined not only by institutional rules and norms but also by the subjective perceptions (mental models) of the institutional entrepreneurs. Mental models are acquired through processes of socialization and learning, and they help rational actors interpret and explain their changing environment. However, the relation between the objective interest of rational actors and their subjective perceptions remains unclear, and if the latter is constitutive of the former, it becomes difficult to maintain the basic assumption that choice is derived from interests. Moreover, if the mental models are shaped by collective ideas and ideologies, the methodological individualism at the heart of rational choice institutionalism is undermined.

While most rational choice institutionalists are reluctant to embrace the idea of objective interests being shaped by subjective perceptions, Paul Sabatier (1988) goes all the way in viewing policy output as a result of political decisions informed by competing advocacy coalitions that are composed of public and private actors sharing a set of normative and causal beliefs. The value priorities and causal assumptions that unify a particular advocacy coalition are transformed by policy learning, which is instrumental for generating new insights that will only be incorporated into the core beliefs of an advocacy coalition if they further its main policy objectives. Although the notion of advocacy coalitions clearly emphasizes the role of ideas and beliefs in interactive policy making, there is hardly any account of the discursive construction of the ideas and beliefs. Hence, there is no explanation of what regulates the production and advancement of particular ideas and beliefs.

Historical institutionalists have also emphasized the role of ideas in public policy. Ideas tend to replace interests as drivers of political action, and institutions are seen as a constraint on the impact of ideas on policy making. New ideas are adopted to the extent that they respond to concrete policy problems, resonate with the interest and ideas of key actors, and are brought to the attention of relevant public agencies that can implement new ideas. As such, the reception of new ideas is explained with reference to objective socioeconomic and sociopolitical conditions. However, the discursive embeddedness of new policy ideas, the struggles about the content of the new ideas, and their rhetorical and argumentative framing are not really taken into account.

Sociological, or organizational, institutionalism breaks with the idea that social and political action is driven by the actors' calculation of the consequences of alternative options and offers a cultural approach that emphasizes the role of normative and cognitive frames and meaning systems in defining appropriate action. Policy change is seen as a result of a *bricolage*, through which concepts, rituals, scripts, and values are recombined. In the development of new policies, legitimacy plays a pivotal role. The basic assertion that interests, rationality, and information are socially constructed within a particular institutional context is shared with the new discourse models of policy, but a major difference is that whereas sociological institutionalism tends to treat cultural conditions of action as a static equilibrium, the discourse approach to policy analysis is more interested in accounting for the formation and transformation of discursive structures through conflicts.

Ideational institutionalism is a new branch of institutionalism that focuses on the substantive content of ideas and the interactive processes through which these ideas are generated and communicated to the public (Colin Hay, 2001). Rather than seeing ideas as constituted by specific cultures, ideational institutionalists view ideas in relation to the discourses that provide the resources for legitimizing particular ideas. Ideas are shaped by discourses, which are in turn shaped by institutions that determine who talks to whom about what, when, and where. In state-centered polities, ideas and discourses are communicated to the public to secure support, whereas in decentered polities the relevant actors must first establish consensus about the content of the policy discourse and its embedded ideas. By placing ideas within a broader discourse, ideational institutionalism provides a crucial stepping stone to discourse models of policy. However, foregrounding singular ideas and the conception of institutions as an extradiscursive constraint separates ideational institutionalism from a discourse theoretical approach that focuses on the impact of discourses constructed through hegemonic struggles, which take place in a sedimented institutional context that is dislocated by new events.

Discourse models of policy focus on the structural power exercised when the formulation and implementation of policy are conditioned by hegemonic discourses that are shaped and contested by political strategies. Foucault's governmentality theory provides a good starting point for analyzing the discursive conditions for policy making. Governmentality theory aims to answer the key question of "how to govern and be governed" by studying how government, in the sense of the "the conduct of conduct," has been problematized in modern society and how successive problematizations have transformed the collective and institutionalized mentalities, rationalities, and technologies. Governmentality defines a particular "art of government" that conditions the concrete "acts of government." The object of regulation, the regulating and regulated subjectivities, the implicit telos of regulation, and the available governance techniques are formed by the ruling governmentality (Mitchell Dean, 1999). Foucauldians use the archaeological method to analyze governmental discourse and deploy the genealogical method to analyze how governmentalities are constructed in and through myriad struggles that include and exclude particular concepts, identities, and practices.

Another important discourse approach to policy analysis is provided by critical discourse analysis (CDA), which has been used in studies of policy responses to globalization and the politics of New Labour in Britain. According to Norman Fairclough (2001), CDA aims to address social and political issues and problems by conducting a close study of texts, interactions, and other forms of semiotic material in order to detect the changes taking place around key issues. CDA emphasizes the role and impact of ideology in policy making. Ideology is not defined in terms of the comprehensive and coherent worldviews but in terms of a discursive naturalization of contingently constructed meanings and identities. Particular groups and elites may have an interest in reproducing and propagating particular ideologies as they might help them maintain, or even enhance, their political power.

Whereas Foucault's governmentality theory and Fairclough's ideology analysis study affect the discursive contexts of policies, the theories associated with the "argumentative turn" in policy analysis focus on discursive strategies that shape the form and content of public policy and guide its implementation. Discourse frames policy problems and policy solutions, and the political actors struggle to include and exclude particular themes, concepts, and ideas. In the discursive battle, institutionally situated actors advance particular arguments and aim for acceptance of these arguments from other actors by mobilizing their ability to argue a persuasive case (*logos*), their reputation and credibility as speakers (*ethos*), and the rhetorical skills that arouse particular emotions (*pathos*). A hegemonic policy discourse can structure the context in which particular phenomena are understood and defined ("discourse structuration"). Over time, the hegemonic discourse may become sedimented into a set of concepts and organizational practices that are taken for granted by social and political actors ("discourse institutionalization"). The crux of the argument is that hegemonic discourses often hinge on the construction of a story line that provides a short, condensed, and often metaphorical expression of how the policy discourse defines problems and solutions. A story line simplifies the discursive space and helps bring about discursive closure. Social and political actors who subscribe to a particular story line form a discourse coalition. Adherence to a particular story line tends to facilitate mutual learning and compromises while excluding competing problem definitions and alternative policy solutions.

Poststructuralist discourse theory, synthesized by Ernesto Laclau and Chantal Mouffe and summarized by Jacob Torfing (1999), offers a conceptual and argumentative framework that further develops the ideas implicit to the argumentative turn. First, the notion of "floating signifiers" helps analyze instances of conceptual ambiguity where an expression has different contents and meanings and therefore enables policy actors to use the same vocabulary to talk about different things. Second, the notion of "articulation" provides an understanding of how meaning is partially fixed within discourse through practices that establish a relation between elements such that their identity is mutually modified. Finally, the concept of "social antagonism" identifies how policy discourses are unified with reference to a threatening otherness that both tends to stabilize the discursive system and provides a source of potential disruption.

POLICY, EMPLOYMENT

The realm of employment policy includes a diverse set of public programs and regulations that seek to improve a population's employment experience. In particular, employment policy attempts to reduce employment-related risks for the population, to improve the overall quantity of employment opportunities available, and to promote the quality of established employment relationships. Within employment policy, one commonly distinguishes between "passive" and "active" labor market policies: While passive policies focus on attenuating the consequences of market rule, for example, through offering unemployment insurance that guarantees income support during periods of unemployment, active policies intervene in the labor market to help the unemployed gain employment. Conceptually in between, labor laws regulate diverse aspects of the employment relationship, including issues such as nondiscrimination and unfair dismissal.

Seen through a sociological lens, employment policies are an integral part of any stable labor market. Given the strong empirical and conceptual links of employment policies with education and social security policies, as well as with the regulation of industrial–labor relations, the boundaries between these policy realms are quite fluid. This entry first reviews the functional needs for employment policy in theoretical terms and then describes the evolution of employment policy making in the advanced industrialized countries from its early beginnings in the 19th century through the tumultuous interwar period, the golden age of welfare capitalism in the 1960s, the stagflation of the 1970s, and, finally, the contemporary period.

Functional Needs for Employment Policy

In contrast to simple product markets, the labor market requires special employment policies that help sustain the market's legitimacy in the eyes of the population and produce a high level of economic performance. Indeed, while standard products can easily be allocated as commodities through market mechanisms, this is far more difficult in the case of labor. The units of the labor market neither are created for the purpose of exchange nor can they be treated as disembedded from their social surroundings; instead, they are human beings with social and physical needs. As such, labor is a rather imperfect "commodity," with a supply function that is very different from standard, less socially embedded commodities. For instance, at both ends of the supply spectrum, labor supply tends to show a negative correlation between prices and quantity, which is the opposite of the standard relationship: At the bottom end, wage reductions can prompt workers to work longer hours in pursuit of the particular income level necessary for a desired living standard; at the higher end, wage increases can induce workers to choose more leisure. But such behavior is not the only deviation from standard commodity markets. Equally crucial for policy making and unusual compared with other commodities, employers cannot autonomously decide how to use their purchased labor; instead, they always depend on the repeated and active collaboration of their workers.

Given these characteristics, all advanced capitalist countries have created social protection mechanisms in their labor markets to reduce the dislocations associated with market allocation, safeguard the stability of society at large, and thus support the long-term viability of the labor market as an allocation device. Moreover, governments have also tended to allow for the formation of unions as workers' collective organizations, the establishment of collective wage-bargaining systems, and the creation of mechanisms for exercising stakeholder voice within the firm. Such measures have reduced the frequency and scale of worker revolts, which were once common.

In capitalist democracies, the functional requirements for employment policy are particularly high, because employment policy plays an important role in "decontesting" the organizing principles of capitalism and those of democracy: Employment policy serves as a means to make compatible (a) employers' attempts to effectively and efficiently use human resources and (b) the upholding of civil and social rights that democracies guarantee to all their citizen. At times, policy solutions can be found that simultaneously serve both democratic and capitalist logics, such as with governments' recent attempts to broaden access to higher education, which serves to increase the equality of citizens' opportunity as well as to provide companies with more much needed human capital. However, in other instances, democratic goals have taken clear precedence, such as when some countries sought to promote "workplace democracy" and the "humanization of work" or when citizens are unconditionally guaranteed basic income support that might undercut work incentives.

Finally, employment policies have an important role to play in improving economic performance. Consider, for example, workers' investments in the acquisition of skills that can only be used in particular economic activities. The success of individual companies and whole sectors depends on the availability of such specific skills; however, without institutional guarantees by companies or governments that reduce the risks associated with specific-skill investments, specific skills might be undersupplied, and workers might choose to invest in general skills instead. Institutional guarantees that can encourage specific-skill investments include employment protection rules supporting long-term employment, a collective wage–bargaining system buttressing real-wage stability, and an unemployment insurance system providing workers with wage-related unemployment benefits in case of job loss and releasing them from the need to accept *any* available job.

In summary, by helping the population deal with employment-related risks, employment policies are the basis for a stable labor market, and if designed well, they can contribute to the effective and efficient employment of the population.

A Short History of Employment Policy

Public employment policies have their roots in the establishment of large-scale labor markets during industrialization. The goals and content of these policies have since then evolved, driven by the development of new political answers to changing socioeconomic challenges. As such, the evolution of employment policies has been at the center of the changing character of statehood and the shifting regulation of large parts of social life. Importantly, even though individual countries' responses to common challenges have always included similar features, each country has traveled on a distinct and contingent national developmental trajectory, in which feedback from earlier policies has tended to bound policy innovations in later periods. The next section highlights both common trends and national particularities.

Building Welfare States

Industrialization during the 19th century gave rise to the "social question" of how economic progress could be maintained in the face of the political and ethical threats emanating from the abysmal conditions under which the working class was employed. The answer was the progressive development of welfare states, with employment policy being a core part of a new active form of statehood. Over time, and framed around the nation as the community of fate, prudent political leaders set up social protection institutions to provide collective mechanisms for covering the costs of progress and to manage employment-related risks. The first labor market regulations and social insurance programs were set up before the end of the 19th century; by the 1930s, unemployment insurance and the first active labor market policies were established.

Some governments addressed new social needs more quickly and some more slowly, some to preempt pressure from below, some in reaction to such pressure, and some out of ethical conviction. A leader in the expansion of suffrage, Britain had established labor market regulations, such as on working conditions in certain industries, maximum working hours, and age thresholds for legal employment by the later part of the century. At the same time, Germany's monarchist government sought to calm revolutionary impulses through carrot-and-stick policies that included both the outlawing of the Social Democratic Party's activities (1878–1890) and the introduction of statutory social insurance schemes for health (1883), accidents (1884), and disability and old age (1889).

The establishment of national unemployment insurance systems took a little longer. In the United Kingdom, a mandatory public unemployment scheme was established in 1911. In Germany, an unemployment insurance scheme was introduced in 1927, replacing a system of income support set up in 1911. In the United States, national unemployment insurance was established in the mid-1930s as part of the Social Security Act, a piece of legislation conceived to limit what were seen as the dangers of modern American life. But the eligibility and disbursement of unemployment benefits can also be organized in another way: Named after the Belgian city where it was first implemented, the Ghent system is a voluntary scheme that grants unions the responsibility to administer unemployment benefits. With the exception of Norway, the Scandinavian countries run Ghent unemployment insurance systems to this day, although the regulation and financing of these systems has changed over the years, with the countries' national governments regulating and subsidizing union-administered funds.

Active labor market policies were introduced on a larger scale in the interwar years, prompted by widespread unemployment in the wake of the Great Depression. For instance, in the United States, several New Deal agencies were set up to provide employment until the economy improved. One of these agencies, the Works Progress Administration (WPA), became the nation's largest employer. Offering almost 8 million jobs between 1935 and 1943, the WPA carried out public works projects all over the country, from constructing new public buildings and roads to running arts and literacy projects. Only the country's entry into World War II brought an end to the efforts of the WPA and other agencies.

Parallel developments were under way in Europe, albeit under very different political auspices. In Germany, a democratic government introduced a voluntary labor service in 1931 as a means to reduce unemployment. A few years later, the National Socialists established a 6-month mandatory scheme that all young men, and after 1939 also all women, had to join. Finally, facing totalitarian threats from both the East and the South, the Scandinavian countries completely reoriented their national economic policy regimes around a more interventionist state during the 1930s. Based on explicit political deals between Social Democrats and agricultural parties, policy solutions were developed that served both the struggling working class and farmers. For instance, in Denmark, the so-called Kanslergade Agreement laid the foundation for extending the length of collective agreements for currently employed workers without wage reductions, initiating public works programs and winter relief for the unemployed and their families, granting farmers both an export-stimulating currency devaluation and agricultural price supports, and consolidating the existing social insurance and poverty relief measures into a comprehensive program of old-age pensions and health, unemployment, and accident insurance.

The Golden Age

The postwar period brought a 30-year-long economic boom and the golden age of welfare capitalism. Nurtured by a broad discourse about social rights, of which the 1944 Beveridge Report in Britain was just one example, and sustained by system competition with communism, the workers in Western democracies received their peace dividend in the consolidation of the mixed-economy welfare state, which sought to combine economic growth, full employment, social partnership between capital and labor, and universal welfare programs. Based on the efficiency increases and employment opportunities provided by the widespread adoption of Fordist mass production techniques within industry and supported by political commitments to wage compression in the economy more generally, the pleasures of middle-class life became accessible to broad majorities of the population, even for those workers without higher levels of education.

Within the realm of employment policy, macroeconomic Keynesian demand management was put into the service of guaranteeing the full employment of all willing man power. This was feasible because the newly founded international economic regime around the Bretton Woods institutions tolerated policy making geared toward domestic concerns and allowed for cheap public borrowing at rates of interest below those of economic growth. Moreover, in part, Keynesian demand management was also necessary: Having replaced the traditional craft organizations with Taylorist principles internally, companies recast themselves as vertically integrated corporations, geared to making use of economies of scale and "pushing" standardized products into the market over long production runs. Such large-scale manufacturing came with a degree of rigidity in the economy, with drops in demand being difficult to absorb for companies, leaving the potential for initial downturns in demand to accumulate into bigger crises.

Reacting to Stagflation

With the collapse of the international financial regime and simultaneous increases in unemployment and inflation, the 1970s heralded the end of the Keynesian era. A series of increases in oil prices provided the advanced economies with negative supply shocks, which traditional methods of economic policy making could not effectively address. Keen to get wage-push inflation under control, many governments experimented with income policy that sought to provide a ceiling for wage increases. Moreover, in exchange for wage moderation in the short term, some governments offered increased pension levels that would provide workers with delayed benefits in the long term. In these quests, countries' relative success depended very much on how much their macroeconomic institutions facilitated strategic coordination between the government, organized labor, and capital, as well as the country's interest rate–setting central bank. Here, countries with strong macrocorporatist institutions had certain advantages.

Particularly, in the pluralist English-speaking countries, which were institutionally least equipped for effective tripartite coordination between the government and the organized social partners, conservatives' ideas about how to proceed became increasingly popular. Conservatives located the source of current economic problems in welfare states' institutions themselves. Moreover, the advanced democracies' populations were increasingly tired of shouldering the tax increases associated with states' weakening finances, and tax revolts occurred in places as far apart as California and Denmark. Talk about sclerotic institutions and the problems of bureaucracy eventually became mainstream. On that basis, government action was increasingly seen as the problem rather than the solution; moreover, rather than being perceived as positive agents for increasing worker welfare, unions came to be seen as self-interested, rent-seeking, and, ultimately, harmful lobbies. These ideas helped bring Margaret Thatcher and Ronald Reagan to power; in moderated form, they animated the election victories of the political center-right in other countries.

Breaking with demand-side–oriented policies during the postwar period, the advanced democracies' governments sought to improve their economies' supply sides through deregulation throughout the 1980s. Often, however, liberating market forces and retrenching the welfare state proved to be a more difficult undertaking than imagined, because electorates continued to support many social insurance programs. In this context, it was symptomatic that the U.S. Social Security retirement program in the United States became known as the "third rail of American politics," promising certain political death to those who would seek to reduce it. While cuts were eventually made even in Social Security, these remained comparatively moderate in contrast to the cuts in employment policy programs that primarily benefited the poorer and politically less vocal strata of the population. Labor market programs that were linked to the U.S. War on Poverty during the 1960s and to the public employment initiatives launched in the 1970s fared particularly badly, as they came to be easy targets for politicians who framed the former as special-interest policies for racial minorities and the latter as vehicles for corruption.

While it was broadly agreed that welfare states had grown to their limits, countries diverged in how staunchly they walked the deregulation walk. For instance, the policy record of Germany's center-right government at the time was quite different from that of Thatcher or Reagan. In line with some other countries, Germany strongly embraced early-retirement policies as a means to reduce long-term unemployment and to buy peace in labor relations. In the early 1980s, policymakers introduced the possibility for people aged 60-plus to claim a full pension, as long as they had been unemployed for more than a year. Helped by such regulations, overall employment in Germany declined by an average of 0.3% annually from 1980 to 1990; by 1988, less than one out of every three German men between the ages of 60 and 64 still worked. Finally, when hit by the seismic shock of unification in 1990, the government followed a familiar adjustment pattern, unburdening the East German labor market of excess labor through early retirement, job creation, and training schemes that brought down the official East German unemployment rate to half of what it would otherwise have been.

Increasing Labor Market Flexibility

Driven by the continued deepening of economic globalization, economies' turn toward services, and—maybe above all other reasons—persistent long-term unemployment, the debates about necessary reforms of employment policies further intensified throughout the 1990s. Inspired by neoclassical economic analysis that saw labor market rigidities at the root of Europe's unemployment problems, international experts—including those from the Organisation for Economic Co-operation and Development (OECD)—recommended increasing the flexibility of labor markets. Given that the future of economic growth depended strongly on further increases in labor productivity, some analysts called for the removal of regulations that stood in the way of the most efficient employment of labor resources, including employment protection rules. Others stressed the importance of increasing labor market participation, partially as a means to support economic growth but also to increase the ratio of the active to the inactive population. The latter was seen as necessary to sustain the working population's continued ability to finance social security benefits and services for those unable to work in the context of rapid population aging. Finally, while most discussions about flexibility tended to stress the importance of expanding employers' choice sets, changing employment patterns had also prompted workers to demand employment regulations that offered increased flexibility for themselves: For instance, with double-earner households having replaced male-breadwinner arrangements as the norm, parents have been looking for innovative ways to combine work and family life.

These discussions prompted a series of complex changes, the breadth of which is probably best illustrated in the European Employment Strategy: Through a continued monitoring and benchmarking process, the European Union seeks to encourage its member states to increase the role of preventive labor market policy, put in place measures that strengthen workers' employability and adaptability, equalize employment opportunities for men and women, as well as invest in education and lifelong learning.

The biggest change in employment policy across all rich countries has occurred in how states treat their unemployed workers, with governments of all colors having embraced new measures that seek to activate the unemployed and reduce the time they spend in unemployment. Moreover, the changes have been so far-reaching that many sociologists see them as heralding a lasting transformation in the character of the state, that is, one in which the state withdraws from its commitment to guarantee comprehensive welfare *independent of* the market and moves toward a commitment to support individuals' attempts to succeed *in* the market.

Emphasizing that citizens do not only have rights to claim but also responsibilities to fulfill, politicians strengthened job search requirements for the unemployed and introduced stronger penalties for the repeated rejection of job offers. In many countries, unemployment benefits have become less of an entitlement geared toward sustaining a family's lifestyle and ever more a basic *job seeker's allowance* (to use the official British term). Finally, workers on benefits are increasingly expected to quickly accept job offers that pay below—or offer fewer responsibilities than—what former employment positions had provided. This is an important change from earlier practices that gave workers more time to look for employment appropriate to their professional status and level or focus of education.

Importantly, the implementation of activation policies differs strongly between countries. While activation in some countries can often be quite punitive, more progressive versions of "workfare" policies seek to empower individuals through providing extensive placement services, setting up individual action plans, and offering training opportunities. For instance, in the United States with its (neo)liberal institutions, the welfare-to-work regime set up in 1996 has strong elements of control and punishment, which some critics view as being harsh on benefit claimants. In contrast, running a workfare policy regime within the context of a social democratic universal welfare state, Denmark seeks to reach all potential workers, not just benefit claimants; moreover, caseworkers are supposed to offer activation options that can increase individuals' capabilities. Finally, Germany as a Christian democratic country falls probably somewhere in the middle, offering more substantial income support than the U.S. system but having strongly cut back on training offers for the long-term unemployed. Common to activation approaches in all countries is the adoption of new public management techniques in the public employment services that administer activation policies.

As this overview about employment policy has sought to show, the history of employment policy has been both long and full of changes. Cutting-edge political science work on employment policy seeks to uncover the political drivers of diverging national developments and to conceptualize the links between the neighboring policy realms of employment, welfare, and education.

POLICY ADVICE

Policy advice does not exist in a vacuum. If it did, it would be irrelevant to political affairs, of only abstract interest. Instead, policy advice can only be understood in relational terms. It is offered by some to others. Therefore, a number of central—and closely interrelated—questions can be asked:

1. What is public policy advice?
2. To whom is such advice provided and why?
3. Who offers policy advice?
4. Why is policy advice needed?
5. How is policy advice provided?
6. What constitutes "good" policy advice?

What Is Public Policy Advice?

Policy advice is a generic term referring to a wide range of activities within the processes of governmental policy making. These include research, both formal and informal; the writing and presentation of policy memoranda laying out policy choices and options; discussions and negotiations on public policy issues; and the monitoring and evaluation of the effectiveness, efficiency, and economy of policies.

Policy advice may usefully be distinguished from political advice, though there is no clear and unambiguous distinction but rather shades of gray. Whereas policy advice relates to the content of public policy, and may often address complex technical issues, political advice comprises counsel that addresses considerations of political costs and benefits that may be borne by those policymakers who hold elected office in liberal democratic societies. All high-level policy advisers are usually required to be sensitive to the political context of the advice they provide.

For heuristic purposes, the so-called public policy process is often depicted as a policy cycle moving sequentially from problem definition, to policy formulation, to policy implementation, to policy evaluation, and then perhaps back to problem redefinition and policy reformulation, and so on. In reality, the process is usually not that tidy, and various stages of the cycle can occur simultaneously rather than sequentially. As the American political scientist Carl Friedrich (1940) famously put it, "Public policy is being formed as it is being executed, and it is likewise being executed as it is being formed" (p. 6). Nevertheless, policy advice can be directed at one or all of these stages of public policy making, and advisers may be specialists in particular areas, most notably perhaps in policy formulation, in policy implementation, or in policy evaluation.

To Whom Is Policy Advice Provided?

The principal answer is that policy advice is provided to those whose formal responsibility it is to make public policy. Generally speaking, in parliamentary systems, this is the main function of the political executive, headed by a prime minister whose government must enjoy the confidence of the legislature, from which it is drawn; and in republican constitutional systems, in which the executive and legislative arms of government are formally separate, it is the president and his or her top executives. It also includes members of the legislature in both types of system, whose role is to scrutinize and debate public policy and to pass the laws that enact it.

Again, as indicated by Friedrich's observation, some policy advisers may simultaneously be the recipients of advice, especially those who hold senior bureaucratic offices. They themselves will often be receiving policy advice from their organizational subordinates.

Who Offers Policy Advice?

In Western democracies, just about anyone can offer policy advice. A policy advice continuum could show that at one extreme are citizens who make their views known to governments on public policy issues and at the other extreme are those who earn their living by offering policy advice to governments. The former may have no expertise in a policy field except—and it can be an important exception—the "expertise" embodied in their own understanding of their interests and aspirations and their personal familiarity with a particular policy's effect on them. The latter is dominated by bureaucratic officials and policy analysts and advisers working in government agencies.

Between these two loosely defined extremities can be found a wide range of people who offer policy advice to government decision makers. These people include, in particular, academics in tertiary education institutions, researchers in various nongovernmental policy think tanks, analysts and lobbyists working for interest groups, and independent private consultants. In the case of academic researchers, those most likely to offer policy advice to governmental authorities are those who engage in what James Coleman (1972) calls "decision-oriented," as distinct from "conclusion-oriented," research. The former is an explicit guide to action, attempting to connect the academic world with the world of political action. This is often a fraught endeavor for both parties.

Why Is Policy Advice Needed?

The total absence of public policy advice in any political system would imply the existence of a single dictator dependent solely on his or her own counsel for the decisions that he or she takes. That has probably never been the case anywhere.

Instead, policy advice is needed to better inform the policy decisions taken and to try to ensure that the prospects for policy effectiveness are maximized and the risk of policy failure minimized. This is because public policy is purposive in nature, at least in its most explicit form, rationally designed to attain intended and finite outcomes or to achieve, modify, or maintain certain standards of performance over time. Governments universally are required to formulate public policies, often in the face of high levels of technical complexity and uncertainty, and in doing so, they must depend heavily—but by no means exclusively—on often sophisticated bodies of theoretical knowledge, much of which will be generated by technological and scientific research. For these reasons, there has been a huge growth over the past several decades in most Western democracies, particularly in the United States, of what might be called the "policy analysis industry"—producing rapidly increasing numbers of policy analysts and advisers in public organizations who have been trained and educated in public policy and associated disciplines in tertiary education institutions. Whereas before World War II the study of public policy focused largely on why and how governments made policy, analysis *of* policy, since then the focus has become much more normative and prescriptive, analysis *for* policy.

How Is Policy Advice Offered?

Policy advice can be offered formally or informally. Most of what has been said above refers to the formal offering of policy advice through established and managed institutional arrangements, such as those between, in parliamentary systems, cabinet ministers and their senior bureaucratic advisers, or in a republican system, such as that of the United States, between the president and his or her top appointees in executive agencies. Advice can be offered in formal memoranda or verbally (which has perhaps become a more common practice because what was once considered confidential advice is now more publicly accessible through official disclosure legislation).

Decision makers seeking policy advice can, however, do so outside the formal institutional arrangements, at their discretion (and with sensitivity to political risk). The bureaucratic reforms that took place in several Westminster parliamentary systems in the 1980s and 1990s—such as New Zealand and Australia—were intended, among other things, to render policy advice more "contestable," that is, to ensure that cabinet ministers were less dependent on the counsel provided by their top bureaucratic advisers.

What Is "Good" Policy Advice?

Policy advice in liberal democracies ideally aspires to satisfy two main criteria: to be open and politically contestable, on the one hand, and to be rational, on the other. The two are not necessarily always compatible. In his seminal article, "The Science of Muddling Through," Charles Lindblom (1959) recognized this tension in arguing that the test of "good" policy itself can be that it achieves its objectives or that those contributing to its formulation can agree to act together, even though they may not agree on the objectives a policy is intended to achieve.

Thus, good policy advice can be demonstrably instrumental in shaping "successful" policy, in that the desired objectives are achieved; or in securing political coalitions of the "policy willing" to ensure that action itself takes place; or in achieving some combination of both. Policy advice may be seen to be good in political terms—by a government, by a cabinet member, or by a minister—but not by others, whether they be policy analytical peers or people affected by or who have an interest in the particular policy.

As Lindblom (1977) shrewdly observed, "A good defense for a bad policy will be that it is the result of a process in which everyone was heard" (p. 256). This insight speaks to the importance of genuine consultation in democratic policy processes, in the interests of effective coalition building. Consultation can itself be an important form of research, involving the interviewing and surveying of interested and affected parties, carried out by policy analysts and advisers.

The word *policy* itself may suggest that in contradistinction to politics, policy is apolitical. But such a claim cannot be sustained. Peter Jackson (2007) forcefully argues that "policy advice and its knowledge bases are ideological in nature and it is pure obscurantism, pretence and conceit to suggest that it is 'objective' knowledge, that it is independent of political or social interests and without moral considerations" (p. 263). While this assertion may be seen by those of a more technocratic, or antipolitical, disposition as extravagant, it is not difficult to defend.

The clients of policy advisers more often than not have to march to the beat of a political drum, which is not always well understood by those who find it difficult to understand the inevitable tensions between the norms of democracy and rationality. Often politicians may be less inclined to hear arguments that run counter to what they "know" to be true or desirable, even when those arguments are supported by logical reasoning and impeccable evidence. These latter qualities, as desirable as they are in themselves, cannot always carry the day.

Policy making is generally based as much on beliefs as it is on evidence. The politicians who are held publicly responsible for it are required to act, more often than not, rather than to reflect and may—for reasons perfectly rational in themselves—bemoan what they see as "paralysis by analysis." For their part, policy advisers soon learn that their craft demands a willingness to make acceptable trade-offs between the need to be technically dispassionate and objective and the requirement that they also be politically relevant. They may not always admire politicians, but they must learn to understand them. The converse is equally true.

Neither quantitative nor qualitative methods of analysis and research have any monopoly on the quality of policy advice. Rigorous analysis that can form the basis of sound policy advice, however assessed, is not confined to the application of quantitative techniques. Disciplined and rigorous thinking is also a central requirement in qualitative research—for example, in applying the "lessons" of history to current policy issues (Richard Neustadt & Ernest May, 1986). In any event, good policy advice will depend on grounded experience, discerning judgment, and intuitional wisdom as much as on rigorous analysis.

Finally, policy advice must be kept open to revision in the light of changing circumstances, unfounded assumptions, and poor judgment. It should embody a capacity for ongoing learning, resisting any tendency to become self-fulfilling in its effects. And while it may aspire to wisdom, as a category that transcends data, information, and knowledge, it may also reflect some understanding that wisdom itself inheres in an intuitive sense of the interconnectedness of things in the complex and uncertain world of public policy making.

POLICY ANALYSIS

Policy analysis is a term that is applied to a wide variety of practices and intellectual approaches and that cannot be reduced to a neat definition. The relationship between intellectual approaches and practice is not clear. Certainly, there is a dominant paradigm that sees policy analysis as an exercise in applied social science, in which the analytic method of the social sciences is mobilized to enable governments to make the optimal choice, and graduate programs in policy (particularly in North America) elaborate and refine the knowledge and skills required for policy analysis in this sense. But even those who are trained and employed as policy analysts find a disjunction between the methodology in which they have been trained and the demands of the job, and there is an undercurrent of anxiety among analysts about the extent to which their analysis is used and uncertainty about whether, and in what way, they should involve themselves in policy practice. So it is difficult to give an unambiguous definition of *policy analysis* as a field of study or of practice. It is conventional to distinguish between analysis *for* policy and the analysis *of* policy, and we will begin with this distinction. But it will become clear that the diversity of perceptions of policy analysis reflects the different ways in which we think about policy, mobilizing multiple and overlapping frameworks of meaning to make sense of what we see and what we do, so we will need to dig deeper to get a fuller understanding of policy analysis. Working through these various usages of the term will be like peeling an onion, though we hope to do it without too many tears.

Analysis *of* Policy or *for* Policy?

The distinction between analysis *of* and analysis *for* reflects an attempt to separate observation from practice and, in particular, to distinguish policy analysis as a specific form of applied social science from the broader field of the study of government. Analysis *of* has tended to be the less significant branch, perhaps because its focus on the analysis of process made it hard to distinguish from traditional political science. At one point, there was a tendency for the study of government to be renamed "public policy," with the work of government being seen as the production of policy and the study of the process being "policy analysis." This rested on a perception of policy as a process of official problem solving, which was widely shared but which later came under scrutiny from what was called the critical or interpretive approach to policy analysis (which is discussed further in this entry). It was also challenged (less directly) by the governmentality approach deriving from the work of Michel Foucault, which looked beyond the implied question of "what is the best way for the government to solve this problem" to ask how situations became problems, who could or should address them, what modes of practice are seen as appropriate responses, and in what way these situations recede from the ranks of problems that claim public attention.

Policy Fields

Much of the analysis *of* was focused on specific policy fields: health policy, transportation policy, environment policy, and so on. This interpretation of policy analysis shares the assumption that government is a process of official problem solving, and the task of policy analysis is to identify the problems, the participants, the responses, and the outcomes. The analyst is seen as the source of expert knowledge on what has been done and could be done, and the focus is on what is described as the "substance" of policy—problems and putative solutions—rather than on the process. Here, the distinction between analysis of and analysis for has tended to fade, as the outside observers who become expert in what has been done are often seen as sources of advice about what should be done (and in any case, tend to have strong views on this topic whether they are asked or not). At the same time, those employed as policy analysts tend to become more specialized, experts in a particular field (and increasingly, engaged in it and committed to particular approaches) rather than detached technicians used to compare policy alternatives with one another and concerned to give an "objective" answer. This perception of policy analysis as "knowing about" a particular policy field is widely shared—among academics, practitioners, and the wider public—and underlies much of the writing with *policy* in the title.

The Call for a Policy Science

But the main game in policy analysis has not been about the subject matter but about method. The origins of policy analysis as an intellectual approach and a field of practice are often traced back to the United States in the aftermath of World War II, when Harold Lasswell called for a "policy science" that would be problem focused, interdisciplinary, and explicitly normative. The focus on policy and analysis would, it was felt, "lift the game" of the American political system so that it would be driven by a focus on problems and outcomes rather than by techno-bureaucratic inertia and partisan allocation and become both more transparent and effectively democratic. The policy analyst, by applying the social sciences, would produce expert and objective advice on the questions confronting government. At the same time, the existence of this technology of critique would empower the "outsiders" in government, strengthening their ability to challenge the operations of government by creating a discourse of instrumental rationality in relatively transparent terms.

Policy Analysis as a Field of Study

Through the 1950s and 1960s, policy analysis took root in the United States, both as a body of knowledge and as a field of practice. The early policy analysts were likely to have PhDs in economics or operations research and to come from institutions such as RAND in California. But soon graduate schools of public policy emerged, offering master's degrees (comparable with MBA). These graduate programs were more oriented to political science, but the core courses in policy analysis that they usually offered elaborated a technology of choice grounded in economics, with the task of the policy analysis being to identify a number of options; to estimate their feasibility, cost, and likely impact; and by making the appropriate calculations, to determine the optimal course of action. The methodology was grounded in (usually unspoken) assumptions—that policy activity consists of dealing with discrete and context-free problems, that government is composed of "decision makers" who are recognized as being responsible for any given problem, that their sole concern is to solve the problem, and that calculations from welfare economics are recognized as determinant in arguments about the best course of action. The work of the policy analyst was to use this methodology to determine the optimal course of action and to communicate this to the "policymakers"—"speaking truth to power," as Aaron Wildavsky, the founding dean of the Graduate School of Public Policy at the University of California, Berkeley, put it. The teaching of these institutions was supplemented by conferences, journals, and the formation of a professional association, the Association for Public Policy and Management (APPAM). APPAM conferences became major meeting places for the intersection of policy analysis as a field of study with policy analysis as a field of practice, and its journal has been a showcase for exercises in the systematic evaluation of options. By the turn of the century, it was confidently claimed that policy analysis in the United States had "come of age."

Policy Analysis as a Field of Practice

What was less clear, though, was just what it was that these policy analysts were doing. The initial perception had been that they would be detached scientific experts who could be called in when required, or if they were to have a permanent presence, it would be in a small unit close to the top, where they would be "advising the Prince." This was the way Robert McNamara sought to use policy analysis as U.S. Secretary of Defense in the 1960s, seeing it as offering a systematic and impartial appraisal of the ambitions of the military chiefs. But this could set in motion a dispersal of policy analysis through the wider world of governing: If chief executives were using policy analysis as the basis for their choices, it would be only sensible for executives at the next lower level to employ their own policy analysts to try to negotiate with the top-level analysts or at least to second-guess them. For this reason, policy analysts became common at lower levels in the organization, and in business associations and nonprofit organizations, to facilitate their dealings with government. Increasingly, policy analysts found themselves not so much advising the prince as negotiating with policy analysts from other organizations. Rather than being experts in choosing between courses of action, they became experts in particular fields of action, such as child care or urban mass transportation, and, increasingly, advocates of particular approaches to these areas of concern. The technologies of choice in which they had been trained became not recognized ways of identifying the optimal course of action but "dueling swords" to be used as resources in encounters with policy analysts and others from other organizations. And the work of policy analysts was often only loosely connected to advising decision makers, covering everything from background research for legislators to public education campaigns to lobbying for particular public policies.

Policy Analysis and Policy Advising

In the development of policy analysis, the focus was on the application of the canons of the social sciences to generate the basis for a decision maker to make the optimal choice. It was assumed that this would be what the decision maker wanted, and policy analysts expressed frustration when their carefully crafted solution was not adopted. But leaders in government found that "problems" were not neatly set up for them to address like a golf ball on a tee but were part of a continuing flow of activity involving a range of participants who might have divergent perceptions of the nature of the problem, its significance, and what response would be appropriate and whose responses were in any case shaped by their experience of past dealings with the other participants and their expectations about future dealings. These leaders might feel that the knowledge that they needed was not so much a calculation of the optimal outcome as guidance about the best way to manage an ambiguous, contested, and continuing field of activity. Policy workers found that they were concerned as much with the strategic management of the policy issue as with the systematic comparison of options, and in many cases, their work was described as "policy advising." Some writers have stressed the importance of distinguishing between analysis (seen as detached and scientific) and advising (seen as more engaged, experiential, and judgmental). Others built the diversity and conflict into the analysis, looking for formulae that would incorporate the divergent perceptions and agendas of the participants into the calculations in the hope that they would accept the outcome because their views had been "taken into account," although it was commonly found that trying to resolve conflict through formulae was not successful because the conflicting parties simply used the data from the analysis as ammunition in the continuing conflict. But this extension of policy analysis into the management of policy conflict was done through formulae or advising based on criteria drawn from experience: It raised for policy workers the question of whether they saw policy analysis as a technical input into the policy process or as a continuing and committed engagement with it.

For some policy workers (and writers), the technical skill of policy analysis is seen in terms of the analyst's understanding of the process—the situation as well as the problem—and the task for analysis as "in these circumstances, how can we achieve the most satisfactory outcome?" Policy analysis becomes less the selection of the optimal outcomes and more an exercise in skilful maneuvering in a crowded terrain, involving an understanding of the participants, stances, and structured processes as well as the substance of the policy issue, with policy analysis as a more or less formal exercise that might be mobilized in support. In this perspective, books on policy analysis are less concerned with analytic method than with street-smart guidance for the practitioner, though recently there has been more research (particularly in Europe) on how policy workers approach the task of making these strategic appreciations of the question and the extent to which this generates an experience-based analysis that might counter the instrumental calculations and projects of traditional American policy analysis.

Evaluation: The Policy Analysis That Got Away

The first generation of policy analysts in the United States was trained in the expert appraisal of alternative courses of action, and the methodology for making these appraisals became a standard part of the graduate programs in policy that emerged in the United States. It was essentially based on welfare economics and sought to calculate the net utility gain from each of a limited number of alternatives—usually before the event (*ex ante*) and sometimes after it (*ex post*). This developed into a distinct field of knowledge and practice called evaluation. It can be argued that this had its origins in the assessment of educational practice, but it gained its impetus in the 1960s and 1970s, particularly in the United States, as the instrumental use of grants by governments (particularly central governments) became more common and was increasingly accompanied by requirements that the performance of the grantee agency be subject to independent evaluation. This reflected the increasing appeal of principal–agent theory in government. It had been common for governments to give financial support in various ways to, for instance, religious or community bodies carrying out charitable works, but in the later years of the 20th century, this support was seen as the means for government to contract with agents to achieve known and specified outcomes. The charitable bodies were defined as the agents of government, and evaluation was seen as the means whereby governments could check that what they had paid for had been delivered. The methodology of these evaluations drew broadly on the research methods of the social sciences, applied in a framework of instrumental rationality: What were the objectives of the program? How could these be measured? Were the specified outcomes achieved? In this way, it was argued, the systematic analysis of the social sciences could be mobilized in support of the pursuit of policy goals.

But as with policy analysis, beneath the development of methodologies for evaluation lay the tension between detachment and engagement: Is the evaluator to be an inspector (a detached part of the apparatus of control) or a coach (a committed part of the team)? The central officials who commission evaluation may see it as a means of exercising control over the evaluated, but on the ground, inspectors tend to enter into trading relationships and develop shared understandings with the subjects of their scrutiny. Egon Guba and Yvonna Lincoln (1989) have argued that there has been a shift over time, from a detached inspectorial form of evaluation, which they called "third-generation evaluation," to a more supportive and negotiated "fourth-generation" type, but while there is some evidence to support this argument, it is challenged by the increased use of quasi-contractual relationships in government and the demand for "objective" measures of performance, which suggest that the inspectorial evaluation is alive and well. The explanation seems to be that there is an inherent tension between inspection and collaboration, but both have their part to play in the action, with the internal logic pointing to practices of collaboration and the external logic calling for the presentation of evaluation in terms of detached inspection.

Policy Analysis as Applied Knowledge

The last subcategory of analysis *for* might be called applied knowledge—that is, where policy analysis is seen as generating the sort of knowledge that is needed for decision making. Certainly, there are often research bureaus established within government in specific areas such as health policy, industry policy, or agriculture policy, and this can be seen as evidence of a need for specialized analysis of policy areas. In some cases, though, there seems to be a tendency to wind down specialist units within government and rely more on the ad hoc use of consultants. Also, the evidence that political leaders seek the advice of the subject experts within the tent, or that it constitutes a distinct form of analysis, is not very strong, and institutional analysts like James March and Johan Olsen would argue that this sort of explicit gathering of knowledge is not so much to inform the decision makers as to reassure the audience that the decision was appropriately made.

Perhaps more significant is policy analysis as oversight: the mobilization of analysis for a more comprehensive and overarching interrogation of the work of government. Sometimes high-level policy analysis and review units are established in government, such as the United Kingdom (UK)'s Central Policy Review Staff in the 1970s. The argument is that a small unit, not involved in the operations of government and reporting to the top-level leaders, will be able to generate an analysis that takes in the whole of government activity, identifies the interconnections, and focuses on outcomes and alternatives. This may be so, but there are not many examples of these units, they tend not to be very long-lived, and it is difficult to discern a distinctive mode of analysis emerging from them. Often, governments prefer to commission a one-off independent review of a policy area (to which they can pay as much or as little attention as they like) rather than to have systematic review built into the normal expectations of government. It can also be argued that now the claims for the merits of overarching policy analysis carried out ad hoc by high-level special units have been supplanted by the broader based advocacy of evidence-based policy as part of normal expectations.

Practicing Analysis, Analyzing Practice

Clearly, *policy analysis* is a term applied to a diversity of intellectual approaches and forms of practice. Because it is a concept that is mobilized in practice, its meaning will reflect its utility in facilitating practice as well as in its contribution to the analysis of practice. The *idea* of policy analysis is important in validating the activity of government, part of a set of rituals by which society assures itself that human existence is built around intelligent choice. But the forms of practice that count as policy analysis vary, reflecting the fact that "policy" itself is made up of a complex overlap of meanings that are manifest in an interplay of accounts. Hal Colebatch argues (2009) that it is helpful to see policy in terms of the interplay of accounts of *authoritative choice*, *structured interaction*, and *social construction*. Authoritative choice accounts present policy in terms of governments making decisions, structured interaction accounts see it more as the outcome of continuing interaction by stakeholders, and social construction accounts focus on the "collective puzzling" about what is normal and what is problematic, what demands action, and what sorts of action are appropriate. Each of these accounts of policy makes meaningful and legitimate a distinct array of practices, to all of which the term *policy analysis* can legitimately be applied. To make sense of this diversity of practices, then, we need to consider the nature of these accounts and the sort of policy analysis that they validate.

Policy Analysis in an Authoritative Choice Account

The dominant account of policy is that it is an exercise in authoritative choice: It is whatever government decides to do or not to do. This focuses on the episodes of attention in governing that give rise to rituals of choice—making decisions, authorizing programs, allocating resources, and so on—and underpins the perception of policy analysis as a technology of intelligent choice: gathering data on the problem, identifying alternative ways of responding to it, calculating the costs and benefits of these alternatives, systematically comparing options, and advising the decision makers of this information to enable them to make the optimal choice. Once the choice has been made, the same technology can be applied to assess whether the action solved the problem—evaluation.

In general, policy analysis is seen as an activity that precedes the choice (or that, in the case of evaluation, follows closely in its footsteps). Its knowledge base is the technology of selection, and its focus is on the decision process, not on the functional knowledge of the operational staff that tends to be relegated to a secondary place: The functional experts may propose, but the policy analyst is needed to evaluate their proposals, drawing on skills of selection and choice. But the separation of the technology of choice from operational knowledge can never be complete, and the demand for evidence-based policy links the field knowledge of the functional expert to the choice expertise of the specialist policy analyst, imposing on the functional specialist a requirement to demonstrate the instrumental efficacy of the proposed course of action and on the analyst a demand to identify the optimal course of action. The complexity of government also gives rise to a supporting role in policy analysis for the "process manager," the expert in procedure who can identify the steps that need to be taken in order to translate a decision to act into a correctly formulated and approved act of state.

Policy Analysis in a Structured Interaction Account

The authoritative choice account sees the task for analysis as enabling the policymakers (unspecified) to make the optimal informed decision. The structured interaction account, though, focuses on the variety of participants, all of whom contribute to the process, but few can bring it to a close with a "decision." These participants are likely to have distinct perceptions of the nature of the problem being addressed, what could be done about it, and how important it is. In this account, the task for analysis is to identify the participants and their stances, discover the extent of shared meanings and understandings and divergent and conflicting ones, and explore the discourses, practices, and locations through which mutually acceptable outcomes could be pursued. It is more like diplomacy than laboratory science, seeking to discover a basis for concerted action among participants who are not necessarily seeking to solve the same problem. It is concerned to facilitate consultation and negotiation, and here it overlaps with the process work of interorganizational communication, which has in many cases become a cottage industry in its own right, with consulting firms becoming adept at organizing "public consultation" exercises in which policy concerns or (more commonly) proposals are subject to structured discussion by nonofficials.

Here, we can see that the cognitive and the social element of policy analysis are closely related to one another: Sharing an understanding of the policy problem makes it easier to work together toward an agreed outcome, and people who are accustomed to working together are likely to develop shared understandings. In the 1970s, scientific concern about the climatic implications of the emerging hole in the earth's ozone layer led, extremely quickly, to international agreements to prohibit the use of chlorofluorocarbons in refrigerators. Peter Haas argued that this remarkable piece of policy development was due to the policy activity of an international network of scientists who shared an understanding of the problem and were all able to convince their home governments to act in concert with the rest of the world; he called this an "epistemic community" (from the Greek *episteme*—"knowledge"): The knowledge defined the community. But we can also see that in any policy area, there will be a range of participants who are all interested in the policy area but from diverse perspectives and knowledge bases. In agriculture policy, for instance, there will be agriculture bureaucrats, farmers' organizations, unions of agricultural workers, transporters, marketers, journalists, academics, and so on. Groupings such as this are not *epistemic* communities in Haas's terms, because they do not start from a common body of knowledge, but the more they work together over time, the more they develop shared understandings about who should be involved in the policy field, how to talk about it, and what sorts of action can be contemplated, and as this happens, they come to form a "policy community" of participants who recognize one another's legitimate expectation of a place at the table and who share an interest in securing a mutually acceptable outcome and a form of discourse that is likely to lead to this. In cases such as this, the forces for social cohesion lead to the development of modes of discourse that in turn strengthen the cohesion.

The recognition of the importance in the policy process of shared understandings has sparked a distinct school of interpretive or discursive policy analysis, which argues that much of the work of policy analysis is concerned with the negotiation of meaning, often in contested and ambiguous situations, and focuses attention on the way that meaning is constructed and communicated in policy work. Studies of relatively low-level workers (e.g., town planners, police, or social workers) find them engaged in constructing the links and negotiating the meaning through which governing is accomplished and argue that this communication and meaning construction is an integral part of policy making. Beryl Radin found that while U.S. policy analysts tend to define their role as "advising the Secretary," they often spend most of their time negotiating with policy analysts from other agencies, with the policy analysis techniques they learned in graduate school being deployed as "dueling swords" in these encounters, and she argues that policy analysis has moved from an ambition to "speak truth to power" to developing the capacity to speak truths to multiple powers.

Policy Analysis in a Social Construction Account

Policy cannot be reduced to decisions by "the authorities" (authoritative choice) or deals between stakeholders (structured interaction) but rests on shared perceptions of what is normal and what demands action, who can speak with authority, what sorts of action are appropriate, and who can be held responsible—that is, it rests on a bed of socially constructed problematization. The development of policy on climate change, for instance, has not been a matter of governments simply recognizing a problem but of an extended process of argumentation among scientists, activists, officials, industrialists, and commentators about how to interpret phenomena and to relate them to patterns of governing. It has been a continuing and contested process across constitutional and national boundaries, a pattern of meaning construction to which government players could contribute but that they cannot control. Indeed, when the former U.S. Vice President Al Gore won the Nobel Peace Prize for his efforts in raising the public consciousness on climate change, there was a demand for him to return to politics as a candidate for the presidency, but he resisted this, and it was suggested that he had come to realize that even the president could not change U.S. policy on climate change until public opinion had come to accept both the policy problem and the implications for corporate and individual practice.

In this context, then, policy analysis (both *of* and *for* policy) has to do with the construction and maintenance of the problematic. Analysis *for* is concerned with the development of an account of practice that focuses attention on a problem, validates ways of thinking about it and appropriate responses, and allocates responsibility for action. In this respect, the work of policy analysis is more like that of a lawyer than a laboratory scientist: It is finding good reasons for doing things. When Tony Blair was prime minister of the UK, there was in his press office an official called the Head of Story Development, whose task was to ensure that what was being done in government made “a good story.”

But to say that policy analysis is concerned with framing the action suggests that there may be more than one way of doing this and that the analysis will have to contend with competing frameworks of meaning. Policy workers in health, for instance, recognizing that the available resources—hospitals and doctors—are preempted by the ever-expanding claims of “illness response” at the expense of activities that would contribute more to health, try to strengthen the discourses on health maintenance and self-care (rather than illness treatment) and the position of the participants who engage in these discourses. Policy workers closely analyze the wording in official discourse and try to make sure that the words used will bear the interpretation that they want to put on them and, if not, will seek to replace them with words that are more convenient. And the framing is not only done with words: Titles, uniforms, and the architecture of buildings can be powerful symbols that convey the meaning of policy.

So from a social construction perspective, analysis for policy is not a technical exercise conducted in advance but part of the continuing strategic judgment of the participants, as they frame the world (and react to the framings of others) in a way that makes sense both to themselves and to other participants. This means that they must be sensitive to the different framings that are in use at any point and make the appropriate responses. Tim Tenbensel, drawing on Aristotle, argues that within the one policy context, there are likely to be discourses grounded in knowledge from study (Aristotle’s *episteme*), in knowledge from practice (*techne*), and in ethical-practical judgment (*phronesis*) and shows that an important skill in policy work is the ability to analyze the policy setting, discern the nature of the discourse in use, and engage in it with the appropriate language. This brings us back to a recurring theme in the discussion of analysis for policy: Is the task to do the analysis or to bring it into use in the shaping of policy outcomes?

Conclusion

Policy analysis is a concept in practice, and what it means reflects the way in which it is used. The intellectual foundations of the concept lay not only in political science but also in economics and operations research, and as it developed as a conceptual field, concerns about organizational dynamics, problematization, and the construction of meaning were added. As a component of practice, it is used to describe a wide variety of activities. The question is not so much “What does policy analysis mean?” as “How is the term *policy analysis* used to characterize and validate activity?”

Initially, it was seen as a distinct and prior stage in the process of governing, a form of intellectual activity that would precede the exercise of authority. This presentation was part of a modernist account of government as a form of systematic collective instrumentality, in which the government identified problems and decided what to do about them. The argument ran that by hitching the investigative techniques of social science to the operational capacity of government, governments would be better informed about the nature of the problem and the likely outcomes of alternative responses open to government. Its advocates saw it as a source of scientific and unbiased answers to contested questions in government.

In this respect, the experience was somewhat disappointing. Formal modes of the identification and comparison of alternative courses of action were elaborated, taught in graduate programs, and reported in the literature (e.g., "Optimal Compensating Wages for Military Personnel" or "The Impact of State Tax Credits in Stimulating R&D"). But often, those doing the analysis felt that it had little impact on the decision process and that sometimes the decision had been made before the analysis was called for. One response sees this as a "two-cultures" problem and calls for policy analysts to be more "user-friendly," less concerned with adding to the systematic body of academic knowledge, and more concerned with the quick delivery of answers to urgent policy questions, even if this means ignoring the methodological canons of good social science: Analysis that is "quick and dirty" might be what is needed in policy. This response also calls for policy analysts to pay more attention to the communication of their findings, writing shorter and more accessible texts that focus on the immediate implications for policy. This raises the question of the extent to which policy analysts should involve themselves in "marketing" their analysis to increase the likelihood of it being used in the policy process. Should they be advocates for their own findings? Should they, in carrying out their analysis, cultivate relationships that are likely to strengthen the chances of its acceptance or to neutralize potential opposition? In other words, are they to be detached scientists or active participants in the policy process?

This has not been a topic for abstract debate but has reflected the way in which policy analysis became institutionalized in and around government, particularly in the United States. Radin, who has been both a participant in and an observer of this process, found that policy workers tended to become specialists in particular policy fields rather than general-purpose analysts and that while they have been trained in the systematic comparison of policy alternatives and see this as the real work of policy analysis, they find that they are likely to be spending more of their time talking not to policymakers looking for guidance but to policy analysts in other organizations, each primarily concerned with protecting the interests of his or her own organization. She argues that in practice, policy analysis has moved from being a purportedly objective judgment that could resolve policy arguments to being the vehicle through which they could be continued. It has become a mode of discourse mediating relations between the various participants in the policy process—not simply between policy analysts from different agencies but also between elected leaders, officials, and activists. Officials call for analysis to question and delegitimize the projects of elected leaders, leaders commission analysis to defend these projects against bureaucratic scrutiny, and activists table analysis to support their demands and to establish their credibility as serious players in the policy process. Policy participants were interested in policy analysis not because it would deliver the self-evidently correct answer to a policy problem but because it could facilitate interaction by giving the contending participants a shared language.

This evident development in policy practice (analysis *for*) has been paralleled by a growing interest in interpretive modes of policy analysis (analysis *of*), which focus attention on the construction of meaning and the way it is related to patterns of interaction. The relationship is (as Anthony Giddens puts it) "recursive": The accepted construction of meaning indicates who the appropriate participants are and how they should act and interact, and who participates and how they interact determines the meaning of the question. Interpretive policy analysis directs attention to the ways in which meaning is constructed from the competing interpretations (story lines) available: What is the policy about? Is policy on child care, for instance, about the reconstruction of gender relations, increasing workforce participation, promoting socialization, or the education of the young? These are all valid policy aspirations, but how significant they are in any specific context is likely to depend on which participants are involved, and the various participants are all concerned with ensuring that their perception of the problem is reflected in the policy statement. Interpretive policy analysis draws attention to the way in which participation and meaning interact with one another.

At the same time that analysis of policy has been broadening its gaze and recognizing the ambiguity of purpose in policy, there has been among some practitioners a strong move in the other direction, back in search of more clarity and a policy analysis that will identify the right policy to choose—in a sense, returning to the spirit of Lasswell's 1951 call for a policy science and the American graduate programs that it inspired. This perspective on the function of analysis has been boosted by the application of principal–agent theory in government, which underlies the enthusiasm for purchaser–provider splits, the contracting out of functions, and quasi-market relations between the center and the operational arms of government. In this context, the function of policy analysis was to clarify what it was that the center should be seeking and to verify whether the operational arms were delivering it.

By the turn of the century, this model of arm's-length trading was being supplanted by discourses of partnership and governance, but there was a growing demand for evidence-based policy, which also looked to policy analysis to reduce uncertainty in the policy process. This followed pressure in the health sector for evidence-based medicine, stemming from a realization that while systematic comparison of alternatives had played a large part in the advance of medical science, there was little comparative evaluation of the standard operating procedures of medical practice. This concern resulted in the formation of the Cochrane Collaboration as a forum for scrutinizing the evidence on the efficacy of different forms of treatment, with the randomized controlled trial as the gold standard of analytic methods. This movement was paralleled in policy analysis by the establishment of the Campbell Collaboration, which aimed to establish definitively what works in policy, and this gave new life to traditional American policy analysis, with its focus on the definition of the problem, the identification of options, and the systematic comparison of alternatives.

So policy analysis is characterized by two major tensions. One is the tension between scholarship and practice: To what extent is policy analysis the generation of scientific knowledge, and to what extent is it a contribution to governmental practice? The second tension is between the two divergent paradigms of policy on which it draws. One is the paradigm of instrumental rationality from which policy analysis emerged, which portrays a world in which the problem is clear and there is a single decision maker, a known hierarchy of values and objectives, and certainty of outcomes. In this world, the role of the policy analyst is to calculate which course of action will best achieve the values of the policymaker. This is countered by an alternative paradigm that sees policy as emerging from a world characterized by diversity: multiple participants, conflicting agendas, dispute over values and objectives, and uncertainty about the outcomes that might be achieved or how these would be evaluated. In this paradigm, policy analysis is a part of the game, mobilized by the participants as part of the continuing struggle for support. These two paradigms are not entirely separate; rather, one tends to assume the other. There is an awareness of diversity and also a yearning for cohesion. Policy participants recognize the multiple voices in the process of governing but at the same time find it difficult not to use a single-voiced narrative in which an actor called the government makes decisions that resolve conflicts by the creation of policy. The question for participants is to what extent policy analysis is seen as a vehicle for accomplishing the purposes of the government and to what extent it operates as a device for facilitating the achievement of some degree of concerted action among the diverse and fractious players in the game, with statements of objectives (or about the problem itself) being means for the achievement of collaboration rather than evidence of its existence. And for the academic observers, the question is how much they take policy analysis on its own terms, as the careful documentation of an exercise in instrumental rationality, and how much they see it as a part of the process that they are attempting to analyze.

POLICY COMMUNITY

In current conversational use, *policy community* refers to the population of organizations with a stake in an area of public policy. In its more technical sense, it refers to interorganizational structures exhibiting a close, stable, cooperative relationship between a limited number of, mainly self-selected, interest groups and "partnering" elements of the governmental machinery. This entry describes the development of this term and also discusses the numerous critiques that have been made concerning it.

Developments

The term *policy community* appeared in the literature independently in several sources in the 1970s (e.g., Jeremy John Richardson & A. Grant Jordan, 1979), and this timing reflected the shift in focus in political science away from formal legal and legislature-based study to tracking empirical policy biography. Empirical research found that the effective locus of decision making was not the legislature, cabinets, or politician-led committees but group/bureaucrat arenas. The term recorded the conclusion that much policy evolution was not the result of ideological struggle between conflicting political parties with distinctive ideologies and agendas but of apolitical (or at least nonpartisan) discussion and information exchange.

It was thus one of a family of concepts capturing segmented policy-making features—for example, group subgovernment, corporate pluralism, and iron triangles. The characteristics of a generic subsystem approach include the following: the expectation of bargaining in stable (sectoral) environments, the evolution of stable coalitions, the low visibility of decisions, well-defined and uncontested policy jurisdiction, the narrow and low scope of conflict, a small number of participants, and some restriction of access to the process.

In real-life settings, policy communities are not black-and-white arrangements with gatekeepers and badges of admission. The policy community was not intended as a one-size-fits-all policy explanation. What it intended to capture was a sense of surprise (reflecting a wave of case study research) that policy making was to a substantial degree the result of non–legislature-based bargaining.

Whereas in party and parliamentary venues policy differences are exaggerated in adversarial fashion for political advantage, in policy subsystems, there is a premium on minimizing differences and underplaying the apparent significance of the outcome. Participants resolve issues within the network in the belief that it is counterproductive to highlight grievances (attracting other competing perspectives). The suppression of competing interests is reinforced by presenting issues as humdrum or technical. Trumpeting the importance of one's concerns might just attract attention. So it would be difficult to get an impression of the number and importance of these arrangements from, say, a sampling of press articles or ministerial speeches. The policy community premium is in avoiding such attention.

The Main Critiques

The concept has found little empirical application and instead has generated debate about what it implies rather than demonstrations of its usefulness or otherwise.

Its original usage in the United States and the United Kingdom (UK) was remarkably congruent. In the UK, Richardson and Jordan's *Governing Under Pressure* sought to reorient attention in policy-making studies toward a

> special type of stable network which has advantages in encouraging bargaining in policy resolution . . . where there are effective shared "community" views on the problem. *Where there are no such shared attitudes no policy community exists.* (Jordan, 1990, p. 327)

However, while the policy community was seen as being a set of participants with shared understandings, this did not mean a lack of conflict: *Community* deliberately implied a sort of "circumscribed conflict," not its absence.

Its usage in the UK stood as an implicit rejection of Arendt Lijphart's majoritarianism that suggested that British policy making was top-down—using stable parliamentary majorities to drive through manifesto-based policy. It suggested instead that policy is normally built up through agreement in constituencies of affected interests. A theoretical capacity for policy imposition is actually marginalized by the political benefits of building consensus and implementing them through cooperation.

The general assumption in these sources is that much policy making is in effect subcontracted to informal institutions of the relevant civil servants and affected interests. For example, Randall Ripley and Grace Franklin, writing about the United States, observed that most of the policy making with which subgovernments engage consists of routine matters resolved in fairly restricted and consensual settings. Thus, an assumption underpinning these policy resolution "institutions" is that the breadth and complexity of the government agenda require the disaggregation of policy into more manageable subissues involving a smaller number of relevant and knowledgeable participants. The fragmentation of policy takes decisions to a level of particularity where few are interested enough to mobilize or have the time or resources to become involved. Those with an interest look for acceptable outcomes.

As suggested by Keith Dowding, the original concept was no more than metaphorical, useful in signaling as important a particular set of (nonparty political) participants and suggesting a community-like quality to these relationships. Others have been more ambitious for the concept—but mainly those exaggerating its ambitions to prove a weakness. Critics have generated a caricaturing process. Martin Smith criticized as being "too vague" Richardson and Jordan's assertion that policy communities developed in response to complexity in the wider political system. Smith's claim fails to distinguish between a definition that is vague and a reasonably precise definition of uncertainty.

The attention by politicians to a handful of high-profile areas (not necessarily the most vital) implies that they have to neglect the vast majority of the policy mix. It is argued in the policy community literature that many (but by no means all) of the numerous remaining areas fall to policy community–type resolution. There is, however, a preliminary assumption that it makes sense for participants to try to deal with matters in the milieu of consultation rather than electoral politics. It is not a deficiency of a model of routine decision making that it does not very well accommodate nonroutine decisions.

Another criticism of the policy community model is that it fails to account for change. For example, Wyn Grant (2005) cites Richardson to the effect that the main weakness of the concept is the implication of stable policies, relationships, and membership. This does not seem a particularly strong criticism—akin to complaining that a map of Washington is a poor guide to Montreal: The policy community sketch was not meant to account for change but to explain enduring stability.

Frank Baumgartner and Bryan Jones (1993, p. 6) used the term *policy monopoly* to label informal policy structures very similar to policy communities. Their term referred to the "monopoly on political understandings," that is, the ability of certain groups to maintain a dominant policy framing. The policy community is in essence the venue or institutional arrangement that reflects and reinforces the dominant understandings of which Baumgartner and Jones wrote in their work on agenda. They suggested that policy making is often unlike the pluralist idea of mobilization and countermobilization, and instead monopoly/community arrangements are seen primarily as instruments of mutual noninterference in the "absence of serious opposing voices" (p. 14).

Frank Baumgartner and Beth Leech supplied a sense of scale about what they call "policy bandwagons"—political issues generating widespread group interest. These they proved to be atypical. They identified a random sample of 137 cases of lobbying and looked at high- and low-conflict proportions. They found extreme polarization, with the top four issues accounting for more than a third of all interest-group activity. Twenty-six issues out of 137 captured 81% of the lobbying. The reverse is of course that 111 cases reflected 19%. This confirms two things: (1) that not all lobbying events are the same and (2) that many of them are low profile, with few people participating. It would be a leap to say that all the cases with a small number of participants were examples of policy communities, but the data at least underline that much political processing is low-participant activity.

As argued by Grant Jordan and William Maloney, the arrangements exist because there is a "logic" to building cooperation about delivery by preconsulting relevant interests. Organizations trade or exchange information/advice to secure access to, and influence within, decision procedures. The logic of this relationship holds, regardless of the political persuasion controlling the government. Therefore, radical policy shift is rare and does not routinely follow a change of government.

Critics tend to define the policy community concept in a comprehensive, rigid way that can be demonstrated as not fitting real-life cases. In fact, the articulation may have itself overencouraged ideas about institutional formality. In real-life policy development, participants are not clearly identified. It is conspicuous and significant that propolicy community authors fail to give definitive lists of their examples. This may not be because the concept is vague but because it tries to capture a phenomenon that lacks formality and certainty about a list of participants. Policy community "structures" may be less important than the "logic of accommodation" procedures that they exhibit but do not monopolize. Even where the policy-making arrangements do not make a policy community description appropriate, the process "borrows" some of the conflict reduction features because policy communities are part of the search for policy resolution but not the only aspect.

POLICY CYCLE

Policy cycle refers to the process whereby political actors attempt to shape the definition of problems, the setting of a policy agenda, the formulation of policy alternatives, the adoption and implementation of policy decisions, and the evaluation of policy outcomes. This perspective is underpinned by a linear, problem-oriented, rationalist, and systemic view of the policy process. In the conventional conception of the policy cycle, policy problems are identified by policy advocates and other political actors and then put onto the policy agenda; politicians and officials then develop policy measures to address these problems and adopt the best possible alternative to tackle the problems after considering the likely impact of these alternatives; and evaluation would be done after the policy is implemented, and the responses and reactions to such evaluation would be fed back into the policy process.

Policy Process

The emphasis of the policy cycle perspective is on the *process* of policy actions and interactions involving many different political and bureaucratic players. Hence, it has gone beyond the study of formal political institutions or the input side of politics, such as interest-group activities and political participation, which were once the main concerns of political science. The conception of the policy cycle could be traced to Harold Lasswell's seven prescriptive steps in policy making, namely, (1) intelligence, (2) promotion, (3) prescription, (4) invocation, (5) application, (6) termination, and (7) appraisal. Nonetheless, his prescriptive conception focuses mainly on policy making within government, without taking into account the impact of other political actors and the external environment. Major texts published in the 1970s and 1980s by Garry Brewer and Peter DeLeon, Charles O. Jones, and James E. Anderson have further contributed to the policy cycle framework. While the most commonly recognized stages of the policy cycle include problem definition and agenda setting, policy making, implementation, and evaluation, other formulations have proposed somewhat different, but still largely similar, stages, such as initiation, estimation, selection, adoption, legitimation, implementation, evaluation, and termination. The terms *policy cycle* and *policy stage* are often used interchangeably in the literature, hence this is also called the stages approach to the policy process. The cyclical metaphor, however, highlights the role of feedback in linking the input and output phases of policy making, as in David Easton's system model, and hence emphasizes the continuous evolution of the policy process.

Criticisms of the Policy Cycle Concept

The policy cycle perspective is perhaps the most widely adopted and long-standing framework used in organizing major texts on policy making and policy analysis because it simplifies the complicated, amorphous processes into distinct and easily identifiable stages. Its contribution to the conceptual organization of the policy process should not be underestimated. However, despite its widespread usage, it has come under criticism from various angles, ranging from critique of its empirical relevance to its promise as a policy theory. First, one key criticism is that the policy cycle is not a causal theory or model. It does not offer an explanation of the entire policy process, even though the perspective encompasses the most prominent aspects of public policy making. It fails to clearly identify a set of key variables that explains the process, which is considered not conducive to the further development of policy theory. Nor does it specify the relationship between these variables or generate a hypothesis for testing its claims. In the eyes of the critics, the policy cycle at best provides a descriptive account and an analytical framework of the policy process rather than a theoretical explanation of how the policy process proceeds in the way suggested by its proponents. Hank Jenkins-Smith and Paul Sabatier prefer to call it the "stages heuristic," namely, just a learning device.

Second, another major criticism argues that the policy cycle presumes a linear, unidirectional conception of the policy process, as if one stage will lead to another, which does not resemble the real political world. In reality, interactions among different stages of the policy process often take place, and the interplay of politics and the influence of the external environment are critical in shaping the twists and turns of the policy process. Third, the sequence of stages in the policy cycle is often considered as empirically inaccurate because different phases of the cycle may take place at the same time and policies do not always proceed as suggested in the framework. For instance, the evaluation of existing policies affects agenda setting and policy making, and the unintended outcome of one policy may pose a problem that needs to be addressed by another policy. While the different phases or stages of the policy cycle are conceived as discrete steps clearly differentiated from each other, it is often not easy to delineate the different phases neatly in reality. Policies are proposed in the context of other existing policies, and they are usually amended or revised continuously.

Fourth, the policy cycle takes into account policy evaluation but not policy learning, although many studies have studied how policy analysis and policy learning can be integrated into the policy process. Fifth, some critics further argue that the framework may incorrectly highlight the policy cycle as the unit of analysis. Instead of having only one cycle, many different, interacting policy cycles concerning a multitude of diverse policy measures initiated at different governmental levels may be proposed at the same time, especially in big, federal political systems such as the United States.

Sixth, a top-down, legalistic bias is also implicit in the policy cycle because its focus is on the adoption, promulgation, and implementation of government legislation rather than the interactions between different aspects of the policy process or the politics between governmental and societal players. Politics, whether within the government in the form of bureaucratic politics or in the community at large, however, are often powerful determinants of the dynamics of the policy process. Such a deficiency was later explicitly addressed in other competing theoretical frameworks of the policy process.

Last but not least, the policy cycle cannot fully capture the multifaceted political dynamics of the policy process, which is more critical than the rational calculus in determining policy outputs and outcomes. The seminal contribution on agenda setting by John Kingdon (1984), for instance, aptly emphasizes the importance of the coupling of the three streams, namely, the problem, the policy, and political streams, in shaping the policy process. According to Kingdon, the problem stream refers to the perception and definition of problems as worthy of further attention and action by policy actors; the policy stream refers to the ongoing policy deliberation among the policy actors and the emergence of policy proposals within the policy community; and the political stream refers to the major developments in the political arena, such as the changes in the national mood, turnovers in administration, and personnel reshuffling. The combination of these three forces constitutes a powerful factor in opening the policy window that will usher in policy decisions or policy change. By emphasizing the interplay of political as well as ideational factors, Kingdon's view contrasts sharply with the more ideal-typical, simplified procession of stages in the policy cycle perspective.

Contributions to the Study of Public Policy

The policy cycle framework is clearly not embedded in a casual theory, but is it completely inadequate as an important scholarly contribution to the study of public policy except in its service as a learning device? On balance, the framework has helped organize research by highlighting significant, generic features of the policy process, even though it has not postulated a policy theory. Indeed, the specification of the key stages of the policy process in this framework is both a strength and a weakness. If a sound theoretical explanation of policy evolution is to be formulated, there is a need to put the framework within specific institutional contexts in order to take into account the impact of political structures, the multiple layers of government and their interactions, or the specific constitutional arrangements in shaping policy politics in different national contexts. At the same time, the overarching concepts of the policy cycle do highlight comparable features of the policy process that can be easily identified in different political systems, even though the actual characteristics of each phase vary across nations. Such a conceptual space is especially critical in fostering comparative research, particularly because the literature on public policy primarily focuses on the United States and other developed democracies.

Most major scholarly works on public policy in the 1990s do not attempt to develop a theory of the entire policy process; rather, they tend to examine the dynamics of each of the constituent phases of the policy cycle in much greater depth and with increasing methodological sophistication. For instance, many studies investigate how problems come to the attention of policymakers (e.g., John Kingdon), how political systems process information and prioritize problems (e.g., Bryan Jones and Frank Baumgartner), and how policy agendas have evolved and changed over time (e.g., Jones and Baumgartner). Others have analyzed how competing advocacy coalitions sharing basic policy beliefs within a policy subsystem have organized to change policies (e.g., Paul Sabatier and Hank Jenkins-Smith) and how public policies are implemented (e.g., Michael Hill and Peter Hupe). Scholars have also studied how policy design has affected the behavior and interests of target clients of policies (e.g., Anne Schneider and Helen Ingram). Moreover, while investigating one policy phase involving a piece of policy legislation may require a relatively shorter period of time, some major studies have taken a long view of the policy cycle to take into account the effects of implementation and policy learning. For instance, research on the advocacy coalition framework has studied policy change and learning over a decade (researchers include Jenkins-Smith and Sabatier), and the punctuated equilibrium theory studies changes in the American policy agenda over many decades (researchers include Bryan Jones and Frank Baumgartner). The duration of a policy cycle is critical if a more thorough analysis of the entire policy cycle is to be attempted.

Since the actual policy process concerns highly complex, fluid, and strategic interactions between many political actors over time, the simplicity of the policy cycle continues to offer not only a sound heuristic device but also a very effective framework to stimulate thinking and organize research on public policy. In fact, disaggregating the policy process into stages constitutes a critical first step that facilitates further conceptual refinement, theoretical inquiry, and empirical research. Research hypotheses within specific stages of the policy cycle, such as agenda setting and policy making, or across these stages, for instance, could be generated for further theory building. Such hypotheses would then be made amenable for empirical testing or refutation. Therefore, in spite of the lack of a core theoretical argument, the policy cycle perspective has not limited the conceptual and methodological advancement in the study of the policy process.

POLICY EVALUATION

Policy evaluation concerns the estimation of the effectiveness of public policies, programs, or projects and their management and implementation. Because policy is about change, policy evaluation should explain what factors or determinants led citizens or groups to do things or take actions that otherwise they would not do (e.g., quit smoking, recycle products, practice sustainable behavior, end domestic violence, retain students in school, attract investments, reduce unemployment). To implement such policies, governments have created programs with specific achievement goals. The role of policy evaluators is to give educated estimates of the effects of changes in government policies. From a public administration perspective, program evaluation is a scientific activity that entails the use of scientific methods to measure the outputs, implementation, and outcomes of programs for decision-making purposes. But beyond all this, the key question in policy evaluation is the following: What does government do to improve the quality of life of individuals-citizens? It is also important for policy evaluators to decide if it is better to do something than do nothing to resolve a problem. This entry examines approaches to policy evaluation, the political role of evaluation, and some of the techniques used for policy evaluation.

Historically, the role of social scientists and program evaluators in governments has been at the forefront of the debate on the relevance of normative versus empirical research in the decision-making process. The opposition between those who favor the "scientifization" of politics and those for the "politicization" of science has created two classes of program evaluators: those who think that we can bring social changes by looking at and comparing the action taken by several governmental entities to resolve social problems and those who believe that everything remains normative and the support of stakeholders is essential for the implementation purposes. Looking back on the New Deal of Franklin D. Roosevelt, the Beveridge Report, the Coleman Report of education, and the War on Poverty, all these policy initiatives led to several actions and new programs to respond to social issues.

Therefore, policy evaluation refers also to the broad idea of social engineering, meaning the capacity of evaluators to resolve social problems and to find superior solutions. The evaluators' role in governing is also to suggest the best policy alternatives to resolve a social problem. Decision makers need to understand the impact of their actions; therefore, policy, program, and project evaluations as a knowledge activity contribute to the rationalization of decision making by determining the best course of action and the limitations of governmental interventions (Lee Sechrest & Aurelio Figueredo, 1993; Evert Vedung, 1997). Thus, evaluators are not mere technicians measuring what government has been doing but also are intimately connected to making and improving public policies.

The Role of Policy/Program Evaluators in a Changing Environment

The concept of "experimenting societies," that is, trying to test social theories and hypotheses in our social environment, in many ways poses a challenge and a burden on program evaluators (Donald Campbell & Jean Russo, 1999). How can program evaluators improve the well-being of citizens? How can they reduce the social risks associated with unemployment and slow economic growth, poverty, and income inequalities? How can they improve the social status of unprivileged groups? To bring about such changes, evaluators realized that the state is only one of many sources of power in society. Governments have to compete with many actors—interest groups, social groups, nongovernmental organizations—who want to participate in the policy process. Furthermore, in addition to competition, the public sector also now engages in extensive cooperation with actors in the private sector in the provision of public services.

One difficult task for program evaluators is to convince decision makers that the social and political risks of inaction are often more costly than taking action to provide a remedy to a problem. Evaluators have to tell politicians not only what they are supposed to do but also what they ought to do. If governments wait too long to repair bridges, the lives of citizens can be threatened and important economic and social consequences may ensue. Evaluators have to establish clearly the consequences of change or no change—which are often the cause of fear, inertia, and conservatism—on the future of society. Social changes or policy/program changes cannot be implemented without an overall social or organizational consensus about the necessity of such a transformation. The determination of the appropriate change criteria based on the goals and objectives of programs is at the heart of establishing the indicators of performance and both the economic and the political feasibility of programs.

From a methodological viewpoint, a discussion about the "best" research protocol or research design and the use of reliable measuring instruments are essential elements of any evaluation to establish either the success or the failure of any governmental program. The task of evaluators is to operationalize the program goals, to specify the indicators to measure the social changes associated with the program, and to suggest the appropriate policy instruments to achieve the programs goals. Evaluators are concerned not only with outcomes measurement but also with the implementation process. Therefore, putting in place within governments or organizations a monitoring-tracking system—to evaluate regularly changes in the program outcomes and the processes through which results are supposed to be obtained—is also a crucial element of the evaluation function.

Thus, evaluators are first of all researchers, with policy evaluation remaining a scientific activity. However, some scholars have suggested that evaluators can also become "agents" of social change and, in some cases, policy advisers do devise the most effective strategies for achieving program goals. From this perspective, evaluators constitute a class of "new social scientists" who understand what governments do (governance), what are the key determinants of the decision-making process (public administration), what are the best policy instruments to use, and how to evaluate the impact or outcomes of decisions (public policy). The task of evaluators therefore is enormous and focuses on the multifaceted nature of governmental activities.

Governance and Policy Evaluation Processes

If in the United States, program evaluation was developed largely outside government, being firmly rooted in the experimental tradition of the social sciences and at the border between public policy and public administration, this was not the case in most industrial countries. In the United Kingdom, Canada, and Australia, the evaluation function has developed and evolved within governmental institutions, departments, and agencies. In other countries, such as France and Germany, program evaluation is still perceived as a means of administrative control, and the line between program evaluation and audit remains fuzzy. Therefore, the policy evaluation processes have followed different paths and have been carried out by different stakeholders.

Sometimes, program evaluation is perceived not as a part of the field of public policy or of public administration but simply as a function within the government management and monitoring system. It is a means used by decision makers to move toward good governance. The development of policy evaluation was also perceived as a part of the budgetary process since the implementation of the Programming, Planning, and Budgeting System (PPBS) by the Lyndon B. Johnson administration in the United States; it is also considered as an element of the accountability of government. That led to confusion between the functions of evaluation and audit and between cost-effectiveness and cost–benefit analysis. If program evaluation is a careful assessment of government interventions, internal audit is more concerned about the use of the financial resources of the public sector. Nevertheless, both can play complementary roles in determining the criteria leading to good governance and improve the delivery of programs to citizens.

In recent years, program evaluation as a field of research has been under heavy criticism, with several scholars arguing that over the years no substantive knowledge has been attached to program evaluation. The main reason for a situation of this kind to have developed was that program evaluation operates in a highly politicized context and has become part of the political process where program evaluators are embedded in the program itself (Eleanor Chelimsky, 1997). Therefore, it was proposed to distinguish formative from summative evaluation, the former leading to managerial change in the delivery of programs while the latter looks at the factors leading to the success of programs. Furthermore, when new governments take over, the origins and outcomes of the public programs of the previous government are forgotten.

The Science of Program Evaluation

Policy evaluation was clearly an outgrowth of the development of the welfare state and one of its principal consequences: the increase of governmental expenditures. Even if there are several theoretical elements beyond policy evaluation, the central theory is to model governmental change (Marvin Alkin, 2004). In 1959, when Charles Lindblom wrote his seminal article "The Science of Muddling Through," he suggested that in any incremental analysis, social scientists should distinguish small budgetary changes (simple incremenental analysis) from the complex (disjointed incrementalism) and very complex situations (strategic analysis). For Lindblom, incrementalism is simply a method of analysis and action—the most effective way is to respond to bureaucrats' and voters' demands. From his perspective, nonincremental policies are simply irrational and politically irrelevant because their consequences are unforeseeable for any political system. Leaders who want to stay in power will be wiser to bring small budgetary changes and introduce small adjustments. In some ways, incrementalism can be perceived as an outbreak of rational decision making.

Therefore, incrementalism became a central concept of public policy and decision-making processes, and it was defined as a mutual adjustment process that may produce small ranges of budgetary outputs. If this concept is widely accepted among scholars, it is, however, inadequate to explain policy changes, especially in periods of rapid political and social transformations. The study of incremental change also led several studies to determine if the type of political and party system influences the budgetary process. Also, questions related to the impact of newly elected governments and the increase of departments', ministries', or agencies' budgets as a factor leading to changes in public policies (Niskanen theory on bureaucracies) became part of the task of explaining governmental growth. Thus, with the election of new leaders and political parties, some policy adjustments and some partisan mutual adjustment processes in the policy goals and objectives can be expected. If the traditional incrementalist school suggests that political elites have a small influence on the policy process and its outputs, some scholars, on the contrary, think that to measure the impact of policy, political analysts should look beyond the "muddling through" process. Therefore, the purpose of policy evaluation is, basically, to understand the role and functions of governments in our societies.

Incrementalism and Social Transformations

The postulate of incrementalism is that the observed policy change in a given time period is determined by the preceding time period. In other words, a good part of the change observed is highly dependent on the existing situation. In the case of budgetary change, annual budgets represent incremental decisions because political leaders, bureaucrats, and appropriate committees are concerned only with small changes in the budget year after year. Therefore, governmental policies, programs, and budgets are never completely reviewed as a whole because of the incremental calculations from the actors, and the value of all programs is never completely compared with other policy alternatives. In the case of the budgetary process, the previous year's budget is the main reference to fix the appropriations of the next year. The incrementalists do not assume that cuts and reductions in budgets and programs are impossible from year to year but that decision makers are only interested in the increments—small increases or decreases. Then, it is possible to observe some incremental cuts in departmental budgets or programs.

From a public administration perspective, the increment approach refers to the difference between what the administrators of a department or program request in a specific year and what they actually received in the prior year. If a department or program receives less than it had in the previous year, policy analysts talk about a *decrement* instead of an increment. However, such decrements are rarely observed directly and in some ways represent deviant cases in public administration. In other words, since most policies and program budgets are rarely controversial, the budgetary base does not really change from one budget to the successive ones. However, if the budget of a program remains the same over time, one can argue that there are actually incremental cuts because program expenses are not following the normal inflation growth pattern. Aaron Wildavsky, for example, gives another definition of the *budgetary base*. For him, the policy analyst should take into account the expectations of the stakeholders. Rarely, decision makers will ask for a decrease of their program budgets, and therefore the base represents "the commonly held expectations among participants in budgeting that programs will be carried out at close to the going level of expenditures" (Wildavsky, 1986, p. 11).

If these concepts (e.g., incremental change, increment–decrement, budgetary base) are accepted among policy analysts, it is more their applicability for decision-making purposes that is challenged. Some authors have criticized the normative character of the incrementalist theory because of the perceived conservative trend in this approach and the absence of any reflection about the policy implementation process of new policies. The theory and the models proposed are essentially too stochastic. Also, because changes are only marginally different from the status quo, the hypothesis that policy administrators and politicians will adopt incremental behavior is merely descriptive. It should also be proven that the base actually represents the status quo. In others words, measuring change is not easy and depends on the evaluators' reference standards before the evaluators can establish the size of the change observed.

The last issue concerning incrementalism is to define it empirically. It is difficult to determine what an incremental (small) change is. At which level can budgetary changes be considered significant—5%, 10%, or 30% of the program budget? And what are the characteristics of such changes? It is suggested that policy evaluation should be able to make the distinction between *mandatory requests*—the new expenditures needed to keep a program operating at the same level—and *programmatic requests* for initiating new programs. The first type of budgetary change is perceived as incremental but not the second one. It is also suggested that in any budget, there is a part that is controllable and a part that is uncontrollable and includes all expenditures not regulated by the legislation.

Policy Processes and Bureaucratic Changes

According to Lindblom (1959), "democracies change their policies almost entirely through incremental adjustments" (p. 84). In democracies, it is easier for political leaders to focus just on incremental changes. The effect of such behavior is that the value of the status quo is constantly reinforced. A high degree of social stability and continuity is necessary in any political system to allow bureaucrats to follow the muddling through approach; in periods of rapid social changes, this method becomes inadequate. If incrementalism confines the bureaucrats in the day-to-day routine and reduces their motivation and their capacity to innovate, then incrementalism is a way to reinforce the pro-inertia ideology and support the tendency of organizations to resist change. Therefore, the central question is how to define the status quo (the baseline measurement) and how to measure small changes from the status quo. Also, do small changes really reinforce the status quo?

However, Lindblom remains skeptical about the argument that his policy model supports the antimotivation forces existing in any organization. If the rational-comprehensive model seeks to stimulate the administrators and bureaucrats, he cannot foresee how his model can be seen as a tactic for conservatism. He argued that fast-moving sequences of small changes can bring about policy changes more rapidly than can only infrequent redefinition of policies. Lindblom argues that in periods of political crises, the value of incremental changes is that they can be implemented rapidly and that decision makers and bureaucrats are in general less ideologically oriented since their main goals is to serve the public interest. Consequently, one important element of the incrementalist theory is that the bureaucracy is relatively autonomous within the political system and immune to pressure coming from interest groups and stakeholders.

Therefore, incremental politics offers to democratic societies the best way to introduce the changes requested by citizens. The model proposed by Lindblom and others suggests that governmental budgets and the changes observed (reductions, increases) are the result of incrementalism. For stakeholders, when the decisions made are only incrementally, it is not only easy for them to anticipate the policy direction, but they can also develop their own strategy accordingly. In the case of complex social problems, when opposite values are at stake, decisions makers and bureaucrats will focus mainly on the feasible changes in the short run. A strategic policy approach will imply the development of the best possible alternatives to respond to the stakeholders' expectations through a mutual adjustment process. It then can be argued that incrementalism is an outgrowth of pluralism.

As some critics have mentioned, the incremental approach does not describe the policy evaluation process by which public policies or programs are modified and implemented. Several authors have also argued that one difficulty with incrementalism is that it detaches administrative concepts from the context of constitutional and political theory. With regard to budget appropriations, it is clear that over the years this function has become much more specialized, and in many countries, the budgetary process has become more isolated within governments and in some way removed from political and judicial controls. Policy evaluation becomes a complex enterprise in light of the different programs and activities developed within each governmental entity. It was also noted that national priorities have often been determined, based on evaluations, analyses, and reports, by bureaucrats, who are isolated from the political sphere. This has raised several important questions about good governance and the accountability of governments.

Performance Measurement

The issue of how to measure the effect of a policy, a program, or a social intervention has been a recurrent methodological question in policy evaluation. In 1963, Chester Harris published a seminal work titled *Problems in Measuring Change*, where contributors propose several approaches on how to study change. By definition, the study of change involves two or more measurements of the same variable over time to provide the basis for inferring whether change has or has not taken place. The general principle is to predict status in the absence of policy intervention and to calculate the added value of such action. In practice, the idea of policy modeling is to offer policy-making elements for judging the nature and expected impact of policy intervention. This also raises the question about the linear, curvilinear, or exponential nature of the expected impact. Fundamentally, any decision should be based on real observations and data.

One of the first problems indentified was related to the lack of valid and reliable sources of data. If measurement is defined as the "process of linking abstract concepts to empirical indicators," the first task of policy evaluators is to provide policymakers accurate representation of the concepts used. If the goals of programs are to reduce poverty and inequalities, increase productivity, improve students' performance, improve quality of life, and so on, then all these abstract notions should be translated into questions that reflect a domain of content. Over time, several critics have asserted that theoretical concepts in policy analysis have not been described with the required exactness. This issue, which has been termed *construct validity*, refers to the efforts by evaluators to use impact indicators that can provide an accurate measure of the effect of a policy. The measure of the true social attitude or policy impact can also be affected by the social or political desirability of an intervention. Therefore, the choice of the right criteria for determining the success or failure of a policy intervention is also at the heart of policy evaluation.

In the field of policy performance measurement, which is the regular measurement of performance indicators, many issues/problems have been identified that might lead to faulty conclusions in policy evaluation (Carolyn Heinrich, 2007). The inadequate definition of a concept, the sensitivity of measures, and the use of a single measure (monooperationalization) or a single line of evidence (monomethod bias) are all threats to conclusion validity. In recent years, governments have made efforts to put in place some results-based measurement frameworks by asking departments to develop their own indicators of performance and to establish what they judge to be a successful intervention. In other words, research protocol should be sufficiently precise and powerful to be able to detect the effects of policies, programs, and/or projects. To put it simply, policy evaluation can be a risky business, especially if evaluators conclude that a program has some tangible effect when in fact it does not (Type I error) or conclude that a program effect does not exist when it does (Type II error). The reliability of performance indicators is also crucial. Do the research design and the methods used yield the same results on repeated interventions? Is it possible that the measurement instruments (indicators, scales) used have some systematic biases, underestimating or overestimating the net impact of a policy? To assess the reliability of the observed results, evaluators should compare evaluation results with the results of similar studies. Measurement is a key element in policy evaluation, and systematic effort to define the concepts and develop the appropriate performance indicators remains at the heart of evaluation.

Since the early works on measuring changes, the field of policy evaluation has seen an increase in the number of books and articles on methods and approaches. In general, three methods have been suggested. The first approach is to randomize participants between experimental and control groups in order to be able to differentiate the expected normal growth patterns from the net impact of a policy/program. Second, some baseline measurements can be taken prior to a policy/program intervention to evaluate if there are, for example, age or income variations and to be able to determine the value added of an intervention over specific groups. A third approach is to use reference standards such as health statistics. For example, it is known that growth patterns differ for boys and girls. If a child has a growth deficiency, doctors are able to compare the individual situation with what is known as the "normal" growth pattern. The challenge for a policy evaluator is therefore to differentiate what is "normal" change over time and to see if a governmental intervention can accelerate or decelerate the patterns of change.

Finally, many social and environmental phenomena do not occur in a linear way. In general, people expect change to occur in a linear fashion. A well-known example of this point was the study of governmental expenditures. Contrary to expectations, especially in the postwar period, the growth of governmental expenditure follows a nonlinear pattern. Data should be properly analyzed, otherwise there may be a systematic bias that policy evaluators' statistical methods will not be able to capture. In recent years, this became even more evident in the case of environmental policy because many patterns of growth are exponential. It is essential to know the exact pattern of change before conducting an evaluation.

Measuring the Impact of Government Policies

Policy Evaluation Design and Research Strategy

The purpose of policy/program evaluation is to develop research tools to be able to measure the relationships between the objectives of a program, its activities, and its impact. Of the issues related to the development of systematic approaches or analytical procedures, the evolution of program evaluation as a scientific activity has been critical. For an evaluator, it is essential to distinguish between the condition that led to the implementation of a program, the type of activities proposed to achieve the program goals, and the particular factors or threats that might limit the evaluator's capacity to get an unbiased estimate of the "real" versus the "observed" impact of a program (Richard Hurteau, Vincent Lachapelle, & Guillame Houle, 2006).

The first step before conducting any policy evaluation is to have a clear indication of the policy goals. Over the years, evaluators have complained about governmental officials and their inability to define precisely the goals and expected impact of their policies. Imprecise and diffuse goals—some of which may not even be stated—make evaluators' work extremely difficult. Governments might want to reduce the level of poverty or put in place a minimum-income policy without specific achievement goals to indicate whether the policy has attained its objectives. Before any evaluation is conducted, evaluators have to communicate with administrators to establish the expected effects of the policy/program.

The second step before deciding what type of research design should be used is to have a clear knowledge about the definition of a particular concept and the conceptual universe related to it (Richard Bingham & Claire Felbinger, 1989; John Owen & Patricia Rogers, 1999). If the goal of a program is to reduce inequalities, to measure policy innovation, or to improve participants' abilities, a clear and undisputed definition of the concepts as well as general acceptance of the idea (content and construct validity) are prerequisites for conducting any fieldwork. Issues such as measure sensitivity and the relationship between concepts and measurement lead to this fundamental question: Does the measurement tool measure what it was intended to measure? Extraneous sources of error might result in biased estimates.

The third step is to look at plausible rival hypotheses or explanations of the observed impacts of a program. This is never an easy task; it is quite often difficult to determine cause-and-effect relationships or how societal change has been caused by policy action. Several outside explanations—which evaluators have described as "validity threats"—should be studied to determine how they can affect or have affected the conduct of the evaluation. The evaluation design should minimize the impact of these threats to validity to be able to conclude that the statistical association observed between the program intervention and its measured impact can reasonably be considered a causal relationship. As Thomas Cook and Donald Campbell (1979) have emphasized, the evaluator has to systematically think through how each of the internal validity threats may have influenced the data and to test which threats can be ruled out. Threats such as history, maturation, and selection have been well documented as factors that might affect the outcome measurement. Sometimes, pre-evaluation or the pretest experience (the halo effect) of participants may produce attitudinal or behavioral changes that can be confounded with the policy/program impact.

Nevertheless, different strategies can be used in policy evaluation. This entry now describes the four main approaches or research strategies generally used in policy evaluation: (1) observational study, (2) strategic management and meta-analysis, (3) experimental and quasi-experimental studies, and (4) postevaluation and monitoring studies. Each of these four has some real advantages and also some potential costs that should be considered when choosing strategies for evaluation as well as for policy interventions.

Level 1 Evaluation: Observational Study

The goal of observational study is to evaluate the policy objectives and means among a small number of citizens, usually up to 30 participants. As Lawrence Mohr (1995) pointed out, observational study is defined as one in which "no central authority decides which subjects are to receive the treatment and which are not, or what intensity of treatment each is to receive" (p. 229). The goal of such Level 1 evaluation is to determine if the course of action is appropriate, that the policy/program does not harm participants in any way (socially, politically, morally, or physically), how they react with the policy tools used, and if the relative impact of a policy/program project can be estimated. At this stage, evaluators might want to measure the effects of different policy instruments (e.g., level of taxation, financial incentives, and training methods) on the policy goals or to look over the "best" case study. Methods such as benchmarking can be used to assess why some programs were successful while others were unable to reach their objectives.

The evaluator can observe and record the reaction of different cohorts or use case–control to study and determine the expected benefits for participants. At this point, evaluators are interested in observing the associations/correlations between the policy/program effects on participants and the outcome measures. Evaluators can then propose to relevant decision makers the appropriate course of action to be followed. In such a situation, there are two key questions: (1) Are there better ways to resolve and/or prevent a policy problem? (2) What approaches should be implemented?

Participatory evaluation can certainly be used as a means to gather information from the stakeholders—the key social and political actors who should be involved in a policy/program. For several authors, policy evaluation can be a means to improve the democratic debate about governmental decisions, with the goal of achieving social consensus and offering new perspectives and solutions.

Level 2 Evaluation: Strategic Management and Meta-Analysis

As soon as decision makers have chosen a strategy to follow and have determined the type of policy/program (treatments) that will be implemented, evaluators have the task of assessing its implementation. At this point, it is important to determine whether various types of policy interventions are working or not, and why. For this type of study, evaluators usually look for larger groups of respondents.

Probabilistic measures are often employed at this stage to measure the potential effects and consequences of programs. As such, feasibility studies seek to determine if a policy/program is capable of achieving its goals and which factors can impede the achievement of the goals. Once a tentative policy/program plan has been developed, decision makers will often invest in this type of evaluation to ensure that the assumptions underlying the program plan are correct and that there are no unforeseen issues that might affect the program outcomes. Economic feasibility studies can provide a clear assessment of the capacity of a program to achieve its desired outcomes given the resources available to the program. Is the allocated budget sufficient to allow the program to function as intended? For example, if governments want to launch a vaccination campaign to respond rapidly to the challenges of the H1N1 virus epidemic, this would mean ascertaining the cost and availability of the vaccine and the required medical equipment, the cost of hiring personnel (doctors and nurses), and any other costs. The public safety authorities may implement the vaccination program on a small scale to evaluate the most efficient strategy and to identify unexpected expenses. Another type of study is risk analysis, the identification and measurement of factors that could potentially prevent a program from achieving its goals. Risk involves the possibility of harm/loss and uncertainty. The conduct of risk analysis requires the prioritization of policy/program goals, identification of the potential risks of the adopted strategy, and measurement of such risk.

Finally, one useful research method for policy evaluation is a meta-evaluation or meta-analysis of all relevant randomized evaluation (John Chang et al., 2004). Evaluators might judge that a review of all the studies pertinent to a specific policy problem is necessary for a clear appreciation of the solutions to a social problem. One strategy is to look at all successful programs and measure the "effectiveness factor" of each strategy on specific groups or cohorts. This type of approach provides additional insight about the effect of a policy by applying a global multivariate model, allowing for assessment of the relative effectiveness of each intervention component while controlling for the effect of other components in multifactor interventions across all studies.

Level 3 Evaluation: Experimental and Quasi-Experimental Studies

The use of experimental protocol or randomized controlled trial remains the ideal in evaluation methodology. Participants are randomly assigned to an experimental group (those who participate in the program) or to a control group (those who do not participate in the program). To be able to assess the observed change due to the program (treatment), the two groups should be comparable throughout the evaluation experimentation. What have been described as validity threats are the plausible rival hypotheses or explanations of the observed impacts of a program that can explain the change observed between participants (experimental group) and nonparticipants (control group) in the program. For this type of study, evaluators usually perform multicenter analysis, comparing outcomes in different settings (e.g., schools, hospitals, and communities) on larger groups of respondents.

The purpose of an evaluation design is to minimize the threats to validity to be able to assess the real impact of the program. This type of design has an advantage in political terms: It is scientifically approved and therefore can be justified to the public. Research protocols or *terms of references* describe in general the objectives of the evaluation study, the research designs that will be employed—the use of multiple lines of evidence strategy—the methodology, and other organizational aspects concerning the timing of the policy/program evaluation. Several strategies can be employed in designing the evaluation protocol. Research design such as randomized controlled evaluation, double-blind study, or placebo-controlled evaluation can be used to measure the policy/program impact. The goal is to compare the recipients of a program (treatment group) with a comparable group (control group) to be able to measure the changes that occur due to the intervention.

In the case of quasi experimentation, policy/program evaluators want to approximate the experimental method by trying to identify the consequences of social changes, to provide controls for confounding variables, and then to probe for causal dependencies. There are several types of research designs that can be used to infer the impact of policy and programs on society. Among them are the nonequivalent control group design, the field experiment design, and the interrupted or multiple-time-series design. In these cases, policy researchers manipulate the independent variables to identify the main determinants and to look for patterns of causality. Policy research, however, always is conducted in a politicized environment, in which it is difficult to control many of the factors that threaten validity.

In addition to these results from evaluation studies, the evaluator has to consider the unintended consequences of policy interventions. Most evaluation research does not consider these unintended consequences, although they are certainly significant for the politics of policy. There are, however, relatively few effective means for combining the intended and unintended consequences of programs, except for economic instruments that combine costs and benefits. The political consequences of programs may be more significant than even the intended ones if they are more visible and more immediate, so the politics of evaluation requires careful consideration of the full range of outcomes.

Level 4 Evaluation: Postevaluation Study and the Implementation of a Policy/Program Monitoring System

At this level, evaluators can conduct a summative evaluation, which is a comprehensive assessment of the degree of success or failure achieved by policies–programs, to discuss the overall benefits of the program in light of its initial goals. At this point, evaluators should be more concerned about the impacts of a program on its stakeholders. The evaluators should also be able to conduct a formative evaluation assessing whether the program has been implemented and whether improvements, radical change, or termination is required (Peter DeLeon & Linda DeLeon, 2002). The focus of such comprehensive evaluation is on the four Es of any policy/program—efficiency, effectiveness, equity, and equality—in comparison with alternative strategies to those being implemented. Such an evaluation should also provide additional information and periodic and continuous feedback concerning the implementation of the program.

Program Monitoring: The Short- and Long-Term Impact of Policies–Programs

This analysis of evaluation also raises an important question about the short- versus long-term impact of a policy/program. Fundamentally, policymakers need to know how to answer the following question often asked by politicians, journalists, and the public: How long will it take to find out if a program has achieved its objectives? First of all, some policy initiatives have an immediate impact—for example, increases in consumer taxes and university tuition fees—while some policy initiatives may take several years before significant change is observed. The impact of free trade policies or environmental policies (e.g., the Kyoto Protocol) is difficult to measure in the short term because such policies imply a multi-action strategy over a longer period of time to achieve their goals. Some people may condemn such policies because they do not see their immediate effects or because the political benefits cannot be identified during an electoral mandate. Governments may choose to focus on policies that have rapid outcomes since they are seeking reelection in the short term. Nevertheless, the role of policy evaluators is not to predict but to offer an educated analysis of the short-, medium-, and long-term benefits of any policy intervention. Therefore, several governments have decided that all policies or interventions be revised at least once every 5 years. The external validity of the policy research refers to the idea that the strategy adopted to resolve a social problem can be used in different settings and is replicable and that observations can be generalized to other policies or programs.

Finally, at this level, it is essential for future evaluations to have some periodic collection of data about the policy/program's processes and outcomes. Program monitoring involves not only collecting data during and after the implementation of a program but also providing basic facts about the services provided and its participants (Huey-Tsyh Chen, 2005). The main objective of program monitoring is to determine whether the participants' well-being has improved, deteriorated, or remained the same after the implementation of the program. However, it can hardly explain why this happens or if the observed results should be essentially attributed to the policy/program's intervention. Monitoring also implies a more or less continuous collection of data about the programs in question so that feedback and adjustments can also be relatively rapid.

Two main methods are suggested to monitor government programs: (1) process monitoring and (2) outcome monitoring. *Process monitoring* involves the collection of data about the basic elements of the program's implementation, such as the participants' age and socioeconomic status, risk factors, and the services delivered. The objective for decision makers is to determine whether the program considers the targeted population, their needs, and their success rates in completing the expected tasks. Based on this information, decision makers can decide about the future of a policy/program. In the case of *outcome monitoring*, the goal is to assess the state of the participants before and after the program and if they are doing better, worse, or the same after receiving the services provided by a program.

These tasks, to regularly collect information about the processes and outcomes of programs, should normally be given to a monitoring board and be institutionalized within the evaluation branch of the government or department. The functions of such boards are first to see if within an organization the appropriate measures have been implemented, and in the case of an evaluation if all the fundamental research principles have been followed by the policy/program evaluators. Collecting input from participants, stakeholders, and decision makers may also be judged to be important for determining future policy action.

Conclusion

Evaluation is a difficult and demanding enterprise. It calls for substantial imagination, tenacity, a systematic research protocol, and the development of research skills and ability. Effective evaluation also involves a good deal of political skill because evaluation involves working within the political system to improve the programs. Even if different applied research strategies or frameworks can be employed for policy evaluation, the central function of evaluators is to keep citizens and governments informed about how well programs are working. They should also suggest ways of improving the existing programs. Policy evaluation has become a means and a tool for decision makers not only to respond to citizens' demands for greater accountability but also to support the action of those who are involved in their own social environment (Frank Fischer, 2003). Citizens want governments to offer better programs, to be more effective in their social interventions, and to not waste resources from the public purse. For all these reasons, policy evaluation is a tool for both policymakers and the public to understand what governments do.

POLICY FORMULATION

In plain language, a policy is a statement of intent or goal, or simply a decision to act. The crucial questions in public policy making are as follows: Who make(s) policy and how? Where does power lie in the policy process? What interests and demands are taken into account? Who ultimately benefits from policy decisions and outcomes?

Different policy models and theories capture the understanding and reality of policy formulation differently. Some doubt whether policy occurs entirely prior to action or, at times, is a post hoc rationalization of action already taken. Others question the scientific rationality of policy formulation. Aaron

Wildavsky considers policy analysis an art: While seeking to delineate a field of discipline for policy science, public policy needs to incorporate more awareness of the human aspect of policy making, emphasizing the political choices made in a competitive environment and the social relations that sustain them. In practice, policy formulation has to be both a science and an art. It has to pay attention to a genuine process of identifying problems and issues, looking for cost-effective solutions, and formulating deliverable implementation measures to get things done. At the same time, it needs to recognize the reality that public policy is an interactive process among political actors in the selection of goals and the means to achieve them within institutional, resource, and power constraints. Policy actors and institutions are both important and so are the agenda-setting processes of incorporating problems and ideas into policy formulation and the subsequent implementation of decisions by the bureaucracy.

Scope of Policy Process

The study of policy varies from the analysis *of* policy (to understand its nature and content, how it is made and implemented, and policy as a political process) to the analysis *for* policy (i.e., policy research, information and advice that can lead to a case for action to be taken). The identification and recognition of problems in the policy formulation process can be conceptualized as a predecision, as agenda setting serves to limit the number of subjects attracting attention and getting on the decision makers' agenda. Exclusion of a subject from the agenda is in itself a negative decision as far as the subject is concerned, since agenda setting is as important as, if not more important than, decision making itself.

Conceptually, policy formulation can be separated from policy execution or implementation, but there is a growing literature that sees the two as highly intermingled and being part of a policy continuum. The rationalist approach sees policy as an outcome of a rational—even scientific, technical, and nonproblematic—decision-making process within a relatively controlled environment based on an instrumental "means–ends" causality, leading problems to their solutions and decisions to their implementation. Implementation is similarly taken as nonproblematic, technical, and highly directed and controlled. In contrast, the realist or political approach sees policy as essentially an outcome of negotiation among political actors and institutions based on their competing values, interests, agendas, strategies, and power resources within an uncertain, conflictual, and, at times, turbulent environment. In the real world, the actual process of policy formulation is shaped and defined by the policy institutions and bound by the external policy-making environment and prevailing trends—local, national, regional, as well as global. Policy formulation is triggered by the need to either formulate new policy or change existing policy in order to deal with newly identified or redefined problems. Policy change thus captures a spectrum of types from policy innovation and succession to maintenance and termination. Sometimes policy learning, diffusion, and transformation also generate the need for policy formulation.

Policy analysts also study the policy capacity of any polity, government, and public institution, which refers to its ability or competence to bring together information and decision-making power to make intelligent choices and set strategic directions. Choices are related to values. In the formulation of public policy, apart from the necessity to find solutions to solve problems, it is often argued that it has to adhere to some core values that are relevant to *all* public policies, such as the five Es (economy, efficiency, effectiveness, efficacy, and equity); some would add a sixth E (electability) to indicate the need for any policy to respond to public demands and hence secure the support of the electorate. These values may conflict with one another; achieving the best balance tests the political skills as well as priorities of policymakers. Hence, policy formulation is not an exact science or purely a matter of economic rationality.

Policy Models

Broadly speaking, there are two diverse ways of interpreting decision making: (1) the rationalist versus (2) the realist understanding of policy making and implementation. The former sees policy as intention, while the latter considers policy more as outcome. The former sees policy formulation as a linear process, whereas the latter considers it as an interactive process. The former confines policy formulation to policy choice in response to a problem, but the latter also includes problem recognition and agenda setting, as well as policy implementation, which delivers the real impact of the policy decision made. Within this spectrum, four major approaches to policy formulation have been developed in the policy literature over the past several decades, namely, (1) the rational model, (2) the incrementalist model, (3) the garbage can model, and (4) the institutionalist model.

Rational Model

The purest form of rationalism is the rational comprehensive model, which assumes some "perfect" conditions for rational policy making to be scientific, somewhat akin to rational choice in economic theory. Such conditions are premised on a clearly instrumental logic and sequence of reasoning—namely, defining and ranking values, specifying objectives and subobjectives with regard to the problem, identifying alternative means or options for solving the problem, calculating all the consequences of adopting each option, ranking the various options according to set criteria consistent with specified values and objectives, and finally, choosing the most effective option that maximizes benefits and minimizes costs. The rational model possesses attractive theoretical clarity but lacks behavioral realism. Its comprehensive form suffers from cognitive limitations (lack of knowledge, imagination, and skills), psychological limitations (fear of uncertainty, selective perceptions), organizational limitations (limited goals and horizons due to fixed jurisdictions and standard operating procedures), and resource limitations (lack of resources and time).

Herbert Simon and others argue that these shortcomings could not be made up by more diligent and comprehensive analysis. Decision makers are limited in computational capacity and can only search very selectively through large volumes of possibilities to discover what alternatives of action are available and what the consequences of each of these alternatives are. The search is bound to be incomplete and inadequate, based on uncertain information and partial ignorance, and is usually terminated with the discovery of satisfactory, not optimal, courses of action. Hence, they should go for the bounded rationality of *homo pyschologicus* in place of the full rational choice of *homo economicus* and seek to "satisfice" rather than to "maximize."

Incrementalist Model

The opposite of the rationalist policy model is the incrementalist model, made famous by Charles Lindblom's science of muddling through. This model sees decision making as interaction among actors, hence it is a political rather than a rational process per se. It regards the future as a linear function of the past, somewhat similar to path dependence theory. According to Lindblom, goals and values are rarely clear or predetermined. They change according to available resources and as we learn about the problem through analysis. Hence, in practice, we do not review and analyze all possible options but make successive limited comparisons with current policy and situation. Lindblom's theory, sometimes known as disjointed incrementalism, seeks not only to describe the reality of policy making but also to prescribe incrementalism as a better science. Problem solving is seen as iterative (step by step). His pragmatic advice is to avoid being comprehensive and exhaustive but to look after your part of the problem and let others look after those parts that are assigned to them. Policymakers are urged to define and redefine values and objectives in light of experience and to deal only with solvable problems; they should look at solutions only marginally different from the status quo, apply "feasibility" as the key decision criterion, and adopt a remedial approach (to fix what is wrong with current policy).

Critics of incrementalism contend that it is inherently conservative and pro status quo, so it can cope only with stable, not changing, situations or crises and is ill equipped to help with new, unfamiliar problems or to define problems or solutions that are unconventional or that fall outside the circle of proximate policymakers. Some even accuse it of accurately *describing* the "worst practice" but not *prescribing* the "best practice" and being at best applicable to policy succession instead of policy innovation activities.

Between the utopian and realist poles, some have sought to find a middle ground to embrace both the innovative side of the rational model and the pragmatic side of incrementalism. For example, Amitai Etzioni argues for a third approach in the form of mixed scanning. Scanning refers to the search, collection, processing, and evaluation of information, as well as the drawing of conclusions. In mixed scanning, policy making takes place at two levels—a broad, high-level overview of problems and directions (the "fundamental" problems, which call for the rational approach) and a detailed examination of specific problem areas (the "incremental" problems, which call for the incrementalist approach). This approach has the benefit of both a comprehensive overview that requires full-range and in-depth analysis (back to first principles) and taking incremental steps, which requires incremental and low-level adaptations and "fixing up." It is less demanding than the full search for all possible options under rationalism but more strategic and innovative than incrementalism. While it seems to have an intuitive appeal, even Etzioni himself admits that the merit of mixed scanning remains to be empirically substantiated.

Garbage Can Model

The garbage can model—advanced by Michael Cohen, James March, and Johan Olsen (1972)—is sometimes known as the temporary sorting model. It is premised on certain assumptions about the ambiguity of goals and values, the uncertainty in knowledge and technology, and the political symbolism of policy making, such as political rules and procedures. It emphasizes organizational irrationality or what Cohen et al. call organized anarchies. According to them, an organization is a loose collection of ideas rather than a coherent structure. It discovers preferences through action more than it acts on the basis of preset preferences, as implied in linear rational planning. In the process, it is often choices looking for problems, issues and feelings looking for decision situations, and solutions looking for issues, rather than the other way around. In this model, four variables are presumed to be interacting in a rather complex or even random manner: (1) a stream of choices, (2) a stream of problems, (3) a rate flow of solutions, and (4) a stream of energy from participants. The garbage can process is one in which problems, solutions, and participants move from one choice opportunity or situation to another. Such conception of policy formulation may well score high on model realism and applicability; however, it is weak in terms of deductive power.

Institutionalist Model

Finally, the institutionalist model tries to steer a more independent role for political institutions in policy making without playing down the importance of both the social context of politics and the motives and active intervention of individual actors. It sees organizational change as a contested process involving accidental outcomes and random activity, suggesting that results cannot be predicted and change cannot be controlled by fiat, thus claiming institutional coherence and autonomy. Institutions matter not only because they dispose authority and power but also because they provide the physical, cognitive, and moral frames for joint action, as well as the capacity for intervention. At the same time, institutions also represent certain collective conceptions of interpretation, agenda, memory, rights and duties, and even values, symbolism, and justice. As such, there is a relevant degree of institutional consistency and continuity that affects the process and outcome of policy formulation.

Policy and Polity

Different theories of the state (or polity) provide different interpretations of the power dimension of the policy process. The pluralist theory sees society as made up of diverse individual and group interests, some organized and others more diffused. Government decisions are an outcome of competition and bargained compromise or consensus among competing demands and interests operating within a liberal democratic system. Policy making is thus incremental and a process of mutual accommodation of interests. Most would agree that the political real world is more elitist and less inclusive than is implied or advocated by the pluralist doctrine. The elitist theory sees modern industrial society as built around large, hierarchical, and usually corporate interests. Politics operate in the form of an oligarchy; political or policy elites exist who engage in the actual bargaining and policy making.

As a particular form of elitist theory popular in the 1980s, the corporatist theory sees the state as part of a structure of interest group representation, where it accords exclusive corporate groups (usually peak employers and employee associations) a monopoly over representing dominant social interests (viz., capital and labor, and sometimes also agriculture), resulting in a de facto arrangement existing alongside a constitutional system of representative government. Decision making and consent building take place through consultation, negotiation, and coordination among such peak bodies. Government boards and commissions, and "iron triangles" in the case of the United States (i.e., the nexus existing among congressional committees, government departments, and major interest bodies), would provide the formal channels for the processing and intermediation of corporate interests to reach a collective decision or a consensus. The success of corporatist policy making depends on voluntary cooperation between elites who are capable of withdrawing from any bargains struck. Norms and informal rules emerge from such voluntary bargaining that ought to be observed by the corporate interests concerned.

Opposed to the liberal democratic political tradition is the Marxist theory, which was popular in the 1960s and 1970s but has since waned. It is premised on class-based rationality and argues that the capitalist state exists to serve the interest of capital (though not necessarily the interests of individual capitalists) by creating the conditions for capital accumulation through support for markets and social control (the instrumentalist model). Neo-Marxists have added that the capitalist state also supplies goods and services for collective consumption so as to manufacture the "legitimation" of the capitalist order (the functionalist model). The state autonomy model, on the other hand, presumes a state-independent policy-making approach, where state officials act on their own preferences with regard to what is best for society, based on technocratic and bureaucratic rationality. This may depict a more authoritarian form of polity of either the extreme right (fascist, military dictatorship) or the extreme left (communist) of the ideological divide.

From Problems and Ideas to Policy

According to John Kingdon, problems, politics, and participants all contribute to agenda setting. Not all adverse conditions get recognized as problems that warrant something be done about them. Problem identification is about perception and interpretation. It entails political competition among various interests seeking their "preferred" condition to be recognized and defined as a problem. The act of translating a condition into a problem makes use of the changing values in society (the degree of mismatch between the observed conditions and one's conception of an ideal state), comparisons (the relative gap or disparity as compared with others, such as cross-national comparisons and international benchmarking, to give it a sense of legitimacy), and recategorization (so that the previously unrecognized condition can be reconstituted to structure people's perception of it). Problems may arise as a result of a focusing event (e.g., a major disaster or crisis), social indicators, change of government or leadership, or a combination of these factors. However, there is a limit to the span of attention of the public as well as policymakers, which is normally short-lived. Like fashion, problems come and go. If there is a failure to address the problem, the result may be frustration, and after a while, people would tend to shift their focus to other competing issues and problems.

Ideas are important in policy formulation because they provide new ways of looking at the existing situation (e.g., making some conditions previously considered acceptable as unacceptable according to the new standards) as well as innovative solutions to problems. A good example is the rise of privatization policies in the 1980s due to new economic rationalist ideas and the work of neoliberal think tanks that operated actively on governments and parties. The real world of politics abounds in policy entrepreneurs of all kinds—consultants, politicians, campaigners, policy advocates, and think tanks. These people engage in idea promotion and problem redefinition all the time through publicity, advocacy, persuasion, and bargaining. To the extent that a condition only gets recognized as a problem if a solution is available, policy entrepreneurs who come up with ready solutions help facilitate building the consensus needed for problem recognition. Policy advising is becoming a booming activity in modern-day policy making, but it is effective only if the policy climate is conducive and receptive policymakers are willing to take up external advice and prescriptions.

The Politics of Decision

The garbage can model suggests that policy formulation very often takes the form of solutions chasing the problems; unless solutions are readily available, policymakers would be reluctant to recognize conditions as problems. Kingdon, too, argues that policy making depends on the coupling of problems and policy solutions and of problems and politics.

Problems are recognized and defined according to the processes that are different from the ways policies are developed or political events unfold. Policy proposals emerge according to their own incentives and selection criteria, irrespective of whether they are solutions to problems or responsive to particular political consideration. On the other hand, political events move on their own schedule and according to their own rules and dynamics, with no necessary or even logical relationship to problems or proposals. The three streams (problem, policy, and politics) run parallel and independently of each other until a window of opportunity occurs in a situation where they are joined or coupled—a pressing problem demands attention and a policy proposal is somehow around that is coupled to the problem as a solution; or an event in the political stream (e.g., a change of government or a major focusing event in the form of a calamity) calls for different direction. At that point, proposals that fit with that political event come to be recognized and are coupled with the ripe political climate. Similarly, problems that fit available policies are acknowledged, while others remain to be neglected politically.

Given that policy formulation is an interactive process, the policy demanders (i.e., clients and the interest groups), policy entrepreneurs/advocates, and policy implementors (i.e., the bureaucracy) have a role to play in shaping the policy process and its outcome. Contemporary policy discourse recognizes the strong influence of pressure groups, policy communities, policy and issue networks, and what are known as iron triangles or subgovernments in the United States. A policy community can be either a formal structure or informal network characterized by restricted membership, stable relationships, vertical interdependence, and insulation from other networks and institutions. Policy and issue networks, on the other hand, comprise a larger number of participants with varying degrees of mutual commitment or dependence on others in their environment. Most policy issues and disputes are resolved in the relatively private and specialized worlds of the policy sectors through the relevant policy "professionals" from both government agencies and interest groups. In other words, there has been a bureaucratization or professionalization of policy formulation, whereby civil servants and interest group officials work together as policy elite to produce mutually satisfactory outcomes.

The notion of iron triangles and subgovernments presumes a stable and largely autonomous set of participants, coalesced to control fairly narrow policy programs and operating to further the direct economic interest of each party to the alliance of this small circle. A related model is the advocacy coalition framework, which recognizes two to four advocacy coalitions, typically active in a particular policy domain where groups coalesce around a shared set of values and interests. Policy brokers would mediate the competition among these coalitions within relatively stable systems and based on certain ground rules. Similar to corporatist policy making, decisions tend to be reached through a process of negotiation, by accommodating established interests and reaching a consensus, while maintaining existing forms of relations between interest groups and government agencies within the particular policy community. Hence, as A. Grant Jordan and Jeremy Richardson observe, changes in policy are always marginal, and decision making is essentially incremental.

State managers (whether general or professional bureaucracies) are a key party to such an alliance, because without their involvement, it would be difficult to secure any problem recognition in the agenda-setting process. They are also the ones who eventually implement policy decisions and are thus in a position to influence policy formulation in a backward-mapping manner. For these state actors, entering into formal or informal alliance/network with other stakeholders helps ensure that the policy process is managed and within control, giving them greater clout when advising their political masters. As well documented in the literature on bureaucracy, state managers are not just passive instruments of implementation. They seek to influence policy making through defining the problems and the range of policy options, determining what can be done and what cannot be implemented for various technical and administrative reasons, and in general tendering policy advice in anonymity.

Finally, the recent rise of civil society activists and new Internet platforms such as Facebook and Twitter has brought about large numbers of unconventional and unorganized participants, breaking down the existing rules and norms that govern policy communities and networks. This makes the policy scene more diverse and overcrowded and poses an unexpected challenge to the hitherto corporatist nature of policy making.

POLICY FRAMING

Policy framing is a concept used in public policy and social movement theory to explain the process by which actors seek to understand and act on complex situations. The policy framing process involves policy actors (a) confronting a situation where the understanding is problematic and uncertain, (b) creating an understanding or story that helps analyze and make sense of the situation, and (c) then acting (and persuading others to act) on it. Its basic premise refutes the notion that different individuals can observe the same social and natural phenomena and *necessarily* arrive at the same conclusions. Because the framing of the situation requires the assessment of the potential roles of other policy actors, framing will define the degree to which other potential actors are included and benefit from the policy process and policy decisions. Marginalized groups are more likely to contest a particular frame and promote a counterframe.

Policy framing is a midrange ideational concept that focuses on how humans conceptualize the world and how the elements of the world engage with each other and the policy actors themselves. It captures a notion of ideas that is more focused on the intersubjective understanding by a group of policy actors as compared with ideas, observations, and arguments held and posed by individuals. It is also focused on particular policy problems and situations when compared with the more encompassing focus on wider ideologies and philosophies.

Policy framing is a concept that places an emphasis on the dynamics of change and the constantly changing and contested notion of policy reality. In this, it contrasts strongly with policy concepts such as institutions, which tend to emphasize rules and norms that are slow to change over time. Conflicting policy frames mobilize policy actors to contest the status quo. Policy frame analysis also has a fundamentally different set of assumptions from the rational choice perspectives that tend to assume that while circumstances may change, how actors calculate their interest will not. The framing approach would not dismiss the importance of interest calculation, as will be explained below, but it would emphasize how actors may "key" on different core elements at different times.

Framing has been used in a wide range of disciplines, including psychiatry and psychology. The concept of framing has attracted considerable interest in public policy analysis as well as social movement studies in sociology and politics because it incorporates constructivist understandings of how actors shape the meanings of their experiences. At the same time, it operates on a level that is not much distant from more positivist methodologies and approaches to political and social action. Thus, some scholars have used the frame approach in combination with other, more constructivist or positivist approaches, such as institutionalism and advocacy coalitions, as well as positivist methodologies. For example, there is a tradition in the study of political behavior of examining framing, focusing on topics such as quantitative studies of how the media shape public opinion.

In the public policy field, scholars have used the framing concept to study efforts by decision makers to shape understanding and courses of action in areas where knowledge is uncertain and/or where there are substantial differences and conflicts over interpretation and action. Thus, policy framing has featured significantly in studies of environmental policy, contested social policies such as refugee and women's rights, economic policy, knowledge-intensive areas, media and public opinion, health policy, racial policy, foreign policy, agricultural policy, poverty and education, and so forth.

This entry examines the two key strands of the framing approach (the public policy and social movement conceptualization of framing), focusing on the key intellectual propositions and methodologies. While not strictly devoted to policy analysis, the social movement research provides a number of insights on how politics and policy are shaped by groups in contestation. Because of the focus on essentially the same concept, these two literatures provide insights for each other. At the same time, scholars from both communities sometimes can speak past each other because their main reference points are in their own groups, so it is helpful to understand the development and arguments of both approaches.

The Evolution of the Framing Concept

John Noakes and Hank Johnston give credit to Gregory Bateson for first using the term in a discussion of epistemology and animal behavior. Erving Goffman's 1974 monograph first brought the concept of framing onto the social science agenda. For Goffman, frames were cognitive structures that humans generated to explain events and their involvement in them. Frame approaches have evolved in analytical depth and focus since Goffman's original statement of the concept. This formulation assumed that humans were for the most part unconscious of the framing process, which was constituted by rituals of everyday life that defined individuals and their relations to others. Much analysis focuses on how individuals key on specific elements of an event to understand what is going on and how they should behave; it nevertheless also emphasizes that humans have the ability to transform their realities.

Both in sociology and political science, the emphasis has moved toward understanding how actors actively and consciously seek to build and defend frames and how they project their frames onto others. This enables the policy frame analysis to be used as a critical theory, highlighting actors' efforts to refute a particular representation of social reality.

Social Movement Framing

Arguably, the academics using this sociological approach, when compared with public policy scholars, have made earlier advances in developing a more systematic elaboration of the concepts of framing. Social movement theorists use the frame concept to explain how actors in a movement define what is happening in a situation to mobilize collective action by the movement. This approach supplanted much of the rationalist and organizational approaches in the 1980s and became one of the core approaches to social movements in the

1990s. Noakes and Johnston credit William Gamson, David Snow, Robert Benford and their various collaborators who have sought to systematize this process.

In their 1988 statement on framing, Snow and Benford provided the most prevalent typology of frames. To mobilize individuals to act in a social movement, the framing process involves three framing activities. First, there must be a diagnostic framing of current events that seeks to discredit the prevailing framing and offer a new interpretation. Second, prognostic framing involves the creation of a solution to the problem/situation that the movement can take forward. Finally, motivational framing focuses on the conceptualization that actually triggers people to join the social movement, making the assumption that such communication and persuasion are necessary beyond the first two framing actions.

Using such conceptual tools, social movement scholars expect entrepreneurial leaders to take on such framing roles to arouse the wider public. In doing so, these leaders will seek to link particular actions and events as evidence of injustice or some other unsatisfactory reality and to frame an appropriate response. The leadership will also endeavor to highlight particular aspects of the frames to make them resonate more with the potential followers of the movement. This notion of social movement framing resonating with the followers depends on a number of different elements, including, for example, how credible the arguments and linkage seem to the potential membership and how closely this social movement frame chimes with the belief systems of the targeted audience.

Various kinds of research have been undertaken to study the framing processes at work. The work has tended to take the form of case studies of particular social movements at particular junctures. The overall tendency reflects the epistemological assumptions of much of this field, with its attempt to understand collective beliefs about reality, as well as the ambiguity inherent in such assumptions.

Accordingly, there has been a general concern to push for a more systematic examination of processes while acknowledging the tendency toward proliferation of concepts, often used in a largely descriptive fashion. Nevertheless, in the early 21st century, a significant body of literature on political behavior sought to empirically isolate these frames and processes and determine their impact through quantitative analysis of data from surveys or experiments.

Policy Framing

Concepts

In the 1980s and early 1990s, Martin Rein and Donald Schön provided many of the key statements that triggered the interest in policy analysis for framing. The context of their effort was a belief that the more rationalist orientation of policy studies was unable to get at core aspects of policy decision making. A core puzzle for them was the intractable policy controversy that no presentation of facts and evidence could reconcile.

Rein and Schön attribute this inability to reconcile such policy positions to the existence of conflicting policy frames. These frames involve stories or structures of understanding defined by human belief and perception. Faced with a contested or uncertain policy problem, different actors will seize on different elements and linkages between these elements to construct very different views of reality. Part of the difficulty in inducing a reconciliation of such frames is their tacit nature, which prevents them from being actively scrutinized and assessed by both their proponents and opponents. Furthermore, because the frames will view different events and observations as central, there appears to be no objective reality and, therefore, no potential for falsifying a particular frame in favor of another. This reality gives one insight into the difficulty that climate change policy activists face in persuading climate change “deniers” to accept the evidence of the anthropogenic changes to Earth’s atmosphere and the difficulty the deniers face in winning over the activists. Actors tend to take such frames for granted and are unaware of how they define the policy position they adopt.

Of course this notion of contesting realities existed long before in policy analysis under a different terminology. Since the 1970s, researchers on agenda setting, such as Robert Cobb and Charles Elder, have emphasized the importance of understanding how the definition of a problem shapes the subsequent policy outcome. In the 1990s, a number of scholars found a window of opportunity for the policy frame concept as a way to bridge the constructivist and positivist divide, an approach that was furthered by Rein and Schön's incorporation of notions of discourse.

Delving into Rein and Schön's 1994 conceptualization more deeply, the authors accept that there is an important role for actor interests and how they relate to actor frames; this inherent ambiguity, the relationship between interests and ideas, is an enduring question for all policy analysis. Rein and Schön do not assume that these concepts are identical, but they accept that frames may help define interests and that frames may be undertaken to benefit particular interests. Nevertheless, the core reality is that the frames will be instrumental to defining what is in the interest of the actors. Institutions and other organizations push a particular frame or set of frames because individual members sponsor those frames.

Policy discourse is the mechanism by which frames contest the understanding of a policy problem within any policy forum. Rein and Schön define this as essentially the dialogue that exists between different parties over a particular issue. They differentiate two forms of policy discourse and two associated frames. The first discourse involves the policy debate in which the different policy contestants seek to prevail with their policy stories and frames through various rhetorical efforts involving persuasion, evidence, and symbols. Rhetorical frames will underpin the arguments in the policy debate. The second discourse involves the debate over policy practice in which the actors argue and develop policy stories that influence the creation of procedures, particular policy instruments, and so forth to deliver the policy. Action frames inform this discourse.

Within action frames, Rein and Schön differentiate three types: (1) policy frames, (2) institutional action frames, and (3) metacultural frames. Policy frames are those created by institutional actors to define the problem in a particular policy situation. Institutional action frames represent the more general action frame used by institutional actors to structure a wide range of policy situations—this institutional action frame concept bears some resemblance to policy styles and even standard operating procedures. The institution has characteristic ways of addressing policy problems that the public can anticipate. A metacultural frame, the broadest concept, is essentially the worldview adopted by a particular culture or community. These metacultural frames shape the policy stories that inform both the rhetorical and the action frames.

Rein and Schön view the key policy act as individuals becoming aware of their rhetorical and action frames, a process they defined in 1994 as the "construction" of the frame. They urge policy actors to develop a higher degree of reflection, seeking to learn more about their actions during the process of making decisions. This should lead actors to a process of reframing in which they use reflection and discourse in a manner that leads to a resolution of policy controversies and conflict. When actors engage with their situation and with each other through discourse, they may recognize incongruities, creating a situation that forces people to reflect on their beliefs and frames.

As Falk Daviter has noted, this emphasis on the potential for rational consensus building contrasts with policy approaches that focus on the policy outcomes occurring through conflict and competition. Rein and Schön do not take this rational process of frame reflection for granted. They expect it to be extremely difficult and recognize that frame reflection may not lead to reframing, nor will reframing necessarily require it. The authors formulate the possibility that academics can aid practitioners in developing reciprocal frame reflective processes as well as the mutual trust required for practitioners to expose themselves to such processes.

Methods

The core of understanding in any given frame involves deconstructing key elements from the policy rhetoric and actual policy documents and instruments as well as accounts of individual players (and also the characteristics and interests of these players). In these sources, students can discern the policy stories that the various actors use to analyze particular policy situations and isolate the frames accordingly. Because any given policy frame and policy situation (particularly conflictual ones) are too complex to be understood by one individual and are subject to multiple interpretations, researchers must develop an account of the policy situation from a number of perspectives. As one would expect, the inherent difficulty of isolating intersubjective constructions of reality by its very nature poses enormous practical problems for the researcher. How does one, for instance, differentiate a dissembling rhetorical frame from the core action frame when the actors themselves may come to believe their own rhetorical devices? What happens when frames are translated and reshaped at various different levels of a policy system—or when there are conflicts between those who operate within a particular frame? An overarching frame does not have to be uniform and indeed is unlikely to be so. Perhaps equally significant, the researchers themselves necessarily bring their own frames, which shape how they perceive and analyze these phenomena, into such a research endeavor.

The basic policy approach that scholars have taken involves isolating both the policy rhetoric and policy actions over time and across all the relevant levels of governance. These demands for policy detail and nuance have led to the bulk of the policy research using the qualitative method of a detailed case study. Given the effort involved in studying such processes over time and multiple levels, the research in this area has generally taken the form of a very limited number of case studies, which are also in evidence in the social movement research. Much of this research is clear in its view that framing indeed matters and drives policy.

However, as also witnessed in the social movement research, a substantial body of literature tends to use the framing terminology to express a basic metaphor, much in the same way that some scholars use the concept of networks as descriptive shorthand to refer to people who interact over time in a particular political setting. As noted earlier, numerous scholars tend to use framing as part of a larger analytical construct, such as institutional analysis, advocacy coalitions, garbage can models, and so forth. This entry emphatically does not dismiss such efforts as, for instance, framing and reframing seem to require more theorizing about intersubjective activity between like-minded parties and more conflicting actors. How are frames inserted into institutional processes by various actors and groups of actors? Whether this takes the form of discourse coalitions, epistemic communities, advocacy coalitions, or some other concept, some form of networking processes is required.

While the descriptive and the multiconceptual approaches can enhance our insights about particular policy problems, there is a danger that the elaboration and evaluation of the concept will remain largely at a general conceptual stage. Systematic studies of multiple cases seem to be the next step to isolate key elements of the framing process and determine how particular conditions shape their evolution.

POLICY INSTRUMENTS

The study of policy instruments dates from the early 1970s, though much had been written previously, especially in economics, about government intervention in relation to market imperfections. A policy instrument refers to the means of government intervention in markets or, from a broader perspective, society to accomplish goals or to solve problems. The behavioral assumption underlying a policy instrument is that it attempts to get people do things that they might not otherwise have done. Since the 1960s, there has been a transformation not only in the scope and scale of the role of the government but also in the proliferation of tools that it has at its disposal for public action. In retrospect, a distinction can be made between three partly overlapping arenas in the study of policy instruments.

This entry starts with a discussion of several approaches to defining what policy instruments are. Policy instruments are not isolated but exist in relationship to objectives as well as resources; taking this into account, the next section of the entry considers theories about how a policy instrument should be chosen. A classification of policy instruments is presented, differentiating between three families of policy instruments. Next, the entry examines the choice of policy tools (policy design), the application of policy tools (policy implementation), and the second generation of less coercive and more indirect policy instruments inspired by the limited impact of earlier policy tools. The assessment of the impact of policy instruments (policy evaluation) is complicated by the fact that they often come as part of a policy mix; the entry describes policy evaluation, noting that effectiveness is just one of the many criteria by which to measure performance. The entry concludes with a look at the way ahead.

Approaches to Policy Instruments

The *classical* approach to defining policy instruments (1970–1985), rooted in the instrumentalist school of thought, has been largely supplanted because of its top-down and mechanical view of the world. It put quite some effort into a rather semantic discussion about the definition of a policy instrument, the risk of metaphors and reification, and the classification of policy instruments on the basis of their intrinsic characteristics. It claimed that the selection and consequently the application of instruments are made mainly on the basis of the characteristics of a specific instrument and its effects in terms of goal attainment. Soon it became clear that goal attainment cannot be attributed solely to the characteristics of instruments but that the characteristics of the context should also be taken into account.

The *instrument–context* approach (1985–1995) focused on the development of a theory of policy instruments that would enable policymakers to select the appropriate policy instrument for the problem at hand. The basis for selection of a policy instrument is not only the "logic of consequence" but also the "logic of appropriateness," which includes "goodness of fit." The attention for the context has led to what may be labeled "refined instrumentalism."

Finally, instruments are considered one of the many variables in the *contextual* approach (1995–present) that takes policy implementation as a point of departure. The study of policy instruments merges with the study of implementation. The study of policy instruments has been affected as such by the developments in the field of implementation, notably the shift from implementation to governance.

Policy Theory

A policy instrument comes not in isolation but as part of intervention theory. It can be further specified by identifying the form of the intervention, that is, a policy, a program, or a reform. In this context, attention is paid to a policy theory, that is, the set of assumptions underlying a policy instrument. A policy theory, following Andries Hoogerwerf, consists of assumptions about three kinds of relations:

1. normative relations between what "is" and what "ought to be,"
2. relations between the objectives and means to accomplish these objectives, and
3. more in-depth relations between causes and effects.

The study of policy considers the causal relationship between a policy instrument and the purpose for which it is used. To put it differently, goal attainment is considered to be the dependent variable while instruments are seen as one of the independent variables. It should be underscored, though, that a policy theory does not reflect a scientific theory in the traditional sense of a universal law that has been empirically tested. The external validity of the findings of a policy theory is fairly low. A policy theory provides guidelines for action and is, as such, ideographic rather than nomologic in nature. As they are often in conflict, a policy theory is often the outcome of a trade-off and consequently suboptimal in nature. The quality of a policy theory—coherence, reliability, validity—is an important source of a policy fiasco.

Shapes and Sizes

The means of tackling policy problems are often called *policy instruments* or *policy solutions*. The labels are not without risks. A comparison of a policy instrument with a hammer, a pair of pincers, or a screwdriver may be misleading because it attributes qualities to means that they do not have in reality. Consequently, it may lead to unintended and unforeseen problems that may even overshadow the original problems. The same applies for the term *policy solutions* as it gives the wrong impression that problems may be solved once and for all. In reality, problems are solved at best partly and temporarily. Moreover, the solution of one problem may create another problem, as Aaron Wildavsky has argued: Policies deal less with events in society than with the consequences of policies from the past. Instead of permanent solutions, one should think of permanent problems in the sense that one problem always succeeds and replaces another. A policy is, according to Deborah Stone, more like an endless game of Monopoly than a bicycle repair.

Three Families of Instruments

The study of policy instruments has been long dominated by efforts to put together a classification of policy instruments on the basis of their characteristics. One of the first is a typology by Christopher Hood that makes a distinction between instruments for the collection of information (detectors) and instruments directed to influence development in society (effectors). A quick scan of the literature reveals that the study of policy instruments is almost exclusively focused on the latter. A survey provided by Frans van der Doelen identifies three *families* of policy instruments, also referred to as "sticks, carrots and sermons." The first family consists of *regulatory instruments*, such as orders and prohibitions (licenses, permits, and regulations). Rules may also establish rights. Rights must rest on authoritative rules from the state, but they are distinctive in their reliance on citizens for enforcement. The second family embraces *financial means*, providing incentives. They may be positive (grants, subsidies) as well as negative (taxes, user charges) from a consumer's perspective. The third family includes *communicative tools*, the development of which has received a boost with the advance of the digital age. Such tools may be directed at increasing as well as decreasing the amount of information on the other party.

In addition, a fourth family, *organizations*, can be distinguished, referring to direct government, that is, the provision of goods and services including treatment. The classification of policy instruments is further elaborated by Michael Howlett in a spectrum of "substantive" policy instruments on the basis of the level of state provision, with direct provision of goods and services by the state at one end of the continuum and provision of goods and services by the family and community with no state involvement at the other. In addition, "procedural" instruments can be distinguished that are primarily intended to alter the policy process

Table 1 Three Families of Policy Instruments

Policy Instrument	*Positive*	*Negative*
Regulatory	Prescriptions	Prohibitions
Economic	Grants, subsidies	Taxes, user charges
Communicative	Information	Propaganda

rather than the mix of goods and services provided to society.

The typology of policy instruments is not without controversy; for instance, the use of symbols as policy instruments—“words that succeed and policies that fail” to quote the subtitle of Murray Edelman’s book *Political Language*—does not fit into the typology. In most cases, hardly any attention is paid to the internal instruments used to influence administrative processes, even though they might be preferable from a control or management perspective. The focus is almost exclusively on external instruments geared to a change of the environment of the government—that is, the developments in society. Besides, there is no place for informal instruments to shape a policy according to a government’s preferences for changes in the membership or size of the decision-making body, through bargaining and negotiation, and by mobilization of political support. In response to these and other drawbacks, several other typologies have been offered in the literature, for instance, on the basis of the degree of the following:

- *Coercion:* The extent to which a policy tool restricts behavior as opposed to being merely encouraging or discouraging
- *Directness:* The extent to which a public agency is involved in all stages of the policy process
- *Automaticity:* The extent to which a policy tool uses the existing administrative structure
- *Visibility:* The extent to which the resources attributed to a policy tool show up in the budget-end program review

The degree of coercion is considered to be the main criterion; according to Lester Salamon, a variety of factors have put a premium on tools that are automatic but indirect and invisible. Unfortunately, no criterion is completely exhaustive or mutually exclusive.

Last but not least, policy instruments rarely appear in a pure form. They come bundled in programs combining various tools, each being a package containing a type of good or activity, a vehicle for the delivery of this good or activity, and a delivery system. A prohibition, for instance, may be delivered by a public agency in the form of a rule.

The diversity of policy instruments should be considered as a benefit rather than a drawback, according to Ross Ashby’s law of requisite variety—the greater the variety within a system, the greater is its ability to absorb differences without system failure; in this case, variety in policy instruments increases the effectiveness of government intervention by enabling it to address a greater variety of environmental situations.

Policy Design: The Selection

The selection of policy instruments is often associated with a tool kit from which the government is free to choose a policy instrument. In practice, there is no such tool kit, and at the same time, the government is not always free to choose. On the contrary, a subsidy is not simply a “bag of money” but represents an organizational unit, too. A third party may have preferences of its own. A specific policy instrument, for instance, may provide discretionary power and, therefore, room to maneuver. The same applies for the target group, because interest groups that oppose the implementation of a policy have tools at their disposal that may frustrate a potentially effective policy instrument.

The choice of policy tools, according to B. Guy Peters, is driven by what he calls the Five I’s, which combine together to constitute a checklist of factors that should be taken into consideration:

1. ideas and ideologies that may shape the selection of policy instruments, giving preference to a specific tool above other tools;
2. interests that refer to the assumption that individuals try to maximize their personal utilities;
3. institutions that may have preferences for instruments over which they have control and with which they are familiar;
4. individuals pointing at the role of political entrepreneurs to win support for a new policy; and
5. international environment as shown by the consequences of the process of globalization.

In reality, policy instruments are often chosen for all but rational arguments, that is, the assessment of their positive and negative effects (impact assessment). A policy instrument is often chosen because of extrarational arguments. The following are two such arguments:

> *The normative or political dimension of a policy instrument:* A policy instrument is not just a tool. Contrary to the well-known statement by Niccolò Machiavelli, the ends do not justify the means, as Arthur Ringeling has argued correctly. The choice of a policy instrument is not value free as it may reflect an ideological stance. Besides, a policy instrument may strengthen or weaken the position of an actor.
>
> *Path dependency:* The institutionalization of policy instruments as the selection of a policy instrument may be subject to path dependency. A policy instrument that works is also adopted in other fields. The bias a policymaker has toward a specific policy instrument may even go so far that the problem at hand is shaped in such a way that it can be solved, at least potentially, by the policy instruments of his or her choice.

Last but not least, a policy instrument may be chosen because it is in vogue, as illustrated by the deregulation movement of the 1980s, which seems to have been more an expression of a prejudice against the government or a preference for the market than the outcome of a careful scrutiny of the pros and cons of regulation. Rules and standards have been abolished in favor of financial incentives. Only recently has there been a movement backward in favor of re-regulation.

Policy Implementation: The Application

The application of instruments, often referred to as policy implementation, has been long directed by what Herman van Gunsteren calls the rational central-rule approach, based on the superior analytical insights of an elite and on centrally controlled implementation. It assumes that actors who are involved in the enforcement of a rule are puppets on strings. In reality, they are neither will-less nor powerless, as illustrated by the famous study by Jeffrey Pressmann and Aaron Wildavsky on the implementation of a program to hire the hardcore unemployed minorities of Oakland, titled "Implementation: How Great Expectations in Washington Are Dashed in Oakland; or Why It's Amazing That Federal Programs Work at All, This Being a Saga of the Economic Development Administration as Told by Two Sympathetic Observers Who Seek to Build Morals on a Foundation of Ruined Hopes."

The study of policy instruments has been affected by developments in the field of policy implementation. The confrontation between the top-down and the bottom-up approach has induced a more horizontal mode of policy implementation often referred to as governance. The shift from hierarchy to markets and networks has substantially changed the role of the government. The government is just one of the actors, though a prominent one—the government has a monopoly on the utilization of power and more resources at its disposal and often serves as network manager—each pursuing its own interests and strategy. Being dependent on each other for the accomplishment of their objectives, actors are involved in a multi-actor game of wheeling and dealing. A policy is, as such, a compromise, the outcome of the interaction between these actors or, to put it differently, the result of the coproduction of various actors rather than something imposed by one single actor—that is, the government.

The Second Generation of Policy Instruments

The shift in governance from hierarchy to markets and networks gave birth to what De Bruijn and Ten Heuvelhof have called the second generation of policy instruments. A multi-actor game requires other features beyond the conventional tools, notably multilateral instruments such as covenants, public–private partnerships, and voluntary agreements. Contrary to the first generation of policy instruments, the second generation of policy instruments anticipates the potential resistance of the stakeholders by taking into account the characteristics of a network, notably the autonomy or isolation of the target group and the interdependency of the actors, as well as the pluriformity of society.

With the second generation of policy instruments, the government takes a more remote stance. Instead of directing, the government facilitates development in society (steering from a distance). The new tools are highly indirect and rely heavily on a wide assortment of third parties for the implementation of a policy. In addition, they are characterized by a high degree of relativism and voluntarism. It is left to the target group to take action and to change its behavior.

The development of a second generation of policy instruments does not mean that the first generation of policy instruments suddenly becomes obsolete. To the contrary, second-generation instruments supplement rather than replace the first-generation ones. In many cases, vertical instruments are still appropriate, even in a network setting. The introduction of more horizontal instruments may be seen as fine-tuning for a new situation. In practice, the difference is not that great. The "new" policy instruments often go under the same label as the "old" ones, although the emphasis is more on the bilateral or even multilateral aspect than on the unilateral aspect of governance.

Policy Evaluation

The performance of the government is often measured in terms of goal attainment and effectiveness. The effectiveness of tools—the contribution of policy instrument to goal attainment—may be blurred by external or intervening variables, such as the financial crisis, that are beyond the control of the government. Consequently, an effective tool may not lead to goal attainment, whereas goal attainment may conceal an ineffective tool.

The review of policy instruments is further complicated by a number of circumstances that make it difficult to be conclusive:

1. Goals are not set once and for all but may be subject to goal displacement. The assessment of a policy instrument in terms of the original goals may be methodologically sound but not of much practical relevance.

2. It may be hard to measure the effect of a policy instrument as they often come and go as part of a policy mix. A subsidy, for instance, is often shaped as a regulation containing additional conditions. A regulation is usually backed up by sanctions, and inducements are predicated on rules for handing out rewards or punishments. The packaging could be threefold:

- *horizontal* packaging, which is used if two or more policy instruments are directed simultaneously at the same agent;
- *vertical* packaging, which refers to the application of a policy instrument to facilitate the implementation of another policy instrument; and
- *chronological* packaging, which implies a sequence in the selection or application of diverse policy tools.

The packaging of instruments makes it extremely difficult, if not impossible, to sort out the precise effects of an individual policy instrument and, therefore, its contribution to the accomplishment of objectives.

3. The effect of a policy instrument may be "hollowed-out," according to Roeland in 't Veld, by the law of diminishing effectiveness, which states that a policy instrument may become obsolete after some time because stakeholders learn how to cope with its negative or unwelcome effects.

4. Last but not least, it should be noted that the effectiveness of a policy instrument is just one of the many criteria that may be used to evaluate a policy. The call for improvement in the efficiency of the public sector in the past few years has been at the expense of equity in the distribution of goods and services. Lately, the accountability, legitimacy, and responsiveness of government have become issues.

The Way Ahead: Old Wine in New Bottles?

The reinvention of government not only has put the government back in the spotlight but also has induced other changes (steering, not rowing, is the device). Borrowing insight from the new public management movement, attention has shifted away from the primary toward the secondary process in public organizations. Public management has replaced public policy at the heart of public administration. It has induced a change in vocabulary. In today's jargon, instruments are referred to as outputs, underscoring that the provision of goods and services may also be considered a policy instrument. A lot of effort is now put into the development of indicators to measure performance. The purpose is twofold. On the one hand, allocation and efficiency may be fostered by linking inputs to outputs. On the other hand, effectiveness may be promoted by relating outputs and outcomes. It is still too early to judge the performance movement, but the focus on the development and utilization of indicators may cause a "performance paradox," that is, contrary or even perverse effects generated by, inter alia, focusing on what we can measure and leaving out what we cannot measure. The results, therefore, should be treated with care.

POLICY LEARNING

Learning is a process whereby cognitive frameworks or behavior changes occur as a result of new information, knowledge, and experiences. The various levels at which learning happens are individual, organizational, governmental, and even societal. Policy learning involves all these levels, but it is typically focused on governmental or societal learning about specific policy issues or broad conceptual frameworks that guide government action in different policy fields. There is a vast literature on the psychology of individual learning, as well as a management literature on the dynamics of organizational learning. The literature on policy learning started in the 1960s, with the growing realization that policy making was not simply about power but also about collective puzzling under conditions of uncertainty.

Learning in Public Policy

Learning is a preoccupation in the study of public policy for several reasons. First, there is a presumption that policy making is not entirely a matter of self-interested politics or power. Obviously, the policy process involves interest groups, political parties, social movements, classes, and other forces—and they battle for the supremacy of their agendas and their interests. But there is also the sense that policy making is about pursuing—in some large measure—the public interest. This means that policy is intended to contribute to the public good and that therefore it should be monitored (evaluated) regularly as conditions and information change, and improved if possible. This requires learning. Second, every model of the policy process assumes that policies (and their constituent programs) are intended to deal with public problems and therefore require a careful definition of exactly what the key features of the problem are, as well as its underlying causal factors. This requires reflection, research, and learning. Third, every model of the policy process also assumes a stage of evaluation, where policies are assessed for their effectiveness and efficiency and are modified and improved if possible. Evaluation is intrinsically a learning function.

The successful avoidance, or at least minimization, of mistakes is crucial for public policy and requires a capacity to learn. Part of the challenge of policy learning is that capacity is often blocked by a combination of factors. Uncertainty marks all policy fields, some more than others. Climate change science, for example, is enormously complicated and was being seriously debated even into the 1990s. When governments around the world began massive bailouts and spending programs in 2009 to deal with the global financial crisis, no one was entirely sure what the impacts would actually be. Sometimes the evidence to assess policy interventions takes years to appear (e.g., poverty reduction programs in developing countries). Other policy fields, such as abortion or same-sex marriage, are driven more by moral or ethical perspectives than by scientific research and data. For these and other reasons, policy actors have to rely on policy issue frames or belief systems that consist of a reasonably consistent mix of data, information, research, values, interests, and deeply held assumptions or beliefs. These can operate in various ways, as broadly consistent worldviews of competing players in the policy process (e.g., environmental vs. economic development groups), as paradigms that are broadly accepted by most stakeholders in a policy field, or even broadly at the societal level (e.g., the reality and danger of global warming). So policy learning is not simply a matter of processing clear information or unambiguous experiences. Belief systems and paradigms are often deeply embedded among social actors or institutions and are internally consistent enough that they can resist contradictory evidence.

Organizational Learning

This raises the question of whether organizations can actually learn, as distinct from the individuals that make them up. It is important not to anthropomorphize institutions—they do not exist as separate entities. However, enormous efforts take place in almost all institutions to provide both collective memory and learning. Policy manuals and standard operating procedures (SOPs) mark almost every organization. Organizations—from local day care centers to the military—have retreats and special meetings to breathe, get focused, and act as one. The larger the organization, the more challenging is the learning process. Can states—possibly the largest organizations we know—learn, and can they learn policy lessons? The current record is mixed. The financial crisis of 2008–2009 had the U.S. Federal Reserve and other national banks intervene to keep their economies afloat. Ben Bernanke, the Chairman of the Federal Reserve, who was a student of the Great Depression of the 1930s, learned those lessons and was in a position to apply them with a massive stimulus package. He was an individual in charge of an organization, and the organization and the state absorbed the lesson to a degree. By 2010, the new challenge was deficits, and various state organizations—primarily central banks and finance departments—were attempting to shift from stimulus to cuts. Learning is not a static condition—it requires adaptation, shift, and change. That is why it is difficult.

So can states learn? In principle, yes, if we de-anthropomorphize the organizations, ministries, and offices that make them up and see leaders who look dispassionately at the evidence and move on. On the other hand, policy-making systems and the states within which they are embedded face at least six impediments to learning. First, while making mistakes is the best path to learning how to do better, mistakes are often political suicide. Second, the larger the organization, the more reliant it is on SOPs. States are big—SOPs are important and often helpful, but they become impediments to fresh thinking. Third, stakeholders fight for and cling grimly to the status quo. They are not necessarily the enemies of learning, but they are stalwart defenders of any conventional wisdom that serves their interests. Fourth, many political systems do not have well-developed "cognitive capacities" (e.g., think tanks, foundations, and university departments of political science or public policy). Fifth, there is the invisible human dimension of state organizations (ministries)—the fluid companionship of experienced seniors and enthusiastic recruits. Mentorship—much understudied in the literature—is a crucial mechanism of organizational learning, but it often happens haphazardly. Sixth, in policy areas that concern the safety or security of the public, if things go wrong, there is almost unbearable pressure to "do something." In other words, agencies have to react immediately rather than learn from the experience—terrorist attacks are a perfect illustration. The policy reactions to the attempt to blow up a plane destined to the United States from Amsterdam on Christmas Day in 2009 were clearly designed to "tighten security," even if that was largely meaningless in terms of a real capacity to stop terrorists.

However, at the same time, the Obama administration ordered a review of agency practices in light of the fact that there had not been an intelligence failure but instead a failure to "connect the dots" of existing information. Interestingly, the first response by the U.S. Department of Homeland Security was defensive—the "system had worked." In subsequent days, the administration made it clear that it wanted to know (to learn) what had gone wrong.

Theoretical Approaches

Since learning and policy change evidently take place, various theoretical approaches to understanding policy learning have emphasized the idea of "levels" of belief systems or paradigms that are more or less susceptible to alteration. At the most microscopic level, there is a steady stream of indicators and data that wash through the policy system and trigger attention if they seem anomalous or unexpected. This represents learning from the environment, from feedback signals, and may not generate substantial changes in policy but simply intensified responses based on preexisting policy (e.g., new cases of avian flu). Another approach sees social learning composed of three orders. First-order learning absorbs new information as a basis for making changes in policy settings, such as incremental adjustments in tax rates if the economy seems to be slowing down. Second-order learning occurs when it appears that the policy environment has changed in a substantial way, when it seems that existing policy interventions are not achieving their objectives. In this case, governments will change the kinds of policy instruments that they use—for example, from direct welfare payments to vouchers. Third-order learning is the deepest and most challenging and reflects such an accumulation of anomalies and unexplained or unexpected events and circumstances that an entire policy paradigm—a combination of deep assumptions and the policy instruments that express them—collapses and is replaced by another. A key example is the ascendancy of monetarism over Keynesianism in the 1980s. A more recent example is the global financial crisis of late 2008. Governments around the world that had favored markets and had been skeptical of state intervention suddenly championed massive public spending, nationalization, and effectively state-managed capitalist economies.

The most elaborate version of this multilayered learning model is the advocacy coalition framework (ACF). The ACF oversees policy change and policy learning usually requiring a decade or more and views change and learning in terms of "policy subsystems," which are dominated by competing advocacy coalitions that share causal and normative beliefs. Most important, it interprets policies and programs as belief systems consisting of value priorities and causal assumptions. A distinctive feature of the ACF is its emphasis on the role of ideas and values in the policy process. The ACF assumes that both policy actors and the policies themselves can be understood in terms of the structure of their belief systems. These systems have three key elements. The first is the deep or normative core, which consists of fundamental axioms about human nature, justice, and priorities among values such as security, health, and life. These ideas are very difficult to change through policy arguments. The second set of ideas is the near (policy) core, and it comprises notions about the proper scope of government activity, distributions of power and authority, orientations on substantive policy conflicts, and basic choices about policy instruments. These are difficult to change but can be altered if experience seriously differs from theory. The final set contains secondary aspects and consists of instrumental decisions needed to implement the policy core, such as decisions about administrative rules, budgetary allocations, and statutory interpretation. These are comparatively easy to shift or change and constitute the bulk of technical policy argumentation.

The ACF also has several distinct hypotheses about how policy subsystems operate. Among them are the following: (a) in any subsystem, the lineup of allies and opponents is stable over periods of a decade or so; (b) there is more consensus within coalitions on core beliefs than on secondary ones; (c) government policies rarely change if the original sponsoring coalition is still in power; (d) policies for which there are quantitative data are more amenable to policy learning than areas distinguished by qualitative data; and (e) policy learning across belief systems is more likely when there exists a prestigious forum that forces professionals from all sides to participate. This highlights the way in which policy learning can take place at different rates and intensity, depending on the characteristics of policy subsystems.

The approaches above focused on policy learning and change within a single political system. In the 1990s, research began to focus on policy learning between and among different political jurisdictions (also referred to as policy transfer and policy diffusion). There are varieties of diffusion and learning: lesson drawing (where governments see a problem and borrow an existing solution), legitimation (referring to other international examples to satisfy domestic critics), and harmonization. The latter is facilitated by international governmental institutions such as the Organisation for Economic Co-operation and Development (OECD) and the World Bank. Researchers have emphasized that "borrowing" or "learning" can be voluntary but sometimes can be imposed if third parties have financial or other forms of leverage (such as the International Monetary Fund). Moreover, in a globalized and competitive world, countries increasingly aspire to meet or exceed common governance or policy standards. The OECD is a distinctive example. Even without any coercive powers over its 30 member states, it establishes through its research and publications a variety of policy gold standards (e.g., in educational performance or science and technology policy), which countries study and then often use as guides for their own policy development.

More recent work in critical policy studies has emphasized the microdynamics of policy diffusion and learning. The original diffusion literature thought of policies as "things" or "packages" that were transported and implemented in different regimes. But policies are complex constructs, and their penetration and adoption involves a process of "translation" and epistemic recalibration. The transfer of a "model," for example (whatever it might be—education, city transport, or refuse collection), involves persuasion, coalition building, organizational development, and mobilization. Diffusion, from this perspective, is much more fluid, episodic, fragmented, discursive, and contingent. It is not as much about "learning" as it is about active, social recogitation and realignment.

Effective Policy Learning in a Globalized World

A final issue is a more practical one: how to enhance effective policy learning? One of the best ways to learn is by making mistakes, but this is hardly politically attractive, and governments are naturally reluctant to publicize their errors. Consequently, it is important to institutionalize transparency and challenge functions within a political system and within policy-making organizations. Policy-making institutions are made up of people, and learning will be enhanced if those people are encouraged to exchange information and be continually learning at the individual level. Within policy subsystems, accessibility to outside actors, standards of open discussion and debate, and the development of reasonably consensual policy measures and indicators will enhance learning. Generally speaking, in both organizations and subsystems, network structures, flexibility, and adaptability are key ingredients in effective learning. Hierarchy in the face of a crisis, stress, or emergency is inferior to network structures that both push decision making down and keep information flow open. Modern armies, for example, are increasingly functioning this way to enhance the collective capacity to respond to threats on the ground and learn from accumulated information.

Policy learning remains hugely difficult. At the human, individual level, people seem to make mistakes all the time and hardly seem capable of learning from them. Organizations struggle constantly to induce their members to learn, in the face of inertia and SOPs. States and their policy-making systems are riven with politics and all the forces that encourage routine and stasis. The international system is pressing more and more countries to "learn," but the transfer process is complicated. Many "receiving" states are doing so only to cash in on development aid. Most others are "translating" rather than simply transferring. Most important, many states—developed and developing—are engaged in a global conversation that engages them collectively in both learning and transferring ideas. The Copenhagen Climate Change conference is a case in point—it did not achieve an "agreement" in any meaningful sense, but it contributed to a messy and disjointed conversation that will continue for decades.

Policy learning is a key factor in effective policy change and program improvement in democracies. While it is constrained by both politics and the limits of human cognition, it is becoming increasingly important in a globalized world where stresses coming from the environment—natural, social, economic—are mounting and demand a reasoned response.

POLICY NETWORK

Policy networks comprise international and national governmental and nongovernmental interconnected actors in a given policy space. The climate change policy network, for example, would include United Nations (UN) agencies, government departments of the environment, Greenpeace, Al Gore (founder and current chair of the Alliance for Climate Protection), and David Suzuki (Japanese Canadian academic, science broadcaster, environmental activist, and founder of David Suzuki Foundation). Network members need not agree with each other. They share a common language and a set of reference points and so can argue or disagree within a consensual frame of discourse.

The backdrop to the origins of network analyses is a concern with understanding the relationship between state and society and, in particular, the organization of interests in society. The early postwar history of political science and public policy wrestled with the best way to theorize the connections. While the Marxist literature addressed itself to the importance of class, the non-Marxist literature eventually settled on the notion of interest group pluralism. Work in the 1950s focused on the limitless array of interests that could mobilize around the equally limitless range of policy issues. If people shared interests, they would likely form groups. If policy issues arose that affected those interests, then the groups would politicize and lobby government. The pluralist tradition deemphasizes the state or policy-making institutions and stresses the influence of lobbies and interest-groups politics.

There are four major sources of inspiration for the concept of networks in political science. One of the first breaks with pluralism was over its portrait of the associational system. Empirical studies in that period showed that associational patterns were much more stable and relationships far more closed than the pluralists had suggested. Policy making took place not in the legislature or the executive but in "iron triangles," which truly were subgovernments in that they might all be operating according to different principles, with different rhythms and often conflicting outcomes. By the mid-1970s, the notion of iron triangles seemed like a caricature too, and a new concept of "issue networks" arose.

A second important source of work on networks came from comparative research on industrial performance and economic policy. A key conditioning factor of foreign policy was the structure of domestic interests and institutions. This branch of research had offshoots that remain highly relevant to the work on policy networks today. Work on state structures argued that states had a clear pattern of associational and state institutions. For example, corporatist states had highly centralized associational systems, working in tandem with governments to develop and implement policy.

A third source of inspiration for network analysis was the growing work on new social movements and public interest groups. Social movement organizations rarely act alone, and they connect through various types of networks. The distinction between the movement and the organizations built on it is important and gives a clue as to why the network idea spontaneously arose in this field of research. Any movement (e.g., environmental, consumers', women's) is bound to spawn a variety of organizations that address different aspects of its agenda, but those organizations will have a common cause and will seek to cooperate in order to maximize their policy impact.

A final source of inspiration for the network concept has been modernity itself. Policy domains are increasingly crowded with organizations, and they spontaneously connect to each other, both as antagonists and as allies. The line between public and private is increasingly blurred, particularly since the global financial crisis of 2009. Domestic politics increasingly is leveraged to the international plane, from whaling to the environment. The result is that states increasingly rely on networks of external actors that are not under their control.

Policy Network/Community Analysis

Early models of policy communities/networks divided them into subgovernments and the attentive public. Actual decision making takes place in the subgovernment, which is dominated by large institutions, groups, and core government agencies. Players in the subgovernment often try to limit participation from outsiders. The attentive public is the outsiders, whose main influence on the process is to generate ideas and discussion through conferences, publications, and occasional lobbying. There are several limitations to this way of thinking about policy communities: It is largely static and does not travel well across policy fields. Some areas are indeed dominated by government agencies. But many others are increasingly open to pressure from the attentive public, and that public is not prepared to be polite. In social and educational policy, and increasingly in municipal policy, for example, fundamental assumptions about the role of governments are constantly being posed.

Some of these limitations have been addressed in more recent models of policy networks. There is a structural approach to network analysis, for example, that focuses on patterns of relations among actors, patterns that can be mapped and are to some degree distinct from the beliefs or ideas of policy actors. The degree of organization here means analytic capacity, access to important data and information, the ability to act unilaterally, coordination, focus on long- or short-term issues, and a reactive or anticipatory policy stance. This depiction of policy network types has the advantage of variety.

Most of the policy network literature has been applied to economic policy fields and assumes that concentration plus organization equals policy-capable systems. While this makes some intuitive sense, it needs to be treated cautiously. For one thing, it has a vaguely undemocratic flavor. The more hierarchical, coordinated, and tidy the policy sector, the fewer opportunities there will be for the attentive public to get into the act. Current policy thinking is that the wider the networks and the more competition among players, the better policy outcomes will be. For another, as policy sectors get more complex and more globalized, the demand for information from all sectors and connections among the players rises exponentially. The tightly coordinated policy networks recommended in this literature may not be adequate to the new dynamics of modern policy process.

Practical Applications

The network idea itself can be seen as a response to changing political realities. Concepts related to policy communities and networks began to multiply and develop around the time that associational systems were becoming more complex. The idea of issue networks was designed to capture the idea of a more fluid, information-based policy system in which government departments and industry players were no longer dominant. While there are no reliable data on broad trends in the past decade, there is no doubt that groups continue to multiply across most sectors.

The range of global policy actors is increasing exponentially. The most visible are international governmental organizations such as the UN, the Organisation for Economic Co-operation and Development, and the World Trade Organization. Yet another layer consists of nongovernmental organizations (NGOs) active on the global level but connected to domestic concerns (the environment, human rights). The result is a diffuse system of transnational networks of loosely coordinated governance, as well as of networks of protest and opposition to that governance.

Technology makes these networks possible—the technology of travel, of communications, or of the transfer and circulation of information. Before the advent of cell phones, laptops, PDAs, Google, Blackberrys, Twitter, and e-mail, NGO activists attending UN conferences would have had to queue at the phones to make long-distance calls to their colleagues at home. That has all obviously changed, and the next wave will build on these platforms and create even more empowered network capabilities.

Policy networks are important today not only because they represent interests that have to be integrated into the policy process or information that is crucial to analysis but because they are important sinews for implementation and delivery. The concept of working partnerships for the development and delivery of services implies a very different set of relationships than is typically envisaged in the communities/networks literature. That literature focuses more on the political dynamics of interest representation, whereas the challenges of partnerships focus more on the logistics of joint action to achieve common goals.

The preceding suggests a somewhat confusing array of forces that serve to make policy communities and networks—domestic and global—even more important than they have been in the past but also perhaps more challenging to integrate into the policy process. The associational system shows no signs of shrinking, and some elements of it, such as those involved in the delivery of public services, may face considerable pressure to expand. Information technologies make possible even wider, global connections of interests and communities. Movements such as human rights, environment, and women's issues are truly global in scope. At the same time, some policy issues get driven further down, and so some networks that would have had their center of gravity at the national level now become truly local or regional.

The contemporary importance of policy networks and communities has not diminished; indeed, it has grown. However, the realities of the policy process continue to change the nature and dynamic of those communities and networks, posing challenges for policymakers. A core responsibility for any public manager is the improvement of learning and adaptive capacities, leading to higher levels of policy debate and relevant policy expertise. What this entails in practice depends on the type of policy community or network in question and its specific needs. Capacity building for intellectual communities may mean enhancing informational resources and communication abilities. For communities involved in policy delivery, it may mean development of organizational capacity through training. The governance dynamics of small, dense networks will be different from the dynamics of networks with a large number of members. Thinking about the policy networks and communities relevant to one's policy responsibilities should be a key focus for public managers.

POLICY PROCESS, MODELS OF

The term *model* has multiple meanings. This being so in general, in political science the varying use of the term reflects the diversity of stances on philosophical and methodological issues in this discipline. In its most narrow definition, the term *model* stands for a mathematical formula. More broadly conceived, the term involves some kind of metaphor used to picture a phenomenon in social reality. In the study of government, both sorts of definitions occur, in several variants. All share the aim of offering a cognitive representation of real-world phenomena.

The stages model of the policy process structures analytically the range of activities involved in the collective endeavors to turn public intentions into public achievements. In both the theory and the practice of modern government, this model—as it is called—has been widely adopted. Because of its prevalence, the stages model of the policy process is the point of departure in this entry. The outline of the latter can be summarized as follows. First, questions are explored about which variants of the stages model can be distinguished and what kind of functions these fulfill. Next, the methodological status of the stages model as a representation of the policy process is addressed. In a more narrow definition, it turns out to be a metatheoretical heuristic. It is an analytical framework, rather than a causal model. However, other ways of studying the policy process can be identified. Under the heading of governance research, analytical frameworks are available that can serve as metatheoretical alternatives to the stages model. What the frameworks addressed in the governance section have in common is that they enable the systematic study of government in action. Two of them stem from the field called policy studies, policy science, or the policy sciences, itself. In particular, the *multiple stages* and *multiple governance* frameworks have been developed as a critique to the stages model. The other two frameworks come from institutionally different parts of the study of government, particularly public management (*nested games* and *the logic of governance*) and institutional rational choice (*institutional analysis* and *development*). These alternative frameworks allow the decomposition of the policy process into different elements rather than in stages and in a greater variety rather than as just sets of activities. In fact, the four metatheoretical frameworks provide other ways of structuring the multiplicity of aspects in the analysis of the practice of modern government. The conclusion then is that such an analysis has evolved beyond the stages model of the policy process.

The Stages Model

Variants

The term *stages* implies a picture of the process of public policy making as a chronological sequence of distinct sets of activities. First, problems in society are brought to governments for solution. Next, governmental institutions conceptualize the problems, formulate alternatives, and select policy solutions. Accordingly, those solutions are implemented. When finally evaluated, they may be revised. These are the successive elements Paul Sabatier distinguishes when describing the stages model. The first element concerns agenda setting. Then, policy design and decision making take place, together usually addressed as policy formation. What follows is implementation. The sequence is concluded by evaluation. Each of these nouns refers to an identifiable cluster of activities. The nouns are the common nominators for the major stages in what since Harold Lasswell has been labeled as the policy process. As the founding father of policy studies, Lasswell uses the term *phases* or *stages* while indicating a range of separate and successive steps. Policy is thought of as being made, in principle, in a chronological order. That order starts with initiative and goes via formulation and decision on to evaluation and possibly termination. Lasswell distinguishes between seven stages of what he calls the decision process. As such, he identifies (1) intelligence, (2) promotion, (3) prescription, (4) invocation, (5) application, (6) termination, and (7) appraisal. The last stage offering feedback inputs to the process again indicates a cyclical character of the latter. Therefore, the terms *policy process* and *policy cycle* are synonyms.

Lasswell speaks of a conceptual map, meant to provide a guide to obtaining a generalized image of the major phases of any collective act. Since Lasswell's sevenfold distinction, there have been many variants of the stages model of the policy process. Each specifies the separate stages and/or their number a little differently. In fact, all these definitions concern variants of what James Anderson views as a sequential pattern of action involving a number of functional categories of activity that can be analytically distinguished. In his and in many other textbooks, the stages model has been used to structure the range of accounts on the study of the policy process. Given the complexities of the object, the contemporary study of the policy process appears to go in various directions. Wayne Parsons calls the field rich, both in academic disciplines and in approaches. It is wealthy in models (heuristic and causal) as well as in metaphors and maps. The stages model then offers a structure to bring analytical order to this wealth.

Characteristics

The succession of steps thought of in a chronological order as implied by the stages model has aspects that can be called universal. As such, the stages notion has occurred before and beyond the study of public policy. For instance, Herbert Simon distinguished intelligence, design, and choice as the successive stages in the way people in general reach decisions. What, however, makes the stages model of the policy process more than a reference to a chronological or logical order, thought of as universal, is its connection with the modern state and its institutions. Policy implementation is supposed to follow policy formation. Means are chosen, while ends are given. Administration takes care of those means, after politics has spoken. Woodrow Wilson was once president of the United States. He is also seen as founder of the modern study of public administration, having coined the classic politics/administration dichotomy. In this context, that dichotomy can be seen as a stagist model avant la lettre. Despite the cyclical logic, normatively, a hierarchy is at stake. It embodies a view about the primacy of politics.

The policy orientation was introduced by Lasswell in the 1950s. Policy is directed on what John Dewey once described as the combination of the public and its problems. This problem focus distinguishes the public policy perspective from that of public administration or public management. Connected with the problem-solving objectives of the welfare state, this orientation implies both a rational view on knowledge and an instrumental use of it. In the policy orientation, knowledge from social science can be used to improve society. It also should be used, via public policies, as a form of social engineering. Michael Howlett and M. Ramesh show how the separate stages in the policy cycle each refer to a part of applied problem solving. Agenda setting then corresponds with problem recognition. Policy formulation stands for the proposal of a solution. Decision making means the choice of a specific solution. Policy implementation implies putting the chosen solution into effect; and policy evaluation refers to monitoring results. Policy making thus means problem processing. Deborah Stone speaks of a policy process as a production process. Public policy is the result of what happens in what may be likened to an assembly line.

Its widespread use makes the stages model of the policy process universal as well as modern. Especially during the period of growth of welfare states after World War II, the notion of stages has accompanied the term *public policy* like a shadow. It has since been adopted widely, both in theory and in practice. An element of that widespread adoption is what Michael Hill and Peter Hupe call the primacy of policy on paper. The assumption is that once one knows the good intentions as laid down in a law or official policy document, one can infer the results from it to be realized in the real world in a one-to-one relationship. This assumption forms part of the explanation of the functions the stages model of the policy process fulfils.

Functions

As a comprehensive picture of the policy process, the stages model is the most prevalent one. It fulfils societal, practical, analytical, and programmatic functions. In the public debate and in society in general, the stages model of the policy process stands for an orientation toward problem solving, or at least problem processing. Linking the public and its problems, as Dewey indicated, in the public discourse, it has an enduring normative appeal. In political-administrative practice, the stages model invites and legitimizes a certain division of labor. This particularly involves the relation between two categories of actors. The first category concerns the actors and institutions formulating and legitimately deciding on public intentions. The second category comprises the ones responsible for turning those intentions into factual public achievements. When the problem has been stated and the decisions on necessary measures have been taken, the rest is implementation. That implementation is expected to follow the policy as documented in a one-to-one relationship. If things turn out to be different, the logical distinction between the stages appears to be reified. Especially in situations of a crisis or disaster, the stages model in the practice of public administration may function as a way of shifting the blame. Journalists revealing what they label as policy fiascos mirror this labor division. For instance, in the case of an employment policy, the results of the implementation stage may be obviously disappointing. Journalists may relate these results to the policy intentions concerning job growth as laid down in the policy statutory concerned—the result of the policy formation stage. In the practice of public administration, now and then, such politics of blaming can be observed. Actually, the stages are logical constructions. In situations such as these, however, the stages have become reified.

With its (chrono)logical character, the stages model fulfils an analytical function. It provides a way of rationally ordering the complexities of the reality of government. This being so for political-administrative actors and the public in general, in academia, the functionality of the stages model primarily is a didactic one. In teaching modules and handbooks, it functions as a way to structure the presentation of insights on the policy process. Because of this use, the model is called the textbook approach. The stages model also has a function in academic research. Similar to its function in the practice of public administration, the stages model enables a labor division in academic work. Each of the stages, from agenda setting to evaluation, has grown into a scholarly theme of its own. With its programmatic function, the stages model has set the agenda for research, leading to a variety of classic texts on each of these themes. One could think, for example, of the studies of John Kingdon on agenda setting, Charles Lindblom on policy formation and William Dunn on methods of policy analysis, Jeffrey Pressman and Aaron Wildavsky on implementation, Michael Lipsky on the related theme of street-level bureaucracy, and Frank Fischer on evaluation. The stages model enhanced the development of distinguished approaches such as the advocacy coalition framework developed by Paul Sabatier, Hank Jenkins-Smith, and others. Focusing on the analysis of what is happening in a specific stage of the policy process, theoretical approaches such as these are not an alternative to the stages model. The advocacy coalition model, for instance, instead concerns theory formation on what happens particularly in one stage—in this case, agenda setting.

Limitations

The functions the stages model of the policy process fulfils involve a broad usage of the term *model*. That usage goes beyond the more narrow methodological requirements the term *model* in science may imply. It is exactly this that has invited severe criticism from scholars. Peter John, for instance, is positive about the functions the stages model fulfils in society. Where public policy is often justified in rational terms, the metaphor of stages is helpful. Journalists and citizens try to make sense of the complexities of public policies. They expect the policy process to work in stages. John also acknowledges that the stages model still can be used as a heuristic or learning device. At the same time, however, John sees serious constraints in using the stages metaphor in research. There the stages idea confuses more than it illuminates. There are no neat divisions between different types of activities; policy is continuous. For analysis, John sees the stages metaphor as too simplified to capture enough of reality.

In several publications, Sabatier has expressed similar criticisms. It made him prefer the term *stages heuristic* as proposed by himself and Jenkins-Smith. Those criticisms entail the following. First, the stages model is not a causal theory. It does not enable the causal explanation of empirical variation. Second, the assumed sequence of stages is inadequate in a descriptive sense. Implementing ambiguous laws, for instance, may imply actual policy formulation and even decision making. Third, the stages model has a top-down bias and focuses on major pieces of legislation. It neglects the interaction among a variety of such pieces, including smaller ones. Fourth, the focus on the cycle of one policy-making process shows indifference to actual empirical reality. Within a given policy domain, multiple interacting cycles can be observed. This complexity involves, as Sabatier stresses, numerous policy proposals and statutes emerging from multiple layers of government.

It is in theoretical-empirical research that a model is ultimately put to the test. In the case of the stages model, then, some methodological limitations appear to be inherent. The first one was already indicated previously: the reification of each separate stage. Instead of empirically observing that policy making in fact goes on in the subsequent stages, and of investigating how, the separation between the stages is taken for granted on normative grounds. Furthermore, a certain stage as a specific set of activities is automatically treated as connected with a specific spot—the second methodological limitation. When, for instance, the legitimate formulation of a specific policy has taken place on the layer of the ministry concerned, the subsequent implementation of that policy is seen as consequentially taking place on the layer of local government under it. It may be the case, however, that on the latter layer policy formation (formulation plus decision making) can be observed. This concerns an empirical question. The stages model induces research in which what actors do and where they do it, a priori, are supposed as coinciding. In such instances, Hill and Hupe speak of the methodological fallacy of the wrong layer. Instead, activities (focus) and layers (locus) could be observed independently.

As a third methodological limitation of the stages model, the same authors speak of the control trap. With that label, they highlight a specific implication of the stages model, the inducement of quick judgments on implementation failures and policy fiascos. The stages discourse implies a normative hierarchy. To what extent empirically observed action can be judged as legitimate is as a normative matter. Researchers may not always reflect on the methodological consequences of the top-down bias stemming from that fact. This may be the case, for example, when seeking to do contract research. The implicit adoption of a view from the top may lead to confusing the normative and the empirical. Observations of behavior are treated as judgments on deviance from the standard norm. Instead, an open observation of what happens is to be distinguished from a judgment on the legitimacy of what is observed. After all, for public servants and other practitioners, there is always a necessity to interpret ambiguous legislation. Also, in circumstances that may have been unforeseen by the legislator, there is a need to act. Hupe and Hill speak of an action imperative here. In the research of policy processes, it calls for distinguishing between clinical observation and normative judgments.

Representations of the Policy Process

A Model

The *Shorter Oxford English Dictionary* provides three main categories of meanings for the noun *model*. The term can refer to a representation of structure, a type of design, and an object of imitation. Within a range of, in total, 13 definitions, the ones standing for both the narrow and the broad meanings, as referred to above, can be found. In a narrow sense, the term *model* is defined as a set of entities that satisfies all the formulae of a given formal or axiomatic system. In the broad sense, the term *model* is used as a conceptual or mental representation of something. The *Dictionary* speaks of a simplified description of a system, process, and so on, put forward as a basis for theoretical or empirical understanding.

In his textbook on public policy, Parsons addresses the variety of meanings of the term *model* and other related terms as an issue in itself. He states that in a complex world, people need to simplify. They seek to organize their ideas and concepts. Models, maps, and metaphors—as the title of the section expresses—provide ways to do so. Parsons calls them frameworks, which enable people to think and explain. The activity of theorizing about public policy is like drawing a map. People need such a map, but it must in some respect distort their impression of the territory it represents. Parsons stresses that the way people see and interpret the world of public policy depends on the kinds of models and frameworks they employ. A map may claim to explain but may at the same time be heavily normative and prescriptive.

Parsons refers to the way Graham Allison analyzed American decision making in the 1962 Cuban missile crisis. In *Essence of Decision* (1971), the latter uses three models or lenses. Allison analyzes this one decision-making process in terms of the rational actor, in terms of organizational processes, and in terms of bureaucratic politics. Each provides a very different kind of interpretation of the same events in reality. Allison's study shows how the analysis of decision making involves an awareness of the different frames that can be employed to interpret events. Such awareness concerns the way the observed object of study exists in the context of a variety of contending interpretations.

Models, Theories, and Frameworks

The most important criticism of the stages model is that it is not a causal theory. It is also necessary to ask what it means to call it a model. Like Parsons, Elinor Ostrom has addressed this issue of the meaning of the term *model*. Parsons makes a point of the constructivist effect of using specific lenses—reality is not just out there. He treats the labels for such lenses largely as synonyms. Ostrom, however, makes a plea for distinguishing explicitly between models, theories, and frameworks. Speaking of an often overlooked distinction, she positions these three in a specific way. In her view, models make precise assumptions about a limited set of parameters and variables. Theories, according to Ostrom, enable the analyst to specify which elements of a broader framework are particularly relevant to certain kinds of questions. A framework helps identify the elements needed for more systematic analysis. It provides a list of variables and a vocabulary that can be used to compare theories. Several theories are usually compatible with any framework.

Models, theories, and frameworks vary on the generality scale. Models are the least comprehensive but the most specified. They entail particular sets of expected relationships between limited variables. Frameworks are the most robust but substantively are rather empty. They enable theory formation and model building by providing a metatheoretical language. Theories are in between. They address a certain phenomenon in empirical reality with a more-or-less universal character. Inviting assumptions to be made about elements of that phenomenon, theories enable the analyst to diagnose a phenomenon, explain its processes, and predict outcomes.

By positioning the stages model in this threefold classification, some of the criticisms mentioned above can be tested. First, regarding treatment as a model, in the narrow sense, critics are surely right that it is not. The stages model may fulfill functions as a heuristic device, but for acting as a causal model, it is too general. It leaves too many parameters implicit. At the same time, the stages model is not a theory. To meet Ostrom's definition, it would need more explanatory power. The stages model does enhance the identification of certain elements and variables relevant for the study of public policy. Therefore, it can be called an analytical framework.

At a metatheoretical level, the stages model in research functions as a map. Around it, theory formation and model building may take place. We then need to ask for the requirements for an adequate framework. Comprehensiveness, enhancing middle-range theory formation, and empirical openness can be identified as relevant criteria here. First, an analytical framework must have the capacity to encompass conceptually the multidimensional character of public policy processes. It must enable the identification of the variety of actors, actions, and interactions involved. The stages model indeed aims at comprehensiveness. It claims to conceptualize an entire policy process. However, the focus is singularly on activities, while the locus of a specific set of such activities (e.g., implementation) correspondingly is presupposed. Second, not being a theory itself, the stages model as a heuristic tends to be seen as inviting theory formation. The classic texts on each of the stages are proofs of that function. Third, meeting the criterion of empirical openness for the stages model is difficult. Policy implementation, for instance, is addressed as normatively subordinate to policy formation. Such a hierarchical view may prevent the analyst from observing what happens and explaining why, before expressing judgments on the legitimacy of what is recorded. An analysis normatively biased in this way may lead to less than well-grounded advice to practitioners. To the extent this is the case, it may be counterproductive in the end. Neither the scientific nor the normative goals may then be achieved.

Thus, the stages model meets the criteria of comprehensiveness, to a certain degree, and of enhancing theory formation. It has difficulty, however, in meeting the criterion of empirical openness. The conclusion is that it is a general framework in Ostrom's sense, albeit one with shortcomings. It is this character that lies at the basis of its functioning in academia. The so-called model functions as a robust, rather empty, framework and heuristic device facilitating teaching and research. As a general map for the analysis of policy processes, it is conceptually neither multidimensional nor empirically open enough to do much more than provide a starting point for systematic theoretical-empirical research.

Theoretical Approaches

Public policy scholars have sought to develop various forms of representations of phenomena in and around public policy. Some of those, such as the advocacy coalition framework mentioned above, imply theoretical approaches. They focus on aspects of one particular stage rather than providing an alternative to the stages model as an analytical framework at the metatheoretical level.

Sabatier searched for alternatives to the stages model. In *Theories of the Policy Process*, he collected eight contributions he calls "more promising." This edited volume contains chapters on (1) the institutional analysis and development framework, (2) the multiple streams framework, (3) social construction and policy design, (4) the networks approach, (5) punctuated-equilibrium theory, (6) the advocacy coalition framework, (7) innovation and diffusion models, and (8) the policy process and large-*N* comparative studies. What the the contributions pictured in the eight chapters have in common is that they aim at (causal) explanation, in particular by relating elements of policy processes to other elements. Besides, all have led to subsequent empirical research. This being so, the contributions show differences. First, there is variety in what is seen as needing explanation. For some contributions, this *explanandum* regards policy change; for others, it regards variation in policy outputs. The innovation and diffusion models look at policy adoption. Second, the level or unit of analysis differs in a range going from that of a single policy, via a policy domain, to that of a (nation-)state. Third, and most important here, the eight contributions, collected as theories, are labeled differently. One of them is called a *theory* (punctuated equilibrium) and four a *framework* (institutional rational choice, multiple streams, social construction and policy design, and advocacy coalition). The heading of one chapter includes the term *models*, that of another one the term *studies*, while there is also a chapter with the term *approach* in its title.

The variety of labels for these contributions as expressed in the chapter titles do not preclude similarities. At the same time, however, there is a difference between the common denominator of theories, on the one hand, and the variety of contribution headings, on the other. This does underline Ostrom's plea for precision. A systematic application of her requirements for each type of academic work would specify the particular characteristics of these collected theoretical contributions. Some of them then might appear to involve the elaboration of a framework in Ostrom's sense—like the one developed by herself—and some to provide a model. For several contributions, the term *theoretical approaches* or *conceptual lenses* would seem appropriate. These are steps toward the formation of a theory. In any case, all the contributions in Sabatier's volume differ from the stages model, assessed as it is above as a metatheoretical framework with shortcomings.

Governance Research

Relatively early in research on the policy process Jon Pierre and Guy Peters have explored the consequences of the concept of governance. Related to the Latin verb *gubernare* (steering), the origins of the term lay in the past. In the last decade of the 20th century, however, the concept moved to the forefront of both public discourse and the study of government. Public tasks today are being fulfilled in a broader variety of forms than before. As Pierre and Peters indicate, the term *governance* covers the whole range of institutions and relationships involved in the process of governing. Nevertheless, in a democracy, the rule of law is working. Therefore, it is still government that normatively has the appropriate legitimacy to steer society. Providing direction to society, whether directly or indirectly, is what Pierre and Peters consider to be the activity of central governance.

Looking at shared sets of problem definitions and proposed solutions, Hill and Hupe speak of a current *governance paradigm*. This is seen as being different from previous ones, including the policy implementation paradigm, as prevalent particularly in the 1970s. As characteristics of the governance paradigm, the authors distinguish an awareness of context, a reassessment of traditional public values, a rehabilitation of the hierarchical mode of governing, and a renewed attention to issues of accountability. Perhaps the most prevalent feature of the governance paradigm is the attention to action. Public officials do not just rely on the intentions stated by agents and other actors in the public domain. Rather, they want to secure a view on what those actors are actually doing and on what works.

To a certain extent, labels such as governance imply the use of different lenses to look at the world. The term *governance* is meant to capture the reality of government in the beginning of the 3rd millennium. *The Oxford Handbook of Public Management* and similar publications reflect the state of the art in the study of government. It is there that authors try to assess changes in the object of study, different ways of looking at that object, and the implications of relating the two. In particular, scholars like Geert Bouckaert, George Frederickson, Christopher Hood, Laurence Lynn, and Christopher Pollitt have addressed the issue of positioning paradigmatic concepts such as new public management and governance in the actual study of government. Their assessments are attempts to position new developments in the field of study overall.

Next to this, several academics have reflected on the operational implications the concept of governance might have for theoretical-empirical research. As in the present practice of public administration, researchers, too, are inclined to search behind the policy on paper. This may certainly be the case when using an empirical research design aimed at causal explanation. In the view of Laurence O'Toole, the distinguishing feature of the concept of governance is that it incorporates a more complete understanding of the multiple levels of action and kinds of variables that can be expected to influence governmental performance. As a consequence, the analysis of government in action becomes multidimensional. Such an analysis fundamentally comprises both perceived action and rhetorical justification. It looks at unintended consequences as well as official documents. The focus is on both observed actual situations and original good intentions. Almost by definition, levels of analysis different from the one looked at play a role. Hence, the study of government in action implicates governance research, with its multidimensional perspective.

The consequence then is that researchers see themselves confronted with an overwhelming array of factors. Each of these can be expected to contribute, one way or another, to the explanation of what is observed as happening. Therefore, the aim to explain empirical variation implies a need to structure the vast range of candidate explanatory variables. This is a characteristic of multiple multidimensionality in particular. It seems to make social science at least as complex as natural science. In research, the isolation of a few variables, necessary and unavoidable, goes hand in hand with leaving aside the impact of factors held constant under a ceteris paribus clause. Studying government in action entails, by definition, more than one level of analysis. In a nested configuration, factors play a role from different scales of aggregation. In a given research, focus may be on explaining the relations between only a few variables. Even then, explicitly or implicitly, the impact of a vast range of intermediary factors on various dimensions is presupposed. This variety may be nominated as contextual factors. They may have, however, a possible influence reaching far beyond that general label, and it is often difficult to treat them as held constant.

Aiming at enhancing scientific rigor, analysts of government in action explore various options. In implementation theory and research, authors tried to close the top-down/bottom-up controversy by making a case for developing synthesizing approaches. The sources for identifying relevant factors were no longer to be confined to either the top or the bottom of the policy process. Scholars like O'Toole and Kenneth Meier have pointed to the fact that the number of such variables hence grew to unmanageable proportions. Their plea for parsimony made them develop a formal model of public management containing hypotheses on relations between a limited number of variables. Since then, Meier and O'Toole have been testing this model successfully on large aggregates of data.

Studying the Policy Process as Governance Research

The Study of Government in Action

The concept of governance can be seen as an umbrella concept aimed at capturing the complexities of public policy beyond the rationalist assumptions of the stages model. If that stance is adopted, the study of the policy process in the contemporary world can be conceived as governance research.

In addressing the question of what is needed for such research, the three criteria for an analytical framework, mentioned above, need to be elaborated. Comprehensiveness then refers to an orientation toward capturing the whole range of elements involved in the collective endeavors to turn public intentions into public achievements. The shortcomings of the stages model have been identified above. Serving as an alternative, an analytical framework should provide the possibility of categorizing and positioning relevant factors that both influence and are influenced by actions taken by actors involved in governmental affairs. Parsons speaks of the need to deal in research with multiframed activity while mapping the wider contexts of problems, social processes, values, and institutions in which policy making takes place.

Enhancing theory formation, the second criterion for an analytical framework, means the pursuit of scientific rigor by grounding and testing theoretical suppositions while explaining causal relations. The third criterion, empirical openness, implies specification and differentiation regarding all aspects of the empirical cycle. Most analysts in social science will concur with the normative principles of the rule of law, democracy, and perhaps also the welfare state. Also, many analysts will underline the necessity of observing and explaining social reality in academic research, in a way as normatively unbiased as possible. After all, improving the world can benefit from understanding it.

Both in practice and in theory, the notion of stages may remain prevalent. It is a metaphorical picture fitted to sketch the range of activities actors in governmental affairs engage in. Nevertheless, some authors have attempted to provide alternative general frameworks. With those frameworks, questions for research can be asked and answered while enabling the systematic study of government in action. When put alongside the criteria mentioned above, four of such alternative frameworks can be identified. The contributions to be addressed here come from different scholarly backgrounds. In particular, these include the study of public management (Laurence Lynn, Carolyn Heinrich, and Carolyn Hill), public choice (Ostrom), and public policy (Parsons, Hill, and Hupe).

Multiple Stages

Parsons divides his almost 700-page textbook *Public Policy* into four parts. He calls them meta-analysis, meso-analysis, decision analysis, and delivery analysis. The first part is on analyzing analysis (meta-analysis). After that, Parsons distinguishes three levels or dimensions of analysis, both broad and partly overlapping. Meso-analysis deals with the way in which issues and problems are defined and policy agendas are set; theoretical approaches categorized as meso link the input side and output side of the policy-making process. Decision analysis refers to approaches looking at how decisions are taken, policies are formed, and analysis is used. In Parsons's conceptualization, delivery analysis refers to how policies are administered, managed, implemented, evaluated, and possibly terminated. The author stresses that the parts of the book are not to be read as a set of stages. There is no sequence, because in the real world there are no defined or distinct phases. Parsons suggests reading his textbook in an iterative rather than linear way, by going backward and forward.

Nested Games and the Logic of Governance

In *The Power Elite*, C. Wright Mills (1956) distinguishes between the top, the middle, and the bottom levels of power. Characterizing governmental activity, Lynn refers to that insight while distinguishing three different elements he calls policy games. They relate to each other in a nested configuration. The high game involves deciding whether there is a role for government in a given situation. In the middle game, the direction of the policy is determined. The low game concerns the practical side of policy making, where implementation is central.

More recently, Lynn has related these levels of the game to governance. With Carolyn Heinrich and Carolyn Hill, he provides what they call a logic for governance research. The authors have developed an aggregated framework, aimed at directing attention to the dynamic relations within and between the institutional, managerial, and operational levels of governance. Lynn and his colleagues argue that the logic of governance involves a hierarchy of relationships that carry over from one level to the next: those between (a) citizen preferences and legislative choice; (b) legislative preferences and formal structures and processes of public agencies; (c) formal authority and the organization and management of agencies, programs, and administrative activities; (d) organization, management, and administration and the core technologies and primary work of public agencies; (e) primary work and consequences, outputs, or results; (f) outputs or results and stakeholder assessments of agency or program performance; and (g) stakeholder assessments and political preferences and interests. The results of governmental activity mentioned in (f) are measured in terms of the availability, quality, and cost of publicly sponsored goods and services. Lynn et al. stress that this is a heuristic framework. It enables the identification of relationships potentially influencing governmental performance. When the authors first presented the framework, they explicitly stated that it should not be called a unified theory of governance. They stressed that making statements about the actual influence of the identified relationships requires theory, models, and data.

Institutional Analysis and Development

In a lifelong career, Ostrom has been interested in how institutions affect the incentives confronting individuals and their resultant behavior. Standing in the tradition of institutional analysis from a microeconomic perspective, in an article written with Larry Kiser, she presented the institutional analysis and development framework. Kiser and Ostrom speak of a multitier conceptual map. Indeed, it is a metatheoretical framework meant to order various sorts of institutional analysis. The authors refer to three tiers of decision making: constitutional choice, collective choice, and operational decisions. Together, these form what is addressed as the three worlds of action. The constitutional level explains the design of mechanisms of collective choice. At the level of collective choice itself, collective decisions are made by officials, including citizens acting as officials. These decisions are aimed at influencing actions in one way or another. The decision making at this level includes the authority to impose sanctions. At the operational level, individuals take direct action, sometimes without prior agreement with other individuals. This framework has a nested structure. Decisions at one level are linked to those at the other levels. Constitutional decisions establish institutional arrangements. Within given institutional arrangements, collective choices regarding specific issues are made. These decisions are meant to guide individual action, in particular at the operational level. Collective decisions are enforceable against nonconforming individuals.

Multiple Governance

The distinction between the three tiers of decision making refers to different sets of actions. It leaves open, however, where and by whom this action is performed. This characteristic of the institutional analysis and development framework was adopted by Hill and Hupe and applied to the study of governance. Seeking to develop an analytical framework as an alternative to the stages model, they propose the following metaquestion to precede governance research: Who acts where, doing what, on which scale, and how? A policy process is viewed as positioned in a multidimensional setting of government in action. Each part of the question refers to an element of that setting. Successively—although not in a chronological order—these elements concern actors (who), administrative layers (where), sets of activities (what), action situations and action scales (on which scale), and political-administrative craftsmanship (how). Thus, the authors frame the policy process in terms of governance. They do so taking their lead from both the three worlds of action as conceptualized by Kiser and Ostrom and the governance perspective of Pierre and Peters. In the meaning of government in action, governance consists of three broad sets of activities called constitutive, directional, and operational governance. Constitutive governance concerns the fundamental decisions about the creation of institutional settings. Within given settings, actors provide direction. Directional governance stands for the formulation of and decision making about collectively desired outcomes. Operational governance concerns the actual managing of the realization of those outcomes. Hence, the multiple governance framework gives attention to dimensions of structure, content, and process. The distinction between creating settings, giving direction, and getting things done is addressed as the trinity of governing, or *trias gubernandi*.

The multidimensional character of the framework implies that in research, the specific focus and locus are to be expressed separately. The position of and relations between the sets of activities comprising government in action are neither hierarchically nor chronologically predetermined. Those activities can be performed at any spot in the public domain. A series of empirical questions follows: Who are the actors, looked at on which scale (individuals, organizations, aggregate systems), acting on which administrative layer, de facto engaged in what kind of activities here and now, and with which degree of craftsmanship? When implementation is conceived of as operational governance, research, for instance, entails the question whether the concretely observed action concerns rule application or, rather, rule setting. Thus, factual policy formation may be traced where policy implementation was expected.

Alternatives to the Stages Model

Above, the theoretical approaches of the policy process were addressed that Sabatier characterized as more promising than the stages model. All show a sophisticated level of elaboration and have been applied in several research projects. As such, they meet the requirements for being included in the edited volume. Ostrom's contribution appears to meet her own criteria for a general analytical framework. That is why her institutional analysis and development framework were included above, as well. Also, the logic of governance framework and the multiple governance framework show the characteristics of general analytical frameworks. Parsons's distinction, labeled as multiple stages, seems to have been primarily intended to function in a didactic setting. Aiming at comprehensiveness (the first criterion), the four frameworks share a metatheoretical character rather than providing a substantive grand theory themselves. At the same time, they may function as a heuristic toward the formation of such theories (the second criterion). As far as empirical openness, the third criterion, is concerned, the frameworks invite specifying what needs explanation. All four enable the identification and differentiation of different sorts of actors, activities or actions, layers, and other elements (comprehensiveness). In particular, the frameworks metatheoretically specify the relations between those elements, even if they are thought of as a hierarchy (theory formation). Finally, the frameworks make it possible to structure the multiple dimensions of social reality in an analytical rather than a prescribing way (empirical openness). In research, understanding implementation deficits prevails over condemning them. In any case, the observation and explanation of specified behavior precede judgments on general shortcomings.

Conclusion

O'Toole described the subject matter of implementation studies as what happens between the establishment of policy and its impact in the world of action. He did so in an assessment of research on policy implementation. In a certain sense, this description goes for the object of what has been presented earlier as governance research, overall. Thus, describing the object of the study of government in action in general presupposes a specific conceptualization of governance. In the O'Toole definition, the latter concept is designed to incorporate a more complete understanding of the multiple levels of action and kinds of variables that can be expected to influence performance. When governance is conceptualized in this way, it has consequences for research. Among others, it opens the view on perspectives beyond policy studies in the narrow sense.

In the realm of "what happens," so many factors and mechanisms are active that a device is needed to structure the multiple varieties of dimensions of the research object. This being true in general, it is even more applicable inasmuch as analysts of government aim at enhancing scientific rigor. Against that background, the analytical frameworks identified here can function as alternatives to the stages model. They enable researchers to explore more systematically what they want to know, how to frame that, and which accumulated insights can be deemed relevant to incorporate. The orientation in such research may shift away from merely a vertical one. Confronting public achievements with the public intentions as laid down in the concerned official policy document will not always be the research objective. Governance research implies explaining variation in actual behavior and its impact on all sorts of governmental performance. Questions aimed at explanation will be at the forefront. They will not replace judgments on public policy results as disappointing but may sometimes postpone them. At least, answering such questions will provide a more solid ground for any judgment.

Analytical frameworks such as the ones presented earlier may not immediately appeal to practitioners as broadly as the stages model has done thus far. At the same time, the frameworks respond to the criticisms of that model concerning its usefulness in research. The alternative frameworks may enhance the formation of (middle range) theories and the development and testing of causal models. Then, they would contribute to making the study of government more theory driven. In that perspective, the discovery of the nested character of the study of government in action can be welcomed as an important insight. The gain of explanatory power particularly will be greater to the degree researchers succeed in the coweighing of factors from more than one level of analysis.

The range of activities involved in the collective is structured analytically with the intention of turning public intentions into public achievements. Thus, the stages model of the policy process was defined at the beginning of this entry. That so-called model appears to fulfill functions going far beyond causal explanation. In fact, this academic function proved to be the least developed. At the same time, alternatives appeared to be available.

A pertinent element in the notion of the stages model regards the wish to have complexity reduced to linearity. Since Lasswell introduced the policy orientation, particularly in the 1990s, the multidimensional character of action in government has been acknowledged. This is the case not only in policy studies but also in institutionally different parts of social science. The aim for methodical rigor is now more widely embraced. Multidimensionality-cum-nonlinearity seems to have become the leading principle in governance research.

Both Dewey's focus on the public and its problems and Lasswell's policy orientation seek to help government in dealing with societal issues. The current developments in research stress academic specificities. Therefore, the wish to contribute to those practical aims seems to have been put aside. In fact, this is not the case. The gains can be deduced not only scientifically but from a normative perspective as well. Society looks to becoming ever more complex. In such a context, improving government needs a better understanding of that government in action. Although partly perhaps under different headings, the best years for the study of the policy process are likely still to come.

POLITICAL CLASS

The concept of political class is based on the idea that politicians constitute a group with special characteristics that distinguish them from other social groups. It also contends that the members of this group share common views and interests and act with a relatively high degree of cohesiveness. The theory of the political class posits the study of this phenomenon as a crucial instrument for the understanding of political life. The main questions that have been developed within this broad theoretical field are as follows: Who are the members of the political class? What determines their special status? How and on what bases are they recruited? What are the links that keep them united? What are the forces that drive their behavior? And what determines the decline of a political class and its substitution by another one? In this entry, the origins, definitions, empirical studies, and contemporary relevance of the concept of political class are discussed.

Origin of the Theory of Political Class

The concept of political class has acquired a well-established status among crucial concepts of modern political science since Gaetano Mosca (1858–1941). In his first major work, *Teorica Dei Governi E Governo Parlamentare* (the title can be literally translated as “A Theory of Political Regimes and the Parliamentary Government”), published in 1883 when he was only 24 years old, the Italian scholar proposed the concept of political class as the key to a new innovative approach to the study of political phenomena. Mosca’s ambitions were not only of a substantive nature—to explore a political phenomenon that supposedly was not yet well understood—but also epistemological and methodological. An admirer of the extraordinary developments of the natural sciences during the 19th century, he aimed to overcome the unsatisfactory state of political studies and to attain a more scientific level that would put them on the same level with the more established disciplines. The key to this was to be found first in the development of a sound base of empirical observations to support the formulation of scientific propositions and then in the ability to capture the true substance of the political phenomena and move beyond the mere appearances that often mislead the observers.

To achieve the first objective, Mosca set out to exploit the rich treasures of historical knowledge that in the course of the 19th century had made enormous advances and to draw from them the empirical materials for a comparative analysis of political phenomena. With regard to the second objective, which was to become the focal point of his research, the proposal he advanced was to go beyond the images of politics currently offered by the dominant ideologies (both democratic and traditionalist) and to look for the real power holders, that is, the small minorities, or what he defined as the “political class.” That power is always in the hands of small groups of people was the fundamental postulate of Mosca’s theory of the political class. According to his analysis, neither large numbers of people, such as a democratic demos, nor single individuals, such as monarchs, who are often described by current interpretations of politics (and especially by ideologies) as the rulers of different political regimes, are the real power holders. They always need a relatively small number of organized people to conduct (in their name) the business of government.

The concept of class, which Mosca sought to adapt to the analysis of political reality, had become a frequently used instrument for the analysis of society in the 19th century, thanks to the works of sociologists and economists. Among them, Karl Marx (1818–1883) and Friedrich Engels (1820–1895) had gained special prominence because of their intellectual influence on the socialist movement and because of the enormous political impact of some of their ideas. The same had happened to their theory, which centered on the idea of class as a social group based on the relationship between individuals and the economic processes of production but also stressed the role played in defining such a group by the consciousness achieved by its members of their specific condition. Marx and Engels were not the only scholars working with this concept. Two other important figures of modern sociology, Henri de Saint Simon (1760–1825) and Auguste Comte (1798–1857), had already given the concept of class an important place in their social theories. The attention of the two French authors was directed toward the new upper strata of the industrializing society, which were viewed as being in the process of taking the place of the old aristocratic and clerical ruling classes. In particular, they considered the technical and managerial skills developing with the modern model of industrial production to be the crucial features of the new ruling class. As these two authors focused their attention on the role in society of relatively small groups in the top positions, they contributed even more than Marx and Engels to paving the way for the theory of the political class as developed by Mosca and other social scientists of his time. However, similar to Marx's theory, their interpretation left little room for the political dimension and was fundamentally inspired by a reductionism of politics to economics.

Other authors had paid more attention to the political dimension and, often combining the descriptive and the prescriptive perspective, had made use of similar concepts as instruments for understanding (and evaluating) politics. Among them, one might recall Edmund Burke (1729–1797) and his analysis of "natural aristocracies"; Lorenz von Stein (1815–1890), who not only theorized but also promoted the reform of the governing elites of Prussia; or Hippolyte Taine (1828–1893), with his criticism of professional politicians and of their corruption and the exaltation of a class of natural leaders. With his discussion of the party machine and the role of the political managers, the American scholar and politician John Calhoun (1782–1850) anticipated many future analyses of the new democratic elites. One may remember also the *American Commonwealth* (1888) by the British scholar James Bryce (1838–1922), who began to systematically analyze the new type of professional politicians operating in the American parties and saw their role as not incompatible with the principles of democracy. The writings of these and other authors suggest that the idea was starting to gain ground; none of them, however, gave to this theme such a central place as Mosca did and as Vilfredo Pareto and Robert Michels would do later on. While scholars such as Saint Simon, Comte, and Marx looked at society in general, in his first work, Mosca was already focusing his analysis on the specific developments of the political system. His attention was particularly attracted to the development of parliamentary government in Italy as in many other European countries and to the striking contradictions between the (democratic) theory of the regime and the (oligarchic) practice it displayed. At the same time, a central preoccupation of Mosca, when he started developing his theory of the political class, was to establish the study of politics on more solid grounds. Writing at the time of great advances in the natural sciences and when economics was well on its way to becoming an increasingly professionalized discipline, Mosca deplored the underdevelopment of a true science of politics. On the one hand, he criticized the predominant weight of "vulgar beliefs": a priori judgments based on prejudices and nonsystematic evidence. On the other hand, he expressed his disapproval of the excessive influence of the legal disciplines, with their attention on the purely formal dimension of rules, or of ideologies (in particular the democratic ones). In his view, the scientific study of politics needed a profound renewal and should aim at identifying the general laws of political phenomena. This would require a rich empirical basis of observations as well as more sophisticated conceptual and theoretical tools. With regard to the problem of empirical evidence, Mosca thought that the great advances made by historical studies during the 19th century could be instrumental in providing a systematic source of data. The idea that political science could directly produce its own data was not yet in his mind. The problem was to make good use of these empirical materials, and the key to accomplishing this was to discover behind appearances and purely legal schemes what the true mechanisms of political life were.

Starting from a criticism of the traditional Aristotelian classification of regimes based on the number of rulers, Mosca formulated a sort of iron law of politics. According to this "law," all regimes, in spite of their variable legal formulations and institutional arrangements, were ruled by a "political class." What characterized the political class was the relatively small number of its members, the superiority of their moral resources, and, in particular, the organizational factor that enabled a cohesive minority to prevail over the "great numbers" who were lacking the organizational instruments needed to act purposively and cohesively (*Teorica dei Governi*, chap. 1). Having affirmed that these were the common features of all political classes, Mosca then specified that variations were essentially determined by the peculiar qualities of each political class. If membership to a political class is always motivated by a natural passion for power, the special resources or qualities that enable an individual to be a part of that class vary according to the stages of civilization. Different types of political classes are defined by the specific resources—military force, economic wealth, family ties, personal merit, and ability to win the support of the voters—that characterize them. In his first work, Mosca developed also another important theme for the theory of the political class, what he called the "political formula" (*formula politica*). With this concept, he designated the specific discourse that any political class uses to justify its political power and to establish its legitimacy. Mosca was keen to affirm that, contrary to commonly held beliefs, these legal, moral, and political arguments were not the real bases of political power. In fact, they served more as instruments for disguising the real source of power. At the same time, they played a far from negligible role in promoting broader bases of consent for an existing power arrangement.

These original ideas were further developed by Mosca in his later work (*Elementi di Scienza Politica* [The Ruling Class], 1895/1923) but without many fundamental changes. There, he more clearly stated his criticism against traditional classifications of regimes such as those that consider the possibility that one person (monarchy) or the majority of the people (democracy) rule a country. In both cases, this is only the appearance, while the reality is that of a government by a small group that either enables the monarch to actually govern a country or takes the place of the people in the real conduct of decisions (Pt. 1, chap. 2). The circulation of political classes is another important topic in the theory of the political class. If old political classes decline and new ones take their place, how is this process to be explained? According to Mosca's perspective, this discussion hinges on the analysis of the specific resources that characterize each political class. The crucial factor for the continuity of a political class is the ability of the ruling class to maintain its control over critical resources. Conversely, what determines its substitution is the ruling class's inability to face the challenge of a new class, which in turn proves more able to exploit new, more effective resources. Political classes tend to close themselves to external influences and thus run the risk of a progressive impoverishment; this leaves space for the rise of new groups that control the new resources that have become more important following the changes in the state of civilization. In this discussion, the temporal perspective adopted is grandiose: It stretches from the antiquity of Assyrians, Greeks, and Romans to the feudal ages, to recent developments of representative democracy. It is not the small changes taking place over the years or decades but the macrotransformations developing over centuries that stimulated the interest of Mosca.

In the second part of his later and more mature work, the *Elementi di Scienza Politica*, Mosca addressed a possible criticism of his theory of the political class—that is, that it was based on an extreme level of generalization. If every political system is, by definition, ruled by a political class that also determines its life and death, the risk of ending up in a circular and dogmatic reasoning may indeed be significant. To avoid this, Mosca suggested that further systematic studies be done to analyze both the constant and the variable features of political classes. Mosca felt that such studies would have highlighted the differences among political classes and would have revealed the reasons for their duration or their downfall (*Elementi*, Pt. 2, chap. 1). In the chapters that followed, Mosca started to explore the development of different political classes but still on a very broad historical scale. In his analysis, Mosca used four conceptual categories (autocratic, liberal, aristocratic, and democratic) and proposed two pairs of alternatives (autocratic/liberal and aristocratic/democratic). With the first pair, Mosca distinguished between a regime based on power originating from above (autocracy) and one based on power originating from below (liberalism); with the second pair, he distinguished between regimes based on the tendency of the ruling class to be closed toward the outside (the aristocratic principle) or to be open to new entrants (the democratic principle).

In about the same period, another Italian scholar proposed a not too different version of the theory of the political class. The sociologist Vilfredo Pareto (1848–1923), a former business manager with a scientific background, developed an ambitious general theory of society in his *Trattato di Sociologia Generale* (The Mind and Society; 1916). Some of the basic points had been already anticipated by him in a 1903 book, *Les systèmes socialistes* (The Socialist Systems), as well as in other articles, and he and Mosca contended rather polemically about the original authorship of the idea. Pareto, who preferred the term *elite* to that of *political class*, attempted a more formalized and systematic theory of societies and of the corresponding elites. His theory started from an analysis of individual behavior and incorporated many elements of a psychology of social action. Yet, in spite of all the differences, he shared with Mosca (and with some of his contemporaries) some central features and themes, such as the need to distinguish between reality and the ideological embellishment of it, the "grand theory" approach embracing the whole known history of mankind as a source of evidence, and many ideas about the circulation of elites/political classes. While Mosca had stressed the significance of the organizational factor for the predominance of the political class, Pareto was keener to discuss the different types of qualities (*residui* as he defined them) that different elites would share. Not very dissimilar from Mosca, he too developed the theme of the instruments of justification (which he called *derivazioni*) that elites use to manipulate the masses and to strengthen their domination over them.

The grand theory approach adopted by both Mosca and Pareto was indeed fascinating and probably contributed to the appeal of their concepts. However, it also produced some significant shortcomings that reduced the final impact of their contribution to contemporary political science. Probably the most important one is that the level of abstraction of their analysis was such that a true empirical testing and refutation of their "laws" proved almost impossible. Moreover, the evidence used by the two authors was essentially secondary and was drawn from historical researches of a very broad range. Their analysis thus depended essentially on "data" that had not been collected with their specific purpose in mind and therefore were not always really suitable for offering a sound empirical support to their theories. This lack of empirical data collected explicitly for the analysis of the political class was a particularly serious handicap for a correct interpretation of the new developments of political life that were taking place as a result of the processes of democratization and parliamentarization (which both Mosca and Pareto observed with a high degree of skepticism). It must also be added that their theory, which started from a well-grounded criticism of the legalistic analysis of institutions, went too far in the opposite direction and therefore missed a crucial element for the understanding of the new democratic regimes: the interrelationships between institutions and political actors. The seminal importance of their ideas remains, however, unaffected by these shortcomings, and the theory of the political class contributed to producing a true revolution in the study of politics.

Around the same time, other authors were applying their basic ideas to a more middle-range level of analysis and thus brought the theory of the political class closer to empirical reality. Moisei Ostrogorski (*La Democratie Et Les Partis Politiques* [Democracy and Political Parties], 1902) and Robert Michels (*Soziologie des Parteiwesens* [On the Sociology of Political Parties], 1911) most significantly contributed to the development of a systematic analysis of the new phenomenon of the organized mass parties that were beginning to leave a strong mark on political life in the United States and in some countries of Europe. In the analysis of these new political actors, these authors paid special attention to the "political class" that was produced within the parties and to the novel features it displayed. Michels's contribution had a particularly significant impact on the growing debate about the nature and working of modern democracy and the role within it of one of its crucial actors, the party. His book on the sociology of the political party was a work drawing on the direct observation of real parties and thus based on empirical evidence that was much closer to real-life politics than that used by Mosca and Pareto. Taking the socialist parties and in particular the German Social Democratic Party (Sozialdemokratische Partei Deutschlands, SPD) as the main source of his evidence, the German Italian author sought to demonstrate that even in the most apparently democratic parties, the predominance of a small group of more powerful people could not be avoided. He thus found a sounder empirical support for Mosca's and Pareto's ideas. Michels highlighted that while "in theory" the whole governing process in the socialist parties was regulated according to democratic principles, in practice the elected officials who ruled these large organizations were "driving" the democratic process of selection and, thanks to their resources and position, could manipulate the choices of the great mass of party members. Organization and its logic were, in fact, prevailing over democracy in the real working of the party. Michels, then, making good use of his deep insider's knowledge of the working of the socialist parties of Europe, could show the concrete mechanisms that were offering the leaders an overwhelming position of advantage vis-à-vis the common members. Elements such as duration in office, better education, and technical competence all contributed to the creation of a strong power differential between the party professionals and the rank and file.

Some of the consequences for democracy that Michels had inferred from his findings have been since then seriously questioned. In particular, the skeptical conclusions about the possibility of democracy that he derived on the basis of his observation of the inner life of parties have been found to be insufficiently grounded (e.g., by Seymour Lipset in his 1962 introduction to the American translation of Michels's book). An important stream of reflections on the working mechanisms of contemporary democracy, developed in the wake of Joseph Schumpeter by Robert Dahl, Giovanni Sartori, and Juan Linz, have highlighted the need to distinguish between "democracy within a party" and "democracy among the parties." If democracy within the parties may indeed be contradicted by the existence of an internal oligarchy, democracy as a system of responsible and responsive government, instead, depends on the existence of healthy competition among parties, which makes them responsive to the demands of the electorate. The theory of competitive democracy can therefore incorporate the existence of elites/political classes, provided that their pluralism is ensured and that all the institutional mechanisms of electoral competition are fully working. Whatever the shortcomings of his analysis, it can be rightly said that Michels's work has made a crucial contribution to the empirical study of parties and of their organization, a field that has become one of the major areas of contemporary political science.

Along not too dissimilar lines and around the same time, in his lecture at the University of Munich on *Politik als Beruf* (*Politics as a Vocation*, 1918), Max Weber (1864–1920) was bringing into light the role of the professional politician. In his view, both the modern state and representative government increasingly needed a stratum of politicians fully dedicated to the performance of public functions. In modern representative systems, to count on "rentiers" and "amateurs" as the preferential recruitment pool of politicians, as had been common in the past, was for a number of reasons becoming both impossible and unacceptable. The situation required the development of a class of professional politicians living not only "for politics" but also "off politics"—drawing their economic resources from paid public office. In the requirements of the large organizations of modern times, Weber saw the development of a new class of politicians who would find in politics not only their main engagement but also a very concrete economic interest. Politics was, in many ways, becoming a profession, thus coming to share some of the typical features of any other professional career.

After the "Classics"

In Europe, these early developments of a new political science and of themes crucial for the understanding of modern political regimes were to a large extent stymied by the advent of totalitarian or authoritarian regimes, which made the life of this scientific discipline increasingly difficult. In the United States, however, the development of political science could continue uninterrupted, and some of the stimuli of the theories of the political class could find a fertile terrain. Harold Lasswell's book *Politics: Who Gets What, When, How* (1936) and James Burnham's *The Machiavellians* (1943) were very much under this influence. After World War II, a rediscovery of the "elitists," as they were sometimes collectively called, also became possible in Europe. This rediscovery had to overcome some not entirely unfounded criticisms about their alleged sympathies for authoritarian leaders and their more well-documented skepticism about democracy. But the themes they had addressed soon regained the foreground in contemporary political science.

The new developments of what we may call the "postclassic studies of the political class" took two different directions. On the one hand, there was a continuation of macropolitical analyses of contemporary societies guided by the aspiration to detect which were their "ruling minorities" and to discuss how much this phenomenon could be seen as compatible with democracy. This line of research has had important spillovers on the scientific debate about the interpretation of contemporary democracy and the understanding of its central mechanisms. On the other hand, a new stream of micropolitical analyses of the components of the political classes of democratic regimes (but also of some nondemocratic regimes) and of their distinguishing features began to burgeon. This second stream could take advantage of the behavioral revolution and of its program of quantitatively oriented empirical analysis conducted on the individual level.

In the first direction, a series of studies flourished in the 1950s and 1960s that were intent on detecting who were the real rulers of Western societies behind the appearances of democracy. C. Wright Mills's book *The Power Elite* (1956) had a special influence on this perspective. Contrary to the pluralist theories describing an equilibrium among a broad range of interests, Mills tried to demonstrate that a coalition of top managers of economic firms, high-level military officers, and government politicians, closely linked by similar social backgrounds and institutional proximity, was creating a new "superelite" that was able to dominate the political life of the United States. This type of studies had to face criticisms that are not too dissimilar from those addressed to the classics of elitism. Among them, particularly relevant is the criticism pointing at the difficulty of empirically validating or invalidating the central hypothesis of these studies—that is, the existence of a united group of rulers acting cohesively. Other works have tried to challenge Mills's theory by way of a more empirical analysis of concrete political situations. An example of special importance was the book *Who Governs?* by Dahl (1961), which moved the analysis more clearly toward the empirical ground and could be seen as a response to Mills. Other books (e.g., *Who Rules America?* by G. William Domhoff, 1967) and discussions followed, but this stream of studies has progressively exhausted itself.

Partially linked to this discussion is the debate about the nature of contemporary democracy that developed after World War II. The central theme of the debate has concerned the defining elements of this political regime and the compatibility between the existence of a relatively small number of individuals (elite/political class) who occupy the positions of power and thus rule over the greatest mass of people and the deontological tenets of the democratic idea. Against the positions of those who see in the existence of elites a denial of the principles of equality and popular government and consequently of democracy itself, there emerges the theory of "competitive democracy." This theory argues for the need to reformulate the concept of democracy from that of "a government of the people" to that of "a government controlled by the people," wherein the existence of a political class is not an obstacle provided that it has a plural character. When these conditions are satisfied, competition among the components of the political class enables the citizens to have a choice and thus to trigger the mechanism of responsiveness by which the rulers are compelled to respond to the demands of the people. The activation of this response mechanism becomes the real substance of modern democracy. This new concept of democracy, which finds its foundations in Schumpeter's original formulation (*Capitalism, Socialism and Democracy*, 1942) and is further developed by, among others, Sartori (*Theory of Democracy Revisited*, 1987), has become the predominant paradigm in contemporary political science and has originated a large stream of theoretical and empirical research elaborating on the relationship between rulers and the ruled.

On a somewhat less general level of analysis, we must also highlight the persisting exchanges between the theory of the political class and the study of parties. This is not new, as the two domains of research have shown a significant degree of proximity since Ostrogorski and Michels. The reasons are rather evident: Parties as crucial actors in contemporary democracies contribute significantly to the formation, selection, and structuring of the political class. While Michels concentrated his attention on the (oligarchic) structure that party elites acquired in the mass parties, other approaches have focused on the variable features that the leading party personnel display. These approaches have used this facet as a crucial element for identifying different party types. Starting with Weber and his analysis of the party of notables (the *Honoratioren Partei*), a stream of political scientists from Maurice Duverger to Otto Kirchheimer, Angelo Panebianco, and finally Richard Katz and Peter Mair have highlighted the parallels between changes in the modes of electoral representation, patterns of social embeddedness, and linkages with democratic institutions that characterize the different types of parties (the parliamentary party, the organized mass party, the catchall party, the electoral-professional party, and the cartel party) and the types of politicians they produce (notables, party bureaucrats, professionals of electoral and media techniques, politicians entrenched in public office, etc.). Such typological exercises have opened the way to interesting explorations on the mutable resources, constraints, perspectives, and goals that characterize the different types of party politicians and contribute to explaining their behavior and that of their parties.

Empirical Studies of the Political Class

In a more strictly empirical direction, the theory of the political class has stimulated a large stream of studies that have engaged in the analysis of the components of the stratum of politicians who occupy the top places of democracies and other regimes. From the high peaks of the grand theory of the "classics," these studies have descended to explore the terrain of the specific individuals who compose the political class and of their observable features. The highly abstract hypotheses and generalizations of Mosca and Pareto have been translated into empirical puzzles. For understandable reasons and particularly for their greater openness to public scrutiny, the political classes of democratic regimes have received a comparatively greater coverage. But some important studies of the communist elites, or of military rulers, have also been conducted.

A crucial problem that empirical studies of the political class have had to face is that of the identification of its components. Who are the members of the political class? Where are the borders to be drawn between those who belong to it and those who do not? How large is its membership? These questions have an obvious methodological dimension: When we want to study the political class of a country and analyze its specific features, how can we identify its components? To solve these dilemmas, empirical studies have typically adopted one of three methods: the positional, the reputational, and the decisional one. According to the first method, members of the political class are essentially defined by the position(s) they hold: a seat in parliament, a ministerial office, membership of a party executive committee, and so on. According to the second, the reputation is the best way to ascertain who are the members of the political class: By asking people who are knowledgeable and close to the top to indicate those who exert the greatest influence in a given country and by selecting the names that obtain the greatest numbers of nominations, it is possible to identify the members of the ruling elite. The third method identifies the members of the political class by looking at the decision-making processes and finding out who takes a dominant part in it. The three approaches are based on somewhat different theoretical interpretations of politics itself, and each of them has practical advantages and shortcomings. The positional method is based on the idea that political power in advanced societies is typically embedded in institutions and that institutional positions are thus fairly dependable indicators of a powerful role. An obvious advantage of this method is that, in general, it is fairly easy to identify the positions and the persons occupying them. This method, however, underestimates the potential relevance of noninstitutional positions, of informal power, and may then run the risk of overestimating the importance of some formal positions. The reputational method rests on the assumption that influence is based on an informal relational system rather than on the holding of formal positions of authority and that its reality is well perceived by informed observers. This method seems better suited to catch the "real" dimension of power and to avoid some of the pitfalls of the other method; it enables the observer to go beyond the formal appearances that exist in every regime and get to the true substance of power. However, it is much more laborious than the positional method, and the quality of its results obviously depends on the good selection of those asked to nominate the elite members. Reputations can also be inflated and may not always fully correspond to the reality of power. As for the decisional method, it is based on the idea that power is best evidenced by the ability to take part in decisions and to influence them. A careful analysis of decision-making processes generally enables us to identify, with sufficient precision, those who play a leading role. The main problem with this method is that the number of decisions taken in any political system is high and scrutinizing all of them (or even a sample) is a very demanding task. In the end, in spite of some of its weaknesses, the positional approach has in fact dominated the empirical studies of the political class, particularly when they are applied on a large, comparative, and diachronic scale. The other methods have found greater usefulness for studies of an intensive nature conducted on a smaller scale, such as community studies or policy studies.

When concerned with democratic political systems, empirical studies have predominantly, although not exclusively, concentrated their attention on the holders of positions in elected assemblies. Because of their seats in the highest democratic institution, endowed with functions of representation, lawmaking, and executive oversight, and because of their role in the electoral process, members of parliaments are quite obviously an interesting target for the study of the political class. At the same time, because of the public role of parliamentary institutions, information about the backgrounds, careers, personal features, and preferences of members is generally quite abundant and easy to exploit for the purpose of large-scale studies. As a consequence, in most of the advanced democracies, systematic studies of legislators have been conducted from the 1960s onward. These studies have typically explored the variables pertaining to personal information and the social lives of politicians, such as age, gender, education, professional background, regional origin, and religious affiliation, or to aspects of their political professionalization, such as party affiliation, steps in the local and national political career, seniority in office, and so on (Robert Putnam, 1976). The availability of a rich series of comparative and longitudinal studies of members of parliament has enabled us to discover the existence of significant variations in the features of the members of the political class across countries and political parties over time. The empirical data derived from these studies can be used to identify and explore the factors at work in the recruitment process through which the political class is reproduced (Pippa Norris, 1997) as well as its degree of stability and change. In a more general sense, they provide useful indicators for exploring the transformations of political representation and of the relationships between citizens and rulers (Maurizio Cotta & Heinrich Best, 2007).

Whereas studies adopting what we may call the "input perspective" (who are the members of the political class and to what extent do they represent/mirror society) have been numerous and systematic, at least for established democracies, the empirical coverage of the "output perspective" (what they think and how they behave) has been much less complete. The attitudes and preferences of elected politicians have been the object of empirical research but typically on a single-country basis and without longitudinal continuity: Such studies are obviously more costly as they require interviews or content analysis. Studies systematically comparing attitudes across countries are much rarer. The same can be said about the attempts to explicitly study the output side and to analyze the consequences in the field of policy making of the variable features of the parliamentary elites. At this level, our knowledge is still extremely limited, but some interesting advances have been made recently with regard to the effects of the presence of women in parliamentary assemblies on policy making.

Empirical studies have also explored the features of other groups that may be legitimately included in the concept of political class, for instance, party leaders and party cadres that do not have parliamentary positions or the high strata of public bureaucracies (Joel Aberbach, Robert Putnam, & Bert Rockman, 1981). Such studies, however, have typically been less comprehensive than those dealing with parliamentarians as the information about these categories is much less handy and systematic.

Conclusion

A comprehensive evaluation of the impact of the concept and theory of the political class on the study of politics would require specific and systematic research, which is yet to be done. Some tentative remarks can, however, be advanced here. There are not many doubts that the basic idea that "the men [and increasingly the women] at the top" are a crucial object of study for anyone who wants to understand the functioning of political life has been a milestone in political science. And the same can be said about the contention that we cannot be happy with the study of the legal definition of governing institutions alone and that we must look at the individuals who make them work. In this sense, the classical theorists of the political class have anticipated some of what, half a century later, has been among the central components of the "manifesto" of the behavioral revolution of the 1950s. The aspiration of Mosca and Pareto to build a general theory of politics based on the concept of political class has, however, proven less easy to attain than expected. To move from the high level of generality of the basic proposition that the "organized few" are able to prevail over the "nonorganized many" to a set of interconnected propositions, establishing the relationships between the features of the political class and the different models of political life, has proven much more exacting than anticipated. We do not have yet a general empirical theory of politics based on this idea. However, thanks to this stimulus, we have gained a much wider knowledge about who the members of the political class are, where they come from, how they are recruited, what their views and ambitions are, and how they behave. We have also gained a much better view of the degree of variation in the basic features of the political classes across different periods, countries, and regimes. We know also a lot more about the internal dynamics of pluralist political classes. Moreover, important elements of a theory of the political class have been incorporated into the predominant interpretation of contemporary democracy as a regime based on competition among the elites.

Finally, and with regard to more recent theoretical developments in political science, it is not completely unwarranted to draw some significant connections between the theory of the political class and the rational choice approach, which in the past decades has acquired an increasing importance in political science. This may not be immediately clear, but a closer look at some of the crucial aspects of the rational choice theory can show some of the connections between this more recent development in political science and the "old theory" of the political class. On a rather general level, we can observe that in both cases there is the ambition of building an encompassing theoretical paradigm for the understanding of political life. Moreover, rational choice also prescribes that we should probe beyond the formal crust of political entities to analyze the motives and objectives of the concrete individuals existing behind them. On a more specific point, we can add that rational choice theory has in fact found its greatest successes when applied to the sphere of politicians, of those who live for politics—that is, the political class—rather than for the common people. This has to do with the basic assumption on which this theory has been built, that of rational action: The general (but in itself empty) principle that the behavior of individuals is guided by the choice of the means that will maximize utility becomes much more relevant when the preferences (and the goals) of the individuals can be well specified and when it is possible to assume that the individuals will have a sufficient knowledge of the situation (i.e., of the constraints, the means that can produce the expected ends, etc.). This is clearly a much more realistic description of the situation of the political class (i.e., of the most professionalized section of the political system) than that of the great mass of other individuals who devote much more limited attention to the political processes and have much lower levels of purposiveness in their actions. The theory of rational choice is then particularly interesting for interpreting the games the political class plays: the coalition-making games in parliamentary governments with multiparty systems and the lawmaking games within legislatures or, on the international scene, the strategic games between countries. If this is true, the relevance of the theory of the political class is still alive.

POLITICAL COMMUNICATION

It is not easy to define the boundaries of the field of political communication. The existing literature tries to limit the field as being characterized by the interaction of three main actors: political actors, the mass media, and the public. A fourth dimension is usually added to better define the field: The subjects of the exchange that takes place in political communication are related to matters of general interest. But even with this last addition, the field remains uncertain and difficult to be captured within a single definition. Indeed, all the different dimensions that are used remain vague and ambiguous and may be the subjects of different approaches and theoretical fields: How do we define political actors? Who are they? Are union leaders political actors? And what about interest group spokespersons? Are they political actors? Does what these actors accomplish concern the field of political communication? Or does it belong to the field of public relations? Similar questions may be raised with regard to each of the other defining dimensions. This entry discusses the development of political communication as a subfield of political science, its relationship to neighboring disciplines, and recent tendencies with regard to technological changes and their impact on different spheres of political life.

Because of the vagueness of the dimensions that have been mentioned above, very often political communication is defined, even if with different words in relation to the specific approaches that are chosen, as a field placed at the intersection of the four dimensions just listed: That is, political communication regards the exchange of contents on matters of public interest that involve citizens, social actors, and the mass media. The components of this tentative definition are not self-exclusive—that is, even if one of these components is missing, we can still be facing "a political communication event." Citizens can be absent in a particular event, and notwithstanding that, media and political actors may interact on issues of general interest. Similarly, political actors may be involved in an exchange with citizens on issues of general interest, but this interaction may take place without the mass media.

In spite of its general character that, as we shall see later, leaves the field open to different interpretations that may include a plurality of social events and situations, this definition is marked by a characteristic that seems to be more important than that of the others: Political communication deals with issues of general interest or at least with issues that may gain some sort of relevance in public interest. It may be too easy to state that political communication deals with "ruling the community," but this seems to be its inner nature. Affairs of general interest can be treated by different actors and in different ways so that the other defining components may be useful as they help restrict and define better the field of pertinence.

The Nerves of Government is the title of a seminal work by Karl Deutsch published in 1963. This book clearly shows the importance of communication in government, not just as an expression of conflicting interests but as an essential instrument to rule the community, to produce an informed citizenry, and to reach a higher level of social efficiency. Even if some scholars do not see this book as such, *The Nerves of Government* can be viewed as a text of political communication that without any doubt demonstrates the narrow links existing between political communication and themes of general interest: Ruling the community implies necessarily a continuous activity of communication either when it implies conflict or when it is aimed at a better level of social efficiency. Government needs an appropriate communication strategy that may help in solving the problems of the society. *The Nerves of Government* may have a dubious placement within the field of political communication as the matters it deals with do not imply conflict. Indeed, for most scholars, political communication presents another important feature: It deals with controversial issues about which there are different and conflicting views and positions. For some scholars, this is what differentiates political communication from other forms of communication and specifically from what is defined to be "public communication": Political communication deals with controversial issues about which conflicting views exist, whereas public or institutional communication regards issues about which there is a wider general agreement.

To conclude this defining attempt, political communication is about power. It deals with the distribution of power among different competing views, actors, and interests. Power is what mostly differentiates political communication from other forms of communications: Advertising is about goods and audience, journalism is about news (even if with many overlaps with political communication), and so on. Political communication is about power in society. The narrow relationship of political communication with power implies either a struggle or, as happens mostly in democracies, some sort of negotiation and reciprocal adjustment between competing needs, requests, and interests. Therefore, political communication always implies an exchange: Either it prepares the ground for possible negotiations or its final product is an agreement that comes out of a process of negotiation that takes place through different means of communication.

This brief discussion highlights one main point: Political communication is a very broad field that can be dealt with from different points of view and that may involve different aspects. From a scholarly point of view (i.e., from the point of view of those who study political communication), there are three main areas within the broader field: communication processes, structural tendencies, and production aspects. The area of *communication processes* represents the most traditional and deeply rooted area as it deals with the analysis of communicative exchanges. Indeed, it is possible to include here all those exchanges that take place between the three actors mentioned at the beginning: political actors, citizens, and mass media, even if all of them do not necessarilyhave to be included at the same time in each exchange situation.

The result of each communication event may influence the allocation of power in society, and this is why this specific area has always been the core of every political communication approach. Indeed, it is possible to include within this area all the most prominent aspects of the field, from political socialization to election campaigns, from persuasion to rhetoric, and from interpersonal communication to chat groups on the Internet. In particular, two main domains seem to constitute the core of this area: (1) the study of the content and (2) the study of the effects. Both these domains have featured most prominently in political communication research since its inception following different approaches: The forms, structures, and content of political communication have been the main subjects of many scholars. The research by Harold Lasswell on the symbols and the language of politics has strongly contributed to establish the field of political science as such. More recently, Murray Edelman has further developed this kind of research on the importance of symbols in politics, while other scholars have focused their interest on quantitative content analysis of political messages.

The study of the effects of messages has occasioned the establishment of a new discipline: communication studies. The effects of political communication were among the fields most covered by those who contributed to establishing the new discipline: Paul Lazarsfeld, for example, is a prominent figure in the history of the social sciences. His works largely focused on political communication: *The People's Choice*, written with Bernard Berelson and Hazel Gaudet in 1944, and *Personal Influence*, written with Elihu Katz in 1995, are milestones not just in political communication research but in media studies and sociology in general. In the first book, Lazarsfeld, Berelson, and Gaudet point out the essentially confirmatory role that mass communication has on voters' behavior, while the second book contributed to overcoming the previous view of the so-called powerful media, pointing out how the mass media were acting in a more complicated way than was previously thought: The message does not reach the citizen directly but involves other figures as well, in particular the so-called opinion leaders.

Under the label *structural tendencies*, it is possible to list all the research that focuses on the changes that political communication is undergoing. The main tendency appears to be toward the so-called mediatization of politics: The logic of the mass media strongly affects the structures and the discourse of politics in a way that is even changing political participation. In the view of Gianpetro Mazzoleni and Winfried Schultz, mediatized politics is politics that has lost its autonomy, has become dependent in its central functions on mass media, and is continuously shaped by interactions with mass media.

In the most recent period, scholars have stressed different evolutions related to the mediatization of politics: Political communication is changing because a process of *professionalization* is taking place. This is a very dramatic change because it stresses also an even more important change in the way in which social interests are organized and represented. Indeed, professionalization of political communication is taking place as the traditional mass parties are weakening and almost disappearing in some cases: Politics itself is changing. Political parties often are no longer able to support candidates during election campaigns, and they are not linked any more to citizens/voters through the "affiliation vote," which established solid and long-lasting channels of communication between mass parties and citizens. Angelo Panebianco summarized this shift under the label "electoral–professional party": Progressively, the most traditional, Western-type mass parties were losing ground in the face of a new form of political aggregation, the electoral–professional party. The intervention of professionals particularly skilled in communication and polling is required to reach the citizen/voter, who acts and decides to no longer be bound to mass parties through stable links but to essentially be placed in a situation that many define as a "market," in which the traditional instruments of the market are required and used. Marketing strategies and professionals able to apply these strategies are required.

Other tendencies emerge as well. First of all, there is general agreement about the increasing *personalization of politics*. Individual politicians are taking the place so far occupied by political parties. This tendency, too, highlights the process of transformation of mass parties: Their weakening leaves room for the personalization of politics, which is enhanced also by the increasing role of the mass media, and particularly of television, as agents of political socialization. This process of personalization of politics is said to be a part of the so-called *Americanization of politics*, which affects different political communication activities linked to the electoral choice. Together with the process of personalization of politics, many scholars have devoted their attention to a similar process taking place in the equilibrium of political power: The process of *presidentialization* highlights how powers are shifting from parliament and government to the single figure of the president. Beyond the reasons related to the structural transformations in government, many scholars stress the increasing role of the mass media that allows the president to talk and interact directly with the people, which, in turn, focuses the main attention of the mass media on the president.

Production aspects include all research that looks at how political communication is conceived and produced. Production aspects concern mainly, but not exclusively, the area of journalism and its relationship with the political system. News gathering and news processing are important moments in the production of political news: the moment of the interaction with sources of information (news gathering) and the moment in which news items are selected and become stories for the print and electronic media (news processing).

Many other studies have been conducted on how election campaigns are run: which communication strategies are adopted, how decisions are taken, which kinds of professionals are involved, and how the messages are decided, conceived, and passed on to the public. Much of this research has a very important comparative focus, trying to stress the differences and similarities among countries. In this area as well, Americanization seems to be a very widespread interpretive hypothesis: Election campaigns worldwide seem to have become more and more similar as they are applying all the strategies and procedures already used in the United States.

The Approaches

From what has been said so far, it may appear clear that political communication research represents an interdisciplinary endeavor as it deals with different areas of society and with more general processes of change. Since its beginnings, scholars from different disciplines had devoted their attention to the field that today is called political communication. Indeed, the first look at this field was by psychologists and students of propaganda. The seminal study by Sergei Tchackhotine originally published in 1938 may be considered as the first work entirely devoted to the analysis of propaganda techniques; it was strongly affected by behaviorism, an approach that in those years was influencing the entire field of psychology. Many works by other psychologists were then devoted to what in those years was not yet called political communication. The propaganda label was indeed coming from the perception, very diffuse in those years, of the enormous power of the new propaganda techniques that political structures and systems in different countries were developing. This perception was the fruit of both the behaviorist approach that was used to observe this phenomenon (which stressed the causal relationship between a single stimulus and its consequence) and the experience that the entire world was passing through in those years. Indeed, the works by Tchackhotine and those by many other scholars were devoting a lot of attention to the propaganda machines of Soviet Russia and Nazi Germany. To many observers, these experiences seemed to stress the enormous power of persuasion reached through the use of new techniques such as cinema and radio, with the support of suggestions coming from developments in psychology.

In those first years, persuasion and propaganda were the catchall words used to designate what today is called political communication. Of course, there were differences both in the way in which these phenomena were observed and studied and in the way the communication process itself was taking place. Psychologists were among the first scholars to study how political power was trying to influence the life of citizens, and for many years, psychology was the main approach employed to observe communication processes in government and politics. The sociological approach to political communication was born out of psychology. As already mentioned, the founding fathers of the discipline themselves were deeply affected by psychology: Paul Lazarsfeld in his first works was influenced by the works of the psychologists Harold Lasswell and Carl Howland. All of them devoted great attention to political communication while studying other forms of communication as well. Both psychology and sociology look at the interactions between single persons and between persons and means of communication, but from different points of view: Psychology is interested in looking at the inner motives that push single persons and groups to react in a particular way to the message; sociology gives to these processes a more cumulative view, looking for the variables existing in the social structure that may affect a particular reaction. Moreover, sociology looks at the consequences and the transformations produced by political communication in the society at large.

Political scientists, too, devote great attention to political communication. In a way, it can be said that the field of political communication research itself, as we know it today, was established by political scientists. Indeed, their focus has been on the relationship between political institutions and communication: They have been interested in the consequences produced by political communication on political institutions and in the way in which political institutions communicate and organize to communicate. While sociologists studying political communication look at variables derived from the observation of society at large, including political variables, political scientists give communication a more focused attention: They look essentially at the way in which communication affects the distribution of power in society.

Semiotics and linguistics also have paid attention to political communication. In particular, both these approaches have been interested in looking at the content and structure of political messages, developing specific methods, such as discourse analysis, aimed at the analysis of these kinds of messages. While both these approaches have been able to highlight specific features of political communication, their interaction with other scientific domains has been limited in spite of the fact that their results could be very useful to integrate and complete the outcome of other approaches. Indeed, political communication is undoubtedly an interdisciplinary field placed at the intersection of different social forces and activities producing consequences that relate to different scientific domains.

Three Phases of Political Communication

Political communication has dramatically changed over the years. This change has become even more rapid following the introduction of new technologies. In 1999, Jay Blumler and Dennis Kavanagh proposed a distinction between three main phases in the evolution of political communication that has been adopted by many other scholars and that can also illustrate the more recent tendencies in the field even if the original Blumler and Kavanagh formulation was not able to take into account the dramatic and fast changes created by the Internet. The first phase covers the first 2 decades after World War II, which many political scientists also define as "the golden age of mass parties." Indeed, this period was characterized by the important role played by mass parties: These were organizational machines with thousands of employees and activists, with offices spread all over the national territory. These organizations also performed important communication functions: publishing newspapers, organizing meetings and demonstrations, and carrying out general networking. During this period, interpersonal communication was the main way to reach citizens and party activists, and party employees played the main role in diffusing the ideas of political parties and in mobilizing consensus. Even if other means of communication (e.g., radio or newspapers, very often bound to the party organizations themselves) existed, nevertheless, local circuits of relationships were very important and interpersonal relations represented the main channel to reach citizens who were linked to party organizations by deep-rooted and well-established ideological and cultural affiliations. Party offices and meetings and organizations in charge of a wide range of activities, from sports to culture and from leisure organizations to educational structures, represented the occasions for establishing and reinforcing networks that were mostly based on interpersonal knowledge and recognition. In these instances, communication was mostly aimed at reinforcing the existing links and opinions as voters rarely changed their electoral decisions. Messages had little innovative content: They were limited to repeating what citizens already knew and shared; they also attacked and painted in the worst possible manner the competitors, reinforcing the already existing feelings and opinions.

In spite of the widespread use of what today is called "negative campaigning" and determined by this continuous attempt to reinforce preexisting feelings, political institutions, both government and political parties, enjoyed a high level of confidence and trust. They were not just important organizational machines but also represented trustworthy organizations to which citizens turned for support in a plurality of different situations. Voter volatility was limited, and ideological changes were not very frequent: Political values were quite stable and well rooted in political imagery.

Just as the first phase has been termed *the golden age of mass parties*, the second one may be called "the age of television." While progressively the mass media have replaced interpersonal communication as the principal sources of political socialization, television has achieved prominence among these sources. Structures and forms of political communication change dramatically because society is changing as well: The process of secularization and greater social mobility weaken the role of mass parties that transfer to the mass media, and particularly to television, the communication and socialization functions they were performing previously. This has a major consequence: The existing links between citizens and party organizations lose ground, and therefore, communication strategies that up to that moment were basically aimed at reinforcement change direction. Now, the main aim of communication is to reach and persuade voters who are no longer firmly linked to a particular party. The notion of a voters' market enters the political arena: Citizens become willing to buy, among a number of similar products, the best "political offers" in the same way as they buy goods. Communication strategies follow this change: Messages are essentially aimed at conquering a "buyer" who is linked to particular information sources.

This change is not limited to elections, but the entire political life and government activities are affected by this change; the intrusiveness of the mass media forces many organizations to be better equipped to face the competition from other institutions and the mass media. The first consequence is the process of professionalization of political communication: The traditional figures of political activists and party bureaucrats are now substituted by professionals who are trained in different communication branches. Their expertise is no longer political; their links with political and government institutions are not based on their own political preferences. They are hired because they possess those skills and expertise that party machines are no longer able to offer to candidates competing for public positions. Government and public institutions, too, look for professionals to support their desire to win public support. This tendency is greatly enhanced by technological developments that make possible many new activities but that require specific skills that are no longer provided by traditional political organizations. Words such as *political consultant*, *pollster*, *fund-raiser*, *spin doctor*, and so on become common in political communication as political parties lose ground and single candidates need to be supported by their own electoral machines. Scholars have described this as a shift from "labor-intensive campaigns" to "capital-intensive campaigns"; while in the first phase, the support of party members and activists was essential to run a campaign, in the second phase, money becomes essential to pay all those professionals who are able to get the best possible result out of new technologies and media communication. Most important, money becomes essential to buy airtime for political advertisements.

These changes do not concern election campaigns alone, but the entire spectrum of political and government institutions is deeply affected by the increasing role of mass media and particularly of television. At the same time, the idea of "permanent campaign" emphasizes that the new media environment does not allow communication strategies to be limited to the electoral momentum: candidates, political and government institutions, and public administrations are placed under the control of mass media at all times and not just when they are competing for public offices. The continuous flow of opinion polls also represents an instrument through which all those who are interested in gaining public support can gauge how they are perceived by the people and then take the appropriate initiatives. Permanent campaigning indicates that support building is a continuous process that cannot be limited just to specific moments in time, such as elections.

The word *Americanization* has often been used to indicate these changes. Americanization can have a double meaning: On the one hand, it indicates that these changes took place first in the American political scene and that they have then been adopted in other social contexts; on the other hand, it indicates that there is some kind of influence either explicitly or implicitly played by the United States in exporting their cultural and political practices to other parts of the world, thus changing local cultures. Many studies have been carried out on the adoption of "American" techniques abroad and mostly on the involvement of American political consultants in other parts of the world, essentially in countries that are culturally and politically close to the United States.

Another tendency that emerged in the second phase of political communication and that becomes even more important in the third one is personalization. The progressive weakening of mass parties pushes the focus of political communication toward individual politicians. The ideological links that existed between party apparatuses and citizens are now replaced by the emotional and sympathetic feelings that leaders may establish with the citizens. The entire political life becomes organized around the figures of individual politicians: Political communication reinforces this tendency, which moves the focus of the political debate from ideology and programs to the individual features of those who animate public life. The existing borders between private and public life become blurred, and the electoral decision seems to be moved essentially by personal leadership characteristics. Political candidates are no longer judged on the basis of their political competencies and skills and on their leadership in running the government but, essentially, on their ability to meet the requirements of television discourse.

There are different reasons for this change: Institutionally, personalization is fostered by the changes taking place in electoral systems that in many countries place political figures at the center of electoral choice. For many scholars, mass communication plays a major role in this shift: The development of televised political advertisements makes it possible for individual candidates to enter the electoral arena even without the support of political parties. Candidates with their own money or with money coming from their supporters can buy directly from the networks the airtime that is necessary to reach the voters, and in this way, they can talk directly to them without the intermediation of party organizations. In many cases, candidates are even competing against the choices made by their own parties. In this way, the role of political parties is undermined, and the road toward personalization is fostered. The market-driven logic that moves the mass media system is another reason for the personalization of politics, as they are able to reach a wider audience. Personalization represents another component of the Americanization of politics and more precisely the Americanization of political communication. Indeed, while in Europe political parties still play a major role in influencing citizens' behavior and choice, weak political parties are a particular feature of the American political system, influencing the evolution of other political systems worldwide. All communication strategies are built around single political figures in a way that was first experienced in the United States.

For Blumler and Kavanagh, the third phase of political communication is characterized by the fragmentation of both the means of communication and the audiences. First of all, television offers many more channels: Everywhere, satellite TV, cable TV, and other forms of television come alongside the traditional terrestrial networks. There is also an increase in the television formats within which political communication takes place: Talk shows, infotainment, and docudramas offer politicians new opportunities to address their audience. For politicians, it is just a matter of choosing in which transmissions to appear, but at the same time, the opportunity to exercise control over other politicians also increases. It is essentially the development of the Internet that characterizes the third phase and that offers citizens many more opportunities to receive news and get in touch with other people. The increase in the number of sources of information determines the fragmentation of the audience with the development of different "publics" either interested in specific topics, attitudes, and problems or particularly linked to specific sources of information. The idea and the practice of a coherent mass audience that already during the second phase had undergone a process of fragmentation into different target groups are now almost completely disappearing: There are many publics in relationship to the increasing number of communication outlets. Each of these has different messages, producing an even more dramatic volatility of party affiliation and ideological and symbolical constructions.

Is Everything Alright With Political Communication Today?

In liberal theory, the major goal of political communication is to construct an informed citizenry that is able to consciously take the decisions regarding the ruling of the community. Is political communication able to accomplish this task? Political communication research demonstrates that there exist several problems in reaching this goal. An initial problem arises from the abundance of sources of information: There are too many messages in circulation that compete with each other to gain the attention of the citizens. In many cases, the consequence is a "lost" citizen unable to select among the plurality of messages that he or she gets every day. Very frequently, these messages are contradictory; they do not just compete with each other as is necessary in a democracy. Citizens are lost and confused because they are flooded with a very large number of messages from which they are not able to select the proper one or judge their reliability. The problem becomes even more serious with the Internet, which increases the number of sources of information whose reliability is even less verifiable.

To be noticed among this enormous quantity, each message tends to be increasingly simple and, at the same time, emotional: *Amusing Ourselves to Death* was the title of a book by Neil Postman that has become one of the most important reference books in all communication sciences. Even if Postman was not dealing just with political communication, his book gave a very valuable insight on how the tendency toward entertainment, derived from the increasingly important role of the mass media, and particularly television, was changing the entire society. Following this line, other scholars have stressed the tendency toward dramatization and spectacularization of political communication. Citizens are transformed into spectators: Progressively they lose any active role, instead being transformed into passive spectators of something staged in front of them by political competitors. Political argumentation becomes simpler, shorter, and more and more filled with emotional discourse now made available by the electronic media.

Negative campaigning is another tendency that in the view of many scholars undermines the role of political communication in fostering democracy. Very often, political competitors find it much easier to denigrate the opponent than to propose programs or solutions for existing problems. Denigration is not just more emotionally involving, but it can catch the attention of the news media very easily and therefore get a wider attention from the general public. Tom Patterson clearly demonstrated how negative campaigning meets the needs of the media to reach a wider audience. At the same time, the mass media should exercise their control function, which is supposed to be among the founding principles of liberal democracy. At the end, because of this wave of negativism, this control function is "out of work"; it does not support the development of a more mature democracy.

Jürgen Habermas, in his seminal work *Structural Transformation of the Public Sphere*, has opened a field for scholars of political communication, directing their attention to the way the public sphere is organized in each society and the way in which it may foster democracy. Today, a great deal of political communication research is focused on his concept of the public sphere. At the same time, Habermas has clearly shown that the commercialization of the public sphere can undermine a rational debate on affairs of public interest, and this seems to be the most important challenge that political communication faces today.

POLITICAL CULTURE

Political culture consists of a relatively coherent repertoire of cognitive and evaluative models that enable members of a political community to give sense to their role as political actors, to other political actors, to the community they belong to, and to the institutional structure in which they live. Thanks to this framework, they can decide which objectives to pursue and shape their actions and behaviors accordingly. Political culture has the following features:

a. it is a shared legacy accumulated over time;
b. it consists of a collection of solutions that have proved, with experience, to be effective in solving problems concerning human survival, adaptation to the external environment, and internal integration; and
c. it is transmitted to new members of the political community through socialization.

Political culture has two fundamental constituents:

1. *Cognitive models*—that is, a population of concepts enabling the imposition of an order on the world through a rational process of critical objectivization—and
2. *Evaluative models*, which make it possible to attribute meaning to the world through identification with particular values that separate what is good, right, and desirable from what is bad, wrong, and to be avoided.

The first section of this entry deals with the scientific context in which the concept of political culture was introduced into political science, the questions it seeks to answer, and the operational definitions used in empirical studies. In the second section, there is a description of the main theoretical and empirical developments in comparative studies on political culture, conducted by means of representative sample surveys in an increasing number of countries. This is followed by a section devoted to a discussion of such research design and the methodological and epistemological presuppositions that are involved. The fourth and fifth sections cover different research designs regarding political culture and related concepts. A critical discussion of the analogies and differences between various research designs is presented in the final section, where emphasis is placed on the need to consider the depth of the historic roots of every cultural pattern and, thus, of each political culture.

Like broader cultural orientations, political culture is largely experienced unconsciously by individuals, who are first and foremost carriers and users. To put it in another way, the set of cognitive and evaluative models that make up political culture are, according to Edgard Schein's definition, "assumptions taken for granted." Individuals who share a specific political culture consider such cognitive and evaluative models to be common sense—the obvious and natural way to give meaning to the political sphere, to its actors and institutions, as well as to its boundaries—what is politics and what is not. As anthropologists have observed in relation to cultural models in general, there is nothing objective or natural in the way in which the content of political culture is defined. It has a pragmatic basis and depends on the challenges and problems that human beings have to handle. So political culture is not just a mental construction of assumptions that are taken for granted. These assumptions form the background and the basis for the political behavior of actors—that is, the framework within which individuals act in what is considered a politically appropriate way. This involves excluding actions considered to be inappropriate or deplorable and deciding whether or not to take part in elections, to cooperate with institutions or act in a clandestine fashion, or to organize peaceful demonstrations or take part in violent protests.

Political culture is, therefore, molded by the accumulated experience of a political community and is a constraint that is very durable over time. There is debate among scholars as to how far one must go back to find the roots of today's political culture. This problem is discussed in more detail below. However, there is a general consensus that change in political culture, as in all forms of cultural change, is a slower and more difficult process than institutional, economic, and social change. This is the reason why political culture is characterized by a certain amount of ambiguity. On the one hand, it is a valuable collective resource in that it makes perceptions, beliefs, and individual attitudes toward political institutions and actors relatively homogeneous. On the other hand, it represents an obstacle in the face of social and economic changes. In such cases, political culture may offer solutions that prove ineffective when coping with problems of adaptation to new challenges from outside or from within a given society.

Special consideration is given to the analytic, methodological, and empirical contribution made by studies of social capital, a concept that in the past 2 decades has prompted extensive research into the relationship of norms, beliefs, and social organization with the effectiveness of democracy and economic development. The concept of political culture is also compared with that of nation building, as used in comparative studies of European political development, according to a research design that is complementary in many respects to the one based on representative sample surveys. Finally, this entry discusses the concept that in a political culture that is adequate for an effective democracy, there needs to be a balance between two different components—on the one hand, an emphasis on individual well-being and self-realization and, on the other, a commitment and fairness toward institutions and a moral obligation toward one's local community and nation.

A New Scientific Concept and Its Operational Definitions

Unlike conceptual innovations in everyday life, in the field of scientific research, each conceptual innovation is carefully recorded due to the complete institutionalization of science. The concept of political culture was introduced by Gabriel Almond and Sidney Verba at the beginning of the 1960s in their book *The Civic Culture*. This work was part of an extensive program of theoretical discussion and empirical research into the major processes of political development that had started in the 1950s. The tragedy of the two World Wars and of the totalitarianisms in Europe, the birth of new democracies in the three nations defeated in World War II (Germany, Italy, and Japan), the establishment of communist regimes in Eastern Europe, the founding of new states in Africa and Asia following the end of the French and British colonial empires—all these gave rise to a series of important research issues regarding the stability of the new political regimes, in particular the new democracies. According to the new functionalist and behaviorist approaches of this period, it was imperative for political science to study the cultural orientations of individuals, especially their attitudes to democracy, as these are crucial for the stability of democratic political systems.

The Civic Culture stressed the importance of political culture as a dimension capable of influencing, if not determining, the stability and performance of democratic regimes. The new concept built on an illustrious tradition. In the history of political thought, many authors have emphasized the importance of the cultural and moral orientations of citizens for the prosperity and power of states. The terms may vary, but the meanings are similar: civic virtues (Aristotle), values and feelings of identity and commitment (Niccolò Machiavelli), morality and customs (Jean-Jacques Rousseau), and above all the "habits of the heart," which, according to Alexis de Tocqueville, animated the citizens of the United States in the first few decades after independence and were the foundation of American democracy.

To shed light on the subjective components of politics, the new concept of political culture drew on these classic contributions, producing a new paradigm for empirical research in political science that still underpins the majority of studies in political culture. This new paradigm is based on four of the most significant theoretical and analytic sources for the social sciences in the first half of the 20th century:

1. *The contributions of Max Weber's sociology in the theory of action and in defining a typology of criteria according to which individuals consider political authority legitimate and agree to comply with its rules:* On the one hand, the importance of values in orienting individual behavior is stressed by Weber's distinction between goal rationality—that is, decisions based on a calculation of possible individual benefits—and value rationality, namely, decisions based on value orientations, irrespective of, or contrary to, one's own interests. On the other hand, Weber defines three ideal types of political authority: traditional, legal-rational, and charismatic. Each is supported by different beliefs: the belief in its conformity to the past, the belief in its conformity to established rules, and the belief in the particular personal qualities of a leader. In other words, legitimation depends on one of three different values: tradition, the institutional structure in use, or a single, extraordinary person. The first two values support political continuity, while the latter can contribute to political change.

2. *The four conceptual pairs (the so-called pattern variables) defined by Talcott Parsons in relation to the theoretical foundations of his functionalist approach: universalism versus particularism, achievement motivation versus ascriptiveness, specificity versus diffuseness, and affective neutrality versus affectivity:* The first term in each pair is considered a typical trait of modernity, while the second is a feature of traditional orientations. This set of opposing categories is the basis for all subsequent studies of modernization processes in both the political and the economic realm.

3. *The empirical analysis of attitudes developed by social psychologists such as Louis Guttman, Rensis Likert, and Charles Osgood in the context of the new behavioral approach:* Different attitude scales were designed to collect systematic and comparable data on mass opinions, beliefs, and value orientations through face-to-face interviews.

4. *The influence of Freudian theories on American psycho-anthropology, with the notion of the "basic personality structure," and the importance attributed to socialization processes not only in childhood but throughout the life cycle.*

These four analytic contributions were then combined with the new methodology of public opinion polls, which make it possible to collect data on opinions and attitudes in representative samples of citizens. Indeed, the research design of *The Civic Culture* applies the operational definition of political culture in sample surveys in five democracies: the United States, Mexico, Great Britain, Germany, and Italy.

According to the new paradigm established in *The Civic Culture*, political culture has four characteristics: (1) it consists of the set of subjective orientations toward politics of the individual citizens of a nation; (2) it consists of knowledge and beliefs about politics and a commitment to certain political values; (3) it is the result both of a socialization process that begins in childhood and continues through one's education and exposure to the mass media and also of direct experience acquired during adulthood with regard to the performance of political institutions and actors; and (4) it has an influence on, even if it does not determine, the performance of political institutions, due to a two-way causal link between culture and institutional performance. In general, political culture has an impact on the quality of democracy, but the latter also contributes to orienting the political culture of a nation's citizens.

The study revealed the existence of three different types of political culture: parochial, subject, and participant. Parochial culture is characterized by a prevalence of attitudes based on particularism, localism, short-range trust, and a subjective separation from the state and politics. The main features of the second ideal type are compliance and confidence in the legal authority of the state, its administrative order, and its decisions—the output, according to a systemic view. Participant political culture is based on the active political engagement of citizens who fuel the input side through the creation of free associations, in keeping with Tocqueville's classic reflections.

"Civic culture," which consists of a balance between these ideal types, is considered to be the most suitable cultural foundation for a stable democracy. Of the five political systems taken into consideration, the United States and Great Britain had a civic culture, while Germany and Italy were considered democracies with a high risk of instability at the time when the data for the *The Civic Culture* had been collected toward the end of the 1950s. Germany was deemed to have a predominantly subject-based political culture, while Italy was largely parochial.

Changes in Political Culture: The Rise of Postmaterialist Values

Some of the most important findings of *The Civic Culture* were reviewed and criticized 20 years later by Almond and Verba themselves. They pointed to the growth of a participatory culture in Germany, the reduction of subject attitudes, and an increase in the levels of dissatisfaction and distrust in Britain and the United States. In the meantime, a host of other investigations had been conducted, revealing a drop in the degree of confidence in democratic institutions and increasing disaffection and political protest in Western democracies and Japan.

The observed changes in value orientations are of particular interest. On the basis of a comparative study of six European nations carried out in 1970, Ronald Inglehart noted that the youth protest movements were primarily concerned with issues neglected by the traditional political parties, for instance, environmental conservation, disarmament, and needs associated with individual self-fulfilment rather than economic improvement. Inglehart considered these value orientations to be the effects of the situation of economic well-being in which the socialization of young people had taken place in Western European countries, which had reached an unprecedented level of wealth since World War II. With the modification of political priorities, cultural change was fueled by the demographic replacement of the population due to the arrival of generations with more postmaterialist orientations than the older ones, which gradually disappeared from the scene.

Inglehart based his thesis on the theory of motivation developed by the psychologist Abraham Maslow, who considers the gratification of needs to be as decisive for human action as the classic principle of deprivation. According to this theory, the fundamental needs of human beings are organized into a hierarchy consisting of four ascending levels: (1) basic physiological needs; (2) the need for safety and stability; (3) the need for affection, self-esteem, and a sense of belonging; and at the highest level (4) the need for self-realization. Satisfaction of a need pertaining to a lower level brings to the fore the one relating to the next level. According to Maslow, this framework is an organizational model of the individual personality.

Inglehart turned it into an explanatory model of the changes in political culture: The older generations, who grew up amid the poverty and insecurity generated before and during the two World Wars, were oriented toward the materialist values induced by survival and safety needs. By contrast, young Europeans born after World War II are oriented toward postmaterialist values—that is, values such as belonging, self-esteem, and self-realization. Having grown up in a period of unprecedented economic prosperity, they tend to take a certain level of material comfort for granted and therefore develop the value priorities typical of higher levels of prosperity. As a result, they are more oriented toward themes such as personal fulfilment, individual freedom, and the conservation of nature. This difference between young people's values and those of their parents leads to cultural change since, according to the Freudian concept of the "basic personality structure" developed by Ralph Linton and Abraham Kardiner, individuals tend to maintain in the course of their adult life the value priorities adopted in a deep sense during the formative phases of their childhood and youth.

The operational definition used by Inglehart to collect data on materialist and postmaterialist value priorities is an inventory of 12 possible political goals. Representative samples from Western countries were asked to choose the most important political goals from the following items:

> *Material goals:* maintain order in the nation; fight rising prices; maintain a high rate of economic growth; make sure the country has strong defense forces; maintain a stable economy; and fight against crime
>
> *Postmaterial goals:* give people more say in the decisions of government; protect freedom of speech; give people more say in how things are decided at work and in their community; try to make our cities and countryside more beautiful; move toward a friendlier, less impersonal society; and move toward a society where ideas count more than money

Respondents were then classified as materialists or postmaterialists depending on whether they favor one of the two kinds of goals consistently.

A Worldwide Research Program

The operational definition used by Inglehart to measure value change has become a standard tool in the proliferating studies of political culture, along with questions aimed at surveying interpersonal and institutional trust, preference for democracy or autocracy, life satisfaction, and other similar issues. This series of studies followed the research design originally adopted in *The Civic Culture*. The design has three main characteristics: (1) *a sample survey*: data collection on political opinions, attitudes, beliefs, and values conducted by means of structured interviews with representative samples of citizens; (2) *a comparative design*: the same questionnaire is applied in different political systems in the same period. In other words, the same operational definitions are used in different countries, favoring comparability of data and permitting the testing of hypotheses at an individual as well as a national level; and (3) *a longitudinal design*: if possible, the same questionnaires—or the same subsets of closed questions—are applied in the same countries in different years, creating a rising number of time series for many political culture variables, such as levels of institutional trust, satisfaction with democratic performance, support for leaders, national pride, and so on.

A number of agencies have been established in recent decades to monitor public opinion orientations and political attitudes. The Eurobarometer program of the European Union was set up in 1973 and since 1974 has supplied twice-yearly data on opinions and attitudes for each member or candidate-member of the Union. Similar survey programs have recently been set up. The New Democracies Barometer, established in 1991, covers 12 East European countries; the Latinobarometer covers 19 countries from 1996 onward; while Afrobarometer covers more than 12 states since 1999. Cooperation between different research centers around the world has led to an increase in the number of nations for which data on political culture indicators are available. Increasingly, extensive networks have been built up, making it possible to conduct the same research project at the same time in an ever greater number of nations. In particular, the World Values Survey and the European Values Survey have conducted five waves in a steadily rising number of countries. After the first wave in 1981, successive waves of data collection were carried out in 1990, 1995, 2000, and 2005, covering countries on all continents (with more than 100 in the most recent wave). A further advantage has been the setting up of efficient data archives. Coupled with new data transmission tools, these archives facilitate secondary analyses—that is, the research and empirical testing of hypotheses by researchers who have not taken part in gathering and analysing the original data.

All these developments have resulted in a strong growth in the degree of institutionalization and standardization of research into mass orientations. One of the most recent, and ambitious, findings of this research programme is illustrated in Figure 1. It was produced by Ronald Inglehart and Christian Welzel on the basis of data collected in the first four waves of the World Values Survey.

Figure 1 shows the position of 80 states with respect to two variables. The vertical axis is an index of the quality of democracy in the different countries and takes into account not only the existence or otherwise of free elections but also the moral integrity of the political elites as measured by the "control of corruption" scores provided by the World Bank and other organizations. Corruption among elites is in fact the main factor preventing respect for the equality of rights and the law and therefore for an effective democracy. The lower values on the scale relate to nondemocratic countries with corrupt elites, while the higher scores are obtained by democracies with political elites that guarantee the rule of law and equal rights.

The horizontal axis shows the average values for each country on an index that measures the spread of a cultural orientation based on the predominance of values associated with individual self-realization and self well-being. It is a direct evolution of Inglehart's first postmaterialism scale. This new cultural syndrome is surveyed by five indicators:

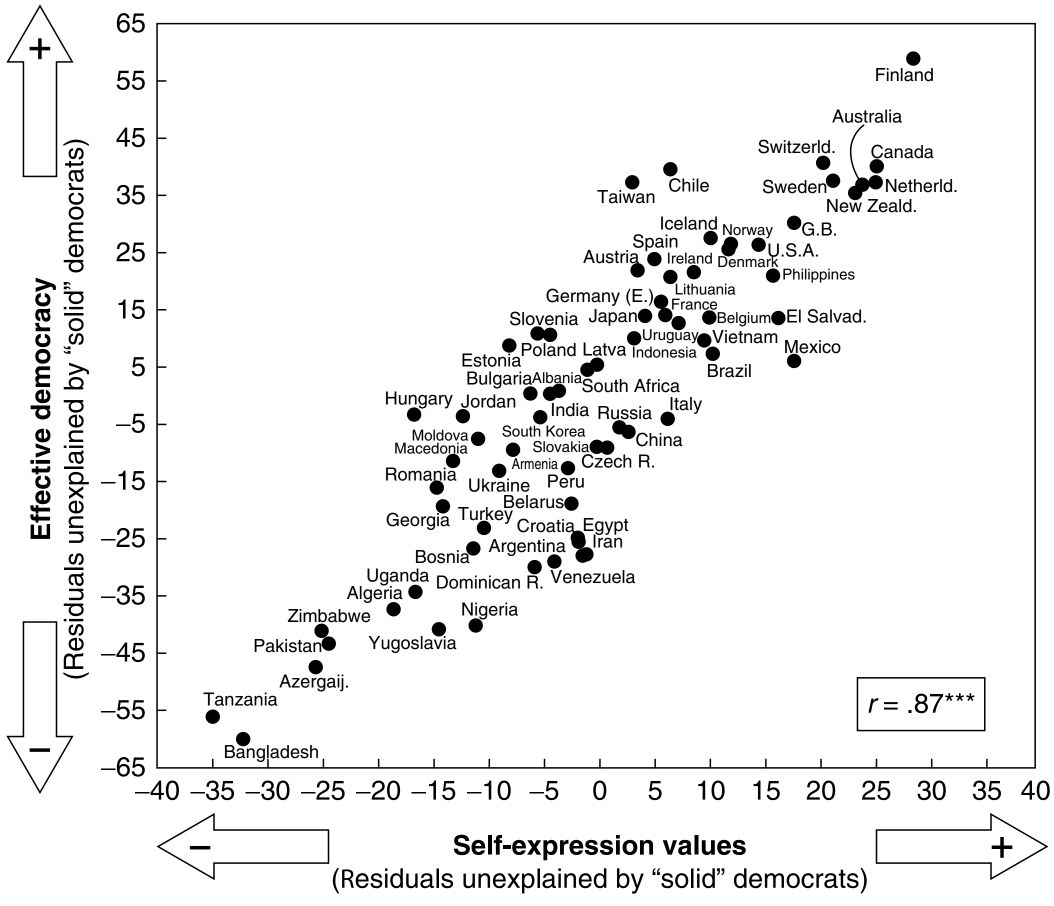

Figure 1 The Impact of Self-Expression Values on Effective Democracy, Controlling for Each Country's Percentage of Solid Democrats

Source: Inglehart, R., & Welzel, C. (2005). *Modernization, cultural change, and democracy*. Cambridge, UK: Cambridge University Press.

1. postmaterialist liberty aspirations (give people more say in the decisions of government, protect freedom of speech, and give people more say in how things are decided at work and in their community);
2. forms of political protest, such as signing petitions;
3. tolerance of homosexuality and sexual liberty;
4. interpersonal trust; and
5. life satisfaction.

The relation between the two variables in Figure 1 is measured controlling for the percentage of respondents who prefer democracy over autocracy, to exclude spurious effects due to merely instrumental prodemocratic motives. Countries where self-expression values are relatively less widespread than mere support for democracy would suggest are those where the political regime violates the rule of law and equal rights more than levels of mere support for democracy would suggest (see bottom left-hand corner). In the opposite corner, countries where self-expression values are relatively more widespread than mere support for democracy would suggest are those where democracy is more effective than mere support for democracy would suggest.

In short, Figure 1 shows the strong linkage between a peculiar syndrome of political culture—self-expression values—and the level of effective democracy: Near the top right-hand corner are the small democracies of Protestant Northern Europe, with England and the English-speaking democracies (the United States, Canada, and Australia). Near the opposite corner are some African and Asian states, with Yugoslavia (at the time formed by Serbia and Montenegro) ranking as the lowest European country on both variables.

The Limits of the Comparative Survey Approach

The application and extension of the research design of *The Civic Culture* in the 40-year period since it was first published has enabled the international political science community to build up a large number of comparable data sets on a growing number of nations. The availability of statistical packages and powerful, low-cost computers, combined with the Internet infrastructure, has facilitated the empirical testing of many hypotheses by means of complex multivariate models. Important changes in political attitudes and beliefs have been monitored over time and compared in different countries. Like any scientific method, technique, or decision, this research design also has certain limitations. As with all research tools, the capacity of sample surveys to achieve objectives depends on the degree to which they offer a simplification of the world, the complexity of which cannot be grasped by any one tool.

The sample survey research design in the comparative study of political culture is no exception to this rule. In particular, it tends to emphasize the orientations of mass political culture rather than those of the elites. Similarly, the wide-ranging comparative design makes it easier to concentrate on mass attitudes relating to the polity and politics levels instead of the policy level, which is more context dependent. Scholars have stressed these limits together with others that stem largely from the basic assumptions of the two main approaches that gave rise to this paradigm: functionalism and behaviorism.

The functionalist approach has two limits. On the one hand, there is a tendency to regard politics as a clearly defined sphere with respect to society and the economy, which is easily recognizable even in very different social systems. On the other hand, functionalism tends to favor a synchronic perspective, with a consequent reduction in the attention devoted to the diachronic dimension and in piecing together the historic origins of the observed processes. As seen above, in the paradigm of the comparative research survey, the temporal dimension is only taken into account through the collection of successive "snapshots"—that is, the various waves of sample surveys.

The behaviorist approach, whose roots lie in experimental psychology, has greatly stimulated the operational definition of citizens' opinions, attitudes, and value orientations. However, it is based on the individualist and atomist assumption that the whole equals the sum of its individual parts. The critical point is, therefore, the link between the microlevel (a sample of individuals interviewed) and the macrolevel. The political culture of a country is viewed as a statistical aggregation of the opinions and attitudes of individual citizens.

In addition to these limitations, which derive from the epistemological features of functionalism and behaviorism, representative sample surveys also have several methodological limitations:

- Actual behaviors, which are the overt output of cultural orientations, are not observed but only inferred by verbal answers to questions.
- It is assumed that the meanings of questions and answers are the same in different countries and languages—a necessary assumption if one is to consider the answers of interviewees to be comparable.
- The number of interviews in national samples is usually too small to guarantee the statistical representativeness of subnational samples. This makes it impossible to explore the regional differences in political culture within a given country.
- Surveys also often have difficulties of grasping the unconscious and "things taken for granted," as pointed out above.

The following sections deal with two different contributions to the study of political culture that can be regarded as complementary to the paradigm established by *The Civic Culture*, in that they pursue different research designs or strategies of inquiry, each of which overcomes some of the limits described above, though in different ways.

Social Capital and Democracy

One of the principal conceptual innovations in political science and sociology over the past 20 years is the notion of social capital, introduced in the 1960s by the economists Gary Becker and James Loury. The concept of social capital became popular in political science as a result of the analytic work of James Coleman, who related it to social networks, and the research of Robert Putnam into the institutional performance of Italian regional governments in *Making Democracy Work*. According to Putnam's definition, social capital "refers to features of social organization, such as trust, norms, and networks that can improve the efficiency of society by facilitating coordinated actions" (p. 167).

In other words, social capital is a collective resource and has some of the features of a public good: It offers advantages to all the members of a group, but no one can appropriate it in an exclusive way. If one person benefits from social capital, this does not reduce its availability for others. On the contrary, social capital has a radically anti-economic feature: The more it is used, the more of it becomes available for the entire community. Social capital, therefore, offers a solution to the dilemmas of collective action posed by scholars such as Mancur Olson and Elinor Ostrom. As a form of social organization, social capital also has positive effects on economic development in that it contributes to creating a favorable environment for market exchanges thanks to cooperation, trustworthiness, honesty, and compliance with formal and informal rules. The notion of social capital is closely related to that of civic culture. They have a common ancestor, Tocqueville, who attributed great importance to the trustworthiness of citizens and the significance of free associations. The two concepts also share concern about the relation between culture and effective democracy.

Putnam's research on Italian regions exploited the opportunity to apply an experimental design. In the 1970s, the newly introduced regional institutions began to operate within the same nation-state. The research question was which variables explain the *differences* in the output of the new regional governments in the common context. According to Putnam's findings, the marked differences in the economic development of the Northern and Southern regions tend to coincide with great differences in institutional efficiency. However, this turned out to be a spurious correlation. The independent variable, when introduced as a control variable that, in fact, explains the differences in both economic development and institutional performance is the amount of social capital present in the various Italian regions at the end of the 19th century. The Northern regions had the same level of poverty as the Southern regions but appreciably higher levels of social capital. Seventy years later, in postwar Italy, social capital or the "civic community" (Figure 2) explains both the difference in economic development and the difference in institutional performance. The well-known economic cleavage between the North and South (i.e., the *Mezzogiorno*) is only one aspect of a multifaceted divide that sets regions with a high social capital and high institutional performance apart from regions with limited social capital and inefficient local institutions.

As Figure 2 suggests, Putnam's point of departure is similar to Inglehart and Welzel's, but the research design differs on many significant points:

1. There is no comparison between different nations but an analysis of a single nation, Italy, with various research techniques. The comparative design regards the Italian regions, thereby emphasizing within-state differences and reducing the risk of comparing cases that are too heterogeneous.

2. The nature of the civic community is measured not only by means of elite and mass surveys but also by gathering data on observable and documentable behavior (involvement in voluntary or other associations, newspaper circulation figures, and election turnout).

3. Data gathered from official documents and historical archives also make it possible to make intertemporal comparisons during almost a century.

4. Differences within the same country are highlighted and their historic origins reconstructed using data and findings relating to the Italian tradition of electoral studies.

5. By conducting a comparative analysis within a single nation, it is possible to make reliable predictions on the basis of dynamic models. The differences between the Northern and Southern regions are not only significant but above all are hard to eliminate, in that they tend to create two opposing conditions of equilibrium. Regions with civic communities display virtuous circles of trust, participation, effective institutions, and economic development. By contrast, regions with uncivic communities are entrapped in a vicious circle of distrust, defection, inefficient institutions, and economic stagnation.

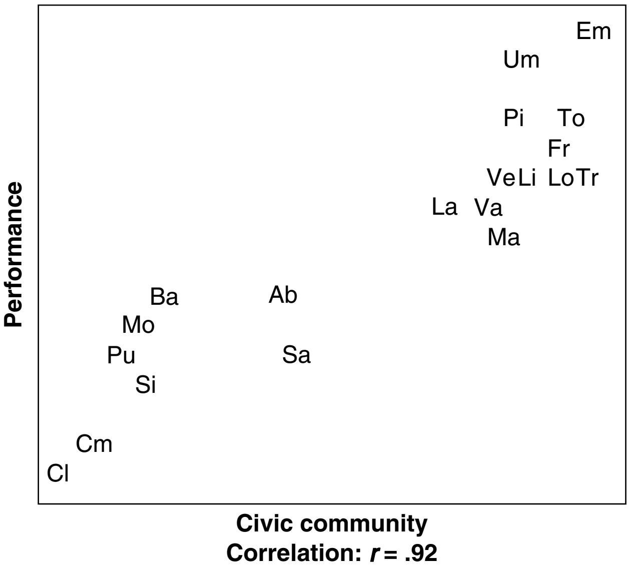

Figure 2 The Civic Community and Institutional Performance

Political Culture, Nation Building, and State Formation

Putnam's conclusions confirm, on the one hand, the importance of political culture for the quality of democracy and, on the other hand, specify the particularity of Italy, as had been observed in the 1950s and 1960s not only in *The Civic Culture* but also in the contemporary ethnographic fieldwork of Edward Banfield in *The Moral Basis of a Backward Society* (referring to a community in Southern Italy), which shed light on the syndrome of "amoral familism." Italy is a case of a divided political culture in which the divisions are to a large extent geographical. In Northern Italy, the civic community, which corresponds to a participant political culture, tends to prevail. In the Southern regions, there tends to be a prevalence of parochialism characterized by localist and familistic loyalties—that is, the vicious circle of the uncivic community.

This latter set of concepts emphasizes a further aspect of political culture, namely, that political culture also consists of beliefs and attitudes that do not have an explicit political content. The political meaning and consequences of familism and parochialism are implicit and embedded. Nonetheless, they are just as important as the explicit political content of participant and subject cultures. More specifically, it can be said that parochial culture is the consequence of historic processes marked by limited social and political mobilization on the part of the elites.

As Karl Deutsch argued, mobilization is a process of change that involves, entirely or partially, the population of countries that are undergoing modernization. In the early stages, this tends to lead to changes in the employment and residence of individuals while, subsequently, it also radically modifies their perceptions, expectations, beliefs, memories, and sense of identity. In other words, the process of mobilization changes the assumptions that people take for granted, in that it changes behavior and the problems that need to be coped with. Sectors of the population that are less affected by this process maintain to a greater degree the traditional set of assumptions and beliefs that political scientists label as parochialism or familism.

Social and political mobilization also lies at the heart of Stein Rokkan's study of state formation and nation-building processes in Europe, starting from the collapse of the Roman Empire. In general, the political development of Western Europe has taken place in four phases, which can be summed up as follows: (1) *state formation*, which involves the establishment of politically centralized control over a given territory, which is defended from external or internal attack and administered in a uniform way by civil and military bureaucracies; (2) *nation building*, promoted through a process of cultural standardization with the imposition of a common language, a single religion, and rituals and myths that lend legitimacy to the power of the monarch or elites; (3) *democratization*, through the granting of suffrage to increasingly large portions of the population; and (4) *the creation of the welfare state*—that is, a state that looks after its citizens, guaranteeing them health care, education, and protection against the risks of poverty.

The ways in which this occurred and the time it has taken for different states to meet these four challenges has had a lasting effect on the quality and stability of democratic regimes. The older states, formed prior to the Peace of Westphalia (1648), have proved to be the most stable democracies in the 20th century. Typical cases are England, Sweden, and Denmark. At the opposite extreme, there is the case of Italy and, to a lesser extent, Germany, which only became unified states in the 1860s and 1870s, after the beginning of a process of social, political, and economic mobilization fueled throughout the continent by the French Revolution and the Industrial Revolution. These new states have had to overcome the four challenges in less than a century. In both cases, the liberal and democratic state collapsed in the period between the two World Wars, with the rise of the fascist and Nazi regimes.

According to this line of research, in Europe, the culture of a country derives from the interaction between three fundamental components: ethnic-linguistic identity, religious faith, and the outcome of processes of cultural standardization activated by nation builders through the education system, compulsory military service, and so on. Political culture is, therefore, profoundly influenced by the timing and the modalities of state formation and nation-building processes. Moreover, the outcomes of these two processes create the patterns that define a feature of political culture that Weber had already considered as decisive for the stability of a regime: the degree of legitimacy enjoyed by political institutions. These may in fact be regarded as positive values—symbols with which to identify as members of a nation—or negative values—that is, symbols of a political regime that has little legitimacy and arouses distrust and suspicion. This top-down schema of the relationship between political culture and institutional architecture assigns a fundamental role to the elites of nation builders and places the origins of modern-day political cultures much farther back in the past.

Rokkan's schema of political development also highlights cases of countries with nonuniform political cultures. This lack of uniformity may be due to resistance on the part of some peripheral areas to the process of cultural standardization promoted by the center or to shortcomings or delays in the state formation process. Spain, the Netherlands, and Italy are three examples of countries that have experienced nation-building difficulties as a result of cultural differences within their frontiers. Spain is a case of early state formation, but it has been unable to overcome the resistance of peripheral areas with considerable economic resources, which have managed to maintain linguistic and cultural autonomy. After the transition to democracy in the 1970s, the new constitution, introduced in 1978, recognizes the existence of a plurality of nations within the Kingdom of Spain.

The Netherlands are an example of a country with different subcultures resulting from linguistic or religious cleavages. These cultural cleavages have been successfully bridged by the concept of consociational democracy founded on "pillarization," involving cooperation of the elites across cleavages. This institutional accommodation is effective to the extent that it recognizes, confirms, and reassures each of the different cultural identities (Catholic, Protestant, and secular). Incidentally, the dramatic developments following the collapse of the Republic of Yugoslavia in the 1990s testify that this accommodation is very difficult to adopt, even within 21st-century Europe, if the countries involved do not have a democratic political culture.

Italy is an example of late state formation carried out by a secularized elite of nation builders that was weak and isolated with respect to the twofold opposition of the Catholic and socialist movements. These movements created strong antistate subcultures, thus contributing to the democratic breakdown in 1922. Here, too, there is a general lesson to be learned: The historic legacy of an element of weakness—strong antistate subcultures—can become a resource once the political and institutional framework and the international context have changed. In postwar Italy, it was the networks of these two subcultures—the unions, cooperatives, voluntary associations, religious groups, and local savings banks—that provided the organizational basis of the civic community of Northern Italy as described by Putnam.

Two Necessary Components of Political Culture

The question about the relationship between political culture and democracy has been answered in many ways over the past few decades and has opened up various research perspectives. Three different research strategies, among the most influential and well-known, have been presented in detail. Of the three, the paradigm of comparative survey research into political culture orientations adopts methods and techniques that differ greatly from those used by Rokkan in his theory about the conditions and processes that led to the birth of democracy in Western Europe. There are four main differences:

1. With each new wave, the World Values Survey has tended to enlarge the number of countries covered by the representative sample surveys, without, however, taking into account the growing variance in the level of economic development, the literacy of the population, and the duration of the democratic regime. By contrast, Rokkan focused on a more limited area that is relatively homogeneous in terms of historical, cultural, political, and economic development.

2. The first paradigm seeks to explain the differences in opinions, beliefs, and values by resorting to multivariate models capable of producing high correlation coefficients. The second pieces together the complex, centuries-old web of social, political, economic, and cultural processes with typologies that can explain the individual national versions of European democracy.

3. The first paradigm alternates between individual- and state-level analyses. The second is interested in detecting the existence of specific territorial cultures within states, interpreting them as aspects of a peculiar path of state formation and national building.

4. The first paradigm recognizes the two-way relation between political culture and the effectiveness of democracy. However, the rising number of countries considered under a synchronic perspective tends to privilege the spread of civic and self-expression values as the causal factor that makes democracy work, according to a bottom-up schema. The second paradigm tends instead to emphasize a top-down schema, analyzing the different nation-building capacities of state institutions—that is, their ability to define political culture.

On all four points, the work of Putnam and his colleagues lies in an intermediate position, resorting as it does to a comparative approach limited to a homogeneous area, stressing the historical roots of the differences between the cases considered and recognizing virtuous or vicious circles between effective institutions and civic community.

Almost paradoxically, the two most distant paradigms yield analogous results. The countries that the series of World Values Surveys have shown to be characterized by the greatest democratic effectiveness and a more self-expression–oriented political culture include the European countries that, on the basis of Rokkan's analysis, were the first to achieve a stable democracy, having concluded the state formation and nation-building phases prior to the French Revolution. These are the two oldest and most powerful Protestant monarchies of Northern Europe (England and Sweden), and the consociational democracies are situated at the source and the estuary of the Rhine in Switzerland and the Netherlands, respectively. More generally, the West European nations reveal a greater presence of postmaterialist values and more democratic effectiveness than the East European countries. Rokkan's schema, which in the 1970s aimed to explain the historical process of democratization in Europe, is therefore a good predictor of the results obtained by Inglehart and Welzel in sample surveys conducted over the past 2 decades to measure the current content of political culture and recent changes. This convergence of results suggests that the two research strategies, though they differ greatly, are not alternatives but are supplementary with regard to the characteristics required of a political culture in terms of democratic effectiveness. There is a continuity between early and successful state formation and nation building and the rise of postmaterialist and self-expression values.

Such a convergence is by no means obvious, because the process of nation building involves the spread of altruistic values and the subordination of individual interests to those of the community—which runs counter to the emphasis placed by postmaterialist values on the primacy of individual liberty and self-expression.

Analytically, the opposition between the cultural outcomes of successful nation building and the syndrome of self-expression values becomes evident if one bears in mind the process that led to the expansion of citizenship rights, as charted by Thomas Marshall. According to a cumulative schema, citizens' rights first saw the light of day in the 18th century with the establishment of the rule of law, whereby the civil rights of all citizens were recognized and guaranteed by impartial courts. The following century saw the development of political rights, quintessentially symbolized by the increasing role of independent parliaments. The 20th century was marked by the introduction of a new family of rights: social rights, with the establishment of compulsory education, public health, and so on.

This threefold typology corresponds, significantly but partially, to the four stages of political development defined by Rokkan, as shown in Table 1.

The succession of the three types of rights corresponds to three of Rokkan's four phases, with the lower row corresponding to the institutional structure of Western European democracies after World War II: a generous welfare state that guarantees social rights and satisfies the material and security needs of its citizens. There is an empty box alongside the nation-building phase, for which there is no corresponding family of rights. In fact, nation building does not presuppose the recognition of citizenship rights. On the contrary, individuals have duties and obligations toward the nation. There is, then, a shift from the preeminence of individuals to that of the community as a whole. The establishment of individual rights is a fundamental feature of European political identity. The concept of the nation relates not so much to an individualistic as to a holistic perspective, according to which the whole is greater than the sum of its parts, as is well expressed by the value of *fraternité* (fraternity) in the motto of the French Revolution.

The United States does not lend itself to comparison with Western Europe. But even in the case of American political culture, scholars have found a similar equilibrium between opposing values: individual freedom on the one hand and communitarian bonds, loyalty, and commitment to institutions on the other. As Robert Bellah has observed, Americans consider individualism to be the preeminent and distinguishing value of their culture. However, this individualism is counterbalanced by

two opposing moral orientations: civic republicanism and the Biblical tradition. Both value sets relate to the holistic nature of the community—respect for the dignity of all human beings and an invocation of the moral goals that guided the Founding Fathers, which place on each citizen responsibility for the common good.

In both Western Europe and the United States, freedom and individual rights are accompanied by solidarity values and subordination to the common good. A political culture in which just one of these components prevails becomes a risk for democratic stability. An effective democracy needs a political culture with a balance between postmaterialist values, which stress the participation, tolerance, and self-expression of individuals, and the values of successful nation building, such as loyalty toward institutions, considered an effective means of guaranteeing the safety and well-being of citizens.

Participant postmaterialist citizens stimulate the renewal of democracies and prompt them to find effective institutional solutions to deal with new forms of inequality relating to gender, ethnic origin, sexual orientation, and so on. However, these value orientations are associated with the privileged sectors of society, especially educated young people. Seymour Lipset and Jason Lakin have recently observed that an excessive number of participant citizens create the risk of provoking a dangerous overload of political demands, thereby generating zero-sum conflicts. By contrast, scholars such as Robert Putnam, Theda Skocpol, and Russell Dalton have stressed the decline of civic engagement in Western democracies, even in younger cohorts.

Democracies have to find a way to adapt to the new attitudes and behavior of Western citizens, who are more critical and less confident than before. Democracies owe their legitimacy to their ability to simultaneously guarantee both the self-fulfilment needs of the more educated, secularized, and postmaterialist sectors of society and the safety and physical needs of the majority of citizens, who share the more traditional and materialist values and are unwilling to engage in stronger forms of political commitment.

POLITICAL ECONOMY

Political economy can be understood in numerous ways, depending on the discipline of study. Economists and, more recently, some political scientists define political economy as the study of politics using economics. Yet within political science, it is more commonly understood as the study of the relationship between states and markets. The two approaches are not conflicting but can be quite dissimilar. Here, political economy is understood as the study of the interdependency of economics and politics, as this is the approach used by the majority of political scientists. This entry emphasizes the interdependency of politics and economics and its impact on several aspects of political performance.

How economics and politics determine each other has been a driving question in political economy for centuries. According to John Roemer, Adam Smith was well aware of the mutual interdependency of economics and politics. In *The Wealth of Nations*, he discusses how politically determined tax mixes (a range of sources of income, with a mix of part-time jobs, self-employment, and full-time jobs) on wages and goods have diverse economic effects. The political causes of tax mixes, and of economic and social welfare policies, in general, are still at the heart of the study of political economy, especially as the provision of public services and goods has reached unprecedented levels. Scholars within the field of political economy study the impact of political competition on economic outcomes and in turn on how underlying economic conditions, such as income and skill distribution or the generosity of social insurance, affect political behavior and political competition. Common questions raised within the field of political economy are as follows: Why do taxes, state pensions, or levels of public debt vary between countries? Do political parties deliver distinguishable economic policies? Under what conditions do politicians raise taxes? In turn, how do economic policies and the underlying economic relations affect preferences for redistribution and institutional change, such as electoral system reforms?

Theoretical models and empirical research have come a long way in answering these questions. However, controversies still exist, primarily due to the lack of extensive data outside the relatively small group of the rich Organisation for Economic Co-operation and Development (OECD) countries. In the rest of this entry, major theoretical and empirical contributions in the field of political economy are reviewed. The first part looks at how the economy shapes policy preferences. The second part is an examination of how the institutional characteristics of polities (their electoral and party systems) aggregate preferences into political action. Third, distribution and redistribution as direct outcomes of political competition are described. Finally, in the last part, causation from economics to politics is reversed to explain the origins of electoral institutions on the grounds of underlying economic relations.

Economic Preferences

Voters' or political parties' policy preferences are the starting point of formal political economy models. Relying on the assumption of self-interested actors who wish to maximize the utility they get from consumption and leisure, political economists commonly assume that voters with higher incomes prefer less redistribution than citizens with lower incomes. Similarly, personal income endowments determine voters' preferences over macroeconomic outcomes such as inflation and unemployment. Kenneth Scheve has shown that those who have more savings prefer lower inflation, even at the cost of higher unemployment, in contrast to those who do not have savings.

Thus, the distribution of income in a society is a determining factor of fiscal, monetary, and tax policies. For example, the Meltzer-Richard model predicts that in societies with high levels of income inequality, taxes and, thus, redistribution should be higher than in societies with low-income inequality. Karl Marx and Friedrich Engels relied on similar assumptions since they believed that once workers were given the right to vote, dramatic redistribution would be achieved.

Yet reality is more complex than that. Among the economically developed countries, income inequality is highest in the United States and redistribution is among the lowest. Why is there not more pressure from voters to redistribute more? To start with, it is possible that some societies value economic equality more than other societies. Indeed, Alberto Alesina, Edward Glaeser, and Bruce Sacerdote show that there is a strong correlation between a nation's belief that luck determines income and the levels of social spending as a percentage of the gross domestic product (GDP). In countries where people believe that the poor have been unlucky, social spending (and thus taxes) is higher. Thus, assuming that voters simply want to maximize their utility from consumption is too simplistic.

Similarly simplistic is the assumption that one's vote is solely driven by financial position. Often voters care about other issues than redistribution, such as abortion, the environment, the role of women in the economy, and so no. If this is the case, then one's income does not determine one's vote, and in fact, it is possible that redistribution is not placed highly on the policy agenda of competing political parties. Another complication is that in unequal societies, rich voters are likely to have more political influence on political parties than poorer voters. For example, it is established that voter turnout is higher among high-income earners than among low-income earners.

Things get even more complicated when we take into account the underlying economic relations in a polity. Production systems can shape economic preferences independently of the distribution of income. Not all holders of capital prefer low redistribution, and not all workers prefer more redistribution. Redistribution preferences, and particularly preferences for social protection, are rather formed by the type of economic production. The varieties of capitalism approaches have moved the discipline forward by showing that preference formation among economic actors and citizens is not universal across different economic systems. The type of the economy and, particularly, the mode of production in an economy largely determine policy preferences.

In economies where workers are required to invest in firm- or industry-specific skills, employers have incentives to lobby for higher social protection and thus side with the trade unions. In contrast, in economies where workers have general skills and employers do not invest in their training, employers tend to lobby for lower social protection than the trade unions. More generally, it has been shown that distinguishing between general and special skills helps explain variations in the levels and type of social protection. For example, Torben Iversen and David Soskice show that citizens who have specific skills favor more generous unemployment insurance than do those who have general skills, as the latter can more easily switch and find jobs.

To recap, the discipline has made tremendous progress in identifying the factors that shape voters' preferences. Yet this is only the beginning of putting together all the constitutive parts of a political-economic model. One still needs to study the conditions under which political parties are responsive to the existing distribution of preferences.

Formal Models of Political Party Competition in Two-Party Systems

Do citizens' economic preferences affect policy outcomes? According to a view of democracy where the majority rules, economic outcomes should reflect the will of the electoral majority. In other words, if the majority of voters demands lower taxes, politicians should deliver lower taxes. However, one cannot assume this straightforward association; a number of issues need to be clarified, and most important, the role of political parties must be considered. Assumptions about the nature of political parties, whether they represent particular economic classes, interest groups, or simply their own interests, need to be made. Moreover, other characteristics of the political party system are also critical: How many political parties compete for office? Is political competition centered only on the question of taxes? And how are votes translated into parliamentary seats? Without taking all these matters into account, one cannot reliably predict policy outcomes given a certain distribution of preferences within the electorate.

Formal models of political party competition are relatively recent. Erik Lindahl was the first to show that the supply of public goods is determined by the relative power of political parties in a polity where two political parties represent two classes of citizens with heterogeneous marginal utilities over a public good. In his seminal paper, he briefly mentions the possibility of partisan policy outcomes as power shifts from one political party to the other. Nonetheless, Lindahl's work did not lead to further development of bargaining models on the distribution of public goods until much later.

Instead, the most well-known formal model in political science is the median voter theorem. The theorem, popularized by Anthony Downs in his *Economic Theory of Democracy*, predicts that when two parties compete on a single policy dimension, they will both converge to the median voter's most ideal policy point. If the policy under question is the level of income tax rate, then both parties will propose the tax rate that is preferred by the median voter. The result is easily explained: Parties are office seeking (which means that they are primarily driven by their objective to win office rather than by their ideology) and thus adopt whichever policy will win them the majority of votes. When voters' preferences are normally distributed, the only reasonable position for parties to move to is the median.

The median voter theorem initiated a new era of research in political economy. For example, the Meltzer-Richard model of redistribution and theories of electoral business cycles rely on the median voter theorem. In practice, however, parties tend to diverge in their policy choices rather than converge. To start with, it is rare that parties will propose similar tax rates at elections. If anything, when elections are contested primarily on economic issues, social-democratic parties propose higher taxes for the delivery of better public services, while parties on the right propose lower taxes and smaller governments. Similarly, public opinion research testifies that voters identify with parties on the grounds of personal characteristics, such as their socioeconomic status, religion, and so on. For example, those with savings who prefer lower inflation tend to self-identify with right-wing parties, while those who prioritize employment over low inflation tend to identify with left-wing parties.

Donald Wittman proposed a model of party competition where parties are solely policy seeking: They compete on the premise of distinguishable policies. His model then predicts that parties will diverge in their policies as long as there is some level of uncertainty as to who the winner in the next election will be. While Wittman assumes that parties are exogenous (i.e., they are not the agents of citizens), his model has been the main alternative to the median voter theorem. Empirically, the literature has found evidence of partisan policy outcomes, for example, with respect to inflation and social spending, but these findings remain contested. It has been shown that policies are often conditioned by other economic and political institutions as well as by the underlying economic conditions, both domestically and abroad.

Formal Models of Political Party Competition in Multiparty Systems

While the median and partisan models of two-party competition discussed above have made the largest impact in the discipline with respect to party competition, the majority of democracies are multiparty systems. This means that the two most well-known models of political competition are not suitable for the analysis of party competition in the majority of cases. More recently, new models of political party competition have been developed to include three political parties competing at elections. For example, David Austin-Smith and Jeffrey Banks developed a model where three office-seeking parties compete and coalition governments are formed after elections. Their model predicts that parties take divergent policy positions to attract votes, and as a result, governments consisting of a large and a small party deliver partisan policies. Another notable example is David Baron's model of electoral competition of three policy-seeking parties. Baron's model is a two-stage model: In the first stage, parties compete at elections, and in the second, postelectoral stage, they bargain over policy. The coalition governments that form as a result of this two-stage process deliver ideologically partisan policies.

Postelectoral bargaining in parliamentary democracies is of critical significance in policy outcomes in multiparty governments. Given that the majority of parliamentary countries do not form single-party governments, postelectoral bargaining delivers to a great extent the government's future policy program. Models of government formation are prominent in the field of political economy. Not only do they address the important theoretical and empirical question of which government we should expect to form after elections have failed to provide a clear winner, they also provide predictions on the policy outcomes that one should expect in a given government, as the Austin-Smith and Banks and Baron models illustrate.

One of the most well-known models of government formation in multiparty systems is the Laver-Shepsle model, based on the concept of the core within the tradition of cooperative game theory. The Laver-Shepsle model predicts that policies will reflect the policy preferences of the ministers who hold the specific ministerial departments and who represent the median voter's preference in that specific dimension. In other words, if the policy space is multidimensional, the party that represents the median voter in each dimension will control the relevant ministry; thus, policy will be located at the multidimensional median.

The Laver-Shepsle model was a breakthrough in the study of parliamentary democracies as it offered a unified framework of analysis of government formation, duration, and policy implementation. Yet it has its limitations, both on the theoretical front (since it relies on the restrictive concept of the core, which can be found only in a three-party, two-dimensional space) and on the empirical front (since the model assumes that ministers and parties do not negotiate prior to or during the government's life). Alternative models of government formation based on noncooperative game theory prove that when parties are policy and office seeking, different governments can form as a result of bargaining over policy and side payments. Yet they do not make any specific claims about the portfolio allocation process, like Laver and Shepsle do. As a result, most of our knowledge regarding portfolio allocation and its impact on policy comes from empirical studies conducted by scholars who study coalition governments.

The Electoral System: A Critical Intervening Factor Between Preferences and Policies

The electoral system is another intervening factor that significantly determines the distribution of political power and thus indirectly determines economic policies. The main direct effect of the electoral system on policy is via its effect on electoral competition at the district level. In single-member district plurality (SMDP) electoral systems, elections are won over marginal districts because parties do not have to worry about safe districts. This motivates parties to target voters and interest groups in these districts. In contrast, in proportional electoral systems where electoral districts are large and can be as few as one (e.g., in the Netherlands), political parties have incentives to target groups of voters instead of districts. As a result, in SMDP systems, there is less social spending but more public spending in the form of targeted goods, such as roads and hospitals.

The effects of electoral system on spending go beyond the district level. Since, as Maurice Duverger showed, the electoral system largely determines the number of parties in the political system, the electoral system has an indirect effect on policy preference aggregation via the number of parties elected in the parliament and in government. In more proportional electoral systems, more voices are represented in the government via multiparty governments as well as via strong parliamentary committees. G. Bingham Powell shows that the median voter is better represented in countries with proportional electoral systems, which have multiparty governments and give a voice to opposition parties in the parliament.

Another important empirical finding is that multiparty governments are larger governments (having higher public spending) simply because they represent more social groups than single-party governments. For this reason, some researchers have argued that multiparty governments are less economically efficient than single-party governments. In multiparty governments, every party has an incentive to spend on its own voters as much as it can since everyone draws from the same pool of money. Yet other researchers, such as Peter Katzenstein or Arend Lijphart, have argued that multiparty governments can more successfully undertake unpopular economic reforms because they can better achieve political and societal consensus.

The work briefly reviewed in the preceding paragraphs is certainly not exhaustive of the rich literature on the role of formal political and electoral institutions in the aggregation of interests and in policy outcomes. It is rather indicative of the complexity and interdependence of the processes that take place at the economic and political spheres. The following section of this entry focuses on how economic conditions affect the choice of formal political institutions.

Types of Economy and the Origins of Formal Political Institutions

One of the growing areas of research investigates the source of electoral institutions. Currently, it is believed that political parties, primarily of the right, chose the electoral institutions that would best ensure their continued power, based on their knowledge of the effects of electoral institutions on electoral behavior and government formation. The best known argument, made by Stein Rokkan and, more recently, by Carles Boix, purports that when the ruling right-wing parties were united and/or confronted with a weak opposition, they chose to keep the existing plurality electoral systems. This favored single-party governments. On the contrary, right-wing parties that were afraid that they would be ousted out of power due to growing socialist dominance chose proportional representation (PR). Under PR systems, the Left would not be able to form strong majority single-party governments, and thus the Right would still have power in the political system. These arguments then suggest that the underlying social cleavages and political parties' survival strategies determined the choice of electoral institutions.

More recently, alternative theories of the origins of electoral systems have been put forward. Here, we focus on a theoretical account that links the underlying production and labor relations with the origins of electoral systems. According to this account, advanced by Thomas Cusack, Torben Iversen, and David Soskice, the ruling right-wing parties acted as agents of the groups they represented, which were employers' organizations. In economies where employers' organizations had already established networks of cooperation and coordination with trade unions, the ruling right-wing parties chose PR electoral systems. The reason was that since PR systems encourage coalition governments and consensus building between the government and the opposition, both employers and trade unions would be guaranteed representation in the policy-making process. Only under a PR system could the existing cooperation between the holders of capital and workers be further fostered. Thus, in countries that had established coordinated forms of capitalism (corporatist systems), the ruling parties chose PR electoral systems. In contrast, where unions and employers did not cooperate, the ruling right-wing parties chose to retain the existing plurality electoral systems.

Other and Future Research in Political Economy

The debate on the origins of formal political institutions is likely to continue in the future. In the meantime, other important questions still need to be addressed within the field of political economy. Questions of the democratic legitimacy of economic and political institutions that make up our contemporary expert democracies (such as central banks and various regulatory agencies) have not been addressed sufficiently. Does economic efficiency legitimize reducing democratic rights to vote on the economy? This question is becoming particularly relevant as economic globalization empowers transnational institutions such as the International Monetary Fund or the European Central Bank. Scholars of political economy will have to seriously study the role of such institutions in domestic politics as they are becoming relevant players and even "partners" in governments' policy decisions in areas such as taxation and social welfare.

If the conduct of economic policy is changing thanks to economic globalization, do voters' preferences and evaluations change as well, or do they remain strongly determined by their local and national realities? How do voters evaluate their leaders when they implement policies that have been "imposed" on them? Do we see a new cosmopolitan versus national cleavage in electoral politics? Such questions cannot be adequately answered until the role of international actors is integrated into the study of domestic economic decision making.

Scholars who work primarily within the field of international political economy have looked at how domestic politics affect foreign economic policy (e.g., Beth Simmons) or the international financial architecture (e.g., Barry Eichengreen). In addition, important work has been done by scholars who work in the intersection of international and comparative political economy, such as Bill Clark or Ronald Rogowski, who study how the global economy constrains national economic policy making. Unfortunately, there is no space here to present this important work. The challenge for political economy in the 21st century is to devise models that capture the tension between global economics and national politics and, particularly, the tension between global market forces and domestic political competition.

POLITICAL INTEGRATION

Political integration refers to the integration of components within political systems; the integration of political systems with economic, social, and other human systems; and the political processes by which social, economic, and political systems become integrated. The context in which the term *political integration* is used indicates which of these three dimensions of political integration is being referenced. A country may have a highly integrated political system and yet have little control over its economic, social, and regional systems. Dictatorships often have tightly controlled political elites but cannot dominate the economy and society. Regions made up of several countries engaged in political processes of creating common institutions for both security and trade are often poorly integrated as political systems. The Southern Common Market of four countries of Latin America (Mercado Común del Sur [Mercosur]: Argentina, Brazil, Paraguay, and Uruguay, founded in 1991) is in the process of strengthening by electing a parliament and expanding membership, while the North American Free Trade Association of three countries (NAFTA; Canada, Mexico, and the United States, formed in 1993) is stagnating or weakening.

The core meaning of integration is *connectedness*. The theoretical context is systems and the integration of its components. Integration is a general characteristic of the relationships among the components of all systems: physical, living, and social.

Human systems have dynamic processes of becoming more or less integrated, and that happens not only through political processes but also through social and economic ones accompanied by patterns of stabilization and destabilization. More than 80% of human societies identified by archaeological research have disintegrated. Integration is part of discussions of the decline and fall of empires, states, and civilizations.

Connectedness of components refers to the *strength* of the relationships among the components, the *inclusiveness* of each of the component's relationships, and the *proportion* of the properties of each component that is affected by those relationships. At one extreme are systems where a change in any characteristic of any component will change all characteristics of all other components with near certainty. An example is a finely tooled clock. At the other extreme are disconnected components where each component behaves independently of the others. This is a set of random elements. In the first case, the system is nearly "perfectly" integrated, and in the second case, there is a random collection of items, not a system. The integration of systems along these three dimensions can be assessed as a probability ranging from 0, or randomness, no relationships at all, to 1, a totally determined system.

A 20th-Century Concept

The idea of political integration is old, but its "modern" conceptual foundations were established in the 20th century. Before then, the concept of political integration referred to several kinds of strengthening political systems. Empire building through force from a center to the peripheries was a dominant form of political organization for around 8,000 years. Empires remain shadows of a past since the collapse of the Soviet Union in 1991. Versions of European states with "parliaments" and "bureaucracies" pervade the world, using threats, rewards, communications, and nationalism to enhance their control. Federations are as old as our knowledge about political entities attempting to expand beyond assemblies of families, clans, and villages. They persist into the 21st century, if only in a symbolic form of sharing authority between localities and a central government. Some of the most influential countries of this century are federations—Russia, Australia, Canada, the United States, and so on, the United States being among the oldest.

The concept of political systems had taken over from that of states as the defining subject matter of modern political science by the 1950s. The idea of political integration referred to cities, countries, transnational regions, and "security" communities, such as the North Atlantic Treaty Organization (NATO). Political systems were more general than states, and most social systems had political systems—families, schools, universities, churches—that were marked by identifiable hierarchies that could make binding, authoritative-collective, decisions. The concept of a political system raised the question of the level and the dynamics of its integration. This shift to general theories of political systems was set back in the 1970s by efforts "to bring the state back in" political science rather than seeing the state as one kind of a variety of political systems.

Hierarchical Systems and Democracy

Political integration is theoretically challenging because political systems are hierarchical and can never be highly integrated systems as though they were finely tooled machines or highly cohesive societies. All hierarchical systems cut and direct relations with the structural principle of subordination and superordination, at the minimum the rulers (fewer) and the ruled (more), attenuating information through vertical flows and controls through intermediaries. The component at the top of the hierarchy has access to all other components through intermediaries, while those at the bottom have only one or two connections, just a level above them. The challenge is democracy, in which information and control should be nonhierarchical but in which reliance on administrative hierarchies to pursue democratic decisions effectively is also required. The democratic aspiration of "self-governing societies," "participatory democracy," and elections of governmental officials have not successfully addressed the issues of complexity and efficiencies of scale necessary for the responsiveness of institutions of governance to democratic political participation.

Political, Economic, and Social Integration

Since the 16th century, the conceptual distinction between the society, the polity, and the economy has advanced to near permanence in the social sciences. This tripartite separation of political systems of countries is the definition of the liberal or liberal-democratic state, distinguished from totalitarian states with their asserted monolithic control of all individual and groups and from socialist states with government ownership and control of the economy but not the society.

Social integration is the oldest of the modern concepts of integration attributed to the "father" of modern sociology, Émile Durkheim (1858–1917). He distinguished between two basic types of social integration: mechanical and organic solidarity. The first is based on similarities in outlook, belief, and characteristics, exemplified by feudal, peasant societies. The second derives from a modern society with division of labor and "functional interdependence" among groups, classes, and individuals. In both cases, social integration is *social cohesion*. The relationships among the components of a society in which each is dependent on others in ways that become more complex constitute social development.

Economic integration, like political integration, does not appear in writings on economics until the 1950s. Unlike political and social integration, it has a clear operational meaning in that it is defined as the absence of barriers, primarily political, to exchange and trade and is tantamount to the world becoming a single economic system with an unencumbered open market.

The term *political integration* is not found in writings on nationalism or state formation until the middle of the 1950s. Nationalism was, however, one of the major forces for political integration in the 150 years or so before the end of World War II, after which it spread throughout the processes of decolonization in Africa and Asia. It was also a strong force for disintegration under the principle of "self-determination of peoples" directed against the polyethnic empires, the Soviet Union being the last of the large ones. The idea of political integration was that it would be the dominant process for creating larger, perhaps more viable, effective, and, indeed, more peaceful political entities out of thousands of localities and feuding language and ethnic. States would emerge through persuasion rather than conquest, which defined empires that provided peace and prosperity in the past.

Political integration confronts more complex phenomena than either social cohesion or open economic systems. Political systems are defined by a string of several characteristics, at least one of which must be present—the principle of superordination and subordination—in a modern context: hierarchy with authority. For theoretical reasons, additional characteristics may include legitimacy, collective decision capacity, and rules of withdrawal. Nevertheless, political systems must have hierarchy, and hierarchies have limits to their degree of integration by the very presence of intermediaries. As political systems expand or are involved in social and economic changes, their level of integration decreases. In addition, as the economy and society become more integrated and more responsive to each other, the political system will lose its relative control over them. That is, the appeal of the short-term maxim for political leaders to "divide and rule." Changes as well as social and economic integration diminish the core logic of hierarchical control of a political system to select and pursue collective goals.

Political Development and the European Union

One of the two main projects of political science to promote political integration was the political development of the newly independent states to establish the post–World War II order of a decolonized world. Political development became the focus for inducing change to establish political systems in newly independent states that could command and control processes of economic and social development. Political integration was taken as one of the conditions of political development. The instruments of political integration were a common political culture, political institutions, and "modern" values. These instrumentalities were applied to authoritarian, military, as well as democratic systems. Nation building, however, took time and patterns of success were mixed, especially in parts of Africa and Asia. Political development lost its theoretical prominence in political science in the late 1960s as the tensions of the Cold War intensified. It might regain that position as a challenge conceived as the democratic political development of all political systems and not just of new democracies.

The second political integration project was European integration to create a common security zone both among European countries and between them and an ascendant, threatening Soviet Union. That project attracted a variety of theories about political integration, one of the better known of which was the spillover theory of learning cooperation from narrow sectors, such as steel production, that could expand to other areas and, eventually, to common political institutions. The European Union, although its trajectory of political integration may have peaked in the first decade of the 21st century, stands as one of the triumphs of political thinking and theory in changing the world. That knowledge is engaged in addressing the problems of global political integration.

POLITICAL PHILOSOPHY

Political philosophy is the part of philosophy dealing with politics and government, that unstable mix of war and *foedus* (treaty), conflictual division, and authoritative union. As "philosophy," it is part of the *vita contemplativa*, which is pure thinking; as "political," it has to do with *vita activa*, which is action and praxis in a world that exists with its own rules and language games before any philosophical attempt is made to make that world the embodiment of a theory, as did Plato. Philosophy, like science, is about truth, whereas politics is about power or, in a more sophisticated view, the *constrained* use of social power that reintroduces truth into the possible constraints alongside rhetoric, persuasion, compromise, and negotiation. *Vita activa* may be viewed either as a part of the philosophical activity, the "theory of *praxis*," until philosophy disappears only to be "realized" in politics, itself bound to wither away in a completely new age, as in Marx's construction, or, more commonly, as a necessary topic of political philosophy (Michael Walzer, 2007). It has also been held that political philosophy is concerned with the core concepts that issue from both the human condition and the cultural models whose change is beyond the scope of conscious collective choices, whereas political theory, closer to *vita activa*, should deal with what is the object, at least partially, of choice and willful collective action. In any case, the "real talk" in politics is far away from the "ideal speech" in philosophy as well as from the "crucial experiment" in science; it is endless and never stops (Walzer, 2007) and, in fact, even concludes with an "evaluation," unless a stronger power, whether it is a dictator, a majority, or the "judgment of history," decides to put an end to it for a time. After defining the field, this entry examines how political philosophy got its autonomy and its professionalization and then describes its epistemological background. Finally, this entry deals with the challenges to an universalist political philosophy represented by the claims of identities and the slow emergence of non-Western political philosophies.

The Domains of Political Philosophy

However important the tensions between the respective requirements of *vita contemplativa* and *vita activa*, political philosophy is now thriving in political science as "thought," "theory," or "philosophy." Textbooks, collections, encyclopedias, treatises, and essays about political philosophy flourish, suggesting a need for connecting the knowledge gained through political science to a concern for a better life and human emancipation. This work suggests, too, that political scientists were definitely convinced that the scientific study of politics is far from providing a sufficient and adequate knowledge of politics and that critical theorists, and especially Jürgen Habermas, had been right at least in stating that a mere cognitive interest in objective "facts" divorced from any concern for a better life and human emancipation produced a deeply flawed "science." Political philosophies, which are historically variable, share in the common endeavor to elaborate, make explicit, and assess the taken-for-granted conceptions of an age, with political philosophy being viewed by Michael Oakeshott as an "abridgment of a tradition." The historicists hold that philosophies are never above the political battles but are part and parcel of them. Admittedly, such a view, albeit dominant, gives rise to many debates, even among historians. It may also be claimed that a philosopher can and must reject historicism, escape from the confines of a historical context, and interpret all historical realities by taking as a starting point the rejection of violence and the liberty of each one within the confines of the satisfaction of all. The "good" is not to be considered as a social construction but as an objective reality, thus putting some rigorous order in the messy state of political opinions, however thoughtful (Leo Strauss, 1959; Eric Weil, 1971). In any case, philosophy, pertaining to *episteme*, is not the servant of the *doxa* of opinions, endowed with the status of objective reality through the intensive use of scientific surveys, since its aim is to convince people that they can and must change their opinion, an arduous and sometimes very perilous task (Strauss, 1959). The combat of liberal political philosophy can be taken as an example, including Muslim philosophy's criticism of the widely popular use of the most rigid interpretations of Islamic shariah in political, criminal, and family matters. Even the Straussian brand of Islamic philosophy goes through the same predicament (Charles Butterworth, 2002).

These are some, among many, troubling problems confronting contemporary political philosophy in its quest for the relations between the realm of well-grounded principles and the realms of actual institutions and behaviors. Political philosophy, like empirical political science, deals with what John Searle names "institutional reality." Yet that does not mean that institutional reality depends on our linguistic fancies. It has, as Max Weber put it, a "cultural arbitrary nature," but that means only that other political arrangements are possible and the current ones may become unreal, not that language is simply a way to take our beliefs, intentions, or desires and broadcast them aloud. Once the ontological categories are created by, and accepted in, the language, the reality they show becomes analogous to the noninstitutional reality, and the Fregean distinction between meaning and reference applies. That is why political philosophy cannot be the ideal construction of a well-meaning solitary philosopher.

Since the 1970s, political philosophy has been considered as the part of political theory that, being neither empirical nor formal ("positive"), is not scientific. Bhikhu Parekh (1968) sorts out its three domains: (1) political ontology (e.g., Aristotle's *polis*, Jean-Jacques Rousseau's general will, and Oakeshott's modes of experience), (2) political epistemology (political knowledge's structure, instruments, and practical utility), and (3) political logic (argument, language, and principles of strategy). It is a valid mode of knowledge different from scientific knowledge yet not contradictory to it. It is not disputed that in certain cases it is even possible to derive "ought" from "is." Political philosophy treats empirical data in a nonempirical way; it elicits their essential structure and puts them within a coherent framework. It is both a model *of* and a model *for* reality, the main goal of which is more logic than empiricism, so its premises and goals are first of all evaluative regardless of the standards of evaluation used. This raises the issue of justification when the idea of foundation, rational, or other, is missing. Admittedly, this view is not shared by those influenced by the neurosciences and neo-Darwinism, who hold that science does not need philosophy to promote normative and praxeological principles, nor by those to whom politics cannot be an object of science and thus does not need it. It is, however, still dominant despite the early assault of analytical philosophy. The hard version of analytical philosophy used to deem political philosophy meaningless: If philosophy is a second-order activity—that is, neither empirical nor evaluative but aiming exclusively at testing the logical coherence of the meaning of concepts and statements—it ensues that political principles, precisely because they are evaluative—that is, neither true nor false—cannot be philosophically justified. Political philosophy must be confined to what Felix Oppenheim calls the "reconstruction" of concepts and must get rid of illogical assumptions such as the ideas that ethics has no relation to facts, that science has no relation to values, and that it is contradictory to claim that ethics involves both value judgments and scientific theory. Yet since John Rawls's integration of a normative perspective in his analysis of justice, analytical philosophers have accepted political philosophers into their ranks, and conversely, empirical theorists are no longer declaring political philosophy "dead" for lack of empirical content, as was suggested in the 1950s by David Easton, Peter Laslett, and Robert Dahl.

Philosophy was long considered to be synonymous with true science. Likewise, political philosophy was the fount of theoretical political knowledge and thus of political science. In the ancient and medieval conception of "practical philosophy," this knowledge was also practical since it aimed at the synthesis of philosophical principles and empirical observations, distinct from both the analysis of processes as "objects" and the abstract deduction *more geometrico* from first principles taken as the foundation of reality. Politics was considered basically as a process of government to be both empirically known and normatively assessed in order to improve through education the rulers' moral virtues and ability to perform their task and the contenders' moral and technical bases to contest the incumbents' positions. Political philosophy was then the performance of that endeavor, whether or not the members of a polity, be it a tribe, a city, a kingdom, or an empire, used the term *politics* or thought of its rules as a separate domain, distinct from religious or ethnic rules. By the same token, political philosophy need not have been named as such since the term *philosophy* points to the rational quest for wisdom and has to be ignored or demeaned in societies ruled by the belief in a natural order of things or a supreme knowledge submitting reason to the revelation of a god-given law. Political thought was never absent from the world of classical Islam, yet *falsafa* (Islamic thought founded on interpretations of Aristotelianism and Neoplatonism) was always less developed and authoritative than *sunna* (the knowledge derived from the study of the Holy Koran), despite the great names of Averroes (Ibn Rushd) or Al-Farabi being associated with it. In the Catholic Church's doctrine, philosophy was deemed "the servant of theology," and though René Descartes in a very Aristotelian fashion put philosophy at the root of all kinds of knowledge, it was because it still appeared possible to marry a specific philosophy to Christian theology, despite Blaise Pascal's admonitions against philosophies. Admittedly, a problem had to arise if religions were torn apart by religious (*fitna* in Islamic parlance) and not merely by economic, ethnic, and dynastic deadly conflicts, together with the symmetric problem of the relations between peoples of different religions that claim to be universal and aim for the conversion of nonbelievers to the religion reigning in a definite area. It was thus necessary to coexist and haggle with the "significant others" since they could not (and for certain theologians, such as the Italian Jesuits in China, should not) be converted right away. In those cases, a philosophy of some sort, as well as a corpus of laws (the Roman jus gentium), was needed to justify different practices, from war to peaceful cooperation, on a basis sounder than the mere empirical fact that, until the final conversion of the whole world to the true faith, a political compromise had to be passed between empires even though they were waging war on one another. Usually, such a philosophy took the form of some natural law common to different religions, a view still largely held today, when "religions" are complemented or replaced by "cultures" and "civilizations."

Contemporary Political Philosophy and Its Professionalization

The fundamental change occurred as the outcome of two processes: the *autonomization of political reason*, contemporary to the European religious wars, and the *autonomization of philosophy*, following the evolution of the concept of science.

In the realm of government, after the age of god-kings in large units came the age of an ontological vision, including the notion of a basic tension between the transcendental and mundane orders articulated by elites that carried models of a cultural order centered on the belief in the creation of the world according to some transcendental vision and command (Shmuel Eisenstadt, 1986). Hence, the "clerical" idea that the "sword," albeit responsible for restructuring the political order, was accountable before a higher authority, be it God or divine law, represented by the "pen." This model was slowly thrown down with the emergence of the sovereign state, which had to be justified and legitimated for its own sake. In Strauss's curious and creative interpretation of Thomas Hobbes, nature and God went radically beyond the reach of Reason's intelligence, and the only "natural law" (the "desire of liberty"—i.e., of survival) that makes the world of the "state of nature" unbearable by each one also makes the political world of "civil society" bearable by all. This led to the de jure separation of the legitimacy of an order given and revealed by a "comprehensive moral doctrine" (in Rawls's parlance) and the legitimacy of a constructed artificial order founded on the necessity of peaceful coexistence between individuals and groups divided by an irrepressible mutual distrust and prone to resort to violence to avoid being unjustly subjugated by others. The safety of physical bodies came to be seen as more important than the salvation of souls. The move was spotted by Strauss in Nicolò Machiavelli's work. Strauss thought that such a sea change justified political "ferociousness," whereas Isaiah Berlin found it morally valid as a part of civic humanism. This marked the beginning of a trend leading to the assertion that the two principles of legitimacy (religious and political) should be kept separated as a consequence of the necessary supremacy of the state's sovereignty. In the political realm, the logic of sovereignty had to prevail, and the sovereign's authority, according to Hobbes, was *jure divino* (divine law), whereas the clerks' authority was only *jure civili* (civil law).

Be it the mark of the new age of "self-assertion," breaking with any revealed theology or foundational philosophy, or, as it is still held by some, the permanence of a political theology masquerading under a new guise (Carl Schmitt, 1988), the original feature of the new ontology was not first secularization, since religion did not immediately lose its grip on public life to be replaced by an improbable, even to this day, "naked public space," but the progressive appearance of a public sphere governed by the primacy of politics and a public morality within the limits of the political order. This does not mean that moral requirements disappeared altogether from the depths of society, since morality is a universal feature, although it is doubtful whether a substantive "thick" universal morality does exist, or that the sovereign governed by "reason of state" is devoid of any morality. Nor did morality depend on the sovereign's self-interest since norms and values do not exist just for efficiency reasons.

For these reasons, the ontology of the axial age faded away in Western political spheres and only there. It is still more alive and deep-rooted than ever in Islamic modernity, where a host of self-styled revolutionary reformers maintain the subjection of politics to justice—that is, a God-given morality under which the individual cannot but be genuinely free since Islamic law and human nature are in perfect harmony, which requires a type of Islamic politics where the individual could be both free and governed. In the Western world, it did not wither away in the moral sphere, divine law being at times merely replaced by human rights, global justice, or biodiversity, all things supposed to be located above politics yet interacting with it and imposing duties on peoples and governments (which may induce the revival of the old and permanent temptation to devise a monist political theory similar to the Islamic one). When Baron de Montesquieu, later followed by Jean-Jacques Rousseau and Alexis de Tocqueville, diagnosed the emergence of a "new political science," outlined in *L'Esprit des lois* (The Spirit of the Laws), he both rejected the direct criticism of political practice for moral reasons and advocated a morality not to be left to the decision of sentiments. He emphasized openly the need for a political philosophy that had been slowly developing and expanding since the 16th century, namely, the search for the relationship between power politics and moral character. Hence, the great divide, still very topical, between the "civil Enlightenment" of Hobbes and Samuel Pufendorf, where political authority is based on its desacralization and on conventions binding physical bodies governed by the *conatus sese preservandi* (self-preservation), and the "metaphysical Enlightenment" of Gottfried Wilhelm Leibniz and Immanuel Kant, "resacralizing" the political realm by basing it not on theology but on a philosophy of the "kingdom of ends" (Ian Hunter, 2001). The first Enlightenment gives preeminence to the legal system and leaves ethics to the private sphere, which may pave the way for moral relativism since many legal rules disciplining practices need not be based on deep philosophical reasoning but only on historical conventions and political convenience, defining for a time what kind of behavior cannot be tolerated. The second Enlightenment expounds the necessary relation between the legal and moral systems, a point stressed today by the varieties of republicanisms, which may lead to the determination of a single moral system as the universally best way, a subject of most of the controversies on the relationship between multiculturalism, universalism, and equality in liberal democracy. Therefore, political philosophy is today always more or less in tension with moral philosophy and more generally with different realms—aesthetic, religious, economic, and so on.

With the appearance of a new conception of natural science and its later extension to the ideational, linguistic, material, and strategic interactions between human beings in specific physical, ecological, and economic contexts, philosophy acquired a new meaning.

Science has always been viewed as a cumulative way to reach the objective truth through formal argument and regulated observation made available to everyone (depending on the political contexts) rather than by revelation, persuasion, or rhetoric, but it was still conceived as a way to be the mirror of reality, a "natural philosophy" confirming the order and beauty of a god-made world. Yet science was becoming divorced from this concern, and in the realm of politics it came to be seen as no longer paving the way for the discovery and prediction of what a "good polity" was and should be in every conceivable case. Admittedly, there are still attempts to solve Montesquieu's problem by reducing philosophy to scientific psychology, as advocated by Dahl in the 1950s; to devise a theory of democracy by bringing empirical and formal theories closer; to use the social welfare function to determine the proper domain of a good government; to elicit the conditions making majority rule both logical and legitimate; and above all to explain why democracy is the only good regime today, a statement that for the moment lacks an indisputable scientific foundation, democracy being actually less valued than the security brought about by a real and effective state and the economic prosperity brought about by good institutions. However, several psychological studies have to admit that it is impossible to disentangle the logics of "appropriation" (avoiding the "gaffes") and utility maximization, and it is necessary to rely on a "sense of fairness" close to Aristotle's concept of justice, which can be observed through surveys but, given its variegated meanings in specific contexts, cannot be conceptualized without resorting to a philosophy taking into account the "public culture" of a given society (Rawls, 1971, 1993, 2001).

For that reason, most of these attempts are based on implicit or explicit philosophical foundations despite their use of empirical or formal (rational choice) scientific research. Several democratic empirical theories actually depend on grand narratives that treat history as a whole as the grand theories of big science treat the evolutionary nature of physical realities, and they do so by moralizing the events. It is *because* political science today has built-in democratic features—roughly, the "bottom" explains the "top," the "micro" explains the "macro," and the individual is a well-meaning and rational being—that it comes to hold that democracy is the best political regime and not because the "value-free" scientific research (a contested concept) has decisively proved that democracy is the one best way, which is merely confusing the causes and the consequences of the statement. The reverse—a "neutral" position on the evaluation of democracy—seems closer to the facts because both the "strong program" of sociology of science and liberalism (as both an intellectual climate and a philosophy) hold that empirical political science can flourish only when there is a pluralism that does not treat democracy as the best way.

Besides, with the waning of general theories aiming at lawlike generalizations applicable to the whole society without leaving anything outside their explanatory system (organicism and holism—both of them still upheld in the natural sciences—and functionalism, systems analysis, and historicism), political science has come to be perceived as the systematic study of institutions and social mechanisms in a state of permanent disequilibrium and provisional equilibrium, viewed as a game's stable outcome achieved through institutions grown by rational actors in a context not finalized by the market. The mechanisms and models are simplifications of reality, not because they are not observable in real life but because they are always embedded in a specific combination of other mechanisms. So, between the mere historical narrative and the nomological ambition, social science aims at the fine-grained analysis of a given society and regime through the use of abstract causal models that may be exported from a given context to another but cannot be considered as "laws" since, in real life, two mechanisms may logically coexist while being contrary to each other. For example, a state may have a formal commitment to democracy, yet it might exhibit authoritarian behaviors in its operation. Moreover, mechanisms are always "local," that is, particular and limited by borders, and so causality is equally local and cannot be replicated but only adapted to fit empirical observations. Jon Elster's two laws of pseudoscience—"everything is a little bit like everything else" and "everything is causally related to everything else"—are no longer taken seriously. Only functionalism still withstands the assault of analytical sociology, at least in so far as it is carefully "situated."

This move toward a science of embedded and combined mechanisms has deprived political science of the claim, still maintained in certain departments of economics, of being able to forecast the future as a whole. But lest the science of politics become the art of entertainment and storytelling, it had to revive the plea for political relevance, long ago taken for granted, then thriving in the 19th-century "noble science of politics" and later openly voiced as a reaction to behavioralism. Not that empirical science lacks a certain political relevance. For example, the elucidation of mechanisms and the findings of behavioral economics, by helping us better understand the causes and (often unintended) consequences of our actions, may lead to an assessment of the conditions of the possibility of political actions and then to an intelligent practical action. But unless those prescriptions are based on a comprehensive philosophical view of the world as a whole, they remain limited to specific and local cases.

So the revival of political philosophy was marked by "the return of grand theory" (Quentin Skinner, 1990). The main obstacle to philosophy as a rational endeavor was long erected by the natural sciences since, as Bernard Williams has noted, the pursuit of scientific truth alone leads to a disconnection between reason, on the one hand, and individual and collective goals, on the other. But if social sciences do not pursue that fantastic endeavor or pursue it in a more modest way, philosophy regains some ground. If the good polity made by good citizens, good institutions, and good rulers is to be from now on beyond the reach of empirical political science despite the valuable efforts made to work out new theories of government, both descriptive and prescriptive, it remains nevertheless a highly relevant endeavor and philosophy. At least in its practical and prudential form, it has to thrive again to restructure political space in order to annul for a moment political time by encompassing it in a worldview. So political philosophy has revived what was called with some contempt the "traditional theory," combining perennial questions (What should man be for the political order to be livable? What should the political order be for man to live a "good life"?) and historical contexts (the diagnosis of a social disease, outline of a better future order, or reinsertion of politics into a wider order). Today, political philosophy figures in some introductory courses of political science as a part of the political theory canon identifying the main domains of scientific research of which it is a necessary input: order, democracy, community, equality, legitimacy, justice, and narrativity.

Political philosophy stays in some respect aloof from apocalyptic or revolutionary utterances since, contrary to the opinion of Max Weber, the different quests for a better world and an axiological rationality are not doomed to lead to a "war of gods." Even though we have long and too well known that the collision of ultimate values may lead to murderous, and unfortunately necessary and even "just," wars (suffice it to recall the real stake of World War II), such a violent outcome is by no means fatal since such a collision is also a permanent feature of a pluralist and peaceful view of politics (Berlin, 1962), and it may be restricted and kept under control in a "cold war." If it is true that several worlds are indeed conceivable and equally good, it is impossible to have the best of all of them, and political philosophy has to put up with this imperfect state of affairs without lapsing into the perspective of "the extreme case" through the subjection of politics to a "methodological exceptionalism" of some sort, where the "exception" (the crisis) is part of the "rule" (ordinary politics)—that is, a "warlike" framework from which all the other political states should be derived (Schmitt, 1972, 1988).

Philosophy can perform that task in two entirely different ways that have long been the watershed of the discipline. The first one, from Plato to Karl Marx, Friedrich von Hayek, and Robert Nozick, considers politics as something awkward, superficial, and empty since, like the state itself, it cannot be reduced by an iconography of order. Therefore, the genuine reality must be located elsewhere, in "society," biology, religion, law, economy, philosophy, and so on. Politics is then a social misformation that should, and could, disappear some day from this world. The alternative, dating back to Aristotle, is to view politics with all its "patterned disorder" as a constitutive dimension of the human condition (Walzer, 2007), the frontiers and values of which may widely vary and be expanded or displaced, as evidenced today by the various feminist political philosophies insisting, for instance, on completing "justice" by replacing it with "care" as the foundation of a fair political community. This entails substantial changes in the assessment of past political philosophies and political science itself. A third way has recently appeared, stating that we are currently witnessing the transformation of the idea of political community inherited from European history and its Wesphalian turn, which may lead to a revival of cosmopolitics, with notions worked out by empirical as well as philosophical theories such as global citizenship, global civil society, transnational governance, world government, global state, and world-state, reminiscent of Dante's universal "Empire" expounded in *Monarchia* and Alexandre Kojeve's comparable concept of a universal homogeneous state. Although the idea of a world-state is sometimes rejected by cosmopolitics and has been strongly criticized by Walzer as a dystopian top-down tyranny (the opposite of the Kantian advocacy of a league of small republics), those ideas are alive since many of them stem from the contention that politics should not be viewed as the taming of the social war and the containment of violent conflicts opposing virtual enemies. Rather, striving to address problems such as climate change and poverty by addressing the factors generating them is the only proper task of politics since politics is first of all about the production of public goods and the implementation of global justice. Although the last position is strongly denied by those holding that social justice can only be conceptualized within domestic politics—that is, the state—globalism requires other virtues such as the Kantian duty to assist those who need it the most. The same problem surfaces when one moves from social to economic justice, raised, among others, by "the more Rawlsian than Rawls," such as Thomas Pogge. Actually, the plausibility of such a turn does not depend on philosophical arguments but on the psycho-sociological consequences of those global changes: If, as it seems almost certain, they entail a vastly unequal distribution of costs and benefits among different areas, then the "common enemy" will not unite humankind but will turn certain frustrated human groups against others and philosophy shall be back to square one.

This leads at times to the fading of the Hobbesian divide. On the one hand, the realist theory of international relations holds that, whatever the preferences of reason, conflict is the order itself and, accordingly, virtual wars are always possible in a metaphoric state of nature, which does not mean that realism is averse to international law and morality. So war may be legitimized by self-defense against aggression, which keeps alive the issue of the moral legitimacy of war, a very ancient concern of Christian, Muslim, Indian, Buddhist, and Chinese political thought, especially in the thorny issues of the preventive use of force and armed humanitarian interventions without the mandate of the United Nations. On the other hand, the liberal philosophy of domestic relations, where war is banished, civility within conflict should reign, and conflict, albeit a necessary component of a vibrant polity, has its magnitude and severity limited by the requirements of order, may question the necessity of a sovereign to reach that goal, one of the most pressing issues of contemporary political science and philosophy since it encompasses all the claims to the obsolescence of the Hobbesian divide. Rawls has attempted to take into account the resilience of the Hobbesian divide by devising another "veil of ignorance" applicable to the construction of justice in the "international community" while getting rid of the concept of (an implicitly "sovereign") "state" (replaced by "people") (Rawls, 1999).

Whatever the life chances of those opposing viewpoints, the professionalization of political philosophy, different according to each historical context, should not be construed as making irrelevant other forms of political reflections derived from religious beliefs and above all from works of art, such as Homer's epic poetry, Greek tragedy, Shakespeare's plays, or, closer to our times, the works of Fyodor Dostoyevsky, Robert Musil, George Orwell, or Alexandr Solzhenitsyn. It may even be claimed that political philosophy and any form of political thought have a "literary dimension," with Martha Nussbaum stressing that the texts always express the linkage between *what* is said and *how* it is said and Stanley Cavell viewing autobiography as intrinsic to all interesting philosophical writing. Of course, philosophy remains bound to seek self-understanding and the understanding of human culture by using logical reasoning instead of an edifying narrative. Yet it remains possible that in such a sense it may miss something vital in politics if it is a knowledge not born of pain and passion since those passions and emotions cannot be tamed by pure reason or even instrumental rationality, so reason cannot rule unfettered in the human world. As Williams noticed, philosophy's shortcoming may be having kept the traces, dating back to the 5th century BCE and earlier, of an Epicurean conscience not yet superseded by Plato's and Aristotle's endeavors to make our relation to the world fully intelligible.

Although a significant part of contemporary political philosophy appears dedicated to keeping political tragedy at bay, a sense of tragedy lingers, due to the Senecaian conflict between the individual will to excel in the practice of self-domination and the political and institutional conventions of the city and also to a conflict involving the meaning and foundation of different values within the same set of conventions. In this respect, the warnings of green political theory are, sometimes unwittingly, not devoid of a tragic character, and, especially but not only in international relations, the practical tensions between restorative justice (righting the wrongs of the past) and peace (ensuring harmony in the present) are more complex than several philosophers seem to think. An idealist and heroic effort to deny any place to tragedy lies at the heart of many contemporary philosophies of democracy: such as economic, deliberative, judicialized, communication based and Kantian republican, educative, without enemies, strong, and cosmopolitan.

Most of them (the economic theories being the obvious exception) extol the virtues of rational and peaceful dialogue as a necessary and sometimes sufficient condition not only of philosophical practice but also of real-world democratic politics, forgetting too often that an ideal dialogue leading to consensus is only one of the many features of a complex process that brings about interaction, understanding, and mutual agreement through a host of creative proceedings, majority decisions, negotiation, compromise, lawmaking, jurisprudence, socialization, economic innovation, and so on (Walzer, 2007). Likewise, the opposite concept, the will of the majority, does not exist as a plain empirical fact, and Dahl's concept of polyarchy is closer to facts, although it leaves out the issue of the necessary decision stressed by Weber. It may even be dangerous if taken as the dogma of the will of the people. The people as a plurality (the Aristotelian multitude) has no unified will except the universal (and universalist) banality that every human being wants to live in the *tranquillitas ordinis* (tranquility of order) of a just and safe society protected against "outsiders," which leads more to interpretive divisions than to political consensus, as evidenced in collapsing states where different peoples want to make up a people without agreeing on its identity, one of the main issues of secession and self-determination. Yet a majority is neither useless nor devoid of validity. It, along with deliberation, is one of the many practical devices invented to reach an acceptable decision. Both of them need prior conditions to function smoothly.

A Tentative Normative Epistemology of Contemporary Political Philosophy

That leads one to venture out into a bit of normative epistemology. First, like historical sociology, political philosophy must eschew both the illusion of "historical inevitability" (the present is already written in the past) and the "fallacy of discontinuity" (the present is *radically* new yet bound to happen).

Second, although philosophy resembles science in so far as it has to rely on argument without claiming any longer to be the mirror of nature, the validity of political philosophy's discoveries should be viewed as different from scientific discoveries. Because philosophical "truths" cannot claim the monopoly held by vindicated scientific theories (at least provisionally until they are falsified by a new scientific discovery), they do have the same status as scientific ones. Political philosophy seeks a balance, depending on practical contexts, between values, for instance, "negative" and "positive" liberty or the "politics of faith" and the "politics of skepticism." Far from being a weakness, this is the enduring strength of contemporary political philosophy: not to edict a theory of everything and to accept as a truth the plurality of reality and so the reasonable pluralism of different philosophies, by nature partial and incomplete, without falling into the relativism of mere opinions. As Williams says about Berlin, being "truthful" is perhaps the only way to be true.

Third, political philosophy should stay away from both sociological and philosophical reductionisms (Maurice Merleau-Ponty, 1983). Sociological reductionism makes philosophical statements and their reception a secondary effect of social determinations; therefore, they need not be studied in themselves but can be explained away as prescientific. Yet sociology properly understood may account for the emergence of ideas and their context of discovery, but it does not follow that the context of justification and justification itself can be disposed of by the same method. On the other hand, philosophical reductionism as a narrative drawing a stylized and idealized picture of politics is flawed, not so much because it may presuppose a human being "floating" above history and untied from any social relation but because it excludes from empirical reality everything that does not conform to its philosophical requisites. As Walzer (2007) puts it, "Habermas argues for unconstrained communication, but he means only to exclude the constraints of force and fraud, deference, fear, flattery and ignorance" (p. 26). Paradoxically, such a reductionism substitutes opinions and impressions for sound empirical knowledge. This does not by any means entail the banishment of utopia from political philosophy: Utopia is not the depiction of an actual perfect future but the present depiction of what shall never be. It is a "transcendental horizon" we should always keep in mind to help us stay alert when dealing with the actual political arrangements of today.

Last, political philosophers should be aware that they operate in different contexts and temporalities than political actors. Walzer (2007) suggests that perhaps philosophy is politics construed in tranquility, while politics is philosophy implemented in confusion. This does not mean that philosophers should ignore real politics or symmetrically agree to become politicians (or claim to be their masters). Quite the opposite—according to Walzer, they should be aware that their discourse has no value if they do not care for the details of the problems and situations they are commenting on, provided they refrain from playing the philosopher-king. For once, it is not the Devil who is in the details; it is humility and the absence of arrogance.

Universalism, Localism, and the Challenge of Identities

Contemporary political philosophy, constrained by the duty to be contemplative and reflexive, yet practical and prescriptive, is also facing the unavoidable challenge to say something universally valid at least "in reach," in Rawls's parlance, while being "municipal" and interpretative of the local conventions of an age or a civilization. Western philosophy with its various brands—contractarian, utilitarian, republican, even communitarian, or pragmatic and ironic—occupies most of the field, and most controversies take place within the general framework of political liberalism and democracy. Some important issues include the requirements of a moral life in liberalism, the nature of political obligation, the justification of economic liberalism, the logical consistency of a liberal social justice and democratic equality, the logical requisites of justice and equality, the possibility of a "civic liberalism," the rules governing institutional design in a democratic context, the role of random selection ("sortition") in resource allocation and more generally in the improvement of democratic processes in various domains, and, finally, the debates around the right normative framework for justifying democracy, whereby collective decision-making procedures should be justified in terms of their epistemic value—that is, their ability to produce the "right" solution for collective problems to achieve political equality, the fundamental standard of evaluation of procedures and outcomes being political equality. Two requisites are opposed: epistemic proceduralism versus a particular substantive theory of justice, the first one being conceived as escaping the accusation of ethnocentrism confining democracy in a predetermined set of standards.

One should mention here the powerful critiques of Alastair MacIntyre, a critic of analytical philosophy coming from its ranks, and the deconstructionist assaults of Michel Foucault. Foucault is more appreciated for his insistence on the microfoundations of power in the depths of modern society, disciplined and subjected to governmentality, than for his philosophical ideas on the status of truth and ethics. His statements on "a political history of truth" are ambiguous enough to go beyond a mere social history of science (and morality) to be suspected of unfettered relativism, which would render void his own statements. Actually, Foucault has an ethical sensitivity. He may be right in criticizing the definitive finding of substances such as transcendental truth and morality beyond the contingency of identities, but that does not exonerate him from the duty to search for the truth, without which any agreement should be considered an agreement about truth. As for Jacques Derrida, Gilles Deleuze, and Emmanuel Levinas (the latter being more included by others in political philosophy than claiming to belong to the tribe), they oscillate between the deconstruction of liberal philosophy, a metapolitical philosophy, and a philosophy of metapolitics.

Therefore, the dominant Western philosophy remains the legatee of the diverse kinds of Enlightenment. One of the only noticeable exceptions is the antiliberalism represented by the Straussian pocket of resistance. Strauss, in his American period, had moved to an untimely liberalism and, albeit careful to distinguish between "ancient" and "modern" liberalisms, paid his respects to modern liberal education. The other two exceptions are the legacy of Joseph de Maistre, and Donoso-Cortès and Carl Schmitt and the conservative thought. The first one is almost outside the borders of "professional" political philosophy, and the second one may claim that being "conservative" it does not deign to be a philosophy. As for nationalism, flourishing under various guises, secular or religious, it must be taken seriously by a political philosophy not entranced by the charms of cosmopolitanism. There may be important arguments about the different types of nationalism or the liberal flavor of certain nationalisms and their compatibility with liberal values, but it cannot be the core of a political philosophy since a nationalist philosophy would be a contradiction in itself.

This apparent dominance of a philosophy born in areas that do not make up more than 15% of the world population and to which the fall of the Berlin Wall marks the beginning of an epochal change in political philosophy brings about its logical and sociological backlash, namely, its indictment of spurious universalism based on a local conception of what an individual is and what his or her concept of liberty, quest for justice, and, more broadly, rationality may mean. To be sure, this small part of the world had once dominated the entire world by founding huge overseas empires, the mere existence and success of which incited many intellectuals belonging to colonized peoples to desert the ranks of traditional thinkers and join the troop of "organic intellectuals," espousing the basic tenets of the conquerors' public philosophy to turn it against their imperial endeavor. But despite, or perhaps more accurately because of, the universal success of decolonization and its major theme, anticolonialism, the dual nature of the West, liberal inside and dictatorial outside, came to be seen not as a logically inconsistent yet sociologically explicable combination of two sets of contrary values but as a whole package of values. This gave rise to *Occidentalism* (the term was coined after Edward Said's famous *Orientalism* to depict a distorted image of the real object)—all the more so as Marxism, which had long been a powerful tool to convince the colonized elites that they could stick to the Enlightenment while getting rid of its racist and colonialist side, had lost most of its appeal, hence the search for new public philosophies to pursue the unfinished struggle against Western intellectual hegemony and to gain a better understanding of what the subaltern needs and visions actually are.

Such an offhand yet plausible sociology should have nothing to do with a serious philosophical and scientific debate. Yet it is a powerful input that paves the way for new inquiries into the meaning of concepts in areas until now left out of Western philosophical concerns and confined to anthropological and ethnological researches not devoid of biases—hence, the renewed interest in, for example, civil society or freedom. Even more important is the surge of concern for "identities" that deeply modify the usual debates about justice by shifting them from redistribution to recognition. The quarrels over "positive discrimination" lie at the heart of the dilemma of the universal welfare state, trapped in the dual duty of providing services to all on an equal footing and promoting particular categories. They become bitterer when the relevant groups are characterized by their location in a social stratification not based on the division of labor and material reward but on ascriptive traits (religion, ethnicity, and even gender). This may lead to a justification based on a compensating rationality and restorative justice, sometimes curiously put forward to claim that groups whose identities have been excluded, suppressed, or marginalized have a right to the recognition and public toleration of their own intolerant practices. So a combination of cultural relativism and respect for the rights of cultural communities pretends, under the guise of empirical descriptions, to be the political philosophy of our age.

Still more debatable are the assaults against current political philosophy and, by implication, political science. Starting with the now (rightly or wrongly) taken-for-granted demise of sovereignty as a sociological concept (which it has never been, being a legal concept) and of the "old" theory of the modern nation-state, caricatured as the superposition of one territory, one people, one sovereignty, one constitution, and one homogeneous political space relating directly the individual to the state, they deny most of the value of liberal and republican philosophy when applied to other areas than those where they were born. Parekh, after exposing the cultural particularity of liberal democracy and excoriating the poverty of contemporary Indian political thought, has set himself the task of explaining why Western philosophy stands no chance of succeeding in countries where, for the historical reasons already mentioned above, political institutions of the past are reenacted as alive or revived. Thus, in these societies, according to Parekh (2003), the political imagination is less "disciplined" (a Foucaldian allusion), bolder, more reckless, and prone to explore a broader range of possibilities than in the West.

Parekh's eulogy can be seen as nothing other than the reverse of the famous "Orientalist" descriptions (perhaps grounded in Hegelian philosophy) that considered non-Western peoples as alien peoples deprived of the values of modern civilization and thus unable to contribute to historical development. A thesis such as Parekh's suffers from two basic flaws. It does not give us any idea about what such new philosophies might look like, once we have disposed of the Foucaldian fancy of a new "political spirituality," to which he refers when interpreting the Iranian revolution. One can ask whether the idea of Islamic human rights betters the usual idea of universal human rights or which is the more creative and imaginative of the two conceptions of the relations between religion and politics and the modern role of Muslim legacy that mark the epistemological divide in Islamic political thought: the transcendence of justice as an intangible and eternal trait of the good society versus the historicity of reason. The first epistemology favors revolutionary conceptions of Islam based on ontological premises adverse to political freedom, whereas the second relies precisely on freedom to criticize the first one's tenets.

In addition, Parekh neglects the necessary combination of universalism and particularism offered by Walzer's (2007) concept of reiteration. Walzer begins with a distinction between two universalisms or rather two dimensions of universalism. In the *covering law universalism*, there is one and only one law, one justice, and one correct understanding of the good life, the good society, or the good regime. In the *reiterative universalism*, taking seriously what it means to have a history, every universalist principle is inevitably reiterated in a particular way in its historical existence; even the will to reproduce a principle and to replicate its application brings about some historical singularity. It ensues that the second universalism makes no prediction about the substance of the successive reiterations. Such a line of reasoning provides a solid basis for a moral universalism opposing the obligation to recognize and include groups whose morality is radically at odds with the requirements of a Rawlsian reasonable pluralism and thus freeing the state from its duty of indifference while recognizing at the same time that liberalism is not averse to, and even promotes, the rights of minority cultures. By the same token, political (nonmetaphysical) secularism can be judged as a universal value, provided that it is not restricted to a particular conception sometimes attributed to Western secularism and mainly conceived from a Protestant culture (a position held by Hobbes, Locke, and Voltaire but certainly not by Kant, Tocqueville, or Rawls) and that it does not rely on a rationalist conception of reason, ignoring its plurality and imposing unjustified limits on the manners in which issues are to be brought into the public domain (Rajeev Bhargava, 1998).

To be fair, let us recognize that Parekh's position is not restricted to an excessive indictment of Western political theory when it ventures overseas. Not only does the empirical basis of Parekh's theory seem quite defensible and supply a theoretical justification for its call to take into account the comprehensive moral doctrines and reconsider the foundations of an autonomous political philosophy, but it also offers some wise advice to do so. Philosophers must confront those doctrines, expose their logical flaws and their inadmissible moral and political implications, and found their own political theory on a reasonably convincing conception of man and the world. However, this is a very difficult task: If the philosopher is involved in politics, he or she cannot start a deep theoretical inquiry for lack of time. According to Parekh

(2003), if the philosopher wants to escape from *vita activa*, the intellectual liberty required by political theory is missing in societies dominated by the religious, ethnic, or ideological orthodoxies, and even in free societies such as India, the inhibition stems from the fear to question the dominant ideological consensus and so to encourage various forms of extremism. The point is very well taken, and Strauss would have been sensitive to those disenchanted reflections.

At least in countries that are "disciplined" by other means and where a relative freedom of opinion and expression still reigns, one could expect political science and political philosophy to eschew the strange dual efforts to (1) accommodate the idea of singular cultural outlooks, irreducible to one another, and the idea of a world community endowed with common values (short of reducing them to market economy rules) and (2) substantiate the idea that the static identities engendering territorial and cultural boundaries are nothing other than the outmoded legacies of nationalism and imperialism while holding at the same time the opposite idea that the cultural minorities and the borderless nations must be institutionally protected, which supposes that identities are somewhat static and worth perpetuating.

POLITICAL PSYCHOLOGY

The relationships between psychology and politics are complex and have generated both controversy and a substantial amount of research. This entry discusses these relationships, which have been the focus of research in the subfield of political psychology in recent decades. They include personality aspects, group and mass phenomena, emotional intelligence, and political symbolism.

In simplistic terms, sociology refers to collective behaviors and psychology to individual ones. Therefore, it might be expected that political researchers who adopt a collective or structural approach toward political relationships would be the most reluctant to acknowledge the relevance of political psychology, while those who support an individualistic approach would be more likely to recognize its usefulness or even to claim its necessity. But this has not occurred. Political psychology has met with much opposition from both sides. Why? After all, Alexis de Tocqueville, whose work is still highly valued by political scientists in both America and Europe, devoted significant attention to psychological considerations of the way in which political systems work. In the 1930s, Harold Lasswell creatively investigated the links between psychopathology and politics, particularly as regards the motivations behind political involvement.

For a long time, however, strong objections to political psychology prevailed as political science became more and more meticulous and rigorous in its methodological practices. Many works in political psychology were speculative essays without valuable data or detailed theoretical frameworks. In Europe, these weaknesses were most apparent in the macrolevel literature devoted to crowd psychology or the ethnic temper of particular nations. Among the concepts in this literature that have been rejected by political scientists are the notion of "collective unconscious" coined by Carl Jung, a psychoanalyst who competed with Sigmund Freud; the cliché of the irrational crowd moved by its "collective soul" put forward by Gustave Le Bon, who considered himself the founder of crowd psychology; the "herd mentality," which was described as a human instinct by Wilfred Trotter; and the approximations of the psychology of various peoples and "national character" that so often appeared in works of the first half of the 20th century. All of these superficial considerations tended to cause confusion and suspicion over the use of psychology in politics. As for the psychology of individual actors, most sociologists have denied its relevance, arguing either that the real motivations of personal behaviors remain inaccessible to knowledge by scientific standards or that investigating these is pointless since social structures or the valorization of social roles (a set of expectations involved in an individual's social status) are the major explanatory factors. Some of these arguments against the use of psychology have merit, but it must be added that a lack of information or a culture predisposed against the psychological field may also explain, at least partially, the refusal of political researchers to borrow frameworks from this discipline.

What is political psychology? It is not a genuine discipline in its own right, nor is it a branch of psychology because it shows no special interest in generalizing about human behavior beyond the political arena. Rather, it is an interdisciplinary academic field intended to provide insights into the way in which politics functions. In fact, each kind of collective behavior, each political event is an outcome of individual actions aggregated and interacting, as Max Weber strongly asserted. So it is not possible to avoid some theory about the cognitive and emotional processing of man in social life when thinking about politics. But if social structures emerge from personal behaviors, personalities are also socially shaped. Moreover, the macrosocial dimensions of politics strengthen the importance of institutional factors to the detriment of free will. This implies, as Erving Goffman has stated, that we need a psychology for sociologists, very different from that for psychologists and, in many respects, quite restricted. Nevertheless, it is useful and even necessary to avoid neglecting contributions and concepts from the neurosciences, cognitive psychology, developmental or community psychology, and, maybe, psychoanalysis. But the relevance of each of these approaches depends on the nature of the fields perceived as psychosociological. And it just so happens that these are very different.

Personality Psychology and Politics

Personality is usually defined as an organized, dynamic but relatively enduring set of characteristics that affects how an individual responds in various situations. In the study of politics, a focus on this concept seems to make sense above all when a limited number of key persons are involved in a process of decision making. For example, it would be important to know whether political leaders are proactive or reactive, conciliatory or aggressive, open-minded or close-minded. But personality psychology strongly matters if, and only if, it is believed that the will of a few policymakers—and particularly that of the political leadership—can overcome the hurdles imposed on the policymaking process and successfully implement their will. This rarely occurs. In most cases, leaders are compelled to search for compromises, to face internal power struggles as well as demands from pressure groups, and to come to terms with the expectations imposed on them by their elite status. So they are obliged to curb their desires, and instead of expressing their genuine motivations (or following what drives them), they adopt behaviors strictly dictated by the power games at play. Thus, it is unsurprising that many sociologists see such psychological approaches as groundless. The real explanatory factors may be elsewhere.

This is all true, but three additional points must be taken into consideration. First, as Fred Greenstein noticed, it may happen that the competing forces of power are so well balanced and under such fluid circumstances that there is space for a key decision maker to make a genuinely free choice among policy options. In this case, psychological characteristics matter. Of course, this situation is much more infrequent in democratic regimes than in dictatorships. Furthermore, in either government structure, leaders are dependent to some degree on the will of their followers and the nature of the alliances they have forged. Second, even if free choice is highly restricted, the fact remains that personal psychology affects the style of governance adopted and particularly the way in which leaders appeal to citizens, supporters, and opponents. This has a great deal of influence on the course of political life. A charismatic style versus a sober tone or a bright versus a stoic appearance can make all the difference in the electoral process—as we saw in the competition between Silvio Berlusconi and Romano Prodi in Italy (2008) or among Barack Obama and several of his challengers in the United States primaries of the same year. Third, personality factors are relevant for leaders acting in situations where strong emotions are triggered, as Betty Glad claims, citing the case of Jimmy Carter handling the Iranian hostage crisis or Ronald Reagan's inability to directly confront people he liked, which hindered his dealings with Menachem Begin at the time of the Israeli invasion of Lebanon in 1982. Investigating the effects of character on role performance is never pointless.

Throughout the 20th century, research in personal psychology dealt with the motivations of politicians and/or their followers. Since the 1950s, many biographical works have emphasized the idea that politicians are qualitatively different from other humans because, as Carol Barner-Barry noted, political behavior is strongly related to making choices between disputed alternatives, strongly oriented toward losing or winning, and often motivated by feelings of justice or fairness. So in these biographers' minds, political involvement derives from special incentives. James Payne (and his associates) have uncovered five main political motivations: the quest for status or prestige, the need to work on concrete issues, the need to have conviviality and friendship, the fulfillment of moral obligations, and the pleasure of competing aggressively in political games. Their research shows how skeptical citizens ought to be about the assertions of politicians, who tend to idealize their motivations. But, even if Payne's list is useful to later analysis, it is too short. Obviously, activists and politicians share other common emotional drives, such as the desire to overcome low self-esteem by public self-realization or to escape the monotony of life through stimulating social games, not just aggressive ones. In the last few decades, several authors also tried to build ideal types of personality. When applied to leaders, such classifications aim not only to make their behaviors more predictable to observers but also to uncover the mechanisms by which they charm their followers (or threaten their opponents). Of course, the appeal of revolutionary ascetics or moral masochists differs from that of absolute narcissists or catchall seducers. Moreover, we may expect that revolutionary (and stressing) situations produce different types of leaders than do ordinary democratic times.

Other authors were interested in designing typologies of ordinary citizens. In this field, the most famous investigation was carried out by Theodor Adorno and a team of psychologists and psychoanalysts; their book *The Authoritarian Personality* (1950) later inspired much subsequent field research in political science. In their view, authoritarian personalities are characterized by traits that result from childhood experiences and become stabilized for life. Harsh and punitive parents produce adults whose personalities are defined by authoritarian submission, conventionalism, destructiveness, superstition and stereotypy, and fear of intraception (the ability to delve into one's deep feelings and attitudes). They used this syndrome to help explain right-wing ideology, prefascism, and fascism. This thesis was widely criticized for methodological flaws, particularly blindness about the characteristics of left-wing authoritarian personalities. But the main objection here is the very use of the concept of personality. Adorno's research implies that political opinions, choices, and behaviors are primarily the outcome of psychological factors since personality is perceived as the center at which such choices are made. It also tends to exaggerate the consistency of individual responses to the challenges of life. Individuals sometimes undergo sudden psychological changes in attitudes, related to changing circumstances such as fear of war, local unrest, or economic decline. For instance, in such trying circumstances, individuals may abandon cooperation strategies in favor of more competitive or defensive ones. In his classic monograph, *Personality and Assessment* (1968), Walter Mischel asserts that personal psychology searches for consistency in the wrong places (e.g., seeking stable responses in cross-situational behaviors). Because the individual's behavior is highly dependent on situational cues, his or her consistency is found in stable patterns of the "if–then" variety—doing A when X but B when Y. So, for instance, similar aggressive personalities can differ dramatically in the types of situations in which they are aggressed. So without dismissing some of the psychological insights put forward by Adorno or Milton Rokeach (author of the famous *The Open and Closed Mind*, 1960), it is better to see personality psychology as complementing rather than supplanting sociological approaches. Too much attention to personal psychology can result in too much attention being paid to personal responsibility, while in fact political life is made up of collective processes and interactions.

Today, there is a shift in political psychology toward other conceptualizations borrowed from behaviorist or cognitive psychology. Both underscore the role of external stimuli and their effects on personal behavior. Burrhus Skinner, a very influential behaviorist, has demonstrated that there is a mutual interaction of the ego with its environment. According to his three-step contingency model (stimuli/responses/consequences), everyone develops habits of thinking and acting that are reinforced by their effectiveness in earlier situations. Cognitive processes involve adaptive selectivity. In the political field, this means, for instance, that the development of Adolf Hitler's or Joseph Stalin's personality was itself a process, strongly related to the course of their political rise and sharpening instrumental tendencies with every victorious step. Moreover, it can be said that the economical, cultural, and political circumstances of their days—a humiliating defeat in World War I for Germany, and civil war and the triumph of the one-party system in Russia—played a role in the later selection of these types of personalities as omnipotent leaders. These personality types fit well with the kinds of crises that their respective countries were confronting. Many political scientists may argue that the critical question is not "Which personality?" but "Under which circumstances did particular persons establish themselves as the leader of a country?" Though this argument underlines the importance of social and political considerations, it would be wrong to entirely dismiss the role of personal psychology because it has a significant impact in other ways.

Interactionist Psychology and Groupthink

Rather than focusing solely on factors shaping a person, political psychology must also take into account interactions between thoughts and feelings that link individuals to each other in a given situation. Cognitive processes such as thinking and judging political events are not affected only by macrosocial influences. Of course, early socialization, economic and cultural status, and religious, ethnic, or political affiliations all shape the ways in which citizens make up their minds in a voting booth or engage in political activities. However, the inner circle—family, friends, highly respected figures—matters, too. And, in this circle, emotional relationships play a significant role. Feelings of confidence or mistrust, a tendency to judge others, the degree of empathy or ambivalence toward relatives, or a fear of annoying them—these kinds of relations can modify a specific behavior like choosing a candidate in an election. It is for this reason that when family or tribal links are strong, as is the case in rural areas or in many non-Western cultures, electoral processes are shaped by factors other than those in more individualistic cultures. Pressure from other members of the "tribe" may compel individuals to endorse particular opinions. In addition, the appearance of competitors may awaken emotional tensions resulting from relationships between parents and children, especially between fathers and sons. A great deal of research shows that these tensions in turn influence the reproduction process of inherited political attitudes.

The influence of these psychological interrelations at a microsocial level is most visible and most consequential for the course of political life when studying decision-making processes. With his theory of groupthink, Irving Janis describes how systematic errors result from psychological biases held by small groups of policymakers taking collective decisions in a very closed (and stressful) environment. The more a group is cohesive, due to its homogeneity of social background and ideology, the more its members value unanimity of thoughts, which in turn may override a realistic perception of facts and alternative interpretations of issues. The risk occurs when the situational context is highly provocative because of recent policy failures or very serious external threats, noticeably in the field of security. The debate can, in these cases, become overloaded with implicit (or sometimes explicit) emotion. Wrong decisions, Janis claims, result from self-censorship of ideas that deviate from the apparent group consensus—each of the members fearing being dubbed "disloyal" to the leader—and from channels that shield the group from disturbing information in order to prevent too much anxiety. To get rid of these biases, Janis advocates some kind of reorganization of the decision-making process, particularly by setting up several independent groups working on the same issue and by increasing the involvement of outside experts. So we can see that certain methods of political management are—or should be—responses to psychological challenges. Much subsequent research has tried to test Janis's thesis in laboratory experiments or in the field. In a broad survey of post-Janis research, Robert Baron claims that groupthink is even more ubiquitous than Janis asserted. In particular, it occurs even if there are neither external threats nor much anxiety present. So in Baron's opinion, such an approach must not be underestimated for explaining political mistakes and misunderstandings of the challenges to be resolved.

Interactionist psychology investigates phenomena such as the way in which political judgment is shaped among members of think tanks, associations, and parties. In political life, engagement means sharing values and goals with others within an organization and, above all, self-identification with those ideas. Politicians and grassroots activists claim an identity that supposedly summarizes what they think and what they are going to do. They call themselves either Republican or Democrat, right wing or left wing. Even within a party, they often claim an affiliation to one faction. This self-categorization or political identity puts big constraints on their actions: first on the kind of labels with which they can describe a situation and, second, on the set of issues they can take for consideration. The rank and file have to represent the positions traditionally taken by their organization in order to avoid accusations of disloyalty, prevent reproaches from their entourage, and avoid being marginalized—which may be painful. This pressure is stronger where organizations are well established and their members allegedly share mutual friendships, based on a past history of political struggles. Sometimes blind allegiance causes a process of real de-individuation: for example, a loss of self-awareness and personal evaluation made about political events and leaders. In this regard, if the authoritarian management of a party mostly attracts persons who completely identify with the leader, this generates feedback reinforcing authoritarian management. A process of isolation and insulation from society may result, as many examples of extremist parties (right wing or left wing) demonstrate.

As for leaders, if they have space to undertake initiatives and formulate political judgments of their own, they can work in a more or less polarized world. If the outgroups they confront are particularly despised (which is the case when competition is high), positions issued by political leaders may be greatly—and negatively—influenced by their opponents' stances. "What differentiates your program from your competitor's?" is a common question leaders have to address. But the distinctions these individuals demonstrate from each other may not only be political. We may consider that, in democratic regimes, political action is as much affected by emotions as formal political allegiances. The degree to which one sees his or her opponents as friends or enemies or the degree to which one treats them with deep respect or equally deep disgust colors political life with a touch of psychology.

Mass Belief Systems in Electoral Processes

How do citizens make decisions in the voting booth? This classic question in political science draws much attention. Some researchers argue that votes are generally consistent with the beliefs and political frames with which the voter grew up. In this regard, the so-called Michigan paradigm, identified with the publication of the influential *The American Voter* (1960), was seminal. This book insists on the long-standing effects of socialization by neighborhood, education, ethnic, religious, and class affiliation. It puts forward party identification as a decisive variable in voting. A second line of thinking sees citizens as relatively naive individuals, relying heavily on wrong, irrelevant, or incomplete information. This research is interested in the way volatile (or nonexistent) opinions are influenced by media coverage in electoral campaigns, above all when real political knowledge is lacking. A third stream of research, closely related to the theory of public choice, underscores the tactical ability of voters to pursue rational goals. Voters are portrayed as consumers searching for the most efficient costs/benefits choice.

All these explanations rely on implicit or, much less often, explicit psychological considerations, even if they are tightly intertwined with sociological and political ones. Contributors to *The American Voter* like Philip Converse, a social psychologist, accept this. Whether people have "sticky" preferences that discriminate according to partisan affiliations or remain independent and open-minded and whether they are prone to trust, or not to trust, political parties, governmental agencies, union leaders, and so on, are significantly related to psychological factors. What may be at stake, for instance, are the degree of self-protection involved and the ways and means of keeping oneself safe. Those who score high on attitudinal scales measuring anxiety are more likely to adopt vigilant behavior and show a strictly selected confidence in a few authorities. As soon as the political situation becomes tense, they view the public arena as divided and feel confronted by merciless foes. By contrast, a strong self-esteem makes an individual more open to opposite views without fearing destabilization, more able to understand others' points of views, and eventually, more likely to adopt conciliatory or balanced opinions and behavior.

Political scientists have always known that political choices are related to ideological values in a country's cultural environment. But they seldom investigate this subject in great depth, making it more difficult for them to understand all the various roles ideology plays in thinking and judging. Rationalizing an action through purported values rewards the Ego, helping individuals keep a sense of self-consistency and self-esteem. This idealizes a given behavior with rationalizing explanations; conceals less glorious motivations for action, such as envy, jealousy, and hate; and confirms linkages between individuals—which are of the utmost importance for individuals participating in political organizations. In this respect, ideological and psychological factors are strongly related to each other but in a complex way that needs to be explored. Voters may cast a ballot for a party candidate because they think that he or she is the best or the least distasteful among the choices; but they may also have in mind a desire to show what kind of citizen they are—a responsible democrat, an enthusiastic patriot, a justice seeker, or even an inflexible rebel—no matter what their real personality may be. Framed early on by socialization and strengthened by the daily influence of an individual's social location, this self-affirmation, ostensibly relying on internalized values, induces a ballot choice that is relatively independent from the real stakes of the polling day (such as policy relevance or candidate competence). It is the reason why public images (of a party or a candidate) matter so much. Politicians, in turn, who make identification processes easier will more easily obtain votes. Issue positions are not enough; a candidate's whole life must testify in his or her favor.

Political psychology, used by political scientists interested in the ways in which mass opinion is created, is hardly psychological in the eyes of "genuine" psychologists because it considers external structures of psychology as well as internal factors. Cultural linkages, as well as the cognitive, ideological, and institutional structures of the political arena, are all taken into account when considering why citizens make a particular choice. In electoral studies, this kind of political psychology has been drawing more and more attention. Since the later 1970s, research based on surveys or various attitudinal scales has attempted to give a more precise picture of different types of voters by taking into account psychological factors such as whether one is pessimistic or optimistic, self-directed or other-directed, or confident or suspicious. In a survey, counting likes and dislikes about issues and candidates has become of the utmost importance in predicting electoral choices. These studies have focused less on personality factors than on psychological styles. They are the product of responses extracted from aggregated statistical data, so that certain general categorizations can be correlated with the appeal of public figures in a highly personalized competition. When Jack Doppelt and Ellen Shearer identify five types of nonvoters—doers, unplugged, irritated, don't know, and alienated—they shed some new light on the phenomenon of abstention and the reasons why such behavior can be volatile from one election to another. These analyses tend to depreciate the idea that electoral motivations are always based on pure rationality and controlled economic calculus.

The ways in which psychology matters in the voting process are well known. Electoral campaigns mostly activate psychological predispositions. Beliefs and emotions like fear or hope and anger or enthusiasm influence perceptions and evaluations of public figures (parties or candidates) that, in turn, determine the final choice. But news media attention to particular incidents or hitches in the campaign can also modify the evaluation process, depending on what problems are being stressed: for example, threats to national security, economic crises, immigration, taxes, or purchasing power. Political scandals can also have significant negative effects. So voting should be understood not only as a political outcome but also as a mediated psychological process.

People cannot be locked into precise categorizations. Many citizens change their mind as situations develop, in accordance with changes in the political arena. Even the Michigan model never claimed that party identifications remain indefinitely stable. So snapshots taken at different times of the fluid mood of an electorate enable us to better understand the way in which beliefs and fantasies cause opinions and emotions and eventually lead to a political choice. An interesting discovery in the United States, valuable to some extent for other Western democracies, is that a large range of public likes and dislikes, extracted from frequent surveys, can be aggregated in a "policy mood" (James Stimson) that has swung, over four decades, from a "liberal" high to a low, in regular increments. Politicians cannot take this finding lightly. It remains to be emphasized again that pure rationality and controlled calculus will never successfully explain any particular behavior. But people with higher levels of political information (and education) know better than novices or lower educated persons how to express through strict political rationalizations their candidate or issue preference.

Emotional Intelligence and Related Concepts

Since the later 1980s, emotional intelligence has been given increasing attention in a wide range of academic publications that draw on observations from political scientists. Just as the neurosciences underscore the links between reason and emotion in the way the human brain works, these psychologists dismiss the idea of pure intelligence. Political scientists may borrow some crucial assertions from Daniel Goleman's book *Emotional Intelligence* (1995)—above all, the fact that all people harness their emotions, even negative ones, to understand and decipher external information and manage these emotions to achieve their intended goals. Some cross-cultural research suggests that there are many universally recognized emotions, which means they are biological in origin even if cultures interfere in their expression. Of this list, which ranges from 6 to 15 in Paul Ekman's works (the most noteworthy being *What the Face Reveals*, 1999), some are of greater interest for political studies: anger and fear, disgust, shame and contempt, all are often described as negative emotions; hope and pride, relief, and compassion are all perceived as positive ones. But this opposition (negative/positive), most clearly expressed by the pairing of satisfaction and frustration, needs to be reappraised even if it is still employed in some field research. Why should shame or pride be always seen negatively? More important, each of these emotions is dynamic, and its intensity is strongly related to the internalized ability of each individual to maintain self-control (which develops through early socialization) as well as to the nature of the challenges faced in his or her environment.

The first lesson of this literature is that we cannot avoid taking into account the primacy of feelings in political evaluations—about issues as well as actors. Affects and emotions interfere with political value judgments and contribute to a selective memory of past events, whether they were pleasant or unpleasant. The fact is well-known to politicians but continues to be underestimated by social scientists. One must expect a complex interaction of emotion and cognition during any deliberation over political decisions. In stressful circumstances, affective states such as fear or anger may unsettle otherwise sound political judgment, resulting in a misperception of the adequate response to a given situation. Noticeably, this is the case when high-level violence occurs, targeting personalities, assets, or even public values. Islamist terrorism has led to suspicion toward Muslim populations, strong war threats have resulted in an overwhelming denouncement of foes, and ethnic disturbances reduce those affected to a single trait of their identity, whether this be origin, religion, or language. But less noticed, even in day-to-day political life, is that emotions diminish or stimulate an individual's capacity to judge actions or actors. Satisfaction prompts people to distance themselves from disturbing or unpleasant information or to adopt convenient interpretations of it, which in turn make it easier for them to remain satisfied. Frustration causes a symmetrical mechanism of increasing frustration. The more this process remains unconscious, the more it weighs in political evaluations and, particularly, voting decisions. Hope and fear, and pride and humiliation, whether well founded or imagined, are the main emotions interfering with rational evaluations of citizens. In electoral campaigns, this phenomenon is greatly reinforced either by the scarcity or, conversely, the excess of information available, which is in all cases hard to control. Uncertainty in cognition gives way to more emotional investment.

The second lesson is that emotions are the engine of behavior. Where you stand depends on what you feel. When taking any action, most people search to build their self-esteem and earn a good reputation among the individuals or groups whose opinions matter to them. This is at the root of both conformism and rebellion. What differs between people are the values or guides to which they refer. Understanding the intensity and direction of such inclinations is decisive for the interpretation of political choices. But such an investigation may be misguided if too much importance is attached to authors' statements of their own intentions. If circumstances compel people to take actions of which they are not proud, their real motives will, if at all possible, be hidden behind more noble legitimizations. In some cultures, ambition, outrage, or compassion are more or less valued, even if everywhere they are decisive factors that determine the degree of political engagement and its relationship to the quest for self-esteem. So political psychology must study the complex factors that, in any society, tend to stimulate or diminish the public acknowledgment of these motivations. Other people are mainly directed by their fears or even by paranoid hatred. In these cases, it is necessary to delve into the conditions under which these feelings arise or even affect an entire population. We know that people who express strongly held anger as a result of difficult challenges they cannot properly face want to hold external agents responsible as scapegoats for their troubles. But what explains the trajectory that leads to mass murder or genocidal violence? A combination of sociological and psychological factors must be acknowledged here.

To take into account these dimensions of the political life, it is useful to refer to the theory of rational choice but understood in an untraditional way. The basic assertion of this economic paradigm is that people evaluate the costs and benefits of the choices they have to make and generally prefer the object that provides the greatest reward (utility, attractiveness) at the lowest price. But in political life, this kind of calculus, when restricted to material costs and rewards, is a myth. This is not only because information is restricted—individuals are unwilling to pay the high costs for complete information—but also because there are costs and rewards of another kind to be taken into consideration. Rational choice theory sets emotionality and rationality against each other. This is an error. Even if emotions easily spin out of control under certain circumstances, they are always part of the rational calculus. Individuals tend to choose the option that will diminish the emotional costs of fear or humiliation. They want to feel more secure as well and search to heal any frustrations, regardless of whether this may take them down a favorable or unfavorable path. But individuals are also attracted by intangible rewards, such as pride, self-esteem, and even surpassing their image of themselves. All these considerations are just as rational as purely material estimations of gains and losses. And as they weigh heavily in political life, researchers, therefore, should be interested in studying what is called (in contrast to ego-psychology) "situation psychology"—that is, the study of emotional costs and rewards that are predictable in a specific environment. Economic crises create particular concerns and fears; the rise of new leaders with a reputation of efficiency or integrity awakens new hopes for economic improvement, political uprightness, and so on. Politicians value emotional appeals when these further their own goals. In dictatorships or in populist discourses, they will not hesitate to mobilize hatred, suspicion, or aversion. In democracies, fear or hope, and pride or outrage remain instrumental but in a way that encourages sufficient monitoring of their effects. Nevertheless, even in these regimes, it happens that "rational calculus," including material and emotional rewards or costs, is somewhat suspended because the level of emotional intensity can spiral out of control. This is the reason why it may be said—under these circumstances but only under them—that emotion can become "irrational."

It should not be forgotten that people problematize their own levels of emotional comfort in accordance with their early socialization and expectations derived from their actual position in social life. On the one hand, some research strongly suggests that individuals acquire, in childhood or late adolescence, lasting predispositions that shape their evaluations of the situations they confront. Racial prejudices, ideological identifications, or an aversion to communism or capitalism all may persist throughout life. On the other hand, short-term considerations also influence attitudes and subsequent responses to challenges. For instance, Linda Putnam refers to the concept of "bounded emotionality" to suggest that "interrelatedness" helps shape individual expectations in organizations. In any situation, many factors that can be perceived as opportunities—bringing hopes or threats, or inducing fear—matter as well. So in these instances, attitudes and choices reveal some kind of "rationality," even if (or, more precisely, because) this rationality is based on emotions. Even if sometimes it happens that emotions get out of control, more often than not they are useful in clarifying the real interests and aspirations in a given environment.

Symbolic Politics

The power of political symbols lies in their strong capacity for evocation—that is, to create associative meanings that enrich the way in which people react to them. This can occur first of all with knowledge more or less forgotten but open to being revived when appropriately stimulated. But above all, reactions are elicited from the emotional charges contained in the symbols—because of their historical origins and/or added content since then. Some words in political discourses are not purely referential but engage strong connotations under special circumstances. They are cognitively and affectively loaded. That is the case, for instance, when a highly respected politician is abruptly charged with corruption or treason by an authoritative agency.

Everybody can understand the destructive stigma of such a powerful allegation. When used in all seriousness, some terms that refer to positive values, such as *liberty* or *human rights*, or those that negatively describe political foes, such as *fascists*, *terrorists*, *plutocrats*, or *communists*, appear to contain heavy emotional associations. Choosing an effective label for a political competition or defining appropriately a social mobilization can give an organization or a political figure a distinct advantage in politics. Take the prochoice and prolife movements: Both attempt to associate their position with indisputable values while denouncing their opponents as being antichoice or antilife.

Strong cognitive and emotional connotations are linked not only to single words but also to elaborate arguments. Storytelling discourses, which often incorporate ethical messages, whether strongly negative or strongly positive, can spark any number of emotions, from praise to reproach or even to outrage. This is often the way history is taught at school to very young children, with the aim of having them embrace the heroism of their country's forefathers and feel connected to the accomplishments of their nation while being repulsed by the actions of their enemies. This can have a lasting effect throughout their lives. Political parties may similarly refer to historical figures or invoke longlasting doctrines to make their assertions more authoritative. They may also recall past disasters to extract painful lessons. So some events, personalities, and accomplishments can become overloaded with affective cognition.

Within these storytelling narratives, there are codified lines of argumentation that use a common thread to make sense of the past and the present or to help decipher the future. To identify them, some academics (Ibarra, Kitsuse) have put forward the concept of "rhetorical idioms." These are common-sense constructions of moral competence. Their deployment tends to presume that the listeners are obliged to acknowledge the importance of the values expressed. Moreover, rhetorical idioms are useful in enlisting people to make sympathetic moves in a particular language game. For example, the "rhetoric of loss" or the "rhetoric of endangerment" prioritizes facts and behavior that show, in a more or less simplified way, how people should fear the extinction or devaluation of something highly valuable and cherished, whether this be national pride, ethnic or religious identity, or political ethics. Such rhetoric appeals to emotional responses: mourning, apprehension, or even dread but, above all, admiration for the potential rescuer and a desire to identify with such a wise prophet.

Symbolism is not restricted to discourses but is also found in both material objects and rituals performed in the political arena. A flag is much more than a simple piece of cloth: it symbolizes the nation, its identity, and glory. Burning a flag is the utmost form of abuse that can be inflicted on the people it represents. The architecture of governmental palaces similarly exhibits power or glory. Statues and monuments, particularly war memorials, signify that they deserve a central place in peoples' imagination and memory. Political rituals such as the opening of a parliamentary session, the appointment of a new prime minister, or diplomatic formalities and protocols—all of these highly codified ceremonies intend to arouse intimidation and deference, to exhibit the gap between ruling personalities and ruled citizens, to signify where the power is and who is to be viewed as being at the center of the social order (Clifford Geertz). But, of course, the substance of the symbolism does not lie within these material objects or ceremonies. Their ability to evoke emotional cognition is contingent on the attitudes and comments they arouse in a given cultural environment. So it may be said that symbolism results from an ongoing process of emotional construction, undertaken by authorities perceived as entitled to do so: intellectuals, social leaders, and politicians interacting with each other. If this process fails, it may be that the symbolic appeal has been exhausted. This may occur when indifference, or even disrespect toward such materials or rites, has developed over time.

What are the uses of symbols and symbolic gestures in politics? They can possibly fulfill three functions, which are all decisive in political life. First, many symbols help develop a feeling of mutual liking and appreciation—what is called "solidarity" in political language. Governments must necessarily try to stimulate solidarity because life in society compels them to impose obligations and sacrifices, which may be more easily accepted if people think they have much in common beyond strict material necessity. A sense of allegiance to a community, within which the members supposedly share the same values and history, makes exercising power much easier. Constructing collective identities, national or otherwise, relies on emotional narratives that emphasize the great things the people have realized together and the highly prized goals they may achieve if they remain united. The reality of this "imagined community" (Benedict Anderson) is exhibited through the symbols everyone learns to love: keywords such as *republic*, *national state*, and *liberty and equality*; material objects such as flags, war memorials, and other emblems of the community and its legacy; historical figures that are endlessly praised; economic, cultural, and sports achievements as a source of communal pride; and so on.

A second function of symbols in politics is to control the need for peace and stability. In international relations, a policy of recognition—one that accepts the principle of equal dignity between states and recognizes the necessity of taking the blame for injuries and damages inflicted on another by the state—is a major factor permitting appeasement between peoples. For this purpose of building better relations with other people, words and gestures matter a lot, as suggested by the respective German Chancellors' kneeling down at the Ghetto Memorial in Warsaw (1970) or a visit to Yad Vashem (2008), both highly charged with emotions. Within any particular state, symbolism appears to be much more intense when institutions become more vulnerable—which predictably occurs at certain stages of institutional life. This is the case, for example, with the formation or the replacement of a government. Constitutions provide explicit rules for such transitions. It is necessary to ensure that these rules are uniformly respected in order to create a consensus about the way in which power must be exercised. When people go to the polls, it is of the utmost importance that the outcome be honored. If not, disorder and instability may quickly appear and destroy the rule of law. It is in these times of uncertainty, when current governments are challenged by opposition figures, that comments on the value of an emotional attachment to democratic principles will intensify on all sides. Any fear of death will similarly evoke symbolic displays, whether this be the deaths of soldiers on the battle front or the unforeseen death of a prominent leader. Elaborate ceremonies and rituals are used to restrain confusion and to prevent the situation from getting out of control.

A third function of symbols is to mobilize citizens to support a "good cause." Purely rational considerations are not always sufficient to get people involved in political life, even when their own interests are at stake. Invoking the breach of equality or the infringement of human rights, both highly prized values, is an effective way to awaken their moral sensibilities and provoke some kind of outrage, which may possibly lead to a commitment to action. More broadly, social problems to be managed by those in power are coded through contextually grounded discourses and vocabularies that designate and dramatize in the same way. Noticeably, they are inhabited by the concept of *victim*, a putative person being subject to harmful conditions of which a *victimizer* is the causal agent. For example, common victims include an unemployed, impoverished populace or powerless minorities, while the victimizers may be the wealthy, capitalism, or even the "system" itself. All of these words, when related to a victimization process, become charged with emotional connotations set up by ideologies and, thus, tend to appear as signals for action. In this way, symbolic politics constructs victim-and-victimizer categories within particular universes of morality where there is good to be loved and evil to be condemned.

Short Methodological Considerations

Political science needs scientific precision. This presents a particularly strong challenge in political psychology. First, because emotions are typically volatile or subtle phenomena and, second, because psychological costs and rewards are often far from being transparently displayed. In the past, the key obstacles included a false consensus on imprecise core definitions, a diversity of underlying psychological theories, and above all, insufficient techniques for data collection. Dramatic advances have recently been achieved with the development of rich interview materials using projective questions, ingenious experiments (the first of them being Stanley Milgram's), the construction of attitudinal scales and EQ (emotional quotient) to measure preferences and subjective reactions with performance metrics (Likert, Altemeyer), and even computer simulations. But these methods must avoid traps such as an abundance of missing data points, sample bias, poor psychometric techniques, and the possible contradictions between attitudinal factors and real behavior. Certain phenomena will never be well understood without longitudinal research that still remains quite scarce. Furthermore, even if the positivist-empirical leaning of modern political psychology indisputably favors strong breakthroughs in better understanding the emotional dimensions of political life, there are possible negative implications as well. One may be tempted to give up questions that are too difficult to translate into solid empirical inquiries or to use exaggerated simplifications. Less sophisticated observations may produce more richness, even if the findings cannot be so strongly asserted.

At this point, it is necessary to discuss what room may be left to psychoanalysis. In mainstream political psychology, this theory is widely ruled out as a method of analysis. This is right because its techniques are far from being compatible with social science requirements of intersubjectively transmissible and controllable findings. Nevertheless, if something is to be borrowed from psychoanalysis, it should be the theory of defensive attitudes in a protection of the self. The blocking of cognitive representation and affect (denial), a sudden reversal to take the opposite position, a projection leading to rationalization or identification with the other—all these processes matter greatly when dealing with psychological or sociological material. The more a researcher seriously engages with these processes, the more likely it is that he or she will be able to identify both the bias that may interfere with his or her interview or discourse material and the bias he or she may experience when setting up a research project.

POLITICAL RISK ANALYSIS

Political risk analysis is rooted in the intersection between politics and business. It analyses the probability that political decisions, events, or conditions will significantly affect the profitability of a business actor or the expected value of a given economic action. This definition incorporates three different approaches among early theorists about the sources of political risk—namely, a focus on foreign national governments, the recognition of the impact of actors from both government and nongovernment circles, and an emphasis on historical and cultural environments. A wide spectrum of political risks may affect business, and political risk analysts use both qualitative and quantitative frameworks to analyze and assess the risks to business.

Cross-border traders and investors are often involved in forms of political risk analysis. However, political risk analysis only became recognizable as an institutionalized business practice in the United States in the 1970s. Several factors enhanced the prevalence of international business activities at the time. Simultaneously, the Organization of Petroleum Exporting Countries (OPEC) oil boycott in 1973 resulted in a partial institutionalization of the political risk function in more U.S. companies. This function became full-time and more firmly centered in many businesses after the Iranian Revolution of 1979. Most initial academic research on political risk analysis was also done in the 1970s and 1980s.

Political risk analysts identify political risks and their variables, assess their significance and the relationships between them, and make recommendations regarding the management and mitigation of political risks. Social science research and nonacademic interpretations of current affairs influence all three phases—namely, the analysis, assessment, and management of political risk. In principle, political risk could also be useful in analyzing the general judgment and policy design of politicians under conditions of uncertainty. However, political risk analysis is undertheorized in this regard and currently remains rooted in the intersection between politics and business.

Although political risk analysis could apply to domestic business, in practice it mostly comes into play when a business is considering business activities in other countries. In the academic literature, the focus tends to be on political risk analysis related to foreign direct investment (FDI) rather than relatively passive portfolio investment. The exposure of assets or personnel in FDI reinforces the relevance of political risk analysis. However, political risk can also affect the expected profits and market stakes of exporters, contractors, and licensors.

Sources of Political Risk

Several, sometimes overlapping, government functions can have an impact on business. In many industrialized countries, its role as a regulator is especially extensive, resulting in legislation related to the environment, health and safety, employment, trade unions, and consumers. A government can also serve as a restrictor (tariffs and trade quotas), redistributor (taxation and welfare policies), director (training, regional and sectoral development, and human resource policies), customer (procurement), or sponsor (subsidies).

Some authors contend that there is an inbuilt potential bias in political risk analysis, whereby any government intervention in the economy is seen as potentially negative, even though such an intervention may be motivated by relevant local interests and aspirations. It is in any case meaningful to locate the particular relationships between multinational business and national governments or other political actors when assessing the actual political risk. The particular cultural and historical context may also influence political risk—for example, where energy or mineral companies are associated with earlier colonial projects in Africa or the Middle East.

The most familiar relationship between business and political authorities is a cooperative arrangement, where negotiations are ongoing and a normal part of operations. While the government would not act deliberately to affect operations, the company would only use lobbying, either singly or through participation in probusiness pressure groups and associations. A second relationship would be collaborative, consisting of joint-venture relationships with public sector companies or privately owned companies with a strong governmental presence.

An authoritative relationship applies when a multinational corporation and a government are at loggerheads. Mostly, a government can impose new rules, which may result in divestment by the company. Two other relationships are far less frequent. A home government may use a multinational company to promote its political objectives. Alternatively, in the case of subversion, a multinational company may actively work to undermine a host government, partly with the covert encouragement of the company's home government. In the latter two cases, the conduct of business can also constitute a source of political risk.

Risks to business in a country may not only ensue from a government in a foreign country but also from actions by the governments in its neighboring or other countries. Transnational or international actors, opposition groups and other domestic stakeholders, and the particular political field in a country may become linked to political risk. In some countries, due to the power or authority of informal networks linked to the government, these groups, rather than the government, may be the main source of political risk to a particular business.

Types of Political Risk

Political risk may vary at different business levels—that is, for all foreign business actors, a particular industry or company, or a particular project. It also depends on the type of investment, its methods of financing, its location, and the time frame involved. Political risk may have an impact on one or more aspects of a business actor, including personnel, assets, contracts, operations, transfers, company goals, and business continuity. The impact may be directly or indirectly in the form of opportunity costs forgone.

Risks to personnel and operations may include intimidation, kidnapping, sabotage, and terrorism, if these risks are motivated by political concerns. However, some of these risks may also ensue from nonpolitical actors and constitute a general security risk only, requiring a different set of preventive measures and incident responses. Asset risks may include general nationalization and specific expropriation, restrictions on ownership, and an insistence on locally owned shareholdings or local directorships. Contractual risks may include changes in contractual conditions due to legislative or bureaucratic action, or the frustration of contracts due to violent or political change, including a revolution, civil war, secession, interstate war, coup d'état, or peaceful succession.

Risks to operations are a wide category and include all host country regulations that affect business operations. These may include labor relations, taxation, restrictions on labor or technology transfer, and local product content regulations. Some other examples include quotas and tariffs, environmental and consumer protection, antitrust and merger laws, discrimination in awarding contracts, and bureaucratic nepotism. Transfer risks could include exchange controls, profit repatriation, and restrictions on royalty payments. Local variations in these risks are also possible in countries where the regional authority of an area is at loggerheads with the central government of the country or where a local power broker is the actual authority on the ground.

Differentiating Political Risk Analysis From Country Risk Analysis

Political risk analysis partly grew out of the country risk analysis conducted by major banks and international economic agencies. The analysis of country risk and political risk differs but may sometimes overlap. Country risk analysis tends to include political risk but also economic and operational risk. Some of the economic factors included under country risk, for example, a bad balance of payments and low creditworthiness, may reflect an inability to pay debt but may also result in a political risk—namely, an unwillingness to pay debt. Political risk may also overlap with some of the country risk factors, where events, foreign confidence, and capital inflows meet.

Political stability as an indicator is included in comparative country risk–rating systems such as the Peren-Clement Index or the Business Environment Risk Intelligence (BERI) Index. However, the management of political risk may differ from that of country risk. For example, many political risks are insurable, whereas many economic and financial risks included under country risk are not.

Political risk analysis may distinguish between a microlevel and a macrolevel political risk. A microlevel political risk is a risk specific to a business or some sectors only. A macrolevel political risk is a non–project-specific risk that affects all participants in a given country. However, it does not include country-level political risk alone, but it may link local, national, and regional political forces, events, and environments. Depending on the requirement of the particular business, political risk analysis can focus on both or one of the two levels.

The Methodology of Analysis

Some major business actors have in-house analysts, while others at least partially outsource the task of analysis to specialist providers. A company's need for political risk analysis may differ at different times. The perceived need for political risk analysis tends to be higher around the decision to enter or avoid a particular country's marketplace, but different forms of political risk analysis are also used as a regular form of early warning, to periodically review in-country operations, or sporadically in response to new uncertainties or setbacks.

Political risk itself is a subjective category and will vary according to the actor defining the risk and the field of action. While pure risk only entails loss or a chance of loss, speculative political risk can entail the chance of both loss and opportunity. In this regard, political risk analysis is not necessarily a linear process of unilateral communication but may become part of an ongoing dialogue between the analysts and (other) actors within the particular business, who may have a better appreciation of the particular business or project than the analyst.

Analysts use both quantitative and qualitative models for analysis, and there is no consensus on the methodology. A model is an extended representation to better understand, adapt to, manage, and control identified political risk factors. The number and nature of variables, their combinations, and the weights assigned to them by the model builders are based on the interpretative frameworks used by political risk analysts.

Quantitative assessment models include complex econometric models and simpler macropolitical risk indexing models that purport to assess various indices such as political stability, based on nominal, ordinal, or interval variables. Some models have been designed for particular sectors, for example, the financial or energy sector, and most models also include an element of qualitative judgment.

The main qualitative techniques are judgmental forecasting, for example, the so-called Delphic method or accumulation of expert opinion under controlled conditions and involving expert feedback. Informal brainstorming between experts is also used, especially where time is of the essence. A more systematic scenario model may be used to identify key assumptions and key drivers to then construct several alternative futures within different time frames and to estimate the likelihood of different outcomes and their impact on particular business concerns. Political risk analysis aims to provide insight into where a business needs to intervene in the political process if it wants to change the environment, mitigate its potential risks, and maximize its potential opportunities.

POLITICAL SCIENCE

See Introduction to Political Science (Volume 1)

POLITICAL SCIENCE, INTERNATIONAL INSTITUTIONALIZATION

Contemporary political science has its ancient roots in the legislations, teachings, and writings of Greek and Roman statesmen, travelers, historians, and philosophers. The issues that concerned them, their reflections, and their advice dominated

European thinking on politics to the Enlightenment, enriched by medieval, Renaissance, and early modern authors. They are still considered relevant by a substantial number of political scientists—not, quite clearly, by a majority. Political science began to be recognized as a legitimate academic discipline, on the same plane as history and economics, and later sociology and psychology, in the second half of the 19th century, in Europe and the United States, and with surprising speed in the latter country. This institutional recognition is considered first. The second part of this entry deals with the birth, programs, and impact of the international institutions, communication media, and exchanges that have shaped the present political science community since the end of World War II. This account draws on an extensive literature, too abundant to be quoted, and also on the author's close connection with the International Political Science Association (IPSA) since 1952.

Institutional Institutionalization Through Recognition

The first professorships and chairs dealing with politics were created in the Netherlands, at the University of Leiden (1613); in Sweden, at the University of Uppsala (1627); and at the Åbo Akademi (1640), now in Finland. Several professorships and departments, including in their title *political science* or *government,* were created in the United States in the second half of the 19th century, starting in 1857 at Columbia University. In Europe, political topics started to be taught at about the same time, as part of the training of future civil servants and members of the political elite. In France, the *École libre des Sciences Politiques* [Free School of Political Sciences], set up in 1872 as a private institution in reaction to France's defeat in 1871 in the war with Prussia, used in its name the plural, thus including the study of politics in the social sciences. The *École* inspired the creation of the Columbia School of Political Science (1880) and the London School of Economics and Political Science (1895), both of which used the singular; similar institutions that followed the *École's* model were later created in Belgium, Switzerland, Italy, Germany, and Czechoslovakia.

The main impetus came, however, from the United States, where a substantial number of chairs and departments of political science, and also of government or public administration, were established in the fourth quarter of the 19th century. The existence of an American community of political scientists led to the creation in 1903 of the American Political Science Association, the first of its kind, and of the *American Political Science Review* (1905). National political science associations were later created in Canada (1913), in conjunction with economics, and in China (1932), Finland (1933), and India (1938).

In Europe, with few exceptions, political science topics were investigated, analyzed, and taught in the 1920s and 1930s by journalists and civil servants and by academics from disciplines such as history, public and constitutional law, sociology, geography, and philosophy. Politics was meant to provide flesh to the abstract approaches; thus, the study of political parties and elections added reality to the traditional state doctrine and constitutional law. Analysis of political ideologies led to the study of political movements and revolutions, for which traditional political philosophy did not account. Political science was not recognized as a discipline and certainly not as a "science." At best, political topics were seen as belonging to an interdisciplinary field and politics as a "crossroads" discipline.

At the same time, in the United States, partly under the influence of American sociologists, social psychologists, and empirically minded economists, political scientists were increasingly attracted by theoretical rigor, quantitative analysis, and systematic comparisons. The influx of German and Central European social scientists, including refugee scholars before and during World War II, contributed to that transformation. The study of mass phenomena, such as elections, public opinion, communications, authoritarian regimes, and international relations, justified innovative approaches, enriched by the views and the experience of the refugees, who found a hospitable haven in American universities at a time when Europe was isolated and European social science stifled, when not suppressed, except in the United Kingdom (UK). Crossbreeding was important, as these European scholars discovered the unfamiliar realities of American politics and America's political traditions.

When the war ended, émigré social scientists, some of whom had, at U.S. and Canadian universities, embraced political science, were invited to teach at universities of their home countries, together with native American colleagues, and laid the ground for the recognition of their discipline in Germany, Austria, France, Italy, and many other countries. Their courses and some of the research fields that they opened up or investigated in new ways contributed greatly to interest in political science as a discipline. European graduate students crossed the Atlantic, professors met foreign colleagues at professional conferences, and the gap was progressively closed. Their contributions to a better and richer understanding of politics and the use of more rigorous approaches and research methods were increasingly accepted, not without resistance, however, from traditional scholars. The same applied to Asian countries such as Japan and later Taiwan and South Korea.

The recognition of political science as a discipline outside of the United States was generally a slow process. It depended very much on the strength of contrary academic traditions, on the sympathy or hostility of scholars in other fields of learning, and on the institutional setting. It was understandingly more difficult in educational systems where decisions concerning the curricula and recruitment procedures were made at the ministerial level than in those where universities enjoyed substantial autonomy; this was more rapid in the United Kingdom and in countries where the knowledge of English made for easier and more intense exchanges and access to the relevant political science works. The UK itself, however, was for many years a hotbed of such resistance.

Thus, even in countries where political science topics were commonly analyzed and taught, the obstacles to recognition proved difficult to overcome. In the UK, with its long and glorious tradition of political inquiry and reflection, there was thus still no political science department at the close of the 1940s, and it is significant that the discipline's academic association, founded in 1950, is still called the Political Studies Association of the UK and its official journal, *Political Studies* (1953); the rival *British Journal of Political Science* was launched only in 1971. Political topics were long taught by historians, sociologists, and sometimes very eminent constitutional lawyers and political philosophers, even at the London School of Economics and Political Science, rather than by political scientists.

The situation was partly similar in France, with an additional institutional obstacle: While in the UK, the Scandinavian countries, or the Netherlands universities enjoyed great autonomy, French universities had only a nominal existence until 1968; higher education was administered by a government department and organized at the level of *facultés*. Of the various social sciences, history and sociology as well as philosophy and geography belonged to the *Facultés des Lettres* (schools of liberal arts), and law and economics to the *Facultés de Droit* (law schools). The proponents of modern political science were thus divided between two separate schools in the universities in which they were active. Introductory political science courses, which became mandatory in the law schools' curriculum in the 1950s, were taught mainly by professors of public law who had had no training in political science and often not much respect for it. For many years after 1945, the main institutions that developed both teaching and research in political science were the Paris *Institut d'Études Politiques* [Institute of Political Studies] and the *Fondation Nationale des Sciences Politiques* [National Foundation of Political Science], the heirs of the *École libre des Sciences Politiques*, jointly known as *Sciences Po*, where research centers on French politics, area studies, and international relations were created in the late 1950s and the 1960s. The resistance of the law schools, finally overcome by public law professors who considered themselves political scientists, prevented, until 1971, the creation of political science doctorates and the adoption of a procedure for the recruitment of political science professors. With a distinct chronology, conditions were not very different in Germany, Italy, and Spain, unlike the UK, where academic autonomy allowed a spectacular development of disciplinary teaching and research, with ever more professorships and departments attracting an increasing number of students.

American political science has remained dominant, thanks to the number and variety of U.S. university institutions and the recognition of the relevance of the discipline for nonacademic careers. It has been supported by the major foundations concerned with the development of the social sciences and by the creation of cooperative institutions such as the Interuniversity Consortium for Political and Social Research established in 1962 at the University of Michigan, which has provided access to a huge international collection of social science data. The annual American National Election Studies, also based at the University of Michigan, and since 1997 considered a national resource by the National Science Foundation, have provided since 1948 invaluable data on the electorate and public opinion. Institutions linked to the military, such as the RAND Corporation, have contributed to the development of strategic studies. Many new theoretical approaches and methodological innovations or improvements have thus originated in the United States and spread everywhere. Some proved to be fads, but the "behavioral revolution" of the 1960s, which emphasized rigorous analysis of political processes—sophisticated treatment of quantitative data, comparative analysis, and the study of new fields—decisively supported by nongovernmental bodies such as the Social Science Research Council and the Ford and Rockefeller Foundations, has had a lasting influence, despite its excesses. A large number of increasingly specialized journals were created; the advent of the information technology revolution, which has transformed both research and teaching, resulted also in what many political scientists consider an unhealthy fragmentation of the discipline.

By the 1960s, it became obvious that for its acceptance and development, political science needed an environment that favored, or at the very least allowed, freedom of investigation and thought. Authoritarian regimes do not encourage or even tolerate analyses that highlight their shortcomings. The political science map coincided very clearly with that of democracy. But there were hidden exceptions: The rulers of powers such as the Soviet Union understood that for policy-making purposes, they needed reliable information and analyses. Strongly controlled centers were set up, where broad access to foreign publications was provided. The collapse of communism revealed their existence, and starting in the 1990s, there appeared in many countries of the former Soviet bloc political science journals and books of a quality close to the internationally recognized standards. A new generation of well-informed political scientists, secretly self-trained, became visible. Political science began to be taught in universities, and the map changed rapidly. The same phenomenon had earlier happened in European countries such as Spain and Portugal and in various Latin American countries, where dictatorships had prevented the open development of political science. High-quality scholars, who had found refuge in the United States and Europe, went back when conditions changed and contributed to the academic acceptance and development of their discipline.

International Institutionalization Through Organizations and Associations

A new and important factor of institutionalization at the international level was the creation in 1949 of the IPSA, to which most of this second section will be devoted.

Before World War II, political science was highly developed, recognized, and taught in the United States in a majority of colleges and in most research universities at the graduate level. It was also taught under various names and in various forms in certain European and Asian countries. There were, however, almost no organized international contacts other than visits and exchanges of scholars and students. The Political Science Congress held in Paris in 1900 was not followed by any large international meetings except for a few regional ones, such as the Scandinavian Political Science Congress held in Stockholm in 1930.

The only organization of any importance was active in the field of international relations. Sponsored by the League of Nations' International Institute of Intellectual Cooperation (IIIC), located in Paris, a Conference of Institutions for the Scientific Study of International Relations had been created in 1928; it changed its name in 1933 to International Studies Conference (ISC). The ISC used for its operations the Secretariat of the IIIC and held annual conferences, the last of which was held on the eve of the war, on August 30, 1939. It was unable to survive the postwar creation of the broader IPSA.

A few other bodies had existed. The International Institute of Political and Social Sciences in their Application to Countries With Different Civilizations did survive but devoted itself mostly to the study of colonized areas. The International Institute of Political and Constitutional History, renamed the International Academy of Political Science and Constitutional History, was, despite efforts by some of its leading members, active mainly in the field of history.

The organization responsible for the conception and birth of IPSA was the United Nations Educational, Scientific and Cultural Organization (UNESCO). Implementing a recommendation made at its very first General Conference (Paris, 1946), the second General Conference (Mexico, 1947) instructed the Director General to promote a study of political science. The UNESCO Social Science Department had singled out that discipline because political phenomena were considered major factors of tensions and because intellectual cooperation was hopefully seen as contributing to the maintenance of peace.

The process soon gained impetus. A massive international study of political science, or its absence, was undertaken by UNESCO in 1948 under the leadership of an American scholar, William Ebenstein, of Princeton University. The huge resulting volume, including no less than 51 national reports, was published by UNESCO in 1950. At a coordination meeting held in 1948 at UNESCO's headquarters in Paris, political science was tentatively defined as comprising political theory; central, regional, and local institutions; parties, groups, and public opinion; international policy and organization; and international law. It was also decided to call a conference to examine the possibility of creating an IPSA.

At that conference, held in September 1949, at the initiative of UNESCO's Director General, 23 scholars—political scientists, political theorists, sociologists, constitutional lawyers, and historians—considered and approved a draft constitution for the future body, constructed as a federation of national associations, and elected a provisional executive committee. UNESCO was similarly active in the creation of associations in other social sciences and the International Social Science Council.

IPSA thus came into existence officially at the end of 1949, as a "foreign association," under French law and regulations, with its legal seat in Paris. Its founders were four associations, those already active in the United States, Canada, and India, plus a French association set up largely for that purpose. Its provisional executive committee elected as chairman Quincy Wright, a professor at the University of Chicago, and a Frenchman, François Goguel, the secretary-general of the *Fondation Nationale des Sciences Politiques*, as executive secretary. A first World Congress, attended by 80 participants, was held in Zurich in 1950 and the second one at The Hague in 1952. Subsequent congresses were organized triennially, at first in Europe only, then in more exotic places such as Montreal, Rio de Janeiro, Washington, D.C., and Buenos Aires. From 1997 (Seoul) to 2008 (Santiago de Chile), all congresses were held outside Europe. Attendance has grown to about 2,000 participants, with IPSA funding many travel grants for young scholars and scholars from developing countries.

Over its 60 years of existence, the number of IPSA's collective members (national associations) has grown from the initial 4 to more than 40. IPSA's existence has contributed to the creation of associations in almost all Western European countries; in a few cases, such as that of Italy, IPSA has had to recognize a new association to replace a previous collective member considered too traditional by the younger generation of political scientists.

Never a Cold War instrument, IPSA emphasized inclusion and dialogue, and the rulers of the Soviet bloc preferred to have delegates participate in it, as in UNESCO. A Polish association was thus created as early as 1950 and was soon admitted to IPSA. Associations were later set up in Yugoslavia (1954), the Soviet Union (1960), Czechoslovakia (1964), Bulgaria, Hungary, and Romania (1968).

Against strong opposition, especially in the United States, IPSA stood by its decision to hold its 1979 Congress on strict conditions in Moscow, despite the Soviet invasion of Afghanistan at the end of 1978. It was later acknowledged that the Moscow Congress had helped young political scientists establish the discipline both in the Soviet Union and in several satellite countries. The "missionary" purpose of IPSA also inspired assistance to political scientists in Asia, Africa, and Latin America, especially where dictatorial regimes were hostile to political analysis.

A major problem arose when Taiwan was, in 1989, admitted as a collective member, under the compromise name of Chinese Political Science Association (Taiwan), although its association claimed to be the legitimate heir of the Chinese Association created in 1932. The compromise accepted by the delegate of the Chinese Political Science Association (People's Republic) was soon rejected, and as of 2010, the Mainland Chinese Political Science Association had not returned to IPSA.

Starting in the mid-1960s, IPSA was strengthened and enriched in its operations by the creation of Study Groups and Research Committees, later merged under the second denomination. Numbering about 50, the committees meet at each Congress and at least once between congresses, with participation by scholars from different countries. They deal with both traditional topics and innovative issues and approaches. Several research committees have their own journals. Associate members—about 100 political science departments and research organizations—and individual members—nearly 2,500—find IPSA's activities valuable.

IPSA's first journal, *International Political Science Abstracts*, launched in 1951, 2 years after IPSA's creation, and prepared since then in Paris at Sciences Po, is still the standard reference tool of the discipline. From 1951 to 1962, it published annually, in four issues, about 1,400 abstracts of journal articles. It now provides each year more than 8,000 abstracts, in six issues, reflecting the explosion in the number of journals; it has since 2007 been published by SAGE Publications. Its database goes back to 1951; at the end of 2009, it contained 270,000 abstracts and is distributed by both EBSCO and Ovid. The second, started in 1980, is the *International Political Science Review*, also published by Sage, which has been recognized as one of the leading journals in the discipline. In recent years, the two journals have also contributed substantially to IPSA's budget. To the journals must be added the *IPSA Portal*, created and maintained at the University of Naples, which selects, describes, and evaluates the top 300 political science websites, and IPSA's newsletter, *Participation*.

Ever since its inception, IPSA has sought to participate in the diffusion of political science as a rigorous discipline and also to serve as a bridge between American political science, in many ways still central, and the rest of the world while respecting the distinct national traditions and different approaches, sometimes strongly critical of those dominant in the United States. Until relatively recently, the landscape seemed pretty clear, with IPSA playing the leading role. It has since then become increasingly complex and somewhat more competitive. Other international bodies have appeared in some regions. American organizations also sometimes supplement IPSA or compete with it.

Regional associations, of somewhat uncertain strength, have in recent decades been organized in Africa (1973) and Asia-Pacific (1983). In Europe, the creation in 1970 of the European Consortium for Political Research, based at the University of Essex and assisted in its first years by the Ford Foundation, has proved spectacularly successful. From 8 founding institutions, it has grown to more than 300, together with associate institutions throughout the world. Its workshops, conferences, and summer schools have contributed greatly to the emergence of a European political science community, and the reputation of its journals—the *European Journal of Political Research*, started in 1973, to which have been added *European Political Science* and the *European Political Review*—and its three book series is enviable. It entertains warm relations with IPSA.

More recently, in 2007, 23 European national and international associations have joined in a European Confederation of Political Science Associations, whose main aim, according to its website, is to "promote the interests of the discipline" and "make it more meaningful in public debate and policy-making." The Confederation has a promising future, as it reflects the vitality of political science associations in some countries where none existed until recently as well as that of the established ones.

Challenges have also come from the United States. Thus, in the field of international relations, the U.S. International Studies Association and its journals have progressively become representative of International Relations scholars throughout the world. The same can be said of area studies organizations such as the U.S. Latin American Studies Association, which attracts and welcomes many Latin American political scientists.

Finally, the powerful American Political Science Association, which numbered more than 15,000 members in 2010, at least twice as many as there are political scientists in the rest of the world, has increasingly become a magnet for foreign political scientists. Its conventions have the dual function of a forum for scholarly exchanges and an unrivalled job market in the discipline. They attract many participants from outside the United States, sometimes assisted by travel grants.

The international institutionalization of political science may thus be at a crossroads. IPSA has proved its ability to play a major role in it by continuously adapting to a changing landscape. Thus, it has of necessity practically forsaken French as its second language for its meetings and publications. Its secretariat, which until recent years used to move to the city of residence of its secretary-general whenever that changed, is now permanently established in Montreal, where the staff is bilingual. It also maintains IPSA's archives, now assembled in a single location.

In this increasingly complex and competitive scholarly landscape, new activities and organizational schemes will need to be experimented with. Major gaps will need to be filled in Africa, Latin America, and Asia-Pacific, concerning obviously China but also countries such as Indonesia and the Philippines. The relevance and the vitality of the discipline seem, however, to be ensured for many years to come, certainly much better than a generation ago.

POLITICAL SOCIALIZATION

Political socialization is a form of socialization. An individual's biological birth is followed by a second phase, described as a "social-cultural birth," which turns him or her into a social being. This procedure is called *socialization.* It is a multidimensional process that significantly shapes the relation of the individual toward the social environment. A great number of people (e.g., educators), institutions (e.g., schools), and factors in the social environment (e.g., mass media) are involved. In the following, the major forces shaping this process in modern societies are discussed.

Socialization can be defined as the following:

- a process of forming an individual into a sociocultural personality through the shaping of those cognitive, linguistic, motivational, emotional-affective, and similar features that enable persons to understand the social environment and to participate in its shaping (primary socialization);
- a process of imparting social values, norms, and abilities for the accomplishment of social existence, occurring outside the family, mainly in peer groups and schools (secondary socialization); and
- a lifelong process of social experience, on the basis of primary and secondary socialization (lifelong learning).

In a wider definition of politics, all processes of socialization can be seen as political. The separation of political and general socialization is unnecessary if politics is defined by all relations of social power (including the family, the workplace, etc.). If the members of a society are subjected to such relations and are thereby shaped politically, socialization always develops political effects as well.

In a narrower sense, political socialization is regarded as a part of the general process of socialization. This contains purposive and functional dimensions. The purposive part regards political socialization in the context of pedagogical institutions and methods (education, tuition). The functional side looks at political goals, values, and norms that are being socialized and form individuals into political beings.

Political socialization is not free of values. It is defined as the entirety of all learning processes that form a person into a political being (citizen). The learning processes can be measured in terms of how far they promote or impede political maturity. Maturity in this context means all abilities necessary to meaningfully participate politically—the competence of participation. Political socialization gains its specific political content from an understanding of democracy, which underlies this value orientation. The aim of socialization is maturity, in the sense of self-determination, and political decision making and responsibility. Democracy determines the political-social process in which politically mature individuals develop. The structural-organizational basis of this ability lies in the institutions and policies of political socialization, whereas the subjective-personal part is found in the competence of participation. This is perceived as a goal of political learning. The question of how this goal of learning can be founded theoretically and how it can be empirically achieved, for example, not only in political education but also in processes of participation, pervades considerable areas of work in the research on political socialization.

Political Socialization as Political Learning/Education

Political education is a historical phenomenon. "Political" thinking, learning, and acting (in a sense of politics as a struggle or competition for influence and power) was only established when a sphere of civil life developed besides the state. Civil life needed and claimed individual freedom from governmental and absolutistic-feudal power, beginning in Europe in the 18th century. The struggle for autonomy of the newly established class—the middle classes—was borne by ideas of the Enlightenment ("liberty, equality, fraternity" as the slogan of the French Revolution). The aim was to replace feudal arbitrariness of power with a constitutional framework that ensured freedom and equality before the law. The guarantee of equal rights for all citizens made political learning necessary for the first time. Political learning in its beginnings was more focused on the idea of civil freedom. Not long after the collapse of the medieval social order, political education turned into a problem from a historical perspective.

The social-historical background of political learning reveals different phases of development:

- *Education of classes in the feudal society:* Being politically educated meant knowing the rights and duties of one's class.
- *Education toward the ideal of civil liberty in the early middle-class society:* It ought to serve as an instrument for the enforcement of civil rights as provided by the constitutional state.
- *Means of controlling the fourth estate of the society in the era of 19th-century capitalism:* In this phase, political education was an intellectual-political weapon for the suppression of the upcoming industrial proletariat;
- *Political education in nationalistic-authoritarian systems:* Political education is focused on the subordination of all people to the state.
- *Education toward a racist ethnic community under National Socialism in Germany:* Education served as a means for the forming of the national-socialist man.
- *Education toward the "new man" under communist systems:* It helped people live harmoniously in a classless society.
- *Education toward democratic behavior in contemporary democratic states:* Political learning takes part in the challenge of enabling the development and stability of democratic conditions.

Political learning continuously tries, in its contents as well as in its methods, to consolidate or to criticize existing forms of authority. In a democracy, its objectives include different concepts of democracy. Political learning that is focused on the imparting of political decision making and responsibility is interested in more than just the imparting of knowledge. It is geared toward certain states of awareness, abilities for political action, and attitudes and motivations for a democratic political commitment.

The achievements of socialization on a microdidactic level (political education/instruction) are limited, though. They are not able to compensate the deficits of the political system and the structural basis of political socialization. However, it is possible to implement the goals of political socialization on a macrodidactic level. Political learning can then be described as functional. This is how it can be distinguished from intentional political education.

Processes of learning that shape the potential of qualification and actions of political decision making and responsibility are processes of participation. Competence in participation can be acquired through participation itself. In this way, participation serves as an educational goal as well as an educational means. Political learning takes place when political consciousness can be applied and political participation can be reflected (learning by doing)—the basis of which is political communication.

Political Socialization Through Political Communication
