Like realism, liberal theories tend to assume that states are the most important actors in international politics and generally regard their identities and interests as fixed and given. Nonetheless, liberal theories of international relations are more sanguine with regard to the future of transatlantic cooperation after the Cold War. In particular, institutional theories maintain that by reducing structural impediments to cooperation—high transaction costs, informational asymmetries, and insufficient communication principal among these—international institutions can produce durable patterns of cooperation even in the absence of world government by creating a common set of rules and norms to govern the interactions of states. Because the long-term benefits of cooperation are held to outweigh the short-term gains that states might achieve from unilateral defection, they are expected to place a high value on maintaining institutions even if the conditions under which they were established no longer obtain.

Hence, in the wake of the Cold War, liberal theorists would expect Europe and the United States to maintain a high degree of cooperation even in the absence of a common enemy. From this perspective, NATO's persistence is explained in terms of its ability to adapt to the challenges of a new era and its potential for managing security relations among its members. Moreover, although there is a surprising lack of formal institutions specifically directed at governing transatlantic economic relations, some have argued that a dense transnational network of like-minded bureaucrats, regulators, and lawyers constitutes an informal institution that has helped Europe and the United States avoid a rupture in their economic relationship.

Constructivist and Cultural Approaches

Whereas both realist and liberal theories of transatlantic relations begin from the standpoint of states with fixed preferences or interests, constructivist theories stress the embeddedness of states in social structures of shared norms and beliefs—that is, culture—which evolve over time. Not only are these social structures shaped by state behavior, but they serve to shape and reshape the conceptions of the identity and interests of states. Constructivists stress the transformational potential in international politics. When states come to share the values, norms, and symbols that provide their social identity, their relations may come to resemble those of individuals in a society or even a community in which the use of force by one member of the community against another is considered unthinkable.

Although security communities are not unprecedented in the history of international relations, the postwar international system appears unique. In modern times, there has never been a period in which war among the European great powers or between a European power and the United States was considered unthinkable. Yet with the end of the Cold War, this appears to be the case. Given the scale and frequency of great power wars in the past, Robert Jervis has argued that the emergence of a security community among the great powers constitutes the single most striking discontinuity in the modern history of international relations.

If true, the claim suggests serious limitations to many realist and liberal theories and their application to the subject of transatlantic relations, which might be better understood from the perspective of actors enjoying shared identities and values. But although they point to the possibility of transformational change, constructivist theories have not done a good job of establishing the conditions under which such changes are likely to take place. Understanding the role of agency in path-dependent processes, thus, poses key challenges for the further development of constructivist theory.

TRANSFORMATION, ECONOMIC

The term *economic transformation* is often used in economics vocabulary, though it is not defined in the discipline's textbooks and dictionaries. In general, the term refers to structural changes in the economic, monetary, and financial systems of states, which are generated by passing from one mode of production to another or by the transition of one model of development to another.

Since the beginning of the modern era, several economic theories have contributed to these structural changes by advocating for the replacement of one mode of production by another, or of one model of development by another, that is more able to ensure the prosperity of nations and individuals. Over time, those that have had the largest influence are mercantilism, classical liberalism, Marxism–Leninism, the heterodox liberal theory, and neoliberal theory.

This entry retraces the history of economic transformations since the 17th century by showing the major impacts of the evolution of economic ideas with regard to such changes. It also examines several approaches in political science that have analyzed the impacts of economic transformations on the political regimes of states and in international relations. It is indeed difficult to devote more attention to the work of political scientists as most have ignored economic transformations and those who have noted them have not carried out any additional analyses of such changes. They have instead focused on the legal, social, cultural, and political impacts of economic changes. Although enormously interesting, the aforementioned literature is not pertinent to this entry.

Mercantilism

Mercantilism appeared in the context of the formation of the first European nation-states during the 16th and 17th centuries. The central idea of this theory, as it was applied in France and England, was that the state had to support the development of trade and industry in order to expand its economic power, which was the principal support of its military and political strength. To this end, the state had to promote the growth of production by subsidies, privileges, monopoly concessions, and maintaining the lowest wages possible. The state also had to encourage the conquest of colonies, which provided a source of primary goods and an opportunity for manufacturing; this involved the construction of a powerful navy to protect trade between colonies and the homeland and to block out rival nations. While this economic model enabled all the European colonial empires to expand, only in countries such as the Netherlands and England, which practiced a form of commercial and financial mercantilism, was the development of a capitalist economy dominated by a rich bourgeoisie in the manufacturing, trading, and banking sectors favored. Over time, this bourgeoisie became more and more hostile toward the constraints of mercantilism, such as laws that forbade the concentration of businesses, limitations on the importation of primary goods, and the iron law of wages, which hindered consumption, provoked overproduction crises, and lowered investments and profits. This conflict was the root cause of the revolution of 1688, which allowed the English bourgeoisie to implement a new economic model inspired by classical liberal economics.

Liberalism

According to classical liberalism, conceptualized notably by John Locke, Adam Smith, and David Ricardo, all individuals are rational and naturally seek to improve their economic well-being at the least possible cost. It is from this common desire that the market is created, a place where producers attempt to sell the largest number of goods at the most advantageous price and where consumers seek to purchase the goods that they need at the lowest possible price. The free market naturally tends toward equilibrium between supply and demand and between the growth of production and income. It is the state's interference in the market that causes the misallocation of resources (unemployment or a lack of manpower), imbalances between supply and demand (overproduction or a shortage of goods), and excessive rises and falls in prices (inflation or deflation). According to this theory, free trade—not only within but between nations—is the source of wealth. Since nations do not possess all the three main requisites of capitalism (raw materials, capital, and manpower), they must specialize their economies according to their comparative advantages to reap the maximum benefits of free trade. Liberal theory became the dominant economic model between 1750 and 1920 because of the British Empire's supremacy and the adoption of the theory by other European colonial powers following the overthrow of absolutist regimes by revolutionary movements led by national bourgeoisies.

Neo-Mercantilism

However, in the 19th century, liberalism was rejected by Germany and the United States, both of which adopted a model based on British mercantilism in order to strengthen their industries behind protectionist barriers. According to the founders of neo-mercantilism (Alexander Hamilton, Friedrich List, Wilhelm Roscher, and Gustav Schmoller), it is to the state's advantage to be protectionist when they are weak or in economic decline and to favor free trade when they are strong or in a period of economic growth. The application of this doctrine permitted both countries to become great economic, political, and military powers in less than a century. However, if the United States practiced a peaceful and isolationist neo-mercantilism because of their vast domestic market, Germany, deprived of both such a market and colonies, opted for an imperialist neo-mercantilism that was one of the causes of the Franco-Prussian War of 1870 and World War I.

Marxism

In the 19th century, the most radical critics of liberal English political economy were Karl Marx and Friedrich Engels. Their theory argued that within the framework of capitalism, value was not found in labor, as Adam Smith and David Ricardo claimed, but rather in surplus value or in unpaid wages to workers. To outlast the competition, businesses would have to constantly raise their growth or profit rates by replacing workers by machines and by creating monopolies, which would bring about overproduction crises, a rise in unemployment, bankruptcy of small businesses, and the impoverishment of the middle class. These barriers to growth in supply and demand would inevitably bring about a relocation of businesses to periphery markets. Such actions, far from countering the falling rate of profit, would generate consequences of the contradictions and evils of capitalism, which would create conditions favorable for a global socialist revolution. Thus was born the famous slogan of the Communist Manifesto: "Workers of the world, unite!" Vladimir Ilyich Ulyanov Lenin, founder of the Russian Bolshevik party, took the theory of Marx and Engels further. According to Lenin, over the course of the last third of the 19th century, capitalism had reached the "highest stage of imperialism." Capital was now more concentrated in the hands of financial oligopolies, which stemmed from the merger of monopolistic commercial, industrial, and banking firms. These oligopolies ferociously struggled among each other for the possession of resources and already conquered or available territories, which led to imperialist wars that victimized the oppressed lower classes. Over the course of World War I, the Bolshevik party called on Russian workers and farmers to mobilize and take up arms against the Tsar, which led to the revolution of 1917 and the creation of the Union of Soviet Socialist Republics (USSR). Confronted with the construction of socialism, a subject largely ignored by Marx and Engels, Lenin developed a theory that would largely serve as a model for those communist regimes that came into being after 1945. According to this theory, the first step in the construction of socialism is the dictatorship of the proletariat, in which the state assumes control of all means of production and moves toward a progressive collectivization of agriculture in order to finance the development of heavy industry, both civil and military—a key sector of the economy and national defense. The development of consumer goods industries is thus pushed back to a later stage.

From 1920 to the Present: Heterodox Liberalism

The troubled interwar period, characterized by several failed attempts at a socialist revolution, the establishment of fascist regimes in a number of countries, the economic depression of the 1930s, and the abandonment of liberalism in favor of protectionism, led several liberal economists, such as John Maynard Keynes, James Meade, Joan Robinson, and Gunnar Myrdal, to develop a new economic theory—heterodox liberalism. This theory argues that neither liberalism, which led to the worst economic depression in history; nor nationalism, which was the source of several wars; nor Marxism, which attempts to mitigate socioeconomic inequalities at the expense of political liberties; is capable of guaranteeing sustained economic growth, greater social justice, democracy, and peace. Following World War II, most advanced capitalist countries adopted this theory. It would serve as the basis for the developmentalist theory of Raul Prebisch, Oswaldo Sunkel, José Serra, and Fernando Henrique Cardoso, which was used by a large number of developing nations. It was at the origin of the Bretton Woods compromise, the foundation of the new world economic order of the postwar period. Due to the economic and social progress that it brought about, it contributed to limiting the expansion of communism. Nevertheless, this theory was adopted, under the influence of the USSR, by roughly 40 countries in Europe, Asia, and Africa in the years following 1945.

According to Keynesian heterodoxy, it is not the rise in supply but the increase in household and business demand that serves as the lifeblood of economic growth. Governments thus sought to promote full employment by investing in infrastructure, protecting labor-intensive industries that produce consumer goods, and encouraging unionization. They also had to support the income of those excluded from the labor market (e.g., unemployed, dependents, pensioners) by social programs and liberalize consumer credit, all while requiring central banks to maintain low interest rates. To counter the imbalances of an unregulated international market, governments were left to establish multilateral institutions that provide the necessary capital to rebuild the European and Japanese economies and to aid the industrialization of developing countries, ensure the stability of currencies and the balance of payments, and promote a gradual and sectored liberalization of trade adapted to the unequal development of nations. These precepts served as the basis for the World Bank, the International Monetary Fund (IMF), and the General Agreement on Tariffs and Trade (GATT). They would eventually inspire the creation of the European Economic Community and several other regional integration agreements. They also allowed for the adoption of agreements facilitating the exportation of manufactured goods from newly industrialized countries (NICs) to industrialized countries (ICs), such as the Multi Fibre Arrangement and the Preferential Trade System.

Theories Inspired by Heterodox Liberalism

For 30 years, the heterodox liberal model generated the longest growth cycle in history; a decrease in socioeconomic inequalities, especially in ICs; a reinforcement of state interdependence and cooperation; and mitigation of North–South disparities from the emergence of South European, East Asian, and Latin American NICs. These transformations were the origin of several new theories in political science.

The most notable of these is the modernization theory developed by Seymour Martin Lipset, which argued that the progress of economic and social development is the main determinant in the emergence and stability of democracies. During the 1960s and 1970s, the validity of this theory was challenged by the domination of authoritarian regimes in most NICs. However, the democratization of most NICs between 1974 and 1995 and the instability of democracies established in developing nations after the Cold War would confirm the legitimacy of the modernization theory. David Mitrany's functionalist theory argued that the modernization of societies generates myriad nonpolitical problems whose solutions require the collaboration of experts from several countries. One of the benefits of such collaboration is that it encourages states to strengthen cooperation by concluding economic integration agreements that contribute to the development of their political integration. This analysis, confirmed by the early stages of European construction, was completed by Ernst Haas's neo-functionalist theory. According to this theory, the creation of supranational institutions is not uniquely determined by the benefits of economic integration. It follows when national leaders are convinced that it is in their interest to transfer their loyalty and their ability to respond to institutions that have supranational jurisdiction. The neo-institutionalist theory advanced by Joseph Nye, Robert Keohane, and Stephen Krasner attempted to demonstrate that the economic interdependence of states reinforces their common interest to cooperate within international regimes; as such, regimes allow them to reduce uncertainty and their transaction costs. Unlike neo-realists, neo-institutionalists argue that international cooperation does not necessarily stem from the leadership of a hegemonic power. The results and actions of international organizations affirm both theories. International cooperation without a hegemon is possible in areas of low politics (economic, environmental, social, and cultural issues) but not in areas of high politics (political and military issues).

Transition to Neoliberalism

At the start of the 1970s, several problems brought about the decline of the heterodox liberal model and the ensuing crisis. The transnationalization of firms and capital gave rise to an increase in the volume of Eurodollars in circulation and a depletion of American gold reserves, in such a way that in 1971, the United States had to abandon the gold exchange standard, which was fundamental to the system of fixed exchange rates administered by the IMF. The latter was replaced by a floating-exchange-rate system entirely at the mercy of the monetary market's supply and demand. For 30 years, the rise in public spending and in consumption was largely financed by public and private debt, which took advantage of surplus capital and low interest rates. However, this dynamic led to a general rise in prices and wages. This inflationist context prompted firms in developed countries to lower their investments and accelerate the relocation of their production to NICs. This movement created a situation of stagflation in ICs, which was aggravated by the oil crises of 1973 and 1979 and the subsequent recessions of 1974–1975 and 1980–1983. Pressure from financial institutions, worried over the solvency of governments and firms, convinced central banks to sharply raise interest rates in 1983. This decision brought about a severe crisis in the public finances of states, which was the determining factor in the transition toward a new economic model based on neoliberalism.

Neoliberal theory is the synthesis of new American economic theories derived from classical and neoclassical liberal economics, which were developed in opposition to Keynesianism during the 1960s and 1970s. Milton Friedman's monetarist theory argues that inflation is caused by maintaining low interest rates through government control of central banks. Governments should allow monetary authorities to adjust interest rates as a function of the market, which would raise the level of money and combat inflation, the principal cause of slowdowns in growth. The supply-side theory, advanced by Arthur Laffer and Jan P. Seymour, maintains that excessively high taxes on incomes and profits discourage initiative, savings, investment, and productive effort, all while encouraging tax evasion and leading to reductions in government revenues. The theory calls for lower taxes for the rich, who spend more than the poor, and for a transfer of social spending to the private sector. Gary Becker and Jacob Mincer's human capital theory maintains that all human activities are determined by cost–benefit calculations. This logic must prevail in public and para-public institutions to raise their productivity and efficiency and to lower deficits and government debt.

The precepts of neoliberalism were upheld by the IMF and the World Bank during the 1980s and 1990s. They eventually led to the creation of structural adjustment programs, which would become conditions for aid to ICs, NICs, and developing countries. Progressively, governments of capitalist countries the world over began to embrace this philosophy. However, very few countries fully applied the recommendations of neoliberal theories. Most adopted mixed economic policies, which combined the ideas of heterodox liberalism and neoliberalism. Contrary to the fears of the Left, the transition toward neoliberalism did not lead to a dismantling of the state or to the destruction of the economic and social achievements of Keynesianism. Nevertheless, the neoliberal model was at the origin of an unprecedented liberalization of international trade. The Uruguay Round of the GATT (1986–1993), the adoption of the North American Free Trade Agreement in 1994, the transformation of the European Economic Community into a common market (following the Single European Act of 1986) and then into an economic and monetary union (following the Maastricht Treaty of 1993), and the creation of the Mercosur customs union in 1994 have all not only abolished trade barriers for manufactured goods but also liberalized the flow of services and capital. The opening of markets has reinforced the power of multinational firms and banks and weakened the control of states over their economies. In 2008, Peter Willets counted 77,200 nonfinancial multinational firms in 138 countries. The few hundred with the most important assets are Western European, Japanese, or American, but a large number are also found in other ICs (Canada, Sweden, and Australia) or in emerging countries (China, South Korea, Malaysia, Singapore, India, Brazil, and Russia). Nonfinancial multinational firms have enormous power over governments as they can relocate their production to other countries that offer better advantages. Financial multinational firms not only largely determine the value of currencies and the interest rates for states but also make investment decisions that determine the profitability of their banks, insurance companies, pension funds, and other financial institutions.

The Crisis of Communism

The crisis of the heterodox liberal model coincided with the crisis of the communist model. In the USSR, it was caused by the concentration of government spending in the military industry and the decline of productivity in other sectors of the economy caused by a disillusionment with the communist ideology, unable to fulfill its promises "of a better tomorrow." In China, it was brought about by the disastrous cumulative economic effects of "The Great Leap Forward" and by the "Great Cultural Revolution" envisioned and led by Mao Zedong. Though the outcome of these crises was a transition toward capitalism, they ran very different courses in each country. In the USSR, the combination of economic liberalization (*perestroika*) and the liberalization of the political system (*glasnost*) led to the disappearance of the Communist Party, the breakup of the USSR, and the collapse of communist regimes in central and eastern Europe in less than 5 years (1987–1991). Russia subsequently adopted an orthodox neoliberal model that had some disastrous effects while mortgaging the democratization of the political regime. Conversely, the countries of Central and Eastern Europe succeeded, between 1991 and 2004–2007, in establishing functional market economies and stable democracies, largely due to the European Union's accession process, closely supervised by Brussels. In China, the transition toward a market economy has been very gradual and controlled by the Communist Party. It has been accompanied by a progressive yet limited liberalization of the political system, with the authorities seeking to preserve the country's unity and stability. This stability has encouraged the inflow of capital and investment by foreign firms, and has been the principal cause of the very strong economic growth that China has seen in the years since 1980.

Conclusion

History demonstrates that over the past four centuries, the capitalist mode of production has been the source of economic transformation in a majority of nations. The communist mode of production appeared in about 40 countries during a brief period of less than 50 years. Today capitalism spans the globe, with the exception of certain regions in central Asia, Africa, and Oceania, where precapitalist modes of production exist. The industrialization and modernization of developing countries are the lifeblood of growth and of the globalization of capitalism. Given that over time these transformations are more and more rapid—the industrialization of European countries happened in 200 years, while the process in NICs in the 20th century lasted 4 or 5 decades—it is highly probable that the possibilities of an expansion of capitalism will dry up before the end of the 21st century. What will happen then? Will we witness the onset of imperial wars, as Lenin predicted; or the establishment of a world order founded on specialization and the economic cooperation of states, as liberals claim; or rather, the institution of a postcapitalist model, characterized by the protection of natural resources, a decrease in population and consumption, and orientation of economic activity toward human needs rather than material ones, as ecologists desire? No one knows for sure. One thing is certain: No mode of production or model of development lasts forever.

TRANSITION

The term *transition* is one of several used in research on the transformation of political regimes. Other competing terms include *transformation*, *regime change*, *system change*, and *democratization*. These terms not only are closely related to each other but also overlap in meaning; however, they are not identical in their meaning. Moreover, they all have specific connotations and are often linked to particular theoretical concepts or even reflect ideological biases.

The term *transition* was first used in political science by Dankwart Rustow in his 1970 article "Transitions to Democracy." However, it was not until 1986 that the term was transformed into a more coherent theoretical concept by the seminal 1986 work of Guillermo O'Donnell, Philippe C. Schmitter, and Laurence Whitehead. They defined *transition* as "the interval between one political regime and another" (p. 6). Transitions are limited in time: on the one hand by the dissolution of an authoritarian regime and, on the other, "by the installation of some form of democracy, the return to some form of authoritarian rule, or the emergence of a revolutionary alternative" (p. 6). The two authors deliberately introduced contingency as an important variable with respect to the regime outcome. They do not deterministically speak about "transition *to* democracy," but "transition *from* authoritarian rule" to an "uncertain something else" (italics added; p. 3). However, the study triggered and inspired an avalanche of empirical research in democratization, first on Southern Europe and Latin America and later on in the 1990s on Asia, Africa, and Eastern Europe.

Transitologists conceive the (not necessarily) successful transition from authoritarian to democratic rule typically in three subsequent phases: first liberalization, then democratization, and finally consolidation. Liberalization marks the beginning of transition. It is the process of granting some of those "liberal" rights to the citizen that are traditionally associated with habeas corpus, (partial) freedom of movement, free speech, freedom of association, the sanctity of the home, and so forth. Authoritarian rulers grant these rights typically in situations when the regime suffers from a crisis of legitimacy and the so-called softliners among the ruling elites prevail over the hardliners by arguing that a limited liberalization and controlled broadening of the ruling base can ultimately save the political power of the authoritarian regime. However, Adam Przeworski has shown that this often turns out to be a misperception. The changing power relations and the dynamics of regime change are barely controllable and often trigger a chain of events and decisions that finally lead to democratization by default. Gorbachev's *glasnost* and *perestroika*, the collapse of the Soviet Union, and the beginning of democratization constitute only one of many examples.

Democratization by default occurs when the newly conditioned and nonguaranteed civil and political rights open a new space for an emerging civil society. The more civil society grows beyond the control and repression of the authoritarian regime, the more the risk of punishment decreases for protest movements and prodemocratic demonstrations. The increasing number of protesters lowers the costs for individual and collective actions against the authoritarian regime. The granting of some liberal rights by authoritarian rulers is often motivated by their calculation of avoiding protests and broadening the base of legitimacy of the old regime. However, the contrary has often been the case: Liberalization has triggered more protests, leading to the emergence of a stronger civil society, which then led to the beginning of democratization.

The phase of democratization is the proper core of each transition. It is the time when the old institutions and the repressive apparatus of the authoritarian regime have lost their power, and the new rules of democracy are not yet fully established. The lack of effective institutions opens a large space for new political actors. In these situations, where the precise power relations are not transparent, the relevant actors of the remaining old regime and the new opposition decide to negotiate form and content of the next steps of democratization. The core of these negotiations involves crucial democratic institutions, such as electoral laws, the form of government, its relation to the parliament, the debate surrounding the decision to have a presidential or parliamentary system, majoritarian or consensus forms of democracy, and a centralized or federalist state. Although the social and historical context of a country and society matters, the final configuration of the new institutions is above all a logical outcome of the power relations and the power struggle between the relevant actors of the old authoritarian regime and the democratic opposition and their strategic decisions.

The role of actors is decisive in transition research. Philippe C. Schmitter and colleagues and Adam Przeworski ascribe to them the crucial role within any transition from authoritarian rule. Structural and socioeconomic constraints or opportunities that are at the core of modernization theory are neglected or deliberately excluded from the analysis by an implicit ceteris paribus clause. It depends above all on the constellation of actors whether a transition leads to democracy or falls back to dictatorial rule. Inspired by the *transición pactada* in post-Franco Spain (1975-1977) and confirmed by the negotiated transitions in Brazil, Uruguay, and Chile in the 1980s or the roundtables in Eastern Europe after 1989, pacted transitions became the paradigmatic key of successful transitions. Particularly when the reformers (softliners) of the old regime and the moderates of the democratic opposition dominate their respective camps and agree in negotiations or even formalized pacts on the next steps of political reforms, democracy is the most probable outcome of the transition. Elite settlements, where the relevant actors agree on the fundamental rules of the democratic game, are considered to be a solid base for further democratization. Elites play the decisive role in the movements, whereas the actions of the masses are mostly understood as a transient phenomenon at the beginning of the political transformation.

Since it is basically an analytical distinction, it is not precisely clear in reality when the phase of liberalization ends and the transition begins. The same is true for the borderline between transition to, and consolidation of, democracy. Both lines are blurred, and the different phases can best be understood and researched as overlapping processes. However, the mainstream of transitology argues that transition has finished when the first democratic elections, the founding elections of the new democratic regime, have taken place. Others, such as Wolfgang Merkel, believe that the passing of a revised or new democratic constitution is the proper end of the transition. Only when the transfer of political power from one person or a group of persons to a set of institutionalized rules has taken place, which are equally valid for both the ruling and the ruled, can the formal rules of democracy be said to be established.

What is the theoretical contribution of transition to democracy literature to our understanding of regime changes or democratization of political regimes? Theoretically, the transition paradigm can be considered, according to Barrington Moore, as an answer to historical structuralism and, according to Talcott Parsons, Seymour Martin Lipset, and others, to modernization theory. While structuralists focus particularly on class relations and the link of social classes to the state, modernization theory could never get rid of a certain deterministic bias. It is above all socioeconomic development and the emergence of the middle classes that lead sooner or later to democracy; actors are not taken seriously into account. One of the strengths of the transition paradigm is that it can shed light into the black box of political actors, actor constellations, and finally political action. Transition theory brought political actors back into the limelight. However, the transitologists constructed their own black box: They did not sufficiently integrate in their analyses the socioeconomic opportunity structure for political action. For some, such as Giuseppe Di Palma, democracy can be crafted only if the actors agree regardless of the socioeconomic and structural constraints. Despite all its merits, the transition paradigm could never overcome the theoretical burden of a considerable degree of voluntarism. The disregard of structural and historical factors was not the least of the issues that contributed to the exhaustion of the transition paradigm in the late 1990s. Since then, historical institutionalism has taken over the paradigmatic lead in regime research and democratization studies linking actors and actions to the structural and historical context. However, the theoretical merit of the transition paradigm lasts: Political actors and agency are back in research on the transformation of political regimes.

TRANSITIONAL JUSTICE

One of the effects of the third wave of democratization that took place in the last quarter of the 20th century has been to confront newly democratizing countries with the need to come to terms with their "evil past"—the human rights violations committed under authoritarian rule. Transitional justice, one of the fastest growing areas within the study of democratization, deals with the manner in which the claims arising from such wrongdoings, often undertaken by the state and its agents, should be handled fairly and equitably.

The study of transitional justice is by no means confined to lawyers or to the discipline of the law. It is an eminently interdisciplinary field in which law, political science, history, sociology, anthropology, theology, and other disciplines converge. A number of institutes in several continents have been established in the first decade of the 21st century to study the many dimensions of transitional justice, to analyze the different policy tools used to achieve its objectives, and to disseminate best practices in the field. The handling of transitional justice issues and their consequences affects the dynamics of the political transition and the subsequent democratic consolidation.

Much like the latter two processes, transitional justice itself is also marked by contingency and paradox. Much depends on the historical context and the legacies of any given political trajectory. Transitions are, by definition, highly fluid, and both political action and the uses of the law find themselves under a different set of rules from those obtaining in periods of stability and calm. To identify the transformative opportunities presented by the conjuncture, which will allow change to proceed toward the new order, becomes an essential task both for political leaders and for those responsible for the transitional justice tools.

Historical Context

Transitional justice falls squarely within the broader issue of human rights. The latter emerged as an international issue in the aftermath of the Holocaust, and was formalized as such in the 1948 United Nations (UN) Human Rights Declaration. However, it was not until the early 1970s, in the light of human rights violations committed in the Southern Cone of Latin America, that the issue of transitional justice came to the forefront of international relations and foreign policy agendas.

In its original incarnation, transitional justice was seen as mainly concerned with transitions from authoritarian to democratic rule. It first drew heavily on the experiences of Southern Europe and Latin America in the 1970s and 1980s as well as on those in Central and Eastern Europe after 1989 and in Southern Africa in the mid-1990s. It shared some of the same value orientation of democratization studies more generally—what Abraham F. Lowenthal has referred to as the "thoughtful wishing" school of scholarship. Over time, however, transitional justice has expanded to other instances, encompassing a much broader scope, to include postconflict societies more generally, arising both from international and civil wars. The field has thus become somewhat less normative and more neutral, with a stronger emphasis on empirical work. After the many internal conflicts that erupted in the post–Cold War world—mainly in Southeastern Europe, Africa, and Asia—transitional justice has emerged as an important tool within the wider panoply of nation- and peace-building instruments to be deployed after wars come to an end.

In all these cases, however, the critical question is the same: What to do "the morning after"—be it after the fall of the dictator or the signing of the peace. And here come to the fore the many dilemmas and paradoxes that are such a hallmark of transitional justice. On the one hand, there is so much to do on so many fronts that the last thing the new leaders may want is to "frontload" their own political agenda—a problem often compounded by the possibility of authoritarian regression. On the other hand, the very legitimacy of the incoming coalition will often be based on their alleged moral superiority over the outgoing elites. It was the new order's denunciation of those human rights violations that contributed to depleting the political capital of the ancien régime. To do nothing now, safely ensconced in office, would seem the height of cynicism. There will thus be strong domestic and international pressures against a policy of "do nothing."

What to do, then, about this evil past and about the evildoers? Though some countries (Brazil and Spain come to mind) effectively decided to do nothing—although this does not mean that the issue itself disappeared—many new governments have felt it necessary to take some sort of action. The reasons for this go beyond the routine pressures the rulers experience "to do something" about a given matter. After dictatorship or after war, there is a deep-felt need to draw a clear line between the old regime and the new dispensation, between yesterday's order and that of today. In many cases—that of apartheid in South Africa is one of them—the suffering inflicted on significant portions of the population has been such that the very notion of pretending that nothing happened or that it is best to simply forgive and forget is abhorrent to many.

Elements of Transitional Justice

Transitional justice, then, as Mark Freeman has pointed out, encompasses four distinct sets of activities:

1. trials in their various manifestations, be they criminal or civil, national or international;
2. fact-finding bodies, of which the most prominent are truth commissions (TCs);
3. reparations to the victims of human rights violations and/or their relatives; and
4. criminal justice reforms designed to avoid the repetition of mass abuses.

Trials and Amnesties

The question is how to go about this highly sensitive task. The classic response to this after wars has been the successor trials—to put the high command of the outgoing regime in the dock. The best known example in the contemporary period is the trial of Saddam Hussein in Iraq, ending in his conviction and execution. And although there are many precedents, the most relevant one for these purposes is that of the Nuremberg and the Tokyo trials after World War II, which in many ways set the template for the form. Nuremberg was largely a response to the Holocaust, which caused such a shock to humanity that it triggered a large number of legal responses and innovations.

Something similar could be said about the post–Cold War era. The large number of internal conflicts that have erupted in the absence of the constraints imposed by the bipolar international dynamic have led to the growth of international criminal justice institutions. The International Criminal Tribunal for Former Yugoslavia (ICTY), the International Criminal Tribunal for Rwanda, and hybrid (i.e., courts that combine national and international elements) criminal tribunals in Bosnia-Herzegovina, Cambodia, Kosovo, Sierra Leone, and Timor-Leste are among them. The most significant addition to this roster of tribunals is, of course, the International Criminal Court (ICC), established in the Rome Treaty signed in 1998, and which came into being in 2002 in The Hague. Despite the unwillingness of some large powers to ratify the Rome Treaty and become party to it (most prominently the United States, which went so far as to formally unsign the treaty), as of 2009, 108 UN member states had ratified it.

The ICC has come to fill a long-standing void in international law, making it possible to bring individuals to justice, something for which the International Court of Justice, also based in The Hague, has no jurisdiction (only states have standing).

Hand in hand with this development has been the expansion of universal jurisdiction. By this is meant the ability of judges to investigate, indict, and ultimately, arrest individuals for war crimes, crimes against humanity, and massive human rights abuses committed anywhere in the world. Although, under normal circumstances, the jurisdiction of criminal courts is fixed territorially (i.e., by the boundaries of the state in which the crime was committed), globalization and a higher awareness of the need to stand up for human rights have started to change this, and a more expansive notion of jurisdiction has taken hold. Spain, where a law allows for universal jurisdiction in cases of human rights violations involving Spanish citizens or Spanish residents, has been a country whose judges have been especially active in this regard.

In 1998, General Augusto Pinochet became the first former head of state arrested abroad (in London) for human rights violations committed at home. Shortly thereafter, Serbian President Slobodan Milosevic became the first sitting head of state to be indicted for such crimes by the ICTY, being eventually arrested and taken to stand trial in The Hague, where he died in prison. Former Liberian strongman Charles Taylor suffered a similar fate, awaiting trial in The Hague. In 2008, Sudanese President Omar al-Bashir became the first head of state to be indicted by the ICC special prosecutor for genocide, crimes against humanity, and war crimes in Darfur. In 2009, the ICC issued arrest warrants against Bashir on the last two charges but not the first.

Domestically, however, as Ruti Teitel has observed, much as successor trials are seen as crucial for the reestablishment of the rule of law, considered to have been compromised by the ancien regime, they also, paradoxically, may endanger the legal foundations of the new order. A basic principle of criminal law is that of nonretroactivity of the penal code: *Nulla poena sine lege.* Yet the crimes for which the authorities and functionaries of the old regime are to be held accountable for are often not typified as such in the statutes of the preexisting order. The risk, thus, is to give the appearance of highly politicized, quasi "show trials" that make a mockery of the moral and juridical superiority claims of the new leaders. Some have argued that that is exactly what happened with the trial of Saddam Hussein. After the return of democracy, both Greece (in the 1970s) and Argentina (in the 1980s) prosecuted the members of the military junta and had them stand trial in special tribunals set up for that purpose.

At the other end of the spectrum of responses are amnesties. The enactment of amnesty takes cognizance of the fact that evil deeds were committed and that they need to be addressed. However, it is estimated that the needs of national peace and reconciliation take precedence and that, for their sake, it is best to let sleeping dogs lie. After its own transition to democracy in 1985, Uruguay enacted such a law. A variant of this is self-amnesty. In 1978, Chile's military regime, led by General Augusto Pinochet, approved such an amnesty law, covering human rights violations committed during the 1973 to 1978 period.

According to some legal scholars, self-amnesties are null and void as they violate a basic legal principle: No one should be entitled to enact legislation for his or her own benefit. Yet when President Patricio Aylwin (1990–1994) gave consideration to derogating Pinochet's amnesty law, one counterargument he faced was that once the penal responsibility for a given crime has been extinguished by an amnesty law, it cannot be recreated simply by derogating the amnesty law.

The limitations and, in some cases, the unsatisfactory results of both successor trials and blanket amnesties have contributed to the rise of a third option in the tool kit of transitional justice—that of TCs.

Truth Commissions

TCs are officially appointed (although usually independent) bodies tasked with investigating human rights violations during a specific period (often that of the previous authoritarian regime or the one on the losing end of a war). Their powers vary, but they are generally made up of respected personalities who are supposed to produce within a specified time period (ideally not more than 6 months to 2 years) a report that documents those violations for the record and establishes a factual truth about them. They serve as group exercises in collective expiation and memorialization. They are not tribunals, and they may be formed by nationals (the general rule), foreign citizens (in cases where nationals dare not tread, as happened in the one in El Salvador), or both.

TCs are not necessarily incompatible with preexisting amnesty provisions, nor do they preclude subsequent prosecutions by the courts. They have increasingly become the policy tool of choice of new democracies as they come to terms with their evil past. Several dozen of them have been established in the course of the past decades. Two particularly significant ones, associated with two emblematic transitions of the 1990s, were the Chilean (1990–1991) and the South African (1995–1998) Truth and Reconciliation Commissions (TRCs). If the quality of the report of the former was considered to have set a standard of sorts, it was the latter, led by Archbishop Desmond Tutu, that most enhanced the profile of TCs, particularly because of its innovative use of public hearings. Since then, countries such as Peru, Panama, Timor-Leste, Ghana, Burundi, Nigeria, and Sierra Leone have relied on them, with varying results. As a rule, TCs have largely not been used in Eastern and Central Europe, where the preferred system of dealing with the past has been that of lustration, whereby former party officials and high-ranking functionaries are disqualified from government service in the new dispensation.

The reasons for this veritable explosion of truth commissioning are many. On the one hand, they provide a reasonable compromise between the extremes of outright prosecution through special courts and full amnesty. On the other, through their fact finding, they can lay the foundations for much of the work that needs to be done to heal the body politic of the blows inflicted on it by dictatorship and/or war. The truth must be established: Violations need to be put on the public record. A measure of justice must be meted out: The culprits deserve some punishment, even if only symbolic. With the facts on the open, reparations can proceed. Not bound by the exacting evidentiary standards of judicial procedures, they have more flexibility to call on witnesses and to gather relevant data. The established judiciary, compromised by its acquiescence to dictatorship, is often not in a position to undertake anything comparable to this. Still, it may well be able to follow up on the work of the TC, using the initial evidence thus gathered to prosecute the culprits of human rights violations.

TCs are most appropriate after a significant regime change, in which major human rights violations were committed primarily by one side, and when there is still a certain balance between the democratizing forces and those of the outgoing coalition. Under such circumstances and when there is often some dispute about what actually happened under the previous regime, the need to have a common national narrative about those facts is especially acute to overcome past divisions and forge a common future.

The parallel has been made with the needs of patients suffering from posttraumatic stress disorder. People who have undergone major traumas in their lives often find themselves disoriented and in acute need of telling their story to someone who will take it seriously. It should not be surprising to realize that individuals who lost their loved ones and/or were themselves submitted to torture and were then publicly denounced as subversives should often suffer from all sorts of psychological difficulties and should need help.

Beyond individual grief and the imperative to overcome it, looms a larger issue, what José Zalaquett has referred to as the cathartic function of TCs. After the collective trauma of repressive dictatorship or war and all it entails, nations need a moment of rebirth or regeneration of their sense of identity and being, one that provides a clean break with that oppressive past and thus gives them the necessary impetus to forge ahead and build a better future. If conducted properly, TCs can perform this function. The experience of the South African TRC, which in its 2.5 years of existence engaged in one of the most extraordinary exercises in national soul-searching ever undertaken, remains a prime example of that. The public hearings held during those years, often in churches, with strong religious undertones and amply covered by the media, made the country come to terms with the legacy of apartheid in a way that perhaps no other mechanism could have.

Until the South African TRC, no TC had ever held public hearings. Since then, many countries, including Nigeria, Grenada, Timor-Leste, Ghana, Peru, Morocco, and Paraguay have done so. Public hearings have distinct advantages over those held in camera. In our media-driven societies, they generate enormous public attention, increase the awareness of past abuses, and are more likely to trigger public debate than the mere publication of a report. However, they are time-consuming, expensive to set up, and demand enormous amounts of staff time. They are also a high-risk endeavor. The need for procedural fairness in the proceedings of TCs is especially apparent in the case of public hearings, given the lack of ordinary judicial rules like witness cross-examination.

Another critical issue is that of "naming names." A key feature of TCs is their victim-oriented approach, so different from the regular adversarial penal proceedings prevailing in the West, mainly directed toward establishing guilt rather than toward highlighting the victim's plight. In that context, the issue of whether the report of TCs should actually name the likely culprits of human rights violations is highly contested. For some, given the lack of exacting evidentiary standards in the TC's hearings and procedures, this would be an inherently unfair and even dangerous exercise. For others, it would be the equivalent of the journalistic mention of the suspects of a crime, no more and no less. Yet given the official weight that the TC reports carry, the latter is a complex, if not downright dubious, proposition. Passing on the relevant information to the courts for further action rather than making such names public would seem to be the more prudent course of action.

Reparations

Inextricably intertwined with TCs, though analytically separate from them, is the issue of reparations for human rights violations. Lost lives cannot be resurrected, and cutting off limbs inflicts permanent damage to its victims. Yet some degree of reparation is both of material and symbolic significance. Through reparations, the state effectively acknowledges its responsibility for past human rights violations. Who qualifies? For how much? How fair is it to impose what may be a heavy budgetary burden for reparations on the governments of developing societies that have great difficulty in balancing competing social and economic priorities? What about intergenerational justice? Why should present and future generations pay for the sins of past ones? These are some of the questions raised by the vexed issue of reparations.

The report of TCs provides an important initial data set that makes it possible to identify, at least on a preliminary basis, the likely beneficiaries of such reparations. There is consensus in the literature, however, that the formal handling of reparations claims should be done by a separate body, established after the TC has discharged its mandate. This is likely to be a long and cumbersome process, which may take several years to be completed.

Reparations are by no means limited to cash payments. Lump sum payments (especially involving high sums to large numbers of people) can be particularly onerous on the public purse, which is why pensions and scholarships are often preferred. As Pablo de Greiff has pointed out, reparations include apologies, educational and health services, pensions, property and job restitutions, business loans, and other types of assistance. A particularly sensitive issue is how to determine the reparations due to torture victims, as evidentiary questions often arise.

Some TCs, though by no means all, have added *reconciliation* to their name. This has also become a contested term. Prima facie, there is nothing wrong with it. Presumably, the very purpose of any TC is to bring the country together, to reconcile it with itself, and to avoid the repetition of another cycle of human rights abuses. Yet some, including Chilean president Michelle Bachelet, herself the victim of human rights violations, have argued that reconciliation is a very personal process that cannot be expected to occur in a collective, such as a nation. Others have stated that it is a concept with religious overtones, which has no place in contexts of separation of church and state.

Setting the record straight in terms of the victims and what happened to them (the "Truth"); aiming for a measure of limited, even if only symbolic, sanction of the culprits ("some Justice"); and setting up follow-up mechanisms that through reparations to the victims or their relatives and some institutional changes (human rights education and reform of the judiciary and of the military) prevent such future wrongdoings may, in the end, be the best that TCs can aim for.

TRIANGULATION

Triangulation is a research strategy in which one brings multiple forms of evidence to bear on a single research question. The term *triangulation* is often modified by an adjective (e.g., within-method triangulation) to reflect how the evidentiary variation is introduced. In the years since the term was introduced into the research methods lexicon, two primary accounts of the value of triangulation have emerged. One account views triangulation as valuable for what it reveals about the validity of a descriptive or causal inference. The second views triangulation as valuable for how it enriches the perspective one gains on the question under investigation. The endorsement of triangulation for one or both of these reasons is widespread within the social sciences, but skeptical and cautious voices are heard as well. This entry discusses varying perspectives of triangulation and points to new developments.

Early references to triangulation focused on measuring concepts with data gathered from multiple methods. The classic reference is to the 1966 volume *Unobtrusive Measures* by Eugene J. Webb and colleagues. The advice was threefold: (1) supplement measures of social and political behavior drawn from interviews and questionnaires with (unobtrusive) measures drawn from physical trace evidence, documents, and observation; (2) test any given hypothesis repeatedly using the different measures of key concepts; and (3) treat the hypothesis as more credible if all the tests converge in support. The reasoning is that measures built from different data sources will each be flawed in ways that the researcher should be able to anticipate, if not correct, in advance. But the particular flaws will vary across the measures. A survey-based measure of alcohol consumption, for example, would likely suffer from social desirability bias, which would not threaten the validity of a measure based on (covert) observation of how many liquor bottles were found in a person's trash, even though the latter will have its own limitations. If, therefore, one finds similar results when testing a hypothesis with each measure, one can draw conclusions with greater confidence. It becomes implausible to view the findings as an artifact driven by biases unique to each measure.

Note that the major concern here is systematic error in the measures (a question of measurement validity) not random error (a question of measurement reliability). Hence the advice is to repeat one's analysis using each measure, not to form indices from the set as if they were simply parallel measures. This strategy loses value, however, if it is plausible to view the bias in each measure as having concordant effects; even if the hypothesis were false, flaws in the measures could produce converging results. Hence, it is important to select measures where the biases are expected to produce discordant effects on the results.

Influenced by Norman Denzin's more expansive treatment of the topic in 1970, social science understanding of triangulation quickly extended beyond the measurement context. To represent the varying ways in which different forms of evidence can be combined, triangulation is now routinely differentiated into types. Between-method triangulation involves multiple methods of data collection (focus groups, sample surveys, participant observation in field settings, content analysis of documents, laboratory experiments, and so on). In within-method triangulation, the data collection method is held constant but the design (e.g., analyze a panel and a cross-sectional survey) or measurement technique (e.g., work with different survey questions or question types) may vary. Data triangulation refers to the use of data on multiple samples, obtained at different times and/or in different contexts. With investigator triangulation, multiple investigators work at least semi-independently on a joint venture. In analysis triangulation, the same data are analyzed using multiple techniques (e.g., apply narrative and conversational analysis to in-depth interview texts or analyze quantitative data with both Bayesian and non-Bayesian statistical techniques).

Two accounts of triangulation's purpose and value emerged alongside this expansion of its forms. One follows the same logic of corroboration laid out in the earlier work on measurement: Because each piece of evidence—generated from research that varies in method, design, measurement technique, sample, investigator, and/or mode of analysis—has weaknesses not shared with the other(s), working with multiple forms of evidence should help the researcher reach conclusions that are more valid than if any one evidentiary source had been used alone. Whether the goal is descriptive or causal inference, triangulation should enhance the researcher's ability to rule out rival explanations for the findings and/or establish their generality.

Of course, just what is gained in any study depends on the research question and form(s) of triangulation employed. Working with multiple samples, as with data triangulation, will speak most directly to questions of generalization. Combining lab and field experiments will offer evidence both on the validity of a causal hypothesis and on whether a result found in the lab setting generalizes to the natural setting. Corroboration of a result when using two or more analysis techniques demonstrates that the finding is not an artifact of the specific assumptions that underlie each one. As these examples suggest, for triangulation to be effective, the researcher must deliberately select forms of evidentiary variation to achieve specific objectives.

The second account of triangulation's purpose and value follows a logic of complementarity rather than corroboration. It boils down to three propositions:

1. Any one form of empirical evidence will inevitably yield a partial or incomplete understanding of the phenomena under study.
2. Different forms of evidence will provide different perspectives on and insights into the phenomena.
3. Thus, by combining forms of evidence, a research project will generate a richer and more complete body of knowledge about the phenomena.

Examples abound. Observational data may make evident what interview data do not because of people's tendencies to focus on what is salient, novel, or positive. Analysis of quantitative data sets might establish an empirical regularity while in-depth case studies provide insights into causal mechanisms. Interviews with multiple actors who work within or interact with an organization will provide multiple, situated perspectives on the dynamics of interest. Documents may be used to gain insight into the historical and institutional context of a problem while interviews are used to acquire perspectives on current debates.

Some social scientists embrace both purposes of triangulation. One version of this position simply conceives of triangulation as a multipurpose research strategy—one that may at times be used to see if a descriptive or causal hypothesis can be corroborated with multiple forms of evidence and that may at other times be used to generate a more complete (deeper, broader, multifaceted, contextualized, complex, and/or holistic) understanding of a topic. Another version sees both purposes as potentially relevant to any hypothesis-testing study, depending on the results: If the triangulated results converge, the hypothesis will be validated by the logic of corroboration, but if the findings are inconsistent or contradictory, the researcher can develop a more complete (nuanced, contextualized, deeper, etc.) explanation that reconciles the divergent results.

Other social scientists adopt one version of the virtues of triangulation but not the other. In some of the literature, triangulation is simply associated with one objective (corroboration via convergence vs. enrichment via multiplicity) while the other is ignored or underplayed. Scholars who work primarily with qualitative methods frequently go further, however, and reject the corroboration point of view entirely, arguing that it presupposes an (positivist) epistemology that is inconsistent with their own. The issues here are complex and the viewpoints many, but they often revolve around the interpretation of convergence versus divergence in results. Consider, for example, a project on the topic of "bureaucratic conflict" that finds widely varying accounts of how much conflict there is between political appointees and civil servants depending on who is being queried about the matter and that uncovers discrepancies between interview reports and evidence gleaned from public records. A simple (perhaps simplistic) application of the convergence logic would treat that variability as due to bias in each indicator of the true or objective level of conflict. To scholars working within constructivist or interpretivist traditions, this would make no sense at all. Differences in perspective across individuals are to be expected, public records have their own generative processes, and all this variation is constitutive of the phenomenon of bureaucratic conflict and central to the inquiry, not getting in the way of a clear understanding of it.

Ideas about triangulation are still evolving. New issues are arising in the burgeoning literature on research strategies that mix quantitative and qualitative evidence (often called mixed-method or multimethod research strategies). Although one still finds the between-methods triangulation label applied to any research project that has a qualitative and a quantitative component, scholars are beginning to depict triangulation as just one form of mixing the methods. For example, since in triangulation the various methods are chosen a priori for how they together provide more insight into a central research question than any one taken alone, it would be a stretch to treat a project in which quantitative and qualitative methods are used *in seriatim*, with the results of the first used to determine what is done (sampled, measured, focused on) in the second, as a case of triangulation. Systematic attention is also being given to the varying purposes served by qualitative and quantitative evidence in mixed-method designs and to the ways in which such evidence can be effectively integrated.

TRUST, SOCIAL

Social trust is the expectation of reliance that individuals in a community have toward each other on the basis of shared norms, mutual reciprocity, and cooperative behavior. Trusting others is based on the belief that their behavior will not be harmful or deceitful. Although trust in family and close friends may be common in most societies, the concept of generalized social trust involves trusting people in a much wider scope of social, political, and economic relations. Also referred to as interpersonal trust, social trust is regarded as a cultural trait that develops with the formation and maintenance of social networks and secondary associations. Rationalist approaches also see social trust as a learned reciprocal and cooperative behavior. Whether it is cultural or rational, social trust varies significantly from one society to another, and this variation is thought to have an impact on politics and economics. This entry reviews the origins of the concept of social trust, the ways in which it has been more commonly measured, the limitations attributed to its measurement, the more general theoretical and empirical relationships between social trust and economic growth and democracy, and the role of social trust as a key component of a broader concept of social capital.

Origins of the Concept of Social Trust

The idea of trust can be found in various political thinkers from different ages, but its current understanding as trust in others within a community or a set of social networks can most prominently be traced back to Alexis de Tocqueville's *Democracy in America*. He wrote that in 19th-century America vast numbers of associations "are formed and maintained by the agency of private individuals" on the basis of trust and shared interests. From this perspective, trust is strongly related to associational life, which in turn facilitates the pursuit of common goals that would be harder to achieve through purely individual efforts. The link between trust, secondary associations, and democracy has been emphasized by many authors throughout the second half of the 20th century and still attracts a lot of attention, particularly because indicators have shown a significant decrease in social trust, a point that we will return to later.

In the late 1950s, an influential culturalist approach to politics put the concept and measurement of social trust at the center of the academic debate. *The Civic Culture* study, published in 1963, established a theoretical and empirical relationship between trust and democracy. The authors, Gabriel Almond and Sydney Verba, conceived of trust as a component of a democratic political culture. In their view, stable democracy requires a set of democratic values and beliefs that supports it, and trust in others is one of those values. Their book, based on survey data from five nations, reinforced the idea that social trust is a condition for the formation of secondary associations and, as a consequence, a feature that fosters the development of a participatory society, a pillar of democracy.

The relationship between social trust and democracy was very persuasive, and it had a great impact on subsequent empirical political research. As trust was part of a more general democratic political culture, higher levels of interpersonal trust were consequently linked to higher levels of democratization. Subsequent research has shown that social trust is related to effective democratic governance, not only because secondary associations are a vital part of democracy but also because trust enhances the development of a loyal opposition respecting the "rules of the game," facilitates self-compliance of political agreements, and fosters tolerance. Democratic politics is based on rules and procedures that require the acceptance and compliance of the parts, and trust is a positive intervening factor. It is important to note that the close relationship between social trust and democracy as a form of government does not mean that trusting other people is the same as trusting political institutions. Social trust and political trust, generally understood as confidence in political institutions, may be related, but they are two different concepts, and each one is subject to different explanations.

Measures of Social Trust

Social trust has been measured in various ways but mainly through survey research. The most common indicator was used in *The Civic Culture* study, but it was only one of five original survey items designed to measure "faith in people" that its authors borrowed from previous research. The measure of social trust derives from the following question: "Some people say that most people can be trusted. Others say you can't be too careful in your dealings with people. How do you feel about it?" The percentage of survey respondents who chose the option "most people can be trusted" became an empirical representation of social or interpersonal trust as well as an initial basis for cross-national comparisons. Today, many comparative public opinion surveys include this item in their questionnaires, and some of them have kept record of it for several years, providing a relatively standard measure for a wide array of societies with different levels of economic development, political institutions, and cultural traditions.

Although many surveys use this indicator as a standard measure of social trust, the question from which it is derived has been subject to criticism and continual revision. One of the main complaints is that the question is posed as a simple dichotomy in which people in general can only be trusted or distrusted. This implies that trust is not a matter of degree. However, this is questionable because, as some argue, some groups in society can be trusted at a higher rate than others, or the same group of people can be trusted under some circumstances but not so much under different ones. This leads us to a second criticism, which is that the standard question fails to provide any social context or group reference that could help evaluate who can be trusted and who cannot. If a person says that "most people can be trusted," who is included in that response and who is not? Moreover, can the same person be trusted under different circumstances or situations? This leads to a third criticism—that the question is ambivalent and, therefore, an unreliable indicator of social trust.

Despite these problems and the development of alternative, context-specific questions in cross-national survey research, the standard question of generalized social trust continues to be widely used. And this is so mainly for two reasons: First, many believe that, despite its limitations, the standard question does tap generalized social trust, and second, the percentage of respondents who say "most people can be trusted" has a high level of cross-national variation. This is shown by the most recent European Values and World Values Studies, conducted in 2005 to 2007. The data from those surveys display a range that goes from a high of 74% of respondents in Norway who think that "most people can be trusted" to a low of 4% in Trinidad and Tobago (see Table 1). This significant variation in trust also correlates with other variables, such as the level of economic development and democracy. Richer and more democratic societies tend to express higher levels of generalized social trust.

Trust and Economic Development

Cross-national comparative studies as well as more particular case studies on social trust have shown that some societies are highly trusting while others are driven by a culture of suspicion and distrust. The economic and political implications of this variation have been documented in various works. On the economic side, some authors argue that high-trusting societies where social networks exist are far more efficient and much more able to take advantage of information technology, for example, than low-trusting societies. The latter face several organizational and competitive disadvantages when compared with the former. Others argue that norms of trust and reciprocity facilitate good economic performance and create economic prosperity. Part of the explanation is that trust diminishes the costs of transaction and makes economic relations more efficient. Also, data gathered in different environments have shown that the rates of financial investment are related to trust, thereby, influencing economic growth. Organizational perspectives have linked trust to teamwork and higher levels of productivity. From any of these perspectives, trust is clearly an economic asset.

Trust, Democracy, and Social Capital

On the political side, the relationship between trust and democracy has been extensively discussed.

Interpersonal trust is viewed as part of a set of values that are related to the development of democratic institutions, although the causal direction in this relationship has been the subject of an ongoing debate. The role of trust and its accompanying associational life influence the functioning of democracy, and civic engagement is thought to have a positive effect on democratic governance. But this is where a more general concept of social capital unfolds, and social trust is only a part of it. Social capital, generally understood in terms of social networks and norms of reciprocity and trustworthiness, is a more comprehensive construct. However, social trust can be seen as an important but autonomous component. Recent research has found, for example, that the link between social capital and socioeconomic development is mainly mediated by trust and not by an organized civil society. Thus, social trust is a component of social capital, but it should not be equated to it.

Social capital studies have recorded a steady decline in trust and associational life during the last decades, mainly in the United States. This decline has several theoretical and empirical implications, and scholars have asked whether a decline in trust is also a decline in democracy or a decline in socioeconomic development. Following social capital studies, as trust and social networks are strongly associated to giving and volunteering, to participatory communities, to higher levels of tolerance, and as Robert Putnam has called them, to "many other forms of civic virtue," the decline of trust has been an alarming trend. Some argue that this decline is the result of an increase in economic inequality, which means that the once achieved horizontal social relations are returning to vertical and hierarchical ones. Others argue that the decline in associational life is only observed in traditional organizations but that, increasingly, autonomous individuals driven by self-expression and emancipative values are creating different ways of organizing, even through the use of new technologies. Trust, for example, is seen as part of a more postmodern cultural syndrome of well-being than a part of civic traditions.

We can confidently say that the literature on social trust takes on a vibrant topic that is not limited to the macrophenomena of democracy and socioeconomic development but that contributes to important issues in organizational research, where social trust is viewed as a process, even a strategy, for successful joint work between individuals, groups, institutions, and nations.

UNILATERALISM

The most precise and parsimonious definition of unilateralism is numerical: a state acting alone. However, unilateralism has a wide range of definitions, none of which has emerged as predominant within the literature. A further complication is that some definitions of unilateralism are general and can be applied to either security affairs or the global economy, whereas other definitions are specific to only one of these realms. This entry first reviews four general definitions of unilateralism, followed by two definitions that pertain specifically to the global economy, and then two definitions concerning security affairs.

Although the term *unilateralism* has long existed, it rose dramatically in prominence during the George W. Bush administration. The Bush administration was widely regarded by scholars and pundits as promoting a strong turn in U.S. foreign policy away from multilateralism and toward unilateralism. The widespread debate over the Bush administration's foreign policy led to greatly renewed interest among scholars about the practice and consequences of unilateralism.

Of the four general definitions of unilateralism, the easiest one to operationalize focuses on the number of countries that coordinate: An action with a single participating state is regarded as unilateral, whereas one that has three or more coordinating states is multilateral. The clarity of this definition notwithstanding, many analysts question whether the mere fact that three or more states coordinate is sufficient to constitute multilateralism. Critics of this quantitative definition argue that the real question is not how many countries coordinate but the way in which they do. Some critics argue that for an action to be considered multilateral, the burden of coordination must be widely shared. These analysts argue, for example, that if a powerful country contributes the vast majority of its troops for a military operation, then it is still best seen as unilateral even if three or more countries do participate in the action. In his critique of the quantitative definition, John Ruggie argues that what distinguishes multilateralism is that it involves the coordination of policies by three or more states on the basis of generalized principles of conduct. In this view, ad hoc coordination by even a large group of states should not be considered multilateralism. The fact that more than 20 countries contributed troops to the 2003 Iraq War, for example, does not constitute multilateralism since this coordination did not occur on the basis of generalized principles but instead reflected particular interests.

The second general definition of unilateralism is a state acting on the basis of narrow self-interest without regard for the interests of other countries. Using this rubric, unilateralism is easy to identify in those situations when a state acts by itself against the wishes of all other countries. Conversely, an action is clearly not unilateral if all countries agree that it should be undertaken. Yet it is rare in international politics that either all or no states agree with a given action, and the literature is unclear regarding how many countries must agree with an action before it is no longer considered unilateral. In this regard, analysts sometimes apply the term *unilateralism* to actions that many states see as beneficial and participate in.

A related general definition of unilateralism is when a state acts without consulting other states beforehand. The literature does not specify, however, how much consultation must occur for a state or leader to avoid being regarded as undertaking a unilateral foreign policy. In this regard, the Bush administration was generally viewed as acting unilaterally during its first term, in significant part because it was seen as not consulting very much with its allies. Yet American consultation with its allies on some matters—such as intelligence sharing regarding terrorists—remained extremely high under the Bush administration. Moreover, in areas where U.S. consultation with allies did drop off, the decline was not to zero; for example, the United States continued to have a very close working relationship on military operations with states such as Britain and Australia.

A final general definition of unilateralism is a state not complying with international institutions and/or withdrawing from them. Actions such as the Bush administration's withdrawal from the Anti-Ballistic Missile Treaty, its failure to ratify the Kyoto Protocol, and its efforts to undermine the International Criminal Court were roundly criticized by the international community as unilateral. As with the previous two general definitions, the literature lacks a threshold regarding this third definition: It is unclear exactly how much noncompliance with institutions and/or treaty withdrawals must occur before a state is regarded as pursuing a unilateral foreign policy in an overall sense. It is notable in this regard is that the Bush administration followed its predecessors in continuing to comply with many international institutions, particularly in the economic realm.

Unilateralism has two principal definitions with respect to the global economy, the first of which is a departure from the principle of nondiscrimination. The significance of nondiscrimination is typically outlined with respect to trade, in which a defining feature of the Bretton Woods order was the extension of most-favored-nation treatment to all members of the General Agreement on Tariffs and Trade (GATT). Unilateralism can also be applied to the monetary sphere; in this regard, unilateralism is typically equated with the creation of exclusive currency blocks, as occurred during the interwar period.

A second definition of unilateralism pertaining to the global economy is the aggressive use of power by a dominant state to force a weaker state to accept concessions in economic negotiations. Analysts who advance this definition, such as Jagdish Bhagwati, stress that a powerful state such as the United States is at inherent advantage over other states in bilateral negotiations. In this view, a departure from negotiations within the context of global international institutions such as the World Trade Organization constitutes unilateralism.

With respect to security affairs, there are two key definitions of unilateralism. The first focuses on operational conduct. According to this perspective, a military action is obviously unilateral if only one state participates. Yet it is rare for a state to act in the military realm without any help whatsoever from other states. In light of this, Sarah Kreps argues that an action by a coalition of states should still be considered unilateral if one state contributes the vast majority of the troops and financial resources and also if the lead state is able to effectively control the decisions made by the coalition. Kreps argues that from an operational standpoint, the 2003 Iraq War was clearly unilateral in nature since the United States contributed around 90% of the troops, bore the vast preponderance of the financial costs of the war, and was dominant in terms of the planning process for the timing and conduct of the military operation. She argues that, in comparison, the 1991 Gulf War was multilateral since it was much more balanced on all three of these dimensions: The United States provided less than 75% of the troops, was responsible for only 11.5% of the coalition expenditures for the war, and had relatively less authority regarding the planning of the war since most of the other major powers in the world also participated.

Second, many scholars define unilateralism in the security realm on the basis of whether an international institution authorizes or endorses a military action. Scholars who make this argument typically argue that a military action is unilateral if it does not receive the backing of the United Nations (UN). A key reason for this focus on the UN is international law. According to customary international law, the use of military force is unlawful without the authorization of the UN (the sole exception is self-defense in response to an armed attack). Other scholars argue that it sets too high a standard to say that any action should be considered unilateral if it fails to receive UN authorization; they stress that if this standard were adopted, then the 1999 Kosovo War would be considered unilateral even though this military action was approved by the North Atlantic Treaty Organization (NATO) and was prosecuted collectively by its members. For these analysts, the Kosovo case suggests the need for a more narrow definition of unilateralism: A military action should be considered multilateral if it is approved by any international institution and is unilateral only if it completely fails to receive institutional backing.

Although the concept of unilateralism is used very prominently by scholars and pundits, analysts typically employ the term without specifying it. Given the plethora of different meanings of the term, it is incumbent to be precise about the particular definition that is being used. It is only recently that scholars have moved to establish detailed coding procedures for clearly distinguishing unilateralism from multilateralism, and more work along these lines would be beneficial.

UNITED NATIONS

The United Nations (UN) is an intergovernmental organization dedicated to the maintenance of international peace and security. It achieved nearly universal state membership in 2002. With 192 members at the beginning of the 21st century, the organization rests on the principle of collective security, by which its members commit themselves to reject the use of force in the settlement of their disputes and promise to act jointly against any aggressor. Founded at the close of the modern world's most destructive war, the final provisions of the UN Charter were negotiated at the San Francisco Conference, which met from April through June 1945. The organization came into being on October 24 of that year with the issuance of sufficient ratifications by member governments.

History and Philosophy

At the time of its creation, the UN was the latest manifestation of a 130-year-old search for mechanisms of international cooperation and law to supplant the traditional methods of national self-defense and war that had been common to international relations. Following the defeat of the French Emperor Napoleon Bonaparte in 1815, the victorious allies gathered at the Congress of Vienna and crafted an arrangement dubbed the Concert of Europe to maintain a hoped-for peaceful continent. Under the arrangement, the major powers of Europe agreed to meet regularly and to act collectively against any threat to the post-Napoleonic settlement. Often considered a conservative settlement, the Vienna meeting nonetheless ushered in a reasonably tranquil 19th century, which experienced a creative expansion of international organizations. Early river commissions such as the Central Rhine Commission (1815) and the European Danube Commission (1856) reflected a new interest in "functional" international organizations that built trust among peoples by providing venues of cooperation to resolve common problems. The International Telegraphic Union (1865) and the Universal Postal Union (1874) paved the way for numerous future international agencies dealing with issues as diverse as narcotic drugs, agriculture, health, weights and measures, railroads, time zones, and tariffs. "Political" international organizations meant to ease tensions and resolve formal disputes between governments also proliferated. In 1899 and 1907, the Hague Conferences established the Permanent Court of Arbitration for the resolution of legal controversies between states.

The Congress System collapsed in the carnage of World War I. However, the war itself convinced many leaders of the need for a world organization with the authority and political will to avert another major conflict. U.S. President Woodrow Wilson led the effort at the 1919 Versailles Peace Conference to create the League of Nations, committed to maintaining peace and security, fostering international cooperation, and developing comprehensive international law as enforceable substitutes for the use of force by any member of the league.

The League came into being on January 10, 1920, with its headquarters in Geneva, Switzerland. The organization consisted of an Assembly composed of all members, a Council that included permanent members from the great powers, and a Secretariat. Both the Assembly and the Council required unanimity on any decision. The Covenant also established a Permanent Court of International Justice to hear disputes between states and a mandate system (whereby major colonizing powers would prepare colonial areas for independence) that foreshadowed the end of colonialism. The most controversial provision of the Covenant, Article 10, called for collective security to assure nations of the League's protection against aggression.

Wilson's League proved ineffective in resolving the most important conflicts of the interwar period. In no small measure, the U.S. rejection of the Versailles Treaty, and, therefore, its nonparticipation in the League, undercut the will and authority of the organization. Also, the Covenant requirement that decisions in the League's Assembly and Council secure unanimous approval—acknowledging each member's sovereignty—made action to stop an aggressor nearly impossible. The League collapsed as fascist governments ignored the terms of the 1919 peace settlement and carried out aggression in both Europe and Asia.

Just as the League of Nations was the brainchild of Woodrow Wilson, so too the UN had its origins in the deliberations of an American president and his administration.

When President Franklin Delano Roosevelt entered World War II as an advocate of great-power realism, he argued that the League had been too dependent on world public opinion and not adequately sensitive to the realities of power. By 1943 he had come to believe that only a world organization that had none of the League's weaknesses was needed to secure the postwar peace. Roosevelt himself would name the organization the "United Nations," taking the name from the "Declaration by United Nations," signed by the allies in January 1942.

Roosevelt's views shifted in part because of the strong advocacy by the U.S. State Department for some postwar agency that could enforce the rule of law and the pacific settlement of international disputes. U.S. Secretary of State Cordell Hull was the primary promoter of the idea. He established a departmental committee to draft plans for an international organization. This committee, largely under Leo Pasvolsky's leadership, worked until the end of the war to develop the proposals that would ultimately be the basis for the UN Charter itself. The projected Charter, like the League's Covenant before it, created a plenary conference, a secretariat, agencies for technical services, and most important an executive committee, in this case consisting of the four allied powers—the United States, Great Britain, China, and the former USSR—plus other nonpermanent member states. In a series of meetings during the spring and summer of 1943, Roosevelt informally gave his blessing to the effort to obtain British and Soviet assent to a new international organization. Following the Tehran Conference of wartime leaders in November 1943, Roosevelt approved a "Plan for the Establishment of an International Organization for the Maintenance of International Peace and Security."

The most serious Charter issue that Roosevelt had to solve in the final months of the war was the question of voting; from his perspective, the issue was how to protect the traditional sovereignty of the nation-states that would be members of the world organization and yet not allow the UN to fall victim to the requirement of unanimity among the members. The topic was addressed at the 1944 Dumbarton Oaks Conference and at the Yalta Conference in February 1945. Josef Stalin, the leader of the Soviet Union, while acceding to majority voting in both the General Assembly and the contemplated Security Council, insisted on an absolute veto in the latter even over the discussion of any issue that threatened international peace or security. The United States opposed the Soviet position, and in the end, a compromise emerged under which any issue could be brought to the Council but substantive action on the matter required an enlarged majority and the concurrence of the five permanent members—the four allied great powers plus France—in effect, giving each a veto.

As many as 50 governments sent representatives to the UN Conference on International Organization in San Francisco. While the Big Three—the United States, the Soviet Union, and Great Britain—already had agreed on important aspects of the new organization, the participation of many other nations, with their own interests, made the conference a complex exercise in multilateral diplomacy.

The great powers often were required to make meaningful alterations in the proposed Charter in order to achieve the necessary votes for passage. In response to small-state concerns, the competence of the General Assembly was expanded. It was given control of the UN budget. The conference agreed that the Assembly could discuss any issue, including security concerns and threats to the peace, at least until the Security Council was "seized" with the issue. Further, the secretary-general, elected by the General Assembly, would be able to bring any matter that he believed threatened international peace and security to the attention of the Council (UN Charter, Article 99).

States from Latin America, Africa, and Asia envisioned an institution of universal membership with extensive activities in the economic, cultural, and human rights domains. In particular, they pressed for a UN role in the achievement of "independence" for existing colonial possessions. Their demands led to a declaration on self-government being incorporated in the final Charter. Under the leadership of Latin American governments, there was also an effort to promote human rights. The final UN Charter draft reflected this new concern, becoming the first international treaty to use the term *human rights*, in this case citing those rights six times in the text and calling for their protection. To support this effort, the founding delegates called for the creation of a Commission on Human Rights. Once established in 1946, the Commission proceeded under the leadership of Eleanor Roosevelt to draft the Universal Declaration of Human Rights.

Structure and Purposes of the United Nations

The UN Charter serves as the constitutional basis for the organization's structures and procedures, the rights and responsibilities of UN members, and the UN's authority to act in the international community. The Charter envisions an institution with revolutionary powers and authority in international affairs. The organization is granted not only the traditional instruments of diplomatic practice but also the authority to impose crushing sanctions and to use military force (Article 41), with nation-states required to put their troops at the disposal of the institution. Chapters VI and VII of the Charter provide the legal legitimacy for these sweeping powers. Chapter VII contains the primary mechanisms for collective security, allowing the organization to undertake enforcement measures, while Chapter VI provides for the traditional means of diplomacy to achieve the "pacific settlement" of disputes.

Chapter VII, Article 39, gives the Security Council the authority under international law to "determine the existence of any threat to the peace, breach of the peace, or act of aggression," and to "decide what measures shall be taken" to halt the threat or punish the aggressor. Article 40 empowers the Council to take provisional measures to prevent an escalation or aggravation of a dispute. In July 1987, the Soviet Union and the United States for the first time joined in a resolution (598) on the Middle East and demanded that Iran and Iraq "observe an immediate cease-fire" in their ongoing war. Citing Article 40, the Council decided "to consider further steps to ensure compliance" if either of the parties refused to accept the UN's demands.

According to the original conception of the UN as the guarantor of international peace, the organization was expected to command military forces under the authority and direction of the Security Council and with the help of a Military Staff Committee. All member states, as charged by Articles 43 and 44, were obliged to contribute troops and equipment to these UN-led operations.

Despite the intentions of the founders, the Military Staff Committee quickly fell into disuse, largely ignored after 1946 as the Cold War intensified. In place of direct UN military action, the more common practice emerged of the Council empowering individual states to take such action, usually in the form of ad hoc coalitions. In this context, the Council's role of legitimation is critical. Using Article 48, which requires member states "or some of them," to "carry out the decisions of the Security Council," the body has regularly authorized coalitions "to use all necessary means" to restore peace and stability. Thus, the 1991 Gulf War against Iraq and interventions in Somalia, Rwanda, Bosnia and Herzegovina, East Timor, Albania, Liberia, Afghanistan, and the Central African Republic were authorized UN-enforcement operations.

On paper, Chapter VII worked a revolution in international politics. The Cold War, however, made that revolution more theory than practice. With the Security Council locked in a superpower stalemate, Chapter VII provisions generally could not be implemented when conflicts arose. Council members and the General Assembly were forced to fall back on the more traditional methods outlined in Chapter VI in the hope of resolving a dispute or ending hostilities.

Chapter VI describes mechanisms for noncoercive measures to settle disputes peacefully between nations.

On its own, Chapter VI gives the Council little beyond the means of international public persuasion to end disputes. Yet without the far-reaching remedies of Chapter VII at their disposal, the Security Council and the General Assembly often have turned to broad interpretations of Chapter VI to end a particular conflict. It is through this process of reinterpretation that the devices of "peacekeeping" and "observer" missions have come about. Secretary-General Dag Hammarskjöld coined the term *Chapter VI½* to designate the Charter-based authority for these operations. A new "gray area" of UN action emerged, keeping UN involvement relevant to the resolution of disputes in ways that neither the Charter formally established nor earlier practice by the League of Nations contemplated.

The Charter establishes six principal organs to guide the organization: (1) the General Assembly, which serves as the plenary body of the full membership; (2) the Security Council, made up of five permanent members and, as of 2009, 10 nonpermanent members who are elected on a rotating basis to 2-year terms; (3) the Economic and Social Council, which oversees the myriad functional agencies reporting to the world body; (4) the Trusteeship Council, which is now defunct, having presided over the end of the colonial system; (5) the Secretariat headed by the secretary-general, which provides the international civil servants for all the administrative tasks of the UN; and (6) the International Court of Justice (ICJ), successor to the League of Nations Permanent Court of International Justice (PCIJ). All but the ICJ are headquartered in New York City. The Court sits in the former chambers of the PCIJ in The Hague, the Netherlands.

These six organs are at the center of a much larger umbrella organization. The "United Nations System" includes a full array of UN entities, programs, funds, specialized agencies, and international bodies related to the UN and scattered around the world. Much of the work of the UN is done far from New York City, in other headquarters cities, most particularly in Geneva, Switzerland, where more diplomatic meetings are convened each year than in New York and where the UN High Commissioner for Human Rights and the International Labour Organization have their offices; in Nairobi, Kenya, the home of the UN Environment Programme; and in Vienna, Austria, the seat of the International Atomic Energy Commission.

Some entities in the UN system act independently, but as a rule, intrasystem communication is directed from the various wings to the six principal organs of the UN. The secretary-general manages this sprawling system by way of the Chief Executives Board for Coordination (CEB). The CEB is made up of the heads of UN bodies and agencies. The specialized agencies on the CEB are autonomous, self-governing entities that, nonetheless, fall under the rubric of the UN. In 2009, 17 specialized agencies were affiliated with the UN, including well-known entities such as the World Health Organization, International Civil Aviation Organization, World Bank Group, Food and Agriculture Organization, and Universal Postal Union. Among the UN "Programmes and Funds," the most important are the UN Development Programme, World Food Programme, UN Children's Fund, UN Population Fund, UN Environment Programme, and International Fund for Agricultural Development.

The public "face" of this worldwide system is the secretary-general, who is nominated by the Security Council and elected by the General Assembly to a 5-year renewable term. By tradition, the post is never held by an individual from a major power. As of 2011, there have been eight secretaries-general: Trygve Lie (Norway, 1946–1952), Dag Hammarskjöld (Sweden, 1953–1961), U Thant (Burma, 1961–1971), Kurt Waldheim (Austria, 1972–1981), Javier Pérez de Cuéllar (Peru, 1982–1991), Boutros Boutros-Ghali (Egypt, 1992–1996), Kofi Annan (Ghana, 1997–2006), and Ban Ki-moon (South Korea, 2007–). Secretaries-general must be both adroit managers and world-class diplomats. Often during their tenure, their attempts to fulfill both of these roles have led them into conflict with one or the other of the great powers. In the 1960s, for example, the Soviet Union attempted to replace Dag Hammarskjöld, calling him a puppet of U.S. policy. In the 1990s, the United States vetoed a second term for Boutros Boutros-Ghali, largely for being ineffective in carrying out administrative and budgetary reform in the UN.

The United Nations and the Cold War

In the late 1940s, the expected cooperation among the world's great powers essential to UN success dissolved into a Cold War contest between the United States and the Soviet Union, each with their respective allies. Superpower competition affected the working of the UN Security Council most intensely because the veto could deadlock any contemplated UN action. Early confrontations in Iran, Greece, and Turkey highlighted the ineffectiveness of the Council when the national security interests of the United States and the former USSR conflicted. They also foreshadowed Council inaction in later conflicts in Vietnam (1947–1974), Hungary (1956), and Czechoslovakia (1968). Only in Korea in 1951 was the Security Council able to invoke its powers under the Charter's collective security provisions to declare the North Korean government the aggressor in the conflict and to order member nations to take all necessary military measures to repulse the attack. This was only possible, however, because the Soviet Union was boycotting Council meetings at the time to protest Western unwillingness to seat the new government of Mao Zedong as the legitimate representative of China in the body.

When the Soviet delegate returned to the Security Council, the United States circumvented the Council by pushing through the General Assembly the "Uniting for Peace Resolution," which allowed the Assembly to make recommendations on the restoration of peace and security when the Council was deadlocked by the veto. The Soviet government protested the maneuver as an unconstitutional revision of the Charter. Korea was a prime early indication of the Cold War's impact on the UN. Fighting ended with an armistice in 1953, but the country remained into the 21st century, long after the end of the Cold War, the last divided country dating from the end of World War II.

The Congo crisis of the early 1960s further underscored the Cold War challenge to the UN. When the Congo became independent from Belgium in 1960, a complicated civil war broke out, with one side being supported by the Soviet Union, one side by Washington, and a third side trying to secede. Secretary-General Dag Hammarskjöld tried to insert a UN presence to bring the disorder to an end. Believing Hammarskjöld to be carrying out the wishes of the United States, the Soviet Union demanded a reorganization of the office of secretary-general, replacing the single secretary with a "Troika," whereby there would be a three-person executive with equal representation from the Western bloc, the Eastern bloc, and the neutral countries in the UN. The Soviets, along with the French, also refused to donate their assessment for the Congo operation, claiming it to be illegal since it had not been approved by the Security Council. Their refusal to pay contributed to a serious financial crisis for the UN that would plague the organization for the rest of the century.

Because of the deadlock in the Security Council, the locus of UN activity shifted to the General Assembly, where, after 1960, states from the developing world gained a working majority. As a result, UN attention shifted to the problems of the so-called Third World. Economic development and the amelioration of social dislocation in postcolonial

regions became primary concerns of the membership. In 1965, the Assembly established the UN Development Programme to address the extraordinary challenges of poverty, underdevelopment, and the humanitarian crisis in Africa, Asia, and Latin America.

Of course, General Assembly decisions imposed no mandatory requirements on the member states. Consequently, the Assembly depended on moving world public opinion and putting in place new programs that could command near-universal support for their success. In the context of the Cold War, where the Soviet/Third World bloc, after 1970, had a working majority in the Assembly, finding such a consensus proved nearly impossible. UN debate became increasingly acrimonious, and UN decisions proved to be less and less commanding of world attention.

Post–Cold War Cooperation and Reform at the UN

The 1980s witnessed the first glimmer of a new and expanded role for a world body such as the UN. The rise of Mikhail Gorbachev to power in the Soviet Union in 1985 and the Kremlin's rapid fashioning of a new, less antagonistic foreign policy opened the door to possible U.S.–USSR cooperation under UN auspices to address global conflicts. By the time of the Iraqi invasion of Kuwait in 1990 and the Gulf War in 1991, Gorbachev's anticipation of an effective UN seemed prescient, as Moscow and Washington cooperated within the Security Council to declare Iraq the aggressor and to authorize military action under Chapter VII of the Charter.

Success in the Gulf War translated to a new optimism that the UN might be an effective instrument for resolving global problems. After 1985, UN peacekeeping operations evolved into nation-building experiments, with some success in Namibia, Cambodia, and East Timor. More problematic were UN efforts in Somalia, Bosnia, and Kosovo. The UN, reinforced by a newly engaged Security Council, took on a plethora of global challenges: terrorism in the wake of the September 11, 2001, attacks in the United States; HIV/AIDS, particularly in Africa; pandemic disease in Asia; climate change; human rights violations, which it met not only with sanctions against governments complicit in human rights abuses but also by its creation of the International Criminal Court; and the endemic economic and social problems of the developing world, which it attempted to meet by the implementation of a set of Millennium Development Goals, established in 2000.

Under strong pressure from the United States, the UN also carried out a significant reform program. Particularly under the leadership of Secretary-General Kofi Annan, the UN apparatus streamlined its budgetary and administrative processes, cutting the staff by a quarter and operating with a zero-growth budget for nearly 5 years. After 2005, UN members also took up structural reform. They replaced the much maligned Commission on Human Rights with a new Human Rights Council and established a Peacebuilding Commission to manage assistance to postconflict states and regions. Eased regulations opened many of the UN decision-making bodies to influence from nongovernmental organizations and private actors such as corporations, social groups, and individuals. There were also lengthy discussions and several proposals to expand the Security Council to include states representative of new centers of power in world politics. While several permanent members of the Council blocked these efforts for the time being, there was a general recognition that structural change at the UN would need to come sooner or later to reflect the changed realities in the international system. As the millennium began, there appeared to be an emergent "new" UN, still reflective of the basic Charter provisions established in 1945 but prepared to respond to the changed conditions of the 21st century.

UTILITARIANISM

Throughout the history of moral and political philosophy, the idea of welfare as a moral good has repeatedly appeared. Utilitarians distinctively take welfare consequences to be the central good and the principle by which to judge the morality of individuals' actions. It would be odd, even perverse, to suppose that political theory should not attend to the consequences of actions or policies, because consequences are the very point of important policies. Hence, moral and political philosophy is a joint program in the view of utilitarians. Indeed, Jeremy Bentham's most cited statement on utilitarianism is in his 1789 book *An Introduction to the Principles of Morals and Legislation*. Thereafter, utilitarianism was more or less a dominant moral theory into the beginning of the 20th century with Henry Sidgwick's *The Methods of Ethics* (1907) in philosophy and down to this day in the work of many economists. Herbert Hart (1958/1983) states that it dominated legal theory from Bentham through roughly the 1960s, when somewhat disorganized and often contradictory theories of rights rose to a brief heyday. Since then, a hundred flowers and not a few weeds have grown. This entry examines both act utilitarianism, which focuses on the consequences of *individual actions*, and rule utilitarianism, which states that we should act in accordance with the *rules* that achieve the greatest happiness for the greatest number. It also considers the role that institutional rules play in utilitarian assessment of public policy and examines the utilitarian perspective on distributive justice.

During all of this development, utilitarianism was often taken in new directions. For much of its first century, it was grounded in the value theory of interpersonally comparable and additive utility theory. This was cardinal rather than ordinal utility, roughly in keeping with views in economics, most especially in the utilitarian discussion of Francis Edgeworth. If utility is interpersonally comparable, 10 utiles for you is equal to 10 utiles for me in our overall evaluation of our society. If it is additive, your utiles added to mine sum to 20 utiles.

Paul Samuelson notes that many issues in economics can be well understood only if we treat utility as not simply additive but as ordinal. You can prefer A to B, but you cannot say by how much you prefer it. It follows that your utility from a policy cannot simply be added to mine to yield an overall value of the policy. Although this view has been criticized because it is not part of Bentham's statement of utilitarianism, such critics incorrectly assume that utilitarianism is all and only what Bentham states. In fact, utilitarian theory develops in tandem with the value theory of utility in other fields, particularly, of course, in economics but also in psychology and in recent experimental games. More typically, John Rawls (1999) compares his own theory of justice with utilitarianism. But after smartly canvassing David Hume's value theory and implicit utilitarianism, which he seems to think are more credible than Bentham's, Rawls then argues for the superiority of his own theory over utilitarianism as though the only definitive utilitarian vision is that of Bentham (1789/1970).

An obvious problem with ordinal utilitarianism is that it is much harder to do aggregations. We cannot simply add everything up to determine how great a particular community's welfare is. It is important to note that this difficulty is not an artifact of the theory; it is inherent in the world to which the theory is applied. On our best current understandings of economic value theory, the ordinal, noninterpersonally comparable value theory is descriptively correct. It is the underlying reality that is difficult. The developments in utility theory and therefore in utilitarianism are clearly driven by the wish to achieve realism.

Rawls gives himself the trivially easy task of basically attacking act utilitarianism, which should be distinguished from rule utilitarianism and which focuses our concern narrowly on individuals' actions, many of which cannot be motivated by interest but only, if it is available, by beneficence. Indeed, no standard classical moral theory for individuals can be the basis for a distributive theory. No serious utilitarians would disagree with this point, nor would they think it relevant to start from an account of individual action to reach distributive judgments. To dismiss utilitarianism in its most primitive Benthamite version in order to reach conclusions about distributive justice is irrelevant both for any theory of distributive justice and for aptly sophisticated utilitarianism.

Hume's general concern is the naturalist analysis of our motivations and actions. He virtually dismisses act utilitarianism—before the term existed—because it requires too much beneficence, which Hume thinks is in too short supply to have much impact at the societal level. He thinks that the supposition that we can all be motivated by beneficence violates human nature. Our concern with ourselves largely trumps our beneficence.

Any moral theory that cannot address institutional issues may be reduced to a sideline game with trumped-up examples. A useful theory must be a joint moral and political theory and must address real issues in the world in which we live. Combining moral and political theory is an easy challenge for utilitarianism, which from Bentham forward, and arguably even from Hume forward, is inherently a joint theory. We can label the broader concern as institutional utilitarianism. Such utilitarianism addresses many of the problematic issues that have arisen since Bentham. Beginning arguably with John Stuart Mill, theorists have tried to accommodate the theory to institutions and norms with a theory of rule utilitarianism. This idea solves the seeming problems of calculating which of the available actions would contribute the most to overall welfare. Unfortunately, the difficulties in determining what rules we should follow might commonly be as great as those in directly calculating what action to take. This difficulty has generally been resolved in practice—typically without any reference to utilitarianism—by creating institutions that guide us or even control us in following institutional rules. Daily life is full of such institutional rules. Many of these merely coordinate us on some good action, as argued by Hume for a remarkable array of social contexts. It could be true that many people see the usefulness—one of Hume's favorite terms—of various institutional arrangements, but if they follow the rules of the institutions, that will be because the institutions can give them incentives to do so, not because they see and are motivated by the good of having people comply in general.

Finally, we take note of the intellectual reception of utilitarianism. Far more than any other moral theory, utilitarianism is invoked explicitly or implicitly by social scientists. This fact does not make the theory morally correct. Most social scientists are essentially naturalists. With Hume, they seek to explain people's moral views, their morally motivated actions, and their moral failings, as when their interests trump their moral visions. Utilitarians and social scientists share a central concern with institutions and their workings. Institutions have a minor secondary role in most of moral theory and no role at all in some of it.

Competing moral visions, such as Kantianism and virtue theory, are taken far less seriously by nonphilosophers. Strangely, its critics arguably have spent more time on utilitarianism than its advocates have. Many of the criticisms wrongly claim that utilitarianism is self-contradictory. For example, critics argue that utilitarians must spend so much time calculating that they have no time left for living, so that utilitarianism is crippling in practice. This criticism was demolished with ridicule by Mill nearly 2 centuries ago, and yet it lives on. We have institutions to handle many complicated issues. Often, we can rely on the past experiences of millions of others who have gone this way before. Individuals are therefore not left in the lurch when they face an important decision for action. They can act and then get on with living.

It is interesting that Rawls (1955) has given utilitarian theory one of the best defenses against a pervasive but misguided attack. Not surprisingly, it is in the realm of justice under the law. To the commonplace objection that a utilitarian sheriff must violate the law and allow the lynching of an innocent prisoner to quell the impending violence of a mob, Rawls argues that this is a specifically institutional problem for which utilitarianism has adequate resources. Implicitly, he argues for institutional utilitarianism. Unfortunately, he forgets that vision in his later theory of justice.

The main criticism is that the focus on utility or welfare and therefore on consequentialism is misguided—that is, a moral theory should focus instead on evaluating actions and not their outcomes, as pointed out by Gertrude Anscombe. This is to say that utilitarianism is thoroughly misguided. There is no credibly insightful way to respond to such an attack. What theory of distributive justice, for example, could possibly make compelling sense without attention to the consequences? The disagreement here has come to have an almost ideological tone. It is pointless to adjudicate this difference. It is far more compelling to focus on the structures of utilitarianism and competing theories rather than on their whole-cloth justification or rejection.

UTOPIANISM

Utopianism is the systematic use of utopias—that is, forms of thinking that depict a desirable but impractical state of things. As with all other isms, the concept may also have a pejorative connotation but not necessarily so.

The term *utopia* derives from the eponymous book (1516) by Thomas More, who coined it to designate the imaginary ideal society that he described in the second part of his book. More intentionally, it played with the ambivalence of the term, since *u-topia,* from ancient Greek, can be a contraction of both *eu-topos* (the "good-place") and *ou-topos* (the "no-place"). This, as we shall see, would have enduring consequences. With time, the term came generally to mean all ideas or proposals that are good but unrealistic or even impossible. As Karl Mannheim famously put it, a state of mind is utopian when it is incongruous with the reality within which it occurs: Utopias break the bonds of existing social order. This entry discusses the concept of utopianism by reconstructing its forms, its functions, and, finally, its prospects in the contemporary world.

Forms of Utopianism: "Good-Place" or "No-Place"?

Generally speaking, we can distinguish between two forms of utopianism. The first is the literary genre that followed the example of More's *Utopia*. Tommaso Campanella's *City of the Sun* (1602), Francis Bacon's *New Atlantis* (1627), and William Morris's *News From Nowhere* (1891) are all examples of such a genre. The description of the good-place often takes the form of a narrative by a traveler who discovers the land of utopia, typically an island or at least a territory separated form the others. Soem works in this genre are negative utopias, such as Orwell's *1984* (1949), which describes the dreadful dream of a disciplinary and totalitarian society ruled by Big Brother. These works are also at times called "dystopias"—from the Greek *dys*, which means abnormal, faulty, or bad.

The second form of utopianism is that of works that are not part of the literary utopian genre but nevertheless enclose significant utopian elements. Political treatises such as Jean-Jacques Rousseau's *The Social Contract* (1762) or Immanuel Kant's *Perpetual Peace* (1795) contain important utopian moments in that they depict societies that are good-places but also no-places. The degree to which they are realizable is still a matter of controversy: Rousseau portrayed a direct democracy where human beings stand as free and equal, whereas Kant's *Perpetual Peace* defined the articles of the hypothetical international treaty that would put an end to the international condition of anarchy and war. In synthesis, a work contains utopian elements when it expresses the belief that some (or all) social evils can be eliminated and a better society created.

While in the case of the literary genre it is relatively easy to determine whether a work is part of it or not, the degree of utopianism of works that contain utopian moments is highly controversial. Things are further complicated by the fact that the concept of utopianism has at times a pejorative connotation. A significant example is Karl Marx and Friedrich Engels's *Communist Manifesto* (1848). On the one hand, perhaps, no other authors have been as influential in spreading the belief that social evils can be eradicated and a good-place developed. On the other hand, Marx and Engels's prospect of a communist society does not derive from imagination alone but is grounded on a scientific analysis of the historical conditions of the proletariat. In their *Manifesto*, they strongly criticized former socialists such as Comte de Saint-Simon, Charles Fourier, and Robert Owen for their utopianism—used here in the pejorative sense. Having theorized about the emancipation of the proletariat in an epoch when the material conditions for emancipation were not yet ripe, utopian socialists necessarily failed in identifying the economic presuppositions for such a transformation, so that their social criticism remained a merely fantastic picture of an impossible future society. To such utopian socialism, in which personal inventiveness takes the place of historical action, Marx and Engels opposed their scientific communism.

Some authors have criticized utopianism by arguing that by depicting inexistent perfect societies, it can generate authoritarian and totalitarian attempts to endorse them. According to Karl Popper, for instance, utopias such as Plato's idealized republic endorse visions of a "closed" society that anticipate those of modern thinkers such as Hegel and Marx and must therefore be repudiated. Utopias can, however, be defended in many ways from their critics. First, one can argue that utopias are by definition no-places. Indeed, most utopian thinkers did not even think of trying to enforce their schemes of perfect society. Even those who actually tried to transform their no-places into something real most often favored means such as education and small-scale experiments. Those who endorsed the possibility of a violent revolution remain a minority.

Second, the accusation of totalitarianism holds at best only for major utopias. The distinction between major and minor utopias is another helpful distinction to group the different forms that utopianism can take. As Jay Winter observed, major utopians are those, such as Hitler and Stalin, who radically aimed at extirpating all social evils from the world and resorted to unconditional violence to realize their projects. Their totalitarian visions and their commitment to ruthless removal from the world of those malevolent elements blocking the path to a beneficent future, even at the price of extermination, render them *major* utopians. Minor utopianism is generated by imaginings of liberation on a usually smaller scale, which also sketch out a world very different from the one we live in but from which not all social conflicts and evils are eradicated. Examples of such minor utopians are the authors of the Universal Declaration of Human Rights (1948) or the ideologists of ecological movements.

The Functions of Utopianism

Against the critics of utopianism, it can also be observed that the latter performs very important functions within society. In the first place, utopias are the means to exercising a *critique* of the present. By depicting "good-places," they tell us where we are and therefore also how far away we are from that ideal. It comes therefore as no surprise to find out that the first part of More's *Utopia* was devoted to the analysis of the evils affecting the society More lived in. Even when utopians do not explicitly go through the detailed description of the evils of society, a criticism is implicit in the radical alternative to the existing order that they disclose. To put it in a nutshell, utopias transcend reality but do not depart from it.

Utopianism has therefore an important regulative function. By "regulative," we mean the capacity of an idea to serve as a guiding ideal for human conduct independent of its content of reality. Utopias in this sense are not necessarily blueprints for the creation of a radically new society. They are the means to measure the good and the bad contained in each society. The presupposition of such a critique is the conviction that the current state of affairs is modifiable. This can be the result of a belief in the perfectibility of human nature or of the social world.

Finally, we should observe that utopias also help develop new ideals. Utopias not only tell us where we stand, they also uncover the new directions that we may take. They are the result of the work of the imagination that discloses alternative scenarios and, therefore, enrich the sense of human possibility. As Victor Hugo once said, today's utopia is tomorrow's reality. The aphorism is usually understood in the sense that utopias can be realized, at least to a certain extent. But we could also reverse it by saying that tomorrow's realities are today's utopias. Indeed, modern conquests such as the abolition of slavery or universal suffrage have all been utopias once. In a way, all ideas that contribute to social progress have to contain a certain degree of utopianism insofar as what they portray is a no-place.

The Prospects of Utopianism Today

We have seen that utopianism unfolds itself in the disclosure of "good-places" that are also "no-places." This also means that utopianism breaks away from the present but only to criticize it. One could even argue that utopianism is realistic in the sense that it tells us where we do not stand. Of course, utopias can be more or less realistic in this sense. If the literary utopias of the Golden Age or the Paradise Lost after the original sin have very little grasp on contemporary reality, the most significant utopias of modernity have all contributed to the critique of existing societies and the disclosing of new directions for their development. Utopias are often reality whose time is not yet ripe. This clearly emerges if we think of major social conquests such as universal suffrage or the abolition of apartheid, which used to appear as impossible, utopian goals. The societies that have been created after their achievement are not perfect but certainly better ones.

Although historically less significant, we should also mention the attempts to realize integral utopias. Even if this remains a small phenomenon, there is a type of utopianism that has inspired the design of integrally utopian experimental communities. These living utopias range from religious communities such as the Oneida community in the United States, first formally established in 1848, to the socialist phalanxes inspired by Charles Fourier that were created in France and the United States in the 19th century, to the kibbutz, a form of Jewish settlement that began early in the 20th century.

Despite the fact that utopianism is far from vanishing, many authors have claimed that we live in an epoch of the death of utopia. For instance, they observe that the utopian genre is increasingly limited to literature and fiction. This is partly because the high degree of specialization in the social sciences has rendered global utopias unacceptable to the academic community. But according to some interpreters, behind the alleged death of utopias, there are more structural reasons. Herbert Marcuse, for instance, observed that the concept of utopia becomes obsolescent in the contemporary world because today any transformation of the technical and natural environment is a real possibility. On the opposite front are those who consider utopia dead because they see no possibility of envisaging an alternative to the status quo. In an epoch when many celebrate the end of history, there seems to be no space in terms of time, and also no need, to embark on a journey to the land of utopia. Yet the societies we live in are far from perfect, and this ultimately guarantees the possibility of and also the persisting need for utopias.

VALUES

Several definitions of *values* have been influential in the social sciences. For the anthropologist Clyde Kluckhohn, a value is a conception of the desirable that influences the selection of available modes, means, and ends of action. Central to this definition is the notion of "a conception of the desirable." A desire is a wish or a preference, while the term *desirable* goes beyond a wish or a want by bringing in considerations of moral content.

For the psychologist Milton Rokeach, a value is an enduring belief that a specific mode of conduct or end state of existence is preferable to opposite or converse modes of conduct or end states of existence. Rokeach's definition includes several elements that can be used as a point of departure for discussing several dimensions of the value concept. Rokeach indicated that there are two types of values: (1) consummatory (end state of existence) and (2) instrumental (mode of conduct) values. Rokeach also differentiated between personal and social values. People have values that they want to emphasize in their own lives (self-centered) and also those that they would emphasize in their social environment (society centered). This differentiation can be expanded to different domains, and one can talk about, for example, family values, work values, bureaucratic values, and political values.

For Rokeach, a value is a basic and relatively stable element in a person's belief system. A value is a prescriptive belief wherein some means or end of action is judged to be desirable or undesirable. Values are sometimes contrasted with *attitudes*, which are often defined as a set of beliefs organized around a specific object or situation. A value is considered to be a basic (prescriptive) belief that often influences a specific attitude together with other beliefs. Beliefs, attitudes, and values can be conceived to lie on a center–periphery dimension where values are the most central, intensive, and enduring and beliefs are the most peripheral.

Building on Rokeach and others, Shalom Schwartz identifies six formal characteristics that are the defining features of basic human values: (1) Values are beliefs (2) about desirable end-states or behaviors (modes of conduct) that (3) transcend specific situations or actions, (4) guide selection or evaluation of behavior and events, and (5) are ordered by relative importance to form a value system. (6) The relative importance of values guides attitudes and behavior.

Other researchers such as Jan van Deth and Elinor Scarbrough consider the relationship between values and attitudes as a reciprocal one that, at the individual level, provides opportunities for the modification and adaptation of values. These scholars use the notion "value orientation" for constellations of attitudes that can be patterned empirically and interpreted theoretically in a meaningful way. This implies that value orientations can be studied with data that include indicators of attitudes.

Culture can be considered as the rich complex of meanings, beliefs, symbols, norms, and values prevalent among people in a society. Cultural differences can be studied along many dimensions. Given that values are the central elements in individuals' belief systems, the values that are emphasized in a society are a very central feature of culture. A major conceptual advantage of an approach in which values are central is that values can be considered as important intermediate variables between several independent background variables and various variables that can be considered to be consequences of values.

Sociostructural, personal (including personality traits), and various institutional variables can be considered independent variables that can explain variations in value priorities. Values are considered determinants of virtually all kinds of social behavior: evaluations and attitudes, moral judgments, and justifications of self and others. Values are also determinants of political behavior, for example, various types of political participation and voting behavior.

Given the central intermediate role values have in the causal chain, from background variables to behavior, values often play a central role in *explaining* the impact of background variables on behavior. Some general value dimensions have received considerable attention. First, these are presented. Then, the focus is on political value dimensions, political value change and comparative patterns of value priorities, and political values' antecedents and consequences.

General Value Dimensions

The Dutch social scientist Geert Hofstede's studies of national cultural differences have received worldwide attention. Culture consists of values, rituals, heroes, and symbols, according to Hofstede, but values are seen as most fundamental. His famous five dimensions of national cultures are power distance, uncertainty avoidance, individualism versus collectivism, masculinity versus femininity, and long- versus short-term orientations. Hofstede studied in detail national differences in culture in more than 50 nations along these dimensions and examined the consequences of the cultural dimensions along a series of domains, for example, family patterns, school and work organizations, and politics.

Another influential theory of human values was formulated by Schwartz, who describes 10 types of basic human values that are distinguished by their motivational goals. These values are power, achievement, hedonism, stimulation, self-direction, universalism, benevolence, tradition, conformity, and security. This theory formulates a structure of dynamic relations among the values. This is indicated by a classification of the 10 value types in a circular continuum. Adjacent value types share some motivational emphases and are therefore compatible, while other values are more distant from each other and are considered to be conflicting or even diametrically opposed.

The oppositions can also be summarized by organizing the values into two bipolar higher order dimensions. One dimension contrasts openness to change and conservation values. This dimension puts self-direction and stimulation values—which emphasize independent action, thought, and feeling and readiness for new experiences—in opposition to conservation values, security, conformity, and tradition—which emphasize self-restriction, order, and resistance to change. The second higher order dimension contrasts self-enhancement and self-transcendence value types. This dimension puts power and achievement values—which emphasize one's pursuit of success and dominance of others—in opposition to universalism and benevolence values—which involve concern for the welfare and interests of others. There has also been considerable research on the causes and consequences of each of these value types.

Political Values and Political Value Dimensions

Consummatory political values can be considered as end states that individuals would like to see characterize the society as a whole and see implemented through the political system. Instrumental political values are modes of conduct that are considered legitimate (or illegitimate) to influence political decisions, for example, various types of political participation and ways of influencing political decisions. In political science, the concept of values is at the core of David Eastons's famous definition of politics—as interactions through which values are authoritatively allocated for a society.

The most well-known political value dimension is that of the materialist/postmaterialist value orientations. These value orientations were originally formulated by Ronald Inglehart, who argues that "new" postmaterialist values are deeply rooted and stand in opposition to more traditional materialist values. Materialist values emphasize economic and physical security, such as economic stability and growth, law and order, and strong defense. Postmaterialist values emphasize self-expression, subjective well-being, and quality of life. The new postmaterialist political values are central to the "New Politics" because these values are associated with new political issues such as environmental concerns, lifestyle issues, social and political participation, minority rights and social equality and social issues, and a change in the social base for radical, change-oriented politics. Another way of conceptualizing the New Politics is represented by *environmental versus economic growth values*. Today, this conflict is firmly rooted in the public consciousness, and in many West European countries, conflicts over environmental values seem to be the most manifest expression of the New Politics conflict. A clear manifestation of this is the emergence of Green parties, which have gained considerable electoral support in many Western democracies.

Scott Flanagan has emphasized that Inglehart's conceptualization of value change combines two dimensions: (1) a *materialist/nonmaterialist dimension* and (2) a *libertarian/authoritarian* dimension. Flanagan considers value change along the latter dimension as most important. The overarching concept that integrates libertarian values is self-actualization, and the central value orientations within the notion of libertarian values are autonomy, openness, and self-improvement. The authoritarian value orientations designate a broader cluster of values, which, along with concerns about security and order, includes respect for authority, discipline and dutifulness, patriotism, intolerance toward minorities, conformity to customs, and support for traditional religious and moral values. The libertarian/authoritarian value orientations are also the central components in Herbert Kitschelt's important work on changes in the party systems of Western democracies.

Though dominant, research on materialist/postmaterialist political values has gradually been supplemented by work on other political value dimensions. Political value conflicts can be considered to originate in the most crucial sociopolitical cleavages. For example, according to the seminal work of Seymour Martin Lipset and Stein Rokkan, the most important political cleavages in industrial society are the religious cleavage and the class cleavage. Both of these cleavages are associated with important value orientations. Christian values focus on the importance of Christian morals and principles in society and politics and on traditional moral guidelines in school and society in general. Secularization is often understood as a process whereby mundane reality is less and less interpreted from a supernatural perspective, and secular values are based on more modern norms of morality that people want to decide for themselves without the guidelines of the church. Religious/secular values tap these contrasting orientations. Religious orientations are often considered to comprise two different aspects. One aspect is the religious beliefs that people hold. This can be tapped by concrete questions about which religious conceptions and dogmas the respondents believe in, how important God is in their life, or what kind of God—if any—they believe in. The other aspect is church-oriented religion or church religiosity. The essence of this dimension is "church integration": The more people participate in the relevant church's rites and services, the more church integrated they are.

The Industrial Revolution gave rise to economic interest conflicts that were anchored in hierarchical sociostructural variables. The most important political value orientations that emerged from the Industrial Revolution were the economic (materialist) left–right values. These value orientations are economic in nature, and they refer in particular to the role of government in creating more economic equality in society versus the need for economic incentives and efficiency. These value orientations incorporate value conflicts related to control, power, and the degree of distribution of resources in the production sphere. They include workers' control and state regulation of the economy versus private enterprise, private property, and the market economy, and the size of the welfare state and economic and social equality versus the need for differentiated rewards for stimulating effort. The moral value dimension and economic left–right values are often referred to as "Old Politics" because they capture the essence of the traditional lines of conflict in industrial society. In contrast, the New Politics refers to value conflicts emerging from postindustrial society.

Inglehart has broadened his study of value dimensions by emphasizing that his materialist/postmaterialist dimension is only one component of a much larger value syndrome. In an alternative way of conceptualizing and analyzing value orientations in a long-term perspective, he focuses on a two-dimensional value structure: one dimension based on traditional versus secular-rational values and the other based on survival versus self-expression/well-being values. These two dimensions are associated with the structural changes from preindustrial to industrial and from industrial to postindustrial society, respectively. The most essential values in the first dimension are religious versus more secular values, but the traditional pole also includes family values, social conformity rather than individualistic striving, deference to authority, high levels of national pride, and a nationalistic outlook, while the secular-rational pole has the opposite preferences.

The self-expression values on the second dimension are values and attitudes such as tolerance, trust, emphasis on subjective well-being, and civic activism that emerge in postindustrial societies with high levels of existential security and individual autonomy. At the opposite pole, survival values emphasize economic and physical security, and they include orientations such as intolerance of outgroups, an authoritarian outlook, insistence on traditional gender roles, and resistance to cultural change. Materialist/postmaterialist values are central in the second dimension. Economic left–right values do not appear to be central in their characterization of either of the two dimensions, but they could, nevertheless, be primarily located along the first dimension.

Value Change and Cross-National Differences in Political Value Priorities

Inglehart incorporates most explicitly the issue of cultural change in his work. He identifies a "silent revolution" in which a gradual value change takes place along the materialist/postmaterialist dimension. As older and more materialist generations die, they are continuously replaced by younger, less materialist generations. Inglehart's theory is based on two hypotheses: (1) The *scarcity hypothesis* implies that short-term effects may induce all cohorts to emphasize postmaterialist values when economic conditions are good and materialist values when economic conditions decline. The cohort differences are explained by differences in economic and physical security during the formative years of the various cohorts. (2) The *socialization hypothesis* predicts a watershed between the post–World War II and the prewar cohorts in value priorities because they have such different experiences in the formative years regarding economic security (economic scarcity vs. economic prosperity) and physical security (war vs. absence of war).

The theory of value change is based on a strong and consistent relationship between age and materialist/postmaterialist values and presupposes that life cycle effects are not dominant for explaining age differences. These expectations are supported by comparative survey data. Inglehart finds also that support for postmaterialist values is strongest in wealthy countries and that generation differences are largest in countries with high economic growth. This is explained by differences in economic security during childhood and youth (formative years): In wealthy countries, a large portion of the population has grown up in an economically secure environment. In countries with a high level of economic growth, the various cohorts have experienced dramatic changes in levels of economic security. Similar patterns and explanations have been put forward for comparative differences and generational differences on the broader survival/self-expression value dimension.

Empirical research has shown a fairly consistent decline in religiosity in rich, advanced industrial countries along the different dimensions discussed above. In the discussion of secularization in Europe, some have argued that this applies only to the church-oriented dimension, not the belief dimension. Comparative longitudinal empirical research, however, has found that these two sides of religious involvement are highly correlated and even that the distinction between them is difficult to uphold in empirical analysis. Church-oriented and belief-oriented religious involvements tend to “go together” and are difficult to separate in empirical research. There is even evidence that the changes in the two measures take place simultaneously, with changes in church integration being paralleled by similar changes in religious beliefs. The most important aspect of secularization at the individual level is the decline in both religious beliefs and church attendance. In other parts of the world, religiosity has been much more stable. Overall, the world is apparently becoming more religious even though the advanced industrial countries in the West have become considerably more secular.

The late 1970s and the 1980s saw a revival of conservative and neoliberal ideas and movements and increased support for nonsocialist political parties that challenged the postwar Keynesian consensus on the welfare state, state intervention, and citizenship rights in the social domain—economic leftist values that had been implemented in most West European polities. This right-wing ideology underscored the superiority of market mechanisms in promoting both economic prosperity and the maximization of individual freedom. It was also adamant that state intervention did not work and accorded a minimal role to the state in the operation of the economy and the social order. In many countries, nonsocialist governments with a neoliberal agenda came to power. The value change that underpinned these rightist trends was a move toward economic rightist values that could be documented in many countries. However, the 1980s saw a trend toward leftist values, and in many countries, the mass public’s values were as leftist as they had been before the shift toward the right around 1980. In the 1990s, many social democratic governments came to power but with more centrist programs than before, and trends in economic left–right values from the 1990s show stability or inconclusive patterns.

Two different perspectives on comparative differences in priorities of economic left–right orientations are found in the literature. The first one is that values will vary according to the welfare regime that exists in the given country. The point of departure is the well-known distinction between the universal or social democratic, the conservative or Christian democratic, and the liberal or residual welfare state. Welfare state attitudes are—according to this perspective—formed by the character of the institutional regimes of social policy. Universal welfare states are underpinned by strong popular support because most social groups are included as recipients. This is not the case with the liberal welfare state, where the recipients are the lower social classes. Support for these hypotheses is rather mixed.

The second perspective predicts that leftist orientations will receive greatest support in the least advanced Western societies, where welfare programs and the regulation of the economy have been low and where social inequalities are fairly large. People in these countries want change in a more egalitarian direction, while those in more advanced welfare states live in a different economic environment where the need for further development of leftist policies is not appreciated. In Inglehart’s conceptualization, there is a diminishing marginal utility or return of classical economic leftist policies such as economic regulation and income equality in advanced welfare states. This view is supported by different comparative studies of attitudes toward income equality and state intervention, as well as general economic left–right orientations.

Antecedents of Political Value Orientations

Most of the research has been done on materialist/postmaterialist values. According to the theory of the New Politics, the social basis of these values turns the old order upside down: The spread of postmaterialist values is explained by economic growth and wealth, generational replacement, the growth of the new middle class, and the spread of higher education. Change-oriented postmaterialist values should be most frequently found among the higher educated strata, the new middle class, and the younger cohorts. Studies have found that support for environmental and libertarian values in advanced industrial societies is strongest among the younger age-groups, those with higher education, and those who belong to the new middle class.

Regarding religious/secular values, age and gender are the most important predictors, while education has a smaller impact and other sociostructural variables such as social class are of less importance. Men and the younger cohorts have more secular values. Economic left–right values are coupled with the class cleavage. Leftist values are strongest among the working class, those with lower income, and the lower educated strata. The correlations between these class variables and economic left–right values have, however, declined considerably over time. Age and gender are seldom consistently correlated with economic left–right values in comparative research.

Consequences of Value

Personal and social values can have important consequences, as research on Hofstede's and Schwartz's value dimensions has shown. Most of the research on political consequences of values, however, has focused on political values. According to the theory of the New Politics, materialist/postmaterialist values will have important consequences for political attitudes and behavior in advanced industrial democracies. This is framed within a developmental perspective: There is a transformation of cleavage structure from ascriptive variables (e.g., gender and religious denomination) and achieved or hierarchical (social status) variables to postindustrial (political value) variables. New value conflicts are gradually replacing traditional social structural variables for explaining political behavior, or—in Inglehart's words—there is a change from a "class-based to a value-based pattern of political polarization."

In accordance with New Politics theory, materialist/postmaterialist values have several aspects:

1. They have shown themselves to be important predictors for attitudes toward social change. Individuals with postmaterialist values express stronger support for radical social change.
2. They are increasingly the basis for identification with the ideological labels "Left" and "Right." This implies that the ideological meaning of *Left* and *Right* changes from meanings related to the social structure and values in industrial society to postmaterialist values.
3. They are an important cause of the "participatory revolution"—that is, the increase in protest activities or unconventional participation.
4. They will increasingly become an important determinant for party choice. They will constitute a new political axis that will cut across the established social cleavages and polarities between the New Left and Green parties and the New Right parties.
5. They are determinants of a series of political attitudes that are closely related to the New Politics, environmental concerns, lifestyle issues, social and political participation, minority rights, and social equality and social issues.

However, when economic left–right values and religious/secular values are included in the analyses, these values sometimes have an even larger impact on attitudes and behavior than materialist/postmaterialist values.

There are also different views on the impact of values on political attitudes and behavior. When Van Deth and Elinor Scarbrough (1995) explicitly examined the impact of the three sets of political value orientations, the main finding was that the behavioral consequences of value orientations are rather modest: They are not uniform across countries, and the impact of values on different phenomena did not change much from the 1960s to the 1990s. A major exception to the modest impact of political values is party choice, where all three sets of value orientations have considerable impact and tend to cut across each other in the way they differentiate between various political parties.

VARIABLES

The term *variable* is used in a variety of senses in social science methodology, with the various usages unified by reference to a score on an indicator that in some sense could have been different. Variables, in the broadest sense, are indicators that are not constants; contrasting usages of both terms are briefly considered below. Social scientists and other methodologists often make more fine-grained distinctions among variables in terms of their statistical or causal characteristics. In this entry, these distinctions and their applications are discussed.

Variables and Constants

Some indicators capture traits that are ontologically variable: If a study were to be in some sense repeated, the score on this indicator for a given case could have been other than what it was. An intuitive example of a variable in this sense is the result of rolling a die. If the die were to be rolled again, there is no particular reason to believe that it would show the same number of dots as on an earlier roll. Hence, the number of dots shown on the die after a roll is a variable in the ontological sense. An equivalent example in social science research involves random experimental assignment of a subject to one of a number of treatments: If the process of assignment were to be repeated, one may reasonably expect that many subjects would get a different assignment than they did in the initial iteration of the study. For this reason, one may conclude that experimental assignment is a variable, not a constant.

A second common usage of the distinction between variables and constants involves describing the data actually produced by a particular study, rather than the ontological characteristics of the data-generating process. In this usage, an indicator is said to be a variable if the cases included in the study have more than one score on the indicator. Thus, a research design in which only political activists are selected for analysis may be described as one in which political participation is a constant; in contrast, if some apolitical individuals are added to the research design, participation would then be said to be a variable. This is the usage employed in the common aphorism that it is impossible to explain a variable with a constant.

These two usages are nonequivalent. An indicator may be ontologically variable while still producing the same score for every case in a given study. As a simple example, consider an extremely unfair coin that shows heads in 99.9% of flips and tails in 0.1%. The study involves flipping the coin 100 times, recording 1 for each instance of heads and 0 for tails. With this setup, the probability of observing a score of one for each of the 100 cases of flipping the coin is about 90.5%, so it is quite probable that the resulting indicator will be a constant in the second sense. However, each coin flip obviously involves a variable in the ontological sense: It is not impossible (although obviously unlikely) that a given flip will show tails rather than heads.

Likewise, an indicator may take on different scores across the cases in a given study without being ontologically variable. Consider a hypothetical, badly designed experiment in which the students in a large lecture course are assigned to one of two treatments by the decision rule that students whose last names start with the letters A to M receive one treatment (recorded as 0), while those falling between N and Z receive the other (recorded as 1). Clearly, the indicator recording the resulting treatment status does not have the same score across all cases and is thus a variable in the second sense. Nevertheless, consider the research design. The set of experimental subjects is fixed; if the study were to be repeated, the same students in the same lecture course would be the participants. Likewise, the decision rule for assignment to treatment is deterministic—that is, a person would always get the same treatment assignment (unless he or she were to change last names during the course of the term). Therefore, in the ontological sense, treatment assignment in this study is a constant, even though it takes on different scores for different cases. The key idea is that, for a given individual in this research design, treatment assignment could not have been other than what it was.

Types of Variables

Probability theory distinguishes variables in terms of the mathematical characteristics of the set of values that the variable may take on, as well as the probability that each specific value (or sometimes a value within a narrow window of the specified point) will actually turn up in a specific realization of the variable. The first of these criteria produces the distinction between discrete and continuous variables, while the second generates the various families of named random variables discussed in probability theory. *Discrete random variables* are those that take on values that can be associated with (some subset of) the integers. Discrete variables in political science may include the number of times a survey respondent was contacted by representatives of a political party during the past year, the number of battle deaths during an armed conflict, or the number of seats per voting district in a legislative election. These variables may or may not have an upper limit; the number of battle deaths in a conflict is essentially unlimited, whereas the number of legislative seats in a district probably cannot exceed several hundred. What all discrete variables, whether bounded or not, share is that some numerical values between the lowest and highest observed scores are in principle nonsensical. For example, it makes little sense to speak of a conflict that produces 134.52 battle deaths or of a survey respondent who was visited three and a half times by representatives of a party.

Continuous variables, in contrast, are those that take on values that are too numerous to be mapped onto the integers. A simple example of a continuous variable is the angle between the minute and the hour hand on a clock. Because the angle can, in principle, be measured with virtually unlimited precision, the set of possible results of this variable is essentially infinite. In political science practice, few variables are measured with such high precision. However, variables that are measured with sufficient detail to take on a very large number of possible scores are essentially treated as continuous, even though in principle they are discrete. By this reasoning, variables such as an individual's age or years of education, a country's per capita gross domestic product, or the proportion of the population of a country belonging to the country's largest ethnic group are effectively continuous.

The distinction between discrete and continuous variables has sometimes played a major role in recommendations for data analysis, with researchers being advised to choose techniques that are close fits for the characteristics of the variable that they seek to explain. Hence, unbounded continuous variables may be explained using ordinary least squares (OLS) regression, while discrete variables should be explained using techniques such as logistic regression, Poisson regression, negative binomial regression, and so on. A different perspective, which places less emphasis on the distinction between continuous and discrete variables, has recently received increased attention. In this perspective, OLS regression always predicts the mean of the variable to be explained, conditional on the values of the other variables included in the model. Further, the mean is an important quantity regardless of whether the variable of interest is discrete or continuous. Therefore, OLS regression may be a useful analytic tool regardless of whether the variable to be explained is itself discrete or continuous.

Probability theorists and statisticians have described a large number of more specific families of discrete or continuous variables. These families of variables are characterized in terms of the probability that specific outcomes will occur. For example, consider two different kinds of continuous variables. One can take on any value between 0 and 10, and each of those values is equally likely to occur. This is one example of the family of *uniformly distributed* variables; other members of the family are generated by moving the lower and higher bounds of the variable's range of possible values. The second variable is unbounded, although most of the scores fall between 0 and 10. Whereas with the uniformly distributed variable all values within the range are equally likely, with this second variable, the probability associated with a given value increases as the value gets closer to 5. If the distribution of probability across values follows what is informally described as the bell curve, then this is a normally distributed variable; otherwise, it may follow one of many similar distributions, such as the *t* distribution.

These formally characterized families of variables have highly specific mathematical forms and generally tolerate no deviations from the ideal. Thus, for example, if the second variable described above is slightly more likely to take on values below its mean than above its mean, then the variable does not follow the normal distribution or any of the other bell-like distributions. Indeed, statisticians routinely argue that most real-world variables do not exactly conform to any of the mathematically described families of variables. Instead, they may typically have their own idiosyncratic probability structures. Named and well-studied families of variables may nonetheless be useful as approximations to the probability distributions of real-world variables, although specific arguments about why a given approximation is useful in a particular context are needed.

Social scientists routinely distinguish among types of variables in terms of their causal, rather than statistical, structure. A hypothesis to be tested, or the report of a finding, may be specified in terms of a series of variables that are said to play certain roles with respect to each other. The most common distinction in this vein is between dependent and independent variables, but scholars also discuss confounding or omitted variables; collider variables; intervening, mediator, or mechanism variables; moderator variables; exogenous variables; endogenous variables; and instrumental variables. These categories of variables largely crosscut the various meanings of *variable* vis-à-vis *constant* discussed earlier.

A *dependent variable* is the variable to be causally explained; it is the outcome of interest. Such a variable is said to be dependent because, if the hypothesis is correct, its value depends causally on the values of several other variables specified by the analyst. The variables that are hypothesized to cause the dependent variable are routinely described as independent variables. This usage seems to draw on experimental research contexts, in which one or more key hypothesized causes of the outcome in question are randomly assigned to subjects. With a large enough sample, random assignment will make these hypothesized causes have no statistical relationship with each other or with any other variable that they do not cause; hence, they are independent of each other and of all other causes of the dependent variable. In nonexperimental research, the independent variables are rarely statistically independent in this sense. Thus, for nonexperimental research, it is best to regard the term *independent variable* as a synonym for hypothesized cause.

Confounding or *omitted variables* are usually variables that cause one or more of the independent variables in a hypothesis *and also* the dependent variable. (Confounding variables may also have more complex positions in a causal chain.) Omitted or confounding variables are important because, if they are not dealt with in some appropriate way, they can distort the relationships between the independent variables and the dependent variable—making a causal relationship appear to exist when it does not or changing the apparent direction or magnitude of a really existing relationship. Strategies for dealing with confounding variables include randomly assigning cases to different categories on the key independent variable or variables to ensure (with large enough samples) that no confounding variables exist; choosing a set of cases in which a suspected confounding variable does not vary, such that its effects are constant across the cases; identifying some component of the key independent variable that is known to be unrelated with the confounding variable and using that component to test the hypothesis; or incorporating the confounding variable into a statistical model to remove its interference.

Collider variables, first discussed by Judea Pearl, are variables that meet the following criteria. First, they are caused by a key independent variable or by a cause of that independent variable. Second, they are also caused by an unmeasured variable that is statistically and causally unrelated to the key independent variable. Third, that unmeasured variable is a cause of the dependent variable. Collider variables typically pose no problems to causal inference when they are left out of a research design; however, if the research design mistakenly identifies a collider variable as a confounder and either selects cases so as to hold the collider constant or incorporates the collider into the statistical model, the result will be to induce a statistical relationship between the key independent variable and the unmeasured variable, thereby distorting any causal inference.

Variables that are said to be *intervening*, *mediator*, or *mechanism* variables are those that constitute a step in the causal process, linking an independent variable to the dependent variable. These variables thus help answer the question, "How does the independent variable cause the dependent variable?" Researchers often attend to intervening variables because they regard accounting for the causal process connecting the independent and dependent variables as central to their analytic task. Moderator variables are variables that act to change the causal effect of an independent variable. For example, watching a campaign advertisement might increase Democrats' evaluation of the candidate in question while decreasing the evaluation of Republicans and leaving political independents unaffected. In this case, if watching the advertisement is regarded as the independent variable, then a subject's party identification is a moderator variable.

Exogenous variables are independent variables that have no causal or statistical relationship with any confounding variable. Typically, this is either because of random assignment or because the causes of the exogenous variable or variables are not themselves causes of the dependent variable. If an independent variable is exogenous, then its apparent relationship with the dependent variable will generally provide information about the true causal relationship between the variables. *Endogenous variables* are independent variables that are not exogenous (sometimes, the dependent variable is also said to be endogenous). In other words, an endogenous variable is causally or statistically related with one or more confounding variables. As a result, the apparent relationship between an endogenous variable and the dependent variable provides little direct information about causal relationships.

Finally, *instrumental variables* are exogenous variables that cause an endogenous independent variable but have no direct causal relationship with the dependent variable. That is to say, instrumental variables are variables that cause one of the hypothesized causes of the outcome and that are unaffected by confounders. Sometimes, an experimental assignment can serve as an instrumental variable if the outcome caused by that experimental assignment is itself a hypothesized cause of another variable of interest and if the experimental assignment has no direct effect on that other variable. Alternatively, researchers seek instrumental variables by looking for causes of their key independent variable that seem to be in some sense like an experiment. For instance, the amount of rainfall in a given year may be usefully like an experiment as a cause of agricultural productivity, which in turn may have effects on various political outcomes that are not themselves directly affected by rainfall. Instrumental variables are useful because they can identify a component of an independent variable that is not affected by confounders.

VARIABLES, INSTRUMENTAL

Confounding is a pervasive problem for drawing inferences about political causes and effects. In brief, some individuals, countries, or other units are exposed to a "treatment" or "intervention," while others are not. Differences in outcomes may reflect the effect of treatment, or they may be due to confounders—that is, variables associated with exposure to treatment and with the outcome. For example, does civil war inhibit economic growth? Do political institutions shape development? How does service in the military affect wages after war? Such questions are difficult to settle, because a range of unobserved variables are associated with the presence of civil war, types of political institutions, or service in the military, and these may shape growth, development, or individual wages. Reverse causality can also be a problem.

Instrumental variables can be used to address the problem of confounding, in both experiments and observational studies. In randomized controlled experiments, a coin flip determines which subjects are assigned to treatment, so subjects assigned to receive the treatment are, on average, just like subjects assigned to control. However, even in experiments there can be confounding, if subjects who accept the treatment are compared with those who refuse it. Analysts should, therefore, compare subjects randomly assigned to treatment with those randomly assigned to control. Instrumental-variables analysis may be used to estimate the effect of treatment on Compliers (subjects who follow the treatment regime to which they are assigned). In experiments, treatment assignment usually satisfies two key requirements for an instrumental variable: It is statistically independent of unobserved causes of the dependent variable, and it plausibly affects the outcome only through its effect on treatment receipt.

In observational studies (those in which assignment to treatment is not under the control of the researcher), the problem of confounding is typically more severe because units self-select into the treatment and control groups. Instrumental-variables analysis can be used to recover the effect of an endogenous treatment—that is, a treatment variable that is correlated with confounders. However, strong assumptions are often required, and these can be only partially validated from data. The use of instrumental variables in observational studies is discussed below, after a benchmark application to experimental data is first described.

Instrumental-Variables Analysis of Experiments

In experiments, subjects often fail to follow the treatment regime to which they are assigned. In A. Gerber and D. Green's (2000) study of the effect of door-to-door canvassing on turnout, for example, some voters who were assigned to receive a get-out-the-vote message did not answer the door. It is misleading to compare subjects who answer the door with subjects who do not because there may be confounding. However, treatment assignment can serve as an instrumental variable for treatment receipt, which allows an estimation of the effect of treatment on Compliers.

An example from the health sciences helps make the logic clear. In the 1960s, the Health Insurance Plan (HIP) clinical trial studied the effects of screening for breast cancer. About 31,000 women between the ages of 40 and 64 years were invited for annual clinical visits and mammographies, which are X-rays designed to detect breast cancer. The group of women invited for screening was called the assigned-to-treatment group, or just the treatment group. In the control group, 31,000 women received the status quo health care. The invitation for screening was issued at random, so that the women in the assigned-to-treatment group were just like the women who were not, up to random error.

Table 1, adapted from D. Freedman (2009), shows death rates from breast cancer 5 years after the start of the trial. In the assigned-to-treatment group, 20,200 women or about two thirds of women accepted the invitation to be screened, while one third refused. It might seem natural to compare the women who received screening with those who refused. Yet women self-select into screening, and those who accept screening are different from those who refuse. There is an important confounder: Richer and better-educated women tend to come in for screening, and while such women are less vulnerable to other diseases (see the final column of Table 1), they are more prone to breast cancer (probably because they tend to have fewer children and childbearing is protective against breast cancer).

The correct, experimental comparison is between women randomly invited to come in for screening—whether or not they were actually screened—and the whole control group. This intention-to-treat analysis shows a strong effect in relative terms. In the assigned-to-treatment group, there were 1.26 deaths per 1,000 women, while there were 2.03 deaths per 1,000 women in the control group. So the effect of assignment to screening is −0.77 deaths per 1,000. However, the intention-to-treat analysis likely understates the effect of screening—after all, one third of the women in the assigned-to-treatment group were not actually screened.

What, then, was the effect of screening on women in the treatment group who accepted screening? Instrumental-variables analysis answers this question. To begin, it is useful to think about the experimental population as comprising two kinds of subjects: Compliers and Never Takers. Here, Compliers are women who accept screening if they are assigned to treatment but are not screened if assigned to control, while Never Takers are women who are not screened, whether they are assigned to treatment or control. By looking at the control group alone, we cannot tell which is which: Never Takers look just like Compliers, since neither type of subject receives the treatment when assigned to the control group. In the treatment group, however, 20,200 or about two thirds

of the women accepted screening. Because subjects are randomly assigned to treatment and control, the mix of Compliers and Never Takers should be about the same in both groups. We can thus estimate that two thirds of women in the control group are Compliers, just as in the treatment group.

Instrumental-variables analysis compares death rates of Compliers in the treatment group with death rates of Compliers in the control group. It is easy to measure the former quantity because we observe which subjects are screened in the treatment group and can track their death rates. But what about the latter? First, note that Never Takers in the treatment group and Never Takers in the control group should have a similar incidence of death from breast cancer—after all, neither group was screened. In the treatment group, 16 women who refused screening—these were Never Takers—died from breast cancer. Thus, about 16 of the women who died from breast cancer in the control group are also Never Takers. (Here, the treatment and control groups are the same size; if they differed, we would use rates instead of numbers.) Because 63 women died from breast cancer in the control group, it implies that about 47 (i.e., 63 = 16) of the women who died from breast cancer in the control group were Compliers.

We can then fill in the third column of Table 1 for the subjects assigned to control, dividing deaths from breast cancer by group size. The analysis implies a death rate of 1.14 deaths per 1,000 women among Compliers in the treatment group and 2.33 deaths per 1,000 among Compliers in the control group. Thus, the effect of screening on Compliers is −1.19 (i.e., 1.14 − 2.33) deaths per 1,000 women—a substantially larger effect than suggested by the intention-to-treat analysis. One may arrive at this same estimate by dividing the estimated intention-to-treat parameter by the fraction of the treatment group that was screened—that is,

$$-\frac{0.77}{0.65} = -1.19. \qquad (1)$$

In the instrumental-variables estimator in Equation 1, we are implicitly assuming that no women in the control group were screened. (In the 1960s, few women sought out mammography on their own.) In other contexts, subjects who are assigned to the control group may seek out the treatment. With a double crossover, the model for compliance would be extended to include Always Takers—that is, subjects who receive treatment whether assigned to treatment or control—as well as Compliers and Never Takers. In the denominator of the instrumental-variables estimator analogous to Equation 1, we would then need to subtract the fraction of the control group that was screened from the fraction of the treatment group that was screened. Note that random assignment is crucial here, because it allows us to estimate the counterfactual outcomes for women in the control group who would have accepted screening had they been assigned to control.

Some assumptions are required. For one, we must assume that there are no Defiers: These are subjects who do the opposite of what they are told. In the HIP breast cancer study, Defiers are subjects who would take an exam if assigned to control but would refuse an exam if assigned to treatment. Notice also that Equation 1 estimates the causal effect of treatment for a specific subset of experimental subjects—namely, Compliers. When the effects of treatment are heterogeneous for different subjects, this “local average treatment effect” may not in general be the same as the average causal effect of treatment for all subjects in the experimental population.

Instrumental-Variables Analysis of Observational Data

In observational studies, researchers do not apply the treatment or intervention; instead, the subjects select themselves into treatment or control groups. Selection is usually highly nonrandom, and there is typically confounding. However, under some conditions, researchers may exploit instrumental variables to recover the effect of an endogenous treatment variable. Just as in experiments, a valid instrumental variable must be independent of other causes of the dependent variable, and it must influence exposure to treatment but not influence the outcome, other than through its effect on exposure to treatment. The latter condition is sometimes called an *exclusion restriction*, with reference to the exclusion of the instrumental variable from a causal equation governing the outcome.

Joshua D. Angrist (1990), for example, uses draft lottery numbers as an instrumental variable for military service during the Vietnam War. Understanding the effects of past military service on labor market earnings is difficult, because people who choose to serve in the military may be different from those who do not, in ways that matter for future earnings. A key assertion in Angrist's study is that the draft number is as good as being randomly assigned: Whether one's draft number is high or low is, therefore, independent of factors that influence future earnings. With a dichotomous treatment (military service/no military service), the instrumental-variables estimator is analogous to Equation 1, though the denominator should be adjusted for a double crossover: Some people dodge the draft, while others serve in the military even if they are not drafted. An important but reasonable assumption is that there are no Defiers—that is, people who sign up for the military if not drafted but emigrate to Canada when their number comes up. Note that, here, instrumental variables estimate the effect of treatment for a particular subset of subjects—those who serve in the military if drafted, but not otherwise. Whether this effect is informative about the effect of military service for other subjects may be a matter of opinion.

A second example comes from an influential study by E. Miguel, S. Satyanath, and E. Sergenti (2004) of the effect of growth on the probability of civil war in Africa. Confounding poses a big problem in this research area, since many difficult-to-measure variables may affect both growth and the likelihood of civil war. However, year-to-year variation in rainfall is plausibly as-if random, and it may influence economic growth—that is, treatment receipt—without independently affecting the probability of civil war through other channels. If so, an instrumental-variables analysis may allow estimation of the effect of economic growth on conflict for those countries whose growth performance is shaped by variation in rainfall. This application illuminates another, distinct concern about the interpretation of instrumental-variables estimates: Variation in rainfall may influence growth only in particular sectors, such as agriculture, and growth in distinct economic sectors may have different effects on the probability of conflict. Using rainfall as an instrument for studying growth may capture such idiosyncratic rather than general effects, so caution may be advised when extrapolating results or making policy recommendations.

Finally, D. Acemoglu, S. Johnson, and J. A. Robinson (2001), in a pathbreaking study of the effects of institutional arrangements on countries' economic performance, use colonial settler mortality rates as an instrumental variable for current institutions. These authors argue that settler mortality rates during colonial years do not affect current economic performance in former colonies, except through their effect on current institutions; they also argue that settler mortality is as good as randomly assigned, at least conditional on covariates. Since neither assumption is verifiable from the data, a combination of historical evidence and a priori reasoning must be used to try to validate, at least partially, these core assumptions. The portion of current institutions that is "explained" (in a statistical sense) by past settler mortality rates may also have idiosyncratic effects on economic growth, which could limit the generalizability of the findings.

Strengths and Limitations of Instrumental-Variables Analysis

As these examples suggest, instrumental variables provide an important tool, because they help confront the problem of confounding—a first-order issue in the social sciences. Instrumental-variables regression may also be used to correct for error in the measurement of independent variables, which can pose important inferential obstacles in social scientific research. In recent years, instrumental variables have been used to estimate causal effects in many substantive domains.

Nonetheless, the use of instrumental variables often requires strong assumptions, which can be only partially validated from data. Some empirical tests can be performed to assess the central assumption that the instrumental variable is as good as randomly assigned; for instance, the instrument may be shown to be uncorrelated with pretreatment covariates (those that are determined before the intervention). A priori reasoning and detailed knowledge of the empirical context may also play an important role. In observational studies, however, because there is often no actual randomization, the validity of an as-if random assignment is often a matter of opinion; this assertion may be classified along a spectrum from “less plausible” to “more plausible,” but it is difficult to validate the placement of any given study on such a spectrum.

Additional issues arise in many applications, often in connection with the use of multiple regression models. For instance, concerns about the endogeneity of a single treatment variable will typically lead researchers to use instrumental-variables regression. Yet analysts typically do not discuss the possible endogeneity of other covariates in their multiple regression models. (One reason may be that the number of instruments must equal or surpass the number of endogenous variables, and good instruments are difficult to find.) Furthermore, instruments that are truly random may not be strongly related to an endogenous treatment; in this case, a substantial small-sample bias can arise. One recommendation for practice may be to report “reduced-form” results. (Reduced form is a synonym for intention to treat; here, the outcome is regressed directly on the instrumental variable.)

Another recommendation may be to report instrumental-variables regressions without covariates; with one endogenous treatment variable and one valid instrument, including covariates can be unnecessary and even be harmful. The estimand should be carefully defined, and difficulties that may arise when extrapolating results to other contexts and types of subjects should be considered. In multiple-regression models, the statistical model itself must be validated, to the extent possible; with regression, the identification of causal effects depends not just on the exogeneity of instrumental variables in relation to a posited regression model but also on the validity of the underlying model itself.

Finally, it is important to emphasize that neither of the core criteria for a valid instrumental variable—that it is statistically independent of unobserved causes of the dependent variable and that it affects the dependent variable only through its effect on the endogenous treatment—are directly testable from data. Analysts using instrumental variables should defend these assertions using evidence and reasoning, to the extent possible. Yet instrumental-variables estimates should be interpreted with an appropriate degree of caution, especially outside the experimental context.

VETO PLAYER

A veto player is an individual or collective actor who possesses veto power in a political process and behaves strategically. Particular conceptions of the basic concept have to specify, among other things, what the relevant process is, who the veto players are, and what motivates them. The most influential conception of veto players has been developed by George Tsebelis (2002) in his veto player theory. That model has been elaborated in a number of different ways by subsequent scholars.

Tsebelis relies on the concept of the veto player to unify the comparative analysis of political systems. One part of this unification is *conceptual.* Tsebelis argues that traditional institutional dichotomies such as between unicameral and bicameral parliaments or between presidential and parliamentary systems of government can to a significant extent be replaced by analyzing political systems and situations as particular veto player configurations.

But veto player theory also aims at unifying our *causal* understanding of politics. The basis of this causal unification is the concept of *policy stability*—that is, the difficulty of changing the existing policies (the status quo) in a political system. Policy stability is the causal mechanism that links veto player configurations to particular outcomes of substantive importance. Tsebelis argues that in parliamentary systems, in which the cabinet depends on the confidence of the assembly, policy stability leads to *cabinet instability*. If the cabinet cannot agree on policy change, it will be replaced. For presidential systems, in contrast, veto player theory predicts that policy stability is likely to encourage a coup or some other form of *regime instability*. Neither of these two arguments is completely new, and they can be criticized, but veto player theory embeds both of them, and many others, in one relatively parsimonious and coherent framework.

Tsebelis distinguishes two types of veto players: (1) *Institutional* players are those established by a country's constitution. For example, the U.S. Constitution identifies the president as a veto player. (2) *Partisan* players are established by the way political competition plays out in a given country at a given time. One important analytical strategy of veto player theory is to focus on partisan veto players whenever possible. For example, instead of treating the Finnish parliament as one institutional veto player, the theory treats cabinet parties forming a majority coalition within the parliament as partisan veto players. One advantage of "replacing" institutional with partisan veto players for analytical purposes is that we may be able to ascribe particular policy preferences to the latter. Estimating actors' preferences is crucial for the application of veto player theory.

Tsebelis relies on game theory and a spatial representation of preferences. Actors' preferences are represented by a point—their so-called ideal point—in some one-dimensional or multidimensional policy space, and the actors' main goal is to move the collective decision as close as possible to this point. Based on these formal tools, Tsebelis derives specific hypotheses about the relationship between veto players and policy stability.

A superficial reading of veto player theory often misunderstands it as proving a seemingly trivial point—that a higher number of veto players increases policy stability. Yet one crucial insight of the formal analysis is that the *number* of veto players alone tells us little about the potential for policy change. What matters is how this number interacts with the *distances* between the ideal points of veto players' preferences. Moreover, the location of the status quo, the allocation of agenda-setting power, and the internal cohesion of collective veto players may also be of great importance for the outcome of collective decisions. Veto player theory analyses the *interplay* of these explanatory factors.

One important formal result of veto player theory is the "absorption rule." This rule states that if a (potential) veto player has an ideal point that is geometrically embedded within the ideal points of other veto players—that is, if its ideal point is in the so-called unanimity core—then this player does not matter in the analysis; it is absorbed. For example, Tsebelis argues that even courts with the authority to review and veto legislation can often be ignored in veto player analyzes because they are selected in ways that virtually guarantee their absorption.

Discussion and Critique

Distinguishing between "pure" and "interpreted" veto player theory is helpful in discussing the limits and criticism of Tsebelis's theory. The *pure* theory consists of the formal models in which the conclusions follow logically from the assumptions. Yet we know that the assumptions are idealizations or useful fictions. The combination of these two facts—"false" assumptions and valid conclusions—implies that testing the "truth" or "falsity" of the veto player theory is not a meaningful enterprise. The more important question is whether the theory is *useful* for particular purposes.

In contrast to pure theory, *interpreted* veto player theory includes assumptions about how the formal models relate to reality. It is mainly these assumptions that give empirical content to the theory and hence make it testable. Moreover, while no theorist doubts the validity of Tsebelis's deductions, many theorists make conflicting assumptions about how these deductions are to be applied to the real world.

Consider an example. In a five-party, multidimensional legislature, parties A, B, and C form a majority coalition whereas parties D and E are in opposition. Tsebelis's interpreted veto player theory assumes that A, B, and C are veto players on all policies. A competing assumption, proposed by Michael Laver and Kenneth Shepsle (1996), is that each minister is a sort of policy dictator for his or her portfolio so that one of the three parties *alone* determines policy on a particular issue. A third assumption, highlighted by Anthony McGann (2006), is that legislation may reflect the preferences of all five parties. The reason is that one of the opposition parties may undermine the existing coalition by forming an alternative coalition that makes some of the members better off. Taking opposition parties' preferences into account may thus be a way of reducing their incentive to challenge the existing coalition. Formally speaking, while Tsebelis expects the collective decision to be within the unanimity core of the putative veto players A, B, and C, McGann expects it to be within the so-called uncovered set for the entire five-party parliament. For Tsebelis, it is sufficient to be a member of the *actual* winning coalition in order to be a veto player. For McGann, a true veto player must be a member of *every* possible winning coalition, as would be the case if one party had a majority in parliament.

Just as Tsebelis's pure veto player theory may be interpreted differently, theorists may also use the label of "veto players" to refer, at least in part, to other pure theories. For instance, Scott Basinger and Mark Hallerberg (2004) question the importance of Tsebelis's absorption rule. They highlight the relevance of the mere *number* of veto players, regardless of the distances between their preferences, based on the view that many veto players increase *transaction costs*.

Interpreted veto player theory is often tested in isolation rather than along with competing theories. Or it is simply applied to some phenomenon. Even these noncomparative tests or applications are not without problems, however, for two related reasons: It is difficult to adequately *measure* actors' policy preferences, and it is difficult to unambiguously *identify* the actual veto players.

The *problem of identification* is most obvious in the case of minority cabinets. By definition, the parties forming a minority cabinet do not have sufficient seats in parliament to change the status quo, but it is not known in advance which party or parties will support the cabinet on a particular piece of legislation. Tsebelis argues that minority cabinets tend to have a privileged position in the policy space as well as strong agenda-setting powers, so that they typically do not have to make significant concessions to support parties. Hence, he treats only cabinet parties as veto players. Other authors, such as Steffen Ganghof and Thomas Bräuninger (2006), doubt Tsebelis's assumptions and believe that support parties can be quite powerful. Assumptions about how to identify veto players are part of the interpretation of pure veto player theory: They increase the theory's empirical content and hence testability, but they may be contested.

The *problem of measuring preferences* is as follows: Veto player theory refers to actors' final (all things considered) preferences over legislative proposals. Yet these preferences are often difficult to measure, especially in broad comparative studies. Empirical estimates of preferences based on party manifestos or expert surveys often measure parties' general ideological orientations or *outcome* preferences (e.g., more growth vs. more equality) rather than their final *policy* preferences (e.g., a high or a low business tax rate). If this is the case, there is a significant gap between theory and measurement. If this gap is ignored, the predictions of veto player theory may be misunderstood. For example, if an empirical analysis measures veto players' outcome preferences, it is far from clear whether large distances between *these* preferences lead to policy stability. It is also possible that policy preferences are much more proximate, possibly due to strong economic or technological constraints faced by the players, thus allowing for significant policy change.

The problems of identification and preference measurement also imply that veto player theory is strongest when applied to *cohesive and/or disciplined parties*. While veto player theory has all the formal tools to deal with situations of noncohesive parties, comparative analyses typically lack the detailed information on individual preferences that would be needed to apply these tools empirically. The difficulty of dealing with noncohesive parties is quite significant because the likelihood of such parties is much greater in presidential systems. At the same time, presidential systems are also more likely to have significant institutional veto points in addition to (the first chamber of) parliament. Applications of veto player theory, therefore, often focus on parliamentary systems and boil down to the assumption that *cabinet parties* are veto players.

Despite these limitations, veto player theory is a significant achievement. It helps unify our understanding of political systems and political processes. And such unification of knowledge is central to scientific progress.

VIOLENCE

In addition to finding food and shelter, the containment of violence has always been a vital issue for humankind. Violence denotes the use of physical force to inflict injury on persons or cause damage to property and manifests itself in forms as different as *homicide* or *state violence* (e.g., repression, coercion). This definition is independent of agents, objects, or circumstances of violence. *Political* violence can be distinguished from *collective* or *civil* violence (such as social banditry) by (a) the *number* of persons involved, (b) the *intentions of the actors*, and (c) the *reactions of the public*.

The more discontent is blamed on the political system, the greater the potential for political violence. Often, there is no clear boundary between a *bargaining*, a *coercion*, and a *terror* model in the use of violence. Also, *domestic* (political) violence is to be distinguished from *interstate* violence in that at least one participant is not a government.

Typologies of violence flourish (violence against persons/nonhumans, direct/indirect, physical/psychological, individual/collective, organized/spontaneous, criminal/political, and noninstitutionalized/institutionalized [e.g., the Mafia or the period in Colombian history known as La Violencia, or noninstitutionalized]). Our definition precludes the dichotomy between personal and structural violence, the latter implying no direct actor but rather “structural or indirect” (Galtung, 1969, p. 170) causes. Such a definition excludes very little and thus inflates the concept of violence.

The most important differentiation is between *legal/illegal* and *legitimate/illegitimate* violence. Max Weber defines the modern state by its specific *means*, that of physical violence. Where the authority of the state is considered legitimate, stable rule will result. In the opposite case of illegal and illegitimate violence, social disorder prevails, with the violence and instability envisioned by Thomas Hobbes. To a lesser extent, social order also breaks down where legal state violence is not accepted by the population and in the reverse scenario where violence is illegal but considered highly legitimate by the people. These are instances of classical, often revolutionary protest.

The challenge to the state monopoly of violence can be combined with challenges to the national borders, by separatist groups or foreign powers, and to the societal consensus, for example, by revolutionary groups. This leads to a three-dimensional table classifying at least eight different forms of violent political conflict.

Note that with violent protest and demonstrations, usually, neither the state monopoly of violence nor the societal order is challenged. As noted by Douglas Hibbs (1973), the response of the state authorities, to a large extent, determines whether protests escalate into internal war (civil war)—the organized, initially often clandestine form of challenging the state monopoly of violence. Robustly, these two dimensions have reoccurred in analyses of diverse forms of violent political conflict. Apart from genocide and massive external warfare, internal wars claim the largest numbers of victims.

There are many overlaps between these different forms of conflict, especially from a dynamic perspective. International terrorism, for example, would have to be located between the first and second box in the first row of Figure 1. Together with the challenge of international order, a fourth fundamental dimension arises here. Yet there are analytical and empirical limitations for all 16 types to emerge.

Political violence can be analyzed at four different levels: (1) international (wars, militarized interstate disputes, and external military interventions), (2) national (macrolevel), (3) subnational groups (mesolevel), and (4) participating individuals. According to Ted Robert Gurr (1970), both variants of deprivation (i.e., the discrepancy between expected value positions and the capabilities to achieve them), *absolute* deprivation and *relative* deprivation, fall short in explaining violent political conflicts. There are many more such situations of deprived masses but few manifest conflict events. The lack of a unifying ideology and charismatic leadership that can overcome the collective-action problem (viz., incurring relatively high costs and little rewards at the beginning of a protest action) is one factor. Without these factors making for mass mobilization, it is simply too costly for an

Figure 1 Politics and Violence: Central Dimensions and Forms of Conflict

individual to undergo the burden of violent conflict in view of its limited success.

A broader and theoretically more pertinent approach, *resource* mobilization, stresses the resources available to potential conflict agents (number of participants, money, weapons, organizational skills and networks of mobilization, availability, leadership, and unifying ideology). Yet even such a rational-choice view of resources, contrary to the approaches of need deprivation, cannot explain the point in time when conflict potentials materialize. This usually occurs in situations of a widening political opportunity structure marked by elite dissent, fiscal crises, external military defeats, electoral realignments, inconsistent repression, and unforeseen events. All these factors add up to making predictions at the macrolevel difficult if not impossible. As Timur Kuran (1995) points out, only the occurrence of informational and emotional "cascades" among the protesters made the dramatic changes of system collapse and transformation understandable in the demise of communism in Eastern Europe in the early 1990s. Individual and group behavior is codetermined by macrofactors at the national and international level, and only through group-mobilized (violent or nonviolent) actions and particular elite responses can the changes at the macrolevel be explained. There can be no *plausible* explanation by relying on macroprocesses alone.

At least five major explanatory variables have been found at the macrolevel, distinguishing more violent nations/states from others. (External wars are excluded here.)

Economic Development and Growth

Developed states with at least some social security provisions display lower amounts of violent conflicts (measured in terms of dead and injured victims). It is unclear whether this is a consistent linear trend or whether a curvilinear relationship predominates, with mid-level states reaching the maximum values. Here, incentives for protest would be strongest, combined with higher demands and still limited means to satisfy them. Highly developed democracies such as the United States, the United Kingdom, and many Mediterranean states frequently exhibit strong patterns of protest and demonstrations but usually avoid their escalation into violent internal war. There is also a group of rather quiet democracies consisting of Scandinavia, Switzerland, and the democratic outposts of former British rule overseas (New Zealand, Australia, and the Caribbean islands). In particular, semiauthoritarian states in the Third World and successor states to the Soviet Union in the Caucasus and Central Asia, in sub-Saharan Africa, and elsewhere often exhibit high values on both dimensions simultaneously—protest and internal war. Only totalitarian states with high and consistent repression succeed in avoiding both forms of conflict. North Korea is the remaining prime example. Once state repression is lowered, however, events parallel to the disorders in Zimbabwe and parts of the former Soviet Union often occur.

Surprisingly, rapid economic growth may spur protests due to the uneven distribution of benefits from such dramatic changes (e.g., Iran in the 1970s). Corruption and rigged elections often are further contributing factors. In situations of manifest economic crisis, one often finds less conflict due to obstacles in overcoming the free riding problem—that is, incurring particularly high costs when being among the first protestors and with little hope of achieving goals. Fears of becoming unemployed dominate and lead to individualistic solutions to such mischief. Yet where the system capacity to deal with these problems is *massively* reduced, conditions furthering mobilization are more likely to be expected.

Socioeconomic Inequality

Contrary to much speculation, inequality in landownership, wealth, or income is not often associated with more violent conflicts. Ideological and religious beliefs (e.g., caste systems) may justify the persistence of such patterns. Only where these inequalities become the focus of mobilized social groups does more violent conflict have to be reckoned with. Thus, for example, massive oil revenues are passed on to the lower classes in some Latin American countries, buying off (temporary) protest and conflict. Albert Hirschman, with his "tunnel effect" (i.e., waiting in a traffic queue further back in a tunnel but still moving ahead and thus having hope for progress), predicts tolerance for inequality as long as growth trickles down. Again, deprivation must be articulated and mobilized before such structural factors may contribute directly to violent conflicts.

State Repression

The conflict-instigating effect of political repression (political censorship, bans on opposition parties and basic political rights, large internal security forces, manifest acts of repression, etc.) is countered by a deterrent effect once the level of repression has passed a vital threshold where protestors become concerned with their own physical safety. This double reasoning makes it understandable why state repression in liberal democracies often contributes to more protest, while more repression in highly authoritarian states can reduce both forms of violent conflict. Also, the turning point of driving protest underground becomes understandable—namely, where a protestor starts fearing for his or her own life. Semirepressive regimes are thus most unstable and often the place of the most persistent forms of violent conflicts, due to injustices from the past, fears for the future, and inconsistent repressive measures.

Ethnocultural Fractionalization

Ethnocultural fractionalization is the most likely and most persistent causal factor in predicting the incidence of violent conflict, even though almost any hypothesis about the size composition of the underlying populations and violent conflict has been tested and partially rejected due to other factors and contrary logic. Thus, an equal division of two distinct populations could lead not only to continual fighting (e.g., Israel and Palestine) but also to the insight that neither population will win permanently. A majority of four to one by one group may deter any challenges from a minor group, which, in effect, often may be economically more successful as, for example, the Basques in Spain, Tamils in Sri Lanka, or the Chinese in Southeast Asia show. In contrast, it may vigorously instigate such challenges due to feelings of long-term discrimination. At least four structural factors turn those multicultural relations between dominant and dominated groups into persistent ones:

1. Distinct cultural groups produce lower transaction costs for respective group members in everyday-life behavior. Also, the public good of security in the end rests only with one's own kin.
2. Such groups in the past often have been victims of violent conflict.
3. This memory effect produces a lasting legacy for the future.
4. Moreover, state institutions may possess *private information* withheld from subordinate groups. Such information may be used at the next opportunity, to the detriment of subordinate groups. Perhaps only supranational supervision, as supplied in part by the European Union or the United Nations, may serve as a "permanent" control here.

There is also Karl Deutsch's (1966) prediction at the macrolevel that, with an underlying *heterogeneous* population, the means of modernization and social mobilization will be used for within-group strengthening, thus causing larger between-group differences. *Homogeneous* populations, in contrast, do not face these challenges. At least one major study (Hibbs, 1973) corroborates this general effect of ethnocultural differentiation combined with social mobilization. Irredenta populations created by colonial border drawing or other historical effects exacerbate this conflict scenario.

Finally, there are many linkages between internal and external conflicts, such as attempts at diverting internal tensions, intervention by external agents, or the spillover of defeat in war.

Territorial characteristics, shortages of natural resources, and disputed boundaries have been identified as causes of internal wars and guerilla warfare; often combined with terrorism, they have become a renewed and intensified focus of a group of researchers, largely at the Institute of Peace Research (Oslo) and the University of Zurich. Also, there are specific accounts, such as that by Stathis Kalyvas (2006), of why and how some peaceful multicultural settings break down, while others persist. Dynamic analyses at the communal level thus strengthen insights in the understanding of violence.

VOTING RULES, ELECTORAL, EFFECTS OF

Voting rules determine how voters cast their ballots and how vote shares are converted to seats or mandates in the elected assembly or office. Voting rules are thus among the principal building blocks of representative democracy. They establish the most fundamental theoretical and empirical links between public preferences, political representation, and, ideally, government formation and policy making. Thus, the political consequences of alternative voting rules have always concerned political scientists. Both majoritarian and proportional voting rules exert profound effects on alleged political efficiency (i.e., the format and the fragmentation and polarization of political party systems and their propensity for sustaining single-party or coalition governments) and for different modes of formal and substantive political representation (i.e., the distortion of vote shares and seat shares and the representation of the median voter in parliament, in government, or actually in enacted policies).

The study of voting rules and their respective consequences belongs to the very core of comparative political research. As illustrated by William H. Riker, research on voting rules and electoral behavior has been organized as a cumulative science. In theoretical and conceptual terms, the arguments have advanced from the early, inductive reasoning by John Stuart Mill, Henry Droop, or Thomas Hare toward the codification of Duverger's law and hypothesis, thereafter toward their refinement by scholars such as Giovanni Sartori or Rein Taagepera, and, more recently, toward the sophisticated, game-theoretical treatment by Gary W. Cox. Further research extended the scope of the analyses so as to also consider the additive effect of social structure or direct presidential elections and, most important, the *interactive* effects of institutional structure and political cleavages.

Voting Rules and Electoral Fragmentation

Inductive Generalizations at the National Level

Supporters of majoritarian democracy focus on the efficiency dimension and thus on the effects of voting rules on the number of viable electoral and/or parliamentary parties. The fragmentation of national party systems is their most important and politically most consequential feature, which is directly related to the impact of the respective voting rules. Riker took what is now canonized as Duverger's sociological laws as a yardstick to assess the truly scientific character of the discipline—the cumulative process of generating knowledge by a series of constant revisions and improvements. Riker's theoretical point of departure was Maurice Duverger's analysis and lawlike codification of the effects of alternative voting rules, which he discriminated into Duverger's law and Duverger's hypothesis: (a) the law states that plurality rules tend to systematically favor two-party systems and (b) the hypothesis suggests that majority systems and proportional representation (PR) tend to systematically produce multipartyisms.

These processes are fueled by two interrelated causal mechanisms: (1) The mechanical effects of voting rules operate in a deterministic way and refer to the formal conversion of exogenous given vote shares to seat shares. (2) The psychological effects, in contrast, work in a probabilistic fashion and evolve from the anticipation of these mechanical effects by (a) voters who want to avoid wasting their vote (*strategic voting*) and (b) party elites who want to avoid fielding and investing scarce resources for candidates or lists that are in fact out of the running (*strategic entry*).

Majoritarian Voting Rules

Majoritarian voting rules require successful candidates or lists to win a—however defined—majority of the votes. This broad category comprises a number of heterogeneous subtypes that are associated with different political consequences.

Plurality or "first-past-the-post" systems apply the relative majority rule. In an electoral district that consists of *n* seats, the *n* strongest competitors are awarded a mandate. In empirical terms, plurality rules are most frequently implemented in single-member districts. However, this combination does not necessarily belong to the core concept of plurality but merely flags an empirical regularity.

In contrast, *majority* rules build on an alternative concept and definition of majority. These voting systems regularly require an absolute majority for the assignment of a seat in the assembly or office—that is, candidates or electoral lists need to obtain at least 50% plus one vote of the overall votes cast. In multiparty systems, this threshold often cannot be cleared by any competitor so that vacant seats need to be assigned by either a runoff of the (two) strongest parties (runoff systems) or by a second ballot that builds on some kind of plurality rule (majority plurality systems). As before, majority rules also tend to be implemented in single-member districts, but this is not included in the definition of majority voting rules.

Although every voter still casts an exclusive, individual vote, the *single nontransferable vote* (SNTV) implies the application of plurality voting rules in multimember districts. The available seats are filled by the *n* strongest candidates or electoral lists.

Empirical assessments of voting rules did not sustain Duverger's law as a deterministic national-level generalization. Systematic analyses, for instance by Douglas W. Rae, Arend Lijphart, or Gary W. Cox, have illustrated that majoritarian voting rules grosso modo (roughly) tend to allow for lower levels of electoral and parliamentary fragmentation than proportional voting rules. However, plurality in single-member districts does not unambiguously sustain two-party systems anywhere outside the United States. Instead, the empirical effects of classical "first-past-the-post" systems happen to depend on a variety of specific technical and contextual features, for instance, district boundaries that may be subject to the practice of gerrymandering, the structure of political competition, and alternative degrees of party system nationalization.

Proportional Voting Rules

Proportional voting rules require successful candidates or lists to win the support of a certain share of the votes that is either defined by the electoral quota or determined by the application of some highest-averages method. While majoritarian rules can in principle be combined with any possible district magnitude, PR logically only works in multimember electoral districts.

Quota systems define an electoral quota, which is calculated by the numbers of votes and available seats in an electoral district, as the price of a seat. Each party is awarded as many seats as it has full quotas, and eventually, the remaining seats are often distributed by some largest-remainder criterion. Common quota variants are, for example, the Hare quota, which is based on the number of votes divided by the number of seats; the Droop (or Hagenbach-Bischoff) quota, which divides the number of votes by the number of seats plus one; or the Imperiali quota, which divides the number of votes by the number of seats plus two.

Highest-average rules divide the votes cast for a respective party list by a series of divisors. The d'Hondt system applies the divisor sequence $\{1, 2, 3, \ldots, n\}$, the Sainte-Laguë method implies division by the series of odd numbers $\{1, 3, 5, \ldots, n\}$, and the Imperiali quota builds on the divisor sequence $\{1, 1.5, 2, 2.5, \ldots, n\}$. In the second step, the *n* seats at stake are awarded sequentially by the size of the respective averages.

The single transferable vote (STV) system realizes candidate-based PR and aims at limiting the potential for wasted votes by a system of preferential voting. STV initially assigns seats according to the stated first preferences. After candidates have been either elected or eliminated, surplus votes or wasted votes are transferred to the remaining candidates based on lower-ranking preferences of the voter.

Empirical analyses revealed ambiguous evidence for Duverger's hypothesis. Grosso modo, proportional voting rules do allow for higher numbers of viable parties or electoral lists than majoritarian ones. However, depending on societal polarization and political cleavage structures, proportional voting rules are also compatible with highly concentrated two-party systems.

Within the scope of proportional voting rules, there have often been intense debates about the mechanical consequences of alternative proportional formulae. However, their empirical consequences regularly do not differ much and have often been profoundly overestimated. Generally, the highest-average formulae, especially d'Hondt, are expected to benefit larger parties, while quota systems are supposed to be fairer for small parties. Simulation studies have illustrated that the effects of either group of voting rules overlap and, unless they are reinforced by a multitude of parallel electoral districts, do not have significant electoral consequences. When the mechanical consequences of alternative proportional allocation methods tend to be limited, alternative proportional voting rules do not bring about the need for strategic behavior by voters or by party elites. Note that in empirical electoral systems, pure proportionality is normally restricted by additional regulations—for example, low district magnitudes as mathematical and predefined legal thresholds as formal entry barriers. Typically, the mechanical and psychological effects of average district magnitudes and legal thresholds clearly exceed the consequences of alternative PR rules.

Further Refinements

Giovanni Sartori has contributed additional refinements and reformulations to Duverger's sociological laws. Instead of the conceptually dubious and problematic established dichotomy of proportional and majoritarian technical rules and conceptual ideal types (and some combinations of different systems in between), Sartori arranged voting rules along a unipolar continuum from feeble to strong. Voting rules that are a priori supposed to exert a significant modifying impact on actual electoral behavior (i.e., majoritarian voting rules) are considered "strong," while those that are not expected to induce these substantial psychological effects (i.e., proportional voting rules) are labeled "feeble."

The second dimension of Sartori's typology brings in contextual features. Parallel to the voting rule dimension, Sartori contrasts strong (i.e., structured and nationalized) and feeble (i.e., unstructured and heterogeneous) party systems. In the resulting 2 × 2 matrix, Sartori expects a reduction in the number of viable political parties and a drive toward a two-party format where strong (i.e., plurality) voting rules meet strong (i.e., highly structured) party systems. However, when strong voting rules are combined with feeble, unstructured party systems, the reductive effect is actually less developed or limited to local bipartism within isolated districts. Any combination of feeble voting rules with structured party systems still implies restrained political competition, but then, political competition is structured by political incentives that originate not from the institutional rules of the game but solely through party channelment. Eventually, feeble party systems might be combined with feeble, unstructured party system contexts, indicating a "no effect" situation.

Subsequent empirical analyses revealed that Sartori's observance of contextual features, above all the party system context that fosters or prevents the effectiveness of voting rules, adds significant insight when the scope of an actual analysis is extended beyond the long-standing democracies of the Organisation for Economic Co-operation and Development (OECD) world. Transition countries typically lack structured modes of party competition and thus regularly fail to meet the necessary conditions for the effectiveness of constraining effects that originate from strong electoral systems. Problems with "strong" rules in these contexts can be clearly illustrated by the recent electoral history of postcommunist polities.

Searching for a general expression that ties together Duverger's law and hypothesis, Rein Taagepera and Matthew Shugart proposed an inductive inspection of actual electoral returns that replaces the analysis of qualitative voting rules by an exclusive focus on quantitative district magnitudes. They reason that their measure of electoral fragmentation—the Effective Number of Electoral Parties—is on average linked to district magnitude by a logarithmic association:

$$E[N|M] = 1.25 \log M + 2.5,$$

with N denoting the Effective Number of Electoral Parties and M denoting the district magnitude at the national level. The equation allows for the prediction of fragmentation levels that will, as the authors argue, usually fall within an interval of ± 1 unit from this quantitative generalization of Duverger's law.

At the national level, any link of the *national* number of parties and *average* features of the respective electoral system at the national level cannot be more than a rough, inductive generalization that lacks the necessary causal argument or mechanism. While the substantive quantity of interest, the number of electoral or parliamentary parties, is observed at the national level, the conversion of votes into seats and thus the causal mechanisms that lie at the bottom of the wasted vote argument and Duverger's psychological effect all operate at the district level. From a conceptual point of view, there are additional problems with Duverger's law and subsequent generalizations. A number of recent empirical studies sweep under the carpet an important distinction incorporated in the original law and hypothesis. Duverger linked plurality systems to bipartism, while both majority and proportional voting rules were supposed to allow for different degrees of multipartyism. As a consequence, any exclusive focus on the key variable district magnitude, therefore, no longer applies to the original argument, obviously disregards its core causal mechanisms, and potentially introduces an omitted variable bias to the empirical analysis.

Moreover, national-level analyses often follow Duverger's flawed idea of a multiplying effect of proportional voting rules: The more permissive an electoral system (i.e., the higher the district magnitude), the more parties will be viable in the electorate. This notion is established as a quasi-deterministic argument that does not take into account intervening factors such as social heterogeneity or collective action problems partisans face when setting up their platforms. However, even the most effective PR system just reflects social heterogeneity and political polarization, which are the products of social structure and political cleavages; political institutions like voting rules do not artificially produce these phenomena. As a consequence, electoral systems need to be conceptualized as constituting an upper bound to the number of viable candidates and/or political parties and not as artificially producing an institutionally defined quantity of party system fragmentation or multiplying the number of viable competitors.

Causal Mechanisms at the District Level

In a series of contributions, Cox has explicitly focused on the district level of electoral systems, strengthened the causal stringency of Duverger's original argument by an elaborate game-theoretical reformulation, and attached conditions to its functionality. His argument concentrates on the role of expectations in electoral competition and subsequent strategic coordination attempts by voters and by party elites—that is, it concentrates on Duverger's psychological effect. Building on both classic statements of formal theory and the inductive tradition of data analysis in comparative political science, he was able to strengthen the causal argument, to broaden its applicability, and attach conditions to its functionality. In essence, Cox's contribution deals with problems of strategic cooperation in electoral politics. Formal modeling suggests, quite in accordance with the original propositions by Maurice Duverger, that in each single-member plurality district ($M = 1$) there will be only two vote-getting candidates in a game-theoretical equilibrium. Next, Cox extends his arguments to multimember districts ($M > 1$) with majoritarian SNTVs and, eventually, with proportional voting rules (d'Hondt). As a direct generalization of Duverger's law, he suggests that there may be no more than $M + 1$ viable candidates in each district of the magnitude M. This proposition, labeled the $M + 1$ rule, is the central building block of Cox's contribution to the analysis of electoral systems: $E[N|M] \leq M + 1$, with N denoting the raw number of electoral parties and *M* denoting the magnitude of a local electoral district.

The formal argument spelled out in detail by Cox overcomes some of the central flaws of inductive macro–macro generalizations. In the first place, it explicitly focuses on the district level, the wasted vote argument, and the causal incentives that drive strategic voting and strategic entry. Second, Cox also develops an explicit generalization to double-ballot majority systems when he argues that the limit of $M + 1$ viable candidates does not actually relate to the actual district magnitude ($M = 1$) but to the number of first-round candidates that can qualify for the usually decisive second round (either $M = 2$ for the classical runoff system or even $M > 2$ for two-round majority plurality systems like the French one). Third, the $M + 1$ rule does not suggest a specific number of viable contenders that would be deterministically produced by the electoral structure, but in contrast, it conceptualizes institutional constraints as erecting an upper limit to or a carrying capacity for the number of viable candidates or lists in a game-theoretical equilibrium.

Next, Cox spells out a set of conditions that need to be fulfilled so as to induce a restriction to a maximum of $M + 1$ viable candidates or lists in a game-theoretical equilibrium. In particular, these contextual factors involve the presence of strictly hierarchically ordered, transitive voter preferences (as opposed to voters who do not distinguish between two or more electoral options); the absence of a Condorcet winner, short-term instrumentally rational calculations on the voters' side; and full, common information about the state of the electoral contest with the clear identifiability of competitive and trailing candidates or lists.

However, causal stringency and clarity do not come without substantive costs. The argument provided by Cox is presented in two successive stages of strategic coordination: first *within* the electoral districts and second *across* these districts. Therefore, the $M + 1$ rule does not directly address the politically meaningful number of parties at the national level but the quite politically, somewhat inconsequential fragmentation of local electorates within the respective electoral districts. The subsequent step evolves into another, second-stage coordination game when the locally viable competitors decide to link up or to abstain from cross-district linkages, to coordinate (or not to coordinate) across the various districts of an electoral system so as to form a nationalized political party, or to remain a regionalized political force. Cox specifies national policy goals, the presidency, the premiership, and the existence of upper-tier seats in the electoral system as potential factors pressing toward cross-district linkages.

Voting Rules, Formal and Substantive Representation

The theoretical visions of democracy in which alternative majoritarian and proportional voting rules are rooted also incorporate different standards for the assessment and evaluation of political representation. Supporters of consensus or consociational democracy emphasize the alleged legitimacy dimension and focus on the inclusiveness of electoral rules and descriptive representation. Their assessment of the formal quality of representation builds on the relation of vote shares and seat shares—that is, on disproportionality indicators that have been, for instance, suggested by John Loosemore, Victor J. Hanby, and Michael Gallagher. Theoretical models and empirical analyses have illustrated that proportional, "feeble" voting rules tend to foster descriptive representation, while majoritarian, "stronger" voting rules tend to trade descriptive representation for more effective party system concentration, probably easier government formation, and supposedly higher government stability.

Supporters of the majoritarian vision of democracy would generally not accept formal, descriptive representation as a conceptually adequate and substantively meaningful criterion for evaluating alternative voting rules but rather adopt a principal–agent perspective on political representation. Thus, representation means having one's voice represented either in the decision-making process or in its outcome—actual enacted policies and their correspondence to the preferences of the electorate. In the classical spatial model of politics as devised by Harold Hotelling and Anthony Downs, two parties or candidates that compete under plurality rule and on a single policy dimension are expected to converge toward the median voter's position so as to maximize their vote shares and their probabilities of victory (the famous "median voter theorem"). When more than one mandate is at stake and some proportional voting rule is adopted—that is, when a majority of the votes is no longer necessary but some share of the vote suffices—these centripetal incentives cease to apply, and parties or candidates are expected to spread evenly along the policy space.

The theoretical argument spelled out by Cox and others posits that majoritarian voting rules have a higher potential to ensure the correspondence of public preferences and government policies. Strong centripetal incentives generated by "strong" voting rules foster enacted policy representation; the absence of these centripetal incentives under proportional voting rules in contrast potentially allows for the fabrication of (coalition) governments and enacted policies that are more distant from the median voter's position. Vice versa, as its proponents are ready to concede, the political consequences of majoritarian voting rules depend on effective strategic coordination by voters and by party elites, and thus effective representation of the median voter position depends on a variety of contextual parameters. Subsequent empirical analyses by G. Bingham Powell and others have, however, cast serious doubt on the capability of "strong" voting rules to produce more adequate policy representation than weak ones.

Voting, Causal Complexity, and Intervening Factors

Ultimately, voting rules—as any social or political institutions—do not originate from nowhere and, quite contrary to the notion of a sociological law, institutional pressures and the virtues of "constitutional engineering" tend to be only one impact factor in the formulation of voting rules, alongside and in interaction with others.

Empirical findings that indicate an association of voting rules and electoral fragmentation, voting rules and inner-party democracy, or voting rules and the quality of political representation do not "prove" anything about causality and the direction of potential causal effects. While the institutional perspective suggests that voting rules profoundly affect these features of party systems and political representation, scholars such as Harry Eckstein or John G. Grumm have first concluded that voting rules are either inconsequential or themselves a product (rather than the reason) of political competition and party systems, but they are designed and negotiated by party politics to cater to partisan interest.

Theoretical and empirical insights reveal that voting rules have political consequences, for instance, on the number of viable political competitors or parties and on the quality of political representation. In turn, the very idea that voting rules might have (redistributive) effects implies that politicians will be interested in manipulating these effects in their favor. Politicians would thus not bother about electoral rules when these were of no or little significance for party competition and their respective interests.

Voting rules (or other institutional features) are only one factor among many others that affect party system fragmentation and the quality of political representation. Empirical analyses, for example, by Peter Ordeshook, Octavio Amorim Neto, and Gary W. Cox, have demonstrated additional institutional effects such as direct presidential elections and the electoral cycle. Moreover, political cleavage structures and the number of societal groups are consequential for party system fragmentation. In-depth analyses have shown that these macrosociological variables often do not directly affect the fragmentation and political representation but interact with electoral structure. Taking on the above notion of the carrying capacity of electoral systems, this means that electoral fragmentation does not originate when there are either many polarized sociological groups or a permissive electoral system (additive causation) but occur only when social and institutional factors operate conjointly (interactive effects).

These findings correspond exactly to the theoretical insights incorporated in the $M + 1$ rule: Voting rules do not artificially "produce" a specific number of viable candidates or political parties, but they only, in combination with additional features of the electoral system, establish and define the certain carrying capacity and thus an upper bound to the number of (locally) viable candidates or electoral lists. However, whether the empirical number of parties approaches these respective upper bounds is determined by sociological and organizational aspects.

VOTING RULES, LEGISLATIVE

Legislative voting rules are the rules that govern the lawmaking process, as opposed to the voting rules that govern the election of representatives to lawmaking bodies. There are two kinds of rules that govern the lawmaking process. First, there are rules that define and regulate the lawmaking bodies and the relationships between them ("constitutional rules"). These rules determine the number of legislative chambers, their relative powers, and their relationship to the executive, among other things. Second, there are rules that govern the internal working of the legislative bodies ("parliamentary rules"). These rules cover matters such as control of the legislative agenda and the committee system and are usually made within the legislature. In this entry, we will discuss the theory of voting, constitutional rules and their effects, and finally parliamentary rules.

The study of the rules of lawmaking can be traced back at least as far as Aristotle. Although there are exceptions, traditional approaches to legislative rules have tended to be descriptive and formal, drawing heavily on constitutional law. As political science took a more behavioral turn from the 1950s, many scholars put less emphasis on formal rules, as these rules did not seem to have much effect on how political agents actually behaved. However, approaches based on social choice and rational choice theory (the "new institutionalism") did give a central place to formal rules and provided a link between these rules and behavior. Social choice theorists characterized the mechanical properties of voting rules and found these often produced counterintuitive results. Rational choice theorists considered how maximizing agents would act within a framework of formal rules. The key insight was that small changes in seemingly unimportant rules could have very large effects on predicted behavior in equilibrium.

There has also been a growth in comparative empirical work on political institutions. Recent work has considered the effect of differences in constitutional rules (and to a lesser extent, parliamentary rules) on policy outcomes such as redistribution, state size, and growth. These various approaches to legislative voting rules are likely to be complementary. For example, rational choice approaches emphasize the importance of small, seemingly insignificant rules; identifying these rules in specific legislatures requires that someone do "thick" descriptive work.

The Theory of Voting

Before considering actual voting rules, we will briefly consider the theoretical analysis of voting rules. This gives a powerful illustration of the effect that voting rules can have. The voting rules in virtually every legislature in the world use some variant of a binary amendment procedure. Here, a proposal is made, and amendments to this proposal are considered one at a time. The final bill, with amendments, is then voted on. This procedure is binary because only two alternatives are voted on at any one time. The most common procedure for deciding between two alternatives is majority rule, although supermajority rules (a proposal fails unless it receives, say, 60% of the votes) are used in some instances. Majority rule has a special place in democratic theory in that it is the only binary rule that treats all voters and proposals equally. The pervasiveness of binary amendment procedures may be due to their simplicity; it may also be due to the fact that procedures that consider more than two alternatives at a time can be manipulated by adding extra (possibly irrelevant) proposals.

While binary amendment procedures eliminate one kind of manipulation, they are vulnerable to another. Simplifying greatly, Arrow's theorem shows that majority rule or any other nondictatorial binary procedure is vulnerable to cycling (or, strictly speaking, intransitivity). That is, it is possible for the voters to choose A over B in a head-to-head contest, to choose B over C, and to choose C over A. Cycling creates opportunities for agenda manipulation. Suppose we first have a vote between A and B and then put the winner up against C. A beats B in the first round but is then beaten by C, so C is chosen. However, suppose we put B against C first, B beats C but loses to A in the final, so A is chosen. If we put A against C in the first round, B is the eventual choice. The outcome thus depends completely on the order in which we consider the alternatives. It should not surprise us that those who get to decide the order in which alternatives are considered, such as the Rules Committee in the U.S. House of Representatives, have considerable power.

How much influence the agenda has over outcomes will depend on how often voter preferences produce cycles. Later work in social choice suggested that if more than one issue is considered at a time, cycles are almost inevitable and an agenda can be found to produce absolutely any outcome. This led some to the conclusion that political institutions and elite agenda manipulation, not voter preferences, controlled outcomes. William Riker's *Liberalism Against Populism* was perhaps the strongest statement of this position. More recent social choice results lead to more moderate conclusions. If legislators are just as smart as the agenda setter, they can resist agenda manipulation by voting strategically. Nicholas Miller showed that strategic voting with a fixed agenda, an open agenda, or a competitive agenda would produce outcomes in the "uncovered set," which is typically a relatively small, centrally located set of alternatives. Thus, agenda setting would influence the outcome, but this would be quite tightly constrained by the preferences of the voters. Under this scenario, voting rules matter, but we are not driven to the extreme conclusion that they are the only things that matter.

Constitutional Rules

We have made a distinction between *constitutional rules* (which define the lawmaking bodies and their relations with each other) and *parliamentary* rules (which govern the internal workings of legislatures). Constitutional rules are often codified in a written constitution, which requires either the agreement of multiple institutions or a referendum to amend. Parliamentary rules can usually be changed by the legislature itself. There are some exceptions where this distinction is less clear-cut. For example, there are countries where the constitution can be changed by statute law (e.g., the United Kingdom, Israel).

One important constitutional feature that is not dealt with here is the choice of electoral system. Clearly, the effect of the legislative voting rules may vary depending on how the legislature is constituted. In particular, whether the electoral system produces a single-party government (as is often the case with plurality elections) or multiparty coalition governments (usually the case with proportional representation) is important. In some cases, electoral laws are defined or restricted by the constitution, but in others, they are simply defined by ordinary legislation. They may even be made (as in the United States) by subnational legislatures.

Constitutional rules differ over a variety of dimensions. However, they can be considered in terms of whether they concentrate legislative authority in one body or disperse it among several bodies. Rules that require the concurrence of several bodies to pass legislation have an effect similar to having a supermajoritarian rule in a single legislative body. Having more veto points means that more than a simple majority is required. For example, it is harder to pass legislation through two legislative chambers than through one, even if both chambers use simple majority rule voting. This is particularly the case when the two chambers are elected in different ways. Constitutional features that may have an effect similar to a supermajoritarian voting rule include the following.

Bicameralism. Having two legislative chambers instead of one creates an extra hurdle for proposed legislation to clear. How significant this hurdle is will depend on whether the two chambers have equal powers or whether the second chamber has limited powers to amend/propose legislation or can be bypassed by the first chamber. It will also depend on whether the two chambers are elected the same way and, thus, have very similar policy preferences. The term *strong bicameralism* is sometimes applied to systems with equally powerful chambers that are elected in different ways, while *weak bicameralism* is applied to bicameral legislatures without these characteristics.

Presidentialism. If there is a presidential veto, then the president is essentially an extra chamber of the legislature. Thus, a system like that of the United States is essentially *tricameral*, although the presidential veto can be overridden by a supermajoritarian vote of the other chambers. Even without a legislative veto, presidents can effectively change or block legislation by the way they implement it, while in a parliamentary system, the executive is directly answerable to the legislature.

Federalism. Under a federal system, implementing a policy may require the cooperation of both central and subnational governments. Federal systems also often have strong bicameralism in the national legislature, with the second chamber representing subnational units.

Judicial Review. Constitutional courts may provide another veto point. The legislature may overcome this by changing the constitution, but this often requires a supermajoritarian procedure.

Referenda. These allow the entire population to be treated as a chamber of the legislature. Constitutions vary as to whether referenda can be demanded by the voters or whether they can only be called by the government; and they also vary as to whether they can propose new legislation or only invalidate legislation passed by the legislature. Referenda can be used to break a legislative gridlock, but they can also be used obstructively to dismantle a multi-issue legislative program one issue at a time.

The normative justification given for constitutional rules that disperse legislative power (and thus work in a supermajoritarian manner) is that this prevents the abuse of power by the government and protects minorities from majority tyranny. Critics of this position argue that by making government action difficult, such rules effectively entrench existing injustices and prevent the remedy of new ones, thereby harming vulnerable minorities. Regardless of one's normative evaluation, we should expect constitutional rules that are effectively supermajoritarian to lead to slower change in government policy. Empirically, countries with such rules seem to have less redistributive government policy and have built welfare states more slowly. This should not be surprising, as the constitutional rules provide more opportunities for groups that lose from redistribution to block the process.

Parliamentary Rules

There are a variety of parliamentary rules (rules that regulate the internal workings of legislatures) that will significantly affect outcomes. As was argued in the first section, the theory of voting suggests that the order in which proposals are considered can change the eventual choice. The way proposals are bundled together can have a similar effect. Suppose, for example, that one proposal has the enthusiastic support of 40% of the legislature, while another proposal has the support of a different 40%. If the two proposals are bundled into a single bill, it may well pass with a majority, even though each proposal would have failed if considered separately. This process is known as logrolling. In some legislatures, it is carried out through decentralized deals between legislators, while in others, there is centralized negotiation between party leaders (the coalition agreements that follow elections in some European countries can be regarded as large, centrally negotiated logrolls). In either case, we would expect whoever has control over the order of business and what bills get to be proposed to have considerable influence. The following are among the institutional features that affect this:

Control Over Proposing Legislation. The legislative leadership (usually the government in parliamentary systems) will be in a more powerful position if it has a monopoly (or near monopoly) of the right to introduce new legislation. It is notable that some legislatures delegate the developing of some legislation to legislative committees or independent commissions (such as the Royal Commission in some Scandinavian countries) in which both government and nongovernment parties are represented.

Control Over Amendments. Once legislation is introduced, the legislative leadership may exercise different levels of control over how it may be amended. If there is a *closed rule*, the legislature is not allowed to amend the legislation and must either accept or reject what has been proposed. This increases the influence of whoever gets to propose legislation. However, under an *open rule*, where anyone can propose new amendments, the power of the agenda setter is far weaker. An intermediate position is a rule that allows only certain kinds of amendments. An important feature of some European legislatures is that the government has the right to propose the last amendment. This restores a considerable degree of agenda-setting power to the government because counteramendments to this last amendment are not possible.

Control Over Legislative Timetable. Control over what is debated, when, and for how long is also important. The legislative leadership obviously cannot get its program passed if it cannot get it debated. An extreme example of a lack of leadership control in some legislatures is the right to unlimited debate. This allows a minority to filibuster or essentially veto legislation by refusing to stop debating it (although there may be a procedure allowing a supermajority vote to end debate, as in the U.S. Senate).

Committee System. Detailed consideration of legislation is usually delegated to legislative committees before being presented to the full legislature. The legislators on these committees may develop policy expertise and be deferred to by other legislators. In some legislatures, committees may act as veto points in that all legislation on a particular topic has to pass through them. The number and importance of committees varies considerably between legislatures. In some legislatures, the governing party or coalition controls all committee chairmanships, while in others, they are shared between all parties.

Degree of Party Discipline. In some legislatures, representatives are more or less free agents, who may represent the interests of their constituents as much as their parties. In other legislatures, parties are tightly disciplined, and important decisions are made by negotiation among the party leaders. If party discipline is tight, parliamentary rules may serve to facilitate agreements between parties (in particular the coalition agreement) rather than agreements between legislators.

There are, however, two reasons to be cautious about trying to explain policy outcomes in terms of parliamentary rules. The first is the problem of *heritability*. Parliamentary rules are usually chosen by the legislature itself. Further, the legislative leadership that implements the rules is also chosen by the legislature. If the legislature does not like the outcomes the rules produce, they could presumably change either the legislative leadership or the rules themselves. If this is the case, rules do not so much produce outcomes but are rather the means by which the ruling coalition in the legislature gets what it wants. This would suggest that the effect of constitutional rules may be more profound than those of parliamentary rules.

The second problem is that of *functional equivalence*. It may be possible for the governing coalition to get its way by a variety of different means. For example, in some countries, the government keeps very tight control over the legislative agenda. In other countries, nongovernment parties have far more ability to amend legislation, but the government has the right of last amendment. However, in both sets of countries, the government seems to be able to get most of the legislation that was laid out in its coalition agreement passed. Similarly, in some countries, there are very detailed committee hearings on legislation, while in other countries, these appear to be little more than a formality. However, if the legislation in those countries was developed by a Royal Commission on which the legislative committee members served, this compliance is not surprising. This in no way diminishes the importance of parliamentary rules in understanding the working of legislatures, but it does make it harder to find statistical relationships between parliamentary rules and outcomes.

War and Peace

The 21st century has begun much as the 20th century ended: in war and armed conflict. Conflicts of many types, old and new, are under way in war zones such as Afghanistan, Iraq, Lebanon, the Democratic Republic of the Congo, Sri Lanka, Colombia, Lebanon, Chechnya, and Sudan. The threat of war remains, but the nature of warfare is changing in tandem with often unforeseen geopolitical, technological, economic, and ethnic changes. According to the studies performed since 2005 by the Human Security Centre at the University of British Columbia, violence is in *decline:* In the past dozen years, there has been a significant decrease in violence as measured by the number of wars, genocides, and human rights violations.

Since the end of the Cold War, the number of armed conflicts has fallen by about 40% from about 50 in 1991 to about 30 in 2004. High-intensity conflicts (those that cause more than 1,000 battle-related deaths per year) are down 80%, also down are civil wars (80%), genocides (80%), major and minor terrorist attacks (50%), the number of refugees (45%), coups and attempted coups (60%), and international crises (70%). More than 100 conflicts have ended, including 70% of secessionist conflicts, and the average number of battle deaths per armed conflict decreased by 98%, from 38,000 in 1950 to 600 in 2002. (Iraq since 2003 is an exception to the trend.) There were 20,000 battle deaths in all wars combined in 2003, compared with 700,000 in 1950. In the 1990s, the ratio of battle deaths to population was a third of what it had been in the 1970s. However, these positive developments were mitigated by continued strife in some regions, particularly in Africa, where war is claiming more victims than on all other continents combined. But even in Africa, there are fewer armed conflicts today (about 10 compared with 15 per year 5 years ago). The number of African countries torn by armed conflict has therefore dropped by a third. During the same period, direct battle deaths have decreased in Africa by 24%.

At the dawn of the third millennium, inhabitants of the planet had an average risk of becoming a casualty of war of approximately 0.4%, compared with an average of about 1% between 1945 and 1990. People are much more likely to die of disease and pandemics (91%) or in car accidents (2%) than in a war. However, there is little cause for celebration, for armed conflicts that could, theoretically, have been prevented or controlled continue to claim hundreds of thousands of direct and indirect victims year after year. Of the 22 million people who have perished in armed conflicts since World War II, 5.5 million died between 1990 and 1995. The causes of conflict are far from being resolved, and the dangers attendant on conflict have by no means been eliminated, although they are perhaps being anticipated and managed more successfully. In short, it is too early to say that war is being eradicated or even curbed. Human insecurity remains a challenge and a serious danger. Many armed conflicts continue to rage with deadly consequences and wars that seemed to be coming to an end have flared up again. In the wake of the genocides in Rwanda and Sudan, the civil war in the Democratic Republic of the Congo, and the new outbreaks of violence in Ivory Coast, Somalia, and Angola, there is no guarantee that we will not witness other unexpected and tragic events in Africa. Interstate conflict also remains a possibility: For example, hostilities could break out between North and South Korea should the North Korean regime decide, despite the armistice, to attack the South; between China and Taiwan over the latter's desire to secede; between India and Pakistan over their long-standing dispute over Kashmir and recently because of terrorism; between Ethiopia and Eritrea over unresolved border disputes that caused 70,000 deaths between 1997 and 2000; in central and Western Africa, where internal chaos and quarrels between neighboring countries make for a dangerous mix; in the Persian Gulf, where the Kurdish question has yet to be settled in Iraq and between the countries in the region; and in Lebanon, as the Israeli intervention in the summer of 2006 demonstrated.

These disputes are only a few examples of the continuing impact of interstate rivalries and domestic insecurity. There can be no doubt that the end of the Cold War has led to greater peace between states than at any previous time in history (hence Francis Fukuyama's well-known "end of history" thesis of 1992). However, the real challenge now is preventing or resolving intrastate wars. In other words, present-day conflicts are of a new type: In the past, states fought each other, but now clans, ethnic groups, and factions are challenging the state itself. Interstate warfare is therefore being replaced by ethnopolitical warfare. State actors are losing their monopoly on violence as infrastate players get in on the act. Supranational bodies are intervening in matters that were previously the exclusive preserve of states, in a bid to manage and control crises. It can be argued that the words *war* and *conflict* have taken on new meaning.

The Transformation of Armed Conflict

War between great powers in the industrialized world has lost its raison d'être in view of technological developments (nuclear weapons), demographic changes (low birth rate), economic factors (trade), and political factors (liberal democracy). However, wars continue to ravage underdeveloped and developing regions of the world. The creation of a relatively unipolar system dominated by the United States has not prevented armed conflicts from breaking out. The world is no longer divided into strategic "protectorates" as it was during the Cold War, and the emerging multipolar system is aggravating geopolitical rivalries in some regions.

War is becoming "deinstitutionalized" and reverting to what it was before 1648—hence the suggestion that we are returning to "premodern" warfare. Classic warfare is disappearing as war becomes "privatized," in the sense that it is being waged increasingly by private armies rather than conscripts or professional soldiers. Since the beginning of the decade, there have been growing numbers of nonstate armed conflicts—that is, fighting between different factions within a state as opposed to fighting between the state and one or more factions. For example, in 2003, there were 29 armed conflicts involving states and 30 nonstate conflicts. However, both types of conflicts are in decline.

Forty percent of the casualties of war are direct victims (killed in battle), and 60% are indirect victims (those who die as a result of the consequences of armed conflict—displacement, disease, pandemics, malnutrition, and famine). Civilians, who make up a large percentage of the casualties, are 10 times more likely to be indirect victims than direct victims. It is estimated that approximately one third of the civilians who die in armed conflicts are killed by government forces and two thirds by intrastate groups.

The indirect victims of armed conflict are largely women and children. Many are sexually assaulted. Of the male casualties, 90% are direct victims of combat, but there are also large numbers of men among the indirect victims. Men are more likely than women to perish in mass killings or to die of pandemics or malnutrition.

More wars are ending than there are new wars breaking out. For example, between 1991 and 2004, 28 armed struggles for secession began or resumed, while 43 were curbed or ended. In 2004, there were 25 such armed conflicts under way, the smallest number since 1976.

Every year, "ethnic wars" account for the majority of "major" armed conflicts (12 out of 19 in 2005). However, the number of such wars has plunged since the end of the 1990s, as has the number of civil wars. Typically, ethnic conflicts are caused by the collapse of states, not the reverse. They grow out of severe crises of governance that cause states to disintegrate. (Half a dozen states have crumbled over the past 20 years, including Afghanistan, the USSR, Yugoslavia, and Somalia.)

Armed conflicts are also spurred by the profit motive: fierce competition for control of resources, particularly minerals, diamonds, oil, and water. Elites, guerrillas, mafia, and mercenaries engage in warfare to exact tribute or to lay their hands on a nation's wealth. The geography of a conflict—its fault lines—is shaped more by the distribution of resources than by ideological or political differences (as is clearly seen in Central and Western Africa).

Democratization is a growing source of violence. Approximately one third of states are in transition. There are more democracies today than ever before in the history of the world, but the recent wave of democratization has left scars in its wake because of the failure of many transitional states to protect human rights or establish a state of law and because the democratization process has given rise to instability and bouts of political violence (examples include the former Yugoslavia, Colombia, Afghanistan, the Democratic Republic of the Congo, Burundi, Rwanda, Liberia, Sudan, the Palestinian territories, and Iraq).

The Phenomenon of War

Interstate war is a recurring phenomenon that appears to be part and parcel of the Westphalian system; there were 278 such wars between 1648 and 1940, or one every 2 years. In 2003, J. David Singer calculated that there had been 412 interstate and intrastate wars between 1816 (when there were 23 states) and 1997 (when there were 181); 135 of these wars occurred after 1950. In all, there were 179 wars in the 19th century and 233 in the 20th century. Of the 2,340 weeks between 1945 and 1990, only 3 were entirely free of war. According to Singer, the record is not encouraging: The two decades with the largest number of wars since 1816 have been the 1970s (36 wars) and the 1990s (31 wars). In recent years, between 10% and 15% of states have been at war. The good news is that as a proportion of the number of states in the world and the world's population (both of which are growing), the number of wars is decreasing. The ratio of wars to states has fallen steadily over the decades, from 0.74 in the 1890s (the highest in history) to 0.26 during the 1940s and 0.17 during the 1990s (one of the lowest in history). However, the number of battle deaths has been stable since 1950, at an average of approximately 2.6 million per decade, or one per 1,000, for a total of approximately 13 million dead. (These figures do not include indirect victims of war.) Wars caused an estimated 38 million battle deaths (including 11 million soldiers) between the years 1 CE and 1899 and more than 46 million deaths (including 22 million soldiers) between 1900 and 2000. From 1816 to 1939, interstate wars caused 28.4 million battle deaths and civil wars 6.8 million. Between 1940 and 2000, the proportions were reversed: 3.3 million battle deaths in interstate wars and 11.5 million in civil wars. World War I claimed a total of 20 million direct casualties, counting both soldiers and civilians, and World War II killed 40 million. Five wars accounted for more than half of all combat deaths during the 1946 to 2002 period: the civil war in China, the Korean War, the Vietnam War, the Iran–Iraq war, and the Afghan wars. These numbers do not include government-backed massacres of their own people (genocide, politicide, and femicide), which are estimated to have caused more than 175 million deaths between 1900 and 2000, of which approximately 125 million were caused by genocides and famines (70 million in China alone), 24 million by light arms, 17 million by artillery, and 2 million by aerial or naval bombardments.

Definition of War

We will return later to the statistics and trends, but first, we must attempt to define what war is. There is no consensus in the abundant literature. One of the classics, *A Study of War*, written by Quincy Wright (1942) of the University of Chicago, defines war as "violent contact of distinct but similar entities" (chap. 1). States may enter into violent contact, but so too may lions or tigers: This definition is inadequate since it ignores the importance of the political dimension of war. In Chapter I of his classic *On War*, the traditional strategist Carl von Clausewitz described war as "an act of violence intended to compel our opponent to fulfill our will" and then famously commented, "War is a continuation of politics by other means."

War may be considered, then, to be an armed confrontation between enemies with irreconcilable or incompatible political goals, which *always* has the potential to escalate into an unlimited engagement aimed at achieving total victory and the destruction of the opponent. It is the ultimate instrument of policy where political differences cannot be resolved except by the use of force. War is also an organized process, a dimension stressed by the expert on war, Gaston Bouthoul: "War is armed and bloody struggle between organized groups."

From a realist point of view, therefore, war implies acts of violence conducted and organized by political and military actors with antagonistic motives, which may be governments or infranational or supranational entities. Similarly, in the negative, we can say, with the realists, that peace is the *absence* of organized violence between groups or states. We shall see that, in the case of intrastate and ethnopolitical wars, there is disagreement between those who believe that war is inherent in the security dilemma (*realist theorists*) and those who argue, on the contrary, that war is constructed through the manipulation of identity by political entrepreneurs and decision makers (*critical theorists*).

War can take different forms in different eras:

> *International war* is war between states, such as the Gulf War of 1991, North Atlantic Treaty Organization's (NATO) war against Serbia in 1999, the intervention in Afghanistan in 2001, and the invasion of Iraq in 2003. It may be a regional war, such as the wars in the Middle East or between Pakistan and India, or a world war if the conflict spreads, as in World Wars I and II.
>
> *Intrastate war* has been the most common type of warfare since the end of the Cold War. The examples of the former USSR, Yugoslavia, Rwanda, the Democratic Republic of the Congo, Somalia, Sierra Leone, Sudan, Colombia, Afghanistan, and Sri Lanka illustrate the wide scope of violence between governments, factions, ethnic groups, and other groups trying to win or maintain control over territory and political power. Intrastate war may also be associated with civil strife or traditional ideological warfare (revolutionary wars, national liberation wars, guerrilla wars).
>
> War may be conducted by *conventional means* (invasion, bombing, coercion) or *unconventional means* (terrorism, insurrection, using chemical, biological, or nuclear arms). The means used determine the nature of the war.
>
> Wars may be *short*, *long*, or *indeterminate*. They range in duration from the Six-Day War in 1967 to decades-long conflicts, such as the Vietnam War, which continued from 1945 to 1975. Civil wars, such as the ones in Northern Ireland, Sri Lanka, and Kurdistan, which long appeared interminable (or still do), may come to seem like a permanent condition.
>
> War may be *total* or *limited*. In the first case, it knows no bounds: The annihilation of the enemy, the extermination of its population, and the end of its regime are the objectives. In the second case, the war is conducted within a restricted framework and is aimed primarily at preventing an escalation to unbridled violence. The restrictions limit the geographic scope of the conflict, the number of opponents, the use of specific means or specific weapons, and the intensity of the fighting. Examples of "limited war" include the U.S. military engagement in Korea and Vietnam, and the Soviet engagement in Afghanistan.
>
> *Unconventional wars* include psychological warfare, proxy or indirect wars, "nonwar operations," and cold war (the potential for violence is ever present in all these types of warfare); *new wars* include information wars, "star wars," the war against international terrorism, the war on drugs, and wars for control over resources (cases in which the potential for the use of force and for armed conflict is high).

Definition of Armed Conflict

Some research centers that compile statistics, such as the International Institute for Strategic Studies (IISS) in London and the Stockholm International Peace Research Institute (SIPRI), use the term *armed conflict* rather than war. An armed conflict may flare up sporadically, without necessarily constituting a war as defined above, but is more than a mere conflict in that it is not limited to a political dispute. There are generally some 20 "major armed conflicts" in any given year, as defined by SIPRI ("the use of armed force between the military forces of two or more governments, or of one government and at least one organized armed group, resulting in the battle-related deaths of at least 1,000 people in any single calendar year"). The international environment is shaped to a large degree by these armed conflicts. Most are intrastate, and the majority occurs in Asia or Africa. A significant proportion, but less than half, began before 1989. Civilians make up the bulk of the victims. As a result, the number of refugees and displaced persons remains high. Recently, the Human Security Centre has begun compiling deaths resulting from armed violence between nonstate actors as well as from government-led violence against its own people.

More broadly, the term *conflict* can be used to refer to a situation of opposed interests that does not necessarily lead to armed confrontation (e.g., the 40-year East–West conflict). If it does develop into armed conflict, it can be the same thing as a war. Conflict generally implies a situation of strong opposition between a state, ethnic group, clan, or other group and another of these entities due to incompatible goals, which may be of a territorial, political, diplomatic, economic, military, ethnoreligious, internal, or external nature. The range of distinctions that can be applied to conflicts, armed or otherwise, indicates their diversity:

> A conflict may be over *control of the government and the state* and therefore involve deep nationalist, ideological, or ethnic divisions (Afghanistan and the Democratic Republic of the Congo are good examples). Conflicts of this type can escalate into violent confrontation between groups or factions seeking at least partial control of the state (e.g., the rival guerrilla groups in Colombia).
>
> *Territory* is a key issue in many conflicts. The motives may be ethnic (as in the former Yugoslavia, Sri Lanka, Nagorno-Karabach, Georgia), economic (Iraq and Kuwait, the Spratly Islands), or strategic (Israel and Syria on the Golan Heights, India and Pakistan in Kashmir, Morocco, Western Sahara).
>
> *Ideology* can be an important factor when it is enmeshed in a long-festering dispute (as in the China–Taiwan and Israel–Palestine conflicts).

Many conflicts fall into more than one of these categories. In some, all the above factors come into play, intensifying the conflict. Collapsed states often present political, territorial, and ideological challenges that can be difficult to manage or contain. Numerous examples can be seen in Africa (Rwanda, Democratic Republic of the Congo, Somalia), the Caucasus (Georgia, Armenia, Azerbaijan), and Central America (Guatemala, El Salvador). Some major conflicts are regularly in the news; other conflicts are minor in scope and limited in time (such as the fishing disputes between Canada and Spain or between Iceland and Great Britain). Finally, in a minority of cases, we see local or regional conflicts that are confined to one country or neighboring countries, but a growing proportion of these have consequences with international ramifications (e.g., refugees, fears of escalation, collapsed states, displaced persons, humanitarian crises).

Trends and Developments in Armed Conflict

Violence, a prominent characteristic of the international system, is changing with time. What then are the main features of such violence, and how have they changed? What are the major trends in war, conflict, and violence around the world?

First, "major" wars (between major powers) have declined substantially, from 27 in the 16th century to 17 in the 17th century, 10 in the 18th century, 5 in the 19th century, and 5 in the 20th century. There have been no wars between major powers since 1945. If the trend holds, there should be no—or at the most very few—major wars in the 21st century. On the other hand, the destruction wrought by major wars has increased exponentially due to more advanced weaponry and the defense dilemma. The European wars of the 16th century caused slightly more than a million casualties, while 60 million soldiers and civilians died in the two world wars of the 20th century, more than the casualties of all previous wars combined. Since 1945, wars have caused an additional 40 million civilian and military casualties. (Civil wars and wars of independence in the Third World account for a large proportion of these.)

Second, 95% of armed conflicts and wars are intrastate. One of the goals of warfare today is the creation of smaller states, not larger ones as was the case in the past. As Kalevi Holsti observes, the great majority of wars since 1945 have been waged within states: "Almost 77% of the 164 wars were internal, where armed combat was not against another state but against the authorities within the state or between armed communities." Notwithstanding the oft-heard thesis that this is a phenomenon of the post–Cold War period, it has in fact been a well-established trend for 50 years. In other words, states have been under threat of fragmentation for some time.

On the one hand, interstate wars are becoming less frequent; on the other, intrastate wars are becoming more so. While there were a dozen civil wars per decade in the first half of the 20th century, the average has increased to 20 in the last 50 years. During the 1990s, the majority of *civil wars* lasted more than 5 years, two fifths lasted more than 10 years, and a quarter more than 20 years. Between 1989 and 1996, more than one third of United Nations (UN) member states—countries with a combined total of 20 million soldiers and a civilian population of 3.3 billion—were torn by civil war. Civil wars in the Third World left some 40 million dead.

Third, territorial factors are becoming considerably less important as a cause of war. Between 1648 and 1945, about one half of wars were territorial in nature, compared with 30% since 1945. As noted above, between 1945 and 1989, close to 77% of wars were internal, of which half were ideological and the other half ethnic conflicts or wars of secession.

Whereas during the Cold War armed conflicts were fairly evenly divided between conflicts of a territorial, ideological, and ethnopolitical nature, since 1989, the greatest proportion of conflicts has fallen into the last category; most commonly, these have been ethnic and identity-based conflicts in states at risk of collapse. On the other hand, serious territorial conflicts have a *greater* chance of escalating into war than do other types of conflict. While there are fewer and fewer disputes between states over territorial sovereignty, 17% of the world's 309 land borders are disputed, and 39 countries are still involved in jurisdictional disputes over archipelagos or islands. Some observers argue that territory remains an important issue, particularly in the age of globalization, as some states fight fiercely to maintain their integrity while they see their economic independence slipping away.

Fourth, the majority of wars and armed conflicts are being waged in the Global South, primarily in Africa and Asia but also in the Middle East and the Caucasus. In Latin America, the number of armed conflicts has declined considerably. Three regions have seen no interstate wars since 1945: North America, South America, and Western Europe (except for the intervention against Serbia in 1999).

Fifth, fewer soldiers and more civilians are involved in wars. Civilians have become the leading victims of armed conflict by far: In the 1990s, 90% of the victims of war were civilians, compared with 65% during World War II and 40% during World War I. There were nearly 5 million military and civilian battle deaths in intrastate wars (counting both colonial and civil wars) between 1900 and 1949, and more than 10 million between 1950 and 2000. Interstate wars claimed 27 million military and civilian battle lives during the 1900 to 1949 period and 3 million between 1950 and 2000. These figures do not include state genocide perpetrated against domestic populations in the former USSR, China, Cambodia, and elsewhere, which have claimed more than 100 million victims.

Civil strife has had devastating effects. For example, there have been close to 4 million battle deaths in the Democratic Republic of the Congo since 1998. With 1,250 people dying daily, the war in the Congo has been the deadliest since World War II. The use of rape as a weapon of war and the spread of pandemics such as AIDS, which are rampant in many countries and in the armed forces in particular, should also be noted (60% of soldiers are infected with the human immunodeficiency virus [HIV] in Zambia, 55% in Zimbabwe, 40% in Angola and the Democratic Republic of the Congo, and 10% to 30% in Tanzania, Ivory Coast, and Nigeria). A growing proportion of civilian victims are children, and the majority of armed conflicts involve child soldiers under the age of 15. In the Third World, industrialization and the expansion of the service economy are creating an influx of young people into the urban centers where more jobs are available. As a result, the population of the cities is swelling, leading to the "urbanization" of conflicts. Jean-Louis Dufour has predicted that cities will be the battlefields of the next century.

In light of this survey, there is reason for both optimism and pessimism about the prospects for violence in the future.

On the one hand, while there are many more states today than there were 200 years ago, there has been no increase in armed conflicts between states. In proportionate terms, there are fewer armed conflicts today than there were at the beginning of the 20th century. On the other hand, it is clear that the human tendency toward violence has not subsided; in fact, it has become more intense and less state driven.

The Future of Peace Missions

Since the early 1990s, the UN has played a central role in the implementation of conflict prevention and resolution strategies. As a rule, the UN is automatically involved in peace missions. The existence of an international organization that is able to deploy soldiers supplied by member countries in order to maintain or restore an often fragile peace is a new development of historic significance. Over the past 50 years, the UN has sent hundreds of thousands of Blue Helmets (i.e., peace forces) to carry out a variety of observations and to monitor missions designed to help prevent a resumption of hostilities. Since the end of the Cold War, the UN has adopted two additional goals: (1) creating conditions for a lasting peace settlement and (2) supporting efforts toward reconciliation and reconstruction in societies that have experienced violent conflicts. This expanded agenda explains the significant increase in peacekeeping missions during the past decade.

Seventeen UN peace missions were launched in the 4 years following the end of the Cold War, from 1989 to 1993—as many as during the preceding four decades. There had been a total of 15 missions up to 1989, all but 5 in connection with interstate conflicts. Between 1989 and 2000, there were a total of 38 new missions, all but 5 for intrastate conflicts. In 1991, there were about 11,000 peacekeepers on the ground; 2 years later there were more than 78,000, an all-time high. In the late 1990s, a certain amount of fatigue, coupled with cost concerns, set in, and the number of Blue Helmets dropped to 30,000 in 1999; however, by the end of the first decade of the 21st century, there were again almost 80,000 UN soldiers involved in more than 20 missions (approximately 100,000, if one includes military observers and civilian police). In addition, 65,000 NATO and European Union (EU) soldiers were on duty in Afghanistan, Kosovo, and Bosnia as part of robust operations aimed at maintaining a fragile peace. The UN is therefore more active than ever. The number of peace missions has increased, even though the number of conflicts has decreased. Three quarters of the total number of peace missions in the history of the UN have been launched since the end of the Cold War at an annual cost of around $5 billion (equal to 1/100 of the U.S. security budget). According to Peter Wallensteen, the UN helped work out 25 of the 39 peace agreements that were signed between 1989 and 2000 for the purpose of ending armed conflicts. The UN is involved in peacemaking and peacebuilding in no less than half of the civil wars taking place today. Between 1990 and 2002, peacemaking initiatives increased fourfold; the imposition of sanctions, fivefold; preventive diplomacy missions, sixfold; and mediation mechanisms and truth and reconciliation commissions, sevenfold. The total number of peace operations more than tripled from 7 in 1988 to 23 in 2008 (see the reports from the Human Security Centre at the University of British Columbia and the *Annual Review of Global Peace Operations* from the Center on International Cooperation at New York University). Between 1948 and 2008, some 2,200 Blue Helmets were killed during peace missions; more than half of those have died since 1993. Since intrastate wars have largely replaced interstate wars, to which UN mechanisms appear better suited, peace missions have become more demanding and more dangerous. In the new international security environment, the UN has been redesigning the mandates and methods of peace operations launched to end civil wars and ethnic conflicts. The results, however, have been mixed. The UN's own self-assessment reports on the Rwandan genocide of 1994 and the massacre in the Bosnian village of Srebrenica in 1995 uncovered serious weaknesses in peacekeeping mechanisms and decision making. Since these events, there have been many analyses of the shortcomings of the UN's peace operations and international security efforts. Those deficiencies have been made evident again by the UN's inaction in Darfur and the Democratic Republic of the Congo.

The impartial Blue Helmets, standing between the combatants with the consent of both parties, seem to be a thing of the past. In today's peace missions, UN soldiers (and, ironically enough, NATO soldiers) are called on to maintain and strengthen the standards that underpin peace. In a country that has become ungovernable, the mere presence of UN forces can be enough to provide a level of security, which will enable the country to get past the roots and the effects of war, at least for a time. In addition, there is hope that as they move toward a liberal conception of democratic standards and a market economy, these countries will recover the peace that they lost or never knew. Together with other actors, particularly humanitarian organizations and financial institutions, the Blue Helmets are taking initiatives and applying principles that go beyond the limited, traditional concept of peacekeeping. Their new role pursues the far more ambitious objectives of peacemaking, peace enforcement, and peacebuilding. Realists consider this to be a praiseworthy but naive approach that is based on false hopes and doomed to failure. In their view, the UN cannot abandon the Westphalian conception of security on which it was founded in 1945. According to the realists, if the UN claims a right of interference, which entails an increased practical commitment to human security, it will flounder on the severe limitations and enormous obstacles faced by intrastate peace missions. For one thing, the possibility of artificially reshaping a society in the image of a Western democracy appears to the realists to be doubtful at best. A basic contradiction immediately presents itself: The UN and other organizations such as NATO are increasingly expressing a desire to keep the peace not only *between* states but also *within* states. Whereas during the Cold War, most states wanted the UN to be no more than an arbiter of interstate relations, and a weak one at that, some now expect the UN to rescue and, if necessary, revive collapsed states that are unable to govern themselves or maintain security. Can the UN fulfill this role? Are UN peace forces able to resolve intrastate conflicts? This question can be expected to arise with every new peace mission and to fuel bitter debate for years to come.

Definitions of Peace

In general, a peacekeeping mission refers to the deployment by the UN (or another intergovernmental organization [IGO]) of civilian personnel, police, and Blue Helmets for the purpose of conflict prevention, management, and resolution. The UN's military operations include a full range of activities aimed at curbing and resolving conflicts, from traditional peacekeeping to peace enforcement.

Peace has often been defined as the absence of violence. In the post–Cold War period, this classic, primarily "negative," definition has come to be seen as inadequate, and the international community is working toward a more progressive and "positive" definition of peace. The negative conception of peace implies that peace is only temporary. Peace exists when we succeed in preventing the outbreak of conflict. It is a fragile interval produced by the balance of forces. It may be based on the hegemony of one state, the balance between major powers in the international system (e.g., where several countries possess weapons of mass destruction), or the play of alliances. These are all shaky foundations for peace and, in the view of the realists, have not prevented the persistence and regular resurgence of war, the natural order of things, throughout history.

The positive conception of peace is based on the establishment of values, networks, and multilateral mechanisms that can ensure the long-term survival of a stable international system. The threat is no longer military in nature and cannot be addressed by states acting on their own. The principle "every man for himself" is replaced by "all for one" and the idea of power by the concept of sharing. Individual attitudes must change, the machinery of war must be abandoned, and peace and justice education must be promoted.

Approaches to Peace Missions

Approaches to peace and peace missions sometimes adopt a positive and sometimes a negative conception of peace.

During the Cold War, the (negative) concept of peacekeeping was the only one in common use. With the proliferation of peace missions and mandates since 1989, new (more positive) concepts have gained currency. Most notably, the Agenda for Peace proposed in 1992 by UN Secretary General Boutros Boutros-Ghali and revised in 1995 set out principles and terms that gave new impetus to research efforts and introduced a more precise classification of peace missions. From the voluminous literature on peace missions, we will discuss four terms that are now widely in use.

Peacekeeping means deploying UN personnel—primarily, military personnel—with the consent of the parties to the conflict to maintain a cease-fire and prevent a resumption of hostilities. By positioning multinational forces between the parties, the UN tries to preserve or increase the chances of peace. The forces are deployed only when a peace agreement has been reached and has taken hold. The forces remain impartial and neutral. They can fire only in self-defense. If hostilities break out again, they are immediately withdrawn. The UN Charter made no provision for such forces; they are often said to be mandated under a fictional Chapter VI and a half, halfway between the cooperative means of Chapter VI and the coercive means of Chapter VII.

Peacemaking includes all forms of mediation and negotiation intended to bring the parties closer together, essentially by peaceful means. The cooperative means referred to in Chapter VI of the UN Charter are used to help achieve a settlement of the conflict. Preventive diplomacy, particularly the preventive deployment of peacekeepers, can also be useful for containing the outbreak and escalation of violence between the parties. The deployment of forces with the consent of the parties can help establish a climate of trust and security conducive to the resumption of negotiations and mediation.

Peace enforcement refers to coercive action authorized by the UN Security Council pursuant to Chapter VII of the Charter in response to "threats to peace, breaches of the peace and acts of aggression." Multinational military forces under UN command must then enforce the agreements that they are supposed to guarantee and, if necessary, engage in armed action. Peace enforcement can also be undertaken by a regional organization under Chapter VIII of the Charter and in accordance with rules stipulated by the Security Council.

Peacebuilding means a concerted effort by the UN and the international community as a whole to develop political, economic, and security infrastructures to achieve long-term suppression or resolution of a conflict. Peacebuilding attempts to lay the foundations for reconciliation and reconstruction. It seeks to avert any resumption of violence in a bid to redraw the settlement. While it is intended primarily for the postconflict phase, it can also be applied as a preventive measure before violence breaks out or even during the conflict to firm up an unstable or precarious peace. It is based on the economic and social measures described in Chapters IX and X of the Charter, among others.

These approaches are used in succession as part of an overall strategy for peace.

Development of Peace Missions

The development of peace missions can be thought of as spanning two periods: (1) the Cold War, from 1948 to 1988, during which traditional peacekeeping operations were conducted by the Blue Helmets, and then (2) the 1989 to 1993 period, during which the deployment of peacekeepers and their assignments expanded exponentially. A third emerging phase, the post-1994 period, is less distinct: It is a continuation of the preceding period with some accentuated features.

The first period opened with the UN Observer Missions monitoring in Palestine in 1948 and Kashmir in 1949 (the dates of the beginning of the operations). The goal of the "Blue Beret" missions was to monitor cease-fires and armistice agreements that had been agreed to by states. The deployment of the "Blue Helmets" (a Canadian invention) along the Suez Canal in 1956 was the beginning of a new, more engaged phase. Similar operations were subsequently carried out to enforce, as far as possible, other demarcation lines and cease-fires between opposed countries or communities, such as Cyprus in 1964, the Sinai in 1973, and the Golan Heights in 1974.

The Blue Helmets were positioned between the combatants to police a buffer zone and reduce the risk of a resumption of hostilities. The principle was clear, and the success criterion was the absence of war—that is, the realization of the negative conception of peace. Other missions were mandated to verify the suspension of hostilities between Iran and Iraq in 1988, to supervise the withdrawal of foreign troops from Afghanistan in 1988 and Angola in 1989, and in the first intrastate conflicts that the UN has dealt with, to restore order in Congo in 1960 to 1964 and in southern Lebanon in 1978. This period also saw multilateral operations outside the UN framework, such as the one in Lebanon in 1982, in which several countries joined forces to deploy an implementation force.

During the second period, which extended from 1989 to 1993, 17 new missions were conducted. As the Agenda for Peace noted in 1992, the UN deployed tens of thousands of Blue Helmets to carry out expanded missions. They supervised elections (Namibia and Nicaragua in 1989), helped settle disputes (El Salvador in 1991, Cambodia and Mozambique in 1992), and served as a prevention force (on the Kuwaiti border in 1991 and Macedonia's border in 1992). They also monitored disarmament (Iraq in 1991), ensured the security of humanitarian operations, protected refugees and displaced persons (in northern Iraq in 1991, in Somalia and Bosnia in 1992), and observed and monitored the (often futile) implementation of peace agreements (in Angola in 1991, in Rwanda in 1993).

These examples confirm three notable changes in Blue Helmet missions.

1. They affirm (reinforce) the new right of intervention to provide humanitarian assistance, proclaimed by the Security Council after the Gulf War in 1991.
2. Most of these Blue Helmet missions addressed intrastate conflicts, without necessarily obtaining prior consent from the government or the rival factions.
3. The missions were multidimensional; that is, they simultaneously comprised peacekeeping, peacemaking, peace enforcement, and peacebuilding components.

Since 1994, a third generation of missions has emerged: The focus is on peace enforcement to stabilize collapsed states through reconstruction, democratization, and development. In these missions, peace enforcement and peacebuilding interpenetrate.

In one new feature, many of these missions were originally conducted by an actor other than the UN but with the UN's approval. This occurred for the first time with the deployment of U.S. troops in Somalia in 1992, initially for strictly humanitarian reasons. The subsequent use of force by the United States in Haiti in 1994, by NATO in Bosnia in 1995 and in Kosovo in 1999, by Nigeria and Economic Community of West African States Monitoring Group (ECOMOG) in Sierra Leone in 1997, by Australia in East Timor in 1999, by Great Britain in Sierra Leone in 2000, by NATO again in Afghanistan in 2001, and by France in Ivory Coast in 2002 revealed the UN's significant shortcomings when it came to deploying an *armed* force without the full consent of the host country's political authorities. Over the past 6 years, UN peace forces, acting in some cases with the support of small contingents from the African Union (AU), Organization of American States (OAS), Economic Community of West African States (ECOWAS), or the EU, have taken over such missions in Sudan, Sierra Leone, Liberia, Ivory Coast, Burundi, the Democratic Republic of the Congo, Haiti, and East Timor but only once the situation was relatively stable. In Somalia, Haiti, and East Timor, the UN Blue Helmets took over the missions only once security had been reestablished. Elsewhere, the Blue Helmets continued to conduct traditional monitoring and peacekeeping operations lasting for years in Cyprus, the Middle East, Western Sahara, Kashmir, and the Ethiopia–Eritrea border. There has been lively discussion about the role of the peace forces and heated polemics about their operations against the background of UN reform and the redefinition of its mechanisms.

Clearly, there are huge obstacles to giving the UN real peace enforcement capabilities. These include the lack of a real military mechanism at the UN, archaic command structures and doctrines, lack of equipment and financial resources, poor coordination, overly decentralized training and supervision of peace forces, inability to react swiftly, and, most important, the UN's dependence on the countries that supply the Blue Helmet troops.

Hence, it is not surprising to see devolution of military operations to defense organizations, including NATO, and to major powers, such as the United States, which have greater experience and more resources in this area. Another promising approach might be to "regionalize" peace enforcement and provide regional organizations such as the AU with the logistical means, funding, and training in command and coordination that they need to conduct enforcement and combat missions more independently, although still under the aegis of the UN. Hybrid missions of this type would also better reflect the contribution of southern hemisphere countries to UN peace missions: Five nations—India, Pakistan, Bangladesh, Nigeria, and Ghana—are now supplying three quarters of the Blue Helmet troops. At the end of the day, the UN serves the cause of peace more effectively in its role as impartial mediator than in a military capacity. However, it appears that armed force is needed to establish and shore up the peace. This is a battle that the founders of the UN clearly did not foresee and that the Blue Helmets are not equipped to wage.

WARLORDS

The term *warlord* reemerged on the political scene due to a number of bloody intrastate conflicts since the beginning of the 1990s. In particular, the long-standing wars in West Africa, in Somalia, in the Democratic Republic of the Congo, and in Afghanistan led to the frequent use of the term in politics, media, and academia to describe powerful men and their armed organizations, which profit economically from war and violence. Modern archetypes, such as Charles Taylor (Liberia), Johnny Paul Koroma (Sierra Leone), Mohammed Farah Aideed (Somalia), Jean-Pierre Bemba (Democratic Republic of the Congo), Mahmud Khudoberdyev (Tajikistan), and Gul Agha Shirzai, Ismail Khan, and Abdul Rashid Dostum (all Afghanistan) are regarded as both a result and a key characteristic of the so-called new wars. This entry analyzes the phenomenon, in general, and points to the main characteristics of organization, leadership, and other key aspects.

The Phenomenon of the Warlord

The warlord phenomenon is not a new challenge for governments and the international community. On the contrary, warlords have been constant companions of wars since the ancient times and the medieval period. In particular, the situation in Britain in the early Middle Ages with a number of rival armed local commanders, dukes, and lords is seen as a historical precedent. But also during the Thirty Years' War of the 17th century, feudal warlords—Max Weber used the terms *Kriegsfürst* and *Kriegsfürstentum*—dominated European battlefields. They recruited and paid their own soldiers, and they were known for plundering the local population; perhaps the most prominent figures being Duke Albrecht von Wallenstein and Duke Mansfield. Another historical point of reference is the Chinese warlord era after the collapse of the Qing Dynasty in 1911. Due to the fragmentation of the Empire as well as the competition of local rulers and army commanders, about 1,300 warlords (in Chinese called *junfa*), subdivided in different cliques, were involved in more than 140 greater and smaller wars in the 1920s and 1930s. From a historical point of view, the figure of the warlord can thus be seen as the classical antagonist to the modern state's monopoly on the use of force, which was successively established in Europe and later elsewhere against various forms of warlordism.

In general, warlords are portrayed as profit-driven, economically motivated actors who have an interest in ongoing conflicts and, therefore, undermine peace and stability. As Max Weber (1978) pointed out, "The warlord becomes a permanent figure when there is a chronic state of war" (p. 1142). Moreover, warlords may also be present in a fragile postconflict setting or in situations of state failure. Under such circumstances, as demonstrated, for example, in Afghanistan after 2001 or in Bosnia after 1995, warlords and their private militias aim at consolidating the territorial, financial, or economic gains that they have made during a violent conflict. In other words, warlords may also exist outside of war times and may influence postwar economies and politics, in particular, as long as state structures are weak or failing and the state's monopoly of the use of force does not exist.

In press reports as well as in the academic literature, the label *warlord* has been used for very different persons and groups. In some cases, presidents, heads of government, leaders of political parties, or former army generals also have been described as warlords. But mostly the term refers to an armed nonstate actor who is able to control a particular territory and its inhabitants, during or after the end of a violent conflict. Or as James

Sheridan (1966) put it, a warlord is a man who exercised effective governmental control over a fairly well-defined region by means of a military organization that obeyed no higher authority than himself. The regions or territories dominated by warlords are often remote, far away from the capital, and beyond effective control of the national government. In some cases, territorial control exceeds even international borders. For example, in 1992–1993, Charles Taylor controlled not only most of Liberia but also parts of Sierra Leone and the border region with Ivory Coast (known as "Taylorland").

Generally, warlords aim at controlling areas rich in resources such as timber, oil, minerals, diamonds, gold, or other precious metals, which are easy extractable. These resources are exploited directly or indirectly, such as by selling concessions to national or international companies. The population under the control of a warlord organization also serves as an important resource. Warlords and their fighters may regularly plunder and loot villages and farms, they may raise special "taxes" for granting physical security, and they may also benefit from local businesses and trade relationships as well as from criminal activities (e.g., drug cultivation and trade, human trafficking, smuggling of goods), which they either control or at least allow as long as they can enjoy their share of the profits. In addition, warlords—like other armed groups—may use humanitarian or developmental aid, provided by international donors, for their own purposes. Or, alternatively, they demand money or goods for allowing nongovernmental organizations (NGOs) or aid agencies to supply the local population with basic services or to start infrastructure projects. As emphasized by Mark Duffield (1998) and William Reno (1998), warlord organizations need to operate across borders and try to get access to regional and global networks as well as to gray and illicit markets in order to persist. Therefore, successful warlords establish transnational links with businesspeople, companies, governments, or organized crime.

The Organization and Other Key Aspects

These economic activities, however, are not only driven by selfish profit interests, but they are a necessary requirement to finance a warlord's activities, including acquiring weapons and paying their fighters and supporters. Warlords have to be able to recruit, maintain, train, and equip their own private paramilitary forces. Sometimes they also use child soldiers, but mostly they will rely on experienced comrades and fighters. The relationship between them and the warlord is often based on personal loyalty and to a lesser extent on ethnic ties or political ideology. Therefore, a warlord should be distinguished from a clan chief or a rebel leader. It may, however, be the case that key members of a warlord organization come from the same ethnic group, tribe, clan, or family to enhance the coherence of the group and to ensure trust among its leadership. This pattern can be found in particular in Somalia and Afghanistan where clan and tribe organizations are still very strong. In some instances, the charisma of the warlord and the myths about his ("glorious") life play an important role in attracting supporters, in particular young men. The kind of organization differs from case to case and ranges from rather hierarchical structures to a loose band of commanders and subcommanders who pursue their own interests and have a certain degree of autonomy.

Nevertheless, to stay in power, warlords have to rely on their leadership and organizational skills as well as on their ability to sustain coalitions and networks. In this respect, many warlords can make good use of their capabilities and contacts they have made in their former lives. As several biographies show, they have often been part of the political or military establishment of a country; sometimes they come from wealthy, influential families (e.g., Bemba), a number of them have made a professional career in the army or the security sector (e.g., Khan, Dostum, Koroma, Aideed, and Khudoberdyev). Others had experience as businessmen and a few even studied abroad such as Taylor in the United States or Bemba in Belgium (both earned degrees in economics). Most of them first supported the existing regime but later joined the opposition and set up armed groups (e.g., Taylor's National Patriotic Front of Liberia [NPFL]) or used the opportunities offered by state failure and civil wars. For example, during the 1980s and 1990s, the Afghan warlords managed to establish themselves as key field commanders and build territorial strongholds. Warlords, however, cannot always be seen as antagonistic to state actors. Sometimes, they collaborate with the government and may even join forces with the state's military if this fits their interests and as long as the government does not challenge the warlord's autonomy.

To sustain their rule, warlords cannot only rely on the (potential) use of violence to deter enemies or intimidate the population; they often perform a political role and try to achieve some form of governance. As Paul Jackson (2003) pointed out, established warlord organizations can be understood as "quasi governance" or "embryonic states" that aim at enhancing support and legitimacy of the population by providing basic services and maintaining infrastructure. "Taylorland" serves again as an illustration since it had its own currency and banks, media, transport, and communication infrastructure as well as "external" trade relationships. Many warlords, therefore, made attempts to act as "politicians" in order to secure their power base as well as their resources and profits. They establish political movements and take part in elections; others become incorporated in official state structures. In Afghanistan, for example, a number of warlords became—at least for a certain period of time—provincial governors, ministers in the central government, or members of parliament. Similar careers can be studied in Tajikistan, in the Democratic Republic of the Congo, in Somalia, or in West Africa. The most prominent figure has certainly been Charles Taylor who was elected president of Liberia (1997–2003). However, it can be stated that warlordism is not a long-term phenomenon. Only in very few cases were these figures able to keep their position for more than 10 years; more often they vanished from the scene, they became ordinary criminals, or they were defeated or killed by their enemies or by internal rivals. Even in the case of Charles Taylor, the story did not end gloriously; first he had to live in exile in Nigeria before he was arrested and transferred to Sierra Leone in 2006, where he faces the Special Court on war crimes.

WEBER, MAX (1864–1920)

At the beginning of the 21st century, the International Sociological Association asked its members to list five books published in the 20th century that were most influential in their work as sociologists. The book that was listed most often overall was Max Weber's *Economy and Society*, and *The Protestant Ethic and the Spirit of Capitalism* ranked fourth. The latter was also listed among the New York Public Library's *Books of the Century* (1895–1995). The regard for Weber's thought thus extends beyond sociology, and it continues to inform a variety of disciplines, including political science, today.

The Protestant Ethic and the Spirit of Capitalism

The Protestant Ethic and the Spirit of Capitalism is arguably Weber's best known study, but its purpose and main results have often been misrepresented or misunderstood. Both terms in the title represent what Weber called "ideal types," that is, they are not directly observable entities but rather constitute one-sided conceptual abstractions that provide the social scientist with a tool to better understand and interpret aspects of reality. In this work, the particular aspect of reality that Weber was most interested in was a core constitutive element of the specifically modern type of capitalism: its underlying motivation or "spirit." For Weber, modern capitalism's constitutive features were not only the systematic pursuit of profit and a rational organization of the production factors of labor and capital in the economy but also a distinctive modern ethos that guided work and acquisition.

Weber illustrated this ethos by using Benjamin Franklin's admonitions of how to act in order to succeed in business. Franklin stressed methodical, industrious, and frugal conduct, viewing it as an ethical responsibility to increase one's material well-being through honest hard labor and focusing thereby on long-term results. Such ethical responsibility, or duty, to pursue one's vocation or (secular) "calling" in a diligent and competent—thus, in the modern sense, professional—manner sets the "spirit" of modern capitalism and also sets apart modern capitalism itself from other economic motivations and forms of the economy. At the most general level, Weber distinguishes capitalism and its profit motive from (a) socialism/communism, which does not aim for profit making but for the satisfaction of the needs of a collective; (b) the "hand-to-mouth" existence in a subsistence economy, with no surplus to trade on markets; and (c) traditionalism, an economic motive according to which a person works only as much as is necessary to achieve or sustain a certain standard of living—an economic motive antithetical to dynamic and expanding markets. Capitalism itself can be differentiated into *market capitalism* and what Weber termed *political capitalism*. In political capitalism, a state uses its political power and resources to extract a surplus from its own citizens or even from other countries. This use of force contradicts the formally peaceful means employed in modern capitalism. The "spirit" of modern capitalism à la Franklin undergirds modern *rational* capitalism and sets it apart from robber and booty capitalism, by which a corporation or an individual employs force and illegal activities to gain an economic advantage, and from adventure capitalism, which, though not necessarily illegal, involves irrational speculation and a daredevil attitude. The motives of adventure and robber capitalists are incompatible with the spirit of capitalism and its emphasis on the engagement in a vocational calling with the aim to make renewed, long-term profit.

Weber considered the "spirit" of modern capitalism the heir of the "Protestant ethic." The "Protestant ethic," according to Weber, was a form of inner-worldly asceticism practiced among ascetic Protestant groups that ultimately derived from Calvinist theology and its concept of a "calling." These groups shared the view that individuals had to prove themselves in their entire life conduct, for it was through ascetic conduct, particularly in one's profession and vocation, that members could gain assurance of their salvation status. Such ascetic moral conduct, Weber wrote in a companion essay, "The Protestant Sects and the Spirit of Capitalism," also allowed ascetic Protestants to gain and retain membership in groups that provided certification of moral qualification and thus business and social creditworthiness. In this context, Weber acknowledged not only the sectarian discipline in these groups but also their flat hierarchies and self-governance, which contributed to the emergence of public citizenship in civil society, dynamism in governance, and the social responsibilities of the rights-bearing individual. Ultimately, however, while Calvinist doctrine had led to the disenchantment of the world, as the use of magical means was no longer considered legitimate, paradoxically, it also laid the foundation for secularization (the decline of religion's influence on other social spheres) and the embrace of materialism (the pursuit of material gain instead of religious goals), which led Weber to his oft-quoted characterization of the modern world as an "iron cage" devoid of meaning.

In spite of Weber's claim that his study was merely an illumination of how ideas can become effective in history and focused on the emergence of the modern professional (*Berufsmenschentum*) in its significance as a component of the capitalist spirit, *The Protestant Ethic* has sometimes been seen as an anti-Marxist idealist construction of history, and many historians have raised doubts about the imputed influence of religious notions on economic activities in the early modern age. Weber himself sought to broaden the scope of his inquiry by addressing the mutual influence of religious and economic factors in his writings on the "Economic Ethics of the World Religions," in which he also widened his thematic focus beyond religion and the economy to religion and the rationalization of all spheres of life.

Economy and Society

Many social scientists consider *Economy and Society* as Weber's major work and one of the most important contributions to the discipline. Due to the fragmented nature of the compilation, it is often used as a compendium from which scholars draw selectively on Weber's ideas, frequently from the first four chapters, which contain Weber's "Conceptual Composition" and are the only parts that Weber actually had sent off to the printer before his death. In contrast to this newer part, the older parts of the compilation include Weber's writings on communities, in general; religious communities; law; domination; and the city.

Among the most influential perspectives is Weber's sociology of domination. Weber distinguished between power and authority. Power is the chance to realize intentions even against the resistance of others, whereas authority is the probability that specific commands are obeyed by a group of people. Weber believed that people typically obeyed commands so long as they considered them legitimate. He further specified three different claims to such legitimacy. *Traditional legitimacy* is based on the belief in the validity of long-standing traditions and customs. The ruled owe a personal loyalty to the ruler, who may rule over a household as a patriarch or use staff or other administrative apparatus, as in the case of patrimonialism. The social and political order under traditional rule is static. *Charismatic authority* is based on the extraordinary and exceptional qualities, or charisma (literally, a "gift of grace"), of a person, who in declaiming a "mission" motivates others to become followers and even disciples. Charismatic authority is apt to break through the static order of traditional rule. It tends to be unstable, however, as it is tied to a person; thus, Weber addressed the ways by which the inherently unstable nature of charismatic authority is depersonalized and transformed into a more stable system of authority, a process he called the *routinization* of charisma. One outcome of the routinization of charisma is "office charisma," in which an office is vested with authority from customs (traditional authority) or legal-rational rules (bureaucracy). Finally, *rational-legal authority* rests on the formal legality of enacted rules and the right of those in authority to enforce rules. The purest manifestation of such authority was modern bureaucracy, which in Weber's view was the most formally efficient and rational way to administer complex modern societies. A bureaucracy relies on the knowledge of trained professional officials, whose duties and obligations are expressly defined in written regulations and whose employment and promotion are based on administrative training and experience.

Weber's views on domination had implications for his views on politics. In modern society, the bureaucratization of society could lead to its ossification into an "iron cage," governed by bureaucrats, who, unlike politicians, were typically not elected nor subject to direct public oversight. He foresaw the bureaucratization of modern capitalism through the proliferation of bureaucratically run corporations and the bureaucratization of politics through the emergence of party machines run by political functionaries. He believed that what he called a plebiscitary leader democracy, in which a charismatic leader injects politics with dynamism yet remains tied to approbation by the ruled masses, could be a solution to this problem of the bureaucratization of politics. In one of his most famous lectures, "The Profession and Vocation of Politics," he elaborated on this thought.

"The Profession and Vocation of Politics"

Weber noted that the modern state is characterized as a community that successfully claims a monopoly on legitimate physical force on a certain territory, using a bureaucratic apparatus and holding ownership over administrative means (including those that involve force). Weber not only related his notions about the state to his views on authority and power but also more precisely outlined the characteristics of a modern politician, whom he viewed as the product of larger societal trends of democratization, bureaucratization, and professionalization. The modern politician was a full-time professional who lived both for and off politics. The action of politicians, in contrast to that of bureaucrats, is not about administering rules and regulations impartially but governed by the principle of taking responsibility in leadership. In doing so, the politician can adopt either an “ethic of conviction,” which is motivated by good intentions but does not take into account the outcomes of action, or an “ethic of responsibility,” which takes them into account and which Weber personally preferred over the former and considered more appropriate for modern politics. Leadership by professional politicians is part of the struggle among parties, which Weber saw headed toward governance by an impersonal apparatus, unless a politician who saw politics as both profession and vocation established a plebiscitary form of leadership democracy. This notion has proved controversial, for some scholars have viewed Weber’s concept as an endorsement of nationalist power politics that paved the way to fascist rule in Europe after Weber’s death, while others have pointed to Weber’s cosmopolitan, Anglophile political liberalism to reject this view.

WEIGHTED LEAST SQUARES

Weighted least squares (WLS) is a standard compensation technique for nonconstant error variance (heteroscedasticity), which is common in political science data. By assigning individual weights to the observations the heteroscedasticity can be removed by design. The square root of the inverse of the error variance of the observation is typically used as a weight. The key idea is that less weight is given to those observations with a large error variance. This forces the variance of the residuals to be constant. WLS is an example of the broader class of generalized least squares estimators. The idea was first presented by Alexander Aitken (1935). The foundations of this procedure and a concrete example are presented below.

Motivation

Standard regression modeling assumes that the variance of the residuals is constant across the levels of the explanatory variables. Often in political science this is violated, causing potential problems of fit and interpretation. George Downs and David Rocke (1979) give the well-known examples of increasing spread around consumption as income increases, increasing spread in the proportion of felons incarcerated in states as legislative interest increases, and decreasing spread in that proportion as the average education level in the state decreases. All of these are examples where one aspect of the relationship between the explanatory variable and the outcome variable, outcome uncertainty, changes as the levels of the right-hand side are altered. WLS addresses this problem by *modeling* this heteroscedasticity rather than ignoring it. Thus, there is a trade-off between increased model complexity and increased interpretational complexity.

Theory

The ordinary linear model has the form $\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \varepsilon$, where $\mathbf{y}$ is an $n \times 1$ outcome vector with continuous measure, $\mathbf{X}$ is an $n \times k$ nonsingular matrix with explanatory variables down the columns and a leading column of ones, $\boldsymbol{\beta}$ is a $k \times 1$ parameter vector to be estimated, and ε is an $n \times 1$ error vector with assumed mean zero. The ordinary least squares (OLS) estimator of $\boldsymbol{\beta}$ is arrived at by minimizing the squared error terms and is formed by $(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}$. In the presence of heteroscedasticity, the OLS estimator of $\boldsymbol{\beta}$ is not the best linear unbiased estimator (BLUE). The term *best* here means that the estimator achieves the minimum possible variance.

WLS allows one to reformulate the model and generate estimates that are in principle the BLUE. The introduction of a weight matrix $\mathbf{\Omega}$ into the calculation of $\hat{\beta}$ removes the heteroscedasticity from the model. The $\mathbf{\Omega}$ matrix is created by taking the error variance of the *i*th case (estimated or known), ν_i, and assigning it to the *i*th diagonal, $\mathbf{\Omega}_{ii} = 1/\nu_i = \omega_i$, leaving the off-the-diagonal elements as zero. In this way, large error variances are reduced by premultiplying the model terms by this reciprocal. We can premultiply each term in the standard linear model setup by the square root of the $\mathbf{\Omega}$ matrix (i.e., by the standard deviation). This "square root" is actually produced from a Cholesky factorization: If $\mathbf{A}$ is a positive definite symmetric ($\mathbf{A}' = \mathbf{A}$) matrix, then there must exist a matrix $\mathbf{G}$ such that $\mathbf{A} = \mathbf{GG}'$. A matrix $\mathbf{A}$ is positive definite if for any nonzero $p \times 1$ vector $\mathbf{x}$, $\mathbf{x}'\mathbf{Ax} > 0$. In our case, this decomposition is greatly simplified because the $\mathbf{\Omega}$ matrix has only diagonal values (all off-the-diagonal values equal zero). Therefore, the Cholesky factorization is produced simply from the square root of these diagonal values. Premultiplying gives

$$\mathbf{\Omega}^{1/2}\mathbf{y} = \mathbf{\Omega}^{1/2}\mathbf{X}\boldsymbol{\beta} + \mathbf{\Omega}^{1/2}\boldsymbol{\varepsilon}.$$

Instead of minimizing the squared errors in the usual manner, we now minimize $(\mathbf{y} - \mathbf{X}\boldsymbol{\beta})'\mathbf{\Omega}(\mathbf{y} - \mathbf{X}\boldsymbol{\beta})$, and the subsequent WLS estimator is calculated as $\hat{\boldsymbol{\beta}} = (\mathbf{X}'\mathbf{\Omega}\mathbf{X})^{-1}\mathbf{X}'\mathbf{\Omega}\mathbf{y}$. The WLS estimator gives theoretically the BLUE of the coefficient estimator in the presence of heteroscedasticity.

Weighted Least Squares and Feasible Weighted Least Squares

In this setup, it is required that the variance of the error, ν_i, be known. In principle, there are two possibilities: (1) ν_i is derived from the underlying data-generating process or (2) ν_i is estimated. An example of the first is the linear probability model in which the structure of heteroscedasticity is known. In a binary model, the variance is $\mathrm{Var}(\varepsilon_i) = \mathbf{X}_i\boldsymbol{\beta}(1 - \mathbf{X}_i\boldsymbol{\beta})$. This gives an expression of the form of heteroscedasticity and allows the analyst to estimate a linear model with WLS. The weights are directly computed by using the OLS estimates of $\boldsymbol{\beta}$ to compute $\mathrm{Var}(\hat{\varepsilon}_i)$. Because $\hat{\boldsymbol{\beta}}_{\mathrm{OLS}}$ is an unbiased estimator, $\mathrm{Var}(\hat{\varepsilon}_i)$ is also unbiased. A possible obstacle here is that the linear probability model may produce a $\hat{y}_i$ that lies outside the [0, 1] interval and therefore produces negative weights.

Often the form of heteroscedasticity is not known, and $\hat{\nu}_i$ rather than ν_i is used. By relying on an estimate of ν_i, the WLS estimator is no longer unbiased. But it is still a consistent estimate and asymptotically more efficient than the OLS estimator. This is often referred to as *feasible weighted least squares* (FWLS). This implies a two-step procedure. In the first step, a linear model is estimated using OLS, and based on $\hat{\boldsymbol{\varepsilon}}_{\mathrm{OLS}}$, one can derive $\hat{\nu}$ and therefore $\hat{\mathbf{\Omega}}$. The FWLS estimate is obtained by minimizing $(\mathbf{y} - \mathbf{X}\boldsymbol{\beta})'\hat{\mathbf{\Omega}}\,(\mathbf{y} - \mathbf{X}\boldsymbol{\beta})$. The next section illustrates an FWLS estimation.

Example

This illustration is based on political data from Swiss cantons in 1990 (Adrian Vatter, Markus Freitag, Christoph Müller, & Marc Bühlmann, 2004). The outcome variable is the number of cantonal employees per 1,000 inhabitants. The two predictor variables are the degree of proportionality (PR) in the electoral system and cantonal gross domestic product (GDP, in 1,000s). The results from a standard OLS estimation of the linear model do not allow rejection of the null hypothesis for either of the explanatory variables at standard thresholds.

Based on the results presented in Table 1, the conclusion is that the degree of PR has no effect on the number of public employees. It is possible to test for heteroscedasticity by using, for example, the Breusch-Pagan test (Trevor Breusch & Adrian Pagan, 1979; Dennis Cook & Sanford Weisberg, 1983). In this example, the squared residuals $\left(\hat{\varepsilon}_i^2\right)$ are regressed on the predicted values of the outcome $(\hat{y}_i)$. If the residuals have a common variance, the explanatory power of the regression is low. The null hypothesis of the test states a constant error variance. In the example here, the test value is 5.68 (χ^2 with 1 degree of freedom), which corresponds to a p value of .017. Based on this, the null hypothesis can be rejected.

In Figure 1, the residuals from the OLS estimation are plotted against the outcome variable.

There is a strong positive trend, which visually confirms the Breusch-Pagan test result. The WLS approach is an effective way to address the heteroscedasticity in such cases. Based on the estimation results of the OLS procedure, it is possible to derive $\hat{\boldsymbol{\Omega}}$, where $\hat{\Omega}_{ii} = 1/\hat{\varepsilon}_i^2$ and $\hat{\varepsilon}$ is the estimated error of the OLS procedure. The second column in Table 1 reports the results from the WLS procedure, $\hat{\boldsymbol{\Omega}}^{1/2}\mathbf{y} = \hat{\boldsymbol{\Omega}}^{1/2}\mathbf{X}\boldsymbol{\beta} + \hat{\boldsymbol{\Omega}}^{1/2}\boldsymbol{\varepsilon}$. The GDP of a canton still does not have a reliable effect on the outcome variable. But in the WLS procedure, the effect of the degree of PR on the number of cantonal employees is negative and significant at conventional levels.

Conclusion

WLS allows analysts to estimate linear models in the presence of heteroscedasticity. Premultiplying the observations by a weight matrix, $\boldsymbol{\Omega}$, makes the error variance constant. There are also other possible remedies for heteroscedasticity. First, heteroscedasticity may be the result of a misspecified model and may require the researcher to change the model. Second, the OLS estimates may still be unbiased, and robust standard errors such as the Huber-White sandwich estimator can be used to correct for heteroscedasticity. WLS estimation is a standard regression tool for social scientists and others, and is used in iteratively WLS to estimate generalized linear models (Jeff Gill, 2007).

WELFARE POLICIES

This entry examines the role of the state and the political dimension surrounding the recognition of social needs to improve the well-being of citizens. It then discusses the multiple meanings of the term *welfare policies* across jurisdictions and analyzes welfare policies defined as actions to provide a basic level of subsistence for individuals. The type of policy instruments used to address basic needs has also generated a rich literature on the causes of poverty and on the consequences of welfare policies, which is summarized in the third section. The conclusion of the entry presents two new recognized needs: (1) low wages obtained by the working poor and (2) social exclusion.

Generally, welfare policies represent various programs, transfers, and assistance provided by the state or other organizations aimed at improving the well-being of individuals. It is impossible to develop policies to fulfill every citizen's well-being, as there are unlimited wants but limited resources. As a result, governmental authorities must decide on welfare priorities, which generate political debates usually involving a discussion of social needs and risk. First, most welfare policies seek to address *recognized* social needs. As stressed by the sociologist Richard Titmuss, defining what constitutes a need is very trivial and it is constantly changing. For example, Titmuss mentioned that Britain's needs in 1900 were very different from those in the 1950s. The process of need recognition and, subsequently, the development of a policy to address a need can be long and arduous. Providing income relief to the elderly and facilitating alternatives to the poorhouse took decades, and it took nearly a century to raise substantially the living standards of retirees. Major events, such as wars, can accelerate both the identification of needs and the implementation of solutions to address them. For example, a major extension of welfare policy in Japan is attributed to World War II with one key issue being the ill health of its citizens, resulting in high rates of failed physicals to join the army.

There are other elements that affect the recognition of needs. For example, citizens tend to consider the needs of seniors more favorably than the needs of young adults because the former are considered to be more worthy and vulnerable. Thus, there will be stronger support to provide social assistance for an elderly citizen who failed to reintegrate the labor market near retirement age than a young citizen who cannot find employment on graduation even though both conditions can be caused by a weak labor market. The recognition of need can also be based on other factors such as the meaning of citizenship. Historically, in the United States, access to welfare policies often excluded African Americans, and race continues to permeate discussions surrounding welfare policies. In a similar optic, the gender critique stresses that recognized needs often fail to consider women. Also, immigrants often face multiple obstacles to obtaining the same treatment as citizens who were born in the country of residence. In Canada, for example, immigrant retirees must have resided in the country for at least 10 years prior to receiving the Guaranteed Income Supplement, which is given to low-income retirees.

The role of the state with regard to social needs is also politically salient. In multiple jurisdictions, social assistance is still not fully endorsed by all elected officials as a need that must be covered by governmental authorities. Worse, a need can be recognized and the state can opt to address it, but policies may still fail to resolve it. The lack of universal coverage granted by the American health system has been acknowledged, but reform efforts have failed to resolve this issue. Some needs also consist of policy problems that cannot be fully resolved. It can be possible to reduce poverty, but eradicating poverty may be impossible.

An alternative way to conceive welfare policies is by considering the ways in which they protect individuals against social risk. This form of welfare policies is often termed *social insurance* because the policies fulfill primarily insurance functions. This includes, for example, sickness, unemployment, disability, and retirement insurance. Other programs such as active labor market policies also fall into this category since they seek to alleviate the risk of an individual to leave the labor market and fall into poverty.

Within this perspective, an interesting debate spearheaded by the Danish sociologist Gøsta Esping-Andersen has sought to classify industrialized nations within welfare regimes. In a liberal regime, exemplified by the United Kingdom (UK) and the United States, the private sector plays a dominant role in providing social insurance and the state is involved primarily as a last resort. In a corporatist regime, the state has sought to preserve status along occupational lines, which explains the complexity and multiplicity of social insurance schemes in countries such as France and Germany. The state plays an integral role in providing generous universal coverage in Scandinavian countries, which typifies the Social Democrat regime. While Esping-Andersen argues that there are three welfare regimes, critics have pointed out that Australasia and Southern Europe are distinct and could represent welfare regimes in their own right. The feminist critique has been the most salient, however, by demonstrating that women are not attached to the labor market in ways similar to men, resulting in a very different experience of social insurance.

In the past 10 years, a strand of the welfare literature has focused on the emergence of new social risks caused by the socioeconomic changes that have transpired with the transition to a postindustrial society. This shift has led to an increasing number of single-parent families and elderly, to employment precariousness, and to the rising importance of education and training in the labor market. This literature on social investment assumes that the role of the state is not to satisfy a basic need but rather to invest in individuals in order to empower them to assume more responsibilities. As such, it seeks to make individuals more competitive in the new economy.

The literature on both social needs and risks has stressed the impact of preexisting programs on the capacity of the state to adapt its welfare policies to new realities. Once a welfare program is adopted to fulfill specific needs and/or cover a social risk, it fosters a clientele and support groups, which can facilitate its expansion. This clientele will likely oppose the creation of new programs or a redefinition of welfare objectives. Further, there is a substantial literature stressing that organizations have a bias toward improving existing programs, which occurs at the expense of developing new ones.

These conclusions are, however, being increasingly challenged. In light of increasing budgetary pressures that are accentuated by an aging population and a recent financial crisis, multiple reform initiatives have been introduced. Contrary to previous expectations, political leaders have not shied away from substantial reforms even if it leads to a noticeable impact on opinion polls. The literature has been quite eclectic in providing explanations for this reversal of fortune for the welfare state. While some contributions have reverted to traditional cleavages such as class and party politics or a reconsideration of arguments related to globalization, others have targeted the role of political leadership in altering successfully the discourse surrounding the goals and objectives of the welfare state. The latter stresses that the basic understanding of social rights has been altered. In many instances, such as in health and pensions, the state has been assuming less responsibility by facilitating the creation and/or expansion of private alternatives while reducing the generosity of public benefits. The roles of international financial associations have been considered to be particularly important in prompting privatization in developing countries. Nonprofit organizations have also seen their role expand in many countries by providing a growing range of welfare services to an increasing number of citizens.

Multiple Meanings of the Term *Welfare Policies*

It is important to note that there are many national differences with regard to what welfare policies entail. For example, the term *welfare* has traditionally been used in the United States as a synonym for transfer payments to the poor (e.g., "being on welfare"). As such, it is a synonym for social assistance. In contrast, *welfare* has a more general use in Sweden, focusing mostly on social services, but it can also include policies such as taxation, pensions, employment, health care, and social assistance. In the latter case, the term is closely related to *welfare state*. What welfare policies include and do not include has been the source of multiple debates in the social sciences. The remainder of this entry focuses primarily on welfare policies in the context of providing a basic level of subsistence for individuals. Beyond the enactment of programs and services, this also includes goals such as alleviating poverty and social exclusion.

The role of the state in combating poverty varies noticeably across industrialized countries. The use of means-tested benefit, where the state plays the role of last resort, is predominant in the UK and its former colonies (i.e., Australia, Canada, New Zealand, and the United States) but not confined exclusively to this group of countries. In these cases, the influence of the English Poor Laws remains. Although previous acts and practices dealt with the poor and the working poor, the first set of formalized poor laws was adopted in the early 17th century (Old Poor Law), followed by the New Poor Law in 1834. Immediately on its creation, a sharp distinction was made to distinguish between those considered too ill or too old to work and those capable of working. This distinction is often stated as a difference between the deserving and undeserving poor. Individuals in the latter group had to enter workhouses (in the United States, these were referred to as poorhouses), whose conditions were pitiful and where individuals were often referred to as inmates. This was done deliberately to ensure that this would be a solution of last resort in order to receive poor relief.

The creation and expansion of friendly societies, the emergence of social programs (such as unemployment insurance and old-age pensions), and changes in attitude toward the poor resulted in the abolition of the workhouses in the early 20th century. The causes behind these welfare improvements have been the object of multiple debates in political science. They have been attributed to protest actions by the poor, industrialization, the rise of socialist parties and unions, the leadership role of the civil service, state capacity, and even war. While the private sector continues to perform a role in providing welfare provisions, whose importance varies across jurisdictions, the state is now the primary welfare giver in industrialized countries. However, in many developing countries, the importance of employers and other private parties remains noticeable. When employers provide social benefits, which can include child allowance, death benefits, and health and pension insurance, to name a few, it is usually termed *occupational welfare* since the type and scope of benefits offered varies across occupations. Although not provided by the state and granted exclusively to some members of the labor force, these benefits often receive a subsidy by the state to provide an incentive to both employers and employees to establish this kind of social benefit.

Types of Welfare Policies

There are currently multiple types of welfare policies based on needs and instruments. The most common form of welfare policies involves the transfer of financial resources where recipients receive a sum of money or a tax credit. First, there are policies put in place to provide a source of income for individuals living with disabilities. This can include physical and psychological disability, and eligibility is usually based on medical recommendations and the extent to which an individual can thrive in the labor market. Second, financial assistance is granted to poor retirees based on the value of their retirement income and assets. Third, social assistance is granted to individuals who, for various reasons, exit or fail to enter the labor market. Fourth, payments can be made for families to help raise children. Rather than giving financial assistance directly to the recipient, the state can also subsidize basic needs or limit the goods and services an individual can obtain with the financial support offered. This is achieved by tying benefits to specific needs such as housing (subsidy) and food (food stamps). Financial help cannot assist with issues such as sickness, substance abuse, or being homeless. As a result, welfare policies also involve a wide range of services such as health care, shelters, and job training.

In spite of strong variance in the level of support across industrialized countries, survey research demonstrates that benefits targeting the old and the disabled receive substantially more support than policies assisting other groups. The schism between deserving and undeserving poor remains strongly embedded in most debates surrounding welfare.

Still, today, welfare remains stringent on fulfilling social, economic, and financial conditions. The demonstration of needs plays a key role in accessing benefits. Means-tested benefits are often the norm, which implies that individuals must demonstrate a lack of resources and/or a specific condition to be eligible. The means test can actually take multiple forms. When related to a medical condition, individuals must often substantiate the claims that they are unable to participate in the labor force. Authorities can also develop criteria on the basis of various sources of income (including wages, dividends, and interest earned) and/or assets such as an automobile, a dwelling, or even artwork. Moreover, the income and assets of a third party can also be considered for assessing eligibility. It is quite common to consider the revenues and/or assets of a spouse or partner, but this is sometimes extended to others such as parents (which can occur in the case of students seeking public financial aid) or roommates in the case of shared living space.

The means test can also apply to socioeconomic conditions that are not related to health and financial resources such as age, citizenship, location, and marital status. Younger adults face the most difficulty in receiving social assistance with the requirement of prior work experience being the most important. They also tend to receive less generous benefits irrespective of employment opportunities. Citizenship also matters quite often when it comes to means-tested benefits. Recent immigrants are often excluded from receiving state aid. In some instances, authorities consider the region where a claimant resides to increase or restrict the generosity of social assistance. In regions where unemployment is widespread, eligibility criteria might be more relaxed than in regions where labor shortages are present. Marital status continues to play a role in the treatment of need. The way in which an individual becomes a single parent is sometime considered in the application of the means test, with a widower receiving preferential treatment to someone who failed to declare a parent.

As a result, street-level bureaucrats, or third parties such as medical doctors, often play a key role in assessing who can and cannot receive assistance. The stigma attached to welfare often results in admissible individuals not seeking their benefits. For example, the British Treasury still assumes in its budget that 25% of elderly, considered to be deserving poor, will not collect their means-tested pension. Another issue involves the process on which individuals receive the benefits. It is often onerous, intrusive, and complicated. The application for the British Pensions Credit has 18 pages, which can make reading cumbersome for many seniors and make the benefit less accessible. This is in stark contrast to the Canadian case where federal authorities consider only taxable income. Individuals can access the benefit easily by adding a one-page attachment when they file their income tax.

At the heart of welfare policies are two important debates on the causes of poverty and, ultimately, reliance on welfare benefits. First, to what extent does welfare cause dependency? This has been a hallmark of recent American debates surrounding welfare. Conservative critics have stressed that welfare policies create disincentive to work and create a culture of poverty that makes a return (or entry into) to the labor market less likely. These concerns are hardly new. The Royal Commission of 1832 in England, established to study the Poor Law, was particularly concerned with the impact of granting cash benefits to nonworking individuals. Thus, it stressed that individuals in poorhouses should face conditions worse than those of the poorest working poor. An underlying assumption by these critics is that individuals on welfare are primarily responsible for this outcome and eventually feel entitled to their allowance. With the expansion of welfare benefits to a higher number of individuals, they became one of the neoconservatives' favorite targets for retrenchment. In the past 25 years, multiple jurisdictions have tightened qualifying conditions to receive welfare benefits with countries such as Canada (particularly the states of Alberta and Ontario), the United States, and the UK even introducing some forms of workfare, whereby individuals must perform compulsory labor or service to obtain their benefit.

Critics have emphasized that individuals on welfare are not themselves mostly responsible for their inability to find work, as indicated by the rise of welfare cases during a recession. Moreover, the use of the word *dependency* in the context of welfare policies evokes powerful negative images of specific groups, such as single African American mothers in the case of the former Aid to Families with Dependent Children (AFDC) program, and it fails to acknowledge that non–welfare recipients also receive substantial state support. For example, the "hidden" welfare state in the United States, consisting of multiple tax credits, costs far more than the totality of welfare programs targeting the poor.

Second, another important debate within the literature focuses on the consequences of having welfare policies targeted at specific groups of individuals, as opposed to being universal. The more universal a benefit is, the more likely that it will receive strong political support, which is in stark contrast to targeted benefits such as social assistance, where beneficiaries lack numbers and resources to bolster their support. Survey research demonstrates that citizens are more likely to support universal programs such as education than targeted programs such as subsidized housing and social assistance. The retrenchment literature has actually stressed that politicians have been far more successful with the latter.

Targeting the poor (or any other group) may actually result in a growing gap between the policy outcomes generated by public programs and the original need behind their creation. Ironically, there is strong evidence suggesting that means-tested programs fail to combat poverty and may even accentuate it. The type of program or mixes of programs needed to alleviate poverty has been the source of multiple debates in the literature.

New Focus: The Working Poor and Social Exclusion

In recent years, welfare policies have been developed to tackle two newly recognized needs: (1) poverty among full-time workers and (2) social exclusion. The first is a direct consequence of stagnant wages for low-income individuals. In many industrialized countries, minimum wage has not been indexed properly, resulting in an actual decrease in real income. Various measures, such as granting tax credits and readjusting the minimum wage, have been introduced.

The term *social exclusion* originated in France and it has since been adopted by the European Union (EU), which has made social inclusion a vital component of its fight against poverty. The EU defines social exclusion as "a process whereby certain individuals are pushed to the edge of society and prevented from participating fully by virtue of their poverty, or lack of basic competencies and lifelong learning opportunities, or as a result of discrimination" (European Commission, 2004). EU countries have been elaborating and implementing national action plans to tackle social exclusion and the World Bank has recently included social exclusion within its own analyses of poverty.

WELFARE STATE

The expression *welfare state* denotes a number of policies through which the government provides protection against a predetermined set of social risks and needs. The term made its appearance in the political vocabulary of English-speaking countries during the 1930s and early 1940s. State activism in the social sphere dates back, however, to the second half of the 19th century and was essentially prompted by the modernization process and its accelerating pace throughout Western Europe.

From an institutional viewpoint, the essence of the welfare state is the rights-based character of protection. Through social policies, the government defines rules and standards regarding resources and opportunities, which are considered to be highly relevant for individual life conditions and thus worthy of being "guaranteed" by state authority. In contemporary democracies, such rules and standards are typically incorporated in the notion of social citizenship. Being a citizen means to enjoy not only certain civil and political rights but also specific social rights—that is, entitlements to obtain resources such as a pension or opportunities (e.g., access to medical or employment services) that uphold life chances. Social citizenship thus contributes to the concrete realization of the great normative ideals of Western modernity: freedom, equality, solidarity, and security.

A welfare state does not only limit itself to defining citizens' entitlements (and, of course, the corresponding financial obligations) but also typically organizes the production and distribution of social protection, for example, through public insurance schemes or health services. Welfare administrations occupy the center stage of contemporary bureaucratic systems (e.g., in terms of staff employed), while social spending makes up around 50% of the public budget in the Organisation for Economic Co-operation and Development (OECD) area. In the European Union (EU), social-protection expenditures amount to about 27% of GDP (gross domestic product; 27 average, mid-2000s). State programs funded by tax money are not the only providers of welfare: markets, families, and intermediary associations are other important spheres and channels of provision. Each society has its own composite welfare "mix" or "regime." In the course of the 20th century, however, the state has extended and strengthened its regulatory power over all forms of welfare provision (e.g., through family or labor law) and has affirmed itself not only as the most salient but also as the ultimate "social sovereign." By expanding its sovereignty in the social sphere, the state has fundamentally transformed its own structure, function, and legitimation basis, prompting the appearance of novel political actors and dynamics. The following sections of this entry will illustrate the main stages of development of the welfare state, from its early origins to the present phase of crisis and reform.

Early Origins

The historical background of the modern welfare state is constituted by the various "poor relief" measures introduced in European states since the 17th century and codified in some of them (e.g., England) in organic sets of provisions (the Poor Laws). The institutional watershed was, however, the establishment of compulsory insurance, resting on the new principle of a rights-based protection backed by state authority. The pioneer country was Wilhelmine Germany (1890–1914), which introduced sickness insurance in 1883, work accident insurance in 1884, and pension insurance in 1889. By the end of the Great War, virtually all West European countries had legislated at least one compulsory insurance scheme. The United States and Canada followed suit with federal insurance schemes between the 1920s and 1930s.

The relatively close temporal proximity of the introduction of compulsory social insurance reflects the similar problematic pressure that all countries were suffering in the wake of capitalist industrialization and, more generally, modernization. The specific timing reflects, in contrast, specific national political constellations. Authoritarian regimes (e.g., Germany and Austria) moved as front-runners, in the hope of taming an increasingly active workers' movement that threatened to jeopardize conservative hegemony. Despite their more advanced level of socioeconomic development, the early democratizers, such as Britain, lagged somewhat behind: In these countries, political elites were less worried about legitimation and consensus, and the introduction of social insurance had to wait for the strengthening of socialist representation within national parliaments.

The early phase of "instauration" witnessed the emergence of two distinct basic approaches to social insurance. The occupational approach (prevailing in continental Europe) was based on labor market status and proceeded through the establishment of several occupational schemes (the first typically covering blue-collar industrial workers), often with different regulations. The universalist approach (typical of English-speaking countries and Nordic Europe), in contrast, was based on need and later citizenship. In 1913, Sweden introduced, for example, the first universal pension scheme for all elderly citizens, including a modest flat-rate benefit topped by means-tested supplements. Rooted in different institutional traditions and reflecting historical variations in class structures and systems of corporate and political representation, the early choice of the occupational versus universalist path had significant implications for subsequent institutional developments and distributive outcomes.

The Golden Age of Postwar Expansion

In many countries, World War II spurred ambitious reform projects (e.g., the Beveridge Plan in Britain) for strengthening social protection, also with a view to underpin national cohesion. The 3 decades from 1945 to 1975 witnessed an impressive growth of the welfare state in both quantitative and qualitative terms. At the beginning of the 1950s, social expenditure was still below 10% of GDP in most European countries. By the early 1970s, many countries (e.g., Belgium, Denmark, France, Germany, Italy, the Netherlands, and Sweden) had come to pass the 20% mark and most of the remaining ones had already surpassed 15%. The vast majority, if not the totality, of the population had come to be included in social protection schemes for all the "standard risks": old age, disability, and bereavement; sickness, maternity, and work injuries; and unemployment and family dependents. At least in terms of eligibility, the European welfare states had "grown to limits": They had reached or were about to reach their widest possible domestic boundaries, coinciding with the whole citizenry. During this "golden age" of welfare state expansion, the more localized systems of protection were progressively marginalized in their financial size and functional scope. Sophisticated techniques were invented and deployed to improve and rationalize the extraction of taxes and contributions, govern redistributive flows from the center, and deliver benefits and services to the various clientele. Finally, alongside the various insurance schemes for the standard risks, new noncontributory programs of general social assistance were created, as well as increasingly complex health care systems providing a wide array of medical services.

A vast literature has explored cross-national variations during the long expansion phase. According to the Danish sociologist Gøsta Esping-Andersen's influential analysis, three distinct welfare "regimes" (i.e., systems of relationships between state policies, labor markets, and the family) consolidated themselves between the 1950s and the late 1970s: a social democratic regime, prevailing in the Nordic countries and centered on encompassing and generous schemes; a conservative-corporative regime, prevailing in the continental countries and centered on fragmented schemes linked to labor market status; and a liberal regime, prevailing in the English-speaking countries, centered on universal but means-tested schemes offering only meager benefits. The three regimes were the product of specific class coalitions and their capacity to mobilize "power resources" in their own interest. Each regime had also specific distributional implications, especially in terms of *decommodification*; that is, the extent to which workers are freed from market dependence for the satisfaction of basic needs. Esping-Andersen's pathbreaking work led to a vast debate. By looking in more depth at the experience of specific areas or countries (e.g., southern Europe, Australia and New Zealand, the United States, and, more recently, the postcommunist countries or East Asia) various authors have articulated the original regime tripartition, adding new types and models, and have highlighted additional analytical dimensions (e.g., the capacity of regimes to "defamilize" care and promote gender equality) and theoretical insights.

The Crisis and Permanent Austerity

In the wake of the oil shocks of the 1970s, the developmental trajectory of the welfare state started to invert its direction: The "golden age of expansion" gradually faded away and was replaced by a new phase of "permanent austerity." This shift was mainly the result of exogenous pressures coming from the environment of the welfare state: the environment external to the nation-state and the internal environment (i.e., changes in domestic economies and social structures). The following section briefly reviews the nature and impact of all these pressures, starting with the external ones.

Globalization

Since the 1980s, the growing international integration of markets has started to impose new constraints on the welfare state, by restricting the margins of maneuver that national governments enjoyed during the golden age in designing, managing, and funding their social-protection systems. The globalization of finance has seriously weakened governments' control over national tax bases. Policy liberalizations have widened the "exit options" for capital, investors, and firms, thus making it much more difficult for the state to steer the economy and the labor market and to reconcile the twin goals of economic competitiveness and social consensus.

In the political debates of the 1980s and early 1990s, globalization was often portrayed as a subversive force, inevitably conducive to a "race to the bottom" through regulatory competition. During the past decade, a number of serious systematic comparative analyses have, however, challenged these negative and pessimistic views. Far from being an irresistible destroyer of social protection institutions and a "flattener" of country-specific preferences and diversities, globalization is now seen as a challenge that (a) is filtered through various elements of domestic political economy configurations and (b) can be more or less effectively contravened through politico-economic responses and institutional adaptations. The debate has noted that, if appropriately (re)configured, social policies can play a precious role in upholding the performance of domestic political economies in the new globalized environment.

European Integration

When it was launched in the 1950s, the project of European integration did not intend to challenge the institutional foundations of the nation-based welfare state. Quite to the contrary, the founders conceived of European integration as a project capable of creating and sustaining a virtuous circle between *open* economies and outward-looking economic policies on the one hand and *closed* welfare states and inward-looking social policy on the other.

The international economic crisis of the 1970s prompted, however, an ambitious project to enhance economic integration, based on two steps: (1) completing the internal market and then (2) moving toward a fully fledged economic and monetary union (EMU). The Single European Act of 1986 unleashed a dynamic of "market making," primarily through measures of negative integration (i.e., the removal of national barriers to economic transactions). By setting fixed macroeconomic requirements and deadlines for admission into the "euro," the Maastricht Treaty of 1992 imposed further constraints on the autonomy of national governments in the welfare state sphere.

Like globalization, the EMU project was largely considered in the early debate of the 1990s as a subversive factor for national social contracts, in the wake of increasingly stringent market compatibility requirements, the new power of business, the hardening of budgetary constraints, and the impossibility of creating some sort of Social Europe due to the institutional obstacles to "positive" integration. Recent discussions have adopted a much more nuanced view. European integration has indeed forced several domestic adjustments but not necessarily for the worse: the economic, fiscal, and monetary discipline enforced by supranational authorities has prompted or accelerated a dynamic of welfare state recalibration, which was anyway appropriate and desirable for coping with a host of endogenous problems. Liberalizations have made several goods and services more affordable to consumers, enhancing the range of options available to them; in certain areas, such as health and safety, market integration has also brought about more consumer protection and higher labor standards. Some regulatory competition has indeed taken place but not necessarily with the worst results. As in the case of globalization, the literature has moreover highlighted a multitude of factors that mediate the impact of European integration on domestic redistributive arrangements, as well as the scope and intensity of their "Europeanization."

Internal Challenges: The Transformation of Domestic Economies and Social Structures

In addition to external pressures and constraints, welfare state programs have also been facing growing challenges posed by the transformations of their domestic economic and social environments. The foundation and the expansion of such programs in states had taken place in the context of "industrialism"—understood as a general mode of organizing the spheres of economic production and social reproduction. The past 3 decades have witnessed a rapid transition toward a new "postindustrial" order, in the wake of the rising importance of services, changes in household patterns, and behaviors and population ageing.

The shift from an industrial to a postindustrial economy, mainly centered on the service sector, has originated serious upheavals in the occupational structures of advanced countries. "Fordist" employment (stable and guaranteed jobs with permanent contracts) has been witnessing a steady decline since the 1970s, not fully compensated by the rise of nonstandard "atypical" forms of employment (such as temporary or part-time jobs). Low wages and poor-quality jobs have increased the numbers of "working poor," systematically exposed to the risk of the labor market and social exclusion.

The second important change has involved family and gender relations. While in postwar industrial societies, traditional families with a male breadwinner and a housewife predominated, the postindustrial age is characterized by a greater plurality of household forms: dual-earner families, single-parent households, de facto unions, and so on. Average household size has declined, not only partly due to a fall in fertility rates but also due to the greater number of single-person households and to a drastic drop in multigenerational households. In parallel with the increase of separations and divorces, these changes point toward a general "precarization" of social relations in advanced societies. Another important trend since the 1970s has been the increased participation of women in the labor market—a phenomenon that is closely connected to the rise of the service sector.

The third significant transformation has been demographic aging, due to lower birth rates and higher life expectancy. The proportion of elderly people in the advanced societies has been constantly increasing in the past 3 decades. All projections point toward a dramatic intensification of this process, especially in Europe and Japan. The OECD estimates that the over-60 age-group, mainly retired people, will rise by almost 50% by 2020: For each elderly person, there will be fewer than two workers. Largely due to the full maturation of the generous benefit formulas introduced in the past, these elderly will retire on average with higher pensions than current retirees: Thus, the real intergenerational transfer of resources will grow by much more than 50%. A similar syndrome will affect the real expenditure on health care.

These internal transformations have reinforced the pressures and constraints (especially in financial terms) linked to external changes and have originated delicate policy dilemmas. They have also generated a host of new social risks and needs: from new forms of poverty and social exclusion to personal dependency and from skills obsolescence (and thus unemployability) to situations of work–life imbalances. The rebalancing of social expenditure toward the new risks and the more vulnerable social groups has clashed with the high "stickiness" of the institutional status quo—a defining feature of that "new politics of the welfare state," which has been the object of a lively debate in the literature of the past decade or so.

Welfare State Recalibration at a Glance

Despite the gloomy prospects outlined by the early "crisis" debate, the welfare state has not crumbled under the weight of the contextual changes described so far and has actually given signs of at least some adaptive capacity. Institutional adaptation has been a complex incremental process, which has proceeded with different speed and success across the various countries and which has involved different policy areas: from macroeconomic management and industrial relations to tax policy and labor market regulation. Limiting ourselves to the core elements of social protection, at least four key general trends of reform can be identified.

The first—and the most significant—of these trends is constituted by structural adjustments in response to socioeconomic developments. In the field of pensions, the 1990s witnessed a substantial wave of reforms, based on the following ingredients: increasing the age of retirement, tightening qualifying conditions, restricting indexation rules, or strengthening the link between contributions and benefits. In the field of health care, reforms have been introduced with a view to enhancing efficacy and efficiency in the allocation of resources and in the provision of services through better incentives at both the macro- and the microlevels. Social services and family policies have also witnessed some innovation in both substantive and organizational terms, with a view to responding to the rising needs of the elderly population, the changing gender division of labor, and new forms of poverty and exclusion.

A second general trend has been a move to an *active* approach in the management of work incapacity (e.g., disability) and especially unemployment, with a view to preventing long-term dependency on income support. In the course of the 1990s, the "job first" principle has gradually made its way throughout OECD (un)employment protection systems. Access to benefits has been generally made more restrictive and conditional, but at the same time, new networks of public and private employment services have been set up to promote and facilitate the labor market reintegration of workers without jobs. Activation strategies have proceeded hand in hand with wider exercises of labor market reconfiguration, pioneered by the Netherlands in the 1980s under the banner of "flexicurity." Reforms in this field have received explicit spurs by the EU and in particular by the European Employment Strategy (EES), launched in 1997.

A third general trend—which cuts across various social protection programs—has been greater "targeting" or selectivity of resources toward those most in need, also in the wake of the policy recommendation of influential international bodies such as the OECD or the World Bank. Different strategies have been experimented with, depending on national preferences, constraints, and opportunities: greater use of traditional means testing, linking the amount of benefits received to income or means testing from the top, clawing back transfer payments from those less in need via the tax system, and so on. Alongside these strategies of "vertical" targeting based on economic resources, a trend is also observable toward "horizontal" targeting based on social risk: reducing the generosity of some core transfer programs (e.g., old age, disability, and survivor pensions) while increasing family benefits, introducing new subsidies for caregivers or categories with special needs, or expanding programs against social exclusion.

A fourth general trend has involved the financial side of social protection. Pension systems have witnessed a strengthening of "funding" (i.e., the accumulation of real financial reserves) to make income security at retirement less vulnerable to demographic imbalances and to shift some of the responsibility for its provision from the state to individual workers or the social partners. Another important development on the financing front has been the attempt at reducing charges on business and labor, particularly those in the form of nonwage labor. This development has been primarily motivated not only by competitiveness preoccupations but also by the wish to neutralize the vicious circles generated by "contribution-heavy" social insurance systems. More generally, most countries have reviewed the incentives of their tax-benefit systems to make them more "employment friendly."

Conclusion

The welfare state can be considered as one of the most salient achievements and legacies of the 20th century: Its programs have greatly contributed to consolidating democratic institutions and to harmonizing economic growth with changing social needs. A child of Western-style (and in particular European-style) modernization, the welfare state has been rapidly growing throughout the developing world as well during the past decades. A number of socioeconomic transformations are posing today serious challenges to the sustainability and effectiveness of this institution. Although many of its traditional objectives and instruments will have to be reconsidered and redesigned (a process that is already under way in many countries), it seems, however, plausible to predict that the 21st century will witness a further strengthening and articulation of rights-based social protection, anchored not only to state-national but also possibly to supranational and international institutions.

WESTPHALIAN IDEAL STATE

Westphalian ideal state is the conceptualization of the modern state widely assumed to have derived from the Peace of Westphalia treaties of 1648. The Münster and Osnabrück treaties ended the Thirty Years' War and made sovereignty and territorial principles the cornerstones of the new international arena: They paved the way to the state as the main actor in international relations (IR) and are accepted by the scientific community as the symbol of the "interstate system," which is still preeminent now, even if it is more and more contested. The modern state has been central to political science and IR since their consolidation as academic disciplines around the turn of the 20th century; in fact, both disciplines have long regarded it as axiomatic that the state is of primary importance, indeed indispensable to society. Even when, in the 20th century, it became fashionable to predict the obsolescence of the state as we know it, this in itself paid tribute to the state's significance and tended to cement it. This entry first defines the ideal state, including its historical context and key aspects such as sovereignty, internationally recognized territory, and nonintervention of other states. It then critically examines the theory that this state originated with the Westphalian peace treaties.

Defining the Ideal State

What is the state? Prevailing opinion considers it to be coeval with civilization; thus, as far as "Western" civilization is concerned, the Sumerians are usually credited with its invention and with passing it on to peoples further west. Both the "city-state" and imperial structures that transcended it have, since the 19th century, been held to be instantiations of "statehood," in the case of the Sumerians as well as in the case of the pre-Christian Greeks and Romans or of the kingdoms of ancien régime Europe.

Semantically, this attribution of statehood to the political structures of bygone eras was necessarily retrospective, since the process by which words such as *state* in English and its homologues in other European languages came to designate the state as we know it did not get under way until the 15th century at the earliest and was not complete until the 19th century; the Latin *status*, from which those words are derived, has never had this meaning. Retrospective attribution of statehood also necessarily presupposes that statehood is in fact independent of the words used to designate it, that the state exists independently of political discourse—a premise that constructivists, in particular, must question.

Moreover, this notion of the timelessness and ubiquity of the state has always sat somewhat uneasily with the realization that political structures have varied greatly in history. That realization has virtually never, as yet, led modern writers to challenge the belief in the inescapable historic necessity of the state for civilization in principle. It has, however, encouraged attempts to track the evolution of concrete historical forms that the state is thought to have taken—more particularly, the evolution of the modern state over the past few centuries.

Such attempts were helped—indeed made possible—by the efforts of social scientists around the turn of the 20th century to define what could be called the ideal state. Most important, Georg Jellinek in 1900 posited that the state needs a territory, a people, and a government. Max Weber, in his lecture *Politics as a Vocation* (1918), identified the state as an "entity which claims a monopoly on the legitimate use of physical force." In practice, this monopoly, which the wording chosen by Weber vests in the state as such, can of course only be wielded by the government or those empowered by it.

Sovereignty is another concept commonly regarded as an indispensable ingredient of statehood—indeed, semantically, the two are commonly yoked together in the expression "sovereign statehood." Although in modern democracies sovereignty is said to emanate from the people, it is, in practice, essentially wielded by the government and closely related to the monopoly on legitimate violence singled out by Weber, giving the government the last word in most domestic matters. Domestic sovereignty is complemented by external sovereignty, which, conversely, denies the right of any agency outside the state to dictate to it or any of its parts or members. The "rule of nonintervention," proscribing interference in the internal affairs of another sovereign state, is a corollary of this. International law in what may be called its "classic" modern form—likewise elaborated around the turn of the 20th century by scholars such as Lassa Oppenheim—also laid great stress on sovereign statehood, considered the precondition for being able to create order norms as a subject (rather than merely an object) of international law.

It is quite clear that many of the preindustrial political structures to which 19th- and 20th-century historiography habitually applies the term *state* fell short of the ideal state as defined by scholars such as Jellinek, Weber, or Oppenheim, which their own time came at least close to making a reality. Rightly or wrongly, the general conformity of more ancient structures—such as the "city-state" of the Greeks or the Roman Empire—to the ideal state is not normally called into question. Concerning Christian Europe, however, the "feudal system" is widely perceived to have been at odds with the ideal state, that system being characterized by diffusion rather than centralization of power, by competing and entangled, rather than territorially exclusive, jurisdictions (borrowing from Friedrich Meinecke, John Ruggie has, influentially in IR, called them "heteronomous") and by a corresponding lack of any monopoly on legitimate violence.

Moreover, the collective memory of Western civilization correctly holds that civilization was informed by a lingering sense of the oneness of the Christian community (at least to the extent that it was traditionally focused on Rome) even in the late pre-Reformation phase and indeed, if probably to an ever-decreasing degree, for a century or two after the Reformation. The continuing influence of a political paradigm that emphasized oneness over diversity is, less correctly, thought to have provided a platform for the Western emperor (the ruler of the Holy Roman Empire) to claim suzerainty over Western Christendom, this of course being at odds with the concept of sovereignty.

Critical Issues

A well-known article by the international lawyer Leo Gross, published in 1948 to mark the tercentenary of the Peace of Westphalia in 1648, helped shape the widespread view of that settlement as marking a watershed in the consolidation of the ideal state as conceived today. Gross was not offering a wholly new interpretation—thus, the archetypal IR textbook, Hans J. Morgenthau's *Politics Among Nations*, contains brief allusions to the 1648 peace that are consistent with the article by Gross, and since Morgenthau's book first appeared in the same year as that article, it is unlikely that it was influenced by it. Rather than create a new orthodoxy, Gross articulated authoritatively an orthodoxy that already existed.

Echoing (unwittingly and indirectly, while also adding a further "spin" of its own) the 17th-century anti-Habsburg propaganda, this view presents the Thirty Years' War as a struggle between Habsburg aspirations for universal monarchy and attempts by other actors to emancipate themselves from such aspirations in the name of sovereignty. It takes many liberties with the historical evidence—beginning with the text of the peace settlement itself, which Gross suggested need not be taken too literally, which later exponents of the same view have most often ignored entirely, and which, it should be stressed, provides no corroboration at all of the interpretation in question. But this Grossian view nevertheless commended itself by offering, or at a minimum cementing, what has become the founding myth of the modern state. In this view, that state was freed by the Peace of Westphalia from the shackles of feudal "heteronomy," and the concept of sovereignty and the attendant rule of nonintervention were considered (wrongly) to have been enshrined by the text of the settlement for the entire European system.

It is true that writers and diplomats started a custom of declaring the 1648 peace as being of special significance within a few decades of its signing. The grounds for doing so have not been uniform, to the extent that they are actually spelled out—once established, the habit probably became self-perpetuating, eliminating the need to give a reason for it while at the same time opening up the possibility of identifying new grounds for this special significance. The view expounded by Gross thus put the established significance of the Peace of Westphalia on a new foundation in line with the political agenda of its own period.

This gave rise to the still solid consensus among IR scholars that the "international system" as we know it began with the Peace of Westphalia—hence its designation as the "Westphalian" system in much IR literature. Once that expression had become established usage within the discipline of IR, the epithet *Westphalian* came to be applied also to the type of state that is the modular unit of this system and that is the ideal type described earlier. More recently, usage of the epithet has started spreading beyond the confines of IR.

At the same time, criticism of the epithet has been growing as well. As pointed out, there is nothing about the state as such in the text of the Westphalian settlement, nor is that settlement concerned in any way with issues such as sovereignty, territorially exclusive jurisdictions, or the rule of nonintervention, which are key aspects of the modern state. It has also been asked whether the modern state did not in fact begin to emerge only at the very end of the ancien régime and was consolidated only in the course of the 19th century. Thus, whereas external sovereignty is today considered to be vested in the state as a corporate entity, in 18th-century Europe sovereignty was still vested, not only in fact but also in law, in rulers as persons rather than what they ruled over or represented. Moreover, while those rulers did, for the most part, have effective external sovereignty, their domestic sovereignty was still severely limited—for example, no central power in ancien régime Europe was capable of policing its own territory effectively, or of passing, let alone enforcing, general legislation on a regular basis, which, in contrast, became normal in the 19th century.

Such criticism, on historical grounds, of the epithet *Westphalian* seems so far to have had little impact. It may of course be argued that the appellation does not matter unless, beyond the reference to a current political phenomenon, it is intended to make a statement about history as well. This, however, is usually the case, implicitly or indeed explicitly, with much of the textbook literature, for example, expressly recalling the presumed historical origins of the modern state and the modern international system and thereby perpetuating the "Westphalian myth." Political scientists were probably more in search of a name for this interstate system that was progressively shaped; historians generally do not point to a sharp break and designate a specific year for the emergence of this system, as political scientists did with 1648. Political scientists, focusing on the tension that opposed old empires to new states, considered the Westphalian Peace as the symbol of passing from one to the other. Nowadays, the state monopoly is more and more challenged by the growing influence of nonstate actors—as a result, the concept of "post-Westphalian" system is more and more frequently used.

WORLD BANK

The genesis of the World Bank lies in the creation of the International Bank for Reconstruction and Development (IBRD), following a conference at Bretton Woods in 1944 (which also led to the creation of the International Monetary Fund). Today the World Bank Group comprises in addition to the IBRD, the International Development Association (IDA), International Finance Corporation (IFC), Multilateral Investment Guarantee Agency (MIGA), and International Centre for Settlement of Investment Disputes (ICSID). Since their inception through 2009, the institutions comprising the World Bank group have been involved in lending nearly three fourths of a trillion dollars (Table 1).

There are two key questions about the World Bank: (1) how is power and influence brought to bear on the institution and (2) how does the institution itself exercise power and influence on others, especially its borrowers?

International organizations in general are plagued by severe agency problems, and the World Bank is no exception. Long chains of delegation and multiple stakeholders make this inevitable. Larger shareholders obviously have greater influence, with the United States being the most dominant. Nonetheless, even the United States is a distinct minority shareholder, which places considerable limits on how much it can directly influence the institution. The key mechanisms that have shaped the World Bank's governance have been senior personnel appointments (especially the President, who has been a U.S. national since inception) and importantly, the nature of the institution's finances. The financial design of the Bank, relying as it did on Wall Street initially and global financial markets in later years, was critical in establishing a degree of political autonomy for the

institution, although this came at the expense of greater reliance on the preferences of financial markets.

This began to change with the advent of IDA as the market-based autonomy (from governments) that the IBRD built for itself was slowly eroded by the public resources that funded IDA. The replenishment procedures of IDA—its periodicity and burden-sharing procedures—made it susceptible to the goodwill of major shareholders. In any burden-sharing scheme, the largest contributor sets the tone. From the late 1960s onward, as the United States began a long process of reducing its financial share, other donors began to link their contributions to that of the United States—which paradoxically increased the bargaining power of the United States even as its contributions declined. The periodicity meant that every 3 to 4 years, new demands could be made on the institution. The peculiarities of the U.S. budgetary process with annual authorizations ensured that the exercise became perennial and further enhanced U.S. influence. Thus, over time, the Bank's overall strategic direction was set not by its own board but by the IDA deputies—the personnel representing donor countries who were charged with completing the IDA replenishment process.

The reliance on governmental monies also resulted in a shift in power (most acutely in the United States) from the executive branch to the legislative branch and nongovernment actors, a trend that accelerated with the end of the Cold War. A different tack was taken by some donors (particularly the Nordic countries and Japan) after the 1980s, who supplemented the institution's budgetary resources through "trust funds," thereby seeking to shape institutional priorities and governance and bypassing the Bank's budgetary process.

For most observers, the World Bank's exercise of power and influence has been through its lending—who it lends to, for what purpose, and with what conditions. Although the Articles of Agreement of the World Bank specifically proscribe political considerations in its lending, as a creature of nation-states, whose governance has long been dominated by the industrialized countries (and especially the United States), political factors inevitably affected its lending priorities. During the Cold War, foreign aid was an instrument of the West, and the World Bank was firmly embedded in this architecture. Radical and left governments such as Chile in the Allende era, Vietnam in the 1970s and 1980s, and Nicaragua and Panama in the 1980s were denied Bank lending. With the end of the Cold War, countries engaged in actions deemed hostile to Western interests were similarly penalized—Iran in the 1980s and 1990s, the reduction of lending to India and Pakistan after their nuclear tests in 1998, and the hiatus in lending to China in 1989 (after Tiananmen). In contrast, the continuation of lending to countries such as Egypt, Pakistan, and Russia, despite staff concerns about their policies in different years, are all examples of lending being swayed by political pressures. Nonlending in the 1950s and 1960s and later during the 1980s debt crisis and the 1997–1998 Asian financial crisis was at least in part shaped by pressure from major shareholders to press debtor countries to settle with private (mainly Western) creditors. In most cases, however, there has been a veneer of plausible justification since judgment as opposed to a strict rule-based approach is integral to the Bank's work. If the political biases of the major shareholders had leaned differently, then the decisions could easily have gone the other way.

The purposes of World Bank lending are another key mechanism by which it seeks to influence a borrower. Lending focused on physical infrastructure until the 1960s, agriculture and rural development in the 1970s, policy-based loans (so-called structural adjustment lending) in the 1980s, and human capital and public sector governance–related loans in the 1990s. More recently, lending has focused on the financial sector and global public goods, and is done in support of the Millennium Development Goals. As with country allocation decisions, lending priorities have been affected by a specific view of what constitutes development and how best to achieve these goals as well as by political and ideological considerations. Indeed, lending by the Bank invariably came packaged with certain messages and conditions on what to do and how to do it. Through its loan conditions, the World Bank has acted as an external institution of restraint as it has sought to restrain developing country governments from engaging in poor economic policies, especially microeconomic policies (the IMF plays the same role with regard to macroeconomic policies). The wider the perceived gap between norms of "sound" economic policies and actual policies, the more important this role.

In early decades, this role of the Bank was tacit and less visible. Later on, especially in the 1980s, with the advent of policy-based structural adjustment lending, with specific loan conditions, this role became more overt and visible (and also encountered much greater resistance). However, the demise of the Soviet Union and the concomitant shift in global ideological currents made it easier for the Bank's lending to press for neoliberal economic policy changes and equally, to tread into sectors that were politically sensitive and previously off-limits. Significantly, the Bank began to stress the relationship between political variables in borrowing countries and their impact on the poor. "Governance," or the quality of government and corruption-related issues, began to be debated openly. Rather than dealing exclusively with governments, the Bank began to work with civil society and NGOs in implementing its antipoverty programs. And acknowledging that the fungibility of public resources meant that money channeled to a government may or may not go to the official objective, the Bank began to use public expenditure reviews to influence the overall budgetary priorities of borrowing governments. Lending programs began focusing on institutional change and core government institutions such as the civil service and judiciary.

In addition to lending, the Bank has always sought to set the development agenda. Its didactic role, through its research and information intermediary roles, has arguably been, if not more important than its lending role, at least a mechanism that has influenced it. The Bank has always sought to portray development research as a global public good and used that to obtain greater resources for itself for this purpose. As a result, it emerged as the principal producer of data and research, giving it a legitimization and imprimatur role that greatly leveraged its influence.

Perhaps, most important, the Bank has exercised influence through socializing developing country policy elites. Many developing country policy elites have at some time or the other worked in or with the Bank. By educating, convincing, and exposing LDC (least developed country) elites to a set of ideas and practices, the Bank has acted to diffuse global neoliberal economic norms and ideas. Thus, in many cases, especially in countries with a reasonable set of economic institutions and a bureaucracy, the Bank has often gone into countries whose policy doors have already been unlocked from within instead of being forced open through loan conditions.

The World Bank's influence has been a function of several factors: the structural power of its major shareholders in the world system, the degree of competition, and the demand for its money and advice. Until the 1980s, major shareholders had strong influence, but the imperatives of the Cold War also limited the degree to which the Bank could be hegemonic. With the end of the Cold War, while the influence of major shareholders grew even more, the phenomenal growth of international financial markets began to chip away the Bank's role in the larger, emerging developing countries. But with failures inherent in financial markets, the boom–bust cycle in private financial flows has meant that to the extent that international capital flows have a cyclical component, the importance of the World Bank will be much greater in the down cycle. Indeed, in times of crisis—whether financial or in the aftermath of natural disasters—the insurance role of the Bank inevitably gives it greater influence.

In the large set of poor developing countries, where private financial flows have been limited—not as a cyclical but as a trend phenomenon—the Bank's soft loan facilities (namely IDA) are still important. For nearly three decades (since the early 1980s), the economic travails of these countries (especially in sub-Saharan Africa) made them much more dependent on the World Bank. More recently, however, a revival of their own economic fortunes and growing investments from China and other emerging markets, with fewer strings attached and with much lower transaction costs, has given these countries more bargaining power. Indeed, major shifts in global economic power are bound to affect the governance of major international institutions such as the World Bank whose power structures still reflect the world as it was when the institution was established. How these shifts influence the Bank's own governance, and in turn, its roles and functions, is an open question.

WORLD SYSTEMS THEORY

World systems theory is one of the most influential of the Marxist-inspired theories of international relations. Its impact has been felt across the social sciences and humanities, influencing not only students of politics but also historians, geographers, and sociologists. The focus of analysis is on a global economic system, which is the source of processes of historical change and many features of the social world. The key influences on world systems theory include Lenin's analysis of imperialism, the work of dependency school theorists such as Andre Gunder Frank, and the French Annales school, in particular Fernand Braudel. World systems theory is most closely associated with the work of Immanuel Wallerstein, and his work provides the focus for this entry, although the general approach has been adapted, developed, and critiqued by a number of other writers.

Key Features of the Theory: An Analysis

Three main characteristics distinguish world systems theory:

1. It is ontologically and epistemologically systemic.
2. It provides a historical explanation of the development of social structures.
3. It provides an account of the spatial division of the world.

World systems theory is arguably the most systemic approach to understanding international relations. As such, it offers a radically different perspective on world politics. Rather than a world of states, diplomats, and international organizations, the focus is on a global economic system. Wallerstein's earliest research was on the characteristics of poverty in Africa. He came to the conclusion that it was not possible to understand the persistence of poverty by studying individual countries. Instead, the poverty of specific countries could be understood only by considering their position within a wider economic system and international division of labor. That a higher level of analysis was necessary led to the development of the idea of a world system. The "world" in world systems does not necessarily refer to a global reach. Instead, a world system is the smallest unit of analysis that can be described as a stand-alone entity, or, in other words, can be investigated without reference to elements outside of the system. Within a world system, all developments can be analyzed with reference to forces within the system. Further, Wallerstein argues that the character of a world system determines all features of the social world at any particular time. So, for example, in the current world system, key features such as states, markets, and even the family are produced through the workings of the system. Additionally, except for periods of crisis, when a system is about to collapse, there is very little potential for agency—in other words, there are few possibilities for escaping the constraints of the system.

A second key feature of a world systems approach is that it provides an account of social change. The current world system, which Wallerstein labels the "modern world system," is one of a succession of world systems. There have been two main types of world systems: (1) world economies and (2) world empires. The modern world system is an example of a world economy, and, according to Wallerstein, there have been examples of world systems of both types. What differentiates world systems from world economies is the system of political control. In world empires, there is one political center that has dominated the whole system (e.g., Rome in the Roman Empire), whereas in world economies, there are multiple, competing centers of political control. In the modern world system, these competing systems have been states. Historically, world empires have tended to be more enduring compared with world economies. The modern world system, however, has been remarkably stable. A number of factors have contributed to this stability, one being the efficiency and expansive character of capitalism. A second feature has been the emergence of a "geoculture," a set of ideas and norms that has acted to provide legitimation for the key features of the modern world system.

In addition to a sequence of world systems through history, each world system has its own unique history. The modern world system is no different in that it had a beginning, a middle, and will at some point come to an end. The origins of the modern world system can be found in Europe in the 16th century, where a combination of factors led to the emergence of capitalism. This system expanded rapidly and ultimately led to the incorporation, for the first time, of the entire globe within a world system. In the three volumes of *The Modern-World System*, Wallerstein outlines in great detail the early expansion of this system. The developmental path of the modern world system has been influenced by rhythms and tendencies within capitalism itself. Wallerstein draws on the work of the Russian economist Nikolai Kondratieff, who argued that capitalism goes through successive waves of expansion and contraction on a regular basis (known as Kondratieff waves). Although these waves are regular, the start and end point of each wave are not exactly the same, meaning that secular trends in the capitalist system can be detected (expansion or contraction). Capitalism is also affected by contradictions, and Wallerstein argues that there is a tendency for underconsumption—the capitalist system produces more than can be consumed, leading to a decline in profitability. For a while, the world system can absorb contradictions; however, ultimately they lead to a crisis, resulting in collapse and replacement by another world system. Much of Wallerstein's most recent work has focused on the end of the world system, as his analysis indicates that the modern world system is now in a state of terminal decline and will be replaced by some other form of system.

The final defining characteristic of Wallerstein's world systems theory is the division of space. In the modern world system, there are three main areas: a core, a periphery, and a semiperiphery. The core constitutes the most powerful countries of the system. These have the highest living standards, the most effective systems of social provision, highest education levels, most profitable industries, and the largest coercive forces. The periphery includes the most exploited countries in the system. The periphery is the main source of raw materials for use in manufacturing in the core and provides a market for the core's manufactured goods. In the periphery, states are typically weak and are unable to provide high standards of welfare for their citizens or to protect their populations from the depredations of core states. The countries of the core and periphery are linked by a process of "unequal exchange," the implications of which are that wealth is systematically extracted from the periphery for the benefit of the core. This marks an important distinguishing feature from more traditional Marxist approaches. Wallerstein sees exploitation as deriving from exchange rather than being a result of the production process. In between the core and periphery lies a semiperipheral zone. The countries of the semiperiphery are involved in some manufacturing but primarily in those industries that are no longer profitable in the core. These countries are also involved in supplying raw materials to the core. The semiperiphery is a transitional zone, including some states that were once in the core, but that have lost their competitive edge, and some countries that have managed to escape from the periphery. The semiperiphery, according to Wallerstein, plays an important part in stabilizing the modern world system. It is an intermediate zone that is both exploiter and exploited. In its intermediary role, it plays important functions in maintaining the stability of the system. First, by dividing the opposition to the core (and sharing some of the core's interests), it deflects some of the pressure from the periphery for changes to the exploitative system. Second, it also acts as a reserve pool of labor, which can be used to undermine wage militancy in the core.

Much of Wallerstein's recent work focuses on the more immediate developments in the modern world system. The collapse of the Soviet Union and the end of the Cold War did not mean the "end of history" in the sense that there was now no competitor to liberal capitalism. On the contrary, he argues, the system is now in a final crisis. While it cannot be predicted what form the world system (or potential world systems) will take that replaces the current system, ominously, Wallerstein warns that it may be replaced by an even less just set of arrangements. However, in this point of crisis and transition, much rests on personal choices and decisions. The determinism of the world system lessens, and there is much more potential for individual agency. Wallerstein advocates the study of "utopistics," a consideration of alternative world orders that could be more equitably organized, as a means of pushing the world toward a more just future system.

Recent Developments

Wallerstein's work has been taken and developed by a number of writers within a world systems school. Some approaches have been more sympathetic to Wallerstein's general approach. For example, Christopher Chase-Dunne has retained Wallerstein's basic framework and historical analysis but has focused more attention on the development and roles of the system of states within the modern world system. Other writers have been more critical. Janet Abu-Lughold argues that rather than emerging in Europe, the European world economy was a peripheral offshoot of an economic system that had its core in the Middle East. Extending the analysis even further, Andre Gunder Frank and Barry Gills have argued that the existence of a world system can be traced back 5,000 years, with its core in Asia. As such, their work offers a direct challenge to the notion that capitalism emerged exceptionally in Europe—a view held by most analysts of capitalism of all perspectives.

Conclusion

The world systems theory provides a radically different approach to the understanding of international relations. Rather than being a set of relations primarily between states, the key determinant of social relations is the global capitalist system; this system is the source of the main features of the social world, and the fate of the world system will have impacts for all social relations. While being a systemic approach to international relations, it also provides the basis for an historical and geographical account of global developments, particularly the division of the world into differing zones, where the life chances of the individual will be radically different. Finally, if Wallerstein is correct that the demise of the world system is imminent and that this is a period where the impacts of social structures on individual agency slacken, then it is also a political call for action and analysis to bring about a more just and equitable social order.

WORLD TRADE ORGANIZATION (WTO)

The World Trade Organization (WTO) is the heir of the General Agreement on Trade and Tariffs (GATT). The GATT treaty was hastily—almost by default—adopted in 1948, and GATT as an institution was barely known until the mid-1980s. For many years, it had little in common with the International Bank for Reconstruction and Development (IBRD, the World Bank) or the International Monetary Fund (IMF), both founded in 1944 with great unanimity and pomp. However, half a century later, the WTO is widely seen as an institution that is as important as the two others.

Economics and Politics of Trade Policy

Such success is due largely to GATT's capacity to fit well the basic economics and politics of trade policy, a crucial heritage for the WTO. GATT was largely shaped by the views of Cordell Hull, Roosevelt's Secretary of State (and in 1945, he won the Nobel Peace Prize for his role in creating the United Nations). Hull believed in an open world trade regime based on no discrimination among countries as a key instrument of world prosperity and peace. But as Hull was deeply involved in the opening of U.S. markets to foreign goods after 1934, he was well aware that trade policy required both economic soundness and political realism—a difficult blend.

Economic soundness values trade liberalization as the best policy (exceptions are very limited in practice). It is in the best interest of the consumers, and consumers' interest is the widest possible form of "general" interest (it can even include future generations, as in the case of environmental issues).

But consumers are too numerous to build strong coalitions and make their voices heard. This creates a deep political problem because it leaves governments under the pressure of producers alone. Fortunately, producers have opposite interests. On the one hand, domestic producers facing increased competition at home are eager to maintain or increase the level of domestic protection. They are powerful (they are often close to the political establishment in their own countries), few enough to build coalitions easily, and induced to lobby hard (they gain a lot from keeping things unchanged). On the other hand, domestic producers who are able to export to foreign markets support the opening of domestic markets, if this is the price to be paid for opening the foreign markets to which they could export. They are less powerful than protectionist interests: They are often embryonic (they need foreign markets to expand), more diverse, and more focused on foreign markets to conquer than on domestic governments to lobby. Their interests are close to those of the consumers, but their influence stops as soon as they get the market access they want.

In short, liberalizing is not easy and requires political will from governments. Joining efforts in a multilateral (world) forum makes such an endeavor politically easier while amplifying its expected economic benefits. This then is GATT's, and WTO's, role.

GATT's Growing Success (1947–1986)

In 1947, the Havana Conference tried to solve this complex blend of economics and politics by drafting a long charter, reflecting the diverging views between the United States and the rest of the world, led by the United Kingdom. The British view, shaped by John Maynard Keynes, did not see trade as a key instrument to achieving world growth and stability; hence, it was favorable to preferential trade agreements and moderately opposed to protection. The charter ended up as a stack of contradictory provisions. The U.S. Senate evidently recognized this and rejected the charter.

This decision left trade negotiators in a difficult situation. They had already agreed on tariff cuts that needed to be consolidated rapidly. They then took the charter's chapter on Commercial Policy and converted it into the GATT text, with some limited additions.

The GATT text suits political realism by stating three—only three—key rules:

1. The "most favored nation" (MFN) rule states that a member lowering a tariff (opening up a market) has to do so for the same goods from all the other GATT members—rich or poor, weak or strong.
2. The "national treatment" rule states that imported and locally produced goods should be treated equally after the foreign goods have entered the market.
3. The "binding" rule states that, once declared bound, commitments cannot be reneged upon by a member without paying compensation to the other members or risking retaliatory measures from them.

These three rules have little to do with liberalization. A protectionist-minded country can abide by them as easily as a "free trade" country. Their value flows from the trust they create. GATT members are assured that they will not be discriminated against and will have collective ways of dealing with breaches of commitments. This is GATT as a "rule maker."

GATT "Rounds" promote economic soundness. A Round consists in GATT members negotiating concessions in terms of tariff cuts or other means to open markets. A Round is launched when enough members feel ready to open their economy more (the United States was mostly in charge of testing the waters) and is concluded when members feel that they have got an acceptable deal. The agreements are achieved by consensus, with all the members having the same weight (there is no vote). This is GATT as a "negotiating machinery."

Such a "collective" liberalization occurred in seven Rounds scattered between 1947 and 1986. It generated a progressive—hence politically manageable—liberalization of the industrial sector in an increasingly large number of countries. As Hull had hoped, trade became a powerful engine of growth: It has grown almost two times faster than domestic production since the 1970s.

Of course, growth is not enough. Issues such as distribution of the benefits from growth are key. But economics and politics converge to suggest that such issues are domestic matters heavily loaded by national values. Hence, they should be handled by domestic policies (taxes, subsidies, regulations) that GATT rules allow in the vast majority of cases, contrary to what is often said.

From GATT to WTO: The Uruguay Round (1986–1995)

This remarkable success—nothing comparable happened during the 19th century—had some serious limits. First, in 1986, GATT was a de facto club of rich (or rapidly becoming rich, like Japan or Korea) members. Most developing countries remained opposed to trade liberalization. Second, GATT Rounds covered only the industrial sector (which ranges from 20% to 30% of GDP for most countries) but not key sectors for developing countries (textiles). Last but not least, agriculture and services were totally untouched.

The key objective of the last GATT Round—the Uruguay Round, 1986 to 1995—was precisely to bring these untouched sectors under GATT rules, by the same token becoming more attractive to developing countries. Agriculture was key to changing the mind-set in countries such as Brazil and Argentina. Services played the same role for India and Pakistan. This new mind-set was boosted by China's rapid growth since its late 1970s reforms (though not yet a GATT member, China was rapidly becoming a more open country than most developing country GATT members).

The Uruguay Round results have been mixed. New market openings were substantial in manufacturing, in particular, with the elimination of nontariff barriers on trade in goods of key interest for developing countries (textiles). But in agriculture, the liberalization process was so badly designed that, despite the rhetoric, market openings were very limited.

Turning to a broader picture, the Round succeeded in expanding the GATT negotiating machinery to services and intellectual property rights. It also established a "litigation machinery," with a dispute settlement mechanism (DSM) that was much more credible than the one that had existed until 1995. To evaluate some of these results requires caution. Although there is no doubt that the potential gains from liberalization in services are huge, the case of intellectual property rights is more debatable (these rights consist in granting monopoly rights, possibly endangering future competition). A stronger DSM makes it more probable that WTO members will litigate rather than negotiate. Such an evolution (not yet observed) would be worrisome since it assumes a drastic change of mind in the way international relations at large are conceived.

And there were outright failures. The Round was unable to discipline the use of the "escape clauses" (safeguard, antidumping, and antisubsidy), which allow members to reestablish protection too easily. Even more important, the Round adopted the "Single Undertaking" approach—all members shall agree on all the results of a Round (GATT allowed members not to sign some agreements at the end of a Round). Such a condition deeply rigidifies, hence weakens, the WTO negotiating process since it gives an implicit veto to any member.

The WTO: Challenges and Ambitions

While the Uruguay Round was shaping the WTO, an old world was vanishing: Centrally planned economies disappeared, and developing countries opposed to freer trade had begun to open their domestic markets. These changes were epitomized by China's accession to the WTO in 2001 (today, one third of the Chinese provinces are close to becoming as rich as the Central European countries that are members of the European Community).

These sweeping changes induced the WTO to abandon GATT's low-key approach. The cautious preparations of GATT Rounds were replaced by a rush to launch a new Round (the European Community proposed to launch the Millennium Round 5 years before the end of the enforcement of the Uruguay Round). The price was high: The TV cameras that the WTO ministerial meetings attracted made it the favorite target of antiglobalizers of all kinds, disturbing WTO's first years of operation and making cumbersome the launch of the Doha Round in 2001 (technically, the Round has not yet been officially launched).

However, the key challenges facing the WTO are not from the increasingly scattered antiglobalization ranks. Indeed, most Americans, Europeans, Chinese, and Indians realize that even though globalization has its drawbacks, closing their doors to foreign products would be a much more costly solution. Also, the current economic crisis has not so far witnessed any notable move toward reprotection.

The WTO's key challenges will come from the new world that is emerging. First, there is an ongoing tectonic shift among key players. GATT greatly benefited from the benevolent role of the United States. The United States was always very careful to keep in mind the interests of the world economy and not exploit its full power (if the United States had wanted to exploit its leverage fully, it would have concluded bilateral agreements, not pushed for a nondiscriminatory world trade regime). The rise of China and India is slowly making the United States one key player among a few others. Multipolarity is a laudable concept, but it is hard to practice. To what extent the four to six largest economies will be eager to play collectively the benevolent role that the United States played alone for the past 50 years is a crucial open question for the years to come.

The second challenge concerns the WTO negotiating machinery. In trade in goods, the WTO will be doing "GATT business as usual": eliminate the remaining high industrial tariffs (all the members), bind more firmly and systematically the other industrial tariffs (emerging and developing members), and cut the high protection (tariffs and subsidies) in agriculture (industrial members).

Trade liberalization in agriculture will be particularly crucial. Today, the issue of climate change or water availability is widely seen as antagonistic to the world trade regime relying on GATT–WTO rules. As some critics have pointed out, this is a major mistake. Climate change will require more—not less—trade in agriculture. The half dozen models assessing the impact of climate change have only one common result: The key way to soften the adjustments required by climate change is to facilitate trade among countries. In short, cuts in barriers to trade get a new raison d'être—to be a key tool for fighting climate-driven hunger and water-driven conflicts.

Another big challenge to the WTO negotiating machinery is services. Because they amount to 50% to 70% of GDP, opening these markets will offer huge gains to consumers for many decades to come. But negotiating concessions in services is notoriously difficult. On what basis can opening a domestic audiovisual sector be considered equivalent to the opening of a foreign distribution sector? More crucially, such negotiations require trust in trading partners because services liberalization consists in a dynamic and long process of domestic regulatory reforms, which are often hard to anticipate when negotiating the initial agreements.

Such a trust cannot be delivered by the WTO because the regulatory reform capacities of its members are too heterogeneous. This makes it attractive to negotiate agreements in services among a narrower group of countries ("plurilateral" agreements). Such agreements could be negotiated during (probably more frequent) WTO Rounds, but they could also be initiated outside the WTO and then repatriated under the WTO rules of non-discriminatory binding.

In short, the systemic shift of focus from goods to services suggests that the role of the WTO as a negotiating body may become less prominent. But the role of the WTO as a rule maker is as crucial as ever, buttressed by its capacity for litigation.

ZIONISM

The word *Zionism* was created in the late 19th century to describe an ideology and a political movement whose objective was the rebuilding of a Jewish nation within a political framework. The goal was defined as a Jewish national home until 1942, when the establishment of a state was officially endorsed by the Zionists. Although nourished by the 2,000-year-old Jewish commitment to the land of Israel (Zion), and by religious practice, Zionism is not merely a simple extension of this longing. It basically embodies a nationalism, deeply marked by the European nationality movement of the second half of the 19th century, whose project is highly political. However, from the start, this project was contested both within the Jewish world and, more forcefully on the ground, by the Arab majority in Palestine, which saw Zionism as a settler movement.

Zionism and Its Jewish Critics

The Zionist project came up at a time of crisis for the Jewish world, which faced a double challenge during the 19th century. The first challenge was internal, linked with the weakening of traditional community structures, speeded up by the growing interaction between Jews and their surrounding societies. The second challenge was external and stemmed from the hostility that Jews continued to face in European societies, be it the "old anti-Judaism" based on religious grounds or the "new, racial anti-Semitism," which was aimed primarily at newly assimilated Jews. Zionism presented itself as a way to overcome this double challenge by inventing a new form of togetherness, a national one. As Theodor Herzl, the founder of political Zionism, wrote in his manifesto *The Jewish State* (1896), the "Jewish question" was first and last a national issue that had to be resolved by the building of a state for the Jewish people.

Half a century later, this objective was reached with the founding of the state of Israel in May 1948. The eventual success of Zionism should not obscure the fact, however, that among the Jews the issue was passionately debated and met with strong, sometimes fierce, opposition from some quarters of the Jewish world.

The critique of Zionism took three main forms. Those who chose to assimilate had implicitly rejected the basic premise of Zionism concerning the historical continuity of the Jewish people. For the followers of Marxism or supporters of political liberalism, the Jews were no longer a people; they were just human beings following a particular faith who had to take part either in the general revolutionary struggle against capitalism or in the political debates within the states of which they had become citizens during the emancipation process. The second criticism came from the followers of Jewish ultra-orthodoxy (who were numerous in Eastern Europe): They fully accepted the idea that the Jews were a people—but a people apart from the others, with a strictly religious calling. The longing for political normalization, which was the aim of Zionism, was condemned because it broke with this unique destiny. The third form of opposition was driven by other Jewish nationalisms, particularly the one advocated by the Bund (General Jewish Labor Union of Lithuania, Poland, and Russia), which campaigned for the recognition of the cultural autonomy of Jewish communities and their political rights in the diaspora.

If Zionism at the beginning was clearly a minority movement, how did it manage to become an almost undisputed fact within the Jewish world?

Reasons for the Historical Success of Zionism

Efforts to explain why Zionism was historically successful have focused on three reasons: (1) its strong ideological coherence, (2) its capacity for mobilization of support, and (3) its political record. Among the various Jewish nationalisms that came to life in the late 19th century, Zionism was the most inclusive. Unlike its main rival, the Bund, which wanted to be the representative of the Jewish proletariat and thus excluded large segments of the Jewish people, Zionism had as a goal the creation of a "home secured by public law," which was able to attract a wide range of Jews regardless of their cultural, political, and social differences. Its ideology was comprehensive enough to attract both middle-class people and workers, religious and laypeople, Ashkenazim (European Jews) and Sephardim (Jews from Islamic countries), supporters of the left and followers of the right. Of course, ideological cleavages, sometimes marked, persisted, and in the 1930s, the struggle was fierce between socialist Zionism, the dominant force in Palestine as well as within the World Zionist Organization, led by David Ben Gurion, and its rival, right-wing revisionist Zionism, led by Vladimir Jabotinsky. Nevertheless, the differences (e.g., on the nature of the future society or the pace of state building) were always subordinated to the primary objective: the achievement of political independence within a national framework.

Second, Zionism was the sole Jewish nationalism that reached the ultimate stage of development—namely, mass mobilization. Zionism was defended by an intelligentsia—composed chiefly of journalists, teachers, and students—that strove to revive the Hebrew culture and provide it with a "political roof." Although in Western Europe, Zionism remained a minority phenomenon in Jewish communities, where the goal for many was integration into the mainstream culture, it became a genuine mass movement in Poland, Bulgaria, and Romania, where historically the most violent anti-Jewish pogroms had occurred. (In Russia, the seizure of power by the Bolsheviks quickly led to a ban on Zionist activity.) It also had considerable success in South Africa, where most of the Jewish immigrants were of Lithuanian origin. Zionism had more difficulty in winning over the Jews in the United States because its nationalist creed clashed with the dominant ideology of Americanization of the Jews, but it nonetheless gained influence in the 1940s with the gradual discovery of the genocide of European Jews. Although the Holocaust did not "produce" Zionism, it appeared like a tragic confirmation of its central thesis—namely, the vulnerability of Jews in the diaspora. From then on, Zionism—often manifested as unconditional support for Israel—had no difficulty in rallying around its cause the vast majority of the Jewish world.

Finally, the historical rise of Zionism was greatly advanced by its positive political record, while its Jewish political rivals could not show any tangible results. On the one hand, Zionism was recognized as an international political force in 1917 with the Balfour Declaration, in which Britain declared itself in favor of the establishment of a national home for the Jewish people in Palestine. On the other hand, in the interwar period, Zionism also asserted itself as a sociopolitical reality in Palestine. Gradually, an independent Jewish society, regularly strengthened by the arrival of new immigrants, took shape—with its own economy, Hebrew culture, political parties, and institutions. This quasi–Jewish state lacked only full sovereignty, which it finally gained, first through endorsement by the international community (the United Nations resolution of November 29, 1947), then by the force of arms in 1948, during the war against the Palestinians and the neighboring Arab countries, which had rejected from the start the political rationale of Zionism. Indeed, like Janus, Zionism always had two faces: (1) a legitimate national self-determination movement for the Jews and (2) an enterprise of gradual dispossession for the Arabs.

Zionism Seen From the Arab Side: A Colonial Process

The political equation Zionism had to solve seemed intractable. Indeed, in 1897, when the Zionist Organization was created, its leaders claimed for the Jewish people, 99% of whom were living in the diaspora, the land of Palestine, which culturally and demographically was Arab, the Jews being only a small minority of 5%. Zionism could only hope to reverse this unfavorable trend by building a strong territorial foothold, despite the opposition of the native population, and with the help of an imperial outside power, namely, Great Britain. In practice, the fulfillment of Zionism had to come through colonial settlement, which seemed perfectly legitimate in the age of imperialism. Apart from a small minority of left-wing Jewish intellectuals who defended the idea of binationalism, the majority of Zionists shared the then common, dominant Orientalist vision, which viewed non-Europeans as irrelevant. The latter rejected outright this ideological depreciation and fought forcefully against Zionism in the interwar period. To become reality, the Zionist dream had to be imposed on the natives, who refused to relinquish or compromise their own right to self-determination. Of course, unlike other colonial settlers overseas (e.g., the United States, Australia), the Jewish immigrants were symbolically connected with the land in which they had settled, but for the Palestinian population, this did not make any difference: "For the Palestinian, Zionism has appeared to be an uncompromisingly exclusionary, discriminatory colonialist praxis" (Edward W. Said, 1980, p. 69). The return of the Jews was, for the Arabs, akin to a conquest.

The year 1948 was a turning point: Both the local Arabs and the Arab states refused the partition plan because they saw it as basically unfair. War was inevitable and led to a massive Arab depopulation of what became Israel. The authorities of the new state chose to make this demographic upheaval irreversible: Palestinian refugees were immediately barred from returning, while at the same time the small Arab minority remaining in the state of Israel was controlled and marginalized. These policies could not but strengthen the Arab conviction that Zionism was structurally linked with the subjection of Palestinians, a conviction that was restated after 1967, when in the newly occupied territories (Golan Heights, East Jerusalem, West Bank, Gaza Strip, Sinai) the state itself encouraged the building of new settlements.

Reconciling the Jewish and Arab narratives on Zionism seems, to many, utterly unrealistic. Perhaps the best hope is that the former acknowledge that their national movement has had tremendous negative consequences for the native society, which has retained the inalienable right to build a state of its own, while the latter recognize that, despite its initial colonial component, the Israeli polity has become a legitimate reality in the Middle East. In other words, a two-state solution may be the only credible way out of a situation of permanent conflict. Many observers believe that such a solution should be the objective of the peace process launched in the 1990s between Israel and the Palestine Liberation Organization, but its realization remains uncertain as it is caught in the complexity of vexing issues such as the status of Jerusalem, the question of Jewish settlements, and the plight of Palestinian refugees.
