INTERNATIONAL SOLIDARITY

Solidarity is a type of social relation as old as the first societies. Whether based on family, friendship, religion, corporate bodies, or trade, solidarity takes multiple forms, but all forms have in common a relation in which groups and/or people bring, not necessarily reciprocally, a particular assistance. Every social order supposes a minimal level of solidarity between its elements and, conversely, every social relation acts as an indicator of a certain social order, according to Émile Durkheim. Therefore, there is no study of societies without considering the forms of solidarity they enclose. At an international level, the question is more delicate: The existence of solidarity is disputed given the fact that the very existence of a society is much debated.

In the tradition of international realism, the world is perceived as a general competition of powers, and solidarity is expressed only through military alliances. Actually, one should speak of functional policies oriented toward maintaining the balance of power—the only principle that is able to regulate the international anarchy—rather than of solidarity. Theoretical approaches competing with realism in international studies (liberalism, functionalism, transnationalism, and constructivism) are more attentive to demonstrations of solidarity in international relations. In highlighting what binds actors as much as what divides them, realists admit the existence of an international order that entails relations of cooperation and assistance. Among these approaches, the British school of international relations has contributed more than any other to the development of the concept of "international society." The latter, mainly composed of states, is organized around norms and institutions that secure a minimal order for the common interest of its members and enable the pursuit of shared objectives. According to Hedley Bull, such a conceptualization of the international system supposes necessarily the existence of relations of solidarity and fully supports their analysis.

From a historic and empirical point of view, demonstrations of international solidarity are quite undisputable. Under various names—support, assistance, mutual aid, and so on—actors have always joined together to defend their interests and promote their causes. These practices have involved states as well as nonstate actors. But the densification, that is, the increased number and complexity, of relationships between societies (what is called "interdependence") has led to a new dynamic.

Three dimensions of international solidarity are considered here. The most traditional one refers to a political will to form alliances for mutual empowerment. Second, since the beginning of the 20th century, international solidarity has also been used as an instrument for building up an international order. International solidarity is in fact a doctrine of international peace. But, parallel with the development of the means of communication and the greater sensitivity of societies, international solidarity has also turned into a strong means of international contest of the global inequalities. Thus, there is a third dimension in which actors of international solidarity are nonstate actors that contest state policies. Each of these dimensions has its own characteristics and aims, but all speak for the fact that international solidarities are at the heart of the political, economic, and social history of international relations.

A Rationale of Power

Let us consider the first dimension: mutual empowerment. In a context of partially competitive relations, the actors of the international system seek naturally to decrease their vulnerability to pressures from other nations and to enhance their strength and build on their assets. Solidarity therefore consists in appealing to presumed common ties and shared objectives to build a union that will reinforce the capacities of each of the parties and the strength of all. This classical function of international solidarity as a power multiplier may assume several shapes. The first one is that of military alliances that tend to maximize the security of their members through reciprocal assistance (e.g., Article 5 of the North Atlantic Treaty Organization [NATO] treaty) or through various means of bilateral cooperation. The creation of regional unions with multiple vocations illustrates a second form of mobilization of solidarity aimed at benefiting from the (economic and diplomatic) advantages of an actor of international scale (e.g., the European Union). Third, the organization of some economic lobbies also expresses a form of solidarity in the defense and the promotion of sector-based interests at the service of the power of concerned states (e.g., Organization of the Petroleum Exporting Countries [OPEC]). Eventually, a fourth form of solidarity resides in the elaboration of political alliances, the aim of which is to promote a cause or a position on the international scene (e.g., the Non-Aligned Movement).

In all cases of solidarity in this first form, solidarity may be value grounded, but it is mainly an instrument of power and influence. If states usually are the main actors and benefactors, nonstate actors also know how to benefit from this type of mobilization to strengthen their capacity for action. The International Workingmen's Association, known as the First International, which was created to defend the workers and to reinforce their organizations, is a famous historical example of the way nonstate solidarity was invited to demonstrate its strength. Many other international mobilizations were to follow this path.

All these practices of solidarity result in a paradoxical situation: All solidarities are favorable to unity, but all define themselves in rivalry and confrontation. In this power rationale, solidarity is as much a factor of cooperation as one of conflict.

A Doctrine of International Peace

Let us now turn to the second dimension of international solidarity: international order. A very different conception of solidarity emerges as early as the end of the 19th century. The "first globalization" (1860–1914), characterized by a spectacular development of trade relations and communication means, substantiates the idea that the world is becoming more and more interdependent. World War I and the 1929 economic crisis reinforce the same image of a shrinking world. No state, and specifically not in its economic and social development, appears to be able to act on its own; all seem more or less dependent on the others. Their interdependence is perceived as a reality that the first "technical" international organizations (telegraphs, post, transports, etc.) account for, and it is in part independent of the actors' own will. Thus, solidarity is no longer the result of an act willfully undertaken by states but has become a social fact perceived by actors as such. The interdependence hereby created reaches beyond the acts of solidarity undertaken.

Léon Bourgeois (1851–1925) was one of the first to transform this empirical recording into a political doctrine (solidarism). Conceived at the level of society as a third path between liberalism and collectivist socialism, solidarism calls for a certain degree of social intervention to guarantee a liberal and just order. At an international level, according to Bourgeois, this doctrine supports the resort to international organizations to ensure peace and justice. David Mitrany notes that many authors were to encourage this perspective, which consists in increasing and regulating interdependences between states to better pacify their relations, through the mediation of international organizations.

Parallel to the development of sector-based international organizations, the creation of the League of Nations and then the formation of the United Nations (UN) carries further the efforts and tends to ground international order in a global political solidarity. The tragic experience of the two World Wars acted as a determining factor. With various successes, multilateralism imposed itself as a method of negotiation between several parties and aimed at gathering states around shared values. After 1945, multilateralism spread to almost all fields (monetary, economic, trade, social, etc.) at the world as well as the regional (the European construction) levels. The mobilization of concrete solidarities in the service of a global solidarity from which all may benefit became the official doctrine of multilateralism. It was strengthened after decolonization and under the growing influence of countries from the Global South. However, just as at the time of the League of Nations and despite the reinforced authority of the UN Security Council, practices of solidarity remain limited. The assessment is incomplete regarding functional cooperation (technical cooperation, development aid, etc.). Such solidarity is limited with respect to political and military cooperation. The Cold War cannot be held as the only element responsible for these limitations. Collective security, as envisioned by the UN Charter, proved impossible to accomplish and therefore is considered a major failure with regard to international solidarity, which should have presided over the implementation of Security Council decisions. Another failure derives from an interstate conception of international solidarity within the UN. Solidarity is reduced to the interests of the most powerful states although, as phrased at the beginning of the Charter ("We the People of the United Nations"), it was officially addressed to the societies of the member states. The UN, as it functions, consecrates an interstate order that favors powerful states instead of being an instrument of solidarity between societies.

A Social Dynamic of Contest

Let us finally turn to the third dimension of international solidarity: the emergence of international social movements that contest the established interstate order. As early as the 19th century, international solidarity has been extended to the relations between societies in reaction to state policies: The actors of this form of international solidarity are nonstate actors. Taking advantage of the development of means of communication, many social groups grew conscious of the resources they could draw from their solidarity in the defense and the promotion of common causes. Mobilizations of solidarity multiplied (abolitionists, suffragettes, pacifists), for instance, the international movements of workers or the action of International Committee of the Red Cross (ICRC), in fields neglected by states. In parallel to rising multilateralism, a new form of solidarity was born on the international scene: both social and transnational. After a period, when it fell back at the eve of World War II (despite the singular episode of the International Brigades during the Spanish Civil War), the dynamic strengthened itself globally through the creation of a growing number of nongovernmental organizations (NGOs) having an international vocation in domains as various as humanitarian emergency, human rights, development aid, environment, and so on. This activism of solidarity now adds up to that of transnational social movements, which inscribes itself even more clearly in a perspective of contesting state policies (as the action of groups claiming themselves as partisans of an alterglobalization and the brutal response of authorities in Seattle in 1999 or Genoa in 2001 have testified). Using various means (global campaigns, lobby, boycott, countersummits, etc.), the mobilized social bases have become more diversified while the organizations have transformed, thanks to the Internet, into broad networks of correspondents (even if they remain located mainly in the North), as noted by Marco Giugni and Florence Passy.

The acceleration of communications and the media exposure of international events have led to an intensification of relations between societies. However, transnational solidarities remain fragile. They are primarily anchored in local and national levels of action and therefore strive to embody global objectives. They often remain fragmented and virtual. They interfere in interstate relations but are no substitute for them.

Trapped between diverse conceptions and practices, international solidarity remains an ambivalent notion. It reveals a certain state of international order and also designates one of the elements of its transformation.

INTERNATIONAL SYSTEM

The international system is made up of individual, constituent units and an ordering principle that arranges the structure of those units, together forming a whole toward an outside environment.

A third defining characteristic of the international system is the interaction that continuously occurs between the level of the individual units and the overall structural level. This notion, comprising three basic elements (units, structure, and unit–structure interaction), suffices to describe a limited, *structural* conceptualization of the international system. An alternative definition that also encompasses the connections between the units (units, structure, unit–structure interaction, and unit–unit relations) may be referred to as a broader, *relational* conceptualization of the international system. The use of the concept, in either version, is justified as soon as the system exhibits properties that individual units do not.

After a brief note on the intellectual heritage of the concept of the international system, this entry offers a discussion of four sets of issues found pertinent to the subject in contemporary political science and international relations scholarship. The four sets of issues that will help elucidate key aspects of the concept of the international system are (1) the properties of units and structure; (2) its origins and historical evolution; (3) understandings of change, transformation, and breakdown; and (4) the inherent potential and limitations of the concept.

When it comes to the basic figure of thought, it can be argued that some idea of an international system was envisaged in the Amarna letters of ancient Egypt during the Late Bronze Age and is implicit in the classical writings of Thucydides, Kautilya, Sun Tzu, and others who commented on the subjects of diplomacy, trade, and war. Several of these authors described periods of rather intense interaction between political units and a wider political or economic structure, outside of which there was significantly less such interaction. The international system, however, is a concept that emerged in the early-modern era in the treatises of prominent lawyers and philosophers. Following in the footsteps of Jean Bodin, Hugo Grotius, and Thomas Hobbes and their respective works on sovereignty, state equality, and political order, Samuel Pufendorf explicitly referred to *the states system* as several states that are connected as to seem to constitute one body but whose members retain sovereignty. During the 20th century, the rise of new academic disciplines made its mark on all concepts containing the component "system," and structuralist authors of organicist, process-oriented, or functionalist persuasion subsequently applied systems theories to virtually all branches of the nascent social sciences. Arguably, this intellectual trend had a profound effect on the academic field of international relations.

Properties of Units and Structure

Relational concepts of the international system ascribe most importance and explanatory power to the units that together form a whole, as well as to the mutual bonds that are forged among them. Realist balance-of-power theories provide a good illustration of this, as do liberal theories that attribute significance to the internal organization of political units such as city-states, empires, or (modern) states. The idea inherent to the latter is that the internal organization of individual political entities affects the way in which they interact and conduct business with their peer entities.

Structural concepts of the international system assume that unit-level action is essentially shaped and conditioned by the overarching incentive structure, which is why causes are difficult to locate at lower levels of analysis (and abstraction). At the unit level, we merely find the attributes and interactions of the constituent parts. At the system level, a powerful structuring principle arranges the positions of the units and thereby predisposes the mode of interaction among them.

Depending on the characteristics of the particular theory, the international system is a concept infused with some ontological premise as to its purpose, function, or design. This aspect was underdeveloped in much realist theorizing during the post-1945 period but has received more attention in recent years. The same theoretical neglect long applied to the system/environment distinction and to the means of upholding that difference.

Origins and Historical Evolution

The differentiation between the international system and its environment, the latter typically involving peripheral/nonrecognized units and asymmetric/low-density interaction, is critical to any account of the origins of that system. Some have argued that a trade relationship constitutes a prerequisite for other types of ties between political entities (units). Others believe that political or strategic ambitions may be just as common as the first step toward creating a significant level of interaction and therefore toward a new unit joining the international system. Once established, many agree, the system is self-reproducing in that units sustain (boundaries between) themselves and fend off systemic intrusion.

Several important contributions regarding the origins and historical evolution of the international system were provided by scholars associated with the so-called English School of international relations. Informed by diplomatic history accounts of political relations, these scholars described how the international system arose in Renaissance Italy and then progressively expanded via Western Europe to North America, Turkey, and other Middle East countries and later to Asia, Australia, Africa, and South America.

Key protagonists of the English School nevertheless felt that the structural conception of the international system strongly downplays the social dimension of interaction and launched a relational notion called *international society*. They insisted that the latter reflects a more demanding level of political and diplomatic exchange than a "mere system," in that states perceive that they are bound by a common set of rules and institutions.

Most of today's scholars do not heed this distinction but appear to have subsumed part of the arguments forwarded by the English School into more nuanced understandings of the international system. Indeed, even structural realists who stress material factors and interests of powerful actors as explanatory variables operate with some notion of socialization and cognitive adaptation to the actions and preferences of other actors.

Another increasingly influential body of work highlights the constitutive role of legal precepts, interstate accords, international organizations, and jurisprudence in fashioning the institutional framework within which governments and other actors pursue interests and promote values. An older view of international law as little more than positive morality, akin to the dress code of a private club (as one philosopher put it), is thus giving way for a more comprehensive understanding that acknowledges the expanding body of private and public law in the international realm. It is further accepted that the United Nations, for all its flaws and limitations, has played a constructive and at times crucial role in de-escalating conflicts between great powers.

Theoretical Understandings of Change, Transformation, and Breakdown

One of the chief criticisms of structural conceptions of the international system concerns its weak explanation of change or major transformation. According to the most influential account, the international system is anarchic, lacking an institution of central authority, and can only shift to a hierarchical system if functional differentiation among political entities is greatly enhanced and the distribution of capabilities (powers) becomes more even.

That prospect, though, is theoretically implausible. Instead, the law of inertia perpetuates the existing international system, with minor fluctuations on the margins. New members are socialized into the system through learning and mimicking the practices of more successful peer entities. Even though the present international system is characterized by an unprecedented degree of interaction, trade, and communication, proponents of a structural conception of the former maintain that most signs are of continuity and incremental change, the latter induced by states or possibly by transnational advocacy networks and international organizations.

Advocates of relational concepts of international system, in contrast, are more open to the possibility of large-scale change induced by interacting units. Transformative processes, some say, have occurred in connection with the two World Wars of the 20th century and can ensue whenever major powers fundamentally alter the way in which they deal with each other. More radical perspectives project the eclipse of U.S. preeminence within the next 20 to 25 years and believe that a new constellation of powers led by China will become predominant by that time. In fact, some doubt that 21st-century citizens will remain loyal to a single state or nation and predict the onset of an era of cosmopolitanism or "new medievalism."

A new medievalism with overlapping authorities and multiple loyalties would not necessarily be turbulent or violent, but the latter notion gently approaches the most dramatic type of scenario, that of a breakdown of the international system. Two alternative tragic visions of the future seem to have gained currency in recent years, and inform the security and defense policies of many individual states (especially in the West). One is that of an epic confrontation along religious, cultural, and/or civilizational lines, pitting the Euro-American transatlantic community of countries against challengers predominantly in Asia and the Middle East.

The second tragic vision is that of ecological disaster on a scale not previously experienced. While this is a devastating prospect, the difference lies in the nonantagonistic character of the latter threat. A breakdown of the international system prompted by environmental damage could conceivably therefore help usher in a new era of global cooperation over and beyond previous political boundaries, jurisdictions, and mandates.

Inherent Potential and Limitations of the Concept

The international system is one of several theoretical notions that paved the way for studies with a global reach by playing down the importance of political borders and helping wind down the methodological nationalism characteristic of older social science. The structural conception of the international system, though subject to critique in this entry, was clearly instrumental in widening this research agenda to what used to be viewed as peripheral regions and issues. Relational conceptualizations, meanwhile, are less likely to reify structure or overemphasize the system level at the expense of explanations that account for unit-level actors and institutions.

The "international" element in the concept of international system, however, cannot reasonably transcend the state-oriented focus associated with either version of the argument. And just as states and governments are privileged as unit-level actors, both the structural and the relational conceptions typically rely on an implicit notion of the primacy of politics. In that sense, the international system is a concept that may not remain analytically relevant in the 21st century to the same degree as in the 20th, as the realities it was created to depict have altered substantively.

INTERNATIONAL TRADE

International trade is the exchange of goods and services across borders. However, the boundaries between trade and investment have become increasingly blurred. Many services can only be delivered across borders through a foreign commercial presence, implying foreign direct investment. An increasing share of world trade also takes place within multinational firms or through international production networks in which multinationals play a central role.

The political analysis of international trade has centered on two closely related issues: (1) the determinants of free trade and protection at the national level and (2) the determinants of international cooperation on trade issues, including through multilateral organizations. The first section of this entry provides an overview of models of free trade and protection at the domestic level, focusing first on interest-based approaches and then introducing collective action problems and the role of institutions. The second section examines some of the core issues in the international politics of trade, including the central features of the General Agreement on Tariffs and Trade (GATT)/World Trade Organization (WTO) regime and the growth of regional arrangements. Brief mention is also made of the long-standing literature linking trade to security considerations and conflict. The conclusion considers future research directions that are emerging from new developments in trade theory, including the role of multinational firms, the enduring role of geography, and the political economy of agglomeration.

Models of Free Trade and Protection

In their basic assumptions, political economy models of free trade and protection resemble other models of public policy and regulation. Voters and interest groups constitute the "demand side" of the political market with their preferences driven by the effects of trade and trade policy on income and assets. The extent of interest group organization and the willingness to expend resources to secure protection (so-called rent-seeking behavior) are key variables in many political economy models.

Politicians, in turn, supply trade policy in return for votes and campaign contributions (both legal and illegal). Bureaucratic agents can also play an independent role in trade policy where they exercise discretion; an example would be the bribery of a customs agent. The behavior of both politicians and bureaucrats will also be affected by the design of electoral and other political institutions.

The Role of Interests

The early literature on the political economy of trade focused on the structure of protection at the national level, that is, the levels of tariff and nontariff barriers across industries. Virtually all of this work was on advanced industrial states, and the United States in particular. Early empirical models explored a variety of factors that might be consequential, including the growth of output and employment and exposure to import competition at the industry level. However, the logical underpinning for this analysis was to use trade theory to identify the characteristics of industries (and ultimately investors and workers) that would make them more or less likely to support free trade.

Classic trade theory offered up two, quite different approaches in this regard. In the Heckscher-Ohlin setup, factors of production—capital and labor in the simplest two-factor variant—move costlessly across industries and returns to them therefore tend to equalize across the economy. Going back to David Ricardo's classic formulation of comparative advantage, countries (and regions within them) will export goods that intensively use abundant factors and will import goods intensive in the scarce factor. Trade thus benefits owners of abundant factors and harms the scarce factor. In capital-abundant economies, capital should therefore favor free trade while labor should oppose it; in labor-abundant economies, the opposite would be the case.

In a sweeping application of the Hecksher-Ohlin approach, Ronald Rogowski's *Commerce and Coalitions* (1990) attempted to show how changes in the costs of trade in the late 19th century influenced not only the politics of trade but wider social cleavages in a number of countries. In recent years, studies of protection at the industry level using a Heckscher-Ohlin motivation have been supplemented by survey research that trace preferences down to the individual level. For example, Kenneth Scheve and Matthew Slaughter found that the level of education, taken as a proxy for skills, was positively correlated with individual preferences for free trade.

The Hecksher-Ohlin model predicts that the interests of factors will align; in a two-factor setup, capital and labor should have opposing trade policy interests. This model could not explain the anomaly that capital and labor frequently seemed allied with one another in opposing free trade in the advanced industrial states, for example, in declining sectors such as steel and textiles. In the specific factors or Ricardo-Viner model, factors are not mobile across alternative uses. Once investments are made in industry-specific physical and human capital, those investments are not easily redeployed. As a result, trade policy coalitions form not along factoral lines but by sector depending on the level of exposure to international trade. Export-oriented and import-competing industries constitute the dominant cleavage.

The interest group foundations underlying both the mobile and fixed factor models had an important limitation in not capturing the constraints on politicians in acceding to rent-seeking demands. Trade theory is useful in outlining the distributive consequences of policy, but it also underlines the distortions and welfare losses associated with protectionism. Indeed, if free trade is welfare enhancing, politicians responding to the median voter should consistently support free trade. In an influential article, Helen Milner and Keiko Kubota show that democratic developing countries were more likely to liberalize trade beginning in the 1980s than their authoritarian counterparts.

In a highly influential synthesis, Gene Grossman and Elhanan Helpman model politicians as seeking to maximize their chances of election by balancing two considerations: (1) the political contributions coming from factor-specific lobbies and (2) the aggregate social welfare gains and losses associated with any trade policy choices, which should affect the support of voters at the margin. A core element of the Grossman-Helpman model is the extent of industry organization; protection increases with the extent to which sectors are organized.

Collective-Action Problems

A central problem with both the Heckscher-Ohlin and Ricardo-Viner approaches is that they are ultimately theories of trade policy preferences, not effective influence or outcomes. For preferences to be translated into policy, groups must be organized and politicians must respond to them.

Several early empirical studies found that organizational factors, proxied by measures of industry concentration, had a more powerful effect on trade policy than measures that capture preferences, such as the factor intensity of output. High levels of industry or geographic concentration may have influence by lowering the transaction costs of forming effective organizations and mobilizing support.

But high levels of industry and spatial concentration may reflect other factors, such as the specificity of assets, and can even dilute the electoral impact of an industry. An industry that is concentrated in a particular district commands the full attention of its political representatives. However, if the industry is spatially concentrated in a small number of districts, it is unlikely to command wider legislative support. Electorally dispersed industries are typically assumed to have more political clout since more legislators will care about the fate of such industries.

A more direct way to get at industry influence is to move beyond economic proxies such as concentration to more direct measures of organization and influence. Beginning in the 2000s, several studies exploited data on campaign contributions and found them to be positively correlated with protectionist outcomes at the sectoral level.

These studies still begged the question of why some groups are better organized than others. Moreover, there is a strong case that interest groups are endogenous. Anne Krueger's famous model of rent seeking argued not that rents were the result of lobbying but rather that rent seeking arose as a result of various forms of government intervention (and could presumably be reduced if governments credibly swore off such interventions).

To date, there has been surprisingly little work on the determinants of interest group organization around trade. It is commonly believed that protectionist interests enjoy advantages in solving collective-action problems because of the concentrated nature of the benefits they can realize when compared with the diffuse gains to highly dispersed consumers. However, importers of intermediate goods, firms engaged in intrafirm trade, and concentrated retailers, such as the American retail giant Walmart, do not have these organizational disabilities. The political strength of these "concentrated consumers" is undoubtedly a factor in the continuing liberalization of world trade.

Introducing Political Institutions

The work by economists on the determinants of trade policy tended to be institution free, in part perhaps because these studies were often undertaken within the context of a given country in which institutions were invariant. However, the Milner and Kubota findings on regime type suggest that institutions matter; more competitive political systems are more responsive to the median voter than to special interests and thus have freer trade. This finding is consonant with the Grossman-Helpman model but underlines that institutions may affect the trade-off between securing campaign contributions and appealing to the median voter.

One line of research on institutions and trade policy in democracies looks at the effects of electoral rules. For example, proportional representation (PR) electoral rules are accompanied by larger electoral districts, which are more heterogeneous and thus less prone to capture by special interests. On the other hand, majoritarian systems have features that might induce free trade as well, including the tendency for parties to converge on median voter interests. In a useful synthesis, Fiona McGillivray notes that the empirical work on the effects of electoral rules on protection has proven ambiguous and that their effects may be contingent on other factors such as the geographic concentration of industries. For example, a highly concentrated industry in a swing district that is crucial for winning the presidency or securing a parliamentary majority will have a clout that far exceeds what is predicted by its level of organization alone.

The effect of institutions on trade policy is by no means limited to their effect on legislative votes. Delegation also plays a crucial role in trade policy. In both the United States and the European Union (EU), legislatures have delegated substantial authority to executives (the president and the European Commission, respectively) to negotiate trade agreements. The means through which this delegation is structured can strongly influence policy outcomes. The literature on trade policy in the United States places particular weight on the liberalizing effect of delegation to the president under the Reciprocal Trade Agreements Act of 1934 and subsequent innovations, such as fast-track authority, that limit the ability of Congress to amend trade agreements once negotiated (legislators are constrained to vote them up or down).

Delegation also plays a role in the growth of administrative channels for securing protection. Prevailing international trade law permits countries to protect industries in response to unfair trade practices (subsidies and dumping) and in the face of fair trade practices that threaten significant disruption to the industry (the so-called escape clause). Relief under these provisions is typically not legislated on a case-by-case basis but through quasi-judicial processes that can be either more or less favorable to industries seeking protection. For example, these processes might allow standing to adversely affected interests, thus balancing protectionist claims. The ability to make filings may be more or less difficult, both substantively and administratively. A growing body of empirical literature, particularly on antidumping/countervailing duty cases, shows that administrative bodies are responsive to political pressures emanating from the legislature and interest groups. The details of administrative procedure have become a central issue in disciplining the growth of administrative protection.

The International Politics of Trade

The Bretton Woods Conference (1944), which led to the creation of the World Bank and the International Monetary Fund, also introduced the idea of creating the International Trade Organization (ITO). As governments engaged in the complex negotiations over the ITO, 15 states negotiated the General Agreement on Tariffs and Trade (GATT) as a forum to reduce tariffs in the short run. Once the ITO failed to secure ratification from the United States, only the GATT agreement—a very much thinner organization—was left in place. Not until 1995 was the GATT replaced by the World Trade Organization (WTO). In the interim, however, regional trade agreements—most notably the EU—as well as bilateral free trade agreements (FTAs) have proliferated rapidly, making them a central feature of the international politics of world trade.

The GATT/WTO and the Logic of Multilateralism

The role of the GATT and WTO in liberalizing trade is frequently misunderstood. As an organization, the GATT/WTO has very little authority in structuring the negotiating agenda or influencing outcomes. Nor does the organization seek to negotiate a common tariff structure across countries (harmonization) or vote on liberalization measures.

Rather, the GATT/WTO is primarily a forum in which countries trade "concessions": Countries offer reductions in their own trade barriers in exchange for reductions in the barriers of others. The process of trading concessions has an important political effect at the domestic level. For export-oriented industries to secure advantages abroad, the country must be willing to make corresponding or reciprocal concessions. The very fact of negotiating a trade agreement thus changes the politics of trade; as export interests are politically mobilized to influence the course of trade talks, they constitute a counterweight to protectionist forces.

Although nominally a multilateral institution with a consensus decision-making structure, the GATT/WTO has in fact operated through bilateral deals among the major trading countries or among small groups of countries. This procedure dominates in part not only because of the difficulty of reaching a consensus among a growing number of parties but also because power in the organization is effectively exercised through the ability to make concessions. As a result, the demands and concessions of the major trading powers typically drive the agenda and ultimate outcome of the negotiations.

A distinctive feature of the negotiations, however, is the concept of nondiscrimination, under which any concessions that are extended to any one party are multilateralized to all members of the organization through the most favored nation (MFN) principle. The nondiscrimination norm has been a significant institutional feature of the GATT/WTO system and has almost certainly contributed to the liberalization of world trade in the postwar period.

Nonetheless, as with the controversy over the governance of the international financial institutions, there has been significant debate about the extent to which the GATT/WTO also embodies biases of various sorts. On the one hand, the major trading partners effectively control the agenda by structuring the issues and products over which negotiations occur. In its early days, the organization focused overwhelmingly on trade in manufactures that were of interest at the time mainly to the developed economies. Products of primary interest to developing countries, including agriculture, received little attention.

On the other hand, the power of the advanced industrial states was also due to the fact that many developing countries opted out of the organization altogether or argued successfully that they should enjoy special and differential status within it, effectively exempted from making concessions. As the developing countries began to undertake reforms and as their industrial capability increased, they entered the organization in large numbers and began to change the nature of the negotiations.

During the Uruguay Round (1986–1994) and current Doha Round (launched in 2001), developing countries brought new issues onto the agenda. The advanced industrial states sought to push negotiations on issues in which they enjoyed comparative advantage, including trade in services, investment, and the protection of intellectual property. Developing countries, by contrast, sought concessions on trade in labor-intensive products (most notably textiles and apparel), agriculture, and a strengthening of the dispute settlement mechanism (DSM).

The reform of the DSM was a major development of the Uruguay Round negotiations that led to the creation of the WTO. Under the prior DSM structure, plaintiffs faced an uphill battle in securing relief because prevailing rules effectively gave the defendant the ability to veto investigations. The new DSM is much more legalized, with a highly structured process for the empowerment of review panels. Despite the fact that the ultimate enforcement mechanism is retaliation, and large countries should therefore continue to enjoy advantages over small countries, there is evidence that larger parties tend to comply with rulings that go against them. Current legal research on the DSM is considering the extent to which it may become the foundation for judicial lawmaking through the establishment of precedent, rather than a process that is limited to the interpretation of statute.

The Rise of Regionalism

Regional trade arrangements got a bad name during the interwar period, as Japan and Germany sought to carve out exclusive trade zones. Britain and France also strengthened preferential trading zones with their colonies, contributing to the fragmentation of the international trading system. The strong commitment to the nondiscrimination norm in the GATT/WTO system was motivated in large part by the desire to avoid such outcomes in the future.

However, the dramatic economic success of the European Community raised the question of whether regional agreements were necessarily incompatible with liberalization at the international level. The negotiation of the Single European Act in 1985 and subsequent developments following the signing of the Maastricht Treaty in 1992 set Europe on the course of deeper integration through completion of the common market and ultimately monetary union. The United States also pursued a regional option through the U.S.–Canada Free Trade Agreement (1988) and its extension to Mexico in the North American Free Trade Agreement (NAFTA, 1994). Beginning in the 1990s, regional arrangements and bilateral FTAs began to proliferate rapidly and became a major research topic in the political economy of trade.

On the one hand, a number of arguments suggested that regional agreements could be the building blocks of multilateral liberalization. Strong regional agreements could provide the template for deepening cooperation through the GATT/WTO and could even be used to leverage multilateral agreements. U.S. commitment to the NAFTA had an important effect on European participation in the Uruguay Round. A distinctive feature of U.S.–led FTAs has been the inclusion of environmental and labor standards, provisions that have also been mirrored in the web of agreements surrounding the EU.

On the other hand, there is increasing concern that the multiplication of regional agreements—now numbering more than 400—will increasingly complicate the politics of international trade. Almost by definition, free trade agreements are discriminatory; even if they do not raise trade barriers to outsiders, they nonetheless extend preferences that give insiders advantage. Once created, regional agreements have the result of creating vested interests that will resist expansion. In both the Western Hemisphere and particularly in East Asia, there have been growing debates about how existing arrangements—such as the NAFTA in North America and the Mercosur (centered on Brazil, Argentina, Uruguay, and Paraguay)—might be reconciled.

"Low" and "High" Politics: The Strategic Dimensions of International Trade

The politics of international trade is by no means limited to economic issues narrowly conceived. Beginning with Albert Hirschmann's *National Power and the Structure of Foreign Trade*, an important strand of research underlined how large powers could use asymmetric trade relations as an instrument of political influence. Such considerations played a role in the emergence of dependency theory in the 1960s, which not only questioned the economic benefits of international trade but also noted how trade and investment ties might lead to political influence in developing countries as well.

Strategic considerations were by no means limited to North–South trade relations. Another important strand of research has examined the extent to which foreign trade was related to broader political relations, such as alliances. Alliance commitments were of obvious importance in structuring the postwar trading system, with its strong initial focus on the deepening of North Atlantic trade in conjunction with American commitments to Western Europe and the self-imposed exile of the Soviet bloc from the world trading system.

A final strand of research in this vein centers on the long-standing question of whether trade acts as a deterrent to military conflict; Etel Solingen has provided the most compelling recent synthesis of these arguments. Countries dominated by export-oriented coalitions are likely to favor conciliation and multilateral cooperation. Those with more closed economies are likely to be more hostile to international cooperation, in part because of the direct threat posed to vested interests in the closed economy. Isolating the effects of trade in such models is difficult, since more open economies also tend to be more democratic and democratic polities appear more pacific, at least toward one another. Nonetheless, these debates have strong policy implications as analysts consider the possible consequences of the rise of new powers such as China, which combine increasing economic openness with persistent elements of statism and authoritarian rule.

New Directions

The political economy of trade constitutes a very dynamic area of research, yet significant gaps are emerging between developments in the economics of trade and work in political economy. The Heckscher-Ohlin and Ricardo-Viner models of trade had appeal because of their apparent ability to explain the protectionism associated with the rapid growth of North–South trade in manufactures beginning in the 1960s. Yet even with the rise of the China and other middle-income countries, the majority of world trade continues to take place among the advanced industrial states. As early as the 1970s, it was recognized that this trade could not be explained by standard models and that consideration had to be given to the effects of increasing returns, product differentiation, and the corresponding emergence of intra-industry trade patterns. This trade appeared to be less vulnerable to protection than the interindustry trade characteristic of North–South relations.

The remarkable growth of foreign direct investment since 1980 has also exercised a strong influence on the political economy of trade. In contrast to earlier expectations that North–South trade would necessarily generate protectionist pressures, the organization of international production networks controlled by lead firms from the advanced industrial states has probably had important countervailing effects.

More recently, the so-called new trade theory has focused attention on the geography of trade. Borders still create much larger barriers to trade than was previously appreciated; intracountry trade still dominates international trade by a large margin. Despite the revolutions in transport and communications, distance remains a serious deterrent to trade as well. These facts suggest that there are substantial fixed as well as marginal costs to entering international trade with important implications for the ability of developing countries to benefit from specialization. The new trade theory has also emphasized the way the benefits of trade, and production more generally, tend to cluster or agglomerate in particular locations raising important questions of how such clustering arises in the first place. These new issues—the role of multinational corporations, the enduring influence of borders and distance, and the role of agglomeration economies—constitute important frontiers for the political economy of trade.

INTERVENTION

An intervention is a coercive action taken by one international actor to affect the political authority of another. This entry examines the concept of intervention and then discusses the balance between the protection of human rights and respect for state sovereignty, the legal basis for humanitarian intervention, and the issues related to the strategies employed in humanitarian intervention.

The notion of intervention is notoriously elusive and controversial. In what remains the most relevant conceptual work on the issue, James Rosenau proposed to delimit the notion in two ways. First, an intervention is a coercive action, implying a sharp break from previous, conventional, behavior. This sudden interruption in the course of established relations between political units is finite and transitory. It has a beginning (the usual modes of behavior are abandoned) and an end (these modes of behavior are reestablished or, because they persist, they become conventional in turn). Military intervention—either directly or indirectly, such as the support of subversive or terrorist-armed activities—is an especially conspicuous and significant form of coercive action, but it is not the only one. There are other types of measures, either diplomatic or economic, that can constitute a forcible interference and provoke a sharp break in preestablished relations. Second, an intervention is not just any type of break: It is directed at affecting (changing or preserving) the political authority of another actor. Political authority notably refers to the actors and the processes that enable a political community to choose its own political, economic, social, and cultural system as well as its foreign policy. The target is thus deprived, at least momentarily, of its capacity for self-determination.

Interventions are therefore different from the foreign policies that imply a continuous presence in the target society. For example, the presence since 1945 of U.S. troops in Europe and in Northeast Asia is not considered today as an intervention, a sharp break with long-standing relations. On the contrary, this military presence is integrated and largely taken for granted. The continuous exercise of regular diplomatic and economic influence is not considered as an intervention either. Similarly, colonialism and imperialism imply a long-standing presence of the colonizer and expand well beyond the notion of intervention. Interventions are also distinct from the numerous external actions that have as their main goal an influence that is not focused on structures of political authority. For example, measures favoring investment abroad, an international public relation campaign to promote the candidacy of a city to host the Olympic Games, the expulsion of diplomats, or the signing of an alliance all alter previous behavior. But the main goal of these actions is to affect the capacity of other international actors, not directly their authority structure (even if, in the long run, authority structures might be somewhat affected).

Both practically and theoretically, the notion of intervention is one of the most disputed in international relations for two main reasons. First, the phenomenon touches on some of the core issues, notably the imperatives of order and justice (sovereignty and individual rights), of a variety of legal, normative, political, and strategic/military perspectives. As a consequence, different practitioners of international politics (diplomats, soldiers, lawyers, human rights advocates, etc.) as well as several academic disciplines are simultaneously interested, which leads not only to a proliferation of studies and approaches but also to a disconnect between these relatively autonomous debates. Second, for international relations practitioners and analysts, the notion of intervention is at the root of a key issue, the evolving divide between the domestic, especially the domestic politics that enable each person to work out his or her own destiny, and the international. The changing reach of international relations and the concerns that these changes generate are at the core of the debates on intervention, linked to states' sovereignty, territorial integrity, and political independence. Article 2(7) of the Charter of the United Nations (UN) provides, "Nothing contained in the present Charter shall authorize the UN to intervene in matters which are essentially within the domestic jurisdiction of any state." The UN Charter affirms the inviolability of state boundaries, but the content of the "matters which are essentially within the domestic jurisdiction of any state" has been continually disputed. What are the matters and concerns that are within the reach of the society of states and what are the matters and concerns (if any) that are off-limits, that is, for the political communities to decide?

Since the end of the Cold War, with the rise of human rights norms in international affairs, numerous crises brought back to the fore the issue of intervention, notably humanitarian intervention. The general context of a globalizing international system has favored porous borders and greater intrusions into what was considered as the domestic jurisdiction of states. On the one hand, these trends have been perceived as a unique opportunity to prevent, and to respond to, massive violations of human rights. On the other, however, they have posed a growing threat to the right of distinct political communities to work out their own political arrangements. Humanitarian military interventions have been at the forefront of debates about when military force should be used, and they have influenced local conflict, aid organizations, and military strategy. The tension between the emerging norm of humanitarian intervention to protect civilians from harm and the continued respect for state sovereignty as well as the recognition of the danger and cost of the enterprise have been at the center of controversial decisions and nondecisions about Somalia, Bosnia and Herzegovina, Kosovo, Rwanda, East Timor, Sudan (Darfur), and many other places. In earlier cases, which might have been humanitarian interventions, the states justified their action primarily as self-defense, notably the intervention of India in East Pakistan (1971), of Vietnam in Cambodia to overthrow Pol Pot (1978), and of Tanzania in Uganda to overthrow Idi Amin (1979). Since the establishment of safe havens to protect the Kurds in Northern Iraq in 1991, the No-Fly Zones in Northern and Southern Iraq, and North Atlantic Treaty Organization's (NATO's) Kosovo operation in 1999, the use of force to prevent humanitarian atrocities has been more frequent.

While, from an international law perspective, the notion that there is a right to intervene to avert an overwhelming humanitarian catastrophe remains disputable, there is a stronger legal and political basis for forcible humanitarian intervention with the authorization of the Security Council under Chapter VII or VIII of the UN Charter. Formulated in 2001, by the International Commission on Intervention and State Sovereignty (ICISS) set up by the Canadian government, the notion of responsibility to protect showed that international society has evolved to recognize the norm of humanitarian intervention as a legitimate exception to the principle of nonintervention. The ICISS also listed six criteria, inspired by just war principles, that would constitute a legitimate (but not necessarily legal) humanitarian intervention: (1) right cause, (2) right intention, (3) right authority, (4) last resort, (5) proportionate means, and (6) reasonable prospects. The responsibility to protect has been endorsed by the 2004 UN Secretary-General's High-Level Panel on Threats, Challenges, and Changes. Its report, *Our Common Future*, noted that there is an emerging norm of collective international responsibility to protect,

> exercisable by the Security Council authorizing military intervention as a last resort, in the event of genocide and other large-scale killing, ethnic cleansing or serious violations of international humanitarian law which sovereign Governments have proved powerless or unwilling to prevent. (UN Department of Public Information, 2004)

In the 2005 World Summit Outcome, the Heads of State and Government made a significant political commitment to take action, through the Security Council, in case of genocide, war crimes, ethnic cleansing, and crimes against humanity. However, the opposition of Russia and China to action against Myanmar and Zimbabwe indicate some of the potential limits of the responsibility to protect.

Legal and normative justifications are, however, not the only significant aspects of humanitarian interventions. Humanitarian interventions are an act of strategy, and it is important to examine their ends, means, operational practice, and effectiveness. As humanitarian claims become more widespread and, to an extent, more legitimate, they became part of the art of coercion. The emerging norm of humanitarian intervention affects the ways in which states commit themselves to intervention and persuade their adversaries and allies; it affects the manipulation of risk by local and international actors as well as the idiom of military action, that is, the specific ways in which force is used to fulfill the main goal of these interventions—saving the lives of civilians at risk. Humanitarian motives and the responsibility to protect can be, and actually are, strategically manipulated. Many governments, particularly in Africa, Asia, and Latin America, see the responsibility to protect as a legitimation of military intervention by strong states, using their technologically advanced weapons, against weak ones. While some of these concerns might be exaggerated, humanitarian and political objectives have been often blurred, for example, when the goal of UN-led operations in Somalia and Bosnia and Herzegovina was to alleviate human suffering as well as to promote a political resolution to the crisis. There is a thin line between the protection of fundamental human rights in extreme circumstances and the protection or promotion of civil and political rights. Moreover, by raising expectations of diplomatic and military intervention to protect, the emerging norm has been criticized for unintentionally fostering rebellion by lowering its expected cost and increasing its likelihood of success. Convinced, rightly or wrongly, that they will get international support on humanitarian ground, vulnerable groups rebelled, triggering major retaliations and reinforcing the human suffering. The prospect of humanitarian intervention and the intervention itself can feed wars.

Moreover, as Taylor Seybolt pointed out, the strategy employed by the intervener under the appropriate circumstances is a central determinant of success, defined as saving lives by preventing or ending violent attacks on unarmed civilians and/or assisting the delivery of aid. His analysis of 17 military operations in six conflict areas that were the defining cases of the 1990s—Northern Iraq after the Gulf War, Somalia, Bosnia and Herzegovina, Rwanda, Kosovo, and East Timor—shows that the majority were successful. The intervening states employed four types of strategy: (1) helping deliver emergency aid, (2) protecting aid operations, (3) saving the victims of violence, and (4) defeating the perpetrators of violence. In sum, in the long history of legal and normative debates about interventions, in general, and humanitarian interventions, in particular, principles and strategies should be connected.

INTERVENTION, HUMANITARIAN

Humanitarian intervention refers to coercive action, involving the use of military force, in the affairs of one state by another state, group of states, or international organization with the express purpose of addressing massive human rights violations or widespread human suffering. Two aspects of this definition are worth noting. First, humanitarian intervention is distinct from the broader category of "humanitarian action," which might include a range of activities (both military and nonmilitary) designed to address humanitarian emergencies. Second, the explicit and most prominent purpose of the military action must be humanitarian—even if additional objectives are achieved through the use of force.

There are alternative definitions of humanitarian intervention that attempt to narrow the concept still further. Most legal conceptions, for example, insist that the term *humanitarian intervention* encompasses only those coercive actions that do *not* involve the consent or invitation of the host country. However, in practice, this definition is difficult to maintain. In many cases where military force has been used for humanitarian purposes, consent from the government of the target state has been either coerced (as it was in the case of Indonesian consent for intervention in East Timor in 1999) or ambiguous (as it was in the case of Bosnia during the Balkan wars of the 1990s). In other instances, such as Somalia in 1992, the breakdown of order within a country makes it difficult to identify authorities who would provide consent for outside action.

Humanitarian intervention has been the subject of controversy, for both scholars and policymakers, because of two tensions that it invokes. The first is between international society's commitment to sovereignty, territorial integrity, and nonintervention and its commitment to upholding and promoting individual human rights. Both of these goals are enshrined in the United Nations (UN) Charter. The second tension is between the objective of protecting individuals from extreme persecution and violence and the use of coercive means (which can involve the death of soldiers and civilians) to achieve that goal. For many nongovernmental organizations involved in the delivery of aid and humanitarian assistance, the very term *humanitarian intervention* is a contradiction in terms.

Origins and Evolution of the Practice of Humanitarian Intervention

The origins of humanitarian intervention, and the tensions that it raises, date back to at least the 17th century and to the writings of the international jurist Hugo Grotius on the legality and morality of war. Grotius was attempting to reconcile his belief that war could be justly waged by one sovereign on behalf of peoples facing oppression by another with his wider concern to curtail the right of sovereigns to engage in conflict over religious differences. The latter notion became more deeply embedded in international society during the 18th century, largely through the writings of positivist international lawyers such as Emmerich de Vattel and Christian Wolff, who championed the principle of nonintervention as an essential component of state sovereignty. The objective of these jurists was to limit the causes of war that could be considered "just" and to sanction outside intervention only in situations of civil war where clear lines could be drawn between a ruler and his or her people.

In the 19th century, humanitarian intervention became more prominent as a political practice, as European states intervened in the internal affairs of other countries either to rescue their own citizens from harm or to protect religious and national minorities who were subject to persecution. Enshrining this practice as a right in international law, however, continued to be strongly opposed. By the time of the UN Charter, signed in the aftermath of World War II, a destructive global conflict, the overwhelming objective of state leaders was to outlaw aggression and to circumscribe the grounds on which armed force could be used. As a result, the Charter itself remains silent on the question of whether humanitarian intervention is a legitimate practice. Moreover, for most of the Cold War period, the UN Security Council proved unwilling to consider or discuss humanitarian crises as part of its remit for managing peace and security, and individual states were reluctant to accept humanitarian rationale as legitimate justifications for the use of force.

A series of developments during the latter part of the 20th century created a more permissive context for intervention by outside actors in the face of grave humanitarian crises. These include, inter alia, the rise of international human rights instruments, the increased vulnerability of civilians in the context of civil conflict, the global and instantaneous access to information that heightened popular awareness of human suffering, and the greater willingness of the Security Council to define instances where mass atrocities are occurring as threats to international peace and security (as it did in Northern Iraq, Haiti, Somalia, and East Timor during the 1990s). In addition, the delayed and inadequate response of the international community to the genocide in Rwanda in 1994 led many to argue that intervention for humanitarian purposes could be justified as part of the requirements of a more just international order.

Opposition to Humanitarian Intervention

Despite this more permissive context, the assertion that there is a new right of humanitarian intervention has been opposed on both legal and moral grounds. The legal skeptics start with the basic presumption that the use of force is illegal as indicated in Article 2(4) of the UN Charter. The only legitimate exceptions to this rule are military actions taken in the name of either self-defense (Article 51) or collective security (in which case the Security Council authorizes the use of force explicitly through a resolution adopted under Chapter VII). Those who favor a new right of humanitarian intervention make two kinds of claims. First, they suggest that exceptions to the general prohibition on the use of force in the Charter should be widened to accommodate other important principles of the UN, such as the promotion and protection of human rights. Second, they assert that there is emerging customary law on humanitarian intervention that runs parallel to the Charter, based on a series of interventions carried out by Western governments during the 1990s and early years of the 21st century.

In reply, the skeptics have argued that neither treaty nor customary law supports a change in priorities between the different goals of the UN; while there have been significant developments in the measures designed to protect human rights over the past 50 years, these have not influenced the interpretation of Article 2(4) or the broader commitment in international society to limiting the legitimate justifications for war. They also question whether the new customary law is developing, since much of non-Western legal opinion does not support the view that humanitarian intervention is becoming a more acceptable practice in international society. This opposition derives from a suspicion that humanitarian intervention would not operate in the way prescribed by its advocates but instead would legitimate self-interested intervention by the powerful under the guise of humanitarianism.

The ethical objections to humanitarian intervention fall broadly into two types. The first argument, best articulated by the political philosopher Michael Walzer, claims that sovereign states provide the protective shell for the process of self-determination and the exercise of human freedom. In fulfilling these functions, they become moral entities that should enjoy the presumptive right of nonintervention. While this norm of nonintervention is intended to apply to all communities equally, in practice it has had particular purchase for developing countries and former colonies. By emphasizing the connection of nonintervention with self-determination, such countries have sought to protect themselves from stronger powers seeking to further their own interests through intervention.

The second set of ethical objections to interventionism is consequentialist and emphasizes the negative outcomes (both anticipated and unanticipated) that can result from the use of military force. There are two main consequentialist arguments at work. First, those from the so-called realist school of international relations contend that intervention in the name of humanitarianism is likely to create more problems than it solves and could therefore compromise the more important goal of furthering the national interest. Opposition may be created on the ground in the course of engaging in military action, or expectations may be inflated among those suffering from oppression elsewhere, who will quickly accuse the international community of bias if there is no intervention to support their cause. Furthermore, it is impossible to know beforehand if intervention will succeed in meeting its humanitarian objectives or whether it will lead to an acceptable level of casualties. This has raised the larger question of how the success of humanitarian intervention should be determined: by the achievement of short-term goals (such as the alleviation of hunger or suffering and the return of refugees to their homes) or by addressing the underlying causes of suffering through the reconstruction of stable and well-functioning states.

A second version of consequentialism alleges that any use of force, no matter how well intentioned, can undermine the broader goal of preserving international peace and stability. The international relations theorist Robert Jackson has argued that while states have a responsibility to pursue international justice where they can, they should not jeopardize other fundamental values in the process. In balancing these considerations, international peace should have particular weight, since it is in situations of war—particularly war between great powers—that humanitarian values are most likely to come under attack. The second position is a belief that the consensus that underpins international society is much more procedural than substantive. It is confined to agreements on how states should behave outside their borders and does not extend to a common view on deeper political or economic values. According to this view, sovereign states are unlikely to converge on what counts as injustice or oppression inside a state and hence unlikely to agree when interventions to address humanitarian crises would be justified.

Humanitarian Intervention and the Responsibility to Protect

While a diversity of political and economic values continues to characterize international society in the 21st century, a consensus has emerged that certain actions against individuals and groups—such as the commission of genocide—are sufficiently grave to constitute “crimes against humanity” as a whole. In these extreme cases, those raising ethical objections to humanitarian intervention often allow for some suspension of the nonintervention rule. So, for example, Michael Walzer acknowledges that when the rights of people within a community are seriously threatened such that they can no longer be said to be truly self-determining, outside intervention to protect basic individual rights is morally defensible.

This kind of reasoning has inspired diplomatic efforts to enshrine a new principle in international society, known as the responsibility to protect. In

2005, at the World Summit commemorating the 60th anniversary of the founding of the UN, heads of state unanimously agreed that all states have a responsibility to protect their populations from genocide, crimes against humanity, war crimes, and ethnic cleansing. They went on to agree that when national authorities are "manifestly failing" to protect their populations from such atrocities, the international community—acting through the UN—can take action (including, if necessary, the use of force) to fulfill the responsibilities of protection. Although the concept of the responsibility to protect is closely related to humanitarian intervention, it differs in two core ways: First, the activities that protect populations are not restricted to the use of force and, second, the responsibility encompasses the need not just to respond to mass atrocities but also to prevent their occurrence.

INTERVIEWING

Interviewing is a commonly used research method throughout the social sciences. Approaches vary, with some types of interviews conducted in an informal and open-ended manner and other types of interviews designed to be much more strictly structured and controlled. Regardless of the approach, interviews by definition always involve one person asking questions of another. The researchers (or staff members working for the researcher) seek information through conversation with their research participants. Although political scientists often use interviews to collect information about their topics, interviewing methods have been developed primarily within other disciplines—including anthropology, sociology, and journalism. Political scientists have taken these methods and adapted them to their own purposes. This entry provides an overview of the types of interviews most commonly used in political science and reviews some of the most important methodological issues associated with interviews as data sources for political scientists.

In the early 20th century, the study of political science was restricted mainly to the library, with analysis of legal rulings and of the structures of government that the primary methods used. The shift to a behavioral approach to politics—looking at what actually happens in government rather than simply what the laws say should happen—meant that political scientists would need to observe and collect information about the activities of government officials and the interactions of government officials and the public. Interviewing was one of the first ways in which this new information was collected, and in the 1920s, political scientists like Pendleton Herring and Elmer Eric

Schattschneider began conducting fieldwork in Washington, D.C., interviewing government officials and representatives from groups and businesses to be able to better describe the workings of government and how it interacted with organized interests. Today, interviewing remains a common data collection technique, especially for scholars who study political elites.

Types of Interviews There are several styles of interviewing, each appropriate for different informational needs. These styles exist along a continuum: At one end are interviewing techniques that use extremely directed, closed-ended questions, such as those in a survey, and at the other are interpretive techniques in which questions are extremely open-ended and subject to change depending on the guidance of those being interviewed.

When researchers do not know very much about the topic at hand, or when they want to capture an insider perspective on the topic, they often turn to an ethnographic style of interviewing. This approach, borrowed from anthropology, involves long interviews in which the interview subject (sometimes referred to as the interview consultant) helps direct the interviewer. The questions are open-ended. Rather than requiring the respondent to select an answer from a list written ahead of time and requiring the respondent to limit the answer to those options, an open-ended question may be answered in whatever way the respondent chooses. This often provides the researcher with an opportunity to learn about previously unknown aspects of a topic. The interview consultant is treated as the expert, as the guide, in this process. The goal of the interviewer is to guide the interview subject as little as possible, so as to elicit the unbiased views of the interview subject. Such unstructured interviewing techniques are often combined with participant observation, in which interviewers spend time in, and among those they wish to, study. Ethnographic interviews such as these often provide new and unexpected insights, but as a result of how open they are to new directions, they have a tendency to drift away from the researcher's original topic. Thus, they are not the best way to measure concepts reliably across multiple respondents or across multiple field settings, as each interview will be unique. This unique insight is both the advantage and the disadvantage of this type of interviewing.

At the opposite extreme are closed-ended interviewing techniques in which the questions and the possible responses have been predetermined by the interviewer. Outside of political science, both journalists and courtroom litigators often use closed-ended questions. In the courtroom, respondents are often limited to responding "yes" or "no" to the questions posed to them. The trial lawyer seeks to control what information is put before the jury by keeping a tight rein on the questions posed to witnesses. Trial lawyers do this because they are not interviewing to collect new information—they are supposed to have learned the answers already during their depositions of the witnesses. Likewise, political scientists use closed-ended questions when they already know a great deal about the topic at hand. The most common application of this type of interview in political science is the mass opinion survey, such as those conducted biennially by the American National Election Studies. While some surveys are self-administered—that is, survey respondents fill out the questionnaires themselves, either on paper or online—survey interviews are conducted by an interviewer, either in person or on the phone. To write closed-ended questions, the political scientist must already know what the important issues are and what the possible responses could be. The only thing that remains to be learned from the interview is how many people will end up in each response category. This, of course, is an ideal type, and in practice, surveys that are conducted in person by an interviewer also include a number of open-ended questions. In general, however, control over possible responses is fairly tight, and the goal is to make the responses as easily comparable across respondents as possible. Data that result from interviewing using closed-ended questions are much more likely to be reliably compared across participants and across field settings. These data are often used for hypothesis testing, but the closed-ended nature of the questions means that answers will be limited to the answers the interviewer could imagine before the study began and is not likely to be the source of new ways of looking at political phenomena. Whatever errors exist in the researcher's theoretical approach at the beginning are likely to remain after the study is completed.

When political scientists today think about interviewing as used in political science, they most likely are talking about a form of interviewing that strikes a balance between these two extremes. Semistructured interviews with open-ended questions are designed to focus the interview on a particular research topic and to ensure that particular questions are answered, but the interviewee is allowed a great deal of latitude in how he or she responds. Interviews with members of a parliament or Congress, or staff members of those legislators, usually are conducted as semistructured interviews. Questions are aimed at getting the respondent to talk about a topic fairly naturally in order to help capture the specialized knowledge that the respondent has. "Describe to me what happened during the debate about proposal *X*" is an example of an open-ended question that might be used. What makes the semistructured interview different from the ethnographic interview, however, is how the interviewer works to control the interview once it has begun. While the ethnographic interviewer might allow the respondent to decide what is most important to relate about proposal *X*, the researcher conducting the semistructured interview will have a predetermined list (written or mental) of questions called "prompts." This type of semistructured interviewing is also sometimes referred to as "elite" interviewing because it is most often used to collect information from elected and appointed government officials and other highly educated, highly knowledgeable respondents (who might chafe at being forced to pigeonhole their responses into the preordained categories of a mass survey instrument).

Methodological Concerns

Like all data collection methods, interviewing poses potential methodological pitfalls that must be avoided if the data are to be valid and reliable. Interviewers should remember that the order in which questions are asked, as well as the way in which they are asked, may affect the content of the answers. An early question about gun control, for example, may increase respondents' tendency to name "gun control" when asked later in an interview what they view as the most important issues facing the nation. Survey research has shown that small changes in question wording sometimes create large changes in responses, and similar effects may result from changes in interview questions. The effects of question order and question wording are arguably not as severe in elite interviews as they are in mass surveys, however, since interview respondents answer in their own words and can be prompted for more information. Sticking to exact wording and question ordering does not always work in an elite interview. For instance, the interviewer needs to be willing to drop a question if the respondent has already volunteered that information in response to an earlier question. The interviewer can adapt the question, asking whether there is anything *else* besides what the respondent has already mentioned, but the interviewer needs to show that he or she is paying attention and heard the earlier response. Otherwise the interviewer risks losing rapport with the interviewee, and answers may become less candid and less complete. For the most part, exact wording and exact question order are less important than rapport and getting the respondent talking in an elite, semistructured interview. The idea is that the open-ended, semistructured nature of the questions will allow a more "true" and complete answer.

As is the case with surveys, the data one collects from interviews are only as good as the people being interviewed. People are fallible and may give incorrect or incomplete answers. People may seek to please the interviewer rather than answer honestly. Finally, even in the case of interview subjects who seem very reliable, the relationship between what they say and what they do may be tenuous. People are not always self-aware enough to be able to describe their behaviors with complete accuracy or to give true insight into the reasons why they do what they do. Nevertheless, it is often difficult or impossible to learn about political beliefs and attitudes in any way other than asking about them, and political elites often have firsthand knowledge of events that cannot be discovered in any other way. Some of the methodological shortcomings of interviews can be lessened by making sure to interview multiple sources and use multiple data collection methods (e.g., consulting historical documents or using experimental methods) whenever possible.

Despite the potential drawbacks, interviews provide an invaluable method of collecting information about a wide range of political phenomena, from political attitudes to political history.

What political scientists have learned through open-ended and semistructured interviews in particular has often led to new research hypotheses that then are tested using other research methods. Because interview-based research is labor-intensive and time-consuming, it is unlikely to become the dominant data collection method in political science, but it will remain an important one.

INTERVIEWS, ELITE

Elite interviews are a significant source of data in political science and sociology. The concept of the elite and, consequently, its empirical identification, however, lacks a clear consensus. Elites are typically thought to have more resources and influence than mass publics in whatever sphere they happen to be located. Sociologists sometimes define elites as a set of people with special credentials in society such as Nobel Prize winners. Political scientists are especially likely to define elites in the context of political power and often as formal holders of institutional authority—typically public officeholders. Political sociologists may be more inclined to look for the powerful, whether or not they are holders of formal authority. Of course, the definition of who is powerful is highly contentious and, therefore, far from self-evident. In this entry, some specific features of interviewing elites are discussed.

There are many ways of procuring information from those plausibly described as elites. Background data are often available through documentation but are not always comparable across individuals. Sometimes written surveys are sent to elite populations. The rate of return on these may be spotty and, by definition, nonrandom. Thus, the response rate often leads to unrepresentative samples. It is also unclear who fills out the requested information when the respondent has staff personnel to deal with such matters. Consequently, elite interviews are taken here to mean some form of direct contact between an investigator (or a member of an investigator's staff) and targeted individuals drawn from an elite population.

Objectives of Elite Interviews

Elite interviews may be conducted to satisfy different objectives of inquiry. Broadly, one purpose of elite interviewing is to tell a story about a process, to relate how events or a set of events unfolded so as to ascertain proximate causality, or to ascertain influence relations among actors. These often produce case studies more likely to be predominantly qualitative in method. A second purpose of elite interviewing is to discover characteristics, perceptions, and opinions of the actors themselves. In this use, the members of the particular elite stratum become the units of analysis. Hence, the focus is on the actors themselves, their attitudes, perspectives, career paths, and backgrounds. Therefore, it becomes especially vital to have samples that are representative of the populations to which inferences are being made.

Case Studies

Typically, when the objectives of elite interviewing are to understand how a process or set of events has unfolded, the number of individuals to be interviewed may be relatively small and conducted with the narrative as the foremost objective. One purpose is to evaluate different versions of an event from the various perches that elite actors occupy and to assess the extent to which a common or differentiated picture is being held by the various actors. In some instances, interviews may start out with the purpose of snowballing to find other actors whose perspectives or roles in events may be particularly important and who are thereby recommended by those whom the investigator starts off interviewing. Typically, each interview is somewhat unique as the investigator seeks to fill in elements of a process or event. Thus, these interviews are usually relatively unstructured as the interviewer adjusts to new information and cues as to possible new informants. It is not unusual in complex systems that the best informants about process may be the facilitators rather than the principals. Staff personnel may often be better informants than the principals themselves in the sense of knowing more of the actual details of what occurred. And they are typically more accessible as well.

Elites as Units of Analysis

An entirely different kind of study involves using individual members of an elite to assess its aggregate characteristics, show its coherence or divisions, and examine differences relevant to roles or to settings. In this case, sampling reliability, uniformity of stimuli (or at least cross-validation of the stimuli), and missing data issues are all pertinent. It is essential that samples be representative. In some instances, for example, a legislative chamber, one can know in advance many of the basic parameters of the population such as distributions by party, region, age, gender, and metropolitan–rural distinctions. Other populations may be less well defined, for example, business executives or even civil servants or political officials of the executive branch of government. Willingness on the part of the individuals to participate tends to be inversely related to their organizational status. The higher up they are, the harder they are to get.

Whereas interviews undertaken for the purposes of analyzing a case may be less systematic in design, in part because of the need to adjust in the field and follow leads supplied by elite informants, interviews undertaken for the purposes of characterizing an elite population must be systematically designed at the outset with correspondingly less adjustment in the field. Adjustments that may seem sensible as the result of learning from the field experience, nevertheless, may introduce contaminating nonuniform stimuli that could induce unknown bias or error in responses.

The Hybrid

A few studies have made use of elite interviewing for the purposes of collecting information about a population's behavior as well as to flesh out information about particular cases so that each form of information gathering sheds light on the other. By providing independent sources of information, the particulars of a case study may be confirmed by the more general attitudes of the relevant elites. Equally, the expressed attitudes of elites may be assessed through the behavioral patterns manifested in the cases.

Definitions of the Elite Universe

Two definitions of an elite population exist—one defined by the power or influence of a set of individuals and the other by definitional or institutional roles. The problem with the first definition is that the influence any set of individuals or a group exercises is based either on reputation or on behavior. It is hard to disprove reputation since that is based on an assumption that repute is either equivalent to behavior or that it reduces the propensity for opposition to arise. By contrast, behavior may be shown only by the influence that some set of individuals' exercises over decisions that may vary depending on which individuals are involved regarding a specific set of decisions. Because such behavior can be assessed only after the fact, political scientists are especially likely to use formal institutional roles as a basis for defining a political elite and for analyzing them as a population. However, individual influence is likely to vary within a given institution. Party leaders, more senior members, and heads of committees are likely to play a more substantial role than backbenchers in a legislature, for example. Influence also may vary across institutions. Legislative bodies, for example, vary greatly across political systems in the authority they are able to wield. They are not equally influential in decision making. Where the executive and legislative bodies are separated, as in the United States, the legislature typically is more directly influential in policy decisions. In parliamentary systems, the pool of people likely to become more influential, for example, cabinet ministers, will be drawn from the members of parliament even where the parliament itself may exert relatively little independent policy-making influence.

Access to the Elites

Typically, it is helpful for the interviewer to have some institutional or personal credentials in order to gain access to elite populations. Sometimes, having an interlocutor to speak for the investigator's credentials can be an advantage, at least with some elements of the elite. Some elite populations are more willing to be interviewed than others and often look forward to the opportunity to express their views. Typically, these are underaccessed populations. Politicians, especially legislators, tend to be overaccessed, whereas, for example, civil servants traditionally have been underaccessed. For plenty of reasons, including busy schedules and security measures, top-level political elites are typically very hard to interview, at least while they are in office. The passage of time, however, frequently eases accessibility even when talking about controversial history and the subject's participation in it. Interviews with small numbers of primary actors in events long past, and with actors long past their prime in the public spotlight, become possible, impeded only by the mortality or decrepitude of the participants in those events.

Accessibility to governmental elites has become more complicated as a result of the security precautions that have become increasingly commonplace in public buildings. Therefore, proper introductory credentials are increasingly essential, and onsite interviews require that the interviewer's identification papers be in order.

Structured and Nonstructured Interviews

Whether an investigator should have a high level of structure over the interview protocol or a looser structure depends greatly on the objectives of the inquiry. To the extent that the investigator is looking to discover a process, it may be wise to begin with a relatively less structured interview protocol that allows different perspectives to be revealed. Those perspectives can then be used to narrow questions as more elements of the process become identified and the pathways of inquiry can be more clearly developed. This also, of course, assumes that the investigator begins the inquiry along lines that are more inductive than deductive.

Alternatively, if the investigator is seeking attitudinal responses, it is important that the interviews proceed along a relatively fixed course. There should be as well opportunities to assess convergent validation of attitudes by asking the same question in somewhat different forms across different places in the interview. Elites like to be treated as the sophisticated individuals they often are. A menu of fully closed-ended questions is likely to bore them and will possibly lead to a desire to end the interview. The interviewer must be alert to changes in mood, to signs of restlessness on the part of the respondent, to hyperinterest that may lead to an exhaustingly lengthy interview, and to a respondent's tendency to careen away from the subject matter the interviewer is focused on to a special topic that the respondent wants to discuss. Above all, the interviewer needs to be aware of time management during the course of the interview. Managing time is usually less of a problem in the unstructured interview than in the structured interview protocol. In adapting to problems of time management, the investigator may need to indicate to the interviewer, in instances where they are not one and the same, which sets of questions are fundamental and which are optional. In some instances, it may be necessary to tie questions together to present a logical follow-up to a respondent's prior answer. That is partly to maximize the efficient use of time and partly to treat the respondents as the elites they are, even though this may sporadically violate the canons of maintaining question placement.

In either case, unstructured or structured interviews, interviewer experience and adaptiveness (within limits) are key elements in creating a context where the respondent is comfortable with the interview situation and where the interviewer can be prepared for the multitude of possible interruptions that can eat into the time available for the interview, including the occasional need to bring a respondent back on track when he or she goes off on a time-consuming tangent.

Conclusion

It is likely becoming more difficult to obtain interviews with current officeholding elites than in decades past. Security measures have made it more difficult to roam through official buildings after one interview in order to set up another. Also, the use of electronic or digital recording equipment may be impermissible in some installations. Yet elite interviewing is an essential part of understanding events from the varied perspectives of the actors and intimate observers and of understanding the views of the elites themselves. Nevertheless, to a surprising degree, elites are often amenable to the entreaties of well-prepared researchers. And interviewing them is typically an illuminating exercise. But for these opportunities to be optimally rewarding, investigators must be well prepared.

Interviews, Expert

An expert interview is a semistandardized interview by one or more interviewers with a person identified as a so-called expert and serves to generate data in a research context. This raises the following questions: What constitutes an expert? Why are experts of such particular interest in a social and/or political scientific research setting? The answer lies primarily in the knowledge that they have acquired in the course of their (professional) activities. Experts not only have (a) specialist professional or technical knowledge and (b) knowledge of organizational procedures and processes, but they also have (c) interpretative and background knowledge ("know-how" and "know-why") in their particular field. Such professional/technical knowledge and process knowledge are generally explicit knowledge, which experts can usually communicate in a systematic and deliberate manner. Interpretive and background knowledge is predominantly tacit and draws on the relevant individual experiences, organizational social practices, or collective interpretive patterns encountered by an expert in professional practice. People with this kind of broad knowledge are usually to be found on the middle and upper—occasionally also on the lower—levels of the organizational hierarchy. Given their position in the organizational and functional context, experts often have at least a partial chance of putting their knowledge and action to practical use, that is, accomplishing their own interests and ideas and, thus, making a decisive contribution to what goes on both inside and outside the organization. This ability to assert themselves and shape events is generally linked to their position and permits experts to speak as a representative of an organization and be recognized as such. In this entry, the history, use, and specific problems of expert interviews are discussed in greater detail.

The History of Expert Interviews

Expert interviews were first encountered primarily in German-speaking countries, where they have been used increasingly in social, economic, and political science research since the 1980s. However, it was not until the early 1990s that they slowly began to establish and distinguish themselves as a specific qualitative social research method. In the meantime, a number of books have been published on the methodology and methods of interviewing experts, and most pertinent, newer German-language books on qualitative research methods now also include expert interviews. The situation is quite different in their English-language counterparts, where—unlike interviews with the elite—expert interviews are rarely mentioned. In fact, there are many similarities between these two interview forms, from the sampling and difficulties of gaining access to the field through to the actual specifics of the interview process. However, the key difference lies in their target groups: the elite are the powerful, top echelon of a society. Indeed, the label "elite" is ascribed to a person or group/class of persons with high social, educational, and economic status and, thus, the power to make (or at least the possibility of making) a significant impact on society. From a sociology of knowledge perspective, the elite can also be seen as experts with expert knowledge, but more precisely as experts who have particular power. In essence, they are top company executives and members of corporate supervisory bodies, senior civil servants, or high-ranking government officials. The actual person who will be able to provide the best information for a particular research topic, the type of knowledge sought, and the position of the interviewees in their hierarchy will ultimately always depend on the specific research context.

Using Expert Interviews

Depending on the research design and topic(s) being researched, expert interviews can be used for the following different purposes:

1. Exploratory expert interviews are used to obtain an overview of and access to a less familiar field.
2. Systematizing expert interviews serve to systematically reconstruct "objective," specialized technical and procedural knowledge in a particular field.
3. Theory-generating expert interviews focus not just on specialized expert knowledge but also on the tacit and subjective interpretative and background knowledge gained through (professional) experience.

Many research projects combine the use of expert interviews with other methods (mixed methods or triangulation of methods). In political science research, for example, expert interviews are often used in combination with document analysis to ascertain the history behind certain documents. This is usually done less with a view to validating the data and results but more often to establish a broad picture of social practices in a specific field.

Sampling and Access Problems

Selecting the appropriate interviewees for a particular research project depends greatly on the actual research topic(s) and specific field of research. There are often only a limited number of experts in a given field. In such cases, it is best (where possible) to interview all relevant experts, particularly since they will often have their own networks. Such networks can help encourage experts to participate in an interview to ensure their views are included. Altruism, or even a desire to enhance their own status, can also be a possible motive for agreeing to an interview. The first step in the sampling process involves analyzing literature or media reports and talking to relevant sources—people who are familiar with the field—to identify the key experts. The original sample should then be extended in the interview phase by asking the interviewees themselves to recommend further experts.

Time restrictions and a general lack of willingness to provide information can frequently be a problem when seeking access to experts, so it is particularly important that the first contact—either in writing or by phone—is carefully prepared. To encourage experts to participate in an interview, the first contact with them should briefly outline the goals and relevance (e.g., innovativeness) of the research and explain how important it is that they participate. Interviews should be calculated to last no longer than 45 minutes (even if they ultimately take longer in reality). If a face-to-face meeting cannot be arranged, an interview can also be conducted by phone. One problem with this option is the lack of control over the interview situation: The interviewee might, for example, be distracted by other tasks. Similarly, no account can be taken of body language or gestures.

Interview Guidelines/Topic Guide

Drawing up a set of interview guidelines is an essential part of the preparation for an expert interview and familiarization with the relevant vocabulary and field of research. Such guidelines should structure the central topics in line with the expected course of the interview and can be sent to any experts who request information about the interview prior to the event. Nonetheless, to ensure that the interviews flow as authentically as possible, the guidelines should not be overly detailed. In the actual interview, they serve as an aide-mémoire and prevent the interviewer from overlooking any important questions. However, they should only be used as guidelines and not worked through rigidly point for point: Interviewees should be given the maximum opportunity to express their own opinions and ideas. The more an interviewer succeeds in getting an expert to talk, for example, through a narrative generating introductory questions and request for concrete examples the greater the chance that tacit knowledge (in the form of interpretive and background knowledge) will emerge in the interview. This knowledge is particularly relevant for reconstructing social practices in a particular field.

Interaction Situations and Effects

Expert interviews are—like all interviews—a form of social interaction. The basic intent is to get the interviewees to say what they think needs to be said in a given situation. "What" they say and "how" they say it depends on many different elements of the interaction—from expectations and motives for participation to situational aspects such as time pressure, sympathy or antipathy, and trust or mistrust. The interviewee's capacity to remember and the interviewer's interviewing skills, way of asking questions, openness, inquisitiveness, self-assurance, and so on will also influence the conversation. Gender relations can also play a twofold role in the interview. First, most of the experts are men, as there are relatively few women in management positions. Second, the probability of the participants "doing gender" (i.e., assuming gender-specific roles, particularly in a mixed-gender setting) becomes highly likely. Of particular relevance for interaction in an expert interview setting are the status and relationships the interviewee accords the interviewer. The latter is typically perceived as a co-expert, a potential critic, an accomplice, a controlling authority, or a layperson. These associations affect the interviewee's behavior, willingness to communicate and manner of communication, attitude, and so on. Interview effects resulting from an individual interview constellation cannot be avoided and are not necessarily disadvantageous. They may even be of strategic benefit. For example, if they consider the interviewer a layperson, interviewees may well be more willing to provide information about their field of expertise and experience. Interviewers should also be aware that even research-related interviews are a form of social interaction and do not permit a "pure" or even objective gathering of data.

Analysis

There is no standard procedure for analyzing expert interviews. In principle, all qualitative social research analysis methods can be used, for example, the code-based procedures common in grounded theory or qualitative content analysis, or the sequential analyses applied in hermeneutic sociology of knowledge or objective hermeneutics. A combination of different methods is also admissible. The most suitable form of analysis ultimately depends on the actual research project. Computer-assisted analysis using special qualitative data management programs can help but cannot automatically complete the data analysis. Even if computers are used to assist with data analysis, it remains the task of the researchers to interpret the data in a transparent, plausible, and comprehensible manner.

Ethics

Given their prominent position in what is often a small and clear field, it can be difficult to keep the identity of experts hidden. Consequently, the researcher should always clarify how much of the information obtained from the interviewee can be published in a nonanonymous form (e.g., as quotations). In some cases, it may be necessary to have the interviewee expressly authorize the use of the minutes or interview transcript for analysis or publication purposes. The expert should, in all cases, be given the assurance that all data will be treated in confidence.

IRREDENTISM

The term *irredentism* is derived from the Italian word *irredenta* (unredeemed). It originally referred to an Italian political movement during the late 1800s and early 1900s that sought to detach predominantly Italian-speaking areas from Switzerland and the Austro-Hungarian Empire and incorporate these territories into the new Italian state, thus "redeeming" these territories. Modern usage denotes territorial claims based on a national, ethnic, or historical basis. In many cases, an irredentist movement is referred to as creating a "Greater *X*," with the "*X*" being the name of a nation or state—for example, the quest for a Greater Serbia was in part responsible for the Wars of Yugoslav Succession during the 1990s, and the Greater Romania project (*România Mare*) was partially responsible for Romania siding with the Axis powers during World War II. It is related to, but distinct from, secession: Irredentism is the process by which a part of an existing state breaks away and merges with another, whereas in secession merging does not take place. The importance of irredentism in international relations is based on the intersection between nationalism and the causes of war; because such a movement invariably means taking land from another state, irredentist claims have been known to provoke ethnic conflicts and territorial aggression. The continued discord between nations and states means that the potential for irredentist wars remains serious. This entry identifies some notable cases, provides examples of how irredentist claims are sometimes enshrined in state constitutions, and reviews the literature on this phenomenon.

Notable examples of irredentism include Nazi Germany's claims on the Sudetenland of Czechoslovakia; the "Megali Idea" that sought to create a Greater Greece; China's desire to reincorporate the territories lost during periods of historical weakness; Somalia's invasion of Ethiopia during the Ogaden War of 1977–1978; the attempt by Hungary to reverse the 1920 Treaty of Trianon and reclaim territories in Slovakia, Romania, and Yugoslavia during World War II; and the continuing conflict between Armenia and Azerbaijan over the Armenian-populated Nagorno-Karabakh region. More questionable cases include those without a direct ethnic component but rather based solely on historical claims, such as Argentina's invasion of the British-populated Falkland Islands (Islas Malvinas) in 1982 or Serbian claims to Kosovo, which was the birthplace of Serbian nationalism but is now populated overwhelmingly by ethnic Albanians. However, these territories could also be considered "unredeemed," and therefore, these cases can fall under the category of irredentism.

In some instances, states have gone so far as to incorporate irredentist claims directly into their constitution. For example, Argentina claims that recovering the Falkland Islands is "a permanent and unrelinquished goal of the Argentine people," and China considers Taiwan to be part of the country's "sacred territory." The 1937 Irish constitution originally laid claim to the entire island of Ireland, but this was changed following the 1998 Good Friday Agreement resolving the conflict in Northern Ireland.

Despite the numerous potential cases of irredentism, and the long history of these claims sparking armed conflict, there has been surprisingly little scholarly research done on this topic, and no consensus position on its causes, dynamics, or resolution has emerged. However, five explanatory categories can be identified: (1) structural, (2) realist, (3) rational choice, (4) domestic, and (5) constructivist. Given the complexity of irredentism, there are likely multiple and overlapping explanations for any particular case.

Structural explanations argue that the international or regional context within which the potentially irredentist state operates will play a large role in determining whether such a project is initiated and the conditions under which it ends. In most cases, this focuses on the relative support in the international system for state sovereignty versus national self-determination. If the latter is emphasized, then nationalist claims will be allowed to override the inviolability of sovereign borders; if the former is emphasized, then the legitimacy of irredentist claims will be widely rejected. The dramatic increase in irredentist conflicts during periods of major international upheaval and normative reordering is seen as important evidence in favor of this position.

Realist arguments emphasize the relative balance of power between the irredentist state in question and either the target state or the international community. In the first case, military weakness vis-à-vis the target state will force the irredentist country to relinquish its claims; in contrast, relative military strength will precipitate such a project. A weak Albania had little chance of forcibly altering its border with Yugoslavia, but a strong Nazi Germany could pressure France and Great Britain to force territorial revisions on Czechoslovakia. The latter argument takes the balance of power to a higher level by examining the degree to which relevant international actors (states or international organizations) acquiesce in or tolerate the policies of specific irredentist states. The more tolerant they are, the more an irredentist state can get away with; if they are less tolerant, then an irredentist state is forced to temper or restrict its policies. During the early years of the Wars of Yugoslav Succession, the international community did little other than rhetorical condemnation to stop Croatia's and Serbia's irredentist projects. However, once key states (particularly the United States) adopted a more robust and muscular stance, then both countries recognized the prewar borders of the Yugoslav republics.

Rational choice accounts examine the decision-making processes of elites that initiate an irredentist conflict for instrumental purposes. Two arguments fall under this rubric: elite conflict and diversionary theory. Under the first explanation, leaders will attempt to use irredentism as a tool to counter challenges from other elites by appealing to the nationalist sentiments of the populace. For example, Slobodan Miloševic used irredentist claims in Kosovo, Croatia, and Bosnia-Herzegovina to rise to political preeminence in Serbia. According to the latter argument, decision makers will initiate an irredentist conflict to divert the attention of their population from domestic problems. Argentina's invasion of the Falkland Islands to prop up the military junta is often considered a classic case of diversionary war theory.

Domestic-level explanations also come in two forms: demographics and regime type. The first argument holds that ethnically homogeneous states are more likely to be irredentist because the populations of ethnically divided states will be unwilling to support a project that benefits only one group and might have the effect of altering the ethnic balance of the state if successful. For example, given the serious discordance between ethnicity and statehood in nearly all African states, it should not be surprising that the only substantial irredentist conflict was the one launched by ethnically homogeneous Somalia. The second explanation argues that democratic states are less likely to have irredentist-type conflicts between them because of increased institutional restraints on launching an irredentist project; enhanced protection for minority groups, which undermines the reasons for moving to protect one's diaspora; membership or possible membership in international organizations that prohibit such claims (e.g., North Atlantic

Treaty Organization [NATO] or the European Union); and the dynamics of democratic peace theory, in which democratic states tend to resolve their disputes peacefully. The reduction in tensions between Hungary, on the one hand, and Romania and Slovakia, on the other, was associated with the consolidation of democracy in these countries, whereas nearly all irredentist conflicts were initiated by authoritarian regimes.

The final explanation for irredentism is derived from the insights of constructivism, which holds generally that the social construction of ideas and concepts is instrumental in determining political outcomes. When applied to the issue of irredentism, two arguments emerge. The first asserts that the type of national identity that is dominant in a particular state or nation will influence the degree to which it will become irredentist: An ethnic identity emphasizes the unity of the culturally based nation across political boundaries and lends itself to the promotion of altering borders to realize a physical union of the nation; a civic national identity is political in nature, usually tied to a preexisting state, and is therefore more easily limited to status quo boundaries. Some 25 million ethnic Russians found themselves as minorities scattered throughout the former Soviet Union on its collapse. However, despite the fact that many of these Russians were in territories contiguous to Russia itself, the association of the Russian Federation (*Rossiyskaya Federatsiya*) with the concept of *rossiiski* (civic) rather than *russkii* (ethnic) dampened the legitimacy of an irredentist project aimed at creating a Greater Russia in the 1990s. By contrast, ethnically based national identities, such as that found in Nazi Germany, more easily lend themselves toward a desire for unification. The second constructivist argument focuses on the ways in which the irredentist claims are justified in a society. This justification includes the arguments that assert the group's right and obligation to unify the nation and the proper means by which to achieve this goal. The potential for irredentism can be reduced if this justification is somehow undermined, perhaps by reconceptualizing the nation's history, the physical boundaries of the nation, or the place of the nation in the international community. The belief that Serbia was obligated to protect its fellow Serbs in Croatia and Bosnia-Herzegovina, when mixed with the conception of the Serb nation as the defenders of Europe against Islam, helped fuel the quest for a Greater Serbia. By contrast, Germany's renunciation of aggression after World War II and the self-described role of facilitator of Pan-European cooperation precluded adjustments in the country's post–World War II borders.

ISLAM

Why is Islam, which is a religious faith and a local culture, placed as an entry in an encyclopedia for political science? This discipline is not supposed to deal with religion and culture but instead with the polity and government. The subject matter is a religious faith that assembles nearly 1.6 billion people of humankind as an *umma* (community) that consists of a great variety of local Islamic cultures. These are, however, related to one another in terms of shared values and worldview. On these grounds, there is a resemblance that unites all Muslims to one civilization. Cultural diversity exists in Islam within the unity of one Islamic civilization. In view of this cultural diversity, there is no monolith named Islam.

The answer to the question concerning the legitimacy of this entry is that Islamic civilization matters to politics since the great changes in the world around the end of the previous century, particularly with respect to decolonization and globalization. Islam at the beginning of the 21st century is a major factor in politics on two political levels. First, on the state level, the Organization of the Islamic Conference (OIC) unites 57 states with an Islamic majority population. Second, there are Islamic nonstate actors (e.g., Al Qaeda and the Muslim Brotherhood) that engage on all levels of politics.

The politicization of the religion of Islam is connected with the claim that Islam is not only a faith but also a constructed system of government. The idea of an Islamic state is based on sharia law, believed to be the constitution legislated by Allah for a divine order. This political interpretation of Islam makes from this religion an ideology of Islamism that leads to inner conflicts within Islamic civilization. The political theorist John Brenkman characterizes this issue as a "civil war" within Islam (e.g., the fight between the secular Kemalists and Islamists in Turkey). The spillover of this process to world politics assumes a geopolitical dimension with the related effects on world politics.

The politicization of Islam suggests a more complex relation between religion and politics on all three levels: local, regional, and international/global. The major issue is a return of Islam to politics that indicates the failure of the secularization process in contemporary Islamic civilization. This failure is, among other things, related to the crisis of the secular nation-state as a crisis of development.

The Roots of Politics in Islam

At issue is political Islam, not the Islamic faith based on religious-cultural meaning inherent in a cultural system. In short, Islamic politics matter to political science. This politicized Islam serves as a political ideology often used as a device for political legitimacy. This is not a novelty to Islam, since it is a peculiarity of this religion to have had a close relation to politics and war from its birth onward. The novelty is, however, the recent phenomenon of Islamism and its idea of an Islamic state. To understand the distinction, one has first to look at the past. Islamic revelation started spiritually in Mecca in the year 610. It was not until the creation of the polity of the *umma* (i.e., community, not the Islamic state, as Islamists today wrongly contend) in Medina in 622 that Islam was intermingled with politics. In that year Islamic history commences, and therefore, in their calendar, Muslims number 622 as the year 1. This is the Islamic *hijra* calendar. Therefore, *hijra* (migration) has a specific meaning in Islam: A Muslim is supposed to migrate in pursuit of the spread of Islam. In the year 622, Prophet Mohammed migrated from Mecca to Medina and engaged in political activity to spread Islam. For Muslims, this is a binding precedent. In his new location, the Prophet made political decisions and also fought wars. Therefore, the late French scholar of Islam, Maxime Rodinson, characterized Prophet Mohammed as a combination of Jesus and Charlemagne. However, neither the holy book of the Muslims, the Koran, nor the tradition of Prophet Mohammed, that is, the scripture of the *Hadith*, ever made provisions for how to rule the polity. It follows that there is no provisioned system of government in the authoritative scripture of Islam. In short, the idea of an Islamic rule is a construction made after the death of the Prophet. One has also to add that the system of the caliphate, established after the death of the Prophet (in 632), should not to be conflated with the Islamic state for which Islamists at present fight. These are distinctly different issues.

In 632, the aristocracy of Mecca, which was composed of elders of the Islamized tribe of Quraysh, established three tenets: (1) the Islamic ruler should be a successor, that is, a caliph, of the Prophet; (2) the caliph should be descended from the tribe of Quraysh—a requirement that contradicts the Islamic provision that all Muslims form one community that transcends tribes and creates a transtribal umma in which tribal affiliations are abolished; and (3) the caliph should be close to the Prophet and to the tradition he established. In this *khilafa* (meaning "caliphate") system, selection of the caliph was based on merit and descent in the formative years of Islamic rule from 632 through 661. There were four Qurayshi leaders—Abu Bakr, Omar, Othman, and Ali—who were selected to rule as caliphs. Three of these righteous (*rashidun*) caliphs, including the last one, Ali, were brutally assassinated. Despite this bloody feature, the *rashidun* age is considered to date to be the model for emulation with regard to political rule.

Following the assassination of Caliph Ali in 661, the Islamic umma experienced a violent schism between the Sunnis and Shiites. The Omaiyyads usurped the caliphate and established dynastical rule. In so doing, they transformed the caliphate from selective to hereditary rule. They also shifted the capital of Islam from Medina/Mecca to Damascus. This first imperial rule of Islam, named the Omayyad caliphate, successfully led global jihad wars. This Islamic expansion resulted in an Islamic empire that stretched from China to Spain. In Islamic history, two other such imperial caliphates followed successively, namely, the Abasside of Baghdad and the Ottoman of Istanbul. In this imperial history, which lasted until 1924, Islam was not only a faith practiced in a great variety of local cultures but also the basis for a cross-cultural civilization and for the legitimacy of imperial rule (or caliphate). This rule is considered to be the Islamic system of government. Muslims fought jihad wars from the 7th through the 17th centuries in pursuit of an Islamic expansion envisioned to map the entire globe into *Dar al-Islam* (realm, or house, of Islam).

History did not follow this course prescribed by Islam. The world was mapped into another system, namely, the Westphalian one of sovereign states that was established in 1648. This system continues to be the basis of the modern international system.

The End of Islamic Expansion and the International System

For Islam, the Peace of Westphalia matters with respect to both the past and the present. The roots for the launching of a competitive globalization project are related to the rise of the West with its "military revolution" (1500–1800), based on the industrialization of warfare. This rise interrupted the Islamic expansion and replaced it with its own European expansion, which is the crux of the relation between Islam and politics. In the past, the rise of the West halted Islamic expansion. At present, the Westphalian system of states maps the entire world of Islam. The Islamic revolt against the West is not only a revolt against this system but an attempt to reverse history.

After their failure to capture Vienna in 1683, the Muslim armies retreated and lost all the ensuing wars. The importation of European military practices into Muslim armies did not remedy the existing deficiencies. European powers not only stopped Islam from further invading Europe and pushed it back from Europe, but they also invaded the world of Islam itself. The third and last global Islamic caliphate of the Ottoman Empire declined. After a successful revolution, Kemal Atatürk abolished the caliphate in 1924, following the declaration of the secular republic of Turkey. Turkey is the only secular republic in the world of Islam that enshrines secularism in its constitution. One year after the abolition of the caliphate, the Al-Azhar scholar Ali Abdel-Raziq (1888–1966) published his book *al-Islam wa usul al-hukm* (Islam and the Origins of Government), in which he argues that Islam was just a religious faith and was wrongly used to legitimate political rule. This depoliticization of Islam was strongly contested by Muslims. As punishment, Abdel-Raziq was fired from his position at Al-Azhar University in Cairo, and he died in poverty in 1966. Like Turkey, most Islamic states underwent various forms of secularization, without, however, a formal adoption of secularism. The transitory period of colonial rule in most of the former provinces of the Ottoman Empire ended in the building of independent, secular nation-states throughout the world of Islam. These states were mapped into the Westphalian system of sovereign states and became a part of the modern international system. This was the age of secular politics in the world of Islam, which lasted from 1924 to 1967. The Six-Day War of 1967 launched in its effects the return of Islam to politics. This process was facilitated by the fact that the new secular nation-states had a weak legitimacy and lacked political capacities. This weakness was emphasized by the 1967 defeat, and Arab states appeared as "nominal nation-states," even as "tribes with national flags." The lack of institutions that would have been shaped within the national cultures of these countries resulted in a dangerous lack of legitimacy.

Islamic Politics and Islamic States

In the historical period between the abolition of the caliphate in 1924 and the Six-Day War of 1967, Islam receded by and large from the political arena. The Muslim Brotherhood movement was established in 1928 in Cairo, but despite their activity, such movements were by then mostly at the fringe of politics. Secularism prevailed in a variety of forms in most Muslim countries—of course, not in Wahhabi Saudi Arabia but especially in the staunchly secular republic of Turkey. Also, the Pan-Arab Egypt under Gamal Abdel Nasser had a secular legitimacy, as did the largest nation of Islam in Southeast Asia—Indonesia—under the rule of the secular Ahmed Sukarno. The Arab defeat in the Six-Day War of 1967 had repercussions that led to a delegitimation of secular regimes, first in the Middle East and then in the rest of the Islamic world. Among the consequences was the ascendancy of political Islam (Islamism), which moved from the fringe to the core of politics. For a number of reasons, the effects of this process spilled over from the Arab Middle East to the rest of the world of Islam. One of the factors that promoted the spillover effects is related to the Arab part of Islamic civilization being recognized as its core. It generates cultural-religious influence over the rest of the world of Islam. For instance, the Middle East influences Southeast Asia and not the other way around, even though Indonesia's population is about three times greater than that of Egypt.

The connection between Islam and politics is established today by the Islamist movements that reclaim an Islamic order (*nizam Islami*) following a global trend that gives a more important role to religion in politics. Today, it is Sunni Arab Islam and not the Shiite revolution in Iran that generates (a) jihad in the new understanding of an Islamic world revolution; (b) shariatization of politics, based on a new understanding of Islamic law; and (c) a call for the return to the golden age of Islam in a messianic perspective that appeals to people who feel frustrated and deprived after the breakdown of communism and the end of the East–West conflict. The uprising of 2011 against the existing authoritarian order of the state, which began in January in the Arab world, first in Tunisia and followed by Egypt and Libya, is to be placed in this context.

Islam's return to the forefront, in the shape of Islamism, creates a bipolarity between the Islamic and non-Islamic worlds and is accompanied by Islam's conflicts with modernity. Islam is a civilization subjected to a politicization that is also—in terms of world politics—a politicization of what Raymond Aron called the "heterogeneity of civilizations." This process leads to an intercivilizational conflict. The reader is reminded of the distinction that a conflict is not a clash: A conflict can be peacefully resolved in a negotiation process that could assume the shape of a dialogue between civilizations, whereas a clash is based on an essentializing view and on the fault lines of polarization. The pertinence of Islam to political science and also to international relations is related to the fact that religion and politics have become intertwined in the countries of Islamic civilization. Religion is among the new sources of conflict. The articulation of needs in religious language first generates real cultural tensions, which later become political. There are many levels in this conflict. The first level is an inner-Islamic conflict over the secular nation-state. Under conditions of globalization, this conflict within Islam is then extended to an international one. The conflict escalates with the rise of powerful Islamist movements that challenge the existing nation-states in the world of Islam, with the aim of replacing them with an Islamic state. This claim leads to tensions and conflicts, first within Islam and then through spillover effects to the international and intercivilizational level. The inner-Islamic and international levels intermingle with one another.

The call for an Islamic state is not to be conflated with the aim of restoring the caliphate, as some pundits contend. There is a novelty, next to the fact that politics is becoming religionized and religion is subjected to politicization. This novelty is the idea of an Islamic order that incorporates the Islamic state. This particularism promotes tensions that ignite conflict. These are also related to images of the self and of the other. Of course, there are socioeconomic and political constraints underlying the political conflict articulated in religious terms. This articulation in religious terms matters to the analysis in the sense that political, social, and economic concerns become religionized. The reference to Islam is not merely a cover, nor does it happen instrumentally, as some Western pundits contend. The religionization of conflict gives politics a new shape. Conflict becomes intractable because beliefs are not negotiable. Some students of Islamic politics argue that these Islamist Muslims are virtually secular, because they use, or abuse, religion for nonreligious ends. However, fieldwork shows that Islamists act in good faith as believers. Their good faith is not to be confused with cynicism. Many

Westerners fail to understand the place of culture and religion in post-bipolar politics.

Areas of Concern in Islam and Politics

The contemporary view of Islamism as an embodiment of religionized politics relates Islam to the areas of knowledge of politics and law and also human rights in a contestation of the secularization of the world of Islam. Political scientists are expected in their study of Islam to be wary of and to avoid the biased debate in which accusations of Orientalism replace scholarly analysis. Empirical evidence, however, has shown that cultural tensions related to Islam lead to political conflict.

The study of religion and politics covers all religions, but the pivotal place given to Islam in this analysis is related to the following assertions:

1. Islam as a religion invades the public sphere, teaching that the primary unit of society is the *umma*, the international brotherhood of believers.
2. Islam forces people to follow sharia laws. If this law is elevated to state law in a process of shariatization of politics, then conflicts based on a religious component are likely. These are much harder to solve than purely political conflicts. The involvement of religion in politics makes conflict intractable.
3. Political Islam is central to post-bipolar world politics through the transformation of Islamic universalism—in the course of a process of politicization—into a politics that leads to a religion-based internationalism. This contemporary Islamist internationalism should not be conflated with the Pan-Islamism of the 19th century's Islamic revival since from it emerges the claim of a new world order based on Islamic tenets, which may provide an explanation for "Islam's geopolitical war," which some political theorists posit in their linking of the terrorist attacks of September 11, 2001, to post-bipolar politics. Surely, this assertion is also a contested translation of the role of the jihad, which must be more exactly defined as the effort by believers to get closer to the will of God. Therefore, one needs to establish a distinction between traditional jihad and Islamist jihadism.

The contention that there is a model of an Islamist state matters to political science. In international relations of the post-bipolar politics, the competition among different cultural models generates political tensions that develop domestically, regionally, and internationally. Islam's problems with cultural modernity are central in this context. The ignited tensions occur not only among Muslims but also in their relations to the "non-Muslim other" in an international environment of crisis.

Conclusion

Political scientists involved in peace studies and in mediation are challenged to relate civilizational encounters to the study of conflict from the point of view of conflict resolution. However, preventing the clash of civilizations cannot dispense with the study of intra- and intercivilizational conflict. Some political scientists have gone to the other extreme of a constructed *convergence of civilizations*. Western political science needs a better understanding of Islam and politics and the related conflicts. Again, one should remember that a conflict is not a clash.

The study of religion and violence in Islam also matters to political science in its reference to the place of jihad and jihadism in politics. Many believe that there can be a democratic response to terrorism to replace the war on terror pursued in the name of security. The political interpretation of jihad as a "world revolution," as advocated by Sayyid Qutb, allows—as jihadism—the resort to violence in an irregular war. This is also among the areas of concern in the study of Islam and politics.

The political theorist John Brenkman states that Islam is in the midst of a civil war. Then, he boldly ascertains that most of the dangers are emerging from the Muslim world. Today, such views are often qualified as an expression of Orientalism, but the concern articulated in the above statement matters to political scientists. The study of conflicts generated between radical Muslims themselves, on the one hand, and with the West, on the other, is a concern of political science. The cultural analysis of political conflict is not a culturalism. The conflict within Islam is ignited by political Islam that uses Islam not only to gain legitimacy in its Islamist movements but also as a concept of order. The study of issues such as the resolution of intra- and intercivilizational conflicts and the combination of Islam and democracy is the business of political science. Another area of study is the history of political ideas. In medieval Hellenized Islam, there existed a rational political philosophy established by Farabi (870–950) that lasted until Ibn Khaldun (1332–1406). This Islamic humanism helps establish a bridge between the civilizations.

ISLAMIST MOVEMENTS

In recent decades, Islamist movements have become an important social and (sometimes) political force in many Arab countries. They share three major characteristics:

1. Islamists are critical of prevailing societal conditions in Arab countries, which they describe interchangeably as decadent, underdeveloped, or unjust.
2. They blame authoritarian ruling establishments for these societal conditions and therefore consider political change as the first crucial step toward altering Arab reality. Islamist movements operating in the Arab world differ from missionary groups and Islamic charitable organizations, which see change as a long-term process of Islamizing societies that takes place outside of the realm of politics.
3. They legitimize their practices and create popular appeal for their movements by basing them on religious norms and values, which serve as the ultimate ideological frame of reference for society and politics.

Within the broad category of Islamist movements, groups can be differentiated by their attitudes toward violence and their perceptions of politics. Militant groups such as the Egyptian Jihad and the Algerian Islamic Group use violence and seek to establish theocratic states as the sole means of changing conditions in Islamic societies. Their sources of inspiration are either idealized interpretations of past moments in Islamic history or contemporary models of Islamic republics, be they in Iran, Sudan, or even Afghanistan. Mainstream

Islamists reject violence and endorse competition through pluralistic politics. They exclude radical strategies as options for political transformation and see gradual democratic openings as the only viable way to challenge repressive authoritarian regimes in the Islamic world.

This mainstream position is relatively new. In the 1980s and 1990s, mainstream movements still had not accepted the value of democratic governance. Caught in the iron grip of regime oppression and continuous radicalization at the outer edges of the Islamist spectrum, these movements were sometimes forced out of the official political sphere or violently banned and denied any public role. In a few countries such as Morocco, where Islamists were partly integrated in the political process, Islamists' preoccupation with rhetorically sound though politically unattainable goals—Islamization of legislative environments and educational systems—did not help them overcome general doubts about their real objectives. By the end of the 1990s, Arab Islamists had failed to change political realities in their homelands despite considerable popular support. This failure prompted various revisionist trends that gathered momentum in the past few years. As a result, mainstream Islamists have become increasingly receptive to democratic procedures.

Three Paradigms of Islamist Participation

In this context, it is possible to identify three major modes of mainstream Islamist participation in politics. The first comprises the Iraqi, Lebanese, and Palestinian cases. While the Islamist movements in these instances operate with relative organizational freedom in the context of political party plurality, these experiences also take place in a climate of relative chaos, whether because foreign occupation has wrought the collapse of the institutions of government and public security or because an ongoing intractable crisis of internal discord so hampers the efficacy of government as to constantly threaten the stability of the political system and encourage the prevalence of monopolistic/exclusivist tendencies that conflict with the spirit and substance of peaceful participation.

The Islamist movements in Iraq, Lebanon, and Palestine are characterized by hierarchical internal structures, possession of the means to exercise violence, and a tendency to resort to, or threaten to resort to, violence to resolve their political conflicts. The inclusion of such Islamist movements in plural politics, at a time when they have yet to develop a full commitment to peaceful participation and when such participation is perhaps only a tactic within the framework of a greater strategy, reduces or even eliminates the chances of propelling political plurality forward through a process of democratization.

In sharp contrast to these instances, the second mode of Islamist participation in politics adopts participation as its one and only strategic option. The campaign motto "participation comes first" typifies the attitude of these Islamists who are prominent in some Arab countries such as Morocco, Algeria, Kuwait, and Bahrain. Whereas Islamists form small parts of the governments of Algeria and Kuwait, their counterparts in Morocco and Bahrain lead the opposition camps. More significantly, some of these movements have succeeded in formulating a functional separation between religious proselytizing activities and politics, thereby transforming themselves into solely political organizations guided by an Islamist code but run by professional politicians and the activities of which steer clear of the rhetoric and activities of a proselytizing movement.

In spite of qualitative differences between their movements, the Islamists who follow the motto "participation comes first" share several fundamental characteristics. Above all, they honor the legitimacy of the nation-state to which they belong, and they respect that state's governing institutions, the principle of equality among all citizens, and the pluralistic, competitive nature of political life. This attitude, which they have generally adopted as much in spirit as in form, has led to the decline in exclusionist rhetoric, whether directed toward ruling establishments or to the liberal and leftist opposition. It has also resulted in a gradual shift away from ideological diatribes and categorical judgments and toward the formulation of practical political platforms and constructive attempts to influence public policy, whether as minor partners in government or as members of the opposition.

The third mode of Islamist participation is epitomized by the cases of Egypt, Sudan, Jordan, and Yemen. In spite of the considerable differences between them, Islamist movements in these countries have persisted in the face of a volatile political space and the fragility of their relationship with the ruling establishments. If in Egypt and Jordan, Islamists have been given some room to participate in pluralistic mechanisms, in legislative elections, in professional syndicates, and in other areas of civil society, the sword of the security forces is constantly hanging over their heads. By contrast, the Islamist movements in Sudan and Yemen throw into relief the danger of the nondemocratic accommodations Islamists have struck with paramilitary ruling establishments and the negative impact of such alliances on political life and on the internal dynamics of the Islamists themselves.

The motto of these Islamists may be described as "participation until further notice." They may have adopted a strategy of peaceful participation, but it is no more than a strategy. In view of the perpetual fluctuation of their role in the political life of Egypt and Jordan or the swings in their positions from partners in authoritarian governments to antagonists, in the case of Sudan and Yemen, their leaders and followers continue to hover in the abstract heights of ideology, social narratives, and megapolicy (the role of religion in public life, the implementation of the Islamic Law, and the re-creation of the Muslim nation) while ignoring the need to evolve a culture that values consensus making and constructive mechanisms for influencing public policy.

Challenges of Islamist Political Participation

When examining the three modes of Islamist participation in politics, special attention has to be given to the impact of participation on the organizational complexity of Islamist movements, the separation between religious proselytizing and civil-political components, and finally the balance between Islamist interest in public policy matters and in ideological and moral issues.

Essentially, the relatively stable experiences of Islamists in the political process, as in Morocco, Algeria, Kuwait, and Bahrain, contributed to the rapid development of the Islamists' organizational units. They now have increasing functional specialization and variation, distinct institutional separation between religious and civil components, and a core emphasis on public policies. However, the volatile experiences of Islamists in Egypt, Jordan, and Yemen have prevented the materialization of equally successful trajectories, despite the fact that some elements of progress can be noted.

The Islamists' experience in Morocco, Algeria, Kuwait, and Bahrain testifies to the existence of a direct relationship between the stability of the available realm for political participation, as a result of the decline in the government's recourse to the security pretext to exclude or repress them, and a relatively rapid rise in their resolve to respect and play by the rules of the game and to reach consensual agreements over the conduct of public affairs in a nonconfrontational manner. Nevertheless, these Islamists still face a number of tests of their intent. On the one hand, they have yet to demonstrate their unconditional commitment to the mechanisms of a pluralistic form of government, even if those mechanisms produce policies that do not conform to their religious beliefs. On the other, they must continue to convince their constituencies of the efficacy of peaceful participation at a time when authoritarian ruling establishments have yet to shed their suspicions of the Islamists and to accustom themselves fully to their participation in politics.

Notwithstanding the fact that mainstream Islamists have developed in general a strategic commitment to the peaceful participation option, the constant flux that defined their experiences in Egypt and Jordan or their shift from active participants in authoritarian governments to semi-opposition entities—as is the case in Sudan and Yemen—contributed to the erosion of their popular support or the emergence of a confused mentality among their leaders. Naturally, both of these consequences negatively affected the capacity of the Islamist movements to take meaningful advantage of the participation option.

Because their participation lacks the relative stability of Islamists' experiences in Morocco, Algeria, Kuwait, and Bahrain, Egyptian and Jordanian Islamists have remained preoccupied with the traditional mix of normative, social, and political issues with no discernable evolutionary trajectory toward more pragmatism. Both movements have constantly demonstrated various signs of internal dissent and infighting between participation-friendly and participation-critical leaders and members.

And although participation-critical voices inside Egyptian and Jordanian Islamist movements have not been pushing for giving up their commitment to nonviolence, they have been putting forward two alternatives that are worth noting and bear potential risks: (1) retreat from politics to the social sphere and (2) increased confrontational attitudes toward the ruling establishments. The notion of retreating to the social sphere has never lost its appeal to Islamists, especially in moments of political exclusion and prosecution, as a temporary strategy to regroup and revitalize their movements. However, in Egypt and Jordan today, calls to leave politics and retreat to society are increasingly articulated in a definite way that attests to the internal fatigue and frustration of Islamists. In contrast, other voices have been pushing for assuming more hard-line stances toward official policies and for using whatever political space Islamists can sustain to confront the ruling establishments. Looking at the ongoing polarization of Egyptian and Jordanian politics, primarily driven by ruling establishment/Islamist conflicts, this is clearly a recipe for instability and reform freeze.

The current challenges facing Islamist movements are inextricably intertwined with the overall distortions that define the contemporary Arab political reality. The participation of Islamists in and of itself does not prolong the realization of a healthy democratic order, nor for that matter does it bring their polities closer to that order.

ITEM–RESPONSE (RASCH) MODELS

Item–response models define a set of data reduction techniques that relate observed discrete variables to a much smaller set of unobserved latent variables. These models are primarily used in political science to relate observed votes on legislative roll calls to legislators' unobserved ideology. Originally developed in the context of educational testing, these models were designed to recover characteristics of test questions (items) and the "abilities" of student test takers. Consequently, much of the model description and interpretation retains education terminology. The data involves N test takers (indexed by i) answering M test questions (indexed by j), with an answer (response) by student i on question j (y_{ij}) equal to one if correct, zero otherwise. In legislative voting, the "test takers" are the legislators, the "items" are the roll calls, and the "ability" is the legislator's ideology. The canonical model for the answers posits the following probability model:

$$\Pr(y_{ij} = 1) = \frac{\exp(x_i\beta_j - \alpha_j)}{1 + \exp(x_i\beta_j - \alpha_j)},$$

where x_i is the student's ability and parameters β_j and α_j characterize the question. This is simply a logit model of a correct answer as a function of one independent variable, the ability measured by the test, with the additional complication that the independent variable is unobserved. Of course, other cumulative density functions can be used instead (e.g., the normal for a probit model). This is a latent variable model, similar to factor analysis. The test items are all observable indicators (manifest variables) of the unobservable common factor x, with β_j analogous to a factor loading. In the item–response case, all the indicators are binary, whereas they are continuous in factor analysis.

The probability model is frequently reformulated as

$$\Pr(y_{ij} = 1) = \frac{\exp(\beta_j(x_i - \kappa_j))}{1 + \exp(\beta_j(x_i - \kappa_j))},$$

with specific interpretations to each item parameter. The slope coefficients β_j are the *discrimination* parameters and the values of κ_j are *difficulty* parameters. Discrimination is the extent to which a test question separates students with higher and lower levels of abilities. If $\beta_j = 0$, then the test question does not measure the ability gauged by the test. Higher values of κ_j indicate a more difficult question. κ_j represents the ability level of a student who has a 50% probability of answering the question correctly and 50% answering incorrectly. Note, κ_j and x_i are on the same scale; if $x_i = \kappa_j$, $\Pr(y_{ij} = 1) = .5$.

Other Item–Response Models

A special case is the one-parameter model, known as the Rasch model (after Georg Rasch):

$$\Pr(y_{ij} = 1) = \frac{\exp(x_i - \kappa_j)}{1 + \exp(x_i - \kappa_j)}.$$

This model assumes that every item discriminates abilities equally well ($\beta_j = 1$ for all questions j). In this model, all the observed information is contained in the total score, the number of correct responses: an extremely desirable property for tests. This property is only true for the logistic one-parameter model though.

A generalization of the two-parameter model is the three-parameter model:

$$\Pr(y_{ij} = 1) = \gamma_j + (1 - \gamma_j)\frac{\exp(\beta_j(x_i - \kappa_j))}{1 + \exp(\beta_j(x_i - \kappa_j))},$$

where γ_j is a "pseudoguessing" parameter. It allows for the absolute worst student (with ability approaching negative infinity) to have a positive probability of answering a question correctly; that is, a student answers a question correctly, not because of a higher level of ability but because he or she happened to mark the answer correctly. The "pseudo" aspect of guessing is that students do not necessarily guess but use reasoning processes unrelated to their ability (sometimes actually worse than pure guessing).

Political Science Applications

The original application of the model is educational testing, but the item–response model represents a general latent variable model for any application that posits an abstract, unobserved concept recoverable from observed manifest binary variables. One prominent application in political science is the estimation of legislator ideal points. In the spatial model of voting, legislators choose between "yea" and "nay" alternatives, with the "nay" alternative typically representing the status quo and "yea" a change to the status quo. The utility of each choice depends on how far each alternative is from the legislator's "ideal" policy. The legislator votes for whichever is closer to the legislator's ideal point. This model also applies to other actors who take announced positions, such as Supreme Court justices or members of the boards of independent agencies. Joshua Clinton, Simon Jackman, and Douglas Rivers demonstrate that when assuming a particular functional form for this utility, the model for this decision reduces to the standard item–response model from educational tests. The discrimination parameter indicates the extent to which a particular vote relates to an underlying liberal–conservative dimension. In educational testing, $\beta_j \geq 0$, since test questions that students with lower ability have a higher probability of answering correctly than those with higher abilities are counterproductive to the purpose of the test. In the legislator context though, the sign of β_j indicates whether a "yea" vote is liberal (negative) or conservative (positive). The difficulty parameter is the "cut point" between the two choices, that is, the ideal point for a legislator who is completely indifferent between the alternatives.

While item–response models are frequently described as unidimensional, the model can also be multidimensional. Instead of a general liberal–conservative dimension, one could specify policy preferences over multiple areas (e.g., economic policy, social policy, and foreign affairs). The rotational indeterminacy that affects factor analysis is also present in this model. To recover the parameters, some restrictions must be implemented. Specific legislators can be fixed to specific positions in the ideological space, with estimates of other parameters relative to these positions. More useful in these applications are restrictions on β_j, similar to those restrictions found in confirmatory factor analysis, such as restricting some votes to loading on only one of the policy areas (with the discrimination parameters of other issues restricted to zero).

Estimation

Since β_j, κ_j, and x_i are all unobserved, estimation can be tricky. An additional complication is the large number of parameters to estimate. For a one-dimensional model, there are $2M + N$ parameters. In the legislative case, that can easily exceed 1,000 parameters. Maximizing the likelihood over all parameters is actually not recommended, since it does not provide consistent estimates of the parameters. In educational testing, the dominant approach estimates only the item parameters, which are used to calibrate standardized tests; estimates of the abilities are less consequential. Marginal maximum likelihood assumes that the latent variable parameter x is normally distributed and then "averages out" (integrates over) to produce a model with only the item parameters. Estimates of the ability parameters can be obtained a posteriori by calculating the expected value given the answers and item parameters.

In political science, recovering estimates of the latent variables is actually more important. To simultaneously estimate the item parameters and the latent variables, Bayesian approaches are used. Assuming a priori the parameters follow certain distributions (some of the same assumptions used in the marginal maximum likelihood approach) and the model of the data produces the joint distribution of item and ability parameters. These parameters can be summarized by simulating from this distribution using Markov Chain Monte Carlo (MCMC) methods. The Rasch model is much easier to estimate through maximum likelihood conditional on the total score. The three-parameter model is estimated using the same methods as the two-parameter model, but the pseudoguessing parameter can be difficult to estimate. As a result, restrictions on γ_j in the three-parameter model are often implemented.

Other Types of Data

While the standard item–response model is fitted to binary (correct/incorrect, yea/nay) responses, the model is extendable to polytomous data. One application involves nominal responses from multiple-choice tests. Instead of coding answers as merely correct or incorrect, responses to the separate correct and incorrect responses are modeled. The model is the same as the binary case, except that the probability function is analogous to a multinomial logit model for each multiple-choice question. While there have been political science applications of this model, political science researchers are more often confronted with ordered responses.

In educational testing, ordered models are used for the grading of short answers and essays or any question for which partial credit is granted. In most instances where political scientists use factor analysis, the ordered-item/response model will be a more appropriate choice, especially for the Likert-type scales found in most surveys. Applications include the estimation of survey respondent ideology, policy preferences, or political knowledge. The model is applicable to any circumstance where a latent variable of interest is measured using ordinal variables. For instance, when the unit of analysis is countries, one can recover from ordinal items the level of democracy in these countries, as well as numerous other characteristics of government and society, such as the economic development, corruption, or adherence to human rights.

There are also item–response models using non-multinomial probability models. For instance, the responses can be frequencies or relative frequencies. In political science, such models have been used to estimate the ideological positions of parties or legislators. For parties, the responses are relative word frequencies in party platforms; for legislators, relative word frequencies in speeches. The number of times observation i uses word j (y_{ij})) follows a Poisson distribution, with mean number of counts $\lambda_{ij} = \exp(x_i\beta_j - \alpha_j)$, which specifies a count regression model.

The item–response model also allows for some more unique data structures, such as multiple-rater data. J raters evaluate each of N observations based on M characteristics (items). The raters place the observations on each of the (typical ordered) items. The models produce estimates of the observations' latent quantity, as well as item- and rater-specific parameters. This approach allows researchers to incorporate evaluations from *multiple* experts to create more accurate measures. For example, researchers can collect through expert surveys the evaluations of scholars in bureaucracy to measure the ideology of agencies or ratings from comparative politics experts to estimate the ideology of political parties or the level of democracy of a country.

Conclusion

The item–response model, while developed for educational testing, is a general measurement model for many different types of discrete data, with many potential extensions. It is particularly well suited for political science applications, which use many abstract theoretical concepts measured with discrete-level data.

Joint-Decision Trap

The joint-decision trap is the name for a particular situation that arises in the making of public policy. It is relevant for systems that are divided into layers of government where decisions are made jointly by the central and lower levels. These systems may turn into traps, in the sense that changes from the status quo are difficult. Actors are caught in a deadlock. The joint-decision trap model has had the most impact on the understanding of politics in the European Union (EU) and the German federal system but is relevant for a wide range of multilevel systems.

The joint-decision trap was identified by the German scholar Fritz W. Scharpf, first in German federalism and later in policy making in the EU. Scharpf developed the thesis in the early 1980s on the basis of many years of studies of institutional rigidities in German federal politics. The German version of the thesis was published in the mid-1980s, and the English version followed a few years later. The thesis was notable for two reasons. First, it was one of the first neo-institutional analyses of policy making in the EU. As such, it helped pave the way for, or even spearheaded the breakthrough of the neo-institutional paradigm into, studies of the EU. Second, the thesis avoided the sui generis approach to the EU that until then had tended to isolate studies of European integration from mainstream social science. Scharpf's approach was comparative. He sought to understand policy dynamics in the EU by comparing it with German federalism.

The joint-decision trap is a designation for a specific, but far from uncommon, institutional setting for policy making. Two institutional conditions are specified: (1) central government decisions must be directly dependent on the agreement of constituent governments and (2) the agreement of constituent governments must be unanimous or nearly unanimous. These conditions fit the cases of German federal politics and the EU reasonably well, at least at the time when Scharpf was writing. A logic of action follows from these conditions that leads to a stalemate and a severe bias in favor of the status quo. Whenever a proposed change of policy has a negative impact on just one actor, this actor will want to oppose the change unless it is compensated for the loss. Since all actors possess (near-)veto rights and because adequate compensation is often difficult, policy changes will often be blocked. In most cases, existing policy cannot be changed as long as it is preferred even by one or a few participants. In a dynamic environment, this is critical. The quality of public policy will gradually worsen. The result will be the continuation of past policies in the face of a changing policy environment and policies that are suboptimal even by their own original criteria.

To make matters worse, the joint-decision trap is also a trap in another sense. It not only leads to pathological policy choices, but it also blocks its own further institutional evolution. The present institutional setup represents the local optimum in the actors' cost–benefit calculation. It is a Nash equilibrium. There is thus no way that joint-decision systems may transform themselves into institutional arrangements of greater policy potential. Institutional change would require external intervention. All in all, the joint-decision trap paints a pessimistic picture of modern political systems and is close to structural determinism.

The joint-decision trap is an abstract analytical model that may be used in a variety of settings. Scharpf originally suggested that the logic might apply to settings as diverse as political coalitions, military alliances, and neo-corporatist arrangements. In the original version, however, the trap has had most resonance in studies within its own empirical field—namely, intergovernmental relations in modern political systems. It has been used to understand systems in several countries—for instance, Canada and Denmark. But its most profound influence has probably been within studies of German federalism, where it is used almost as a matter of routine today, and in studies of policy making in the EU, where it is standard material for textbooks.

The joint-decision trap's influence on EU studies may strike one as paradoxical. The trap was identified and the thesis developed after a long period of "eurosclerosis." According to many observers, the 1970s and early 1980s were a period of stagnation for the EU where the hopes from the 1950s and 1960s for further integration were strangled in a quagmire of stagnation and policy deadlocks. Scharpf's joint-decision trap was widely acknowledged as an explanation of this development. However, the 20 years that have passed since the publication of Scharpf's article in 1988 have been a period of unparalleled dynamism and creative policy making in the EU. Through a series of treaty changes, the EU has experienced several rounds of enlargement, the number of policy areas covered by the EU has increased, the Council of Ministers has changed its decision rule from one of unanimity to qualified majority voting in most areas, and the European Parliament has become a full colegislator in most areas.

At first sight, these changes might be considered a refutation of the logic of the joint-decision trap. However, the development has spurred investigations into ways in which decision makers may avoid joint-decision traps. B. Guy Peters argues that segmentation of policy making at levels below the Council of Ministers and the influence of policy entrepreneurs may help actors avoid the trap. Adrienne Heritier finds that actors in the EU system engage in politics of subterfuge and creatively use strategies of compensation, compromise, and package deals to avoid stalemates. Jens Blom-Hansen argues that traps need not be inherent in joint-decision systems. If the central government has an exit option in its relations with subcentral governments, it may switch between arenas and use both "exit" and "voice" options to pursue its interests. In this way, joint-decision systems may turn into an asset.

Scharpf, in a reevaluation of the joint-decision trap 20 years after it was first proposed, argues that such an exit option is in fact also available to the central decision maker in the EU. Rule making may follow the well-known community method according to which the Commission presents proposals, and the Council of Ministers and, in selected areas, the European Parliament enact them. This is the area where the joint-decision trap is operative. However, rule making may also follow the "supranational-hierarchical mode." This takes place in the judicial arena. To use it, the Commission exploits the doctrines of supremacy and direct effect of European law. To make rules, the Commission only needs to assert that a particular rule should have direct effect and that certain laws or practices in member states are in violation of it. If these arguments are then upheld by the European Court of Justice, the interpretation will be the law of the land in all member states without any further action by governments or parliaments. In short, the Commission may strategically use both the traditional community method and the "supranational-hierarchical" way to change the status quo.

However, although the agenda-setting powers of the Commission and rule making by use of the European Court of Justice may reduce the impact of the joint-decision trap, it is still likely to be operative in EU politics. The number of member states has now increased to 27, and although unanimity is no longer necessary in the Council, qualified majority voting is still quite a demanding decision rule. As a result, decision making in the EU is still cumbersome, difficult to manage, and easily blocked. Scharpf's thesis on joint-decision traps helps us understand why.

More broadly, Scharpf's contribution highlights how easily two-level decision systems where the central level is dependent on the (near-)unanimous agreement of the constituent levels fall prey to stalemate and institutional deadlock. Since almost all countries are divided into several layers of government, there is wide scope for empirical application of the thesis. Not only has the joint-decision trap increased our understanding of the empirical world, but it has also stimulated further theoretical development in the social sciences. This holds for both theorizing on institutional deadlock, such as veto player theory, and theorizing on circumventing deadlocks.

JUDAISM

Judaism is the religion, philosophy, and culture of the Jewish people. This entry presents the basic beliefs and practices of the Jewish religion, its adaptation to exile, its relationships with other religions, its Ashkenaz and Sepharad components, and the role of rabbis; then, following emancipation, new religious and secular developments; and, in conclusion, contemporary challenges.

Judaism is the first monotheistic religion. It appeared with the Hebrew Patriarchs—Abraham, Isaac, and Jacob—and the Matriarchs—Sarah, Rebecca, Rachel, and Leah—some 3,500 years ago. Judaism crystallized with Moses, with emphasis on the exodus from Egypt, freedom from bondage, and the revelation of the Ten Commandments. In Judaism, God is transcendent—beyond representation—omnipotent, benevolent. He created the world, revealed himself, and will lead to redemption. The covenant between God and Abraham, renewed at Mount Sinai between God and the Children of Israel, is an eternal one: Jews exist as a representative of the deity (kingdom of priests, holy people: Exodus 19:5–6), God exists because Jews proclaim Him. Basic monotheistic beliefs are embodied in the commandments: 248 positive and 365 prohibitive or negative, for a total of 613. Gentiles, to share the world to come, must keep the Seven Noahide Laws (prohibition of idolatry, blasphemy, bloodshed, sexual sins, theft, and eating of flesh from a living animal and establishment of a fair legal system). From the conquest of Canaan, the establishment of a Jewish sovereignty, until the destruction of the Second Temple by Titus in 70 CE, Judaism is the religion of a specific people with a specific belief, monotheism.

This explains the savagery of the war between Rome and Jerusalem. The Roman Empire, to impose its rule on a defeated people, mandated that Caesar be worshipped as divine. Judeans could not accept a god other than the Only One. Wars continued for close to a century; Jerusalem was captured; the Temple destroyed; and the very name of the country, Judea, replaced by Palestine to erase any memory of a people and a religion so different from that of Rome.

Faced with a new situation, disappearance of its political and religious institutions, exile, and minority status, Judaism had no other choice but to adapt. The first innovation was to write down what had been until then the Oral Law, explanations and comments on the Written Law, Deuteronomy (the fifth book of the Torah, the Hebrew Bible). This massive effort gave birth to the Talmud, which would become the authoritative interpretation of

Judaism, its source of jurisprudence and education. The only group of Jews who had no knowledge of the Talmud was the group in Ethiopia. The second innovation was an increased value accorded to religion as compensation for lost sovereignty. Such reliance on religion has been the mark of other oppressed peoples (Poles, Irish, Thai, etc.).

Exilic Judaism, with its synagogues as substitutes for the Temple of Jerusalem and the Talmud as its basic source of knowledge, dominated the following 2,000 years. Halacha, Jewish Law, was the core of Judaism, a code of laws, practices, and observances. Based on the Pentateuch, Talmud, and the decisions of sages and rabbis until contemporary times, Halacha is binding for the Orthodox, though not for other groups within Judaism.

Relationship with the two other monotheistic religions, Christianity and Islam, became crucial. Both have their origin in Judaism and believe that they have superseded Judaism. Most Jews were living either in Christian Europe or in Muslim North Africa and the Middle East. Both Christianity and Islam tried to impose conversion but eventually accepted the presence of Jews, if only as a despised minority, their inferior status presented as a proof that they were no longer the Chosen People of the Living God. With great differences according to varying times and places, Jews played a significant, even if usually not recognized, role in the development of Christian and Muslim cultures. Comparatively few Jews settled in nonmonotheistic countries such as India and China, where, although their religion seemed strange, they were not subjected to persecution or accorded any special status.

In exile, a distinction appeared between Ashkenazic and Sephardic Jews. Ashkenaz, who first settled along the Rhine River, circa 1000 CE, expanded toward Central and Eastern Europe, then to the New World. Sepharad, originally from Muslim Spain, formed new communities around the Mediterranean Sea after the 1492 expulsion. Today, Sephardim are usually linked with *Edot Hamizrah*, Oriental Jews (Iran, Yemen, Kurdistan, etc.). The major differences are historical—with most Ashkenaz living in Christian countries, most Sepharad in Muslim ones—and liturgical. In most places, for generations, down to the present day, as soon as Jews from a certain geographic area have constituted a critical mass, they have opened their own synagogues. Due to migrations, most major communities have both Ashkenazi and Sephardi synagogues, but they are often united at the religious services level (Kosher food, rabbinical courts, etc.)

In Israel, the Chief Rabbinate is legally headed by two chief rabbis, one Ashkenazi and one Sephardi. The liturgical distinction has become politicized. From a strictly religious one, it has become a social one (Ashkenazi dominancy in the old elite, challenged by Sephardim) and eventually a political distinction. Of the three major religious parties, one is Ashkenazi, one is Sephardi, and one is mixed.

Around the 11th century, a new actor emerged in Judaism: the rabbi. The general custom had been to have a learned man, versed in Jewish law and engaged in worldly endeavors, to serve as a religious interpreter of the law. The new rabbis became experts in that field, engaged and paid by Jewish communities and recognized as the official religious leaders (*rabbi* means “my master”). They had to compete with *dayanim*, religious judges involved in judicial matters and not in community ones, and, later, with the directors of *yeshivot*, institutes of higher Talmudic studies. The modern trend, either on a voluntary basis or imposed by institutions, is to belong to a rabbinical association. They offer a common philosophical ground, following the various streams of Judaism, a consultation place, and services such as health insurance, pensions, and so on. In contemporary times, the rabbinate as an institution is more a professional association than a political force within the Jewish community.

Emancipation and democratization were the hallmarks of modernity for Jews. With emancipation, European Jewry underwent a transformation: Whereas previously there were structured, autonomous Jewish “nations,” recognized as such by the sovereign, with their social institutions and tribunals imposing norms on Jewish communities, now affiliation to any kind of Jewish institution, including religious ones, became a voluntary association. New forms of Judaism appeared. As for other people, nothing impeded Jews who did not want to follow the beliefs and practices of their religion. Some Jews wanted a Judaism with no national component, no dream of returning to Jerusalem to rebuild the Temple, and no customs too different from those of their Catholic and Protestant neighbors. Reform Judaism appeared in the 19th century in Germany and flourished in the United States. To answer this new trend, neo-orthodoxy, also in Germany, offered a mixture of strict adherence to Jewish religious laws—hence "orthodoxy"—but within modern society, science, and democracy—hence "neo." (In the United States, these congregations refer to themselves as Modern Orthodox.) Other Orthodox groups did not want to change anything in their approach to religion and the world and stressed strict adherence to Judaism alongside or outside modern society but not within. Both Hasidism, a new orthodox trend that emerged in the 19th century, with a rebbe, a charismatic leader, at the center of the group, and their opponents wanted a return to premodern times. Between Reform and Orthodox, a third group, Conservative, tried to amalgamate a respect for tradition and a will to adapt it to modern conditions. As there is no central authority in Judaism, anyone may offer a new vision and try to create a new form of Judaism.

Two ideologies threatened the centrality of religion in Jewish life, socialism and Zionism. Socialism, under the banner of Bund, was a Jewish component of the struggle for power by the proletariat. Based on Jewish ethics, favorable to the poor and the destitute, and on Jewish customs such as Yiddish, Bund became a force mostly in Central and Eastern Europe. Decimated by the Shoah (Holocaust), attacked by Stalin and his successors, Bund has, for all intents and purposes, disappeared. Zionism transformed the Return to Zion from a eschatological perspective to a political program. It relied on centuries of longing for Jerusalem omnipresent in liturgy, from everyday prayers "Bless be You who rebuilds Jerusalem" to the annual cycle of festivals, all of them centered on Jerusalem and culminating at the end of Yom Kippur, and during the Passover Seder with "Next year, in Jerusalem." Throughout the life cycle, from birth to death, Jerusalem was evoked. What followed was a deeply ambivalent relationship between Judaism and political Zionism, inspired by the same set of beliefs and customs but differing in their modern implications. Some chose to combine both in Religious Zionism. Many religious leaders were reluctant to support, if not outright hostile to, the new nonreligious ideology that was making rapid headway among the Jewish masses. The non-Zionists and anti-Zionists were from both Reform Judaism, which did not recognize Jews as a people but only as a religion, and Orthodox Judaism, which was opposed, like Catholicism, to any new secular philosophy. Eventually, following the Shoah and the creation of Israel, most religious opposition to Zionism disappeared. Approximately half of the surviving Hasidic leaders live in the United States, half in Israel; with a few exceptions, they participate in Israeli elections.

Judaism in the 21st century faces a number of challenges:

- to strengthen its leadership, which is scattered, its streams divided on both theological issues (Deuteronomy as divine revelation or human text) and practical ones (continuity through matrilineal descent for Orthodox and Conservative, through patrilineal descent for Reform), often marginalized by secular Jewish leaders;
- to create new scholarship and provide new answers in a domain not probed for centuries, regarding religious decisions linked to Jewish sovereignty and not limited to the Jewish community as a minority;
- to navigate between a Judaism that follows societal trends and a Judaism that rejects the modern world;
- to be sensitive to gender issues; Reform and Conservative streams have female rabbis and the Orthodox has none, but there is already a shift within Orthodox Judaism, such as *tohaniot bet din*, female specialists in divorce religious laws, being accepted as quasi advocates by Israeli rabbinical courts;
- to respond to an unprecedented situation in which, regardless of migrations, the Jewish population outside Israel is declining while within Israel it is growing; the absolute number and, even more, the proportion of Orthodox and ultra-Orthodox is on the increase everywhere, and it becomes necessary for the diminishing majority to accommodate Judaism in its Orthodox expressions and for religious authorities to offer leadership not only to their own limited communities but also to all those searching for Jewish values; and
- to offer, as a monotheistic religion, answers to scientific and biogenetic advances with ethical consequences.

In contemporary times, Judaism is an expression of Jewish identity, a privileged means to transmit it.

JUDICIAL DECISION MAKING

While the executive and legislative branches are the most visible aspects of government, the third branch—the judicial branch—is in many ways more important. In many countries, it is the judiciary that rules on whether the actions of the other branches are constitutional and, thus, permissible. Thus, while judicial decision making (JDM) tends to occur in private settings, out of the spotlight, it would be a mistake to conclude that the decisions made by judges are not consequential.

This entry discusses two fundamental questions: (1) How do judges make decisions? (2) What impact do those decisions have on governments and societies? The latter question is especially important for individual rights as well as broader political issues. Most empirical research on courts and JDM has been done in the United States because of the unique role of the U.S. Supreme Court (USSC) in the American system of government; however, many recent studies examine courts comparatively. The theoretical perspectives and approaches used to study courts and judges are normative, legal, behavioral, neo-institutional, based on rational choice, and sociological. This entry provides a broad introduction to these approaches, with a special emphasis on the USSC.

Normative Legal Judicial Decision Making (The Legal Model)

Normative approaches to JDM focus on how law ought to be interpreted. Often emphasis is placed on purely legal factors, such as the language of the law passed by the legislature, the wording of constitutions or founding documents, and, in common law systems, precedent (previous cases decided by courts). The focus on normative jurisprudence is not what judges personally decide but what the law demands. Normative jurisprudence tends to think of the law as a puzzle to be unlocked and the correct answer revealed, not a malleable concept with many possible arguments and answers. A normative legal approach can be seen in the classic writings of William Blackstone, Learned Hand, and the founding fathers of the United States (especially James Madison and Alexander Hamilton), who were heavily influenced by enlightenment thinkers such as Thomas Hobbes, John Locke, and Baron de Montesquieu.

Although the modern study of JDM has moved from a normative to a positivist approach, many scholars continue to recognize the importance of legal factors in explaining judicial decisions. These studies tend to focus on the importance of case facts on the outcomes of various types of cases. However, while it is clear that “the law” matters for some case outcomes, it is also clear that many judicial decisions are affected by nonnormative considerations. Indeed, it may be most useful to consider the normative as more prescriptive than descriptive. That is, it may explain what we think judges ought to do (more factors they should take into account when they decide cases), but it is less useful is describing what actually occurs (what factors actually matter to judges).

The level of court being studied also matters. For example, in trial courts, where judges have to rule on evidentiary matters, charge the jurors, and so on, it is likely that the normative/legal model is generally applicable. These judges are constrained by appellate judges above them, and if they were to make rulings inconsistent with the facts and the law, they would likely be overruled. However, for judges in courts of last resort, the situation is quite different. First, these judges have no higher court that can overrule their decision. Second, these courts tend to hear cases that are much more difficult. By difficult, we mean that reasonable people can disagree as to the proper outcome. If the facts and the law could support both opposing outcomes, then it is not hard to see how judges can be constrained in this way.

Behavioralism

Eventually, scholars began to notice that normative legal factors did not explain all judicial decisions. Not all legal decisions are clear-cut, and judicial preferences and ideologies help explain the formation of voting coalitions on courts, especially high-level appellate courts engaged in lower court review. The work of early behaviorists such as C. Herman Pritchett and Glendon Schubert was expanded on by others, most notably Jeffrey Segal and Harold Spaeth in *The Supreme Court and the Attitudinal Model*. Behavioralism takes into account the role of ideological preferences on the decision making of judges and has found considerable evidence that judges are influenced by their personal ideology, especially in the USSC context. Of course, to be able to explore the impact of preferences, reliable and accurate measures of judges' preferences must be available.

Measures of judicial ideology have been created for most judges in the United States. Measures of the ideology of U.S. Supreme Court justices include those developed by Jeffrey Segal and Albert Cover (1989) and Andrew Martin and Kevin Quinn (2002). Segal and Cover used newspaper articles written at the time of a justice's confirmation to have an independent indicator of voting. This allowed them to avoid the endogeneity problems that plagued other measures that used past votes to predict future votes. Martin and Quinn used Bayesian analysis to develop a dynamic model of the ideal point of judges using their votes on past cases. Other measures have been developed for federal appellate and state court judges in the United States.

Neo-Institutionalism and Rational Choice

Judicial scholars also explore the impact that institutional configurations and other actors have on JDM, in addition to the traditional legal and behavioral factors. Institutional influences can be either internal or external in nature. Internal structural factors, such as term length, docket control, and the like, affect judges' behavior, often allowing them (or requiring them) to be strategic when making decisions. Neo-institutional interpretations are also prominent in separation-of-powers studies, which focus on the external relationship between courts and other political actors. The neo-institutional orientation is often used when studying state courts in the United States because the diverse nature of institutional configurations lends itself well to such explanations, but it is also promising as an orientation for comparative research. Although institutionalism is a traditional theory of government, it is only since the 1990s or so that neo-institutionalism has been regularly applied to integrated research designs of contemporary legal studies. Current institutional and rational choice studies trace their theoretical roots to the early strategic work of Walter Murphy, who argued that judicial decisions were not always based purely on political preferences.

Comparative Judicial Behavior

There are many possible ways to approach comparative judicial politics. Typically, studies focus on one of three aspects: (1) structural differences and sociological impacts, (2) judicial independence, and (3) judicial legitimacy. The study by Herbert Jacob, Erhard Blankenburg, Herbert Kritzer, Doris Marie Provine, and Joseph Sanders in 1996 is particularly comprehensive and examines the structures and impacts of eight different judicial systems. Such global studies are relatively rare as most studies focus on one country or area.

Charles Epp's *The Rights Revolution* is a particularly noteworthy work focusing on the sociological and practical political impact court decisions have on the rights of citizens. Epp's study examines the impact courts can have on individual rights in four different common law countries, including the United States, Britain, Canada, and India. It is an important addition to the literature on the sociological impact of court decisions as he makes a solid argument demonstrating the need for a group-driven support structure, in addition to basic constitutional, judicial, and structural factors.

Judicial independence is an important topic, particularly in countries with a long history of political instability or authoritarian regimes. Independence studies often focus on Latin America, Russian, Japan, or Italy. There is extensive evidence of the challenges facing courts in countries without a history of a strong rule of law and clear indications of fundamental differences in how citizens use courts in such countries.

Legitimacy is an important issue for courts the world over. All courts face obstacles to the implementation of their decisions, especially when the legitimacy of the court or of the decisions themselves is questioned. While scholars of American politics do not typically focus on legitimacy, given the unusually strong position enjoyed by the USSC, legitimacy is an important research topic for other courts. Prominent scholars include Vanessa Barid, Gregory Caldeira, and James Gibson. Much of the legitimacy research finds that courts outside the United States typically have little legitimacy, in large part due to a lack of information about courts. This raises serious concerns about compliance with judicial decisions. Interestingly, studies also find that courts have the potential to build institutional legitimacy through court rulings, even in countries (e.g., the former German Democratic Republic [East Germany]) that have had little experience with a professional judiciary.

Supranational Judicial Behavior: The European Court of Justice

As the European Union has evolved over time, so has the role of the union's highest court, the European Court of Justice (ECJ). Literature on the ECJ generally examines the role of the ECJ in promoting European integration as a unique supranational institution. Paralleling theoretical orientations in comparative politics generally, ECJ studies tend to be either intergovernmentalist or neo-functionalist in their orientation. Intergovernmentalists argue that the court is actually a weak actor in promoting the integration of European countries into a strong centralized supranational government. Neo-functionalists instead pointed to the court's role in enhancing loyalties to its decisions, thereby cementing its role in the integration process.

Conclusion

There is much more to say about courts and JDM than can be said in one brief essay, so this entry has limited its survey of the nature of JDM, both in the United States and in other countries. Most basically, the studies discussed here commonly try to determine what factors influence judges' decisions and how those decisions affect society. Most of this research has focused on courts in the United States because of their unprecedented influence as coequal third branches with expansive powers of judicial review; however, many recent studies have begun to examine courts comparatively. Indeed, the comparative study of courts and judges has been an area of rapid growth since the 1990s.

Moreover, while the studies cited above answer important questions, there are a host of other questions that have not been mentioned owing to space constraints, such as judicial selection, retirement, compliance with judicial decisions, and resource inequalities between litigants. In addition to the topics discussed above, scholars have been studying questions such as these, which are fundamental to an understanding of the judicial system.

Finally, it should be clear that the study of courts and judges is characterized by diversity. The theoretical approaches used by scholars were normative, legal, behavioral, neo-institutional, based on rational choice, and sociological. Scholars study courts of last resort as well as intermediate appellate courts, trial courts, and even transnational courts. Topics include the law, the preferences of judges, and the institutional arrangements under which decisions take place. While some may say that this diversity has hindered the development of general knowledge about the judiciary, the authors agree with scholars such as Lawrence Baum, who argue that such diversity in approaches is welcome because it is most likely to lead to a more complete understanding of judicial behavior.

JUDICIAL INDEPENDENCE

Judicial independence is a notoriously difficult concept to define, to the point that some scholars have questioned whether the concept serves any useful analytical purpose. In a literal sense, judicial independence refers to the ability of courts and judges to perform their duties free of influence or control by other actors. However, the term is more often used in a normative sense to refer to the kind of independence that is considered desirable for courts and judges to possess. Consequently, there are two sources of confusion over its meaning. The first is conceptual, in the form of a lack of clarity regarding the kinds of independence that courts and judges are capable of possessing. The second is normative, in the form of disagreement over what kind of independence courts and judges ought to possess.

As a practical matter, the type of judicial independence that is widely considered both the most important and the most difficult to achieve is independence from other government actors. On the one hand, this type of judicial independence is highly valued among those who impute to courts a special responsibility for ensuring that individuals and minorities do not suffer illegal treatment at the hands of the government or a tyrannous majority. On the other hand, this type is also considered especially difficult to achieve because the other branches of government ordinarily possess the power to disobey or thwart the enforcement of judicial decisions, if not also to retaliate against the courts for decisions that they oppose. In Alexander Hamilton's famous formulation, the judiciary is the "least dangerous" branch, having "no influence over either the sword or the purse" and is therefore least capable of defending itself against the other branches.

Formal guarantees of judicial independence from government control date back to at least as far as England's Act of Settlement of 1701, which gave judges explicit protection from unilateral removal by the Crown in the context of a larger shift of power toward the parliament and the courts. Today, the idea of judicial independence has such broad and powerful normative appeal that even states that do not honor it in practice are wont to profess a commitment to it. Two thirds of the world's current written constitutions contain some form of explicit protection for the independence of the judiciary, and the proportion of constitutional documents that contain such protections has been rising over time. Judicial independence has been formally endorsed at the international level as well, for example, in the form of the *Basic Principles on the Independence of the Judiciary*, adopted by the United Nations in 1985. Empirical research suggests, however, that the existence of formal constitutional guarantees of judicial independence is poorly correlated with actual respect for judicial independence in practice.

Any comprehensive and coherent definition of judicial independence must address several questions. The first is the question of independence *for whom*; the second is the question of independence *from whom*; and the third is the question of independence *from what*. To supply satisfying answers to these questions, however, demands resorting to some normative theory, explicit or otherwise, of why judicial independence is valuable and what it is supposed to accomplish. In other words, it is also necessary to address the question of independence *for what purpose*.

Independence for Whom?

Judicial independence can be defined as a characteristic of individual judges or as a characteristic of the judiciary as a whole. Neither conception is indisputably preferable to the other as a practical matter. On the one hand, if judicial independence is guaranteed at the institutional level but not the individual level, individual judges can be forced to obey the wishes of the leadership of the judiciary, which may result in a less-than-wholehearted enforcement of the rule of law. In Chile and Japan, for example, the extent to which the judiciary as an institution commands obedience and conformity from its members has been blamed for producing timid judges who are unwilling or unable to rule against the government. On the other hand, if judicial independence is ensured at the individual level, individual judges will find themselves at liberty to pursue their individual preferences. Not only does unchecked discretion of this kind invite abuse, but it also raises the likelihood that judges will decide cases in inconsistent ways, with the potential effect of undermining the predictability and stability of the law.

Independence From Whom?

The existence and adequacy of judicial independence become matters of practical concern only when a court decides a dispute involving the interests of some actor or institution with potential or actual power over the court. Generally speaking, the more powerful the actor whose interests are at stake, the greater is the need to protect the independence of the court from that actor. If both sides to the dispute are powerful, however, that symmetry of power may provide part or all of the necessary protection.

The three scenarios that a court may encounter are

1. disputes between private actors,
2. disputes between government actors, and
3. disputes between private actors and government actors.

In the first scenario, the court must strive to remain independent from the parties, who may attempt to undermine its independence by a variety of means, such as bribery or intimidation. In this situation, the government is a friend of judicial independence: It can be expected to defend the independence of the court from the efforts of the parties.

In the second scenario, the prospects for judicial independence are again relatively favorable. The court is asked not to face down a powerful actor on behalf of a weak one but, rather, to choose sides between two powerful actors in an impartial way. Whichever side the court chooses, the result will be a two-against-one dynamic that ought to provide the court a degree of protection from retaliation. The government does not pose a meaningful threat to judicial independence in such cases because it is at war with itself.

In the third scenario, the government does pose a potent threat to judicial independence, but this threat may be either counteracted or compounded by the public. Suppose, for instance, that a ruler seeks to extend his or her own term of office in an illegal fashion. In this case, the court faces a threat to its independence from the government, but its ability to withstand this threat is greatly improved to the extent that it can count on public support if it rules against the government. As long as the court is in the position of siding with either the government or the public, its independence enjoys protection: Either should be capable of providing the court with the support that it needs to withstand attacks from the other. In other situations, however, the court may be asked to take a position that is antagonistic to that of both the government and the public, as in the case of illegal government discrimination against an unpopular minority. Here the prospects for judicial independence are at their nadir: The judiciary is called on to demonstrate independence from both the government and the public, yet it lacks the help of a powerful ally to withstand the pressures that it faces.

There are various ways to protect judicial independence in the face of such threats. Common strategies include limiting government discretion over judicial salaries, placing heavy restrictions on the removal of judges from office, fixing the minimum jurisdiction that courts are to possess, and relieving judges of personal liability for acts performed in the course of their duties. Less obviously, the internal organization of a judiciary can also have a profound effect on its susceptibility to external influence. The organization of the Japanese judiciary, for example, renders lower court judges highly obedient to an administrative bureaucracy controlled by the chief justice, who in turn is invariably appointed close to mandatory retirement age. As a result, the government can influence the ideological direction of the entire judiciary simply by availing itself of the relatively frequent opportunity to replace a specific judge. A decentralized organizational structure that grants greater autonomy to individual judges, by contrast, may make it harder for the government to capture or co-opt the judiciary as a whole.

In the long run, however, it is difficult, if not impossible, to create a perfectly independent judiciary that is completely insulated from all forms of political and popular influence. The relatively lengthy experience of the U.S. Supreme Court, for instance, suggests that even a highly independent court is likely over time both to be reshaped by political forces and to accommodate the wishes of a durable political majority. It is optimistic to think that a handful of judges, lacking the power of either the purse or the sword, can consistently defy more powerful actors and institutions without ever suffering any consequences, no matter what formal protections they may enjoy. There are limits to what can be accomplished simply by adjusting the institutional characteristics of the judiciary or enacting solemn declarations about the inviolability of judicial independence. Ultimately, the prospects for attaining even moderate levels of judicial independence are likely to depend on political and historical conditions that are exogenous to the judiciary and may lie beyond reach, such as the existence of a stable, competitive, multiparty democracy.

Independence From What?

Not all forms of influence over judicial decision making constitute threats to judicial independence. While some activities aimed at influencing courts, such as bribery and physical intimidation, may be inappropriate under any plausible conception of judicial independence, others can only be evaluated on the basis of a contestable normative judgment. Consider, for example, public protests in front of courthouses. One view might be that such protests should be privileged as a form of political expression and that judges in a democracy are permitted or even obligated to take public opinion into account. Alternatively, one might take the view that judges should be shielded from such expressions of public opinion, much as jurors are sequestered, to ensure that their deliberations are not tainted by considerations that ought to be irrelevant. Likewise, a public campaign to deny a judge reelection because he or she has ruled in unpopular ways on controversial issues can be characterized as either a healthy manifestation of democracy or a threat to judicial independence.

Whether such efforts to influence judicial decision making are consistent with judicial independence cannot be answered by fiat. To define the requirements of judicial independence in such cases demands instead a normative theory of what courts are supposed to take into account when deciding cases, what judicial independence is supposed to achieve, and to what extent judicial independence can and should be balanced against other objectives and considerations.

Independence for What Purpose?

Judicial independence is generally considered a means to an end, rather than an end in and of itself. Most would probably agree that the ultimate goal can be described as the fair and impartial adjudication of disputes in accordance with law. If that is indeed the goal, however, then the pursuit of judicial independence is open to several objections.

One objection is that the goal itself is unattainable because it rests on a misconception of the nature of both law and adjudication. It is a commonly held view among legal theorists that the law is frequently indeterminate and that it is therefore impossible for judges to decide disputes simply by applying preexisting law. Rather, it is said, the act of adjudication requires judges to make the very law that they purport merely to apply. Yet if adjudication necessarily entails lawmaking, then, judicial independence does not simply protect the ability of judges to decide disputes in accordance with law but instead licenses them to make and impose whatever laws they see fit, which is a prospect that many consider incompatible with either the appropriate role of judges in a democracy or the idea of separation of powers.

Another objection is that judicial independence is neither necessary nor sufficient to ensure impartial adjudication in accordance with law and may even undermine that goal if left unchecked. On the one hand, it is possible for a judge who faces potential retaliation to nevertheless decide cases in an impartial manner. On the other hand, there is no guarantee that giving judges the freedom to decide cases as they wish means that they will choose to do so fairly and in accordance with law. Even if it were possible to create a judiciary that is completely free from both popular and political control, what would then prevent the judges from deciding cases on the basis of personal prejudice or self-interest? It is on the basis of such concerns that many consider it essential to balance judicial independence against judicial accountability and to distinguish appropriate forms of influence over the judiciary from inappropriate forms. However, any mechanism that might be devised for preventing or punishing judicial abuse of power is itself likely to prove susceptible to abuse. The resulting question of how to oversee the judges who are responsible for overseeing the government—*quis custodiet ipsos custodes*—has long vexed constitutional and political theorists and admits of no simple solution.

JUDICIAL REVIEW

The term *judicial review* refers to the practice of judges deciding whether or not to declare void a statute or an executive order on the grounds of conflict with a higher law. This entry first describes two sorts of judicial review and also the political logic by which the institution of judicial review is criticized and that by which it is defended. It then discusses the history of the adoption and spread of the practice of judicial review. Finally, it describes the kinds of judicial review that are now prevalent in the world.

When the judge declares void an order from an executive branch official on the grounds that the official has transgressed the bounds of his or her statutory authority, the practice of judicial review is not particularly controversial. It is necessitated by the idea that the rule of law is preferable to the unchecked rule of individual will. (This version is sometimes called *administrative review* to distinguish it from the review of the statutes themselves.) A judicial power to declare void the acts of elected legislatures, however, is more controversial, especially in systems where judges are not elected. The criticism of this sort of higher law judicial review is that it substitutes the will of non–electorally accountable persons for the will of the people's elected representatives. The defense of it relies on the premise that the legislators will not be inclined to police themselves to stay within the constitutional bounds of their authority and on the premise that persons independent of political pressures and incentives and trained in the law—judges—will be able to uphold better the legal limits on governmental power.

Judicial review began in the courts of American states under the Articles of Confederation, perhaps influenced by the fact that the British Privy Council had wielded a veto power over colonial legislation; at first, the practice aroused considerable opposition. At that time, most of the states had constitutions written and adopted by the legislature, so judges looked to natural law or the law of nations or Anglo-American common law for the higher law to which they claimed statutes must conform. Some opposing attorneys argued that an appeal beyond statutes was illegitimate, and some judges on the bench made similar claims. It also provoked popular mass protest meetings, legislative censures, attempts to outlaw it, and serious efforts to impeach judges for engaging in it.

A man named Thomas Tudor Tucker, writing in 1784 under the pen name of Philodemus (friend of the people, in Greek), in a pamphlet titled "Conciliatory Hints," developed the idea that the legislatively adopted constitution of his state, South Carolina, should be replaced by one written by a constitutional convention specially elected by the people and that the people should ratify it in an election, thereby giving their express consent. Moreover, the constitution should state that it is paramount to ordinary legislation and not changeable merely by the legislature. Finally, and crucially, Tucker suggested that a peaceful rather than violent solution to abuses of power by legislatures would be to have the constitution state that no act of the legislature contravening it can be valid, and this declaration could be enforced in the courts of law. Thus was born the system of judicial review for safeguarding a popularly ratified constitution as higher law.

The idea spread quickly to other states, and members of the Constitutional Convention treated this power as something the federal courts would have. They did not explicitly characterize it as a power over law adopted by Congress but merely implied that federal courts would have such power (by including constitutional prohibitions on certain kinds of laws and allowing the courts to take cases "arising under the Constitution"). As to state laws, the U.S. Constitution was explicit. Article VI says plainly that the national constitution, national laws, and national treaties "shall be the supreme law of the land; and judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding." Therefore, judges in the United States were obliged to throw out any state-level law that conflicted with a federal-level higher law. The fourth U.S. Supreme Court chief justice, John Marshall, explicitly developed and applied the implied power to declare void a federal-level statute for the first time in 1803, in the case of *Marbury v. Madison*, 5 U.S. 137.

Switzerland's 1848 constitution also spelled out a power in its Supreme Tribunal to declare void cantonal law on grounds of conflict with the national constitution. On the other hand, it refrained from allowing judicial review over laws produced by the national parliament. Instead, such laws could be challenged by a process of national referendum.

The Argentina Constitution of 1853, closely modeled on the U.S. Constitution, and then also its amended version in 1860, allowed for judicial review of national-level law. The Argentine Supreme Court plainly so interpreted it in 1864, in the case *Fiscal v. Calvete*, 1 Fallos 340, and did declare void a congressional statute in 1888 (in *Municipalidad de la Capital v. Elortondo*, 33 Fallos 162). This court then implemented its power on a regular basis until 1930, but from 1930 to 1983, the country was frequently ruled by a military dictatorship that in some periods dominated the court.

Then in 1866, via judicial precedent, the judiciary of Norway acquired the power of judicial review over national legislation. As of World War I, then, the courts of the United States, Norway, and Argentina had this power. (Icelandic courts did strike down a royal decree in 1877 but did not strike down a national statute until 1943.) In the interwar period, the Weimar Republic, Austria, Spain, and some of the states of Central/Eastern Europe had specialized constitutional courts to exercise judicial review, but all these were ended by the wartime constitutions. The paucity of countries with judicial review changed after World War II, at first gradually and then quite rapidly.

During the 1940s and 1950s, there was a postwar wave of reconstruction constitutions that instituted judicial review; these included the constitutions of Austria, Italy, Germany, France, and Japan. The decolonization of Africa and Asia in the 1950s and 1960s brought judicial review in several of the newly independent constitutions in Africa and Asia. Democratization in Southern Europe brought judicial review to Spain, Portugal, and Greece in the 1970s and, then, in the late 1980s and early 1990s, to new democracies in the Republic of South Africa and in several Latin American countries. Yet another wave came along in the 1990s, as the Soviet, Soviet bloc, and Yugoslavian republics adopted liberal democratic constitutions that included judicial review. As part of no specific trend, several additional countries in the period between 1979 and 1994 adopted new constitutions or new constitutional guarantees of fundamental rights to be enforced via judicial review. These included Sweden (1979), Egypt (1980), Canada (1982), Belgium (1985), New Zealand (1990), Mexico (1994), and Israel (1992–1995). By 2004, 80 countries in the world had adopted a system of judicial review.

There are two basic types of intracountry judicial review. The first follows the U.S. model, allowing all judges to declare void a law that conflicts with the constitution. The second was designed by Hans Kelsen for Austria in the interwar years. This model sets aside a particular specialized court or council, the Constitutional Court, which is given a monopoly on the power of judicial review and which exists only to exercise that power. Until the late 1970s, the U.S. type of judicial review was the more prevalent, being used in about three fourths of the judicial review countries. Since that time, the more recent democracies have tended toward the Kelsenian approach, adopting a single constitutional court.

In the 1960s, yet another form of judicial review burst forth on the world—judicial review by a transnational court. The European Court of Justice (ECJ) had been established to enforce the three 1950s treaties that bound together the European Communities (since 1992, called the European Union [EU]): The European Coal and Steel Treaty of 1952 formed the European Coal and Steel Community; the Treaty of Rome of 1957 formed the European Economic Community; and the Euratom Treaty of 1957 formed the European Atomic Energy Community. This court, the ECJ, declared in the case *Costa v. ENEL* (1964) not only that the treaties had wiped out any prior conflicting legislation of the member countries but also that these treaties now would function as higher law, making void also any *subsequent* member country legislation contrary to them. In 1970, the case of *International Handelsgesellschaft v. EVGF* extended this principle even to member-country constitutional provisions that might conflict with any of the European Community treaties. According to these rulings of the ECJ, ordinary judges in the member countries, even in countries that did not previously allow judicial review of statutes, were now obliged to give European-level law "precedence" over conflicting member-state law. And they did. As of 2008, there are 27 members in the EU.

Then, in 1998, the European Court of Human Rights, which is the court for upholding the 1950 European Convention for the Protection of Human Rights and Fundamental Freedoms of the Council of Europe (a 47-member body that stretches from the United Kingdom and Ireland to Azerbaijan and Russia, and from Norway to Greece and Turkey), was made a permanent court with compulsory jurisdiction over each member country and to whom individuals with human rights complaints were given direct access. Since that time, this court too has been exercising genuinely effective judicial review of a transnational variety with power to demand legislative remedies to Convention violations in the member countries as well as the power to insist that member governments issue financial compensation to litigants whose human rights have been violated.

These two European courts exercise most plainly the power of transnational judicial review, but there are some two dozen other international courts, many of whom, to one degree or another, exercise softer versions of judicial review. Judicial review on the world stage is a rapidly evolving phenomenon as of the 21st century and will warrant the attention of political scientists well into the future.

JUDICIAL SYSTEMS

Although the core of judicial systems is the trial, pretrial practices dispose of most potential litigation. Social, economic, or political pressures or lack of knowledge or resources will inhibit most aggrieved parties from bringing suits. Even among those suits seriously contemplated or filed, most will be resolved by voluntary settlement, plea bargaining, mediation, arbitration, consent decrees, administrative hearings, or decision by clan, guild, village, market, business, or religious "courts" that either operate parallel to or are embedded in the official judicial system.

Access to trial is also typically narrowed by "standing" (only those who can show that they have been directly and seriously injured may sue the alleged wrongdoer) and other rules, such as a requirement that those in dispute with the government exhaust their administrative remedies before resorting to the judiciary or that suits be filed within a certain time after the injury or offense (statutes of limitations). In some legal systems, under certain circumstances, however, standing rules may be relaxed or not applied at all, for instance, when a party alleges that a particular statute violates constitutionally protected individual rights or some action harms the environment.

The economic, social, and psychological costs to persons brought to criminal trials is so severe, even if they are not convicted, that many criminal justice systems provide for some kind of "trial before the trial" to determine whether actual prosecution is justified, such as grand jury indictment, arraignment, or preliminary investigation by a judge.

Trial courts may consist of a moot or whole community sitting as judge, a single professional or lay judge, a panel of professional or lay judges, a mixture of professionals and lay persons, or a judge and jury. Practices may be designed to bring all factual and legal issues together at a single time and place to be resolved in an oral proceeding, or a trial may be a file of papers developed over an extended time period as written records of witness statements, investigative reports, and relevant documents such as deeds and contracts until final disposition occurs through the delivery of a judicial verdict in court.

Proceedings are typically governed by rules specifying who may participate in what order, rules of decorum, rules of evidence defining what testimony and documents will be admitted as sufficiently reliable, and relevant standards of proof such as the "beyond reasonable doubt" rule or the Islamic rule that conviction requires testimony of guilt by two witnesses. Confessions, either voluntary or induced by coercive practices, are a major feature of most criminal justice systems. Such systems are often classified as adversarial or inquisitorial depending on the degree to which the case is developed by the prosecutor and defense counsel or by the judges themselves. Both civil and criminal justice systems have historically varied enormously in the degree to which judges actively intervene in case development. In Imperial China, lawyers did not exist, and the magistrate was solely responsible for case development with even the parties playing little role except as severely coerced witnesses. In the United States, judges are expected to remain largely passive recipients of the lawyers' presentations. In other systems such as the English, lawyers present the cases for each side, but judges intervene fairly actively.

Judicial systems are often organized in a single pyramid or hierarchy with many local trial courts, a certain number of which are clustered under an appeals court; these intermediate appeals courts are clustered under the highest appellate court. Sometimes there are separate hierarchical systems of civil, criminal, administrative, commercial, labor, and/or religious courts or separate trial courts, such as small-claims or juvenile courts, under the supervision of the general courts. In some instances, there is a separate court with exclusive jurisdiction over constitutional issues, and some higher courts also serve as trial courts for particularly important matters such as impeachment of government officials or suits between two member states of a federal system. Appellate courts almost always consist of a panel of three or more judges. One function of appeal is to protect parties against trial court errors. Another is to serve central political authorities by ensuring that laws made by them are effectively and uniformly enforced by the web of local trial courts.

The principal function of courts is often said to be the resolution of disputes between two parties, deciding that one party was right and the other wrong, according to preexisting legal rules. In reality, many cases really involve not simply two individuals but large clashing social, economic, or political interests; many are resolved by intermediate decisions under which both parties gain something and lose something, and some are resolved by rules that the judges have just constructed. Judicial discretion in the making of new legal rules is greatly constrained by many factors, including the need to explain their decisions in published "opinions," the existence of other more politically powerful lawmakers such as legislatures and executives, public opinion, courts' extremely limited means of enforcing their judgments, the degree of completeness and specificity of existing legal rules, and professional or craft standards of permissible legal reasoning and judicial creativity. Nevertheless, in many polities, judicial systems have been a significant source of new public policies and thus sometimes of political controversy.

Some degree of judicial law making characterizes all judicial systems, not necessarily because judges consciously seek law-making power but because acceptance of judicial decisions is most likely when they are purportedly the judicial application of preexisting legal rules rather than judicial fiats. Thus, in cases where there is no relevant preexisting law or that law is too general or unclear to prescribe the outcome, judges themselves will be moved to generate a decisive legal rule attributing its origin not to themselves but to judicial "interpretation" of the body of preexisting law.

Because courts are necessarily simultaneously dispute resolvers and lawmakers, judicial selection is difficult. Judicial neutrality and independence would seem essential if courts are to successfully resolve disputes. Yet, as lawmakers, judges ought not to be independent but rather politically responsible to the people or their elected representatives in a democracy and to whoever holds political authority in nondemocracies. This insoluble paradox results in judicial selection processes that range from direct election for short terms of judicial candidates nominated by political parties to appointment and dismissal of judges at the pleasure of an authoritarian ruler or selection for life terms by an independent council consisting of incumbent judges and distinguished legal scholars, with every imaginable combination of independence leaning and political accountability devices in between.

It is often claimed that judicial systems are separate from political systems, but more realistically speaking, they are treated as subsystems of the political. While courts are frequently associated with the protection of individual rights, most political regimes, even those with little regard for such rights, have invested in judicial services. They do so not only because conflict resolution fosters economic activity and social peace but because courts serve as instruments of social control enforcing whatever policies the regime enacts into law. The appellate hierarchies described earlier are channels for transmitting to the localities and enforcing laws made by central political authorities. To the extent that judges themselves make law, they themselves are active participants in the public policy-making—that is, the political—process. There is a perennial argument over how active judges ought to be in policy making, but some level of judicial lawmaking, and thus judicial politics, is inevitable.

It is argued by some that judges engage in a unique and superior method of decision making. Because they proceed case by case with regard for stability, continuity, and consistency in the case law, their decisions are claimed to be pragmatically rooted in the particular, concrete realities presented in individual cases rather than generated by abstract and general prognostication not rooted in reality. Because they know that the rule they announce in one case will probably be used in subsequent cases and because most serve for relatively long terms, they are said, unlike politicians desperately concerned to survive the next election or crisis, to pursue long-term public values rather than their personal, immediate survival in office. Others argue that case-by-case decision making is simply the judicial version of the incremental decision strategies used by all public policymakers, that precisely because judges know that the rule they make in one case today may be used in future, somewhat different, and somewhat unpredictable cases, they mix concrete, immediate considerations with more general, probabilistic considerations of how a current rule might work in the future just as legislators, administrators, and political executives do, and that even those judges who anticipate long terms are subject to the pressures of immediate events and current crises that play on other lawmakers. There is certainly much empirical data indicating that judges' decision making is significantly influenced by their political ideologies and affiliations and their personal policy preferences, but such studies do not resolve the question of whether judges enjoy a decision method different from or superior to those of other lawmakers.

Effective judicial systems are often touted as routes to economic and political development because they provide security of expectations for investors and protect individual rights. Yet, under some circumstances, investment can be attracted by the expectation of high returns even in the absence of court-provided security, and authoritarian regimes can use judicial processes for repression rather than protection of individuals.

It is widely believed that, beginning in the latter half of the 20th century, the courts have played an increasingly active role in public policy making (the so-called judicialization of politics) through their powers of constitutional judicial review, review of the lawfulness of administrative actions, and general statutory interpretation, although it is not clear that courts were less active in earlier periods.

JUDICIALIZATION OF INTERNATIONAL RELATIONS

The judicialization of international relations refers to the political reality that judicial actors are increasingly involved in defining what international agreements mean. Judicialization is an aspect of legalization of policy and politics in which politicians conceive of their policy and legislative options as bounded by what is legally allowed and where citizens, organizations, and firms see law as conferring on them rights that others may not abrogate. Judicialization occurs when courts gain authority to define what the law means. Where judges have the authority to say what the law means and where litigation becomes a useful way to reopen political agreements, judges become de facto lawmakers. Negotiations among actors become debates about what is legally permissible, and politics takes place in the shadow of courts with the lurking possibility of litigation shaping actor demands and political outcomes.

Most people used to think that law only existed where there was coercive power to enforce it, and thus, judicialization of politics was only possible within states. But increasingly, international relations have become both legalized and judicialized. This entry reviews how international relations came to be part of the domain of courts, discusses how the judicialization of international relations has changed international politics, and identifies where judicialized international relations are more and less prevalent.

How Did International Relations Become Judicialized?

In the age of monarchies, what we today call international law consisted primarily of agreements among kings and queens, enforceable through reciprocity by state leaders. This old conception of international law still exists in public law theory and in international relations approaches that see international law as mere contracts between states. This view of international law is still voiced by governments when they assert that they have absolute sovereignty. But these are old-fashioned conceptions of international law, relics of another time and place. This "old terrain" of international law started to recede around the turn of the 20th century when domestic courts began hearing cases of alleged violations of what were largely unwritten international rules and when countries started negotiating and ratifying more detailed international treaties.

Since the end of the Cold War, international law and judicialized politics have entered a fundamentally new terrain where international treaties create binding laws, creating duties, expectations, and rights that penetrate the surface of the state. The new terrain of international law is the result of a double shift that has accelerated since 1945. One force leading to this new terrain is the substantive expansion of international law to cover issues that were traditionally governed exclusively by states. This expansion has been fueled by the rights revolution and the rising trend of governments exerting an extraterritorial reach to domestic laws. The rights revolution, which took off in the post–World War II era, is based on the premise that individuals have certain rights even if domestic constitutions or statutes do not explicitly recognize these rights. The United Nations General Declaration of Human Rights in 1948 created an aspirational goal, as the declaration itself was nonbinding. Civil rights movements of the 1960s pushed forward the development of binding international laws and treaties explicitly addressed to individuals. These rights are universal; thus, they do not depend on national ratification to exist. Meanwhile, governments in a number of capitalist countries constructed a law-based global international trade regime, and they expanded the extraterritorial reach of domestic property and antitrust rules so as to protect domestic economic interests and shape the way global forces affect domestic markets. With powerful countries already asserting an international reach to their global and domestic economic rules, the idea of increasingly coordinated international rules became a least bad alternative, even if these rules touch on issues that in theory remained the exclusive prerogative of states.

The result of these trends is that international law increasingly speaks about how governments should treat their citizens, which goods are allowed into national markets and on what terms, how many environmentally destructive products states should allow their firms and people to create, and so on. While we count on governments to implement these rules, increasingly substate actors are going to the source of the rules, invoking international laws and regulations directly in national contexts. If individuals, nongovernmental organizations, and firms see governments as having duties and themselves as having rights based on international law, and if governments start to interact with substate actors as if they have rights under international law, then both domestic and international politics move into the new terrain of legalized international politics.

The second shift is a result of the growth of multilateral institutions. In very real and concrete ways, multilateral institutions have gained governance roles. As executive bodies, *multilateral* institutions propose legislation and convene meetings where representatives of states agree to collective rules that, once ratified, can become binding both on signatories and nonsignatories alike. Some multilateral institutions at the regional level (e.g., the European Union [EU]) have legislative abilities wherein councils of state representatives can pass legislation that does not require the traditional step of national ratification for the legal rule to be binding. Multilateral institutions also have been granted administrative roles, with an international secretariat issuing binding interpretations of rules and decisions related to implementing international rules. Combined with the first trend—the substantive expansion of national and international law—the trend of delegating a variety of powers to multilateral institutions means that increasingly there is governance that does not depend on national legislative consent for its authority and that exists largely outside of domestic judicial oversight.

These two factors have contributed to the growth of creating and using international courts (ICs). It used to be that domestic courts were the primary enforcers of international rules. Even with the rise of powerful and active constitutional courts in many countries, domestic enforcement remains uneven because national judges are inclined to see international law as external to the national legal order and international relations as falling into the realm of executive prerogative. As multilateral institutions have gained more powers, states have turned to ICs to oversee the exercise of this power.

The end of the Cold War ushered in a revolution in the creation and use of ICs. It disrupted traditional alliances. Former Soviet satellites rushed to join the international institutions of Western states, and states that had relied on Soviet support had to seek new patrons. Around the world, states embraced the trappings of liberal democracy—free markets, human rights, and open trading systems. These changes led to the creation of a slew of new ICs, reforms to existing ICs, and an expansion of membership in a number of international legal institutions.

We can literally see the judicialization of international politics. In 1985, there were eight ICs that met the Project on International Courts and Tribunals' definition of an IC as

1. a permanent legal body,
2. composed of independent judges,
3. hearing legal cases in which one of the parties is a state actor or an international organization (IO),
4. deciding on the basis of predetermined rules, and
5. issuing binding legal rulings.

By 2009, there were 20 active ICs meeting this definition and 8 more in various stages of development. These "new" ICs are not only recent creations, but they are also qualitatively different entities. Newer ICs are more likely to have compulsory jurisdiction, meaning states do not need to consent to litigation for the case to proceed. They also tend to allow private access or access for international nonstate actors to initiate litigation, even though most observers agree that these design features make ICs more independent and more likely to make a ruling on cases in which a government is an unwilling participant. The new ICs are far more likely to be activated, which explains in part why IC usage has also increased. By 2007, ICs had issued more than 30,000 binding legal rulings where an IO or state actor was the defendant. These rulings are not only mostly routine, but they also fill gaps in the law and, at times, radically reinterpret law on the books so that ICs end up as lawmakers with significant power to influence domestic and international outcomes.

The ingredients for judicialized international relations are now in place. We have an extensive body of binding and fairly precise international legal rules. We have state and nonstate actors who see these rules as conferring rights and duties on state actors. We have courts—both domestic and international—with the capacity to interpret and enforce these rules in cases raised by states, private firms, individuals, and international prosecutor-type actors.

How Does the Judicialization of International Relations Affect International Politics?

It is important to recognize that judicialized politics is not the same thing as courtroom politics. Legalized politics involves the extension of legal rhetoric and legal calculations into the larger realm of politics. When courts start to issue decisions that interpret rules, judicialized politics extends to politicking over new rules, actor decisions regarding different courses of law-compliant action, and negotiations to resolve disagreements about existing rules.

During treaty negotiations, judicialization of international relations mainly affects politics by creating a web of commitments that constrain new policy making. Certain international treaties exert a constitutional influence over bilateral and multilateral treaty negotiations and domestic policy making. For example, the World Trade Organization's framework for free trade casts a shadow over domestic and international negotiations regarding trade issues because any new agreement that conflicts with the rules of the World Trade Organization can give rise to a legal challenge. International human rights law also exerts a constitutional influence in that new international and domestic policies must respect what are seen as elemental individual rights.

Judicialized politics play an even larger role during the implementation stage, when actors are applying existing rules on a case-by-case basis.

Legalization's largest although least perceptible influence is in shaping how actors make choices. For most actors, the first step involves figuring out what the law allows or requires. People usually choose legal action because law provides a starting place to make decisions and because law-compliant behavior is safe. Following the law becomes the default condition; one usually needs a reason to choose a riskier illegal action over what the law prescribes. Even when actors choose to violate the law, they will attempt to bring legal understandings with them. For example, when the U.S. government under the leadership of President George W. Bush sought to escape well-understood legal obligations under the Geneva Conventions (1949) and the UN Convention Against Torture, it asked for legal briefs that suggested that its policy choices were actually consistent with what the law required.

Law also becomes a tool used by parties when disagreements arise. At this point, state discretion can be constrained by judges (domestic and international) interpreting and enforcing the law as they see it. Law becomes a framework that the parties use to figure out what arrangements are reasonable. Law prescribes the duties owed and the rights that can be claimed. Again, we see that judicialized politics are not per se courtroom politics. Litigation is meant to be a last resort and a fairly rare phenomenon. Instead, the prospect of litigating a disagreement casts a shadow over out-of-court negotiations regarding legal compliance. Actors are supposed to adjust their behaviors both because they prefer to be law-abiding (being law-abiding is seen as more legitimate) and to avoid a legal suit. Where legal violations exist, threatening litigation becomes a useful bargaining tactic, as most actors will prefer settlement rather than public legal sanction and with it a binding legal precedent. Judicialized politics is therefore present in the many debates and arguments over what the existing set of rules do and do not allow.

A proportionally small number of disputes will end up in front of legal enforcement bodies—international or domestic courts, monitoring and enforcement bodies, or arbitral bodies. Rising litigation rates involving international agreements suggest that litigation is a useful political tool, but it is hard to assess how effective litigation is. The effects of litigation cannot really be measured because the many suits that settle out of court are systematically excluded in any examination of compliance with the law. The cases we can observe—those that reach the legal ruling stage in a court—tend to be the most difficult, those where the parties refuse a settlement, and thus where compliance with the law is the least likely. Studies on compliance with IC rulings find that a vast majority of IC rulings elicit full or partial compliance. Even if rulings do not elicit immediate or full compliance, IC actions cast a shadow over subsequent politics. The fact that an IC has declared one interpretation of the rules "legal" and another "illegal" affects perceptions regarding the rectitude of certain behaviors. State and nonstate actors may become less willing to abide by bargains and policies that have been named illegal. Over time, lawbreakers may find that it is simply easier to create a legal solution to end a conflict. The legal solution may involve compliance with the law as interpreted by the IC, writing new legislation to create a new definition of what is "legal," or creating a side bargain in which the victims of the legal breach are compensated in exchange for dropping their legal claims. All of these shifts from straight-out noncompliance—settlement, changing the law to unseat a court ruling, compensation, and compliance—reflect judicialized international relations.

Where Are Judicialized International Relations More and Less Likely?

A well-known saying is that "all's fair in love and war." But with judicialized politics, actors who break a love contract or who engage in war can face costly litigation. This aphorism does, however, capture the reality that certain domains are more law constrained than others.

Judicialized politics are less prevalent with respect to new-issue areas where there are few existing legal rules. The Internet, for example, experienced a period of time without legal regulation where there were only norms of conduct but not legal rights and duties. While there is much discussion about international environmental accords, the environment remains another domain in which international legal obligations barely exist.

In tightly knit social settings where social mores matter more than law, and around the fringes of political life where social opprobrium counts for little, social interactions tend to be less constrained by law. Thus, we find that in many areas of the world, local custom matters more than international human rights law. We also find that illegal realms, such as the black market or drug and human trafficking, operate largely outside the law and legalized discourse.

The realm of security has fewer rules limiting state discretion, although over time this policy domain has also become judicialized. State actors who indulge in violence across borders, who violate promises that have been codified via international agreements, or who commit atrocities against noncombatants may be recipients of legally authorized sanctions. Other states may refuse alleged war criminals, the citizens of states engaged in war, or the regular courtesies of international life, such as international travel, the landing of airplanes, and trade across borders. With the rise of universal jurisdiction and the creation of the International Criminal Court, perpetrators of war crimes can even find themselves being brought to court.

In international economic relations, interstate interaction is highly legalized and judicialized. The rules for creating barriers to the movement of goods and services are detailed and known. (World Trade Organization rules constituted a starting template for most international trade regimes.) A state that violates these rules will usually be confronted with legal claims, legal threats, and even litigation.

The final area of international politics that is increasingly judicialized is human rights. Nongovernmental actors increasingly monitor state actions, using legal claims and legalized strategies as they expose violations of individual and group rights. While activists may fail to sway a determined government, outside groups would have no right or leverage were it not for the existence of binding international duties and obligations. Meanwhile, domestic and ICs around the world are increasingly willing to help protect human rights.

This discussion reveals that judicialized politics is not defined by law obedience. Instead, judicialized politics is defined by legal politics, where the fights are about what constitutes obedience to the law. Where politics is judicialized, judges have political power because they have been given the final authority to say what the law means. Judges do not, however, get to determine what the law ultimately becomes. If enough actors are unhappy with the state of the law, they will change the law. Judges will then get another chance to interpret what the new law means. Through a recursive interaction among judges, lawyers, policymakers, and the people ultimately called on to respect the law, the meaning of the law gets contested, defined, and reshaped. Judicialized politics means that judges have inserted themselves into this recursive political dynamic and that the political status quo can be destabilized by litigants making legal appeals to judges.

Conclusion

Today international agreements are negotiated by executive branches, written down and registered, and then implemented by state bureaucracies. Bureaucracies usually apply existing rules in cases involving individuals. Following the law is nearly always the simplest and safest course of action, which is why bureaucracies will follow the law, unless there is a compelling reason not to.

Before courts were involved in interpreting international rules, bureaucracies had significant discretion to define what the law meant. By shaping bureaucratic behavior, governments controlled how international law affected domestic policy. The growing trend of having legal bodies—domestic and international—interpret and apply international rules has contributed to the judicialization of international politics. Government bureaucracies are increasingly swayed by the possibility of international review of their decisions; thus they are increasingly willing to follow IC interpretations of the law even if their government has not explicitly directed them to do so. Now that courts can pronounce on the law and even review the actions of state bureaucracies, state discretion has diminished.

Legal obligations exist where legal rules exist. Legislative bodies make legal rules, and where there are no rules, actors retain discretion. This means that through their legislation, legislative bodies drive where and when international relations become legalized. But when courts became involved in interpreting international law, judges start to create law to fill in lacunae that legal suits expose, and states begin to lose discretion and control over how legal rules are understood. Political actors will need either to make codified law that is more to their liking or to let judges define the law. The ultimate import of the judicialization of international relations will depend on the interaction between existing laws, the willingness of litigants to invoke the law and pursue litigation, and the behavior of judges.

This realm of judicialized politics has been spreading in an accelerated fashion. Many factors account for its spread. Democracy and the growth of professional bureaucracy increase the number of actors who participate in policy making and who have a stake in the rule of law, both domestic and international. Technology aids in the dissemination of information and the coordination of actors across borders. A rising trend of delegating authority to international legal bodies increases the venues available for litigating. The increasing willingness of national courts to weigh in regarding international legal issues has also increased the prevalence of bargaining in the shadow of a court.

At this point, even if governments decided to stop using law and litigation as a tool of dispute resolution, there would still be judicialized international relations. Legal rights are hard to take back. International law provides a right for outsiders to peek over borders and to criticize what governments do in their own backyard, and judges have gained jurisdiction regarding international legal issues. At the same time, the rule of law—both domestic and international—is far from monolithic. There are always territories and issues where one finds social order that is not defined by law. The next challenge for students of judicialized international relations is to determine where and when law plays a greater role in everyday international relations and to better understand the factors that shape how judicialized international politics plays out.

JUDICIARY

All modern societies tend to entrust the adjudication of disputes arising from the application of recognized norms to a specialized actor, the judge. Collectively, the judges are designed as the judiciary. In some countries—such as France and Italy—the judiciary also includes public prosecutors since they form a unitary organization together with judges.

Due to the significance of the adjudication, the judiciary tends to enjoy a special position in most political systems and especially so in constitutional democracies. In most political systems, since the middle of the 20th century, the significance of the judiciary has increased, leading to the phenomenon defined as "the judicialization of politics."

The Judiciary in Constitutional States

The role of the judiciary in a political system cannot be analyzed without taking into consideration the institutional function of the judge: adjudication. Adjudication is a type of dispute resolution that relies on an externally appointed judge acting as the third party and where the parties to the dispute must comply with the judge's decision, even though they have no control over the choice of judge, who is appointed by the state. Thus, judges are inherently placed in a difficult position. They must resolve cases without the main element that makes the triad an effective means of resolving disputes: the willingness of the participants to submit to both the proceedings and the involvement of the third party. To address this weakness, the judicial process tends to include a number of principles creating the appearance of and reinforcing judicial impartiality. More specifically, the need to guarantee judicial impartiality implies that judges must be independent from the parties in dispute and protected from interference by them. Such independence is a necessary condition as any judge who is dependent in some way on one of the parties cannot be, and cannot appear to be, impartial.

In the political development of Europe, the incorporation of judges into the machinery of the state and the superiority of government-appointed judges over other types of judges—for example, feudal or city judges—have largely guaranteed judicial independence from the parties in dispute. However, the incorporation of the judge into the state organization creates the need to redefine judicial impartiality when one of the parties is the state itself or one of its representatives. Only by defining judicial independence in relation to the state can the judge act as an impartial third party in disputes between the state and citizens (e.g., in criminal trials). Judges can then become an effective check on the way in which public functions are performed since guarantees of independence allow them to resolve such disputes and interpret the relevant laws without coming under pressure from the state. Thus, the protection of judicial impartiality through strong guarantees of judicial independence has become one of the most important traits of constitutionalism since one of its main objectives is to limit the arbitrary exercise of political power and make it legally accountable.

The strength of the judiciary is influenced by whether it is in a civil law or common law country. In a civil law country, legislative law takes precedence over case law, and judges are bound by civil codes without regard to previous judicial decisions; in contrast, judicial rulings take precedence over civil law (legislation) in common law countries, and judges are bound by previous rulings issued by higher-level courts (stare decisis). Historically, judges in civil law countries have enjoyed less independence, and their role has tended to be less politically significant. Mistrust of the judiciary has always been high and judicial power considered an important power to be checked. Traditionally, continental judges tend to act in a subordinate way to the political branches and to the norms they enact. This reflects a historical interpretation of the "separation of powers" principle that assigns a privileged role to the legislature since it represents the popular will. Therefore, for a long period, any form of judicial review of legislation was ruled out.

The situation in England and many of the former British colonies, including the United States, is different. In England, the centralization of political authority resulted in the hegemony of one institution—Parliament—but in a more polycentric setting: The political branches do not monopolize the creation of legal norms. As a result, English judges have been able to maintain some autonomy in relation to parliamentary statutes, and common law principles developed by judges still remain one of the basic elements of English law. In the United States, a written constitution combined with judicial review of legislation has ensured from the outset that the judiciary would not be subordinate to the political branches.

Therefore, in any constitutional state whose main objective is to safeguard the rights of citizens, judicial independence is primarily aimed at guaranteeing and supporting judicial impartiality in the adjudication process. As a consequence, its main point of reference must be the state and its institutions, particularly the executive, which directly or indirectly is most often a party to such adjudication, as in criminal trials where one of the parties is usually the public prosecutor. With the introduction of judicial review of legislation, the legislature also becomes a point of reference for judicial independence. The judiciary is considered a power on the same level as the legislative and the executive: It becomes a veritable third branch of government, as it is often defined in the United States.

This picture emerges even more clearly from a comparison of the status of judges in authoritarian states with that of judges in totalitarian states. As a rule, the judiciary in authoritarian regimes plays a minor role in the political system. Political repression is usually entrusted to special politically appointed courts or dealt with directly by the police or other security forces. The ordinary judiciary is only marginally involved in the policies of the regime and usually retains a modest degree of independence (as in Spain under Franco or in Portugal under Salazar). On the other hand, totalitarian regimes invariably try to enlist the judiciary in their attempts to implement deep social and political changes. In these regimes, judicial independence is extremely low if not nonexistent, with judges appointed and dismissed at the pleasure of the regime. These judges are part of the state apparatus, and the judiciary is usually a strong hierarchical organization made up of members of the totalitarian party. Judicial elections, when present, only ratify the choice of the political leadership. Hence, the judges are politicized, and their values necessarily mirror those of the regime.

Bureaucratic and Professional Judiciaries

All democratic constitutional systems protect judicial independence, but differences emerge when considering the status that judges enjoy in practice. The most significant elements concern appointments, salary, transfers, disciplinary proceedings, and career patterns, with the last factor being the most important variable characterizing the organizational structure of the judiciary. All of them determine the position of individual judges in relation to their colleagues and those responsible for decisions affecting their professional lives. Taken as a whole, these elements can be used to assess the extent of both internal and external judicial independence. While external independence refers to the relations between the judiciary and other branches of government, internal independence focuses on guarantees aimed at protecting individual judges from undue pressures from within the judiciary: fellow judges and, above all, superiors. The role played by organizational hierarchies is crucial for understanding the internal dynamics of the judiciary, which in turn affect the actual degree of judicial autonomy.

Broadly speaking, two types of judiciary can be distinguished: (1) bureaucratic, to which civil law judiciaries tend to belong, and (2) professional, characteristic of common law judiciaries. This is obviously an “ideal–typical” distinction since actual cases are more complex. But judiciaries in democratic countries can be placed on a continuum defined at either end by these two types. The French judiciary has traditionally represented the bureaucratic model, while the English judiciary has most closely reflected the professional model.

The defining elements of a bureaucratic judiciary include the following:

1. Selection of judges is made on a technical basis through examinations at a young age, usually immediately after university, with little or no emphasis placed on candidates’ previous professional experience.
2. Training takes place primarily within the judiciary.
3. A hierarchy of ranks determines organizational roles. Advancement up the career ladder is competitive, and promotions are granted according to formal criteria combining seniority and merit. Hierarchical superiors have wide discretion in determining merit.
4. Judges are supposed to be capable of performing all organizational roles associated with their rank (e.g., to be able to adjudicate criminal, bankruptcy, family law, and fiscal cases, or to act as a public prosecutor). They are therefore recruited not for a specific position but for a wide set of roles and, in the course of their careers, will tend to change jobs often. This makes guarantees of independence more problematic because of the influence hierarchical superiors (or, in some cases, the government itself) have over these moves.

5. Judicial guarantees of independence tend to be weaker, especially because judges tend to enjoy a lower degree of internal independence.

On the other hand, the following are the defining elements of a professional judiciary:

1. Judges are appointed only after having acquired professional legal experience. In some instances, this experience is taken into account in recruitment for specific judicial positions.
2. This experience usually, but not always, involves being a legal advocate. In the United States, for example, legal academics are often appointed to the federal bench.
3. There are no formal provisions for advancement, although higher ranking judges (especially in England) often exert some influence in both the initial appointment process and the promotion of judges from the lower ranks.
4. Judges are recruited for specific positions. Promotions are not widespread, and on the whole, there are much weaker internal controls over judges by their higher ranking colleagues.
5. Stronger guarantees of both internal and external judicial independence exist.

Both civil and common law judiciaries have checks to ensure that their members pursue institutional goals, but the approaches are different. Since Anglo-American judiciaries tend to employ individuals with lengthy legal experience outside the judiciary, there is less emphasis on internal controls. In contrast, because continental judges are recruited without significant professional experience, young judges are placed at the bottom of the judicial pyramid, and their organizational socialization is constantly monitored through a career based on moving up a hierarchical ladder. The organizational setup also affects the "reference group" of judges—those individuals and groups judges take into account when reaching a decision. In bureaucratic judiciaries, the reference group lies mainly inside the judiciary, where judges tend to be professionally socialized. The hierarchical structure enables senior judges to influence the behavior of lower ranking judges since they control promotions, transfers, and discipline. In professional or common law judiciaries, a similar type of hierarchy does not exist, and reference groups tend to lie outside the judiciary. However, there is a difference between the English judiciary, which traditionally had a small professional reference group (the Bar), and the American judiciary, which has a much more diverse composition and a recruitment process that incorporates different types of professional and political influences.

Changes in the Judicial Organization

Since the mid-20th century, significant changes have characterized the judiciaries in several countries. In England, in 2006, the institution of a Judicial Appointing Commission—an independent body in charge of proposing appointments to the Lord Chancellor—has circumscribed the traditional powers of the executive. However, the most important change has been the creation of judicial councils in several civil law countries since it has considerably increased the political significance of the judiciary. Judicial councils are collegiate bodies—composed of judges and lay members—in charge of administering the status of judges. Their impact has been a more or less radical alteration of bureaucratic judiciaries by strengthening judicial independence and, at the same time, fostering new connections with the political system. In this process, the powers and composition of these bodies are critical factors. The more extensive their functions, the stronger their role will be, and judicial independence tends to be stronger when there is a higher ratio of members chosen directly by and from the judiciary.

One of the main consequences of creating judicial councils is to increase the *external* independence of the judiciary by decreasing the traditional power of the executive. But since no judicial council is composed solely of judges, an important role remains for the institution in charge of appointing the nonjudicial members. This is usually assigned to parliament, which allows political parties to bypass the minister of justice and influence the judiciary directly. The creation of a judicial council also has consequences for the *internal* independence of the judiciary. Entrusting the promotion and appointment of judges to a collegial body where normally all judicial ranks are represented contradicts the traditional hierarchical principle, whereby only higher ranking judges are entitled to evaluate lower ranking colleagues. In this way, the lower ranks acquire a new power since they can participate in the process of choosing higher ranking judges. As a result, challenges to the very idea of a judicial career by the lower ranks have often been successful. It is not coincidental that in countries with judicial councils, the number of judicial ranks has been reduced, and the influence of senior judges' assessments of lower ranking judges seems to be declining.

The erosion of hierarchical links is particularly relevant to the general expansion of judicial power. With the creation of judicial councils, the reference group of judges has become more varied. Traditional members of the reference group, such as legal academics and senior judges, have decreased in importance since they no longer enjoy a monopoly over evaluations for judicial promotion. Thus, the professional criteria of the judiciary have also begun to shift: Technical legal knowledge (and ideological conformity) is no longer the determinative element in promotions. Views of others outside the judicial system (e.g., political parties in parliament and also unions and interest groups) have gained in importance. Similarly, the interests of the media and the judiciary increasingly overlap, as judicial actions provide the media with news. In return, the media are able to support and publicize the actions of judges (and prosecutors). Inside the judiciary itself, judicial councils have increased the role of judicial associations since they organize the electoral participation of judges. On the other hand, since the council is also composed of political appointees, their point of view also has to be taken into account. In fact, as judicial actions gain political significance, the council may become the main institution where the judiciary's elected representatives can meet political representatives. As the experience of Latin European countries suggests, the creation of judicial councils is capable of producing a radical change in the judiciary's traditional setting; this in turn can diversify the judiciary's reference group, which is becoming more horizontal and, at least in part, placed outside the judiciary. As a result, more activist conceptions of the judicial role tend to prevail.

The expansion of judicial guarantees of independence has also involved public prosecutors. This process has been stronger in those countries in which judges and prosecutors form a single professional group. In Italy, prosecutors enjoy the same guarantees as judges and, together with judges, elect the majority of the members of the judicial council. Their autonomy is extremely high: The executive cannot in any way issue instructions to them. Also, in France, where the ministry of justice has been able, at least so far, to keep most of its traditional powers, the autonomy of public prosecutors is growing and the executive has often been unable to exert all its institutional powers on public prosecution.

While these changes have affected the position of the judiciary in several states of Latin and Eastern Europe, other countries have seen little alteration of their judicial setting. In Germany, judges and prosecutors remain organized along hierarchical lines that allow the minister of justice, higher ranking judges, and senior prosecutors to influence their careers. Although the 1949 Basic Law introduced judicial review—entrusted to a politically appointed Constitutional Court—judges still regard their relatively passive role as a professional barrier against possible political interference and carefully protect their reputation as guardians of the law. The role of judicial councils and judicial associations remains limited, at least in comparison with other countries.

The Judiciary in the Political System

In the second part of the 20th century, a trend toward a general expansion of judicial power can be singled out in most democratic regimes, a development often described as the judicialization of politics. The rise of judicial power has involved both the civil and the common law worlds, although it has been stronger in some countries than in others. The reasons behind these developments are several. First of all, the antiauthoritarian backlash has supported a new constitutionalism with the institution of forms of judicial review of legislation as well as the strengthening of guarantees of judicial—and prosecutorial—independence. In this process, the supranational dimension of constitutionalism has to be taken into account: For instance, the increased activism of national judiciaries has often found support in the European Court of Justice and the European Court of Human Rights.

An additional factor of judicialization can be found in the growth of welfare policies. The consequent proliferation of legislation increases judicial significance: Where a legal rule exists, sooner or later a judge will be asked to interpret and apply it. Gaps remain despite, and perhaps because of, the growing number of laws, and judges are called to fill them. Another supporting element has been changes in the legal culture. A new emphasis on citizens' rights and entitlements and the emergence of an instrumental approach to law—understood as a tool for advancing individual or collective goals—have become common traits of contemporary societies. Today, there is virtually no area of social life immune from public regulation, and thus, no area can be excluded from judicial intervention. Thus, the demand for individual and collective rights, fueled by the development of both constitutionalism and welfare policies, has meant that individuals and groups increasingly seek out the judicial system with the aim of obtaining an authoritative decision in their favor.

However, there are significant cross-national differences in the political prominence taken by the judiciary. Bureaucratic judiciaries, when freed from hierarchical and executive influence, have seen a significant increase of their role in the political process. As for the political context, fragmentation tends to support judicialization. In this case, the lower decisional effectiveness of political structures leads to interests having an incentive in putting pressure elsewhere, for instance, on courts. On the other hand, for fragmented political institutions, it is more difficult to confront judicialization—that is, to assemble the political majorities in order to curb judicial power, for example, by overruling unwelcome judicial decisions, reducing judicial independence, or appointing accommodating judges.

Political fragmentation is obviously related to a corresponding institutional setting. Strong separation of powers, making easier the advent of divided government, is a case in point, as is true bicameralism—leading to disalignments between the two chambers—or a proportional electoral law, making a multiparty governing coalition more likely. Also federalism, by pitting the central government against the states, supports fragmentation. In turn, a fragmented setting is likely to be the by-product of a political transition in which no actor is able to impose its preferences, trust tends to be low, and the uncertainty about the future is high. In this case, judicial power offers an insurance policy for prospective losers in the electoral arena.

The judicialization of politics has given new life to the traditional debate on the democratic legitimacy of an independent judiciary. The increasing role of independent judges in the policy process has been criticized. Some critics argue that to the extent to which judges are no longer constrained by law, an irresponsible policymaker seems to emerge. To this view, a different interpretation of the judicial role has been opposed: In a constitutional state, judges are bound to follow the constitution rather than statutes. Sometimes, it has also been argued that judges have no discretion since there is always one right answer to the case they have to decide. In fact, discretion seems to be an unavoidable trait of judicial decision making. So political power results inevitably from increased judicial independence. However, the expansion of judicial power is also the by-product of specific decisions taken by democratically responsible bodies. The fact that judicial decisions can go against the will of political majorities is inherent in the institutional template of constitutionalism: It is an inevitable price to pay. However, it seems unlikely that the judiciary will remain out of step for long with the political branches. As long as courts become politically significant, politicians become interested in exerting influence on them through judicial appointments (especially in the highest courts), through jurisdictional reforms (e.g., removing politically significant cases from courts), or by influencing judicial careers—through the powers of the ministry of justice or of a politically influenced judicial council. However, although it is not certain whether long-term political influence on judges is likely to succeed, in the short run, the political role of the judiciary has become—and is likely to remain—significant.

JUSTICE

Justice constitutes a normative cornerstone of political society. Classical and contemporary philosophers, from Plato and Aristotle to John Rawls, have seen it is as the main guiding principle for regulating political power. They disagree about *what* counts as justice, but they agree that justice *counts* for much in shaping, maintaining, and improving political order. The asymmetry of wide agreement on its importance and deep disagreement on its content, however, creates difficulties with the idea of justice. To restore the credibility of this idea, its complicated structure must be elucidated. This entry attempts to provide such an elucidation by exploring the competing ideas of justice, comparing the various philosophical grounds that have been advanced for the universalization of justice, and analyzing the legitimation of political decisions in society.

Is Justice an Empty Idea?

The deep and persistent disputes over what counts as justice have generated skepticism about the philosophical significance of the agreement that justice counts. Value relativism, which applies to values in general, including justice, is a part of this skepticism but not the whole of it. The distinctive skepticism that is evoked toward justice by the aforementioned asymmetry of its widely acknowledged importance and deeply disputed content is the suspicion that justice is an *empty* concept. Those who harbor this suspicion hold that the endless controversy about the nature of justice exists not because it is an unfathomably profound idea but because it is an empty magical formula that we can fill with whatever content we may think useful for rationalizing our claims to what we want and dismissing the competing claims made by others. Hans Kelsen, a representative positivist legal philosopher in the 20th century, is a notable example of such critics of justice.

To dispel this suspicion, attempts have been made to identify the common conceptual core of justice. The starting point is the distinction between *the concept* of justice and *conceptions* of justice. The concept of justice represents the *meaning* of *justice*, or what we mean by saying about something that "it is just." Conceptions of justice specify the *criteria* by which we can judge whether and when the adjective *just* is applicable to something. Each conception constructs a theory to defend its own distinctive criterion (or set of criteria) against other competing conceptions, which expound different criteria (or different sets of criteria). For example, utilitarianism and individual-rights theories are two competing groups of conceptions of justice, each with its own competing varieties, such as direct and indirect utilitarianism and libertarian- and egalitarian-rights theories, respectively. The chief purpose of this distinction is to stress the point that there can be genuine conflicts between competing conceptions of justice *because* and *only if* they present different (sets of) criteria for the *same* concept of justice. If they were expounding different (sets of) criteria for *different* concepts, they could not be conflicting but only at cross-purposes with each other.

This point can be supported by the general semantic thesis that criterial conflicts about a word are possible only if the same meaning is attributed to it as well as by the hermeneutical thesis that interpretive conflicts are possible only if the same concept is interpreted in different ways. Whether the semantic and hermeneutic theses are generally applicable or not, however, the aforementioned point is hard to deny as far as justice is concerned. For example, there is a genuine conflict between *talio*, the ancient conception of retributive justice that stipulates "an eye for an eye," and the modern utilitarian conception of corrective justice, which approves of less (or more) harmful punishments than the harms inflicted on victims by wrongdoers if such punishments are sufficient (or necessary) to bring about the optimum deterrence effect, which is calculated taking punishment costs into consideration. But suppose that while an advocate of *lex talionis* and a utilitarian were having a debate with each other, a devout Christian moralist said to both of them, "If someone slaps you on the cheek, turn your other cheek to him." Has the Christian joined in the debate, adding a new view on the issue in question? Certainly she has not. Rather, she has changed the subject matter. Her standpoint is at cross-purposes with those of the *talio*-retributivist and the utilitarian. This is because her criterion for the appropriate response to the other person's wrongdoing is one not for the concept of *justice* but for a different concept, *love*. What she has propounded is a Christian conception of love, not a conception of justice that competes with the other two. By changing the subject matter to love, she has gone beyond the conceptual space of justice. There is a genuine conflict between *talio*-retributivism and utilitarianism just because they belong to the same conceptual space of justice. This shows that justice has a conceptual core that delineates the range of competing conceptions of justice and makes their rivalry possible.

It is one thing to show that there must be some conceptual content that the conflicting conceptions of justice have in common. It is quite another to be able to tell what it is. How is it possible to identify the normative content of the concept of justice that underlies the conflicting conceptions of justice as their common matrix? There are two methodological approaches to this problem, each resulting in a distinctive view on the common normative content of the concept of justice. They may be called the inductive and negative approaches. The following two sections provide an overview and comparison of the two approaches.

The Inductive Approach: Justice as the Demand for Regularization

A paradigmatic form of the inductive approach can be found in the work of Chaim Perelman, a Belgian legal philosopher noted for his theory of rhetoric, who pioneered the development of philosophical awareness of the distinction between the concept and conceptions of justice in his article "*De la Justice*," published in 1945.

According to this approach, the first step is to collect, as data for theory building, a variety of specific formulas of justice that were set forth by different political ideologies. Among them are "To each according to his merits," "To each according to his works," "To each according to his needs," "To each according to his rank," "To each according to his entitlements," and so on. The second step is to abstract (or "induce") the common formal structure from them. All the specific justice formulas share the form: To (or from) each according to *x*. Different conceptions of justice expressed in different justice formulas substitute different values for the variable *x*, which specify what type of attributes or situations of agents are relevant to the distribution of benefits and assignment of burdens and responsibilities to them. The constant part of the common form, especially "according to," symbolizes the common concept of justice, which Perelman calls *the formal idea of justice*. It requires us to treat all agents not in an ad hoc way but in such a rule-governed way that the same treatment should be given to all agents if their attributes or situations belong to the same relevant type. The demand for regularization (treatment according to type features) is the core of the common concept of justice that the inductive approach identifies with the formal idea of justice, presented as its classic formulation, "Treat like cases alike," called the Justinian principle because of its roots in the Code (*Corpus Juris Civilis*) issued by the Roman emperor Justinian.

The formal idea of justice in the above sense is not Perelman's invention but a logical reconstruction of a widely shared understanding of the Justinian principle as a formulation of the common concept of justice. It seems to be free from the controversy that pervades competing conceptions of justice, but this is because it does not give us any substantive guide for judging what norms are relevant to questions of justice. Consequently, positivist philosophers such as Hans Kelsen and Alf Ross criticized it as an empty formula that hides its emptiness. This criticism is not wholly fair. The formal idea of justice implies an important constraint on politics: Political power must be exercised in a rule-governed way that assures its subjects of its predictability. This constraint can hardly be rejected as trivial because without it, people would be unable to seek security by adjusting their conduct on the basis of prudential calculation of the interference of political power in their lives. The importance of the rule-governed exercise of power is fully appreciated and emphasized by Lon Fuller in his conception of the rule of law as *the internal morality of law*, which he derived from his concept of law as the enterprise of subjecting human conduct to the governance of rules.

Although there is some basis for regarding the formal idea of justice as empty, it nevertheless has some element of truth. The formal idea of justice as a demand for regularization is too thin to capture the normative aspirations underlying the concept of justice. It does not provide a guide for distinguishing between the permissible and nonpermissible kinds of discrimination to which justice cannot be indifferent.

The Negative Approach: Justice as the Demand for Universalization

The negative approach looks to our intuition about what is unjust for a key to answering the question "What is justice?" In his *Nicomachean Ethics*, for example, Aristotle recommended that if we want to understand what justice is, we should begin with the analysis of *un*just people. This approach has had a persistent hold over many later thinkers who do not necessarily share Aristotle's answer to the question of what is justice. At least three reasons underlie the appeal of Aristotle's recommendation.

First, our sense of justice is more strongly aroused and more sharply focused when we react against the actual injustices that we experience than when we think abstractly about what justice is. We express our deep-felt sense of (in)justice when we exclaim, "That's not fair!" Even a relativist philosopher who cynically asserts that there is no right answer to the question of what justice is would vehemently object to an injustice done to him (e.g., another author's plagiarism of his work), thereby betraying the presence of a sense of justice. Our sense of justice is basically revealed and exercised as our sense of injustice. Second, injustices invite our indignation not only when they are done to us or our family and friends but also when we see them inflicted on perfect strangers. Although the discourse on justice can be manipulated to rationalize our self-interest, our sense of injustice seems to be propelled more by our sense of fairness to others than by self-interested motivation. Third, and most important in the present context, there are examples of injustices such as killing and torturing innocent people that are commonly condemned as unjust by those who hold competing conceptions of justice. Our judgments seem to be more convergent when we react against injustices than when we try to define what is just.

If the negative approach is to be taken to the task of identifying the common concept of justice, the question to be asked is this: What is the common feature of the conduct that competing conceptions of justice concur in rejecting as unjust? The natural answer would be that it is egoism. No conception of justice can defend egoism *as such*. To be sure, there may be a conception of justice based on Bernard Mandeville's doctrine of "private vices" as "public virtues," which approves of egoism on the ground that it brings about the consequence that serves public interest. Likewise, utilitarians take the self-interested motives of individuals into account when they judge which institutional design would bring about the maximum utility. But even these conceptions of justice exclude egoism from their evaluative grounds and rely on some conception of public interest. Actually, utilitarianism does not hesitate to require severe self-sacrifice from individuals if such a measure is necessary to maximize the aggregate utility of the whole society.

It must be noted with haste here, however, that egoism in the sense relevant to this context is not simply the pursuit of self-interest; justice may well be said to constitute fair rules of the game among agents seeking their own interests. The egoism that justice excludes is rather the lack of disinterested impartial treatment of the other agents—that is, my self-centered discrimination against the other person, which is ultimately reduced to my claim that my interests outweigh the other's interests because my interests are *mine* while the other person's interests are not. This means that the core of the concept of justice revealed by our shared sense of injustice is the prohibition of *nonuniversalizable* discrimination against others, which ultimately depends only on the difference in individual identity between *me* and the other person. In other words, our sense of injustice is rooted in the notion that if one is treated differently from someone else, there must be a morally relevant reason for the difference.

The Justinian principle that like cases should be treated alike, presented above as a classic formulation of justice as the demand for regularization, can also be interpreted as the demand for universalization. But it is necessary to emphasize here that demands for regularization and universalization are *not* equivalent. The demand for universalization is normatively *stronger* than the demand for regularization because it rejects as unjust those rules of type-differentiated treatment that are not justifiable in universalizable terms.

For example, the practices that involve *free riding, vested interests*, and *collective egoism* are rejected as unjust even if they can be set up to be following some rules for type differentiation. This is because they privilege some particular agent and discriminate against the others in a nonuniversalizable way. Free riding is unjust in that a free rider refuses to share with others the cost of maintaining a public resource benefiting all of them, simply because it is *he*, not the others, who is thereby advantaged. Vested interests are seen as unjust because they, too, privilege a particular agent and discriminate against others simply on the basis of one agent's personal stake in a given case. Collective egoism gives precedence to the collective interest over individual interests and thus seeks pseudo-public interests, but it is unjust because collective egoists seek their own special group interests at the expense of the wider society, even when there is no difference between their situations and those of the outsiders except for the fact that the advantaged group is *theirs* while the disadvantaged ones are not.

The universalization criterion allows us to judge social discrimination based on general classifications such as race and gender to be unjust even when they are just according to the regularization criterion. This is so because what universalization requires is not only that the discriminative practices should follow some general patterns but also that they should be justified on universalizable grounds. Claims that are unjust according to the universalizable criterion are often based on incorrect empirical assumptions. For example, a manager may discriminate against female employees in promotions, believing that women are too easily swayed by emotion to be effective managers. Justifications for discrimination may also be based on circular assumptions, for example, about the kind of behavior to be preferred.

Since the demand for universalization offers a fundamental normative test for eliminating the privileges and discriminations that any conception of justice is bound to reject as unjust, it is a more appropriate representation of the common concept of justice than the demand for regularization, which is too formal to provide such a test. This point can be supported by the fact that many philosophers and thinkers have shown their appreciation of the basic importance of the demand for universalization, though they have given different theoretical expressions and scopes to this demand. There are important conceptions of justice that do not focus on universalization; for example, utilitarians suggest that justice ultimately consists in maximizing aggregate welfare, while libertarians focus on the importance of limiting state authority and maximizing the individual's freedom from coercion and governmental intervention. However, universalization seems to have a central role in our common understanding of what is fair and unfair, just and unjust. The remainder of this entry examines some notable examples of the analysis of the concept of justice in terms of universalization and then explores the implication of these theories for public morality and political legitimacy.

Philosophical Expressions of the Demand for Universalization

The General Will in Rousseau

In the history of political thought, Jean-Jacques Rousseau's doctrine of the *general will*, advocated in his treatise on the social contract, is a precursor of the development of the concept of justice as the demand for universalization. He distinguishes the general will not only from the particular will but also from the will of all. This is intelligible only if attention is focused on his view that the general will is general with reference to its *object*. By this, he means that the general will can pursue not *particular* interests but only *common* interests. Even the will of all is a particular will if it is a unanimous decision that all parties accept not as a result of deliberation about the common interest of the whole society but simply out of consideration for their own particular interests. But how can we distinguish the pursuit of the common interest from that of particular interests? Rousseau gave a revealing answer to this question by identifying a test to make this distinction. According to him, our will can be said to be the general will in the pursuit of the common interest only if it meets the following requirement: "Each necessarily subjects himself to the conditions that he imposes on the others." He holds that this requirement brings about what he calls "an admirable accord of justice and interest that gives a character of equity to common deliberations" (*The Social Contract*, Book 2, chap. 4). This means that we can pursue our interests in accordance with justice only if we do not exempt ourselves from the burdens and costs that we require the others to bear in the same situations that we are placed in. Here, Rousseau showed an insight into the conceptual core of justice as the prohibition of nonuniversalizable discrimination against others.

The Categorical Imperative in Kant

Immanuel Kant restated Rousseau's test of justice for the general will with some of his well-known multiple formulations of the categorical imperative, which he set as the second-order requirement that our first-order practical judgments must meet if they are to be moral judgments. This can be clearly seen in his first formulation of the categorical imperative: "Act only according to that maxim by which you can at the same time will that it should become a universal law."

What Kant meant by this is the following: You cannot exempt yourself from the universal laws that are applicable to everyone. Likewise, you cannot exempt yourself from the same duties that your maxims impose on others if they are to have the status of moral judgments that transcend prudential and technical norms (hypothetical imperatives) that merely show the means to advance your self-interest. Here, Kant gave an emphatic and solemn (though somewhat abstruse) expression to the demand for universalization that Rousseau presented in plain and casual language in his doctrine of the general will.

It may be said, however, that Kant differs from Rousseau not only stylistically but also substantially. While Rousseau presented the demand for universalization as the demand of justice, Kant made it the fundamental criterion for moral action more generally, arguing that only when people act on the basis of laws that they can rationally will as universal laws are their actions morally right. If Kant's concept of morality is a broader and more generic one than the concept of justice as a distinctive value of political morality, this difference is certainly nonnegligible. But in fact, Kant elaborates the categorical imperative in a way that enables it to be a foundation of political morality, through his concept of the kingdom of ends. Kant holds that human beings belong to what he calls a kingdom of ends—that is, an idealized association of autonomous and rational agents who treat each other not merely as the means to their specific ends but as "the ends themselves" under the common law, which makes their exercise of rational autonomy compatible. So it is not impossible to interpret the Kantian concept of morality to be coextensive with justice as the underlying regulative principle for the public morality of political society.

It is useful here to distinguish contexts where justice is central from those in which it is out of place to demand universalization in nonpolitical, purely personal relationships such as love. In such relationships, we are not only allowed but are even required to make nonuniversalizable discriminations. To say, "I love you because you happen to meet better than anyone else the right kind of qualification that anyone must meet to deserve my love" is tantamount to saying, "I would love another person if he met that qualification better than you." This attitude may be "fair," but it would surely destroy love. What a genuine lover is supposed to say is "I love you because you are *you*, not the others." Love requires existential commitment to the loved individual, which involves nonuniversalizable discrimination against the others. The demand for universalization is appropriate only for the aspect of our life that justice is expected to govern, namely, our political relationships, in which we exercise power (governmental power and politically authorized private power, such as rights, sheer violence, etc.) over others and are required to justify our exercise of power to the others who are affected by it. Rousseau is right in applying the demand for universalization to the political order that justice inherent in the general will is to govern.

The Veil of Ignorance in Rawls

In his theory of justice as fairness, Rawls (2001, pp. 42–43) attempts to define a just distribution of benefits and burdens within a state by identifying the principles that would be chosen by a rational, self-interested person who has no knowledge of her personal situation. He argues that a such a person in this hypothetical decision-making situation would choose a society in which social and economic inequalities satisfy two conditions: First, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity and, second, they are to be to the greatest benefit of the least advantaged members of society (the difference principle).

To understand the role of the universalization demand in Rawls's theory correctly, care must be taken not to be misled by his terminology. In his theory, the demand for universalization as distinguished from regularization is implanted in the "veil of ignorance," which Rawls stipulated as the most crucial one of the conditions constitutive of "the original position," which is his contractarian model of the counterfactual setting for choosing the principles of justice to be applied to the basic structure of political society.

In the original position, all parties to the contractarian choice are indifferent to each other's interests and seek to advance their own interests. But their choice is constrained by the condition of the veil of ignorance, under which they are deprived of all information about themselves that would enable them to know their special situations. They do not know whether they are talented or disabled, whether they are rich or poor, to what race or ethnicity they belong, what their religious backgrounds and attitudes to religions are, what gender and what sexual orientation they have, and so on. This constraint has two implications. First, all parties can seek to optimize only their share of primary goods that are absolutely necessary for pursuing whatever conception of the good life they have. They cannot seek the special goods that they would have wanted if they had known the special facts about themselves that the veil of ignorance hides from them. Second, since they do not know what circumstances they will find themselves in once the veil of ignorance is lifted, they cannot help choosing the principles of justice that they could accept irrespective of whatever lot might fall on them—that is, the principles that all can accept as fair irrespective of their different payoffs.

The veil of ignorance is a device for inducing self-interested individuals to choose a principle (or a set of principles) of justice that treats others as fairly as themselves. Although Rawls characterized his theory as an attempt to apply Kantian constructivism to political morality, his use of the veil of ignorance reflects a strong influence of Rousseau, who, as noted earlier, tried to bring about "an admirable accord of justice and interest" by imposing on the citizenry as the sovereign political ruler the requirement of the general will: "Each necessarily subjects himself to the conditions that he imposes on the others." The veil of ignorance can generate a similar accord between justice and the self-interested choice of the parties in the original position by virtue of the demand for universalization that it represents just as Rousseau's test for the general will does.

The aim of the veil of ignorance is to disable every party in the original position from choosing a principle in consideration of the fact that the chosen principle is in *her* favor because of *her* special situation. To achieve this aim, it is not necessary to deprive the parties of special information as such—namely, the special facts about the individual members of the political society to which the chosen principle is to be applied. All that is necessary is to deprive every party of the knowledge of the identity of the individuals in question—namely, the knowledge of which individual *she* is. Separated from the information about the individual identity, special information does not spoil the aforementioned aim of the veil of ignorance. Moreover, it may be the case that full special information about the distinctive urgent needs and particular vulnerabilities of the individual members of a political society is needed to elaborate the adequate-priority rule for the rights assigned to them by the principles of justice applied to that society. Whether the latter point can hold true or not, it can be said that the normative essence of the veil of ignorance can be revealed most correctly if it is reformulated as the demand for universalization, which prohibits us from favoring ourselves and discriminating against others on the basis of differences between us and the others in terms of the individual identity.

Further Demands of Justice: Reversibility and Public Reasons

The normative force of the requirement that the concept of justice be rooted in universalization can be more fully appreciated if light is thrown on its deeper implication: the demand for *reversibility*. Prohibition of nonuniversalizable discrimination implies that if my claim against another agent is to be just, I must recognize that the agent could justly make the same claim against me *if he were I* and *if I were he*. Otherwise I would discriminate against him because *he* is not *I*, that is, because he and I are different simply in individual identity. The claims about justice must be such that they would be acceptable even if the claimer and the claim addressee were reversed. This is the demand for reversibility. It applies not only to the claim itself but also to the reasons for the claim that the claimer advances to the claim addressee. The claims about justice must be justifiable for reasons that would be acceptable even if the roles of claimer and claim addressee were reversed. The aforementioned typical examples of injustice (free riding, vested interests, and collective egoism) are unjust because those who enjoy advantages in these examples all fail to pass the test of reversibility in some way or other.

The demand for reversibility is not a novel idea at all. It finds its classical expression in the Christian Golden Rule: "Do to others as you would be done by." The same idea is expressed by the Confucian maxim "Do not do to others what you would not like to be done to yourself." But the reversibility demand requires further refinement to forestall its distortion. Here, we can use it to examine a reductio ad absurdum argument that may be made against it. The argument goes as follows. Suppose, for example, that you are a masochist. The reversibility demand would require you to abuse others because that is what you would like to be done to yourself. This conclusion is absurd. Therefore, the reversibility demand must be rejected.

The fundamental problem with this argument is that it misinterprets the reversibility demand as the requirement that we should reverse only our circumstantial *positions* while keeping our *perspectives* unreversed. In the above example, you are supposed to reverse positions with others while carrying your masochist perspective with you into their positions. But the counterfactual conditional "if you *were* they" involved in the reversibility demand presupposes that they *are not* you. And the fact that they are not you implies that their perspectives are not necessarily the same as yours. To replace their distinct perspectives with your own is to give a privileged moral status to your perspective simply because it is *yours*. It runs counter to the prohibition of nonuniversalizable discrimination that underlies the demand for reversibility. In the moral thought-experiment of reversibility, therefore, you have to test not only the *positional reversibility* but also the *perspectival reversibility* of your claims against others. You have to ask whether your claim against others would be acceptable even if your perspective as well as your position were reversed with theirs. If you as a masochist conducted this moral experiment on yourself, you would not accept as just the abuse of other, nonmasochist persons. The reductio ad absurdum argument refutes not the reversibility demand itself but the misinterpretation of it as a mere positional reversibility demand.

The reversibility demand has a further important implication: the demand for *public reasons*. As discussed above, the reversibility test applies not only to our claims against others but also to the reasons that we give to justify our claims to them. Since the test requires perspectival reversibility, we have to justify our claims to our claim addressees with perspectivally reversible reasons—reasons that we could accept even if our perspectives were reversed with theirs. Such reasons can be called *public reasons* because they are reasons that would be acceptable not only from our own perspective but also from the different perspectives of others, thereby being distinguishable from *private reasons*, which are unacceptable or even unintelligible to those who do not share our idiosyncratic perspective. It may be objected that the perspectival reversibility test cannot screen public reasons because it requires that we should abandon our private reasons only to yield to the private reasons of other agents to whom we are required to justify our claims. This objection fails to hold because the other agents are also required to conduct the test of perspectival reversibility on their counterclaims. The public reasons required by the perspectival reversibility test, to put it more precisely, are the reasons for our claims against others that would be acceptable even from their perspectives *provided* they seek and subject themselves to the reasons that would be acceptable even if their perspectives were reversed with ours.

A philosophically thornier objection against the demand for perspectival reversibility and public reasons is this. It is impossible for you to know the perspectives of others. When you imagine that you are adopting their perspectives, you are simply projecting your perspectives onto theirs. This objection can be a sobering warning against our tendency to make hasty, prejudiced, and self-deceptive presumptions about what others think and how they feel, but it is a half-truth whose negative implication should not be exaggerated. It is true that "other minds" are not transparent to me and that my perceptions about the thoughts and feelings of others are *mine*, not *theirs*. But it does not follow that it makes no moral difference for me to make an honest endeavor toward understanding and paying due attention to their perspectives. Certainly, the self-regarding perspective, from which I care only about myself, and the other-regarding perspective, from which I care about the perspectives of others as well as mine, are both *my* perspectives, but there is a big difference between these two perspectives in terms of their moral quality. Even if I cannot go beyond my perspective, I can bring about moral transformation of my perspective from within through the process of self-critical reflection to which I subject myself in the dialogue with others who challenge me about the justice of my claims.

This point was intimated by Rousseau in his distinction between the particular and the general will. If this distinction is to be intelligible, it must be interpreted to be concerned more with the moral status of the *object* of the will (to what purpose?) than with the *subject* of the will (whose will?) as was seen above. The particular and the general will are, in this interpretation, not the wills of ontologically differentiated agents (e.g., the individual and the collective agent, the parts and the whole of society) but the two morally differentiated perspectives immanent and latent in each individual's will. What Rousseau called "common deliberation" is expected to bring about the moral transformation of the perspective of each individual from the particular to the general will.

The problem of the cognitive opacity of others in morality was more consciously and explicitly addressed and solved by Adam Smith in his classic work *The Theory of Moral Sentiments*. Although the principle of sympathy constitutes a foundation for his moral theory, from the beginning of this work, Smith conceded with a surprising candidness that since "we have no immediate experience of what other men feel," the sympathy we expect from others can be nothing more than the product of our imagination about "what we ourselves should feel in the like situation" (Pt. 1, sec. 1, chap. 1). Paradoxically enough, this concession did not prevent him from developing a moral theory in which the crucial test of the justice of our conduct is whether our conduct would be able to gain the sympathy of spectators. The paradox is dissolved when it is seen that he idealized the spectator as *impartial* and internalized him in our perspectives. While Smith regarded the sympathy of others as the product of our imagination, he distinguished this imagination of ours from our raw feelings and instinctive desires. Our imagination detaches us from such feelings and desires and generates the normative perspective of impartiality within us by subjecting us to critical self-examination. This is why he referred to the impartial spectator as "the imagined man within." Although Smith was keenly aware that we cannot transcend ourselves to have an immediate experience of the perspectives of others, he realized that by exercising our imagination to care about their perspective, we can transform our perspective *from within* so that it will grow from the sheer self-centered one in the pre-imaginative stage into something morally higher that is open to the sense of impartiality and fairness to other persons.

Justice and Legitimacy

Our moral imagination can transform our motivation so as to seek public reasons acceptable to others whose perspectives are different from ours. But it does not follow that we can reach a consensus about which public reason should prevail. Even if our moral imagination is fostered through our common deliberation, there is no guarantee that our judgments about public reasons will converge. Actually, part of the condition of human life is the existence of persistent disagreements among those who sincerely seek the public reasons required by justice. This is not surprising. Judgments about public reasons are guided by different competing conceptions of justice, and the universalizability demand, which entails the demand for public reasons, imposes only negative constraints on admissible conceptions of justice without uniquely specifying which is the best conception. Furthermore, the more sincere our commitment to public reasons is, the more difficult it is for us to make nonprincipled strategic compromises.

Rousseau did not have to worry very much about the disagreement that remains even after all individuals have adopted the perspective of the general will. This is because the polity he had in mind was a small-scale, face-to-face homogeneous community where there is a solid consensus among the citizens, even though his favorite Greek polis, *Lacedaemon* (Sparta), may not be appropriate as a historical model of such a polity given the fact that it was not immune from internal strife. Whether Rousseau's ideal polity is sustainable or not, however, the divergence of public reasons raises a serious problem in contemporary large-scale pluralist societies. Contemporary advocates of deliberative democracy tend to make light of this problem because they are generally optimistic about the possibility of reaching a rational consensus through common deliberation. There is no ground for this optimism, however. There is every reason to think that free, rational, and mutually critical discussions will bring about a proliferation of divergent views rather than their convergence. Rawls located the common basis of public reason in the idea of an "overlapping consensus" on constitutional essentials and basic matters of justice among competing reasonable, "comprehensive doctrines" after he converted to political liberalism as distinguished from philosophical (or comprehensive) liberalism, but his attempt failed to attain his aim because he simply rejected the dissenting comprehensive doctrines as unreasonable by resorting to his own very controversial philosophical standpoint about what counts as reasonable.

The nature of this problem is well captured by Jeremy Waldron in his explication of what he calls *the circumstances of politics*, which have the following two features. First, the circumstances of politics are contrasted to what Rawls calls the subjective circumstances of justice, where our conceptions of the good life are so divergent that they must meet the condition of what he calls *the primacy of justice over the good*, which is the requirement that conceptions of justice, if they are to be the common principle of the basic structure of our political society, should be justifiable independently of any specific conception of the good life and should constrain the latter. In the circumstances of politics, there is a deeper conflict: Not only our conceptions of the good life but also our conceptions of justice are divided so that the primacy of justice over the good is not enough to sift out the common political principle that can govern the basic structure of our society.

Second, whereas it is possible to give a "let's agree to disagree" solution to the problem of the conflict in the conceptions of the good life by endowing individuals with the right to choose their conception of the good life autonomously, it is impossible to apply this solution to the conflict in the circumstances of politics. Since the conflicting conceptions of justice are competing to get control of the political order of the same society, conflict resolution in this case can be brought about only by a collective decision of the political society (hereafter referred to as political decision for short) that binds not only the supporters of its content but also the dissenters who object to it. As an example, although we can let each individual choose freely her religion according to her own conception of the good life, we cannot let each individual choose the tax system according to her own conception of distributive justice. We have to make a political decision about whether our tax system should be shaped along the utilitarian aggregate-welfare-maximization line, the libertarian primacy-of-property line, the Rawlsian difference-principle line, or the lines of some other conceptions of distributive justice, not despite but because of the absence of agreement on the matter.

The circumstances of politics as presented above raise the problem of legitimacy: How is it possible for us to respect as legitimately binding on us the political decision that we hold to be wrong according to our conceptions of justice? The problem of legitimacy so stated may appear to imply that the idea of justice is totally irrelevant to it. But this is not the case. Although we cannot resort to any specific conception of justice as a criterion of legitimacy, the common concept of justice as the universalization demand can offer a guide for solving the problem of legitimacy. Because legitimacy is concerned with the fact that we have to respect whichever conception of justice we may consider the best, it can be illuminated by the concept of justice as the common normative constraint on competing conceptions of justice. The following two points are especially important in this connection.

First, the way democracy can give legitimacy to a political decision can be reconceived in light of the concept of justice. In his answer to the question of legitimacy, Waldron rejected constitutional constraints on democracy, such as judicial review, in favor of simple majoritarian democracy. This position is difficult to sustain. Democratic decisions can have legitimacy only when the *losers* (especially marginal minorities who cannot hope to be winners) in the political strife of the democratic process can respect the resultant decisions as the public decisions of their own political society instead of regarding them as mere products of the majority's private will, to which the minority acquiesces simply out of prudential considerations. This would be impossible unless losers are given some institutional guarantee against the danger of the winning majority's refusal to subject themselves to the test of reversibility, which requires them to examine sincerely whether the decisions that they succeeded in imposing on the losers could be justifiable *had they themselves been the losers*. Such an institutional guarantee can and should be embodied in constitutional arrangements for facilitating power change so as to secure actual reversibility of the positions of political winners and losers, compensating for the handicap of marginal minorities in their political resources for effective democratic participation, preventing the government from denying equal rights to politically powerless victims of social discrimination, and so on. This is the real significance of the distinction between the role and the holder of the role and the normative background of the political institutions.

Second, a further ground for legitimacy can be explained by reconstructing the fair-play argument for political obligation in the light of the concept of justice. By claiming that your conception of justice should be incorporated in the political decision binding on others who have competing conceptions of justice, you also claim that they should bear the *moral cost* of compromising their own conceptions of justice to sustain the political system of collective decision making. Therefore, you should bear the same moral cost when their conceptions, not yours, succeed in being incorporated in the political decision. You should acknowledge the legitimacy of the political decision that you hold wrong in the light of your conception of justice, thereby accepting the political obligation to defer to it. Otherwise, you would be a moral free rider who violates the demand for reversibility inherent in the concept of justice.

K

Kant, Immanuel (1724–1804)

Immanuel Kant (born in Eastern Prussia, now Kaliningrad) is one of the leading philosophers of the Enlightenment and has had a lasting impact on modern philosophy. His major works include *Kritik der reinen Vernunft* (*Critique of Pure Reason*), first published in 1781, an attack on traditional metaphysics and epistemology; *Kritik der praktischen Vernunft* (*Critique of Practical Reason*), 1788, concerned with the philosophical foundations of ethics; and *Kritik der Urteilskraft* (*Critique of Judgment*), 1790, dealing with aesthetics and teleology. This entry discusses his "political philosophy," even though none of his works has appeared under this title. His major work on political ethics and the international order is *Zum Ewigen Frieden* (*Perpetual Peace*), 1795.

Kant breaks with the Aristotelian tradition of political philosophy (*Politiká*), including his "political economy" ("Aristotle," I 8–13) and deals with these subjects only under the perspective of Roman law and natural law, which he forms into a law of reason. Whereas for Aristotle politics means the realization of human beings as political beings ("zoon politikón") and is oriented toward the nature ("phýsis") of men, for Kant politics is always related to a system of law endowed with the power of physical force. Politicians and political acts are judged according to norms in the legal system. Politics is judged positively when it conforms as an executive power ("ausuebende Rechtslehre," VIII 370) to the standards of law. The goal of political acts in "status civilis" is the realization of the ultimate political good, stable peace (VI 355, VIII 386). Peace only can be attained in a cosmopolitan order. With this idea, which is still very relevant today, Kant follows, on the one hand, stoicism, a Hellenistic school of philosophy, and, on the other, reflections on the French Revolution, leading to his conclusion that only republics with separation of powers are peaceful (VIII 341–386).

Political acts can be judged according to the criterion of "publicness" (VIII 381–386). The duty that a politician performs can, but need not, be of an ethical nature; it is founded on the special legal duty to lead an honest life (*honeste vive*) that all human beings have (VI 236). There is no external sanction, as with other legal duties, nor is there necessarily an internal motivation to act according to this duty. Even those who become politicians out of sheer vanity can (and should) fulfill these duties. Similarly, peace is a result of the ethical virtues of citizens. For this reason, the promotion of an appropriate infrastructure and education on which men are dependent to become ethical human beings is a part of politics. Therefore, politics must ensure that citizens receive the education they need to become ethical human beings and must create the infrastructure needed to support it.

The actions of politicians are judged negatively if they are not oriented toward the law but are based on interests of power and an alleged knowledge of human nature (VIII 374). Implicitly, Kant thus turns against Aristotle's concept of politics, which presupposes knowledge of human nature. Kant, like John Locke before him, denies the possibility of knowing human nature empirically. In his critical philosophy, neither an empirical nor a "rational" knowledge of human nature derived from "pure" reason can serve as a foundation of norms for political action and ethics, and the rule of law cannot be justified anthropologically. Only when both are perceived from pure reason can this knowledge be applied to human beings.

Kant's image of politicians in a pejorative sense has been influenced by Niccolò Machiavelli's *Principe* (1513):

> Our politicians act, as far as they can, like [the Jewish prophets] and are as skilful in their prophecies. We must, they say, take human beings as they are, and not as some ignorant pedants or well-meaning phantasts dream what they should be. *As they are* then means: to what we have made them through unjust force and treacherous acts of the government, namely stubborn and rebellious. Then, of course, when the tight reins are loosened, sad things happen which fulfil the prophecies of these "wise statesmen." (VII 80)

A politician who is not guided by law but by his alleged knowledge of human nature is incapable of realizing in certain phenomena, for example, the French Revolution, the signs of reason and a better future and to act accordingly. In *Perpetual Peace*, Kant calls the Machiavellist a "political moralist" and a person conscious of the law a "moral politician" (VIII 377).

So far, the definition of politics and law seems to be possible without any problem. This becomes more difficult when two specificities of the Kantian theory of law and philosophy of history are taken into account: In his theory of law (first part of *Die Metaphysik der Sitten* [*The Metaphysics of Morals*], 1797), the state does not implement the law of reason in its pure form, as demonstrated in the two sections on private law, but the state practices a version modified for its purposes. In the third section (VI 296ff.), it is shown that the perceptions of "law in itself" have to be restricted to be at all realized by a state. This is demonstrated by the example of some court decisions that deviate from the "law in itself" so that the court and, therefore, the state can come to quick and solid decisions. This applies, for example, to the respect of property rights when products have been purchased in the market according to legal norms (VI 300–303), even if they are stolen items or (not mentioned by Kant) products from a slave plantation. The state also can apply "tortura spiritualis," confessions under oath, even if this contradicts the "law in itself" (VI 303–305). Strictly speaking, politics here commits an injustice, because of the constraints of the state that lead to a restriction of the "law in itself" in its implementation. In the interpretation of Kantian legal and political philosophy, this antinomy has not sufficiently been taken into account so far.

In the philosophy of history, another peculiarity can be noted. Whereas political economy in the sense in which Aristotle used it takes the same nature, the *phýsis*, of men as the guiding principle (*Politiká I*), for Kant a negative anthropology is the real source of political and economic prosperity. Ethics and politics do not coincide, as already diagnosed by Bernard de Mandeville in his *The Fable of the Bees: Or, Private Vices, Public Benefits*. There, the result was that if politicians really take moral laws seriously, they would regress economically and would have to retreat from modernity into the woods!

Kant follows Mandeville and describes both in his philosophy of history and in his anthropology the moving forces of the common good as the unfettered instincts of greed, vanity, and power (VIII 21, VII 271). This triad is already a firm constellation for Thomas Hobbes (*Leviathan* I, II: "Riches, Honour, Command"), and not by chance, because these are the moral vices that are opposed to the first three cardinal virtues in Plato's *Politeia*. The "modestia" of peasants is opposed by their greed, the "fortitudo" of soldiers by their ambition for honor, and the "prudentia" of kings by their lust for power. Whereas in antiquity and the Middle Ages the naturally good *polis* or city was founded on the virtues (including the fourth one, justice) and the evil city ("città cattiva") was subjected to the opposite vices, in modern times this judgment is turned around: The vices are now the necessary forces that maintain and foster the state economically and politically. This corresponds also to the view of Giambattista Vico, who considers it inevitable that a well-functioning society is based on "ferocia, avarizià, ambizione," the "tre vizi" that have accompanied mankind since its eviction from paradise (*La scienza nuova*, second edition, II 7). Kant's diagnosis of historical and political reality is the same. What about this dilemma in Kant's view of current politics? Must a politician for moral reasons introduce and maintain laws that will ruin the state, or does he or she have to tolerate vices or even promote them because of the "raison d'état"? This is, of course, a very topical question even in the present day. Kant himself has not addressed this dilemma. His solution may be as follows: A moral politician in a liberal society with an efficient economy in the sense of Adam Smith (*The Wealth of Nations*) would not interfere with the internal motives of actors and ban vices as long as the external frame of law is maintained. The rules of the law of reason restrict greedy, vain, and power-seeking actors but enable them to secure their profits. That private profits will lead to welfare for all lies not only for Adam Smith but also for Kant in the nature of things ("the invisible hand"). "As an old merchant said: create good roads, mint good money, exchange currencies quickly, etc. but apart from that 'let us do!'" (VII 19–20). This "laissez-faire, laissez-aller" policy is the solution for Kantian economic policy. Politicians should not intervene in self-regulating trade. Johann Gottlieb Fichte as well as Karl Marx would have stood against this liberal economic policy; Kant closed his eyes to the devastating consequences of a liberated economy in Europe, internal exploitation, and exploitation of the economically weaker countries by the stronger ones in the colonial territories. Kant believed that these problems would resolve themselves in the long run.

Kant does not comment on the day-to-day politics of his time, neither in his publications nor in his notes or letters. The central event of his time is the French Revolution after 1789, which marked the turn from despotism to a republic (not the "Declaration of Independence" in Virginia in 1776) and which was seen by other authors as a parallel event to Kant's own "Copernican Revolution" of breaking with ancient and medieval metaphysics (III 12, 14). For Kant, it is evident that men legally can only pursue reforms, not a forceful revolution, but the French Revolution had demonstrated the feasibility of a republic—this event "will not be forgotten" (VII 88).

Author's note: References to Kant's works refer to the volumes and pagination of the Akademie edition, Berlin, Germany, 1990ff.

L

LABOR MOVEMENT

The concept of *labor movement* refers to the development of workers' organizations driven by collective mobilization. It consequently implies some degree of coexistence between two distinct processes subject to close analysis in political science: (1) interest representation and (2) social mobilization. Descriptions of labor movements that emphasize the former process usually focus on trade unions, these being associations that represent the labor force as well as organizations that play wider economic and political roles. By contrast, descriptions that emphasize the latter process concentrate on the dynamics of social movements and therefore center on the construction of a social identity, the forms assumed by collective mobilization, and its eventual institutionalization.

This entry first outlines the main "classical" theories concerning the labor movement. It then shows how the labor movement has evolved amid constant tension between collective mobilization and institutional forms of labor representation. Next, it discusses how trade unions work to represent workers' interests, as well as acting as partners to employers and the state in collective bargaining and tripartite concertation. A brief conclusion considers the role the labor movement may play in the near future.

In Search of a Theory of the Labor Movement

Labor movements are phenomena both complex and, in a sense, contradictory. They first arose as groups organized to improve conditions in capitalist industry. But they have often pursued the much more ambitious goal of changing society as a whole. Everywhere, they have bred organizations that gradually came to accept the rules applied by the economic and political systems in which they had to operate but still pursued long-term goals that frequently conflicted with those rules. Although these organizations manage industrial and social conflict, the integration of large masses of workers into the economic, social, and political systems of industrial democracies would have been very different in nature—and perhaps impossible—without them.

While contemporary social sciences have conducted detailed analyses of labor movements, more general discussions of them are still largely couched in conceptual terms drawn from theories developed several decades ago that may be termed *classic*. The explanatory capacity of these theories is dubious and erratic, but their continuing interest for social scientists stems from rather different factors. Each of them has been put forward as a general theory but has centered on only one of the different alternatives faced by labor movements across countries and historical periods. Yet it is precisely for this reason that these theories have become important as self-interpretations by different components of the international labor movement, thereby influencing the latter's perception of itself and its goals. Hence, these theories are simultaneously analytical instruments and ideologies.

From this point of view, Marxism—which developed the most powerful theoretical apparatus—also can be seen as the dominant ideology shaping socialist positions within labor movements. Its contribution to the analysis of such movements, however, is still relevant in many respects. First, by framing labor movements in the context of a structurally divided class society, it helps remedy the shortcomings of merely psychological or behavioral explanations of their origins and goals. Second, by explaining industrial conflict in light of a theory of social change, Marxism suggests that analysis should extend beyond the short-term objectives of such conflict and consider the aspirations latent within it to achieve a different social order, which may cyclically orient collective action. Finally, by viewing unionism as one—albeit the most important—of the many different forms assumed historically by labor organization, it allows the latter to be seen in relation to other types of action available to workers rather than as the sole natural expression of their needs and culture.

While the Marxist socialist tradition—in its social-democratic and communist versions alike—has by far outweighed any others in the history of labor movements, a significant role has nevertheless been also played in several countries by the "revolutionary syndicalist" tradition. This tradition's departure from Marxist theories has been evident ever since the early work of its major proponent, Georges Sorel, who envisaged workers' autonomy embodied in trade unions as a "global society" with its own economy, organizational forms, and culture, which contrasted with the decaying bourgeois society. Sorel's theory was based on a view of the social structure as sharply divided into two classes. It was the purpose of the general strike—the key form of action in the revolutionary syndicalist tradition—to expose this dichotomy. Sorel's theory was also based on a simplistic view of political structures and institutions. Nevertheless, like Marxism, in late-19th- and early-20th-century Europe, it expressed the ambition of a rising working class to become the hegemonic class and therefore to go beyond its activity, confined to the labor market, to address more general societal problems.

From this point of view, theories of the labor movement developed in the Anglo-American countries stand in sharp contrast with those described above. Their differences notwithstanding, they have never proposed far-reaching projects for the revolutionary transformation of capitalist society. Their objectives have been more modest, in that they have concerned themselves with the analysis of the actual role performed by the labor movement in the existing society rather than with scenarios for social change. The major theoreticians of British trade unionism, Sidney and Beatrice Webb, developed what can be regarded as a functionalist approach. Trade unions were merely means to achieve specific goals. And they were so in a twofold sense: (1) because their function was defined within the strict limits of workers' defense against the workings of the market and (2) because such activity had to be compatible with the systemic imperatives of firm productivity and economic development. A more general implication was that the labor movement's legitimacy should be assessed not only in terms of its utility to workers but also in terms of its contribution to creating a more democratic though efficient society.

Selig Perlman's view—which can be considered the theoretical basis for North American "business unionism"—differed sharply from that of the Webbs. Perlman maintained that the mentality of workers and militants was dominated by their awareness of the scarcity of jobs. Far from being based on class consciousness, therefore, actual labor movements were based on the consciousness of the competitive nature of the job market. While intellectuals in trade unions sought to give them anticapitalist objectives, the main purpose of workers' self-organization was to claim the collective ownership of available jobs so that they could be shared among the members of the union. Workers were uninterested in the endeavor to reform the capitalist system and in mass political action. Nevertheless, the long history of the labor movement demonstrates that Perlman's theory, too, unduly generalized values dominant in specific periods and countries, besides assuming the existence of a universal "workers' psychology," which, as shown by a large body of research, is instead strictly determined by the specific culture and historical context.

None of the classic theories, therefore, addressed—let alone answered—the crucial question for a theory of the labor movement: Under what conditions are the different components of the working class and their organizations induced to behave as fragmented interest groups or, conversely, as unified collective actors pursuing economic and social goals? Despite decades of comparative work in the social sciences, this question is still largely unanswered. A large amount of evidence has been collected to account for developments in individual countries, but a convincing theory with general explanatory power is still far from being developed.

Collective Mobilization and Its Fate

In several countries, the origin of labor movements was twofold in nature: (1) as a form of solidarity and defense of workers and (2) as a revolt against the capitalist mode of production and society. The former tendency led to the creation of various types of friendly societies, cooperatives, and, later, trade unions. The outcomes of the latter ranged from Luddism to workers' councils, to different forms of political mobilization and organization for the achievement of citizenship rights. Both these tendencies sprang essentially from the exclusion of a young working class from the management of the economy and society in countries undergoing rapid industrialization and development. Both tendencies embodied contradictory aims: workers' rejection of the existing society and their endeavor to build an autonomous culture, on the one hand, and their aspirations to full industrial and political citizenship, on the other.

In the early stages of the Industrial Revolution, the more educated and resourceful skilled workers also acted as a politicized vanguard. They saw socialism as an opportunity to regain control over the means of production, which had been expropriated from craftsmen. However, technological innovations and the rationalization of production soon rendered obsolete the skills that gave those workers their market power. At the same time, because they increased the rigidity of production and interdependency among jobs, they endowed unskilled workers with unprecedented disruptive power. Moreover, just as technology and rationalization broke the monopolistic position of skilled workers and enabled the mass of workers to organize, so too did the peasant origin of the latter rupture the traditional political subcultures with their strong identities and revolutionary projects.

Generalizing and simplifying somewhat, it can be argued that the more a labor movement grows and expands its role in society, the more its ideological tension comes under severe strain. Its main activity becomes collective bargaining, rather than political mobilization or expressive action. Besides enlarging their rank and file, this helps trade unions develop their organizational strength. Problems to do with bureaucratization arise, and more generally, organizational concerns tend to prevail over those typical of a social movement. Partly for this reason and partly because the political recognition of labor movements (first in the West and then in other, developing areas of the world) gives workers full political and social citizenship, the revolutionary impetus has dwindled. The economic action of labor movements is increasingly restricted to negotiation within a framework of shared rules, while political action takes the form of pressure politics or support for prolabor reformist parties.

Of course, what has just been outlined is only a very general pattern that applies to a greater or lesser extent to labor movements in different countries. Today, the main differences among their behaviors are apparent in the diverse structures assumed by collective bargaining or in the relative importance of this form of action compared with political action. To some extent, all labor movements use both instruments. But some of them (e.g., in the United States) by tradition place overwhelming emphasis on the former. Through negotiation with companies, they seek to achieve the joint regulation of labor. Bargaining focuses principally on wages and working conditions, but it may extend to many other aspects of workers' lives—pensions, health insurance, and so on. By contrast, many European and Latin American labor movements have given greater priority to political action. Trade unions have long worked in close alliance with "brother" (socialist or labor) parties to support reformist programs, and they have a direct interest in labor and social legislation. In the post–World War II period, moreover, most of them also engaged, for shorter or longer periods, in concertation with governments to design economic and social policies.

Hence, the evolution of labor movements shows that a revolutionary and globalistic approach may prevail, especially when workers uprooted from their communities and not yet integrated in industrial society are rapidly introduced into modern production. When, conversely, workers are rather well integrated into society, labor movements are less able to provide their members with identity incentives. They are more concerned to seek particularistic advantages than to strive after the ideal of an alternative society. This observation, however, should not be mistaken for an evolutionary theory. Even less should it be taken as the obituary for the labor movement that diverse theorists in different periods have been wont to write. Industrial societies may cyclically reproduce the phenomena described. They continue to generate new groups in the labor market and in society at large that lack adequate representation of their interests and therefore occupy marginal positions in the industrial relations and political systems. Moreover, as new countries set off along the road of rapid economic development, their labor movements are likely to exhibit similar patterns.

Trade Unions as Representative Organizations

In several countries, trade unions became powerful organizations that entirely assimilated the requirements of capitalist systems and their workings but still appealed to a collective identity that often embodied long-term goals in conflict with those systems. Today, trade unions are widely regarded by companies as rent-seeking bodies. Nevertheless, they often perform key productive functions by providing workforce cooperation, participating in income policies, and more generally contributing to the regulation of work.

Research in the social sciences has identified three main dimensions of unionism. The first dimension consists in the role of trade unions as associations representing collective interests. The second comprises the problems and opportunities facing trade unions as organizations. The third dimension concerns their role as economic and political actors.

A trade union is an association of individual members whose functional interests it seeks to represent collectively. The drawback of the collective representation of functional interests is that rank-and-file demands are inevitably altered by the association that expresses them. In fact, any trade union association must first collect and interpret workforce demands, giving voice to what are often vaguely expressed needs or grievances. Second, the requirements of consistency, organizational stability, and recognition prevent even highly representative associations from expressing demands that contrast with their long-term strategy. Third, if a trade union is to gain concrete benefits for its members, it must make such demands negotiable, and for this purpose it must transform expressive behavior into instrumental claims. Finally, to represent interests collectively, it must aggregate individual demands that are normally dispersed and potentially contradictory. It is these factors that explain why, regardless of the quality of a trade union's internal democracy and the responsiveness of its leadership, it inevitably filters, and even profoundly changes, the demands put forward by the employees that it seeks to represent. Furthermore, for a trade union to be considered a reliable partner by the companies or public institutions with which it reaches agreements, it must control and to some extent police its members to ensure that they comply with the rules agreed on.

This may give rise to "crises of representation," which unions must be able to control if they are to survive and maintain their role. The rate of unionization, or "union density"—that is, the percentage of union members in the workforce—is usually considered to be the best indicator of a trade union's ability to represent employees' interests, and indeed of its strength. However, a large body of research has shown that the variation in union density across countries is closely conditioned by several other factors, among them the role of trade unions as providers of services. Moreover, union density is strongly affected by the varying "coverage" of collective bargaining: In several countries, this is established by law, so that collective agreements apply to all employees irrespective of whether they are members of the unions signatory to those agreements.

Yet trade unions are not simply associations formed if and when employees feel a need for collective representation of their interests. After an initial formative period, they have everywhere grown into stable organizations, which pursue as much the goal of maintaining and enlarging their power vis-à-vis other organizations as the original one of representing their members' interests. This logic of action induces trade unions to try to optimize their resources whenever they must find solutions for the dilemmas they encounter.

The first of these dilemmas for a trade union is how to define its sphere of representation or, in other words, the boundaries of the interest group whose demands it intends to advance. Historically, the main options have been to act as an "associational" or as a "class" union. A union of the former kind chooses to restrict its sphere of representation to the members that it actually recruits. The latter kind of union claims to speak on behalf of all workers, whether or not they are its members. The second dilemma for a trade union is how to define its sphere of action: Should it give priority to action in the market, addressing demands to companies and negotiating with them, or should it give priority to action in the state, addressing public institutions as the main targets of its claims and its main partners? However a trade union may define whom it wants to represent and with whom it wants to interact, it still has several further choices to make. One such choice is among the instruments for action, which can range from conflict, to collective bargaining, to various forms of joint management, to tripartite concertation. Another concerns the level of action, which may be centralized at the industry or cross-industry level or decentralized to the company or territorial level.

In addition to acting as associations that represent collective interests and large-scale organizations, trade unions have grown into important actors in several political economies. Where they have moved beyond an exclusively distributive function, they have come to perform a wider role in economic development. On the one hand, in fact, they may be decisive factors in labor market rigidity and an excessively generous social expenditure that generates huge public deficits. On the other, they may perform positive functions for companies by organizing the workforce's cooperation with the new modes of production and contributing to its skill formation. They can also help governments improve economic performance by coordinating wage dynamics in accordance with an income policy and by contributing to labor market and welfare reforms.

Open Questions and Scenarios

Today, the issue that concerns all countries is the new meaning and scope of solidarity among workers or, to put it bluntly, the capacity of the labor movement itself to construct social and political solidarity. If a labor movement decides to do no more than represent only traditional workers, it will continue to enjoy the advantages of participating in the economic and political systems. But it will do so at the cost of seeing its status reduced to that of just one interest group among others, and it will probably have to deal with the rise of new representative organizations in competition with it. It may alternatively decide to offer interest representation to newly formed social groups as well, although these often mobilize around nonnegotiable, or at least radical, demands. If it does so, it will probably extend its political influence and assume the features of a social movement but at the cost of losing some or most of the benefits stemming from its economic and political integration.

Whether we regard trade unions as primarily associations for interest representation, as organizations, or as economic and political actors, the importance that they acquired in most advanced economies in the latter part of the 20th century is increasingly challenged by various developments. The most important of these is perhaps the continuing fragmentation of employees' interests and demands due to processes such as the reorganization of production, the search for flexibility, and the growth of the service sector and of nonmanual and atypical work. Trade unions may find it increasingly difficult to build their demands around key professional figures such as the assembly-line worker in the Fordist factory. Not only has it become more difficult to aggregate demands and identify "general class interests," but as individual workers identify increasingly less with the "working class" as a whole—and with the projects for economic and political reform historically pursued by the labor movement—they also tend to identify more with the company or production unit to which they belong. In other words, the traditional endeavor by trade union organizations to impose uniform protection standards on employers is now regarded by many employees as an oversimplification of their needs and capabilities.

In conclusion, the labor movement in the new millennium seems to be faced with various difficulties but also with new opportunities. The former indubitably include the reduction of trade unions' scope for action within the economic system due to industrial restructuring and the greater precariousness of labor markets. Among the more general difficulties is the disappearance of a certain type of solidarity based on homogeneous working and living conditions, ideology, and the ability to standardize demands. On the other hand, the new opportunities open to labor movements seemingly depend above all on their capacity to interpret and mediate the need of management for closer workforce involvement in companies by qualifying the cooperation/involvement requested and subordinating it to the fulfillment of workers' general interests and objectives. From this point of view, it may become of great importance for labor movements to develop the ability to induce companies and institutions to relinquish market strategies based exclusively on costs and to adopt, instead, a competitiveness model based on product quality and a highly skilled workforce—that is, a model centered on the full development of human resources.

LEADERSHIP

Given the essential and inescapable role of leaders in political life, the notion of political leadership has been a constant presence in the development of political thought. Historically, however, there has never been an agreed-on definition of political leadership, and even the political science literature developed during the second half of the 20th century has not modified the somewhat fuzzy nature of this concept.

It was the contribution of the modern elite theory—and particularly the work of Gaetano Mosca, Robert Michels, and Vilfredo Pareto—which overwhelmed the traditional Machiavellian associations between "leader" and "power," as well as the vision of the "great man" theory of history. In the context of elite theory, leadership was conceived of as a behavioral concept: It is relatively easy to individuate leaders as persons who exercise control over the behavior of others, but their capabilities and their natures vary from one case to another. The new empiricism developed within the social sciences at the dawn of the 20th century brought about new efforts to study political leadership as a result of human interactions. Since then, political leadership has remained a core concept in political science, although not many works have explicitly addressed the notion.

Taking into consideration some selected works about the nature of political leadership developed in the 20th century, we can roughly describe the evolution of scientific reflection on this notion, identifying three historical phases: The first phase, developed during the intrawar period, was particularly fruitful in producing theoretical contemplations about the nature of leadership during the critical historical scenario of the so-called first democratization—that is, the process of changing to a democratic regime for the first time. The second phase—in the second half of the 20th century—was characterized by a significant growth of behavioral studies, which put the transformation of political leadership at the core of the empirical analysis of politics. The current phase is dominated by attention being newly paid to the problem of the complexity of political leadership in a different geographical area.

From Weber to Lasswell: Classic Reflections on the Nature of Political Leadership

All the theoretical assessments of political leadership refer to the well-known tripartite typology developed by Max Weber, which is very often labeled as an ideal-typical classification of political leadership—traditional, legal-rational, and charismatic rule. Actually, this celebrated piece of work is an analysis of legitimated rule—not of leadership. Indeed, Weber's influence is due to his intuition about the growing presence within modern leadership of peculiar elements, which determine the leader's capability to "change history." According to Weber, charismatic authority is that particular feature of leadership which explains the development of single figures and new styles of command, justifying exceptional changes in political life. Legal-rational rule, on the other hand, is the ideal type of continuity, constraining the behaviors of the innovators. Moving from this argument, the study of leadership within the democratic environment has been expanded all along the course of the 20th century, focusing on the causal links between democratization, crises, transitions, and types of legitimate rule.

If Weber's work is a crucial step in the analysis of the link between leaders and power, other classic social scientists of the 20th century have renovated the study of the link between political leadership and political personality. Probably the first modern attempt to define the qualities pertaining to political leadership can be found in the work of Robert Michels, who critiques and illuminates the characters of leaders from the Platonic tradition to the 19th century—initially focusing on the art of rhetoric. However, it was Harold Lasswell who provided an important basis for the empirical study of leadership behaviors. According to Lasswell, whose theories had been initially influenced by classic elite theorists and by Freud's psychoanalysis, personality is a crucial variable shaped by a system of interactions between the values of the social and the political system at the macrolevel and the cultural and social/familial environment at the individual level. Although Lasswell was never concerned with the notion of leadership, his work had much influence on future reflections on such a notion, and his call for a more attentive study of biographies and social connections of political leaders was decisive in the development of behavioralism.

Empirical Studies in Political Leadership

The impetus provided by Lasswell for an analytical study of political leadership has resulted in a significant growth of knowledge. Especially during the 1960s and the 1970s, the refinement of the comparative method and awareness that a nonparochial analysis of politics was necessary paved the way for accurate explorations of the manifold empirical dimensions of political leadership. The use of behavioral theories and support from research in various disciplines of the social sciences, including political psychology, sociology, and history, have enabled us to fathom the hidden dispositions of our rulers. The works of James MacGregor Burns (1978), grounded in the notion of transformational leadership, for instance, were fundamental in understanding the usefulness of intensive biographical studies aimed at creating taxonomies of leaders based on their different capabilities of interaction. In the same period, Glenn Paige (1977) put the notion of political leadership at the center of a complex multidisciplinary framework that explains the variance in the behavior of leaders by using a number of macro variables, including personality, role, organization, values, and capability of interaction.

A large number of studies were then undertaken in different disciplinary environments, focusing on different definitions of political leadership. In particular, the analytical dimensions of leader's ambition and leader's style gained immediate relevance for the new generation of political scientists. These dimensions of variation were at first studied above all in the United States. However, the seminal works of scholars like Arthur Schlesinger Jr., James Barber, and Lewis Edinger became a fundamental starting point for a discussion that soon spread to Europe, leading to new important studies in a few years. More or less at the same time, institutional analysis considered the relevance of leadership positions in assessing the different nature and performance of political systems. One should mention here that many important theories were developed between the 1970s and the 1980s on the nature of chief executives and the institutional environments in which they act.

Later, works on political leadership were focusing on different aspects of the phenomenon, also including the relationships between leaders and public opinion. Jean Blondel provides a general assessment of the role and the impact of political leaders in the contemporary world. In terms of empirical analysis, this work suggests a new typology of political leaders based on two dimensions: the extent of their concern with maintenance or change in the society and the scope of the political message they want to introduce in the political system. Working within such a conceptual grid, it is possible to assess the role of a wide set of leaders, from the anonymous managers (specialized reformers aiming at maintenance, such as ministers who deal with day-to-day administration) to the famous ideologues of the 20th century—for instance Mao or Hitler—who carried out important societal changes with a strong political message.

Leader Democracy? Transforming the Link Between Representation and Leaders

Decades of empirical studies have provided a significant understanding of the dynamics of contemporary political leadership. However, we still lack a comprehensive and agreed-on definition of what leadership is, and scholars are still divided about the correlation between (strong) leadership and (good) democracy. Moreover, the rapid transformation of democratic politics raises a number of new questions about the meaning of political leadership. The focus seems to have shifted away from the interpretation of classic puzzles, like the duration of leaders and measurement of their charisma, to the extent of a leader's role in policy making, communication, and electoral performance. Political theorists, in particular, have stressed the trade-off between the decline (transformation) of representative democracy and the emergence of a strong leadership influence in specific policy sectors and processes. Bernard Manin (1997) argues that the partial independence of representatives has been reinforced—in what he calls audience democracy—by an electoral link built on images rather than programs. This would increase the capability of single leaders to conduct policy processes and shape political discourse.

The changing link between representatives and the represented is also seen as an element of a broader change, connected to an evolutionary phenomenon that involves political processes and the functions of democracy. According to Andras Köröseny, the meaning of political representation tends to be more and more differentiated from the two traditional images of deliberation and mirroring since what is at the core of political representation is "acting and supplying new policies, creating a new quality"—that is to say, leadership. The selection of leaders who would be really free to make changes is therefore the very function of democratic rule. Leaders are expected to represent the people in a qualitative rather than in a mechanical way. In empirical terms, a lot of implications can be derived from such a statement: They refer, respectively, to the spheres of democratic institutions and political discourse.

Concerning the effects of leadership in terms of institutional change, many recent studies have converged to support the argument that core executives or chief executives have been incrementally more motivated to turn specific policies in new directions. The thesis of presidentialization of politics is grounded in the development of the role of guidance and coordination among a number of policymakers who are much more evidently subordinated to the leader. In a similar way, the processes of vertical governance shift, which would determine phenomena such as globalization or the Europeanization of domestic politics, envisage the emergence of more room for maneuver for national leaders, who are therefore not only free to shape policy processes but also to have an impact on public opinion.

Finally, an open question that lies at the center of a vivid discussion concerns the influence of current political leaders on political discourse and electoral outcomes. Conventional wisdom suggests that such a role is growing due to the effects of less well-identified phenomena such as "leaderization" and/or personalization of politics. However, not all the implications of this conventional view are true. According to Anthony King (2002), democratic polities are not necessarily personality oriented; partisan preferences and party politics still count—more than the personal features of a party's own leaders—although a great deal of variation can be seen if one observes the electoral outcomes of a number of political leaders in advanced democracies. Similarly, a high degree of variation has been noted by Jean Blondel and Jean-Louis Thiebault (2009), who conducted research on 11 recent political leaders. According to them, the relevance of personality in political leadership has increased during the last 50 years, balancing the decline in importance of relevant variables such as social stratification, class, and religious affiliation. Personalization of leadership is therefore a real phenomenon, although its impact seems to be strongly influenced by historical and country-specific variables. Therefore, "personalized leadership" seems to differ from one case to another.

LEGALIZATION OF POLICY

One of the significant elements of the transformation of governance and public policy across the world is its increasingly juridical character. This process of legalization refers to the transfer of public policy making to judicial institutions, the increasingly juridical and rule-governed processes of policy making, the central role of administrative law in the governance of public policy, and the growing importance of independent regulatory bodies in areas such as finance and health. The legalization of public policy is driven by an increasing fragmentation of interests and institutions within the state; a specific strategy of core executives and dominant social and political coalitions is to protect their interests, control subordinate authorities, and move contentious issues into nonpolitical arenas, which is often a strategy promoted by international organizations and agents. Legalization brings with it an array of new actors—courts, public interests lawyers, and regulatory institutions—using a wide array of new instruments of state authority such as contracts and audits.

What is intriguing is that this legalization has gone in tandem with programs of market reform across the developed and developing world. As noted by Kanishka Jayasuriya, market reforms have led to new forms of regulatory governance. It is clear that the credit crisis of 2008 will further accelerate the development of regulatory governance. One of the significant features of this regulatory governance is its increasingly juridical character, in that it is rule governed—relies on judicial, quasi-judicial, or independent agencies, for its implementation—and uses a range of regulatory techniques, which include the use of standard-establishing procedures for the operation of policy and the use of contractualism and audit.

Mechanisms of Legalization

Five main mechanisms of legalization of public policy can be identified:

1. Legalization has been driven by the increasing fragmentation of institutions as well as actors providing incentives for political elites to legalize various areas of public policy. It does this, in part, because by making public policy rule governed, it places the core executive at a distance from the competing interests of subordinate institutions and actors in areas as diverse as communications and agriculture. Even in authoritarian systems,

legalization has become a desired option: For example, the Chinese Communist Party now faces pressures from competing clients on issues such as environmental and economic regulation. In these circumstances, legalization becomes an attractive option because it moves the adjudication of contentious issues to a seemingly neutral arena.

2. Legalization, especially through the judicialization of politics and policy making, provides the basis on which the threatened élites and vested interests can protect their assets from encroachment by assertive political forces within the democratic political process. For example, the Thai Constitution of 2007, which further accelerated judicial policy making, reflected the desire of sections of the middle-class nongovernmental organizations, some professional groups, and the Thai monarchy to protect their interests from populist forces with majority electoral support.

3. Legalization facilitates a process of metagovernance that allows the core executive to control the structural process of governance rather than the actual conduct of policy. Hence, for example, the rules, actors, and issues of network governance—an important tool of public policy—are controlled by higher level public or even private agencies. As another example of metagovernance, take the case of the Indonesian Constitutional Court, which has been active in asserting control over various aspects of local political processes, such as electoral laws.

4. Legalization has been driven by the fact that symbolic and cultural political disputes cannot easily be resolved by the cut and thrust of electoral politics, which are amenable to distributive politics. For example, the protection and recognition of multiculturalism in the constitutionally enshrined Canadian Charter of Rights and Freedoms has been an important influence in both policy formulation and implementation.

5. Legalization has been driven by international forces, which increasingly work not through treaty of hard law but through soft forms of internal governmental regulation. Hence, for example, some bilateral trade agreements establish investor mechanisms that legalize what otherwise would be in the domestic arena of governance. Similarly, the advent of global administrative law—that is, the rules and regulations of global governance located within national policy-making institutions—has served to legalize areas of domestic economic and social governance.

Actors in the Legalization of Policy

Judicial organizations have taken on a key role in the legalization of public policy. These include constitutional or appellate courts that increasingly set the parameters of public policy, which in turn include regional courts such as the European Court of Justice but also courts such as the Supreme Court of India. All these have become assertive through the category of public interest litigation (PIL). PIL allows courts to dilute the requirements of *locus standi* and allow social activists, lawyers, and even letters of complaint as the basis for the investigation and resolution of policy and political disputes over environmental and other issues.

New institutions have been set up to oversee the legalization of public policy. For example, the regulation of sport has become increasingly juridical through the complex dispute settlement processes in the International Council of Arbitration for Sport (ICAS). This body adjudicates disputes over issues such as performance-enhancing drugs or the observance of criteria for team selections. In addition to international policies, legalization of policy has also occurred in many areas at the national level. For instance, in 1995, with the agreement of all Australian governments—federal, state, and territories—the National Competition Policy in Australia has articulated competitive principles to be applied to all legislation. These new rules were to be enforced by a new independent agency called the National Competition Council. In the case of the competition policy, legalization is designed to ensure economic order and competitiveness. In effect, this amounts to the subordination of regulatory rule making to economic imperatives, and what matters are not the specific rules as such but the justification of policy decisions framed in terms of economic criteria.

Legalization of public policy and the other actions of courts require the existence, mobilization, and support of a wide range of lawyers, activists, and other state actors. In China, the functioning of the administrative law regime requires the participation of lawyers and other state officials to give the administrative court system some legitimacy. Legalization of public policy requires the embedding of judicial institutions within a complex set of relationships between those actors and the legal and nongovernmental organizations.

There has been a shift toward autonomous dependent state agencies that are independent of the political executive. This is best illustrated by the increased independence of central banks from political institutions. For example, the Bank of Korea (BOK) Act effectively entrenches the autonomy of the BOK from the Ministry of Finance. Although mechanisms of consultation between the ministry and the BOK have been established, the executive is unable to impose a particular course of monetary policy on the monetary board, thereby diminishing the capacity of central economic agencies to direct the kind of industry policies followed, which has been a marked feature of the developmental state.

Instruments

Rules Versus Discretionary Policy

Increased independence for state agencies has been accompanied by a rule-based rather than a discretionary policy-making process—often in a juridical form. Economic governance has become increasingly focused on the implementation of rules (often with a legal basis) that govern economic policy. These rules are legalized to the extent that they stipulate more specifically the principles or standards to be applied, making the observance of these standards or rules mandatory, and delegate their enforcement to an independent agency or dispute resolution mechanism.

Even in what once was the paradigm case of discretionary policy making in East Asia, a more assertive legalism has emerged in public policy. The panoply of administrative guidance and executive discretionary power of the developmental state has given way to the flowering of a growing and assertive legalism and constitutionalism in economic and political decision making. One such important regulatory institution is the Financial Supervisory Commission, which operates autonomously and has been given considerable power to regulate and monitor the Korean financial system.

Proceduralism

Legalization is often directed not at specifically influencing the behavior or conduct of individuals or policy but rather at attempting to provide the framework or principles through which policy making is undertaken. In this respect, governance consists of a procedural regulation for setting the broad procedures and mandates for policy making. Through proceduralism, autonomous sites of governance come to be constituted not by direct application of state law, regulation, or authority but through more indirect means that enhance or generate the capacities of these sites of governance for self-regulation.

Consequently, these processes specify procedures to be followed by individuals or corporate bodies complying with regulatory rules. For example, a corporate regulator, such as the Australian Competition Council, will institute compliance processes within the corporate entities rather than directly intervene to enforce rules. The objective of the agency is to create a system of metagovernance to monitor the extent to which regulated entities have put in place a process of regulatory compliance.

Contractualism and Audit

A key instrument of legalization is through a contract-like relationship between public agents, the deliverers of policy (i.e., those who implement policies), and clients. The agents operating these frameworks—be they individuals or local/national government, civil society actors, or even transnational agencies—are required to meet certain standards of performance and conduct as a condition for the receipt of a grant or a benefit. What is more, the performances of these standards are monitored, and there are specified mechanisms of enforcement. For instance, employment and welfare programs in the UK provide an excellent illustration of contractualism. They exemplify governing through contracts either directly with individual welfare recipients or with private providers of public services. In fact, this enrollment of private individuals or agencies in a pervasive system of regulatory governance is one of the distinguishing elements of contractual governance of public policy.

One of the consequences of this contractualist governance is the proliferation of audits, such as quality assurance audits in public education and health. Many of these audits and auditing agencies have statutory powers. As private agencies or public–private partnerships can take on enhanced governance functions, they are subject to increasingly stringent audit and inspections mechanisms. In other words, the firm or the university itself becomes the site of self-regulation. Far from being in retreat, this contractual governance reaches deeper into civil society than was the case during the peak of the postwar welfare state.

Conclusion

The distinguishing feature of the emerging forms of regulatory governance is that that challenges our conventional understanding of public governance and accountability. This new governance turns away from the traditional command-and-control system of regulation by public administration agencies in favor of independent agencies and judicial authorities using new forms of regulatory techniques that are increasingly juridical in character. Political analysts are now obliged to pay greater attention to the ways in which politics are played out in these various regulatory arenas—be they in monetary policy or corporate governance. This highlights, above all, the need for a more rigorous analysis of the new kinds of actors, institutions, and arenas that have been unleashed by the legalization of public policy.

LEGITIMACY

The legitimacy of any system of power, including that of its individual power holders, lies in the degree to which it is acknowledged as rightful, both by those involved with and subject to it and by third parties whose support and recognition it may depend on. Although the definition of legitimacy as rightful power or authority is a widely agreed-on one, much else about the subject is strongly contested:

> How significant is legitimacy to the maintenance and effectiveness of power relations?
>
> Who are the key audiences for legitimacy claims?
>
> What exactly is it that makes power rightful?
>
> How is legitimacy created and maintained?
>
> What are the key features differentiating the legitimacy of different political systems, and what are their respective strengths and vulnerabilities?

This entry treats these main points of disagreement in turn.

A useful starting point is to distinguish between a philosophical and a social-scientific approach to the study of legitimacy. Throughout human history, those occupying positions of power, and especially political power, have sought to ground their authority in a principle of legitimacy, which shows why their access to, and exercise of, power is rightful and why those subject to it have a corresponding duty to obey. These claims have been elaborated by apologists in narrative form and by iconographers in pictorial and artistic representations. However, where the possession or exercise of power has been challenged or contested, critical reflection and argument about what makes power rightful has taken place. It has usually been the task of philosophers to elaborate such reflection into a considered theory or theories and to test legitimacy claims against accepted standards of normative validity and discursive argument. From at least the time of the ancient Greeks onward, the study of legitimacy has been central to the practice of political philosophy, through its analysis of normative principles of the right and the good.

The study of legitimacy as a subject for political science, by contrast, is comparatively recent, dating from the early 20th century. In contrast to political philosophy, its focus is more empirical than normative, more on processes and outcomes than on abstract principles. Its concern is less with the reasoned validity of legitimacy claims than with the degree of their recognition by the relevant social agents and with the consequences that follow from that recognition for the stability of a system of power or rule and for the manner in which it is organized. It was the German sociologist Max Weber who was first responsible for elaborating a social-scientific account of legitimacy and for exploring its significance for power relations in his work *Economy and Society.* Most of the key debates in political science since then have stemmed from Weber's work, and this entry will return to it at a number of points.

The Significance of Legitimacy for the Exercise of Power

According to Weber, wherever power holders are acknowledged as legitimate or rightful, they can count on those subordinate to them obeying their commands and following their instructions without the widespread use of coercion or the constant fear of disobedience or subversion. This is because people will recognize a duty to obey and not merely an interest or advantage in doing so. As Weber argued, motives of personal advantage, solidarity, custom, or whatever are not a sufficiently reliable basis for power relations. In addition, there is normally a further element—the belief in legitimacy. Every system of power, therefore, attempts to establish and cultivate the belief in its legitimacy and to demonstrate a moral authority going beyond any purely coercive capacity.

While most later authors agree on the significance of legitimacy for the reliability and durability of a system of power, they are divided on the question of who constitutes the key audience for legitimacy claims. If we distinguish between the key power holders, their enforcement and administrative agents, and the wider population that is subordinate to them, then, one school of thought holds that a belief in legitimacy is necessary only for the first two of these. It is the powerful who most need to believe in their own rightfulness if they are to have the self-confidence to rule effectively, and their administrative staff must believe likewise if they are to be effective and reliable enforcers of their superiors' policies. In this view, it matters little what wider strata of the subordinate believe since it is primarily a recognition of their own impotence in the face of the powerful—a sense of "dull compulsion," not any sense of duty—that typically keeps them in line. By the same token, it is only when those in power, or their administrative staff, come to lose confidence in their own legitimacy that the power structure comes to be critically weakened. And it is divisions within a ruling elite, not the loss of legitimacy among a wider public, that holds the key to the decline and fall of regimes.

Now, it is certainly true, and Weber acknowledged as much, that both historically and in the contemporary world, we can point to examples of power structures where the obedience of those subject to them has been maintained simply through coercion and a sense of their own impotence. However, to limit the significance of legitimacy merely to those who exercise power and administer it can be challenged on two grounds. First, where power over a population depends on coercion alone, it requires a costly apparatus of enforcement and surveillance to maintain it, extending to the agents of enforcement themselves, who may, as in the late Roman Empire, simply sell themselves to the highest bidder. Moreover, the system of power now has only one line of defense—that of force—and it can therefore collapse very rapidly if the coercion is insufficient or if people believe that those in power have lost the capacity or the will to use it. Once Premier Mikhail Gorbachev made clear that the former USSR would no longer intervene militarily in Eastern Europe, the writing was on the wall for the Communist regimes there since their loss of internal legitimacy meant that they were only kept in place by the threat of Soviet invasion.

So first, then, a wider acknowledgment of legitimacy enhances the stability of a system of power, as well as its economy of operation, through the recognition of the subordinates that they have a corresponding duty to obey and cooperate with it and that they do not merely have a contingent interest in doing so. People expect power holders to meet certain moral or normative conditions in their access to and exercise of power, and the loss of moral authority consequent on their failure to meet these can lead to widespread disobedience or resistance, reaching into the coercive agencies themselves. It would be a mistake therefore to see a regime crisis as originating in divisions within the ruling apparatus alone and not in the attitudes and behavior of a wider population. The collapse of the Shah of Iran's regime in 1979 is a particularly spectacular example of the erosion of an army's loyalty in the face of repeated mass protests, resulting from the regime's loss of moral authority in the eyes of the population at large.

A second reason why acknowledgment of a power regime's legitimacy by those subordinate to it is important is that those in power are much more able to achieve their purposes when these depend on the willing cooperation of those subject to them. Once again, the exceptions or limiting cases prove the rule. For example, there have been purely coercive labor regimes, such as slave societies or early industrial capitalism, where the subordinates were regarded as objects (e.g., chattels, hands), readily dispensable for new recruits, and the quality of their cooperation did not greatly matter. In these cases, the elaborate justifications constructed to legitimate these arrangements were not intended for those subjected to them but for the wealthy and powerful themselves and for the other elite audiences whose cooperation they might need.

However, the more a power structure is dependent on a settled subordinate population for the achievement of its purposes, and especially where the quality of the performance matters, the more essential it is that the relationship is constructed according to an acknowledgment of reciprocal rights and duties, such as that that only a principle of legitimacy can provide. This entails that the power relation is defined as a normative and not just a de facto one and that this definition sets limits to the scope of the powerful as well as to the obligations of the subordinate. Where the legitimacy of the powerful is widely acknowledged, to that extent will the powerful be able to rely on the cooperation of the subordinate necessary to achieve their purposes. This issue is particularly pertinent to the modern state, which requires those subject to its authority not only to obey its laws but also to pay their taxes, cooperate with its policies, and even to fight in its defense.

Some simple examples will serve to demonstrate the point. No one likes paying taxes. But it makes an enormous difference to a system of tax collection if people acknowledge the right of the state to tax them and accept the system as broadly fair. Then, the vast majority will pay up without resistance. Naturally, the administrative arrangements will have to be efficient, and there will have to be compulsion at the margin to deal with backsliders and to convince the rest that there are no free riders. But a state where people recognize no duty to pay taxes will have to engage in enormously expensive systems of enforcement, which will substantially reduce the overall take and may even compromise the capacity to raise taxes altogether. It follows that the effectiveness and the legitimacy of a system of power are not unconnected features, as many writers have supposed. This is because the capacity of political authorities is also dependent on their moral authority or standing among those whose cooperation is required for them to achieve their purposes.

Another example we could take is that of policing. Where policing is based on consent, that is, where the police are recognized as broadly working for the benefit of the population as a whole, treating people fairly and with restraint, and where there is confidence in the system of complaint and redress in the event of abuse, then, people will cooperate with the police in the prevention, reporting, and investigation of crime. To that extent, the police will be enabled to carry out their function effectively. Or take the mundane example of a classroom teacher. If pupils do not share a belief in the purpose or value of education, on which the justification of the teacher's authority is based, he or she will have to devote correspondingly greater energies to maintaining order than to teaching. To that extent, the purposes for which power is held will not be achieved, and this may lead in turn to a further erosion of legitimacy.

Enhanced order, stability, and effectiveness—these are the typical strengths of a legitimate system of power as a result of the obligations on subordinates that follow from their recognition of its legitimacy. As already mentioned, there may indeed be examples of power systems where the audience for legitimation claims is confined to the powerful themselves and their immediate associates, and legitimacy is needed only for their internal self-belief and cohesion in the face of a population compelled to brute obedience. Yet these are only limiting cases. More typically, legitimacy matters for both the rulers and the ruled, for power holders and those subordinate to them, and their relationship is constructed as a normative and not merely a de facto one, with legitimating norms establishing mutual ties of obligation and performance between them.

A final potential audience for legitimacy claims should be mentioned here—that is, third parties who stand outside a given system of power but on whose recognition and cooperation it may depend. It is difficult to generalize about these since contexts vary so widely. Yet it can happen that a refusal by an outside body to recognize a given power as legitimate can have significant repercussions for it internally, especially when withdrawal of necessary cooperation or some other sanction follows. For example, the international sanctions imposed on the apartheid regime in South Africa because of its violation of internationally established norms against race discrimination made their own contribution to the loss of self-confidence on the part of the regime and to the success of the internal liberation struggle. The role of internationally accepted norms in sustaining or eroding the legitimacy of states or their governments in the contemporary world will be discussed more fully later on.

What Exactly Makes Power Legitimate?

According to Max Weber, what makes power legitimate in a social-scientific analysis is not what meets the political philosopher's independently validated principles of rightful authority but what is accepted by the relevant agents as legitimate in their context. Legitimacy for the social scientist is simply the belief in legitimacy since it is this that determines people's behavior. Moreover, legitimating beliefs will vary enormously from one historical period or societal type to another. We may regard the divine right of kings as philosophically groundless, but the task of the social scientist is to understand how people came to believe it, how the belief was reproduced and disseminated, and by whom and what followed from it for how a given system of rule was organized and for how people related to it. In other words, the critique of ideas has to give way to a sociology of knowledge if we are to explain the key features of any given system of power that we wish to study.

Some philosophers have objected to what they see as a completely reductionist definition of legitimacy, equating it with the purely subjective belief in legitimacy; to the dismissal of ideas as simply ideology, myth, ruling formula, and so on; and to the substitution of the study of the origin, reproduction, and dissemination of beliefs for a critical analysis of their content. The implication seems to be that people can be brought to believe almost anything, however preposterous, by those who control the production and dissemination of ideas. Should we then treat power as legitimate simply because enough people have by one means or another come to believe that it is?

Now, it is true that a social-scientific analysis of ideas has to start from a relativizing standpoint and that a historian or political scientist can only understand the ideas of a different age or society to the extent that he or she stands back from his or her own beliefs and the assumption of their self-evident truth. Yet such an understanding of a different set of beliefs is only possible through a careful analysis of their content and internal logic as well as of the circumstances of their production and dissemination. In the case of legitimacy, despite all the historical variability of legitimating ideas, it can be shown that they all share a common and distinctive threefold structure to their content. Power, and especially political power, is recognized as legitimate to the extent that the following conditions are satisfied:

1. It is acquired and exercised according to established rules. This is the level of legality, whether or not the rules take an informal, conventional, or explicitly legal form. On its own, however, legality is insufficient since the rules have to be underpinned by normative principles that justify them. Hence, we also have the following.
2. The rules of power are justifiable according to accepted beliefs about (a) the rightful source of authority, which determines who is qualified to exercise power and how they are appointed and (b) the proper ends or purposes of power and standards in its exercise. This is the level of normative justifiability. There is a further dimension still, however, and that is the following.
3. Positions of authority are publicly acknowledged by relevant subordinates through actions that confirm their acceptance and recognition of it. This is the level of legitimation.

These three levels are not alternatives since all contribute to legitimacy; together they provide the subordinate with moral grounds for compliance or cooperation with authority. The fact that all are required can be shown by the different negative words used to express the different ways in which power may lack legitimacy. If there is a manifest breach of the rules, we use the term *illegitimacy*. If the rules are only weakly supported by societal beliefs or are deeply contested, we can talk of a legitimacy deficit. If consent or recognition is publicly withdrawn or withheld, we speak of delegitimation.

If we take the subject of political power, the most extreme example of illegitimacy is usurpation or coup d'etat—power attained in violation of the rules. Examples of legitimacy deficit are enormously varied, from situations where changing societal beliefs leave existing institutional arrangements unsupported or where people have widely diverging beliefs—say, about which state they should belong to—to situations where government is chronically unable to meet the basic purposes, such as welfare or security, which people expect it to. Legitimacy deficits usually only become critical when some performance failure of government exposes a fundamental doubt about its rightful source of authority. Examples of delegitimation include acts of widespread public opposition to a regime, of which revolutionary mobilization is the most extreme example. Revolutions follow a typical course from chronic legitimacy deficit of the regime (doubtful or disputed source of authority compounded by performance failure), through its delegitimation by mass oppositional mobilization, which splits the governing apparatus, to an illegitimate seizure of power, which heralds its reconstruction under a new set of legitimating rules and principles.

The different levels or dimensions of legitimacy outlined above constitute only the most general or abstract framework, the specific content of which has to be filled in, so to speak, for each historical society or example of rule. They provide a heuristic tool to guide analysis. Is political authority valid according to the rules? The relevant rules have to be identified, their conventional or legal form established, the mode of adjudication appropriate to them determined for the given context, and so on. Are the rules justifiable in terms of the beliefs and norms of the particular society, and are these norms relatively uncontested? We need to examine the specific beliefs current in the society about the rightful source of authority, on the one hand (divine approval, dynastic inheritance, privileged knowledge, ethnic membership, the people, etc.), and the proper ends of government, on the other (conquest, security, welfare, salvation, or whatever), all of which assume the fulfillment of a general interest beyond the narrow interests of those exercising power. Are there, finally, actions expressive of consent or public affirmation on the part of those qualified to give it? Who counts as qualified and what actions count as appropriate (e.g., oaths of allegiance, acclamation, and election) will be determined by the conventions of the given society or system of power. Underlying all these historical differences, there is a common structure to legitimacy to guide analysis.

This common structure of legitimacy is not arbitrary or accidental since each component relates to a different aspect of power that is socially problematic. All power over others, and especially political power with its access to the means of violence, is potentially disruptive of and intrusive into people's lives and well-being. Therefore, its acquisition and exercise cries out to be rule governed and located in the most imposing source of authority acknowledged by the society. Since those who exercise power enjoy great status and privilege, they have to be shown to merit it and to use it to serve a more general interest than merely their own advantage. Finally, since power entails the capacity to get others to do what otherwise they would not choose to do, the loss of freedom involved is validated by public acts of acknowledgment, which serve to bind in subjects and subordinates to obedience. These are the elements, therefore, which combine to make power rightful or legitimate.

The recognition that legitimacy is multidimensional and a knowledge of what these dimensions are moves social science away from treating the subjective belief in legitimacy as if it were totally content free—that just any belief will do—and closer to the philosopher's discursive analysis of the content of ideas. In particular, it shows how social science and political philosophy share a common subject of enquiry, with recognizably common features. Yet a crucial difference remains between them, as already indicated. For the social and political scientist, legitimating ideas and practices derive their force from the beliefs, conventions, and procedures current in and specific to a given historical society or political system. And the focus of enquiry is always an empirical one: How are legitimating ideas reproduced and disseminated? Through what agency? What effects do they have and on whom? Above all, what makes them credible in the given social context, and why, if they do so, do they come to lose their credibility?

In answering these questions, we need to get away from the view that the only processes that require examination are those involving the ideologists, who develop and disseminate ideas, and the institutions that reproduce them. Of course these are important. But we also need to examine the way in which the very structuring of power makes certain legitimating ideas credible or believable. It is a notable feature of power relations that they are themselves capable of generating the evidence required for their own legitimation.

Two recurrent ways in which this occurs can be identified. One is the way in which the evidence of superiority and inferiority, which justifies the difference of fates and inequalities of condition between dominant and subordinate, is itself largely the product of this condition. Those who are excluded from key positions, activities, or resources are thereby denied the opportunity to acquire or demonstrate the capacities and characteristics appropriate to their occupation and exercise, so justifying their subordinate position. Throughout history, the exclusion of women from privileged positions or activities monopolized by men has prevented them from acquiring the capacities necessary for their occupancy or exercise. Their inferiority thus appears naturally rather than socially constructed, serving to justify their exclusion in a self-fulfilling manner.

Second, there is the way in which the idea that the powerful serve a general interest gains credibility from the structuring of power itself. Once some necessary social resource or activity comes to be controlled by a particular group, it follows that the interests of society at large can only be met through satisfying the interests of that group and on terms acceptable to them. Those who have historically controlled the means of production or subsistence, by violence or administration, have been in a position to ensure that general needs for welfare, employment, or security could only be met through the power relations that simultaneously secured their own privileges. To this extent, their claims to serve the general interest have had an evidential basis deriving from the structure of power itself.

We could take today's international bankers as an example. To be sure, their claims to legitimacy have had an ideological basis, in the self-regulating market doctrine that has justified their activities becoming less and less rule governed—a doctrine with its exponents in the economics departments of universities and its disseminators among politicians as well as among the bankers themselves. Yet the very fact that the economy of every society depends on the credit that only banks supply has given credibility to the claim that their activities together serve an essential public interest. And the very complexity and global reach of their operations have reinforced the idea that they are uniquely qualified to understand and manage the processes involved and that their indispensability justifies the enormous salaries and bonuses to which they lay claim.

Of course, the near collapse of the banking system in the credit crunch of 2008 demonstrated that much of this legitimating fabric was illusory. The free market was exposed as far from self-regulating, many of the bankers' activities were shown to be not merely socially useless but also socially and economically damaging, and their claim to possess an esoteric knowledge available only to the initiated was punctured by the revelation that even they did not understand the complex instruments in which they were trading. They suffered a legitimacy crisis of epic proportions. What remains to be explained is why the active process of popular delegitimation that typically follows such a crisis did not fully materialize. Apart from a few broken windows, no bankers' houses were burnt down; nor were any bankers strung up from the lampposts. One reason may be that the institutions in which they work were difficult to penetrate. Another may be that the governments which, as third parties, endorsed the legitimacy of the bankers' activities and rewards, proved to be more accessible targets of popular anger, whether through mass mobilization, as in Iceland; through the sanction of electoral process, as in the United States; or through the public humiliation of parliament in an expenses scandal, as in the United Kingdom (UK). Yet the cost of the bankers' insulation from the full impact of popular anger and of their avoidance of a thorough-going process of delegitimation was shown in the all too rapid return to business as usual and in the displacement of the costs of the crisis from the financial to the political domain.

A social-scientific analysis of legitimacy, then, involves understanding the ideas and processes that legitimate a given system of power in its context; exploring the different dimensions of legality, normative jusitifiability, and legitimation that contribute to the acknowledgment of power as rightful by the relevant actors; identifying both the agents of ideological production and dissemination and the aspects of a power system that give legitimating ideas their credibility; and finally, exploring the processes that may lead to their erosion. The next section will use the framework developed here to delineate the legitimating principles and procedures of the main types of political systems of the 20th century and identify their typical points of vulnerability.

The Legitimacy of Different Regime Types

A third issue that Weber's analysis of legitimacy initiated ongoing debate about was the relation between legitimating principles and the way systems of power are organized. He argued that the kind of legitimacy being claimed had a determining effect on the mode of obedience, the kind of administrative staff developed to guarantee it, and the manner of exercising authority, all of which would differ according to their different legitimating principles. It followed that types of power systems could be classified according to the kind of claim to legitimacy typically made by each. He then proceeded to differentiate between three types of legitimating claims and their respective grounds, which he termed *traditional* (belief in the sanctity of immemorial traditions), *rational-legal* (belief in the legality of enacted and rationally justifiable law), and *charismatic* (belief in the exceptional qualities of an individual and the normative principles ordained by him). He used this typology to structure his political sociology and as the basis for detailed studies of patrimonial authority, bureaucracy, and religious movements, respectively.

There is no doubt that this threefold typology, and Weber's development of it, has proved historically illuminating. For example, in any study of the process of modernization, Weber's characterization of the shift from traditional to rational-legal modes of legitimation—from personal to impersonal relationships of rule, from status distinctions to rights-based authority, from dependency to citizenship, together with the separation of public finances from the private household of the ruler—has been indispensable. Weber's analysis of the appearance of charismatic figures in times of distress, social dislocation, or revolution and the routinization of their charisma in a subsequent order is also valuable. However, as a basis for constructing a typology of political regimes in the 20th century, Weber's types have proved something of a distraction for political scientists. It is not particularly useful to be told that both liberal democracy and fascism are different variants of charismatic authority, one more rule governed than the other, or that communist systems comprised a combination of the traditional, rational-legal, and charismatic modes of legitimacy.

At this point, the structure of legitimacy outlined in the previous section—comprising legality, normative justifiability, and public affirmation—can be used to provide a more coherent basis for distinguishing between the different regime types of the 20th century: traditional, fascist, communist, liberal-democratic, and theocratic. For each, their distinctive form of law, source of authority and ends of government, and mode of public affirmation can be identified. These are shown in summary form in Table 1.

Military and other forms of dictatorship have been included as a limiting case of a nonlegitimate political order, born of illegitimacy and lacking both a rightful source of authority and any mode of expressed consent or public affirmation. Such legitimacy as military regimes have is based entirely on their purpose or mission—to save society from chaos or corruption—and is typically defined as transitional, to promote the restoration of a normal political order. Like all regimes whose legitimacy is limited to the dimension of performance, they are vulnerable once performance falters, and their failure exposes their lack of any valid source of authority. Legitimate political orders, in contrast, which are secure in their source of authority, are able to withstand shocks and performance failures and to effect routine changes of administration that do not threaten the legitimacy of the system itself.

The different political regimes in Table 1 are, like Weber's, constructed as pure or ideal types, and mixed forms combining more than one mode of legitimation can readily occur. For example, a number of recently established democracies, particularly in the South, have persisting elements of tradition-based legitimacy, whether in customary forms of law, chieftain- or clan-based authorities, or the persistence of personal favoritisms and dependencies within a formally rule-based democratic regime. Depending on the form these take, a traditional legitimacy may serve to strengthen the legitimacy of more recently established democratic institutions or come to weaken or undermine them. Of the theocratic systems, to take a different example, Iran has developed an electoral mode of legitimation, albeit flawed, while Saudi Arabia's system is based on the allegiance of a traditional and hereditary social elite. Such combinations and transitions are not uncommon but are best analyzed by starting with clearly defined types.

Table 1 provokes an obvious question: Why is it that the liberal democratic mode of legitimacy, and form of political system, has become globally prevalent by the start of the 21st century? This is partly for negative reasons—namely, that other forms of legitimate political order have proved to

Table 1 Legitimating Elements of Different 20th-Century Regime Types

Regime Type	*Form of Law*	*Source of Authority*	*Ends of Government*	*Mode of Public Affirmation*
Traditional	Custom/precedent	Heredity/the past	Well-being within traditional order	Assembly of social elite
Fascist	Sovereign decisionism	Leadership principle	National purity/expansion	Mass mobilization
Communist	Codification of the collective will	Party monopoly of truth and representation	Building communist future	Mass mobilization
Liberal-democratic	Constitutional rule of law	The people through competitive election	Individual rights protection and advancement	Electoral endorsement
Theocratic	Sacred texts and canons	Divine will interpreted by hierarchy	Purifying society's moral order	Various of the above
Dictatorial	Decree	None	Restore order and national unity	None

be ill adapted to some key aspect of contemporary economic and social conditions and have found their legitimacy to have been eroded. The hereditary monopoly of political authority characteristic of traditional systems has proved to be vulnerable to the modern requirement of a career open to talent and to popular demands for inclusion in the political process. The Communist Party's claim to represent workers' interests proved to be increasingly out of step with its members' own perceptions of them; its claim to exclusive truth lost credibility, and its goal of a realizable communist society came up against the limits of its system of economic planning. The fascist pursuit of expansionary national goals typically led to self-destructive wars, or, where these were avoided, an authority vested in the person of an individual leader proved unable to survive his death. Theocracies have proved vulnerable to fundamentalisms that have quickly forfeited popularity, or else they have provoked adherents of other faiths to open disaffection. Each system has had its own internal crisis tendencies, inherent in its legitimating principles and procedures, which have in most cases proved to be terminal.

The prevalence of liberal democracy, in contrast, is due to the fact that it has proved to be the only sustainable legitimate order compatible with the conditions of market capitalism, on the one hand, and with popular demands for freedom and full inclusion in the political process, on the other. Market capitalism's antipaternalist principles—individuals are the best judge of their own interests, are responsible for their own fate, and are sovereign in the consumer market—have over time led to the demand for people to be sovereign in the political sphere also and have undermined paternalist forms of legitimacy, especially as education has become more widespread. At the same time, the increasingly global dimensions of communication have made closed political systems, claiming a monopoly of information and ideology, unsustainable without levels of repression that provoke popular resistance. The People's Republic of China stands out, however, as a potential test of these assumptions. It remains an open question whether the post-Tiananmen combination of performance legitimacy through rapid economic growth and strenuous reinvention of the party's justifying ideology will carry conviction over time beyond the ranks of its own cadres.

This is not to say that liberal democracy does not have its own characteristic crisis tendencies, deriving from some of its legitimating principles and procedures. The electoral competition for power, with its winner-take-all outcome, gives ruling leaders and parties a powerful incentive to curtail basic rights and freedoms for opponents or to skew the registration and electoral process in their favor. Democracy's majoritarian principle can lead to the permanent exclusion of significant minorities from any share in power, provoking secessionist tendencies if not outright civil war. Also, the inescapable tension between the economic and social inequalities intrinsic to market capitalism and the equality of citizenship and political voice, which democracy promises, contains the potential for disruptive social conflict. Any of these challenges can lead to authoritarian and exclusionary deformations of democracy, in which democratic norms and procedures become more of a legitimating façade than a genuinely operative and regulating set of ideas.

However, the fact that even authoritarian regimes now claim the mantle of democratic legitimacy points to a striking feature of the international political landscape since the collapse of communist regimes in 1989. Democracy is now the only form of legitimate political order that has wide attractiveness across borders and whose norms have become endorsed at an international level. This endorsement provides a strong external legitimation to domestic political forces engaged in a struggle for democracy within a country. It is also given practical effect through positive measures of democracy support between countries and negative pressure where aid, trade, and debt interdependences are involved. Democracy promotion in one form or another on the part of established democracies in their dealings with recent or less secure ones has become a major enterprise since its inception in the early 1990s.

Yet it is also necessary to recognize the limits to democracy promotion and the point where it comes up against other legitimating ideas and norms. Most obvious of these is the force of nationalism and the principle of national sovereignty or autonomy. Since the late 18th century, the idea of nationhood, as solidarity between a people sharing key markers of identity, has inspired political movements for national unification across borders, secession from within them, and independence from imperial powers alike. The principle of nationalism does not provide the specification for any one kind of political system but only its appropriate spatial reach. It can best be regarded as a background legitimating condition for the rulers of any and every regime in the modern world—that they should share the national identity of the ruled and should not act as agents of, or be subordinate to, an external power. Nationalism can also, of course, become foregrounded as a means to compensate for some significant legitimacy deficit in other aspects of a given regime.

Democracy promotion, then, comes up against one limit when it is perceived as an instrument for the national interests of the promoting power or powers and, above all, when its promotion infringes on national self-determination, as in attempts to impose democracy by force. Another limit, already mentioned, is set by the persisting legitimacy of traditional norms and practices, especially where democratic institutions are seen to displace or undermine these, rather than achieve an acceptable mode of coexistence with them. The transition from one type to the other is necessarily a gradual process, requiring a generational shift in the underlying beliefs supportive of a new order. In this context, it is worth noting that in the UK, it has taken until the 21st century for the hereditary component in the upper chamber of parliament, based on a traditional principle of legitimacy, to be finally abolished.

A further limit to the project of democracy promotion, specific to Islamic countries, lies in the attraction of a competing principle of legitimacy—that of a political order based on sharia law and interpreted by a religious hierarchy. Although the installation of such an order at state level has over time proved divisive and unpopular, the idea has been a potent source of support for opposition movements mobilizing against only weakly legitimated regimes in the Arab world and beyond.

All three of these alternative sources of legitimacy limiting the effectiveness of democracy promotion were combined in Afghanistan. The lengthy military occupation weakened the legitimacy of democratic institutions, already compromised by electoral fraud, with the taint of foreign imposition. These institutions were both distorted and challenged by clan-based forms of traditional authority to which people owe their primary allegiance. And both these elements were used by the insurgent Taliban to gain support for its alternative theocratic agenda. Given such a combination, it is hard to imagine a more unfavorable terrain for a democratizing project.

Legitimacy Beyond the State

Any analysis of the legitimating principles of contemporary regimes has to take into account the way in which forces beyond the nation-state act to constrain its decisional autonomy and compromise its claim to sovereignty. These forces may include the actions of other states, pressures from the financial and economic markets, or the rulings of international treaty bodies and other international organizations. Since the actions of the latter are becoming both more pervasive and more intrusive, for good and ill alike, the basis for their legitimacy is becoming an important subject of analysis and debate.

The legitimacy of the international organizations set up in the aftermath of World War II, and the decisions and resolutions taken by these bodies, has historically derived from the participation of member state governments and the process of agreement between them required for a binding decision. However, in more recent times, that legitimacy has increasingly been called into question on the grounds that voting rights have been skewed toward the major powers in the developed world and have not reflected either emerging powers or the weight of their populations. This is most obvious with the United Nations (UN) itself, whose permanent members of the Security Council with veto powers constitute a historical anomaly dating from the 1940s and 1950s. With similar effect, voting rights in the International Monetary Fund and World Bank depend on the amount of capital a country contributes not on equality of state membership. And even with a body like the World Trade Organization, whose members states are formally equal, decisions in practice were for a long time predetermined in so-called green room meetings of the larger trading nations and influenced by the much greater research capacity available to their delegations. The cumulative outcome of these procedural inequalities has been policies and agreements that have benefited the developed world more than the developing one.

In the changed conditions of the 21st century, it is now widely recognized that full legitimacy and the respect necessary for effective global cooperation can only be restored to these institutions by reform of their membership rules and procedures. However, there is considerable disagreement about what this should entail. If we take the UN itself, there are at least three contending views. The first holds that the basic idea of the Security Council, consisting of permanent members plus rotating temporary ones, is still necessary to ensure that the major powers have an incentive to take part in the organization rather than bypass it. From this viewpoint, what is needed is to extend the permanent membership to include states that better reflect today's configuration of power, such as Brazil, Germany, India, and South Africa.

A second view holds that the whole idea of privileged membership of the Security Council is anachronistic and can no longer be justified. Any criterion of fairness would require equal opportunity for states to participate in the Council, albeit with some adjustment mechanism to reflect differences in size. The latter principle could also be extended to the General Assembly by assigning differential voting power according to the size of a member state's population.

A third more radical view, associated with proponents of cosmopolitan democracy, holds that the legitimacy deficit of international organizations consists in the fact that they represent only states and their interests, not peoples. In this view, reformed intergovernmental organs of the UN should be complemented by a people's assembly, directly elected from all the peoples of the world. They point out that the UN has already begun moving in this direction by recognizing nongovernmental organizations and advocacy groups at its world conferences and as participants in international treaty negotiations. A move to a more formalized system of popular representation would constitute a more equitable and transparent extension of this practice.

These differences of view show that there are no agreed and settled criteria for establishing what counts as legitimacy in respect of international bodies. Nowhere has the issue been more contested than in debates about the legitimacy deficit or democratic deficit of the European Union (EU). All depends on what kind of political animal one considers the EU to be. If one considers it as a quasi state, then its lack of any single decision-making institution as the focus for accountability and the lack of any developed "demos" with powers to hold it accountable through the electoral process are major legitimacy deficits. If one considers it primarily as an intergovernmental organization, then the lack of transparency in the decision making of the council of ministers and of adequate democratic oversight of these ministers through national parliaments are major deficits. If, finally, one argues that the EU is a sui generis construction, with careful balancing of powers and accountabilities between its different institutions, then, there is less evidence of a serious deficit than under the first two assumptions. Indeed, it can be pointed out that the EU already possesses all the features that the most radical reformers of the UN wish to see for that organization, including council voting weighted by population, a directly elected parliamentary assembly, and a powerful court to enforce legislative decisions.

One further position in the debate on the EU deserves mention here because it rests on a form of legitimacy that is quite generalized in modern societies, both within and beyond the political domain. This is the view that since the prime function of the EU is that of economic, social, and legal regulation, it is entirely appropriate that its decision making should be entrusted to a technocratic body such as the European Commission and the technical committees representing national bureaucracies that work for it. After all, in most political systems, regulatory activity is undertaken by independent bodies—courts of law, administrative tribunals, regulatory bodies of all kinds—whose judgments are more effective precisely because they are not subject to political or electoral pressure. Their source of legitimacy stems from the authority of professional expertise in a knowledge-based society and their ability to give reasoned justifications for their decisions, which can withstand the scrutiny of their professional peers.

Whatever the merits of this view in respect of the EU—and it is difficult to maintain that its functions are merely regulatory and not also redistributive and therefore highly political—the wider point about the legitimacy of professional expertise is an important one for understanding the legitimating basis of many familiar types of authority in contemporary society—doctors, lawyers, accountants, academics, and so on—and of the wider social authority of the institutions in which they work. However, in a democratic society, these professional institutions and activities have to meet certain criteria if they are to be fully legitimate, such as transparency, accountability, and accordance with fair procedures. Moreover, those independent bodies that have a high political salience—central banks, regulatory bodies of public utilities and the media, ombudsmen, and so on—need their terms of reference and membership to be endorsed by parliament, and to be accountable to it, if their decisions are to have full legitimacy, combining professional or technocratic and democratic authority.

Conclusion

To speak of full legitimacy implies that legitimacy is not an all-or-nothing affair, such that a body exercising power either has it or does not, but is a matter of degree. The greater the acknowledged legitimacy of a system of power—deriving moral authority from a socially recognized source and serving the societal ends or purposes expected of it, according to accepted conventions or standards, whatever these happen to be—to that extent will those subordinate to it not have to be bribed or coerced into obedience and the more likely that they will cooperate in helping it achieve its purposes, where their cooperation is necessary to achieve these. In sum, legitimacy can be seen as a form of public good, which carries distinctive benefits for rulers and the ruled alike.

Research on legitimacy is now moving beyond the governmental sphere to areas of authority outside it—to economic institutions, nongovernmental organizations, criminal justice systems, international bodies of all kinds, and to other authority domains. Attempts are being made to quantify the degree of legitimacy of different regimes and to explore more deeply the psychological processes involved in legitimation. Moreover, with the check being experienced to the so-called third wave of democracy, interest is being revived in exploring the legitimating bases of authoritarian regimes, on the assumption that they cannot be understood as either premature or failed democracies but need to be analyzed on their own terms. All these developments promise an even richer research agenda for the study of legitimacy in the future.

LIBERAL PARTIES

Liberal parties (LPs) represent one of the major party "families," such as the conservative, socialist, and nationalist parties originating from the 19th- and early-20th-century cleavages and party systems, in the context of which they have to be placed. The major characteristics of LPs include a social background in bourgeois groups, which advocate individual and property rights and the rule of law, in opposition to feudal and autocratic forms of the state. This entry discusses the historical roots, social bases, ideological orientations, and contemporary developments of LPs.

Terminology

There are two kinds of terminological variety. In the first case, *liberal* can have rather different meanings concerning ideological orientations or a party's position within the party system. Whereas in the European tradition *liberal* usually refers to parties in the middle of the political spectrum, in the North American context, *liberal* has a more left-wing, or social-democratic, meaning. In the second case, LPs come with many different names. Whereas in the 19th-century LP labels were more consistent with basic ideological features, after 1945, this clarity began to diminish. Basically, the term originated after the French Revolution, when the term *liberal* had first been used by Spanish constitutionalists around 1812. Only in the second half of the 19th century did larger parties in Britain (in the Whig tradition) and Canada call themselves the *Liberal Party*, whereas in France or Italy terms such as *republicans* or *radicals* were more prominent. In some countries *freedom* labels prevail (e.g., Free Democrats in Switzerland, and later in Germany, and Party for Freedom and Democracy in the Netherlands). Examples of democratic parties exist, for example, in Luxemburg, whereas the U.S. Democrats show a mix of liberal but also social-democratic ideology. In Denmark, the term *venstre* (Left) is still in current use. Some (agrarian) center parties, such as those in the Scandinavian countries, were also close to liberalism. By contrast, parties with a definitely conservative character labeling themselves *liberal party* must not be included in the LP family, such as the Liberal Democratic Party in Japan or the Liberal Party in Australia, which for decades has been the conservative counterpart of Labour. After 1945, and particularly during the past decades, a stronger tendency can be observed to use *liberal* as a party label rather at random (e.g., the right-wing populist Liberal Democrats in Russia after 1991).

History

Early liberal movements developed, between the mid-18th and mid-19th centuries, from the cleavage between feudal society and an autocratic state, on the one hand, and commercial economy and bourgeois property and liberty interests, on the other. Economic and personal liberties, the rule of law, and parliamentary representation were core goals in the unfolding party competition with conservative ideologies and organizations. A second "classical" period has been characterized by success in parliamentary elections, development of stronger party organization, and even governmental majorities in several countries of Europe (e.g., in Great Britain) and elsewhere in the last third of the 19th century up to World War I and until some time after. A third period of decline of LPs, after World War I and during the 1930s, saw the rise of socialist/labor parties on one side and populist/fascist forces and regimes on the other. In a fourth period, after 1945, political system values in Western liberal democracies converged with party ideology, which weakened the specific profile and function of LPs. In many countries, they could only secure a minor position in the party systems.

Liberalism and LPs had their primary origin and relevance in Europe and some other regions such as North America. While Russia and China were dominated by communism, large parts of other continents, particularly Africa and Asia, have mainly been concerned with liberation from colonial rule. Only some Latin American countries developed conditions for liberal or "radical" parties; since the 1930s, military and populist authoritarian regimes created cycles of suppression and revolt unfriendly to LPs.

Ideology

Early liberal ideas focused on free, economically independent, enlightened individuals against an autocratic state, a feudal social order, and the moral and intellectual authoritarianism of the Catholic Church. Political values evolved around republican or at least constitutional principles, the rule of law, and limited state functions and political representation, quite often with concepts of limited suffrage. Economic principles highlight market economy, property and commercial freedoms of independent producers, industrial progress, economic growth, and free trade. Capitalist development produced tensions between securing competition by antitrust laws and other means and accepting capital concentration and corporate firms. Trade unions as a counterforce have been accepted only reluctantly.

In social terms, formal equality often gave way to equal opportunity and accepting factual inequality, class polarization, and economic domination by corporations and the wealthy. Supporting equality by education, however, has become a continuous program feature of LPs. Welfare state institutions have long been neglected but finally seen as inevitable to a limited degree.

In the course of history, a growing “ambivalence of liberalism” and tensions inside LPs or between different LPs developed between the liberal-conservative and liberal-radical or social-liberal currents, with radicals or liberal-radicals advocating more republican, democratic, and secular values. These tensions intensified under the pressure of rising socialist or social-democratic parties before and after World War I, in the face of corporate capitalism, and within less polarized party systems after World War II, when LPs in many countries leaned toward liberal-conservative positions rather than liberal-radical or social-liberal ones.

Party Organization

Traditionally, party organization in terms of membership and professional organization of LPs has been rather weak. While representing independent middle-class groups, a cadre, or elite, structure prevailed. Strong links with large special-interest organizations have been more scarce. In addition, a culture of individualistic attitudes has been prevalent in liberal circles, even more so in recent times of growing individualism. LPs rely heavily on members who are lawyers or doctors, independent businesspeople, and in the education services and tend to be less member than voter parties. For party finances, they often depend on state sources or strong economic interests.

Electoral Base, Government Participation

In the period after 1945, LPs had, at least in Europe, on the average, a minor electoral position. Their record of government participation, however, was considerably stronger in the form of coalition parties. Only in a few European countries could the LPs establish a strong government position such as in Luxemburg (Democratic Party), Denmark (Venstre), Switzerland (Free Democratic Party [Freie Demokratische Partei]), and for some time in France (Union for French Democracy [Union pour la Democratie Francaise, UDF], a merger party in the 1970s and 1980s). Medium-sized parties such as the Dutch People’s Party for Freedom and Democracy (Volkspartij voor Vrijheid en Democratie, VVD), the Belgian Party for Freedom and Progress (Partij voor Vrijheid en Vooruitgang, PVV/Parti de la Liberté et du Progrès, PLP), or small parties such as the Free Democratic Party (Freie Demokratische Partei, FDP) in Germany, the Liberal Party in Norway, the Radicale Venstre in Denmark, and the Dutch D’66 could also participate in coalition governments for longer periods of time. Outside Europe, only the Liberal Party in Canada maintained itself as the most important national government party for decades, from the late 19th century and also after 1945.

The main factors for the structural weakness of most LPs are party systems dominated by conservative or Christian-democratic parties and social-democratic ones, with only moderate left/right polarization, in a context of declining ideologies. In addition, Western liberal democracies strongly integrated liberal values into their constitutional structure and weakened the ideological profile of LPs. In terms of the electoral base, problems arose from social structural changes: The decline of the old middle class of independent businesses necessitated moves toward the employed service class of middle-level employees against much external competition and internal tensions. Since the 1980s, Green parties have emerged as a new competitor for young, urban, and well-educated social groups. Thus, unless LPs could operate from a well-established governmental position (such as in

Canada and some European countries), structural conditions changed rather unfavorably in the 1960s and 1970s. Since the 1970s, ideological developments toward neoliberalism have moved LPs into a closer relationship and, at the same time, stronger competition with modernizing conservative parties.

Contemporary Developments

In the context of the recent waves of democratization (1970s to 1990s), one would have expected that the LPs would play stronger roles owing to their affinity with liberal democracy. In fact, during these transformation periods, some parties with liberal ideology or name emerged, but they turned out to remain rather weak and often could not survive under a polarization between left-wing liberation movements and conservative or even reactionary forces.

The fall of military or other dictatorships in Southern Europe and Latin America in the 1970s and 1980s only restored small currents of liberal organizations, somewhat stronger in Argentina's radical tradition (Radical Civic Union). A special case developed in South Africa in the concluding phase of the apartheid regime (Democratic Alliance).

In Russia and Eastern Europe in the early 1990s, the fall of communist regimes finally opened up new opportunities for LPs, which, however, only materialized to a small degree. The double transformation toward liberal economic and political systems with their high economic and social costs for the population, in combination with increasing electoral barriers and missing structural traditions of an independent middle class, has been unfavorable for sustainable LPs. Thus, early offshoots soon reduced in size, such as Yabloko in Russia, or transformed ideologically (in a conservative direction, such as the Civic Union in the Czech Republic, or even to right-wing populism, such as FIDESZ in Hungary). Some potential developed in Slovenia and, after several electoral turnabouts, in Poland, where the Civic Union as a liberal-conservative governing party could emerge from the 2007 election.

Since the 1980s, globalized capitalism has converged with ideological currents of neoliberalism, which has led LPs in many countries to advocate deregulation, low taxes, and downgrading welfare state and public sector functions, with a stronger affinity to conservative (neoconservative) parties and coalitions. The consequences of the dramatic worldwide financial and economic crisis of 2008 may, however, leave them entrapped and in need of strategic reorientation.

Apart from economic liberalism, currently, LPs are once again stressing the values of religious tolerance and secularism as well as protection of lifestyle minorities. In addition, the new technological capacities for surveillance put the limitation of state powers back on the agenda of LPs.

Transnational Networks

In 1947, LPs formed the Liberal International (http://www.liberal-international.org) for fostering some ideological coherence, cooperation, and support for emerging parties. Their membership list, sometimes with new entries and expulsions, provides at least an indicator for identifying LPs in times of decreasing clarity of labels. On a regional basis, the Alliance of Liberals and Democrats in Europe and its caucus in the European Parliament and in the Council of Europe represent a further step in transnational organization.

LIBERALISM

Liberalism offers a prescription of how the state is to deal with citizens: Loosely speaking, the state is to address citizens as equal individuals. The rise of liberalism therefore requires the prior or more or less simultaneous development of a strong principle and practice of individualism. There is a considerable literature on the roles of individualism and of individualist Protestantism in the development of capitalism but a far less rich discussion of its role in the development of political liberalism. This is not a little odd, because political liberalism is defined specifically for a society of individuals, and it requires constitutional protections of individual citizens against intrusions by the state. These three concepts—individualism, constitutionalism, and liberalism—are closely related historically, causally, and conceptually. Before turning to the structure or content of liberalism, there are two major preliminary issues to discuss here: an explanation of why liberalism came to its central place in political theory and practice when and where it did and some account of how it can be protected or enforced.

Individualism

Political liberalism is inherently a philosophy and practice of protecting individuals to live and act as they please, so long as they do not harm others; without individualism, therefore, it has no point. The central figure in the history of a vision of the place of individualism in political theory is Thomas Hobbes, who assumes individualism in his account of social order and the state. One might suppose that his assumption of individualism is normative or libertarian. But for him, in fact, it is much more explicitly a descriptive and causal issue just as Karl Marx's or Max Weber's account of economic motivation is causal. Descriptively, individualism is based on an assumption about human nature. Causally, therefore, it is a necessary part of the explanation of human behavior and, by implication, of political institutions that are designed to deal with individuals. We are self-interested; therefore, to explain our behavior, one must start from the assumption of self-interest.

Historians continue to debate when, where, and why individualism first arose. The most common view is that peasants in England were communally organized and held together by the fetters of the kinship group, and their land was collectively, not individually, owned. Economic progress required what Weber calls "defamilization." Richard H. Tawney observes that most people in England in the 16th century "have never seen more than a hundred separate individuals in the course of their whole lives, where most households live by tilling their great-grandfather's fields with their great-grandfather's plough" (quoted in Alan Macfarlane, 1978/1979, pp. 53–54). In its Greek origin, *economy* means household management, and until recent centuries, that would still have been its apt meaning in most of Europe. For the overwhelming majority of people, there was little exchange and virtually no money or commerce; there was at best merely self-sufficiency in a subsistence agrarian society. In a society under these conditions, liberalism is irrelevant.

Major historians of the relevant periods, such as Thomas B. Macaulay, among the greatest of liberals, commonly do not include individualism in their indexes, whereas the idea runs through the work of the great liberal theorist Leonard T. Hobhouse. In reading the historians who frequently delve into political theory, one often wonders where Hobbes has gone. Not surprisingly, Friedrich A. Hayek makes a major issue of individualism and, implicitly, of Hobbesism. For many liberal theorists, the world of Hayek and Hobbes is in principle our world. In fairness, many other scholars address individualism, although somewhat obliquely, through discussions of Puritanism and Calvinism and the role of individualist Protestant religions more generally in the development of capitalism. While these individualist religions are surely causally important, secular aspects of social life in these centuries and even the secularizing tendencies of the individualist religious beliefs provide the final force for remaking English social and economic relations well ahead of continental Europe.

Liberalism is widely recognized as a magnificent social invention, perhaps the greatest political invention of modern history, not least because it effectively created political modernity. Its development required one of the greatest changes in social structure ever experienced. Elements of it or local instances of its elements precede modern times, but the real transformation begins in a big way only in the 17th-century era of the spectacular efflorescence of—especially—Anglo-Saxon political theory. Hobbes is arguably the most important figure in this movement in part because he is the most insistent on the individualist focus. He is much less concerned with property than with social order. Indeed, he treats property and its protection as required for social order as well as for prosperity. One could rightly say that order must precede finer issues of wealth and prosperity, so that liberalism depends on order. And one should note that Hobbes wrote against the background of brutal wars that likely informed his vision. Later writers, such as John Locke and the grand economists in the line of Adam Smith, could focus on economic growth and "the wealth of nations." Hobbes's case shows that the two strains of liberalism—individualism and constitutional protections—can be separated in theory, and the English case shows that they can be at least piecemeal separated in the institutions that make them work in practice.

Why did liberalism come so late in history? Its appeal seems almost obvious. But social structures virtually blocked it through most of history. Pervasive, brutal poverty got in the way of concern for liberty, so much so that much of the vocabulary of liberalism is a late invention. Rather than a concern with liberty, which must have been hollow, with its implication of a right to starve a few centuries ago, rural families must sooner have focused on collective family welfare and fears of famine and sickness. The development of the transformative concern with individualism came first in England, and therefore, the idea of liberalism seems English, although it is soon followed by a somewhat different French conception.

Anarchists such as William Godwin might hold the optimistic view that individualism could drive a liberal society through the loosely coordinated individual efforts of large numbers of people without an overbearing government. But autocracy is a more likely form of government—the form that has controlled most lives historically. While continental monarchies, especially in France and Spain, increasingly passed into greater despotism, the English became more liberal over many centuries. There were retrograde moves, such as the proclamation of the doctrine of the divine right of kings and the introduction of the Star Chamber. The final reign of autocracy in England was the monarchy of the Stuart, Charles I, who, oddly, signed the strikingly liberal "Petition of Rights" but then went on to ignore its agreed constraints on his actions.

Constitutionalism

The 1787 U.S. Constitution, one of the greatest liberal documents, written in light of English experience, ironically, did not include explicit statements of many of the protections that liberals and what would now be called constitutionalists wanted. Many of these, including freedoms of the press and of religious conscience, were added to the constitution in its first 10 amendments, the "Bill of Rights." It may seem peculiar to create government in order, at least in part, to protect individuals against government when that government is implicitly enabled to act against individuals as readily as to act for them. There is no theoretical guarantee that a supposedly liberal state will or must rein itself in. Constitutionalism is therefore at best a pragmatic move that might work or that might fail. In the vocabulary of *The Federalist Papers*, a constitution is only a parchment barrier that is implicitly no barrier at all. In the history of this and many constitutions, such barriers have often been overridden, even trampled by powerful office holders. When constitutions succeed in regulating conduct, they do so for social psychological reasons and through James Madison's device of countering ambition with ambition.

The rise of constitutionalism has been a long-drawn-out process. The set of liberties to be protected has grown, and support for protection of many of these is virtually universal in liberal states today. Historical struggles over protection of freedoms of the press and speech more generally are typical of several other protections of civil liberties and civil rights. Historically, the most important issue for initial constitutionalism is the protection of freedom of religious conscience and practice. This is the issue that tore societies apart and that still plays a fundamental role in the development of liberalism. Diverse Christian sects were the chief problem in the United States in 1787. Islam, especially militant Islam, is regarded as a problem in much of Europe and North America today. Hobbes noted the near impossibility of assessing or controlling variant religious beliefs in an era in which, for example, England and Holland were increasingly diverse in their religious commitments. Still, he allowed enforcement of religious practices as supposedly necessary for maintaining order. The wreckage caused by religious conflicts in England in his time arguably licenses his illiberal views on this issue.

The Harm Principle

The harm principle says that I may do anything I please so long as I do not harm others. This principle, which has been stated over many centuries by many people in varied ways, has been elevated with its seductive and almost self-defining label by John Stuart Mill, who has perhaps, therefore, come to own the idea despite its common currency. One could say that this principle is the central commitment of liberalism: Do not interfere in the deliberate actions of others whose actions do no harm to us. Mill calls it a very simple principle, but the remarkably extensive commentary on it suggests, rightly, that it has subtle nuances and complex potential meanings. Mill argues against many state regulations, some of them offensively intrusive and some ostensibly beneficial. For example, to go back to the early foundation of liberalism, the state should not impose religious beliefs, qualifications, or practices on its citizens.

Strong defenders of the principle mean it to imply that, if you clearly know that what you are doing is harmful mainly to yourself alone, neither the state nor I should interfere; we should let you harm yourself. When this view is stated in the abstract, it offends many people because it seems to be cruel. But in actual fact, Mill is descriptively right: We commonly act on the strong form of the principle. For example, we do not prevent you from killing yourself through harmful or risky actions such as smoking, skydiving, and experimenting with powerful drugs. It is your life even if you wish to destroy it or to risk doing so. We might even be barred from interfering in your choice to commit suicide. Here, one of the difficult nuances pops up. We might suppose that your suicidal urge is somehow a mistake or a brief and aberrant psychological urge and that you would be grateful tomorrow for our interference today. If we confidently hold these views, what should we do?

Rule of Law

It is hard to read the early history of England without stumbling into surprising, brutal issues of unequal treatment under the law and of high-handed actions by the powerful that are not grounded in law. What today would be legal matters were formerly matters to be resolved by politics, power, and even murder. If the monarch or a baron wanted you out of the way, you had little recourse other than flight. Women, slaves, and serfs were often treated with brutality. In early medieval times, different status groups were subject to different laws and, especially, different punishments for the same offense. The rule of law includes a crude principle of fairness according to which all are subject to the same law and under which there can be no separate statuses for citizens.

In its first article, the 1789 version of the French revolutionary Declaration of the Rights of Man and Citizen stipulates, “Men are born and remain free and equal in rights; social distinctions may be based only upon general usefulness.” This vision may be taken as the ultimate guiding principle of the rule of law. The main target of such a principle is arbitrary government, and the main resolution of this principle is to guarantee that everyone will be treated in accordance with the law. To make this work, there must be general social order and institutions to control officers of the government.

Commitment to the rule of law is of a piece with concern to limit government, which is the main point of constitutionalism. Liberalism and constitutionalism are interdependent defining features of political modernity. If a constitution does not limit government, it is a failed constitution. In this respect, yet again, constitutionalism, liberalism, and individualism are joined together. Already at the height of concern with the rule of law and limited government, however, Jeremy Bentham concludes that government is a close corporation with a vested interest that is potentially hostile to the collective welfare of its society, a view echoed later by John C. Calhoun. Their view is that democracy in England and America is increasingly turning corporatist. As is often more generally true, Bentham is prescient on this development, which must have distressed him deeply because it must undermine his belief in democracy as essentially utilitarian. This conclusion casts a pall over modern democratic society. If democracy is not utilitarian, there is little hope for a generally good form of government. Bentham’s great utilitarian book, *An Introduction to the Principles of Morals and Legislation*, virtually trumpets the association of democracy with utilitarianism. The book is unusual in the identification of its personal moral theory with its political theory: These do not live in separate worlds, as they otherwise typically do in most of normative theory. Their separation is deplored by David Hume and Jeremy Bentham.

Religion

Protection of religious freedom is the fundamental concern that has driven political theory since well before Hobbes. In the United States, the principal obstacle to government enforcement of particular beliefs has been the radical fractioning of beliefs, which nicely sets up a resolution of conflicts over religion in the United States, where the sheer numbers of sects fuels widespread opposition to selecting any sect as the national religion. The only workable compromise in 1787 was to rule out any official recognition of religion and especially to rule against establishing a state church. The problem of religion, which led to heated debates during the constitutional era in the United States, was virtually settled by this provision of the constitution. Indeed, the first Supreme Court case on religion, *Reynolds v. United States* (1878), came before the Court 90 years after the adoption of the constitution. This decision ruled against the Mormon practice of polygamy on pragmatic rather than on religious grounds. The judgment in *Reynolds* is that under religious freedom, one may believe whatever one may, but one cannot act in any way one chooses. It might seem to be hard to formulate an objection to polygamy from the harm principle, but many people do object that the practice of polygamy harms the status of women generally.

Multiculturalism and Group Rights

Over the past few decades, a multiculturalist movement has grown. This is both a matter of claims of particular groups and claims of academic theorists who take themselves to be defending the cultural rights of various minority cultural groups. Liberalism has no resources for dealing with groups, especially large groups well beyond the scale of the family, except to treat them as individuals aggregated into groups. But the features of the aggregations or of the groups play no role in standard liberal treatment of them. Indeed, standard liberal theory often conflicts with claims by the advocates or actual members of the groups themselves. Such theory has invariably been framed for individuals, and on the evidence of the weak, supposedly liberal arguments of academic defenders of the liberal nature of such groups, the liberal theory cannot easily be recast for groups. The greatest conflict commonly arises from certain groups' extremely illiberal treatment of their own children and of women in the groups.

Among the demands that such groups make is to limit their children's education, often so severely as to cripple any chances those children might have to survive outside the groups. In some cultures, girls are not educated at all, and boys are educated primarily in religious texts, such as the Talmud or the Koran. Another common demand is to have public agencies and schools speak in the native languages of the groups. Apart from Spanish, perhaps no other language is common enough across the United States for dual language policies to work at reasonable cost.

A liberal perspective on subgroups with which people are free to identify within a society is not strategically analogous to standard individualist political and economic liberalism. Such a "group liberalism" violates the strategic logic of liberalism. A policy to maintain a cultural group's autonomy and distinctive norms is not likely to motivate the most politically important groups in liberal societies. In particular, if a state attempts to maintain a cultural subgroup's autonomy, the state takes the risk of creating a politically influential class. Nor are resolutions of group problems likely to be self-enforcing, for example, in the ways in which the old liberalisms, once in place, are self-enforcing or a workable constitution is self-enforcing.

The greatest threat to the survival of an immigrant cultural subgroup's ways and norms is the next generation of the group itself. Their interests are often not served by the group's static values and norms. In this, group liberalism has failed. To preserve the group's character, the state would most likely have to intervene to coerce that generation into line. This coercion need not be so draconian as that of the Saudi Arabian morality enforcement squads (the *mutawa*), but it would be dispiriting for many people in the group. It would violate most aspects of liberalism, including the harm principle, and very likely, if the culture discriminates by gender, it would violate the rule of law that requires equal treatment under law. In many of the cases argued in the recent explosion of multicultural arguments, it seems also likely to violate individualism and religious freedom.

At its worst, the violation of religious freedom is astonishing. For example, in the view of many Islamic clerics, apostasy from Islam is a capital offense. Therefore, Salman Rushdie was threatened with murder under a fatwa. It is a remarkable and distressing feature of claims for protecting culture or so-called group rights that they commonly do not address the reality of those claims and, in particular, their violation of the fundamental principles of liberalism. One can reject liberalism in defense of these claims, but it is perverse and wrong to suppose that these claims are or can be reformulated in liberal terms. They cannot be. There might be good moral defenses of various subcultural group practices, but liberalism cannot be distorted enough to provide a defense that merits the hallowed label *liberal*.

Incidentally, "group rights" is at least half an oxymoron. The individualism of rights collapses under the weight of a group. Moreover, groups of any numerical significance are sure to be very indistinct and poorly definable. Does Rushdie continue to be a member of the community of Muslims when he ceases to believe or when Islamic leaders target him for murder?

Liberalism in Moral Theories

With its individualist focus, liberalism seems consonant with the two leading moral theories of our time: utilitarianism and Kantianism. Kantianism might require a lot of groundwork to fit it to what is rightly framed as a consequentialist theory. Immanuel Kant famously asserted that justification of actions from their consequences is immoral, but he was not consistent in this odd view that would virtually rule out any serious understanding or justification of political institutions, whose usual purpose is to effect good consequences.

Writers from Bentham to Hobhouse have argued for a strong connection between liberal and utilitarian principles. Indeed, Bentham essentially derives liberalism from utilitarianism. The harm principle is readily seen as utilitarian, as are the rule of law and freedom of religious conscience, which are conceived of as individualist principles. Insofar as Kantian theories focus on the individual, they too must honor these principles.

Individualism and liberalism have often been associated with utilitarianism, perhaps merely because Mill and others took up all of these. But Mill would likely insist that they are logically coupled. Insofar as Kantian theory is individualist, it too tends to fit with liberalism through its implications for individual autonomy, which, with liberty, is an individual concern. Other moral theories generally do not seem to generalize straightforwardly to a political theory.

LIBERALISM IN INTERNATIONAL RELATIONS

This entry presents an overview of recent trends and developments in liberal international relations theory—both empirical and normative. An effort is made to highlight the link between contemporary liberal scholarship on international relations and the thought of classical liberal figures such as John Locke, Adam Smith, Immanuel Kant, Giuseppe Mazzini, and John Stuart Mill. The first part of the essay introduces key liberal principles and ideas and identifies three different traditions of liberal thought on international relations. Thereafter, we discuss classical and contemporary theories on the relationship between liberal democracy and international peace, followed by an overview of related, recent scholarship on global governance and international cooperation among democracies. The final part of the essay briefly discusses two alternative liberal approaches to the ethics of military intervention and shows, in particular, how liberal theorists, while they all share a fundamental attachment to representative governance and human rights, can fundamentally differ in their support for coercive regime change.

Basic Liberal Principles and Institutions

Liberalism resembles a family portrait of principles and institutions, recognizable by certain characteristics—such as individual freedom, political participation, private property, and equality of opportunity—that all liberal democratic societies, by definition, share to some degree. Political theorists identify liberalism with an essential principle: the importance of the freedom of the individual. Above all, this is a belief in the importance of moral freedom, of the right to be treated and a duty to treat others as ethical subjects and not as objects or means only.

The ideal version of liberalism is marked by a shared commitment to four essential institutions. First, citizens possess juridical equality and other fundamental civic rights such as freedom of religion and the press. Second, the effective sovereigns of the state are representative legislatures deriving their authority from the consent of the electorate and exercising their representative authority free from all restraint apart from the requirement that basic civic rights be preserved. Most pertinent, for the impact of liberalism on foreign affairs, the state is subject to neither the external authority of other states nor the internal authority of special prerogatives held, for example, by monarchs or military bureaucracies over foreign policy. Third, the economy rests on a recognition of the rights of private property, including the ownership of means of production. Property is justified by individual acquisition (e.g., by labor) or by social agreement or social utility. This excludes state socialism or state capitalism, but it need not exclude market socialism or various forms of the mixed economy. Fourth, economic decisions are predominantly shaped by the forces of supply and demand, domestically and internationally, and are free from strict control by bureaucracies.

Locke, Smith, and Kant: Three Pillars of Liberal Internationalism

Liberal internationalism consists, at its most fundamental level, in the attempt to promote the aforementioned principles and institutions across national borders and apply variations thereof to international relations. The classical realists from Thucydides onward described an international state of war that could be mitigated, but not overcome, short of a world Leviathan. The classical liberals, with important variations, broke with this skeptical tradition and announced the possibility of a state of peace among independent, sovereign states.

Contemporary scholarship on liberalism and international relations looks back at three distinct traditions of liberalism, attributable to three groups of theorists: John Locke—the great founder of modern liberal individualism, who claimed that states have themselves rights derived from individual rights to life and liberty (political independence) and property (territorial integrity), thereby providing the liberal foundations of international law; Adam Smith, Baron de Montesquieu, and Joseph Schumpeter—brilliant explicators of commercial liberalism and what they saw as its natural result, liberal pacifism; and finally, Immanuel Kant and Giuseppe Mazzini—liberal republicans who theorized an internationalism that institutes peace among fellow liberal republics. The liberal republican tradition, while incorporating to some degree both liberal individualism and commercial liberalism, has exerted the greatest influence on contemporary liberal international relations theory. It argues that liberal democracy leaves a coherent international legacy on foreign affairs: a separate peace. Liberal states are peaceful with each other, but they are also prone to make war on nonliberal states.

A Separate Peace Among Liberal Democracies

The claim that liberal constitutional states behave differently in their foreign relations goes back at least as far as Immanuel Kant and Thomas Paine, but attempts to demonstrate it empirically are more recent. In the 20th century, Clarence Streit (1938) first pointed out the tendency of modern liberal democracies to maintain peace among themselves, and Dean V. Babst (1972) was the first to find statistical support for the hypothesis. Over the past 3 decades, scholars have found strong empirical evidence for the existence of a separate peace among liberal democracies but not between democracies and nondemocracies. Critiques of the separate-peace proposition have focused largely on the underlying causal argument, suggesting that the interdemocratic peace might be simply a by-product of bipolarity and related strategic alliance patterns during the Cold War (see, e.g., Henry Farber & Joanne Gowa, 1997).

Michael Doyle, in his 1997 book *Ways of War and Peace*, argues that two centuries of separate peace among liberal democracies cannot be dismissed as an epiphenomenon, or by-product, of strategic alliances; in fact, stable international alliance patterns among liberal democracies appear to be largely a consequence of shared liberal values and domestic institutions. Doyle develops an original explanation of the separate peace among liberal democracies based on Kant's essay "Perpetual Peace." In Doyle's interpretation, Kant's hypothetical peace treaty shows how liberal republics lead to a dichotomous international politics: peaceful relations—a pacific union—among similarly liberal states and a state of war between liberals and nonliberals.

First, Kant viewed the republic, based on constitutionalism and popular representation, as the ideal form of government; he understood that republican governments would introduce various institutional restraints on foreign policy and ingrain the habit of respect for individual rights. Of course, we know today that domestic republican restraints do not automatically end war. (If they did, liberal states would not be warlike, which is far from the case.) Kant seems to have been well aware of this: He pointed out that institutional restraints merely introduce republican caution, or hesitation, in place of monarchical caprice. In line with this intuition, modern democratic liberalism does not need to assume either that public opinion directly rules foreign policy or that the entire governmental elite is liberal. It can instead assume that the elite typically manages public affairs but that potentially nonliberal members of the elite have reason to doubt that illiberal policies would be electorally sustained and endorsed by the majority of the democratic public. In other words, liberal states fight only for popular, ostensibly liberal purposes since elites need to be constantly concerned about domestic support for the war effort.

Second, Kant foresaw that liberal republics would progressively establish peace among themselves by means of the pacific union described in his Second Definitive Article of Perpetual Peace. Kant probably had in mind a mutual nonaggression pact or perhaps a collective security agreement with a rudimentary court of arbitration. Complementing the constitutional guarantee of caution, international law adds a second source—a pledge of peaceful respect. As republics emerge (the first source) and as culture progresses, an understanding of the legitimate rights of all citizens and of all republics comes into play; and this, now that caution characterizes policy, sets up the moral foundations for the liberal peace. Correspondingly, international law highlights the importance of Kantian publicity. Domestically, publicity helps ensure that the officials of republics act according to the principles they profess to hold just and the interests of the citizens they claim to represent. Internationally, free speech and the effective communication of accurate conceptions of the political life of foreign peoples are essential to establish and preserve the understanding on which the guarantee of respect depends.

Kant's categorical imperative of course requires that all statesmen and liberal republics reject imperialism and international aggression on moral grounds. But liberal republics cannot simply assume reciprocal peace with all other states; instead, they understand that states subject to international anarchy are potentially aggressive. Only republics tend to be consensual and constrained, and they are therefore presumed capable by other republics of reliable mutual accommodation. The experience of cooperation among republics helps engender further cooperative behavior when the consequences of state policy are unclear but (potentially) mutually beneficial. In short, fellow liberals benefit from a presumption of amity; nonliberals suffer from a presumption of enmity. Both presumptions may be accurate. Each, however, may in particular cases also be self-fulfilling.

Finally, Kant's cosmopolitan law, discussed in his "Third Definitive Article of Perpetual Peace," adds material incentives to moral commitments. The cosmopolitan law and the related right to hospitality permit the spirit of commerce to take hold of every nation sooner or later, thus creating incentives for states to promote peace and try to avert war. Building on this classical liberal intuition, modern economic theory holds that under a cooperative international division of labor and free trade according to comparative advantage, each national economy is better off than it would have been under autarchy—hence, each participant acquires an incentive to solve disputes peacefully and avoid policies that would lead others to break mutually advantageous economic ties. Furthermore, the international market removes difficult decisions of production and distribution from the direct sphere of state policy. As a result, a foreign state does not appear to be directly responsible for unfavorable economic outcomes—states can stand aside from, and to some degree above, contentious market rivalries and be ready to step in to resolve crises. Finally, the interdependence of commerce and the related international contacts of state officials help create crosscutting transnational ties that serve as lobbies for mutual accommodation. The variety of ties among liberal states across numerous issue areas also ensures that no single conflict sours an entire relationship by setting off a spiral of reciprocated retaliation.

In recent years, some scholars, such as Georg Cavallar and John MacMillan, have taken issue with Doyle's interpretation of Kant as the father of modern democratic peace theory. According to these critics, Kant's pacific union, the foedus pacificum outlined in his second definitive article, was probably intended to include all states and not just liberal republics. Stefano Recchia and Nadia Urbinati (2009) go one step further and suggest that the first to explicitly anticipate the emergence of a separate peace among constitutional democracies, based on a defensive pact of alliance against despotic states, was not Kant but Giuseppe Mazzini, the 19th-century revolutionary thinker and democratic political activist.

Against these views, Doyle holds that there are good reasons to view Kant as the founding figure of modern democratic peace theory, and he interprets Kant as requiring that peace must be established by a rightful constitution involving all three definitive articles. Most current scholarship on the democratic peace focuses either exclusively on the role of liberal-democratic institutions, liberal norms, or economic interdependence. But Kantian liberal peace theory, as developed by Doyle, is neither solely institutional, nor solely ideological, nor solely economic: It is only together that the three specific strands of liberal institutions, liberal ideas, and the transnational ties that follow from them plausibly connect the characteristics of liberal polities and economies with sustained liberal peace among states that meet the three criteria embedded in the three definitive articles. Statistical data sets on the liberal peace do not adequately code for these three factors together. As noted by Bruce Russett and John Oneal, the most thorough recent empirical test of the liberal peace hypothesis confirms the separate positive effects of democratic institutions and international trade (as well as membership in international organizations), but it does not separately code for liberal norms and related interdemocratic trust, which may indeed be difficult to measure through quantitative analysis.

Global Governance and Cooperation Among Democracies

Classical liberals such as Bentham, Kant, and Mazzini anticipated that international institutions (especially arbitration courts but also more advanced international federations with their own parliamentary assemblies) would reduce uncertainty and improve mutual trust among states, thereby attenuating the security dilemma and actively promoting international cooperation and world peace. In recent decades, international relations theorists have systematically developed and corroborated this intuition.

Relying on new insights from game theory, scholars during the 1980s and 1990s emphasized that so-called international regimes, consisting of agreed-on international norms, rules, and decision-making procedures, can help states effectively coordinate their policies and collaborate in the production of international public goods, such as free trade, arms control, and environmental protection. Especially, if embedded in formal multilateral institutions, such as the World Trade Organization (WTO) or North American Free Trade Agreement (NAFTA), regimes crucially improve the availability of information among states in a given issue area, thereby promoting reciprocity and enhancing the reputational costs of noncompliance. As noted by Robert Keohane, institutionalized multilateralism also reduces strategic competition over relative gains and thus further advances international cooperation.

Most international regime theorists accepted Kenneth Waltz's (1979) neorealist assumption of states as black boxes—that is, unitary and rational actors with given interests. Little or no attention was paid to the impact on international cooperation of domestic political processes and dynamics. Likewise, regime scholarship largely disregarded the arguably crucial question of whether prolonged interaction in an institutionalized international setting can fundamentally change states' interests or preferences over outcomes (as opposed to preferences over strategies), thus engendering positive feedback loops of increased overall cooperation. For these reasons, international regime theory is not, properly speaking, liberal, and the term *neoliberal institutionalism* frequently used to identify it is somewhat misleading.

It is only over the past decade or so that liberal international relations theorists have begun to systematically study the relationship between domestic politics and institutionalized international cooperation or global governance. This new scholarship seeks to explain in particular the close international cooperation among liberal democracies as well as higher-than-average levels of delegation by democracies to complex multilateral bodies, such as the European Union (EU), North Atlantic Treaty Organization (NATO), NAFTA, and the WTO (see, e.g., John Ikenberry, 2001; Helen Milner & Andrew Moravcsik, 2009). The reasons that make liberal democracies particularly enthusiastic about international cooperation are manifold: First, transnational actors such as nongovernmental organizations and private corporations thrive in liberal democracies, and they frequently advocate increased international cooperation; second, elected democratic officials rely on delegation to multilateral bodies such as the WTO or the EU to commit to a stable policy line and to internationally lock in fragile domestic policies and constitutional arrangements; and finally, powerful liberal democracies, such as the United States and its allies, voluntarily bind themselves into complex global governance arrangements to demonstrate strategic restraint and create incentives for other states to cooperate, thereby reducing the costs for maintaining international order.

Recent scholarship, such as that of Charles Boehmer and colleagues, has also confirmed the classical liberal intuition that formal international institutions, such as the United Nations (UN) or NATO, independently contribute to peace, especially when they are endowed with sophisticated administrative structures and information-gathering capacities. In short, research on global governance and especially on the relationship between democracy and international cooperation is thriving, and it usefully complements liberal scholarship on the democratic peace.

The Ethics of Military Intervention: Should Liberal Democracy Be Imposed?

Liberal thinkers on international relations have always displayed a keen interest in the ethical dimension of foreign policy, based on the assumption that ideas, as well as material interests, ultimately determine state behavior. Thus, questions about the admissibility and desirability of military intervention to spread or uphold liberal values abroad were central to the political thought of seminal figures, such as Kant, Mazzini, and Mill. The classical realists, for their part, did not necessarily dismiss normative concerns entirely (unlike their contemporary followers); yet they were skeptical about the possibility for moral behavior in an anarchical environment where state survival was assumed to be constantly at stake.

Contemporary liberal theory on military intervention consciously builds on the classics. At the risk of oversimplification, one can identify two groups of liberal scholars in the ongoing normative debate on military intervention and regime change: cosmopolitan interventionists, on the one hand, and liberal internationalists, on the other.

Cosmopolitan interventionists typically build on Kant's moral theory, but they only loosely follow his political thought. They assert that everyone who has the ability to intervene militarily in the face of systematic human rights violations also has a moral duty to do so, subject to criteria of effectiveness and/or proportionality. For cosmopolitans, if a state is tyrannical and systematically oppresses its own population, it "forfeits any respect for its independence." As noted by Brian Barry (1998), by implication, "international [military] intervention to displace the government and, if necessary, place the country under international trusteeship" (p. 160) is always prima facie morally justified and indeed required, although prudential considerations might ultimately counsel against the use of force. (See also David Luban, 1980.)

Liberal internationalists, on the other hand, have tended to place greater value on state sovereignty and the attendant international duty of nonintervention. Kant favored absolute nonintervention as a matter of principle: He thought it necessary to stabilize international relations and to ensure that each political community could freely determine its own way of life. Mazzini and Mill were not categorically opposed to military intervention (e.g., they justified it to end protracted civil wars and to save helpless populations from outright slaughter); yet they vigorously opposed the use of force for the purpose of promoting liberty and democracy more generally. They sensed that unless tyranny was defeated domestically, with economic and diplomatic assistance from the outside but crucially without foreign military intervention, any liberty achieved would remain exceedingly fragile and could be hardly sustained in the long run.

Contemporary liberal internationalists such as Michael Walzer (1977) and John Rawls (1999) typically justify (but contrary to the cosmopolitan interventionists do not require) humanitarian military intervention as a last resort in the face of the worst human rights violations, such as state-sponsored slaughter or genocide, suggesting that sovereignty can be disregarded under similar circumstances. But they crucially insist that military intervention ought to be multilaterally authorized and overseen, ideally by the UN Security Council, if it is to be legitimate. The underlying assumption is that collective authorization and oversight reduce the risk of usurpation by powerful states (Doyle, 2006). Most contemporary liberal internationalists follow their classical forebears and reject policies of forcible democratization on both principled and consequentialist grounds. Democratic transformation is best fostered peacefully and indirectly through trade, investment, and foreign aid. These can help diversify societies, and diversified, growing societies tend to demand responsive governance in the long run.

Finally, most contemporary liberals agree that becoming a democracy is hardly a cure-all. Research suggests that overall and on average, the diffusion and consolidation of liberal democracy within countries reduces the chances of both international and civil war. However, there is also evidence that transitions to democracy often produce political turmoil at the domestic level, unless they are carefully managed. Where the rule of law and public institutions are weak, political elites will be tempted to use nationalist rhetoric and violence to achieve and hold office, which may result in international or civil war. Furthermore, as Doyle (1983) pointed out, the very respect for individual rights and shared commercial interests that establish grounds for peace among liberal democracies may establish grounds for additional conflict in relations between liberal and nonliberal societies. Evidence of this can be found today in relations between the United States and its liberal allies, on the one hand, and a resurgent Russia, emerging China, or defiant Iran, on the other. In short, liberal internationalism is no recipe: It merely offers a set of normative guidelines and empirical hypotheses—some of which are indeed supported by solid evidence—and it needs constant, prudent vigilance to avoid crusades and misguided interventions.

LIBERALIZATION

Liberalization is a process that reduces state control over the lives of persons subject to the authority of a state. It may have both economic and political dimensions. Economic liberalization reduces state intervention in the marketplace. Political liberalization expands individual liberty and rights, including the right to speak freely against state authorities and to organize with others to oppose those authorities. Economic and political liberalization may or may not go together. Political liberalization may or may not lead to democratization, which also enables a broadly inclusive electorate to unseat an incumbent government.

The concept of liberalization must be understood in the context of liberalism, the dominant modern political philosophy. Liberalism first emerged in the 17th century as a challenge to the notion that monarchs had God-given, absolute authority. Thomas Hobbes defended absolute authority but grounded it not in divine will but rather in the hypothetical agreement of the subjects to yield entirely to a sovereign their natural rights to defend life and property.

John Locke rejected Hobbes's argument. While agreeing that governmental authority is indeed grounded in the consent of the governed, Locke held that people would leave the state of nature and set up a commonwealth only if they could thereby protect their natural rights to life, liberty, and property. Rather than cede their natural rights to a sovereign, the people became the sovereign by virtue of the social contract through which they established the commonwealth. Monarchs were no more than magistrates who could be removed by the sovereign people if they failed to protect natural rights.

Jean-Jacques Rousseau, in turn, rejected Locke's emphasis on individual rights, returning instead to the Hobbesian concept of ceding natural rights to an absolute sovereign. But Rousseau also rejected Hobbes's idea of a sovereign separate from the people. He envisioned the whole people, acting together, a radically democratic polity in which individual rights had no place. Locke's liberalism was thus bracketed by two absolutisms.

Liberalism after Locke remained committed to protecting individual liberty, but it left behind the conventional device of the social contract. From the late 18th through the 19th centuries, liberals developed the idea of utility, or usefulness, as the central tool for discerning the good. Jeremy Bentham produced the most systematic formulation of utilitarianism as a means of judging what is good and bad. Adam Smith developed the quintessential defense of the free market as the best way to maximize productivity in the economic sphere. John Stuart Mill, the most influential liberal of the 19th century, elaborated utilitarianism as the foundation for a classic defense of individual liberty as well as for the enfranchisement of workers and women in a representative government.

Liberalism began with the project of defending individual liberties against encroachment by the state. The American Declaration of Independence is a classic statement of that sort of liberalism. Increasingly, though, liberalism was also concerned with the growing problem of democracy. The American Constitution, taking the form of an explicit contract among the people to set up a government, is just as concerned with protection from majority tyranny as it is with guarding against individual or oligarchic despotism. And John Stuart Mill, for all his advocacy of expanded suffrage, feared the tyranny of an unenlightened mass.

Liberalism thus betrays a fundamental tension. It denies God-given or traditional rank and privilege and posits the equality of all persons, yet enshrines a free marketplace that leads inexorably to capitalism and growing inequality of power and of wealth. Political liberalism presumes equality and opens the way to democracy but fears the threat to liberty posed by majority rule.

Liberalization, then, should be seen as movement toward liberalism, complete with the contradictions and tensions we have just explored. Its contemporary usage in political science may pertain either to the adoption of economic policies that reduce state intervention or to the opening of political processes to broader exercise of individual rights and liberties.

One major controversy concerns the extent of the association between economic and political liberalization. During the 1980s and 1990s, advocates of the Washington Consensus (the set of economic policies to be implemented by government in countries that are in a situation of economic crisis and recommended by international institutions such as the International Monetary Fund and the World Bank, both of them based in Washington, D.C.) expected that adoption of stringent economic liberalization (i.e., neoliberalism) would lead inevitably to political liberalization and democratization. This expectation was supported by the strong historical correlation between capitalist economic development and political democracy.

Nevertheless, recent evidence on this issue is far from conclusive. The heyday of the Washington Consensus did coincide with a substantial wave of democratization during the same period. On the other hand, a good case can be made that stringent economic liberalization imposes severe stresses on the society and thereby challenges the incumbent government. Many of those incumbent governments in the 1980s and 1990s were authoritarian; implementing economic liberalization tended to increase opposition and bring pressure for liberalization and eventual democratization. However, in other cases, such as the newly democratic Russia in the 1990s, economic liberalization promoted renewed movement in an authoritarian direction.

Two outstanding examples of rapid economic development strongly suggest that there is no association between economic and political liberalization. Singapore has had a vigorous capitalist economy since independence while maintaining an authoritarian regime with relatively low levels of repression but no serious challenge to the regime. And China, since the death of Mao Zedong in 1978, has seen a hugely successful economic liberalization coupled with maintenance of authoritarian control by the Chinese Communist Party, with no significant political liberalization.

A second issue concerns the relationship between liberalization and democratization. The earliest democracies (the United States, the United Kingdom, and France) all went from political liberalization to democratization over decades. The same may be said about some later-emerging democracies, such as Costa Rica, South Korea, or Taiwan. Even in these cases of successful democratization, liberalization was sometimes used by incumbent rulers in attempts to reduce pressure for democratization, as in Costa Rica in the 1940s. Where democratization was successful, it was often in spite of such prophylactic liberalization.

There have also been successful cases of prophylactic liberalization—notably Mexico and Botswana. Mexico arguably had the most successful authoritarian regime of the 20th century, with one ruling party (the Institutional Revolutionary Party, PRI) in power for more than 70 years. The regime used repression when it had to, but fundamentally, the party's survival depended on a façade of regular elections, which were invariably won by the PRI without egregiously obvious fraud, and substantial freedom of speech and press. Only toward the end of its rule, from 1988 to 2000, did it become obvious that the party had to use fraud and coercion to win. It was at that point that the PRI finally lost the presidency to an opposition candidate.

A similar pattern may be seen in Botswana, which was long cited as Africa's most successful democracy (until the South African transition to majority rule in 1996). As in Mexico, the same party has ruled the country for decades (since independence in 1966), but it operates through a regime with regular elections and substantial political liberties. In Botswana, the ruling party keeps winning because there is simply no viable opposition alternative. Fraud and repression play a smaller role here than in Mexico, but Botswana is still a one-party-dominant, liberalized regime and not a full-fledged democracy.

A final issue concerns the variables that promote or retard political liberalization. A substantial literature on transitions from authoritarian to democratic regimes focuses on the conditions of liberalization. A key question is the balance between internal and external pressures. An authoritarian regime that faces no organized internal opposition is extremely unlikely to liberalize, much less democratize. On the other hand, an opposition that is strong and unwilling to compromise with the regime may lead the latter to dig in and refuse to liberalize. As Adam Przeworski formulated the problem, liberalization is most likely when there are powerful regime elements that incline toward liberalizing reforms as a means of keeping power, while powerful opposition elements favor negotiating with the regime for liberalization, hoping that greater political openness will lead to democratization. An inclination toward reform may result from deteriorating economic conditions or other chronic problems that render the authoritarian regime less secure. In such a situation, regime reformers will favor liberalization as a prophylactic against democratization, while opposition moderates will see it as a step toward democratization. Each side may well think it has deceived and used the other, but they can nonetheless agree on moves toward liberalization.

Liberalization may also be a response to external pressures. Samuel Huntington showed that there have been three major global waves of democratization since the early 19th century, separated by periods in which democracy was in retreat. The waves were powered by great power policies in favor of democracy as well as political contagion from neighboring countries. For example, the Third Wave, running from the 1970s to the 1990s, saw the United States and its European allies strongly pushing for democratization of authoritarian regimes in Latin America in the 1980s and in Eastern Europe in the 1990s. Facing such pressure, even authoritarian regimes that did not face powerful internal opposition were nonetheless constrained, at a minimum, to liberalize.

In conclusion, liberalization is a movement toward either economic or political liberalism, enacted by an incumbent government. Economic liberalization is typically enacted under outside pressure, with the hope that a relatively unfettered market will benefit all, even the least advantaged. Political liberalization may respond to internal pressure or external pressure and is typically enacted in hopes of heading off full-fledged democratization. More often than not, however, liberalization opens the way to democratization.

LIBERTARIANISM

Libertarianism refers to a normative political theory that gives top priority to the value of freedom of choice over other competing political values; moreover, libertarianism understands a person to possess freedom of choice so long as no other agent coercively interferes with his or her choices. Since the state characteristically acts by defining laws and coercively enforcing them, libertarians' hostility to coercion typically leads them to conclude that only a very minimal state is legitimate—namely, a state whose only purposes are to protect citizens against acts of coercion (murder, assault, theft, and so on) and acts of fraud in a system of free enterprise. As a result, libertarians regard the modern welfare state to be illegitimate.

Defined in this way, libertarianism names a family of political theories rather than a single theory; diversity among libertarian political theories arises depending on just how strong a priority is given to the value of freedom of choice (a stronger priority tending to push libertarianism in the direction of anarchist political theories, such as anarcho-capitalism). Diversity among libertarian political theories also arises depending on the type of argument a libertarian uses to justify assigning this priority to freedom of choice. Some libertarians justify this priority in a consequentialist fashion—that is, by appealing to the beneficial consequences (understood in terms of happiness or efficiency) of allowing individuals the freedom to act on their choices. By contrast, nonconsequentialist libertarians adopt a rights-based approach to justifying libertarianism: Some regard a natural right to freedom of choice to be an intuitively obvious moral truth, whereas others purport to derive this right from an even more basic moral principle, such as a principle of self-ownership (i.e., full ownership of one's body and labor). These different foundational choices will in some cases lead to differences in practical recommendations (e.g., regarding how to treat economic monopolies, how to raise funds for legitimate government activities, and how to deal with pollution and other environmental issues).

Historically, many libertarians trace their roots back to the seminal writings of John Locke, in particular his *Second Treatise on Government* (1689), a founding text of liberalism, which from a principle of self-ownership argues in favor of strong rights to property and in favor of limited government (though it is a matter of scholarly dispute exactly how limited a Lockean state would be). In light of this claimed historical pedigree and further historical connections with past influential thinkers, such as Adam Smith, some libertarians prefer to call themselves *classical liberals*, as distinct from *egalitarian liberals*, who depart from classical liberalism's strong defense of free markets and property rights. Indeed, some libertarians refuse to apply the term *liberal* to anyone but classical liberals, regarding egalitarian liberal as a corruption of the term insofar as it envisions an expansive role for the state; meanwhile, some egalitarian liberals return the favor by refusing to consider libertarians as liberals, on the grounds that libertarianism in principle permits economic inequalities of such a size as to make a mockery of liberalism's core commitment to equal citizenship. What can be safely said is that libertarians and egalitarian liberals share both the core liberal commitment to constitutionalism, understood as government under the rule of law, and the core liberal commitment to the robust protection of civil liberties such as freedom of expression, religion, and association. In this sense, both libertarians and egalitarian liberals are heirs to the intellectual tradition that has its roots in thinkers such as Locke.

Natural Rights Libertarianism

Perhaps reflecting libertarianism's Lockean heritage, the most familiar form of libertarianism is the form (mentioned above) that appeals to a natural right to freedom of choice grounded in a moral principle of self-ownership, according to which we have a property right to our body and labor. Those who accept such a principle of self-ownership find it appealing for its ability to explain, in one fell swoop, the wrongness of phenomena such as slavery, murder, rape, and other forms of bodily assault as well as the wrongness of horrifying hypothetical cases such as the forced harvesting of, say, kidneys and eyes in order to meet the need for donor organs. Indeed, this principle establishes an extremely strong moral presumption against any use of nonconsensual physical force, the one permissible exception being said to be the use of nonconsensual physical force to prevent or punish violations of the self-ownership principle itself. On this basis, libertarians conclude that governments must limit their functions exclusively to the prevention of force and fraud. (Fraud is understood as the breaking of a contract. Libertarians do not judge the coercion inherent in enforcing contracts to be objectionable since in making a contract, signatories have consented to be liable to coercion in case of noncompliance.) A government that adopts functions beyond the prevention of force and fraud violates the moral presumption against coercion. Thus, for instance, a government that bans the consumption of recreational drugs has violated the principle of self-ownership, which permits individuals to do to their bodies whatever they please, so long as they do not violate others' self-ownership rights.

Less obvious, but no less true, according to libertarians, is the claim that individuals' self-ownership rights are violated when a government builds a park or library or provides some other public good. For provision of these goods requires resources, and since a state acquires its resources via coercive taxation, libertarians argue that such state-supplied goods in effect conscript citizens into working to supply such goods, whether they desire them or not. Hence, the famous claim of Robert Locke, one of the 20th century's best known libertarians, that "taxation of earnings from labor is on a par with forced labor" (Robert Nozick, 1974, p. 169). Along similar lines, libertarians frequently denounce taxation as a form of state-sponsored theft, at least when the taxes are used for ends other than the prevention of force and fraud.

This condemnation of taxation as a form of theft, however, presumes that a person has a natural property right to retain in full whatever he or she comes to possess as a result of economic transactions or gift giving—a right that is violated when a state appropriates a portion of these possessions for its own purposes. In response, critics of libertarianism argue that a natural property right to external possessions does not straightaway follow from rights of ownership to one's body and labor. And if in counterreply libertarians assert that owning one's labor entitles one to sell it in exchange for some external good (such as money), critics will insist that this merely pushes the question back a level, for it must be asked how the person from whom one acquired the external good came himself or herself to possess a property right to that good. Perhaps the answer is that this person acquired it in exchange with an even earlier possessor. But then the same question can be asked of the earlier possessor. And so on. It follows that a chain of economic and gift transactions must stretch back into time and at some point terminate in an act whereby a person comes to acquire some previously unowned resource (say, a hitherto uninhabited piece of land). According to critics of libertarianism, this act of original acquisition is left unexplained by a principle of self-ownership, for it is unclear how ownership of one's body and labor could create a title to some previously unowned external good distinct from one's body.

Undoubtedly, the most famous attempt to use the principle of self-ownership to justify the original acquisition of unowned resources is Locke's own attempt. In what has come to be known as the labor-mixing argument, Locke in essence argued that since you own your labor, it follows that when you mix your labor with some previously unowned resource (tilling the soil, say, or gathering apples from a tree), you come to own the resulting mixture (cultivated land, a bushel of apples, etc.). Well-known objections to this argument exist, however; Locke himself worried about excessive acquisition and insisted in response to this worry that an act of acquisition must leave "enough and as good" of unowned resources for others to acquire. Assessing the labor-mixing argument as well as the more general challenge of justifying the original acquisition of unowned goods remains an active area of debate. Indeed, within this debate, a group of political theorists who call themselves *left-libertarians* has arisen. Such theorists accept the principle of self-ownership of one's body and labor but argue that external goods initially belong to everyone in an egalitarian manner. On this view, private appropriation is permissible, but individuals who appropriate more than their equal share of external goods owe others compensation. On these grounds, some left-libertarians have even endorsed a measure of income redistribution as a form of compensation for hitherto uncompensated past acts of appropriation.

Consequentialist Libertarianism

As earlier indicated, not all libertarians base their theory on a principle of self-ownership or on any other principle from which a natural right to freedom of choice is said to flow. Instead of looking to an abstract principle of rights, these libertarians argue that a minimal government restricted to preventing force and fraud leads to better overall future consequences than do more expansive governments: Resources will be used more efficiently, markets will respond rationally to people's needs, people will do a better job of looking after themselves, and hence, the society will in general be more happy and prosperous. This style of reasoning is consequentialist in nature, *consequentialism* being the name for the moral doctrine according to which the right action to perform is the one with the best overall consequences. (Utilitarianism is the best known, but not the only, consequentialist moral theory.)

The main consequentialist arguments for libertarianism comprise arguments based on incentives and an argument based on the practical constraints faced by governments. Those who appeal to incentives argue that the public provision of goods found in welfare states dampens private incentives to work and to invest in one's skills; they argue that holding property in common reduces individual incentives to care for it (the so-called tragedy of the commons) and that, by contrast, a competitive free market (which entails both the promise of profit and the peril of being outdone by one's rivals) creates incentives for firms to use the most efficient means to produce goods that consumers desire and creates incentives for individuals to acquire skills that are of use in this production.

A second, related consequentialist argument for libertarianism stresses the practical problems that governments face in gathering the information they need to make good decisions; this argument is most famously associated with Friedrich August Hayek. Hayek noted that prices in a competitive market function as signals, widely dispersing useful information to potential producers (e.g., a sharp rise in price means a valued product is undersupplied). Prices also give people an incentive to respond to this information by changing production patterns. For instance, a good that is undersupplied relative to demand can fetch a high price, thereby giving producers incentive to supply more of the good, whereas a good that is oversupplied will experience a drop in price, thereby giving producers of that good incentive to switch production to more desired goods. Hayek argued that no individual or group of individuals (such as the planning board of a socialist economy) could possibly replicate the informational and incentive effects of a free market system of competitively determined prices; he concluded from this that the free market was the most rational system of allocating goods.

These consequentialist arguments have been tremendously influential among mainstream economists, though most such economists do not end up endorsing as pure a form of laissez-faire capitalism as libertarians desire. For a large body of economic doctrine is devoted to the topic of market failures—situations in which the market fails to respond to need or fails to allocate resources efficiently—and many economists conclude on consequentialist grounds that such failures call for government intervention. Examples of market failure discussed in the literature include natural monopolies, externalities (a term that refers to costs of production that producers externalize, i.e., push off onto others—pollution being a key example), and public goods that are undersupplied by the free market owing to the free-rider problem (when the costs and benefits of common resources are not shared fairly). Consequentialist libertarians respond to these worries either by proposing market solutions to these issues (thereby denying that they are genuine cases of market failure) or by agreeing that markets are less than wholly efficient in such cases but then arguing that government interventions would be even more wasteful (a line of argument most closely associated with the public choice school of economics).

Criticisms of Libertarianism

Libertarians face criticism from both the Right and the Left. Right-leaning critics who are anarcho-capitalists object to libertarianism's willingness to endorse any state at all, whereas Left-leaning critics argue that libertarianism's case for the minimal state assumes a flawed account of freedom, fails to recognize competing values such as fairness and the meeting of basic needs, and ignores the social inputs that are a necessary part of any system of production, so that one's possessions are never purely the fruits of one's own labor. While of course these are not the only criticisms made of libertarianism, they are among the most prominent, and each will be discussed in turn.

Anarcho-Capitalism

Anarcho-capitalists such as Murray Rothbard argue that the functions performed by a libertarian minimal state can and ought to be performed instead by private firms operating in a capitalist free market system. Hence, instead of a public system of police, law, and courts, anarcho-capitalists envision a competitive market of private defense agencies, each offering potential customers its own code of protection, complete with its own security agents to enforce this code and its own courtlike procedures for interpreting and applying it. Nor, according to anarcho-capitalists, would there be need for a government to print and regulate currency; there would likewise be a competitive market of private currencies. And so on for the remaining functions typically associated with government. In short, anarcho-capitalists argue that insofar as libertarianism approves of a minimal state rather than trusting individuals to meet all their needs through a system of free exchange, it shows insufficient regard for freedom of choice.

Consequentialist libertarians have an easier time replying to the criticisms of anarcho-capitalists than do natural rights libertarians, for consequentialists can simply argue that a minimal state would in fact do a better job of preventing violence than would private defensive agencies (who may end up fighting each other)—or at least, that it is not sufficiently clear that anarcho-capitalism would deliver better results to make it worth the risks of dismantling the state entirely. By contrast, natural rights libertarians must argue that the minimal state does not violate the economic rights of entrepreneurs who would like to set up their own private defense agency to compete with the public system of police and courts, but who are denied this opportunity by the minimal state's coercively enforced monopoly on the supply of protection. One celebrated libertarian argument in this regard was made by Nozick, who in his book *Anarchy, State, and Utopia* argued that in a competitive market of private defense agencies, a dominant defense agency would eventually arise and establish a monopoly; hence, a minimal state would in essence naturally arise from within an anarcho-capitalist system.

Criticisms of Libertarian Liberty

Some critics from the Left argue against libertarians' account of freedom of choice. One form of this criticism argues that libertarianism's exclusive focus on physical coercion is too narrow, for concentrated economic power can itself be a form of coercive power: Monopolists can charge exorbitant prices for their goods, and business owners can wield their threat of firing to extort actions from desperate employees that the employees would never otherwise consent to perform. In this view, freedom does not necessarily increase as government shrinks, for without antitrust laws, employee protections, and other legal instruments, many individuals may find themselves the unfree victims of economic coercion.

Another criticism of the libertarian account of freedom of choice argues against libertarianism's definition of freedom exclusively in terms of the absence of coercive interference. Freedom so defined is referred to as negative liberty, and the critics in question argue that freedom is instead best understood as autonomy or positive liberty, where the autonomy or positive liberty to perform some action requires not just the absence of coercive interference blocking that action but also the presence of a genuine ability to perform that action. On this definition, for instance, a person who is too poor to afford a university education is not free to attend university and a wheelchair-bound person is not free to work at a second-story business if there are no elevators. Accordingly, these nonlibertarians conclude that overall liberty is enhanced by a state that relieves poverty through redistributive taxation or that requires accommodations for the disabled.

Libertarians typically respond to these criticisms by denying that economic power amounts to a form of coercive power and by arguing that it is a mistake to define liberty in terms of ability. For instance, in support of this latter claim, a libertarian might argue that although most people lack the mental ability to become physics professors, it would be misleading to conclude (as proponents of positive liberty apparently must) that most people lack the freedom to become physics professors.

Competing Values

Libertarianism is also criticized for assigning freedom of choice priority over all other values, it being argued instead that in some contexts values such as fairness or the meeting of basic needs ought to take priority over freedom. Regarding the value of fairness, for instance, critics point out that libertarians reject equal opportunity provisions, such as antidiscrimination employment laws and publicly financed primary and secondary schools; these critics then argue that without such provisions, one's life prospects could be unfairly diminished by accidents of birth, such as one's race or sex or one's family's socioeconomic class. Regarding the value of meeting basic needs, critics, for example, argue that the health needs of a large number of individuals would go unmet in a libertarian society since no health insurance firm can make a profit by insuring individuals with known chronic and serious health problems. A common libertarian reply to these charges is to argue that private charity is the best response to these problems of poverty and health care need.

Society as a Partner in Production

Some critics of libertarianism defend the legitimacy of taxation by challenging the libertarian claim that individuals have a right to retain in full whatever they come to possess by exchange in a market system. This challenge proceeds by arguing that a person's possessions are not the result of exclusively individual efforts but result instead from individual efforts conjoined with a set of social conditions that make the individual's prosperity possible. According to this view, one person's success is never wholly self-made but depends on factors such as the prevailing level of education in one's society, the prevailing level of technology, and the prevailing level of wealth; also crucial are the levels of government investment in infrastructure (e.g., highways and utilities), government stabilization of the economy (e.g., controlling the money supply), and more generally, the cultural capital of one's society (by which is meant the benign cultural practices and social institutions that ensure that the daily interactions of thousands, or millions, of one's fellow citizens are by and large peaceful). For these reasons, according to these critics, society should be viewed as a silent partner that is ever present alongside individual efforts of production; taxation thus represents society's due return on its contribution to production. If society (through its duly elected representatives in government) decides to spend this social wage on additional purposes over and above those of preventing force and fraud, such as the construction of parks and libraries and support for the arts, say, then according to these critics, that is its prerogative. Libertarians commonly respond that the notion of society employed in this argument is at best a vague and unhelpful generalization and at worst a collectivist illusion denying the moral primacy of the individual.

Conclusion

Debates between libertarians and their critics were a vibrant part of 20th-century political theory, and the debate looks set to last throughout the 21st century and beyond, in part owing to developments such as an increasingly global economy. Many libertarians welcome this development, viewing a world of free economic agents as an appealing prospect. By contrast, many nonlibertarians view economic globalization with alarm, seeing it as a threat to values such as fairness and autonomy. As such, the stage is set for the development of new arguments and ideas in this long-running debate.

LIBERTY

Two postulates encapsulate the necessary and sufficient conditions for the existence of particular instances of freedom and unfreedom, respectively:

> F Postulate: A person is free to φ if and only if he is able to φ. (Alternative formulations of this postulate are "A person is free to φ if and only if it is possible for him to φ" and "A person is free to φ if and only if he is unprevented from φ-ing.)
>
> U Postulate: A person is unfree to φ if and only if both of the following conditions obtain: (1) he would be able to φ in the absence of the second of these conditions and (2) irrespective of whether he actually endeavors to φ, he is directly or indirectly prevented from φ-ing by some action(s) or some disposition(s) to perform some action(s) on the part of some other person(s).

In each of these formulations, the Greek letter φ (which stands for any germane verb or set of verbs plus any accompanying words) can denote one's performance of some action, one's existence in some condition, or one's undergoing of some process. Throughout this entry, incidentally, the terms *freedom* and *liberty* are used interchangeably.

These two postulates, which will be explicated further below, are associated with the idea of negative liberty. The principal concern of this entry is to distinguish negative liberty from certain other types of freedom. After an initial elaboration of the nature of negative liberty itself through some amplification of the F and U Postulates, this entry will draw four principal contrasts: between negative liberty and positive liberty, between negative liberty and moralized liberty, between negative liberty and republican liberty, and between physical freedom and deontic freedom.

Negative Liberty: Two Postulates

The F Postulate distills the nature of negative liberty as it exists in particular instantiations. However, the U Postulate does not comprehend all the situations in which particular instances of negative liberty are absent. That is, the two postulates are not jointly exhaustive in their coverage. Apart from being free to φ or being unfree to φ, somebody can be simply not free to φ. In other words, *is not free* and *is unfree* are not equivalent; the latter predicate entails the former, but not vice versa. (What are equivalent are the predicates *is not free* and *is unable.*) Likewise, the predicates *is free* and *is not unfree* are not equivalent. The former entails the latter but not vice versa.

For example, although Joe is not able to run a mile under 3 minutes and is therefore not free to run a mile under 3 minutes, it is not the case that he is unfree to run a mile in such a short span of time. His lack of freedom to run a mile so rapidly is a mere inability rather than an instance of unfreedom. It is a mere inability because it is not due to any action(s) or disposition(s) to perform some action(s) on the part of anyone else. Instead, it is a purely natural limitation.

Hence, the concept of freedom as explicated here is trivalent rather than bivalent. Instead of separating people's abilities and inabilities dichotomously into freedoms and unfreedoms, it separates them trichotomously into freedoms, unfreedoms, and mere inabilities. The mere inabilities are infinitely expansive in their scope, for most of the countless ways in which any person falls short of omnipotence are due to natural limitations rather than to the conduct of other people.

Why should a trivalent conception of freedom be favored over a bivalent conception? To glimpse the answer to this question, we have to take account of another feature of the F and U Postulates. Those postulates deal with particular instances of freedom and unfreedom, rather than with anyone's overall quantity of liberty. A particular freedom is an ability to engage in a certain mode of conduct, to be in a certain condition, or to alter one's situation in a certain way. Any particular freedom has a content that differentiates it from other particular freedoms. A person's overall level of liberty is a complicated aggregate of his or her myriad particular freedoms and also of his or her myriad particular unfreedoms. This entry will not concern itself with the details of the complex calculations by which each person's freedoms and unfreedoms (or, rather, each person's combinations of freedoms and combinations of unfreedoms) are aggregated. Rather, the key point for present purposes is that, although the F and U Postulates are concerned only with particular liberties and unfreedoms, they have been formulated with an eye toward the ultimate aggregation of those liberties and unfreedoms. That is, if an understanding of particular freedoms and unfreedoms is to be compatible with the aim of establishing that the overall liberty of each person is a measurable property, a trivalent conception of particular freedoms and unfreedoms is essential.

Given that this entry will not recount the intricacies of measuring people's levels of overall liberty, the unique suitability of a trivalent conception of freedoms and unfreedoms cannot be fully substantiated here. Nonetheless, the gist of the matter resides in the fact that the calculation of the level of anyone's overall liberty proceeds through a complicated fraction. If mere inabilities were not distinguished from freedoms and unfreedoms, then the numerator or the denominator of the aforementioned fraction would be infinitely large, respectively. After all, as has been stated, anyone's natural inabilities are infinitely expansive in their scope. For example, each person is not only unable to fly around the Milky Way Galaxy once, but is also unable to fly around it twice or thrice or any other number of times. Mere inabilities are limitless. Thus, if those inabilities were to be classified as liberties, both the numerator and the denominator of the fraction for measuring each person's overall liberty would be infinitely large. If mere inabilities were instead to be classified as unfreedoms, the denominator of that fraction would be infinitely large. In either case, then, the project of measuring anyone's overall freedom would be fatally undermined in principle as well as in practice. To avoid such an upshot, a theory of liberty needs to distinguish mere inabilities both from freedoms and from unfreedoms. The requisite distinctions are in effect drawn by the F Postulate and the U Postulate together.

One other aspect of the U Postulate is in need of elucidation. What is meant by the notion that somebody's dispositions to perform actions can prevent other people from doing various things? Plainly, a sheer disposition, which will remain unmanifested if the circumstances that would activate it never arise, does not in itself prevent anything through the actual application of force or the actual introduction of material obstacles. Nevertheless, dispositions to perform actions can be preventive factors because they will lead to the actual application of force or the actual introduction of material obstacles in the event that certain triggering circumstances do materialize.

In other words, each person's freedom or unfreedom is affected not only by what other people in fact do but also by what those other people would have done if events had unfolded differently. Dispositions bear crucially on the freedom and unfreedom of each person since those dispositions play a key role in determining whether the abilities and inabilities of each person would continue as such if the person's conduct or situation were altered in various respects. Only by asking how far those abilities and inabilities reach—past actual events into counterfactual events—can a theorist ascertain the extent of each person's overall liberty and the existence of many of his or her particular liberties. Until we know whether people would or would not have acted in certain ways if a given person had sought to do X, we cannot know whether that person was free to do X. Nor can we know whether the person was free to perform X in combination with manifold subsequent actions.

A simple example can serve to highlight the effects of people's dispositions on other people's freedoms and unfreedoms. Suppose that Jim is sitting in a room. Just outside the door of the room are four people with submachine guns who will shoot and kill him if he seeks to exit through the door. If Jim does not seek to leave the room, then the homicidal dispositions of the four people outside the door will not be activated. Let us suppose that he in fact does not leave the room and that there is consequently no occasion for the other four people to harm him. All the same, he is unfree to exit the room. If any theory of freedom were to lead to a contrary conclusion—that is, if any theory of freedom were to pretermit the four people's unmanifested dispositions and conclude that Jim has not been prevented from exiting—it would *pro tanto* be defective. Opportunities get closed off to individuals not only because of the actual application of force or the actual erection of material barriers but also because of the readiness of other people to exert such force or to erect such barriers (even if no occasion arises for the activation of their readiness).

Of course, the explicit mention of dispositions in the U Postulate should not be taken to indicate that they are productive only of unfreedoms. Other people's dispositions are also centrally involved in the establishment and sustainment of countless freedoms. Suppose, for example, that Julia lives in a well-fortified apartment building in the middle of New York City. Whenever a resident of the building wishes to leave through the front doors—the only set of doors—a security guard has to release the computerized locks. Because no resident knows how to operate the locks, the guard's cooperativeness is essential for each resident's ability to leave the building. Now, if Julia relaxes lazily in her apartment one morning and thus makes no attempt to go out before noon, the security guard during the morning will have no occasion to act on his disposition to release the locks for her. Nonetheless, if the guard would have released the locks in the event that Julia had indeed sought to exit from the building, then Julia has been free throughout the morning to leave via the front doors. Because of the guard's preparedness to open those doors if Julia should endeavor to depart—and only because of his preparedness—she is unprevented from departing. She is free in that respect. In this context, as in myriad other contexts, her particular freedoms are dependent on the inclinations of other people.

Negative Versus Positive Liberty

Especially since the writings of Isaiah Berlin in the 1950s and 1960s, the most famous contrast pertaining to freedom lies between negative liberty and positive liberty. As is evident from what has been said so far, negative liberty consists in opportunities. To be negatively free to φ is to be able to φ and is thus to be unprevented from φ-ing. If somebody is negatively free to φ, then neither internal incapacities nor external impediments have made his φ-ing impossible. Hence, to be negatively free to φ is to have opportunities to φ, whether or not one avails oneself of those opportunities.

Positive liberty is very different. Instead of consisting in opportunities, it consists in the following of certain codes of conduct, the attainment of certain objectives, or the purification of one's motivations and outlook. Being presented with various opportunities is not sufficient for positive freedom; in addition, a person must take advantage of some of those opportunities in certain ways. Whereas negative liberty is a matter of unpreventedness, positive liberty is a matter of accomplishments.

As is suggested by the vagueness of these descriptions, numerous divergent accounts of positive liberty have been propounded from the time of Plato onward. Some theorists maintain that a person becomes truly free only when she or he has persistently exercised certain faculties, such as her capacity to reason and deliberate. Others contend that people are truly free only when they interact regularly in democratic institutions with their fellow citizens. Still other proponents of positive liberty submit that people attain freedom only if they rid themselves of certain ignoble desires or only if they subject their sundry desires and inclinations to rational scrutiny and refinement. Many other varieties of positive-liberty theories have likewise emerged over the centuries.

Although negative-liberty theorists have sustainedly criticized various doctrines of positive freedom, nobody should think that the very use of the terms *freedom* or *liberty* by the advocates of those doctrines is itself mistaken. Their errors are errors of substantive political philosophy rather than linguistic lapses. For example, it is not an abuse of language to declare that a person who achieves a high degree of autonomy has thereby become free in the sense of having liberated himself from the sway of the influences that might have kept him in a heteronomous condition. Such a characterization is not optimally clear and precise but is far from ridiculous or unintelligible. Similarly, it is hardly ridiculous or solecistic to assert that people who together shape their destiny through institutions of democratic decision making are thereby keeping themselves free by avoiding subjection to mandates that they have not themselves collectively fashioned. Though the conception of freedom that is operative in such a claim is plainly not equivalent to the negative-liberty conception, the classification of the democratic state of affairs as *freedom* is by no means an outlandish linguistic slip.

Still, although any accusations of linguistic errors would be misguided, doctrines of positive liberty are themselves misconceived in a number of respects. While a full exploration of the shortcomings of such doctrines as theories of freedom is not possible within the confines of this entry, two of those shortcomings should be noted here.

First, a key problem for any doctrine of positive liberty is that it generates untenable ascriptions of freedoms and unfreedoms. For example, suppose that one such doctrine (which can be labeled here as the Aesthetic Thesis) proclaims that each person becomes truly free only by developing his or her aesthetic abilities to the maximal degree. Suppose further that Kevin is a gifted pianist whose tendency to become distracted by nonaesthetic pursuits will thwart his development of his musical talents unless he is chained to his immobile instrument for several hours every day. Now, according to the Aesthetic Thesis, any opportunities that do not facilitate the maximal development of a person's aesthetic abilities are not freedoms at all. Hence, the countless opportunities closed off to Kevin by his being shackled to his piano are not freedoms of which he has been deprived; they are not freedoms, period. Instead, according to the Aesthetic Thesis, they are obstacles to the realization of his true freedom—obstacles that his chains have enabled him to overcome. His shackles will have helped bring about his freedom without causing him to lose even the slightest instance of liberty. Because the severe curbs on his mobility involve no sacrifices of any particular freedoms, he has not been rendered unfree by those curbs in any respect. So the supporters of the Aesthetic Thesis must contend.

While the scenario of Kevin and his piano is contrivedly vivid, it well illustrates the far-fetched conclusions that are generated by any positive-liberty credo. Every such credo, which affirms that true freedom resides in a person's exertion of certain faculties, or his or her performance of certain actions or following of certain procedures, will commit its advocates to the view that any opportunities inconsistent with the relevant exertions or performances or procedures can be removed wholesale with no loss of any particular freedoms. Instead of characterizing the removal of those opportunities as the elimination of some of a person's liberties for the sake of increasing her overall liberty, the positive-freedom theorists are obliged to maintain that no liberties have been removed at all. Their position in that respect is not self-contradictory or unintelligible, but it is indefensibly sinister. It should be rejected, as a substantive matter of political philosophy. Although some of the objectives favored by positive-freedom theorists are undoubtedly worthy of pursuit, no one should pretend that sacrifices of liberties are not involved when various opportunities are closed off in furtherance of those objectives.

A second main shortcoming of positive-liberty theories pertains to the very objectives that they aim to promote. Whereas the phenomenon that the negative-liberty theorists designate as *freedom* or *liberty* cannot be recharacterized in an illuminating fashion, there are numerous more precise designations for the phenomenon that positive-liberty theorists label as *true freedom*. To denote the condition of negative liberty, some rather awkward and uncommon terms such as *unpreventedness* and *unprecludedness* would be necessary as replacements for *freedom* and *liberty*. The only adequate common substitute would be *ability*, which is less effective than *liberty* or *freedom* in highlighting the relational character of the designated phenomenon (i.e., the fact that the designated phenomenon consists not only in a person's possession of capacities but also in his or her being unprevented from exercising those capacities). For discussions focused on the conceptual space carved out by the negative-liberty theorists, the language of liberty and freedom is singularly apposite.

A very different situation obtains when we turn our attention to positive liberty. While the sundry versions of the positive-liberty ideal will warrant the application of a variety of terms—most of which will be appropriate for only some of those versions—there are indeed many pertinent designations available. Terms and phrases such as *self-fulfillment*, *self-realization*, *self-expression*, *self-mastery*, *autonomy*, *self-reliance*, *self-control*, *self-determination*, *flourishing*, *self-development*, *self-direction*, *popular political participation*, and *active citizenship* can each figure saliently in one or more of the major positive-liberty credos. Moreover, when wielded aptly, each of those terms and phrases will typically be much more exact—and probably more vivid—than *freedom* or *liberty* as a means of pinpointing the state or process that is posited as a fundamental human desideratum. Hence, not only will little or nothing be lost if the positive uses of *freedom* and *liberty* are eschewed, but in addition, the avoidance of those terms as designations for the positive-liberty writers' objectives will promote theoretical precision. *Freedom* and *liberty* in their positive senses are superfluous since the potential replacements for them are myriad, and those replacements are generally superior in denoting the specificities of the ideals that the positive-liberty theorists extol.

Of course, as has been remarked above, nobody should doubt that many of the aforementioned ideals are worthy of pursuit. What is objectionable about positive-liberty doctrines is not (in many cases) the objectives that they uphold but instead their characterizing of those objectives as *true freedom*. For example, when theories of autonomy, democracy, or active citizenship present themselves as accounts of those desiderata rather than of liberty, they may well be admirable. Whether they are indeed admirable is of course dependent on the specifics of their arguments and analyses; however, when they are not misleadingly packaged as theories of freedom, they at any rate stand a chance of being admirable.

Note that the comments in this section about the appropriate senses of the terms *freedom* and *liberty* are concerned with the employment of those designations in the rigorous theorizing that constitutes political philosophy. It would be quite foolish to aim to regiment the multifarious patterns of usage that occur in the much less rigorous discourses of everyday life. In many of those discourses, where consistency, subtlety, clarity, and precision are of far less importance than in philosophical writing, one's labeling of self-fulfillment as the attainment of true freedom might be apt. Plainly, as has already been remarked, there is nothing semantically illicit about the use of such terminology. Given that the language of freedom or liberty is intelligible and coherent and given that the inexactitude of its application does not greatly matter in the to-and-fro of quotidian deliberations and exhortations, there are no grounds for reining in the multiple senses that might attach to *freedom* and *liberty* in a host of ordinary contexts. Such an endeavor would be patently futile in any event.

Not at all futile or ridiculous, however, is an effort to enhance the rigor and precision of philosophical thinking about freedom. If the aim is to come up with a theory that carefully distinguishes the concept of freedom from other major political and moral concepts while capturing its myriad complexities, then some degree of terminological regimentation is inevitable. Some uses of *freedom* or *liberty* countenanced in day-to-day parlance have to fall by the wayside when a painstaking philosophical investigation of freedom seeks to elaborate the necessary and sufficient conditions for the truth of any proposition "P is free to φ." For the purposes of such an investigation, the inexactitude and misleadingness and inconsistency of many of those ordinary uses are to be shunned. Philosophical analysis proceeds by clarifying and refining the concepts that are invoked in relatively unreflective modes of thought and discourse, as it aspires to transcend the murkiness and looseness of those familiar modes of speaking. The tasks of conceptual clarification and purification can scarcely go ahead without some notable tightening of everyday terminology. To insist as much, however, is not at all to insist that a similar tightening is advisable or feasible in everyday discourses themselves.

Negative Versus Moralized Liberty

In some prominent respects—though by no means all respects—moralized conceptions of freedom are similar to positive-liberty theories. Although moralized conceptions of freedom are usually focused on opportunities rather than on achievements, every such conception affirms one or both of the following theses:

1. the preclusion of some action or some state of affairs does not eliminate any particular liberties unless the preclusion is illegitimate or
2. the preclusion of some action or some state of affairs does not eliminate any particular liberties unless the stymied action or state of affairs would have been legitimate.

Under the first of these two theses, the prevention of a person from φ-ing will count as a *pro tanto* curb on his freedom only if he had a moral right against the sort of interference that thwarted him from φ-ing. Under the second thesis, the prevention of a person from φ-ing will count as a *pro tanto* curb on his freedom only if he had no moral obligation to refrain from φ-ing. In either case, a moralized conception of freedom will decline to classify some eliminated liberties as eliminated liberties.

Thus, for example, if Alec's prevention of Susan from wantonly setting fire to a neighbor's house is morally legitimate, then Alec does not deprive Susan of any freedoms at all when he manages to avert the arson by grabbing and restraining her. If she struggles to reach the neighbor's premises so fiercely that he has to pin her to the ground and even bind her hands and feet, she will still not have been deprived of any freedoms. Such is the view taken by the proponents of moralized conceptions of freedom. Whereas the F Postulate and U Postulate explicate the concepts of freedom and unfreedom by reference to one's abilities and to the causes of one's inabilities, a moralized account explicates those concepts by reference to the moral status of the causes of one's inabilities or to the moral status of one's exertions of one's abilities—that is, the moral legitimacy or illegitimacy of the causes of one's inabilities or the moral legitimacy or illegitimacy of one's exertions of one's abilities.

In other words, every moralized account of freedom insists that even the severest constraints on a person's latitude might not remove any of a person's freedoms. No such removal will have taken place unless the constraints are illegitimate or unless the prevented conduct would have been legitimate. Consequently, if the placement of a highly dangerous man in chains or a straitjacket is legitimate because of his uncontrollably violent behavior, neither of those means of immobilization will deprive him of any liberties. A theory that generates such a conclusion can hardly claim to be cogently illuminating.

Moreover, with reference to any situation in which some person *P* has been deprived of the freedom to φ, a moralized conception of freedom must submit either that any questions about the illegitimacy of the deprivation are pointlessly pleonastic or that any questions about the legitimacy of *P*'s φ-ing are pointlessly pleonastic. If the restrictions on *P*'s φ-ing are indeed restrictions on his liberty, then either ipso facto they are illegitimate or ipso facto his φ-ing would have been legitimate. So the proponents of moralized conceptions of freedom are logically committed to maintaining. Hence, any moralized conception whisks out of existence an array of perfectly ordinary inquiries.

Perhaps even more unsettling is that, when a moralized account is focused on the illegitimacy of preventive constraints, it strips freedom of any independence as a factor that can militate either in favor of various sociopolitical arrangements or against them. Because the only constraints on human conduct that will count as limitations on liberty are unjust constraints, a denunciation of certain institutions as restrictive of liberty will add nothing to a denunciation of them as unjust. Likewise, because such a moralized account construes freedom as nothing more than the absence of illegitimate constraints, a commendation of certain institutions as promotive of freedom will add nothing to a commendation of them as legitimate and fair. In short, the fostering or impairing of freedom (as understood by a moralized theory of this type) will have ceased to be a consideration that might carry some independent justificatory or condemnatory weight. The redundancy of that fostering or impairing as a justificatory or condemnatory factor stems from the status of freedom as a mere facet of some substantive moral ideal—an ideal on which the whole burden of justification or condemnation rests. Though moralized approaches to liberty that are focused on the illegitimacy of obstacles might seem to elevate the status of liberty by imbuing it with a morally favorable tenor, they in fact eliminate liberty as an independent phenomenon by reducing all questions of greater or lesser freedom to questions of greater or lesser rectitude. For anyone who wishes to appraise sociopolitical arrangements not only on the basis of their justice or injustice but also (separately) on the basis of their conduciveness or inconduciveness to high levels of overall liberty, a moralized conception of freedom should be forsworn. For anyone who believes that liberty and justice can sometimes conflict—in a clash between liberty and equality, for example—a moralized conception of freedom should be forsworn.

Negative Versus Republican Liberty

During the past couple of decades, the longstanding controversies between negative and positive conceptions of liberty have become somewhat overshadowed by controversies between negative-liberty theorists and civic-republican theorists. The latter theorists generally subscribe to the negative conception of freedom in opposition to positive-liberty doctrines, but they hold that the negative conception has been construed too narrowly by most of its exponents. In two chief respects, they take themselves to have gone salutarily beyond those exponents.

First, civic republicans are keenly alert to the role of public virtue and public service in bolstering institutions that provide high levels of freedom for individuals. They maintain that, in the absence of active civic participation on the part of all or most of the adult citizens in a country, the reigning government and its elite supporters will very likely amass autocratic powers that will extinguish many of the precious liberties that the citizens theretofore enjoyed. Individuals who wish to retain their freedoms must frequently put aside their private affairs to participate collaboratively in holding governmental leaders to account. Republican theorists believe that their attentiveness to the crucial role of civic virtue in securing the enjoyment of freedoms is at variance with the perceived emphasis of modern negative-liberty theorists on the sanctity of the private spheres of individuals. Whereas the latter theorists are said to be primarily concerned with drawing clear limits past which any government cannot legitimately intrude into people's lives, republicans are principally concerned with stimulating people to engage robustly with the institutions that govern them.

The contrast just outlined between civic republicanism and modern negative-liberty theories has been advanced with considerable erudition by Quentin Skinner in his essays on liberty during the 1980s and early 1990s. Nevertheless, the contrast is largely misconceived. After all, the positing of an instrumental connection between extensive popular political participation and the safeguarding of individuals' liberties is perfectly consistent with negative-liberty theories. Of course, what would be inconsistent with those theories is any claim that the extensive popular political participation is itself true freedom. Such a claim, envisaging a relationship of equivalence between civic involvement and liberty, would be expressive of one prominent positive-liberty doctrine. It would therefore clash in most respects with negative-liberty theories. However, as Skinner himself emphasizes, the civic-republican writers have not in fact embraced any doctrines of positive liberty. When they have highlighted the instrumental links between the political engagedness of citizens and the security of individuals' freedoms, they have been propounding a thesis about negative liberty rather than about positive liberty. Accordingly, they have not been affirming any propositions that are inconsistent with those affirmed by negative-liberty theorists. Indeed, their thesis about the aforementioned instrumental links is a commonplace among most modern political thinkers, including the exponents of negative liberty. Civic-republican theorists undoubtedly articulate that thesis adeptly, but they do not thereby establish any substantive difference between themselves and the negative-liberty philosophers.

A second respect in which civic republicanism supposedly goes beyond negative-liberty doctrines has been elaborated since the mid-1990s by Quentin Skinner and Philip Pettit (as well as by others whom they have influenced). According to these modern civic-republican writers, their very conception of freedom is more capacious than the standard conception within the negative-liberty tradition. Instead of concentrating on freedom as the absence of the actual application of force, republicans concentrate on freedom as the absence of domination. Domination occurs through the actual application of force—by a government or by some other powerful party—but it also occurs through the maintenance of background conditions of intimidatory control that render any actual application of force unnecessary. Skinner and Pettit assert that unless a conception of freedom takes account of the full range of ways in which people can be hemmed in by domination, it will obscure more than it illuminates. It will fail to reveal all the debilitatingly confining effects of social and economic arrangements that subordinate some people to others.

As has been argued in response by contemporary negative-liberty theorists, all the insights of civic republicans are easily accommodated by a proper exposition of the notion of negative liberty. Perhaps some negative-liberty theorists in the past have believed that the only type of constraint on anyone's freedom is the actual application of force by others, but such a view does not pass muster among contemporary negative-liberty philosophers. Such philosophers recognize and indeed insist that the constraints on people's liberty include all the background conditions of domination identified by civic-republican writers. As is apparent from the U Postulate's inclusion of dispositions among the potential constraints on human freedom, the actual application of force is not a necessary condition for the curtailment of anybody's liberty. The freedom-limiting effects of the dispositions and actions that constitute situations of domination are all captured by the U Postulate.

A key point in support of what has just been said is that the units over which the modern negative-liberty theorists aggregate when they measure anyone's freedom are combinations of conjunctively exercisable options. (The aggregation also covers anyone's combinations of consistent unfreedoms. That element can be omitted in the present discussion.) A combination of conjunctively exercisable options is a set of liberties that can all be exercised together simultaneously or sequentially. When a person is subject to domination by some other party, many of the combinations of conjunctively exercisable freedoms that would have been available to him or her are not available. For example, her liberty to act at odds with the directives of the dominant party will not be conjunctively exercisable with her liberty to do anything that the dominant party's punitive response to her disobedience would prevent her from doing. Because a relationship of domination removes many combinations of conjunctively exercisable freedoms that would otherwise have been available to the person(s) subordinated in that relationship, it *pro tanto* reduces the overall liberty of the person(s) in question. This insight into the freedom-constricting effects of domination has been expounded rigorously by contemporary negative-liberty theorists; an awareness of those effects is hardly unique to the civic-republican tradition.

Still, although the virtues of civic republicanism are also characteristic of modern negative-liberty theories, the republican conception of liberty and the negative conception of it are not identical. As negative-liberty philosophers have contended, the republican conception of freedom championed by Skinner and Pettit is plagued by a number of shortcomings that do not similarly afflict the negative conception. For one thing, Skinner appears to take the view that a person is unfree to φ only if he or she knows that he or she has been prevented from φ-ing. No such untenable restriction figures in the negative account of liberty. Pettit imposes another such restriction when he declares that unfreedom is caused only by conduct that is intended to produce such an effect. No similar insistence on intentionality or deliberateness is included in the U Postulate since the reasons invoked by Pettit in support of such an insistence are in fact supportive of a focus on any human conduct that gives rise to constraints (whether the constraints are imposed deliberately or unwittingly and whether they are imposed wrongly or innocently).

Even more important, the civic-republican approach mishandles any situation—however rare—in which someone strong enough to mistreat and exploit others is resolutely disinclined to do so. In any such set of circumstances, where the probability of serious encroachments by the dominant person on the overall liberty of his or her contemporaries is practically nil, the redoubtable might of that person (whether bodily strength or some other form of power) does not lessen anyone else's overall liberty significantly. For example, their lineage or talents can make them someone to whom many other people would eagerly attach themselves as loyal subordinates if the former were to allow them to do so.

Because of his or her reclusive diffidence and, consequently, firm unwillingness to take advantage of his or her superiority, the dominant person does not oblige other people to adjust their behavior to his or her desires. Uncommon though such a situation may be, it is plainly possible. Civic republicans, who assert that anyone's sheer possession of the capacity to dominate is sufficient to deprive his or her contemporaries of their freedom, are committed to the view that the diffident recluse in the envisaged situation has severely curtailed the freedom enjoyed by the people in his or her vicinity. Such an analysis of the situation is distortive rather than illuminating.

Still more distortive is the republican approach in application to a scenario of a dominator who is subordinated by someone whom he himself could oppress. Suppose that Lennie is mightily capable of prodigious feats of strength, while George—who is much smaller and weaker than Lennie—is possessed of domineering tough mindedness that offsets his physical deficiencies. (Lennie and George bear a considerable resemblance, though not a perfect resemblance, to their namesakes in John Steinbeck's *Of Mice and Men*.) Although Lennie is physically much more powerful than George and although the intellectual disparity between the two men is not vast, the differences between their temperaments eventuate in the general domination of the more brawny man by the more diminutive. George continually browbeats Lennie into performing countless menial tasks that serve George's needs and comfort, and he insists on getting his way whenever Lennie forms intentions that are at odds with his own. He terrorizes Lennie with his fits of temper and his piercing insults; Lennie, thoroughly overmastered and intimidated by George, is his dutiful servant. Now, even if this scenario were to be moderated by the addition of some ties of friendship and protection between the two men, the basic point illustrated by it would remain prominent. Somebody fully capable of dominating another person—somebody, therefore, whom the civic republicans will classify as a dominator—can turn out to be exploited and bullied by that other person. If we were to describe George as having been made unfree by Lennie's dominating strength, we would be distorting his situation markedly.

Admittedly, it might be that George's irascible and imperious behavior is itself necessary to ward off domination by Lennie. If George's aggressively tyrannical conduct is indeed a means of defending his own overall liberty, then that liberty has been diminished by Lennie's daunting presence. After all, were George to abstain from his domineering surliness under such circumstances, he would very quickly render himself unfree to undertake any projects or activities that will have been precluded by Lennie's assumption of the ascendant posture in their relationship. Under such circumstances, that is, Lennie's latent disposition to exert his might has extinguished the conjunctive exercisability of many of George's liberties. Nonetheless, this feature of the situation is purely contingent. A softening of George's demeanor might instead produce less dramatic effects. Perhaps, it would not induce any substantial changes at all in the subordinate posture of Lennie, who might be unshakably habituated to George's dominance. Or, what is slightly more plausible, the growing emollience of George might simply induce Lennie to become less dutiful and subservient without actually prompting him to act despotically toward George. Instead of inverting the previous relationship of mastery and submission, Lennie might simply opt to live alongside George as an equal or perhaps he would separate from George and go his own way. Whatever might be the precise outcome of a marked alteration in George's authoritarian mien, it would not necessarily involve any significant loss of liberty for George himself (especially if the baseline for measuring the loss is a situation in which neither of the two men dominates the other). In that case, his currently overbearing behavior is not a means of safeguarding his own freedom against the potential dominance of Lennie but is straightforwardly a means of coercing and manipulating the bulkier man. Such a state of affairs can obtain even though the civic republicans' analyses of unfreedom clearly generate the conclusion that Lennie is a dominator. Someone can qualify as a dominator—given how that status is defined by the civic republicans—without significantly impairing the overall freedom of anyone else.

In short, in the rare circumstances where the capacity to dominate genuinely involves extremely low probabilities of nontrivial encroachments on the freedom of the people over whom that capacity could be exerted, the sheer susceptibility of those people to the exercise of that capacity is not to be classified as a state of wide-ranging unfreedom. Neither a diffidently reclusive mighty person nor Lennie in his relationship with George is significantly abridging the overall freedom of anyone to whom he is hugely superior in strength. Civic republicans, with their insistence that the capacity to dominate is itself sufficient to produce dependence and consequent unfreedom, do not provide satisfactory accounts of the situations discussed in the previous few paragraphs.

Most of these remarks about the curtailment or noncurtailment of overall freedom are applicable mutatis mutandis to the inexistence or existence of particular freedoms. If somebody with the capacity to dominate is firmly disposed to use his or her ascendancy to prevent a subordinate person *S* from φ-ing in the event that *S* endeavors to φ, then observers are warranted in saying that *S* is unfree to φ. For most purposes, any probabilistic qualification attached to such an ascription of unfreedom can be left implicit. By contrast, if the likelihood of the powerful person's prevention of *S* from φ-ing in the event of *S*'s endeavoring to φ is lower but still significant, then statements about *S*'s unfreedom to φ should be overtly probabilistic. Finally, if the likelihood of the powerful person's prevention of *S* from φ-ing in the event of *S*'s endeavoring to φ is exceedingly small, then observers are warranted in affirming that *S* is free to φ (vis-à-vis the powerful person). Once again, any probabilistic qualification can for most purposes be left implicit. In other words, with regard to the reduction or nonreduction of a person's overall freedom and with regard to the inexistence or existence of any of a person's particular freedoms, the basic focus of observers in any context marked by someone's dominant strength should be the same. The crucial consideration in such a context is not the sheer presence of the dominant strength but the probability that that strength will result in the prevention of sundry actions or sundry combinations of actions.

Physical Versus Deontic Liberty

Both in the F Postulate and in the U Postulate, the chief concepts are modal rather than deontic. That is, they concern what can or cannot occur rather than what should or should not occur. They concern what each person is able or unable to do rather than what each person is permitted or forbidden to do. They, thus, pertain to physical freedoms and unfreedoms rather than to deontic freedoms and unfreedoms. Someone is physically free to φ if and only if he or she is physically unprevented from φ-ing, and he or she is physically unfree to φ if and only if he or she is physically prevented from φ-ing as a result of some actions or dispositions to perform actions on the part of some other person(s). Here, *physically* is not to be understood in contrast with *mentally* or *psychologically*; rather, the relevant contrast is between *physically* and *normatively*.

Deontic freedom, contrariwise, consists not in physical unpreventedness but instead in permittedness or unforbiddenness. If somebody is deontically free to φ, then he or she is allowed to φ by any applicable authoritative norms, such as legal mandates, moral principles, or institutional rules. Conversely, if somebody is deontically unfree to φ, then he or she is prohibited from φ-ing by one or more of those authoritative norms. When we ask whether somebody is deontically free to φ, we are not asking whether he or she is capable of φ-ing; we are asking whether he is entitled to φ.

Physical liberty and deontic liberty differ in a number of respects that derive in various ways from the basic modal/deontic difference just recounted. For one thing, the predicates "is deontically free" and "is deontically unfree" are contradictories rather than merely contraries, and thus the predicates "is deontically unfree" and "is not free deontically" are equivalent. In other words, the concept of deontic freedom is bivalent rather than trivalent. Someone is deontically free to φ if and only if he or she is not deontically unfree to φ. In regard to such freedom, there is no category that corresponds to the category of mere inabilities.

Perhaps the most obvious dissimilarity between the concept of physical freedom and the concept of deontic freedom is their extensional nonequivalence. That is, a person will often be deontically free to φ without being physically free to φ, and vice versa. For example, although Norma is both legally and morally permitted to run a mile under 4 minutes, she is not physically able to do so; her deontic liberty to run at that speed is not accompanied by a corresponding physical liberty. Conversely, although she is physically able to assault unprovokedly the person standing directly ahead of her in a queue, she is neither legally nor morally permitted to do so. Her physical freedom to commit the assault is not accompanied by a corresponding deontic freedom. Permissibility and ability can coincide and very frequently do coincide, but they likewise frequently diverge.

A more subtle dissimilarity between physical liberty and deontic liberty pertains to the isolability of actions. The removal of someone's physical freedom to φ will often require the removal of his or her physical freedoms to do things that are crucially prerequisite to φ-ing, whereas the removal of his or her deontic freedom to φ (e.g., through the enactment of a legal ban on φ-ing) never requires the removal of any of his or her deontic freedoms to do things that are crucially prerequisite to φ-ing. If people remain physically free to take steps that would immediately antecede their φ-ing, then the prevention of their φ-ing will typically depend on monitoring and rapid interventions by other people. In connection with some activities, such monitoring and interventions will be feasible; in connection with many other activities, however, those last-minute preventive intrusions will not be realistically possible. An intervention at an earlier stage is sometimes essential if a person's physical freedom to φ is genuinely to be eliminated. Nothing similar is ever essential for the removal of someone's deontic liberty to φ. Precisely because the elimination of any person's deontic freedom to φ concerns what is impermissible rather than what is impossible, that elimination is perfectly consistent with a situation in which the person is deontically free to do virtually everything that is physically indispensable for his or her φ-ing.

A further difference between physical liberty and deontic liberty is centered on the avoidability of actions. A person whose mind has not been completely taken over by someone else in a science fiction scenario or by certain severe mental illnesses will retain the physical freedom to eschew any particular action. At the very least, such a person will always have the option of surrendering in a wholly passive manner to the operations of external forces. Accordingly, there is no such thing as a physically unavoidable action. When we cross from the realm of the physical to the realm of the deontic, however, we encounter a very different situation. Anybody can be deontically unfree to forgo certain types or instances of conduct. For example, a person whose income is subject to taxation will typically be legally unfree—and probably also morally unfree—to abstain from writing his or her name on any income tax forms that require his or her signature. Though the person is physically free to refrain from signing those forms in a timely fashion, he or she is not deontically free to refrain and is legally obligated, and probably also morally obligated, to sign the relevant documents. In this case, as in multitudinous other cases, legal or moral requirements can make the performance of certain actions mandatory. In that respect, legal or moral mandatoriness differs from the material impediments that limit somebody's physical freedom.

Of course, these several divergences between physical liberty and deontic liberty should not induce anyone to overlook the many affinities between them. Liberty of each type consists in an absence of constraints. Though physical constraints differ from deontic constraints in the sundry ways that have just been recounted, unconstrainedness is the essence of deontic freedom just as it is of physical freedom. Freedom of either type is negative rather than positive.

LOBBYING

Lobbying is the interaction of an individual, group, interest, or organization with government to influence current policy or create a situation conducive to shaping future policy. It is a fundamental and omnipresent aspect of all political systems, from liberal to elitist democracies, to authoritarian and even totalitarian regimes. Yet although there are common elements to lobbying across all political systems, the particular form that the lobbying process takes in a country, state, province, city, or even internationally, is shaped by several governmental, political, and cultural elements. Furthermore, lobbying is inextricably bound with the activities of lobbyists—that is, those representing individuals, collective interests, and interest groups to government.

This entry draws on research on lobbying across all political systems but focuses mainly on established liberal democracies and developing democracies. First, we look at the relationship between practical politics and political science work on lobbying, followed by the common denominators of lobbying and its ubiquitous nature. Next, the major theoretical explanations are discussed, followed by how institutional structure affects lobbying. Then, we consider the types and role of lobbyists in the United States and other Western democracies, followed by the issue of lobby regulation. Finally, we look at some trends in lobbying across the world.

Development of Lobbying Research and Theory

Even though lobbying has always been a fixture of virtually all groups and governments, only in the past 100 years has it been recognized by scholars as a fundamental, prominent, and crucial part of policy making. Studies of lobbying did not occupy a major place in American political science until after the work of David Truman (*The Governmental Process*, 1951). The increased academic interest in lobbying in the United States from the 1960s onward was also due to the advocacy explosion, first in Washington, D.C., and later in the American states, as more and more interests and interest groups began to lobby and expanded their range of lobbying techniques.

Yet as late as the mid-1950s, many scholars saw lobbying and lobbyists as a purely American phenomenon—a product of the separation-of-powers system and not an aspect of parliamentary systems. In *Anonymous Empire*, Samuel Finer showed this to be an erroneous view of British politics, and work on lobbying in other parliamentary systems followed. As late as the 1970s, however, many texts on the politics of countries such as Britain, France, Germany, and Australia did not include the terms *lobbying*, *lobbyist*, or even *interest groups* (or *pressure groups* as they were often called) in their indexes. Even today, these terms do not appear in many treatments of the politics of developing and reemerging democracies, such as those in Latin America, Africa, and Asia.

Despite the late development of academic interest in lobbying and lobbyists, extensive research and some theories now exist. The lessons and characteristics of this research can be summed up in the following six points:

1. While there are thousands of studies, mainly case studies, from around the world, there is no general theory of lobbying and lobbyists. Even so, there is general agreement among scholars on the other five points.
2. There are three interrelated factors, in particular, that shape the lobbying environment in a place: the degree of political pluralism or

authoritarianism, the structure of governmental institutions regarding centralization or fragmentation of the policy process, and the political culture.

3. Lobbyists exist in all political systems but take on different guises in different systems.
4. The last 40 years or so have seen the use of an increasing range of lobbying strategies and tactics, not only in developed pluralist democracies but also in developing democracies and even authoritarian systems.
5. Largely because of the popular belief that lobbying and lobbyists benefit existing powerful interests at the expense of the rest of society and because of corruption scandals associated with lobbying activity, lobbying and lobbyists are held in low regard around the world. Ironically, however, and especially in democracies, hundreds of millions of citizens belong to interest groups.
6. Because of the potential for abuse and for undermining the goals of authoritarian regimes, the regulation of lobbying and lobbyists has been an aspect of public policy around the world.

The Nature of Lobbying

When two or more people get together, particularly in large groups and in countries, they want to influence others largely to secure economic, political, or other benefits for themselves, their group, or society as a whole. This is the motive for lobbying and why it has always been a central part of human society.

Common Denominators of Lobbying

The most fundamental processes involved in lobbying to achieve a benefit at any group, state, national, or international level consist of three interrelated activities. First, it requires getting access to the person or persons who can make the decision; second, it requires building a relationship with these people and, third, influencing them—exerting power.

Whether it is the Roman Empire, the court of Louis XIV of France, Stalin's Soviet Union, a modern liberal democracy such as the United States or New Zealand, an emerging democracy such as Kenya or Vietnam, or a closed authoritarian regime such as North Korea or Myanmar, these three stages of lobbying occur in some form at various times. In nonpluralist systems, however, they may not occur in all policy situations and may not be very obvious.

The Ubiquitousness of Lobbying

If lobbying takes place in all groups and political systems, why is it that until recently, it was seen to occur in the United States only and was seen as virtually nonexistent in authoritarian political systems? The answer to this question lies in the difference between officially recognized and visible lobbying and unofficial and behind-the-scenes lobbying.

In the United States, much of the lobbying is open to view and officially sanctioned by the Constitution and various laws. Until recently, in most other democracies and in organizations such as the European Union (EU) and the United Nations, it was less public (which should not necessarily be equated with illegal or underhanded) and thus not seen to be performed by people called lobbyists. Nevertheless, lobbying and lobbyists have always been very much a part of these political systems. And even though in authoritarian regimes lobbying and related organizations were either banned (as under many military regimes in Latin America) or not seen to be necessary (as in communist countries), individuals close to the leaders, such as military personnel or their close friends and allies, engaged in lobbying to get their policies enacted or to block the political goals of their opponents.

Explaining Variations in Lobbying Processes

Thus, just because it appears that lobbying is not taking place in a particular government does not mean that lobbying is absent. The actual process of lobbying, however—namely, the avenues of access, forging relationships with policymakers, and influencing them—varies across political jurisdictions according to the three factors identified earlier.

First, the more pluralist the political system, and particularly the institutionalization and acceptance of political opposition, the more visible and formalized lobbying and the activities of lobbyists are likely to be and, in most circumstances, the wider the range of strategies and tactics employed. In contrast, in a more authoritarian system, lobbying will include little more than personal contacts with the monarch or dictator.

Second, institutional structure determines the power or decision points that lobbyists need to focus on in their lobbying effort. This structure is usually very clear in authoritarian systems, but it can be more complex in pluralist democracies. In the U.S. separation-of-powers system, where there is often bipartisanship on some issues, power is fragmented between the three branches of government and also between the federal and state levels. In parliamentary systems with strong political parties, however, power is much more concentrated in the executive, even in federal systems such as Germany. Another factor is the extent of neocorporatism or pluralism in liberal democracies, particularly those in Western Europe.

Third, while research on how political culture—the political values of the governed and those in government—affects lobbying is not extensive and rather inconclusive, a good case can still be made that this factor may be the most important determinant of the activity of lobbying and lobbyists. Broad acceptance of the existence of interest groups and the legitimacy of their activities, as in most liberal democracies, leads to mass group membership and the necessity, openness, and formalization of lobbying, albeit with some skepticism, in a pluralist democracy. In contrast, no or minimal public and policymaker legitimization of lobbying and lobbyists, as in authoritarian and many developing democracies, leads to low group membership and continued and less formalized and open lobbying processes.

Lobbying in the United States: An Aberrant Case

An irony of the lobbying system in the United States is that, although it was once seen as the only place where lobbying took place and is often held as a benchmark for being the most advanced of lobbying systems, in many ways, it is an aberration compared with the lobbying systems in other liberal democracies. This is because its institutional structure and political culture have influenced lobbying in some unique ways.

The U.S. political system was designed to prevent precipitous actions such as the American colonies had experienced under George III of England. So the separation-of-powers system, in which the Congress and the President share legislative power, was born. Later, the courts, particularly the U.S. Supreme Court, also acquired a policy role by being able to interpret and strike down the acts of the other two branches. Add to this the federal system (i.e., the federal agencies that make up the "administrative state") and the fact that ideology has never been as strong in the United States as in Europe, resulting in less disciplined political parties, and the product is a fragmented—very pluralistic—policy process with many power points. As more and more groups and interests got involved in lobbying from the 1960s onward, it led to hyperpluralism—that is, more and more lobbying forces competing for the attention of the same number of policymakers. In turn, this was an impetus to the development of new and indirect lobbying techniques, such as grassroots lobbying, media campaigns, and political action committees (organizations that contribute money to candidates' election campaigns), in an effort to gain access to and influence policymakers.

While not all the processes of lobbying in other democracies are in contrast to those in the United States, there are some notable differences. With centralized policy-making processes shaped by the executive branch in most of these countries, there is much less political benefit from lobbying the parliament or using the courts. Plus, much lobbying is done through political parties and can be especially productive for those associated with the party or coalition in power. With various degrees of corporatist arrangements, from the very liberal democracies of Scandinavia to the reemerging democracies of Latin America, there is not the same degree of hyperpluralism in these countries and thus not the same need for the broad range of lobbying techniques used in the United States. For a combination of all these reasons and because lobbying was not seen as part of these systems until very recently, the U.S. lobbying profession has not developed in the same way as in other democracies.

Theories of Lobbying in Liberal Democracies

Like the rest of political science, interest group studies from the 1960s onward were influenced by the behavioralist and empirical approaches to research. Since then, even though no general theory of lobbying or one that integrates existing theoretical approaches has been developed, quantitative and qualitative techniques and a combination of the two have been used to produce theoretical explanations of lobbying. Virtually every major research approach in the social sciences has been used, including decision theory, rational choice theory, cost–benefit analysis, game theory, exchange theory, and new institutionalism.

One particularly enlightening theory is that developed by John R. Wright using communications theory. Although Wright's research focused on the U.S. Congress, it likely has general application for lobbying around the world. The assumption that lobbyists are primarily information providers is at the root of his theory. After Wright establishes that legislators generally have three overarching goals—reelection, the desire to make good public policy, and to exercise some power—he argues that legislators are forced to pursue these goals in a very uncertain and ever-changing environment. This is where lobbyists and lobbying come in with a mutual legislator–lobbyist benefit to the communication of information. On the one hand, this information will influence government officials to the benefit of the group or organization the lobbyist represents. On the other, this information reduces uncertainty and helps legislators learn how best to achieve their goals. This, to Wright, is not only the core of the lobbying process but the major form of influence.

This theory certainly hits on a key element in lobbying. Yet other research, especially on the 50 states in the United States by Clive Thomas and Ronald Hrebenar, argues that there are other key elements in the lobbying process and lobbying influence. The 2 major elements of the 12 that Thomas and Hrebenar identify are the extent to which policymakers need the group or organization lobbying them and lobbyist–policymaker relations. The more a policymaker needs a group—the more a group can build up a sense of need or obligation—because of votes, money, information, or whatever, the more likely the policymaker is to support the group and its cause. Good lobbyist–policymaker relations built on credibility and trust also appear to be key, and the longer the relationship, the more likely the lobbyist is to influence the policymaker. Furthermore, this lobbyist–policymaker contact is the essence of lobbying and determines the ultimate success or failure of an issue. This has always been the case and likely always will be.

What is needed is an integration of various lobbying theories to provide a comprehensive understanding. This is inhibited, however, by the diverse nature of interest group studies and the fact that several scholars are wedded to one research method to the exclusion of others.

Lobbyists in the United States and Around the World

Earlier, we defined a lobbyist as someone who represents individuals, collective interests, and interest groups to government. A more comprehensive definition, developed by Thomas, which embraces lobbyists around the world is as follows: A lobbyist is a person designated by an interest group to facilitate influencing public policy in that group's favor by performing one or more of the following for the group: (1) directly contacting public officials, (2) monitoring political and governmental activity, (3) advising on political strategies and tactics, and (4) developing and orchestrating the group's lobbying effort.

This definition succinctly embraces the four major roles that lobbyists perform. Not all lobbyists perform all four tasks. This depends on the organization and on the issue at hand.

Types of Lobbyists and Alternative Designations

The word *lobbyist* is often used as if all lobbyists were the same. In fact, there are different types of lobbyists from different backgrounds, which often affects their power base—their ability to be effective. Until recently, varying designations were used to distinguish between types of lobbyists, including *independent lobbyists* and *professional lobbyist*, both of which were sometimes also referred to as *hired guns* because they are paid specifically to lobby. These designations were sometimes contrasted with *amateur lobbyist*, though it was often unclear whether the term *amateur* meant unpaid or not well versed in lobbying techniques. In the United States, by the late 1980s, a standard terminology of types of lobbyists emerged among scholars and political practitioners. There are now seen to be five types of lobbyists:

1. Contract lobbyists are hired on contract for a fee specifically to lobby. They often represent more than one client and are likely to be former elected officials or staffers who are purveying to their clients their contacts with decision makers built up over many years.
2. In-house lobbyists are employees of an association, organization, or business, who as part or all of their job act as lobbyists. They represent only one client—their employer—and are likely to have come from the business or profession they represent. Their major asset is unequaled knowledge in their field, such as education, the environment, or issues and laws affecting the disabled.
3. Legislative liaisons are employees of government agencies who represent their agency to the legislative and executive branches of government. They also represent only one client—their agency. They tend to be career bureaucrats or former legislative or executive staff and have an intimate knowledge of their policy area.
4. Volunteer or cause lobbyists are those who represent citizen and community organizations or informal groups. They rarely represent more than one interest and are usually not paid. Their power base, as much as they have one, is founded on their commitment to the cause and their tenacity.
5. Private individual lobbyists are those acting on their own behalf and not designated by any organization as an official representative. Unless these are prominent citizens, such as those who own sports teams, these will not have much of a power base.

Partly because of the negative attitude toward lobbyists and lobbying, lobbyists are often referred to by other euphemistic designations. These include political consultant, government affairs representative, public affairs representative, and so on. And because of the negative perception of lobbying in other Western democracies and because they have only recently recognized the role of interest groups and lobbyists, there is no agreed-on nomenclature for lobbyists outside the United States. Euphemistic designations similar to those used in the United States are used for lobbyists in these countries.

One major difference between the United States and other democracies is the role of the hired or contract lobbyist (the term *contract lobbyist* is rarely used outside the United States, and they are sometimes referred to as commercial lobbyists). In most countries, including Australia, Canada, and those in the EU, these individuals are less likely to contact government officials directly but act as group advisors, monitor activity affecting the group, and act as facilitators arranging meetings of group officials with policymakers (hence the broader definition of a lobbyist set out above). In fact, in some cases, it is somewhat of a misnomer to call these individuals group "representatives" as some of them rarely advocate the group's position directly to government. Nevertheless, these people are intimately involved in the process of lobbying as defined above and should be considered as part of the lobbyist community in their respective country.

In considering the types and role of lobbyists, the aberrant nature of the U.S. political system is once again evident. While lobbyists in the United States, particularly Washington, D.C. (where they are referred to as Washington representatives), have long had the most visibility and their role is often viewed as a benchmark, in several ways, they are not typical of lobbyists around the world.

Regulation of Lobbying

Regarding liberal democracies, while the most extensive regulation has been developed in the United States, most liberal democracies have enacted some form of lobbying and lobbyist regulation. Such regulations have resulted from a combination of negative public attitudes toward lobbying and those who perform it, a populist desire to even up the political playing field against powerful special interests, and as the result of lobbying scandals involving corruption and illegality. It is the latter that is most often responsible for the enactment of regulation, such as what occurred in the 1990s in the United States, in several countries in Western Europe, and in the EU.

There are, however, several problems with lobby regulation, and its results have been mixed across liberal democracies. One is that regulation often runs up against the right of free speech and the right to petition government, as in the First Amendment to the U.S. Constitution, and this restricts the extent of regulation. A second problem is that the public and policymakers, often, are not clear on what the goals of regulation are: Some hope to even up the political playing field, while others want to publicize the actions of lobbying among other goals. A third point is that regulation cannot make hitherto weak groups powerful—only increased resources and political acumen can do that.

The most that regulation can do is to monitor the activities of lobbying organizations and lobbyists and put pressure on them and the policymakers they deal with not to engage in corrupt activities. However extensive regulation is or might become, it will never entirely root out corruption and nefarious activities in lobbying (and politics in general) as long as the stakes are so high, as they often are in many lobbying campaigns, with many peoples' livelihoods and futures at stake.

Conclusion

While lobbying has always existed and probably always will, several recent trends can be detected regarding this most basic of political activities and the lobbyists who perform it. Three are particularly noteworthy and interrelated.

First, since the rise of the third wave of democracy in the mid-1980s, an internationalization or globalization of lobbying techniques has taken place. This is not to say that all the new techniques in the United States are appropriate to all other political systems, but these techniques are often used when expedient around the world. Second, a reduction of the role of the state in many countries, especially in Western Europe, has undermined the neo-corporatist approach to lobbying and increased the level of pluralism. The first two trends have produced what might be considered an "Americanization" of lobbying across advanced liberal democracies and increasingly in developing democracies. However, this is not because these systems are trying to emulate or mimic the U.S. model. It is due more to the U.S. system exhibiting many characteristics of a highly pluralistic lobbying system.

LOCAL GOVERNMENT

While intending to give a comprehensive introduction to local government, the entry will largely focus on local government systems in Europe in its empirical references. Such focus seems justified and promising for two reasons. For one, it would be feasible, given the limited space, to give an account on local government in a global perspective and coverage. Second, because of the structure and variance which local governments in European countries exhibit they might provide insights into general issues and trends which may well relate and be "extrapolated" to local government developments in other regions of the world. Because a truly comprehensive account of the variations and trends in local governments throughout the world would require far more space than is available here, this entry provides an introduction to local government by focusing on the varieties and differences among local government systems in Europe. Such a review of variations in local governmental structure in European countries can offer insights into general issues and trends, which may then be extrapolated to developments in local government in other regions of the world.

Here, the term *local (self-)government*, which originated and is used in the English-speaking world, will also be applied to the other countries under consideration. The reader should keep in mind, however, that the variance in country-specific terminology, such as *kommunale Selbstverwaltung* (local self-administration) in Germany, *libre administration* (free/autonomous administration) in France, or *sälvstyrelse* (self-steering) in Sweden, conveys not only linguistic but also the underlying country-specific conceptual and institutional differences.

Intergovernmental Setting

A distinction between *decentralization* and *deconcentration* should be made with regard to the arrangement and distribution of powers, functions, and responsibilities in the intergovernmental setting. Decentralization is an intrinsically political concept as it revolves around the devolution of powers and responsibilities from the upper government level to a subnational level with democratically elected and politically accountable decision-making and administrative bodies of its own. By contrast, deconcentration is an essentially administrative concept as it aims at transferring administrative functions from an upper to a lower administrative level.

Regionalization

Historically, in (unitary) countries, the intergovernmental architecture comprised two levels—the central government and the local government—with the exception of federal states where, historically, an intermediate/regional governmental level has been in place—in the German case, in fact, preceding the creation of the national state.

In recent years, in some hitherto unitary European countries, particularly the larger ones, the intergovernmental setting has been shaped by the formation of regions on the intermediary level—placed between the central government and the existing local government levels. Among continental European countries, the hitherto unitary (Napoleonic) states have shown remarkable variance in the degree of regionalization. The factually most advanced case is Spain where, when democratic government was reestablished after 1978, the regions (*comunidades autónomas*) were created with significant legislative powers and fiscal resources of their own. In Italy, the regions were given legislative and operative competences to a degree that has been termed *quasi-federal*. By contrast, in France, where as an element of decentralization in 1982 regions were introduced, it was decided to keep them at a simple, local government status (as a third level of *collectivités locales).*

The United Kingdom (UK), too, abandoned its path-dependent unitary trajectory in that, in 1998 and 1999, Scotland and Wales gained regional status (with elected regional assemblies of their own). Currently, however, the UK has also entered the "road towards quasi-federalism" (David Wilson & Chris Game, 2006), which has remained "asymmetrical," though, as with England (which has 85% of the UK population), remaining (highly) centralized.

Whereas regionalization, particularly in its quasi-federal nuances, has strengthened the democratic as well as the operative potential of the intermediate/regional level, its implications for the local government levels have been somewhat problematic. The politically and functionally empowered regional level, while proclaiming decentralism vis-à-vis the central government level, may be disposed to take a centralist posture in relation to the local government levels. The somewhat hierarchical influence, which in Germany's federal system the regional states (*Länder*) tend to exercise over the local level, hints at a paradox of decentralization.

Similarly Spain's regions (*comunidates autónomas*) have exhibited some dominant stand vis-à-vis the country's local level.

Local Government Level

In most countries, the local government levels are historically made up of two tiers, called, for instance, *counties* and *boroughs* or *districts* in the UK, *Kreise* and *Gemeinden/Städte* in Germany, *départements* and *communes* in France, and *landsting kommuner* and *kommuner* in Sweden. In the following, the terms *counties* and *municipalities* will be generally applied.

In some countries (single tier) local authorities have been formed, which combine municipal and county responsibilities. The German–Austrian local government tradition has long since known such single-tier local authorities (called county free cities, *kreisfreie Städte*) as the organizational base particularly of larger cities. Similarly, in the English local government tradition, the scheme of single-tier county boroughs was in place until 1972 and was resumed, under the new label *unitary* authorities, particularly since the 1990s; by now, in most urban areas, including the major cities, single-tier unitaries have been formed. In central Eastern European countries also, such as in Poland and Hungary, the concept of single-tier local authorities has been put to work.

Intercommunal Bodies

In countries in which, in the absence of territorial reforms, the territorial structure is marked by a multitude of small-scale municipalities, an additional layer of intercommunal bodies has been created or has come into existence, which are meant to provide the institutional frame and encouragement for intercommunal cooperation.

Territorial Organization

The European countries show a conspicuous variance in the average size of their municipalities. On one end of the continuum, there is a group of countries with municipalities with populations averaging more than 30,000, such as the UK (with an average size of 139,000 inhabitants), Denmark (with 55,000), and Sweden (with 31,000). At the other end, there are countries with municipalities having average populations of less than 10,000, particularly France (1,720), Hungary (3,170), Spain (5,400), and Italy (7,200) (see Dexia, 2008, p. 41).

Territorial Reforms

The current territorial structure of municipalities largely depends on whether the countries have, in the past, carried out territorial reform and on the underlying political and cultural factors that shaped the decision to carry out or not to carry out territorial reforms.

In the first group of countries, particularly during the 1960s and 1970s, territorial reforms were guided and driven by the goal, typical of the (rationalist) zeitgeist of that period, of massively redrawing the historically small-size boundaries of the municipalities in order to modernize them and make them administratively more amenable and operationally more effective in conducting the multiple tasks conveyed on the local government level by the (then expansive Welfare) State. Labeled by Alan Norton (1994) as the "North European pattern," in view of the countries in question, this reform strategy was marked by the political determination of the governments concerned to carry out the reforms, possibly against the will of and in the face of protests by the local population, using coercive parliamentary legislation as a last resort. According to John Stewart (2000), particularly in England, the scale of amalgamation has been criticized as being oversized ("sizeism"), fostering political alienation of local citizens (as shown by the low voter turnout).

In other countries (with small municipalities), no territorial reforms have occurred. In France and Italy, in the early 1970s, the national governments attempted, in line with the zeitgeist of the era, to territorially reform the small municipalities (in the French case averaging 1,700 inhabitants). Yet these reform moves almost entirely failed because the governments, adhering to the country's political culture value of "voluntariness," made amalgamation contingent on the approval of the local population, and such a local consensus was not reached.

In Central East European countries (and similarly in East German Länder), after the downfall of the Communist regimes, most postsocialist governments decided to do without amalgamation of the small municipalities in order not to impair the newly created (small) local democracies (in

Hungary, the number of municipalities even jumped after 1990, from 1,600 to 3,170).

Intercommunal Bodies (Inter-Communalité)

In countries in which territorial reforms of the municipal level did not come to pass, different strategies and approaches were followed to institutionally encourage and enable the multitude of small-scale municipalities to engage in intercommunal cooperation, for instance, in the provision of services for the local population. Against the background of the very small size and very large number of municipalities (communes), France, not surprisingly, was the first and exemplary country to create the legal framework—the first as early as 1890—for a great number of such intercommunal bodies, called *inter-communalité*, at first in the form of *syndicats*, then, since the 1960s, in the form of communal unions (*communautés*), with the most important ones being the *communautés urbaines* (in the meantime) in 16 metropolitan areas. As a crucial institutional innovation, the communal unions have been provided with a taxing power of their own (*fiscalité propre*). In line with the traditional principle of voluntariness (*voluntariat*), most of these intercommunal bodies have been formed on a voluntary basis. In other countries (without territorial reforms), similar institutional developments have got under way, for instance, in Italy (with the formation of *consorzi*, in part by binding legislation) and in some German Länder (with the establishment of *Verwaltungsgemeinschaften* [administrative unions], formed also, last resort, by binding legislation). Most recently, a new round of territorial consolidation has gained momentum. Further, on the one hand, quite massive territorial amalgamation strategies have been inaugurated, such as in Denmark (2007) and Lithuania, both arriving at municipalities averaging 55,000 inhabitants. On the other hand, political initiatives have been undertaken to further consolidate the intercommunal networks.

Political Institutions

Local Democracy

Local self-government hinges on the idea and imperative that the local citizens govern themselves in all matters relevant to their local community. In its purest form, local self-government is realized through institutions of direct democracy when the local citizens meet directly to make the relevant decisions. In Europe, the mother country of direct local democracy still is Switzerland, where in some cantons, and even in major cities, citizens meet periodically to make relevant decisions, including those on local taxation. For the rest, in all other European countries, the institutions and procedures of representative democracy prevail, according to which the key political right of citizens is to elect the local councilors, while the elected local council is the supreme and sole local decision-making body.

Political parties made their entry into local politics quite late, when national parties discovered the local level as a relevant political arena to mobilize political support and to recruit political leaders. Recently, however, as noted by Marion Reiser and Everhard Holtmann (2008), there are indications of a “farewell to the party model” in local politics.

In recent years, the dominance of representative local democracy and preponderance of the elected local council as the prime local decision maker has been challenged as, since the 1990s, in a number of countries (such as Germany and Italy), binding local referendums have been introduced as a complement and corrective to the elected local councils. Significant impulses came from Central Eastern European countries (including East German Länder) when, after the collapse of the communist systems, the introduction of direct democratic procedures were seen as a crucial step to move toward reestablishing and reinforcing democratic systems.

Local Political Systems

Among the local institutional arrangements in European countries, two systems can historically be distinguished. For one, essentially in the UK and in Scandinavian countries, monistic local government systems have developed in which decision making (as well the direction of local administration) is ideally the collective responsibility of the elected council, which, in turn, has delegated this monistic responsibility to sector committees (government by committees). From this followed the notion that the executive function (which combines decision making and executive functions) should be entrusted to (sectoral) committees formed by the (plenary) council (government by committee).

This monistic government by committee system is contrasted with the dualistic local government system, which has emerged in Continental European countries. It is premised on the (dualistic) distinction made between the local council as the prime local (local parliament type) decision-making body, on the one hand, and as an executive body with, as a rule, a mayor elected by the council, on the other hand, in a division-of-function scheme reminiscent of a (local) parliamentary system. In most countries, the mayor was elected by the council. Both local government "families" have seen significant institutional changes in recent years, which were triggered by mounting criticism.

In the UK, the traditional government-by-committee system was attacked for lacking clearly identifiable accountability and for fostering policy fragmentation. The Local Government Act of 2000 provided for a reform that was undertaken in England and is the option chosen by most councils. It amounts to a kind of "parliamentarization" of the local government system, in that most of the decision-making and executive powers are transferred to one of the committees (the "executive committee" with "executive councilors" as the local "parliamentary cabinet"); there is a (council elected) leader of the committee who serves as a kind of local "prime minister," while the plenary of the council and its councilors are assigned a scrutinizing function. Sweden, too, has moved toward a quasi parliamentarization of the local government system, stopping short, however, of abandoning the collective responsibility of sector committees.

In continental European countries, the existing dualistic system, with a council-elected executive mayor, was chiefly criticized for constraining the emergence of a local leadership and also because the mayor lacked democratic accountability. Since the 1990s, many European countries (German Länder, Italy, central Eastern European countries) have moved toward the direct election of the mayor, which is reminiscent of a local presidential system. To put a political check on the (possibly domineering) mayor, in most German Länder, a procedure to recall the sitting, directly elected mayor by way of local referendum has been installed.

Functions

The local government levels have historically taken on an ever-broader multifunctional profile as local authorities, responding to mounting social and infrastructural needs, assumed responsibility for social services and public utilities (water, sewage, energy, etc.) in what conservatives sneered at as municipal socialism and which in fact amounted to a local embryonic version of the emergent welfare state. With the advances of national welfare states, which climaxed after 1945 well into the 1970s, local government levels were increasingly put in charge by central governments to implement national welfare state and interventionist policies.

In all countries, the local government levels have been responsible for the provision of social services, urban planning, and for the provision of utilities. Moreover, the concern for cultural and recreational matters ranked high on the local government agenda.

The most important intercountry functional variations are related to education and health services. While, for instance, in Sweden and England, the running of (primary and secondary) schools falls under the operational and financial responsibility of the local government levels, in continental European countries, education, by tradition, is firmly a state matter. In some countries, the local government levels (in Scandinavian countries) or the regions (in Italy) are operationally and financially involved in the public health system. Recently, in reaction to neoliberal (lean state) and marketization demands as well under budgetary pressure, the traditional public sector model and with it the multifunctional municipal sector profile have experienced significant retrenchment and cutbacks both in functions and in personnel, thus putting the traditional local government model at stake (see below).

The significant, in part preponderant, functional weight that the subnational levels, particularly the local government levels, have so far acquired in the respective countries is indicated by the high proportion of personnel at these levels compared with the total number of public sector personnel.

Among the unitary countries, the list is topped by Scandinavian countries, with local government personnel constituting up to 83% (in the case of Sweden) of the total number of public sector employees (see Dexia, 2008, p. 64), and also by some Central East European countries (such as Hungary with 65%) and by the UK (with 56%). The percentage of state personnel is correspondingly small (e.g., 17% in Sweden). While in France the percentage of local government personnel has expanded (to 30%) since the beginning of decentralization in 1982, the share of state personnel continues to be surprisingly strong (some 50% with another 20% in public hospitals). In Italy, the central state continues, despite the decentralization since the 1990s, to employ 58% of the total public sector. Thus, notwithstanding decentralization in these two countries, the central state, hinting at some path-dependent continuity of the Napoleonic state tradition, continues to be organizationally present at the subnational levels

The picture in federal or quasi-federal countries is somewhat more complex. While in Germany the portion of federal personnel is just 12% and in Spain 23% and the rest are employed by the subnational levels, the lion's share of public sector personnel is employed at the federal (53% in Germany) or the quasi-federal/regional levels (50% in Spain), with the local levels also showing considerable personnel strength (e.g., with 30% in Germany).

Local Finances

The status and standing of the local government in the intergovernmental setting essentially depends, of course, on the degree of its financial and budgetary autonomy. A valid indicator of this could be the degree to which local authorities, in order to cover their expenditures, may draw on local taxes of their own as opposed to relying on grants assigned to them at the state level. Historically, the local governments financed their spending almost entirely from local taxes, the "rate" levied by English local authorities being a classical example. Signaling the current fiscal dependence of local authorities is the fall in percentage of "own" tax revenues as compared with the entire local revenues in most countries. Sweden is a lone exception, in that 67% of their local revenues still comes from the local (income) tax; France and Denmark are also remarkably close, with 49%. By contrast, in most other countries, the self-financing local tax margin is less than 20% (see the table in Dexia, 2008, p. 97). Correspondingly, the share of government grants (which can quite easily be changed and manipulated and could also come with strings attached) from the central government has conspicuously risen, standing, for instance, at 49% in the UK and 47% in Italy and Poland.

Local Organizational Structures

Local Administration: Organization and Personnel

Historically, in preindustrial times and in rural contexts, local matters were, as a rule, attended out by "laymen," that is, by the local citizens at large in what literally was local self-administration. The layman practice in local administration was pursued, for instance, in Sweden well into the early 20th century and still exists in Switzerland in certain forms.

However, in countries that underwent early industrialization and urbanization, such as in the UK, an industrial front-runner, and somewhat later in Germany, the local authorities built up regular administrative structures with professionalized staff. In continental European countries, within a state tradition geared to legal, rule-bound hierarchical administration (often identified as the Max Weber bureaucracy model), local administration also showed a Weberian stance. Reflecting the advanced welfare state and its public sector–centered implementation model in some countries, such as in the UK and in Sweden, social services came to be almost entirely rendered (in-house) by public—that is, local government—personnel. In some countries, for instance, in Germany and Italy, traditionally following a subsidiarity principle, social services continued to be provided largely by nonpublic, nonprofit organizations.

Spearheaded by new public management (NPM) concepts, the Weberian model of legal, rule-bound hierarchical public administration was criticized for its inherent inflexibility and its neglect of economic efficiency and was sought to be replaced with managerialist concepts and instruments that, borrowed from the private business sector, aimed at making municipal administration and its personnel more flexible and more cost conscious. The impact that the NPM message had on the administrative world varied from country to country, depending on country-specific cultural and institutional conditions and traditions. It was most noticeable in English-speaking countries, which, as in their Common Law tradition a legally defined distinction between the public and the private sphere is not made, appeared more receptive to the private sector–derived principles. By contrast, NPM had a more difficult access in most continental European countries, in which, against the backdrop of their Roman Law and Rule of Law (*Rechtsstaat*) traditions, the traditional administrative model was culturally more firmly entrenched. In retaining elements of the traditional model and in—at the same time—adopting and "translating" NPM concepts, these countries have, in their administrative model, not least in local administration, moved toward what has been called a neo-Weberian model.

Under the combined onslaught of (neoliberal) welfare state critique and budgetary squeeze, local governments in most countries have resorted to making deep cuts in their personnel over the past 15 years. Perhaps the most conspicuous case is Germany where, between 1991 and 2004, the total local government staff was cut by 30% (in East German Länder, it was even higher at 53%) and in the UK by 5%. By contrast, in France, the local government staff increased by 24%, obviously in the wake of decentralization since 1982.

Mounting Interorganizational Pluralization of Single-Purpose Actors

In the (horizontal) interorganizational setting, the traditional multifunctional leading position of local government in the local arena has been challenged through a number of powerful currents, particularly through the neoliberal policy message, through the NPM message (both becoming rampant during the 1980s), and increasingly (since the 1990s) through the market liberalization drive of the European Union.

First, inasmuch as the previously dominant conception of local government as the public sector/municipal sector–centered providers of public services was challenged and shattered, the local authorities proceeded to "outsource" the conduct of local government activities and the provision of public services to outside providers. While outsourcing was not an entirely new concept in local government practice, it gained momentum when, in the 1980s, compulsory competitive tendering became the battle cry of Britain's Conservative Government under Margaret Thatcher and almost irresistibly spilled over into the modernization agendas in other countries. The provision of social services has subsequently seen a pluralization of providers—public/municipal or semipublic, nonpublic, nonprofit, or, increasingly, private-commercial.

The other important field was the provision of public utilities, which, in some countries, has traditionally been the responsibility of local government and has often been carried out by them in an organizational in-house form. Under the market liberalization pressure, the local authorities have followed two options, which are described below.

First, they turned these activities, in what has been called formal (or organizational) privatization, over to newly created, still municipally owned, but organizationally and financially self-standing corporations. In some cases, such corporatization has been extended to a broad scope of local functions, sometimes with the intention of tailoring the entire administration to a private sector–derived holding (Konzern) scheme. Second, often beset by budgetary needs, the municipalities embarked on substantive (or asset) privatization by selling their local facilities (such as local energy or water companies) to outside providers, mostly of the large national or international corporation kind.

In sum, in the (horizontal) interorganizational setting of the local arena, public tasks, which, in the past, were attended by local government in-house or at arm's length, have increasingly been taken over by, or outsourced to, local-level actors that operate outside the immediate realm and direct influence of local government in the local arena. They constitute the kind of actor networks that, in the currently dominant social science terminology, have been identified as *governance*. On the one hand, these local governance actors can be expected to bring their specific—financial, innovative, entrepreneurial, and so on—resources and skills to bear in the local arena. As they are typically single-purpose and specific-interest actors—that characteristically, first of all, seek to fulfill their own organizational goals and benefits possibly to the detriment and at the expense of other actors and their rivaling interests—their basically "private-regarding" action orientation is bound to pose a challenge to the role and mandate of the elected councils to be (ideally) the advocates and guardians called on to ensure the "public-regarding" view and the best interests of the local community. To exercise its advocacy role and to coordinate the complicated interactions, the local authorities are called on to become active players in the local governance networks. It may well be that the reforms in local leadership could put them in the position of acting as key networker (reticulist) in the field. In conclusion, local government and local governance should not be seen as mutually exclusive but as complementary.

LOCKE, JOHN (1632–1704)

As the father of modern empiricist epistemology, critic of innate ideas, and theorist of a conception of personal identity still very much in vogue in contemporary philosophy, Locke brings key concepts of constitutionalism and toleration to the modern political lexicon: individual rights and freedoms, the rule of law, the separation of powers and the division between private and public. Political power must justify its acts and choices and must practice the virtue of nonintervention in those areas of social life that possess some sort of internal and autonomous normativity, areas where the law of nature does not require the support of positive law. At the heart of Locke's political theory lies a contractualist political model that opposes both the divine right of kings and the absolutist ramifications of Thomas Hobbes's contractualism—a model that reconciles tradition and modernity and addresses both secular and religious concerns.

Between 1689 and 1690, as a troubled period in English history came to a close with the Glorious Revolution and the ascent of William of Orange to the throne, Locke published *An Essay Concerning Human Understanding*, the *Epistola de tolerantia*, and the *Two Treatises of Government.* In many respects, these three works represent an intellectual program begun nearly 30 years earlier, in his juvenile manuscripts on the law of nature—a program that focused on the limits of human understanding, the foundations of political obligation, and the use of reason in discovering the principles of natural law. Belief in past habits and traditions or in opinions supported by custom and convention may lead a person into grave error. Both ancient historians and the authors of modern travel diaries have attested to the great variety of human moral convictions and the impossibility of reducing them to a single, coherent system. Neither history, nor innate principles, nor a general human consensus can help people determine universal rules and principles. The only trustworthy tool in this endeavor is one's own reason, by which one can discover the order that derives from God's supreme will and transcend the multiplicity of traditions and opinions.

Locke places himself within the modern individualist tradition. He needs individualism and equality to challenge the hierarchical and patriarchal structure of feudal society but, unlike Hobbes, he also relates to them as fundamental premises for the creation of a lawful political power, rooted in consensus. Hobbes's atomistic and competitive individualism make it impossible to imagine a social and political order that is not the product of artifice, in the absence of which there is only chaos, anarchy, and bellum omnium contra omnes (war of all against all), a precarious and dreary condition in which there is neither mine nor thine, justice nor injustice. According to Hobbes, only the absolute, unlimited, and illimitable positive law of a sovereign can end the state of war between men and guarantee order, peace, and property. Conversely, the author of the *Second Treatise of Government* distinguishes, at the very outset, the state of perfect freedom of man in the state of nature from license and the state of nature from the state of war. In the state of nature, people are not unrelated atoms moved by instrumental and calculating reason but moral persons who seek relationships of mutual recognition and harbor feelings of benevolence and mutual cooperation. Moral norms exist even in the absence of positive laws, as a result of natural human sociability and a sense of kinship—as members of the same species—and finally, as a result of the theological premise that all men are equal because they are all God's workmanship, all His creatures, and all equally dependent on their common Creator, and called on to participate in his divine plan. This moral equality forbids their using one another in an instrumental fashion. Moreover, inasmuch as he is God's workmanship, man cannot take his own life or that of another but must strive for his survival and the survival of the entire species.

In the *First Treatise of Government*, in response to Filmer's *Patriarcha* (published posthumously in 1680, during the exclusion crisis), Locke denies that God's will, as expressed in the book of *Genesis*, mandates the reduction of men to a condition of natural slavery and subjection. God did not make Adam master of all men and sole owner of the Earth. He gave the Earth to Adam and Eve and, by extension, to all men, that they might multiply and improve the conditions of their lives. The necessity to improve the conditions of one's life and ensure one's survival justifies appropriation. God gave the world to all men in common, but they would die of starvation were each to await the consensus of the rest of humanity before consuming the fruits of nature. Property does not derive from consensus but from labor. Through their labor, men transform and improve nature, creating wealth. The law of nature does not allow natural resources to be used in a profligate manner. The inequalities that derive from the existence of private property and the accumulation of wealth, made possible by the introduction of money, are justified inasmuch as they constitute a general improvement in the human condition. If justice gives every man title to the product of his labor, charity gives one who is unable to support himself the right to assistance: The poor man is entitled to the surplusage of the rich.

The statement that every man is born free, equal, and independent—that is, capable of choosing his own destiny—entails many important consequences from a political perspective. Every man is responsible for his own actions: The sins of the fathers cannot be visited on the sons, no paternal act can deprive the son of life and liberty, and no pact undertaken by the father can be considered binding for future generations. Natural law and the moral equality of men make consent the only possible basis for lawful interaction between equals. The relationship between husband and wife is determined by a pact, which recognizes the legitimacy of divorce and even a woman's right to negotiate the terms of custody of her children and other, similar issues. Voluntary pacts govern interaction between religious associations and their believers, between master and servant, and between magistrate and citizens. The political compact, however, unlike all other pacts, is irrevocable: When a citizen has given his express consent to be part of the political community, he can no longer abandon it; he has no right to emigrate and join another state.

In the state of nature, every man possesses the executive power of the law of nature, which affords him the power to judge and punish, in a commensurate fashion, those who break the law of nature. One who infringes on the life, liberty, or property of another thereby places himself in a state of war with the rest of humanity. Justice in the state of nature fails only as a result of men's passions, which may lead to excessive partiality in the application of sanctions. That is why men decide to abandon the state of nature and form a political community. In adhering to such a compact, they surrender to the state that executive power granted to them by the law of nature. The state's monopoly over lawful violence is thus constrained to respect the limits within which it was legitimately exercised by every individual in the state of nature. The ramifications of this are far-reaching and concern even the relationship between states: No state has the right to initiate a war as an aggressor because the executive power of the law of nature that has been delegated to the state can only be exercised for the purposes of reparation and restraint. Locke, unlike Hobbes, may thus distinguish between just and unjust wars, conceiving limits to the contenders' lawful conduct during a war, implicitly following Hugo Grotius' distinction between *ius ad bellum* (the right to go to war) and *ius in bello* (right conduct in war).

The creation of a single judge would not be an improvement on the state of nature, were it not accompanied by the separation of powers and were the principles of the law of nature not fixed in established and impartial laws decided by the community itself. The compact by which every man authorizes the political community to make laws may not, therefore, institute absolute sovereignty. An absolute sovereign, *legibus solutus* and sole master of all powers, is still in a state of nature with his subjects or rather in that degenerate form of the state of nature that is the state of war. No man, Locke maintains, can be so foolish as to abandon the condition of perfect freedom of the state of nature in order to put himself under the absolute power of another man. In a civil society, legislative power and executive power derive from a fiduciary trust granted by the people. Since such power is founded on trust, it can be revoked by the very same people when its rulers systematically break the law. In response to repeated and widespread violations of individual rights by political power, when judiciary intervention is not feasible, there is always the so-called appeal to heaven. It is only in extreme cases, according to Locke, that people will have recourse to violence. The right of resistance may thus be seen more as a warning to those who govern, that they must obey the law, than as a real threat by the people.

In *A Letter Concerning Toleration*, Locke resorts once again to the strategy of separation that would later become the legacy of the entire liberal tradition, separating the legitimate field of action of the state from that of the churches, conceived as voluntary associations. Care for the soul is a private affair, pertaining only to the individual. Men will never reach an agreement on religious issues but will continue to divide and adhere to different churches. Locke is one of the first philosophers to seriously address the persistence and inevitability of disagreement on religious issues. Each and every believer will continue to consider his church the sole representative of religious orthodoxy. As the magistrate has no greater knowledge of the path to salvation than any individual citizen, he cannot impose his will in religious matters. The state, however, has no reason to fear religious pluralism. Religious citizens in fact possess social and moral virtues that can be useful to the state. Furthermore, as it welcomes the existence, in the social space, of a plurality of civil, commercial, and scientific associations, so the state should admit the presence of a plurality of religious associations. They are no more dangerous than other associations, as long as they are allowed to compete freely. Competition might also improve the moral conduct of each church, both internally and in its relations with other churches. It is atheists who represent a threat to the social order: Their word cannot be trusted because they do not believe in the existence of a God who can see and judge us even in the dark. A church, such as the Catholic Church, that strives to unite in itself both spiritual and temporal power, remains a grave threat to the state and to the public order, as does a church that promulgates beliefs detrimental to human society, such as the belief that it is justified not to keep a promise to one who espouses unorthodox religious doctrines.

LOGIC OF APPROPRIATENESS

James G. March defines the *logic of appropriateness* thus: Individuals and organizations fulfill or enact identities by following rules and procedures that they imagine to be appropriate to the situations they are facing. Following standard operating procedures, they act according to what is expected of them, whether they are politicians, civil servants, or citizens. Appropriateness is a concept taken from culturally oriented theory and is concerned with informal norms and values, but it is also related to structural theory and formal norms because formal structure influences the development of informal norms. A distinction is often made between the processes whereby appropriate modes of thought and action evolve and the situations that call for appropriate action—generally termed *matching situations*.

In this entry, the main features of the logic of appropriateness are outlined and discussed, including the key concepts underlying it—identities and rules, and the relationship between them. Next, the entry will show that acting in an appropriate way involves matching situations that are potentially complex and ambiguous and that formal rules often heavily influence informal ones, which affects the logic of appropriateness. Finally, we will discuss how the logic of appropriateness differs from the logic of consequentiality, the logic most often connected with more rationally oriented theories. The examples used are mostly taken from studies of public organizations.

Main Features and Key Concepts

The three main questions constituting the logic of appropriateness are the following:

1. First, what kind of situation am I actually facing as an actor (individually or institutionally)? This is a question of recognition.
2. Second, what is the main identity of my institution and what is my own main identity?
3. Third, what am I and my organization expected to do in a situation like this? That is, what are the rules connecting the situation and our identities?

A crucial question is how actors set about answering such questions in matching situations. One way is to learn from experience—experiential learning—either by looking at how the matching has been done recently or by finding out how the institution traditionally does this matching. A second way is to react cognitively or through categorization based on mental maps or else through what Karl Weick labels "sense-making." A third way is to use the experience of others to match, either by stressing that the context is exactly the same as the one others have experienced (contextualization) or by arguing that the context belongs to a broad category that is typical for many organizations (decontextualization).

According to James G. March and Johan P. Olsen, the logic of appropriateness deals with what is essential in a role, not with what is instrumentally or arbitrarily defined. Faced with different kinds of stimuli, actors respond in complex, standardized, and almost intuitive ways, without any immediate comprehensive analysis, problem solving, or discretion—the latter being features that become part of the logic over time. Appropriateness presupposes that actors have multiple identities or a repertoire of identities—and hence multiple rule options—and these become relevant according to the different situations actors face. One implicit assumption is that these identities and rules exist in relatively consistent sets to further systematic behavior.

Identities, Rules, and Situations

Identities are connected both to the individual actor and to institutions. For the individual, identity is a conceptualization of the self organized into rules in order to match action to situations. Identities are constructed by the individual actor, imposed by the environment, and influenced by a broader cultural context. Individual identities can be formed by two interwoven processes: a process of individualization, where the actor voluntarily chooses from self-imposed and self-selected roles and rules, and a process of socialization, where obligations, responsibilities, and commitment are learned and followed, not chosen.

Institutional identities are based on the evolution of common individual or group identities, resulting from the same type of experiences or from internal and external constraints, thereby creating similar attitudes, norms, and values. These are organized into broader social roles, and individual identities can be derived from them. Stephen Krasner describes the same phenomenon with his concept of "vertical depth" in the process of institutionalizing norms and values, referring to factors that are especially important for defining attitudes and activities.

The logic of appropriateness alludes more to informal than formal rules, but formal rules definitely influence informal ones, for example, concerning appropriateness in the civil service. Rules are defined independently of the individual actors who enact them, meaning that personal characteristics are of less importance and that different people in the same time period, position, and institution will match situations, identities, and rules in some of the same ways. Rule following can be seen as a kind of implicit contract or pact; if an actor behaves appropriately, he or she will also be treated appropriately. Rules are codified and standardized to a certain extent, as a precondition for channeling ideas and behavior, and may sometimes be inconsistent. They are meant to organize and regularize behavior and to further standardization instead of individual discretionary behavior. But because rules can be violated, are sometimes too inflexible, may disregard consequences, or may function as socially constructed myths, they may potentially have problems fulfilling these functions.

The theory of the logic of appropriateness is little concerned with what types of situations actors face when trying to connect or match rules, identities, and situations. Appropriateness is often connected with familiar and routine situations, but there are, of course, also appropriate ways to behave in poorly defined situations, such as turbulent or crisis periods. Matching is not only about stability but also takes place when both rules and situations are changing. Philip Selznick emphasizes in his cultural theory that so-called critical decisions are what change public institutions the most and are different from routine decisions.

One starting point for elaborating the logic of appropriateness is to underscore that actors, for example, in public organizations, are probably seldom in unambiguous situations where identities are clear-cut and where one identity is dominant. They have multiple individual and institutional identities. Their environment is often turbulent, with complex dependences, creating a complex attention structure, especially when a number of identities are significant and possibly in conflict. A civil servant can, for example, have identities relating to the specialization of the formal structure and the complexity of its cultural history, to professional competence, and to gender. Identities are further connected with employment in a certain ministry, in a specialized division or in a smaller unit, or else with certain specialized tasks and functions. Another set of identities is related to the interpretation of the cultural history and traditions of a public institution. Some civil servants may have a long tenure related to a subculture in the organization, while others may have a short tenure during which they have become socialized into general cultural norms and values.

And actors differ according to their professional backgrounds and the professional contexts they work in. All this illustrates that identities are numerous and characterized by complexity and varying degrees of consistency.

Variety can lead to ambiguity concerning identities or to situations with possibly competing logics of appropriateness; what is appropriate for one actor, individually or institutionally, may be inappropriate for another. Selznick's analysis of cooptation in the Tennessee Valley Authority provides an example of this. When the leadership choose cooptation as a strategy to address business interests in the "task environment," this could be seen as appropriate from a developmental perspective. But had they favored another type of appropriateness, attending to a more conservationist point of view, they would have probably chosen another, less inclusive strategy.

A general question is, therefore, what type of conditions are important for bringing some identities or some aspects of identities to the forefront and keeping others in the background in an actor's allocation of attention. We would claim that identity related to the formal structure, role, and functions in public organizations is more dominant than culturally evolved identities inside organizations or external social status, which are subordinate to formal conditions and less relevant for decision making. Another answer points to the fact that organizations differ with respect to developing collective, institutional identities and, therefore, also with respect to the ease with which members can base their thoughts and actions on such identities. March and Olsen emphasize that some organizations can have strong integrative features, creating a feeling of common goals and destiny among citizens, politicians, or civil servants, while others are more aggregative and atomized.

One would expect the identities of most actors to be dominated by clear-cut formal rules but also to have informal rules or complex patterns of formal and informal rules, which are either consistent or inconsistent, as their main guidelines for action. But rules can also be said to evolve during the process of matching; the matching process also involves creating new rules and identities, not only selecting from preexisting ones. Sometimes rules and identities undergo a transformation or editing process when they are confronted with new or complex situations.

Consequentiality and Appropriateness

The logic of consequentiality is based on a rational instrumental tradition, where utilitarian reasoning about cost and effects is an important part of the equation. The logic of consequentiality may be seen as competing with the logic of appropriateness, but it is more often seen as only one version of rule following; in other words, rationality is one rule that is connected to reasoning about consequences. In the logic of appropriateness, contrary to the logic of consequentiality, preferences and expectations about the consequences of action are not the most important consideration; the main thing is to identify what is appropriate. Rules can be followed even if the consequences are negative—with regard to self-interest, for example. But what is appropriate can also reflect a history of negotiations, consensus building, or winning coalitions.

Although analytically distinguishable, it is often difficult to separate arguments of appropriateness from arguments of consequentiality in concrete decision-making processes. The main reason for this is that the extensive application of rationality and the logic of consequentiality is a very strong ideology permeating modern organizations, to such an extent that behaving appropriately often means demonstrating clearly that one is acting in accordance with this logic. Some aspects of the puzzling mixture of arguments of appropriateness and consequentiality find expression in the creation of rationalized myths (i.e., popular ideas about how to build and change modern organizations) and in the interpretation of their effects.

LOGIT AND PROBIT ANALYSES

Logit and probit models are designed to analyze research questions where the dependent variable is binary. Examples of these kinds of problems are studies of voter turnout (where each individual might vote or abstain), legislative voting on a bill (where each legislator might vote yes or no), and war (where each country might choose to go to war or stay at peace). In practice, there is little difference between the logit and probit models, and these models are interchangeable in almost all research settings. Logit and probit models fall into the category of discrete choice models, so named because the political agents we are studying are making choices from among a finite set of distinct options. In this entry, the derivation and interpretation of such models are discussed.

Deriving the Logit and Probit Models

Perhaps the most straightforward way to derive the logit and probit models is to assume that a political agent's choice is determined by some continuous underlying rating of a political item or a propensity to engage in some behavior known as a latent variable. Each political agent's position on this latent variable (y_i^*) is assumed to be a linear function of a set of some observed variables and coefficients ($X_i\beta$) and some unobserved stochastic influences (ε_i). Thus, a political agent's latent choice preference is given by

$$y_i^* = X_i\beta + \varepsilon_i.$$

If y_i^* was observed, we could simply estimate this equation via linear regression. However, in a binary choice setting, the agent's position on this latent variable is unobserved. Instead, a choice threshold τ divides the latent variable into two categories, and we only observe y, which indicates which choice category the agent selected. We observe $y_i = 0$ for agents who are at or below τ and $y_i = 1$ for agents above the threshold. For instance, a country might have an underlying propensity to fight with its neighbors, but we can only observe this country in one of two discrete choice categories: war or peace.

Since y_i^* is latent, we must make several identifying assumptions to estimate the probability that a political agent makes a particular choice. Although these identifying assumptions are arbitrary, they do not influence the estimate of the relationship between the X_is and choice behavior. The first of these assumptions is to set $\tau = 0$. We make this assumption because we cannot obtain a unique estimate for both τ and the constant term in the model: Since y^* is unobserved, we could add an arbitrary constant to both τ and the constant term and still generate the same probability of an observed outcome. With this assumption, and noting that $y_i^* = X_i\beta + \varepsilon_i$, the probability that an agent selects the choice category represented by $y = 1$ given the observed variables X_i is

$$\Pr(y_i = 1 \mid X_i) = \Pr(X_i\beta + \varepsilon_i > 0 \mid X_i).$$

This equation reveals that the probability that political agents select the choice category denoted by $y = 1$ will depend in part on the unobserved error term ε_i. By subtracting $X_i\beta$ from both sides of the inequality and assuming that the distribution of ε_i is symmetric, we can rearrange this equation to read as follows:

$$\Pr(y_i = 1 \mid X_i) = \Pr(\varepsilon_i \leq X_i\beta \mid X_i).$$

This equation is simply the evaluation of the cumulative density function (CDF) of ε_i at $X_i\beta$, which we can express as $\Pr(y_i = 1 \mid X_i) = F(X_i\beta)$.

The probability that we will observe $y_i = 1$ given X_i can now be estimated once we make some identifying assumptions about the distribution and the variance of the error term ε_i. Almost any distribution can be assumed—for instance, we could assume that this error term follows a uniform distribution and derive a linear probability model. However, in practice, we typically assume one of two distributions.

One common assumption is that the error term is drawn from an independently and identically distributed (IID) normal distribution. This results in the probit model:

$$\Pr(y_i = 1 \mid X_i) = \Phi(X_i\beta),$$

where Φ is the CDF of the normal distribution. As y_i^* is unobserved, we cannot estimate the variance of the error term as we can with a linear regression. Thus, a standard assumption for probit models is that $\mathrm{Var}(\varepsilon_i) = 1$.

Another common assumption is that the error term follows an IID logistic distribution. The logistic distribution is very similar to a normal distribution but with slightly more probability in the tails. This results in the logit model:

$$\Pr(y_i = 1 \mid X_i) = \exp(\mu X_i\beta)/[1 + \exp(\mu X_i\beta)],$$

where exp indicates that we are taking the exponential of the term in parentheses, and μ is a positive scale parameter. As with the probit model, we must make an assumption about the variance of this CDF: In this case, we assume $\mu = 1$, which is equivalent to assuming that $\mathrm{Var}(\varepsilon_i) = \pi^2/3$. Thus, the estimation of a logit model will produce estimates of β that are approximately $\sqrt{\pi^2/3} \approx 1.81$ times larger than the corresponding estimates from a probit model. This difference is due solely to the different assumptions made about the variance of the error term in the two models. In practice, there is almost never a substantive difference between the logit and probit models, and either choice is valid in virtually all cases.

Both the logit and probit models produce a nonlinear relationship between the X_is and the choice probabilities. If the probability of observing $y = 1$ increases as some variable X increases, then graphing $\Pr(y = 1 \mid X)$ against X will produce the well-known S-shaped probability curve characteristic of these models (the mirror image of this curve is produced if the probability of observing $y = 1$ decreases as the variable X increases).

Estimation

Logit and probit models are not estimated via ordinary least squares (OLS) due to the nonlinearity discussed above. Instead, these models are estimated through maximum likelihood estimation (MLE). This is done by first creating a likelihood function and then taking the natural log of this function to create a log-likelihood function (we take the natural log of the likelihood function because it is easier to work with).

For instance, the log likelihood of the probit model is

$$\ln L = \sum_i y_i \ln \Phi(X_i\beta) + (1 - y_i)\ln[1 - \Phi(X_i\beta)].$$

Maximizing this log-likelihood means maximizing the sum of the predicted probabilities assigned to the choices that political agents in fact made. This is done by estimating β to have values such that $X_i\beta$ tends to be large when $y_i = 1$ and small when $y_i = 0$.

One difficulty that can arise in the estimation of logit and probit models is known as separation, which occurs when an independent variable perfectly predicts the binary dependent variable. In these cases, the coefficient and standard error on the independent variable will be infinite. For example, by many commonly used definitions of war, there are no instances where two nuclear states have gone to war with each other. Including a variable indicating that a state is a nuclear power in a logit or probit model with war as the dependent variable would create a separation problem as the nuclear power variable perfectly predicts peace. Researchers sometimes solve these kinds of separation problems by omitting the problematic independent variable, adding random noise to their data, or adopting a penalized likelihood estimation approach.

In general, however, the log-likelihood functions for both the logit and probit models are relatively easy to maximize, with most statistical software packages reaching the solution in seconds. However, note that the consistency, normality, and efficiency of MLE depends on asymptotic arguments—the small-sample properties of MLE are largely unknown. Thus, researchers should be cautious when estimating logit or probit models with small samples.

Interpretation

A simple examination of the coefficients in logit and probit models reveals whether an independent variable had a positive or negative effect on the probability of observing $y = 1$ and whether that variable was statistically significant. However, interpretation of the substantive effect of an independent variable in these models is more difficult than the interpretation of linear regression models as the relationship between $X_i\beta$ and the choice probabilities depends on a nonlinear function. The effect of a one-unit change in one independent variable on the choice probabilities will depend on the values of the other independent variables in the model. This means that we cannot interpret the βs in logit and probit models as we would interpret them in an OLS setting.

The most common method for interpreting the substantive effects of coefficients in logit and probit models in political science is through the use of a hypothetical observation. The researcher begins by selecting values for the independent variables in the model that are representative of some case of interest in the study. Setting variables to their mean or modal values is common, although this is not the only possibility. Often, the researcher will select values for the independent variables that reflect some case of substantive interest. Then, using the estimated values of β and the selected values of X, a baseline probability for $y = 1$ is calculated. For instance, we would interpret the coefficients in a probit model by calculating $\hat{\Pr}(y = 1|\bar{X}) = \Phi(\bar{X}\hat{\beta})$, where $\bar{X}$ represents the selected values for the independent variables. The influence of a particular independent variable on the probability that $y = 1$ can then be examined by changing the value of this variable while holding all other independent variables constant at $\bar{X}$ and recalculating $\hat{\Pr}(y = 1|\bar{X})$.

As these predicted probabilities are based on our model estimate and are thus themselves estimates, it is usually desirable to calculate standard errors for these probabilities. In political science, this is most commonly done through simulation. Hundreds or thousands of draws are taken from the multivariate normal distribution defined by the coefficients and covariance matrix estimated by the logit or probit model, a predicted probability is calculated for each draw, and the mean and standard deviation of this set of predicted probabilities is reported.

Related Discrete Choice Models

Ordered logit and ordered probit models are derived from the logit and probit models by adding additional choice thresholds to the latent variable and were developed for research questions where the dependent variable consists of more than two ordered categories. Multinomial logit and multinomial probit models have been developed to study research questions where the dependent variable consists of more than two unordered categories.

M

Machiavelli, Niccolò (1469–1527)

Machiavellism commonly refers to a cynical, amoral view of power and human relations and also to a politics of force and of calculated arbitrariness. In his major works, *The Prince* and *Discourses on Livy*, the political philosopher and diplomat Niccolò Machiavelli took the scandalous liberty of speaking well of evil: namely, of cruelty, obscenity, treachery, lies, avarice, disbelief, irreligion, craftiness, and boldness. His name has been consequently charged with the abstract and moral notion of evil, particularly in politics. This was certainly a way to render his theories illicit and detestable; nonetheless, a strong interest in them has never diminished. Machiavelli remains one of the most widely published authors of the past 5 centuries and one of the rare ones, along with the Marquis de Sade and Leopold von Sacher-Masoch, to have his name substantiated for describing scary and excessive behaviors. This entry presents, first, some of Machiavelli's most controversial concepts and, second, major events concerning his life.

Machiavelli as Political Thinker

For political science, Machiavelli has symbolized the advent of a realist approach to politics and society. "Realist" means both the criticism of any utopian and transcendental conception of politics and a demystifying analysis of human history. One could insist that medieval jurists, such as Bartolus of Sassoferrato who, in commenting on Aristotle's *Politics*, opposed the moral philosophers of his times, anticipated such an approach. But Machiavelli's oft-quoted formula, according to which it is more appropriate to go behind appearances to the effectual truth of the thing than to the imagination thereof (*The Prince*, 15), brought something different to the debate. Machiavelli proposed analytic tools for an evaluation of the political world as it is essentially and not as it appears to be superficially by immediate experience or by moral assumption. His realism, however, is not a skeptical submission to the existing state of things and to the authority of tradition and the powerful. It is based on a constant dialogue between his own experience of the events of his times and his continual study of antiquity. This is the condition for a theoretical understanding of what can and cannot be possible. The notion that humankind is the same throughout history does not imply that the order of things cannot be changed, nor does it imply that an invisible hand rules it. It makes possible, to the contrary, the intelligibility of political experience.

Philosophically trained by his early work on the ancient poet Lucretius's antireligious *On the Nature of Things*, Machiavelli aimed at rendering men the artisans of their own fortune (*The Prince*, 25). He was the first to propose to everyone, in a bold, clear style, a kind of knowledge about power that was previously reserved for an elite educated in thorny juridical casuistry and in the practice of political affairs. He has been both condemned and praised for having unveiled the “mysteries of the state” and the tools of its authority, potentially acquainting the masses with the inner workings of politics. Until the advent of the age of revolutions, from Jean Bodin to John Adams, Machiavelli was reasonably considered as the founder of a plebeian political philosophy. He introduced the topic of political equality and the equal political ability of all men without consideration of rank, riches, and lineage at the same time as he introduced the concept of a class division of “desire” between the aristocracy (*grandi*) and the people. The aristocracy is moved by its desire to oppress the people and the people by their desire not to be oppressed by the aristocracy (*The Prince*, 9). Tyranny, in Machiavelli’s thinking, is set in motion by the ambition of the aristocracy, which considers itself above the laws and tends to weaken society in order to make it submit it to its own purposes (*Discourses*, I 40, III 28). According to his agonistic and dynamic vision of social institutions, which suggests that popular discord makes society free and powerful, the people appear to be the best guardians of liberty (*Discourses*, I 4–5, 58). By giving voice to even the most extremist discourse of the rebellious working classes (the *ciompi*) Machiavelli granted it a literary and political dignity (*Florentine Histories*, III 13). Added to his consideration that it may sometimes be necessary to extinguish the aristocracy in order to establish a republic (*Discourses*, I 55), the scandalous rupture this anti-elitist political stance introduced into political philosophy forced most successive political theorists to measure themselves, explicitly or not, against his thought. In spite of the censure exerted by the Catholic Church on his works and personal history, most of the great philosophical and political ideas of the past 5 centuries had their beginnings in Machiavelli. His works had a positive influence on Bodin, Montaigne, Bacon, Vanini, Spinoza, Sidney, Bayle, Montesquieu, the Encyclopedists, the Federalists, Hegel, Marx, Weber, and Gramsci, among many others.

The Florentine World

The third son of an attorney and his wife, Niccolò Machiavelli was born in Florence, Tuscany, into a territorial state shaped by heavy political, social, and economic contradictions. The banking and mercantile aristocracy of Florence, who controlled the state’s economic and financial organization, had built a fiscal system in which its contributions took the form of loans bearing interest. By contrast, the inhabitants of Florentine’s subject territories and the masses of the Florentine people carried the weight of taxes, from which a big part was absorbed by the service of the state debt. In 1494, with the beginning of the Italian Wars, the Medici regime, which had consolidated the financial system in favor of the aristocracy, collapsed. A popular government was established with one third of the Florentine householders qualifying to participate in the assembly of the Great Council. It had to face the disaggregation of the territories, which had rebelled against the previous forms of subjection. As Machiavelli asserted, the Florentine ruling class decided to disarm the people in order to enjoy the immediate usefulness of being able to plunder them (*Discourses*, II 30). The intimate link between public debt, the employment of mercenary troops, and aristocratic interests (whose tremendous negative social consequences appeared clearly when an external threat arose, as after 1494) is constitutive of Machiavelli’s political thought and activity. He directed most of his energy, both in practice and in theory, to “arm the people” for the independence of the republic.

Machiavelli’s Life and Works

In June 1498, during a period of heavy political conflicts caused by a major financial and institutional crisis, Machiavelli, then 29 years old, was elected head of the Second Chancery of the Florentine government, in charge of administering the city’s territories; he was soon after nominated to serve the office for military affairs. Involved for the next 14 years in numerous diplomatic missions in Italy and abroad, he nonetheless dedicated most of his time to territorial affairs and to the organization of the militia. The institution of the militia, enacted in December 1506, drew strong opposition from the Florentine aristocracy. The militia’s major achievement was the defeat of the protracted Pisan rebellion (June 1509). Its major failure was its inefficiency in the face of the Spanish armies at Prato (August 1512). But internal conflicts within the Florentine republic and its incapacity to grant forms of citizenship to its territorial subjects had already prevented the consolidation and development of the militia in Tuscany. Machiavelli emphasizes in the *Art of War* (published in 1521 and the most neutral among his major works) that his concept of the people in arms harbored broader ambitions than he could actualize or even express. The fall of Prato led to the overthrow of the republican regime and to the return of the Medici to Florence. In October 1512, Machiavelli attempted in vain to convince the Medici to build an alliance with the people against the aristocracy (*A Caution to the Medici*). In November 1512, he was one of the few members of the Chancery dismissed from his functions. A few months later, imprisoned under the accusation of conspiracy, he was tortured, but he confessed nothing and ultimately benefited from the amnesty that followed the election of Giovanni de Medici as Pope (Leo X).

Over the next years, Machiavelli seemed to play a kind of double game. In attempting to get closer to the Medici, he dedicated to one of them the manuscript of his *Prince,* apparently a satire of the literature directed at the moral instruction of princes, in which he maintained the central idea expressed in his *Caution to the Medici.* But he also frequented those who developed, under his teaching, a radical resistance to the new tyrants of Florence. His *Discourses on Livy*, composed of materials assembled over 20 years, conserves part of this teaching. Published posthumously in 1531, it appeared to be dedicated to one of these radical opponents. The attitudes of those opponents and of the Medici themselves toward Machiavelli, even after the failed anti-Medicean conspiracy of 1522 in which he was not directly involved, indicated that neither ever doubted Machiavelli's continuous attachment to the former republic. In 1521, in his *Discourse on Reforming the State of Florence,* Machiavelli had proposed to Leo X a constitutional reform, at that time considered eccentric, by which the dissolution of the Medici regime would be followed by the reconstruction of a popular state. Machiavelli was then commissioned by Cardinal Giulio de' Medici—later Pope Clement VII—to write the *Florentine Histories,* presented in 1525 and published posthumously (1532). This book draws a ferocious portrait of the rulers of late medieval Florence, the Medici included, in accord with Machiavelli's political theory. In May 1527, with the Sack of Rome, the Medici lost Florence and the republic was restored. Machiavelli was not recalled to his old functions, as he and his republican friends had wanted. He died soon after. Nonetheless, his idea that the militia could strengthen solidarity among the people and also serve as a bit in the mouth of the aristocracy quickly became the official declaration of the last Florentine republic. After the republic's fall in 1530, Clement VII authorized the publication of Machiavelli's unpublished works. It is said that, while reading *The Prince* (published in 1532), he laughed about ideas of Machiavelli that were so contrary to the building of the Medicean hegemony.

Machiavelli's ensuing reputation followed along lines already established during his lifetime, even before he had written *The Prince* (1513–1514). While organizing the militia in 1505 to 1506, Machiavelli was accused by some members of the Florentine aristocracy of being a lower-class scoundrel and someone who wished to establish a tyranny in Florence. But he was also seen as a new Moses, an emancipator of the people, and a philosopher who was not for fools to understand.

MAOISM

Maoism is a body of doctrine developed by Mao Zedong (formerly transliterated as "Mao Tse-Tung," 1893–1976) and his associates in the Chinese Communist Party (CCP) for Chinese revolution and socialist construction from the 1920s until Mao's death in 1976. It is composed of many different kinds of ideas and ideology, and strategy and tactics and is believed to be the creative result of applying Marxism–Leninism to China, a semifeudal and semicolonial country without modern industrial developments. Mao Zedong is the principal Chinese Marxist theorist, a Communist statesman who contributed to the founding of the CCP in 1921, the Communist Army in 1927, and the People's Republic of China (PRC) in 1949 after a long period of military struggle. In contrast with Karl Marx spending his most of life in reading and writing as an editor, reporter, and scholar, Mao had taken part in almost all military struggles, political conflicts, and social movements during his time. He emerged as a supreme leader in 1935 in the CCP because his smart ideas and successful tactics were adopted by most of the CCP leaders. He was chairman of the PRC from 1949 to 1959 and chairman of the CCP until his death in 1976.

After a bloody split in April 1927, Chiang Kai-shek of the Kuomintang, or Nationalist Party, dismantled the united front with the Communist Party against the warlord government in Beijing and broke with his allies in the Communist Party. In the following campaigns, many communist organizations were destroyed, and a large number of communist leaders and members killed. Mao led several peasant uprisings in Hunan and Jiangxi provinces and established the communist military bases during the early 1930s. Based on these experiences, Mao realized the importance of Chinese peasantry in the Chinese communist revolution. In October 1934, Mao and the communists retreated from Jiangxi under the strong military attack by Chiang's Nationalist Army and started their epic Long March to the new base in Shanxi province. By making use of the second united front with the Nationalist Party against Japan, Mao and his communist comrades had not only consolidated their base and expanded their sphere of influence but also formulated a set of ideology and methodology for Chinese revolution, which was officially described as Maoism in 1945. In a new civil war between the Communists and Nationalists from 1946 to 1949, the Nationalist government ruled by Chiang was defeated and retreated to Taiwan. As a result, the Communist Party ascended to power and Mao Zedong declared the founding of the PRC in Beijing on October 1, 1949.

According to the logic of Marxist socialism, socialism based on it would succeed only after the capitalist commodity economy developed fully and highly. After the communist revolution succeeded and the Communist Party came to power in 1949 in China, Mao Zedong and the communist leaders decided to implement and promote the socialist transformation of Chinese economy and society, ignoring the basic facts about underdevelopment and dreaming that their country would immediately leap forward into communism. Therefore, to build socialism and realize communism as soon as possible, they conducted radical and drastic reforms in socialist practice in the light of Marxist theory, especially Stalinist theory. They tried to eliminate private ownership and establish public ownership, reduced free competition, developed the planned economy, limited the role of capital in distribution of resources, and promoted egalitarianism to eradicate economic exploitation and suppression. To promote the socialist transformation and build a new socialist country, the Communist Party must always keep the power in the hand of the proletarian class, take the class struggle as basic line, and consolidate the central leadership. After 8 years of socialist transformation, Mao Zedong declared confidently in 1957 that China was building socialism, that the petty bourgeoisie in agriculture and handicrafts and the bourgeoisie in industry and commerce had both experienced changes, that the individual economy had been transformed into a collective economy, and that capitalist private ownership had been transformed into socialist public ownership.

In search of its own socialist model after Stalin was criticized on the 20th Soviet Communist Party Congress in February 1956, China under Mao Zedong adopted many radical policies and launched mass movements one after another. The most important were the Great Leap Forward (GLF, 1958–1960) and the Cultural Revolution (1966–1976). During the period of the GLF, in rural areas of China, 750,000 higher-stage cooperatives were merged into 25,000 people's communes with multifunction to transform the private farmers into collective peasants and to pursue egalitarian ideals. A huge amount of labor power had been mobilized to build the famous backyard steel furnaces and irrigation works. China's leaders were eager to catch up with Britain, and eventually with the United States, and, at least for a brief moment, were willing to believe that utopian methods worked and would produce more steel and food. The GLF caused a great deal of waste in the development of socialist economy. Also, because this policy emphasized accumulation rather than consumption, the meager development of heavy industry came at the huge cost of little or no improvement in people's quality of life. The GLF caused an immense famine, and the death rate rose from 18.12 per thousand in 1957 to 44.60 per thousand in 1960—the consequence not only of declining harvests but also of excessive requisitioning of grain, based on false reports that far more grain had been produced than was actually the case. Many years later, official sources admitted that 8 million people had died of causes related to the GLF; unofficial sources estimated the figure at between 12 million and 20 million.

During the period of the Cultural Revolution, under the banner of a proletariat revolution, Mao took the class struggle as fundamental. He believed that the main goal of the Cultural Revolution was to save Chinese socialism from the threat of "revisionism" by purging his lieutenants who, as in the case of Liu Shaoqi and Deng Xiaoping, attached greater importance to economic efficiency than to ideological purity. The Cultural Revolution placed emphasis on purifying the superstructure rather than changing the economic conditions, because Maoists believed that purification would give a push to economic development in which the bureaucrats would engage directly and to which the masses, imbued with revolutionary ideals, would exert themselves on behalf of collective undertakings. Meanwhile, with the ideal of egalitarianism, a leftist "wind" swept through the country, resulting in the curtailing of private landholding, a free market, and other personal rights. As a result, however, Chinese society in 1976 was neither more efficient nor more equitable.

Although Maoism contains many different and sometime contradictory elements in the different stages of Chinese revolution and socialist construction, several salient features can be found in Mao's works and experiences. Primary is his emphasis on the importance of peasant issues in Chinese revolution and socialist construction. The Marxist–Leninist tradition treated peasants as incapable of revolutionary initiative and only marginally useful in backing urban proletarian revolution. Based on his life experiences and his analysis of the rural situation in China, Mao came to recognize the potential power of China's hundreds of millions of peasants and decided to establish his base in rural areas instead of in big cities. The peasants constituted the vast majority of China's population, and most of them were the most hard-pressed of all citizens and lived in extreme poverty. According to Mao, they were very receptive to revolutionary agitation and could become a revolutionary force if fully mobilized and properly guided. Proceeding from this belief, Mao proposed to instill in them a revolutionary consciousness and make their force alone suffice for revolution. By so doing, Mao led the Chinese revolution to success and gradually formed a special attachment to peasants. During the Cultural Revolution, Mao sent many city workers, intellectuals, and bureaucrats to rural areas and forced them to receive reeducation through agricultural labor together with peasants because he believed that big cities were a corrupting influence for many.

In Mao Zedong's thinking, there were long-standing populist elements and continuous emphasis on the "mass line." The mass line means the emphasis on the interests and preferences of the common people and demands that the government be responsive to them. It was first created in the revolutionary period, based on the idea of class struggle. The idea of the disadvantaged classes overthrowing the privileged classes through inter-class struggle naturally entailed the idea of mobilizing the oppressed masses to fight for their own interests against those of the oppressing classes. Thus, the notion of class struggle led to Mao Zedong's stress on the importance of the masses and mass movements and to what Mao explicitly labeled as the "mass line" in the Yan'an period (late 1930s and early 1940s) and extolled as one of the vital traditions in Communist history. Therefore, it is common to assert that the mass line is a style of leadership, which is, at its best, a democratic style of leadership. Mao believed that even the vanguard party needed to be rectified and reformed through criticism from the people it led and that the masses of China should be encouraged to become involved in even the highest affairs of state. In the Cultural Revolution of 1966 to 1976, the masses had been mobilized so broadly and deeply that the country verged on anarchy.

In spite of political disorder and economic depression in China, Maoism developed into a worldwide movement in the 1960s and thereafter. All Maoists expressed fidelity to the thought of Mao Zedong. But at a practical level, self-identified Maoist political formations differed considerably. In parts of Asia where conditions were similar to those that prevailed in China before 1949, Maoism was largely a peasant movement, engaging in guerrilla warfare and establishing bases in rural areas, and, if successful, surrounding the cities and seizing state power. Elsewhere in the Third World, especially in Latin America, facing very different conditions, Maoists had to modify classical Maoist forms of revolutionary struggle. In the developed capitalist countries, Maoism meant something very different. Western Maoism was particularly attractive to young people during the 1960s only for its ostensible purity and populist nature. Although Maoism has been upheld as one of the major guiding principles in the CCP and other left-wing parties, it has gradually lost its appeal in China and other parts of the world since China adopted its new "Opening and Reform" policy in 1978.

MARKET ECONOMY

In the 1940s and 1950s, two types of economy were frequently contrasted: the *market* economy (sometimes also called the "free market" economy) and the *centrally planned* economy such as that of the former Soviet Union. Whereas in the latter, prices and production decisions were set by administrative decision, in the former, they emerged as a result of the interactions of myriad firms and individuals who negotiate, buy, sell, and set prices for goods and services.

However, since the 1960s, political science has developed a more sophisticated analysis than this simple dichotomy. It has perhaps returned to political economy traditions of Adam Smith and David Ricardo, with concerns about how institutions and norms create markets and indeed lead to different types of market economy. The starting point of analysis is the argument that markets are socially created, through formal institutions such as law, and informal institutions that govern exchanges, such as norms and trust, so that markets are in fact embedded in societies and marked by historical developments. Given this, the interesting questions become: Which kind of market economies exist? Why? How do they change and develop? What are the effects of different kinds of market economy?

Debates about these questions are frequently linked to broader normative questions about the distribution of power and wealth and indeed issues about democracy. At the same time, in practice, they have (with some delay) been influenced by events in markets and governance. Hence "market economy" is not only a complex concept but one intimately linked with both broader questions in political science and the evolution of markets in practice.

Debates in the 1960s and 1970s

Although many debates in the 1960s and 1970s were dominated by Marxism–pluralism conflicts, at least two sets of analyses were undertaken that remain relevant today. The first concerned problems with "free markets" and was chiefly based in the United States. Political scientists began to study the effects of free markets on the distribution of power, both among social groups and classes and in the political arena. They worried that the power of business, especially large firms, was excessive. Business enjoyed not only great lobbying power but also systemic power: Politicians needed a well-functioning economy and, even without organized pressure, they would seek to protect business interests. The dangers of "capture" of regulators, especially by large concentrated suppliers, was underlined, as these firms could lobby and through votes and/or money could "buy" regulation that would distort the free market through entry restrictions and other protective measures that would allow them to earn rents.

Meanwhile, in Europe, the stark division between planned and market economies became blurred as political scientists mapped out both different forms of capitalism and also the ways in which governments structured markets. Thus, for instance, British and French state roles in markets differed—the latter's ability to plan and intervene on matters from investment to prices was contrasted with the former's more limited, arm's-length role. Thereafter, work on corporatism examined the formal and informal linkages between governments, firms, and organized labor that were particularly strong in northern European countries and used to decide matters such as wage increases, the division of growth between capital and labor, or public spending. Corporatism was linked to the capacity of certain states to pursue high economic growth and a large welfare state. It was often heralded as a means of cooperation and negotiation between different interests that allowed them to shape and control markets.

Regulatory Reform and the Continuing Role of the State

Just as political scientists were discovering nonmarket forms of control and the power of large firms, a major turn toward "the market" took place both in academic study and in policy making. Political science "rediscovered" the market, as it analyzed worldwide moves toward "regulatory reform." Many state-owned strategic industries were sold, such as network industries, banking, extraction industries, and suppliers in public ownership from the 19th century. Privatization was frequently accompanied by liberalization as, contrary to the predictions of the capture theorists, incumbent suppliers failed to prevent the ending of their legal monopolies. Instead, competition was permitted and indeed encouraged even in industries previously seen as "natural monopolies," such as energy, telecommunications, and postal services.

The changes gave rise to vigorous debates. One concerned explanations for these "market reforms." One argument was that they were driven by technological and economic developments, which made state ownership and monopolies untenable. However, such an explanation lacked political mechanisms and suffered from problems similar to those associated with the technological determinism of the 1950s and 1960s. Another framework of analysis underlined the interests of key actors—elected politicians in the proceeds of privatization, managers able to enjoy greater freedom and rewards, consultants, and lawyers—in promoting change. However, the spread of liberal ideas has been another argument, as changes needed to be accepted and legitimated. Finally, however, the reforms can be seen as part of a long cycle of reforms as the pendulum of policy swings between "state" and "market," due to endogenous developments that undermine each. Hence, the post-1945 move to "collectivism" had engendered inefficiencies and dissatisfactions and thus pressures for more individualism.

However, the extent and nature of the changes were also contested. "Market-oriented" reforms were accompanied by the growth of organizations and rules governing competition. Governments created a series of economic regulators, often in the form of IRAs (independent regulatory authorities)—both sectoral regulators and general competition authorities—and delegated powers to them. In addition, "social regulation" (and regulators) concerning matters such as health and safety grew. Moreover, supranational regulation expanded, notably by the European Union and World Trade Organization. As a result, although U.S. scholars dubbed it "deregulation," in fact, reform involved the creation of a "regulatory state," as increased competition went hand in hand with reregulation.

Globalization and Varieties of Capitalism

Liberalization was accompanied by startling increases in cross-border capital flows. Political scientists responded by looking at their effects on national economic policies and institutions. Some argued that these flows of capital reduced the power and autonomy of nation-states. Strong globalizationists indeed claimed that to attract "footloose capital," and driven by economic efficiency, all countries would have to follow a neoliberal path toward a market economy with a smaller state, less powerful trade unions, and greater attention to the needs of international firms.

However, these claims were vigorously attacked by the "varieties of capitalism" literature, which pointed out that there were several different possible forms of markets and indeed of capitalism. It argues that market players, such as managers, investors, and workers, face coordination problems, which can be resolved through either competition or cooperation. Using the notion of *institutional complementarities*, whereby institutional arrangements in different spheres are linked, it claims that there are two models of a market economy—liberal market economies and coordinated market economies. Other work on models of capitalism has added further types, such as statist market economies, based on a leading role for the public sector. The literature on varieties of capitalism claims that a diversity of market economies can exist and indeed flourish in the face of globalization, as each has its distinct strengths and weaknesses and there is no single, most efficient market economy.

Current Debates and Trends

Much political science work on "the market" has assumed that market institutions are largely static. Current debates largely center on changes in market institutions. One debate concerns the speed and extent of change. Whereas the varieties-of-capitalism literature, which was closely linked to historical institutionalism, largely claimed or assumed that national market economies remained stable, more recent work has suggested that major change does occur but incrementally and by building on existing institutions so that countries move toward liberalism while maintaining their distinctive heritages.

A further contribution concerns the role of international factors within domestic settings and their role in the spread of "liberal market" institutions such as privatization, liberalization, and independent regulatory agencies. One argument is that change has taken place through diffusion rather than rational choice and calculation. Owing to mechanisms of coercion and emulation, liberal market institutions have spread regardless of their efficacy. Another is that certain forms of internationalization lead to change in market institutions whereas others do not. Thus, for instance, transnational technological and economic developments may create pressures for change, but these can be resisted, whereas other international forces such as overseas reforms or supranational regulation may lead to the spread of "liberal" institutions because of their impact on policy making, notably legitimating change. A further line of development is to look at relationships as much as at formal institutions and hence to see whether, even if the latter change, enduring patterns of behavior remain that differ sharply across types of economy. Hence, the claim is that even if nations adopt similar "liberal" market institutions, these operate in very diverse ways due to informal institutions.

To many, the recent financial and economic crisis offers challenges to the supposed superiority of competition and hence to many normative underpinnings of the market economy. However, at least most political science work does not assume that only one type of market economy exists and does not neglect the crucial roles of the institutions, relationships, and the state in shaping market economies.

MARKET FAILURE

Market failure can be seen along a continuum. There is a wider and a narrower definition: the wider and imprecise one implying lack of output or even utter skepticism concerning the performance and functioning of markets and the narrower one limiting the term to deficiencies of the market. In this entry, the description of market failure and its basic model is followed by a discussion of market failures resulting from a wide variety of factors including asymmetrical information, monopolies, and external effects. Next, the entry examines public goods deficiencies as the narrower category of market failure. The last section discusses the distinction between market failure and economic crises.

With the worldwide financial and economic crisis that began in 2008, market failure has become a renewed focus of public discussion. Yet there is no need to let the state do what the market can do better—for example, organize free exchange relationships and produce consumer goods. Time-dependent public opinion creates shifts to and from more advocacy of state economic activities in creating an extended infrastructure for transport and goods such as public health and education and, nowadays, a heavy control and regulation of the financial sector. Irrespective of such tendencies, the "golden path"—apart from producing the "social goods proper" (see below)—is a combination of an effective judicial infrastructure respecting individual rights and property rights, market competition, the supervision of free access to markets, and avoidance of misuses by monopolies.

Market failure denotes situations where the result of market transactions is *not equivalent to a Pareto optimal allocation*. With such an allocation, no individual position could be improved while diminishing that of another person. Market failure thus implies a nonoptimal use of scarce resources. In neoclassical theorizing, which focuses on allocation issues rather than issues of distribution, market failure as a pure deficit in allocation stems from factors such as lack of information, external effects, market power, or the character of public goods, also called *collective goods*.

A basic causal model of market failure is presented in Figure 1. Market power is a background factor to informational asymmetry (as are other factors omitted here). Market power has a direct effect on market failure and an indirect one via external effects. As argued by Richard Musgrave (1959), the failure to produce public goods is the key component of market failure. The first three factors are instances of market deficiencies that can be healed to some extent by appropriate institutional devices. Public goods, by definition, cannot be created in a market since citizens cannot be excluded from consumption and are thus not willing to pay, therefore private production fails to emerge. One could also argue that the lack of public goods production is a *cause* for market failure just as much as a *consequence*. We leave this debate unresolved here, with just a line between the two variables to indicate the different nature of the variable "public goods" compared with the other three causal variables, which, in turn, could also be consequences of market failure.

Public goods, just as much as "public bads," are characterized by nonrivalry in consumption and by the lack of excludability—that is, the ability to exclude others from consuming a good (e.g., security of a country). Partially, this is a case of positive externality. Free riding is tempting when potential consumers cannot be excluded from consuming the good without paying. A lack of effective demand is the result. Here the state can organize the provision of such public goods, yet often without sufficient information as to the adequate amount of such a good. Gathering such information is costly, however. Also the limitation of public goods would in itself be Pareto inefficient. Neoclassical economists argue that the state should interfere only in cases of market failure but not beyond and not for political goals.

Following the specifications of Musgrave and thus opting for a more limited definition of market failure, allocation problems in a market economy can be either *market imperfections* (market power

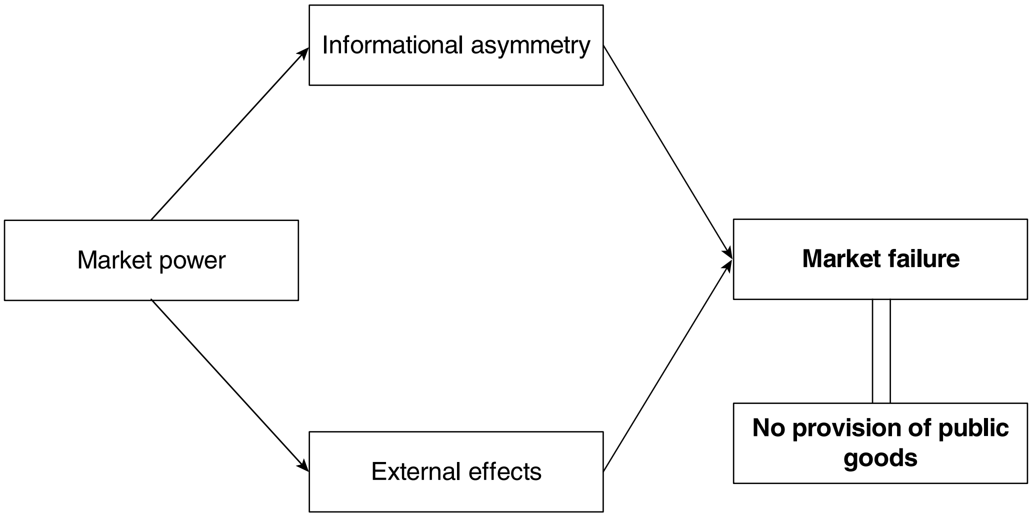

Figure 1 A Basic Causal Model of Market Failure

and external costs/effects) or *market failure* (insufficient supply of public goods).

Usually, market failure is limited to a specific market. Market failure calls for state intervention. The counterposition is that state interventionism could lead to state failure. With the state increasingly being engaged in the economy, information scarcity increases due to the absence of fungible markets. Individuals might be treated as if they all had the same preferences. The greater the differences in their preferences are, the greater the welfare losses become. Citizens might be confronted with package solutions they would not agree to in their entirety, or coalitions may go for solutions other than those initially proclaimed by individual parties.

Consequently, the Austrian school of economics (e.g., Friedrich Hayek, 1944; Murray Rothbard, 1962) even denies such a thing as market failure, since markets are instruments of individual discovery with no preassigned collective goals. According to Hayek, the market is a context of discovery, whereas planned state economies never make discoveries stemming from the spontaneous coordination of individual actors in a market. Yet on many occasions, Hayek does not question the standard theory of public goods.

Instances of Market Failure

Among the factors that may bring about market failure are the ones related to asymmetrical information, monopolies, and external effects.

Asymmetrical Information

Asymmetrical information occurs when the potential contract partners do not have equal information about the supplied goods, services, or risks to be insured. George Akerlof (1970) argues that uncertainty about the quality of goods on the part of consumers drives out good products (e.g., cars just as much as hard currencies in the case of Gresham's law) and leaves only the bad ones on the market. This "lemon" principle leaves only the poorest suppliers able to sell their cars. There is no market clearing, and a negative selection takes place.

Guarantees on the part of the suppliers or independent institutions monitoring the quality of goods as well as legal guarantees could help in mitigating this information asymmetry. The discipline of new institutional economics emphasizes the importance of appropriate incentives from and controls by institutions. The protection of patents is another instance of information asymmetry. Here the trade-off is between quickly disseminating new knowledge versus protecting research and the economic incentives that are derived from particular knowledge, at least for some time.

In addition to adverse selection, as in the "lemon" cases, asymmetrical information may also arise when a contract between partners provides that both should have symmetrical information, but, subsequently, one party is unable to observe the behavior of the other. When such a situation arises after contract formation, it creates a moral hazard in which one partner may be tempted to cheat.

Monopolies

Market power stems from three factors: unique technological inventions, the limitation of competition, and the indivisibility of the production apparatus. Under a monopoly, production is inefficient (a lower amount of goods is turned out at higher prices). A monopolist maximizing his or her market power is selling products at a price above the marginal costs (Cournot point) and not where the marginal returns equal those of the marginal production costs, as in a competitive market (a higher turnout of goods at lower prices).

Remedies against monopolistic markets are antitrust policies and, in cases of indivisibilities and natural monopolies, tax and subvention policies. The indivisibility of the production apparatus (e.g., networks for electric power and gas, the canal system railways) leads to scale effects and thus to lower average costs but also to larger sunk costs, that is, past costs that cannot be recovered when being confronted with new competitors. If only one supplier can do it efficiently, this is called a *natural monopoly.*

If there is a Pareto efficient situation, state intervention by necessity will violate that equilibrium, often for the sake of redistribution issues that are decided politically through majority voting. The median position of the voter in democracies with an interest in redistribution from the rich to the poor and the activities of lobby groups are key factors in such a view. The underlying factor is rent seeking—securing incomes above those in a free and competitive market—by private groups, government bureaucracies, and politicians. (The latter two entities point to the principal–agent problem.) Here, “market failure” is often defined in the reverse sense as an effect of state regulation and interference with otherwise free markets.

Adherents of public choice theorizing point to lack of causal evidence when bringing in the state to remedy situations of market failure. They argue that the costs of state failure could be even higher than those of market failure. Market failure can be closely linked to state failure, not just in case of the communist collapse but also in the market rule distortions created through the networks and influence of the financial sector on politicians to loosen rules on the financial markets. Oliver Blanchard (2009) succinctly lists these failures of the past decade:

> The underestimation of risk contained in newly issued assets; the opacity of the derived securities on the balance sheets of financial institutions; the interconnection of financial institutions, both within and across countries; and the high degree of leverage of the financial system as a whole . . . all combined to create the perfect (financial) storm. (pp. 38–39)

External Effects

External effects occur in two variants. Negative external effects occur where the economic activities of two partners cause damage to a third one (e.g., toxic emissions into the air). Sometimes positive external effects—benefits (e.g., beautifying the environment)—are created by economic contractors. The internalization of external costs is theoretically possible, for example, via Coase negotiations. The Coase theorem states that, under clearly defined property rights, perfect rationality and no-transaction-costs bargaining may occur in such a way that external effects will be internalized by market participants. For future generations, such a condition is absent, however. By means of the Pigou tax, the state places a tax on the producer equal to the external costs. The latter must be known, however, and again transaction costs are not allowed.

Negative external effects (e.g., environmental degradation) are the most often quoted instances of market failure. Firms externalize their costs of production onto third parties (so that customers of respective firms do not have to pay directly) or, in the widest instance, onto the global environment, turning everyone into a victim.

Positive external effects occur in cases where a good is underproduced, because the supplier does not receive adequate compensation for the external rewards that would be provided if full production capacity were used. Other examples come from the health sector where a general vaccination could have external benefits for society at large, but costs for poor people might be too high, thus creating negative external effects of undersupply.

The educational sector offers another instance, in which the provision of a good education nationwide provides many additional advantages for society at large. The provision of subventions for an increasing demand for these goods may, however, be inefficient and create issues of moral hazard (e.g., downgrading one's own private learning efforts since the education does not cost anything).

Public Goods Provision

Deficiencies in producing public goods are often listed as further instances of market failure. Public goods, such as clean air, are ones from which individuals cannot be excluded. Therefore, unlike private goods, public goods cannot be produced effectively through the private market. Following the logic of Musgrave and thus requiring more precise argumentation, they comprise the second and narrower category of market failure, in which the market fails *entirely*. In the cases dealt with thus far, gradual deficiencies of markets occurred. While the market is functioning in principle, there is, however, too much or too little of goods produced. But in the more basic case of complete market failure, some goods are not produced at all, even though the optimal allocation of goods requires them. Goods with only external returns, those with returns only to consumers and not to producers, are heavily undersupplied. The lighthouse is a classic example. Although the lighthouse provides strong external benefits for seafaring, there is no individual incentive to build it. The lighthouse is a public or collective good that is characterized by two features: There is no rivalry in consumption and no excludability (that is, one person's use of a good such as a lighthouse does not reduce the availability of the good to others). Free riding is a consequence of such a constellation. As long as individuals do not reveal how strong their preferences for public goods are, there will be no production of such goods unless the state steps in. The state monopoly of the legitimate use of force, external defense, levees, and the judicial institutional framework are also examples of public goods (what Musgrave describes as "social goods proper"). According to James Buchanan and Gordon Tullock (1962), the real task of the state is to protect property rights.

Crossing the two criteria of rivalry and exclusion in Figure 2, four types emerge.

The two pure types of goods—private goods (Case 1 in Figure 2) and public goods (Case 4 in Figure 2)—have already been discussed. With respect to the mixed goods in Case 2, consumers can be excluded by imposing fees on the consumption of these goods. Even though there is little or no rivalry in consumption (e.g., of streets, bridges, sports events, pipelines, or even cable TV—goods resembling the so-called toll goods), there is a tendency for underproduction of those goods (resulting in, e.g., traffic congestion). With decreasing average production costs, there is also an inherent tendency toward monopoly in such situations. Supervision of market tendencies by independent authorities and/or subsidies to consumers could counteract such tendencies toward underproduction.

With mixed goods in Case 3, where rivalry but no exclusion exists, the reverse instance of overusage emerges, as, for example, in the tragedy of the commons, described by Elinor Ostrom. By defining rights of usage for natural resources such free riding might be controlled. Other means of regulation could be mutual controls or by an agent, sanctions when violating rules, reciprocity, and mutual trust.

The mixed goods in Cases 2 and 3 show some resemblance to the cases of external effects

		Rivalry	
		yes	**no**
Exclusion	**yes**	*1* ***Private goods,*** *e.g., bread*	*2* ***Mixed goods*** *with tendency of* ***underproduction,*** *e.g., highways*
	no	*3* ***Mixed goods*** *with tendency of* ***overusing,*** *e.g., the commons*	*4* ***Public goods*** *e.g., external security*

Figure 2 Exclusion and Rivalry With Public Goods, Mixed Goods, and Private Goods

discussed earlier. While external effects are market imperfections, (pure) public goods as such are not produced by the market at all.

With the state producing such goods on its own, at least two challenges arise. First, the state produces at costs that are too high (which can be counteracted by employing market means in the whole production process wherever possible). Second, consumers may waste resources because the state produces them at no cost to the consumers, creating an ethical issue. Also, consumer sovereignty can be limited through state production of the wrong goods or in wrong quantities (*crowding out*). The production of so-called *merit goods*, such as health, education, and high culture, is a fiat usually set by political/economic elites and rarely by majority opinion. In other markets, allocation of goods may suffer.

In the opposite cases of *demerit goods*, the state again could work with legal provisions and prohibitions, taxes, and subventions and with tradable certificates to introduce market elements—for example, in controlling environmental deterioration. Here economically inefficient and ecologically aberrant rules from the past create no incentives for technological progress. They can be substituted by technological progress the external costs of which are addressed better by auctions and by the selling of certificates. In the long run, overregulation of and by the state may be a crucial factor contributing to market failure, just as much as the lack of monopoly of violence and failure to guard property rights to begin with are.

Economic Crises

Analytically and empirically, one has to distinguish an economic crisis from situations of market failure. Situations of market failure (lack of public goods production) and market imperfection can be the causes as well as the correlates and consequences of economic crises. Yet economic crises in terms of *supply shocks* (e.g., the oil shocks of 1973 and 1980), or simply the overproduction of goods (as, e.g., in the automotive industry today), as well as *demand shocks* (e.g., in cases of natural catastrophes and poor harvests) must be distinguished from the cases and analyses of market failures. In a sloppy colloquial sense, the term *market failure* is often applied here but for incorrect and inconsistent theoretical reasons. An economic crisis basically means that producers have miscalculated the amount and type of goods consumers are willing to buy. The consequence is an uncleared market and, in case of a deepening crisis, a further extension of unsold products. This cumulative downward process (see Knut Wicksell, 1898) of overproduction and falling prices stops when consumers anticipate higher prices in the future and start buying again. Thus, a *normal* economic crisis has the character of a *cleansing crisis*, wiping out unproductive suppliers.

Such economic crises can be caused and intensified by financial crises (just as much as they can be alleviated through built-in stabilizers as in the European social market economies from 2008 onward; see Joseph Stiglitz, 2010). The Great Depression with the financial crises emerging in the early 1930s is a case in point. Institutional adjustments in the financial sector then included repealing the liberalization measures of the Glass-Steagall Act and separating commercial activities of banks from their investment activities, giving the Federal Bank a stronger leeway in raising liabilities for banks yet with very little Keynesian reflation of the economy. In the crisis after 2008, institutional adjustments included increased liability for banks and other financial agents, more transparency with hedge funds, better control of the stock exchanges and of rating agencies, elimination of speculative deals such as short sales, tax on financial transactions, higher taxing of banks, separation of investment banks from retail and commercial banks, breaking down banks that are "too big to fail," and the socialization of private losses via a bailout through the taxpayer; these were intended to prevent financial bubbles (and the oversupply of goods such as housing) in the future. At the same time, from 2008 on there was a heavy reflation of the major economies to avoid the procyclical monetary and fiscal policies of the 1930s. Yet as noted by Carmen Reinhart and Kenneth Rogoff (2009), underlying factors such as human speculation and miscalculation as well as greed will always contribute to economic crises so that the very basic features of the next bubble will not be so different from those of previous ones. The economic fallout of both the Great Depression and the current crisis coming close to a breakdown of the financial engine of the free market system is grave enough. It is, however, even in its magnified effects, an instance of absent or failing institutional regulations. Given human creativity and greed, one will have to reckon with further such imbalances. They are instances of far-reaching contractions of markets due to a lack of institutional safeguards. Market failure in a more theoretically strict sense has, however, to be distinguished from these grave challenges.

Nevertheless, the failure of the institutional framework (creation of a public bad in not containing the financial speculation and letting it transgress into the goods and services markets) is a clear case of de facto market failure in the present financial and economic crisis. At the global level, there are no adequate rules to allow for the separation of real growth effects of financial transactions from cases of gross overspeculation. (Some economists argue that there could never be such a separation between sound and unsound financial transactions since every speculator is always met by a countertrader.) Legitimacy for a market society has been strongly undermined, fortunately in the absence of other more repressive system alternatives as present and tried in the 1930s.

Given the high debt burdens, the global market power, informational asymmetries, the externalization of costs, environmental damages, moral risks, and rent seeking in all its varieties, market failures may become more likely. The market does better than the state in providing incentives and competition, in allocating scarce resources, and in controlling economic and, thus often, political power. For these functions, state activities cannot be a substitute for the market. With historically unseen market extensions in a fully globalized economy, however, it may become more difficult to establish rules of consent shared worldwide. There are always some externalities involved, be they only in the form of misperceptions of one's own long-term advantages with respect to, for example, issues of global warming and other climate changes. The failed Copenhagen Climate Change Conference of 2009, just as much as the current financial crisis with dramatic public debt, not only figures in European, American, and the majority of Asian states but also speaks just as dramatically to new (potential) mixtures of market failures cum failures of political systems, whether they are organized around autocratic principles or around the preferences of the median voter, or occur in emergent systems such as the European Union and the eurozone. The temptations for free riding may have become higher under global economic markets, but so have external costs and burdens on future generations. There is a lag in ordered structures for global markets to function without creating excessive external costs.

MARX, KARL (1818–1883)

Karl Marx is among the most famous and influential theorists of the modern age, from whom the socialist or communist movements derived their ideas. He is not only a political thinker but also a social philosopher and economist, whose research ranged widely over many fields. Marx has had a profound impact on the thoughts and actions of people in many countries since the mid-19th century, and in the 21st century, he is still regarded as the greatest instructor by the political left, including the adherents of communist parties, and derided as a source of political and social chaos by the political right. The ideas and programs developed by Karl Marx in cooperation with Friedrich Engels have been generally called Marxism.

Born in Trier, Germany, into a Jewish family on May 5, 1818, Marx received a good education and displayed great potential as an outstanding student. At the universities of Bonn and Berlin, Marx studied history and philosophy, took a strong interest in the works of the philosopher Georg Wilhelm Friedrich Hegel, and joined a student–professor group called the Young Hegelians. Marx submitted his doctoral thesis at the University of Jena in 1840 and received a doctoral degree the following year. After an initial and unsuccessful effort to establish an academic career, his liberal political views led him to find employment as an editor of a radical magazine in Cologne, *Rheinische Zeitung*. Because of his journalistic abilities and radical beliefs, Marx was well received in liberal circles in Germany and quickly promoted to editor of the magazine. This radical publication, under Marx's guidance, had to face the problem of censorship by the authoritative Prussian government and was finally suppressed after the printing of Marx's article on the poverty of farmers in the Mosel Valley.

In 1843, Marx married his girlfriend Jenny von Westphalen and emigrated to Paris with her to escape political persecution. There he made the acquaintance of French socialist thinkers and began to witness firsthand the living conditions of people in poverty by socializing with working-class people. More important, he came into contact for the first time and subsequently established his lifelong friendship with Engels, the author of the classical work *The Conditions of the Working Class in England* published in 1844. As a result of his economic and philosophical research, Marx wrote *Economic and Philosophical Manuscripts* in 1844, in which he showed great concern for the dignity and freedom of the individual. In February 1844, Marx started a new journal, the *Franco-German Annals*, together with the philosopher and political writer Arnold Ruge, in which he published articles on a broad range of matters, such as philosophy, politics, and society.

Based on his experiences living among working-class people and his comprehensive researches on history, economics, politics, and philosophy, Marx became an ardent communist. He proposed his ideas about communism by criticizing the alienation of labor under capitalism. According to Marx, under capitalism, the working class invests its creative labor while the capitalist class appropriates the results of this labor in exchange for wages. This means that the human world created by the proletariat does not belong to them but is instead owned by a class of nonlaboring owners.

His radical ideas were not tolerated in France. When Marx published an article on capitalism in the *Franco-German Annals*, he upset his partner Ruge, and the journal was banned in France and Germany. In January 1845, Marx was expelled from Paris by Premier François Guizot at the instance of the Prussian government and moved to Brussels, Belgium. During his stay in Brussels, Marx exchanged polemics with the Hegelians, Feuerbach, Stirner, and the "True Socialists" and finished two important works, *The Holy Family* and *The German Ideology,* in collaboration with Engels. In *The German Ideology*, Marx provided a historical and material basis for his radical views and insisted that the nature of individuals depended on the material conditions determining their own productions. According to his interpretations of history, the sum total of the relations of production forms the real basis of society, on which a legal and political superstructure is established. In 1847, Marx started another polemical exchange with Pierre-Joseph Proudhon and wrote *The Poverty of Philosophy*, in which he developed the fundamental propositions of his economic interpretation of history.

By early 1846, Marx had established the Communist Correspondence Committee to connect all of Europe's socialist leaders. The following year, the socialists held a conference in London and established the Communist League. Marx went to attend the Communist League meeting and wrote *The Communist Manifesto* together with Engels, inspired by Engels's *The Principles of Communism. The Communist Manifesto*, originally written as the platform of the Communist League, has become one of the most radical and influential books since it was first published on February 1848. It begins with the famous proposition "The history of all hitherto existing society is the history of class struggle" and contains a summary of Marxist theory. For example, one of the major points is the need to abolish private property and implement public ownership of the economy. The theory of the Communists may perhaps be summed up in the single phrase: abolition of private property. Another aim is to bring the proletariat to power and annihilate the exploiting class, especially the bourgeoisie, in politics. According to Marx and Engels, the first step toward the revolution by the working class is to raise the proletariat to the position of the ruling class in order to win the battle of democracy. The Communist Party as the avant-garde of the proletariat then comes to power after winning the struggle against the old classes, such as landowners and the bourgeoisie. The third is to envision a classless society in which the free development of each is the condition for the free development of all. On its publication in 1848, *The Communist Manifesto* quickly became the credo of the poor and oppressed all over the world, which led to the greatest political upheavals of the 19th and 20th centuries and to the establishment of the communist governments that ruled half the globe for several decades.

After the *Manifesto* came to light, even the relatively tolerant Belgian government served Marx with an expulsion order. The revolutionary atmosphere in Germany in 1848 enabled him to return to Cologne where he persuaded some liberal industrialists to back a new version of his old journal, the *Neue Rheinische Zeitung*. Under Marx's editorship, it became extremely radical and antigovernment and was suppressed again by the authorities. Marx printed the last issue of the *Zeitung* in red ink. For this reason, he was arrested for press offenses and incitement to armed insurrection. But after a long and powerful speech at his trial, Marx was acquitted by a jury in Cologne. Faced with expulsion from Cologne and suppression of his journal, Marx visited Paris again as a representative of German democracy before the Paris National Assembly but was similarly served with an expulsion order from Paris.

In 1849, Marx moved to London, where he lived with his large and devoted family until his death. Although Marx was a correspondent to the *New York Tribune* from 1852 to 1861, for the most part he was financially dependent on generous support from Engels. His typical workday, from 10 a.m. to 7 p.m., was spent in the reading room of the British Museum, where wrote many volumes on different subjects. Sometimes he lacked money for postage to send his manuscripts to the publishers. Afflicted with boils, eye and liver trouble, and a contentious and uncompromising temper, Marx was not a prepossessing sight during his last years. Although virtually unknown in England, he enjoyed great popularity on the Continent, especially in liberal circles and among the working people. In 1864, the International Workingmen's Association was founded at a meeting in St. Martin's Hall, London, and Marx was invited to draw up the inaugural address. In 1867, the first volume of Marx's greatest work, *Capital* (*Das Kapital*), was published. The second, third, and incomplete fourth volumes did not come out until after Marx's death in 1883.

In *Capital*, Marx analyzed the secret of capitalist production by focusing on the concept of surplus value and formulated his revolutionary theory by revealing the injustice of the capitalist system. According to Marx, labor is a commodity like any other; therefore, following the labor theory of value, it must be valued by the man-hours devoted to its "production"—that is, to feeding, clothing, and sheltering the worker in order to maintain life at subsistence level. In the capitalist system, labor is bought just like any other commodity. But, unlike any other commodity, labor is not consumed in a clearly determined period of time. A laborer is bought for the price of sustaining him physically, prorated in hours or days or weeks. But he may produce the equivalent of the price in economic value in 6 or 8 hours of work, whereas the factories of Marx's day kept men going for 10, 12, or 14 hours a day. The difference between what the worker does and what he is paid is surplus value, the source of all capitalist profits. In the capitalist society that is divided into the capitalist class with the means of production and the proletariat without the means of production, the injustice heaped on the workers is not the result of bad men but of a particular system. Reform within the system, however well intentioned, is doomed to failure.

Only revolutionary overthrow of the whole capitalist system can succeed.

Marx died on March 14, 1883, and was buried in Highgate Cemetery, London, with a tombstone epitaph reading "Workers of all lands unite," the last slogan in *The Communist Manifesto*. In the years following Marx's death, Engels edited and translated his works and in many ways continued their friendship until his own death in 1895. Although Marx spent most of his life in reading and writing as a student and scholar, he has had a strong influence not only on modern ideas but also on political practices and social movements in many countries all over the world. Even today, his works are reprinted and read widely, and his ideas are discussed and debated in philosophy, sociology, and political science.

MARXISM

Marxism is the system of social and political theory about human life, historical development, the capitalist crisis, and the communist revolution developed by the German philosopher and economist Karl Marx along with his close friend and supporter Friedrich Engels during the middle and late 19th century and subsequently elaborated by their disciples from various backgrounds all over the world. Although there are inconsistencies and contradictions in Marx's theory during the different periods of its development, and there are considerable debates and disputes over its nature and structure, some basic consensus can be reached based on the analysis of Marx's works and studies on the subsequent evolution of the theory. A historic landmark in social and political thought, Marxism provided the foundation for the communist revolution and socialist reform that marked the 20th century, the influence of which continues to be felt worldwide.

Theoretical Sources

Marx developed his eponymous theoretical system from three major sources: German philosophy, French politics, and English economics. Marx showed great interest in law and philosophy in his early works; his later works were more concerned with political economy and political strategy.

The German philosophy on which Marx drew was primarily that of Georg Wilhelm Friedrich Hegel but also included the Young Hegelians and Ludwig Feuerbach's materialism. During his student days at the universities of Bonn and Berlin, Marx studied history and philosophy, took a strong interest in the works of the philosopher Hegel, and joined a student–professor group called the Young Hegelians. Many of Marx's basic ideas, such as his critique of civil society and private property, emerged when he was writing *Critique of Hegel's Philosophy of Right*. He asserts that religion is the "opium of the people" and calls for an "uprising of the proletariat" to realize the conceptions of philosophy, a point also made in *Theses on Feuerbach* (1845). Marx had been strongly influenced by Hegel's *Logic* and dialectical method, and his great work *Capital* is imbued with intellectual categories derived from Hegel.

French politics and socialist movements played an important role in shaping Marx's thoughts. Marx's father-in-law, Baron von Westphalen, and his teachers were all strongly influenced by the French Enlightenment. Marx was also strongly influenced by the French Revolution and by French thinkers such as Jean-Jacques Rousseau. After he emigrated to Paris together with his wife to escape political persecution by German authorities, Marx became acquainted with French socialist thinkers and began to witness the living conditions of people in poverty by socializing with working-class people. French socialism enabled Marx to break with Hegel's teleological approach to history, to develop a broad-ranging social economy, to understand the social and personal impact of modern industry, and to grasp the significance of socialism. After studying the development of Bonapartism and commenting on the nature and significance of the Paris Commune, Marx completed several political works (*Class Struggles in France* and *The Eighteenth Brumaire*) and expounded his major political ideas about the state and revolution.

The third major source of Marx's theory was English economics, exemplified by writers such as Adam Smith, David Ricardo, and Thomas Malthus. It was during his years in Paris that Marx began his study of English economics; from the early 1840s, he made an increasingly detailed study of the works of English economists. After moving to London, Marx undertook deep and systematic research on the development of the capitalist mode of production in England. In writing the 1844 *Manuscripts*, Marx relied extensively on the work of Adam Smith, especially his views on the division of labor, rent, subsistence wages, and the three stages of society. Once he became acquainted with Ricardo's work, *Principles of Political Economy*, Marx abandoned the economic theory developed in the 1844 *Manuscripts*. His critique of *The Poverty of Philosophy* was Ricardian in character. By absorbing the ideas in the works of classic political economists and analyzing the capitalist development in England, Marx established his own status as a political economist.

Although Marx drew on various sources, he did not merely combine them mechanically. A distinctive feature of Marx's theory is his creative synthesizing ability. A thorough study of German philosophy, French politics, and English economics allowed Marx to develop his own philosophical, economic, social, and political theory.

Historical Materialism and Social Development

Marx's unique contribution to historical philosophy is his historical materialism and theory of social development. According to his explanations in *The German Ideology* (1846) and *The Critique of Political Economy* (1859), the nature of individuals depends on the material conditions determining their productions. In the social production of their existence, people enter into definite relations that are indispensable and independent of their will. According to Marx,

> These relations of production correspond to a definite stage of development of their material forces of production. The sum total of these relations of production constitutes the economic foundation of society on which there arise legal and political superstructures and to which correspond definite forms of social consciousness. (*Contribution to the Critique of Political Economy*, Preface)

The mode of production in material life determines the general character of the social, political, and intellectual processes of life:

> It is not the consciousness of men that determines their existence, but, on the contrary, their social existence determines their consciousness. At a certain stage of their development, the material forces of production come eventually into conflict with the existing relations of production. [. . .] From forms of development of the forces of production these relations turn into their fetters. Then comes the period of social revolution. With the change of economic foundation the entire immense superstructure [. . .] is more or less rapidly transformed. In considering such transformations the distinction should always be made between the material transformation of the economic condition of production [. . .] and the legal, political, religious, aesthetic, philosophical, in short, ideological transformation. (*Critique of Political Economy*, Preface)

All ideological transformations "must be explained from the contradictions of material life, from the existing conflict between the social forces of production and the relations of productions" (*Critique of Political Economy*, Preface). Therefore, the legal relations as well as the forms of state could neither be understood by themselves nor explained by the so-called general progress of the human mind; they are rooted in the material conditions of life.

Since every society is divided into various groups, a strong minority tends to use their economic power in order to exploit the mass population by appropriating the economic surplus for their own benefit. This inherently conflicting situation gives rise to a class struggle that centers on the ownership and control of the means of production. The social group that controls the means of production forms the ruling class, and the group without the means of production constitutes the ruled class. All political institutions and cultural beliefs are shaped by the ruling class so as to bolster the unequal distribution of resources. The history of all hitherto existing society is the history of class struggles. According to Marx,

> Freeman and slave, patrician and plebeian, lord and serf, guild-master and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted [. . .] fight that each time ended, either in a revolutionary re-constitution of society or in the common ruin of the contending classes. (Section I, *Communist Manifesto*)

Based on the conflict between the forces of production and the relations of production, the history of mankind progresses through revolutions to the next higher stage. In the Marxist view of history, the primitive agrarian society was followed by the slave society of the ancient world, the feudal society, the capitalist society, and finally the communist society. The progress is made by inevitable and ultimately uncontrollable material forces, rather than human thought and initiative. This is sometimes summarized as so-called economic determinism. In fact, while Marx emphasized the crucial role of material forces in social development, he also analyzed the important and strong influences of political superstructure and human initiative on history.

Capitalist Crisis and Surplus Value

In February 1848, Marx and Engels published the well-known pamphlet, *Communist Manifesto*. It is usually regarded as a public statement of general theory and political principle of Marxism and a call for general cooperation among different workers' organizations. According to their analysis, capitalism as a revolutionary mode of production was fundamentally changing the course of civilization. It introduced market relations and cash nexus into all spheres of society and throughout the world. The market kept ever growing, the demand ever rising. This market has given an immense development to commerce, to navigation, to communication. The bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society. By continually modernizing the forces of production and promoting the division of labor, capitalism prepared the material conditions necessary for social cooperation and planned management in economic life. Despite the ever-increasing social character of capitalist production or socialization of the forces of production, the capitalist system was operated for private profit under private ownership. The search for private profit imposed fetters on the further development of production. The capitalist relations of production came finally into conflict with its forces of production. While a huge sum of wealth was accumulated in the hands of capitalists, its direct producers were impoverished. Lack of demand coexisting with unsold goods produced ever-worsening economic crises. This dynamic of capitalism created conditions of its own overthrown.

Moreover, capitalism was creating the industrial proletariat as its own grave diggers. As capitalism destroyed precapitalist modes of production at home and abroad, other classes were eliminated and the proletariat expanded. According to Marx,

> With the development of industry the proletariat not only increased in number; in became concentrated in greater masses, its strength grew, and it felt that strength more. The various interests and conditions of life within the ranks of the proletariat were more and more equalized, in proportion as machinery obliterated all distinctions of labor, and nearly everywhere reduced wages to the same low level. (Section I, *Communist Manifesto*)

As individual workers, then groups of workers in a factory or trade, and eventually all workers in a nation-state or even the world economy mobilized to resist capitalist exploitation, the proletariat would grow more conscious of their shared class position and their common interest in the overthrow of capitalism. When their economic struggles encountered resistance of the state as well as individual capitalists and groups of employers, the working class would develop a revolutionary consciousness and move from trade unionism to political party. With economic crisis deepening and the proletariat gaining in strength, revolution would be inevitable.

In 1867, the first volume of Marx's greatest work, *Capital* (*Das Kapital*), was published. The second, third, and incomplete fourth volumes did not come out until after Marx's death in 1883. In *Capital*, Marx analyzed the secret of capitalist production by focusing on the concept of surplus value and formulated his revolutionary theory by revealing the injustice of capitalist system. According to Marx, labor is a commodity like any other commodity; therefore, following the labor theory of value, it must be valued by the man-hours devoted to its "production"—that is, to feeding, clothing, and sheltering the worker in order to maintain life at subsistence level. In the capitalist system, labor is bought just like any other commodity. But, unlike any other commodity, labor is not consumed in a clearly determined period of time. Labor is bought for the price of sustaining the laborer physically, prorated in hours or days or weeks. But he may produce the equivalent of the price in economic value in 6 or 8 hours of work, whereas the factories of Marx's day kept men going for 10, 12, or 14 hours a day. The difference between what the worker does and what he is paid is surplus value, the source of all capitalist profits. In the capitalist society that is divided into the capitalist class with the means of production and the proletariat without the means of production, the injustice heaped on the workers is not the result of bad men, but of a particular system. Reform within the system, however well intentioned, is doomed to failure. Only revolutionary overthrow of the whole capitalist system can succeed.

Communist Revolution and Classless Society

Since the revolution is an inevitable historical product as the result of the conflict between the forces of production and the relations of production, and especially class struggle between the bourgeoisie and the proletariat in capitalist society, neither Marx nor Engels paid attention to the means of revolution, especially political leadership and political strategy, which would be explained and expounded by their followers such as Lenin and Mao Zedong. They also said little about what would happen after the revolution. It was believed that it would be absurd to predict the future society in detail. Nonetheless, some major ideas about communism can be found in the classic works of Marx and Engels.

When revolution breaks out, the proletariat seizes the power of the state and transforms the means of production in the first instance into state property. As Marx and Engels suggested, the revolutionary measures in the most advanced countries would include abolition of private property, a heavy progressive or graduated income tax, abolition of all right of inheritance, confiscation of the property of all emigrants and rebels, centralization of credit in the hands of the state, centralization of the means of communication, and transport in the hands of the state. By doing so, it puts an end to itself as the proletariat, it puts an end to all class differences and class antagonisms, and it puts an end to the state as state. The government of persons is replaced by the administration of things and the direction of the process of production. The state is not "abolished"; it withers away. But in a few places, Marx and Engels referred to the transitional stage as "the dictatorship of proletariat." The existence of classes is bound up with particular historic phases in the development of production; the class struggle necessarily leads to the dictatorship of the proletariat; this dictatorship itself only constitutes the transition to the abolition of all classes and to a classless society.

With regard to postrevolutionary politics, Marx cited the experience of the Paris Commune and talked about the possibility of bridging the gap between the state and civil society that had been opened up by capitalist democracy. As an instance of the abolition of the division of labor in politics, Marx welcomed the Commune's proposal to have all officials, including judges, elected by universal suffrage and revocable at any time; to pay officials the same wages as manual laborers; to replace the standing army by the armed people; and to divest the police and clergy of their political influence.

The initiative of the Commune could yield a decentralized, federal political structure and an economy based on cooperatives united by a common plan.

According to Marx's explanation and prediction, the fundamental features of communism include at least the following elements:

- The first is to eliminate the private property and implement the public ownership in economy. The theory of the Communists may be summed up in a single phrase: abolition of private property.
- The second is to limit free competition and carry out economic planning. The classic socialist believes that capitalist-free competition may lead to economic disorder and increasing inequality. Only after all economic activities are placed under the comprehensive economic plan can economic development be promoted and economic crisis avoided.
- The third is to distribute the economic surplus based on labor and need. In contrast to the capitalism in which capital plays the most important role in the process of distribution, the Communists insist that labor and need are the most important factors in distributing social wealth.
- Finally, the state as a tool of rule by the ruling class would wither away and would gradually be replaced by the administration of public affairs. In place of the old bourgeois society, with its classes and class antagonisms, there shall be an association, in which the conditions for the free development of one are the conditions for the free development of all.

Marxism After Marx

The classic Marxist theory was expounded and elaborated based on the historical developments in the Western industrialized countries such as England, France, and Germany. After economic, social, and political changes took place, many social theorists and political leaders tried to redefine and develop Marxism based on the new situations.

Revisionist Marxism

During the period of economic depression and political repression in the 1880s, Marxism became dominant in the German Social Democratic Party. Karl Kautsky explained and defended the theories of surplus value, class struggle, and capitalist crisis. His works defined Marxism for the generation after Marx and constituted the fundament of "orthodox Marxism." Another theorist, Eduard Bernstein, launched the revisionist attack on "orthodox Marxism" and directly refuted the theories of surplus value, impoverishment, capital concentration, and crisis. According to Bernstein, workers were not becoming poorer; the numbers of peasants was not declining; a new middle class was growing in size and importance; share ownership refuted the claim of capital concentration; and capitalism was developing mechanisms to reduce competition and remove recurrent economic crisis.

Western Marxism

The term *Western Marxism* normally excludes orthodox communists of strict Marxist obedience and is confined to the collection of thinkers that centered on the work of Georg Lukacs and Karl Korsch in Central Europe, Antonio Gramsci in Italy, and the Frankfurt school in Germany. Unlike the previous generation of Marxist theorists, most of the Western Marxist thinkers were not important figures in political parties. They tended to be academics rather than activists, writing in a period of declining working-class movements due to capitalist democratic and economic developments. Western Marxism is a philosophical meditation on the defeat of Marxism in the West. Although some people might question whether Western Marxism is real Marxism, the modes of thought in Western Marxism undoubtedly extended the horizons of Marxist discussion beyond the rather limited perspective of the Second International and Leninist orthodox. Antonio Gramsci's concept of hegemony and its consequences for political culture, the treatment of Sigmund Freud by Herbert Marcuse, the drastic critique of the Enlightenment by Max Horkheimer and Theodor Adorno, all these attempts to remedy weakness or gaps in the classical Marxist tradition have produced meaningful and insightful works on philosophy, politics, and society.

Leninism

Contrary to Marx's expectations, the socialist countries were not founded in the Western advanced countries but in some underdeveloped countries such as Russia and China. After the Bolshevik Revolution of October 1917, the first socialist country was established in Russia under the strong leadership of Vladimir Lenin. To lead the proletarian revolution, Lenin contributed a lot to Marxist theory in his theory of the party and his concept of capitalistic imperialism. In the process of building the first socialist country, Lenin had been searching for several models of socialism, such as War Communism and the New Economic Policy, in the face of foreign invasion and domestic hardship. In comparison with the comprehensive state direction and management of the economy in War Communism, the New Economic Policy was the strategic retreat in which the state withdrew from the ownership and management of small and medium enterprises, retaining only the very large-scale, strategically important parts of industry and communications. Freedom for peasants and traders to market their goods was extended as the state withdrew. However, after Joseph Stalin ascended to the top of the party-state in Soviet Union, he proceeded to announce radical plans for the rapid industrialization of the country and the collectivization of agriculture.

Maoism and the Theory of Deng Xiaoping

Mao Zedong, the principal Chinese Marxist theorist, was the Communist statesman who contributed to the founding of the Chinese Communist Party in 1921, the Communist Army in 1927, and the People's Republic of China (PRC) in 1949 after a long period of military struggle. Maoism is composed of many different kinds of ideas and ideology and strategy and tactics and believed to be the creative results of applying Marxism–Leninism to China, a semifeudal and semicolonial country without modern industrial developments. The most salient feature of Maoism is his emphasis on the importance of the peasant issue in Chinese revolution and socialist construction. The Marxist–Leninist tradition treated peasants as incapable of revolutionary initiative and only marginally useful in backing urban proletarian revolution. Based on his living experiences and his analysis of the rural situation in China, Mao came to recognize the potential power of China's hundreds of millions of peasants and decided to establish his base in rural areas instead of big cities. The peasants constituted the vast majority of China's population, but most of them were hard-pressed and lived in extreme poverty. According to Mao, they were very receptive to revolutionary agitation and could become a revolutionary force if fully mobilized and properly guided. Proceeding from this belief, Mao proposed to instill in them a revolutionary consciousness and make their force alone suffice for revolution. By so doing, Mao led Chinese revolution to succeed and gradually formed a special sentiment for peasants. During the Cultural Revolution, Mao sent many city workers, intellectuals, and bureaucrats to rural areas and forced them to receive reeducation through agricultural labor together with peasants because Mao believed that many of them began to become corrupt in the big cities.

After the death of Mao and the end of the Cultural Revolution, Deng Xiaoping emerged as the new supreme leader and began to review and revise the basic line adopted by Mao. Deng Xiaoping thought it was imperative to give a new perspective on socialism and make a breakthrough on socialist theory under the banner of "emancipating the mind" and "seeking the truth from the facts." The new theory of socialism with Chinese characteristics has been expounded and enriched by Deng Xiaoping and other Communist leaders during the past 3 decades. At the beginning of 1992, Deng Xiaoping made a famous southern tour in which he talked a lot about the nature of socialism and redefined it as "liberating productivity, developing productivity, eradicating exploitation, getting rid of the polarization between rich and poor, and finally getting rich together." According to Deng, the planned economy is not equal to socialism, and there are plans also in capitalist countries. The market economy is not equal to capitalism, and there are markets also in socialist countries. The criteria for socialism or capitalism are not that there are more markets or more plans but whether it is helpful to develop productivity, enhance the comprehensive national power, and improve living standards for the common people. In contrast with the traditional socialist theory that rejected commodity economy and market mechanism, the new theory of socialist market economy insisted on the coexistence of socialism and market economy because socialism has been redefined as the grandiose schemes for developing productivity and getting rich, and market has been regarded as the mere means to organize and regulate economic relations. Deng Xiaoping's theory has been called Marxism of contemporary China, the latest product of applying Marxism to China's socialist practice.

MASSES

The concept of *masses* is intricately interwoven with the concept of *elites.* Both concepts were introduced into the social sciences during the period of industrialization in the late 19th and early 20th centuries. With the demise of feudal society, new social categories emerged that defied the traditional classifications of the old corporative state. Just as modern elites do not coincide with traditional aristocracies, *masses* do not coincide with the *third estate.* Neither was the Marxist concept of class appropriate for grasping the socially heterogeneous composition of mass electorates and social movements. In this entry, the origins of this concept, its major proponents and critics, the respective empirical evidence, and its contemporary relevance are discussed.

Social philosophers and social scientists writing about masses have mostly referred to their large numbers and their lack of structure. The rise of masses was seen as a consequence of industrialization and urbanization. The German sociologist Ferdinand Tönnies argued that the increasing division of labor would replace primary interpersonal relations with indirect, secondary relations, thus leading to an erosion of the traditional social bonds of family, kinship, and neighborhood. This development is aptly captured by his dichotomy of *Gemeinschaft* and *Gesellschaft.* Since that period was also one of mass political mobilization and the political enfranchisement of ever larger parts of the population, the concept of masses also played a role in the political debate about the effects of universal suffrage. Earlier critics such as Edmund Burke and Alexis de Tocqueville had primarily raised concerns that this might impair the quality of political leadership and governance. The classic elite theorists Vilfredo Pareto, Gaetano Mosca, and Robert Michels instead argued that democratization, rather than increasing the political influence of ordinary citizens, would lead to a centralization of political power in the hands of a small elite. Mosca and Michels explained this with the inability of large groups to organize for effective political action and the personal and organizational advantages enjoyed by the elites. During the first half of the 20th century, the rise of communist and fascist totalitarian mass movements showed that some of the concerns raised by the older authors were not unfounded. However, when the success of representative democracy proved that most of their dire predictions did not materialize, the preoccupation with the presumed dangers of mass politics gradually subsided. Today, the term *masses* is mostly used interchangeably with *ordinary citizens*, *mass publics*, or *nonelites.*

In his 2002 book *Against the Masses*, Joseph Femia analyzed three major lines of reasoning against mass democracy:

1. The *perversity thesis* holds that democratization is not capable of achieving its main objective of transferring political power from a small aristocracy to the majority of the people but will instead achieve the opposite—namely, a centralization of power that makes popularly

elected elites even more dominant than the old aristocracy ever was.

2. The *futility thesis* emphasizes the inevitability of elite rule and argues that the natural inequality of human beings and the functional necessities of organizations will thwart any attempt to empower the masses.
3. The *jeopardy thesis* finally points to the conflict between democracy on one side and other important social values, in particular liberty, social cohesion, and economic development, on the other.

While the proponents of the futility thesis shared a pessimistic view of human nature and expected that both democratic elites and masses pursued particularistic interests, proponents of the perversity and jeopardy theses were critical of the political changes brought about by democratization. They believed in the superiority of the traditional republican model of government by a deliberative representative assembly elected by limited suffrage, whose members are primarily motivated by the intention to serve their country. They were therefore afraid that universal suffrage would require the formation of organized political parties and interest groups that would primarily pursue their particularistic interests. The observed shortcomings of representative democracy were thus compared with an idealized model of a predemocratic political order that had rarely existed in reality.

The critics of mass democracy also emphasized the inability of masses to understand the complexities of political life as well as their lack of motivation to devote much time to public affairs. They argued that the classic conception of democracy as self-government by the people made unrealistic assumptions about the masses. Joseph Schumpeter and others took up these arguments and developed a more realistic theory of representative democracy that acknowledges the limited political role of ordinary citizens and instead relies on competitive elections and institutional constraints for enforcing the political accountability of elected leaders. Under these relaxed assumptions, most of the problems predicted by the critics of mass democracy turned out to be much less severe in practice than in theory.

While the simple dichotomy of elites and masses made by the classics of elite theory has given way to more differentiated analyses that treat neither elites nor masses as unitary actors, three basic theoretical questions raised by these writers are of continuing relevance. These are the motivation and qualification of mass publics to participate in public affairs, their susceptibility to manipulation by elites, and finally the ways in which citizen demands are transmitted into the political decision-making process.

Political Involvement and Political Beliefs

Michels and Schumpeter were the first to provide an in-depth analysis of the division of labor between politicians and ordinary citizens in representative democracies. They argued that the overwhelming majority of citizens are only marginally involved in political affairs. While Michels tried to demonstrate the existence of an *iron law of oligarchy* governing all organizational life, Schumpeter developed a new model of democracy as electoral competition among political parties, thereby attempting to reconcile democracy and elite rule. Both assumed a division of labor among voters and elected representatives, thereby claiming an active role for politicians in determining the political agenda and a largely passive role for citizens.

Public opinion research has confirmed that the number of citizens who are continually involved in public affairs is relatively small. Philip Converse and others have repeatedly claimed that only about 10% to 20% of citizens possess a high level of political sophistication. However, empirical research has also demonstrated the existence of a large degree of variation in political interest and involvement among citizens, ranging from the politically apathetic to well-informed political activists. It is, therefore, more appropriate to assume the existence of a hierarchy of political involvement rather than a dichotomy of political elites and mass publics. Finally, public opinion surveys in consolidated democracies have also provided evidence on differences in political values and beliefs between political elites and mass publics. While both elites and citizens overwhelmingly support fundamental principles of democracy—such as general elections and free speech—support for minority rights, civil liberties, limits on governmental power, or the right of due process are much lower among mass publics than among elites. These differences are especially large where respondents are confronted with a choice between those rights and other highly valued political goals such as public safety or economic well-being. As noted by Ian McAllister (1991), the political issue attitudes of elites are finally more polarized, especially when they are related to the traditional cleavage lines of a party system.

Based on the limited support of mass publics for democratic values, some political scientists, most notably Herbert McClosky, concluded that mass political culture is of only minor relevance for the consolidation and sustenance of democracy. However, libertarian value orientations are considerably higher among the highly educated and politically involved. It would therefore be wrong to assume that only elites can be considered as the *carriers of the democratic creed*, as McClosky concluded. Rather than relying on the existence of elite competition as a sufficient barrier against nondemocratic tendencies, the role of active citizens as political watchdogs against elite transgressions should not be underestimated. They provide the crucial link between political leaders and passive citizens and are therefore indispensable for enforcing political accountability.

Psychological Characteristics of Masses

Cultural critics have frequently emphasized that modernization inevitably leads to an erosion of traditional social bonds of family, kinship, ethnicity, castes, and so on and will ultimately result in an atomization of society. Gustave Le Bon's still popular work on the psychology of crowds is an example of the dangers such critics have associated with the twin developments of modernization and democratization. Le Bon claimed that crowds—understood as large gatherings of individuals—are susceptible to persuasion by political agitators and therefore prone to participating in political actions that their individual members would never consider for themselves. He emphasized their lack of critical judgment and their potential for irresponsible and destructive behavior.

Some of Le Bon's observations have been partly confirmed by social psychological experiments dealing with the phenomenon of *risky shift* in group decision making; in other words, a tendency for groups to engage in riskier decisions than individuals. While there is solid empirical evidence that risky shifts do indeed occur, this is not necessarily the case. Based on a review of several decades of social psychological research, Daniel Isenberg concluded that group decisions are influenced by a variety of factors, of which the most important were the initial preferences of the group members, the plausibility of the arguments brought forward for different courses of action, and the social status of the individuals advocating different solutions. Risky shifts can, therefore, only be considered as a special case of *choice shifts* and are by no means the inevitable result of collective decision making.

Moreover, although collective violence by crowds (e.g., lynchings) and political riots are not uncommon, such incidents are nothing peculiar to modern societies. Le Bon's assumption that even mass electorates and parliaments are susceptible to crowdlike behavior is especially vastly overdrawn and cannot be sustained empirically. Electoral research has instead shown that voters are exposed to a variety of contradictory influences by primary and secondary groups as well as the mass media. Moreover, although the relevance of short-term factors has increased, social structural (social class, religion, ethnicity) and psychological (party identification) commitments continue to be relevant determinants of voting behavior. Le Bon did not adequately take into account the persistence of such particularistic loyalties and even less so the capacity of individuals to form independent opinions.

Theories of Mass Society

In his 1959 book *The Politics of Mass Society*, William Kornhauser attempted to integrate the assumptions of aristocratic and democratic critics of modern society into a comprehensive theory of society. Based on their patterns of elite–mass relations, Kornhauser distinguished four ideal types of society: communal (traditional), pluralist, mass, and totalitarian. The bottom-up perspective involves the accessibility of elites for mass demands, the top-down perspective the availability of nonelites for elite domination and manipulation. This yields a fourfold table (Table 1).

Table 1 Four Ideal Types of Society

Accessibility of Elites	*Availability of Nonelites*	
	Low	*High*
Low	Communal society	Totalitarian society
High	Pluralist society	Mass society

Source: Adapted from Kornhauser, W. (1959). *The politics of mass society* (p. 40). Glencoe, IL: Free Press.

Kornhauser argued that pluralist society is characterized by a high degree of responsiveness of elites to citizen demands as well as a high degree of elite autonomy from public pressures. Citizen demands are transmitted into the political decision-making arena through a dense web of intermediary associations (political parties, labor unions, etc.) via institutionalized channels of interest articulation rather than through direct mass action. Mass society is instead characterized by a lack of voluntary associations, which implies that elite and nonelite interactions become precarious. Elites are put under undue pressure to accede to mass demands articulated by direct political action, while citizens become objects of elite manipulation. Although Kornhauser emphasized the distinction between mass society and totalitarian society, he argued that mass society is vulnerable to totalitarianism because atomized individuals have no means of influencing politics other than through participation in direct political action.

Kornhauser's theory is but one example of a long-standing tradition of theories emphasizing the crucial function of intermediary associations for societal integration, ranging from theories of pluralism to more recent approaches such as communitarianism or theories of civil society or social capital. Many of these writers have also warned of the dangers associated with the demise of intermediary organizations. However, such diagnoses have frequently been preoccupied with the decline of specific associational types, without considering that new types of organizations may already be on the rise and that, rather than leading to social atomization, the eclipse of traditional organizations may simply indicate their historical obsolescence. In this vein, the abolition of compulsory guild membership in West European countries during the period of industrialization paved the way for the formation of a wealth of business and professional associations as well as labor unions. Moreover, the expansion of the suffrage in the 19th century required the formation of political parties as instruments for mobilizing political support among newly enfranchised voters. As pluralist theorists later showed, rather than becoming atomized, industrial societies were characterized by the existence of an intense network of intermediary associations. Likewise, preoccupation with the current decline in membership among traditional mass membership organizations such as political parties and labor unions tends to neglect or underestimate the rise of new types of associations (e.g., nongovernmental organizations, third-sector organizations) that may serve as functional equivalents. The fact that they are different does not necessarily imply that they are incapable of fulfilling the functions of their older counterparts.

Continued Relevance or Obsolescence of the Concept?

In emphasizing the inevitability of power and elites, the classic elite theorists replaced the dichotomous class model of Marxism by an equally crude dichotomy between elites and masses. Nevertheless, some of their insights are of continuing relevance and have contributed to the development of a revised model of democratic politics. Representative democracy has institutionalized a pluralist elite structure with competing political parties, thus enforcing political accountability of elected representatives. Likewise, nonelites are not necessarily tantamount to atomized masses. Modern democracies are instead characterized by the existence of a multitude of voluntary associations and private interest groups performing a crucial linkage function between elites and nonelites. While their leaders belong to the elites, they are internally stratified according to the degree of involvement of their members.

Moreover, empirical research has demonstrated that the assumption that mass electorates are characterized by low levels of political sophistication and involvement in public affairs and susceptibility to manipulation by populist elites grossly misrepresents the reality of modern democracies, even though most voters may not live up to the classic ideal of citizenship. Simply comparing elites and masses therefore provides a simplified portrait of modern democracies that disregards the complex structure of both elites and mass publics.

MATCHING

Matching is a statistical method that can be used to estimate quantities of interest that depend on missing, that is, unobserved, values of some variable Y. (As is made clear later in this entry, the variables with missing values in causal inference applications are subtly different from the *observed* outcome variable, which is commonly referred to as Y.) Schematically, matching works as follows. For each observation with a missing value of Y, find another observation that does not have a missing Y value but that is otherwise maximally similar to the initial observation in question. This similar observation is said to match the observation with the missing Y value. Now use the observed Y value from the matched observation to fill in the missing Y value. Matching can be done by selecting matching observations with or without replacement from the original dataset. It is also possible to match many observations to a single missing observation, in which case the mean of Y from the matching observations is typically used to fill in the missing Y value.

Matching can be applied to a variety of missing data problems—from estimating the population mean of Y to estimating causal effects. Examples below make this clearer. Matching is not a panacea. Matching methods rely on assumptions that can only be tested given auxiliary data and/or assumptions. The key assumptions of *conditional ignorability* and *overlap* are discussed later in this entry. There are a wide variety of ways that matching can be implemented by. A discussion of particular matching methods and their statistical properties is beyond the scope of this entry.

Examples

The easiest way to begin to understand how matching works is to walk through some relatively simple examples.

Estimating a Population Mean

Consider a situation where we are interested in estimating the fraction of Republicans in a population. We sample 20 individuals from this population and administer a face-to-face survey. The pollster records the respondent's gender (0 = *male*, 1 = *female*), race (0 = *nonwhite*, 1 = *white*), and partisanship (0 = *non-Republican*, 1 = *Republican*). All respondents report their gender and race accurately; however, some respondents do not report their partisanship. Respondents who report their partisanship will be called *reporters* and those who do not report their partisanship will be called *nonreporters*. These data are summarized in Table 1.

We would like to use our sample data to estimate the fraction of individuals in the population who self-identify as Republicans. The simplest way to do this is to take the sample average of the partisanship variable among the reporters. Doing so,

Table 1 Hypothetical Missing Data Example in Which One-to-One Matching With Replacement Is Used to Estimate Average Partisanship

Observation	*True Partisanship*	*Observed Partisanship*	*Imputed Partisanship*	*Race*	*Gender*
1	0		0	0	0
2	0		0	0	0
3	0		0	0	0
4	0	0	0	0	0
5	0	0	0	1	0
6	0		1	1	0
7	1	1	1	1	0
8	1	1	1	1	0
9	1		0	1	0
10	1		1	1	0
11	0		0	0	1
12	0		0	0	1
13	0	0	0	0	1
14	0		0	0	1
15	0	0	0	1	1
16	0	0	0	1	1
17	0		1	1	1
18	1	1	1	1	1
19	1	1	1	1	1
20	1		0	1	1
Average	0.35	0.44	0.35		

Note: Sample average of observed partisanship is not equal to the sample average of true partisanship because of missing data. Using matching to impute partisanship produces a sample average that is correct.

we would estimate that 44% of the population are Republican identifiers. Note that if individuals who are more likely to be Republicans answer the partisanship question more often, this simple approach will generally yield estimates of Republican partisanship that are falsely high. Looking at the true (but partially unobserved) partisanship of each individual in Table 1 and the associated sample average, we see that the simple approach of ignoring the missing data yields an estimate that is 9 percentage points too high.

While it is clearly not the case that the average partisanship of reporters and nonreporters is equal—hence the 9-percentage-point difference—if it is the case that (a) the distribution of reporters' partisanship is equal to that of nonreporters *within each race–gender combination* and (b) each race–gender combination that has nonreporters also has at least one reporter, then one can use matching to produce better estimates of partisanship. Condition (a) is sometimes called the *conditional ignorability* assumption, and condition (b) is sometimes called the *overlap* assumption.

Looking at Table 1, we see that we do not observe the partisanship variable for Observation 1. The only observation that has the same race and gender values as Observation 1 and that has an observed partisanship value is Observation 4. We can thus match Observation 4 to Observation 1 to impute Observation 1's partisanship. Observation 4 is also matched to Observations 2 and 3. A more interesting situation lies in how to deal with the missing partisanship of Observation 6. Here, three other observations—5, 7, and 8—have the same race and gender values as Observation 6. Here, we would randomly pick one of these three observations to be the match for Observation 6. Doing this, we pick Observation 8, which implies that the imputed partisanship for Observation 6 is 1. Note that while this is not equal to Observation 6's true partisanship, randomly choosing matches from among the observations with $1 = \mathit{race}$ and $0 = \mathit{gender}$ and observed partisanship will be correct in expectation because of the conditional ignorability assumption. Thus, while individual-level values may be incorrect, sample averages will be correct in expectation. Imputing data in this way is sometimes referred to as *hot-deck imputation.* We continue to impute the partisanship variable in this way until it is completely filled in. After doing this, we see that the sample average of the imputed partisanship variable is equal to the true sample average of 0.35. In actual applications, the average based on the imputed partisanship variable will only equal the true sample average in expectation.

Estimating Average Treatment Effects

Most recent applications of matching in the social sciences have been within the context of estimating average treatment—that is, causal—effects. To see how matching works in such situations, we consider a simple example. Let $X = 0, 1$ denote the treatment variable, $Z1$ and $Z2$ denote the measured confounders, and Y denotes the outcome variable. We are interested in the average treatment effect (ATE), that is, the difference between the average value of Y in a world where all units get treatment ($X = 1$) and the average value of Y in a world where all units do not get treatment (control) ($X = 0$). To formalize this, let $Y(1)$ denote the Y value of a randomly chosen unit if it were assigned treatment ($X = 1$) and let $Y(0)$ denote the Y value of a randomly chosen unit if it were assigned to the control condition ($X = 0$). The ATE is $E[Y(1) - Y(0)] = E[Y(1)] - E[Y(0)]$. In an abuse of notation, we will, at some point below, refer to the $Y(0)$ and/or $Y(1)$ values of a particular unit without subscripting the potential outcomes.

If one is willing to make assumptions that ensure that the potential outcomes $Y(1)$ and $Y(0)$ are well-defined, then the estimation of the ATE requires solving two missing data problems that are analogous to the simple example of estimating a population mean in the presence of missing values. Note that we need to estimate $E[Y(1)]$ and $E[Y(0)]$ where the expectations are taken over all units in the population. We get to observe $Y(1)$ for units that received treatment but we do not get to observe $Y(0)$ for these units. Conversely, we get to observe $Y(0)$ for units that were in the control group, but we do not get to observe $Y(1)$ for these units. Table 2 presents a simple data set that makes this clearer. Column (a) displays the true, but unobserved, potential outcomes for all units in the study. Here, we see that the average value of Y under treatment is 0.85 and the average value of Y under control conditions is 0.70. Thus, the true ATE in this sample is 0.15. Life is complicated because we do not get to observe all of the information in Column (a). Instead, we only get to observe the information in Column (b). Again, we can match units that have maximally similar values of the measured confounders—$Z1$ and $Z2$—to impute the missing values of $Y(0)$ and $Y(1)$.

To see how this works, look at Unit 11, which, having received treatment, is missing its $Y(0)$ value. Units 7, 8, 9, and 10 received control and have the same $Z1$ and $Z2$ values as Unit 11. They are thus potential matches. Half of these units have $Y(0) = 0$ and half have $Y(0) = 1$. There should thus be a 50% chance that Unit 11's value of $Y(0)$ is 0 and a 50% chance it is 1. Suppose we match Unit 11 to Unit 9. Then $Y(0)$ for Unit 11 is 0. This is reported in Column (c). Again, note that this is not equal to Unit 11's true value of $Y(0)$ that we see in Column (a). However, the 50% chance of being matched to a $Y(0) = 0$ unit is correct for all units with $X = 1$, $Z1 = 0$, and $Z2 = 1$ (Units 11 and 12), which keeps the sample average of $Y(0)$ among the $Z1 = 0$, $Z2 = 1$ units correct in expectation. Using this same sort of matching procedure to fill in the remaining missing $Y(0)$ values and the missing $Y(1)$ values, we arrive at the imputed potential outcomes in Column (c). Taking the averages of these variables and then taking the difference of the averages gives us an estimate of ATE that is in line with the true value reported in Column (a).

Table 2 Hypothetical Causal Inference Example Where One-to-One Matching Is Used to Estimate the Average Treatment Effect (ATE)

	(a)		*(b)*		*(c)*				
Unit	*True Y(0)*	*True Y(1)*	*Observed Y(0)*	*Observed Y(1)*	*Imputed Y(0)*	*Imputed Y(1)*	*X*	*Z1*	*Z2*
1	0	1	0		0	0	0	0	0
2	1	0	1		1	1	0	0	0
3	1	0	1		1	0	0	0	0
4	0	1	0		0	1	0	0	0
5	1	0		0	1	0	1	0	0
6	0	1		1	0	1	1	0	0
7	0	1	0		0	1	0	0	1
8	1	1	1		1	1	0	0	1
9	0	1	0		0	1	0	0	1
10	1	1	1		1	1	0	0	1
11	1	1		1	0	1	1	0	1
12	0	1		1	1	1	1	0	1
13	1	1	1		1	1	0	1	1
14	1	1	1		1	1	0	1	1
15	1	1		1	1	1	1	1	1
16	1	1		1	1	1	1	1	1
17	1	1		1	1	1	1	1	1
18	1	1		1	1	1	1	1	1
19	1	1		1	1	1	1	1	1
20	1	1		1	1	1	1	1	1
Average	0.70	0.85	0.60	0.90	0.70	0.85			
Estimated ATE	0.15		0.30		0.15				

Note: Because units with $Y(0) = 0$ are more likely to be assigned to the control group than the treatment group and units with $Y(1) = 0$ are also more likely to be in the control rather than the treatment group, the estimate of ATE in Column (b) is incorrect. Imputing data via matching on $Z1$ and $Z2$ solves this problem in Column (c).

Why Does Matching Work?

As noted above, standard matching methods rely on two important assumptions—conditional ignorability and overlap. Each is briefly discussed as follows.

Understanding the Conditional Ignorability Assumption

There are multiple versions of the conditional ignorability assumption. Here we will focus on a fairly weak version—conditional mean ignorability—that is relatively easy to understand. Conditional mean ignorability states that, among observations with the same values of measured covariates, the mean of the missing *Y* values is the same as the mean of the observed *Y* values. In causal inference applications similar to that represented in Table 2, missingness is completely determined by the treatment assignment *X*. Thus, conditional mean ignorability also implies that, among units with the same values of measured covariates, the mean of the potential outcome $Y(1)$—the value of Y under a *hypothetical* assignment of a unit to the treatment ($X = 1$) condition—does not depend on whether a unit *actually* received treatment or control. The same is true for the mean of the potential outcome $Y(0)$. Assuming conditional mean ignorability allows one to estimate the mean of Y when some Y values are missing because it states exactly how the expected value of the missing data relates to observed values of Y.

Understanding the Overlap Assumption

Of course, for a conditional ignorability assumption to be useful, it must be the case that observations exist with observed Y values that are appropriate matches for observations with missing Y values. The overlap assumption is a formal statement of this need for good matches. While the examples above make use of exact matches, it is not necessary to obtain exact matches for the matching to be effective. For instance, it is possible to eliminate bias by matching on a unidimensional summary of the relationship between measured covariates and the missingness pattern. In situations where overlap does not hold, it is common—especially in causal inference applications—to change the quantity of interest to one for which there is good overlap.

MAXIMUM LIKELIHOOD

Maximum likelihood is a general method for estimating parameters in a statistical model. Given a known probability distribution Y with known probability density function (pdf), assume that we have a random sample, $y_1, \ldots, y_n$ from Y, where θ is an unknown population parameter associated with Y. The likelihood function $L(\theta)$ is the product of the pdf for each value evaluated on the n sample points:

$$L(\theta) = f(y_1, \ldots, y_n|\theta) = f(y_1)f(y_2)\cdots f(y_n)|\theta = \prod_{i=1}^{n} f(y_i|\theta).$$

Maximum likelihood chooses the estimate of the parameter θ that maximizes the likelihood of the observed data. Joint pdfs and likelihoods appear to be quite similar, but the two differ in an important respect. A joint pdf is a function of the data where the parameter is assumed to be known, while the likelihood is assumed to be a function of the unknown parameter θ and not the data. The value of θ that maximizes the likelihood function is the maximum likelihood estimate for θ. Common estimators such as ordinary least squares and the sample mean and proportion are in fact maximum likelihood estimators. Maximum likelihood possesses a number of desirable properties that account for its widespread use in statistical estimation. Maximum likelihood is widely used in political science to estimate logit and probit models, count models, and event history or survival models among others. In this entry, the origins, properties, and possible applications of this method are discussed.

Origins

R. A. Fisher invented the method of maximum likelihood in a series of papers published early in the 20th century. Fisher's work on maximum likelihood began with his derivation of the principle of "absolute criterion" in a paper he published as a third-year undergraduate. While this paper contains the origins of maximum likelihood estimation (MLE), there is little in the paper that many readers would recognize as MLE. In later papers, he developed the concept of likelihood as distinct from probability. Then, in 1922, Fisher united several earlier streams of his research and was the first to use the term *maximum likelihood* for a class of estimators as an alternative to Bayesian or method of moments estimators. In the same paper, Fisher proposes that maximum likelihood estimators have properties of efficiency, sufficiency, and consistency. Later work by other statisticians would establish the properties of MLE more rigorously.

A simple example is helpful for understanding the principles of MLE. Let us say we wish to estimate the sample proportion for a set of data. Assume we have a random sample of data $y_1, \ldots, y_n$ with n observations randomly drawn from a binomial distribution with common parameter p, where $0 < p < 1$ and each y is either 1 for success or 0 for failure. For these n independent and identically distributed variables $y_1, \ldots, y_n$, the density of each observation is

$$\binom{n}{k} p^k (1-p)^{n-k}.$$

We next write the likelihood function, which is the density evaluated at the data as a function of the parameter p. However, because the binomial coefficient does not depend on the parameter of interest, p, we can omit it from our derivation of the maximum likelihood estimator. The likelihood function is the product of the individual densities for each observed data point:

$$\begin{aligned} L(p) &= P(Y_1 = y_1, Y_2 = y_2, \ldots, Y_n = y_n) && (1)\\ &= p^{y_1}(1-p)^{1-y_1} \times p^{y_2}(1-p)^{1-y_2} \\ &\qquad \times \cdots \times p^{y_n}(1-p)^{1-y_n} && (2)\\ &= \prod_{i=1}^{n} p^{y_i}(1-p)^{n-y_i}. && (3)\end{aligned}$$

Due to the independence of observations, we can write the likelihood as the product of the n binomial densities. The maximum likelihood estimate for p is the value of p that maximizes this likelihood function. To find the maximum, we take the first derivative of the likelihood function, set the derivative equal to zero, and solve for p. It is often easier to work with the logarithm of the likelihood function. Since the likelihood function is a monotonic function, taking the log of it will not affect the estimate of p. The log-likelihood function takes the following form:

$$\ln L(p) = \sum_{i=1}^{n} y \ln p + n - \sum_{i=1}^{n} y \ln(1-p).$$

Differentiating the log-likelihood with respect to p returns,

$$\frac{d}{dp} = \sum_{i=1}^{n} y \frac{1}{p} - n - \sum_{i=1}^{n} y \left(\frac{1}{1-p}\right).$$

We set the derivative of the log-likelihood equal to zero and solve:

$$\begin{aligned} &\frac{\sum_{i=1}^{n}}{p} - \frac{n - \sum_{i=1}^{n}}{1-p} = 0, \\ &\hat{p} = \frac{\sum y_i}{n}. \end{aligned}$$

The maximum likelihood estimate for p then is simply the proportion of successes we observe in the sample.

Properties of Maximum Likelihood Estimators

Maximum likelihood estimators have a number of desirable properties. The properties were outlined by Fisher in an informal way but were not proven rigorously until later. The properties of maximum likelihood estimators require a set of regularity conditions.

These regularity conditions are as follows:

- The values of y for which $f(y|\theta) > 0$ (i.e., the sample space) do not depend on θ.
- $f(y|\theta)$ is twice differentiable with respect to $\theta, \forall\theta \in \Theta \subseteq R^k$.
- The information matrix is positive definite and bounded.

- The first three partial derivatives of the likelihood function with respect to θ are bounded, and the bounds on the third such derivative do not depend on θ.

Subject to these regularity conditions, the properties of maximum likelihood estimators come in two forms: finite sample and asymptotic properties. The finite sample properties hold regardless of the sample size used for estimation. Asymptotic properties hold as the sample size increases. The finite sample properties of maximum likelihood estimators are the following:

- Maximum likelihood estimators are invariant to reparameterization. The invariance property ensures that the MLEs for σ^2 are equal to the square root of the MLE for σ.
- In a finite sample, if a minimum variance unbiased estimator (MVUE) exists, then the method of MLE chooses it. For an MVUE, its variance is said to equal the Cramer-Rao lower bound. For example let $\hat{\theta}$ be an unbiased estimator. If it is an MVUE, the following will be true for its variance:

$$\mathrm{Var}(\hat{\theta}) \geq \left\{-nE\left[\frac{\partial^2 \ln f(y,\theta)}{\partial^2\theta^2}\right]\right\}^{-1}.$$

The asymptotic properties of the MLE are as follows:

- It is consistent; that is, $\lim_{n\to\infty} P(|\hat{\theta}_n - \theta| < \varepsilon) = 1,\ \forall\varepsilon; > 0$. In other words, the sampling distribution for the MLE of $\hat{\theta}$ collapses to a spike at θ as $n \to \infty$.
- It is asymptotically normal. The sampling distribution of θ converges to the normal distribution as $n \to \infty$.
- It is asymptotically efficient. For large n, the standardized distribution of $\hat{\theta}_n$ has variance equal to the Cramer-Rao lower bound. Therefore, the maximum likelihood estimator, compared with any other consistent and asymptotically normal estimator, has a smaller asymptotic variance.

As an example, let us return to the maximum likelihood estimator for the sample proportion. One can easily prove that it is an unbiased estimator for the sample proportion. One might ask whether it is a minimum variance unbiased estimator. We need to compare the relevant quantity from the MLE for the proportion with the Cramer-Rao lower bound. The second derivative of the log-likelihood for the sample proportion is

$$\frac{\partial^2 \ln f(y,p)}{\partial^2 p} = -\frac{y}{p^2} - \frac{1-y}{(1-p)^2}.$$

The expected value of this second derivative is the following quantity:

$$E\left[\frac{\partial^2 \ln L(p)}{\partial^2 p}\right] = -\frac{p}{p^2} - \frac{1-p}{(1-p)^2} = -\frac{1}{p(1-p)}.$$

We next take the inverse and multiplying by $-n$:

$$\frac{1}{-n\left[-\frac{1}{p(1-p)}\right]} = \frac{p(1-p)}{n}.$$

This quantity is equal to the variance for maximum likelihood estimator for the sample proportion. Therefore the maximum likelihood estimator for the sample proportion is not only unbiased but no other estimator for the proportion has a smaller variance.

Other than ordinary least squares, which is a special case of maximum likelihood, no other estimator is more widely used in political science. MLE is especially important for the analysis of categorical variables. For example, vote outcomes are quite often measured with nominal variables that record which candidate or political party receives an individual's vote. Such variables are analyzed with models where maximum likelihood is the usual estimation method. Other types of political variables typically analyzed with models that use maximum likelihood for estimation are counts of political conflict, length of political conflict, duration of governments, and voter turnout among others. In almost every area of political science, analysts will encounter categorical variables that are often analyzed with models estimated by maximum likelihood. Even for analysts that embrace the Bayesian tradition, the likelihood function remains a critical part of their analyses. Maximum likelihood is also used for the estimation of propensity scores, which are important for matching estimators.

MEASUREMENT

Measurement may be defined as the process that connects theoretical concepts with empirical indicator(s) designed to represent those concepts. As such, it is vitally important to social science research. This entry presents the most important properties of measurement, validity, and reliability, in their various forms. In addition, measurement levels, scales, indices, and related statistical techniques are briefly discussed.

It has been argued that inadequate measurement, more than mistaken concepts or faulty hypotheses, has hindered progress in the social sciences. The sources of inadequate measurement are complex but may be rooted in an oft-cited definition of measurement. In 1951, Stanley Smith Stevens characterized measurement as assigning numbers to objects or events according to particular rules. This is in itself an inadequate conceptualization of the process. It presents measurement as an empirical, almost mechanistic process that overlooks the important role of theory in social science research. Until researchers have worked through their measurement problems, they may not really have a theory capable of generating testable hypotheses. The difficult process of measuring theoretical concepts can make theories clearer, richer, and more subject to empirical investigation. A fuller and more appropriate definition of measurement, then, is the representation of abstract, theoretical concepts with concrete, empirical indicators. This is accomplished through the process of construct building by linking abstract, theoretical, and unobservable concepts with empirical indicators for which researchers have direct observations. This definition involves both theoretical and empirical considerations. Empirically, the focus is on the observable response—answers on a questionnaire, observed behavior in an experiment, material from an archive. Theoretically, the interest is in the underlying unobservable (and not directly measurable) concept that is used in the explanation of some social phenomenon and is represented by the response.

When the relationship between the theoretical concept and the observable response is strong, analysis of empirical indicators can lead to useful inferences about the relationships among the underlying concepts and a greater understanding of the phenomenon under investigation. When the relationship between concept and indicator is weak or faulty, analysis of the indicators leads to incorrect inferences and misleading conclusions concerning the underlying concepts. From this perspective, the auxiliary theory specifying the relationship between concepts and indicators is as important to social research as the substantive theory linking concepts to one another.

Measurement issues arise in many contexts within political science. For example, when respondents are asked in public opinion surveys which party or candidate they voted for in the previous election, questions of measurement are immediately apparent. Do some of the respondents who voted for the losing party or candidate systematically misremember and claim that they voted for the winner? If so, then, as we will see below, this evidence would raise serious questions about the validity of recall questions that purport to measure previous voting behavior. Other measurement issues arise with instruments such as that used in the Polity Project, which codes the authority characteristics of states in the world system for purposes of comparative, quantitative analysis. Coders are instructed to assign yearly scores to all major, independent states in the global system, measuring features of these regimes such as constraints on executive authority, openness of political competition, and peaceful changes in government. Obviously, a crucial concern in this project is the degree to which different coders assign identical or widely different scores when evaluating these characteristics of these countries, an issue of reliability as we will also see below. These examples illustrate the ubiquitous nature of measurement in the social sciences generally and political science in particular.

Properties of Measurement

There are two key properties of measurement: validity and reliability. Validity is the most important property of measurement. Validity focuses on whether a measure represents the phenomenon it is claimed to measure. This is fundamental to any inferences that can be drawn about the relationships between the theoretical concepts. If empirical indicators do not measure the theoretical concept at issue, it is not a valid measure of that concept and any inferences concerning the relationships between concepts will be problematic if not downright wrong.

Reliability is the extent to which an experiment, test, or any measuring procedure yields the same results on repeated trials. It is concerned with the consistency of a measure over repeated observations. Reliability focuses on random error—all of the chance factors that confound the measurement of any phenomenon. If, on the one hand, an indicator is a reliable indicator of a theoretical concept, that indicator will produce consistent results on repeated observations because the random error is not great enough to cause notable fluctuation from one observation to the next. On the other hand, an unreliable indicator will produce inconsistent readings from one measurement to another. Thus, the greater the random error, the less reliable is the measure. For example, if an automobile speedometer registers the speed of the car at 3 kilometers more than the true speed on Monday, 6 kilometers less than the true speed on Tuesday, and 10 kilometers more than the true speed on Wednesday, the readings of the car's speed are being affected by random error and the reliability of the speedometer is low.

There is a second basic type of error that affects empirical measurements: nonrandom error. Nonrandom error, or systematic error, has no effect on a measure's reliability. For example, if an automobile speedometer always registers the speed of the auto as 5 kilometers per hour more than the true speed, it is a reliable or consistent indicator. The error in this case is not random, indeed, it is quite nonrandom—it is consistently 5 kilometers per hour too high every time. In this case, the measure is perfectly *reliable*, but it is not a *valid* measure. It does not measure the true speed of the automobile. The scale does not measure what it is intended to measure.

Validity

Validity is the extent to which any measuring instrument measures what it purports to measure rather than reflecting some other phenomenon, some source of nonrandom measurement error. The use to which one puts the test must always be considered when assessing validity. That is, an eye examination may be valid for determining the quality of one's vision, but it will not be valid at all for determining one's body temperature. Validity is always an argument between competing theoretical claims. Because of this, what is validated is not the instrument itself but the instrument in relation to the purpose for which it is being used.

There are several types of validity that are appropriate in social science research. Each takes a slightly different approach in assessing the degree to which a measure is valid. One may find references in the literature to internal validity, statistical validity, construct validity, convergent validity, discriminant validity, cross-validation, face validity, concurrent validity, external validity, content validity, sampling validity, criterion validity, predictive validity, and empirical validity. Some of these types of validity overlap. Face validity is sometimes discussed as a separate type of validity and sometimes as a subtype of content validity.

Some are the same only with different names, for example, criterion-related and empirical validity are used to mean the same thing. Some are used to denote subtypes of a main type of validity. For example, both concurrent validity and predictive validity are subtypes of criterion-related validity. Convergent validity, discriminant validity, and cross-validation are used to denote types of construct validity. This discussion presents the three most basic types of validity—content validity, criterion-related validity, and construct validity—and their relevance to social science.

But before discussing these three types of validity, we first need to consider the difference between internal and external validity. *Internal validity* concerns the extent to which causal inferences from a given set of cases are correct for those cases. In experimental research, the question of internal validity relates to whether the experimental treatment made a difference in this specific experimental instance. In nonexperimental research, the question focuses on whether the independent variable causes a given change in the dependent variable. In both types of research, the fundamental issue related to internal validity is whether there is a strong logical and empirical basis for establishing causal inferences. *External validity*, by contrast, focuses on generalizability—that is, the extent to which causal inferences about a given set of cases can be applied to other cases. External validity concerns what populations, settings, treatment variables, and measurement variables the established causal inference apply to. From the perspective of this distinction, all the three types of validity discussed below relate to internal validity.

Content Validity

Content validity focuses on the extent to which a particular empirical measure reflects a specific domain of content. That is, does the set of items adequately and comprehensively represent what it is supposed to measure? The items are said to be content valid if they reflect this full domain of content. For example, a driver's test that consisted only of right turns and excluded left turns, parking, stopping, and an understanding of traffic signals would not be content valid.

Obtaining content validity involves two interrelated steps. First, the researcher must be able to specify the entire domain of content that is relevant to a particular measurement situation. In the example of the driver's test, everything that one needs to know to operate an automobile safely and legally is contained in the state's driver's manual. This is the domain. It is much more difficult to demarcate the full domain of social science concepts. Take, for example, the concept of democracy. Minimally, the researcher would need to include an indicator that represents free, fair, and competitive elections. But it might also need to include an indicator of a free press, which is often considered fundamental to democratic rule.

The second step involves selecting, or constructing, the specific items that are used in the measure. For example, a written driver's test contains a sample of items from the driver's manual. In this example, specification and selection procedures are relatively straightforward. This is more complex in the social sciences. Specification of the domain of content for abstract concepts such as ideology or alienation is a formidable task. One would begin by consulting the literature on the subject to come to an understanding of the concept. Once the researcher has a general understanding, the researcher would then construct items that reflect the meaning of particular aspects of the phenomenon under study. It is impossible to state a general rule for the number of items that should be included to represent any particular domain of content. It is always preferable to include too many indicators because deficient items can be dropped, while it is much harder (and sometimes impossible) to add new or better items at a later stage in the research.

Establishing a content-valid measure of a concept used in social science such as ideology or alienation is a very difficult task, much more complex than developing a content-valid measure of driving proficiency. When dealing with abstract concepts, it is difficult to establish the domain of content relevant to the phenomenon, as most theoretical concepts in the social sciences have not been described with the required exactness. Further, when measuring most concepts in the social sciences, it is impossible to sample content. A researcher chooses one or a set of items that are intended to reflect the content of a given theoretical concept. Without a random sampling of content, however, it is impossible to ensure the representativeness of the particular chosen items.

Thus, there are two fundamental limitations of content validity as applied to the social sciences. First, the domain of content must define the variable of interest. But as easy as this may be to achieve with regard to some tests, such as proficiency tests, it is extremely difficult to accomplish for more abstract phenomena that tend to characterize the social sciences. The second limitation of content validity is the lack of agreed-on criteria for determining the extent to which a measure has attained content validity. This leaves the researcher with the task of having to provide a plausible rationale for accepting his or her version of what constitutes the domain of content and for believing that the items included in the measure have been satisfactorily sampled. Because of these limitations, content validity is not a fully satisfactory means of assessing the validity of social science measures.

Criterion-Related Validity

Criterion-related validity is a second type of validity, and it is more closely related to what is usually meant in everyday usage of the term. This type of validity concerns the correlation between a measure and some criterion variable of interest. Using criterion-related validity, one can validate a driver's test by demonstrating that the test is a good predictor of the ability of a well-defined group of subjects to drive a car. Criterion-related validity is fully determined by the degree of correspondence between the measure, or test, and its criterion. If the correlation is high, the measure is valid for that criterion. If the test does not correlate significantly with the criterion, it is not valid for that criterion and thus useless for that particular purpose. The higher the correlation, the more valid is a measure for a specific criterion. For criterion-related validity, this is all that matters. It is the only evidence that is relevant. It does not matter if the test makes no theoretical sense as a predictor of the criterion. If the accuracy of one's horseshoe pitching is found to be highly correlated with college success, then horseshoe pitching would be a valid measure for predicting success using criterion-related validity. There is also no single validity coefficient. There are as many coefficients as there are criteria for a particular measure.

Criterion-related validity can be differentiated into two types. If the criterion exists in the present, then one can assess concurrent validity by correlating the measure and the criterion at the same point in time. For example, a verbal report of voting behavior could be correlated with participation in an election, as revealed by official voting records. Predictive validity, by contrast, concerns a future criterion that is correlated with the relevant measure. Using the (formerly known as) Scholastic Aptitude Test (SAT) as a predictor of success in college is an example. Scores on the SAT could be correlated with a student's subsequent performance in college to demonstrate the predictive validity of the SAT. The logic of concurrent and predictive validity is the same. The only difference between them concerns the current or future existence of the criterion variable.

What is sometimes overlooked in assessing criterion-related validation procedures is that the scientific and practical utility of criterion validity depends as much on the measurement of the criterion as it does on the quality of the measuring instrument itself. For example, in many different types of training programs, much effort and expense goes into the development of a test for predicting who will benefit from the program in terms of subsequent job performance. However, the measurement of subsequent performance, the criterion, is often given very little attention. Job performance is very difficult to assess. Thus, those using criterion-related validation procedures should provide independent evidence of the extent to which the measurement of the criterion is valid. While criterion validation is intuitively appealing, it has a major limitation with regard to the social sciences. For many if not most measures in the social sciences, no relevant criterion variables exist. It is not clear, for example, what an appropriate criterion variable would be for political ideology. Thus, criterion-related validation has limited usefulness in the social sciences. Further, the more abstract the concept, the more difficult it is to find an appropriate criterion.

Construct Validity

The third basic type of validity is construct validity. Construct validity is concerned with the relationship between the measure under consideration and theoretical expectations about that measure.

Construct validity is important when there is no universally agreed-on domain of content for the phenomenon under investigation and no relevant criteria for its assessment. This is the typical situation in the social sciences. Thus, construct validity is theory driven. Using theory, the researcher formulates theoretical predictions, types, directions, and degrees of relationship that are used to validate the construct empirically. If the empirically observed outcomes are predicted by the theory, then the measure is said to be construct valid. This type of validity is more pertinent in the social sciences than either criterion-related validity or content validity.

There are three distinct steps involved in construct validation. First, the theoretical relationship between the concepts themselves must be specified. Second, the empirical relationship between the measures of the concepts must be examined. Finally, the empirical evidence must be interpreted in terms of how it clarifies the construct validity of the particular measure. A researcher might specify that political ideology is related to social class, such that those respondents with lower social status would more likely be leftist in political orientation, whereas those with higher status would more likely be on the right. If income was employed as the measure of social status, and attitudes toward the government provision of health care were used as the measure of political ideology, then the researcher could calculate the relationship between these variables. If the correlation between these variables was statistically significant in the expected direction, then this correlation would constitute one piece of evidence supporting the construct validity of the measure of political ideology.

Thus, the fundamental feature of construct validation is theory. There must be a theoretical framework that is relevant to the concept or it will be impossible to validate the measure. Without this theoretical framework, it is impossible to generate theoretical predictions that, in turn, lead directly to empirical tests involving a measure of the concept. What is required, then, is that the researcher must be able to investigate several theoretically derived hypotheses involving the particular concept. Construct validity is not established by confirming a single prediction on different occasions or confirming many predictions in a single study. Instead, construct validation ideally requires a pattern of consistent findings involving different researchers across different studies involving a variety of diverse but theoretically relevant variables. Only if and when these conditions are met can one speak with confidence about the construct validity of a particular measure.

A problem exists if the theoretically derived predictions and the empirical relationships are inconsistent with each other—that is, the evidence relevant to construct validity is negative. This negative evidence typically indicates that the measure lacks construct validity. That is, the indicator does not measure what it purports to measure—the construct of interest. The accumulation of negative evidence leads to the conclusion that the measure is not construct valid and should not be used as an empirical representation of that concept in future research. Previous research using that particular measure of the concept is also called into doubt. There are, however, other conclusions that are consistent with this sort of negative evidence. One could interpret it as meaning that the theoretical framework used to generate the empirical predictions is incorrect, that is, the theory is wrong. Another interpretation is that the statistical method or technique used to test the theoretically derived hypotheses is faulty or inappropriate or that the researcher could be using it incorrectly. Finally, negative evidence could be interpreted as being due to the lack of construct validity or the unreliability of some other variable(s) in the analysis. It is a very subtle point, but when one assesses the construct validity of the measure of interest, one is also evaluating simultaneously the construct validity of measures of other theoretical concepts. Thus, it could be the case that the construct validity of the measure is quite high, but the measure hypothesized to correlate with that measure is invalid.

There is no foolproof procedure for determining which one (or more) of these interpretations of negative evidence is correct in any given instance. The first interpretation, that the measure lacks construct validity, becomes increasingly compelling as grounds for accepting the other interpretations become untenable. To the extent possible, one should assess the construct validity of a particular measure in situations characterized by the use of strong theory, appropriate methodological procedures, and other well-measured variables. Only in these situations can one confidently conclude that negative evidence is probably due to the absence of construct validity of a particular measure of a given theoretical concept. One can see from this discussion that construct validity is the most appropriate and generally applicable type of validity used to assess measures in the social sciences. The researcher can assess the construct validity of an empirical measurement if the measure can be placed in theoretical context. That is, this type of validity, unlike other types, focuses on the extent to which a measure performs in accordance with theoretical expectations.

Reliability

Classical Test Theory

Classical test theory is used to assess random measurement error. By determining the amount of random error, one can estimate reliability. Random error is present in any measure. Indeed, estimating random error and eliminating it to the extent possible is fundamental to measurement. In classical test theory, the observed score is equal to the true score that would be obtained if there were no measurement error, and a random error component, or

$$X = t + e,$$

where X is the observed score, t is the true score, and e is the random error component, or random disturbance.

The true score is the unobservable quantity that cannot be directly measured. Theoretically, it is the average that would be obtained if a phenomenon were measured repeatedly over an infinite number of times. The random error component, or random disturbance, indicates the differences between observed score and the true score. For example, an individual's observed score may be a little above the true score on one observation and a little below on another.

We make the following assumptions about measurement error (Frederic Lord & Melvin Novick, 1968, p. 36):

> Assumption 1: The expected error score is zero, $E(e) = 0$.
>
> Assumption 2: The correlation between the true score and errors is zero, $\rho_{(t,e)} = 0$.
>
> Assumption 3: The correlation between the errors on one measurement and the true score on a second measurement is zero, $\rho_{(e_1,t_2)} = 0$.
>
> Assumption 4: The correlation between the errors on distinct measurements is zero, $\rho_{(e_1,e_2)} = 0$.

Next, using these assumptions, we see that the expected value of the observed score is equal to the expected value of the true score: $E(X) = E(t) + E(e)$. And following Assumption 1, the expected value of e is zero or $E(e) = 0$, then, $E(X) = E(t)$.

This formula applies to repeated measurements of a single variable for a single person. But reliability refers to the consistency of repeated measurements across persons and not within a single person, and, therefore, we make a simple transformation. We rewrite the equation for the observed score so that it applies to the variance of the single observed score, true score, and random error:

$$\mathrm{Var}(X) = \mathrm{Var}(t + e) = \mathrm{Var}(t) + 2\mathrm{Cov}(t, e) + \mathrm{Var}(e).$$

Since Assumption 2 above states that the correlation between the true score and error is zero, then $2\mathrm{Cov}(t,e) = 0$, and $\mathrm{Var}(x) = \mathrm{Var}(t) + \mathrm{Var}(e)$.

So the observed score variance equals the sum of the true score variance and the random error score variance. To calculate reliability, we compute the ratio of the true score variance to the observed score variance:

$$\rho_x = \mathrm{Var}(t)/\mathrm{Var}(X).$$

Thus, ρ_x, is the reliability of X as a measure of T. Alternatively, reliability can be expressed in terms of the error variance:

$$\rho_x = 1 - [\mathrm{Var}(e)/\mathrm{Var}(X)] = \text{reliability}.$$

Parallel Measurements

One estimate of a measure's reliability can be obtained by correlating parallel measurements. Two measurements are defined as parallel if they have identical true scores and equal variances. Thus, X and X' are parallel if $X = t + e$ and $X' = t + e'$ where $\mathrm{Var}(e) = \mathrm{Var}(e')$ and $t = t$. Parallel measures are functions of the same true score where the differences between these measures result from purely random error.

Assessing Reliability

There are four basic methods for estimating the reliability of empirical measurements. These are the retest method, the alternative-form method, the split-halves method, and the internal consistency method.

Retest Method

Perhaps the most common method of assessing reliability is to correlate the same measures administered at different points in time. Figure 1 shows a representation of the retest method.

The equations for the tests at Times 1 and 2 can be written thus:

$$X_1 = X_t + e_1,$$

$$X_2 = X_t + e_2.$$

Since in parallel measures $t = t$ and $\mathrm{Var}(e_1) = \mathrm{Var}(e_2)$, and by Assumption 3, $\rho_{(e_1,t_2)} = 0$ and by Assumption 4, $\rho_{(e_1,e_2)} = 0$, it follows that $\rho_x = \rho_{x_1,x_2}$.

So reliability in this case is the correlation between the scores on the same test obtained at two points in time. If the retest reliability coefficient is exactly 1.0, the results on the two administrations of the test are the same. However, because there is almost always random measurement error, the correlations across time will not be perfect.

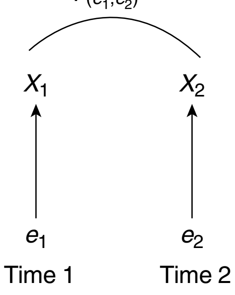

Figure 1 A Representation of the Retest Method for Estimating Reliability

Although the test–retest method is a simple and intuitively appealing way to assess reliability, it has some serious problems and limitations. First, often researchers can obtain a measure of a given theoretical concept at only a single point in time. It may be too expensive or impractical to measure some phenomenon at multiple points. And if the test–retest correlations are low, it may not indicate unreliability but the possibility that, in the interim between tests, the theoretical concept of interest has undergone a fundamental change. Another problem that affects test–retest correlations and lowers reliability estimates is reactivity. Sometimes the very act of measuring a phenomenon can induce change in the phenomenon itself. A person may become sensitized to the concept being measured and may answer the question on the second administration of the test based only on the earlier measurement. Lowered reliability estimates are not the only effects. If the period between Time 1 and Time 2 is short enough, the participant may remember his or her answer at Time 1 and appear more consistent than the he or she actually is. These memory effects can inflate reliability estimates.

Alternative-Form Method

Another method for assessing reliability is used widely in education to estimate the reliability of all types of tests. It is called the alternative-form method and is similar to the retest method in that it requires administering a test to the same people at different points in time. The difference between this method and the retest method is that an alternative form of the same test is given on the second testing. The two forms of the same test are intended to measure the same theoretical concept. The two forms should not differ systematically from each other. Using random procedures to select items for the different forms of the test can ensure that this does not happen. In this case, the reliability is the correlation between the alternative forms of the test. The two forms should be administered about 2 weeks apart to allow for day-to-day fluctuations in the individual to occur.

The alternative-form method for assessing reliability is superior to the retest method because it reduces the extent to which an individual's memory can inflate the reliability estimate. Like the retest method, the alternative-form method, when used at only two points in time, does not allow the researcher to distinguish true change from the unreliability of the measure. Therefore, the results of alternative-form reliability studies are easier to interpret if the phenomenon being measured is relatively enduring and not subject to rapid and radical alteration. A limitation of this method is the impracticality of designing alternative forms of measures that are truly parallel. This is easier to do in education where achievement tests are widely employed but much more difficult to accomplish in other social sciences where researchers typically focus on measuring abstract theoretical concepts.

Split-Halves Method

Reliability estimated by using the split-halves method, unlike the retest or alternative-form methods, can be conducted on only one occasion. The total set of items is divided in half, and the scores on the halves are correlated to yield an estimate of reliability. The halves can be considered approximations to alternative forms. The correlations between the two halves would be the reliability for each half of the test and not for the total test. To estimate the reliability of the entire test, we must estimate a statistical correction, called the Spearman–Brown prophecy formula. Since the total test is twice as long as each half, the Spearman–Brown prophecy formula is

$$\rho_{xx''} = \frac{2\rho_{xx'}}{1 + \rho_{xx'}},$$

where $\rho_{xx''}$ is the reliability coefficient for the whole test and $\rho_{xx'}$ is the split-half correlation.

The more general version of the Spearman–Brown prophecy formula is

$$\rho_{x_n x_n''} = N\rho_{xx'}/[1 + (N - 1)\rho_{xx'}].$$

This general formula gives the reliability of a scale that is N times longer than the original scale.

A researcher can also use this Spearman–Brown prophecy formula to determine the number of items that would be needed to attain a given reliability and test length. To estimate the number of items required to obtain a particular reliability, one uses the following formula:

$$N = \rho_{xx''}(1 - \rho_{xx'})/\rho_{xx'}(1 - \rho_{xx''}),$$

where $\rho_{xx''}$ = the desired reliability, $\rho_{xx'}$ = the reliability of the existing test, and N = the number of times the test would be lengthened to obtain reliability of $\rho_{xx''}$.

There is some degree of indeterminacy in using the split-halves technique to estimate reliability due to the different ways that the items can be grouped into halves. The most typical way to divide the items is to place the even-numbered items in one group and the odd-numbered items in the other group. But other ways of partitioning the total item set are also used including separately scoring the first and second halves of the items and randomly dividing the items into two groups. For a 10-item scale, there are 126 different splits, and each will probably result in a slightly different correlation between the two halves, which will lead to a different reliability estimate. It is therefore possible to obtain different reliability estimates even if the same items are administered to the same individuals.

Internal Consistency Methods

The aforementioned methods of estimating reliability require either the splitting or repeating of measures and thus have distinct theoretical and practical limitations. An alternative approach to estimating reliability focuses on the internal consistency of measurements. The most popular of these coefficients for assessing internal consistency is Cronbach's alpha. Cronbach's alpha is equal to the average of all possible split-half correlations for a composite scale $2N$ items long and is calculated from the variance–covariance matrix as follows:

$$\alpha = \frac{N}{N - 1}\left[1 - \frac{\sum \mathrm{Var}(Y_i)}{\mathrm{Var}_x}\right],$$

where N = the number of items, $\sum \mathrm{Var}(Y_i)$ = the sum of the item variances, and VAR_x = the variance of the total composite.

If one is using the correlation matrix rather than the variance–covariance matrix, the formula becomes

$$\alpha = \frac{a}{a-1}\left[1 - \frac{a}{a+2b},\right],$$

where a = the number of items in the composite and b = the sum of the correlations among the items.

Coefficient alpha thus depends on the number of items in the scale and the intercorrelations among those items. Generally speaking, longer scales with higher intercorrelations are more reliable than comparable scales composed of fewer items that are less highly intercorrelated. Alpha is a lower bound to the reliability of a scale of N items where each item contributes equally to the scale. Representing a lower bound, the reliability of the scale is always equal to or greater than alpha. It is equal to the reliability if the items are parallel. The reliability of a scale can never be lower than alpha even if the items depart substantially from being parallel measurements. Thus, alpha is a conservative estimate of reliability.

Cronbach's alpha is a generalization of Kuder and Richardson's procedure designed to estimate the reliability of scales composed of dichotomously scored items. These items are scored either zero or one depending on whether the individual possesses the particular characteristic of interest. Because Cronbach's alpha can handle multiply scored or dichotomously scored items, because it encompasses the Spearman–Brown prophecy formula, because it makes use of all of the information contained in the items, and because it is easy to compute, it has become widely used as a measure of reliability.

Correction for Attenuation

No matter which specific method a researcher uses to compute an estimate of reliability, one of the estimate's most important uses is to "correct" correlations for unreliability due to random measurement error. If we can estimate the reliability of each variable, we can use these estimates to determine what the correlation between the two variables would be if they were perfectly reliable. This process is called correction for attenuation. The formula for the correction for attenuation is

$$\rho_{x_t y_t} = \frac{\rho_{x_i y_j}}{\sqrt{\rho_{xx'}\rho_{yy'}}},$$

where $\rho_{x_t y_t}$ = the correlation corrected for attenuation, $\rho_{x_i y_j}$ = the observed correlation, $\rho_{xx'}$ = the reliability of X, $\rho_{yy'}$ = the reliability of Y.

The resulting correlation—the observed correlation purged of random measurement error—might be thought of as the correlation between theoretical concepts that have been measured with perfect reliability.

Levels of Measurement

Because of the fundamental importance of measurement in making inferences, drawing conclusions, and formulating hypotheses about theoretical concepts, it is essential to be as precise in our measurement of these concepts as possible. The statistical techniques that a researcher can use in a particular analysis depend on the level of precision at which variables are measured. More precise measures allow the researcher to use more sophisticated and rigorous statistical techniques and to have more confidence in the results. The precision of an indicator depends on the level at which it is measured. Stevens identified four levels into which we can classify measures. In order from least precise to most precise, they are nominal, ordinal, interval, and ratio. Each level has particular characteristics that set it apart from the others. By determining the level of the measures available, a researcher can determine which statistical techniques are appropriate for the analysis and which are not.

A variable measured at the nominal level represents a typology in which the attributes of a variable are classified into various categories. The categories of a nominal variable are mutually exclusive and together they exhaust the possibilities—that is, there is one and only one category for every possible attribute. Thus, a grandparent can be classified as either a grandmother or grandfather. This is the least precise of the levels of measurement, and for that reason, the researcher is limited in the quantitative techniques applicable to those appropriate to variables measured by unordered categories, for example, frequency distributions and determining the mode.

The next most precise level of measurement is at the ordinal level. Ordinal-level variables possess the characteristics of the nominal-level variables and add the property that the attributes can be ordered from less of an attribute to more of that attribute. More sophisticated statistical procedures can be used with variables measured at the ordinal level. Determining the median, percentiles, Spearman's rho, and gamma are examples of statistical techniques that can be applied to variables measured at the ordinal level.

In our hierarchy of measurement, the next step toward more precision is the interval level. In addition to having all of the characteristics of nominal- and ordinal-level variables, the intervals between each of the categories are equal. This was not a requirement of the ordinal level. To move up from nominal to ordinal, a variable's categories had to have a logical order, but the distances between those categories did not have to be equal. Now, to move from ordinal to interval, those intervals must be equal. Statistical techniques that are appropriate for variables measured at the interval level are very sophisticated and include adding, subtracting, and computing the mean, standard deviation, and Pearson's product moment correlation. Finally, the most precise level of measurement is the ratio level. It differs from the interval level in that a ratio level variable contains a natural zero point. Because of this zero point, we can express categories as ratios, for example, someone who is in a particular category has twice as much of the attribute as someone who falls into another category.

Multiple-Indicator Measures

As we have said, measurement involves a process whereby abstract, theoretical concepts are represented by concrete, empirical indicators. These complex concepts are more appropriately measured by using a composite of multiple indicators rather than a single indicator. Estimating reliability using a single indicator is almost always impossible without having some a priori information that is usually unavailable. And even if the reliability of a single indicator can be estimated, it will usually be affected by random error more than a composite and thus have a lower estimated reliability. Multiple-indicator measures, or multiple-item measures, are indices made up of more than one item. They are ubiquitous in the social sciences. They are used to measure attitudes, opinions, emotions, personality, and many other social science concepts.

There are many reasons why a composite measure is preferable to a single item. First, many of the theoretical concepts being measured are complex, broad, and abstract and, as a result, cannot be adequately represented by a single item. This is a question of validity as discussed earlier. Does the empirical measure actually provide an adequate representation of the theoretical concept? As a simple example, no one would argue that an individual true/false question on an American government examination is a valid measure of the degree of knowledge of American government possessed by a student. If several questions concerning the subject are summed, we get a better estimate of the student's understanding of American government. To take another example, a person's level of anxiety cannot be measured adequately by a single item in a clinical evaluation but is routinely done so with a battery of questions.

Another reason to use multiple-item measures is accuracy. Single items lack precision because they may not distinguish subtle distinctions of an attribute. If the item is dichotomous, it will only recognize two levels of the attribute. The final reason for using multiple-item measures is reliability. Single items include more random error than multiple-item measures because the latter allow random error to cancel out because of the multiple measurements. Because they are constructed of more than one indicator of a particular phenomenon, multiple-item measures increase the reliability of an empirical representation of a concept that would be attainable if single indicators were used in analysis. In other words, combining several individual items into a single multiple-item composite indicator will generally decrease random error.

Scale

A scale is a composite measure used to measure some underlying concept. Many phenomena in social science are theoretical constructs that cannot be directly measured by a single variable. To understand the causes, effects, and implications of these phenomena, the researcher must develop a valid and reliable empirical indicator of these concepts. This empirical indicator is called a scale. In this sense, the scale is composed of a set of measurable items that capture empirically the essential meaning of the theoretical construct. Good scales are data reduction devices that simplify the information and, in one composite measure, articulate the direction and intensity of the concept. They are usually constructed at the ordinal level of measurement, although some can be at the interval level. Because they are constructed of more than one indicator of a particular phenomenon, they increase both the reliability and validity that would be attainable if the individual indicators were used in analysis.

There are three related but distinct purposes for scaling. In the first case, scaling may be intended to test a specific hypothesis, for example, that a single dimension, party identification, structures voters' choice of presidential candidates. In this case, the scaling model is used as a criterion to evaluate the relative fit of a given set of observed data to a specific model. Another purpose for scaling is to describe a data structure. For example, a political scientist might use a scale to discover the underlying social, economic, and cultural dimensions of the U.S. electoral system. This would be an exploratory analysis rather than a hypothesis-testing approach. Finally, scaling can be used to construct a measure on which individuals can be placed and their scores related on that scale to other measures of interest.

There are several possible models that can be used to combine items into a scale. These include Likert scaling, Thurstone scaling, and Guttman scaling. The method chosen depends on the purpose that the scale is intended to serve. Scaling models may be used to scale persons, stimuli, or both persons and stimuli.

The Likert scale is a scaling model that scales only subjects. Broadly, any scale obtained by summing the response scores of its constituent items is called a Likert or summative scale or a linear composite. An examination in a mathematics class is an example of a linear composite. The scale (test) score is found by adding the number of correct answers to the individual items (questions). The composite score on the scale (test) is a better indicator of the student's knowledge of the material than is any single item (question).

Louis Thurstone's interest lay in measuring and comparing stimuli when there is no evident logical structure. The Thurstone scaling model is an attempt to identify an empirical structure among the stimuli. To do this Thurstone scaling uses human judgments. Individuals are given multiple statements, maybe as many as 100. These "judges" order the statements along an underlying dimension. Those statements that produce the most agreement among the judges are selected as the items to be included in the scale. These remaining items (approximately 20) should cover the entire latent continuum. These items are then presented to subjects who are asked to identify those that they accept or agree with. The average scale value of those items chosen represents the person's attitude toward the object in question.

A unidimensional structure exists in those situations where a single, fundamental dimension underlies a set of observations. Examples of this condition are measures used to evaluate the qualifications of political candidates, a scale of political activism, or a measure designed to describe a single personality trait. The presumption is that there is a single common dimension on which the candidates, or citizens, or personality traits are arrayed. Many theoretical constructs used in the social sciences are quite complex. A single, homogeneous, underlying dimension may not be adequate to express these complex concepts. This complexity may require us to turn to more elaborate explanations of the variables' behavior in which more than one latent dimension underlies a set of empirical observations. This is multidimensionality. The task of the researcher is to uncover these multiple dimensions. We hypothesize their existence because theory suggests that they should exist, or we can predict these latent dimensions because of the variation in the empirical observations at hand. Almost all hypotheses in the social sciences concern relationships between concepts. The more abstract these concepts, the more likely they are to be multidimensional.

Louis Guttman developed a method of scaling as an alternative to other scaling methods that did not account for the dimensionality of the phenomena being measured. Using this method, one can establish that a series of items belong on a specifically unidimensional continuum. Guttman's method orders both items and subjects with regard to some underlying cumulative dimension according to intensity. Guttman scaling, also known as scalogram analysis and cumulative scaling, is cumulative in the sense that if the researcher knows that a respondent's score is, for example, 3, the researcher knows not only that the respondent answered three items "correctly" but also knows that the items answered "correctly" were Items 1, 2, and 3. A perfect Guttman scale is rarely achieved in practice; indeed, scalogram analysis anticipates that this ideal model will be violated. It then becomes a question of the degree of deviation that one is willing to tolerate before conceding that the empirical data cannot be adequately represented by a single quantitative variable on an underlying unidimensional continuum.

There are two principal methods used to determine this degree of deviation from the ideal: minimization of error proposed by Guttman and deviation from perfect reproducibility based on work by Allen Edwards. According to the minimization-of-error technique, the number of errors is the least number of positive responses that must be changed to negative or negative responses that must be changed to positive for the observed response to be transformed into an ideal response pattern. The method of deviation from perfect reproducibility begins with a perfect model and counts the number of responses that are inconsistent with that pattern. Error counting based on deviations from perfect reproducibility will result in more errors than the minimization-of-error technique. It provides an accurate description of the data based on scalogram theory and for this reason is superior to the minimization-of-error method.

While agreeing that the Guttman scale is intuitively appealing, Jum Nunnally argues that it is impractical for several reasons. First, because it is a deterministic model, having no measurement error, there are very few, if any, sets of items that fit the model's requirements. Second, the perfect pattern of responses is a necessary but not sufficient condition for establishing a scale's unidimensionality and therefore the items may not all belong to the same factor. Moreover, the fewer the number of items in the scale, the easier it is to manipulate the model to get the proper pattern of responses. Finally, the goal of the Guttman model is to develop only ordinal, not interval, scales.

Index

An index is a measure in which the researcher combines more than one indicator of some abstract theoretical concept into a single summary score. In this regard, a scale is a type of index. Often, researchers use the terms *index* and *scale* interchangeably. But whereas scales arrange individuals on the basis of patterns in the data, an index is typically simply an additive composite of several indicators, called items. Unlike a scale, there is no theoretical specification of a measurement model in the construction of an index. For this reason, scales are more difficult to construct. While indexes, or indices, may generally seem valid and reliable, because of the lack of an underlying measurement model, these properties are not usually examined in depth.

Further, an index may not be unidimensional. For example, political scientists use a 7-point index to measure party identification in the United States. This index is arranged along a continuum as follows: strong Democrat, weak Democrat, Independent leaning toward Democrat, Independent, Independent leaning toward Republican, weak Republican, strong Republican. One can easily see that this index consists of two separate dimensions. The first is a directional dimension, from Democrat through Independent to Republican. However, there also exists an intensity dimension, going from strong through weak, independent, weak, and back to strong.

Frequently, governments use indexes of official statistics to measure aspects of the country. For example, the consumer price index is used as a measure of the level of prices that consumers pay for goods and services and the Federal Bureau of Investigation's crime index is the sum of the seven so-called index crime rates and is used as an indicator of overall crime in the United States. Another example is the Human Development Index compiled annually by the United Nations Development Programme, which combines rates of average life expectancy, infant mortality, and literacy for all United Nations member states.

Multidimensional Scaling

Scaling models may differ with regard to several characteristics—the purpose for which the scale is being used, the phenomena being scaled, whether the model is deterministic or probabilistic, the type of data used, and whether the model is unidimensional or multidimensional. Dimensionality is a complex issue and can take on different meanings for different scaling models. A unidimensional scale is appropriate in those situations where there exists a single, fundamental dimension that underlies a set of observations. Examples could include a scale to evaluate the qualifications of political candidates or a scale designed to measure a single personality trait. The presumption is that there is a single common dimension on which the candidates or personality traits are arrayed.

Many theoretical concepts used in the social sciences, however, are quite complex and may not be amenable to being expressed on a simple, homogeneous, unidimensional scale. Multidimensional scaling models are used when more than one dimension underlies a set of observations. Multidimensional scaling techniques are mathematical methods used to model the similarity (or dissimilarity) of a set of data points to uncover the underlying structure of those data. The objects under study are placed on a "map," a representation of the points in a spatial, or geometric, form simultaneously along more than one dimension, which can then be interpreted by the researcher.

In multidimensional scaling, respondents judge the similarity or difference among a set of stimuli. In that regard, this is an extension of the unidimensional scaling of stimuli represented by the Thurstone scale. A subject must compare stimuli and determine which are more similar to each other. If a researcher wanted to measure the weight of different objects but did not possess a scale, he or she could present pairs of the objects to respondents and ask which of the two is heavier, then compare the heavier with another object in the set and so on until all of the objects are arrayed from lightest to heaviest. Construction of a multidimensional scale may proceed in the same manner except that the subject would be asked to make the judgment of similarity but would not be presented with a dimension along which to order the objects. Thus, some subjects may array the objects along a dimension of weight, while others may group them on a dimension of size. Multidimensional scaling can be used when the researcher does not know the structure of the observations—that is, the underlying dimensions may be unknown. These methods can also be used when the researcher has developed and then tests specific hypotheses about what dimensions underlie the data.

A related method used to uncover the underlying dimensions of data is factor analysis. Factor analysis focuses on the measurement of latent variables. The technique attempts to statistically reduce the number of variables to a minimum number of underlying dimensions (latent variables or factors) that underlie the covariation among the observed variables. Each observed variable is linked to one or more unobserved factor. These links are called factor loadings and can be thought of as a correlation between the observed variable and the unobserved factor. There are two types of factor analysis: exploratory factor analysis (EFA) and confirmatory factor analysis (CFA).

When a researcher has no (or not much) a priori knowledge of the latent factors underlying a set of variables, EFA can be used to uncover that structure. The correlation between each observed variable and each unobserved factor is estimated and the observed variables that have high loadings are said to define the latent variable. Using the factor loadings as weights, the researcher can construct measures of the latent variables and use them in subsequent analyses. CFA is an inferential process that can be used to test specific hypotheses about the latent factors underlying a set of observed variables. That is, based on theory or prior empirical study, the hypothesis may be that Variables 1, 2, and 3 define a factor, Factor 1, and Variables 4, 5, and 6 define a second factor, Factor 2. The adequacy of this model's representation of the observed data can be assessed by a variety of goodness-of-fit indexes.

MEASUREMENT, LEVELS

In its basic form, research is about the relationships between concepts measured as variables. Researchers make inferences, draw conclusions, and form new hypotheses based on the patterns they detect in these relationships. It is important, therefore, for researchers to be as precise in their measurement of concepts as possible. The statistical techniques that can be applied to a set of variables are contingent on the level of precision at which the variables are measured. The more precise a measure, the more sophisticated statistical techniques can be employed in the analysis, and the stronger the conclusions that can be drawn. In this entry, the major levels of measurement, the appropriate statistical procedures based on them, and a few concrete examples are discussed.

Measurement is usually discussed in terms of four levels, as stated by S. S. Stevens (1946). Moving from least precise to most precise, they are nominal, ordinal, interval, and ratio. Nominal measures simply classify members based on particular attributes. These must be mutually exclusive and exhaustive. For example, gender is a nominal variable. It is made up of the mutually exclusive and exhaustive categories of (a) *male* and (b) *female* or (a) *female* and (b) *male* (neglecting other possible distinctions). It makes no difference how numbers are assigned to the categories because there is no judgment made as to how much of a variable is possessed by an attribute. That is, male is not higher than female, or vice versa. It is simply a way to categorize a sample or population, and neither male nor female possess more of the quality of gender than the other.

For instance, suppose we have a population in which everyone belongs to one of four religions: Catholicism, Judaism, Islam, or Protestantism. Then, religion is a variable—that is, it is mutually exclusive and exhaustive (at least with reference to our example population). Everyone is classified into one of the four categories. However, none is higher on the scale. *Protestant* is not more or less religious than any of the others, nor is *Catholic*, *Jewish*, or *Muslim*. The only quantitative techniques we can use with nominal variables are those based on the categories—that is, frequency distributions and the mode. We cannot perform statistical procedures—for instance, take a mean or find a standard deviation—using this variable. We cannot add or subtract them. Statistical procedures must turn these variables into binary ("dummy") variables to be able to use them; this is discussed below. Many examples of nominal variables exist in social science, such as race, ethnicity, region, marital status, and occupation.

The next level of measurement is the ordinal level. Ordinal variables, like nominal variables, allow the researcher to classify attributes into mutually exclusive and exhaustive categories, but, unlike nominal variables, the attributes categorized in ordinal variables can be ordered so that they run from less of an attribute to more of that attribute. Big, bigger, biggest is an example of a logical order. Ordinal variables are quite common in social sciences. Agree/disagree questions measure on an ordinal scale. For example, "The world is flat. Do you (a) strongly disagree, (b) disagree, (c) neutral, (d) agree, or (e) strongly agree?" This answering scheme produces an ordinal measure because there is a logical ordering from *strongly agree* (with the statement) to *strongly disagree.* A "feeling thermometer" is an ordinal variable. For example, on a scale of 0 to 100, with 0 being *very cold* and 100 being *very warm*, one can ask, "How do you feel about Barack Obama? John McCain?" Statistical measures that one can use when the variables are measured at the ordinal level are the median, percentiles, Spearman's rho, and gamma. Other examples of ordinal variables used in social science are variables with answer patterns running from like to dislike and variables measuring attitudes.

Moving up the continuum of levels of measurement, the third level of measurement is the interval level. Interval-level variables allow one to classify attributes into mutually exclusive and exhaustive categories, like nominal and ordinal levels. Like ordinal variables, they possess a natural order. But, now, the intervals between the ordered categories are equal. In the earlier example of the variables with the categories, *strongly agree* through *strongly disagree*, the distances between each of these categories are not equal; indeed, they are not even known. One respondent may interpret them as equal, while another may interpret the distance between *strongly agree* and *agree* to be shorter than the distance between *agree* and *neutral*, or vice versa. There is no way to know. All that is known is that this is the order of the responses. If a variable is measured at the interval level, the distances are all equal. The usual example given of an interval variable is temperature. Every degree is equal to every other degree. For example, 30 degrees is 10 degrees colder than 40 degrees, and 80 degrees is 10 degrees colder than 90 degrees. Because of this property, the statistical techniques that can be used on variables measured at the interval level are some of the most sophisticated known. Analysts can add and subtract, determine the mean and standard deviation, and compute a Pearson's product–moment correlation or regression coefficient.

The property that interval-level measures lack is a natural zero point, or origin. Temperature, which we have already classified as an interval scale, has a zero point—on the Celsius scale, it is the freezing point of water; on the Fahrenheit scale, it is 32 degrees below the freezing point of water. The fact that there are two scales with different points labeled 0 is illustrative of why temperature is not a ratio scale. Neither 0 degrees Celsius nor 0 degrees Fahrenheit means the absence of temperature. Zero in this case is simply an arbitrary point on the scale. We can measure temperature below zero. What matters in this case is the interval. Each interval is the same size. That is, any interval (degree) on the Fahrenheit scale is equal to every other interval (degree) on the Fahrenheit scale, and any interval on the Celsius scale is equal to every other interval on the Celsius scale. Of course, an interval on the Fahrenheit scale is not equal to an interval on the Celsius scale. But, a reading of 10 degrees on a Fahrenheit or Celsius scale is not twice as much as 5 degrees or half as much as 20 degrees. One cannot say that when the temperature is 100 degrees, the temperature is twice the temperature as when the temperature is 50 degrees. In the big, bigger, biggest example, one cannot say that big is half as big as bigger. These comparisons make no sense because there is no zero and no starting point. Examples of interval-level variables in social science are standardized tests such as IQ (intelligence quotient) tests or SATs (formerly known as Scholastic Assessment Tests), crime rates, and voter turnout.

A true zero point allows researchers to form ratios, and this leads to the most sophisticated level of measurement of all, the ratio scale. The ratio scale is classificatory, the categories can be ordered, the intervals between categories are equal, and the scale has a natural, or true, zero. Using ratio-level variables one can form ratios—for example, the amount of money in my bank account is half as much as it was yesterday. It can be described this way only because there is a zero, a starting point. One can say that family income is 4 times what it was in 1970 or that A is twice as tall as B. Money, income, and height are examples of ratio variables. There are many examples of ratio-level variables in social science, such as the number of children one has, the number of times one has been married, the number of years of education that one has had, the number of times one attends church in a week, and the number of murders that have occurred in a particular jurisdiction in a year. With ratio-level variables, analysts can use statistics such as the geometric mean and the coefficient of variation, a ratio itself.

When designing research, it is desirable for researchers to give much thought to the kinds of conclusions they would like to draw and how they want to state them. The way findings are presented is a result of the level of measurement at which researchers collect their data. If they intend to give broad, general conclusions, nominal variables may be acceptable. Usually, however, researchers want to give specific, precise statements of their findings. This will probably entail collecting their data at the highest possible level.

It is possible to aggregate a higher-level variable into a lower-level variable. For example, we could measure age by asking how old the respondent is in calendar years. This would be a ratio scale because it classifies orders with equal intervals and has at least a theoretical zero. In our analysis, we may group the years into several groups, for example, less than 18 years old, from 18 to 21 years old, from 22 to 25 years old, and so on up to more than 65 years old. This would be an ordinal variable—the first and last groups are not equal to the others. The ordinal level may be exactly what we want in this case. However, we may want to address another hypothesis using the original variable in years. This is the sort of question to be addressed before data collection begins. It is a simple matter to group calendar years into groups; however, it is impossible to disaggregate data into finer grained categories if the data have been collected in groups in the first place. A rule of thumb is to collect data in the most disaggregated form that time and budget will permit.

It is also possible to transform nominal variables into variables that can be used as interval variables. These are called dummy variables. Dummy variables are binary variables in that they have two categories—presence of the attribute and absence of the attribute. In the nominal variable discussed earlier, religion, we classified our population into four groups—Catholic, Jew, Muslim, and Protestant. As a nominal variable, we can show a frequency distribution or report a mode, but that is about all. If we transform the variable, we may be able to use the resulting dummies in higher level statistical techniques. In this case, we would create four dummies—one for each category. Our original variable was mutually exclusive and exhaustive, so all respondents are in one and only one category. We compute a dummy variable for the Catholic group—1 if Catholic and 0 if not. We do the same for the other three categories. When the process is completed, we have created four new variables that tell us whether someone is Catholic (yes/no), Jewish (yes/no), Muslim (yes/no), or Protestant (yes/no). We can then use these dummy variables in statistical procedures such as multiple regression analysis.

MEASUREMENT, SCALES

In the natural sciences, scaling is usually very precise, and a single measure is often sufficient to describe a dimension—for example, when measuring temperature in Celsius, weight in grams, or distances in meters. In these cases, the assignment is quite simple: Distances can be measured by a ruler, temperature by a thermometer, and weight by a scale. The situation in economics is somewhat different. One of the most important indicators in international finance is the purchasing-power parity. The validity of this measure depends on the choice of an appropriate "basket" of consumer goods, which is not the same in all countries. In 1986, *The Economist* magazine introduced "Burgernomics" and has been publishing since then annually the prices of McDonald's Big Mac hamburgers in different countries. The advantage of the Big Mac is that it is produced and consumed around the world; the unique basket consists of prices for beef, cheese, lettuce, onions, and bread—and since the recipe is the same worldwide, there are (almost) no differences in the share of these five ingredients among countries. Note that the one-dimensional Big Mac Index consists of several indicators that have different weights—there is, for example, a higher share of beef than onions in a hamburger.

In the social sciences, scaling is the process of measuring or ordering entities with respect to quantitative attributes. While natural scientists use instruments that are as precise as possible, social and political scientists use survey research methods such as face-to-face or telephone interviews to evaluate the attitudes and beliefs of the population. In the following, some examples from large data sets such as the International Social Survey Programme (ISSP), the World Value Surveys (WVS), and the American Nationwide Election Studies (ANES) are shown to illustrate problems of frequently used measurement scales such as Likert or Guttman scales.

Typical research questions include the discussion of latent variables (dimensions, factors) such as the level of national identity or the level of political efficacy and trust. The validity of the measures depends on the quality of the instruments: It is not possible to measure the correct length with a broken ruler, and it is not possible to measure true attitudes and beliefs with poorly worded questions. Starting with a single question, closest to a metric variable might be a feeling barometer that runs from 0 to 100. The ANES 2004 provides the following question: "Where on that thermometer would you rate George W. Bush?" The problem with this kind of question is that respondents are not able to differentiate between values such as 43 and 44; most are not even able to differentiate between scores such as 62 and 76. An alternative is to reduce the scale to values between 0 and 10 or, for getting an easy-to-catch midpoint, to values between −5 and 5, as is done, for example, in the German Politbarometer. Although it is probably easier to respond to an 11-point scale than to a 101-point scale, it is still difficult to differentiate between categories such as 2 and 3.

While it is possible to evaluate political parties and politicians by a single question, for estimating the level of a complex phenomenon such as political trust and efficacy, one has to use a larger set of items. In the ISSP 2004, participants were asked to grade the following six statements on a 5-point scale running from *strongly agree* to *strongly disagree*:

1. People like me don't have any say about what the government does.
2. I don't think the government cares much what people like me think.
3. I feel I have a pretty good understanding of the important political issues facing [country].
4. I think most people in [country] are better informed about politics and government than I am.
5. Most of the time, we can trust people in government to do what is right.
6. Most politicians are in politics only for what they can get out of it personally.

A first approach to analyze this kind of items has been formulated by Rensis Likert (1932); his ideas are known under the terms *summative scaling*, *Likert scaling*, and *technique of summated ratings*. They can be summarized in three steps: First, collecting a large set (approximately 100) of positively and negatively formulated items, which are possible indicators of the dimension of interest, say political efficacy and trust; all of them running from *strongly agree* to *strongly disagree*. Second, rating the items: Respondents in a sample that is representative of the target population have to rate how strong they are in favor (disfavor) of each statement. Then, items are selected by excluding those to which very different respondents gave the same answers and those to which very similar respondents gave very different responses, only keeping the items that differentiate most clearly between the top and bottom quarter of the respondents. The set of remaining items, say 10, should have high item–total correlations, that is, high correlations with the sum score of all items, and high discrimination values. In the third step, these finally selected items are used in the main survey. The mean values of the item scores reflect the level of political efficacy and trust of each respondent. Note that values of negatively/positively formulated items have to be reversed so that high values always refer to a high/low level of political efficacy and trust.

There are several drawbacks to just adding the scores of such items. Let us take a 5-point scale running from 1 to 5, from *strongly agree* to *strongly disagree*. First, the extreme points, say means that are greater than 4.5 and smaller than 1.5, are relatively easy to reconstruct, while other values can be the result of very different responses; for example (considering two variables only), giving a 3 two times produces the same mean as 2 and 4, 4 and 2, 1 and 5, and 5 and 1—that is, very different answers result in the same scale values. Second, in case of 5-point items, the mean categories, often verbalized as "neither–nor," have two meanings: On the one hand, they are used as real "neither–nor" and, on the other hand, as a substitute for "I don't know" (Jörg Blasius & Victor Thiessen, 2001). Third, there may be respondent-specific answer formats: While some people use the extreme categories quite often, others are more careful, for example, using *agree* more often than *strongly agree*. Fourth, all items have the same weight, for example, all items determine the latent variable to the same degree. All these problems are well known; applying principal component analysis (PCA) provides different values for the items and solves the fourth problem. Even better is applying categorical PCA, which provides different weights for the single-item categories, solving the first problem at least partly. For solving the second and third problem, dichotomized items are often used—with the drawback of receiving less information from the single indicators.

Before discussing dichotomous items, we introduce ordinal variables with categories that are not in symmetric order: for example,

> There has been some discussion about abortion during recent years. I am going to read you a short list of opinions. Please tell me which one of the opinions best agrees with your view? . . . : 1. By law, abortion should never be permitted. 2. The law should permit abortion only in case of rape, incest, or when the woman's life is in danger. 3. The law should permit abortion for reasons other than rape, incest, or danger to the woman's life, but only after the need for the abortion has been clearly established. 4. By law, a woman should always be able to obtain an abortion as a matter of personal choice. (ANES, 2004, http://www.electionstudies.org)

In this example, there is an implicit order of responses, but it includes four categories only. Considering an additional response such as "the law should permit abortion in cases when the child's life is in danger" would pose the problem where to place it—between Categories 2 and 3 or between Categories 3 and 4? Another frequently discussed example is religious beliefs; here, as an example, are seven items from the WVS 1996 to which respondents could either agree or disagree: (1) Do you believe in God? (2) Do you believe people have a soul? (3) Do you believe in sin? (4) Do you believe in life after death? (5) Do you believe in heaven? (6) Do you believe the Devil exists? (7) Do you believe in hell?

In the 1940s, Louis Guttman (1944, 1950) developed a method based on a set of dichotomous variables as the one above, which is known as *scalogram analysis*, *cumulative scaling*, or *Guttman scaling*. His idea was to construct a set of items that has an inherent order, say, in religious beliefs. If the order of the items is perfect, every respondent should agree with the items as long as they are below their own level of difficulty. Thereby, difficulty is reflected by the share of agreements: The fewer agreements an item receives, the more difficult it is. With respect to the WVS 1996, Wijbrandt van Schuur and Jörg Blasius (2006) found for the Netherlands an empirical order of soul, God, sin, life after death, heaven, Devil, and hell; that is, it was most difficult for the respondents to believe in hell and easiest to believe in soul. In a perfect Guttman scale, nobody was expected, for example, to believe in God without believing in soul; and somebody who believes in hell should believe in all the other religious items. The level of religious beliefs for all respondents is equal to their number of agreements, which are in case of a perfect Guttman scale the ranking places of their most difficult items. The measurement error of the scale is the share of misplaced zeros, for example, the share of neglected items between two accepted items.

The main problem of this scale is that all items receive the same weight; the respondent scores are equal to the number of agreements. An extension of this method is Rasch scaling where it is assumed that the items follow a probabilistic distribution instead of a deterministic one. In Rasch scaling, the distances between the items and their weights are not equal; they are estimated by using the logistic distribution.

MEASURES OF ASSOCIATION

See Cross-Tabular Analysis

MEDIA, ELECTRONIC

The word *medium* denotes an intermediary agency that enables communication, by which is meant the production and transmission to other parties of messages, information, knowledge, discourses, and culture in the broad sense. Historically, the first electronic media—the telegraph and the telephone—arose at the height of the Industrial Revolution, together with the electrification that gradually came to replace steam power. These media had the capacity to restructure people's perceptions of time and space. Electronic media today, in the fullest sense, are radio, television, and the so-called new media (in this entry designated as "online" media). These media have various features in common:

1. they transmit knowledge to a heterogeneous and potentially limitless audience,
2. they are typical products of late modernity,
3. they are important agents of socialization, and
4. they perform an essential role in democratic processes.

Only with the development of electronic media has it been possible to speak properly of the "rise of mass communication." Communication media in early modernity disseminated knowledge, culture, and ideas—such as books, newspapers, the theatre, architecture, painting, and sculpture—but widespread illiteracy and generalized poverty prevented access to them for the bulk of the population. Although printing had been invented in the 15th century, books and newspapers could only find a "mass market" after political, social, and economic conditions had radically changed. Moreover, in the 20th century, cinema, radio, and then television also became more easily available and were associated with the leisure and entertainment that Europeans had attained through social struggles in the late 19th and early 20th centuries. These characteristics ensured that mass media indeed became ubiquitous.

This entry first outlines the history of the electronic media, paying particular attention to the early development of radio, television, and the

Internet. This is followed by a survey of some of the main theories espoused in research on mass communication—in particular, the mass communication research derived from studies on political communication conducted in the United States during the 1940s and 1950s and media studies in Great Britain during the 1970s and 1980s. Next, the role of the electronic media in the political dynamics of contemporary democracies is analyzed. This topic will be addressed from two points of view: The first concerns the influence and impact of electronic media on political attitudes and behavior—an issue explored by the first analyses in communication research and even today one of its main fields of inquiry. The second aspect deals with the effects of the electronic media on the political system, which are commonly identified with the "mediatization of politics."

The Rise of Electronic Media

Radio

From a technological point of view, the radio evolved out of the telegraph and the telephone. A decisive advance in the development of the radio as we know it today occurred in June 1896, when Guglielmo Marconi presented in Great Britain the progress achieved in the study of electromagnetic waves for the production, transmission, and reception of acoustic signals. The subsequent evolution of applied studies on radio broadcasting led to the medium's first application in business and public administration and subsequently to its use for military communications during World War I. The radio gradually entered private homes from the 1920s onward, first in the United States and then in Great Britain and the Netherlands. Beginning with the British Broadcasting Company (BBC) in 1922, followed by the National Broadcasting Company (NBC) in 1925 and the Columbia Broadcasting System (CBS) in 1927, the institutionalization of companies able to organize and produce programs for a broad public transformed radio broadcasting into a full-fledged form of mass communication.

Political powers understood the potential of radio as early as the 1930s; from that period until the outbreak of World War II, the radio became a powerful instrument with which to manipulate the mass public. In that decade, in fact, authoritarian regimes in Europe controlled and used radio broadcasting for the purposes of propaganda. The Soviet Union was the first regime to exploit the radio systematically so that its voice could penetrate homes in even the remotest regions. The same propaganda system was adopted in Nazi Germany, where Joseph Goebbels played a decisive role in its development, first as chief of Nazi propaganda and then as Minister of Public Enlightenment and Propaganda (*Volksaufklärung*). In fascist Italy, too, the radio became the voice of the regime, first with the creation of a central body for the control of information and propaganda and then with government measures to increase collective radio listening in public places. The radio was given the delegated power of amplification and persuasion. In democratic countries, American President Franklin Delano Roosevelt used the radio to deliver his "fireside chats": talks that were broadcast every week throughout the country and in which Roosevelt directly addressed American citizens, his purpose also being to create and strengthen a favorable climate of public opinion during the Depression and subsequently to boost the nation's morale during World War II. From the end of the 1960s onward, radio lost its position as the principal mass medium as a result of the diffusion of television.

The massive use of radio in homes and public places, the growth of the organizations that produced its programs, and its use for political propaganda purposes also aroused strong interest among academic researchers. It was mainly in U.S. communication research that the first pioneering studies on radio were conducted, with the focus, in particular, on the effects produced on the audience. The political scientist Harold D. Lasswell also concentrated on the content of messages by analyzing key symbols in Radio Moscow's propaganda broadcasts. From a more sociological perspective, the social impact of radio broadcasting was studied as early as 1940. The Princeton Radio Project, for example, challenged beliefs concerning the medium's purportedly excessive power. These were market analyses of a quantitative type based mainly on opinion polls. One of the first and best known of these studies examined the public's reactions to Orson Welles's dramatization of *The War of the Worlds* broadcast as part of the CBS Mercury Theatre radio series. This program was reported to have caused panic among its listeners, many of whom believed that the simulation of an invasion from Mars was real. However, research showed that these effects had been mediated by numerous other factors not dependent on the medium.

Television

Like the radio, television as a means of communication first came into use in Great Britain and the United States and then spread through other European countries. The technological development of this medium is more difficult to reconstruct, because diverse research groups, countries, and companies already consolidated in other sectors (from photography to the cinema) contributed to its success. A decisive step in the diffusion of this new medium, with its combination of sounds and images, came during the mid-1930s in Great Britain, where this service began to be offered to a limited public and was resumed in 1946 after the interruption of World War II. In the meantime, television had also developed in the United States, where already in the early 1950s there were 10 million television sets in American homes. The linkage between radio and television services has been one of the distinctive features of the development of television. In fact, organizations such as the BBC in Great Britain, and CBS and NBC in the United States, have been the vehicles through which television has been strengthened, spread, and entrenched in the everyday habits of millions of consumers. In television's first decades of existence, while in the United States the development and production of television programs was immediately appropriated by the market, in Europe it was allocated to a public service: The organizations that produced and broadcasted programs were official institutions financed mainly by license fees. Only after the mid-1970s did private organizations in Europe, too, go into the business of television information and entertainment and obtained large market shares. In this way, the commercialization of television occurred, and advertising became the main source of financing. Some public service broadcasters also began to supplement their revenues by broadcasting commercial messages.

The advent of television brought about one of the greatest social, cultural, and political changes of the 20th century. Academic studies on communication, which had already acquired strong legitimacy in pretelevision social research, were mobilized to examine the characteristics and effects of this change. The result was a large and diversified scientific output, with an abundance of theoretical perspectives and methodologies, as well as empirical data and interpretative paradigms. Now that television had grown into a global phenomenon, the study of mass communication became internationalized, and American communication research was supplemented by British media studies, French poststructuralist theories, and other, minor, schools of thought. In this period, moreover, media analysts began to examine the other actors involved in the communication process: not only the receiver but also the transmitter and the content that was transmitted. It was during the late 1970s and early 1980s that a large body of studies concerned with the routines and logics determining the production of information were conducted, which provided a detailed analysis of the content of television programs. As research extended to include the other components of the communication process, questions were raised as to the effect of television on its audience. The impact and ubiquity of the medium aroused fears that it influenced the public excessively in terms of voting behavior, consumption, lifestyle choices, and the construction of frames of meaning to interpret reality.

Not coincidentally, it was precisely in this period that "political communication"—a specific area of communication studies—acquired greater autonomy and further academic legitimacy, both in political science and sociology. The link between the development of electronic media and the practices of political communication has been well evidenced in the work of Jay Blumler and Dennis Kavanagh, who have identified three phases in political communication since World War II. The first phase, which lasted until the 1950s, saw the dominance of the political scene by parties that fed on the social cleavages and dynamics typical of the reconstruction years. In that phase, political communication was subordinate to a system of institutions and solid political loyalties. Citizens responded to party-political communications by strengthening the opinions and attitudes already manifest in their strong political allegiances. The second phase, from the 1960s through the 1980s, was marked by the spread of television. It was during this period that, albeit to a different extent in the existing democracies, traditional political loyalties increasingly faded. A weakening of the public's selection mechanisms exposed it to the messages of all political leaders, major and minor, whether during electoral campaigns or otherwise. Television, moreover, enabled politicians to reach sections of the electorate that had made scant use of the old media and had been consequently unaffected by party-political communication. Television formats and languages had an impact not only on the public but also on the time frames, languages, and forms of presentation of politics. The third phase began in the 1990s and, since then, has consisted of five main processes: (1) professionalization of the relationship with public opinion, (2) increased competition between media contents and political communication, (3) populism, (4) centrifugal communication, and (5) sporadic consumption of political communication. The growth and spread of online media, especially the Internet, have prompted academic studies to envisage the onset of a fourth phase of political communication, which is discussed in the following section.

In the second half of the 1990s, technological development also decisively altered the way in which television was conceived. The media scenario radically changed because traditional analogue terrestrial television was now supplemented by satellite and digital broadcasting. Today, digitization is having three major consequences: (1) growth in multimedia and convergent practices in production and consumption, (2) proliferation of mono/multimedia channels, and (3) the internationalization and globalization of content (with a small and well-identifiable group of media companies acting as global leaders).

The Internet

The gestation and early development of the Internet were much slower than those of radio and television, but thereafter, technological progress meant that this new medium underwent rapid and tumultuous growth. It still harbors numerous surprises, especially in the applicative domain. The Internet came into being at the end of the 1950s, but for 20 years its use was restricted to military communications in the United States. During the Cold War, the creation of the Advanced Research Project Agency (ARPA) in 1958 to research and develop new technologies led to the setting up of Arpanet, a system that linked the agency's computers. With time, this network—which closely resembled telephony because it was designed for one-to-one communication, as opposed to the one-to-many system of radio and television—also created connections with civil and nonmilitary users (universities and research centers), giving rise to the network of networks today known as the Internet. The closure of Arpanet in 1989 enabled the expansion and commercialization of the Internet, so that users belonging to neither the armed forces nor research centers could access it. Thereafter, with the advent of the World Wide Web, the Internet underwent extremely rapid development, which definitively changed it from military to civil use and increasingly enlarged its boundaries. Since the 1990s, access to and use of the Internet has also been favored by technological upgrading. Greater speed of transmission and increased content have been followed by technologies that facilitate Internet access and connection (broadband, Wi-Fi, and Bluetooth). These successive technological advances have given rise to phenomena that have radically changed not only Internet use but the entire media system as well. The process of multimedia convergence, which had already come about in television, was driven by the growth of quality and the contents transmissible via the Internet. Moreover, because of these technological changes, the use of the Internet is now becoming increasingly interactive.

Academic research in the field immediately grasped the importance of this new communication medium. But the interest of social research increased especially during the transition from the so-called Web 1.0 to the Web 2.0 and subsequently intensified with the further transition to Web 3.0. The term *Web 1.0* indicates merely passive use of the tool: access to use the contents offered by the Internet. *Web 2.0* denotes the evolution that led to greater interaction in the use of Internet content, with users being able to leave comments and provide feedback. The next development has been termed the *convergence culture* driven by the spread of Web logs (blogs) and the creation of social networks (Facebook, YouTube, and Twitter, among others). Studies on the political implications of these technological changes have suggested that a fourth phase of political communication can be added to the three already identified. This interpretation, however, is anything but unanimously held, and opinions have polarized between two extremes. On the one hand, there are those who maintain that this technological revolution is producing an electronic democracy in which grassroots practices create a public sphere in which citizens can advocate their own issues, build alternative frames **for** institutional political communication, mobilize public opinion on certain themes, and act as "watchdogs" on the public powers. On the other hand, there are those who argue that the development of the Internet and the opening of spaces in which users can express their opinions strengthens the power of those who already possess it, primarily because in this way disintermediation channels can be activated: Politics has preferential forms of communication with the electorate and can thus bypass mediation by the more traditional media (television and newspapers). The mass of content and opinions on the Internet makes it possible to monitor the mood of the electorate just as—and in certain cases better than—any type of quantitative survey can.

Applied Research Versus Critical Theory

The principal theories employed in the study of media in general and the electronic media in particular—and especially their effects on the public—can be related to two particular periods: the 1940s onward with the development of the sociology of communication in the United States and the mid-1960s with the birth of "media studies" in Great Britain.

The first of these two periods was characterized by the distinction between "applied research" and "critical theory." Applied research originated in U.S. communication research—which was the first of all contexts in which study began on the electronic media (which did not yet include television). As its founder Paul Lazarsfeld defined it, applied research was academic work in the service of external public or private customers, and it developed techniques to gather and analyze information on attitudes toward the mass media (especially radio, print media, and film). It is significant that the first research undertaken in this area started from opposite questions and suggestions concerning the results obtained. During the 1940s, the electronic media were regarded as exercising an almost unlimited power over the public. The period between the two world wars, in fact, was dominated by an almost universal agreement as to the capacity of the media to exert influence. The literature that reconstructs the successive theories on media effects identifies this period as that of the "hypodermic needle" model: The media were viewed as needles able to penetrate directly the "skin" of their audiences. This theory—which had no specific founder but was more akin to a "mood" concerning how the mass public received and internalized media contents—was also partly motivated by the above-described intensive use made of the radio by the authoritarian regimes of Europe.

The applied strand of U.S. communication research has been distinguished by the work of the Bureau of Applied Social Research of Columbia University in New York—whence its name as the "Columbia school"—directed by Lazarsfeld. Here, it is necessary to distinguish between two different lines of inquiry, which collected complementary results but used different methodologies: the experimental psychology–based approach and the empirical sociology–based one. There were two main similarities between these two lines of inquiry: First, they were driven by a particular interest in how the media in general, and the electronic media in particular, operate during election campaigns (i.e., how they influence voters); second, both of them led to the definitive superseding of the behaviorist stimulus–response model typical of the hypodermic needle theory.

The experimental psychological approach must be considered as an autonomous sector of communication research. In this case, too, it was applied mainly in the area of political communication, where research showed that the audiences of the electronic and print media filter their contents selectively. This selectivity depends on several factors: the interest in acquiring information (indifference to certain themes creates impermeability to the messages received), selective exposure (the audience tends to expose itself to information congenial with its attitudes and to avoid messages that are not), selective perception (existing predispositions influence the way in which messages are received), and selective retention (contents that match the audience's predispositions are remembered more easily). This type of inquiry did not focus solely on intermediary factors relative to the public; it also examined those relative to the message, seeking to understand the characteristics that a message must have to be effectively influential on its audience. The factors identified were, among others, the credibility of the communicator, the order of arguments (on some occasions the initial arguments are more effective and on others those expounded at the end are), the completeness of the overall argument, and the clarity of the conclusions. With the introduction of intermediary factors, therefore, it was established that the media constitute just one component of political persuasion and work in ways very different from that feared in keeping with the hypodermic needle theory.

The sociological approach definitively structured the history of communication research. The body of studies conducted in this area was, for the U.S. social and political context of the time, so exhaustive and convincing that in 1959 Bernard Berelson—one of the most prestigious members of the Columbia school, on par with Robert K. Merton and Elihu Katz—declared that analysis of media effects could be considered complete. This research had the merit of linking the processes of mass communication with the characteristics of the social context in which they occurred. For this reason, too, a further step forward was taken from the notion arising from psychological inquiry that the media are a source of persuasion. They, indeed, have an influence; but it is a limited influence always mediated by the context and the social relationships in which media users are embedded. The best known studies conducted by the Columbia school were *The People's Choice* (1944), *Voting* (1954), and *Personal Influence* (1955) (the first two dealt with communicative dynamics during the presidential election campaigns of 1940 and 1948, respectively). In the results of these studies, three theories embracing the sociological dimensions of the effects of media communication can be identified, which add to the *selectivity* of the psychological approach:

1. *Social determinism:* Social characteristics determine political preferences; voting is an individual behavior regulated by collective norms.
2. *The limited effect of election campaigns:* Change in voting intentions in response to messages received during the election campaign is restricted to a small group.
3. *Social influence:* Messages and ideas imparted by the mass media reach the "opinion leaders," who act as intermediaries for the less active members of the electorate.

In short, the media are dependent variables in the process of influence.

The first studies on television then, however, reversed this vision of the limited effects of the media. Using the theoretical framework developed within communication research, Jay G. Blumler and Denis McQuail studied the 1964 British election campaign, showing that voters/televiewers did indeed expose themselves to messages to have their opinions confirmed. But, to a statistically very significant extent, they did so to know whom to vote for, to keep up with the campaign, and to gain an idea of how one party or the other was behaving.

The counterpoint to the empirical approach adopted by much U.S. research—and also typical of other schools, such as the "voting studies" carried out at the Survey Research Center of the University of Michigan—was critical theory. This theory, which sought to uncover power relations in cultural phenomena, is historically identified with the group of scholars at the Institut für Sozialforschung of Frankfurt—better known as the Frankfurt School—who greatly influenced culture and research in Europe and the United States. The advent of Nazism forced some members of the school to move to the United States, where they made contact with the Columbia school. A close intellectual relationship developed between Theodor Adorno and Paul Lazarsfeld, and they frequently engaged in joint research. The attention of the Frankfurt School in the United States at the New School of Social Research in New York shifted to the phenomenon of the "massification" of culture. The intention of Max Horkheimer, Theodor Adorno, and Herbert Marcuse was to bring social research back to a theory of society understood as a whole. They consequently criticized communication research for conducting what they regarded as spectral studies. They focused on the new dynamics characterizing society at that time: in particular the birth and growth of the culture industry, in which the electronic media predominated. For the Frankfurt School, the mass market compelled standardization and uniformity: The tastes and needs of the public imposed stereotypes and poor quality. The logic of the production system that created and disseminated "mass culture" was that of ideological hegemony and manipulation of the public, which lost all its autonomy. The individual envisaged by critical theory was no longer able to select among media messages; rather, she or he was compelled to adjust uncritically to imposed values and consequently forced into a subordinate role.

Despite the numerous criticisms brought against critical theory—indeed, many of its contentions became obsolete owing to social changes and to other lines of inquiry—it had the merit of shifting the focus of attention among media analysts. Research no longer concentrated solely on media effects but extended its scope to include the role of the media in society. This approach was not new, however, for it had precedents in the U.S. functionalist branch of communication research developed by Merton in the 1960s, which originally sprang from the studies on the functions of the media conducted in the 1930s by Lasswell. The functionalist theory of the media had numerous proponents, and it had important consequences for communication studies. It showed that, although the media were not a sufficient cause for changes in people's opinions and behavior, they nevertheless performed an important social role. One theoretical development that arose from this framework was the analysis conducted in the mid-1980s by Daniel Dayan and Elihu Katz of "media events." These are ceremonials (such as the Olympic Games or the Football World Cup) given solemn coverage by television and that interrupt normal schedules. The function of these important media events is ritual unification of the viewers' experiences. They unite the individuals watching the event at home, so that the entire society is involved in a collective celebration. These events, therefore, affirm a shared identity.

The earlier hypotheses and suggestions concerning the strong influence of the media on their audiences had been abandoned in light of the findings of U.S. communication research. But they returned during the 1970s—by which time both the media and society had substantially changed. There were now two major differences: first, the apotheosis of television and second, the decline of the political parties. Of particular interest are the two strands of analysis that addressed, with different outcomes, this changed situation. Both arose within British media studies during the 1970s: "cultural studies"—particularly the section devoted to audience studies—and the "political economy" of the media. Although these two strands sprang from a Marxist tradition, their respective research trajectories yielded very different results.

Starting from a more complex vision of the dynamics of mass communication, cultural studies analyzed a specific form of the social process: the one by which the public makes sense of reality through its use of media contents. The focus was, therefore, on shared social practices and on a common stock of meanings. It was assumed that the use of contents transmitted by the electronic media involved values, meanings, and practices and that the media were active elements in those constructs. Investigation was therefore made of the structures whereby the institutions of mass communication sustain and reproduce social and cultural stability. But for cultural studies, this process did not come about smoothly; rather, it was negotiated and contradictory because social and cultural stability had necessarily to adjust to constant conflicting pressures. Cultural studies developed in two different directions, analyzing, on the one hand, the production of media contents (paying special attention to news making and thus combining analysis of the electronic and the print media) and, on the other, media consumption as the locus of negotiation among diverse communicative practices. It was in the evolution of the latter research trajectory that, despite numerous differences in methodology and theory, the results matched those already obtained by U.S. communication research. Studies conducted in this area highlighted (a) the ambiguous and contradictory nature of media texts (especially televisual ones, although some studies also analyzed the cinema), which, although they are never completely overt, at least have a "structured polysemy," and (b) the public reconceptualized as an active audience able to produce meanings through its use of media contents. These findings thus entailed a more cautious evaluation of the allegedly strong influence of the media.

The political economy theory was part of the "radical approach." While cultural studies reevaluated the practices of the audience, the political economy of the media scaled down the specificity of the cultural-ideological dimension. It regarded economic dynamics as furnishing the necessary explanation—in some cases sufficient—to understand the process of media effects. Here, the focus was on the *power* exerted by the owners of organizations on both the production process and consumers. This approach concentrated on two aspects in particular: ownership and the size of the market. The idea with regard to ownership was that the owners of communications media were able to control them, so that they also exerted strong influence on the public's habits and tastes. As regards the size of markets, the political economy approach highlighted the progressive concentration of the electronic media market, arguing that this diminished the plurality of supply. These economic variables, therefore, reduced the users of media content to subservience while strengthening the positions of those who already wielded power in society.

Media and Political Behavior

As mentioned above, academic research on the media on the two sides of the Atlantic has often addressed themes and issues that concern the sphere of politics. Interest in the impact of the media with regard to the exercise of political power first arose when presidents and governments sought to know public opinion so that they could influence it or when political parties and candidates wanted to use the media effectively for propaganda purposes during election campaigns. Both the Columbia school and the field of voting studies investigated the role of not only the mass media but also social networks in the dynamics of influence on political attitudes, opinions, and behavior. This was the area of inquiry that analyzed the psychosocial effects of the media, as opposed to the systemic effects discussed below. Turning to the most recent period, that of the so-called third phase of political communication, the current state of scientific knowledge suggests that the least amount of influence attributable to the media is due to their being the principal sources of political knowledge and political information. However desirable it may be to reduce the influence of the media, it is indisputable that for citizens they are essential vehicles of knowledge about political affairs. The media, in their twofold form as electronic and print media, often initiate processes of individual or interpersonal knowledge processing. Despite the massive growth of information and its delivery through new channels, to state that the media are the main sources of political knowledge is not to imply that the current phase of political communication has seen the advent of a rational citizen informed on all political facts. Numerous studies have shown that civic commitment in the mature democracies coincides with low knowledge gathering. The U.S. scholar Michael Schudson has introduced the notion of the "monitorial citizen." Such citizens are substantially uninterested in political information and action, they monitor events, and they mobilize when a problem of particular interest to them arises. The information used by monitorial citizens comes in small doses; it is the "soft news," which may be considered insufficient but is all that they feel they need.

With regard to political knowledge, a second level in the degree of influence exerted by the media is that at which they supply clues with which to interpret political reality. The media should not be considered merely as sources of knowledge and information but, on the contrary, as vehicles of meanings, emotions, and visions of the world. The frames through which the media treat events significantly influence people's attitudes, beliefs, and preferences. A third level is the one emphasized by the agenda-setting theory: The media are able to determine what people should know simply by giving coverage to some facts and ignoring others. The greater the exposure of the public to information, the more intense the agenda-setting effect becomes.

Studies more specifically concerned with the influence of the media on political behavior—be it participation or voting—can be divided between two opposing groups: those that are pessimistic and those that are optimistic. Lazarsfeld and Merton had already spoken in communication research of the "narcotizing effect" of the media. As already emphasized, their attitude toward the media did not consist of a preconceived and ideological aversion. Instead, their judgment arose from the observation that increasing doses of mass media content sap the energy that individuals reserve for active participation. These considerations still did not take account of television, which would become a decisive factor—both in the United States and Europe—in reinvigorating the notion that the diffusion of the electronic media deflected political participation. It was Robert Putnam who argued that television privatizes civic activity and discourages social interaction and individual civic commitment.

Contrary to these pessimistic views are those that instead see the increased circulation of political information as an important stimulus to participation. This position has been bolstered by the spread of the online media and the consequent proliferation and fragmentation of information channels. The Internet, in fact, has on several occasions proved to be an important resource for mobilization, even on a global scale.

Research has not yet reached clear and firm conclusions with regard to media influence on voting choices. Although such influence cannot be ruled out, it is still difficult, if not impossible according to some authors, to produce clear-cut empirical evidence for it. The media share their influence with numerous other determinants of voting behavior, which international research has listed as follows: party identification, the positions of parties and candidates on issues, negative political preference, and the image of the party leader. In addition, this is connected with informal networks of social interaction.

A great deal of research has focused on television's influence on the outcomes of elections, but once again, the results have been contradictory because the forms of influence observed in one country are not directly applicable to others, given the differences in political culture, traditions of electoral behavior, media systems, and styles and habits of television consumption. Television certainly has a great capacity to shape visions of the world and therefore political opinions, but it is not clear whether this capacity operates in the brief period of an election campaign or in the long period of formation of political beliefs and attitudes. Sociological prudence à la Lazarsfeld requires distinctions to be drawn among these diverse effects according to the degrees of political conviction among citizen electors. The sections of the electorate that are either undecided or do not regularly consume television information seem more susceptible to the influence of television messages during election campaigns, while voters with strong political allegiances are more resistant to the action of television. In short, television—like other media, electronic or otherwise—does not have magical powers that give omnipotence to those who use or control it—at least, not in a context of a healthy democracy and sufficient pluralism in information sources and media. In a situation where channels for the circulation of information and ideas proliferate by virtue of new technologies—digital television, satellite broadcasting, mobile telephony with its numerous and versatile uses, Internet applications (blogs, forums, social networks, and the like)—it is difficult to attribute influence precisely to any particular electronic medium. But what is certain is that all these media are today important tools of political communication.

Media and the Political System

Although the media, and the electronic media in particular, have uncertain effects on the behavior of individuals, they have nonetheless produced significant changes in the political process. They have influenced political systems, the formation of leadership, and the ways in which politicians communicate to such an extent that it is difficult to describe the workings of a political system or the dynamics of a polity without considering their media-driven dimensions. Scientific analysis has highlighted what is termed the *mediatization of politics*, the contemporary process whereby public political action takes place within the media arena and that depends to a significant extent on the action of the media. The systemic perspective on the influence of the electronic media has generated a large body of studies mainly concerned with the effects of television. During the 1990s, fears were voiced that a "videocracy" was imminent—especially when the political success of the television mogul Silvio Berlusconi was analyzed. Among the theorists of this drift toward a videocracy is the leading Italian political scientist Giovanni Sartori, who has argued that television has turned politics into a "videopolitics" that tends to replace, if not to destroy, the political parties, at least in their mass organized form. Videopolitics is, however, also an attitude: the "videodependency" of the political parties, which concern themselves increasingly less with genuine events and increasingly more with media events.

The effects exerted by the media on politics are generally grouped into two categories: media driven and political. The former concern the media aspects of political communication, the latter the nature and functions of the political system.

Media-Driven Effects

For some years, research on the role of the media in civil society and politics has emphasized the changes that have taken place in political discourse and in the ways political messages are produced, expressed, and transmitted. Television especially, despite its control by certain governments (in Europe and elsewhere), has managed to exert influence on politics directly with more aggressive forms of investigative journalism and indirectly with the force of popular culture and the language of images.

Political actors have had to adjust to the invasive and uncontrollable presence of television. The predominant logic of this electronic medium is commercial: Television companies—including the public ones in Europe—respond to industrial imperatives in order to remain in the market. This means that they must cater to popular tastes and demands, producing political information intended to satisfy the needs of the audience rather than those of political leaders, or of a government. The scientific literature has often pointed to infotainment, “soft news,” “media populism,” and the popularization of politics (“pop politics”) as the responses by the televised representation of politics to the commercial logic of the electronic media.

There are three media-driven effects on political discourse. The first is the spectacularization of politics. Television has heightened the traditional tendency of politics to dramatization. Under its spotlights, political activity has come to lose its sacred aura and has been forced to adapt its traditional forms to the new languages and the new tastes of television. The rhetoric of mass mobilization has given way to the rhetoric of seduction. Today, no politician can communicate effectively without couching his or her message in the grammar of television. The spectacularization of political discourse is a circular process whereby the media dramatize politics, emphasizing its more marketable aspects, and the politicians—in search of consensus—obey the rules of the game by adopting communicative strategies that secure the attention of the media.

A second effect is that of “agenda shaping,” the ability of the media to select, and also to impose, the important issues in the public debate—those that politicians cannot ignore and on which they must take a stance. It is true, however, that not always and not everywhere are the media able to set the political agenda, for this depends on the type of power relations that exist between the political system and the information system. Where the relationship is that of subordination of the latter to the former, the agenda is more likely still firmly in the hands of the government and the parties.

The third media-driven effect in the relationship between media and politics is the fragmentation of political discourse. Television has reduced the public and political debate to its minimal terms, precisely because of the production constraints imposed by the media industry. American democracy of the mid-19th century was epitomized by the debates between Abraham Lincoln and Stephen A. Douglas. For the debate of August 21, 1858, the two contenders agreed that Douglas should first speak for an hour; Lincoln would then have an hour and a half to reply; and Douglas would finally have a further half hour to respond. This agreement was reached to drastically reduce the usual length of the debate! In the simultaneity offered by the electronic media, political discourse instead consists of sound bites and ready-made quotes perfectly suited to the urgent pace of television news or talk shows.

Political Effects

As regards political effects, the most significant and evident of them in modern, and all the more so in postmodern, politics is the “personalization” or “individualization” of politics. As a medium that prefers to give faces to ideas and issues, television has changed the ways in which politics is conducted by politicians and perceived by citizens. The mediatization process has led to representation of the politician as no longer an exponent of a party or an ideology but as a person with his or her own personal, professional, and familial peculiarities. The private dimension is no longer disregarded by the media; rather, it forms a part, often a large one, of the narration of politics.

This effect cannot entirely be attributed to the electronic media alone. Personalization is also the result of the loss of centrality of party organizations.

The importance of *personae*—be they presidents, heads of government, leaders of parties, or election candidates—has increased in concomitance with the decline of the great ideologies and with the transformation of parties into electoral machines at the service of actions and programs linked with specific political personalities. The second political effect frequently reported by research on political communication is the personalization of leadership, which is often closely connected with the just discussed individualization of political representation. Democracy headed by a leader is the form best suited to modernization in the Western democracies, and especially to mass communication. The media, with their peculiar coverage of the political events and their celebrity-building processes, represent a crucial variable in the personalization of leadership that adds to the institutional variables (e.g., the constitutional order).

The third and final political effect of mediatization concerns the selection of political elites. As a result of the loss of importance by party organizations, the mechanisms for recruitment of the political class have been transferred from the party machines to agents external to the party-political system, which operate outside the control of the traditional party selectors. Often predominant among these external agents are the media, whose preference for telegenic personalities skilled in debate and with a ready wit has given rise to the so-called winnowing effect: the choice of candidates who perform best in the arenas constituted by the media. The news media seek to dramatize election campaigns, and they give intense coverage to the most mediagenic personalities, creating candidate-celebrities to the detriment of those left out of the spotlight. In this regard, the United States provides a good example of the power to select political elites exercised by the media in the political arena. This effect is becoming increasingly evident in other countries and political contexts as well.

Conclusion

The electronic media, in their diverse forms as radio; television; terrestrial and satellite broadcasting networks, both analogue and digital; fiction; entertainment; journalism; online services; and systems of public and commercial media, are crucial determinants of modern and postmodern cultures and societies, as well as important actors in political contexts and systems. The media–politics interaction characterizes political life, shapes the public debate, and conditions the actions of governments, leaders, parties, and movements. It is today impossible to imagine and study politics without considering the influence of the media and their contents on national political cultures and, in an increasingly globalized world, also on the policies and the communication strategies of the great international political actors. Since television's advent on the domestic and international political stage, it has often been (a) the co-protagonist, together with political actors of great historical events, from the Kennedy–Nixon debates to the fall of the communist regimes in Eastern Europe; (b) the sometimes unwilling witness to dreadful events, from natural catastrophes to the terrorist attacks on September 11, 2001, on the World Trade Center and the Pentagon; and (c) itself an agent of great and small changes, simply by being present in places and situations where it has conditioned the behavior of those using it as actors or spectators.

The current development of television, and the great popularity of the new interactive media with their constantly new technologies and modes of consumption, suggests that the electronic media will continue to be decisive actors in politics. In particular, the diffusive many-to-many nature of social networks resists attempts to control them by governments, especially those of an authoritarian and repressive type, and they can be viewed as vehicles for the democratic empowerment of citizens unimaginable in the age of one-to-many mass communication.

MEDIA, PRINT

The print media have long been key players in politics. Newspapers, periodicals, and individually produced publications engage the public and elites by providing information and analyses. In the process, they influence the decisions and perceptions of the entire range of political actors. The print media and their journalists and editors are engaged in all aspects of the political process, and the political institutions and players are occupied, in different ways, in determining what appears in the media. The print media are also an economic force in societies, although they account for only a small percentage of media usage even in highly literate and wealthy countries. In this entry, their more general political impact and their role in different types of political systems are discussed.

The role of the print media in politics is determined by the political system in which they work, the initial ways in which the press worked in that system, the available technology, and the demographic and economic character of the state's population. That role has changed as new broadcasting technologies have developed. But the print media remain paramount in local news as well as in significant national discussions. They are also more likely than broadcast media to be focused on specific groups rather than aimed at a general audience. Within the print media, there are clear differences between media focused on drawing a mass readership and media aimed at the educated and the affluent. It is in the print media that the focus on the latter is most feasible and common, while the mass audience has shifted predominantly to television as its source of information and entertainment.

The print media, as they are traditionally known, normally consist of newspapers and periodicals, although other print media such as books and flyers also have played a role in politics. The traditional print media are produced by a staff of journalists and editors, who usually develop, edit, and place the articles on various issues in the publication and put it together. In addition, to reach a large audience, printing equipment and distribution channels are needed. To provide ongoing national and international information, most print media rely not only on their own staff but also on outside contributors and wire services, for instance, the British Broadcasting Corporation (BBC) or Agence France Press, which are public, and private agencies such as Associated Press. The funding this requires ties the media to a sponsoring organization, to the state, or to private owners, to whom the print media are to give their profits. The simplicity of the production of the most basic print media also has allowed its use by opponents of a regime more readily than radio or television. Finally, in areas where the literacy level is low, print media are used to present images to the population and also as ways to increase literacy and, in turn, activate citizens.

The development of technology has been significant in the transformation of the print media in the political and social arena. Initially, getting information and then producing and distributing print media were very slow processes. As a result, they were used only for commercial purposes, to list the dates ships were due and their cargo, or to present ideas. After the telegraph was invented, the speed with which information could be transferred began to increase exponentially. Developments in photography and in printing technology also brought events and images to audiences increasingly rapidly and with greater emotional impact. Consequently, the role of the print media shifted from announcing what was planned to reporting on events that had happened and engaging people's interest.

Beginning after the 1920s (the "golden age" of the press in the United States), the development and increasing range of the broadcast media (radio and then television) resulted, over time, in a shift in the role of the print media away from being the prime source of information on events outside an individual's personal experiences. The pattern came to be that television news introduced and highlighted events and issues and the daily press and periodicals provided in-depth information. The print media became an agenda setter and a source of analysis. This function has been furthered by the ever-increasing speed and immediacy with which news can be reported on the broadcast media and by the development of the Internet and other technologies. In response, the print media first moved to provide both paper copies and Internet versions and then, to maintain readership levels that would bring in advertising revenues, shifted to continual updating of reports and analyses. Gradually, though, the print media, even in their online editions, have lost audiences and revenue as individuals and groups have been able to produce the news through blogs and special sites. This means that more information and opinion are not being filtered through professionals who are committed and have the resources to investigate and present a balanced analysis. Without the print media's editorial leadership, issues are increasingly presented on the Internet by unnamed or biased sources without market or professional controls on the accuracy of what is said or how it is presented. Unlike the print media, these broadcast and Internet sources reach across national boundaries and can circulate far more rapidly while avoiding government control.

Theories of the Relationship Between the Print Media and Government

The initial set of models of the relationship between the print media and government focused on the initial uses of the press by those in power. The models in Fred Seaton Siebert, Theodore Peterson, and Wilbur Schramm's seminal 1963 work, *Four Theories of the Press*, were as follows:

1. the "authoritarian model" of the early European monarchies, in which the rulers controlled the print media to support and advance their policies;
2. the "libertarian model" of the American press and European democracies, in which the print media were a separate institution free from state influence and were engaged in informing and entertaining the public, with the profit-making incentive ensuring that the print media worked to provide "the truth";
3. the "social responsibility model" of the United States and European democracies in the 20th century, which includes all the roles of the "libertarian model" and in which the media deliberately serve as a forum for open discussions; and
4. the "Soviet-totalitarian model," in which the media were used by the rulers to mobilize and control their societies.

In the authoritarian model and the Soviet-totalitarian model, the print media are closely controlled and directed. In the libertarian and social responsibility models, the print media are self-directing, and "control" emerges through competition. Later theories of government–media relations have focused on the impact of the political processes themselves, how the print media influence politics, and the nature of the print media that emerges.

Democratic Media Systems

Democratic media systems in the developed world differ in the nature of pluralism in the print media, the role of the market versus the state in funding and directing the print media, and the nature of the journalism profession itself. The model developed by Daniel C. Hallin and Paolo Mancini essentially divides the print media into three different categories:

1. In the Anglo-American "liberal model," where there was early democratization and a more individualized system of representation, there is a long-established commercial press that seeks to appeal to the broadest audience by presenting neutral information oriented to the public interest. In this model, market mechanisms and commercial media dominate. Although party papers (those tied to a specific social or political group) are significant in Britain, most publications are deliberately less ideological in their coverage, often providing commentary across the political spectrum. In most cases, editorial opinion is distinct from news coverage. Journalism is highly professionalized and self-regulating.

2. In Central Europe and Scandinavia, where there was also early democratization, with a historic emphasis on consensus, pluralism, and social welfare, the "democratic corporatist model" holds. In this model, the print media have high circulations. Historically, particularly in the national press, party papers were strong; but there has also long been a more neutral commercial press. Journalists belong to powerful professional organizations. The state provides subsidies and regulates the work conditions for journalists. But freedom of the press is also well protected.

3. In France, Italy, Spain, Portugal, and Greece, the "politically pluralized model" holds. These states were marked by later democratization and strong roles for political parties, alternating with periods of authoritarianism. In this model, the print media have focused on the elites, not on mass circulation, and they are characterized by a high degree of political partisanship. Government intervention is greater, with press subsidies and periods of government censorship.

Communist Media Systems

Communist media systems were based on the Leninist adage that the press should be a collective organizer, agitator, and propagandist. Providing information and news was incidental to that role. These media systems were orchestrated, to a greater or lesser degree depending on the interests of the regime, by the Communist Party. In the Soviet and East European media systems, individual print media were aimed at specific audiences and interests. The themes to be covered were set out in advance by Communist Party authorities in both general and individual plans. They also controlled the resources, circulation, and coverage options of each publication. Reporting was to reflect positively on the system as a whole and also reveal individual problems. Control was exercised by the official censors' review of what was to be printed; by the editors based on the directions they were given; or, after publication, by the Party's press departments. Journalists sometimes used coded language to give more information or present a veiled critique. Readers also interpreted what was said in the print media by "reading between the lines" and looking for telling differences in what was said, as well as comparing what they read with what they experienced directly.

In times of weakness and division among the leadership, the print media have been the bellwether in these countries. Increasingly critical reporting and analyses, as well as different positions appearing in the press, signaled the possibility of more openness and triggered further public discussion. When the print media grew increasingly open and critical, there was increased dissension. By the end of the 1980s, the openness of the media and, in Hungary, Poland, and Czechoslovakia, public action contributed to the dissension prior to the collapse of the communist systems. In the post-Stalin period, in some countries including the Soviet Union, Poland, Hungary, and Czechoslovakia, an independent *samizdat* (self-published) print media developed. While such publication and distribution of print materials without state approval was illegal and those involved were sanctioned, these materials provided an important outlet for the exchange of alternative views, information, and literature that could not be published in the legal media. They served as the central work of those opposed to the system.

The Chinese model under Mao Zedong was different from the Soviet model. It put even less emphasis on information and much more on the press as a mobilizer. The traditional print media, in this period, had a far smaller role to play. Instead, banners, flyers, and publications of slogans and Maoist statements were considered important in stimulating people to get engaged in various campaigns and to attack the evils in the society as perceived by the regime.

In the transition from communism, the print media shifted to reporting the news and scandals not publishable earlier. There also remained a tendency on the part of journalists to try to direct people's thinking on political issues. Where separate parties emerged, they established their own print media organs. Where they did not, as in China, the media have diversified while remaining within the permissible boundaries. The journalism profession was also affected by the increasing financial pressures that came with privatization.

Print Media in the Developing World

The print media play different roles in the developing nations, where wealth and literacy are more limited. They tend to be less significant for the vast majority of the population in these countries because of low literacy levels and the inability of people with marginal incomes to buy the published material. They also have tended to be weaker in their reporting and coverage simply because of the high cost of international or even national reporting. As a result, their political significance is limited largely to the educated classes and to government programs to educate the larger population.

The Uses of the Print Media: Individuals, Elites, and Scholars

Research on the specific impact of the print media on political knowledge and behavior has been indicative rather than definitive. Those who use the print media tend to be more educated and affluent than television viewers. The influence of the print media on their attitudes and knowledge tends to be gradual and depends on their cognitive skills. In addition, research shows that individuals tend to expose themselves to media and subjects that reflect their preexisting beliefs. They interpret messages in a way that makes them consistent with those beliefs. And they are most likely to retain information that fits with that belief set, often forgetting specific facts and remembering the broad principles. There is also some evidence that newspaper readers have higher levels of social capital than those not exposed to media reports. It also appears that regular exposure to negative reports about politicians and politics tend to result in more negative perceptions of politics and politicians than individuals would have otherwise.

The print media do play a major role in agenda setting by both politicians and the public. In evaluating what issues are politically salient, politicians often use highly respected print media not only to get their messages out but also to identify the people's concerns and make policy decisions based on them. Research also shows that the media's presentation of issues as social rather than personal, for example, unemployment, causes people to see their personal problems as larger societal problems. Finally, the context in which print media place an issue affects how seriously individuals consider the issue and how it is incorporated into their broader priorities and beliefs.

Exposure to any media gives individuals a greater sense of the world and their position in it. Although the print media were less easily accessible until they began to appear on the Internet, for the educated populace, the print media provide the most information and analysis. Exposure to international media, particularly broadcast media but also print, also allows people who do not have direct contact with the rest of the world to see how others live and make comparisons with their own lives. This can create a sense of relative deprivation, which stimulates popular demand for improvements in the system.

For scholars of politics, the print media are often the most accessible resource for looking at what has been said and how. Therefore, they are the most used source for research on what happened in a given case or what information people had access to at the time of a given political incident or on a given political topic.

MEDIATION IN INTERNATIONAL RELATIONS

The international environment of the 21st century, much more so than its predecessors, is experiencing conflict and violence both within states and between states. Such conflict is costly, destructive, and highly dangerous for individuals, communities, and regions of the world. In addition to conflicts between well-defined actors, other forms of violence (such as terrorism) and serious threats (such as environmental degradation) pose a major risk to the very viability of the international system. Clearly, these conflicts and issues have to be resolved. Mediation is fast becoming one of the most effective ways of responding to proliferating conflicts and the numerous threats that we face in international relations today.

The Charter of the United Nations (UN) is quite explicit on the diplomatic structures that can, and should, be used to deal with these problems. Article 2(3) of the UN Charter proscribes any form of violence and exhorts, "All member states shall settle their international disputes in such a manner that international peace and security, and justice, are not endangered." The available methods of peaceful settlement of international conflicts are numerous and varied. They are listed in Article 33 of the UN Charter, which requests that

> the parties to any dispute, the continuance of which is likely to endanger the maintenance of international peace and security, shall, first of all, seek a solution by negotiation, inquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their choice.

The UN Charter highlights three basic diplomatic structures to deal peacefully with international and other conflicts: (1) direct negotiation between parties to a conflict, (2) various forms of mediation, and (3) binding methods of third-party intervention (e.g., arbitration and adjudication). Each of these methods has its own characteristics, strengths, and disadvantages, and each has an important role in the practice of modern diplomacy. Whatever differences there may be between these methods, they all exemplify the peaceful nature of diplomacy and the desire to avoid the use of force. This entry discusses mediation, which is growing in popularity as a method for resolving such issues. Indeed, there is considerable empirical evidence to suggest that mediation has been the most popular way of dealing with international conflicts since 1945. The following sections describe its unique features, explain what mediators actually do, and posit some conditions that may help or hinder the process of international mediation.

Mediation: Definition and Features

For many years, the study of mediation has suffered from conceptual imprecision and a startling lack of information. Practitioners of mediation, formal or informal, in the domestic or international arena were keen to sustain its image as a mysterious practice, akin to some art form, taking place behind closed doors. Scholars of mediation, on the other hand, did not think their field of study was susceptible to a systematic analysis. In short, neither group believed that it could discern any pattern of behavior in mediation's various forms or that any generalizations could be made about the practice in general.

The prevalent agnosticism toward analysis and the desire to maintain the mystery and uniqueness of mediation acted like something of a ghost that haunted many scholars and practitioners for too long. There may be little consensus on how best to study or practice mediation. Mercifully, there is now a very broad agreement that this particular ghost should be exorcised. Mediation can, should, and must be studied properly, and the lessons derived from such a study should serve as signposts in the quest for a better understanding of the process and more effective conflict management.

Etymologically, *mediation* comes from the Latin root for *to halve*, but different definitions of mediation purport to (a) capture the gist of what mediators do or hope to achieve, (b) distinguish between mediation and related processes of third-party intervention (i.e., arbitration), and (c) describe mediators' attributes. Some see mediation as purposeful action designed to remove any misunderstanding, others may see it as an extension of negotiation, and yet other scholars may prefer to emphasize the neutral and impartial nature of all mediators.

The many approaches to definition are simply indicative of the enormous scope of mediation. Mediation may take place in conflicts between states, within states, between groups of states or organizations, and between individuals. Mediators enter a conflict to help those involved achieve a better outcome than they would be able to achieve by themselves. Once involved in a conflict, mediators may use a wide variety of behaviors to achieve this objective. Some mediators make suggestions for a settlement, others refrain from doing so. Some mediators are interested in achieving a compromise, others are decidedly not. This is why a comprehensive definition of mediation is a prerequisite for understanding this complex reality. The following broad definition provides suitable criteria for inclusion (and exclusion) and serves as a basis for identifying differences and similarities. Mediation is here defined as a process of conflict management, related to but distinct from the parties' own negotiations, where those in conflict seek the assistance of, or accept an offer of help from, an outsider (whether an individual, an organization, a group, or a state) to change their perceptions or behavior and to do so without resorting to physical force or invoking the authority of law.

This may be a broad definition, but it is one that can be generally and widely applied. It forces us to recognize, as surely we must, that any mediation situation comprises (a) parties in conflict, (b) a mediator, (c) a process of mediation, and (d) the context of mediation. All these elements are important in mediation. Together they determine its nature, quality, and effectiveness, as well as why some mediation efforts succeed while others fail.

What, then, are the main features or characteristics of mediation across levels? A number of these are listed as follows:

- Mediation is an extension and continuation of peaceful conflict management.
- Mediation involves the intervention of an outsider—an individual, a group, or an organization—into a conflict between two or more states or other actors.
- Mediation is a noncoercive, nonviolent, and, ultimately, nonbinding form of intervention.
- Mediators enter a conflict, whether internal or international, to affect it, change it, resolve it, modify it, or influence it in some way.
- Mediators bring with them, consciously or otherwise, ideas, knowledge, resources, and interests of their own or of the group or organization they represent. Mediators often have their own assumptions and agendas about the conflict in question.
- Mediation is a voluntary form of conflict management. The actors involved retain control over the outcome (if not always over the process) of their conflict, as well as the freedom to accept or reject mediation or mediators' proposals.
- Mediation operates on an ad hoc basis only.
- Mediation in international relations is particularly appropriate when a conflict is long-drawn-out and complex, when the parties' own efforts have failed or reached an impasse, and when both parties are prepared to cooperate to avoid further loss of life.

Mediation Behavior

What is it that mediators do to achieve a cessation of violence and a political agreement? Considerable attention has been given to this subject, and it seems apt to suggest that in general mediators enter a conflict (whether they are invited or not) to change its structure, dynamics, and termination. They do so by first trying to understand the conflict (i.e., understand the issues involved, the history and causes of the conflict, and the parties involved in the conflict and their relationship); then arranging for some communication between the parties (directly or indirectly), establishing some protocol, and delineating an agenda to discuss; and finally helping the parties save face by rewarding the concessions made by each party and recommending possible solutions. These types of behavior correspond roughly to three broad strategies that the literature suggests mediators may engage in—that is, facilitation-communication behavior, formulative behavior, and directive behavior.

As to the question of how involved a mediator can or should be, we can say that mediator behavior may range along a spectrum of increasing levels of intervention. In some cases, a mediator may engage only in facilitative behavior, while in others, a more radical intervention may be required if the parties are to be nudged from their inflexible positions. Thus, we may speak of a facilitative mediator, a formulative mediator, and a directive (or better still, a power) mediator, each of whom creates different circumstances and produces different outcomes.

The strategy mediators adopt, and the way they behave in each international conflict, is rarely random. Mediators do not just happen to choose a strategy. Mediator behavior is influenced by factors such as conflict intensity and fatalities (e.g., high-intensity conflicts may call for more active strategies), time pressure (when time is pressing, there is a higher need for more directive strategies), mediator rank (high-ranking mediators, such as heads of state, can use more resources and strategies), and previous relations between the parties (where parties have a history of friendly relations, facilitative strategies may be sufficient). The actual process of international mediation is one of reciprocal relationship between a mediator, the conflict itself, and the parties involved. At times, mediators can be quite active and use significant resources, at other times, all they can do is act as the go-between. Effective mediators know how best to identify actors in conflict, the nature of a conflict, which strategy to use, what resources to marshal, and just how much control to exercise over the parties.

Whichever strategy mediators use, their underlying objectives in any conflict are to change the following:

a. the physical environment of conflict management (e.g., by maintaining secrecy or imposing time limits, as U.S. President Carter did at Camp David during Israeli–Palestinian negotiations);

b. the perception of what is at stake (e.g., by structuring an agenda and/or identifying and packaging new issues); and

c. the parties' motivation to reach a peaceful outcome by, for example, using subtle pressure.

Any international conflict presents opportunities for some form of mediation. To be effective, however, mediation strategies must reflect the reality of the conflict and the resources of the mediator. To that extent, international mediation is truly a contingent and reciprocal political activity. It depends on, and is shaped by, the parties, their conflict, and the conflict environment.

Success and Failure in International Mediation

When is international mediation most likely to be successful? This is a question that practitioners and scholars have been asking for many years. Some guidelines may now be offered.

To be successful, international mediation must take place at the right, or the ripe, moment. By this we mean that a mediator must ensure that parties to a conflict are genuinely ready to tackle their conflict. This usually occurs when the parties find themselves in a situation that they both dislike and yet cannot escape from or when they recognize some opportunities for a mutually beneficial settlement. An experienced mediator can convince the parties that continuing to engage in violence will be futile and that the moment is ripe for resolution. The timing of mediation and a perception among the parties that opportunities may be lost if they fail to recognize their mutually hurting behavior is a crucial factor affecting mediation success in international relations.

Closely related to this is a strong and genuine motivation by each of the parties to engage in serious mediation. If the belligerents approach mediation merely in an attempt to buy time or forestall a possible defeat, then any mediation effort, whether undertaken by the UN or a state, will be doomed to failure. Mediation works best when both parties are willing, interested, and genuinely committed to the process. Here again, a mediator can create the conditions, in the early phases of a mediation, where both parties are optimistic about the process and truly committed to it.

Mediation also appears to work best in international relations where there are no major power disparities between the parties, when both states are small or medium powers (rather than superpowers), and when both states hold similar political values. Shared norms, political similarity, and relative equality in military and economic power enhance the likelihood of successful mediation.

In addition to these factors, we also note that certain kinds of mediators and mediator behavior are more likely to succeed. Although much is made of the potential of regional and international organizations, the reality is that the more successful mediators tend to be the larger states with more leverage and resources. Mediation is an attempt to change the parties' perception and/or behavior; hence, it stands to reason that more powerful countries, with more resources, prestige, and leverage possibilities, are more likely to succeed in this attempt. And, of course, related to that, we can see that mediators who can influence the parties through a wide range of interventions from the least directive to the most directive are the ones most likely to succeed.

Other factors may have an impact on the success or failure of international mediation (e.g., relationship between the parties, nature of conflict between them) and must be taken into account. What is important about international mediation is that it is part of the political process. It is a voluntary process, yet one in which states may use mediation as an extension of their foreign policy, or they may use it out of a genuinely altruistic desire to resolve a conflict. Whichever their motives, mediation is a powerful, important, and often successful tool in resolving international conflicts.

MERCANTILISM

The rise of early-modern states in the form of strong monarchies provided the historical context for economic writers who have been named *mercantilists*—members of a particular "mercantilism school" of political economy. Among them are writers between the late 16th and mid-18th centuries who published pamphlets and tracts on economic issues, especially regarding international trade, money, finance, and beneficial governance. They were state bureaucrats, merchants, and politicians from all over Europe, from Spain to northern Scandinavia, during the so-called early-modern period. They generally believed that economic wealth and income could be increased through the capture of foreign trade and commerce. Perhaps not all of them agreed that the creation of wealth was a zero-sum game, but many of them came quite close to believing so.

The concept of *systéme mercantile* was first used in print by the Marquis de Mirabeau in 1763. However, it was Adam Smith, who in his *Wealth of Nations* in 1776 called it the "mercantile system" and made it famous. Yet, to what extent mercantilism is really a "system" or "school" of economic thinking has been a hotly debated issue ever since. The bulk of what is commonly known as "mercantilist literature" appeared in Great Britain from the 1620s up until the middle of the 18th century. Perhaps the most well-known English mercantilists were Thomas Mun (1571–1641), writing in the 1620s, and James Steuart's (1713–1780) whose *Principles of Political Oeconomy* (1767) is regarded as perhaps the last major mercantilist work. Other English economic writers regarded as belonging to the mercantilist school are Josiah Child (1630–1699), Charles Davenant (1656–1714), and Nicholas Barbon (1640–1698). According to the main inventor of the "mercantile system," Adam Smith, the core of the "commercial" (mercantile) system consisted of the popular folly of confusing wealth with money. Hence, their suggestion that a country must export more than it imports leading to a net inflow of bullion, the "positive balance of trade" theory.

According to Smith, mercantilist theory and practice served as a cloak for a special interest that used the idea of a positive balance of trade to propagate a protective trade policy in general, including duties on imports, tariffs, and bounties. The mercantile system implied a giant conspiracy on the part of master manufacturers and merchants to skin the public and the consumers. From Smith onward, the view of the mercantile system as state dirigisme (particularly export and import protection) to support a special interest with the aid of the ideology of the positive balance of trade developed into its present status as the canonical interpretation of 17th- and 18th-century economic thinking and writing. David Hume had made his specie-flow theory public in 1750, arguing that the favorable-balance theory was an intellectual error (a net inflow of bullion must certainly mean a relative rise in prices, which, through the export and import mechanism, will tend to correct itself). Smith then drew the conclusion that the argument for protection and against free trade in general was based on a mere intellectual mistake.

Undoubtedly, the fixation of a mercantile system—or mercantilism—became an important part of the story that liberal political economy during the 19th century sought to explicate. Up until 1776—according to its stylized version—the thinking as well as the practical policy making of the 17th and 18th centuries was dominated by dirigiste and protectionist ideas. After this intervention by Smith, a new, more scientific version of economics developed that emphasized the role of the "invisible hand" and free trade as a motor of economic growth and prosperity. The overturn of the mercantilist school became part of a wider "Whiggish" interpretation of history, which used Great Britain as an ideal type for depicting the development of free trade and minimal government as a natural force in history. Without doubt, such a simplistic version seldom receives enthusiastic applause today. On the contrary, it is most often argued nowadays that the step from "mercantilists" such as Steuart to the "liberal" Smith was not as big as it was once described. Hence, many scholars—for example, the English writers before 1776—were ready to admit the advantages of market liberalization, free trade, and even the existence of an invisible hand. Indeed, very few of them made the mistake of identifying wealth with gold and silver. Likewise, none of the members of the so-called classical political school in the beginning of the 19th century was a free trader or a libertarian in any modern sense of the world. Many of them admitted to the positive role of state intervention, and some, even, were reluctant to propagate for free trade as long as not all countries were ready to abolish their tariffs and duties.

Perhaps the most important concern with the Whig interpretation, however, is that it needs to be seen in its historical context. The world that economic writers during the 17th and 18th century contemplated was characterized by an often violent and competitive struggle for power and influence. From the late-medieval period, it had been well understood that the economic strength of a state required a powerful political and military position. One method to increase the wealth of a ruler was to conquer more land plowed by peasants who could pay taxes and land rents to the Crown. Exceedingly, however, it was perceived that more income could be gained by taxing profitable trading operations, to introduce indirect taxes and *accises* (excise duties). Against this background, competition over trade and trade routes became an ever more important princely occupation. It was generally believed that a country that could capture important trade routes as well as establish colonies, or "plantations," would have an advantage in times of military conflict and political power struggles. Moreover, during the 17th century, a view increasingly emerged among rulers that it was most favorable to establish domestic industry in order to use up raw materials instead of exporting them. By encouraging manufactories, more hands could be employed while at the same time industrious manufacturers and merchants could earn more profits, which would lead to even more production and employment—resulting in more taxes, of course. Hence, wealth creation could be cumulative and not only a consequence of zero-sum activities. However, without a strong state with an ability to keep up a trade monopoly, such gainful spirals of income creation were always threatened and insecure.

Certainly, the political economy of the relationship between economic means and power politics goes back at least to the Florentine political thinkers of the Renaissance period, including Niccolò Machiavelli. As is well-known, Florence's republicanism was a broad tradition that recognized the role of patriotism and other manly values in a well-governed and virtuous state. In England, during the 17th and early 18th century, such patriotic thinking focused strongly first on the Dutch republic and later, after 1660, on France. Holland, especially, was a showcase for those who wanted to emphasize the wealth-producing effects of capturing international commerce and establishing manufactories. It was on that basis that this tiny country was able to house such a plentiful population that was a cornerstone of political power and military strength. In the early years of the 17th century, the Dutch had snatched the Baltic fishing industry from under the nose of the English, as the mercantilist writer Thomas Mun wrote in the 1620s. It was time to take it back as well as to capture more of the international trade in grain and other products that flowed from East to West and from the Baltic to the North Sea.

Clearly, the position of a specific state in the international competitive struggle for power and influence is a key to understanding the writings of the mercantilists in their respective countries. Antonio Serra in Naples would ponder over how a small nation without domestic resources in silver and gold could be able to survive and even gain from this fact. In 1613, he suggested that Naples should export to cover both the importation of necessities and luxuries as well as the importation of money (silver). In turn, this meant that Naples had to develop a "favorable balance of trade." Pamphleteers in states that felt they were in the same position, such as England in the 1620s, lent a ear to Serra and themselves became proponents of a favorable balance of trade.

In Spain, on the other hand, a shortage of silver and gold was not a major disturbance during the 16th and 17th centuries. Such wealth in awesome proportions was amply provided by the Spanish imperial forces and shipped over from the Americas protected by a potent navy. Already, by the end of the 16th century, it was well known that this bullion had not brought riches to Spain but, rather, poverty. Already, by 1556, Martin de Azpilcueta had formulated the famous so-called quantity theory of money (that a great influx of silver and gold implies that the value of money will fall). In fact, the so-called price revolution and its dire effects was a well-known phenomenon among contemporary Europeans. When the price level increased in Spain, domestic industries as well as agriculture suffered from cheap foreign competition. In the 1580s in Spain, Luis Ortiz, controller of the public finance, argued for a strict ban to prevent Spaniards from exporting their money and buying foreign goods—a policy that had been used by many states since the medieval period and that in England was called the Statute of Employment.

In France, a policy of economic nationalism was developed from the beginning of the 17th century onward. Around 1600, the *valet du chambre* to King Henry IV, Berthélemy Laffemas, published tracts in which he advocated the establishment of manufacturing in France to avoid "unnecessary" imports. In a highly aggressive tone some decades later, the message that foreign imports should be banned and the ugly face of foreigners forever deported from *la belle* France was reinforced by the writer Antoine de Montchretien (who was the first to use the concept "political economy"). His argument for strong protectionist measures taken by a dirigiste state became after 1660 the backbone of the so-called Colbert system, after Jean-Baptiste Colbert, Louis XIV's minister of finance, who greatly provoked the English at the end of the same century.

Hence, the historical context in which the mercantilists wrote and advised was perhaps better understood by 19th-century German scholars such as Gustav Schmoller (belonging to the German historical school), who identified mercantilism as an expression of nation building during the early-modern period, than by 19th-century British liberalism. Nevertheless, Smith's definition of mercantilism as a specific school of economic theory building on flawed views of the true relationship between commerce and wealth is still widely acknowledged. To what extent the straw man of a mercantilist school he produced corresponds to historical reality may be doubted, although it did serve to convince everybody of the revolutionary character of Smith's own contribution.

META-ANALYSIS

The meta-analysis research design involves analyzing many individual cases or research reports and looking for commonalities and discrepancies in the published findings. In this design, a group of previously researched cases is selected and subjected to comparative analysis. Gene V. Glass (1976) introduced the technique as a "rigorous alternative to the casual, narrative discussions of research studies which typify our attempts to make sense of the rapidly expanding research literature" (p. 3).

Meta-analysis is an observational technique used to summarize and compare the results of studies produced by other researchers. Objectives for meta case research include establishing the state of research findings on a subject and providing an overview of what others are saying about the subject. Referred to as an analysis of analyses, the method involves statistical analysis of a large collection of individual case studies for the purpose of integrating the findings of the total set. Below, the advantages and disadvantages of meta-analysis and the requisite steps are discussed in greater detail.

Meta-analyses should only be applied to empirical research reports—that is, studies that have analyzed primary quantitative data collected by researchers who prepared the original reports. The findings of previously prepared research reports are compared or evaluated using such statistical processes as regression and correlation analyses. A recent example of the design is the Chris Doucouliagos and Mehmet Ali Ulabaşoğlu (2008) meta-analysis of 84 published studies of the hypothesized relationship between political democracy and economic growth. The individual results were spread across a continuum of positive, negative, and insignificant findings, leading them to conclude that while democracy does not have a direct impact on economic growth, an inconclusive relationship is common across the studies. Their meta-analysis resulted in three key points:

1. It provided a comprehensive analysis of the democracy–growth research based on the entire body of published cases.
2. Their quantitative analysis made it possible to make inferences based on the significance of the democracy–growth relationship.
3. It revealed the heterogeneity of the results in previous individual studies.

Advantages and Disadvantages of Meta-Analysis

Measurement and statistics researchers at the University of Maryland identified what may be the single most important advantage of meta-analysis: The human mind may be unable to effectively process and evaluate a large number of alternatives; a meta-analysis resolves this issue. Individuals have a difficult time when asked to evaluate the results of, say, 20 similar studies. When the number of studies is increased to 200—a not untypical number in many meta-analyses—the mind reels. Fortunately, statistical methods and software are readily available for coping with the complexity inherent in large numbers of cases.

Mark W. Lipsey and David B. Wilson identified four additional advantages of a meta-analysis. First, the process of coding and establishing criteria for selecting studies (a *survey protocol*), reading the study reports, coding the material, and subjecting it to a rigid statistical analysis imposes a discipline on the researcher that is sometimes missing in qualitative summarizations and comparative analyses. Second, the summaries of research on similar topics may produce finer measurement gradations of themes that might have otherwise been missed with a design using only one or a few cases. The application of common statistical tests across all the studies can correct for wide differences in sample size. Third, because the meta-analysis examines many case studies, it may be possible to find effects or associations that one or a smaller number of other comparative case analyses may have missed. Fourth, the meta-analysis process provides a way to organize and structure diverse information from a wide variety of study findings.

Meta-analysis is not without its disadvantages. A few of the criticisms that have been identified for the method include the following:

1. The large amount of effort and expertise it requires is an often-cited disadvantage of the method. A meta-analysis takes considerably more time than a conventional research literature review and may require specialized knowledge of case information that the researcher may not have.
2. The original may have missed some important issues, including but not limited to the social context of the study, theoretical influences and implications, methodological quality, design issues, and procedures.
3. The mix of studies combined into larger groups may hide subtle differences seen in individual studies.
4. Inclusion of studies that are methodologically weak can detract from the findings in the strong studies included in the analysis.

The Meta-Analysis Method

A meta-analysis follows the same system of procedures as single-case research. Researchers first identify a research question (the purpose for the review) and establish their objectives for the study. Second, they select an organizational framework for the analysis—that is, they determine what variables they will measure across the entire sample of cases. Third, they select a sample of case studies and specify why the individual cases (sample elements) will be chosen for the meta-analysis. Fourth, researchers collect, code, and tabulate the data; this involves investigating and reporting on the relationships found between the studies included in the review. Reporting the findings involves connecting the findings back to the study question, purpose, and objectives of the analysis. The following describes the complete process in greater detail.

Formulating the Problem

The first step involves identifying the reason for doing the research: defining the research problem. In a meta-analytical study, the core task is deciding what questions or hypotheses should be examined and what evidence should be included in the review of the selected cases. Formulating the problem means deciding what research results should be examined.

Criteria for Selecting Cases

Criteria for selecting cases to be included in the analysis might include characteristics of the client population, geographic location, history and/or experience level of the delivering organization and/or its sponsoring government agency, or research method used by the case writer. Each selected case should add to the research question knowledge base. A good meta-analysis is not concerned with drawing a representative sample of the literature on the topic; rather, it seeks to include the entire population of published studies on the topic of interest.

Standardizing the Points for Analysis

Since the meta-analysis design involves analysis of analyses and all analyses are different in some way, this is one of the most problematic steps of meta-analysis. Glass referred to this as the “apples and oranges” problem. The cases selected are studies of different aspects of a phenomenon: They involve different subjects, are done at different times by different researchers, and often involve different research methods. Therefore, they are not all studies of "apples" or studies of "oranges." To get around the difficulties that these differences entail, the researcher must examine the same element in every case, ignoring findings peculiar to the one case alone.

Standardizing the Analysis Procedure

Here, the emphasis is on method rather than focus. The analysis procedure usually involves standard statistical techniques such as regression and correlation analysis. However, the techniques and procedures used in the individual cases studied are often specific to that research question or political science subdiscipline. The meta-analysis reviewer must differentiate between what the original report writer supposed and what the results of the study indicate.

Selecting a Coding Scheme

Coding of variables for comparison or tabulation must be consistent across the body of literature reviewed in the meta-analysis. There are few rules for coding, other than to retain consistency. Numeric coding is the preferred approach since most researchers will use computers and statistical software for their analysis.

Describing the Statistical Processes Used

A guide to follow in describing the statistical processes used in meta-analysis is to refer to the available statistical software. Much of this software has been available free. Meta-Stat, from the University of Maryland, is an example of meta-analysis software. Statistical analysis described in this software ranges from simple descriptive statistics and correlation analysis to regression analysis and analysis of variance, to name just a few of the popular tests included. Meta-analysis is facilitated using a meta-analytic schedule or cross-case table. Rows are cases; columns are the results of the analysis on the items or attributes of interest. Cell entries may be brief summaries of the findings or as simple as a check mark. The schedule makes it easy to record and communicate analysis results.

Analyzing the Data and Writing the Report

Data analysis is a product of the statistical software used by the researcher and, as such, is rather straightforward. Writing the report, however, introduces a subjective element to the study. The researcher must decide how much information to include and how much to leave out of the report. Care must be taken to control for issues of validity, although statistical inferences are generally not made with meta-analysis findings. Because meta-analysis involves the interpretation of materials written by others, great care is needed in preparing the final report of the analysis.

Meta-analysis analysis has been found to be facilitated by following the principles of *hermeneutic analysis*. Hermeneutics is a method of analyzing all types of data, but it is particularly relevant for the analysis of written material such as that found in case studies. Hermeneutics follows a set of principles that requires the analyst to (a) decipher the meaning in the texts through the eyes and intent of the writer or creator, (b) frame the meaning in the time period of the case research and writing (often referred to as the *context* within which the document was prepared), and (c) determine the meaning considering the political and social environments at the time of the creation of the text or artifact.

A Final Caveat

Although use of the meta-analysis technique has grown dramatically since its adoption in 1976, Glass suggested in 2000 that, despite this increasing popularity, it might be time to replace meta-analysis with an approach that reflects more closely the nature of modern research in social science.

METAGOVERNANCE

Metagovernance refers to the need of formal public organizations to exercise some control over devolved and decentralized decision-making organizations. In line with the common use of the prefix *meta-*, which means over and beyond, the shortest definition of the term *metagovernance* is the governance of governance. Just as the meaning of metaphysics is determined by the definition of physics, the meaning of metagovernance in practice depends on how the term *governance* is defined. It is generally accepted that three ideal-typical styles of governance can be distinguished, which usually form combinations: hierarchical, network, and market governance. When one style dominates, the other two often run in the background. Other forms of governance, such as public–private partnerships and the European Union's open method of coordination, can be considered as hybrids of the three basic styles.

Each of the ideal types has a clear and distinct internal logic. The central value of hierarchical governance is authority; therefore an authoritative and legitimate form of governance is sought. The central values of network governance are empathy and trust, and therefore, the results are preferably based on consensus. Market governance is based on competition and price, which makes it logical that the best results are the most competitive and cheapest products.

This most used threefold concept of governance leads to defining metagovernance as the governance of hierarchies, networks, and markets. More precisely, metagovernance is that which produces some degree of coordinated governance, by designing and managing sound combinations of hierarchical, market, and network governance, to achieve the best possible outcomes from the viewpoint of those responsible for public sector performance. Metagovernance is not a supergovernance style but an attitude and an approach that is expected to help overcome some of the typical failures of each of the governance styles and of their combinations.

Variations of Metagovernance

The term *metagovernance* was coined by Bob Jessop in 1997. He argued that the three ideal-typical governance styles can be mutually undermining and that they each have their typical failures. He proposed metagovernance as a required coordination mechanism. After having investigated reforms of the Australian public sector, Lynn Davis and Rod Rhodes (2000) confirmed this argument: Creating effective mixtures of the three styles if they undermine each other is an important challenge for the public sector. Another reason why the concept of metagovernance may be useful is that each of the three styles has such a distinct logic that it is quite tempting to consider it as a solution for everything—a panacea—while neglecting the inherent failures of the style and the mitigating characteristics of the other styles.

A last reason is that devising successful approaches to governance has become more difficult since our societies have become more complex. With the emergence of Manuel Castells's network society and the acceptance of network governance as the third main style, the dilemma of dealing with two major approaches, hierarchy and market, evolved into a triple dilemma, or trilemma. The proponents of metagovernance argue that applying metagovernance as judiciously intervening in governance style mixtures, taking a bird's-eye perspective, increases the capability of public sector organizations to deal with complex societal problems or opportunities.

The three ideal types of governance are value laden. Using metagovernance implies deliberately taking a situational view: What is best is determined by the type of problem, the organizational culture, and the level of pressure of stakeholders, for example. The concept has a light normative dimension, because the underlying concept of governance has inherent assumptions, for example, that the intention is to solve collective problems, not for individual profit but for the common good.

Some scholars use the term *metagovernance* in the meaning of the governance of one specific governance style. This form of metagovernance can be called first-order metagovernance, compared with the then second-order metagovernance of hierarchies, networks, and markets. Following this line of thought, Eva Sørensen and Jacob Torfing (2007) define metagovernance as a way to enhance network governance, by use of hierarchical mechanisms or instruments, such as introducing house rules in a network or producing a legal framework in which network processes should occur. This makes sense when the field of research is democratic network governance, where the main tensions are between participative and bureaucratic forms of democracy. Others, such as Josie Kelly (2006), define metagovernance as an attempt to regain state control over new forms of governance. They observe that hierarchical governance emerges in a new form to coordinate network and market styles of governance. This secures governmental influence in the form of command and control within network and market style governance regimes. As Mark Whitehead (2002) notes, metagovernance is then a counterprocess to governance of networks.

The Metagovernor's Rationale

The role of metagovernor can be taken up by any public manager or politician in charge of finding solutions for societal problems or creating new societal opportunities. When such responsible agents design and intervene in governance style mixtures, they may have a specific logic of action or rationale. The question is how they can govern from the center while also maintaining enough autonomy (market governance) and involvement (network governance)? A comparative research showed that public managers used three metagovernance strategies:

1. The first strategy is combining styles. Combining the styles not only prevents conflicts but also creates synergy. Hierarchy brings structure and market governance enriches a network with efficiency and entrepreneurship. Network governance may secure just enough empathy in a new public management approach (which is a combination of the two rational ideal types—hierarchy and market).

2. The second strategy is switching between styles when the situation requires this. A policy project may start with a network approach and then introduce hierarchy by establishing rules, while the next phase may be dominated by market mechanisms such as efficiency-driven autonomous activities of the involved stakeholders. A hierarchical phase may be necessary to secure the results, after which a new network phase may start.

3. The third strategy is maintenance of situationally successful governance-style mixtures. This is a second-order strategy and complements the combining and switching of strategies. For example, conflicts are prevented by isolation—separating a team's approach to prevent it from being undermined by the characteristics of the other styles—or empowerment—giving the team a sufficient high degree of discretion. Maintenance requires awareness of the weaknesses of the three ideal types. During a crisis, for example, the almost unlimited discretion may lead to abuse.

Another dimension of the metagovernor's rationale is the understanding of five framework conditions that influence the feasibility of metagovernance:

1. The first condition concerns the culture, traditions, and history of the administrative and societal

system. National underlying preferences for a governance style influence the composition of governance mixtures to a certain extent but do not predict a specific style combination. However, they seem to predict the first style to be considered—the "default style"—which is, for example, market governance in the United Kingdom, network governance in the Netherlands, and hierarchical governance in Germany. The other styles are only applied when the default style turns out to be inappropriate.

2. The second condition is the personal affinity of the responsible politician with one of the ideal types.

3. The third condition regards societal expectations of the role(s) of governmental organizations. Civil society may lobby for network arrangements, whereas enterprises typically strive for a combination of market and hierarchical governance.

4. The fourth condition concerns organizational characteristics. The organizational culture may be open or closed, professional or task oriented, and the dominant style of leadership may be command and control, coaching, or enabling.

5. The fifth framework condition is the type of problem. This codetermines which style would serve best as the dominant one. If the policy problem is defined as an urgent matter, the rationale is to choose a hierarchical approach. If it is a routine issue that should be dealt with as efficiently as possible, market governance often works best, and for complex problems, network governance has a lot to offer.

Together the strategies and the framework conditions constitute the metagovernor's rationale.

Practical Implications and Feasibility

Metagovernance provides an analytical framework that enables discussions between professionals with different belief systems and can, to a certain extent, be used for the design and management of governance approaches. This applies to both policy making and organizational design.

In addition, the broad version of metagovernance may provide useful insights for the design of management development programs. Such programs usually mirror the dominant style of an organization. The problem is that a hierarchical conception of management development implies training subordinates only to listen well and obey authority, a market-oriented training program promotes clients to become more entrepreneurial, and network training concentrates on helping colleagues create effective dialogues. Management development programs based on the concept of metagovernance would be based on different assumptions. They would teach managers to apply governance styles for which they feel no personal affinity. They would stimulate personal development toward being able to reflect on all governance styles and having enough self-insight to understand their own biases. In addition, they would include training in management techniques that are typical for the three styles: (1) line and project management for hierarchy, (2) business management for market governance, and (3) process management for network governance. They would also involve training in investigating and assessing the governance environment, to be able to deal with the framework conditions distinguished earlier.

Advocates of each of the three governance styles have different assessments of the feasibility of metagovernance. From a network perspective, metagovernance may seem a rational attempt to steer "unsteerable," chaotic situations, which implies that the feasibility is low. Taking the more rational perspective of hierarchical and market governance, there is no fundamental reason to doubt whether metagovernance can be done; however, the problem may have a normative character. For those who take this perspective, introducing metagovernance implies that also the softer, nonrational network approach must be taken into consideration, which might make the governance system messy and slow. Metagovernance does not suggest a rational bias but a perspective over and beyond the rationality versus chaos discussion.

To conclude, metagovernance as mixing hierarchical, network, and market governance provides a bird's-eye view of public issues. The concrete feasibility of metagovernance of the three ideal-typical styles depends on the (metagovern)ability of key people and on the framework conditions distinguished above. Scholars concentrating on this concept hope that such a reflexive, multiperspective view may prevent the public sector from running into unnecessary problems.

METHODOLOGY

Political methodology deals with all issues related to empirical political research (nonempirical work, such as pure formal or normative theory, is excluded here). Methodology, as it is understood here, simply refers to the ways in which we acquire knowledge and comprises a multitude of specific methods and techniques. As such, it is embedded in an epistemological tradition of "critical rationalism" (Karl Popper) and "scientific realism." This has been summarized as the "twofold conviction that the world consists of causal mechanisms that exist independently of our study—or even awareness—of them, and that the methods of science hold our best possibility of our grasping their true character" (Ian Shapiro, 2005, pp. 8–9). While it is often confused with narrower topics such as statistics, methodology is a broad area that deals with every aspect of political research, both quantitative and qualitative. While some methodological issues are more relevant to certain subfields or types of research, all political science is subject to similar standards and logic. While political methodology is related to more general social science methodology, there are specific issues that distinguish political methodology, while there is, of course, a shared logic and standards across the empirical social sciences. Since political science is itself defined by substantive questions, there is much importing of methods from other disciplines into political science. Questions of what is imported and the relevance of imported methods are important issues in political methodology. This entry discusses some of the major advances in this field.

While political methodology deals with empirical research, there cannot be any purely empirical research. Every empirical study involves some relationship between a theoretical concept and its empirical referent. Even very narrow empirical research, such as the measurement of electoral turnout in a given locality in a given period, requires a theoretical assessment of what is electoral turnout. For example, are people who are of legal age to vote but excluded from the process because of a prior felony (as some are in the United States) counted in the denominator? While empirical studies of voting turnout are less complex theoretically than studies of, say, whether being a democracy causes a nation to be more pacific, both studies involve a mix of theoretical and empirical analysis and both can be assessed using the same logic. Thus, issues of measurement are always critical; such issues have become even more critical as technology makes new forms of data (video, blogs) available, or it makes it possible to easily analyze data that we have always used but found hard to deal with (text). The ability to deal with new sources of very complicated data and, with modern computers, the ability to code massive amounts of nonquantitative data, as well as the ability to collect individual data via the Internet, are among the most exciting developments in political methodology. Along with this, there has been much progress on issues of measurement.

Similarly, there can be no difference in the underlying logic of qualitative and quantitative research. While obviously the specific tools will be different, if the question of interest is why countries have differing regulatory systems, we may pursue this in a number of ways. But, in the end, all such studies must be able to answer whether the evidence used leads to the conclusion asserted. While process tracing through official papers of decision makers is different from regressing regulatory rules on political variables, both may use one type of quantitative method, while students of cross-national comparative politics may use another type; these subfields are also subject to the same fundamental logic. This point has been forcefully made in recent years in important books by Gary King, Robert Keohane, and Sidney Verba and by Henry Brady and David Collier. The interrelationship (both similarities and dissimilarities) between quantitative and qualitative analysis, and how to combine both types to improve research, is another research area in political methodology that is seeing much discussion.

Some political science research is purely descriptive: how many people vote, whether more people voted the previous year than this year, and the like. As noted, even for this simple issue, serious measurement issues arise: What kind of people vote, and what does it mean to vote? Obviously, such issues are simpler than asking how many countries are democracies, but the methodological logic does not change. Most political science research, however, is not simply descriptive. While sometimes we care only about associations, much research uses causal language, metaphors, and ideas. Thus, while we might be interested only in whether there is a correlation between being a democracy and the amount of public goods provided, we are often more interested in whether there is a causal relationship, such that being a democracy leads to more public goods being provided. In purely associational studies, the variables are all treated symmetrically; when using the language of causality, there is always a variable that is being caused and one or more variables doing the causing. Issues of assessing causality are in the forefront of current discussions of political methodology, whether quantitative or qualitative. These issues can all be considered under the heading of research design.

Finally, when the above issues have been dealt with, there is the issue of how to get the data to speak clearly and how to assess what inferences can be drawn from the data (be it qualitative or quantitative). This is the realm of statistics (for quantitative studies). Obviously, the use of sophisticated statistical methods has mushroomed in political science, at least partly as a function of the increased computer power that is now commonly available. But while this part of methodology is often seen as highly mathematical and complicated, it is usually the simplest part of political methodology. It is also the case that the most sophisticated statistics cannot save a poor research design or poor measurement; by contrast, good research design often leads to simple statistical analysis. This entry begins with developments in data and measurement, proceeds to research design and measurement, and concludes with a discussion of statistical methods.

Data and Measurement

Empirical research, of course, deals with data (observations), and earliest empirical work, that of Aristotle on constitutions, took as data the various Greek constitutions. Data are gathered in a multitude of ways, ranging from reading diaries or internal records of decision making, to conducting field observations and (unstructured or semistructured) interviews with local leaders, to analyzing carefully collected economic statistics or a variety of highly structured survey data. Every type of research has certain types of data that are more commonly used, but all types of data are subject to the same standards and issues. There is a difference between journalism and political science, and much of that difference has to do with standards for data. Both journalists and political scientists may interview political leaders, but the way they collect and code that information is usually quite different.

Modern technological developments have had an enormous impact on political science data. Much of the data we use are textual (laws, party manifestos, records of debate and deliberation, court decisions, newspaper accounts, and minutes and records of administrative procedures, among many others). Our discipline has always used such data, but coding these data was extremely difficult and time-consuming, leading to such data being underused. Now, much of these data come in machine-readable form, and any data available in hard copy can be scanned and put into such form. Thus, it is now relatively easy to code documents for the use of different types of words (or themes or tropes or whatever one likes). Machines can quickly search the records of various newspapers to code for various types of political events, a task that used to require a large team of graduate students and a very large budget. With modern computations, it is relatively easy for any investigator to code these textual data in a way that meets the needs of an individual research project. This is one of the most exciting advances in data collection in our discipline, an advance that is well under way. The possibilities for the analysis of textual data are almost limitless.

The analysis of surveys has been a mainstay in our discipline for the past half century or more. Until recently, analysts were at the mercy of the survey organization; conducting a survey was a multimillion-dollar task. Thus, electoral analysts in each country worked with the same standard survey collected by some national research organization; research could not go beyond the questions asked by that organization. With modern advances in communications and computers, it is now relatively easy for researchers to design their own surveys to suit the needs of a specific research project. We are also seeing more standardized surveys, so students of elections can now analyze a similar set of questions in almost any European country (and there are similar efforts in other parts of the world, with the Afrobarometer and the Latinobarómetro and the World Values Survey). At the same time, a researcher wanting to study a specific event can put a survey in the field in a short space of time and at a reasonable cost. Larger survey houses can monitor populations over the course of an election and even change or add questions as issues arise over the course of a campaign. Critical to this is the ability to monitor a survey on a day-to-day basis. In earlier times it would have been months or years until survey data became available; with the new technology such data are available on a daily basis. Thus, for example, it was possible to track changes in the British electorate in 2010 and their responses to the introduction of debates into the British campaign soon after or almost immediately.

Modern technology also makes it easy to embed experiments into a survey. Thus, one can give different respondents different scenarios or different question wordings or whatever else one likes, and these different treatments can be chosen randomly. This technology has greatly increased the use of field experiments. The incredible growth of the Internet has been extremely important here. Various survey organizations in many countries give the researcher access to a huge pool of respondents, as well as the tools to quickly design a survey instrument and to allow the researcher to take advantage of experimental manipulation in the questions (subject only to ethical constraints on such manipulation). Internet surveys can be undertaken at very low cost and are within the budget even of students. While there are still many issues on the use of the Internet in this manner, we are clearly seeing more and more use of the Internet (both for reasons of cost and sample size and because other modes of interviewing are becoming more problematic).

Once data are collected, numbers must be assigned. This is the process of measurement, which relies both on concept formation and (for quantitative studies) various methods often associated with psychometrics. Qualitative scholars have paid much attention to concept formation, and, in conjunction with tools such as Charles Ragin's "Qualitative Comparative Analysis," much progress has been made. Students of comparative politics have paid much attention to how concepts generalize across geographic locations and to how we can generalize across locations without having too much "conceptual stretching."

At the same time, statistical and computing advances have allowed researchers to move beyond the psychometric techniques available 20 years ago. Today, there is vibrant activity in multidimensional analysis, and in recent years, scaling techniques, both uni- and multidimensional, have been put on a much firmer theoretical basis. The new textual data have brought to the forefront issues such as how to locate political parties in a multidimensional issue space, and new statistical methods have allowed for great advances in the location of individual legislators in such a space.

The past decade has seen a great increase in the amount of data sharing (largely through the impetus of funding agencies) as well as in journals requiring authors to make replication data sets available. While this works very well for quantitative data, it is more problematic for qualitative data (interviews, field observation notebooks, and the like). However, as it becomes easier to either collect these data in digitized format, or to convert them to such format, it can be expected that it will be as easy to make qualitative data publicly available as it now is for quantitative data (though obviously there are more issues of confidentiality and the like).

Research Design

Political scientists have relied heavily on observational studies (whether quantitative or qualitative). However, while there is some interest in pure description, there is usually more interest in making causal interpretations from the data. Thus, while we begin with simply observing that pairs of democracies usually do not go to war, we are more interested in the question of whether, as countries democratize, they become less likely to go to war. Finally, we try to deepen the explanation, asking what facet of democracy makes democracies less likely to fight each other.

The question of how we can infer causality from observational data has vexed philosophers as long as there have been philosophers. The meaning of causality is a vibrant topic in modern philosophy. Applied researchers have attempted to find ways to assess causality and, at a minimum, to attempt to rule out other, noncausal explanations for findings. In the above example, being a democracy may not really be the causal variable; perhaps, instead, the real causal variable is economic development and richer countries are simply more likely to be democracies. Thus, the observed association (correlation) between democracy and peacefulness could be artifactual or spurious. Both quantitative and qualitative researchers have devoted enormous attention to this issue.

On the purely qualitative side, researchers have paid great attention to J. S. Mill's methods. Thus, we see large numbers of comparative case studies, with researchers choosing the cases so as to obtain variation on the key dependent variable and the causal variable but little or no variation on other variables. Researchers also choose cases for theory testing based on the cases that are likely to prove hardest for the theory to explain. Researchers are also taking advantage of difference in designs where two cases are compared at two different times: where the cases were originally similar but a key variable (and preferably only that key variable) has changed in one case but not in the other.

Moving to larger numbers of cases, researchers have used various configurational techniques to see how variables are related to each other and to study complicated causal paths. Great attention has been paid to necessary and sufficient conditions and to designs that can distinguish whether a condition is necessary, sufficient, or both or in some more complicated relationship to a variable of interest.

Qualitative researchers have often chosen their cases based on issues of research design or the importance of their cases; quantitative researchers, conversely, have often chosen cases to maximize generalizability, either via national surveys or via large cross-country analyses. But trends in quantitative research are tending to blur the difference between qualitative and quantitative designs (with both designs subject to similar standards about inferring causality). All of these are attempts to bring experimental insights into political science.

One relatively new development that shows the convergence of various approaches is the "analytic narrative." Here, researchers attempt to show how some important development in history can be explained by modern analytic theory. While these analytic narratives cannot test analytic theories, they can make such theories more or less plausible. There is much controversy about whether this tool can really be used to either help validate a theory or to explain an important historical event: can a clever user of the tool explain anything, or, as Jon Elster put it, are they simply "just so" stories? However, this joining of modern analytic (usually formal) theory and careful historical evidence shows how two very different traditions can be combined in a potentially fruitful manner.

Political science studies are most frequently observational. Other fields, such as medicine, rely more heavily (though far from exclusively) on experiments. In medicine, the gold standard is the clinical trial, where subjects in a selected pool are randomly assigned to either a "treatment" or "control" group and where, under appropriate conditions, one can infer whether the treatment causes a better outcome.

Experiments are much harder in political science. We cannot assign countries randomly to be either democracies or not, nor can we assign voters to be randomly rich or poor. We can, however, set up a laboratory and then randomly assign participants in an experiment to a treatment or control condition. Thus, for example, we can study whether people prefer "fair outcomes" by having pairs of subjects bargain, where each pair is randomly assigned to some initial endowment or price system. While this is an exciting new area of political science, issues of generalizing from experiments to the real world (external validity) will always limit the use of laboratory experiments in our discipline. However, where experiments are possible, we can be much more certain about assessing whether some political treatment had a causal (and not spurious) effect on an outcome of interest. Experiments may be particularly useful for testing formal theories of politics, since those theories are themselves highly abstract representations of the political universe.

Experiments need not be limited to a laboratory; it is perfectly possible (and now with modern technology even easier) to conduct field experiments. The move from the laboratory to the field increases external validity at the cost of our being less certain about our causal inferences (internal validity). Perhaps the first examples of this came in conjunction with surveys, where different people could randomly receive different question wordings or question orders. It was easy to move beyond this to providing different people different information randomly (subject of course to ethical guidelines on dealing with human subjects, which do not permit, at a minimum, misleading them). Perhaps the most common field experiments have to do with the effect of various attempts to motivate people to vote and to what extent voting turnout can be influenced by various communications strategies.

Field experiments are now also common in the assessment of various interventions. Thus, if we want to know if certain types of political interventions (say national-level monitoring of local corruption) have an effect, and if the area of intervention is chosen randomly (because the state cannot monitor all localities), it is then relatively easy to study the impact of the anticorruption intervention. Of course, this depends on the willingness of the state to intervene randomly, something they are not always (or often) willing to do. On a simple level, we can often study things such as educational reforms by comparing students who were randomly selected for the reform with those who applied but were not selected in a lottery. New programs that are oversubscribed often choose participants in this way. Of course, if we simply compare those in the program with those not in the program, we do not know if the program, or factors that led people to choose to be in the program, led to the observed outcome, and so no causal inference is possible. But there is more and more demand for careful evaluation of programs (such as aid programs sponsored by various large foundations), and so, this type of approach will become more and more common. This is a major step for applied researchers who want to see whether innovations actually work.

A somewhat different, but related, strategy is to keep laboratory control but move the laboratory from the research university to real-world settings. In a university laboratory, we can study how undergraduates in research universities bargain. In field laboratories (again made possible by technological innovations) we can study how a wider group of people bargains. Researchers can also embed more "real-world" features in these experiments. Thus, in some particularly exciting experiments on the role of ethnicity and trust, some people bargained with people of their own ethnic group, while others simply bargained with a randomly selected person. Thus, we can now make advances in studying group trust with studies that are both at least somewhat externally valid while still allowing for reliable causal inference.

Perhaps the strongest convergence of qualitative and quantitative thinking comes in what Donald T. Campbell and Julian Stanley called "quasi experiments" in their pathbreaking 1963 book on research design. Unlike experiments, some external force (political or natural) has "assigned" one group to a treatment and another to a control. Since this is not a true randomized experiment, researchers must show that the treatment was assigned in such a way that the assignment process was independent of the outcome. For example, the British drew boundaries in Africa as if they were random (i.e., following various geographical markers); thus, one ethnic group might be divided between two countries, and one can then see whether there are differences in the behavior of the same ethnic group in the two countries. In the actual study of Daniel Posner, there were two ethnic groups split across two countries, with the division into countries being "as if" random; Posner could then see whether political and social rivalries between the two groups differed as a function of the larger political structures in each country. We are seeing more and more such designs. These research designs obviously have high external validity, though they lack the clear ability to show causal effects, since the assignment to groups was not totally random. But researchers are taking advantage of "almost random" natural assignments to study the effects of changing laws (with laws cutting natural labor markets artificially, the effect of, say, a change in the minimum wage law in half the labor market can be compared with what happened in the same labor market not subject to the change). This approach is very exciting, though of course one must work hard to show that the assignment process was effectively random. From a methodological standpoint, it does not matter whether the data collected from the two groups are quantitative or qualitative, and, in general, both types are collected. But even if the data from the two groups come from large surveys, we are still comparing only two groups.

A related research design that brings together both quantitative and qualitative researchers is the difference-in-difference design. In a simple before-and-after comparison, we do not know if the intervention between the observations caused the observed change. If we simply compare two units, one with an intervention and one without, we do not know if the intervention or something else caused the observed difference. The difference-in-difference design asks the researcher to find two similar units where one unit had an intervention (e.g., a change in a law) and the other did not. We need to be able to observe both units both before and after the intervention in one unit. If there is a bigger difference in the unit with the intervention, then we have evidence that the intervention had a causal impact. As before, this design has good external validity, but it does not rule out all other causal explanations. And, as before, we can compare many units, leading to a quantitative design (so long as the units were similar beforehand), or we can do a simpler two-cases difference-in-difference design, allowing for more in-depth analysis of the two before-and-after cases.

The study of causality has also been a big issue in statistical analysis. But even without statistical innovations, all empirical researchers have clearly been affected by new thinking about using good research design to infer causality.

Statistics

Multiple regression is clearly the workhorse of the quantitative political scientist. But political scientists have been quick to use related methods that better fit the data analyzed. A quarter of a century ago researchers still found methods such as logit and probit for dichotomous dependent variables to be either just at or just beyond their grasp. Today, these methods are commonplace. Similarly, researchers with ordered dependent variables, event count–dependent variables, or length-of-time–dependent variables, typically, know how to find the correct methods (and all commonly used software makes it easy to use these methods in practice). While the gains here are often, but not always, small, they usually come at no price, so there is no question that researchers should match their choice of method to the type of data being analyzed. These issues, typically important in cross-sectional research, are, by and large, now solved problems.

Similar strides have been made in the analysis of time series. While in the past the important issues of time series (which often have enormous consequences for results) were ignored, over the past quarter of a century the discipline has become much more sophisticated. Thus, most researchers analyzing time series get the technical details right. Econometricians, at the same time, have made great strides in studying data that are trending (or, more technically, nonstationary). Political scientists have been quick to pick up on this, and we see much fewer spurious regressions. So while the issues here are more complicated, and there are still open issues about trending series, as with cross-sectional analyses, time-series analyses in political science are now done reasonably well.

In comparative politics, we have data that consist of time series observed over a number of countries: time-series cross-sectional data. Many articles now analyze such data, and the discipline has become good at analyzing such data. Similarly, we can have cross-sectional surveys with repeated observations on each individual: panel data. The analysis of such data has also become commonplace, with the appropriate methods often used. Finally, there have been great advances in data where individuals are observed over multiple units (e.g., common surveys in different countries): multilevel data. Again, there have been great strides recently in the analysis of such data, and the correct analysis of multilevel data has also become more common.

This is not to say that all statistical issues have been solved. Most current methods assume that observations in one unit are independent of observations in other units. But this assumption is clearly false for political science. What goes on in one country affects its neighbors and trading partners; a dyad going to war must have impacts on a large number of other dyads. Recently, political methodologists have been investigating methods for modeling spatially dependent data, and great strides are being made in this area.

Another active area of research is on ecological data, that is, data where interest is on individuals but only aggregate data are observed. Political science is rich with aggregate data, particularly voting data collected at the precinct level. But, often, interest is at the individual level. For example, who voted for the National Socialist Party in Germany in the 1930s? We have lots of data on aggregate vote at the precinct level and some knowledge of the social characteristics of such precincts. Obviously, we would like to do surveys, but these are impossible for events in the past. Since William Robinson's classic 1950 work on the "ecological fallacy," we have known that it is not simple to make inferences about individuals from data collected at a higher level of aggregation. However, recent advances have shown that we can use such data to gain insights into individual data (and also to show when the data cannot support such insights).

An important issue that is currently the subject of much discussion is how to interpret statistical results. Political science has been dominated by the null hypothesis–testing framework, where we calculate the probability of obtaining the data observed if the null hypothesis (almost always that two or more variables are unrelated) is correct. If this probability is low enough, we "reject" the null hypothesis, otherwise we do not reject it. This approach is highly problematic, since rejecting the null hypothesis does not imply that there is a strong relationship between variables, and failing to reject the null hypothesis does not mean that there is no relationship between variables.

In the past few years, there has been much discussion of moving to a Bayesian paradigm. Much of this is driven by the computing power, rather than the interpretive possibilities, made possible by a Bayesian approach. Bayesian interpretation assumes we know something about the world, expressed as a statistical "prior distribution" on some parameters of interest. This prior distribution is combined with the information in the data—the "likelihood"—to produce a posterior distribution. Statements about the parameters of interest can be made based on this posterior distribution. There is much controversy on how to use prior information and on the issue of different scholars having different priors. But this is a very active area of current research, both in political methodology and beyond, and Bayesians ideas (as well as computational methods) are making strong inroads in political science.

Statistics and Causality

Regression and its maximum likelihood cousins (limited dependent variables, event counts, event history, and time series) estimate a model of a dependent variable conditional on an observed set of independent variables; these independent variables are assumed to be exogenous—that is, they are determined outside the system being modeled and hence can be taken as given. For pure description, this is fine. But we generally want to make causal inferences. To take the simplest regression case (and all holds in the more complicated cases mentioned above), we believe the data were generated for unit *i* by the process

$$y_i = \beta x_i + \varepsilon_i,$$

where x refers to either a single independent variable or a vector of such variables, and ε is a standard unknown error term. Clearly, β can be interpreted descriptively—that is, as the slope of a line (or plane) that best fits the points. But can it be interpreted causally—that is, do we believe that if for a given unit x increases by one point, then y will increase by β points? (Obviously, we will have to use an estimate of β, but this discussion holds even if we know the value of β for sure. This is not an issue of estimation.)

There are a number of reasons why the relationship between x and y could be noncausal. The simplest is that there is some other variable, z, that causes both x and y. For example, there may be a good-sized β in a regression of spending on public goods on democracy, but it may be that it is really how rich a country is that is causing both spending on public goods and democracy; there may be no causal relationship between democracy and spending on public goods in the sense that simply making a country more democratic, but keeping everything else the same, may lead to no increase in spending on public goods.

Traditionally, this was dealt with by including z in the regression and seeing if the coefficient on x has changed. This is not an unreasonable way to proceed. However, it can be problematic. First, it assumes that the effect of x and z on y are linear and additive. For just the two variables, this means that we are assuming that

$$y_i = \gamma x_i + \delta z_i + \varepsilon_i,$$

where x and z are now scalars. While the details are a bit more complicated, this procedure estimates the effect of x on y by subtracting off from each observation δz_i. But if the effect of x on y varies with z, or if the linear additive model is otherwise incorrect, this correction is, alas, not correct.

This is not the only problem. Let us say x is binary (democracy/nondemocracy) and let z be national income. Can we make a poor autocracy comparable (in terms of public goods spending) with a rich democracy by simply adding δz (z is income) to its y (spending on public goods)? Given that there are few rich autocracies or poor democracies, this approach depends a lot on extrapolation well outside the data and so depends on a strong belief that the linear additive assumptions are correct.

Recently, researchers have proceeded in a different way, at least for the binary x case. For each democracy, they attempt to find one or more autocracies that are very close on various exogenous variables that might influence x and z (what Judea Pearl has called backdoor paths between x and y and what Paul Rubin has called confounders). If one has eliminated all potential "confounders" by matching them, then the difference in means between the democracies and autocracies will give us the effect of democracy on y. Of course, this means that the various confounders must be observable and measured in the data set (and, of course, there are many technical issues that must be resolved by the researcher).

What if we cannot match all the democracies with autocracies? These unmatched cases are simply dropped from the analysis. Thus, we do not have to extrapolate well beyond the data, but this limits us to studying causal impacts in comparable cases; thus, for example, we cannot say what would happen if Denmark were to become an autocracy. This is almost certainly the right degree of modesty.

This matching literature is undergoing rapid development at the current time. Issues that must be studied include how to handle continuous (or multivalued) xs and how to deal with studies where we cannot focus solely on one independent variable of interest. There are also many technical issues that are continually being dealt with, such as what does it mean for two cases to match and how many and which cases should be dropped from an analysis because they do not match. But clearly, this approach is often superior to multiple regression (and when multiple regression is correct, it provides roughly the same answer).

Perhaps more important, even if one decides to continue to run regressions, the insights of the matching and causality literatures are of great value. There are two difficult issues in multiple regression on which statistics give few insights: which independent variables to include in the regression and which cases should be studied. The matching approach suggests that only variables that are on backdoor paths between the key independent variable and the dependent variable should be included in the regression. Equally important, variables on front door paths, where x causes z and y, should not be included in the regression. Thus, if some variable is a consequence of x, if we include it in the regression, we may incorrectly conclude that x has no causal impact on y.

In terms of which cases to include in a regression, the matching literature tells us that, for any given potential causal variable, some cases give us no leverage because it is impossible to match cases where the causal variable is present to those where it is absent. This is often not a problem in survey analysis but can be a major problem in the study of comparative and international politics. We often analyze a group of countries because they belong to a data-reporting organization; the matching approach gives a more principled way of starting to think about which cases should be included in an analysis. And, just as important, the cases to include vary with the causal variable being studied. But, as with simple matching, we then must remember that the causal effect that is estimated is a function of which cases are studied.

The matching approach (and multiple regression) assumes that we can observe the various confounders that impede causal inference. But what if they cannot be observed? There are several approaches that are promising, though, as with any method, they must be used with care. One is to model what is known as selection and the other is to use what are known as instrumental variables. These deal with issues of selection bias and endogeneity.

Selection bias is a critical empirical issue. In applied work, if we want to see if, say, some new type of school provides better outcomes, and we compare outcomes of those who attend the new school against a sample from other schools, we may find that the new type of school seems to work either because better students choose to go there or because students who have knowledge of themselves and who have good reason to believe that the new type of school will work for them choose the new school. The former problem is always critical, while the latter is critical if we wish to encourage everyone to use the new type of school.

This problem was formalized by the Nobel Prize–winning economist James Heckman in the 1980s. He was interested in the returns to education (in terms of wages) of women; we only observe the wages of women who choose to enter the labor market. This may lead to underestimating the effect of education on women's wages, since women with less education may only enter the labor market if they have some reason to know that they will do well in that market. Alas, such reasons are usually not observable in a data set.

In political science, we may be interested in the effect of being involved in a scandal on the electoral success of incumbents running for reelection. But those who see little chance of reelection may choose not to run, and those who were involved in a scandal but chose to run anyway may have private reasons to know that they are likely to do well. Are campaign ads effective? Perhaps people who already like a candidate are more likely to see that candidate's ads.

Similarly, in international relations, if we only study the outcomes of wars, many nations that are militarily weak may simply choose not to fight; thus, the weak will fight only if they have some private information that they have a chance of winning, and so we may underestimate the effect of military strength on winning a war. Similarly, does international mediation actually help solve conflicts? Perhaps mediators only take on their task when they think success is likely. In comparative politics, autocrats who believe that they can remain in power if they liberalize are perhaps more likely to liberalize. These are just a few examples, but selection bias is pervasive in observational studies.

One solution is to match those who select some treatment (war, watching an ad, etc.) with those who chose not to do so. But if the data set does not contain enough information to match on critical variables (nations that are militarily weak but have other, unobserved, private reasons to believe that war is in their interest), this approach does not work. Heckman suggested a two-equation model, one for selection and one for the outcome-given selection, with the errors in the two equations correlated (so that nations that should not have gone to war but did for unobservable [error term] reasons will also be more likely to do better, again for reasons that are in the error term). Note also that the various research design issues (experiments, quasi experiments, and such) can also be a critical tool for dealing with selection bias. But even if there is no statistical solution available, and we are not lucky enough to observe a good quasi-experimental situation, understanding the nature of the problem is critical for causal inference.

The other issue is endogeneity. Does high income lead to good institutions or do good institutions lead to high income? Do voters who like some candidate assume his or her position to be close to theirs or does closeness on issues lead voters to choose that candidate? Disentangling whether *x* causes *y* or *y* causes *x* is critical to political science; and observational data on cross-sections cannot help answer this question, since, as is well known, association tells us nothing about causation. For the above two examples, we would observe the same exact data regardless of the causal process. The research design tools discussed previously can sort out these issues; if *x* changed for some reason external to the system (perhaps because of some natural event), then we could study whether *x* causes *y* and is not simply associated with it.

In the 1950s, economists associated with the Cowles Foundation at Yale thought they could solve the problem by estimating a series of equations, one for *x* and one for *y*. Of course, these had to be estimated jointly, and this technique came to be known as the estimation of simultaneous equations. Interest in this approach waned as it became obvious that we simply lacked strong enough theory to allow the estimation of such equations. This theory, at a minimum, was necessary to tell us that there was some exogenous *z* that affected *y* and not *x* and some other exogenous *w* that affected *x* and not *y*. At least in political science, it seemed hard to find such exogenous variables with such asymmetrical effects.

Interest in part of this approach—instrumental variables—started to reappear in the 1990s and now has become an extremely active area of research. The basic idea is that we are interested in the causal impact of, say, economic growth on having a civil war. However, in a cross-sectional study, we would worry that civil wars hurt economic growth. The instrumental-variable approach is to find some exogenous variable that affects growth but only affects civil wars through its link with economic growth. In an ingenious study, Ted Miguel, Shanker Satyanath, and Ernest Sergenti decided that, for southern Africa, rainfall would be a good instrument. They had to convince themselves that rainfall affected the outbreak of civil war only through economic growth (since it is clear that rainfall is exogenous). The method of instrumental variables, in its simplest form, then regressed both civil wars and economic growth on rainfall (both regressions are fine since rainfall is exogenous). Having the effect of rainfall on both variables, we can divide these effects and then obtain a good estimate of the impact of economic growth on civil wars without worrying about the reverse direction of causality.

Research on instrumental variables, both on the theory on when they are useful and also in various applications, is one of the most vibrant current research areas in political science. It is hard, but not impossible, to find good instruments. There is much current research on what properties a good instrument should possess and if and how empirical researchers can test whether a given instrument is a good one.

Conclusion

Political methodology was not even considered a field for research 30 years ago. The world has changed remarkably. The American Political Science Association has subfield groups for both quantitative and qualitative methodology; these groups are among the largest such groups in the association. The past few years have seen a huge increase in specialized short courses in methodology, both quantitative and qualitative, worldwide. Almost all departments of political science now require methods training for all of their PhD students.

Thirty years ago, the focus was on statistical inference. While many still focus on that issue, the advances over the past 30 years have made the estimation of many complicated models quite easy. Today, there is an incredible revolution in data collection and measurement, and renewed interest in research design, especially as it relates to making causal inferences. There has been huge growth in thinking about experimental and quasi-experimental approaches to studying critical questions.

While qualitative and quantitative researchers often go their separate ways, there is surely renewed interest in what these two approaches have in common methodologically (and where they appropriately differ). In short, political methodology has been one of the great success stories of our discipline over the past 30 years.

MIGRATION

Migration is a topic that is characterized by an interdisciplinary approach, both theoretically and empirically. It crosses several disciplines, including demography, geography, sociology, anthropology, economy, history, and political science. Social scientists do not study migration from a shared paradigm but from a variety of competing theoretical viewpoints that are fragmented across disciplines. Migration emerged as a field of research in political science in the mid-20th century, and in the 1980s to 1990s, it had already become a major research topic. It is now one of the major political issues facing the 21st century. It has taken time for migration to acquire legitimacy as a research topic in the discipline. Several factors contributed to create this delay, among which are the absence of a political theory of international migration, a lack of cohesion between macro- and microanalysis, and the fact that the problematics raised by migrations are constantly evolving.

The term *migration* refers to human mobility: A migrant is someone who has left his or her country of birth and who is living in another country. A *migrant* differs from a *foreigner*, the latter being defined juridically as a "nonnational." There are internal and external migrations. Most international migrants are foreigners, and most foreigners are migrants, but not automatically so. Today, we are facing the second wave of world migration since the mid-19th century, when millions of Europeans left Europe for the New World to find work (United States, Canada, Australia, New Zealand, Latin America), to colonize and conquer (Asia and Africa), for trade, or as missionaries. The number of migrants (200 million, 3% of the world population) has tripled since 1970, and globalization, the transnationalization of networks, and push-and-pull factors have made individuals mobile internationally. Together, these factors challenge national borders, the sovereignty of states, and the notion of citizenship, which in turn affects international relations (IR) and political identities.

Most political science research that focuses on migration tends to deal with either the role of the nation-state in controlling its borders, the making of immigration policy, the impact of migration on sovereignty (including foreign and national security), or issues of citizenship (dissociation between nationality and citizenship, identity, allegiances, and political inclusion). Such research draws on several disciplines, including IR, public policies, and the sociology of political behavior. Research conducted within the field of migration studies takes two main directions: on the one hand, the study of flows (migration policies and comparative and international analysis), which focuses on macrolevel issues, and on the other hand, the study of stocks (on living together and political incorporation), which focuses mainly on microlevel issues. Placing emphasis on the existence/the study of social ties, some political scientists have proposed a "mesolevel" of analysis. Some problematics remain unexplored, and gaps in the research include topics such as emigration policies (rules of exit), the "diplomacy of migration" led by emigration countries, or the root causes of the establishment of regional or world migration systems. Many political scientists have studied the respective impact of political decision making and of other competing factors, such as economic liberalization and securitization, on the opening and closing of borders. Others have focused on the relation between citizenship and the political inclusion of migrants. However, only a few have analyzed the link between immigration flows, incorporation (integration) policies, and political behavior.

If migration has become an object of analysis encompassing local, regional, national, and international levels, it has also weakened the two central pillars of the international political system: (1) sovereignty and (2) citizenship. Migration brings anomie to the national and international realms, where the state would want to remain the exclusive actor. Nation-states are currently threatened from above by globalization and from below by multiculturalism. In the following sections, we will analyze to what extent migration, as it blurs the frontiers between sovereignty and citizenship, undermines the external and the internal political order.

Migration and Sovereignty

Difficulties of Border Control

Despite the development of transnationalism, mainstream scholars have continued to view the state as a unitary and rational actor and to place it at the center of their analyses. The first question that is raised by migration in relation to the issue of sovereignty is linked to border control. Migration challenges the Weberian notion of sovereignty, in that it questions the relation between population, territorial space, and monopoly of power. In the past, many states viewed migration as a break of allegiances, and they fought against nomadism to control their territories. Today, several factors undermine state sovereignty, notably the inability of states to control the flow of illegal immigrants across their borders, the capacity of states to rule migrations through regional agreements and international rules, and the fact that heterogeneous populations and minorities now contribute to define national identity. In a context where the vast majority of the world is sedentary, migration appears as an exception that has rapidly grown due to fluid exchanges (transportation, and information facilities and networks). The right to mobility is itself becoming a human value. The main difference between the first world migration wave of 1880–1920 and the second one of 1980–2000s lies in the border control of immigration and emigration countries. A century ago, it was as difficult for one to leave one's own country (because borders were closed from inside) as it was easy for one to enter another country (because there were at that time only few controls and passports). The population was a state's main resource, and its movement was either prohibited or strictly controlled. On the other hand, in countries of arrival, new populations were welcome to work and to settle. Now, the situation has reversed, even in countries such as the former USSR, China, and most Third World countries, where the change took longer to settle. Opened borders are now commonplace in countries of departure, which see emigration as a good thing for them. On the other hand, it has become very difficult to enter countries that are attempting to fight undesired immigration flows.

Markets and Mobility Rights

Liberal democracies in particular have difficulties in controlling immigration. The notion of sovereignty and its emphasis on upholding political order and a feeling of political community within borders is challenged by a liberal commitment to the free flow of goods, money, and people across borders. Migrations exacerbate the relations between states and markets: Sometimes the state is brought back in, and sometimes the gap between actual migration flows and migration policies deepens. James Hollifield has called this the "liberal paradox." Pressure on immigration policy comes from numerous organized and contradictory interest groups such as political parties, trade unions, employers, associations of human rights, and countries of origin. However, it is difficult to conciliate control in democratic societies. Why, then, do states "risk" migration? They risk migration for economic, demographic, and human rights reasons (asylum). Why, on the contrary, do states close their borders? The states close their borders to maintain internal political order and a welfare system as well as to accommodate public opinion. As noted by Myron Weiner, in a globalized world where states fail to fully manage migration and in which individuals are the main actors, the increase of international migration is viewed as a threat to security and stability. Although international and national rights set out a framework within which states control immigration, most democratic states eventually end up both failing to control borders and violating human rights principles and international conventions. At the European level, and through the use of buffer zones, states are developing regional migratory systems as well as externalized and remote controls of borders. Neighboring countries—which sometimes tend to serve as departure or transit countries—are becoming border guards. However, repression does not prove dissuasive, and states fail to fully control population movements. In fact, pull factors and networks are revealed to be stronger than the public policies of immigration countries. Some political scientists have formulated hypotheses about the political dimension of international migration. In particular, as they noticed that the "main gates" of entrance were closing and the "back doors" were opening to illegal immigrants, some, such as Aristide Zolberg and colleagues (1989), developed the idea that controlling the territory actually blurs the boundaries between the internal and the international political order. When migration for economic purposes is closed, illegal immigrants seek asylum, citing environmental concerns or family links as reasons for migration. As a result, they contribute to blur traditional categories of migrants. Such a mix-up is also caused by the fact that, depending on circumstances, illegal immigrants fit within various migrant categories. Even when poverty level and demographic pressure are high, they are able to build networks, without which there is no migration. They are also very active in campaigning for the recognition of the right to mobility as a "right to have rights," as defined by philosophers such as Immanuel Kant, Hannah Arendt, and Zygmunt Bauman. Thereby, the right to mobility is seen as a human right in the process of being consecrated. An idea of migrations without borders is emerging that would be seen as a world public good and that could be managed through global governance on the legal basis set out in international rules, such as the Universal Declaration of Human Rights of 1948 and the United Nations Convention on the Rights of All Migrant Workers and Their Families of 1990. In such a system, multilateral decision making would guarantee well-balanced mobility. The human rights regime that is currently taking shape goes beyond states. It is a postnational regime within which international conventions will grant migrants an international legal status.

Transnational Networks Another factor that is currently challenging the sovereignty of the nation-state is the growing importance of social networks that link sending and receiving countries together. States are no longer the sole actors of international migrations: firms, individuals, and transnational communities bypass the regulatory authority of sovereign states. While the world is going through a process of individualization, states are experiencing deterritorialization. Transnational networks challenge the international order of nation-states. Not being able to control migrants, nation-states are not the most legitimate actors of IR anymore. The development of transnational economies led to the creation of transnational social links, and increased communications rendered national migration policies nearly obsolete. These policies are now challenged by networks and by migrants themselves. Alejandro Portes developed the notion of "transnational communities" to explain the logic of international migration flows and patterns of immigrant incorporation. While the international economy pushes for borders to be more open, internal policy pushes for their closure. As Saskia Sassen has observed, globalization has led to the rise of a structural demand for foreign labor and to a loss of border control. Demand for foreign labor is "structurally embedded" (Wayne Cornelius, 1994) in the more advanced industrial societies that cannot function without a cheap labor force. As a result, little space is left for states and national regulations, and the state is marginalized in its efforts to structure international migration. Transnational networks and transnational communities also contribute to strengthening economic globalization: Through remittances ($300 billion in 2007), migrants become the main actors of development in their country of origin; ethnic entrepreneurship creates gray areas where goods, people, and money can circulate freely; family reunification and transnational marriages represent half of the legal entries in most immigration countries, and ethnic minorities are a new factor of transnational citizenship. Diasporas and quasi diasporas collectively contribute to instill more fluidity in the world of nation-states and closed borders.

Blurred Boundaries Between Internal and External Political Order

As Zolberg and his colleagues note, migration blurs the distinction between the internal and the external political order. The theory of globalization, which takes inspiration from the sociology of IR, introduces with migration a bottom-up analysis of the social texture of IR. It is well recognized that external factors may have an impact on internal political orders. For example, conflicts abroad affect refugees, displaced persons, and economic and demographic gaps; and environmental issues affect population movements. Receiving and sending countries often settle bilateral or multilateral agreements that can involve trading raw materials or labor force against legalization procedures, as was the case between Mexico and the United States. Along the same lines, France has been granting residence cards to elites of poor countries and promised development policies in exchange for the repatriation of illegal migrants. Some emigration countries such as Morocco, Turkey, and Mexico are now pursuing a "diplomacy of migration" with rich neighboring countries: Dual nationals, who became voters and were sometimes elected in immigration countries, are being used to influence and sometimes to intrude in some delicate matters such as the practice of Islam within host societies, plural allegiances, or multiple belongings of new citizens. The security approach to migration has contributed to an increasing mix of internal and external politics, leaving little space for state and national regulations while favoring regional agreements such as those addressing the security of European borders. Migration previously dealt with "low politics," but it is now regulated through "high" IR politics, which traditionally deals with war and peace, national security, foreign policy, and regional equilibriums. However, pressures to put international migration higher on the IR agenda did not succeed before the late 1990s. Some IR theorists who were initially interested in international security questions turned to issues related to population control and terrorism instead and began to assert that international population movements and transnational networks can have a dramatic impact on the security and sovereignty of states.

Migration and Citizenship

Migrants as Political Actors in a Multidimensional Political Space

With migration in the foreground, citizenship cannot be understood in its traditional context any more. Initial research introducing migration as a research object of political science focused on migrants as future citizens (from political acculturation to political participation); on migrants who were mostly concerned with politics in their country of origin, either because they were refugees or because, on the contrary, they hoped to return to their home country; or on migrants as politically alienated individuals, eventually involved in social mobilizations around housing issues or at work (politicization of nonpolitical matters). Such research was rooted altogether in sociology (theories of incorporation), economics (labor market analysis of migrants as short-term guest workers), and law (prohibition of any political expression for migrants coming from dictatorships or from former colonized territories). In the workplace, most migrants were integrated. They progressively gained equal representation in firms and trade unions, putting forward claims for freedom of association and for the right to political representation. In Northern European countries, where they were granted local political rights while still being denied full citizenship, migrants became, in Tomas Hammar's term, *denizens*. Albert Hirschman's (1970) treatise *Exit, Voice and Loyalty* illustrates this situation well.

Evolution of the Concept of Citizenship

The notion of citizenship became part of the political analysis of migration in the 1980s. Since then, migration progressively altered the very content of citizenship, most notably through dissociating citizenship from nationality. Studies of the long-term settlement of immigrants in Canada and Australia, and, through comparative approaches, in European countries, examined how far migration was altering the content of citizenship and to what extent citizenship was raising new issues in the field of migration. Field research showed that the emergence of migrants—mostly second-generation migrants—in the political sphere raised the questions of "membership" and "belonging" in immigration countries and of a "double presence" through immigration. Some years later, the idea of a "double presence" affecting citizenship (through double citizenship, multiple allegiances, and plural citizenship) could indeed be substituted for Abdelmalek Sayad's concept of a "double absence" of migrant workers from both their home and host countries. As new nationals of immigrant origin take part in the local civic life, citizenship is seen more as a participative matter rather than being limited to the act of voting. This constitutes a return of the concept of citizenship as was understood during the French Revolution of 1789 (e.g., in the Constitution of 1793, participation in, and adhesion to, the new ideals were considered more important than the question of whether one was or was not a national).

Dissociation Between Nationality, Citizenship, and Dual Citizenship

The dissociation between nationality and citizenship is the most important issue that has been raised by increasing migration and integration among European states. The granting of local voting rights to all foreigners in some Northern European countries followed by the granting of local voting rights to all European citizens living in a different European country (European citizenship) showed that one can be a citizen without being a national of a country, as a result of involvement in local political affairs. In the past, some nationals were not considered full citizens (colonial indigenous people, women, those condemned to prison or to death, the disabled, and soldiers). Approaches to citizenship have evolved through time, and citizenship and nationality have only recently been associated with the rise of the nation-state. The newly found importance of the local manifests itself through the emergence of the notion of "residence citizenship" and through the use of *jus soli* by immigration countries that needed to include the new citizens. In France, the "*beur* movement" added meaning to the classical understanding of citizenship when it introduced the idea of "new citizenship." "New citizenship" is a mix of localism, grassroots participation in inner-city communities, multiple allegiances, and respect for republican values while expressing collective claims to, and identification with, ethnicity and Islam. The idea is that one can be a citizen while being culturally different from other citizens. In the 1990s, most European countries faced widespread debates concerning the reform of their nationality codes. States reacted by introducing elements of *jus soli* into their nationality codes that traditionally rested on *jus sanguinis*. Rogers Brubaker theorized the relations between immigration and citizenship and showed that naturalization law and policies affect the rate at which newcomers are politically incorporated. *Jus sanguinis* immigration countries that were most reluctant to open their nationality codes to newcomers now offer some opportunities to include them as future citizens. In most cases, degrees of political rights and of incorporation can be pictured as a series of concentric circles: At the center are national citizens who are granted the whole range of political rights, and at the outskirts are illegal immigrants and asylum seekers who have no means of political action apart from holding hunger strikes or other protests on the streets. Even in a country such as Japan, which refuses to change its criteria for Japanese identity in order to preserve "racial purity," the nationality code now includes various hierarchized categories of migrants. The transnational nature of migration has also led to situations of "dual citizenship," with *jus sanguinis* being the rule in the country of origin of first-generation migrants and *jus soli* being applied in the country of birth of following generations. With such massive increases in migration, this concept of dual citizenship will develop throughout the world. New realities further stem from this context: Individuals now have plural allegiances to several political spheres; countries of origin attempt to increase their political power by using their own nationals who live abroad and who became citizens in the host country as a potential collective force; diasporic states use displaced persons and refugees living abroad as part of an "influence diplomacy." New citizens (e.g., Latinos in the United States, Germans of Turkish origin in Germany, French from the so-called diversity in France, and

Commonwealth citizens in the United Kingdom) are cherished by most political parties, which are always in need of new voters to extend their political base. Indeed, these new citizens do not necessarily form a voting bloc based on ethnicity or other common identity. In that sense, Islam has somehow introduced new types of relationships between citizenship and religion, leading to a plural citizenship, related to two different nation-states, that created an alternative to voting on an ethnic or on a religious basis.

Multicultural and Transnational Citizenship

Citizenship can no longer be understood in the traditional context of a unified culture. Some countries such as Canada and Australia, where citizenship used to be based on the myth of national homogeneity, have now included multiculturalism as part of the very definition of citizenship. As a result, ethnicity is now a constitutive part of the identity of host societies. In the same way as liberalism and multiculturalism are understood to be working hand in hand, citizenship is now necessarily linked to multiculturalism in countries with large immigrant populations. Over the past few decades, transnationalism has become an important conceptual approach, and, as noted by Rainer Bauböck, transnational citizenship is now accepted as characterizing most or all postmodern states. The nation-state is overwhelmed by such an expression of citizenship across borders: It is unable to both confront the political consequences of the world economy and respond to the challenge of ethnicity. As mobility becomes a way of life and as the free movement of people and cross-national relations intensify, new forms of transnational citizenship increasingly contribute to reshape traditional models of citizenship.

The Individual Migrant as an Actor

At the international level, citizenship has also been transformed through the emergence of migrants as individual actors on the international scene. Migrants are at the cross-point between identities of states and blurred boundaries of territories. As they struggle to achieve their individual goals and to reshape their own life, they become "actors of the future" par excellence: They no longer feel doomed just because they were born in a misgoverned and poor country. Through remittances, migrants also have an effect on the lives of individuals in their country of origin. Further, various transnational practices of migrants challenge the international order that was created by, and served to, nation-states with a large immigrant population.

At the internal level, the existence of discrimination and diversity complicate the issue of citizenship. Also, as noted above, Islam, which is a minority religion in most immigration countries, introduces a system of plural allegiances. This system differs from the former model of citizenship, which implied citizens' exclusive allegiance to the nation-state. Ethnic diversity breaks the myth of a homogeneous nation, in which citizenship would rest on a social contract and where cultural practices and values of citizens would only be expressed in a "private sphere," while the public sphere would be freed from such practices and values. Minority religions, poverty, and ethnicity often lead to discrimination. Discrimination in turn casts doubt on the effectiveness of declarative citizenship rights that neither question citizens' unequal access to rights nor their unequal treatment by institutions. Thanks to migration, diversity is seen as a value in itself that should be considered as an integral part of modern citizenship; and modern citizenship has become plural, transnational, multicultural, and antidiscriminative.

Migration and the Field of Political Science

Migration, by nature, is multidisciplinary; thus, it took a long time for political scientists to include it as a legitimate political science object of study. Migration's main contribution to the field of political science lies in the way it challenges the state as the main actor that regulates borders, identity, and citizenship. Migration places individuals on the forefront: Through it, they become actors of IR. Transnational ties have become the most important networks, and migrants, who play an active role in managing mobility, have become multilateral decision makers. By creating new values for living together in a political community, migration enriches citizenship. Illegal immigrants are now campaigning for the consecration of a right to mobility as a human right. In a world of free movement and blurred borders, such a right could be managed through global governance. Up until now, attempts to unify migration theories have failed because these theories rest on numerous and very dissimilar macro- and micro-approaches. When states failed to control borders and to prevent violence and religious extremism, they attempted to regulate migration through security approaches that came from the field of strategic studies. Migration, however, is an ordinary human phenomenon that has always existed and that should be studied through the lens of comparative approaches on "living together" in an interdependent and constantly changing world.

MILITARY RULE

For most of human history, attaching "military" to "rule" would have been redundant, because almost all political regimes in large-scale societies of the premodern period fused military, religious, economic, and monarchical power. The separation of military and civilian powers and the development of professional, bureaucratic armed forces in European states in the 18th and 19th centuries gave birth to the contemporary understanding of military rule. The most useful definition of the term is a political regime in which the military as an organization holds a preponderance of power. Military rule in this definition is synonymous with military regime and refers to a subtype of authoritarian regime. Other definitions can be useful for exploring specific issues. For example, military rule is sometimes defined as a political regime in which the head of the executive is an active-duty member of the armed forces. Another definition restricts military rule to a regime in which the executive is ruled by a Latin American–style junta consisting of commanders of each of the branches of the armed forces. Nevertheless, the broad organizational definition given above is probably the most useful. It allows for the exploration of a form of rule that has been both common and—frequently—violently repressive. This entry discusses the following important issues related to military rule: the factors that lead to military rule; how militaries mobilize support and exercise power; why and how military rule comes to an end; and what sorts of political arrangements are most likely to diminish military rule, now and in the future.

Not all authoritarian regimes involve military rule. In the 20th century, the most repressive nondemocratic regimes, most notably the Nazis in Germany and the Stalinist regime in the Soviet Union, were party dictatorships in which civilian control of the military was well established. Other types of authoritarian rule distinct from military rule include traditional (e.g., absolutist monarchies) and personalistic or "sultanistic" regimes.

Military rule since the end of World War II has occurred almost exclusively in countries of the so-called developing world. Explanations of the phenomenon vary. Some scholars explain various aspects of military rule largely in terms of political economy and specifically to the position of a given country in the global capitalist system as well as its domestic class structure. This is a hallmark, for example, of studies of "bureaucratic–authoritarian" military regimes or military rule marked by a high degree of state capacity both in managing the economy and demobilizing and repressing civil society. Other explanations rely more on geopolitical dynamics, including the international alliances within which military regimes are embedded. Studies of Cold War "clients" of the two superpowers, many of which were military regimes, are an example of this approach. A third perspective ascribes military rule to specific national and regional cultures. Finally, a fourth, institutionalist perspective sees military rule as an outcome of more or less rational and more or less historically conditioned responses to specific challenges of economic development and political legitimacy in the developing world.

Origins of Military Rule

Militaries are part of the state apparatus but enjoy a high degree of relative autonomy because of their control over the means of coercion. (This control, while still significant in most places, does not necessarily represent a monopoly, owing to the prevalence of irregular armed forces in the developing world.) However, militaries do not constitute a monolithic, single actor. They are hierarchically divided between a high command, junior officers, and enlisted personnel, and horizontal competition and rivalry between the different service branches (typically the Army, Navy, and Air Force) can be intense. Further, they are often divided along class, regional, and gender lines (although militaries in most developing countries still allow very limited roles for women). In ethnically divided societies, variation in rates of military recruitment across the major ethnic groups can result in the armed forces being seen as constituted by, or representing, one ethnic group against others. All these divisions tend to be exacerbated when the military comes to power, and many military regimes have foundered due to their inability to manage them.

Modernization theorists, influential in the 1950s and 1960s, were initially confident that the newly independent nations of the Middle East, Africa, and Asia (as well as Latin America) would evolve into capitalist democracies, with civilian control over the military. These expectations were dashed by a wave of military coups d'état that reached its height in the 1960s and 1970s. The army was usually the most important actor in these actions. Uncovering the mechanisms of coups is difficult, since of course the necessity of surprise requires coup plotters to work in secret. Coups have been common in modern politics. One study claims that since 1945 there have been 345 successful military coups around the world (see Paul Collier, 2009, p. 8) on an average of more than five per year. But for each successful coup, there were several attempted coups and coup plots that were foiled before they could be carried out, making the phenomenon even more ubiquitous. Factors that have been associated with successful coups include acceptance of the coup by a hegemonic regional power, the military's cultivation of key civilian allies, the exploitation of the weakness or absence of the deposed leader, the speed and decisiveness of the coup, the seizure and use of the major means of communication to justify the coup and establish the new regime, and purges of opponents in the armed forces, the rest of the state, and civil society.

A key moment after a military coup is in the intervening weeks and months, when the new leaders establish their political regime. Military regimes are usually marked by one or more of the following characteristics:

> key political leadership held by military officers;
>
> the lack of central, civilian political control over the armed forces;
>
> the application of military law to civilians; and
>
> the threat or use of extrajudicial repression (such as torture, disappearances, and killings) by the state's security forces.

Military rule can be either temporary or long term. It can also revolve around a single strong man or woman and his or her followers or develop a more corporate and institutionalized ethos. The rise of military regimes elicited a reaction from modernization theorists, some of whom decried the trend, while others identified the military as a preeminently "modernizing" institution and praised the armed forces' allegedly unique capacity to achieve economic development and political stability. However, cross-national statistical work has not found a correlation between military rule and high economic growth rates. While examples of successful economic management, such as that of the Park Chung-hee regime in South Korea (1961–1979) exist, there are also many examples of military regimes whose economic record is less than stellar.

Analyses of the rise of military rule in developing countries abound. Large-*n* empirical studies suggest that there is no direct correlation between the size of the military or its budget and its propensity to seize power. Further, the reasons for hierarchical coups (led by the high command) tend to be different from those for coups led by junior officers (those with the rank of, or equivalent to, Army captain or below). Rather more useful is the distinction between factors internal to the armed forces, domestic political variables, and international influences. In the first category, violations of military hierarchy by civilian politicians, an expansion of the military's capacity and/or sense of mission, and a heightened sense of threat can all trigger coups. With regard to domestic politics, high degrees of political conflict (especially ethnic and religious conflict), economic crises, weak political parties (especially right-wing parties), and low-capacity state institutions have been observed to precede military takeovers. Significant in this category is also the image of the military in national politics and in particular the degree of popular identification of the military with certain positive national values. Internationally, the threat of or defeat in war, foreign political and military assistance, and an enabling international environment, including military rule in neighboring countries and international recognition of military regimes, can facilitate coups. A "cascade effect" has been observed in some regions, whereby military rule, first established in a single country, occurs elsewhere in subsequent years, leading to cooperation between military regimes. (For example, the 1964 coup in Brazil was followed by a coup in 1966 in Argentina, coups in 1973 in Chile and Uruguay, and again in Argentina in 1976.)

In general, there has been a shift in recent decades away from macrohistorical explanations of military rule to studies that emphasize the importance of contingency, strategic interaction, and short-term factors. Nevertheless, much recent work suggests that an important structural variable is causally connected to the rise and decline of military rule: superpower competition during the Cold War. Large amounts of military assistance from the United States and the Soviet Union strengthened military capacity within allied or "client" states. Within the U.S. sphere of influence, the increased emphasis on internal security threats in the wake of the Cuban Revolution (1959) contributed to an increase in direct military involvement in politics. Since the end of the Cold War and the breakup of the Soviet Union in 1991, there has been a marked decline in the number of military regimes in the developing world. This decline had already begun during the so-called third wave of democratization that started in the mid-1970s, continued with the fading of the Cold War in the 1980s, and extended into the post–Cold War period of the 1990s and 2000s.

Mechanisms and Impacts of Military Rule

Militaries are hierarchical organizations that specialize in the deployment of violence, so it is often assumed that militaries rule by force and force alone. However, military rule often involves complicated attempts to secure some measure of consent from the governed. Some military regimes, for example, have permitted elections to national and subnational representative bodies. Others have used judiciaries, of varying degrees of independence, to approximate or simulate the rule of law. Still others have promulgated, and sometimes actually adhered to, constitutions.

Unsurprisingly, empirical studies suggest that military regimes are likely to increase military budgets more than their civilian counterparts. Similarly, they tend to engage in more human rights abuses than do civilian regimes. Military rulers usually confront a "coercion problem," in which they not only require security forces to engage in repression but also need to monitor those security forces, something they can do in different ways, each of which has costs. When it comes to regime legitimation, most military rulers take pains to present their intervention in politics as being compelled by some sort of crisis (of corruption, economic instability, succession, or the like) and carried out strictly in the service of the nation. "Nation building" has often been a key goal of military rule in the developing world. In several instances, military regimes lacked a legitimating ideology of their own, describing their rule as a temporary interlude necessary for restoring "order" before restoring power to civilians. This led Juan Linz (1974) to call such instances of military rule "authoritarian situations" rather than "authoritarian regimes."

Military rule increases the probability of subsequent military coups and attempted coups. The rewards of direct rule often increase competition and conflict within the armed forces. Some military regimes attempt to manage this competition by, for example, allocating the spoils of office equitably between the different service branches. (This was true of the 1976–1983 military regime in Argentina.) Other military regimes carefully monitor and purge personnel within the armed forces and/or the state as a whole.

Military regimes have also been linked to militarism or the glorification of war and military prowess. Many military leaders see politics as a continuation of war by other means. This leads them to resort to force in the resolution of conflicts. Military rulers may also demand that civilian organizations develop hierarchical and disciplined configurations along military lines.

Such demands can backfire. Some military regimes have inadvertently stimulated a flowering of oppositional cultural and political activity, as artists, students, religious leaders, dissidents, and others express themselves in new ways in opposition to the authoritarianism inherent in military rule. The attempted imposition of martial standards of behavior on recalcitrant populations can produce rare moments of political electricity in which large numbers of people are united in defiance of the generals. The popularity of Fela Anikulapo Kuti (1938–1997), the outspoken musician and critic of military rule in Nigeria, or the participation of many of the most popular artists of the day in the "direct elections now" campaign (diretas-já) in Brazil in 1984 are cases in point. Such groundswells of cohesive, broad-based opposition usually dissolve once military rule has ended, however.

Transitions From Military Rule

Most military regimes of the 1960s and 1970s became civilian in subsequent decades. Analysts distinguish between regime liberalization, or the lifting of repression and the restoration of various civil liberties, and democratization, or the reestablishment of a civilian multiparty regime with accompanying democratic rights. There is some debate over whether the first process leads inevitably to the second. Regime transitions presided over by the military, in which democracy is the ostensible end goal, have been especially problematic because militaries have tended to periodically interfere in the process in order to produce their desired outcome. An example of this is Nigeria, where the military regime of Ibrahim Babangida (1985–1993) initially promised to return the country to civilian rule by 1990, pushed that deadline back to 1992 after a coup attempt, and then annulled the presidential elections of 1993. The Babangida "transition" ended in a coup led by General Sani Abacha in 1993.

Alfred Stepan (1988) makes the important distinction between the military as government (usually a president and his advisors), the security forces, and the military government (the chain of command of the active-duty military). He argues that the long, complicated transition to civilian rule overseen by the Brazilian military regime (1964–1985) involved a tacit pact between the first and third of those organizations with moderate opponents of the regime. Hardliners in the security forces and radical opponents of military rule were both marginalized in a transition marked by a high degree of institutional conservatism and continuity of political leadership.

Military regimes have ended in a variety of ways. Some have collapsed after a failed military adventure (e.g., Greece in 1974 and Argentina in 1983) while others managed to negotiate their way out of power through the use of formal or informal agreements (an example of the former is the 1984 Naval Club Pact in Uruguay). In an unusual example, the Chilean military regime (1973–1990) was voted out of office in a 1988 plebiscite scheduled in its 1980 Constitution; this was followed by a 1989 election that restored civilian rule. The usual combination of mechanisms for establishing or reestablishing a civilian rule after a military regime is a collapse or insurrection, a pact, or holding of elections. Examples of all these mechanisms, including transitions that involved all three, can be found in the historical record. Not all transitions actually lead to civilian rule, of course. Military regimes are sometimes replaced by a new version of the same type of regime, as in Nigeria in 1993, when General Abacha replaced General Babangida.

Military prerogatives established under military rule can outlast the military regime itself. These prerogatives include army control over the police and/or a role for the military in internal public security; a special responsibility for "law and order" or the rule of law being bestowed on the armed forces in the constitution, giving it constitutional cover for political intervention; a fixed allotment of the national budget for the military; higher salaries for military officers than other state officials; control over the intelligence apparatus; control over civilian activities (such as civil aviation); economic privileges (such as special export–import licenses, direct control over state-owned firms, and the like); and military veto power over various decisions beyond national defense. An important question that can be asked of any civilian regime established after military rule is which of the state activities need military approval? The answer in some new democracies would comprise a lengthy list. Stable civilian rule is not synonymous with the reduction of military prerogatives, and indeed civil–military peace is sometimes purchased at the price of not reviewing or reforming any of these authoritarian enclaves or legacies of military rule.

Politics and the Future of Military Rule

In recent decades, there have been strong international pressures to civilianize military regimes and to avert or roll back military coups. The end of the Cold War and economic globalization have created an environment in which overt military rule is less accepted than it was in the past and in which military interventions and military regimes are more likely to falter or fade than they would previously. "Failed" coup attempts in Guatemala in 1993, Paraguay in 1996, and Ecuador in 2000 are cases in point (the degree of their failure is open to interpretation; in some instances, such as in Ecuador, coup participants did succeed in ousting an elected president). Similarly, the desire for admission into the European Union (EU) has led the Turkish military, which has engaged in frequent military interventions in the last few decades, to engage in a new kind of restraint in its interactions with civilian politicians. Another example is that of Pakistan where the regime of General Pervez Musharraf (1999–2008) was eventually replaced by an elected civilian regime. Despite these trends, the increased emphasis on security in the aftermath of the 2001 terrorist attack in the United States has enhanced the possibilities for militaries to engage in authoritarian "solutions" to political problems around the world. The military may therefore remain a powerful force behind the scenes in many different regimes.

There are few overt military regimes today. Even in Burma (Myanmar), which has been ruled by a military junta since 1962, the generals spoke of the possibility of elections in 2010. Similarly, the Thai military coup of 2006 that toppled Prime Minister Thaksin Shinawatra did not lead to a long-standing military regime. Elections were held at the end of 2007, and the military rule lasted for only 16 months. Military rule established after a coup in the West African country of Guinea (Conakry) in December 2008 also appears destined to be replaced by a civilian regime.

Debates exist as to how best to institutionalize civilian control over the military, once military rule is over. Some scholars assert that limiting militaries to a classic external defense role is the best recipe for success. By forbidding the military to engage in internal roles such as drug interdiction, social welfare programs, the building of infrastructure, and the like, civilians will curb, the reasoning goes, the military's temptation to abuse its power and intervene in politics. Others take the opposite view and argue that expanded internal missions for the armed forces are healthy for democracy, in that they enhance the military's image, focus officers' minds on the country's problems, and diminish the chances of coups. Others go beyond this particular debate to point to the importance of the development of civilian expertise on defense matters—not only in the Ministry of Defense and parliament or Congress but also in civil society.

The recent discussion of "hybrid" regimes (regimes with mixed authoritarian and democratic characteristics) is relevant to the analysis of military rule. While coups and overt military rule are less prevalent now than in the past, military influence is more likely to be exerted in subtle and disguised ways, as civilian state institutions are "hollowed out" and military forces take their place. Protected democracies, with strong military prerogatives and effective military veto power over issues outside national defense, are more common today than conventional military regimes.

The recent diminution of military rule in the developing world has been a significant and welcome development. Nevertheless, the international and domestic political circumstances that helped foster this transformation are not necessarily permanent. If military rule has become a kind of political taboo in international circles, the military's control over the means of coercion still gives it significant power. This power could become more overt than it is now in moments of crisis. It is therefore too early to write the obituary for this type of regime.

MILITIAS

The term *militia* can have multiple meanings ranging from the legal to the historical, but in general, it denotes a military force composed of ordinary citizens. A militia may be used to provide defense, law and order, or security during emergencies. It may be a way for the state to fulfill a legal obligation to provide defense activities to protect a community, its territory, property, or laws. In some countries or cultures, a militia may consist of volunteers who are able-bodied citizens, including women, whereas in other countries or cultures, it may be a reserve force composed of citizens/soldiers. It can also be a private, nonstate force with or without government sanction. The term *militia* can also refer to a national police force, as in Nazi Germany or in former communist states such as the Soviet Union or Yugoslavia. This entry discusses the empirical meaning of the concept and the phenomenon and the role of public and private militias in a number of countries.

Definition and Early Examples

Etymologically, the term *militia* is derived from the Latin *miles*, implying soldiers; the suffix *itia* denotes a state, activity, quality, or condition of being. Hence, the term *militia* (*miles* + *itia*) implies a military service. Although the classical Latin meaning of militia implied soldiers in service of a sovereign or a state, today it means "a military force raised from the civilian population of a country or region, especially to supplement regular army in an emergency, distinguished from mercenaries or professional soldiers" (*Oxford English Dictionary*, 2002). It is important to distinguish militia composed of professional soldiers in paid service from those made of persons giving voluntary or unpaid service on an ad hoc basis.

Its history can be traced back at least as far as the early colonial period in the United States, when there were many examples of groups of able-bodied males who were ready to fight in any emergency. In fact, the militia was the first permanent armed military force in the 13 colonies. George Washington, then adjutant general of the Virginia militia, called on the militia to respond to a frontier Indian attack. Article VI of the Articles of Confederation (1777) stated,

> Every State shall always keep up a well-regulated and disciplined militia, sufficiently armed and accoutered and shall always provide and constantly have ready for use, in public stores, a due number of field pieces and tents, and a proper quantity of arms, ammunition and camp equipage.

Similarly, militia turned out with great alacrity in Maryland and Pennsylvania, where they performed the role of internal police and looked out for people with suspect allegiances. Militias continued to be raised following the Revolutionary War but often lacked traditional military values. Officers were commonly selected on the basis of popularity rather than their military training, experiences, or ethos. The public was also reluctant to support the militia through taxation. The militia was seen as a peacetime army outside civilian control. For instance, in 1794, a militia comprising about 13,000 people was raised by President George Washington to quell the Whiskey Rebellion in the state of Pennsylvania. In 1802, the federal academy at West Point was established to rectify some of the flaws in the training of the militia and to inculcate in them a greater sense of discipline.

After the end of the U.S. Civil War, the role of "policing the southern states" fell to provisional militia. A significant number of these troops were black, and constant tension prevailed between the official and unofficial, permanent and ad hoc, white and black, and male and female sections of the militia. In 1903, a Militia Act was passed that allowed various states to maintain a reserve military force known as the National Guard. Their primary job was to assist the soldiers and the military police. It was composed of able-bodied men in the age group of 17 to 45 years. Today, the age limit for enlistment with no prior service is 35 years for the Army National Guard and 40 years for the Air Force National Guard. For the Army and Air Force National Guards, the maximum age for enlistment for those with prior service is 59 years, as long as the member has enough years of prior service to be able to complete 20 years of creditable service for retirement by 60 years of age.

Militias in the Contemporary World

The role of the modern militia can be seen both as a service and as a duty. It can be organized or unorganized. There are also private militias formed of nonorganized individuals based on their own concept of militia. In Austria, the multiple militias became affiliated with certain political parties after World War I. For instance, the Heimwehr (Home Defense) became affiliated with the Christian Socialist Party. In Canada, too, the term *militia* was associated with the reserve force of the Canadian Army in earlier times. Today, Canadian militias have no official standing but are essentially private armies. In China, there were militias of varying abilities. Their prime motto was to seek certain concessions from the British rulers during the colonial period, such as inheritance, property, or marriage rights for the indigenous peoples. In Denmark, the Danish Militia played a crucial role in repelling an attack from Sweden on Copenhagen in 1659. In Iran, the Basij Militia founded by Ayatollah Ruhollah Khomeini in November 1979, shortly after the removal of the Shah, was composed of 90,000 regular soldiers and 300,000 reservists. Today, it has more than 11 million members.

Similarly, in Iraq, we find several armed militias engaged in defending their respective cultures and territories along with neighborhoods from any type of insurgency. They are like the vigilante groups functioning in underpoliced areas in some parts of the United States of America. In Sri Lanka, the militias were formed by the kings for military campaigns both within and outside the island. In 2004, the LTTE (Liberation Tigers of Tamil Eelam) claimed to establish an auxiliary force to help in rehabilitation, construction, forest conservation, and agriculture besides serving as a reserve force. However, with the defeat of the LTTE at the hands of the Sri Lankan Army, it ceased to exist in early 2009.

Quite surprisingly, the Swiss militia, at one time comprising 33% of the total population, had only 2.7% in 2004. It is composed of voluntary participants, including women. Article 59 of the Swiss constitution has a provision for militia known as *militardienst* in German, *militaire* in French, *servizio militare* in Italian, and *servetsch militar* in Rumantsch.

From service-oriented groups, militias have evolved into groups with the right to defend or protect. People engage in militias in response to a call-up by any person aware of the threat requiring the response. Even a single person or a group of people can take the responsibility of defending the community. As such, there cannot be any minimum size of the militia in this general sense.

Private Militias

Private militias are armed groups of civilians not necessarily recognized by the federal or state governments. Today, about 50% of the states in the United States of America forbid private militias to parade and exercise in public, though the formation of private militias is not forbidden per se.

In the United States, some private militias participated in the tax protestor movement during the 1970s and 1980s. Today, the militias may support presidential candidates and oppose certain political parties or pressure groups. Other private militias in the United States have expressed sentiments against globalization and the "new world order" and are often right-wing extremist groups whose leaders consider the U.S. federal government illegitimate. It is difficult to estimate the number of U.S. militia groups; however, the Southern Poverty Law Center (SPLC), a civil rights group that monitors hate crimes, estimated that militia groups existed in 20 states in 1994, 42 states by late 1995, and all 50 states by 1996. The SPLC has also reported a resurgence in "patriot groups" or militias and other extremist groups that see the federal government as their enemy.

Even the North Atlantic Treaty Organization (NATO) forces in Afghanistan are said to be relying on illegal militia, often run by warlords responsible for human rights abuses and drug trafficking. NATO is said to be using private militias not only to guard their camps and convoys but also for "black ops." These militias function outside Afghan law, which bans unlicensed armed groups. Many of them compete with the state authority and are usually run by former military commanders responsible for antisocial activities. Many governments are now financing private militias as alternative power structures to fulfill their short-term security needs, but this practice can have very bad repercussions in the long term. Once the private militias are financed and armed, it becomes difficult to disarm them, and those hired to provide security can become the very source of "new threats" to the state by indulging in antisocial activities.

MISSPECIFICATION

Misspecification is a fundamental problem in empirical modeling. The origins of this problem can be found in the theoretical exercise of using a statistical model from a sample to make inferences about an unobservable population of interest. Any deviation from the true population model in the sample model means that the sample model is misspecified. This, in turn, means that the inferences from the sample model about the population are suspect.

The importance of problems of misspecification is underscored by the amount of attention paid to different types of misspecification in introductory texts on ordinary least squares (OLS) regression models. As an example, consider Damodar Gujarati's widely used textbook, *Basic Econometrics*. Gujarati's treatment of OLS is centered around 10 assumptions of the linear regression model. Six of these 10 assumptions are statements that the model does not contain one or more types of misspecification.

Discussed throughout this entry is misspecfication in OLS. The logic and importance of misspecification in OLS extends directly to other, more complicated types of models. Almost all such models contain some equation that indicates the relationship between the independent variables and the dependent variable is dictated. Getting this equation wrong means that the model is misspecified.

As the Gujarati example shows, misspecification can take on many different forms. In the sections that follow are discussions of several of the most common forms of misspecification, the detection of statistical problems caused by misspecification, and strategies for avoiding misspecification.

Types of Misspecification

The purpose of empirical model specification is to try to develop an accurate model of relationships in an unobservable population with observed sample data. In OLS, we can represent the population regression model as

$$Y_i = \alpha + \beta_1 X_i + \beta_2 Z_i + \varepsilon_i$$

and the sample regression model as

$$Y_i = \hat{\alpha} + \hat{\beta}_1 X_i + \hat{\beta}_2 Z_i + \hat{\varepsilon}_i,$$

where Y is the dependent variable; X and Z are the independent variables, $\hat{\alpha}, \hat{\beta}_1$, and $\hat{\beta}_2$ are sample estimates of the population parameters α, β_1, and β_2; and $\hat{\varepsilon}_i$ is the sample estimate of the population stochastic term ε_i.

If any element of the population model is not appropriately represented in the sample regression model, then the inferences about the population model from the sample model may be problematic. The entry now turns to more in-depth discussions of four of the most common forms of misspecification.

Omitted Variable Bias

One of the most common critiques of empirical work is that the authors have left a relevant independent variable out of their model specification. This problem associated with this critique is known as "omitted variable bias." For example, if the population regression model is

$$Y_i = \alpha + \beta_1 X_i + \beta_2 Z_i + \varepsilon_i$$

but the sample regression model is specified as

$$Y_i = \hat{\alpha} + \hat{\beta}_1 X_i + \hat{\varepsilon}_i,$$

then there is a strong possibility that the sample model is prone to omitted variable bias. To illustrate the nature of this problem, consider what happens to the parameter estimate for the effect of X on Y, $\hat{\beta}_1$. In summation notation, the OLS formula for this parameter estimate is

$$\hat{\beta}_1 = \frac{\sum_{i=1}^{n}(X_i - \bar{X})(Y_i - \bar{Y})}{\sum_{i=1}^{n}(X_i - \bar{X})^2},$$

and because one of the properties of OLS is that the resulting regression line (or plane in the case of a model with two independent variables) goes through the mean of each variable, we know that

$$(Y_i - \bar{Y}) = \beta_1(X_i - \bar{X}) + \beta_2(Z_i - \bar{Z}) + (\varepsilon_i - \bar{\varepsilon});$$

we can see that the expected value of $\hat{\beta}_1, E(\hat{\beta}_1)$, under these circumstances is

$$E(\hat{\beta}_1) = \beta_1 + \beta_2 \frac{\sum_{i=1}^{n}(X_i - \bar{X})(Z_i - \bar{Z})}{\sum_{i=1}^{n}(X_i - \bar{X})^2}.$$

Any time the expected value of the parameter estimate is not equal to the population value, we have a biased estimator. In this circumstance, $E(\hat{\beta}_1) = \beta_1$ only if

$$\beta_2 \frac{\sum_{i=1}^{n}(X_i - \bar{X})(Z_i - \bar{Z})}{\sum_{i=1}^{n}(X_i - \bar{X})^2} = 0,$$

and this will occur only if either one of two things is true:

1. The covariance between X and Z is equal to zero,
$$\mathrm{COV}_{XZ} \frac{\sum_{i=1}^{n}(X_i - \bar{X})(Z_i - \bar{Z})}{n} = 0.$$
2. The true impact of Z on Y is equal to zero, $\beta_2 = 0$.

If neither of these conditions holds, then the estimated impact of X on Y is biased due to the omission of Z from the model.

Unnecessary Extra Variables

In the previous section, we saw the problems that can occur when a variable that should be in a model is left out. The problem of "unnecessary extra variables" is the reverse of the problem of omitted variable bias, in the sense that variables that are not in the unobservable population model have been included in the sample model. Note, however, that we do not call this problem a form of "bias." This is because the presence of unnecessary extra variables does not bias the estimates of the parameters for variables that should be in the model. Instead, the impact of unnecessary extra variables is that they artificially drive up the model's R-squared statistic and chew up extra degrees of freedom.

For example, if the population regression model is

$$Y_i = \alpha + \beta_1 X_i + \beta_2 Z_i + \varepsilon_i$$

but the sample regression model is specified as

$$Y_i = \hat{\alpha} + \hat{\beta}_1 X_i + \beta_2 Z_i + \beta_3 W_i + \hat{\varepsilon}_i$$

the inclusion of the variable W_i in the model is unnecessary.

Wrong Functional Form

Another common form of misspecification occurs when the model specification fails to properly take into account the underlying relationship between the independent variable and the dependent variable.

For example, if the population regression model is

$$Y_i = \alpha + \beta_1 X_i + \beta_2 Z_i^2 + \varepsilon_i$$

but the sample regression model is specified as

$$Y_i = \hat{\alpha} + \hat{\beta}_1 X_i + \hat{\beta}_2 Z_i + \hat{\varepsilon}_i,$$

this model will not give us an accurate estimate of β_2.

Failure to Include Interactions

Political scientists have increasingly become aware of interactive relationships. Although researchers frequently expressed their theoretical ideas about the relationships between variables in a way that implies interactive relationships, they have often failed to specify their models as such.

For example, if the population regression model is

$$Y_i = \alpha + \beta_1 X_i + \beta_2 Z_i + \beta_3 X_i Z_i + \varepsilon_i,$$

the sample regression model is specified as

$$Y_i = \hat{\alpha} + \hat{\beta}_1 X_i + \beta_2 Z_i + \hat{\varepsilon}_i.$$

Detecting Misspecification

Detecting misspecification is not an easy process. There is no direct way of testing for all types of model misspecification. Instead, there are a variety of different ways to test for specific symptoms of misspecification. Most of the procedures for doing this involve visual and/or statistical examinations of the estimated stochastic components or residuals after the original model has been estimated. These tests amount to using residuals, $\hat{\varepsilon}_i$, to make inferences about the unobserved population stochastic components, $\hat{\varepsilon}_i$.

Tests for Autocorrelation and Heteroskedasticity

The use of numerical tests for autocorrelation and heteroskedasticity has become standard practice. Autocorrelation and heteroskedasticity are often symptoms of model misspecification (although this is often overlooked). Consider, for instance, Gujarati's discussion of the sources of heteroskedasticity (pp. 389–391) and autocorrelation (pp. 442–448). Each of the eight sources of heteroskedasticity (failure to account for learning processes, failure to account for income differences, failure to account for improvements in the measurement of data across settings, outliers, incorrect model specification, failure to account for skewness, incorrect data transformation, and incorrect functional form) and each of the eight sources of autocorrelation (inertia, excluded variables, incorrect functional form, the cobweb problem, failure to include lags, improper manipulation of data, improper transformation of data, and failure to account for nonstationarity) can be classified as a type of model misspecification.

The general logic of these tests is best seen through a discussion of the omega (Ω) matrix. The Ω matrix contains the expected covariation between population stochastic components across observations,

$$E(uu') = \Omega = \begin{pmatrix} \operatorname{cov}(\varepsilon_1,\varepsilon_1) & \operatorname{cov}(\varepsilon_1,\varepsilon_2) & \cdots & \operatorname{cov}(\varepsilon_1,\varepsilon_n) \\ \operatorname{cov}(\varepsilon_2,\varepsilon_1) & \operatorname{cov}(\varepsilon_2,\varepsilon_2) & \cdots & \operatorname{cov}(\varepsilon_2,\varepsilon_n) \\ \vdots & \vdots & \ddots & \vdots \\ \operatorname{cov}(\varepsilon_n,\varepsilon_1) & \operatorname{cov}(\varepsilon_n,\varepsilon_2) & \cdots & \operatorname{cov}(\varepsilon_n,\varepsilon_n) \end{pmatrix},$$

which can be rewritten as

$$E(uu') = \Omega = \begin{pmatrix} \operatorname{var}(\varepsilon_1) & \operatorname{cov}(\varepsilon_1,\varepsilon_2) & \cdots & \operatorname{cov}(\varepsilon_1,\varepsilon_n) \\ \operatorname{cov}(\varepsilon_2,\varepsilon_1) & \operatorname{var}(\varepsilon_2) & \cdots & \operatorname{cov}(\varepsilon_2,\varepsilon_n) \\ \vdots & \vdots & \ddots & \vdots \\ \operatorname{cov}(\varepsilon_n,\varepsilon_1) & \operatorname{cov}(\varepsilon_n,\varepsilon_2) & \cdots & \operatorname{var}(\varepsilon_n) \end{pmatrix}.$$

Two of the assumptions that are implicit in the use of OLS are that of no autocorrelation and that of no heteroskedasticity. A general expression of the assumption of no autocorrelation is

$$\operatorname{cov}_{\varepsilon_i,\varepsilon_j} = 0 \qquad \forall\ i \neq j,$$

which means that we do not expect to see evidence of covariation between any pair of population stochastic components. A general expression of the assumption of no heteroskedasticity is

$$\operatorname{var}_{\varepsilon_i} = \sigma^2 \qquad \forall\ i,$$

which means that we do not expect to see evidence of unequal variance across population stochastic components. If both of these assumptions hold, then

$$\Omega = \begin{pmatrix} \sigma^2 & 0 & \cdots & 0 \\ 0 & \sigma^2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \sigma^2 \end{pmatrix},$$

which can be rewritten as $\Omega = \sigma^2 I$.

The Ω matrix and the assumptions that we make about it are important because they are used to estimate the variance of OLS parameter estimates,

$$\operatorname{var}(\hat{\beta}) = (X'X)^{-1}X'E(\Omega)X(X'X)^{-1}.$$

If we make the OLS assumptions about the stochastic component, then this means substituting in $E(\Omega) = \sigma^2 I$. We can then substitute in

$$\hat{\sigma}^2 = \frac{\sum_{i=1}^{n}\hat{\varepsilon}_i^2}{n-k}.$$

Because we use $\operatorname{var}(\hat{\beta})$ to test our theoretically derived hypotheses about the relationships between variables, if our assumptions about no autocorrelation and no heteroskedasticity are invalid, we run the risk of falsely accepting or falsely rejecting the null hypothesis and thereby arriving at faulty conclusions about our causal theories.

Because of the importance of knowing about the presence of evidence of autocorrelation and heteroskedasticity, there are now a wide range of statistical tests that can be used to diagnose these problems. All of these tests, either implicitly or explicitly, use information from sample model residuals contained in $\hat{\Omega}$ to make hypothesis-testing inferences about Ω. Most of these tests do so by looking for specific forms of autocorrelation or heteroskedasticity.

For instance, tests for first-order serial autocorrelation in time-series data look for evidence that $\varepsilon_t = \rho\varepsilon_{t-1} + \varepsilon_t$, which would show up in an $\hat{\Omega}$ matrix as

$$\hat{\Omega} = \sigma^2 \begin{pmatrix} 1 & \rho & \rho^2 & \cdots & \rho^{n-1} \\ \rho & 1 & \rho & \cdots & \rho^{n-2} \\ \ldots & \ldots & \ddots & \ldots & \\ \rho^{n-1} & \rho^{n-2} & \cdots & \rho & 1 \end{pmatrix},$$

while tests for spatial autocorrelation test the hypothesis that

$$\hat{\Omega} = \sigma^2 \begin{pmatrix} 1 & \rho_{12} & \cdots & \rho_{1n} \\ \rho_{21} & 1 & \cdots & \rho_{2n} \\ \ldots & \ldots & \ddots & \ldots \\ \rho_{n1} & \rho_{n2} & \cdots & 1 \end{pmatrix}.$$

Tests for heteroskedastity test the hypothesis that

$$\Omega = \begin{pmatrix} \sigma_1^2 & 0 & \cdots & 0 \\ 0 & \sigma_2^2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sigma_n^2 \end{pmatrix}.$$

Tests for "Unnecessary" Variables

There are a variety of different statistical tests that are designed to help researchers decide whether or not they should add one or more variables to their model specification. These tests follow the logic that if the new variable or group of variables does not significantly increase the explanatory power, then they are unnecessary and therefore should not be added. While these tests can be helpful guides for keeping a model specification parsimonious, the discussion in the section "Omitted Variable Bias" should not be forgotten when considering the usefulness of these tests.

One of the most common tests along these lines is an F test, for which the null hypothesis is that the R^2 statistic for a model is not improved when one or more new variables are added to the specification. This test statistic is calculated by going through the following steps:

1. Estimate the original model, which we'll call Model 1, and obtain the R^2 statistic from this model, R_1^2.
2. Estimate the original model with the new variable(s) included, which we'll call Model 2, and obtain the R^2 statistic from this model, R_2^2.
3. Using the R_1^2, R_1^2 statistics, the number of degrees of freedom from Model 1 (k_1) and from Model 2 (k_2) to calculate

$$F_{k_1,k_2} = \frac{(R_2^2 - R_1^2)/(k_2 - k_1)}{(1 - R_2^2)/(n - k_2)}.$$

Correcting for Misspecification

As discussed above, heteroskedasticity and autocorrelation get a lot of attention in books and classes that introduce OLS regression models. In practice, most empirical researchers tend to view heteroskedasticity and autocorrelation as statistical diseases that can be cured by statistical procedures such as feasible generalized least squares (FGLS; discussed in the following section). This type of cookbook approach is popular, but it has come under attack in recent years. As noted above, most of the sources of autocorrelation and heteroskedasticity are one form or another of misspecification. When these symptoms of misspecification are "cured" by FGLS, opportunities may be missed.

FGLS Procedures

In the presence of evidence that $E(\Omega) \neq \sigma^2 I$ many scholars turn to a set of procedures known as FGLS. The logic of FGLS procedures is to diagnose the specific type of violation of the OLS assumptions about Ω by estimating $\hat{\Omega}$ and then to correct for them by using the estimated nature of the problem contained in $\hat{\Omega}$.

In regular OLS, the matrix algebra formula for the parameter estimates is $\hat{\beta}_{\mathrm{OLS}} = (X'X)^{-1}X'Y$. With FGLS, this formula becomes

$$\hat{\beta}_{\mathrm{FGLS}} = \left(X'\,\hat{\Omega}^{-1}X\right)^{-1} X'\,\hat{\Omega}^{-1}\,Y.$$

The formula for the variance of the parameter estimates is

$$\mathrm{var}(\hat{\beta}) = (X'X)^{-1}\,X'E(\Omega)X(X'X)^{-1}$$

in both models, but $E(\Omega) = \sigma^2 I$ in OLS.

It is worth noting that with real-world data, we never see Ω but we make inferences from our OLS estimates of $\hat{\Omega}$. When we find evidence of violations in the OLS assumptions about Ω in our estimated matrix $\hat{\Omega}$, we use FGLS to correct them. This is a leap of faith from $\hat{\Omega}$ to Ω and is worth keeping in mind as we use it to adjust our estimates.

MIXED METHODS

Variants of mixed-methods research design, that is, the combination of qualitative and quantitative components within one single research design, have been practiced since the beginnings of the social and related sciences and before the complex construct *mixed-methods research* was conceived. It could be argued that in the first half of the 20th century, the combination within one research project of what was subsequently referred to as qualitative and quantitative research was not unusual, at least for well-known studies such as Samuel A. Stouffer and colleagues' *American Soldier* (1949), Theodor Adorno and colleagues' *Authoritarian Personality* (1950), and most types of psychometric measurement and scaling procedures during this time. Only in the 1990s did researchers begin to systematize this research approach and design to the extent to which it became explicitly and systematically studied and applied. In this second wave of conceptualization and application, Abbas Tashakkori, Charles Teddlie, John Creswell, Julia Brannen, and Alan Bryman were most influential in establishing this type of research design. It is often proclaimed that a third generation of mixed-methods studies is about to emerge. Some optimistic predictions include the replacement of mono-method studies by mixed-methods studies, research becoming more ethical or democratic due to the integration of different methods and perspectives, the ability to access a phenomenon under investigation objectively due to the combination of qualitative and quantitative methods, and new ways of conceiving, collecting, and analyzing data that are no longer identifiable as qualitative or quantitative in nature. The field of mixed-methods research is indeed changing, but the third generation is most likely to rectify some of the simplifications and misconceptions that have established themselves in the past 3 decades, due in part to various attempts to establish separate, that is, qualitative and quantitative "paradigms" and the resulting incompatibility thesis. This entry discusses definitions, forms, applications, and further developments of mixed-methods research.

Nomenclature

Although now well established, the use of the term *mixed-methods design* is not ubiquitous. One contender is *methods triangulation*. A shortcoming of this term is that it implies only studies in which the results of the qualitative and quantitative parts converge or verify each other. Under certain circumstances, this may indeed be of interest, but there are other possibilities of mixing methods unrelated to triangulation. Another alternative is using words such as *combining*, *blending*, *synthesizing*, or *merging* instead of *mixing* because, strictly speaking, qualitative and quantitative methods are not mixed but rather combined in different ways and for different purposes. Despite these alternative proposals, *mixed-methods research design* is now the accepted nomenclature for this kind of design.

Two related designs should be mentioned briefly. Multimethod design is the label given to research designs that combine at least two different quantitative or two different qualitative methods within one research project. Accordingly, a multimethod quantitative design consists of at least two distinct quantitative components, while multimethod qualitative design consists of distinct qualitative components within one research design. Finally, mixed model design describes a research design that combines quantitative and qualitative components across all phases of the research process, where it ostensibly is no longer possible to clearly distinguish between the qualitative and quantitative contributions to the overall research results. However, it is questionable whether the research components that most authors refer to in this context can indeed be clearly attributed to the quantitative or qualitative component. Thus, mixed model design is best used for research designs where the quantitative and qualitative components are intertwined such that they are no longer clearly separable or where the line of demarcation between quantitative and qualitative research components becomes indistinguishable.

Justifications

Among the many interrelated reasons listed in the literature on the improvement of mixed-methods research on mono-method research designs are that some research questions are better answered by using the strengths of qualitative and quantitative research approaches; mixed-methods designs may help control for a methods bias inherent in mono-method approaches, and results from different methods may cross-validate each other; a combination of methods may allow for a greater diversity of theoretical and empirical approaches or it may contribute to a more holistic perspective on a given research problem; and mixed-methods designs may improve the ecological and external validity as well as the internal consistency of a study. Most reasons, however, can be summarized into three families: (1) convergence, (2) complementarity, and (3) holism.

Convergence

The first set of justifications for a mixed-methods research design relates to the traditional idea of methods triangulation, where researchers use qualitative and quantitative approaches to cross-validate their findings. For instance, clinical interviews often aim at verifying whether the score of a formal psychometric test converges with clinicians' assessments. In voting participation studies, researchers may use semistructured interviews to assess the convergence of the interview data with the responses in a survey on various reasons for the types and degrees of political participation. Given that survey or test items are structured such that respondents merely take position to the researcher-generated items, and given that in a semistructured or clinical interview, interviewees are able to present their own perspective on a particular issue, a convergence of these two sets of data may indeed contribute to the triangulation and thus validation of research findings.

Complementarity

The second set of justifications for employing mixed-methods research design relates to the idea that different methods may contribute additional insights into a phenomenon under investigation. In this sense, the qualitative and quantitative parts complement each other to produce a particular answer to a research question. In other words, the results would not have emerged from employing either a qualitative or a quantitative approach. For instance, before a standardized scale can be established, the phenomena underlying the scale may have to be explored in a nonstandardized, exploratory manner. This procedure is well established in measurement theory in psychometrics, and it is also often applied in question and questionnaire design. In this sense, political scientists may want to first explore the way in which members of a population of interest think and behave in relation to political participation before selecting different survey items for their study. Alternatively, the same researchers may find interesting or surprising relations between variables during their statistical analysis. Rather than engaging in post hoc hypothesizing, it may be interesting to also conduct a few exploratory interviews to help generate explanations or hypotheses for future studies.

Holism

A number of important texts on mixed-methods design go as far as to claim that the ultimate goal of mixed-methods research should be the examination of a particular phenomenon from all possible positions, be it all theories potentially suitable for the investigation of a phenomenon, all data available, or all possible analyses of these data. Starting from the argument that qualitative and quantitative methods have different strengths and weaknesses relating to ontology, epistemology, axiology, the ability to identify general causal laws, and so on, their combination may help draw from the strengths of one to offset the weaknesses of the other types of methods. Detailed analyses of all relevant data from all possible theoretical positions and with all possible analytic methods ostensibly produce many different pieces of information. Sometimes the metaphor of a puzzle is used in this context. If assembled correctly, the different results produce objective findings, that is, findings that are devoid of any form of bias. In this context, John Brewer and Albert Hunter refer to not only two kinds of principal research methods—qualitative and quantitative—but four: (1) fieldwork, (2) survey research, (3) experimentation, and (4) nonreactive research. Within this framework, fieldwork would provide ecologically valid and testable hypotheses relating to a phenomenon under investigation, survey research would examine the extent to which the phenomenon is generalizable, experiments would determine the causes of the phenomenon, and in the nonreactive portion of the research, investigators would examine "naturally occurring" data, that is, data unbiased by the data collection process. In the end, all theories, data, results from analyses, and different interpretations ought to converge. However, it is unlikely that collecting many data sets, employing all possible methods, and subjecting data collection and analyses to all possible theoretical frameworks will lead to a single valid answer to a research question. Thus, this third family of reasons for employing a mixed-methods design is reminiscent of pre-Popperian positivism. Holism is unlikely to lead to successful research outcomes, because, among other reasons, research methods do not combine in the manner envisioned by their proponents and because such an undertaking would be impossibly complex, expensive, labor intensive, and unfocused.

Forms of Mixed-Methods Research Designs

Creswell and his colleagues have specialized in the identification of various forms of mixed-methods design. For illustrative purposes, only three families of mixed-methods design are covered here.

Sequential Mixed-Methods Design

Sequential mixed-methods design includes at least one qualitative and one quantitative research component, which take place in a temporal sequence. For example, the exploratory investigation of appropriate wording or phrasing of survey questions in the form of semistructured interviews implies a sequence of data collection and analysis, that is, exploratory interviews, analysis of the interviews, wording and phrasing of survey questions using some of the findings of the interviews, and, finally, the survey research. It is also possible to use survey research and interviews in a reverse order, that is, analyze survey data and, based on some of the findings, conduct exploratory or semistructured interviews, which may help in interpreting some of the findings from the statistical analysis of the survey data. The findings from these interviews could lead to a further link in the sequence by, for instance, formally testing some of the hypotheses that emerge from the post hoc interviews.

Concurrent or Parallel Mixed-Methods Research Design

Concurrent or parallel mixed-methods research design describes a family of approaches, which include relatively separate qualitative and quantitative strands within one research project. Focus groups or nonparticipant observations may produce data for qualitative analysis on political decision making with a given set of stakeholders. The link of these findings to their voting records or responses on surveys may be fruitfully explored in a convergent or complementary mixed-methods framework.

Nested Mixed-Methods Design

Nested mixed-methods design describes a set of designs in which either the qualitative or the quantitative part of the research project is nested in the quantitative or qualitative part, respectively. For instance, the main part of a study may focus on a specific group of people who refuse to vote. A dominant, qualitative research design may focus on identifying the dimensionality of their justifications for nonvoting as well as alternative forms of political participation. The embedded quantitative part of the research may quantify the extent of the phenomenon under investigation as far as this is possible with available data, for example, nonvoting among a specific subgroup of a population and its relations to demographic characteristics.

Fields of Applications

The uptake of mixed-methods research design varies tremendously between the social and related sciences as well as between the different fields of interest within the disciplines. Currently, the most frequent applications can be found in education, public health, nursing, sociology, media studies, management studies, and evaluation. Interestingly, political science and psychology are currently underrepresented in this emergent design, even though, in principle, both have well-developed qualitative and quantitative traditions. Other fields not represented due to a traditional preference for qualitative or quantitative methods are social anthropology, social work, gender studies, geography, and economics. It could be argued that these disciplines are still engaged in the oft-proclaimed paradigm war, where proponents on both sides are still attempting to argue the overall superiority of one type of method over another. With the rise of interdisciplinary and transdisciplinary research, however, more researchers are likely to embrace mixed-methods research designs within and across disciplines. The few published examples that can be found on topics relating to political science include reception studies of political campaign messages, political alienation of voters, gender and political power, social justice in relation to action research, and appropriateness of welfare policy in different contexts.

Limitations and Misuses

The mixed-methods research design has numerous limitations. First, it is a far more complicated research design than a mono-methods design. Not only do researchers have to engage in qualitative and quantitative research—and most empirical researchers are not specialized in more than one family of methods—but they also have to combine results in a convincing way. Even or especially when research teams work in groups divided by methods competence, the combination of results may turn out to be nearly impossible because of the lack of communication skills and understanding between them. Second, unfocused research often leads to different data collection and analysis possibilities. Rather than finding or deciding on a well-focused research question, many researchers and especially research teams prefer to leave options open and, thus, believe that a mixed-methods design gives them the justification and tools to pursue unfocused research. What often results from this is a number of disparate research results around a research theme. This, however, is not mixed-methods research. Third, it is often believed that a mixed-methods research design can bridge the gap between different epistemological and ontological positions. This, too, is not the case because it does not make sense to frame the qualitative part of the research in a constructivist framework and the quantitative part in a (post-) positivistic framework. At fault here are the problematic assumptions underlying qualitative and quantitative research, which were, in part, a result of the influence of French social theorists on qualitative research from the 1970s. Fourth, and connected to this point, is the claim that the mixed-methods research design is a third paradigm and separable from qualitative and quantitative paradigms. It is questionable whether the use of the term *paradigm* is suitable for the tremendous variability within the family of qualitative methods or quantitative methods. As, on closer inspection, it is extremely difficult to describe the core characteristics of all qualitative methods, on the one hand, and of all quantitative methods, on the other, stating that mixed-methods research is systematically different due to its ability to deal with heterogeneous theoretical and empirical approaches is unconvincing to some researchers. Fifth, many texts on mixed-methods research inadvertently and often unintentionally defend the use of this design to obtain more valid (in the problematic sense of objective and positivistic) research results. Some of the better known forms of biases may indeed be detected, using different analysis methods. However, much of the current literature on this design subordinates qualitative exploratory research to quantitative research and formal hypothesis testing. It thus practically neglects the possibility of conducting mixed-methods research in a constructivist and exploratory framework.

Conclusion

Mixed-methods research design is a label that applies to a large family of research designs that can integrate diverse theoretical and empirical approaches in empirical research and evaluation. It is suitable for all social and related sciences but not to all research questions. Some research questions will remain best answered with a well-focused mono-method design. The answers to other research questions will be enriched by the possibilities of linking qualitative and quantitative methods. But the mere application of a method that is both qualitative and quantitative to explore a research topic is a necessary but insufficient condition for mixed-methods research. In practice, the flexibility of this design leads many inexperienced researchers to conduct unfocused research. However, due to its flexibility and capacity to enrich both mono- and interdisciplinary research, it is not surprising that this type of research approach and design has enjoyed so much popularity throughout the history of the social and related sciences. Now, at the end of the second generation of mixed-methods research, which mainly aimed at incorporating assumptions about the possibilities and limits of mono-method approaches, documenting different types of mixed-methods design, and cataloguing good-practice examples, the next generation of mixed-methods literature is likely to turn away from carrying baggage left over from the paradigm wars and attempting to address some of the inconsistencies by referring to a vague form of pragmatism. Instead, mixed-methods research is likely to become even more dominant in applied research within and between fields, playing out its strength particularly in inter- and transdisciplinary research.

MOBILIZATION, POLITICAL

Political mobilization is the process of organizing groups, social networks, crowds, and social units for political goals. Challengers to the status quo mobilize to redress grievances and for reforms when conventional political institutions fail to respond. Regimes mobilize to realize a political program, subdue adversaries, and counter mobilization by challengers when they need popular support. Resources for mobilization are manpower and funds (often from volunteers), commitment and solidarity of supporters, and shared beliefs and values. By mobilizing, a group gains power against an adversary. Political goals tend to be collective goods whose attainment in large groups entails organization costs and free-rider tendencies, as Mancur Olson (1965) theorized for interest groups and voluntary associations. When political mobilization is countered by the authorities with repression, obstacles are even higher. Nevertheless, in a 1990 empirical study of political mobilization by 53 challenging groups in the 19th- and 20th-century United States, William Gamson found that the Olson theory is a useful starting point for explaining both conventional lobbying and unconventional modes of collective action. Charles Tilly (1978), Anthony Oberschall (1993), Sidney Tarrow (1994), Bert Klandermans (1997), and Mayer Zald and John McCarthy (1987) have added key insights, terms, and processes to the theory that have increased its explanatory power.

There are hundreds of empirical studies of political mobilization in particular instances, many of ethnic and religious minorities around the world and many others of advocacy groups (e.g., environmentalist, feminist, and antiabortion). Two core dimensions that provide theoretical coherence to these studies are micromobilization and mobilizing structures.

Micromobilization

Micromobilization explains participation with five pivotal variables: P, V, N, S, and C:

> P is the expected probability of success for collective action;
>
> V is the value of the goal, collective good, or issue for the participant (e.g., justice for a minority);
>
> N is the expected number of participants or contributors;
>
> S is the selective incentive or personal benefit from participation; and
>
> C is the expected cost of participation.

The theory hypothesizes that for participants, P times V (value expectancy or benefit) plus S is greater than C; that is, $PV + S - C > 0$.

V is distributed in a population from the most positive values (true believers) to most negative (opponents). V is not necessarily a personal experience—for example, justice for a minority may be valued by some who are themselves not targets of injustice. V is fought over in the court of public opinion by adversaries who package issues in media frames for persuasive communication. Framing situates and connects events, people, and groups into a meaningful narrative in which beliefs and explanations are communicated persuasively using metaphors, catchphrases, and symbols. It colors judgment about the truth of beliefs and legitimacy of causes.

N, the expected number of participants, enters the expression because both $P(N)$ and $C(N)$ are a function of N: Expectation of success increases and expected cost decreases ("safety in numbers") with the number of participants. P and C functions, called production functions, are not linear with N. Their shape varies with the type of collective action and other circumstances, and they influence the strategies and tactics of confrontation used by the adversaries. Some tactics require only small numbers of participants for achieving what participants define as "success"—for example, a vigil by dissidents. Others require huge numbers, sometimes in the hundreds of thousands, to achieve success, as in the case of a petition drive or a demonstration. *Critical mass* is a number or range of turnout at which the participants and opponents judge the collective action to be successful. Turnout is therefore contested by the adversaries, who engage in a battle over numbers in the court of public opinion.

S stands for rewards and benefits that are obtained by participation that free riders don't get. For challengers, S tends to be social, moral, and ideological rewards of standing up for a cause. C is the cost in time and resources of contribution to collective action and expected cost due to social control such as arrest and marginalization. In contrast, regime mobilization is well placed to lower C and increase S with material and political benefits to supporters. At an extreme, repressive regimes target adversaries, with license to their followers to attack and loot (S is positive) adversaries without police interference (C is zero).

The five variables are socially constructed by the challengers and their adversaries during contention and confrontation. If *V* is a collective good such as nondiscrimination legislation, the motivation for *V* comes for varied social psychological reasons: anger at injustice, belief that justice for all is a moral imperative, solidarity with an oppressed group, personal experience of discrimination, and others. Activists argue and publicize their cause through moral and ideological appeals to increase *V*. Because social and political movements have limited resources to provide tangible, selective incentives for participants, they build a sense of community among kindred souls that makes participation itself a source of satisfaction (increase *S*). Ritual, drama, and entertainment provided by rock bands and celebrities sharing the stage at mass gatherings build a sense of community and reward those who turned out with a memorable public spectacle that free riders don't get. Survey research on participants in diverse settings has found that such moral appeals and selective incentives overcome free riding and boost participation.

To apply micromobilization, consider dissidents in a repressive regime. There are few members (*N* is low). They mount a vigil or some other symbolic protest in a crowded square during rush hour. Only a few participants are needed to unfurl a banner or hold up signs before they are arrested (*C* is high). They define success as visibility to many people and the media: *P* as a function of *N* increases steeply and is close to 1 for small *N*. A dozen well-placed protesters can do it; two or three may not be enough; more than a dozen does not add to visibility and leads only to unnecessary arrests. *V*, the value for them of standing up for freedom or a cause, is very high. *S* consists principally of the respect and social standing earned among their peers for courage. Thus, *PV* plus *S* minus *C* for small *N* can be positive for the vigil. Contrast symbolic protest to a petition campaign in a democratic society. Signing the petition is close to cost free to the signer. For success, *N* has to be large (possibly tens of thousands) for a positive effect on the public, the media, and legislators. *P* as a function of *N* is a *J* curve. Because *S* for signing is low, organizers may give away a free pen or sticker with an icon as a token to boost *S*. Because many signers are needed, the organizers can't simply sign up the high-*V* public but must appeal to the mid- to low-*V* sympathizers through advocacy and create high *N* expectations. Opponents will attempt to confuse the public by claiming that the petition has all sorts of hidden costs and undesired consequences: *V* is not what the advocates claim, and there are negative *C*. These are two quite different modes of political mobilization, in two very different political settings, for which micromobilization applies. Other types of collective action have their own production functions, such as for demonstrations, inclined *S* shape, and *P* increasing with *N*, then decreasing beyond a critical mass. Whether one analyzes petition drives, strikes, marches, demonstrations, sit-ins, building occupations, selective buying campaigns, contributions for a cause, or vigils, the same five-variable micromobilization model for participation in collective action is salient.

Mobilizing Structure

Olson assumed that obtaining a collective good voluntarily in a large group requires considerable costs of organizing and that collective good incentives are not sufficient for participation. Coercion is needed for supplying collective goods. Coercive powers such as a state enjoys with compulsory taxation is, however, beyond the reach of voluntary groups.

The 1960s witnessed an outburst of social and political movements in the United States and Western Europe that succeeded in mobilizing large numbers of participants in large populations: the civil rights movement; the anti–Vietnam War and other peace movements; youth and counterculture movements; environmentalist, feminist, and ethnic minority movements, and so on. Empirical study of these movements discovered a variety of mobilizing structures that were omitted in Olson's theory. Large populations are not made up of isolated persons who had to be recruited at a considerable cost by a large organization. On the contrary, many populations are thick with associations, communities, groups, and networks. There exist structures with leaders, members, internal links, communication networks, and resources for collective action, such as African American churches and the student governments in historically black colleges in the South. The leadership and members of such groups committed to political goals in the

1960s (e.g., ending segregation) and joined local autonomous units such as churches or campus student associations into a federated overarching structure called a social movement organization (SMO), as the Southern Christian Leadership Conference and the Student Nonviolent Coordinating Committee became. Preexisting structures make federation into an SMO possible. "Bloc" recruitment takes place; that is, blocs of persons already networked and sharing an identity are recruited, instead of individuals one at a time. Shared identity activates a "grievance multiplier" (V increases) when a perceived injustice to a member of a group or category is experienced as a collective injustice by others as well. Resources such as funds for action campaigns, leadership training centers, volunteer programs, and the like are provided by nonbeneficiary "outsiders" who are moved by their values and conscience to support a cause. Federated structures, bloc recruitment, grievance multipliers, and nonbeneficiary support lower organization costs and weaken free-rider tendencies.

Other research on the anti-Vietnam war and New Left student and counterculture movements found that dynamic mobilization emerges during confrontations in a loose structure that adapts to opportunities against opposition. Loosely structured collective action characterizes a coalition of activists, part-timers, and sympathizers whose boundaries are ill-defined and shifting; who lack a shared, central leadership and organization; and who use the mass media as a tool for communicating to potential supporters in lieu of a strong grassroots base. In a loose structure, mobilization costs are kept low through a division of labor that links a small leadership cadre of full-time activists to a much larger pool of part-time teams who contribute their presence episodically in short-lived campaigns for a cause—for example, a campus sit-in. Supporting them is a larger "conscience constituency" that contributes funds and public opinion support. Beyond them is a much larger bystander public that is attentive to the issue but initially indifferent or nonpartisan. Loose structure makes for low-cost mobilization and flexible tactics as the leadership responds to its adversary's moves: shifting from confrontations with transitory teams to legislative lobbying, to fund raising for the next confrontation campaign, and peaking with a massive peaceful gathering for which the conscience constituency and bystanders are mobilized in addition to the activists.

The effectiveness of political mobilization has been empirically studied, most completely in the Netherlands with respect to new social movements (NSM), such as the peace, women's, and environmental movements. Public opinion polls measure the sentiment pool for an issue and identify the sympathizers. When activists organize a campaign for a petition, a march, or other collective action, survey research measures what proportion of sympathizers was reached, was motivated to act, and actually participated. The overall effectiveness of the campaign can thus be measured as well as that of various targeting tactics such as door-to-door canvassing, telephoning, media appeals, and so on. Further statistical analysis clarifies the effects of V, S, C, and P and N on participation and which components of mobilizing structure are effective. Hanspeter Kriesi (1993) compared the effectiveness of mobilization across five NSMs and compared NSM mobilization with that of political parties and trade unions. Among his conclusions is that political values, V, are the crucial determinants of the level of mobilization.

Diffusion

Large-scale collective action has taken place in autocratic regimes that curb opposition and has on occasion toppled regimes long thought to be powerful, as in Eastern Europe in 1989. How can tens of thousands of people coordinate their actions without a central organizing mechanism? Protests spontaneously spread from the capital to other cities and from one country to another, and the authorities were helpless to stop the diffusion. Diffusion was also typical in the 1960s movements of the United States, when students seized campus buildings at many universities after the initial Columbia University student protests in the spring of 1968, the Harvard protest a year later, and the diffusion of the African American sit-in movement in 1960 throughout the South.

To understand diffusion, further specification of underlying mechanisms for micromobilization and mobilizing structures are needed: focal point, repertoire of collective action, signaling, pacesetter–follower dynamics, political opportunity, and assurance or uncertainty reduction. Focal point is the key to understanding coordination of action with only minimal communication and without leadership. It requires common knowledge embedded in political culture—for example, knowledge by citizens that in the past, for momentous political events, crowds gathered at a certain date in a historic square demanding freedom or reforms. They also know what flags, songs, and other symbols to carry and sing, signaling unity of commitment and purpose. The shared symbols and behavior codes that are embedded in the political culture and well known to participants is called the *repertoire of collective action*. The important matter is that not only do most people know the focal point and repertoire, but they also know that others know the same thing and will respond in the same way to "when and where we all assemble, and what we do there."

The contemporary protest repertoire par excellence of large crowds is the demonstration and march that winds its way through the major avenues and landmarks of the capital city. Repertoires create expectations for the adversaries and bystander public and provide some predictability for action; yet some spontaneous actions also take place. New repertoires are invented and tailor-made for specific purposes.

Collective action depends on expectations for *P*, *C*, and *N*, which are uncertain. To trigger convergence on a focal point and activate the repertoire, what is needed is a political opportunity signal to many people simultaneously that *N* is expected to be large, *P* is increasing, and *C* is decreasing. The signal might be a lack of support for a regime by an important ally, as when the Soviet premier Mikhail Gorbachev signaled in 1989 to East European communist regimes that they were on their own, or a successful challenge in neighbor states, as when Prague crowds witnessed the collapse next door of the East German regime. When political opportunity is judged to be favorable, a potential participant who estimates *P*, *C*, and *N* has some assurance that he or she will not be at the demonstrations with only a few others. Research has shown that an assurance process takes place in neighborhood, peer, work, and civic groups whose members communicate with one another and build confidence and commitment to participation. The assurance process has also been conveyed in recent years on websites, through cell phones and e-mail, text messaging, and other modes of electronic communication. Assurance reduces uncertainty, which inhibits collective action. Thus, the turnout is thousands, not just a few.

When protest starts at a focal point, it diffuses to other places and social units with pacesetter–follower dynamics. By virtue of history, culture, and geography, a mobilizing structure has a center–periphery structure: What happens in the capital is a wake-up call to provincial cities, and what happens at a prominent university campus triggers followers in peripheral colleges. Diffusion is explained by changing expectations about *P*, *C*, and *N* by potential followers depending on the outcome of confrontations at the pacesetter and at other sites that have already acted. The diffusion dynamic explains the spatial and temporal sequence of collective action because proximity and similarity are salient signals for expectations. The waxing and waning of participation at a particular site, be it the center or periphery, can also be thus modeled.

Violence Specialists

Much political mobilization researched in the 1960s through the 1980s was that of social and political movements using unconventional modes of collective action that were by and large nonviolent. Since the end of the Cold War, there have been many insurgencies for the overthrow of a government by violent means and terrorism. In response, regimes mobilized paramilitaries and special forces that not only fought armed enemies but assaulted the civilian population suspected of sympathy with the opposition. The issues at contention were state formation, secession, political autonomy, and power sharing in ethnically deeply divided societies. Research has found that micromobilization and mobilization structure models explain insurgent and regime mobilization in violent conflicts.

Ethnic and religious communities provide a mobilizing infrastructure of ethnic associations, kin networks, churches, mosques or temples, religious schools, funding and welfare organizations, an ideology, a shared culture, and leaders. Insurgents, fighters, and terrorists are recruited, trained, armed, and indoctrinated within this infrastructure, get social support, and are shielded from the authorities. Resources are obtained from external sponsors, including states that provide weapons, funding, safe places, and bases across a border. Just as for peaceful movements, the Internet, websites, and electronic modes of communication have made loose mobilizing structures possible.

Studies of insurgents and terrorists cannot rely on survey research with participants and on other routine social science methods. Nevertheless, court records from trials, interrogations of captured militants, informers, captured data from computer hard drives, and confessions from those who give up insurgency enable one to piece together the contours of micromobilization and mobilizing structure. Marc Sageman (2004) reports that for more than 400 Al Qaeda terrorists, the conversion to jihad was not a solitary decision but came about through interpersonal relations and with social support. Jihadists formed links with others like themselves and congregated in the same mosques, students associations, neighborhood clubs, and Islamic bookshops and often lived together. In these local communities, they became radicalized militants who advocated the violent overthrow of corrupt Arab regimes and other Islamist causes. These findings are in line with existing models and theories.

Mobilization of regime by violence specialists for ethnic cleansing, mass purges, and killings rests on a four-legged structure: (1) a radical elite and cadres running a party-state, (2) bands of armed militants and paramilitaries, (3) core constituencies who vote for the regime and keep it in power, and (4) a bystander public swayed or confused by propaganda. The armed bands, who perpetrate much of the violence against civilians, are recruited, organized, financed, trained, and indoctrinated by political parties and state security forces. The pattern is top-down mobilization by the regime elites for violence specialists and bottom-up for the core constituency and bystander public. The armed bands become distinct and privileged formations that serve the regime more reliably and loyally than the regular police and army. Their members are attracted by the racist and extreme nationalist ideologies of leaders who manipulate perceived threats, fears, and hate against target groups, often minorities. Although opportunists are attracted by the prospects for loot (*S*), many are convinced by propaganda that their cause is patriotic and morally justified (*V*) and that a preemptive strike against unarmed civilians of the target groups is actually saving their society from subversion and destruction. An example is the Interahamwe village militias organized by "Hutu Power" leaders in the Rwanda genocide. Similarly, paramilitary bands in the Yugoslav Wars were organized by political parties, criminal groups, local crisis committees, and the authorities and were responsible for much ethnic cleansing and massacres of civilians.

According to Donald Horowitz (2001), studies of ethnic, religious, and sectarian riots around the world (e.g., Hindu–Muslim riots in Indian cities) found a similar pattern of top-down, bottom-up mobilization as for insurgents and for regime mobilization. Political parties, factions, individual politicians, extremist organizations, and secret societies organize criminal gangs and train young men and women for fighting; these people are in the forefront of rioting, burning, and looting shops and attacking innocent people. These bands are joined by ordinary people who attack a target group, burn their homes and shops, and commit atrocities in passionate killings.

Elaborations of micromobilization and mobilizing structure models have to be made in these applications. The social psychology of motivation for a suicide attacker is going to be more complex than for a petition signer or a protest marcher. Clandestine insurgent organization is going to be different and more complex than a legal association that advocates a clean environment. Nevertheless, the five pivotal variables (*P*, *V*, *N*, *S*, and *C*), focal points, signaling, uncertainty reduction, diffusion dynamic, loose structure, external allies, and other key terms and processes in political mobilization are useful for theory development for all manner of mobilization, covering both democratic polities and autocratic regimes, by regimes and by opponents of the authorities, using unconventional modes of contention and confrontation, both nonviolent and violent.

MODEL SPECIFICATION

Model specification refers to the process of expressing a theory in mathematical (functional) form. The choice of model specification affects the validity of causal inferences. Arguably, severe specification errors impede the validity of inferences more than the choice of a suboptimal estimator. Yet applied researchers rarely follow a strategy when trying to develop and potentially improve the specification of their model. Rather, the choice of a model specification usually depends on a crude mixture of what is common in the field of research, methodological fads, and individual intuition. Misspecification occurs when the assumptions underlying an empirical analysis deviate from the true data-generating process. Nonrandom sampling, measurement error, model uncertainty, and a lack of independence of observations rank most prominently among the sources for model misspecification. Since researchers hardly, if ever, know the true model, most models analyzed in the social sciences will, necessarily, be misspecified. The most common misspecifications result from insufficient theoretical guidance. The resulting model uncertainty usually implies that researchers do not know the correct set of regressors (independent variables), their optimal operationalization, or the accurate functional form. This entry discusses the origins and types of specification problems and reviews the standard solutions to misspecification. The entry concludes with a discussion of the way in which researchers deal with specification issues.

Model Uncertainty

Model uncertainty results from underspecified theories. In the social sciences, theories aim at simplifying reality, therefore making generous use of ceteris paribus clauses and of highly stylized assumptions. In other words, theories neither provide full guidance about model specification to applied researchers nor do they aim at providing such information. Usually, they do not say much about which variables to include in the list of regressors, which functional form relates the right-hand-side variables to the dependent variable, the existence of conditional effects, and the existence and correct specification of temporal and spatial dependence. This section discusses the resulting specification problems in turn.

Model Uncertainty and Sensitivity Analysis

Model uncertainty has multiple origins; it occurs when researchers do not know the correct set of right-hand-side variables, the correct functional form that relates the dependent to the independent variables, the correct structure of conditionality between exogenous variables (those whose values are independent of the states of other variables in the system under study), and/or the causal dependences between exogenous variables, to mention just a few model uncertainties. Logically, researchers need to start with identifying all exogenous factors that influence the variation of the dependent variable across observations. Both the inclusion of too few or too many regressors may cause bias and will render inferences potentially invalid.

Assume, as an example for the "too many" case, that researchers intend to estimate the effect of income on vote choice but include the vote intention into the model. Since vote intentions depend on structural factors such as income and education, the inclusion of the vote intention variable causes right-hand-side endogeneity (i.e., regressors may not be independent of the dependent variable or the error term; see below). If this endogeneity is not correctly modeled, it makes the correct interpretation of results impossible. Indeed, the vote intention variable will capture much of the influence of income and education on vote choice, but researchers cannot separate the two causal mechanisms unless they estimate a simultaneous equation model or unless they drop vote intention from the list of regressors, hoping that income and education fully determine vote intentions.

In the absence of perfect knowledge of the true set of explanatory variables, researchers may conduct a sensitivity analysis to validate inferences. A sensitivity analysis distinguishes three types of explanatory variables: (1) the variable(s) of interest, (2) consensual determinants, and (3) contested determinants. Researchers then follow a quasi–Monte Carlo approach in which they estimate a large number of models, which always include the first two sets of variables and randomly draw a fixed number of "contested determinants" (typically three) into each single model. While methodologists agree on the structure of these sensitivity tests, they disagree on the criterion under which an effect may be considered to be robust. Suggestions include the condition that an effect is robust if and only if the estimated coefficients of all iterations have the same sign and remain significantly different from zero. A more generous definition ignores the significance criterion. Finally, an even more relaxed definition of robustness in sensitivity tests accepts an effect as robust if it generates the same sign in 95% of the iterations. Unfortunately, none of these criteria are fully convincing since the estimation will almost certainly be misspecified in a large number of the iterations. For example, when (at least) two regressors are highly correlated, the parameter estimate will become inefficient, and the point estimate can produce almost any result. As a consequence, sensitivity analyses are telling when they bring about robust results, but they are not when they do not. If a hypothesis does not find robust support, it is not necessarily wrong. There may just have been too many misspecified models among the iterations.

Functional Form and Conditionality

Exceptions may exist, but the huge majority of social science theories do not predict the functional form of an effect. The absence of theoretical guidance stimulates empirical researchers to simply assume a linear function or to take the logarithm of either the independent variable alone or of both the independent and dependent variables. While this arbitrariness gives researchers some influence over estimation results, the true functional form can greatly differ from all the above standard assumptions. Curve fitting offers an obvious, but inherently a theoretical, way to deal with this problem. Adding the squared term and possibly the cubic term (and so on) of a variable to the list of regressors allows for a sufficiently unconstrained functional form that allows the right-hand-side variables to "fit" the variance of the dependent variable. Yet curve fitting not only leads to overconfidence because it shrinks standard errors, but it can also result in vastly wrong estimates if the functional form is not the only specification problem. In the presence of other misspecifications, the higher power terms will undoubtedly pick up some variance of the other specification problem, thereby vastly increasing the bias of the estimate.

Whether or not a variable influences the dependent variable often depends on certain conditions. For example, the response to international tax competition depends on the degree to which political institutions, other political actors, and the voters constrain the government. Failure to model conditionality has the same consequences as omitted variable bias and biases at least the conditional variables. Researchers can easily mistake a misspecified functional form or an omitted variable for conditionality, as these misspecifications have very similar consequences for the residuals. If researchers cannot distinguish between a misspecified functional form and an unmodeled conditionality, a semiparametric analysis of the potentially misspecified variables may help. In such an analysis, researchers estimate a model using dummies of different combinations of variables x and z rather than including the two variables and their product separately. For example, if both variables x and z can be conveniently split into three categories (low, middle, and high) each, researchers either include these nine categories and estimate without intercept or include eight of the nine categories and estimate with intercept.

Incomplete Models and Unit Heterogeneity

Omitted variables usually reveal their existence in the form of structure in the residuals, suggesting that the Gauss-Markov conditions have been violated. Panel data help detect structure in the residuals because errors must be simultaneously independent and identically distributed across both space and time, which is more demanding than the same assumption for either simple cross-sectional or single time-series data. While structure in the residuals indicates model misspecification, it reveals little about the true causes of model misspecification. For example, in panel data, the sum of residuals for a single unit often deviates from zero. Econometricians interpret this structure as unobserved, time-invariant heterogeneity, which is but one of the possible reasons. However, this violation of Gauss-Markov conditions can result from most types of model misspecification, including omitted time-varying variables, a wrongly specified functional form, unmodeled conditionality, and so on.

Panel data textbooks suggest a radical "solution" to the problem of panel heteroskedasticity (i.e., unequal variance in the regression errors). When the estimated model does not fully explain the cross-sectional variation, econometricians suggest completely ignoring all cross-sectional variation (the so-called between variation). However, this common solution may lead to an improvement as well as a deterioration in the *ex ante* validity of causal inferences. In fact, inferences tend to become less reliable when the eliminated variation largely exceeds the remaining variation. In this case, the decline in analytical efficiency reduces the *ex ante* reliability of the analysis more than the potential decline in bias improves the validity of the analysis. In addition, when the model omits both time-varying and time-invariant variables, the elimination of all between-variation may actually increase the bias from the omitted time-varying variable.

Dependence

Regression models assume independent observations. Yet strict independence appears illusory in the social sciences, where individual action usually depends on past actions (temporal dependence) and on what other actors do or have done in the past (spatial dependence). As a consequence, most social science data sets violate the assumption of independence. Fortunately, this problem can be solved or at least moderated. Solutions to the problem of dynamic misspecification require the existence of time series. To account for temporal dependence, researchers would usually need to observe at least 30 sufficiently independent periods per case. The more within-variation can be collected, the more reliable the results eventually will become. If it is possible to gather sufficient variation over time, temporal dependence can be modeled in numerous ways ranging from serially correlated errors through the inclusion of the lagged dependent variable or a Prais-Winsten transformation, distributed lags models to more demanding models involving panel co-integration. The choice of the optimal dynamic specification for solving this problem depends on the degree of serial correlation, whether researchers have a theoretical interest in short- or long-term adjustment (or both), and whether the dynamics of different included regressors are sufficiently similar to justify simple techniques.

Spatial misspecification can take three different forms. First, the dependent variable in the unit of analysis depends on the value of the dependent variable in other units of analysis (not necessarily in all other units of analysis). Second, the dependent variable can depend on the value of explanatory variables in other units. Finally, the errors may be spatially correlated due to some form of unobserved spatial heterogeneity such as common shocks or common trends. The standard solution to spatial dependence requires the inclusion of a correctly specified "spatial lag" in the empirical model, which often needs to be instrumented (or analyzed by spatial-ML methods [a markup scheme for representing places mentioned in text and their relationships]) to account for endogeneity (see below).

Yet the existence of numerous solutions to problems of temporal and spatial dependence creates a new, higher-order problem. Since applied researchers have very different solutions available—model specifications that solve the problem of temporal and spatial dependence—the choice of the solution becomes a specification issue in itself. Econometric theory offers little guidance here, and different solutions may lead to substantively different results. Specifically, the impossibility of testing the weighting matrix independently from the spatial autoregressive term leaves applied researchers with important arbitrary decisions. Other issues, such as the choice of the correct functional form for the continuous weighting matrices, further add to these important specification problems.

Sampling and Data Imperfections

Sampling usually attracts major attention in empirical research. Indeed, a sample is optimal if it represents the population and if, at the same time, it is large enough. When researchers are able to observe a sufficiently large number of observations, random sampling appears to be the ultimate strategy. Any possible selection bias should be carefully avoided or—if this proves to be impossible—be accounted for. The following sections discuss, first, the impossibility of perfect random sampling; second, they examine the specification issues and research designs in the presence of (systematic) data imperfections; and third, they discuss unit heterogeneity.

Nonrandom Sampling

While econometricians often assume that researchers analyze a random sample drawn from the population, applied researchers seldom analyze a sample that represents the population. This problem also occurs when researchers analyze a "random draw" from a preselected sample, which is unlikely to represent the population. However, the population consists of all cases about which a theory makes predictions. It is this population from which cases must be drawn to constitute a true random sample. For example, a random draw from the record of British telephone landlines in 2009 is not a random sample of the population of cases on which a voting theory makes predictions. First of all, this theory claims validity not just for the British electorate but certainly for all democracies. Second, the theory's validity does not begin in 2009 and end in 2010.

Nonrandom sampling occurs frequently in comparative politics and international relations, where scholars have to deal with the mere existence of 24 typical Organisation for Economic Co-operation and Development (OECD) countries, roughly 60 typical democracies, and a total of 120 countries for which reliable data are available. Standard samples cannot be drawn from a larger population of countries (which does not exist), but the existing country-years do not constitute the population about which a theory makes predictions. Nonrandom sampling limits the generalizability of findings and may invalidate inferences. Yet social scientists have to live with these consequences. Unless social scientists formulate theories of rather limited scope, samples will never be truly random. The consequence of the absence of true random samples is clear: external validity remains limited. Yet the positive message is that this validity varies with the quality of the research design and with the extent to which researchers take nonrandom sampling and model uncertainty seriously.

Data Imperfections

In the social sciences, the limited quality of measurement may lead to serious problems. Many phenomena that social scientists need to measure cannot be directly observed. Take, for example, the "measurement" of per capita income. First of all, per capita income is a composite measure that divides the gross domestic product by population size. Second, to compute the gross domestic product of a country, one would have to aggregate all economic transactions. Yet whether a transaction is economic or a gift exchange depends on social standards. Likewise, the relative share of black market and illegal transactions depends on the scope of market distortions. Third, in the absence of a common currency, conversion rates between countries can be arbitrary. Fourth, population measures result from census data. Population counts are imprecise in censuses, and between census years, they are simply estimates. Neither the census count nor the estimates in between can be precise because illegal immigrants and undisclosed emigrants cause measurement error. Neither part of the measurement error appears to be unsystematic. Rather, social, economic, political, and cultural factors influence the accuracy of measures of per capita income heavily. As a consequence, a comparison of per capita income between countries gives an idea of per capita income in an international comparison, but analysts using this information need to understand that their data come with potentially significant measurement error.

Applied empirical research too often ignores measurement error. With the rise of Bayesian methods, however, attention to uncertainties became more common in the social sciences. Bayesian econometrics clearly paved the way, but frequentist approaches followed suit. Both methodological paradigms allow researchers to estimate models in a way that generates measures of the uncertainty of an estimate. For example, using standard econometric measures, scholars can repeatedly estimate a model with measurement error and randomly add this to the variable of interest that likely suffers from measurement error. This procedure gives a distribution of coefficients. If this distribution includes the zero, the measurement error is strong enough to influence inferences.

Yet the limits to observability lead not just to measurement error but also to censoring, truncation, and selection. Over the past decades, econometricians have developed a fine-grained set of estimation tools that help deal with very different kinds of sample selection issues. Censoring arises when the dependent variable is measured exactly only above (or below, or both) a certain threshold. As a consequence, researchers know only parts of the distribution. Income data, for example, may be measured exactly above the poverty line, while lower income is reported at the poverty line. Models for censored data deal with the problem of censoring by estimating a replacement for the censored observations.

Truncation arises when the dependent variable is observed only above (or below or both) a certain threshold. The information on both the dependent and the independent variables can be truncated. In this case, researchers may fit a regression model from the sample drawn from the restricted part of the population. Under the assumption that the error terms in the truncated regression have a truncated normal distribution, a correction for the truncation becomes possible.

Other conditions may limit the observability of the dependent variable in a subset of the population. Not all countries report socioeconomic information to international organizations. Obviously, the sample of nonreporting countries deviates largely from the sample of reporting countries. Usually, governments in less democratic and poorer countries are significantly less likely to provide information. Nonresponse in survey studies creates similar problems for researchers. Heckman selection models correct for sample selection if researchers are able to specify a model that explains selection. The estimated nonselection hazard is then used in the final stage of the estimator to correct for the selection process.

More recently, econometricians modeled solutions for very specific selection processes. For example, selection may occur but cannot be directly observed. Fishing at a pond in a park provides the standard example. Since the number of fish caught is not observed reliably at the pond but only at the gate of the park, zeros can be caused by either not fishing or by failure to catch fish. The zero-inflated Poisson or negative binomial model generates most promising results in situations such as this. However, the model does not correct for the possibility that visitors spend a very different amount of time fishing. This problem cannot be solved by a zero-inflated model unless somehow miraculously the time visitors spend fishing can be observed through the number of fish caught. This problem should similarly apply in most applications of the zero-inflated Poisson model.

Endogeneity and Simultaneity

In the social sciences, almost nothing is truly exogenous. Social sciences are concerned with choices. Actors choose between options by calculating the consequences of their options. The criteria on which actors base their decisions are often the consequence of other intentional actions. As a consequence, social interactions shape the basis on which decisions rest, but these decisions provide parts of the basis of other decisions. For example, participatory political institutions have a higher probability of survival in relatively affluent societies. At the same time, political institutions and political stability influence economic growth. Therefore, estimating the effects of political institutions on socioeconomic factors is hampered by endogeneity.

Classical Endogeneity

Endogeneity is often defined in a narrow sense meaning that at least one of the regressors is not independent of the dependent variable. To use a famous example, simple estimates of the effect of political institutions on economic growth are likely to be biased by the fact that the choice of institutions depends to a certain degree on economic performance. At the very least, social conflict and cleavage structures codetermine political institutions and economic performance. In a broader sense, endogeneity is defined by its consequences: the correlation between the error term and one regressor. In this definition, omitted variables, measurement error, or a misspecified functional form exclude conditionality and so *cause* endogeneity.

This problem can be solved in three classical ways. First, researchers may be able to find an exogenous proxy for the endogenous right-hand-side variable. Of course, a good proxy often does not exist. A second, more popular solution requires the use of instruments for the endogenous variables. Instruments need to satisfy two criteria. They have to explain as much as possible of the endogenous right-hand-side variable (the instrumented variable) and need to be uncorrelated with the error term. Applied researchers often generously ignore the first condition and exclusively pay attention to the second. For example, political institutions have been instrumented by settler mortality rates, because settlers only invested in good political institutions where mortality was low. While the argument seems convincing, settler mortality data do not provide a good instrument for institutional quality. Institutions may change slowly, but they change. Using historic settler mortality data as the sole instrument, however, only captures the time-invariant exogenous part of political institutions. In addition, while settler mortality may influence the choice of institutions, economic growth and settler mortality are hardly the only influences on political institutions. Yet the choice of poor instruments largely reduces the efficiency of the parameter estimate, and it may easily result in unreliable point estimates. The use of poor instruments then leads to less reliable estimates than estimating a model that ignores existing endogeneity issues.

Endogeneity, thus, is a serious problem in the social sciences. "Solving" endogeneity problems with weak instruments generates an even more serious problem. A weak instrument is a variable that is not correlated with the error term but only weakly correlated with the endogenous variable. Estimates with weak instruments are always less efficient than estimates that ignore the endogeneity, and they can, at the same time, be even more biased. In these cases, the cure is worse than the disease. This result, though known since the early 1990s, contrasts starkly with claims that the instrumental variable (IV) model allows causal inferences in a nonexperimental setting.

Right-Hand-Side Endogeneity

Misspecification also occurs when one regressor (partly) depends on at least one other regressor. In this case, estimates, first, suffer from inefficiency caused by multicollinearity. As a consequence, inferences become less reliable. Second, researchers may find it difficult to interpret the effects of the two correlated right-hand-side variables. When two or more regressors depend on each other, parts of the effect of one variable are captured by the other variable. If researchers are not aware of the dependence, serious misinterpretations become likely. To solve the problem of right-hand-side endogeneity, solutions that also deal with reversed causality are feasible. As before, using instruments for one of the right-hand-side endogeneous variables or estimating a simultaneous equation model that explicitly models the endogeneity between the regressors provides a solution.

"Solving" Specification Issues: A Cautionary Note

Though model misspecifications bias estimation results and may lead to invalid inferences, methodologists and applied researchers tend to take some specification issues more seriously than others. The extreme importance of unobserved time-invariant heterogeneity relative to time-varying heterogeneity seems unreasonable unless one understands that methodologists believe that they have a solution to the former but not to the latter problem. Are solvable specification problems more common than unsolvable ones? Certainly not, but at least researchers can deal with them.

Specification problems are fads and deeply embedded in the cultures of various disciplines. A serious problem for one discipline might easily be a nuisance for another discipline. To mention just another example, over the last decade, economists appeared to be obsessed with endogeneity and thus with instrumental variable models. At the same time, researchers working in other disciplines were much more likely to ignore endogeneity. Who is right? The answer is that it depends on the quality of the instruments, which is more an assumption than a known entity. Too many IV models are certainly not any better than too few. And this result is generalizable: Too much effort to solve even the most obscure potentially existing specification problem is as costly as the ignorance of specification problems. And often, this holds even if the solutions work in the desired direction. This is because these solutions come at a price. Currently, econometricians suggest two standard solutions, which can be defined as

1. removing "bad variation" and
2. removing "bad observations."

Both standard solutions (which can of course be combined) and their costs are discussed in turn. Fixed effects models and instrumental equations are the most common techniques when researchers seek to eliminate parts of the variation to improve proper variable "identification." Fixed effects models assume that a part of the variation of the dependent variable is explained by an unobserved factor, which is correlated with one of the regressors. If researchers do not find a way to account for the unobserved regressor, the existence of this unobserved omitted variable will bias the estimates of all correlated regressors. Similarly, instrumental equation models assume that the dependent variable explains an unknown but positive quantity of the variation of at least one of the regressors. In both cases, researchers would like to perfectly account for the problematic parts of the variation. Unfortunately, this is not what fixed effects models do, and instrumental variable models are, at best, unlikely to just strip the problematic variation of the instrumented variable. In fact, the fixed effects model does not use variation between units at all, and instruments typically explain less than the "unproblematic part" of the endogenous variable.

As a consequence, researchers live with what many think is the second best option: a model that throws away too much variation. In the standard econometric textbook world, researchers pay an almost irrelevant price because econometricians are mainly interested in asymptotic properties; that is, they ask, "How do we get the optimal estimate when we have an infinite amount of information?" In this world, throwing away, say, half of the variation does not matter, because half of infinity still gives infinity. But applied researchers do not live in this convenient world. They have limited amounts of information at their disposal, and when they want to make the best of it (i.e., the most reliable causal inferences), throwing away more than necessary may really be costly.

More recently, methodologists have developed research designs that "solve" specification issues not by eliminating variation but by "intelligent" sampling techniques. For example, rather than estimating a fixed model, researchers could also sample observations that do not seem to have significant unobserved unit heterogeneity. Of course, both techniques should give relatively similar results—but this hardly ever happens with real data. In principle, however, by eliminating observations from the sample, researchers can account for the influence of some problematic regressors. In this case, researchers may use matching techniques to make the distribution of the problematic variable more similar across groups. This technique thus clearly accounts for misspecified functional forms, but it cannot reduce bias from a wrongly specified model, and it comes at the price of reduced efficiency and dubious external validity.

Experiments provide a more radical solution to the problem of model uncertainty. If researchers are able to design controlled situations in which all but one (potential) influence on a variable are held constant, they can get close to identifying the true effect of the variable. Yet in the social sciences, one usually cannot hold variables constant without losing external validity. For example, holding gender constant will reduce the extent to which the experiment's results can be generalized to the true world in which different genders exist. However, experimental design can hold the distribution of variables stable between different groups. In experiments, researchers usually randomize the treatment and then hope that the distribution of confounding factors is identical in the treatment and control groups. Whether this assumption holds depends on the number of independent experimental observations as well as the distribution of the potential confounding factors. The rarer a confounding factor is, the stronger its influence, and the larger the number of groups, the greater the number of experimental observations needed to guarantee a sufficient approximation to equal distribution.

To give but one example, assume that social scientists conduct a decision experiment with 1,000 participants—a number larger than what we usually see in the social science experiments. Five hundred participants receive a treatment, and the remaining 500 get a placebo (or some other nontreatment). Now, assume the existence of an important genetic property, which occurs in 1% of the population. This leads to two questions: First, what is the probability that 1% of the participants have this defect? And second, what is the probability that the defect occurs equally among the participants in both groups? The answer to the first question is that if the sample is drawn from the population, roughly 100 ± 10% will have the defect. Of course, there is a roughly 5% probability that the sample includes fewer than 80 or more than 120 participants of this type. The second question proves to be more important. The probability that both the treated and the control group include the same number of participants of this type is only marginally above zero. On average, the difference will be 6.66. Accordingly, if the experimental design controls confounding factors by randomization, bias will be different from zero unless the sample size approaches infinity. Thus, experiments identify the "true effect" only asymptotically and fail to do so in all real-world experiments. However, experiments still have a clear advantage over estimation—namely, that the true model does not need to be known. The price researchers pay for this advantage is a sharp decline in external validity.

Robustness tests offer a radical alternative to the logic of removing variation or removing observations. Rather than solving specification problems, robustness tests seek to provide an estimate of the importance of specification issues for causal inference. Robustness tests identify areas in which the true specification remains unknown and then vary the model specification in a way that accounts for the model uncertainty. For example, when measurement errors reduce the validity of point estimates, researchers can generate additional controlled measurement error (using Monte Carlo techniques) to analyze the influence of measurement error on parameter estimates. In this case, the parameters will vary across the iterations of this experiment, but this variation may not affect causal inferences and thus demonstrates the robustness of the results. Further robustness tests include groupwise jack-knives, bootstrapping, sensitivity analysis, semiparametric techniques, the choice of alternative estimators, and many more. Robustness tests do not try to solve specification problems when solutions appear to be too costly. And they do not claim to produce certainty where of course there can be none. After all, even the best solution to the most pressing specification problem can give unbiased results if and only if the model is otherwise perfectly specified.

MODELS, COMPUTATIONAL/ AGENT-BASED

All models of politics are models in the colloquial sense of being simplified "miniature" artifacts that their creators believe represent some important aspect of the real world. The hope is that manipulating moving parts of the model gives useful intuitions about how the real world works. "Useful" in this sense means something that is a valid inference from the model, nonobvious, and, at least a priori, empirically plausible. *Theoretical* models are constructed from abstract statements about the real world. Useful general propositions about the real world may be derived *analytically* by "solving" the model using some form of logical manipulation. For example, if one knows the radius r of a circle and wants to know its area, A, he or she can make use of an ancient analytical result: $A = \pi r^2$. This result derives from a formal mathematical proof and is always and forever true in a Euclidean space.

The same result could be derived from a well-designed *computational* experiment:

1. Scatter p dots at random on a Euclidean plane, in a uniform distribution; every locus on the plane is equally likely to have a dot on it.
2. Randomly select a locus (x, y) on the plane; draw a circle with radius r centered on (x, y), picking values of x, y, and r at random; count n, the number of scattered dots inside the circle; n is a computed estimate of A, the area of the circle.
3. Iterate (1) and (2) above m times.

Careful analysis of observations from this experiment would reveal, among other things, that n is completely uncorrelated to the values of x and y, the coordinates of the center of the circle; the best-fit prediction of n is $n = \pi r^2$. The *precision* of this estimate will depend on the number of dots scattered, d, and the number of times the scattering is done, m. In other words, it depends on the amount of computational resources deployed on the problem—the more the better. All this computation would be an utterly pointless waste of resources. It is known analytically that $n \approx A = \pi r^2$.

Very often, however, empirically plausible models of real-world processes that actually interest researchers are analytically "difficult" or "intractable," leaving them unable to generate the formal proofs that they would very much like, because they cannot solve the model analytically. An intractable model is one that researchers know cannot be solved analytically. A difficult model is one that researchers do not know cannot be solved analytically, but they do know that it has not yet been solved, and they do not yet know how to solve. There are two basic solutions to this very common intellectual problem. The first is to make the model tractable by simplifying its representation of the real world. The resulting model looks less like the real world, but at least it can be solved analytically. The second solution is to use computational methods to investigate and in some sense "solve" difficult or intractable models. In this entry, the strengths and limitations of computational modeling and its possible applications in political science are discussed.

Computation and Analysis

Consider a two-dimensional policy space in which voters' preferences are described in terms of "ideal points." Assume that these ideal points have a symmetric bivariate normal distribution with a mean at the origin of the space. We want to estimate the number of ideal points (dots) located within a circle of radius r from an arbitrary point (x, y) in the space—for example, the number of voters within distance r of some party policy position. This problem, while precisely specified, is at the very least difficult to solve analytically since we cannot use the analytical result $n \approx A = \pi r^2$. This is because, given the bivariate normal distribution of ideal points, the number of ideal points in a circle of given radius now depends critically on the locus of its center. Generalize the problem further to any arbitrary, or even unknown, distribution of voter ideal points. The problem becomes increasingly difficult, if not intractable, analytically. One solution is to simplify the model by assuming the arbitrary distribution of ideal points to be uniform, restoring access to the analytical result $n \approx \pi r^2$. The gain would be analytical rigor, in some odd sense, but the cost would be realism and thus empirically valid intuition. The "rigor" of the result would depend on assuming something we knew for certain to be false. The other solution would be to run the very simple computational experiment outlined in Items 1 to 3 above, ridiculous with a uniform distribution of ideal points but now powerful in allowing us to estimate, in a transparent way, the number of points within a circle with radius r and center (x, y), for any arbitrary distribution of ideal points. More generally, a computational experiment can be designed to retrieve any analytical result, but computational experiments can also be designed to retrieve results that can never, or cannot yet, be derived analytically.

Such computational work does not at all depend on using electronic computers; all computations could in theory be carried out by hand. In practice, the relatively low cost of electronic computers and the increasing sophistication of the programs that run on them mean that nearly all computational work is now done on computers. In the same way, analytical results are in practice not all derived using a pencil and paper. Computer programs may be used to solve difficult systems of equations. Unseen inside the program, these solutions may involve simulations, while program output, and thus computer-assisted formal "proofs," may or may not be amenable to checking by the human analyst.

Theoretical Intractability, Decision Heuristics, and Agent-Based Modeling

A famous and intensively studied intractable problem that is simply stated is the Traveling Salesmen Problem (TSP). Given n cities arbitrarily located on a map, find the shortest route that visits all of them and returns to the starting point. This cannot be solved analytically for the general case with an arbitrary number of cities at arbitrary locations. Any particular example of the TSP can in theory be "smashed" computationally by elaborating every possible route, computing the length of each, and picking the shortest route. However, the number of different possible routes between n cities is $(n - 1)!/2$, which expands at an explosive rate with the number of cities. The number of different routes between "only" 100 cities is about 4.666×10^{155}. This problem cannot in practice be smashed with feasible finite computing resources. Since the TSP is a real problem for real humans, for example, when they devise travel itineraries or vehicle delivery routes, its analytical intractability has important implications, both for actual decision making by real humans and for the representation of real humans as agents in models. In the absence of a formally provable best solution to the problem, any analyst—including the decision-making agents whose behavior is being modeled—must rely on informal *decision heuristics* or *rules of thumb*. These are decision rules that have been generally found, through a process of experimentation and learning, to produce good solutions to the problem at hand but that cannot be proved to be optimal and may indeed be highly suboptimal in certain cases. One heuristic for attacking the TSP, for example, is "start with a random city; visit the closest unvisited city; iterate until all cities have been visited." This is a "greedy algorithm," doing what looks best at any given stage in the search and performs well in many circumstances. It often finds something "close" to the shortest route in easy cases where the shortest route is known from having smashed the problem. But particular examples can easily be constructed for which this algorithm produces disastrous results. Thus, the search for efficient heuristics for attacking the TSP is an important ongoing project in computer science.

Political science is, of its essence, concerned with many analytically intractable problems. One mainstream example concerns the search by party leaders for vote-maximizing party policy positions in a multidimensional policy space, in a setting where all voters support their closest party. This is a special case, in a political context, of the more general mathematical problem of competitive spatial location, a problem that has also been shown to be formally intractable in a space of more than one dimension. Despite formal intractability of this problem, party leaders must still set party policy positions. One response to this, very common in political science, is to simplify the model of party competition in ways that allow the derivation of an analytical result. A very common simplification is to assume, not n parties and m dimensions, but one dimension and a small number of parties, possibly even only two. This gives access to a portfolio of well-known analytical results, for example, about the role of the "median" voter on the solitary dimension. These results may be considered intuitively useful if the empirical setting under investigation can plausibly be described as having only one policy dimension and a small number of parties. If researchers are intrinsically interested in competition in multiparty systems with multidimensional policy spaces, however, they will not find one-dimensional analytical results intuitively useful. Formal intractability of the problem of competitive spatial location in multidimensional spaces tells researchers, further, that these one-dimensional analytical results do not generalize and suggests the use of computational methods to attack the problem.

Moving beyond methods that might be used to attack interesting but intractable problems, a far deeper substantive implication of intractability concerns the behavior of real humans. In the absence of formally provable best-response strategies for setting party positions in multidimensional policy spaces, for example, and given that such positions must nonetheless be set, party leaders must use informal decision heuristics. This is a very good example of the type of problem that can usefully be analyzed using agent-based modeling. Agent-based models (ABMs) are bottom-up models that, typically, assume settings with a fairly large set of autonomous decision-making agents, each agent using some well-specified decision rule. The modeling exercise is to elaborate the patterns that emerge when these agents interact with each other. The essence of agent-based modeling is conveyed clearly in a simple but powerful model of spatial segregation put forward by Thomas Schelling in the 1970s. The original Schelling model was computational but was implemented with coins on a chessboard, not an electronic computer. Scatter some pennies and nickels, say 20 of each, at random on the chessboard; move each coin to the center of its closest square. Each coin has eight adjacent (neighboring) squares. (Coins on the edge squares are different but this does not affect the result.) Coins represent people, and people have two different colors. Assume that people have some view about the color of their neighbors. This is expressed by a preference parameter p, the minimum proportion of people on neighboring squares I would like to be the same color as me. This preference can be very mild. If $p = .25$, for example, I am unhappy only if less than a quarter of my neighbors are the same color as me; if $p = .5$, I am unhappy if less than half of my neighbors are the same color. The modeled behavior is simply that unhappy agents move to a randomly chosen nearby empty square. A model run begins with agents scattered at random; agent behavior is then implemented iteratively using this rule until no unhappy agent wants to move.

Figure 1 shows an example of the surprisingly strong patterns of spatial segregation that emerge from this simple model, implemented on a computer using the agent-based modeling environment NetLogo. The left panel shows a starting configuration with 1,000 gray and 1,000 white agents scattered at random on a 51 × 51 square "chessboard." At the beginning of the run, given this particular scatter, on average, agents find that 50% of their neighbors are the same color. Agents in this model run were given a p of .50; those finding themselves in a location where less than 50% of their neighbors were the same color moved to a new location. The right panel of Figure 1 shows the steady-state configuration of agent locations that was the outcome of this particular run. The emergent pattern of spatial segregation can be seen very clearly. The surprising result is that, on average, 88% of each agent's neighbors are now the same color. This social interaction generated a much more intense pattern of spatial segregation than any individual agent prefers. Even very mild preferences about neighbors can increase spatial segregation. From the same random start shown in Figure 1, setting $p = .25$ increases the mean percentage of similar neighbors from 50% to about 60%. In other words, even if people only move when less than a quarter of their neighbors are the same as them, segregation will increase. This was an unexpected and counterintuitive result that continues to be debated.

The striking Schelling segregation results would be, at the very least, difficult to derive analytically; yet a simple computer program gives full access to them. A theorist approaching this problem with the tools of classical formal analysis, for example, would in essence have to model strategic location decisions made by each of 2,000 agents, each decision taking into account what each of the other 1,999 agents is likely to do. This, of course, would also be making a preposterous assumption about the behavior of real humans. The Schelling ABM in effect makes the "satisficing" behavioral

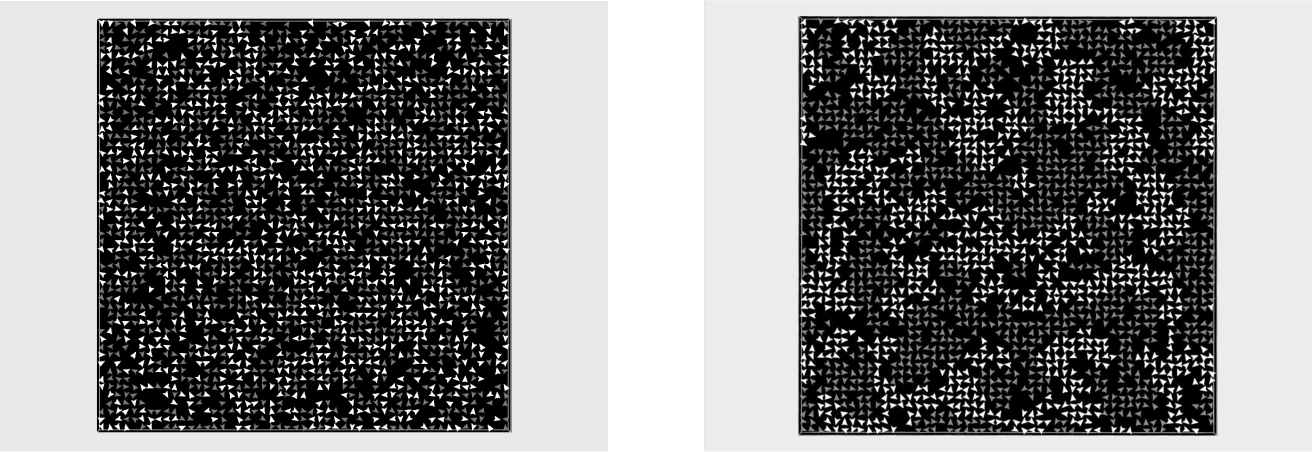

Figure 1 Random Start and Steady-State Outcome of the Schelling Model of Spatial Segregation

assumption that people in such complex settings stay put if they are happy, defining happy in some precise way, and move if they are not. This is a classic example of a "win-stay lose-shift" decision rule that is a common behavioral assumption for ABMs. His computational model then systematically elaborates interactions between large numbers of agents using this rule. Thus, while ABMs do deploy decision heuristics as methodological devices to attack analytically intractable problems, the fundamental motivation for using ABMs is a behavioral assumption that, given the complex settings in which they find themselves forced to make decisions, real humans use rules of thumb when they must pick a course of action. ABMs are much better justified as plausible models of real behavior than as methodological responses to intractability.

Trade-Offs Between Rigor, Realism, and Parsimony

There are thus two quite distinct epistemological dimensions that distinguish agent-based modeling from classical formal analysis in political science. The first is methodological and contrasts formal analysis with carefully designed computational experiments as distinctive ways of deriving general results. The second is behavioral and contrasts the forward-looking strategic analysis that is assumed by formal game theorists to be performed by real humans, for example, with the deployment of simple decision rules, which is the typical behavioral assumption of agent-based modelers. The complexity of the problem under investigation may well dictate the trade-offs that are made within this epistemological space. In a simple setting that is analytically tractable, formal analysis can yield easily accessible yet rigorous results. Given this, further, it may seem reasonable to assume, behaviorally, that real humans can perform the same analyses as the modeler. This convergence of method and behavioral assumption is pleasing, since a sophisticated analyst is then not assuming that real humans can do things that the analyst cannot do himself or herself. In such cases, there is little point in using computational methods or ABMs.

Typically, however, the real political problem under investigation is complex, and analysts face hard trade-offs. One response, as noted above, is to simplify the model to a point at which it is tractable, by making assumptions that are, inevitably, less realistic. (If they were more realistic, there would be no point in the more complex model.) Typically, though not inevitably, in the case of game theoretic models in political science, such simplifying assumptions concern the setting being modeled not the rationality of the agents. An intrinsically dynamic setting is assumed to be static—for example, the dimensionality of the preference space is reduced; only a very small subset of actors is modeled, and so on. Set against the benefits arising from analytical rigor, given the simplifying assumptions, the costs arise because the model is now less realistic. A contradiction arises, further, if real agents are now assumed to apply a sophisticated strategic decision-making model to an assumed setting, which, if they were indeed sophisticated, they would know is far more complex than the one being modeled. In a nutshell, agents may be assumed to be smart enough to perform complex strategic calculations in a one-dimensional space, for example, but not smart enough to see that the real space is not one-dimensional, and their calculations are thus pointless. The pleasing conjunction of method and behavioral assumption has been lost in the search for rigorous analytical results in intractable complex settings.

In complex settings involving many agents, the desire to attack substantively interesting problems may more or less mandate computational methods if even a semblance of empirical realism is to be retained. Considering the spatial segregation problem illustrated in Figure 1, for example, most people would feel that the core intuition would be lost by simplifying this down to a fabulously rigorous formal model of strategic location decisions made by five agents in a one-dimensional space. The fundamental substantive interest of this problem is that it is at least two-dimensional and involves unintended consequences of interactions between large numbers of agents. Riots, revolutions, and indeed voting in large electorates are other examples of this type of problem. While we can easily specify a formal game played between "a rioter" and "a government," most people would probably feel this misses the entire point about riots, which concerns how interactions between people in large groups are in some important sense different. The inevitable price paid for all computational work is that computation, of its essence, involves observing outcomes of particular model runs, conditional on particular parameter settings. An analytical result, if general, is good for all conceivable valid parameter settings. Strictly speaking, computational results are only valid for those points in a model's parameter space that have actually been investigated. Inferences about parameter settings that have not been investigated are, in effect, interpolations.

This focuses attention on two matters of primary concern to those engaged in computational work that is carefully designed and rigorously executed. The first concerns sampling from the model's parameter space; the second concerns the techniques used to draw general inferences from particular observations. Computational work in essence generates simulated data about model outcomes, conditional on model parameter settings. Viewed in this way, it is closely analogous to empirical work, which collects "real" data about outcomes under investigation, together with associated values of independent variables of theoretical interest. In each case, collecting more (unbiased) data is always better, while it is vital to match techniques of statistical inference to the underlying data-generating process. In the case of computational analysis, therefore, analysts become more confident in their inferences, the more "data" they have, and this is achieved by having more model runs that investigate more points in the parameter space. A single model run tells researchers rather little—very much like an election study that interviews a single individual. One thousand model runs, sampling 1,000 points at random from the model's parameter space would, in contrast, tell researchers quite a lot. Of course, there is always the possibility that there is an unsampled parameter vector that would generate a "peculiar" result, but two distinct things happen as the size of the sample is increased. First, the probability of failing to sample some peculiar point in the parameter space is driven down. Second, even if analysts do fail to sample some peculiar point, they become more confident that the inference drawn from their sample is in some sense a good representation of model outcomes and that the hypothetical unsampled peculiarity is an anomaly. If analysts really do worry about unsampled parameter points that might have blown up the inferences had the analysts only sampled them, the solution is simple—increase the size of the sample. Analysts can, if they wish to reduce the possibility of undiscovered anomalies, conduct a million model runs. The only matter at issue is the opportunity cost of doing something more productive with their time and computing resources. It is thus perfectly possible to design "heavy-duty" computational work, which, combined with rigorous statistical analysis of model outcomes, enables confident and replicable inferences to be drawn about the effects of all the model's moving parts. At the end of the day, these are precisely the same types of inference that emerge from classical analytical modeling.

Finally, it is important to note that the ability to derive intuitions from any model, computational or analytic, depends on the model being parsimonious, in the sense of having a transparent logic and relatively few parameters. Parsimonious models tend not only to be easier to analyze than complicated models, but also their substantive implications are typically much easier to interpret. To set against this, the price paid for a more parsimonious model is that it may be less realistic than a richer (more complicated) model of the same process. In the realm of classical analysis, parsimony is to a large extent self-policing. There are few incentives to complicate a parsimonious model that has been solved with some difficulty and seems to be doing a good job at explaining something of interest. It is typically very easy, by contrast, to take a computational model and graft on layer after layer of complication, each layer added in a quest for enhanced realism. Parsimony is not self-policing, and, if model outcomes do indeed seem more realistic as a result of the added complication, the trade-off between parsimonious but less realistic models, as opposed to complicated but more realistic ones, is drawn in much sharper relief. The matter of whether more realistic and complicated or more parsimonious but less realistic computational models provide better intuitions about real politics is to a large extent a matter of taste, however, since there is no gold standard for good intuition in political science.

MODERNIZATION THEORY

The analysis of modernity—of the modern social order and civilization—has constituted a basic core in the modern intellectual discussion of the development of modernity in sociological, anthropological, and historical scholarship. In sociology, the analysis of modernity constituted the focus of the major early evolutionists, such as Auguste Comte and Herbert Spencer. In different ways, such analysis was also the central focus of the discussion of modernity in the works of Karl Marx, Alexis de Tocqueville, Émile Durkheim and Max Weber, Ferdinand Tönnies, and many others. This entry traces the evolution of modernity from the theories of the 1950s through the present time, focusing especially on the varied forms that modernity has taken and its relationship to changing concepts of power and the legitimacy of the nation-state. The entry concludes with a look at the impact of globalization and at the negative aspects of modernity.

Classical Theories

The "classical" theories of modernization of the 1950s have indeed identified the core characteristics of modernity and of modern society, such as the decomposition of older "closed" institutional frameworks; the development of new structural, institutional, and cultural features and formations; and, to use the terminology of Karl Deutsch, the growing potential for social mobilization. The most important structural dimension of modernity attesting to the decomposition of former relatively narrow formations was seen in the growing tendency for structural differentiation—manifested, for example, in growing urbanization; commodification of the economy; and in the continual development of distinctive channels of communication and agencies of education. On the institutional level, such decomposition gave rise to the development of new institutional formations—such as the modern state, modern national collectivities, and new market (especially capitalist) economies—that were perceived or defined to some extent at least as autonomous and that were indeed regulated by specific, distinct mechanisms—such as rules of the market, of bureaucratic organization, and the like.

In some later formulations, it was the development of such distinct autonomous spheres, each regulated by its own logic, that was very often defined in the essence of modern institutional formations. Concomitantly, modernity was seen as bearing a distinct cultural program and shaping a distinct type of personality characteristic.

These theories, as well as classical sociological analyses of Marx, Durkheim, and to a large extent even of Weber (or at least one reading of him), have implicitly or explicitly conflated the structural and cultural major dimensions of modernity, as they saw it developing in the West. A very strong, even if implicit, assumption of the studies of modernization was that the cultural dimensions or aspects of modernization—the basic cultural premises of Western modernity, the "secular" rational worldview, including a strong individualistic orientation—are inherently and necessarily interwoven with the structural ones. Accordingly, most of the classics of sociology as well as the studies of modernization of the 1940s and 1950s and the closely related studies of convergence of industrial societies have assumed, even if only implicitly, that the basic institutional formations, the definitions of the institutional arenas, the modes of their regulation and integration that developed in European modernity, and the cultural program of modernity as it developed in the West will "naturally" be ultimately taken over, with possibly local variations, in all—or at least in the "successful"—modernizing societies. It is further assumed that this project of modernity, with its hegemonic and homogenizing tendencies, will continue in the West and, with the expansion of modernity, will prevail throughout the world.

Multiple Modernities

The reality that emerged proved to be radically different. Modernity has indeed spread to most of the world, but it did not give rise to a single institutional pattern or to a single modern civilization but, rather, led to the development of several continually changing modern civilizations or at least civilizational patterns—that is, of societies or civilizations that do indeed share some central core characteristics but that nevertheless tend to develop different, even if cognate, ideological and institutional dynamics. Moreover, far-reaching changes that go beyond the original premises of modernity have been taking place also in Western societies.

At the same time, the institutional formations that developed in most societies of the world have been distinctively modern even if their dynamics have been greatly influenced by their own distinctive cultural premises, traditions, and historical experiences. This of course runs contrary to the view that the best way to understand the dynamics of different "modernizing" societies is to see them as continuations, even if in new ways, of their traditions and of their traditional institutional patterns and dynamics—a view that was to some extent revived in the context of the contemporary scene as the theory of the "clash of civilizations." Of special importance in this context was the fact that the most important social and political movements that became predominant in these societies—such as the nationalistic ones and, later on, even the fundamentalistic ones, which often promulgated strong anti-Western or even antimodern ideas—were basically distinctively modern ones, promulgating distinctive interpretations of modernity.

Concomitantly with the growing recognition of the great complexity and variability of modern and contemporary societies, a much more complex picture of modernity emerged. From the very beginning of the discourse about modernity, there developed two opposing evaluations, attesting to the inherent contradictions of modernity: One such evaluation, implicit also in theories of modernization and those of "convergence and of industrial societies" of the 1950s and early 1960s, saw modernity as a positive, emancipating, progressive force epitomizing promises of a better, inclusive, emancipating world. The other such evaluation that developed first from within the very core of the first European societies and later found strong resonance in non–Western European societies espoused a negative or at least a highly ambivalent approach to modernity—seeing it as a morally destructive force—and emphasized the negative effects of some of its core characteristics, be it technology or the empowerment of egoistic and hedonistic attitudes and goals.

All these developments have yielded a continual reexamination of theories of modernization, giving rise to the idea or concept of multiple modernities as the best way to understand the contemporary world. Thus, to explain the history of modernity is to see it as a story of continual constitution and reconstitution of a multiplicity of cultural programs and cultural patterns of modernity.

One of the most important implications of the term *multiple modernities* is that modernity and Westernization are not identical; Western patterns of modernity are not the only "authentic" modernities, though they enjoy historical precedence and continue to be a basic reference point for others.

This view of multiple modernities entails certain assumptions about the nature of modernity. The first such assumption is that modernity is to be viewed as a distinct civilization, with distinct institutional and cultural characteristics. According to this view, the core of modernity is the crystallization and development of a mode or modes of interpretation of the world or, to follow Cornelius Castoriadis's terminology, of a distinct social "imaginaire," indeed of the ontological vision, of a distinct cultural program, combined with the development of a set or sets of new institutional formations—the central core of both being an unprecedented "openness" and uncertainty.

This civilization, the distinct cultural program with its institutional implications, crystallized first in Western Europe and then expanded to other parts of Europe, to the Americas, and later on throughout the world, giving rise to continually changing cultural and institutional patterns, which constituted different responses to the challenges and possibilities inherent in the core characteristics of the distinct civilizational premises of modernity.

The core of this program has been that the premises and legitimation of the social, ontological, and political order were no longer taken for granted. Consequently, there developed an intensive reflexivity around the basic ontological premises as well as around the bases of social and political order of authority of society—a reflexivity that was shared even by the most radical critics of this program, who in principle denied the legitimacy of such reflexivity. Politics became a matter for discussion, even if it was then reputed to be based on rationality.

In conjunction with these conceptions, there developed the belief in the possibility of active formation of society by conscious human activity. Two basic complementary but also potentially contradictory tendencies about the best ways in which such construction could take place developed within this program. The first such tendency was that the program, as it crystallized above all in the major revolutions in which people claimed to lead the political change, gave rise, perhaps for the first time in the history of humanity, to the belief in the possibility of bridging the gap between the transcendental and mundane orders, of realizing through conscious human actions in the mundane orders, in social life, some of the utopian, eschatological visions. The second tendency was rooted in the growing recognition of the legitimacy of multiple individual and group goals and interests and of multiple interpretations of the common good.

The modern program entailed also a radical transformation of the conceptions and premises of the major institutional arenas—the political and economic ones as well as those of collective identities, social hierarchy, and economy. The core of this transformation was the breakdown of traditional legitimation of the political and social order, the concomitant opening up of different possibilities of construction of such order, and the consequent contestation about the ways in which political order was to be constructed by human actors. A strong emphasis on at least the potential active participation of the periphery, of "society," and of all its members in the political arena combined with orientations of rebellion and intellectual antinomianism, together with strong orientations to center formation and institution building, giving rise to social movements and movements of protest as a continual component of the political process.

Moreover, the concrete contours of the different cultural and institutional patterns of modernity as they crystallized in different societies have indeed been continually changing due to the combination of the tensions inherent in the cultural and political program of modernity and the continual institutional, social, political, and economic developments attendant on the development and expansion of modernity.

The institutional and cultural contours of modernity were continually changing because the very expansion of modernity, beginning in Europe, entailed a confrontation between the concrete premises and institutional formations as they developed in Europe, later in the Americas, and then in Asia—in the Islamic, Hindu, Buddhist, Confucian, and Japanese civilizations. The manifestations of modernity were shaped, above all, by the internal dynamics of the technological, economic, political, and cultural arenas as they developed in different societies and expanded beyond them. Second, they were a result of the central struggle between different centers of political and economic power that constituted a continual component, first, of the formation of European modernity and, later, the continual expansion of European, American, and Japanese modernities. This struggle took place in a context of shifting hegemonies in the different international systems that developed in the wake of the continual developments in the economic, political, technological, and cultural arenas, and in centers thereof. The manifestation of modernity was shaped by these forces, along with the continual confrontations between interpretations promulgated by different centers, elites, and movements, and the concrete developments, conflicts, and displacements attendant on the institutionalization of these premises. Such confrontations developed already within Europe with the crystallization of the modern European state system and became further intensified with the crystallization of "world systems" from the 16th or 17th centuries onward.

Modernity, Globalization, and the Nation-State

The multiple and divergent modernities of the "classical" age of modernity crystallized during the 19th century and above all during the first 6 or 7 decades of the 20th century in the different territorial nation-states and revolutionary states and in the social movements that developed in Europe, in the Americas, and in Asian and African societies after World War II. These contours—institutional, symbolic, and ideological contours of the modern national and revolutionary states and movements, which were seen as the epitome of modernity—have changed drastically on the contemporary scene with the intensification of tendencies to globalization, as manifest in growing movements of autonomy of world capitalist forces, intense movements of international migrations, and the concomitant development on an international scale of social problems, such as prostitution and delinquency, all of which reduce the control of the nation-state over its own economic and political affairs, despite the continual strengthening of the "technocratic" rational secular policies in various arenas—be it in education or family planning. At the same time, the nation-states lost some of their—always only partial—monopoly of internal and international violence to many local and international groups of separatists or terrorists without any nation-state or the concerted activities of nation-states being able to control the continually recurring occurrences of such violence. Concomitantly, the processes of globalization were closely connected in the cultural arena, with the expansion especially through the major media in many countries around the world, including Western ones such as those of Europe or Canada, of what were seemingly uniform hegemonic American cultural programs or visions.

Above all, the ideological and symbolic centrality of the nation and revolutionary state, of its being perceived as the charismatic locus of the major components of the cultural program of modernity and of collective identity, became weakened, and new political, social, and civilizational visions and visions of collective identity developed. These new visions and identities were promulgated by several types of new social movements. Such "new" social movements, which developed in most Western countries (e.g., the women's and ecological movements), were closely related to or rooted in the student and anti–Vietnam War movements of the late 1960s and 1970s.

These movements developed in tandem with the crystallization of new social settings and frameworks that also went beyond the "classical" model of the nation-state. Among these settings—new especially to the Muslim, Chinese, and Indian diasporas—were new types of ethnic minorities, such as the Russian ones, which emerged in many of the successor states of the Soviet Union. In these, and in many other settings, new types of collective identities emerged, often in movements whose focus was no longer the nation-state. Many of these hitherto seemingly "subdued" identities—ethnic, regional, local, and transnational alike—moved naturally, though in a highly reconstructed way, into the centers of their respective societies and also often into the international arena. They contested the hegemony of the older homogenizing programs, claiming their own autonomous places in central institutional arenas—educational programs, public communications, or the media—and very often, they also made far-reaching claims with respect to the redefinition of citizenship and the rights and entitlements connected with it. In these settings, local dimensions were often brought together in new ways beyond the model of the classical nation-state, with transnational ones, such as the European Union, or with broad religious identities—many of them rooted in the great religions, such as Islam, Buddhism, or different branches of Christianity, but reformulated in new modern ways.

In parallel fashion, continuous shifts occurred in the relative hegemony of different centers of modernity—first European and U.S. ones, moving to East Asia—shifts that became continually connected with the growing contestations between such centers around their presumed hegemonic standing.

Destructive Dimensions of Modernity

Contrary to the optimistic views of modernity as progress, the development and expansion of modernity was not peaceful. It also bore within it very destructive possibilities—which were indeed voiced, and also often promulgated, by some of its most radical critics, who saw modernity as a morally destructive force and emphasized the negative effects of some of its core characteristics. The crystallization of the first and the development of later modernities were continually interwoven with internal conflicts and confrontations, rooted in the contradictions and tensions attendant on the development of capitalism and, in the political arena, the growing demands for democratization and with international conflicts in the framework of the modern state and imperialist systems. Above all, the evolution of modernity was closely interwoven with wars, and genocides, repressions, and exclusions constituted continual components thereof. Wars and genocide were not, of course, new in the history of mankind. But they became radically transformed and intensified, generating continuous tendencies to specifically modern barbarism, the most important manifestation of which was the ideologization of violence, terror, and war—manifest most vividly first in the French Revolution. Such ideologization emerged out of the interweaving of wars with the basic constitutions of the nation-states, with those states becoming the most important agent—and arena—of constitution of citizenship and symbols of collective identity, with the crystallization of the modern European state system and of European expansion beyond Europe and with the intensification of the technologies of communication and of war.

MONARCHY

The *Concise Oxford English Dictionary* defines monarchy as a "state under monarchical government" where a monarch is a "sovereign with title of king, queen, emperor, empress or equivalent." Although this definition has the merit of describing popular usage in the English language, it is readily apparent that it is indeterminate. It amounts to saying that monarchy is what monarchs do, and it leaves open what other titles might be equivalent (in the masculine forms) to king or emperor.

Etymology—and the classical Greek origin of the word—offers an approach that initially seems more determinate: Monarchy is the rule of a single person. This can be contrasted with aristocracy—the rule of the "best" or the "elite"—and democracy—variously the rule of all the people or the "ordinary" people. However, common usage in English and several other languages has come to invest the idea of monarchy with at least the additional criterion of hereditary acquisition. In fact, the hereditary principle lies at the heart of the popular image of monarchy, even though some of the most notable monarchies in history, including the Roman Empire and its supposed successor the Holy Roman Empire were, at least nominally, nonhereditary, the latter being elected by seven "Electors," most of whom did acquire their right of franchise through the hereditary principle. The contemporary Malaysian monarchy is rotated among 12 provincial sultans, normally for a 5-year term, and each new incumbent must be ratified by parliament. It would be easy to argue that many modern monarchies, often incorrectly—or at least confusingly—called "constitutional" monarchies where the monarch is the head of state but does not wield executive power, are much less like monarchies in the Greek sense than is the papacy or a regime such as that of the Haitian dictator François "Papa Doc" Duvalier, who caused himself to be declared "president for life" in 1964.

Thus, the question of how many monarchs have survived into the 21st century is not a straightforward, factual one as it might first appear. The answer depends partly on whether separate monarchical traditions within the same state are distinguished, the obvious example being England, Scotland, Northern Ireland, the Principality of Wales, the Isle of Man, the Bailiwick of Guernsey, and the States of Jersey within the British Isles. Some dependent territories of the United Kingdom offer similar counting problems, and there is the comparable case of a federated multiple monarchy, such as the United Arab Emirates: Is it one monarchy or seven? The answer would also depend on whether you include nonstandard and nonhereditary forms of monarchy such as the papacy, lifetime dictators, or republics with a local monarchical element, such as acknowledged tribal leaders within some African states. It is not normally assumed that the answer depends on the extent to which a monarch has any executive power; the United Kingdom, where the monarch has possessed powers that have been small and diminishing since the 17th century, and Morocco, where King Mohamed VI determines much policy, are both considered to be monarchies to the same degree. Nor is it considered relevant that in many cases the continued existence of the monarchy is assumed to be dependent on the popular will. In most countries that are monarchies but have democratically elected governments, it would be accepted that a referendum on a transition to a republic might be held and that in the event of a vote for such a transition, it would occur peacefully. The Greek monarchy was finally abolished as the result of a plebiscite in 1974, while in Australia in 1999 the change was rejected. However, the assumption that such a change could occur "merely on account of the number of votes"—to borrow a phrase from a monarch (Queen Victoria in her *Diaries*)—might be thought to erode the nature of monarchy in its original sense.

The answer to the question of how many monarchies remain therefore varies from around 25 to 50. Either of these figures might come as a surprise to the many political observers who have, over the past 2 centuries, predicted the complete demise of monarchy. They might be less surprised to discover that about 25 states had the same monarch, Queen Elizabeth II of England. This entry discusses the debate about monarchy and its aftermath as well as the political science research on monarchy.

The Early Modern Debate About Monarchy and Its Aftermath

Monarchy was at the heart of early modern debates about politics and government, which were primarily normative debates. The issue was sometimes whether monarchy was a legitimate (or *the* legitimate) form of government, but more often, the debates were about the form monarchy should take, the rules of succession, the limits on monarchical authority, and the subjects' duties of obedience to monarchs and rights of rebellion against them. All this can be portrayed as a crisis of legitimacy in which states and their apologists desperately sought to establish their legitimacy and thus their right to govern. It would be wrong to portray this crisis as something new and "modern" in the sense of post-Renaissance or post-Reformation: One would only have to read the 10 plays of Shakespeare on English historical topics to realize that the nature of kingship and its succession were always contested. But there was a new element, insofar as there was no longer an accepted religious source of authority providing a natural counterbalance to the claims of monarchs.

It would also be an oversimplification to portray the debate about government in the 17th and 18th centuries as a contest between the ideas of sovereignty as vested in "the Lord's Anointed" versus its being vested in "the people." The main complication is the appearance of religion on both sides. In the English Civil War, for example, both sides referred ultimately to religious authority to justify their actions. The men who signed the death warrant of Charles I in 1649 were, for the most part, no more believers in popular sovereignty than he was, and they did go on to suppress those who did believe in it, including the "Levellers."

In this context, it is important to distinguish between the development of monarchy in France and in Great Britain, both in terms of the working of the institution and the justifications offered for it. In France, kings continued to claim executive power and to rule by "divine right," justified by apologists such as the prelate Jacques-Bénigne Bossuet. They increasingly ignored ancient representative institutions such as the *parlements* and the *états*. But in Britain, following the Civil War and the restoration of the monarchy in 1660, the monarchy developed as a more limited institution with diminished and diminishing executive powers. This has often been referred to as "constitutional monarchy," but there is at least an element of paradox about the use of this phrase because it is also widely stated that Britain has not had a constitution. This is true if what is meant by "constitution" is the sort of coherent, codified document that the United States of America and France (in several different versions) developed after their revolutions.

Proponents of the British monarchy tended to defend a more limited form of the institution and to put their case in a more secular mode. (Even after the French Revolution, defenders of monarchy such as Joseph de Maistre tended to remain religious and fundamentalist rather than consequentialist in their defense of the institution.) As an extreme case, one might cite Sir Robert Filmer's *Patriarcha* (1657). At first sight, it seems to be a fundamentalist case for monarchy written under a failing republic. Filmer argues that legitimate monarchs have a God-given right to rule comparable with—and an extension of—the God-given authority of husband–fathers as heads of households. Filmer's account of the proper order of things is overtly religious, but it has often been pointed out that his argument can easily be reproduced in a purely secular form as an account of the organic existence of society whose natural bonds give it stability and determine its proper leadership: The King is the father of the nation. This can also be seen as the forerunner of later defenses of a limited monarchy, including those by Edmund Burke and Walter Bagehot, in which the monarch is, respectively, the core of a system of institutions that cannot be radically changed without incurring disaster and is something that is necessary at the symbolic level of politics rather than the rational level.

In the 18th century, the commercial success and relative political stability of Great Britain—a parliamentary government under Hanoverian kings—attracted new defenses of limited monarchy. To the Baron de Montesquieu, it was an example of "mixed government," its different institutions being based on separate and even conflicting principles, relating to each other with a kind of creative tension. But his analysis of the working of British government as being based on a "separation of powers" was even more inaccurate than John Locke's 50 years earlier: The powers—as opposed to the forms and symbols—were now overwhelmingly on one side. But the most intellectually unencumbered and radical defense of the monarchical status quo came from the Scottish philosopher David Hume. In his essays, especially "Of the

Origin of Government," "Of the Original Contract," and "Of Passive Obedience," Hume scornfully dismissed the rival Tory and Whig claims to explain political obligation and legitimacy. It was nonsense to claim that government was based on any form of "contract," just as it was nonsense to claim that we had an absolute obligation to obey royal government. Hanoverian stability and prosperity, for which Hume was duly grateful, came about partly because the regime was incapable of providing a theoretical justification for its existence, and it should be judged on its consequences, not on its origins. In the final chapter of his *History of England* (Vol. 6, chap. 81), Hume contrasts William of Orange, who, in the name of his wife Mary, usurped the English throne in 1689, sending James II into exile. James was the more virtuous man of the two, remarks Hume, and his claim to the throne was a superior one. But the consequences of the usurpation were better than the alternative, because of certain negative virtues that William possessed: He was not a Catholic, and the very weakness of his claim was a strength in a limited monarchy. Of the "Glorious Revolution," Hume concludes that "it gave such an ascendant to popular principles" and "this island, have ever since enjoyed . . . at least the most entire system of liberty."

It should not be inferred that Hume favored the Hanoverian arrangements because they were popular government in disguise. Like many of those who devised the constitution of the United States, Hume was clearly of the view that popular sovereignty as an overriding principle was as dangerous as the divine right of kings. His necessary condition of liberty was that no principle be overriding and that monarchy must remain to ensure this, at least in Great Britain.

The French Revolution and the excesses it engendered advanced and renewed the arguments in favor of monarchy in Britain. Some Englishmen, including Tom Paine and Richard Price, were enthusiastic in wanting Britain to follow France in a republican direction. William Wordsworth expressed the enthusiasm of a generation: "Bliss was it in that dawn to be alive" (*The Prelude*, Book 11). But this initial enthusiasm soon faded as France moved toward the Reign of Terror, and war broke out between the two countries. Edmund Burke argued in his *Reflections on the Revolution in France* in 1790 that if "revolution" was taken to mean what the French seemed to mean by it—the radical reconstruction of society along lines suggested by abstract reason—then it was doomed to degenerate into failure and tyranny. This was not true of the more modest form of revolution that had occurred in England in 1789 and in America in 1776, both revolutions that Burke favored. He argued that the "real rights of men" existed only as properly recognized and developed systems of obligation in well-established and well-ordered societies. The liberties of the English were part of a slowly developing system of government and society of which monarchy was an integral part. Thus, liberty and monarchy were part of one another, and there was little chance of sustained liberty in a popular republic that was based on abstract principles. The utilitarian philosopher Jeremy Bentham was even more emphatic in his condemnation of the revolutionaries. In *Anarchical Fallacies*, he attacked the very nature of the French revolutionary doctrines such as "the natural rights of man," arguing that they failed both ontological and ethical tests and were, therefore, "nonsense on stilts." But Bentham was a very strict and self-conscious consequentialist, so his support for monarchy was necessarily more contingent and mutable than was Burke's.

In short, the defenses of British monarchy by Montesquieu, Hume, Burke, and Bentham were different, but had in common the view that by combining parliamentary power with royal sovereignty British government was "limited," "moderate," or "mixed" in ways that were conducive to sustaining liberty. Such government was compared favorably with republican government in which there was no natural balance to the popular will or limit to abstract principles. All of them might argue that "natural rights" or "popular sovereignty" were, if anything, slightly less nonsensical than "the divine right of kings," but in the circumstances they found themselves, the latter was the less dangerous doctrine.

The normative argument in favor of limited monarchy took a new turn with the publication of Walter Bagehot's book *The English Constitution* in 1867. Bagehot attacked the idea that government could be understood only in terms of power and the making of decisions, arguing, in effect, that such accounts were one-dimensional:

> In such constitutions there are two parts . . . first, those which excite and preserve the reverence of the population—the dignified parts, . . . ; and next, the efficient parts—those by which it, in fact, works and rules . . . every constitution must first gain authority, and then use authority; it must first win the loyalty and homage of mankind and then employ that homage in the work of government. . . . The dignified parts of the government are those which bring it force—which attract its native power. . . . The Queen is only at the head of the dignified part of the constitution. The prime minister is at the head of the efficient part. (pp. 3ff)

"Dignity," in Bagehot's sense, humanizes and personalizes our relationship with the state, allowing us to identify it with a family, a history, and a nation. This is unselfconsciously, but entirely, a functionalist account of the working of government, and its predecessors therefore include the accounts of "the body politic" going back to Plato and Aristotle while its successors include 20th-century systems analysts such as David Easton and Oran Young. It remains an important argument on several levels including the defense of monarchy and the general understanding of political systems.

Monarchy and Political Science in the 20th Century

Bagehot's theory of the working of a limited monarchy has been widely quoted, accepted, and taught. It has acquired some of the properties of a self-fulfilling prophecy, influencing both the way in which British monarchs have conducted themselves and the perception of monarchy in the population as a whole. For example, socialist politicians have been surprisingly easily persuaded that the existence of monarchy is compatible with their egalitarian principles—a compatibility that would seem unlikely prima facie. Moreover, they have often made the judgment that there are fewer obstacles to their policy proposals under a monarchy than there would be with a formal, written constitution. In any case, monarchy as a political issue would likely be highly emotive and distracting; like abortion, it would be an unlikely issue for a rational career politician to choose to be involved in. As a result, the existence of the monarchy has been kept off the main political agenda in Britain, and it is only slightly less rare that the precise role of the monarchy has been debated.

Of course, what applies to Britain also applies to different degrees in a number of Commonwealth countries. It is interesting to note that monarchy has been more of an issue in Australia than it has in Canada, though in the Canadian version, the role of the monarchy is more circumscribed, and there has been no equivalent of the events in Australia in 1975 when the Queen's representative, the Governor-General Sir John Kerr, played an active part in dismissing the government of the day during what has been described as the greatest constitutional crisis in Australian history. But it is also the case that Bagehot's theory of the role of monarchy applies at least in part to other monarchies, because in these cases as well, the monarchy can be seen as located in a different dimension from normal politics. The Allied (principally American) decision to allow Emperor Hirohito of Japan to continue as head of state after the Japanese surrender in 1945 falls into this category and almost certainly facilitated the legitimate and peaceful postwar development of the country. In Spain, the restoration of the monarchy in 1975 also proved similarly to facilitate reconciliation and legitimation. In one sense, Spain had been a monarchy since the end of the Civil War in 1939, but it was a monarchy without a monarch, with Generalissimo Francisco Franco as "Caudillo" and acting head of state. To see the Spanish monarchy in this Bagehotian light is surprising, given that monarchy had remained an ideological issue in Spain, but King Juan Carlos I has proved adept at working with elected politicians of all persuasions in the British style. He enhanced his reputation considerably by acting decisively against an attempted military coup in 1981.

The case of Thailand is more difficult to assess. The country has had a constitutional monarch since 1932, and King Bhumibol (as it happens, a native of Massachusetts) has been in office since 1946. The monarchy is revered in Thailand, and the monarch has a religious status as the spiritual leader and highest level of being within the national form of Buddhism. But Thailand has not experienced political stability; it has had a cycle of military coups and democratic restorations with the longest period of sustained democratic government being 1992 to 2006. Spain and Thailand can be seen as the inverse of each other: In Spain, the monarchy has helped provide the conditions for reconciliation and democratization despite the institution being initially divisive, whereas in Thailand, the monarchy is revered as "above" politics but has been unable to prevent political instability. But one could argue that without the monarchy Thailand's divisions would have been expressed much more violently and its sense of national solidarity lost completely. Thus, it is not out of the question to argue for the Bagehotian functionalist role of monarchy even in the Thai case. It may be that without monarchy, Thailand would have experienced more bloodshed and less economic progress.

In all these cases, it is at least arguable that monarchy has been very important politically, principally by providing the context in which politics takes place. So it is surprising to report that there has been very little attention in the academic study of politics to the institution of monarchy. Bagehot's account of the institution, though well known, has barely been refined or developed. The subject has been left to journalists and historians, and it is instructive to consider why this should have been so. It is even the case that most university courses on British politics do not discuss the monarchy as such.

First, there is the question of what James March called "the power of power." The concept of power combines the appeal of "the glories of classical mechanics" with that of "the cynicism of *Realpolitik*." And concern with it has been a defining condition of the modern study of politics. "Politics is about power" is the mantra, which appears to specifically exclude the study of "constitutional" monarchs. But the distinction between the powerful and the formal can never be completely impermeable as is shown by the incidents in Spain in 1981. It is possible to imagine a constitutional crisis in the United Kingdom in which the monarch would assume a similarly important role. In any case, in Bagehot's account of monarchy, the monarch retains certain residual political rights—to warn, to advise, and to be consulted—which may generate influence, particularly when an experienced monarch is dealing with a relatively inexperienced politician.

Second, in the case of those monarchies that retain executive power, the methodological constraints on research are considerable. To investigate the Moroccan monarchy or any of those in the Arabian peninsula would present a Western political researcher with obstacles of language, culture, access, censorship, and coercion. In any case, since there is only a limited set of monarchies, even effective research might appear contingent and anecdotal with little or nothing to say about monarchy per se.

Third, there is also the case of progressivism, whether in its Whig or Marxist forms. That is, although monarchy may exist and be thriving now, forms of developmental model relegate monarchy to the past. Research in the social sciences is naturally more oriented to the present and the future rather than the past. We could argue that 20th-century political science devoted too much attention to unanswerable and superficial questions about public opinion and too little to monarchy.

Fourth—and finally—there is the undeniable effect that research feeds on research and generates fashions. Monarchy is not studied partly because nobody ever makes an attempt to study it, and it would be a brave young researcher who announced that he or she was going to devote his or her career to studying monarchy.

The absence of a political science of monarchy is more complete at the microscopic level than at the macroscopic. At the broad level, some political scientists have accorded at least a curious attention to the effects of monarchy on political culture and thus on the working of political systems. In particular, Seymour Martin Lipset (1960) has contrasted the cultural condition of American republicanism with the more deferential and "governable" characteristics of Canada and European monarchies. Contemporary monarchists might argue, based on this research, that monarchies as a whole remain generally more stable and more prosperous than republics as a whole, but the obvious response would be to point out that this is a spurious correlation dependent on the further observation that most monarchies are either in Northern Europe or the Commonwealth. They would be on firmer ground in saying that the principal advantage of monarchy, especially when compared with executive presidencies, is that it furnishes a state with a head who did not seek the role and whose identity is bound up with that of the society, rather than an ambitious politician with executive responsibilities whom at least a substantial minority of the population are likely to dislike.

MONETARY RELATIONS

International "monetary relations" refers to the efforts of sovereign states to influence the conditions of cross-border flows of money and other financial assets, especially money flows that are not the direct counterpart of real exchanges of goods and services. These conditions include but are not limited to exchange rate regimes and levels, capital and investment controls, foreign debt contracts, the use of reserve currencies, regulation of multinational banks and nonbank financial institutions, and balance-of-payments crisis management. After situating the topic in its theoretical and historical contexts, this entry discusses the relationship of monetary legitimacy to state power, the ambiguous nature of global monetary governance, and the contemporary monetary issues of greatest concern. A final section highlights the range of theoretical and methodological perspectives in use.

Theory and History

Neoclassical economists typically make a number of assumptions when examining the international monetary system, among the most significant being that financial firms and investors act independently of one another, that multinational banks have little home bias in their lending and investing decisions, and that, under fully liberalized global capital markets, firms and countries with objectively similar economic profiles will face homogeneous credit, insurance, and bankruptcy conditions. These analysts model the global monetary system as a decentralized, self-equilibrating market. Within this cognitive framing, national decisions to depart from fully liberalized capital accounts appear suboptimal. Yet the neoclassical approach ignores the role played by states in constituting the rules and institutions within which market transactions occur.

Political scientists in contrast assume an international *political* economy. World markets are embedded in and permeated by social institutions, including formal international governmental organizations (IGOs; with membership limited to sovereign states) as well as informal clubs and processes, each associated with norms, laws, or rules, and standardized procedures. Yet there is neither a world government nor a collective and authoritative enforcement mechanism for global market transactions. Those who defy the "rules" of exchange (honor contracts, represent merchandise honestly, don't bribe, and don't manipulate prices) may be punished by the market in the form of reputational losses. Powerful states also possess a host of additional punishments and inducements, particularly access to their home markets, that core country governments may deploy to get the rules, compliance from others, and occasional exceptions for themselves that they desire. Neoclassical economics does not model these nontrivial special privileges.

International monetary transactions over the past century and a half have occurred within four broad monetary eras. Three were characterized by sets of rules and social institutions designed and enforced by representatives of a dominant state or states, while the fourth period was an ultimately unsuccessful attempt to establish a durable regime.

During the classical gold standard era, roughly 1870 to 1914, the major trading states pegged their paper currencies (fiat monies) to gold, with incumbent governments promising to redeem this paper on demand. The system's anchor was the credibility of the promises of key states, particularly Britain, to exchange intrinsically valueless paper for a preset quantity of precious metal.

The second period was the two interwar decades of unsuccessful attempts to reconstruct the prewar gold standard. With its industrial economy decimated by World War I, Britain especially tried to reestablish sterling convertibility at the prewar gold parity but gave up in 1931. Barry Eichengreen observes that the major industrial capitalist states, responding to pressure from demobilized soldiers, all quickly instituted universal male suffrage following World War I, subsequently making it politically very difficult to reimpose the rigid and harsh automatic-adjustment procedures built into the gold standard. In a contrasting explanation for the failure to establish a durable monetary regime, Charles Kindleberger famously contended that the crucial brake on interwar monetary stability was that the only state with sufficient economic and political resources to lead, the United States, was insufficiently committed to doing so. There was no solution until after World War II.

The key outlines of the postwar multilateral economic institutions negotiated by the soon-to-be victors reflected the generally liberal economic preferences of the United States, which emerged from the war even more relatively powerful than previously. The Bretton Woods regime, named after the New England resort where the conferees met in late 1944, had the goal of free currency convertibility on the current account of the balance of payments, so that the inability of would-be importers to get a license to purchase foreign exchange would not serve as an undeclared trade barrier. However, the Bretton Woods negotiators saw liberal convertibility for the capital account—corresponding to cross-border investment flows lacking a direct trade counterpart—as dangerous and destabilizing. Another key provision was the historically unprecedented creation of two multilateral banks offering loans to sovereign governments: the International Monetary Fund (IMF), providing foreign exchange to countries whose currency was under attack, and the World Bank, to extend longer-term credits for war reconstruction and infrastructure development. The final pillar of the postwar monetary regime was a mostly fixed exchange rate among major currencies. This was the adjustable peg, to be moved only through formal application to the IMF, which was hardly ever done in practice. Only the U.S. dollar, the system's linchpin, was convertible into gold. The United States' strong postwar economy meant that its business community initially accepted low import tariffs, even when trading partners did not reciprocate. But America's postwar trade surplus eventually disappeared. In 1971, and without consultation with the United States' European allies, U.S. President Richard Nixon ended convertibility and imposed a 10% across-the-board import surcharge, effectively devaluing the dollar by an equivalent amount. By the mid-1970s, all the major industrial democracies had responded by floating their currencies.

The post–Bretton Woods regime, or financial globalization era, extends from the mid-1970s to the present. Its dominant themes have been removal of capital controls and dismantling of a wide variety of financial regulatory barriers, such as U.S. legislation prohibiting commercial banks from operating in securities markets. Deregulation led to heightened integration of previously segmented national financial markets and a dramatic expansion of the profits and size of the financial sector in the advanced economies. The period also has coincided with an increase in financial crises, often both balance-of-payments (exchange rate) crises and domestic banking crashes. Crises occurred most often in developing and transitional countries, with the notable exception of 1991–1992's large crisis in Western Europe's Exchange Rate Mechanism. Members of the European Union (EU) then sought to protect themselves from financial uncertainty by the dramatic step of adopting a common currency. Their Economic and Monetary Union (EMU) entered into full effect in January 2002, although without the participation of the United Kingdom and Sweden.

Until 2008, most expected the United States, the center of world financial innovation and possessor of the dominant global reserve currency, to remain immune from serious financial crisis. Yet the U.S. and worldwide financial crisis of 2008–2009 was the worst since the 1930s, leading the global economy to shrink by almost 3% in 2009. The neoliberal model of ever-freer global finance has been at least partially discredited. Robert Wade is hardly the only observer to ask whether a new era of international monetary relations is in the process of being born.

Money and State Power

As recently as the late 19th century it was not uncommon for multiple currencies, including both coins (specie) and paper obligations of public and private entities, to circulate freely in a national territory. Yet from the early 20th century onward, possession of a unique national currency operating as sole legal tender within the geographical extent of the territory came to be seen as an indispensable component of sovereignty. Because fiat money depends on the public's trust of the issuer, currency strength is closely linked to state legitimacy and strength. Niall Ferguson claims that it was early-modern England's superior ability to construct effective public debt markets, encouraging voluntary loans to the state from wealthy private citizens, that allowed England to surpass France in military and political power. Rodney Bruce Hall investigates how national, and ultimately global, monetary credibility is socially constructed in the contemporary world, locating central banks at the core of this process. Leonard Seabrooke emphasizes the critical role of mass publics in the wealthy democracies in sustaining belief in national money and finance. Key to this has been what John Gerard Ruggie baptized the compromise of "embedded liberalism" or support by the advanced capitalist democracies for comparatively open, liberal international economic relations coupled with buffering of their domestic populations from economic downturns via extensive welfare networks and capital controls.

National monetary strength in turn becomes a source of international influence, allowing states to employ financial levers to achieve both preferred global financial governance outcomes and unrelated foreign policy goals. David M. Andrews points to the 1956 Suez Canal crisis, in which the United States informed Britain that it would not lend its support to the sterling, then under market pressure, until the British and French changed their policy and agreed to withdraw from Egypt. Contributors brought together by Eric Helleiner and Jonathan Kirshner worry about the problem of global imbalances—specifically the United States' persistent and ever-growing current account deficit mirrored by the similarly "structural" surpluses of China and others—and what the gradual redistribution of monetary capabilities toward large emerging powers such as China might mean for the dollar-centric global economic governance system still managed by, and some would claim for, the major advanced industrial economies. In mid-2009, all the so-called BRIC countries (Brazil, Russia, India, and China) were among the 10 largest holders of official foreign exchange reserves. There were only two advanced industrial democracies on the list: Japan, number two after China, and Germany, number nine.

The Amorphous Global Financial Architecture

Throughout the Bretton Woods and financial globalization eras the scope, goals, and membership of the international governance regimes for international money and finance have been, in Jacqueline Best's felicitous phrase, notably "ambiguous." One possibility raised by Benjamin J. Cohen is that today's sophisticated monetary relations are qualitatively distinct from those in most other international arenas: It is the market itself that increasingly "governs," limiting the actions of states. On the other hand, the monetary regime does possess formal organizations. The IMF and World Bank are official membership institutions with wide authority over their borrowers, although since the early 1980s, their borrowers have mostly been developing countries and post–centrally planned economies. In the years following the mid-1970s breakdown of fixed exchange rates among the major economies of the day, it has been the Group of Seven (G7, initially the United States, the United Kingdom, Germany, France, and Japan, later joined by Italy and Canada) that has exercised real international monetary governance authority, managing sometimes acrimonious exchange rate negotiations among the dominant capitalist economies, coping with international financial crises, and promoting (or vetoing) multilateral and transnational innovations in collaborative financial and monetary regulation, irrespective of the formal venues for regulatory negotiations. As Andrew Baker explains, the G7 is a "process," at present consisting of quarterly meetings of finance ministers and central bank presidents along with annual heads-of-state summits, rather than a formal organization with a headquarters building and permanent staff. Membership in this exclusive club is on the basis of power, in the dual senses of latent capabilities and realized influence, although whether this is overall global power or monetary regime–specific power is not always clear. Overall power is a necessary but not sufficient membership qualification, assisted by international assertiveness, yet underlying friendly relations, with the leading economies. Thus, Italy successfully demanded inclusion for itself in the mid-1980s by threatening to close American airbases. In the early 1990s, the newly independent Russia was invited to the heads-of-state summit process (the G8) but not for the technical monetary consultations, a move widely understood as a concession to Russia's global importance and nuclear weapons status.

Even the G7 has been to some degree a fiction: In both the Latin American peso/"tequila" crisis of 1994–1995 and the East Asian financial crisis of 1997–1998, U.S. officials in the Treasury, White House, and Federal Reserve brushed aside the preferences of their Western European and Japanese G7 partners. Moreover monetary governance in the sense of regulatory innovation and multilateral or collaborative supervision of cross-border financial flows takes place even further below the radar of public scrutiny, in technical committees associated with the Bank of International Settlements—an invitation-only membership association of the central banks of systemically important countries and other countries they choose to include—and in a host of public–private transnational bodies associated with various branches of the financial industry, such as the International Organization of Securities Commissions and the International Accounting Standards Board. By comparison, the global trade regime, which is often accused of being biased against developing countries in its operation, nonetheless is headed by a formal organization, the World Trade Organization (WTO), whose members include a majority of countries. The WTO has democratic voting procedures, formal rules for trade agreements, a complaint and adjudication process, and ongoing negotiations over agreed-on agendas. The de facto global monetary governance regime lacks all these qualities.

Monetary Relations of the Status Quo Powers

It may be that the combination of ambiguity and centralization in monetary relations has served the world well. There has been steady expansion in the world economy since the Bretton Woods system came into being, although the rate of world growth has been notably slower since the breakdown of its fixed exchange rate component. Prior to 2008–2009, there had been no truly systemic international financial crisis since the 1930s. The consensus of policymakers in the G7 countries as of late 2009 was that collaborative crisis management was working, and world growth would recover in 2010. A repeat of the Great Depression had been averted, at least in the core capitalist economies. As international monetary conditions apparently returned to normal, the attention of both policymakers and scholars in advanced industrial countries refocused on their traditional concerns, including exchange rate negotiations, the degree of autonomy from political oversight to be accorded to central banks, financial regulation and supervision, and the desirability and feasibility of multilateral macroeconomic coordination.

Many of the theoretical contributions of political scientists are related to these topics. Eric Helleiner and Benjamin J. Cohen, respectively, have clarified the political economy of capital account liberalization (CAL) and that of the "unholy trinity" of CAL: exchange rate stability under a floating rate regime and autonomous domestic monetary policy. Jeffry A. Frieden has been at the center of a group in pursuit of a parsimonious theory of domestic exchange rate preferences, employing, on the one hand, interest-group categories such as exporters versus importers, producers of tradables in contrast to producers of nontradables, liquid- or fixed-asset holders, and sectors with or without foreign debt, and on the other hand, political institution variables such as majoritarian versus plurality systems and measures of central bank independence. Explaining the decision of a majority of Western European states to yield up their national currencies by joining the EMU has been a dominant task for political scientists investigating exchange rate politics.

Other scholars analyze the negotiating strategies employed by major states and their use of international monetary power to achieve state goals. In general, countries prefer to have their trading partners make the necessary adjustments rather than having to intervene to move the level of their home currency. Thus, during the G7 negotiations in the mid-1980s known as the Plaza and Louvre Accords, all parties agreed that the U.S. dollar was objectively overvalued. But the Europeans wanted the United States to find a way to rein in government budget and trade deficits, while the Americans argued that, since their reserve currency position made it impractical for them to encourage the markets to let the dollar depreciate, it was up to the European and Japanese to push their currencies up. The United States and China had similar disagreements in 2008 to 2009.

Additional Concerns of Emerging Powers and Peripheral States

The world of the very early 21st century remains unipolar, with only a single superpower. But the trend is toward the emergence of new powers, particularly China. Opinion on Europe splits sharply between observers who identify countries such as Britain, France, and even Germany as states of declining global significance and those who perceive the inevitability of the United States of Europe and thus anticipate future bipolarity or tripolarity with the United States and China. Japan's future status is similarly debated. What is clear is that since sometime in the 1990s, several emerging powers plausibly are approaching members of the G7 in global prominence, particularly if one employs economic size as the single most critical component of relative capabilities. New countries push to be included in global monetary deliberations. The U.S. President George W. Bush in the final months of his administration in late 2008 convened the first heads-of-state summit of the countries of the Group of Twenty (financial G20, not to be confused with the trade G20 of developing countries), until then a peripheral albeit multilateral process initially organized by the United States in the wake of the East Asian financial crisis. Besides the G7, G20 members included Australia and a geographically representative selection of larger emerging economies friendly to the United States. Meanwhile the BRICs countries, formally organized by Russia, had begun meeting at the heads-of-state level in early 2008, cognizant that their main common interest lay in joint pressure for inclusion in the more exclusive clubs for global governance but pragmatically seeking to develop other collective negotiating aims. From the initial summit of the financial G20 (or "larger economies group") in November 2008 onward, the G20 swiftly moved to supplant the G7. Meanwhile the four BRICs countries have made increasingly bold, if still guarded, statements about the need to replace the dollar with a truly global currency, perhaps based on the IMF's Special Drawing Rights.

Global monetary and financial reform proposals important to developing countries, yet long brushed aside by G7 policymakers and academics, finally have entered the elite economic discourse. These include topics such as recognition that countries with prudent macroeconomic and financial regulatory policies may be victims of financial contagion, that there may be a legitimate role for the state in overcoming both national and global market failures in financial markets, that "host" rather than "home" state regulation of multinational banks may better protect investor and borrower rights, and that multinational insurance and stabilization funds for commodity producers might be economically sound concepts. More generally, entirely free markets, particularly in money and securitized assets, may be neither self-equilibrating nor socially desirable. In the terminology of international relations, some states in the developing world, particularly those possessed of objective power resources or influence relevant to the global monetary governance regime, have begun to demand the extension of the protections of embedded liberalism to their citizens. Many of these themes were echoed in a 2009 international commission of experts put together at the behest of the president of the United Nations General Assembly (UNGA) and headed by Joseph Stiglitz, former chief economist of the World Bank and fierce critic of the IMF. Interestingly, the UNGA documents criticize the financial G20 as insufficiently democratic and representative in its composition.

Contending Political Perspectives on Global Money

The conceptual lenses through which political scientists analyze international monetary relations are extraordinarily heterogeneous. In one intellectual corner, associated with several of the most prestigious U.S.-based journals, are scholars who define their task as the application of the dominant methodology of contemporary neoclassical economics—sophisticated statistics—to explore, for example, the relationship between hourly electoral results in a wealthy democracy and the fluctuating value of benchmark global bonds. Elsewhere, students of philosophy, social trust, or of the psychology of panics are fascinated with the mystique of money, in its modern and nearly entirely electronic form—the epitome of accelerating globalization. Practitioners of traditional diplomatic history are finding monetary negotiations to be increasingly central to interstate security relations. Last but hardly least are Marx's contemporary heirs: for example, authors in the volume edited by Leo Panitch and Martijn Konings make a compelling case that the current international financial architecture directly reflects the interests of the United States' private financial sector. One almost might conclude that money is as ubiquitous as power in international relations—or that the two are the same.

MONITORING

Monitoring can be defined as a systematic and continuous surveillance of a series of events. Monitoring is practiced to secure that the activities inside an organization, or the outputs of an organization, are according to established goals. Monitoring thus refers to the control of organizations. In politics, monitoring takes place both between politicians (versus bureaucrats) and within the public administration; in the latter form, it deals with organizational control. Monitoring and evaluation are closely linked; both focus on examining the procedures and processes involved and gathering information about the level of performance. In government practice, the two concepts overlap, as when, for example, the follow-up of a government program can be called either monitoring or evaluation without a major difference. It is also possible to see monitoring as a basic form of evaluation when we add some "how and why" questions, such as why a given program is lagging behind its goals or how certain societal results can be explained by certain policy measures.

Some evaluation scholars do not make a distinction between monitoring and evaluation. Others argue that monitoring does not include judging the worth and value of performance, and hence, evaluation consists of more than monitoring or accounting. In addition, the focus on theory separates evaluation research from other forms of evaluation, such as monitoring. A central concept related to monitoring is accountability. Politico-administrative systems are built on a hierarchical structure, which gives the citizens the right to control the parliament; the parliament the right to control the government; the government, the public administration; and the upper levels of bureaucracy, the lower levels. Much has been written on the possibilities and limitations of parliaments and cabinet members in controlling bureaucracy. Although bureaucrats may be subject to political surveillance, they know how to use their often long (at least in comparative terms) experience, expertise, and isolation from political battles to bypass and make strategic use of any monitoring efforts directed toward them. Whether monitoring reaches the ultimate points of delivery, where street-level bureaucrats deal with various sorts of clients, is an important issue as well, not least from the viewpoint of democracy. Finally, monitoring may be used when governments finance various external projects, as, for example, with development aid. Monitoring can even refer to the control of governmental outlays for typically outsourced projects.

The theory and methodology of monitoring are closely linked to organizational science. Organizations are collective efforts, and large organizations always need to control the unity of the organization. The theoretical issues around the concept thus deal with questions such as what kind of monitoring tools work in what kind of organizations, what motives underlie the use of monitoring, and to what extent governments are using similar or different kinds of monitoring tools and why. As noted earlier, monitoring is tied to characteristics of the organization in question. A small organization, a club, or an association can usually maintain order or homogeneity simply by exchanging communication through face-to-face interaction. Larger and more complex organizations, such as major hospitals, political parties, religious bodies such as the Catholic Church, or national bureaucracies, have a much greater need for ensuring that what the members of the organization do corresponds with the overall will of the leaders of the organization, be they outside or inside the organization.

Alternative Organizational Models

The way the researchers conceptualize monitoring depends on the specific organization model, or metaphor, that they are using. Traditionally, in what we could call the old institutionalism, the politico-administrative system is seen as constituted of rules and organizational arrangements that aim to cement the tasks and responsibilities—the division of labor—within the public administration. The pioneering sociologist Max Weber depicted bureaucracies as rational systems compared with the earlier historical forms of state. The prominent features of this system were specification of jobs with detailed rights, obligations, responsibilities, scope of authority, and a system of supervision and subordination. Monitoring in this context served to ensure that the rules were followed and malpractices would be discovered and stopped. Hierarchic and bureaucratic modes imply the use of coercion or threat to ensure compliance with authoritative rules. In some cases, this monitoring by rules and regulations may lead to an overemphasis on caution and slow, multifaceted processing of issues. Today, we also think of bureaucracies as inefficient, slow, and generally bad. Thus, the concept of bureaucracy has through the years been interpreted in a variety of ways.

Later on, however, the Weberian model of public administration was modified, if not replaced, by a number of other models.

First, a theory contrary to the Weberian rational model is that bureaucratic officials, like all other agents in society, are significantly, though not solely, motivated by self-interest. This theory follows the tradition of economic thought from Adam Smith onward. One influential model in this area is the principal–agent model. The model treats the difficulties that arise under conditions of incomplete and asymmetric information when a principal (e.g., parliament) hires an agent (government department). In this situation, the two may not have the same interests, even though the principal is presumably hiring the agent to its interests. While perhaps not fitting the public administration per se, the model seems to catch the problems embedded in contractual relationships, in which the public authority aims at defining in the form of a contract the liabilities and sanctions dealing with a private agent. The question is whether the agents, say individual bureaucrats, strive for selfish benefits or are servants of the public. Solving this question can be difficult because in reality, bureaucrats whose aim is to expand their organizations may serve both their own and the public interest. In any case, adding the possibility of selfish, individual interests to the picture increases and somewhat complicates the monitoring task.

Second, a (neo-)institutional approach would place the actors in context and predict, for example, that doctors have a particular, professional way of legitimizing their activities, and an outsider (the principal) demanding scrutiny may be in a frustrating or weak position. In addition, organizational change, such as adjusting to new forms of performance monitoring, may not depend on the deliberate decisions made by the organization's leaders but on the fit or misfit between the reform and the norms of the organization. It is well known that the various reforms originating from the new public management paradigm have been implemented in ways reflecting the specific historical, societal, and political culture of a country.

Performance Management

Monitoring the Weberian rule of law emphasizes the avoidance of mistakes but does not emphasize or require results. Poor performance was not really a question in the fiscal accounting system. Now, however, monitoring has widened to include a program element, and likewise, researchers have shifted their focus to questions of performance management. A central issue in research concerns the possibilities and limitations of measuring performance within public administration. One debate focuses on the nature of public policies. It has been determined that performance targets are often quantitative, and this causes bureaucrats to neglect the qualitative, nonmeasured aspects of their performance. Public policies, further, are often services or societal interventions, which make it difficult to point out exactly what the influence of the output is. On top of that, so-called performance indicators often do not measure outcomes but outputs—as, for example, where the police aim at making as many arrests as possible, while the fundamental societal goal is to diminish criminality. In addition, performance indicators have been criticized because of their rigidity. The use of performance indicators can have dysfunctional effects on an organization's performance if it does not react to changes or surprising events. Finally, monitoring performance can be a complicated task. More and more public policies are produced not by single organizations but by several ones in concert. These policy networks or partnerships often follow their own situation-bound, autonomous norms but at the same time form a part of the public authority. The question of accountability becomes more difficult the more actors are involved and can be more accurately called *multiple accountability*. In recent years, there has been a lively debate on governance—for example, concerning a new form, or account, of public policy making, which emphasizes the interaction between private actors and public authorities on various levels. The implications for monitoring are obvious: Instead of coercion and authority, concepts such as trust, custom, and solidarity play an important role.

At a deeper level, performance monitoring reflects questions of ethics and trust. In the Weberian system, it was widely accepted that malpractices need to be identified and omitted. Performance monitoring raises the question of why organizational rules, information from different sources, and professional education are not considered sufficient to guarantee a well-functioning public administration. It suggests that the organizational model in use assumes that bureaucrats are selfish and lazy. Devoted professionals prepared to further develop their policy areas may become disillusioned because of the straightforward simplification of progress into numeric indicators. The central question is how organizations function and to what extent their coherence is based on trust versus control. As mentioned earlier, excessive monitoring in the form of frequently demanded reports, control of communication, time limits for tasks, and so forth can also demand an excessive workload. Thus, one research task in this area is to find and argue for a healthy balance between trust and control, whether based on the organization's size and structure or the type of organization.

Monitoring and Public Policy

Loosening top-down control, a strict way of monitoring, may raise questions of democratic accountability. Democracy is often seen from a narrow perspective as properly expressed only through aggregative representation. Flexible, interactive forms of public policy making can be justified with the help of democracy theory too. At the same time, the transformation of public policy making may radically change the overall opportunities of monitoring by upper levels of government. The move away from this traditional linear interpretation of the policy cycle and toward a more nuanced conceptualization of the policy process reflects a general recent trend toward "post-positivist" modes of analysis in policy science as a whole. Research on monitoring cannot avoid the changes caused by the transformation of monitoring itself.

MONTE CARLO METHODS

Monte Carlo methods describe a set of computer simulation techniques that rely on random number generation to solve complex optimization and integration problems arising in statistics and its related fields. The term *Monte Carlo* is a reference to the probabilistic rules underlying casino games of chance, and though the theoretical underpinnings for their use emerged in the postwar period, it is the advent of inexpensive, modern computing that enabled their widespread adoption for practical problem solving.

Typically presented as an alternative to time-consuming analytical efforts, Monte Carlo methods allow researchers more freedom to posit models and make more subtle inferences from them—that is, they no longer need to rely on standard, but unrealistic, assumptions about complex (causal) processes that ensure a tractable solution exists.

This has proved particularly important in Bayesian analysis, where quantities of interest are available in principal by complex integration operations, yet can be (well) approximated via simulation. Precisely because such techniques have proved popular in political science, this integration aspect of Monte Carlo methods is the focus here. This entry begins with a discussion of the basic integration operation; then, it moves to the importance of random number generation and methods of sampling before considering Markov chain Monte Carlo methods. This latter set of techniques has proved extremely popular in political science over the past 10 years or so, especially for applying item–response models to obtain "ideal points" from roll call data. There are also large literatures dealing with optimization via Monte Carlo procedures and integration via (nonsimulation) deterministic numerical approaches; these are not discussed here.

Classical Monte Carlo Integration

To keep matters simple, consider the evaluation of the following integral:

$$I = \int x g(x) dx, \tag{1}$$

where $g(x)$ is a probability density function. As presented, the integral will yield the expectation of the random variable X denoted $E(X)$. But performing the operation may be difficult, perhaps because the integral has no closed form. A helpful alternative to this effort is to generate a sample of size m from the density $g(x)$ and then to compute the empirical average,

$$\hat{I} = \frac{1}{m} \sum_{i=1}^{m} x_i. \tag{2}$$

As m increases, by the strong law of large numbers, $\hat{I}$ converges almost surely to the true value of I—and thus, the true value of $E(X)$. Denoted the Monte Carlo method, the idea is more general. We can replace x in Equation 1 with some arbitrary function of x, denoted $h(x)$. This might be the median or some other percentile. And we can assess definite integrals so long as we can produce a sample of x values between the specified bounds. The variance of $\hat{I}$ is decreasing in m. When var(m) is finite, the central limit theorem applies as the sample size increases, and we can place bounds on our estimates. Moreover, asymptotically, it is possible to obtain quantities that can be used to assess convergence directly.

This simulated integration takes on an important role in Bayesian statistics, since we often want to perform a variant on Equation 1. In particular, we are concerned with characteristics—such as the mean or median—of the posterior distribution $\pi(\theta|y)$, where θ is an unknown parameter and y the observations. In that case, we need

$$E(h(\theta)) = \int \pi(\theta|x) h(\theta) d\theta,$$

which we approximate as $(1/m)\sum_{i=1}^{m} h(\theta)$. For many regular cases, this simple approach works well, though more efficient alternatives typically exist that do not require being able to directly simulate samples from $g(x)$.

Random Number Generation and Sampling

All methods of simulation necessitate the generation of random numbers; in the case of simple Monte Carlo integration, those random numbers were from some probability function $g(x)$. For a very broad range of functions (the $g(x)$ and $\pi(\theta|y)$ above), at base, the task requires the production of uniform random variables on the unit interval. We then obtain draws from $g(x)$ via the inverse transform. Though there are some cases where nonuniform random number generation can be used, the techniques are difficult to generalize outside of specific distributions. What constitutes an optimal or efficient random number generator is debatable and often subjective.

The inverse transform may not be available, or may not work well, for many distributions. An alternative is to use accept–reject methods (also known as rejection methods or rejection sampling) that rely on a fundamental result involving the uniform distribution. Recall that we wish to generate variates from $g(x)$, which we will assume has bounded support. Imagine now that the random variable X is jointly distributed with an auxiliary variable U such that any hypothetical pair of values drawn will have an x component with some corresponding $g(x)$ and u component that is strictly less than the $g(x)$ and yet nonzero. To obtain that u value, we simply generate from the uniform bounded by 0 and $g(x)$. Yet in doing this, we have, in fact, generated a draw from $g(x)$: For a given value of x, our uniform draw u must be "under the curve" described by g.

Clearly, we need an x value to evaluate $g(x)$, but this cannot be sampled directly from $g(x)$ itself (since this is assumed unavailable to us). In practice then, for a one-dimensional density, we sample the x value from a uniform between zero and the maximum of $g(x)$ and the u value from a uniform that has a range identical to (the relevant part of) $g(x)$. Notice that these two intervals draw a "box" around the density $g(x)$. It must be the case that some of these pairs are points in two-dimensional space that fall under the curve $g(x)$, and we will "accept" these. By contrast, some must fall elsewhere, and we will "reject" those.

The accept–reject approach can be used more generally for cases where neither the maximum nor the support of g are bounded, so long as simulating uniform variates over the implied larger space is possible. The key is to find another density function $f(x)$ such that for every possible value of x, $g(x) \leq Mf(x)$, where M is a constant greater than or equal to one. Now, we begin by generating x_j values from our "envelope" density $f(x)$. We then take a single draw u from a uniform $U[0, 1]$. If the value of u is less than $g(x_j)/Mf(x_j)$, the x_j is accepted as a sample from $g(x)$. If not, we reject the candidate x_j. This approach has an important implication for Bayesian analysis, because we do not need to know the normalizing constant for g to sample from it. Yet this is precisely the situation when dealing with a posterior that is proportional to the prior multiplied by the likelihood: $\pi(\theta|x)\mu p(\theta)g(x|\theta)$. Thus, we can draw samples from $\pi(\theta|x)$ without calculating the normalizing constant.

For some problems, accept–reject sampling can be very inefficient. To reduce the variance in simulations, an alternative is to choose an approximate distribution f and then weight the resulting draws according to the probability that they represent a sampled point from the target distribution g. This idea is known as *importance sampling*. The beauty of this sampling scheme is that there is very little restriction on the choice of the instrumental distribution f, and so it can be chosen such that it is easy to sample from (e.g., a multivariate normal).

Markov Chain Monte Carlo

As described above, Monte Carlo methods produce independent draws from some density $g(x)$. By contrast, Markov chain Monte Carlo methods produce simulated values that are dependent on previous draws from the distribution in question. Recall that a Markov chain is a sequence of random variables with the Markov property, meaning that the present state $\theta^{[t]}$ depends only on the immediately preceding one $\theta^{[t-1]}$. Note that the chain is defined with respect to a state space Θ that constrains the possible values for the variables, and its moves around this space are probabilistically controlled by the chain's kernel. So long as the chain possesses certain properties (among them ergodicity, recurrence, and irreducibility), it will eventually reach a stationary distribution π and stay there. That is, in this limiting distribution, every draw is from π. More important, analogous to Equation 2, the average converges to the expectation we seek.

Markov chain Monte Carlo methods are preferred to simple Monte Carlo methods, including importance sampling, because they are often more efficient, especially for complex problems that involve very high-dimensional integrals. With Markov chain Monte Carlo algorithms, the researcher can spend less time finding the "right" instrumental distribution; rather, simulations from g can be generated from essentially any arbitrary distribution f. The most widespread procedure in use is the Metropolis–Hastings algorithm, which relies on a random walk. The basics are straightforward: Suppose we are interested in a single parameter θ for which the posterior is thus $\pi(\theta)$. After some starting point, at each step t in the chain, we propose a candidate value of θ, denoted θ'. In practice, θ' is a draw from a proposal (or jumping) distribution $q\ (\theta|\theta^{[t-1]})$, where $\theta^{[t-1]}$ is the prevailing value of θ from the previous step in the chain.

The restrictions on the proposal distribution are not especially onerous, and it is often chosen such that it is easy to sample from, with a normal distribution centered at $\theta^{[t-1]}$ being a common choice.

We accept the proposal θ' as the value for $\theta^{[t]}$ if u, a draw from $U[0, 1]$, is less than the ratio of the posteriors evaluated at the different proposals (assuming $q(\cdot)$ is symmetric). If the proposal is not accepted, $\theta^{[t]}$ is simply $\theta^{[t-1]}$, and the process starts again.

The primary concern with Markov chain Monte Carlo techniques is that it is not obvious how many of these updating steps are needed. That is, although we are guaranteed that an ergodic chain will eventually reach its stationary state—and thus that we will be sampling from the posterior we seek—we cannot know beforehand how long this "mixing" will take. A large literature exists on diagnosing nonconvergence, and the methods therein generally rely on monitoring the chain over time, or monitoring the performance of chains with different starting points. Related to this endeavor, researchers typically dispose of early, nonstationary chain values as "burn-in." A special case of the Metropolis–Hasting approach, popular in political science and elsewhere, is the Gibbs sampler. This requires that researchers have the relevant conditional distributions for the posterior $\pi(\theta)$ available to sample from. When feasible, Gibbs sampling is more efficient than a more general Metropolis–Hasting approach since the candidate values are accepted with probability 1 every time. Free software for specifically fitting models using Markov chain Monte Carlo methods is widely available.

MULTICOLLINEARITY

See Regression

MULTICULTURALISM

Multiculturalism as a concept, principle, and policy has become, since the 1980s, one of the most controversial issues in social sciences and humanities. The term refers to countries with territorial and/or linguistic minorities and those formed as a result of the migration of religious or racial and/or ethnic groups. Minority claims for equality have given rise to what the philosopher Charles Taylor (1992) has called the politics of recognition, relating it to the "democratic defense of cultural diversity within a universalistic perspective." Recognition policies along with differentiated group rights are at the core of a "multicultural citizenship" elaborated by Will Kymlicka. For defenders of the principle, multiculturalism matches with the public recognition of cultural identities, with equal rights for ethnic, racial, religious, or national minorities. It therefore constitutes the foundation of democracy. For those who oppose the principle, it leads, on the contrary, to the "disunion" of the nation and to isolated communities in the political arena, and it is therefore perceived as a challenge to the national unity guaranteed by the state. For some, it serves to thwart nationalism and for others, inversely, it serves as the basis of national sentiments and expressions.

The debates oppose those who defend a liberal vision against a republican vision of pluralist society that recognizes citizen identity only on the grounds of social justice. While liberal multiculturalism looks for a response to the management of cultural diversity as a means of equal inclusion of minorities in the political community, the republican view represents multiculturalism as politics, turning the society into a battleground where common values are transformed into particular interests and where identities perceived as majority or minority compete with each other in search of public resources and representation. As a whole, multiculturalism is fundamentally concerned with both universalistic ideology and the idea of a common civic space of political participation for all groups; it questions how to reconcile the integration of minorities into a common civic culture with the protection of the most vulnerable groups. The process has transformed an anthropological perspective of cultural diversity into a normative vision of plural societies. Multiculturalism is thus systematically associated with the question of national unity and its integrative capacity.

Each state has its own understanding of minority and elaborates specific relations with its minorities. Progress in the judicial sphere now involves questions regarding the cultural and religious rights of minorities in their fight against all forms of discrimination. That does not resolve the issue of whether to define a minority in territorial or nonterritorial terms. Definitions continue to remain ambiguous and differ according to national experiences that define the relations between states and minorities. In Canada, the confrontation between the French and English languages, because of Quebec's status and the debates around a bilingual and bicultural society, defined as such by the Royal Commission on Multiculturalism, gave political legitimacy to the concept, thanks to the constitutional multiculturalism used in the Charter of Rights and Freedoms, enacted by the British Parliament and signed by Queen Elizabeth II as part of the Canada Act in 1982, which was thus officially accepted as the fundamental characteristic of the Canadian state. In the United States, the concept has been grounded on the civil rights movement of the 1960s. It took a political and legal shape with the establishment of affirmative action starting in 1965, as a way of increasing the access of members of historically disadvantaged groups to benefits such as employment, college or university admission, and the granting of government contracts. These measures sought to reduce racial or ethnic inequalities and historical injustices by trying to repair the effect of past policies, notably slavery and racial segregation.

In Europe, the term *multiculturalism* is used to refer to various situations according to the structure of the state and the recognition of regional and linguistic particularities and of the minorities. Some countries in continental Europe have institutionalized pluralism through the creation of regions granted limited power, as in Italy and Spain; others have built the state on linguistic pluralism, as in Belgium and Switzerland, where the linguistic and territorial communities each have their own institutions. In Eastern Europe, the presence of some populations on a border of the neighbor state has led to the elaboration of minority rights in kin states, such as for Hungarians in Romania. But in France, Germany, Great Britain, and the Netherlands, the term *multiculturalism* refers to immigrant populations organized around a common nationality or religion (or both) and their demand for specific voices in the public sphere, as with ethnic minorities or Native Americans and African Americans in the United States.

To some extent, similar situations entail recourse to concepts that, used in different national contexts, require new definitions and different policies. In Western Europe, the use of the term *multiculturalism* marks the shift from temporary economic immigration to the permanent presence of immigrant populations and their political participations. From the state perspective, this implies the extension of the welfare state to a new realm—that of immigration and identity—with the establishment of social policies to guarantee integration of these minorities in the larger society. In Germany, the city of Frankfurt created a bureau of multicultural affairs, whose head advocated a "multicultural democracy" inspired by Jean-Jacques Rousseau's social contract. In France, too, during the same period, the media as a political class described French society as "multiracial," "multicultural," "plural," and "pluri-cultural." This terminology found legitimacy in a political discourse that privileged "the right to difference," established in 1981. In Great Britain, the Commission for Racial Equality promulgated in 1976 the Race Relations Act. The main objectives were to fight racism, to eliminate discrimination, and to ensure equality of opportunity and thus establish good relations among different racial groups. The targeted discrimination against Muslims in Britain today has led sociologists to argue for the inclusion of religion—mainly Islam—in ethnic and racial policy and its consideration by antidiscrimination laws.

In the Netherlands in the 1980s, a minority policy took the objective of "promoting multiculturalism and the emancipation of ethnic communities."

Whatever the discourse or the practice and whatever the definition of a minority, gradually all European countries have converged in a sort of "applied multiculturalism." The question is then what are the cultures and groups entitled to recognition? What group rights would be legitimate to recognize? In Europe, multiculturalist policies refer mainly to Islam—the religion of the majority of postcolonial immigrants as new minorities—and to its institutional and legal recognition. The perception of Islam as not separating politics and religion challenges secularist European states, while not recognizing Muslims as a minority is an obstacle to equal inclusion of differences. Its legitimacy stems from equal representation of religions in liberal democratic societies; and, as Bhiku Parekh (2000) suggests, it comes as the extension of existing institutions in a way to include the newly emerging Islam and to promote at the same time a common membership and a common civic culture, allowing citizens to find adequate identification. Here is one of the paradoxes of multiculturalism: political and institutional integration of differences into democratic values to claim the recognition of some cultural particularities of groups that question their compatibility.

Critics of multiculturalism have emphasized the radicalization of Muslim minorities in Europe. Myths, claims, and discourses of such groups perceived as a threat to universal democratic values came to justify the retreat from multiculturalism in countries such as Great Britain, the Netherlands, and even Canada, where, as Charles Joppke notes, the accommodation of minorities has been the core of the integration policy. Arguments are grounded on the effect of multiculturalism on the economic, cultural, and political isolation of communities; ethnic violence, perceived as a result of identity politics that have failed to ensure civic harmony; and a fear of the global transnational forces that penetrate national societies and create a competition between cultural-religious communities expanded beyond the borders and the territorially bounded national-secular community. In the Netherlands, the assassinations by extremist groups of politician Pim Fortuyn and filmmaker Theo van Gogh have engendered a radical change in politics and opinions toward minorities, with an emphasis on the failure of the politics of difference that did not lead to the expected economic integration of migrants but, on the contrary, isolated them culturally and politically. Great Britain has also changed its policy after the terrorist attacks on London's public transportation system in London on July 7, 2005, realizing that the society is getting away from Bhiku Parekh's aspiration for a community of communities and a community of citizens at the same time. In Canada, the attempt to establish a sharia court in Ontario brought the debate to a legal and constitutional level and has created a dilemma on the search for equal justice and the limits of toleration.

Despite the retreat of liberal democracies from multiculturalism, the principle and the discourse are now diffused on international and supranational levels within European institutions and beyond. The question is associated with minority rights, more specifically with national minorities and indigenous populations; it does not concern immigrants and nonterritorial ethnic groups. As noted by Kymlicka (2007), the principle is interpreted as an extension of human rights. In 1966, Article 27 of the United Nations (UN) International Covenant on Civil and Political Rights (Human Rights Committee) stipulated that

> in those states in which ethnic, religious and linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with other members of their group, to enjoy their own culture, to profess and practise their own religion, or to use their own language.

In 1992, the UN adopted a Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities and began to debate in 2007 the rights of indigenous people. After the Cold War, at the first summit of the Council of Europe in Vienna in 1993, states seemed to rush things by advocating "to draft with minimum delay a framework convention specifying the principles which contracting States commit themselves to respect, in order to assure the protection of national minorities. This instrument would also be open for signature by non–member States."

The establishment of minority rights as an international standard through normative institutions as well as "policy networks"—the nongovernmental organizations, intellectuals, media, and actors themselves—is accepted on a discursive level by many states (Kymlicka, 2007). Their objective is to adopt effective policies in a timely manner regarding cultural diversity and ethnic and/or religious conflict in their respective societies. It becomes a sign of democratization for non-Western states. This does not mean, however, that states—Western or non-Western—accept multiculturalism as a principle or as a norm. Each state acts with regard to the complexity of situations, to the variety of minorities, and to their specific historical relations. At stake are peaceful coexistence of ethnically diverse populations, national security, and civic harmony.

MULTILATERALISM

In everyday language, the term *multilateralism* is often used synonymously with *international cooperation*. Among diplomats, it refers to certain cooperative diplomatic practices, and, according to a common scholarly definition, multilateralism is simply international cooperation that includes three or more states. This minimalist conception is sometimes supplemented by a number of conditions, including the idea that cooperation between states should be based on generalized principles of behavior. Given this plethora of different meanings, it seems not unfair to say that the term *multilateralism* is a convenient yet potentially confusing shorthand "tip of the iceberg" concept, representing and connoting a multitude of phenomena. This entry reviews three major different ways of referring to multilateralism, for which reason it is introduced as an institutional system, a foreign policy strategy, and as political ideology.

The Multilateral System

In a *longue durée* perspective—that is, a temporal perspective spanning centuries—we have seen the emergence of an increasingly dense network of multilateral institutions and agreements. This network is frequently called the multilateral system and has essentially developed through four main phases. During the first phase, reaching back to the early 19th century, the system was characterized by the first experiments in collective diplomacy. This form of diplomacy was a feature of the post-Napoleonic era and was cultivated by European diplomats and heads of state meeting in 1815 at the Vienna Congress to determine the future European order. Subsequently, a series of more than 30 conferences, called the Concert of Europe, constituted the first example of recurrent collective diplomacy. In this context, "collective" does not refer to all interested states—the Concert was characterized by special great-power roles and responsibilities. The first phase also included the introduction of international conflict resolution by means of legal instruments, especially arbitration and negotiation, essentially the precursor for the International Court of Justice in The Hague. Notably, the first phase also saw the creation of the first proper international organization, specifically the launch of the International Telegraphic Union in 1865. Subsequently, other specialized international organizations were initiated, and by 1900 about a dozen had been created. All these origins represent the beginning of a novel and increasingly institutionalized feature being introduced to the international states system.

The second phase starts with the establishment of the multipurpose and, in principle, global League of Nations after World War I. Membership in the league consisted mainly of the European states, thereby reflecting the colonial times in which it was established, the eurocentrism of the international states system, and the reluctance of the United States to engage in international politics. The creation of the league was a deliberate attempt to avoid future major wars, for which reason a system of collective security was introduced. Apart from the league, some further specific organizations were created, including the International Labour Organization (1919). The League—and perhaps foremost its member states—clearly failed in the key objective of securing the peace, yet as failure is one source of experience and knowledge, the lessons learned were used when states designed the successor organization during and after World War II.

The third phase begins with the creation of the United Nations (UN) and an increasingly broad range of so-called functional agencies, including the World Health Organization (WHO), Food and Agriculture Organization (FAO), and the United Nations Educational, Scientific and Cultural Organization (UNESCO). During this phase, not all intended organizational projects were feasible, as demonstrated by the aborted International Trade Organization (ITO; replaced by the less ambitious trade regime, the General Agreement on Tariffs and Trade [GATT]) and by the never fully ratified European Defence Community (EDC), which was substituted later by the Western European Union (WEU). In turn, the WEU never got to play a significant defense role, as this function was provided by the North Atlantic Treaty Organization (NATO). Similarly, the Cold War context did not allow the UN to function as intended, and the full potential of the organization never came to fruition. The third phase is also characterized by experiments in terms of regional integration and organizations, most significantly the European Community. Other examples include the Association of Southeast Asian Nations (ASEAN), the Arab League, the Nordic Council, the Gulf Cooperation Council (GCC), and the (failed) East African Common Market.

The fourth phase starts with the end of the Cold War and is characterized by a relaunch of the UN (now freed from the constraints of the Cold War), a new wave of international organizations (e.g., World Trade Organization [WTO], African Union [AU], Organization for Security and Cooperation in Europe [OSCE], North American Free Trade Agreement [NAFTA], Common Market of the South [Mercado Común del Sur; MERCOSUR], Asia Pacific Economic Community [APEC]), and a series of reforms of the European Community, notably its transformation into the European Union (EU). Subsequently, the EU aims at playing a role *in* international organizations, not any longer wishing to *be* just an international organization among others. In summary, it is striking that each new phase of international organization begins as a more or less collective political response to fatal crossroads situations at the end of major wars. Combined, the many international organizations constitute an increasingly dense network of organizations, each based on treaties or agreements characterized by specified sets of principles, norms, and rules. Some analysts call the outcome *global governance*, whereas others prefer the concept of a fragmentary world state.

Formal organizations do not constitute the only feature of the multilateral system. To realize better the diversity of institutions, it is useful to make a distinction between international (governmental) organizations, international regimes, and international conventions. Whereas organizations are characterized by a postal address, employed bureaucrats, and budgets, international regimes can be seen as agreements, whether formal or informal, about very specific issues. Examples of such specific issues comprise the EU's regulation of the import of bananas, regimes concerning the export of missile technology control (MTCR), and the former trade regime, the GATT (being institutionalized in the mid-1990s and, thus, becoming the WTO). Regimes have always been an important part of the multilateral system, but their development is more difficult to categorize in phases. Concerning informal nonbinding agreements, states have a clear advantage in the sense of not being constrained by the agreement. The problem is that other states enjoy a similar advantage for which reason their future behavior becomes less predictable.

Finally, international norms or conventions (notably spelled with a small *c*) refer to implicit rules and tacit understandings. Such conventions are customs and habits, and both allow us to have expectations about likely behavior or interpretations of agreements. In this sense, conventions or norms are informal institutions that can exist for centuries without being codified. Often, international treaties and agreements are little more than codifications of previous conventional understandings. Hence, there is a complex and intimate interplay between conventions, regimes, and organizations. Often, these institutional forms are closely intertwined in reality, and their separation is foremost analytically convenient. This feature can be illustrated by the example of the field of nonproliferation of weapons of mass destruction. It is a field characterized by a number of formal agreements—that is, treaties of nonproliferation, including the Non-Proliferation Treaty (NPT) of 1968. In addition, a group of states have created a handful of export control regimes, including the MTCR, which helps these states specify and reach the objective of nonproliferation. The number of contracting states is rather limited, yet many states adhere to the principles of the regimes as if they were members. Further, some international organizations have been assigned specific tasks in the field, for example, the International Atomic Energy Agency (IAEA) and the Organization for the Prohibition of Chemical Weapons (OPCW). Finally, throughout most of the 20th century, there has been an international convention, a custom, not to use chemical weapons, and in 1997, a formal agreement, the Chemical Weapons Convention, came into force.

In a wider international system perspective, the multilateral system can be seen as a historically new feature of the international states system or, differently conceptualized, as a fundamental institution of international society. The multilateral system is often said to be strongly state-centric; the reason being that states create, reproduce, and, sometimes, terminate the life of multilateral institutions. Further, states are usually exclusive members of such institutions; they negotiate and sign international agreements that materialize in international regimes. States also engage in reproducing the principles, norms, and rules underpinning both organizations and regimes, thereby securing that they are alive and working and not just dead letters in a written agreement. Paradoxically, the multilateral system is so state-centric that the EU, not being a state, experiences severe difficulties in performing as an international actor pursuing European interests. However, while states might have been exclusive players in the past, transnational actors (TNAs) play an increasingly significant role in the contemporary multilateral system. TNAs frequently contribute to agenda setting, sometimes provide intellectual leadership, push for some international agreements, and campaign against other agreements. Prominent examples include the creation of the International Criminal Court and the international treaty banning landmines, both initiatives being sponsored by the EU and NGOs working in the field of human rights. The enduring significance of TNAs in global governance remains an empirical question, yet it is beyond discussion that they, even if not formal members, increasingly contribute to the politics of multilateralism.

Multilateral Foreign Policy

Multilateral institutions have states as members and therefore need these states to engage in some political gardening to keep the institutions on track and on mission. Hence, the foreign policy of states requires a more or less prominent multilateral dimension. Multilateralism is one option among a range of foreign policy strategies. Multilateral foreign policy strategies prioritize the promotion of and commitment to international institutions, including the resources it takes to cultivate these multilateral institutions. The United States opted for this strategy after the end of World War II and also immediately after the end of the Cold War. At other times, the commitment to multilateral institutions has been more ambivalent. One of the stated strategic objectives of European foreign policy is to promote effective multilateralism. Other great powers have been more reluctant or simply unable to shape the multilateral system or its individual institutions. Thus, Russia, China, India, and Japan have had a modest impact on the development of the system. It is telling that the international financial institutions, the International Monetary Fund, and the World Bank thrived during the Cold War partly due to the fact that the

Soviet Union decided not to join. By contrast, middle powers such as Canada and the Nordic states have traditionally been keen supporters of multilateralism: In some cases, they almost fully comply with their international obligations; that is, they ratify the international treaties they sign and subsequently display few infringements against the treaties they have signed.

To further specify the meaning and characteristics of multilateral foreign policy, it is useful to proceed *ex negativo*, or to explain what it is not. The antonym to multilateralism is unilateralism, a "going-it-alone" foreign policy strategy. Application of the strategy implies that a given state essentially does what it wants to do, abandoning consultations, coordination, or cooperation with allies or third parties and employing an approach that is characterized by the absence of international legal or political constraints. However, proponents of a "going-it-alone" strategy sometimes advance their arguments on the basis of a narrow understanding of international customary law. Especially, great powers enjoy the option of unilateral action. During the George W. Bush administration, the United States was prone to unilateral action, diplomatically labeled à la carte multilateralism. Though having a preference for multilateral foreign policy, the EU is no stranger to unilateral action, as demonstrated by the rather frequent use of sanctions—that is, in cases where the EU acts like a unitary actor. However, the invasions of Kuwait by Iraq and the Falkland Islands by Argentina suggest that it is not only the great powers that enjoy the privilege or temptations of unilateral military action.

Like unilateralism, bilateralism is also not multilateralism as it only takes two to cultivate a bilateral relationship. An illustrative example is Japan and the United States cultivating a broad range of bilateral agreements, including defense and security. Sometimes bilateralism and multilateral arrangements are intertwined, for example, France and Germany cultivating a close bilateral relationship, yet within the context of the EU. Also the United States and the EU can be said to cultivate an exclusive bilateralism within the context of a multilateral WTO, in turn triggering opposition coalitions such as the Cairns Group.

The three strategies are not necessarily mutually exclusive. Thus, unilateral diplomatic action can provide the necessary conditions for a major breakthrough in otherwise stalled multilateral negotiations, and bilateral relations sometimes function as the innovative undergrowth, providing the leadership, coalition building, and preparatory work that secure an agreement within multilateral diplomacy, characterized by a large number of participants. Reaching international agreements by a select subgrouping of a larger multilateral organization or regime, which are subsequently adopted by other states, is known as minilateralism. Hence, minilateralism is characterized by an exclusive group of key states within a specific issue area reaching an agreement that is subsequently accepted within a larger multilateral setting. One example is the policy by France and the United Kingdom vis-à-vis the breakup of the former Yugoslavia, a policy that was accepted by partners within the EU and subsequently adopted by the UN Security Council. Minilateralism should not be conflated with plurilateral agreements being concluded by a small select grouping of states and subsequently adhered to by a larger segment of international society. A reference to the plurilateral instrument was made after the 2003 WTO Doha Round meltdown in Cancun, when the EU suggested that given the multilateral deadlock, perhaps a plurilateral approach would be a desirable, attractive, or, at least, possible alternative.

Multilateralism as Political Ideology

In certain contexts, multilateralism should be seen as an ideology that exists in both positive and negative versions. These versions share the view that the qualities of multilateralism are a matter of belief or faith and therefore beyond debate and examination. In the first place, multilateralism is seen as morally superior to other foreign policy strategies. Further, multilateralism tends to be seen as an end in itself, for which reason the instrumental dimension is systematically downplayed. Being multilateral is what counts and, even if nothing can be achieved, it remains imperative to keep the multilateral machinery in place. During the late 1970s and early 1980s, this attitude characterized the European approach to the CSCE (Conference on Security and Cooperation in Europe) process. Finally, in some understandings, multilateralism and the UN are simply synonymous. Due to its global membership, only the UN is considered a genuine example of multilateralism. Interestingly, the authors of the European Commission's annual report seem to take this stance. The positive version has also been called *globalism*, and adherents argue that global agreements should be prioritized even if the number of veto players almost guarantees that no agreement is the likely outcome. The alternative, in terms of an agreement concluded by the, say, 14 most important states for global climate, is dismissed and accompanied by references to problems of legitimacy. Similarly, plurilateral agreements are also dismissed because they are by their nature essentially exclusive.

According to the dystopian ideology of multilateralism, multilateral approaches are synonymous with inaction, unwarranted constraints on state action, or both. One argument is that it would be irresponsible to leave decisions concerning crucial issues to multilateral institutions as inaction and nondecision is often the likely outcome. If states nevertheless opt for multilateralism, it is because they use multilateral institutions instrumentally to cover for inaction. In this perspective, multilateral agreements function as window dressing—for example, the commitment to 0.7% gross domestic product (GDP) on development, a commitment that very few states seem to adhere to. By contrast, the Millennium Development Goals have not been met due to a wider set of failings, including donor shortfalls, recipient shortcomings, and organizational malfunction. A second argument is that powerful states should not constrain themselves by getting embroiled in a web of rules and obligations. A third argument, for instance, used by opponents of European integration, is that small states should not give up the formal and symbolic dimensions of independence or autonomous decision-making power. Finally, proponents of an exclusive league of democracies to replace the UN argue that universalism triggers a fundamental problem as nondemocratic states are given too much of a voice.

Theoretical Reflections on Multilateralism

Major theoretical debates in the discipline of international relations concern the promise of international institutions and the multilateral system. Four issues constitute the backbone of these debates especially. In the first place, some theorists claim that multilateral institutions should be seen as mere arenas on which (strong) states engage in international politics. Such arenas have no independent or significant impact on the script or on what is being played. In contrast, other analysts emphasize that the level of institutionalization in the international system has an impact on state behavior, that international organizations sometimes teach states about their interests, and that organizations can be seen as agents that are not entirely controlled by their principals. In various ways, all these approaches emphasize that the arena approach is most misleading and largely unfounded by evidence.

Second, there is an enduring issue concerning the instrumentality of international organizations. While some theorists are keen to theorize what international organizations can do and what difference they can possibly make to international politics, other theorists focus on instrumental action. As Inis Claude has famously emphasized, we should ask not what the UN can do but what the UN can be used for.

Third, some theorists claim that, at best, multilateral institutions reflect the changing distribution of power and, at worst, trigger naive and dangerous illusions about their potential, making us forget those few but important things that really make a difference in international politics. If, indeed, the impact of multilateral institutions is epiphenomenal to power politics, then why waste time analyzing something that essentially is derived from more powerful explanatory variables? By contrast, other theorists claim that the institutionalization of world politics mold international anarchy, thereby reducing the power of power politics and making a more peaceful world possible. These scholars emphasize that there is a linkage between the growth of multilateral institutions and the pronounced decline in interstate war.

Finally, many scholars tend to take the positive qualities of international institutions for granted, a tendency that is particularly strong among those theorists who regard multilateralism a means toward cooperation and peace. By contrast, other analysts claim that multilateral institutions frequently display an alarming degree of dysfunctional or, worse, pathological features—that is, characteristics that potentially undermine whatever legitimacy these institutions might have and, in any case, provide significant obstacles to reaching global solutions to urgent global problems.

Crises of Multilateralism

The development of the multilateral system and its international institutions has frequently been characterized by crises, ranging from the failure of the League of Nations to the less than perfect performance of the UN during the Cold War and the doldrums of the European Community during the 1970s. However, the contemporary crisis of multilateralism appears to be more profound than previous crises, and it seems to have several sources. Thus, several major multilateral institutions were created during the Cold War, and, as the world has subsequently changed, they are in severe need of more or less comprehensive reform. Further, the international institutions are characterized by an ever more present trade-off between inclusion, legitimacy, and effectiveness. As the number of participant state members increases, so does the number of veto players. At the same time, there is an increasing imbalance between the provision of leadership, which is lacking, and an ever-broader portfolio of global demands and tasks to handle. It does not help that several key states pay lip service to their obligations toward international institutions or act as custodians insisting on yesterday's arrangements, not necessarily because they are perfect or efficient but because they represent a certain distribution of power, pride, and prestige. In the UN, the Group of 77 (G77), controlling the budget and personnel, has shown little interest in administrative reform. Finally, multilateral institutions are characterized by an ever-wider expectation–investment gap, triggering, in turn, frustration, apathy, or cynicism concerning absent expected deliverables. Examples of the crisis abound, ranging from the stalled UN reform process, via the dire straits of the Non-Proliferation Treaty regime, to the stalled WTO Doha Round. It is clear that sustainable solutions to the crisis require some exquisite intellectual innovative thinking and strong political leadership and, it is hoped, not another calamitous external shock to the system to provoke change.

MULTILEVEL ANALYSIS

Multilevel modeling is used in the analysis of data that have a clustered structure. Such data arise in various fields—for instance, in educational research, where pupils are nested in classes; in medical research, where patients are nested within hospitals; and also in political research, where individuals are nested in a social context. A crucial problem in the statistical analysis of clustered data is the dependencies between individual observations. For example, voters from the same city are not independent from one another, because they are all influenced by local policy. The statistical analysis performed on clustered data should account for this dependency. However, statistical analysis can also benefit from such dependency. The characteristics of different levels can be combined into one explanatory model and conclusions can be drawn about their effects, both at each level and in interaction. In the following sections, the multilevel model is explained and illustrated by means of a political example.

The starting point for explaining the multilevel regression model is the idea that the dependent variable, allocated at the lowest level, is thought to be influenced by all distinguished levels. With respect to a two-level model, this principle can be seen in the following equation (the intercept-only model):

$$Y_{ij} = \gamma_{00} + u_{0j} + e_{ij}. \qquad (1)$$

The dependent variable Y of an individual i in group j is decomposed into three different parts. Because there are no explanatory variables in the model yet, the explanatory part of the model consists only of the grand mean γ_{00}. The unexplained part of the model consists of two parts: an error at the highest level (u_{0j}) and an error at the lowest level (e_{ij}). This means that the total variance of the dependent variable is decomposed into two parts: the error variance at the lowest level $\left(\sigma_e^2\right)$ and the error variance at the second level $\left(\sigma_{u_0}^2\right)$. A good explanation of the dependent variable is therefore based on both levels. Of course, one should keep in mind that the division over both levels can differ per variable. The more error variance there is at the lowest level, the less important the second level will be.

Adding explanatory variables of both levels gives the following equation:

$$Y_{ij} = \gamma_{00} + \sum_p \gamma_{p0} X_{pij} + \sum_q \gamma_{0q} Z_{qj} + u_{0j} + e_{ij}. \qquad (2)$$

In this equation, p explanatory variables of the lower level and q explanatory variables of the second level are added to the model. Interactions between variables of the lowest level are also called p, and interactions between variables of the second level are called q. Because these variables will explain a part of the variance at both levels, the errors will become smaller and the explained variance in the dependent variable can be calculated.

Interactions between variables of different levels take up a special position in the model. The influence of a lower-level variable on the dependent variable may depend on a second-level variable. This is called a cross-level interaction (or moderator effect). Adding cross-level interactions to the model, gives the final, and most elaborated, multilevel model:

$$\begin{aligned} Y_{ij} = {} & \gamma_{00} + \sum_p \gamma_{p0} X_{pij} + \sum_q \gamma_{0q} Z_{qj} + u_{0j} + e_{ij} \\ & + \sum_q \sum_p \gamma_{pq} Z_{qj} X_{pij} + \sum_p u_{pj} X_{pij} + u_{0j} + e_{ij}. \qquad (3) \end{aligned}$$

Looking at this equation, one can see that not only are the cross-level interactions added to the model but there also are p extra error terms in the model: $u_{pj}X_{pij}$. The errors u_{pj}, the unexplained parts of the regression coefficients of the lowest level, are multiplied with the lowest-level variables and are therefore different for different values of the X variables. This is called heteroskedasticity. In ordinary regression analysis, homoskedasticity is assumed, which means that the variance of the errors is independent of the values of the explanatory variables. Therefore, analyzing the model presented in Equation 3 requires a multilevel analysis. The variance of the errors u_{pj} is $\sigma_{u_p}^2$.

The assumptions of the most commonly used multilevel regression model are that the residuals at the lowest level e_{ij} are normally distributed with a mean of zero and a common variance σ^2 in all groups. The second-level residuals u_{0j} and u_{pj} are assumed to be independent from the lowest-level errors e_{ij} and to have a multivariate normal distribution with means of zero. Other assumptions, identical to the common assumptions of ordinary multiple regression analysis, are fixed predictors and linear relationships. Most multilevel software assumes by default that the variance of the residual errors e_{ij} is the same for all second-level units. However, certain forms of heteroskedasticity can be explicitly modeled.

Estimation of the parameters (regression coefficients and variance components) is generally done using maximum likelihood. The restricted maximum likelihood method maximizes a likelihood function that is invariant for the fixed effects and therefore leads, in theory, to better estimates of the variance components than the full maximum likelihood method in which both the regression coefficients and the variance components are included in the likelihood function. In practice, the differences between the two methods usually are not large.

Assume that we have data from a random sample of cities and also data from a random sample of inhabitants of these cities. We are interested in explaining involvement of individuals with local policy, measured on a scale ranging from 1 (*not at all*) to 10 (*extremely*). We use the variable *gender* as an explanatory variable at the lowest level, assuming that men are more interested in politics than women, and the variable *local political activities* (measured on a scale from 1 [*almost none*] to 7 [*very often*]) as an explanatory variable at the second level, assuming that, in cities with more local political activities, individuals are more interested and involved in political issues. We have data from 2000 individuals from 100 cities (see Table 1). The first model that is specified is the intercept-only model. The total variance of the dependent variable is decomposed into two independent parts: one at the individual level and one at the city level. Because there are no explanatory variables in the model, the variance found at each level is error variance. The percentage variance at the second level, calculated by dividing the error variance of the second level by the total error variance, is 31.85%. This means that almost one third of the total variance in the political involvement of city members lies at the second level. Multilevel analysis is therefore used not only to account for dependency but also for building an explanatory model containing variables from both levels and their interactions.

In the second model, the explanatory variables gender and local political activities are added to the model. Both variables are significant. The regression coefficient of gender is .88. This means that men score almost 1 point higher on political involvement than women (controlling for local political activities). This is not only a significant but also a relevant result: almost 1 point on the 10-point scale of political involvement. The regression coefficient of local political activities is .22. The interquartile range of the local political activities

$\sigma_{u_1}^2$			0.47 (0.09)	0.43 (0.08)
$\sigma_{u_{01}}$			–0.05 (0.03)	–0.04 (0.03)
Deviance	5802.67	53338.78	5145.00	5138.76

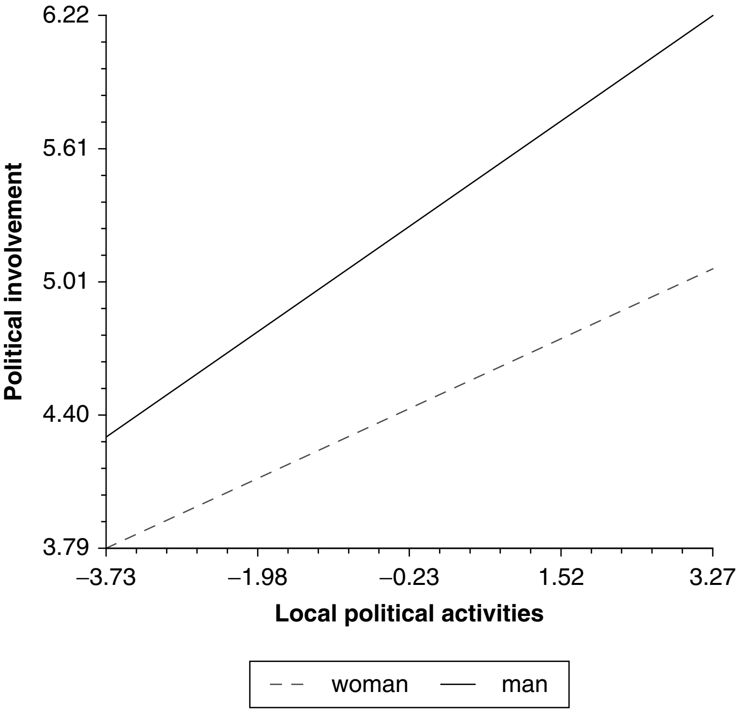

Figure 1 Interaction Effect of Gender and Local Political Activities

variable is 4, meaning that for this range the maximum difference on political involvement is 4 times .22, which is .88. This also seems quite relevant. Another measure for relevance is the explained variance. The explained variance is calculated by subtracting the error variance of the model with the explanatory variables (Model 2) from the error variance of the model without explanatory variables (Model 1: the intercept-only model) and dividing by the total error variance of the intercept-only model. On the individual level, the explained variance is 17%; on the city level, 70% is explained. Both are really relevant.

In the third model, the question to be answered is whether the influence of gender is the same in all cities. The answer to this question is no; there is variation between cities for this effect (slope variance is 0.47). The next step is to explain this variation (Model 4). For the explanation, the interaction between gender and local political activities is included in the model. The effect is significant and positive. This means that men benefit more from local political activities than women (see Figure 1; for statistical reasons, the variable local political activities is centered on the grand mean). The explained slope variance is 10%. The difference between political involvement of men and women is almost 2 times as large when there are a lot of local political activities—in comparison with when there are almost no local political activities.

The example discussed in the previous section shows that multilevel analysis is the appropriate way to answer research questions concerning data with a clustered structure. Multilevel analysis not only accounts for dependency in data, but it also takes advantage of the clustered structure. The individual political involvement is explained with an individual characteristic (gender), a city characteristic (local political activities), and the interaction between these two characteristics. Multilevel analysis provides an optimal use of all available information.

In this short introduction to multilevel analysis, many other possibilities have not been discussed. For instance, the model discussed assumes a continuous dependent variable and normally distributed residuals. The check of these assumptions is not discussed. Of course, this check should always be carried out, but it is beyond the scope of this entry. When the response variable is a dichotomous variable or a proportion, both the aforementioned assumptions of continuous scores and the normal distributed errors are violated. Multilevel logistic regression gives the solution to this problem. Other possibilities are, for instance, longitudinal multilevel analysis, the multilevel approach to meta-analysis, cross-classified models, and multilevel structural equation models.

MULTINATIONAL CORPORATIONS (MNCS)

Multinational corporations fascinate many international political economy scholars. Scholars disagree about their significance and their impact but continue to analyze their dynamic evolution in the global economy. Multinational corporations are private firms that operate in multiple countries. Their primary motivation is economic profit. They may engage in investment, sales, production, services, extractive processes, or any combination of these. Multinational corporations' activities propel economic globalization. They may invest, set up shop, or even buy existing domestic firms as the multinational expands. This entry addresses first the broad views about multinational corporations and then the corporations' motivations to go abroad. The entry continues with a historical overview and concludes with controversies surrounding multinational corporations.

Multinational corporations are incorporated in a home country and are chartered according to the home country's laws and regulations. Analysts have debated the extent to which home country regulations shape multinational corporations' outward conduct. Some argue that such regulations make a major difference in corporations' behavior and standards abroad. Others see multinational corporations as footloose harbingers of global capitalism with no particular state-based allegiances. Realist scholars, who emphasize the supremacy of state power, emphasize corporations' subordination to state laws, jurisdiction, and policies. They tend to cite instances in which the state took actions against the wishes of particular corporate interests—for example, favoring national security over economic considerations. Other analysts suggest that corporations can be more powerful than states and that states may be actually in retreat in the face of rapid economic integration and globalization. These analysts note the increase in the size and role of the private sector at the expense of the public sector. Beginning in the 1980s, many states delegated an ever-greater range of once publicly supported activities to private actors. Private companies have come to run schools, jails, hospitals, municipal water systems, and have even provided security in conflict zones.

Why Firms Go Abroad

Given the risks and costs associated with initiating multinational operations, one must understand firms' motives to do so. In the case of extractive industries, the logic is quite straightforward. Natural resource firms need to establish themselves at the site of the resources—gold, oil, copper, diamonds, cobalt, and so on. Service firms may seek to be closer to customers and be able to adapt to and serve local markets better. Manufacturing firms may seek out highly skilled or, alternatively, low-cost labor. Manufacturing firms may seek to get behind tariff walls, producing and selling their goods within regions protected by high import taxes. These examples demonstrate firms' motivations to leverage *location-specific* advantages. Another class of motivations is *asset specific.* Often, asset-specific advantages are reputation based or trademark related. Obvious examples of firms seeking to leverage asset-specific advantages would be Coca-Cola and McDonald's, entertainment companies (e.g., Disney), and brand-name luxury goods producers and distributors.

Historical Perspectives

While some analysts write about multinational corporations as if they were relatively recent phenomena, in fact, private companies engaged in economic activity abroad date back at least to the age of empires in the early 17th century. European countries competing for colonies often sent companies, which the rulers chartered, to distant shores to establish a presence and engage in economic activity. Charter companies such as the British East India Company and the Dutch East India Company facilitated European expansion beyond what the countries' militaries alone could accomplish. In this way, these companies and their governments participated in a symbiotic relationship that helped fuel both imperial expansion and economic growth. Historical appreciation of the age of mercantilism puts claims of the novelty of private sector power and the stark separation between states and markets into question. In the colonial era, power and wealth were inextricably bound together.

By the late 19th century, firms such as General Electric and Singer Sewing Machines were operating abroad. At the end of World War I, many more companies began to invest and build plants in war-ravaged Europe. Latin American, Middle Eastern, and African countries attracted investors in various extractive and natural resource industries. After World War II, manufacturing firms invested abroad and often set up turnkey plants (fully built and ready to operate with the turn of a key) for production, and service industries established branches abroad. The extractive natural resources industries would integrate their business operations vertically, exercising control over all stages of production and processing. They sought to reduce risk by maximizing control. By contrast, manufacturing and service firms tend to be horizontally integrated and replicate themselves across countries. Their subsidiaries produce the same products or provide the same service in plants and branches in different countries. They are motivated to expand or defend market shares by getting behind tariff walls (producing for or servicing the host country's domestic market) or following their competitors abroad.

In the wake of decolonization, until about 1960, foreign corporations were often the primary source of capital and technology in newly independent countries. Eager to promote industrialization in the face of, or to counterbalance, large numbers of imported goods, many newly independent countries welcomed foreign investment into their economies. Over time, however, foreign companies became a critical target; Marxist-inflected dependency theory took root in Latin American countries and highlighted some of the more exploitative aspects of multinational corporate operations. Critics of multinational corporations complained that they did very little to help develop the host economy. In the 1960s and 1970s, many countries in Central and Latin America adopted measures designed to channel foreign investment into domestic capacity building. For example, governments could limit foreign ownership to less than 50% of a domestic firm or require foreign firms to hire a certain percentage of domestic labor or reinvest a set percentage of profits into the domestic economy.

The spread of multinational corporations heightened scholarly attention to their activities and the implications of their global reach. Political scientists began to examine whether the power and influence of multinational corporations was surpassing that of states. Economic interdependence and dependence on natural resources such as oil sharpened the focus on this question. In 1971, Raymond Vernon published *Sovereignty at Bay*; the title captured some observers' anxiety about multinational corporations. Political scientists recognized such corporations as important actors in international politics. Realists maintained that sovereign states were still the most important actors and pointed out that states could expropriate private property and eject foreign companies. Economic liberals celebrated the spread of multinational corporations as vehicles for deepening economic integration and interdependence. Liberals believed that interdependence could lead to peace. Assertive state efforts in developing countries to channel or control their activities and academic criticism of multinational corporations faded out over the course of the late 1970s and 1980s. High oil prices and a devastating debt crisis meant that bank lending was scarce. Multinational corporations became important sources of capital and investment, so formerly resistant countries rapidly dismantled restrictive foreign investment regimes in an effort to *attract* multinational investment.

Controversies

Scholars analyzed the role of multinational corporations in the political process. A number of scholars highlighted their bargaining role as one leg of a tripod between home government, host government, and corporation. Other scholars adopted a more nuanced view, rejecting binary views of firms *versus* states, and instead focused on the mutual interaction between states' and firms' preferences. The globalization literature of the 1990s and 2000s has examined the exercise of private authority in the global political economy, and particularly corporations, in standard setting, economic integration, and norm creation. One set of debates has addressed the so-called race to the bottom, in which multinational corporations seek the lowest cost or the least restrictive venues. Critics of multinational corporations focus on races to the bottom to highlight their contribution to environmental degradation, the creation of sweatshops, child labor, and gendered exploitation in export-processing zones. Critics of "race-to-the-bottom" arguments counter by demonstrating "races to the top," in which firms export the more stringent or environmentally responsible standards when they establish operations abroad.

Many nongovernmental organizations have highlighted multinational corporations' exploitative practices and have launched naming and shaming campaigns against sweatshops, child labor, and environmentally unsustainable production. These campaigns have targeted high-profile companies with easily recognizable brand names such as Nike, The Home Depot, and Starbucks. In response to these campaigns, multinational corporations have increasingly embraced a "corporate social responsibility" approach to dampen criticism and to improve their reputations. The United Nations launched the Global Compact—a voluntary reporting program in which multinational corporations pledge to uphold certain standards of good conduct. Corporate social responsibility initiatives are all voluntary. Critics have contended that they are ineffective in altering corporate conduct and only serve as public relations exercises designed to prevent stricter government regulation. Supporters of corporate social responsibility initiatives argue that they are having a positive, albeit incremental, impact.

Nation Building

Nation-states are mostly multiethnic and composed of various subnations. Nation building is a process of building a social community within a nation-state. It is closely related to the formation of states in postconflict situations after regime change, after decolonization, or after wars. The nation-building process is particularly important in multination states in Africa. African colonies were formed by the colonial powers without regarding their ethnic and linguistic cleavages. With independence, the process of state building had to be strengthened by social and cultural cohesion. National symbols such as national anthems, national flags, national holidays, and national myths were used to overcome tribalism and ethnic and social rivalries. Nation building of this kind is a cultural foundation for state building and is necessary for economic and social development. Processes of nation building also became important with the breakdown of the Socialist bloc and state and nation failure in the Soviet Union, Czechoslovakia, and the former Yugoslavia. Nation building is primarily an indigenous process, and external assistance often fails. It is meant to reinforce states and prevent secession. Nation building is related to sentiments of national identity, which internally have positive effects of social cohesion by bridging and bonding but which may have negative consequences in the form of xenophobia against noncitizens. Externally, the emphasis on national identity can also reinforce aggression against neighboring countries. This entry discusses the various forms of historical and contemporary nation building and its ongoing problems.

Nation Building: Etymology and Definition

Etymologically, the word *nation* is derived from the Latin *natio*, which stands for "the act of being born." So, a nation is usually defined as a set of people and tribes. *Natio* originally was strongly connected with a term such as *ethnos* (a people based on the idea of a common descent), in contrast to *demos* (a population defined by common citizenship). Nations are socially constructed, so it is unclear who is included and who is excluded. This unclear social cultural definition is expressed in Benedict Anderson's concept of a nation as socially constructed "imagined communities." The broader, "territorial" concept of the nation-state produces a clearer definition. Nation building is a process of collective identity formation to assert power in a certain territory. It refers to existing institutions, customs, and traditions, and it redefines national characteristics. The process of state building depends on this uniqueness and sovereignty. The building of a nation is based mostly on values and beliefs that enhance support for and the legitimacy of the (new) state.

Nation building as a process of developing a national identity can be seen as the cultural foundation for the nation-state and its supralocal power structure. If this cultural projection of a nation is no longer valid, the social contract between the state and individual citizens or groups of citizens may be destroyed and violence may be triggered. This can be seen in the breakup and collapse of a state such as Yugoslavia, leading to civil wars in Bosnia-Herzegovina and Kosovo in the 1990s.

The existence of nation-states can be seen as a safeguard for security and stability. Nation-states act as the basis for economic and social development. According to Eric Hobsbawm (1990), national identity and national pride are created by a feeling of one's supremacy, and they provide a basis for nation building. All forms of national identity (national pride, patriotism, etc.) can become problematic and are related to outgroup hostility.

State Building

Interaction between different ethnic groups is a prerequisite for a successful and sustainable nation-building process. For this reason, the social, economic, and cultural aspects of nation building are important. New forms of cultural discourses representing the nation as a whole become significant. In this respect, aspects such as a common lingua franca, a common literature, sports events, and so on are relevant. Finally, a national infrastructure and national space and communication between different relevant groups have to be developed. Civic education programs and information strengthen the education of citizens and democratic nation building. Administratively, nation building also needs an effective state apparatus.

Nation failure can be seen as an aggravated form of state failure in multicommunity states. Different subnations define themselves by shared class, religion, language, or ethnicity. Too many cleavages will make it difficult to build a state and may even destroy the social contract between citizens and the state. This situation makes it unlikely that government decisions will be accepted or adhered to.

State failure is the breakdown of public institutions meant to deliver political goods to citizens. This may undermine the legitimacy of the state and lead to failing states characterized by disharmony between communities, criminal violence, corrupt institutions, and a decaying infrastructure, as well as inability to control the borders.

State building is the establishment of political structure and policies in a territory. It is organized by sovereign actors as an expression of collective power without the use of coercive measures and physical force.

Nationalism

Nation building needs an integrated ideology that derives from a national identity. National identity is one pattern of orientation within a set of multiple social identities that become relevant in different contexts. It concurs with other identity narratives. All are important for the cohesion of social groups and for the fostering of individual self-esteem. Identities are constructed, and they may be deconstructed as well. Identity may occur in the form of chauvinistic nationalism and outgroup hostility. It may also be defined and constructed as a kind of constitutional patriotism, as pride in the social welfare state or as pride in social-inclusion policies. In democracies, pride in democratic performance, in societal values, and in peaceful policies becomes important.

In his seminal work, Karl Deutsch (1954) highlights the construction of identities and nationalism as well as its latent problems: "A nation is a group of persons united by a common error about their ancestry and a common dislike of the neighbors" (p. 3). He defines nationalism as a doctrine whereby people believe that their culture, history, institutions, religion, or principles are distinct and aspire for self-rule under a political system that expresses and protects those distinct characteristics.

Banal Nationalism

According to Michael Billig (1995), the usage of symbols and common narratives can be seen as a kind of banal nationalism. National identity can be related to national symbols such as flags, anthems, and other symbols. In the cultural field, a country's pride in its "achievement in the arts and literature" is significant, but more often banal nationalism is related to sports events. This "sportive nationalism" is well-known in mega sport events such as soccer (football) world cups and the Olympics. In these events, national symbols such as anthems and flags are used. Pride in the country's "achievements in sports" is expressed as a form of patriotism. Nevertheless, as Hannah Arendt pointed out, banal nationalism is not necessarily harmless or benign. It is always only a small step from benign national identity to aggressive xenophobic nationalism.

National identity is also related to national performance and pride in different domains, such as "political nationalism." Pride in "the way democracy works," pride in the "social security system," and pride in a country's "fair and equal treatment of all groups in society" are other domains within democratic "patriotism." Pride in a country's "political influence in the world" and pride in "the armed forces" are more nationalistic. Pride in a country's "economic achievement" and pride in its "scientific and technological achievements" are more peaceful expressions of national pride.

Nation building is related to national identity. Identity is a complex phenomenon; in the setting of multiple identities, different forms of belongings compete. National identity competes with different local identities and, increasingly, with supranational identities (e.g., in the European Union). There is also the question of who is included and who is excluded.

Banal nationalism is strongly related to the state- and nation-building process, which is obvious in multiethnic states such as South Africa. South Africa has one of the most complex national identities. Currently, various identity narratives exist. The divisions between the "self" and the "other" are regarded as phenomena characterized by cleavages in ethnicity and race, as well as language and religion. Banal nationalism as a governmental strategy is obvious. Although group identities are strong, South Africa is a country with a very high level of nationalism, national pride, and sports patriotism. This development of national identity is strongly related to nation-building ideologies and strategies. In 1995, 1 year after the first democratic elections, the rugby World Cup victory produced slogans such as the Rainbow Nation and Simunye ("We are one"). The common support for the rugby team (in the past mainly a "White" sport) was seen as a triumph of national reconciliation between Blacks and Whites. During the 2010 football World Cup in South Africa, the use of national symbols was openly regarded as part of a broader nation-building strategy.

History of Nation Building

Efforts of nation building are strong in times of regime change. In the different waves of democratization as well as with the winds of change accompanying the independence of African countries, nation building became a central aspect. But historically, nation-building processes are much older.

In traditional societies, political power structures were mostly oriented toward regional and local demands in relatively autonomous rural village structures. The process of nation building destroyed most of the existing local traditional systems of clientelism and personal rule. The centrifugal shift of power toward the regional or national level can be seen as a process of conflict. Cultural, social, political, and economic dominance have to be redefined.

In general, the birth of states and nations took place in conflict situations. As primordial traditional communities shared similar values and language, states existed before the nations themselves developed.

In the foundation phase of most multiethnic states, the ruling power reinforces the development of the national state by not only using oppression but also providing strong economic incentives and implementing cultural policies aimed at cultural homogeneity (language policy, religion, policies in primary and secondary education, etc.)

In the early phases of nation building, political leaders are often interested in financial extraction from their constituencies. They often impose a state apparatus. They also have to act against new social movements and groups agitating for more democratic rights and devolution and/or secession.

Regional Characteristics

Stein Rokkan analyzed the territorial centralization and unification that took place during the period after the Thirty Years War ending in 1648 in Europe. He highlights the role of language mobilization in unification and centralization. In Europe, the large, old dynasties and monarchies encompassed different ethnic and regional entities and used oppression and personal clientelistic networks to develop nation-states, often based on a common religion (*cuius regio, eius religio* [whose realm, his religion]). The Peace of Westphalia in 1648 can be seen as the beginning of the modern state. It redefined new regimes, although most remained monarchies. In this regard, the spatial and temporal contingency of the nation-state in Europe in the 18th and 19th centuries was still significant. The Industrial Revolution reinforced centralization and the development of cultural harmonization and a common ideology. This was inculcated by nationwide school systems, the media, and so on. In the late 19th century and in the 20th century during the interwar period, many new states were formed after the breakdown of the former empires. In most countries, multiethnic states developed, which resulted in different nation-building processes, such as consensus-oriented strategies (e.g., in Switzerland and later also in the Netherlands). Some conflicts have, however, persisted (e.g., in Belgium or Spain). In the 1990s, after the breakdown of the Eastern bloc, new nations emerged. The breakup of Yugoslavia as well as of Czechoslovakia showed that nation building under socialist rule had not been successful either.

Most Asian states had been subjected to British, Dutch, or French colonial rule. After independence—mostly after World War II, with some exceptions such as the secession of Bangladesh from Pakistan as well as the independence of some small island states—nation building was not seriously questioned. This is due to the fact that most of these countries became nondemocratic, authoritarian, or socialist states, suppressing any attempts at secession.

In South America, with the exception of Brazil (1880), countries achieved independence early in the 19th century. Local elites rebelled against the Spanish or Portuguese colonial powers. State formation mostly followed the previous colonial administrative divisions. With very few exceptions these were no longer questioned. In most countries relatively strong "national" identities emerged with some remaining ethnic, racial, and regional divisions. By contrast, African countries have experienced many problems with regard to state and nation building. At the Berlin Conference of 1884, the European powers agreed on a division of Africa. The African colonies were formed without any respect for existing ethnic or linguistic cleavages. With independence, most African states inherited a very heterogeneous sociocultural and ethnic structure. The colonial state had been held together mostly by oppression of the colonial power. The democratic multiparty systems installed by the departing colonial powers were often immediately restructured after independence. Most African countries introduced strong presidential one-party systems in the name of national unity. Presidents often attempted to become lifetime presidents, and many considered themselves as father figures for disunited nations. This trend toward one-party systems was supported during the Cold War as the two blocs discouraged secessions and favored stability. Some authoritarian regimes, supported by the United States and its allies, as well as African socialist regimes, often supported by either the former USSR or China, used the ideology of one party/one nation-state to strengthen their power. In fact, the constitutional reforms toward centralization and a strong executive were seen as instruments against secession.

With the end of the Cold War and the wave of democracy that swept over the African continent in the early 1990s, some of these authoritarian and socialist regimes came to an end. Secession of some regions (e.g., Eritrea and Somaliland) and new waves of civil war (as in Rwanda and Sudan) made it obvious that the nation-building process was still not completed. The latest new state, which was formed after a referendum in 2011, is South Sudan. New forms of power sharing came into place, because many political groups would not accept defeat during elections, in which the winning party takes it all. National governments are often seen as a temporary solution while a new constitution is drawn up and elections are organized. But these are not quick-fix solutions for the lack of a national identity.

In Africa, in spite of the artificiality of state formation and the ethnic heterogeneity in many countries, the number of separatist movements has remained relatively small. Separatist movements base their claims on existing administrative divisions: in the former Eastern Nigeria (Biafra), Casamance in Senegal, Eritrea, Somaliland, the three separatist provinces in Sudan, Katanga in the Congo, and the Anglophone region of Cameroon. Separatist movements such as in the Comoros and in Zanzibar have been reinvigorated in the new millennium. In many countries, ethnic groups also have become co-opted, incorporated, and included in the new political systems. Under certain rules and agreements, de-ethnicized territorial nationalism coexists quite harmoniously with ethnic politicization (see, e.g., South Africa [Zulu], Nigeria [Igbo and Yoruba], and Ethiopia [Oromo]).

Instruments of Nation Building and Constitutional Identity Building

In democratic systems, constitutional identity building is an important factor for nation building. Constitutional processes are often seen as the enshrining of political values in a basic document. Jürgen Habermas as well as Francis Fukuyama championed the idea of constitutional patriotism, where the constitution itself becomes the center of strong collective loyalties. It is a base for identification and identity; older, authoritarian, traditional forms of identity are replaced and become less relevant.

Constitutional processes today are regarded as important steps in nation building; however, they often follow an unrealistic procedure. The constitutional process usually starts with the election of a national assembly by the people to "write" the constitution. The constitution will then be officially adopted by a referendum. This ideal type of constitutional process is often based on wrong assumptions. Nation building frequently happens in postconflict situations, where elections and referenda are neither feasible nor desirable. In many postconflict societies, the former undemocratic bureaucracy has to implement a referendum in a postauthoritarian situation. Early general elections may culminate in the marginalization and alienation of minority groups that had been neglected in the former regimes. This often triggers civil unrest and hinders the development of a broad acceptance of the new constitution. Postconflict situations require other forms of early nation-building processes with deadlock-breaking mechanisms as well as other instruments of reaffirmation and conflict resolution. An agreement on general constitutional principles or a referendum at the beginning of the process may have a reassuring effect.

States may consist of different nations, and there are also multination states. The drafting of the constitution must reflect the diversity of existing traditional values and norms. Multinational fragmented societies should aim for a broad representation and a strong devolution of power to the local and regional levels.

The process of the constitutional discourse as well as the constitutional text itself should include traditional institutions, symbols, and values that highlight the deep collective identity to enhance constitutional patriotism in order to build the united nation.

In postwar societies with regime changes (e.g., Germany after World War II, Afghanistan, and Iraq in the 2000s), nation building often is regarded as a process that can be supported by external actors. This support can take place through development aid and investment in the form of resources, personal assistance, and economic contributions by the external power. Military support may also be given for the new state to maintain order in the transition period. Nation building is, however, basically an indigenous process of identity formation. The ability of outsiders to influence nation building is often overestimated. The idea of injecting certain values and concepts often fails because the development of a national identity is a long-term process. Both external hegemons and supranational institutions such as the United Nations often fail in their overconfident search for a quick solution. The new states tend to fail before they are formed.

Nation building is more successful when the external power realizes that short-term strategies are unlikely to succeed in a country with strong religious, ethnic, and economic cleavages. In such cases, the intervening external power has to identify allies that support its ideas or ideology. This process of transformation and nation building has to be supported by institutional development and new political structures. Although it is often problematic, it is crucial to remove political leaders from key positions. Nevertheless, most postauthoritarian regimes are characterized by a "pacted transition" process, where the former regime's state apparatus must be integrated in the formation process of the new nation. A strategy of acceptance of the values of the people instead of insensitive intervention seems to be more successful. National building is based on national identity as the cohesive force that holds nation-states together.

Internally, it can be used benignly and harmlessly in the nation-building process. But this ingroup solidarity encompasses the risk of outgroup hostility. In some cases, it may directly lead to external aggression. But strong nationalism also encompasses other problems. On the one hand, a strong national identity may be directed against migrants and noncitizens. On the other hand, nation building can be used as a form of repression by the majority ethnic group within the same community. This can lead to conflicts oriented toward secession. The politicization of national identities and ethnic conflicts remains a risk.

NATIONAL INTEREST

The concept of the national interest has long been central to the conduct and the analysis of state action, and particularly of foreign policy. The concept is so central because it is assumed that the notion of interest captures the motives that drive states, or their decision makers, to act. Calling it the national interest is, of course, something of a misnomer, as the interest in question belongs to the state—assumed to be a nation-state—in its interactions with other states. Governments, and specifically their foreign policy decision makers, determine the substantive content of the national interest. Although this content changes over time and varies across space, the term generally denotes the state's most important foreign policy aims, ones that require extensive resources and even, in the extreme case, the sacrifice of lives. Since World War II, national security has frequently been posited as the most salient national interest, which captures the idea that, ultimately, the primary interest of the state has to be the protection of its existence through the defense of its sovereignty and its territory.

How the Concept Is Deployed

As a concept, the national interest is both ubiquitous and divisive. It is ubiquitous because it is deployed in at least three important and overlapping ways, which serve distinct purposes. First, for scholars of international relations and foreign policy, the concept is understood to be explanatory. Scholars thus invoke the national interest to explain, for instance, why the United States entered World War II (e.g., it was in the U.S. national interest to prevent German expansion in Europe), why the United States fought the Vietnam war (e.g., it was contrary to U.S. national interests to allow South Vietnam to fall to communism), and why the Taliban had to be removed from power in Afghanistan in 2001 (e.g., it is in the U.S. national interest both to promote democracy and to fight terrorism). In this usage, the national interest is invoked causally, to explain policy decisions and the attendant state actions.

Second, the national interest can also be thought of as the language of foreign policy decision making or, more generally, of state action. It is through the notion of the national interest that foreign policy decision makers seek to determine what the aims of their foreign policies should be. The national interest thus forms the practical basis for state action in international politics. This adds a normative dimension to the concept, in that decision makers generally assume that they *ought* to act in the national interest. In the aftermath of the attacks of September 11, 2001, for example, Tony Blair's government in the United Kingdom (UK) determined that it was in the British national interest—that is, that Britain ought—to support the Bush administration's global war on terror, support the U.S. war against the Taliban in Afghanistan, and participate in producing regime change in Iraq in 2003. In this second conception of the national interest, as defined by decision makers, it provides the practical aims or goals of state action.

Third, the national interest serves a prominent legitimating function. It is routinely deployed by both politicians and commentators to justify foreign policy decisions and state actions. The national interest is a powerful rhetorical tool, which, in addressing its audience as members of a nation, asks them to agree to policies in their own—that is, national—interest. Most starkly, when states require soldiers to put their lives in jeopardy in the service of foreign policy, this is done in the name of the national interest. The national interest, on this third, rhetorical usage, thus contributes to the creation of public consent to and support for foreign policy and state action.

As several of the examples above already indicate, in addition to being ubiquitous, claims to the national interest are often divisive. This is because the actual content of the national interest is inevitably political: It depends on and reproduces differential power relations and differentially affects diverse publics. As a result, the content of the national interest is both inevitably contestable in principle and often contested in practice. For instance, the prosecution of the U.S. war in Vietnam during the Cold War precipitated mass protest as diverse publics and elites in the United States challenged the claim that fighting communism in South Vietnam was actually in their national interest. Similarly, protests in the UK since the invasion of Iraq in 2003 demonstrate that many Britons, both among the public and among elites, question whether either the invasion of Iraq or the close alliance with the United States are in fact in their national interest.

Although a variety of different theoretical approaches can and do deploy the concept of the national interest, at least two broad and distinctly different approaches can be identified. The first treats national interests in a positivist manner as objective, as given by the international system and by power relations among states. The second treats national interests in a postpositivist manner as social constructions, as socially constituted in relation to identity. These different understandings of the character of the national interest lead to divergent analyses of foreign policy and international politics.

Comparison of Theoretical Approaches

Theoretical approaches to the study of foreign policy and international relations such as both realism (and its variants) and liberalism (and its variants) treat national interests as objective and as given. Political realism provides a good example of such a conceptualization. In this approach, it is assumed that an international system made up of sovereign states is anarchic, without overarching or legitimate authority. States must therefore provide for their own security. Uncertainty about the behavior of other states means that the fundamental interest of any state must be to amass enough power to protect itself from the threat potentially posed by other states. The most basic national interest—amassing power to ensure the state's survival—is thus objectively given by the nature of the international system. Since the actual survival of states is rarely at risk, more specific national interests are determined through—read off of—the realistic assessment of objective power relations and potential external threats. In the face of a threatening powerful neighbor, for example, a small state has a national interest in allying with other states. In the face of its objective geographical location, Russia has a national interest in access to warm-water ports. In the face of a relative decline in economic efficiency, the national interest in protectionist measures increases. And in the face of international terrorism, a global war on terror becomes the national interest. In each case, the concrete national interest is given; it is determined by objective external threats and conditions. Interests, therefore, are assumed to follow from external and objectively identifiable threats and are directly accessible to policy makers and analysts alike.

Theoretical approaches such as constructivism and poststructuralism, in contrast, take a fundamentally different approach. Rather than treating national interests as objective and given, they treat national interests as socially constructed in relation to identity. One constructivist version of this argument begins with the understanding that the social world is constituted through discursive practices—that is, practices that produce social meaning, including identities, whether individual or collective. Foreign policy discourse, for example, constitutes the state as a *particular* state, constitutes the diverse identities of other states, and defines interests in relation to those identities. It was thus a particular U.S. state—constituted as democratic and freedom loving rather than, say, as aggressive and imperialist—that had the Cold War national interest in leading its allies in the free world in the grand strategy of containing the totalitarian Soviet threat. From this viewpoint, threats to states and the interests of states in the face of those threats are fundamentally matters of interpretation. Nuclear weapons provide an example. It is not the physical fact that nuclear weapons can vaporize cities that makes them threats. British, U.S., and Israeli nuclear capabilities are not interpreted in that way by many states. Nuclear weapons only become threats to, say, U.S. interests—necessitating their removal (e.g., from Cuba) or the prevention of their development (e.g., by Iran)—when their existence, or the possibility of their existence, is interpreted as dangerous because they are wielded by communists, by rogue states, or by other dangerous identities. That is, threats are socially constituted as such in discourse—they are not obvious or given. In this approach, the same is true of interests.

These two distinct approaches to the national interest issue result in divergent analyses of foreign policy and international politics. Contrasting them also highlights the inevitably political nature of the identification and deployment of the national interest within either perspective.

Briefly sketching the Cuban missile crisis of 1962 from within the first approach—of given, objective interests—highlights the deployment in Cuba of Soviet nuclear-capable missiles and the need for a U.S. policy response. On this view, the situation faced by the United States and its allies in October 1962 was one in which power relations had changed significantly. The initially secret Soviet deployment meant that the former Soviet Union now had at least 40 more nuclear weapons and that these weapons could strike targets in North and South America. These offensive missiles posed an objective threat to the United States for several (albeit debated) reasons: They altered the strategic balance; they gave the Soviet Union a military bridgehead in the Caribbean; and they provided a bargaining chip to force a settlement in West Berlin and in Germany as a whole. The U.S. national interest in response to this changed situation was indisputable: The missiles had to be removed.

Briefly sketching the missile crisis from the second perspective—that of interests socially constructed in relation to identity—provides a different analysis. This approach asks: How was this particular national interest constructed and in relation to which identities? How did the removal of the missiles come to be understood as the U.S. national interest? It examines the construction in U.S. foreign policy discourse, by both foreign policy decision makers and analysts, of a democratic and freedom-loving United States leading the free world (its allied others) in the fight against the Soviet Union (the evil, totalitarian other). In Cold War discourse, U.S. leadership was always defensive: Whether in Berlin, Korea, Vietnam, or Cuba, it protected freedom from an aggressive and totalitarian international communism led by the Soviet Union. In this context, the missiles were interpreted as necessarily offensive and the interest in their removal confirmed. However, missiles are not inherently offensive or defensive; rather, they must be constructed as such. Moreover, interpreting them as offensive dismissed from the outset Soviet and Cuban claims that the missiles were deployed legally to defend Cuba from a second Bay of Pigs invasion. But other constructions—that the missiles were annoying but legal or that they were irrelevant as the United States did not intend to invade Cuba—were in fact possible. Within this approach, the U.S. national interest in response to the Soviet missile deployment was not indisputable and might have allowed the United States to make no policy response at all.

NATIONALISM

Nationalism is one of the most difficult and contested concepts in social science. There are fundamental disagreements on its definition, origins, historical location, and normative status. This entry examines the concept of nationalism and explores these disagreements on how it should be understood.

Definition

In a very general sense, nationalism implies a strong attachment to the nation as a human collective. In the social sciences, however, it tends to be defined more strictly as the belief that the nation should form the basis for political order. At one time, it was common to define it as a movement in search of its own state or to extend the reach and power of an existing state. In recent years, it has been recognized that nationalists may pursue other forms of polity, including that of their own decentralized or federal region. Attention has also extended from nationalisms seeking to change the political order to nationalism as an everyday mechanism for sustaining the existing political order of the nation-state, as in Michael Billig's "banal nationalism."

This still leaves the question of how the nation itself is defined. For some, the nation is a politicized ethnicity, but this merely begs the equally difficult question of what an ethnic group is. Besides, whatever definition of ethnic group we use, many of them are not organized as nations nor would their members recognize them as such. There appears to be no one single characteristic that would qualify a group as a nation, be it culture, institutions, territory, or history. In many cases, indeed, the idea that a particular group is a nation is contested. There are various ways out of this conundrum. One is to divide nationalisms into different types qualified with prefixes or adjectives, but this risks losing the central concept altogether. A second is to treat the nation as bearing resemblance to a family rather than one with a single core meaning. This allows us to cope with the complexity and variety of nationalisms and to compare aspects of each, rather than forcing them into the same mold. A third way is to see the nation as a subjective category, so that if people feel they are a nation, then, they are. A fourth is to treat nationhood as a claim made both as to the existence of a group and to a set of rights that pertain to nationality, rather than as a sociological category. These central definitional problems have made it impossible to arrive at a general theory of nationalism applicable in all contexts and at all times. Most of the literature therefore looks at particular nationalisms or tries to generalize from specific cases, with decidedly mixed results.

Origins

The origins and causes of nationalism are equally disputed. It is common to place primordialists and perennialists at one extreme and constructivists and modernists at the other. A primordialist would believe that nations have their origins in essential features of humanity that are difficult if not impossible to change. Some nationalists themselves have subscribed to this view, especially in the late 19th century when biological theories of race were developing. Nationality is presented here as an essential characteristic bred into individuals. Very few nationalists and fewer social scientists nowadays would admit to being primordialists, although some sociobiologists seek to derive the nation from the human need for collectivities and the instinct for territory and mutual protection. Whatever the merits of this as a theory of human behavior, however, it can scarcely explain why communities should take the form of nations in general or of specific nations in particular. It thus fails as a theory of nationalism. Perennialists are not primordialists, in that they do not believe that nations are part of the hardwiring of the human being and rather emphasize culture and deeply ingrained social habits. They insist that nations go back a long way in time and are not as easily manipulated or rebuilt as constructivists and, especially, instrumentalists would think. They will cite the existence of things looking very like nations in antiquity and locate the origins of European nations in premodern times.

Constructivists, on the other hand, see nations as the work of human volition and interaction. Although they could logically be constructivists and perennialists, locating the construction of nations in the past, they are almost invariably modernists, insisting that nations and nationalism are the product precisely of modernization and that it makes no sense to talk of them before, at the earliest, the late 18th century. Some modernists such as Ernest Gellner are sociological and functionalist in their approach, seeking the principle of the nation in the needs of modern industrial society for literacy, communication, and mobilization and the breaking down of old barriers to social and geographical mobility. Benedict Anderson is famous for the phrase “imagined communities,” by which he meant not that nations are imaginary and somehow false but that since members of a nation cannot know each other personally, they have to imagine the collectivity (in fact, the idea had earlier been suggested by Hans Kohn). This was not possible before the invention of print media. Sociological modernists have been criticized as teleological or functionalist, seeing the function that nationalism serves as somehow explaining why it came about without specifying the mechanism or the agent, although Anderson makes more of an effort. The timing and geography are also problematic, given that some nations and nationalisms appear to have emerged before industrialization and in nonindustrial societies.

More political approaches agree with John Breuilly that nationalism is essentially a form of politics, especially modern politics. Often it is linked to mass politics and democratization. A key legacy is that of the French Revolution, which proclaimed the sovereignty of the people. This made it necessary to define the people in some way short of the entire human species, and the nation was the result. In exporting their revolution, the French invited other peoples to throw off their rulers and proclaim their own sovereignty, with the ironic result that they turned against their French liberators and forged national movements of their own.

Instrumentalists stress the role of elites, whether state rulers or their challengers, in creating nations to mobilize mass populations in the modern era. They insist that there is nothing natural about nations and that they are manufactured for specific purposes, although sometimes they take on a life of their own. While perennialists believe that it is nations that create states, instrumentalists will often stress the role of states in creating nations using the socialization tools that they possess, including control over education, the media, civic ceremonial military service, and the welfare state, to create shared identities and solidarities. Other scholars believe that either route is possible, so that we must distinguish between those cases where the nation created the state and those where the reverse occurred. Instrumentalists, in their turn, have been criticized on the grounds that nation builders need something preexisting to work with and cannot create communities of such power and durability ex nihilo.

In favor of the modernist argument is the fact that the 19th century was an era of marked nationalism. The French Revolution, which took a century to work itself out, was a profoundly national affair, and it is argued that it created Frenchmen out of the population of a dynastic state with no previous sense of popular unity. The message was taken up in Germany and Italy, where nationalism was harnessed by leaders seeking to enlarge their states and, for the first time, inviting the people into the enterprise. Across the great empires (German, Habsburg, Ottoman, Russian, and British), there was an “awakening of the nationalities” as movements emerged demanding self-government. Most of these sought a measure of autonomy within their imperial systems, but some wanted full independence; with the collapse of the empires in World War I, independent statehood seemed the only option. The problem, however, was that there were not, and could not be, enough states to satisfy all the demands being made, which were often focused on the same territories. So the nation-state principle could triumph only in restricted parts of the European continent.

Against the modernist argument is the fact that many European nations can trace their origins back to an earlier period. Adrian Hastings and Liah Greenfeld cite England as an example of early nationhood, certainly by the 16th century. Scotland, having resisted incorporation into the English Crown, was another example, complete with an early doctrinal justification for its independence. We may rightly be skeptical of the claims of nationalist historians about the antiquity of France or its continuity with earlier polities in the same region, but the French state can trace a long lineage all the same. Probably the best way of resolving the question "When was the nation?" is to tie it to the question "What is the nation?" Then, we can accept that there were indeed proto-nations in premodern times while confining the meaning of the nation and of nationalism in its modern sense to the modern era.

An effort to bridge the primordialist/constructivist and perennialist/modernist divides is the ethnosymbolism of Anthony Smith. Nations, in this vision, are built on ethnic cores or *ethnies*, which themselves are rather ancient and hard but which expand to incorporate peripheral territories, usually through the agency of the state, so creating modern civic nations. The notion of an ethnic core, however, is problematic and difficult to operationalize. The center–periphery model of nation building is a common device in macro history, but endowing the center with an ethnic element is another matter. In the case of England and then Britain (one of Smith's examples), the core, in the southeast of England, was an ethnic melting pot of Anglo-Saxons, Norman-French, and Danes. Softening the concept of ethnic group by labeling it as an *ethnie* does not resolve the essential difficulties of this concept, which seems to have no core meaning but refers to a range of traits, including language, culture, kinship, and proximity, none of which is either necessary or sufficient. Showing that modern nations had earlier predecessors does not prove the case either since there were myriad collective identities in premodern times, the great majority of which did not evolve into nations. So, like the argument about the need for community and belonging, this does not explain the modern nation in general or in particular.

Nationalist Doctrine

Nationalism has often been criticized for lacking a core doctrine or great thinkers. It is true that there have been few grand normative theories and that scholars writing about nationalism have often tended to be skeptical if not outright condemnatory, as is Elie Kedourie. It is also argued that an overall doctrine of nationalism is impossible since it is based essentially on a fiction (the existence of nations) and that it is not universalizable since nationalisms are by definition opposed to each other. There is an element of truth in this, but nationalism is no more or less constructed than other sociological concepts like class. Nineteenth-century nationalists such as Giuseppe Mazzini and Johann Gottfried von Herder did try to universalize their ideas, albeit with very limited success. The principle of national self-determination has enjoyed a measure of international support since the mid-20th century, recognized by the United Nations but tightly circumscribed to apply only to existing states or to colonial territories (by the "salt water doctrine" whereby colonies are by definition separated from the colonizer by a sea) and not to nationalist movements within consolidated states, especially when these are democracies. Beyond that, the view has prevailed that a universal doctrine right of self-determination would be unworkable, given the overlapping and competing claims and an invitation for opportunists to create their own national movements.

The doctrines employed by nationalist movements also adapt themselves to the times and to prevailing ideas of legitimacy. So in the 19th century, the concept of race was used rather freely, together with primordialist ideas since these were also being deployed by states. In recent years, many nationalist movements have sought to stress their liberal democratic credentials and the voluntarist conception of the nation as a union of citizens, in line with prevailing norms. With the collapse of the central empires in Europe, nationalism became a doctrine of separatism, inspired partly by Woodrow Wilson's apparent endorsement of the doctrine of self-determination. In the late 20th century, however, other movements adopted postsovereigntist ideas about self-determination within larger entities like federations, confederations, or supranational orders such as the European Union.

Classifying Nationalisms

Given the difficulties in identifying a core meaning or doctrine for nationalism, it is not surprising that scholars have sought to define nationalism according to different types. This enterprise has also proved frustrating for a number of reasons, not least that the concepts employed often have a strong normative loading. There is a practical distinction between the nationalism of established states and that of movements seeking to create their own states or otherwise advance self-determination claims. As noted, this underpins the international norm upholding the former but not the latter. It is less clear that this represents a difference in principle. Now that the nation-state has been demystified and its sovereignty curtailed by transnational integration, its moral and practical supremacy can no longer be taken for granted, and it must justify itself on the same principles as its challengers. A distinction is also drawn between aggressive nationalisms, seeking domination over other nations, and defensive nationalisms, seeking only to run their own affairs. This looks like both a practical and a normative distinction, but where nationality claims are entangled and overlapping, as in the Balkans, it does not always yield a definitive solution.

Perhaps the most enduring dichotomy is that between civic and ethnic nationalism. This originated in 19th-century comparisons of France and Spain and was articulated in Hans Kohn's distinction between Eastern and Western nationalisms. The former, which included Germany, were portrayed as inward looking and backward looking, defining the nation on narrowly ascriptive grounds and prone to xenophobia and aggression. Western nationalisms, by contrast, were built on the civic, territorial state, open to all within their borders and founded on democratic principles. John Plamenatz made a similar distinction between liberal nationalism developing in England and the nationalisms of continental Europe, although he mostly placed Germany on the civic side of the line. The geographical distinction has been criticized as questionable and as arising from stereotyping and is based on a border that changes with the various authors. It is easily used as an ideological justification for the Western powers to assert their superiority. The idea, however, keeps coming back. Recent authors have retained the ethnic–civic distinction while seeing examples of both in all parts of Europe. Others, such as Maurizio Viroli, have reframed the distinction as that between nationalism and patriotism. The same distinction has been tapped by differentiating inclusive from exclusive nationalism and cultural from political nationalism or from territorial nationalism. While subtly different, these distinctions are similar in tendency, and all encompass both analytical and normative elements. They have been criticized in turn on the ground that there are no pure examples of either the civic or the ethnic (or their various approximations). This objection is beside the point if the categories are taken not as a taxonomy of real cases but as ideal types, or end points on a spectrum, to which real cases approximate to a greater or lesser degree. It is, however, necessary to specify the characteristics to which these labels refer, and here there is considerable confusion.

The central distinction in all of this is between a nationalism that defines the nation by strictly ascriptive criteria (which is what ethnicity means in this context) and one that is more open and in which nationality can be acquired. The most common ascriptive criterion is ancestry, so that it is not possible for somebody to join the nation. Citizenship laws, for example, are often seen as indicators for ethnic or civic conceptions of nationhood, with *ius sanguinis* (citizenship by descent) seen as ethnic and *ius soli* (by birth in the territory) as civic. Certainly *ius soli* is more inclusive, but one can argue that both are ascriptive criteria for membership. The real question is whether people satisfying neither of these criteria can join the nation legally through naturalization and, even if they can, whether they are accepted socially as conationals. Another mechanism is culture and language, with nationalisms insisting on a particular culture said to be exclusive and ethnic. This is also not clear in practice since languages can be acquired, and in some cases, such as the United States, insistence on a single language is defended as a mechanism for inclusion of immigrants rather than exclusion; the same argument is made in Québec and Catalonia. Rather than fix on particular mechanisms, then, it might be helpful to focus on the intent of specific practices and whether, how, and whom they tend to include or exclude, accepting that any nationalism by definition includes some people and excludes others. For all these difficulties, however, there does seem to be a difference in nationalist practices in specific contexts between those that seek to unite the whole community within a given territorial boundary and subject to common institutions and those that seek to redraw boundaries and institutions to fit preexisting conceptions of community. Some national communities are open to incomers, at least in the second generation, while others are more restrictive.

Sometimes this distinction is mapped onto that between the nationalism of existing states, often assumed to be civic and inclusive, and the nationalism of component territories and groups, assumed to be ethnic and exclusive. There seems to be little justification for this other than a predisposition to existing order since nationalisms at both levels can be more or less exclusive.

The distinction is often given a strong normative charge, with civic nationalism seen as liberal and democratic and ethnic nationalism as antidemocratic. Civic nationalism is individualist and based on voluntary adhesion; ethnic nationalism is collectivist and forced. In practice, however, membership and exit from the nation is rarely a matter of individual choice, and Liah Greenfeld argues that civic nationalism itself may take individualist or collectivist forms. The concept of civic nationalism is sometimes further stretched to cover republicanism (an order based on political commitment of citizens toward the polity), Jürgen Habermas's constitutional patriotism (the idea that order can be based on support for constitutional values without an ethnic component), or even multiculturalism (the idea that the state should not impose a single culture). This is to miss the point that even civic nationalism is a form of nationalism, albeit shorn of ascriptive requirements. It may point to a single language, shared values, and socialization through state and society into a single identity, as long as these are available to all within the territory.

The Ethics of Nationalism

Nationalism has historically been associated with liberalism and the advance of democracy through popular sovereignty and with totalitarianism. It has been a force for liberation from foreign domination and for conquest. In the 19th century, John Stuart Mill advocated nationally integrated societies (through socialization rather than ethnic exclusion) as necessary for the trust that underpins liberal democracy. Lord Acton, in contrast, saw in the congruence between nation and state the potential for tyranny and preferred the multinational society with its balance of interests. The issue was reopened in the late 20th century with the debate on liberal nationalism, a concept first introduced by Yael Tamir. It was argued, in Millian fashion, that shared nationality could underpin democracy as long as it was not construed in a narrow ethnic fashion. Others noted that stateless nations could equally be the sites for liberal and civic nation building. David Miller and others have more recently rehabilitated nationality as a principle for social solidarity, so underpinning the social-democratic project and previous conceptions of socialism, which, in theory if not in practice, had been cosmopolitan. It was not clear in these writings what the exact link between nationality and nationalism is, but it was agreed that the state had a legitimate interest in promoting common identities. This idea has been widely taken up in Europe in the face of immigration and a questioning of the ideal of multiculturalism. As the state itself is challenged and demystified in the face of global change and transnational integration as well as challenges from internal communities (whether these are labeled as regions or stateless nations), it can no longer rely on the implicit normative supremacy it had in the past and, having to legitimate itself, has fallen back on the nationality principle.

Nationalist movements, whether at the state, the substate, or the transnational level, are still making incompatible claims about the proper boundaries of political community. In the present day, however, they tend to subscribe to the same principles, eschewing purely ethnic arguments and insisting on more political ones based on the right of democratic self-determination. They also tend to stress their democratic credentials, if only on the basis that they represent the "people." This is perhaps a form of ideological isomorphism as nationality claims reflect the normative principles regarded as legitimate at the time. So "race" is abandoned and "self-determination" comes in. The result, however, is once again a set of principles for defining political community that produce no determinate outcome since the claims are often competing and almost always overlapping. Some theorists seek to adjudicate among these claims based on which of them have the best liberal democratic credentials. Others regard this as presumptuous and unrealistic since there is no supranational authority to enforce such adjudications. Most observers have concluded that nationality issues can never be resolved by redrawing political boundaries. At best, they can be managed by recognizing different conceptions of the nation and of the division of political authority.

NATIONALIST MOVEMENTS

Nationalist movements are (often utopian) political campaigns to “build” nations that correspond to state boundaries. “Nation” is notoriously difficult to define, and “nationalists” often attempt to convince or force people to assume identities about which they were previously unaware of or with which they may be uncomfortable. Attempts to make nations congruent with state boundaries often fail; in many cases, such attempts result in efforts to claim national homogeneity by ignoring or oppressing other ethnic or national groups within the territory of the “nation-state.” This entry discusses problems of definition, varying historical conditions, and the continuing political relevance of nationalist movements.

Definition of Nationalism

The failure of most nation-building projects in modern history raises the question of why nationalist movements have long been so influential and, in many parts of the world, remain so today. The belief that every nation should have a state—and that every state should be a nation—has been the most widely accepted form of legitimation for modern states since the French Revolution. French nationalists themselves devoted much effort, particularly in the 19th century, to creating a common cultural and political identity, a process that Eugen Weber (1976) famously termed “turning peasants into Frenchmen.” Weber argued that popular consciousness of being part of the French nation was weakly developed in the rural areas, with elites using the school curriculum and also universal conscription to instill a strong sense of nationality in the country’s provinces.

Only a few other countries can be seen to have successfully imitated this French example of “successful” assimilation, among them Sweden and Japan. In the 20th century, this assimilationist project grew more difficult, even in venerable states like Spain. Here, substate nationalisms flourished, particularly among the Basques and the Catalans. Arguably, few nation-states were successfully created in the last century, with almost all developing countries that emerged from colonialism being multinational or at least multiethnic and multicultural states. Juan Linz and Alfred Stepan (1996) have proposed that it would be more empirically accurate to speak of “state-nations” (multicultural and often multinational) that still manage to command the loyalty of their citizens despite the lack of a homogeneous nation underpinning the state. Among state-nations there are those in which robustly politicized nationalist movements are active, such as in Belgium, Spain, or Sudan. Other state-nations, however, have managed to create a strong sense of common identity despite multiculturalism (such as Singapore, Switzerland, and the United States). Yet the belief in the necessity of nation-state building by nationalist movements persists, making the task of achieving legitimacy through the establishment of tolerant state-nations more difficult.

Nationalists mostly adhere to the "ideal" of state boundaries being or becoming congruent with the nation (for Ernest Gellner, 1983, this is *the* defining feature of nationalism). This means that from a nationalist perspective, many states are "too large," that is multinational, or "too small," so-called rump states that were formerly a part of larger states. In interwar Eastern Europe, examples of the former were the newly created states of Yugoslavia and Czechoslovakia. Cases of the latter were Austria (many Austrians then considered themselves German, developing a separate identity only after World War II) and Hungary (where many ethnic Hungarians were living outside of the state boundaries). Nation building, the attempt to make national loyalties and state boundaries correspond, thus ran into the awkward problem of ethnic minorities. Either minorities within the state stood in the way of national homogeneity, or they lived outside the boundaries of the mother state with which they shared a common nationality. These two types of minorities often overlapped with an ethnic minority in a multinational state and often were of the same nationality that was the dominant group in an adjoining country. Attempts by oversized states in interwar Eastern Europe to strengthen national identity were often perceived as discriminatory by minorities; nationalism in undersized states led to irredentist claims against (or, in the case of Austria, hopes for merger with) a neighboring state or states.

Nationalism can, thus, play a major role in undermining and discrediting democracy when the logics of nation building and crafting democracies clash. Excessive emphasis by nationalist movements on nation building encourages the rise of extreme nationalism that can doom simultaneous efforts to craft democracies. Political democracy requires the acceptance of societal pluralism. Extreme nationalism, on the other hand, claims a common interest based on shared nationality that overrides all other social divisions. When a nation-building project leads to a conflict with national minorities or with neighboring countries, it tends to create an environment in which all internal opposition is considered antinational and thus nothing less than treason. These developments break the original French connection between national identity and democratic government. When national unity is stressed at the expense of political pluralism, a democratic polity can be severely weakened or even undermined.

Stalin's notorious effort to find a definition of a nation relied on supposedly objective criteria: a people's common history, territory, language, economics, and culture. While there are nations that lack a common language (multilingual nationalities such as the Indians and the Swiss), a common religious or ethnic culture (such as the multiethnic and religiously diverse Singaporeans), or a common territory (such as those with a Kurdish identity who are spread across several states), this primordialist view remains influential among nationalists to the present day. Subjective interpretations of the nation are more plausible, at least from a scholarly point of view. Benedict Anderson famously claimed that nations are but "imagined communities" (1983/2006)—social constructions in which people imagine themselves to be part of a group. This view, in turn, has been criticized for not adequately specifying under what conditions people are likely to come to have this feeling of national commonality, which has led some scholars to combine the two perspectives.

In English and all languages derived from Latin the word *nation* is related to "being born" and "native." But the word *natio* in Latin referred to units like tribes, clans, and families, not the territorial nations we think of today. The idea that "nation" should apply only to a specific territory and a particular people is a modern idea. Thus, although much recent research has pointed to the often ancient roots of recurring national traditions (influential perennialists are Armstrong, 1982; Smith, 1995), national*ist* movements are a modern phenomenon.

Nationalism and Modernity

The relationship between nationalist movements and modernity has been a source of controversy among scholars. Ernest Gellner influentially argued that nationalism played a critical role in modernization. In the "agro-literate" stage of history, rulers had little reason to impose uniformity on their subjects. But with the division of labor in modern times, with work becoming increasingly technical, a need for cultural standardization and context-free communication arose. Nationalist movements helped provide the conditions necessary to create workforces suited to such industrial modernity, making peasants into moderns. In an age of industrialization and bureaucratization, territories became more precisely defined, with national identities used to justify state boundaries. The long conflict between Germany and France over Alsace-Lorraine saw the Germans and French each making claims on the territory based on different national narratives (the fact that the natives spoke a dialect of German was posed against the counterargument that the inhabitants identified themselves as French citizens). This national competition was also a battle over resources among rapidly industrializing neighbors.

Gellner's approach has been criticized for being overly functionalist (modernity cannot work properly without the nation), failing to account for the rise of nationalism in preindustrial societies, and being unable to account for the passions that nationalism arouses (soldiers dying willingly for their nation). But the link between nationalism and modernity is undeniable, even if it is less direct than Gellner suggests. To criticize nationalist movements thus seems to involve criticizing modernity itself. Yet this should not lead the hardships caused by nationalist movements to minority groups to be relativized. Regular media reports about state-perpetuated violations of minority groups' human rights (be it of the Uyghurs and Tibetans in China or Black, non-Muslims in southern Sudan, for example) can be linked to national movements using state power to enforce their vision of a nation-state.

By praising the nation as the most valuable identity (raising it above class, region, gender, or other identities), many nationalist movements in the 19th and 20th centuries became "secular religions." They developed complex "theologies" that stressed supposed commonalities of the "nation" while overlooking or even ignoring the territorial, ethnic, religious, and other forms of diversity their movement faced in realizing its goal of a homogeneous nation. By stressing the interest of their nation, they sacrificed the interests of other competing nationalities, leading to chauvinism, war, and often ethnic cleansing, which was seen in Europe as recently as 1990s in the Yugoslav wars.

Nationalist movements have not been ideologically exclusive, however. They have combined or formed hybrids with liberal, socialist, and conservative ideas and causes. Liberals were among the earliest advocates of nationalism in the 19th century. During the revolution of 1848, some delegates to St. Paul's Church in Frankfurt argued that everyone who lived on German territory was a German and that national identity was not determined by one's ethnic background or language but was a political organism defined through the state, making nationalism a political concept not an ethnic one. This soon became a minority position in Germany, in much of the rest of Europe, and in many other places in the world where ethnic, particularistic, and collective conceptions of the nation replaced humanistic, universalist, and individualistic ones.

Early socialist movements adopted the nationalist agenda only implicitly (but later ones, such as Mao in China and Ho Chi Minh in Vietnam, intertwined nationalism and socialism so closely that they cannot be separated in their thought and actions). Karl Marx and Friedrich Engels argued that class conflict was more important than the differences between nations. Yet they still supported several nationalist movements against oppressive empires (particularly struggles against the Russian and the Habsburg empires but also the Irish independence fight against the British). But Engels, in particular, suggested that only "great, historic nations" would survive into the modern world, advancing the cause of socialism, while smaller nations would be counterrevolutionary, doomed to wither away. An important exception to the chauvinist orientation of many socialist thinkers behind a façade of internationalism was the Austro-Marxists. In 1907, Otto Bauer advocated a program of "cultural–national autonomy" to lessen tensions between nationalities in the Austro-Hungarian Empire, a multinational territory under Habsburg rule while maintaining the solidarity of the working class. Rather than repudiating nationalism, he advocated that socialists should embrace national differences and work to allow the flowering of each national culture in a socialist state. Bauer's tolerant, state-nation approach drew contempt from Lenin and other orthodox Marxists, foreshadowing the dogmatism and oppressiveness of the Soviet Union in regard to national minorities. Benito Mussolini was a socialist who became a fanatical nationalist during World War I. While he was disavowed by the socialist movement, he had exploited the chauvinist side of many socialist thinkers to create what became known as *fascism*. The fanaticism of the Khmer Rouge in Cambodia, who perpetrated one of the worst mass murders in the post–World War II period, was fueled by a deadly mixture of socialism and nativist nationalism.

Initially, conservatives were the slowest to recognize the potential power of nationalism for their political purposes, instinctively fearing the mobilization of the masses. But when they did make this discovery, the consequences were often terrifying. Militarist Japan in the 1930s and early 1940s is one well-known example. While Japanese propagandists justified their country's conquest of much of Asia through a vague notion of Pan-Asianism, a sense of national superiority and a corresponding contempt for other nations underlay this aggression, creating lasting bitterness toward Japan in the region, up to the present (not helped by the unwillingness of some Japanese conservatives to acknowledge the country's war crimes). National intolerance reached its pinnacle under Nazi rule in Germany and their conquest of much of the rest of Europe during World War II. Although the Holocaust has been attributed to the Nazis' racist ideology, nationalist appeals were key to mobilizing initial support for National Socialism in Germany.

Following the famous historian Friedrich Meinecke who distinguished between state and cultural nationalism, the great scholar of comparative nationalism Hans Kohn (1944) made a distinction between the earlier universalist French nationalism that was a product of the Enlightenment and the later particularistic German, Russian, and Eastern European nationalism that stressed cultural particularism. In a more recent effort that draws on Kohn's insights, Liah Greenfeld (1993) has argued that nationalist movements have followed different "routes to modernity." Individualist and civic nationalism arose first in Britain and the United States; then, collective but civic nationalism took hold in France; and finally collective and ethnic nationalism shaped the politics of Russia and Germany. Ethnocollectivist types of nationalism tend to be authoritarian, with a high degree of inequality between nationalist elites and the disempowered masses. In short, efforts to create a nationally defined people have been compatible with democracy in the more individualistic, civic versions of nationalist movements. In other cases, however, nationalist movements that have appealed to collective, ethnic identities leave little room for individual rights, including those of ethnonational minorities.

Contemporary Nationalist Movements

One disturbing recent development among nationalist movements has been the rise of citizen groups accusing the state of insufficiently upholding the national interest. Whether it be in China where nationalist "netizens" have used the Internet to attack the Communist Party's supposed weak pursuit of the national interest (particularly vs. Japan), in Thailand where for domestic political reasons "yellow shirt" protests reopened a border dispute with Cambodia that was long thought to be resolved, or among Buddhist nationalists in Sri Lanka demanding stronger action against Tamil rebels, such societal nationalism has increased internal and external conflicts and made nationalism more extremist. As discussed above, this is highly unfavorable for an existing democracy or for democratic transitions in the future. Such civil societal nationalism has also weakened government efforts to harness nationalism to issues such as national development as this risks allowing societal groups to seize on it to accuse the government of being insincere in its commitment to "genuine" nationalism.

The countries of the European Union (EU) have prided themselves on defusing the impact of rival nationalisms within their community. Post–World War II reconciliation between Germany and France, in which competing nationalisms led to a bloody rivalry between these two European powers, was a crucial milestone. But the postnationalist age that many European politicians have hoped for has yet to dawn. National interests still strongly drive the behavior of European community countries; on the periphery of the EU, Greek nationalism continues to clash with Turkish national claims. Yet Western Europe has arguably come furthest in healing the old wounds inflicted by nationalist movements. By contrast, Eastern Europe (where the short war between Georgia and Russia in 2009 showed how such tensions can quickly erupt into war) remains a region full of nationalist conflicts despite the end of the Yugoslav war. In Black Africa and Latin America, by contrast, nationalist-based conflicts have subsided on the whole (with the exception of a continuing ethnic-based civil war in Sudan and recent nationalist tensions between Venezuela and Colombia). In the Middle East, the age of Pan-Arabism has passed (which reached its peak during the 1960s), with Arab nationalism now focused on the Palestine conflict with Israel. A series of Arab regimes originally legitimized by national movements that seized power, such as Nasserism in Egypt, have lost legitimacy as economic performance declined, with Islamist groups such as the Egyptian Muslim Brotherhood replacing nationalists as the strongest source of opposition. In South Asia, nationalist tensions between Pakistan and India remain high, with the dispute over Kashmir a perennial source of conflict. In Sri Lanka, a decades-long civil war recently ended with the defeat of the Tamil Tiger rebel group, but reconciliation still seems far off as there is little indication that the victorious majority Sinhalese are willing to take the key steps necessary to make the country more tolerant toward the Tamil minority. In Northeast Asia, conflicts over disputed islands (as well as the wounds left from the experience of World War II) between China and Japan remain a major source of potential conflict as does the ongoing dispute between China and Taiwan, with the former warning that it will invade if the latter declares independence (as some Taiwanese nationalist activists nonetheless wish to do). In Southeast Asia, the military government in Burma/Myanmar has reached accords with most rebel groups representing non-Burman nationalities after a long-running civil war, but these were based on its own despotic rules, not a genuine spirit of accommodation. Indonesia appears to be a contrasting case: Releasing East Timor (Timor-Leste) into independence in 2002—and overcoming ethnic conflict in the immediate aftermath of the overthrow of the long-ruling dictator Suharto in 1998—has helped this country, the world's largest archipelago state, to become the most stable democracy in the region.

But nationalist movements will continue to thrive in areas in which inhabitants feel oppressed. In this sense, nationalism retains its liberationist impulse that it so famously developed during the French Revolution but also, for example, in the Greek struggle for independence from the Ottoman Empire in the 19th century. One of the paradoxes of modern nationalism is how progressive causes in opposition to ruling empires often degenerate into new forms of political oppression once control over the state is achieved. Here, the experience of the countries of the former Soviet Union and Yugoslavia is instructive. Nationalist movements were at the forefront of opposition to (post)totalitarian states. Once these multinational autocracies had collapsed, however, the new nation-states that replaced them often proved to be intolerant. The war in the former Yugoslavia along ethnonational lines is only the most extreme example, with Serbian nationalists justifying war in the name of greater Serbia (Croatian nationalism was less destructive only because its state power was weaker). But in the Soviet Union, even some of the most enlightened, democratic countries—the Baltic states of Estonia, Lithuania, and Latvia—have, sometimes openly but often covertly, discriminated against their ethnic Russian populations. Ethnic heterogeneity remains the specter that haunts many states claiming to be homogeneous nations.

NATURAL LAW

The notion of "natural law" is a prime and enduring one in the Western philosophical and political tradition. In antiquity, the doctrine of natural law was based on a conception of nature as a primary ordering force in which every being was ascribed a place. In contemporary times, the doctrine has been reformulated under the guise of "natural rights," meaning that laws should respect inherent human values. Such a multimillennium history could not but entail major variations over time in the meaning, the purpose, and the place of natural law. For this reason, any comprehensive approach to it must make room for the remarkable permanence of some traits of what is called natural law as well as for dramatic changes in its object and definition.

For the Greeks and then the Romans, who crafted the notion of natural law in a doctrine sometimes referred to as *jus naturalism* (from the Latin, *jus naturale*, which means natural law), the concept of law—*nomos* in Greek and *lex* in Latin—is grounded in a cosmological perspective according to which the universe is organized on a definite pattern that everyone has to follow. Such a conception extends its reach far beyond the realm of humanity and embraces animals and even the inanimate. In Aristotle's perspective, for instance, the natural place of a stone is the ground where it stays naturally, while in any other place it would fall. Such is the case with human beings. The city is organized through natural ties of subordination and exchanges, and laws should respect nature in the social bonds thus dispatched. The minutiae with which Plato in *The Republic* or in *The Laws* and Aristotle in his *Politics* describe under which conditions—of climate, population, relations between sexes, and so on—a successful city can thrive reflects a general preoccupation. This establishes the good law as the one respecting natural conditions, which range from the demography of a city to the actual ties of subordination between men and women, free citizens and slaves, and classes in society.

Despite pretensions to the contrary, ancient conceptions of natural law did not form an actual coherent body of doctrine. Authors were keen on disputing what was according to nature or against nature; while the principle of natural law was well established, what it tangibly meant was open to continual discussion. There is probably not a single law, rule, or moral obligation of the antique world that has not been submitted to critical scrutiny and challenged or reasserted on the grounds of what is natural or not: The precedence of family duties over city laws (as is the case in the famous Antigone myth, where Antigone refuses to obey her uncle, the local tyrant, who forbade the proper burial of her brother, but also as in Plato's dialogue, *Euthyphro*, where Socrates critiques a son suing his father for the death of a murderer), the issue of slavery (whether it is natural or not, and under which circumstances, was a constant debate), the question of appropriate leadership (who is the natural leader in a city?), the separation of classes, or what it is proper to do or not do—all these could be subjected to dispute in the name of nature.

As Leo Strauss contended, these continuing and multiform disputes over what is against or according to nature supposed that nature was an object of inquiry in an exercise of reflection and dialogue akin to philosophy. Natural law, to that extent, favors the exercise of personal critical reason by insisting on the fact that human beings should not be forced to comply with rules that are repugnant to reason. As Cicero put it in a famous sentence of the third book of his *De Republica*:

> There is a true law, a right reason, conformable to nature, universal, unchangeable, eternal, whose commands urge us to duty, and whose prohibitions restrain us from evil. Whether it enjoins or forbids, the good respect its injunctions,

> and the wicked treat them with indifference. This law cannot be contradicted by any other law, and is not liable either to derogation or abrogation. Neither the senate nor the people can give us any dispensation for not obeying this universal law of justice.

Natural law conforms to reason because it is discovered by reason and satisfies the demands of reason, which, in its turn, is nothing else but the discovery of the preexisting order of nature.

Quite surprisingly, considering how intimately it was initially linked to a pagan conception of the world, the doctrine of natural law found its place among Christian conceptions. Theoretically, though, the development of Christianity constituted a deadly challenge to this doctrine. For Christians, nature is no more than a creation of God, who is the ultimate reason and sense of the world as the Gospel of John bears it: "All things were made by [God]; and without him was not any thing made that was made" (1:3). Nature as "all the things" is second to God's decision to create it. Far from representing the achieved order of the world, nature is flawed with imperfection since only God is perfect. There is worse: This imperfection means that nature can be regarded as the source of sin. For thinkers like Augustine (354–430), the fact that nature in man is marked by the fate of death is a testimony to its corruption and sinful condition from which only redemption beyond the natural condition of humanity can save us.

Despite this potential tension, the cultural context in which the primitive church developed was so strongly influenced by classical theories that the reference to natural law was spontaneously maintained, as shown, for instance, in Paul's Letter to the Romans: "Sometimes [Gentiles, i.e., non-Jews or pagans] do naturally what the law orders. So they have a law in themselves, although they do not have the law" (2:14). Obviously, the law of God may be followed out of a "natural," inner sense of good and right, thus bridging the gap between revelation and natural law. Centuries later, in a major integration of natural law in Christian conceptions, Thomas Aquinas (1225–1274) develops the point in his *Theological Summa* (Part 1, Question 91): Natural law is the "participation" of the rational creature—man—in the law of God, and reason is thus the way to participate in divine law through natural law. Far from disqualifying it as a model of law, creation establishes nature as God's order in the world and must be followed by men.

The absorption of the conception of natural law inherited from the pagan past in Christian doctrines did not stabilize a consensual understanding of it but elicited new questions eventually provoking a divide sometimes referred to as the opposition between two conceptions of *jus naturalisms*: classic and modern. One key element has been a radical transformation of the meaning of "nature," progressively denoting the inscription of nature in man and no more the insertion of man in the whole order of the universe. Illustrating the evolution in his *Spirit of the Laws*, Baron de Montesquieu (1689–1755) states that "the laws of nature are the laws that derive from our constitution." Natural law, which the ancients considered as part of a cosmology, has become the outcome of a new anthropology insisting on the value of the individual and his personal relation to nature.

Spanning centuries, the transformation of natural law eventually acquired a definition during the Enlightenment, when natural law slowly made room for a conception of individual natural rights, which led to the declarations of the American and French revolutions in 1776 and 1789. The causes and the forms of this revision of the sense of "natural law" are many. It has long been considered that the change occurred briskly in the 18th century. Modern historiography tends rather to agree on an evolutionary process originating in the Middle Ages, with William of Ockham (1285–1349) being often, though controversially, cited as the instigator of this development in the wake of the work of the French historian of law Michel Villey (1914–1988). But it is certain that in the 18th century, natural law eventually came to mean that laws must respect equality and freedom in men (the issue of women was debated), which are considered to be natural features of humanity. This is what the notion of "rights" grants, despite infinite variations over centuries in the definition of these rights among modern and contemporary authors—no less keen in the modern age on discussing natural rights than their ancient predecessors had been on disputing over what is natural or not.

Beyond historical fractures, *jus naturalism* rests today on a fundamental set of convictions regarding the essence of law, the first one being that laws are not arbitrary. Opposing positivist juridical conceptions, which assert that a law is no more than a norm regarded as legal, *jus naturalism* is a reminder that masses could be massively unjust, and the will of the prince or the leader can be detached from any common sense of justice. The theme of natural law thus assumes a normative role as well as a critical one. On the normative side is the idea that nature commands certain actions and forbids others: The appeal to natural law can serve the purpose of justifying laws or justifying the call for new laws by considering them as requisites from nature. By the same token, the reference to natural law also represents a powerful critical tool to contest the validity of laws that would appear to go against nature. This is the basis of one of the most important features in *jus naturalist* conceptions: the distinction between natural law, which is the source of justice, and conventional laws—the laws of a collectivity—which, in the best cases, obey or translate natural law but in the worst situations may well violate any natural sense of justice.

In all its conceptions, natural law addresses the fundamental paradox in human laws, whether understood in a specifically legal or in a broader moral sense. On the one hand, norms vary greatly: What seems "natural" to one human group might well be considered deviant or even strictly forbidden in another one. On the other hand, rules are often felt to be "natural" by their followers, a fact that gives way to uncertainty or bewilderment when they are challenged by the existence of other potentially contradictory rules. To that extent, obedience to rules corresponds to a natural sense of justice. For centuries, the notion of natural law has translated this sense in the theory of law.

NATURAL RESOURCES

A natural resource can be defined as a feature of the natural environment that has some sort of economic, cultural, aesthetic, ecological, or spiritual value. The study of natural resources in political science is ultimately about how such—often conflicting—values are managed and distributed by political actors, communities, organizations, bureaucracies, and countries. After a brief historical background, the remainder of the text reviews current research themes in the study of natural resource management. The concluding paragraph offers some thoughts about emerging research trends.

The History of the Study of Natural Resource Management

Although natural resources and politics have been intimately connected throughout the history of human civilization, a politics of natural resource management in a modern sense did not appear until the 1960s. The "discovery" of a wider set of environmental problems brought with it a growing realization that many natural resources were being exploited in ways that rapidly undermined their future existence. Out of this realization came the perhaps single most influential article ever published in the field of natural resource management: Garrett Hardin's 1968 *Science* article, "The Tragedy of the Commons," has had a substantial and long-lasting impact on how problems of natural resource management are conceived of and theorized. By modeling the usage of jointly owned natural resources—the commons—as a collective action problem, Hardin argued that finite natural resources that were jointly used would eventually be exhausted. Since no single resource user has an incentive to limit his or her outtake from the resource, the resource would soon suffer from overexploitation. Because most natural resources are collectively owned, Hardin's prediction was that the world's natural resources were on the brink of depletion, unless they could be brought under either private or governmental ownership.

The situation described in the "Tragedy of the Commons" continued to be the mainstream model for understanding interactions between society and natural systems until the next seminal work in natural resources management appeared in 1990. Elinor Ostrom's path-breaking classic *Governing the Commons: The Evolution of Institutions for Collective Action* built on the fundamental problem of jointly used resources and the resulting overutilization assumed by Hardin but argued that the depletion of the resource was not an unavoidable outcome. One of Ostrom's core contributions is the conceptual distinction between common property (resources owned jointly) and common pool resources (CPRs—resources that are highly subtractable and have high exclusion costs associated with them). Relying on evidence from multiple case studies and game theoretical models, Ostrom pointed out that natural resource users may solve the commons dilemma through self-organizing institutions that regulate access and resource extraction activities. However, simply setting up an institution is not a panacea for the problem of sustainable natural resource management. Since the very act of constructing an institution is a collective action problem in itself, creating the institution in many cases poses an insurmountable challenge. Moreover, even with the institution in place there is still a large amount of variation in how well different types of institutional configurations are able to achieve sustainable resource use. Factors such as power asymmetries and levels of trust among users, the ability to control access to the resource, whether or not resource units are easily distinguishable, and the degree of volatility in the resource system itself are all highly influential factors for successful management.

The combined legacy of Hardin and Ostrom has securely placed the study of natural resource management in an overall theoretical and methodological framework of rational-choice institutionalism. Most of the work that followed in the wake of *Governing the Commons* can be placed within this paradigm, as also a good deal of the policy recommendations that were based on the findings from CPR studies. Moreover, most contemporary work in natural resource studies has retained many of Ostrom's core notions, such as the pivotal role of institutions and the importance of considering the characteristics of the resource itself.

Contemporary Directions in Natural Resource Management

At least two broad themes can be discerned in contemporary research on natural resource management. The first theme emphasizes the inherent complexity of natural resource systems and argues that this precludes any strong notions of actually governing natural resources. Complete and exhaustive knowledge about the dynamics of a given ecosystem is simply beyond the reach of scientific inquiry, and it is therefore not possible to govern resource systems based on rationalistic and exact templates such as sustainable yield or carrying capacity as these concepts can never be estimated in any precise sense. As a consequence, new management paradigms such as adaptive management or adaptive comanagement are put forward as necessary readjustments of how natural resources should be governed. Such management approaches typically stress the role of learning, innovation, local knowledge, stakeholder participation, and flexibility as core virtues of resource management. There is also a tendency to view policy making as trial and error or as a constantly ongoing experiment, rather than as the pursuit of specific predetermined goals. Critics argue that adaptive management and adaptive comanagement are built on overly optimistic assumptions about the effect of stakeholder involvement, self-organization, and participation in policy making, while downplaying problems such as power and resource asymmetries and the need for accountability and predictability of public policies.

The second theme problematizes the dichotomous conception of nature and society—in which the latter governs the former—by arguing that ecological systems and social and political systems in reality are highly interlinked, constituting so-called social–ecological systems. The social–ecological systems view of natural resource management proposes that rather than studying the effects of social organization on natural resources, analyses must be based on the realization that society and nature are locked into coupled causal relationships, which means that they cannot be studied in isolation from each other. Closely linked to this approach are studies concerned with issues of adaptability and vulnerability. Against the backdrop of ongoing processes of global environmental change, such as biodiversity loss and climate change, scholars in this area seek to understand how the vulnerability of people situated in different social–ecological systems can be reduced through processes of adaptation to novel circumstances.

Comparative and International Perspectives

Due to the strong emphasis on understanding linkages between institutional factors and natural systems, most empirical studies of natural resource management tend to take the form of comparative case studies of small or medium-sized CPRs. There is, however, a smaller subset of large-*N* comparative studies in which nation-level political factors are used to explain cross-national variation in natural resource management performance. An example of a widely discussed topic is the impact of corruption on natural resource management. Some studies have identified a negative effect of corruption on indicators of natural resource management, whereas other authors argue that corruption obstructs more effective resource exploitation.

Studies of the effect of democracy on natural resource management show a similar pattern: Some studies assert that stronger and more encompassing democratic regimes generally perform better in managing and protecting their natural resources, while other studies claim that democracy, due to its intimate relationship with market economies and the need for sustained economic growth, inevitably leads to mismanagement of natural resources.

The effect of decentralization has also been studied in a comparative perspective, focusing on the issue of a possible race-to-the bottom effect of reforms aiming at a more decentralized management of natural resources. Some studies support the existence of such an effect, whereas others argue that there is a race to the top.

A further topic of comparative natural resource management has to do with the relationship between the market economy and nature. The key notion is that the relationship between market economy and resource degradation, when viewed over time, can be thought of as an inverted U-shaped curve. Economies in the early stages of industrialization rely heavily on the extraction of natural resources for growth generation and therefore have a large impact on ecological systems. This phase of economic development is also marked by the use of inefficient and crude technologies that contribute to further environmental damage. This relationship between nature and economy persists until a certain point of economic wealth is reached, beyond which the curve starts to slope downward. In this new phase, economic growth is increasingly generated through the production of services and the development of new technologies, which lessens the need for extraction of crude natural resources. In addition, some scholars have argued that people in more affluent societies start to value things other than material wealth, a process that again serves to weaken the relationship between economic growth and environmental degradation. The environmental Kuznets curve theory (according to which environmental degradation increases while a country is developing but decreases as the GDP rises) has not gone unchallenged, and some argue that it is only valid for a smaller class of end-of-pipe type of emissions, whereas other negative impacts on natural systems such as biodiversity loss, carbon dioxide emissions, and the spread of toxins follow the level of economic development in a roughly linear fashion. Another criticism holds that the environmental Kuznets curve theory might be less applicable to currently developing countries due to their access to already available clean technologies.

As many natural resources are located on regional or even global scales (e.g., migratory birds, sea mammals, and global fish stocks), the politics of natural resources is also to be found in the international arena. A central concept for many scholars studying international natural resource politics is that of environmental regimes. This concept is similar to the concept of institutions in CPR studies but is normally used in studies of how international treaties and organizations influence the behavior of actors in the international environmental arena.

Research in this field has focused on understanding mechanisms underlying regime effectiveness as well as on how regimes are constructed and evolve over time.

Emerging Themes in Natural Resource Management Research

A number of significant themes are currently emerging in natural resource management research. An already ongoing shift is the gradual move away from the institution as the central unit of analysis. Instead, theoretical models and research designs are increasingly framed in terms of systems theory or, more specifically, in terms of socioecological systems. The heightened interest in how social–ecological systems are able to adapt to novel circumstances caused by global environmental change in turn tends to play down focus on action problems related to natural resource management. This redirection also signals a renewed interest in complex systems theory as well as in notions of resilience in social–ecological systems. Another topic of recent debate concerns methodologies in CPR research. The dominance of qualitative case study methods has recently been complemented with more quantitative methods, including systems modeling and social network analysis. A final emerging theme in natural resource management research relates to ongoing shifts toward more governance-oriented forms of policy making, which is likely to have wide-ranging repercussions for the way in which natural resources are governed.

NEO-CORPORATISM

Corporatism is an idea that has been present in political and social life for at least 9 to 10 centuries. Its origins are indisputably European and related to differing conceptions of how the Roman Catholic Church and medieval cities should be governed. Its popularity, however, has had an erratic fate—both as a practice in political life and as a concept in political theory. It has been heralded as a novel and promising way of ensuring harmony between conflicting social groups, and it has also been condemned as a reactionary and antidemocratic formula for suppressing the demands of autonomous associations and movements. In other words, corporatism has always been politically controversial and conceptually ambiguous. There is no better evidence for this than the frequency with which it is so often preceded by contradictory qualifying adjectives or prefixes: state or societal, liberal or authoritarian, archeo- or neo-, Catholic or secular, macro- or meso-, voluntary or compulsory, social democratic or conservative, and, most recently, national or supranational.

The Sites of Neo-Corporatism

After the defeat of fascism in Italy, National Socialism in Germany, and various other authoritarian regimes that flourished in Europe during the interwar period (1919–1939)—almost all of which claimed to be practicing some form of corporatism—the concept disappeared from the lexicon of respectable political discourse, except in Franco's Spain and Salazar's Portugal, where the practice was left anachronistically on display until both countries transitioned to democracy in the mid-1970s.

At almost the same time, scholars from several countries and academic disciplines revived the concept to describe certain features of the politics of advanced democratic polities that did not seem adequately accounted for by the dominant model that had been applied to state–society relations—namely, pluralism. Austria, Finland, Norway, Sweden, and tiny Luxembourg were singled out as archetypical "neo-corporatist" countries that had become deeply penetrated by this type of interest politics since the end of World War II. Important traces of its practice on a less centralized or more erratic basis have been observed in the politics of Belgium, the Federal Republic of Germany, Denmark, the Netherlands, Switzerland, and even in postauthoritarian Portugal and Spain. Great Britain and Australia have attempted to establish similar arrangements without success. Elsewhere among the advanced capitalist democracies, neo-corporatism seems confined to specific sectors (especially agriculture). The United States, Canada, and New Zealand, for example, have never even tried to practice it at the macro or national level; France has only resorted to it in exceptional circumstances, as an emergency (and short-lived) measure.

At the core of this variation in practice were two political prerequisites. Unless they were simultaneously present (and this was a relatively rare occurrence), neo-corporatism in its most centralized and effective form would not emerge: (a) a relative balance of class forces between capital and labor and (b) an active disposition by state agencies to promote it. War and its aftermath provided one favorable context, as did the proto-revolutionary situation induced by protracted economic depression. Social-democratic or socialist party dominance in government, especially without serious competition from far left communist parties, was another. Both of these contributed to overcoming a major impediment—namely, the reluctance of capitalists and their associations to participate in and to be bound by such arrangements. Only when the alternative pluralist course of action was not viable did they embrace neo-corporatism and even willingly seek to exploit it to their benefit. Once these constraints waned, as both did in the 1970s and 1980s in Western Europe, so did neo-corporatist policy making—usually due to the defection of business interests. Neither the relative balance of class forces nor the simultaneous success of left-wing parties characterized North America or the countries of the White Commonwealth as much and, hence, its almost complete absence in the United States, Canada, Australia, and New Zealand—except, interestingly enough, for a brief flirtation with something like it during the American New Deal.

Definitions of Neo-Corporatism

While corporatism has been defined as an ideology, a variant of political culture, a type of state, a form of economy, or even as a kind of society, the most productive approach has been to consider it as one of several possible arrangements through which organized interests can intermediate between their members (individuals, families, firms, communities, groups) and various interlocutors. Representatives of capital and labor were initially assigned the most prominent role, although more recent versions have extended participation to include representatives of other interests such as women, consumers, environmentalists, neighborhoods, youth, and so forth. Agents of the state or government are omnipresent in such arrangements but usually in a facilitative rather than a protagonistic role. They may or may not be overtly present at the table, but those who are there know that legitimate coercion may be necessary for implementing the agreements they reach and may be brought to bear if they fail to reach a consensus. Central to all these negotiating processes in the contemporary context is the role of class, sectoral, or professional associations, permanently established and staffed, that specialize in identifying, advancing, and defending the interests of their members by negotiating agreements directly with organized representatives of conflicting interests and/or by influencing and contesting the policies of public authorities. Unlike political parties—the other principle intermediaries in modern polities—these organizations neither present candidates for electoral approval nor accept overt responsibility for forming governments.

The definition of modern corporatism that initiated much of the contemporary discussion is that of Philippe Schmitter (1974):

> A system of interest representation in which the constituent units are organized into a limited number of singular, compulsory, non-competitive, hierarchically ordered and functionally differentiated categories, recognized or licensed (if not created) by the state and granted a deliberate representational monopoly within their respective categories in exchange for observing certain controls on their selection of leaders and articulation of demands and supports. (pp. 93–94)

This approach emphasizes almost exclusively the input side, that is, the organizational structure of interest associations. Gerhard Lehmbruch (1979) defined what he called "liberal corporatism" more from the perspective of decisional outputs as

> an institutionalized pattern of policy-formation in which large interest organizations cooperate with each other and with public authorities not only in the articulation (or even "intermediation") of interests, but—in its developed forms—in the "authoritative allocation of values" and in the implementation of such policies. (p. 94)

As Alan Cawson (1986) and Peter Williamson (1985) note, subsequent definitions tended to combine both the input and output dimensions, and it became virtually axiomatic that successful neo-corporatism required their coincidence. Only where the interests involved were organized hierarchically into monopolistic and comprehensive associations was it thought to be possible to reach and to implement voluntary agreements on such crucial matters.

The Success and Failure of Neo-Corporatism

Once the authoritarian-fascist-statist variety of corporatism had been virtually extinguished—first, by the post–World War II wave of democratizations and, later, by the post-1974 one—it became increasingly clear which were the polities most successful in practicing the "societal" version of neo-corporatism: small European countries with well-organized, relatively centralized class-based associations and highly vulnerable, internationalized economies. The tendency was all the more marked if they also had strong social-democratic parties, stable electoral preferences and ruling coalitions, relative cultural homogeneity, and neutral foreign policies. Indeed, those that had the most difficulty sustaining such social pacts had weaker social democracies, more volatile electorates, and deeper divisions over military and security issues, for example, the Netherlands and Denmark. Belgium's relative lack of success in reaching such voluntary macrosocial contracts could be traced to its division into rival linguistic groups.

In retrospect, it became clear that neo-corporatism had reached its apex more or less at the very same time when it was discovered and labeled as such by social scientists. During the rest of the 1970s, the 1980s, and well into the 1990s, its practice seemed to be in irrevocable decline. A number of knowledgeable scholars, such as Scott Lash and John Urry (1987) and Mark Gobeyn (1993), even declared it defunct on the grounds that "post-Fordist" systems of production, the decline in political commitment to full employment, the demise of Keynesian economics, the rise of neoliberal ideology, and the growing weakness of trade unions—not to mention the growing significance of globalization and Europeanization—all conspired against its viability. When Swedish capitalists noisily withdrew in 1991 from all policy-making instances they shared with organized labor, its death warrant was thought to have been issued. Prior to this—and for a period stretching back to the late 1930s—Sweden was rightfully regarded as the archetypal practitioner of neo-corporatism.

The Resurgence and Transformation of Neo-Corporatism

And then, just as it was supposed to disappear altogether, neo-corporatism dramatically reemerged toward the end of the 1990s, leading at least two observers to predict that maybe neo-corporatism was a cyclical product related to the vicissitudes of capitalist performance and the public's shifting involvement with public and private goods and, hence, destined to revive—Sisyphus like—every 20 to 25 years or so, only to fail again at the end of a similar period. European integration, which had been considered a negative factor because it tended to impose a neoliberal bias on policy making and reduced the degrees of freedom available to national politicians, suddenly became a positive factor as a series of countries used neo-corporatist mechanisms to prepare themselves for entry into the Euro zone and to improve their competitive advantage when other policy alternatives had been eliminated. Scholars competed with each other to explain why policy concertation and tripartism had again become so appealing (Giuseppe Fajertag & Phillipe Pochet, 1997).

Closer observation of this revival would reveal some important differences. In a few cases, it involved reanimating tripartite bargaining arrangements that had existed in the recent past with the participation of more or less the same actors. The Netherlands, Denmark, and Finland were cases in point; even in the much trumpeted case of Sweden, elements of neo-corporatism seemed to have crept back into its policy practices at a lower and less visible level of aggregation, especially after the return of the Social Democrats to power. What was definitely novel, however, was its emergence in countries that had either not practiced it at all or done so on an erratic basis. Moreover, the participants in these cases (Ireland, Italy, Spain, Portugal, and Greece) were not organized "properly" according to prevailing theory. The associations representing capital and labor in these negotiations were often weak in membership density, poorly coordinated at the national level, fragmented into competing ideological units, and manifestly less capable of ensuring the compliance of the firms and individuals in their respective categories. And, in some instances, the old tripartite formula gave way to a multipartite one in which representatives of other social interests (and even passions) were allowed to sit at the table: agriculturists, feminists, consumers, environmentalists, local governments, youths, and other assorted groups of "policy takers." As if this was not enough, the subject matter being negotiated was less focused on inflation, wage contention, social peace, and redistributive side payments than with things such as restructuring welfare systems, introducing more flexible work procedures, reducing national budget deficits, improving competitiveness at the sectoral or plant level, meeting environmental standards, and ensuring gender equality. And agents of the state played a much more active and visible role in convoking these negotiations and pressuring the participants to reach agreement. Increasingly, they were even prepared to decree the results and make them publicly binding when faced with dissent, especially by trade unions.

The change in policy content may explain why neo-corporatist policy making could produce results after the revival of the 1990s without the collaboration of neo-corporatist interest intermediaries. The growing imbalance of forces between capital and labor due to globalization had already put the latter on the defensive and, therefore, more likely to agree to negotiate in retreat in defense of existing jobs, wages, and benefits under the impending threat of "delocalization." It may also have lessened their opposition to including new participants on the grounds that farmers, consumers, and environmentalists might prove to be allies on specific issues. But the real difference has involved the increased role of firms and state agencies. The burden of implementing most of these "new" policies no longer rests on the autonomous capacity of class associations to deliver the compliance of their members. Many are only "recommended standards" or "voluntary guidelines" at the macro or meso levels, and their implementation is largely at the discretion of individual enterprises or plant-level works councils at the microlevel. Also, those that are intended to be binding on all those affected can be imposed by the government through "legitimate coercion." This has become much more credible since the convergence in programs and policies between Right and Left parties ensures that these policies will not vary with rotations in power. The former association of neo-corporatism with social-democratic or left-center governing coalitions has become less relevant. Indeed, analysts have argued that it has either become indifferent to the party in power or that it is the favored practice when weak, multiparty coalitions rule, on the grounds that, under such centrist governments, neither capital or labor can rely on especially favored treatment by the legislature or the executive, and therefore they have to resort to the second-best alternative of negotiating compromises.

So substantial have been these changes to the practice of neo-corporatism since the late 1990s that it is certainly legitimate to question whether the same label should be attached to it.

The Performance of Neo-Corporatism

Protracted neo-corporatism at the national or macroeconomic level has been convincingly linked to certain desirable outcomes during the post-war period until the mid-1970s: less unruliness of the citizenry, lower strike rates, more balanced budgets, greater fiscal effectiveness, lower rates of inflation, less unemployment, less income inequality, less instability at the level of political elites, and less of a tendency to exploit the "political business cycle"—all of which suggested that countries scoring high on this property were likely to be more governable. Subsequent econometric studies with more recent data have questioned these findings, and no one has ever been able to show that neo-corporatist systems have been capable of higher rates of economic growth. In the turbulent times at the end of the 1990s and at the beginning of this century, as we have noted above, policy concentration among social classes, sectors, and professions has shifted toward matters such as improving productivity, encouraging worker flexibility, and reforming welfare systems.

Regardless of its effects on the economy and society, neo-corporatism has long had an ambiguous and contestable relation to the polity—especially with regard to democracy. From its rediscovery in the mid-1970s, corporatism has borne the burden of its past association with fascism and other forms of authoritarian rule. To describe a polity or practice as "corporatist" was practically synonymous with accusing it of being undemocratic. Moreover, some of its enduring features seemed to confirm this suspicion: Organizations replaced persons as the principal agents in political life; specialized professional representatives gained at the expense of generally interested citizens and broadly aggregative political parties; privileged (if not exclusive) access was accorded to particular associations; monopolies were recognized and even extolled at the expense of overlapping and competing intermediaries; organizational hierarchies reaching up to very comprehensive national peak associations diminished the autonomy of more local and specialized organizations; and decisions were made by secretive negotiations, rather than by public tallying of votes.

As inquiry into corporatism expanded, however, judgment about its impact on democracy shifted. For one thing, many of the countries that are manifestly corporatist are also obviously democratic in the sense that they protect the full range of civic freedoms, define citizenship in the broadest fashion, hold regular competitive elections of uncertain outcome, render political authorities accountable for their actions, and pursue public policies that seem responsive to popular demands. Some of them, especially those in Scandinavia, have even been in the vanguard of experimentation, with such advanced democratic measures as worker participation in management, open disclosure of policy processes, ombudsman arrangements for hearing citizen complaints, public financing of political parties, and even wage-earner funds for extending popular ownership of the economy.

Also, it soon became apparent that corporatist arrangements have a substantial impact on the conditions under which competing interests can participate to influence the process. The spontaneous, voluntaristic, and episodic relations of pluralism seem freer in principle, but in practice they produce a greater inequality of access to those in power. Privileged groups with smaller numbers, concentrated resources, and more compact location have a natural advantage over larger and dispersed ones such as workers and consumers. Corporatism tends to even out the distribution of resources across more comprehensively organized categories and to guarantee at least a formal parity of access to the making of decisions. Moreover, the direct incorporation of associations into subsequent implementation processes may ensure greater responsiveness to group needs than the "arms length" relationship that separates the public and the private realm under pluralism.

Evaluating the impact of corporatism on democracy depends very much on which qualities of democracy one chooses to use. Seen from the classical perspective of encouraging the participation of individuals in the decisions that collectively affect them and of ensuring that all public authorities accord equal accessibility to citizen demands, these arrangements have a negative effect. But when viewed from a more output-oriented perspective that asks whether those in power can be held effectively accountable for their actions and whether these actions are likely to be responsive to citizen needs, the judgment of corporatism is bound to be more positive. Its impact on the central mechanism of democracy—competitiveness—is more ambiguous. On the one hand, this is diminished by eliminating the struggle between rival associations for membership and access. On the other hand, it is enhanced by encouraging rival conceptions of common interest to express themselves within the same association. One can conclude that modern democracies are being transformed by the practice of modern corporatism. Organizations are becoming citizens alongside, if not in the place of, individuals. Accountability and responsiveness are increasing but at the expense of participation and access. Competitiveness is less interorganizational and more intraorganizational. The pace is uneven, the acceptance is unequal, and the outcome is by no means unequivocal, but democracy in almost all modern societies is becoming more interested, more organized, and more indirect.

The Future of Neo-Corporatism

With the dramatic crash of late 2008, the conditions that have previously promoted or impeded neo-corporatism, tripartism, policy concentration, and social pacting, or whatever it should be called, have radically altered. After years of decline in the balance of forces between capital and labor in favor of the former, the terms of encounter are suddenly no longer the same. The hegemony of business interests has been seriously undermined by the collapse of neoliberal ideology as well as the revelations of fraud and misconduct by financial interests. Materially speaking, many enterprises have been devastated in their balance sheets, and their recovery to profitability will require the willing cooperation of labor. Whether mass unemployment will reach the levels of the 1930s and trigger a potentially disruptive collective response by workers and citizens has yet to be seen. Moreover, the initial reaction by state authorities—even in regimes dominated by conservative parties—demonstrates that they are not just disposed but anxious to intervene. So far, their emergency measures have involved distributing massive welfare to capitalists and no high-level negotiations with labor. There has simply not been sufficient time for tripartite policy concentration. But eventually—if the past scenario is any guide to the future—this combination of factors could well lead to yet another revival of it, especially in small, relatively homogeneous and internationally vulnerable countries. The only safe prediction, however, is that, if and when it returns, it will not be the same in either form or substance. Perhaps, then, we can finally declare that neo-corporatism is dead and gone, and begin calling it something else.

NEOLIBERAL INSTITUTIONALISM

Neoliberal institutionalism (NLI) is an umbrella term for liberal research programs in the study of international relations (IR) that focus on the cooperative role of institutions. At its core, NLI argues that international cooperation is possible and most readily achievable, with the creation and maintenance of international institutions broadly defined. Both formal and informal institutional arrangements are the subjects of NLI analysis. Formal institutions include multilateral organizations such as the United Nations (UN), the World Trade Organization (WTO), and the European Union (EU). States create and voluntarily submit to such institutions, which possess collective goals and establish mechanisms to achieve them. Informal institutional arrangements, or regimes, are also voluntarily created by states and constitute sets of implicit and explicit principles, norms, rules, and procedures around which actor's expectations converge in a particular issue area. A well-established regime exists in the issue area of capitalist free trade, for example, since both formal institutions and implicit, collectively shared principles, norms, rules, and procedures are foundational to such activity.

NLI argues that both formal institutions and regimes have the potential to create lasting bonds between nation-states. They do so by facilitating iterated interaction, diffusing information, heightening transparency, and lessening the ability of actors to defect from institutional agreements. By normalizing rules and regulations in this way, institutions promote an environment of trust in which nation-states can obtain a variety of collective gains that they would otherwise eschew. Thus, institutions aid in efficiently solving collective action dilemmas, particularly in areas that do not involve security issues.

As the term indicates, NLI is part of the larger theoretical category of IR liberalism, and it is premised on basic liberal assumptions about the importance of rationality, information, iteration, and institutional arrangements to cooperative outcomes in IR. NLI also constitutes a renewed confrontation with realism—hence its "neo" status. It emerged in the late 1970s as a theoretical competitor to neorealism, which argues that there are debilitating constraints on the efficacy of international cooperation in an anarchic world of self-interested, egocentric nation-states. In neorealist analyses, the anarchic international environment fosters uncertainty and suspicion, which then produce frequent security dilemmas, volatile alliances, and ongoing trade and military competition. In such an environment, international cooperation is difficult to obtain, even when both parties would gain from the effort, due to fear that any relatively greater gains will be employed for competitive purposes. Thus, NLI's theoretical competitor tends to underscore the dangers of defection by highlighting the distrust between actors engaged in potential agreements with one another.

NLI challenges the pessimistic conclusions of neorealist analysis, but it does so by adopting many of the same analytical assumptions. It is for this reason that neorealism and NLI are sometimes categorized together epistemologically and why NLI can be distinguished from earlier liberal variants such as pluralism. Both NLI and neorealist scholars agree that the international system is anarchic, which means that there is no international authority or government to force states to comply with demands or cooperate with one another. As a result, states must help themselves and look out for their own individual survival. NLI concurs that international cooperation will be difficult to obtain in an anarchic international environment that induces fear and uncertainty. Both theories focus on the state as the main actor in international affairs. While NLI and neorealist scholars recognize that other international actors do exist and can influence international affairs, each theoretical lens views the state as the primary mover of international politics. And both perspectives view the state as a rational, utility-maximizing, and self-interested governing entity. In doing so, both are heavily indebted to the study of economics, and NLI is sometimes referred to as rational-choice institutionalism as a result.

NLI and neorealism differ, however, over whether the fear of relative gains is a primary inhibitor in international cooperation. NLI argues that states can be motivated to cooperate in order to achieve absolute gains (or the totality of gains achieved by an actor regardless of the relative gains of others) if their fears of being cheated by one another can be mitigated. This is where institutions play a key role in NLI analysis. NLI scholars argue that institutions mitigate the effects of anarchy, thereby making the realization of absolute gains, and hence the possibility of international cooperation, more likely. Institutions do so because they reflect mutually accepted rules and regulations that are created by the institutional actors themselves. Because actors have a say in what is allowed, and disapproved of, there is an assumption that actors will not agree to terms that they cannot meet, thus making institutional agreements fairly straightforward and easy to uphold. Institutions also foster transparency and information sharing. They provide actors with access to data about other institutional partners to which the former would not normally be privy. The more information that actors possess the better, as this diminishes feelings of anxiety, apprehension, and distrust. And, because the rules of the game are well specified in institutional arrangements, actors are well aware of the institutional expectations that exist. The more information actors have, the better they feel about taking part in an international agreement that makes them dependent on other actors and, arguably, more vulnerable.

NLI also stresses the importance of long-term gains. NLI scholars note that institutions provide a forum for repeated interaction, and they argue that actors engaged in repeated, continuous interactions are less likely to defect from cooperative arrangements. In making this argument, NLI borrows from game theory and the multiple game scenarios (prisoners' dilemma, chicken, tit-for-tat) that materialize when actors seek to engage in bilateral and multilateral agreements. These can be distinguished from one-shot-only interactions, which, NLI argues, is the assumption of neorealist analysis. Alternatively, NLI argues that once actors submit to an institutional agreement, they become locked in. Actor interaction becomes more frequent and common.

Institutions are thus viewed as mechanisms that can create long-term and long-lasting benefits for states in areas related to security, human rights, health, and the international political economy. NLI views iterated interaction as a positive spillover effect of institutional agreements. The more actors interact, the more they come to trust one another and learn the preferences that others possess. Iterated interaction, therefore, catalyzes cooperation among divergent actors. Actors are less likely to engage in hostile interaction because they "know" one another. More important, institutional arrangements lead actors to depend on one another. This dependence lessens the desire among actors to defect or cheat because they too can be hurt—economically and politically—by this misbehavior. Consequently, defectors are left vulnerable because they can no longer depend on the actions of others to fill the institutional needs that had been previously met.

Finally, NLI argues that institutions diminish the ability of actors to free ride. Free riding occurs when one actor benefits from the actions of other actors without paying the price or anteing up. Institutions not only spell out requirements that actors are expected to abide by and uphold but also delineate punishments for failing to comply with one's institutional mandate. This reduces the ability, or desire, of other actors to cheat or free ride in turn because there are known consequences for noncompliance, like sanctions or institutional shunning. Although it can be difficult to enforce institutional punishments, the mere fact that such mechanisms exist can dissuade some potential institutional dissenters.

For NLI scholars, institutional agreements do not impede state sovereignty because states still retain final authority over foreign and domestic policy decisions. Instead, NLI notes that institutions reduce the autonomy of states to act unilaterally, which means that states are forced to consider the needs and interests of other actors if they wish to obtain their own interests in turn. This creates a more pacifistic and harmonious international environment because states will not make irrational decisions based solely on their own desires and wants. Instead, they learn to compromise and take into account other actors while at the same time obtaining their own long-term interests.

Although institutions can mitigate the effects of anarchy in these ways, NLI acknowledges that IR prior to the 20th century conformed to neorealist expectations. Two historical developments created a window of opportunity for the spread of formal and informal institutions in the 20th century. The first was the development of complex interdependence. Thanks to modern technological and industrial advances, nation-states have become more entwined at almost every level and issue area. This has produced multiple channels of interaction between state and nonstate actors, and this allows actors to more easily identify their common interests, overcome barriers to collective action, and reach cooperative agreements to obtain common interests. It has also encouraged nonmilitary problem solving in areas such as environmental degradation, health crises, and human rights abuses.

The second historical development that encouraged the spread of international institutions was that of the United States playing the role of a hegemon after World War II. Borrowing again from the study of international economics, NLI scholars argue that the support of a very powerful state is usually necessary for nation-states to have confidence in and engage with free trade. The United States created and promoted a variety of multilateral institutions, thereby producing a period of hegemonic stability in the latter half of the 20th century. While this promotion was driven by self-interest, it served as the necessary foundation for the subsequent growth of international institutions and regimes and the cooperative benefits they provide.

It is important to acknowledge that NLI does not posit that institutions always matter. This is because institutions are not infallible. Institutions can aid in achieving but do not guarantee collective gains. NLI scholars are cognizant of the fact that institutions can break down or fail to achieve a desired collective action outcome; therefore, how institutions are designed—or the rational design of institutions—is an important focus and research agenda within NLI. Another emerging branch of NLI, known as principal–agent theory, examines how nation-states delegate tasks and authority to international institutions and whether this achieves the desired objectives.

NEOLIBERALISM

Neoliberalism, as the prefix *neo* suggests, is an old concept that reemerged as a policy response to the crisis of Keynesianism and was made popular by the political ascendancy of Margaret Thatcher in Great Britain and Ronald Reagan in the United States in the late 1970s and early 1980s. While neoliberalism has become a central concept in the social sciences describing the structural changes in the global economy since the 1970s, the concept is much contested. At the most fundamental level, neoliberalism builds on the classical liberal notion implying the triumph of market forces and individual autonomy over state power. But there is a considerable normative divergence between advocates of neoliberal ideas, who celebrate the ascendancy of the market, and those who suggest that the policies of neoliberalism are associated with global inequality, economic disparity, growth of unemployment, social exclusion, environmental destruction, and cultural homogeneity. Optimists stipulate that unfettered market forces will result in global prosperity, freedom, democracy, and peace. For pessimists, neoliberalism has become an ideological construct associated with radical market fundamentalism based on the universal imperatives of competitive deregulation, liberalization, and privatization. This latter interpretation is often used synonymously with the concept of an exploitative form of neoliberal economic globalization.

Defining neoliberalism is all the more difficult because the concept as it emerged first in the 1930s differs fundamentally from the form in which it reemerged in the 1970s. In fact, Andreas Renner, of the Walter Eucken Institute in Germany, suggests that there are two neoliberalisms. One is a continental European (i.e., German) version and the other an Anglo-Saxon interpretation. Historically, the European concept of neoliberalism originated in the 1930s in opposition to the Anglo-Saxon laissez-faire liberalism of self-regulating markets. The best account of such a laissez-faire economic system is found in Karl Polanyi's *The Great Transformation*, in which he argues that the collapse of the international economic system in the 1930s was a direct consequence of the attempt to organize the economy on the basis of laissez-faire ideas influenced by the British and Austrian schools of liberal (laissez-faire) economics. In today's social sciences, the terms *laissez-faire* and *neoliberalism* are used interchangeably, referring to the ascendancy of the market over state authority. The historical origin of neoliberalism tells a different story. The next section explores the origin of this concept and its relations to laissez-faire liberalism of the 19th century before turning to the reemergence of neoliberalism in the late 1970s and early 1980s.

Historical Origin of Continental European Neoliberalism and Anglo-Saxon Laissez-Faire Liberalism

According to the German economist Wilhelm Röpke, the term *neoliberalism* was coined in Paris in 1938 at a Colloque Walter Lippmann, a symposium held to discuss Walter Lippmann's recently released book, *The Good Society*. The participants at the Paris meeting chose the term *neoliberalism* to signal the creation of a new liberal movement against the laissez-faire liberalism of the 19th century. The historical importance of this neoliberal circle—consisting of members such as Wilhelm Röpke, Alfred Müller-Armack, Alexander Rüstow, Walter Eucken, and Franz Böhm—is that these ideas and norms became the basis for the continental social market economy of the 1950s. While not all members endorsed the term *neoliberalism*, it nevertheless became an umbrella designation for different trends of liberalism developed under its roof, of which the *Freiburger school*, also referred to as Ordoliberalism, is the most well-known group with Walter Eucken and Franz Böhm as its most renowned representatives.

The exponents of this neoliberal circle united in rejecting the economic reductionism they perceived as central to the ideas of 19th-century laissez-faire liberalism. Instead, they emphasized a normative-ethical foundation of economics, delineating an important role for governments to set the institutional parameters for economic competition in order to serve the larger interests of society. These intellectual proponents of neoliberalism combined economic efficiency with human decency to achieve a just and stable social order. As suggested by the term s*ocial market economy*, which developed from the earlier neoliberal circle and is still used today to describe some of the continental European economic models, the belief in the self-regulatory capacity of the market was rejected.

In contrast to the continental European school of neoliberalism, Anglo-Saxon laissez-faire philosophers and economists—such as Jeremy Bentham, David Ricardo, Thomas Malthus, Edmund Burke, and, from the Austrian economic school, Ludwig von Mises and Friedrich August von Hayek—developed the theoretical foundation for claiming the superiority of economic freedom over public intervention. Characteristic of laissez-faire liberalism as practiced in the early 20th century was a market system based on competitive labor markets, the automatic gold standard, and free trade. Laissez-faire intellectuals postulated that unfettered economic competition was superior to any form of state guidance in coordinating human efforts. But precisely the very belief in the naturalness of the market and the self-regulating power of market forces was disputed in Karl Polanyi's narrative of the historical transformation from a traditional socially embedded economy to a laissez-faire system during the 19th century. The introduction of a market economy necessitated deliberate state action and, contrary to the theories of laissez-faire, did not result from natural market forces.

In summary, the continental European development of neoliberalism in the 1930s was an outright challenge to the 19th-century Anglo-Saxon belief in self-regulating markets. In rejecting the laissez-faire liberalism with its emphasis on creating the largest possible space for the self-determination of individuals, the proponents of neoliberalism questioned the fundamental separation between the political spheres and economic spheres. Seen from this historical perspective, the later reemergence of neoliberalism in the 1970s has more in common with the belief system of laissez-faire liberalism of the 19th century than with the original meaning of neoliberalism in the 1930s. In fact, when Anthony Giddens advocates a "third way" between a laissez-faire neoliberal orientation and a top-down bureaucratic state management, he in fact comes close to the norms, ideology, and practices championed by the original intellectuals of the 1930 continental European neoliberalism.

The Reemergence of Neoliberalism in the 1970s

In contrast to the intellectuals of the 1930s who united under the umbrella of neoliberalism and identified themselves as part of a new neoliberal movement, the reemergence of neoliberalism in the latter part of the 20th century lacks any group affiliation or identity with a larger neoliberal movement. Intellectuals most closely identified with the new norms of market fundamentalism are Friedrich August von Hayek and his student Milton Friedman. However, Hayek's teachings are much closer to the laissez-faire ideas of his teacher and mentor, Ludwig von Mises, than to the original meaning of neoliberalism and later the ordoliberalism of the Freiburg school in Germany. It is thus not surprising that Friedrich von Hayek and Milton Friedman do not use the term *neoliberalism* in their writings, preferring instead the concept of laissez-faire liberalism.

Today the term *neoliberalism* is used to describe global economic processes of governance systems that fundamentally reconfigure contemporary economic and social systems around the globe. Neoliberal economic ideas emerged as a result of the economic stagflation of the 1970s. This in turn led to a rejection of the postwar consensus of Keynesian demand management. Most prominently, Margaret Thatcher and subsequently Ronald Reagan popularized a radical market-oriented system based on supply side economics and rejecting state intervention in the economy. The closest approximation today of a neoliberal socioeconomic model in the real world is the United States.

Twenty-five years later, there is still no shared consensus on the meanings of neoliberalism and neoliberal globalization. At the most fundamental level, these terms convey a rebalancing of state and market, tilting to the privatization of cross-border governance. But these processes are enormously contested. Proponents suggest that measures such as liberalization, deregulation, and privatization remove barriers to trade and financial cross-border transactions and thereby unleash the productive forces of capitalism. In this context, liberalization is to allow the unfettered cross-border movements of capital, labor, services, and goods, while deregulation is geared to remove unwanted government control that interferes with market processes, and privatization transfers previously publicly provided services to the private sector. Critics of neoliberal discourse and practice, on the other hand, argue that the rise and power of global finance and mobile capital as the dominant force in this governance framework have a negative impact on state–societal relations. The diminished capacity of the state to sustain public policies has increased the progressive detachment of individuals from social networks. Since public authorities are faced with dwindling resources to fulfill their traditional mandates, welfare is increasingly provided through market mechanisms. The result is an increase in the individualization of risks.

One of the most contentious intellectual debates concerns the role of the state in neoliberalism. Earlier proponents of neoliberalism envisaged the retreat of the state since they assumed that the market was the most efficient allocator of resources. However, scholars from the Left pointed out that the state was a central actor in creating the emerging transnational governance system. In the process of acting as a supposed midwife to a new neoliberal order, the state also changed from a distributive to a more internationally competitive actor. Other key players who are identified with the norms and practices of market fundamentalism are the World Trade Organization, the World Bank, the International Monetary Fund, and the Organisation for Economic Co-operation and Development. These organizations were maligned for imposing the Washington Consensus in developing countries facing liquidity problems. The policy doctrine of structural adjustment involves macroeconomic stabilization through fiscal austerity programs, trade liberalization, and removing barriers to capital movements. More than any other policy, the Structural Adjustment Programs of the International Monetary Fund and the World Bank came to represent all that is wrong with neoliberal market fundamentalism. Critics from developing countries point to the damaging effects of neoliberal transformation, including the depletion and destruction of the local ecological and biological systems that sustain life and nature. Studies have pointed out that many poor and low-skilled women in developing countries have borne the brunt of the negative effects of neoliberal global transformation.

Stephen Gill has gone the farthest to theorize the neoliberal transformation with its commitment to liberal governmental and market reforms as a shift from embedded liberalism to disciplinary neoliberalism. The change toward disciplinary neoliberalism points to the disciplinary social mechanism used to lock in the market-based commitments to prevent future governments from undoing the reforms. The result is a new constitutionalism as a means to consolidate the market-based governance framework. Whether the 2008 financial and economic crisis, the worst since the Great Depression of the 1930s, spells the demise of the neoliberal norms, ideas, and practices dominant since the 1970s is an open question. It is true that even erstwhile proponents of neoliberal private governance have voted to "bring the state back in" in order to stabilize the global financial and banking systems. But whether this signals a shift from neoliberalism to postneoliberalism cannot be determined at this time.

NEO-PATRIMONIALISM

The term *neo-patrimonialism* refers to a hybrid mode of rule in which informal political ties and exchanges suffuse the management of a state. In a neo-patrimonial regime, the political chief executive and his agents exercise authority mainly through personal whim and material incentive rather than through ideology or the rule of law. Within the state, the distinction between private and public interests is purposely blurred, and officials occupy bureaucratic posts less to deliver public goods and services than to acquire personal wealth and status. While elements of such self-serving practice can be found under various political regimes, neo-patrimonial rule is a defining characteristic of personal autocracies in the world's most underdeveloped states.

As with other building blocks of social science, the concept's origins lie in the ideas of great German sociologist Max Weber. In his opus *Economy and Society*, Weber sought to understand how political leaders justify the exercise of political power. He proposed a threefold classification of types of authority (*Herrschaft*) based on the sources of a leader's claim to political legitimacy: tradition, charisma, or legality. Implicit in the Weberian schema is the recognition that these types of authority are ideal constructs whose essential features are abstracted from empirical observation but unlikely to exist in pure forms in the real world. From the outset, therefore, Weber entertained the likelihood that, in practice, actual political systems would operate according to mixed, or hybrid, principles. While Weber never spoke of neo-patrimonialism—the concept is a late-20th-century one developed by Shmuel Eisenstadt in 1973, Jean-François Médard in 1982, and Christopher Clapham in 1985)—he did anticipate an acute form of bureaucratized patrimonial rule.

In short, neo-patrimonialism is an amalgam. It mixes traditional (specifically, patrimonial) and legal (or bureaucratic) authority. The first component—patrimonial authority—is based on a ruler's claim to exercise intimate personal control over members of society, much as a father does over a household. As a form of traditional authority, patrimonial rule is justified in terms of inherited customs that have been sanctified since time immemorial. To the extent that patrimonial authority is vested in older males, it is also associated with gerontocracy and patriarchal command over women and children. The second component is legal authority, a form of governance based on written constitutional rules and the routines of bureaucratic organization. To Weber, this rational (i.e., knowledge driven) form of authority was quintessentially modern. Insofar as citizens owe obedience, they do so not to individual leaders but to professional office holders in a rule-governed political order. Administration is impersonal, and power is constrained by the rule of law.

Patrimonial and legal-rational forms of authority are commonly juxtaposed in postcolonial situations. On the one hand, agrarian societies—especially in sub-Saharan Africa but also in parts of Asia and Latin America—are governed by informal customary norms exercised by traditional chieftains or feudal landlords. On the other hand, newly independent countries possess the formal apparatus of statehood, even if the empirical coverage of the state's legal and bureaucratic rules constitutes little more than a thin veneer. One origin of such dualistic polities, as noted by Mahmood Mamdani, can be found in the colonial policy of indirect rule as practiced in South Asia and West Africa, in which imperial overlords whose resources were strained devolved local responsibilities to extant traditional authorities. In short, neo-patrimonial rule was born in the political encounter between industrial empires and agrarian societies and is manifest today in the uneasy coexistence of formal-legal and patrimonial modes of rule.

Patrimony and bureaucracy are both based on a principle of hierarchy but, when they coexist, the ultimate source of legitimacy becomes blurred and contested. Is the state the personal property of the ruler or is it an impersonal instrument of constitutional rule? Are citizens required to obey the supreme leader because they owe him political loyalty or because they are required to defer to a rule of law?

The resolution of such tensions gives rise to neo-patrimonial rule. The educated generation of nationalist leaders that rose to power in the mid-20th century with the dissolution of the European empires adapted to their surroundings. Unable or unwilling to satisfy mass demands for rapidly ending poverty, these leaders instead devised forms of rule that aimed mainly at consolidating a hold on office. On the one hand, as pointed out by Robert Jackson and Carl Rosberg (1982), leaders claimed legal authority by virtue of the sovereign status of their countries under international law, and they greatly expanded the scope of state responsibilities by embarking on ambitious national development plans and increasing the size of the public bureaucracy. On the other hand, they treated the state as if it were a private preserve: They appropriated public resources for personal gain, to build political followings, and to establish "official" political parties. Some leaders even invested in a cult of personality, emphasizing themes such as "father of the nation." Characteristically, all neo-patrimonial leaders awarded loyal followers with special favors, both within the state (public sector jobs) and across society (licenses, contracts, and projects). In return for material benefits, clients mobilized political support and referred all decisions upward as a mark of deference to patrons.

This new (*neo*) form of rule differed from classic patrimonialism in that its venue and instrument was a modern state. But the process of constructing neo-patrimonial rule also distorted beyond recognition the classic features of Weberian bureaucracy. The top leader and his subordinate barons seldom make important decisions on the basis of written rules or objective knowledge, preferring instead to maximize their own subjective discretion. They routinely violate Weber's rule that officials should be separated from the ownership of the means of administration, instead turning public means to personal ends. Political loyalty more than technical qualification becomes the criterion for appointing office holders. And these appointees are compensated not only with fixed salaries but also with opportunities to secure illicit rents. Most important, the bureaucratic principle of equality of treatment for clients is narrowed and targeted to political favorites, often defined along lines of ethnic or other communal solidarities.

Indeed, the formal architecture of the state is thoroughly penetrated and often superseded by informal networks of power and privilege. The supremo appoints loyal cronies to strategic positions in key institutions and outlying regions, conceding to them the authority to deploy resources from their own fiefdoms. As long as these barons contribute to the incumbent's goal of retaining political power, they are assured of impunity from charges of corruption. A pyramid of such local networks stretches down from the center to the locality through formal structures such as ruling parties and local governments and through informal links to traditional authorities and even youth militias. As Diana Cammack (2007) notes, to the extent that political loyalty is rewarded with material benefit, neo-patrimonial networks operate according to an informal logic that is resistant to well-meaning efforts at legal reform promoted by international donors, opposition parties, or civic organizations.

This is not to say that neo-patrimonial rulers never employ the formal powers of public law when it suits them to do so. Often lacking the capacity to govern all corners of their territories, such leaders insist vociferously on the international legal principle of noninterference in the internal affairs of sovereign states. They tend to retain restrictive colonial-era constitutions when these documents allow the concentration of powers in the hands of a political chief executive and offer instruments for suppressing political opposition. At the same time, bowing to the waves of democratization that have swept the non-Western world in recent decades, neo-patrimonial leaders seek to wrap themselves in the legitimating mantle of democracy. Even autocrats now subject themselves to election on regular cycles mandated in national constitutions. To be sure, they often use the powers of incumbency to manipulate such elections—through gerrymandering, intimidation, vote buying, or ballot stuffing—but they nonetheless recognize that, in a modern world, political legitimacy inexorably rests on seeming to abide by constitutional and electoral laws. In sum, neo-patrimonial rulers employ universal rules in defense of particular privilege.

This unorthodox fusion of governance strategies is found in differing degrees in various types of contemporary political regimes. Neo-patrimonialism is largely absent in liberal democracies but can serve as a governing strategy in electoral democracies; it is the core modus operandi in electoral autocracies, and it resembles original forms of patrimonialism in traditional monarchies and unreformed autocracies. Neo-patrimonial exchanges can be found in both civilian and military regimes, especially in one-party systems with a dominant leader who prefers adulatory plebiscites to genuinely competitive elections. The model reached its zenith in the personalistic administrations of strongman presidents like Mobutu Sese Seko of Zaire (now the Democratic Republic of the Congo), 1965–1997; Ferdinand Marcos of the Philippines, 1965–1986; and Anastasio Somoza Debayle of Nicaragua, 1967–1979. Contemporary examples include the electoral authoritarian regimes of Robert Mugabe of Zimbabwe and Hugo Chavez of Venezuela who, by 2011, had enjoyed an unbroken hold on power since 1980 and 1998, respectively.

NEO-WEBERIAN STATE

The term *neo-Weberian* has a variety of applications in the literature of political science, sociology, and organization theory as well as in public and business administration. In most cases, it is based on variants of the Weberian model and employs the methods of analysis used by the German sociologist and economist Max Weber. The term *neo-Weberian* usually refers to the application of Weberian principles to a modern state or organization. The label neo-Weberian state (NWS) was introduced by Christopher Pollitt and Geert Bouckaert in 2004 in the second edition of their groundbreaking book, *Public Management Reform: A Comparative Analysis*. NWS refers to traditional (Weberian) administrative systems that are in the process of modernization but retain distinctive public service qualities.

NWS was originally intended as a descriptive concept based on the empirical evidence of public management reforms. It was an attempt at finding common denominators in Continental European developments while acknowledging numerous variations within the region. Turning to a more explanatory mode, NWS could be interpreted as a political response to globalization and political de-alignment in the rich, strong liberal-democratic regimes of Western Europe. Thus, according to Pollitt, the pursuit of an NWS-like solution could be seen as an attempt to protect the "European social model" from the depredations of global markets and neoliberal ideology. Also, NWS appears to receive the attention of the European Commission. Having been originally set up according to the French model, it began to reform in the 1990s, aiming to make itself more externally oriented and consultative, more professional and more efficient, and yet at the same time refusing to abandon key Weberian principles.

NWS challenges the Anglo-American new public management (NPM) model, which aims to import business and market principles and management techniques from the private into the public sector and is based on a neoliberal understanding of the state. NPM, an initiative launched during the 1980s, envisaged an entrepreneurial, market-oriented society, with a tiny government on top, and is characterized by marketization and competition, including large-scale privatization and contracting out, contractual appointments, "client-orientedness," and performance-related management tools. The American equivalent of these reforms was the National Partnership for Reinventing Government, a task force formed during the Clinton administration.

NWS was developed in a context of concerns about NPM shortcomings and other managerial reforms; it is, therefore, a post-NPM concept. Meanwhile, NWS co-opts the positive characteristics of NPM on a Weberian foundation (rather than adding Weberian elements to NPM). Table 1 sums up the NWS model by incorporating the "neo" elements (NPM influence) and the characteristics of traditional public administration ("Weberian" foundation).

The purpose of NWS is not simply to criticize NPM but to present a coherent and up-to-date alternative, which appears to be the answer of continental European governments to the NPM paradigm. According to Pollitt, the ideas of political power and modernization are the two main dimensions of the original NWS concept. On the one hand, compared with Anglo-American governments, the continental Europeans hold a more optimistic attitude regarding the future role of the state. Thus, their objective is not the minimal state but a state that retains a strong steering and regulatory presence in society. The state is not seen as a burden on the economy and society or as a necessary evil. Rather, it is the guarantor and partner of both a strong economy and a socially cohesive society. It initiates or facilitates a range of democratic mechanisms, both representative and direct. Continental European governments continue to regard the state as the irreplaceable integrative force in society, with a legal personality and operational value system that cannot be reduced to the private sector discourse of efficiency, competitiveness, and client satisfaction.

On the other hand, the state is steadily modernizing, professionalizing, and improving its efficiency. Such changes typically include results-based budget reforms, more flexible personnel policies (which, however, do not amount to abandoning a distinctive career public service), extensive decentralization and devolution of authority from central ministries and agencies, a greater emphasis on strategic planning, selective and gradual privatization, and a strengthened commitment to improving the quality of public service provision. Yet it is far from an assumption that copying the private sector is the only way for governments to improve their efficiency, performance, and professionalism. Private sector methods may be adopted on some occasions, in certain types of organizations, and for specific policies, but they have no automatic priority or superiority. Consequently, NWS has led to some changes, whose effect, however, is often dampened by existing structures and traditions and which are

Table 1 Neo-Weberian State

Neo-	*Weberian*
Shift from an internal orientation toward bureaucratic rules to an external orientation toward meeting citizens' needs and wishes; the primary route to achieving this is not the employment of market mechanisms (although they may occasionally come in handy) but the creation of a professional culture of quality and service	[but:] Reaffirmation of the role of the state as the main facilitator of solutions to the new problems of globalization, technological change, shifting demographics, and environmental threat
Supplementation (not replacement) of the role of representative democracy by a range of devices for consultation with, and direct representation of, citizens' views	[but:] Reaffirmation of the role of representative democracy (central, regional, and local) as the legitimating element within the state apparatus
In the management of resources within government, a modernization of the relevant laws to encourage a greater orientation on the achievements of results rather than merely the correct following of procedure; this is expressed partly in a shift from *ex ante* to *ex post* controls but not a complete abandonment of the former	[but:] Reaffirmation of administrative law—suitably modernized—in preserving the basic principles pertaining to the citizen–state relationship, including equality before the law, legal security, and the availability of specialized legal scrutiny of state actions
A professionalization of the public service, so that the bureaucrat becomes not simply an expert in the law relevant to his or her sphere of activity but also a professional manager, oriented to meeting the needs of his or her citizen/users	[but:] Preservation of the idea of a public service with a distinct status, culture, and terms and conditions

Source: Adapted from Pollitt & Bouckaert (2004, pp. 99–100).

more concerned with democratization and modernization than with entrepreneurial government or blindly copying private sector practices.

Although the NWS was originally intended as an empirical–analytical model and not as a normative one, in recent years the concept has also assumed a strong normative meaning, in particular, for new democracies (which, incidentally, were not the focus of Pollitt and Bouckaert's original analysis). It has often been proposed that the key for administrative development in new democracies is first to make sure that the Weberian foundation of the NWS model is present and only then to start gradually introducing the "neo" elements (modern management tools). Guy Peters argues that despite the appeal of the NPM ideas of deregulation and flexibility, governments attempting, at the same time, to build democracy and effective administration must place a much greater emphasis on formal requirements, rules, and strong ethical standards. The values of efficiency and effectiveness are important, but in the short run they should take second place to fostering fairness and responsibility. The NWS paradigm also includes a reaffirmation of the role of administrative law. In addition to preserving the basic principles pertaining to the citizen–state relationship—such as equality before the law, legal security, and legal scrutiny of state actions—the law should be an anchor of predictability, reliability, and legitimacy in the chaotic political and administrative environment of new democracies. Of particular relevance for new democracies are the NWS's (Weberian) elements that promote the unity of public administration and common public service culture, such as the preservation (or first of all, the creation) of a public service with a distinct status, culture, and conditions as well as the recognition of the need for a strong state. This has significant policy implications for newly independent states (e.g., in Central and Eastern Europe) who may be easily attracted to NPM-like reform ideas without having a solid

Weberian foundation. This makes NWS a sound basis for reform strategies in these countries.

The NWS model presents interesting opportunities for both policy makers and researchers. For example, Lawrence Lynn has developed the NWS model further from a theoretical point of view by proposing NWS as either an independent variable or a dependent variable. While the NWS implies a positive synthesis of the new and the traditional, neo-Weberian administration has also been viewed critically by Lynn as a threat to liberal democracy, by which organizations could be subverted by informal and illegitimate patterns of authority and decision making, thus reducing their legitimacy. This is why some less democratic countries could also support the idea of a strong modernizing state that underlies the NWS model. Therefore, it could be argued that, normatively speaking, the implementation of NWS also presupposes, in addition to the Weberian bureaucracy, a viable liberal democracy.

The economic crisis has radically altered the context in which public administration operates: The state is again playing a part in the economy. The crisis thus casts public institutions as enablers of (rather than barriers to) growth and innovation. Peter Evans and James Rauch have demonstrated that there is a connection between Weberianism and sustained economic growth. Wolfgang Drechsler has developed the NWS model further by linking it to innovation, economic growth, and information technology. Effective public administration is seen as a sine qua non condition for economic growth and innovation, as innovation-based society draws on and requires a highly competent, long-term–oriented, and dedicated civil service to implement it—features aimed for by the NWS model. In addition, recent research has shown that information and communication technology (ICT), especially e-governance, which was long associated with NPM because of its parallel occurrence, is actually just as conducive (if not even more so) to the NWS and in turn is promoted by it as well. And beyond crisis and ICT, whatever the future leading technologies will be—nanotech, biotech, convergence, or something completely different—their setup will require a particularly capable state actor and a science and technology policy implemented by a civil service that is characterized by long-term thinking as well as by tolerance of mistakes—characteristics that are not enabled by NPM. In other words, the period in history that we are now entering is bound to be more state friendly than the 1990s, and NWS seems to be one of the most interesting theoretical and normative answers to the question of how a complex innovation-based society should be governed.

NETWORK ANALYSIS

Network analysis systematically quantifies and visualizes relationships between actors, such as knowledge transfer or resource flow. The underlying formal concepts of graph theory make network analysis both a theoretical approach and a toolkit of formal approaches. Social network analysis is an emerging field that combines contributions from different disciplines, such as sociology, anthropology, mathematics, statistics, and, recently, physics and biology. The research approach has recently inspired several books, such as Duncan Watts's *Six Degrees of Separation*, Albert-László Barabási's *Linked*, and Nikolas Christakis and James Fowler's *Connected*. This entry first briefly describes the goals and historical developments of network analysis. Then, the research questions, research design strategies, data collection procedures, and basic formal data analysis mechanisms are discussed. The entry concludes with a look at recent and future developments of network analysis.

Definition of Networks

Networks are social relational systems characterized by a set of actors and their social ties. They consist of a finite set of identifiable nodes; the relationships among these nodes (actors) are represented as ties (edges). Ties are dichotomous: present or absent, or unordered (undirected) or ordered (directed ties). The nodes represent a single entity that potentially may take part in the relationships under study. A network analysis takes the characteristics of nodes and the characteristics of the relations connecting the nodes into account. Attributes—additional information about the actors—are characteristics, such as the behavior, attitudes, or other properties of actors. Networks are represented as a (social) graph, which is defined by a set of nodes together with the set of pairwise relationships among them. Networks present an opportunity and constraint structure: on the one hand offering access to resources flowing through the ties and, on the other hand, restricting choices and controlling behavior.

Definition and Goals of Network Analysis

Network analysis is an interdisciplinary field of research with a history in sociology and anthropology. It provides the formal mechanisms for representation, measurement, and modeling of relational structure and is based on the assumption that actions and decisions of actors are dependent on the context and the actions of other actors. The social structure is an area of (inter)action in which emergent patterns of behavior can be observed, and structural variables help analyze the resulting interactions. Generally, a network consists of actors (nodes) that are connected with each other through ties (edges). The actors can represent people, organizations, countries, or other entities. The relations and ties are conduits for the flow of resources in the form of knowledge, finances, collaboration, and so on. The units of analysis are, therefore, the interactions between the actors.

In a network analytical approach different types of data can be distinguished:

- attributes, which are descriptors of the individual actors in the network, such as age, sex, profession, or political affiliation;
- relational data that are derived from the interactions of at least two actors, such as Country A imports Product x from Country B; and
- structural characteristics of the overall network that can be derived from the relational characteristics of all studied actors, such as density or centralization.

The main goal of network analysis is to understand the emergence of the network structure and its consequences by description, visualization, and statistical modeling. In more formal terms, network analysts analyze which independent variables have led to the observed structure and how the social structure influences other emerging social processes. In this form of "structural analysis," the relationships among actors become the first priority, and individuals' properties are secondary in the study of the flow of structural regularities that might influence actors' choices and their resulting behavior. The result is an approximation to the structure of a more complex system for purposes of studying a particular property (such as the diffusion of a disease in a community). Ultimately, complex situations can be represented using multiple relationships (multiplexity), such as group membership, friendship, hate relationships within the group, hierarchy and reporting structure among the group, and the strengths and frequencies of interactions. There are different ways of looking at the social structure: The researcher can either look at the outcomes of the existing network structure, at the emergent behavioral patterns, or the characteristics of the overall structure.

Brief History of Network Analysis

The first accounts of network analysis can be traced back to the 1930s when Jacob Moreno used sociograms as a form of analysis to visualize the complex structure of social interactions. Sociograms are a method of mapping or graphically representing individuals' perceptions of a complex social structure. Matrix algebra and graph theory were used in the 1940s and 1950s as a mechanism of formalizing social structure. Alex Bavelas added new insights into the functioning of small groups by conducting experiments on communication networks. The experiments were used to understand the speed and accuracy of centralized and decentralized structures to find the shortest path a message can take through different forms of social structures. Stanley Milgram added his "Six degrees of separation" research and Harrison White looked at structural equivalence as a form of similar incoming and outgoing ties to form a new and reduced network in the 1970s. Mark Granovetter then developed his strength-of-weak-ties theory; he showed that strong contacts tend to have very similar information, whereas weak contacts could be the source of innovative information. Based on this theory, Ron Burt developed his notion of structural holes in the 1980s and 1990s and applied it to the benefits of bridging and bonding ties.

Basic Assumptions of Network Analysis

The basic underlying assumption of a network analytical approach is based on the notion that different types of ties serve as conduits for flow of resources through the network. Ties are either absent or present. In most network research, an absent tie needs to be interpreted as this implies that resources are not flowing through the nonexistent tie. Moreover, ties can either be directed or undirected: Directed ties hint at asymmetric relationships between actors, with resources only flowing in one direction. Undirected ties are symmetric and represent either a confirmed relationship or a relationship in which both actors have to be present.

The common assumption of independent observations does not hold in networks. Multiple ties to and from actors are related, and so it cannot be assumed that the tie between A and B is independent of C. In addition, the assumption of continuous, normally distributed variables does not hold when tie variables are binary, nominal, ordinal, or count variables. Moreover, two observations are usually available for each pair of actors (dyads) and are assumed to be correlated actor-wise.

There are two different forms of research questions. First, a network analytic approach can aim to use independent variables to explain the emergence of the social structure. Second, the social structure itself can also be used as an explanatory variable to understand specific outcomes, such as voting behavior. Generally, two research design strategies can be distinguished: The researcher needs to decide whether to use ego-centered personal networks or complete (whole) networks. In an ego-centered network approach, network data are usually collected from a sample of actors (egos) reporting on the ties with and between other people (alters). Here, it is important to obtain as complete a picture of the respondents' networks as possible. Name generators are used to collect ego-centered data by providing a clear definition of which persons known by ego qualify as a network member (or alter) of ego. The relational system is then assumed to be composed of the sampled egos and reported alters and their ties as well as possible additional actor and tie information. In a second phase, the alters will be asked about their relationships among each other and with ego. A complete or whole network approach includes a well-defined group of actors who report on their ties with all other actors in this preset group. A high response rate of actors is needed to get a close-to-complete picture of the interactions. It can be assumed that the ties reported by actors are not usually independent.

After defining the research question and framing the goal and empirical context of the network analysis, the next step is to define who should be included in the final network and from whom network data will be solicited. Simply said, this decision will set the limits on the social relations to be collected. While there are different schools of thoughts on this topic, two approaches seem to be dominant: realist and nominalist philosophies of boundary specifications highlighted by David Knoke. The realist approach assumes that the subjects identified by the researchers know best who should be nominated as part of the network. In comparison, a nominalist approach assumes an upfront theoretical or practical limit to the boundaries of a network. The researcher has either developed a set of theoretical hypotheses that define clearly who is in and who is outside the network boundaries, or it is not practical or doable to collect network data from the whole universe. An example of a nominalist approach is to use defined roles in organizational hierarchical settings, such as all CEOs of Fortune 500 companies. Both strategies have advantages and disadvantages: Clearly, a too extensive inclusion will impose a burden on the data collection process, and a forced exclusiveness might omit important actors and therefore bias the results.

In addition, researchers distinguish between positional and relational boundary specification strategies that are closely linked to the previous decisions. A positional approach defines the network membership based on the formal position an actor assumes in a given social circle, such as the formal affiliation as a team member of a specific department. The relational approach—which is sometimes also called a snowball sampling approach—emerges similar to the realist approach based on nominations by already included subjects: Additional subjects are recovered by the current subject, and their relationships to the emerging network actors are taken into account. Moreover, a researcher might decide to look at participation of specific actors in an incident to answer a research question such as "Which organizations participated in the Iran election protests?" This event-based strategy is different from formal affiliations and memberships and can help identify relevant groups and subjects.

In a network analytical approach, four different data collection strategies are distinguished:

1. collection of the formal structure of the network,
2. collection of data on the content of the ties,
3. collection of data on the frequency or intensity of interactions, and
4. data collected that focus on the perceived connection.

Complete or whole networks are also called total personal networks. In this approach, the network boundaries are well defined, and it is assumed that all listed network actors either know each other or have at least heard of each other (e.g., all members of one department). This macrolevel of analysis has the goal of using every type of relationship in a given network and of representing the network in its entirety. The special focus in whole networks is, therefore, mainly on the identification of specific roles and positions or on the similarities of these roles played by different actors.

There are several different ways in which network data of a whole network can be solicited:

- unrestricted choices (where the subjects are asked to list everyone they know in the network),
- ranking with respect to attractiveness (the subjects rank the most important contacts),
- paired comparison (a range of choices have to be compared),
- free recall rosters (where no names are provided, and the subjects have to nominate the actors they remember),
- fixed number of nominations ("name the five most important actors in this network"), and
- name roster with full network (where all actors are provided, and the subject can choose among the full list).

Data Collection of Egocentric Networks

Egocentric networks describe the relationship a focal subject (ego) has to third parties (alters). Egocentered networks of social relations around a particular individual are also called partial networks and focus on specific types of relationships. These relationships can be multiplex, where there are multiple overlapping relationships that can be used to describe the quality of the relationships. The standard approach to collecting egocentric network data focuses on the question of whom the focal person is connected to and results in a list of dyadic interactions. In addition, attribute data on each of the alters can be collected, and the ego can be asked to record his or her perceptions about the interactions among his or her alters to derive the cognitive structure of the network. Overlaps among different egocentric networks will result in larger networks than just the star formation of a single egocentric network. The goal of an egocentric network analysis is to understand the global features of the universe. Researchers have discovered the need to conceptualize specific aspects of the total network that resulted in ego-centered network research.

Data collection on egocentric networks is used to identify family structures or group compositions, such as friendship structures or problem-solving groups. The challenges of an egocentric approach are to (a) identify the appropriate egos that are representative so as to describe generalizable dimensions of the overall network and (b) delimit the number of alters at the right upper boundary without excluding too many potential alters and still receive meaningful results. Specific name generators are usually used in egocentric network analysis approaches to derive the perceived network structure but also to solicit information about the number of actors that have to be included in the analysis.

The most common method is to use name generators, where the names of the alters are elicited from the ego to understand from his or her perspective what the social structure around him or her looks like. In a second round based on the names collected with the help of a name generator instrument, a name interpreter is used, and the ego is asked to highlight details in the form of attributes about the alters (such as age and relationship type to ego). As opposed to asking who is connected to whom to explore the formal structure of networks, the content of ties can be identified by asking the following questions:

What are people talking about?

Why are they connected?

What is the nature of their relationship?

Table 1 shows the different qualities of interactions: Question 1 asks for the professional support network, Question 2 asks for the social support network, and Question 3 highlights the purely instrumental network.

Instead of asking which actors in a focal network are connected to each other, researchers might want to find out how intense these relationships are. The interaction is already established (1/0); in addition, it might be of interest what the quality of the interaction is, to understand whether an interaction constitutes a strong or weak tie. Table 2 shows an example of a questionnaire that includes the frequency of the interaction.

The result of each of the questions is usually a dichotomous matrix in which an existing or present tie is denoted by a 1 and a missing tie by a 0. The cells indicating the relationships between actors x and y can also be filled with a numerical value indicating the frequency or intensity of the relationship. In this symmetric adjacency matrix, the diagonal is not defined, indicating that actors do not have ties with themselves.

Network Analytical Concepts

The most prominent form of network analysis is descriptive, following Linton Freeman's approach to use analysis procedures often based on the decomposition of the adjacency matrix. An adjacency matrix is an $n \times n$ representation of the nodes in a social graph that are next to each other. Actors are compared on the basis of their tie variables and by taking their actor characteristics (attributes) into account. The relationships—and even nonexisting ties—represent nomination patterns among actors in a network. The more often a focal actor is nominated by other actors in the network, the more central the actor becomes. Centrality is an indicator of prominence, importance, reputation, or power within the overall structure and generally describes the number of times an actor is chosen by other actors. Centrality shows the level of influence specific actors have in the network when it comes to power in the network. Some examples of network research questions that can be answered using centrality measures are the following: How are political opinions adopted, and how do they diffuse through social groups? or How are diseases spreading in a classroom, school, or other social circles?

Different forms of centrality can be distinguished. Degree centrality is the sum of the number of ties a node has. It can be distinguished into in-degree centrality (the number of incoming ties) and out-degree centrality (the number of times the actor itself nominates other actors). Closeness centrality represents the total distance of a node from all other nodes. A larger value indicates a less central actor, while a smaller value indicates a more central actor. On the whole network level, this measure is called centralization and is usually used as a comparative measure. The Freeman "betweenness centrality" measures the number of times a node needs a given node to reach another node—or in other words, the number of shortest paths that pass through a given node. This form of centrality shows how strategically important an actor is to connect different parts of the overall network that might otherwise be disconnected. It might also indicate the resource dependences and interdependences between individual actors.

The density of a network is represented by the number of links divided by the number of possible links. It is an indicator of the overall connectedness of the social graph. In a complete graph, every node is connected with every other node, and the density is 1. Smaller numbers indicate a less well-connected network. Moreover, it might be interesting for a researcher to understand whether there are distinct subgroups within the overall network that restrict access or connectedness. Components in a network represent a subset of actors, with the characteristic that there is a path between any node and any other one in this subset. The whole graph forms one component and is therefore called totally connected. Cliques are subgraphs in which any node is directly connected to any other node of the subgraph.

Sociograms

Another way to interpret the social structure is to use sociograms—a visual two-dimensional representation of the relationships between all actors in the network. A sociogram is a reduction of the complex relationships to a single dimension at one specific point in time, on a well-defined set of discrete components with strictly dyadic relationships. A sociogram represents the formal properties of the social configuration. Sociograms as a form of visual exploration of the social structure are one form of network analysis and help interpret the structure without necessarily using formal analytical methods. Figure 1 shows a sociogram, where nodes are connected to each other through ties.

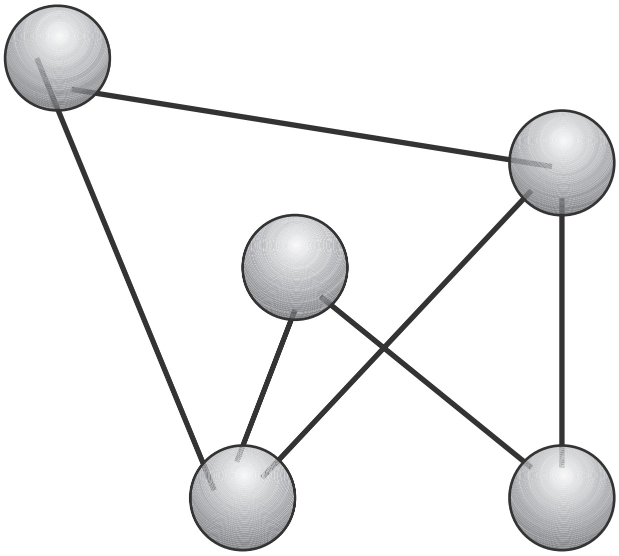

Figure 1 Sociogram

Applications of Network Analysis

Networks can be useful in different analytical settings. Policy networks explain outcomes such as policy decisions and the interactions between the different parties involved in the preparation and decision-making processes. Networks can also be used to explain the spread of political opinions and how these might result in specific voting behavior. The spread of diseases and also the most central hubs in a diffusion network can be identified, and measures can be targeted directly to the central node. Network analysis has recently become a method to fight terrorism and increase national security. The capture of Saddam Hussein is, for example, attributed to a network analytical approach. Recently, network analysis has also gained some momentum in resilience research to understand how well connected communities are and how they might rebuild or restructure when central nodes are removed.

In the future, network analysis will be used more and more to predict how the future structure of a network might develop based on the past interactions of its actors and what might influence the social structure. First models have been developed but are not widely accepted at the moment. Moreover, network analysis is used for new forms of networks found in online social networking services, mobile phone networks, or other forms of online networks, such as the link connections of the World Wide Web.

NETWORKS

Networks are about relations. Accordingly, rather than the properties and attributes held by actors, it is the ties connecting any two, three, or more individuals, organizations, or institutions that form the basic unit of analysis.

In the most general terms, the emergence of the network paradigm during recent decades can be attributed to the following:

- transformations in the reality of states, markets, and societies as perceived by competent observers (e.g., the emergence of organized society; the events of functional differentiation, decentralization, and fragmentation; and the growing interdependence and complexity of virtually all societal spheres);
- changes in conceptual and theoretical developments in the respective disciplines dealing with these systems of order (e.g., increasing attention drawn toward informal arrangements in politics, new modes of governance and public–private alliances, and a shift from hierarchical control toward horizontal coordination); and
- the development of a methodological apparatus for relational analysis as a result of a more pronounced structural approach in the social sciences (e.g., formal analysis of relational configurations, new statistical procedures, advancements in available software programs).

The boom in network research in sociology, organization theory, and political science must be understood as part of a general shift, beginning in the second half of the 20th century, away from individualist, essentialist, and atomistic explanations toward more relational, contextual, and systemic understandings. This entry first presents the historical background of this trend in the social sciences and then discusses some of the methods used in that area of inquiry. Next, it turns to those disciplines that have embraced network approaches most often and successfully and addresses the use made of them in political science and policy analysis.

Epistemological and Historical Background

In the history of science, there has been a shift from the analysis of substance and essence toward analysis of relations and connections. More than 60 years ago, in a series of papers on epistemology and logic, two eminent political philosophers/scientists, John Dewey and Arthur F. Bentley, outlined three historic levels of paradigmatic organization of the social sciences. In order of chronological appearance, these advancements, presented almost as a secular trend, underwent three major transformations in perspective—self-action, interaction, and transaction. The first two of these are labeled substantialist, while the latter could today be recast in terms of relational thinking. The perspective of self-action is described as a prescientific concept regarding humans and things as possessing powers of their own that initiate or cause their actions. It was most characteristic of ancient and medieval philosophy and of the Christian doctrine of the soul. In the second version of substantialism—interaction—the relevant action takes place among the entities themselves. Yet much like billiard balls or the particles in Newtonian mechanics, these entities remain fixed and unchanged throughout such interactions. It is only in the perspective of transactionalism, fundamentally opposed to both variants of substantialism, does scientific inquiry turn to aspects and phases of action, without final attribution to elements or other independent entities and without isolation of presumably detachable relations from such independent elements.

By reinterpreting and contextualizing this early contribution, its classificatory scheme was later refurbished by Mustafa Emirbayer (1997) in a manifesto for a relational sociology. In particular, the author draws attention to the units of analysis inherent in and dominating social science models of more recent derivations. Methodological individualism, norm-based approaches, and variants of structuralism are all assigned to the paradigm of self-action. The first, in its rational-choice version, takes individual human action as the elementary unit of social life. In the game-theoretic version, pregiven entities are seen to generate self-action—that is, actors engage in games with others without their underlying interests and identities encountering substantial change. In norm-based approaches, individuals are depicted as self-propelling, self-subsistent entities pursuing internalized norms, with the latter actually forming the basic unit of analysis. Finally, structuralism does not posit individuals but self-subsistent societies, or social systems, as the exclusive sources of action. Accordingly, it is durable, coherent entities that constitute the starting point of inquiry. The second variant of substantialism—interaction—is present today in the form of conventional survey research and historical–comparative analysis. It is the so-called variable-centered approach, including methods such as multiple regression and factor analysis, that best represents this variant. Providing merely the empty settings within which causation occurs, it is not the substances or actors in question that do the acting according to this particular view but, rather, the very variable attributes themselves.

What Dewey and Bentley have called transactionalism actually represents the cornerstone for the type of relational perspective adopted and methodologically elaborated by various strands of network theory and analysis. These strands have a number of origins. The prehistory of the approach developed through a process of accumulation of knowledge over approximately 40 to 50 years. Some have detected its origins in the empirical and conceptual work of Bronislaw Malinowski (1884–1942), Georg Simmel (1858–1918), Alfred Radcliffe-Brown (1881–1955), and Claude Lévi-Strauss (1908–2009), while others refer to important methodological contributions in the tradition of Jacob Moreno (1889–1974). In any case, both the method and its theoretical underpinnings have emerged from the multidisciplinary efforts of a whole range of scholars in anthropology, social psychology, and sociology. Key advancements and topics addressed include structural functionalism, theories of social structure, gift giving, systems of specific and generalized forms of reciprocity, and social exchange circuits (anthropology); Gestalt psychology, field theory, cognitive balance, and sociometry (social psychology); and *tertium gaudens* ("the third who benefits"), friendship and informal relations of assistance at the workplace, community research, and social exchange theory (sociology). This prehistory of today's network analysis culminated in what some have called the Harvard breakthrough, achieved by scholars such as Harrison White and his associates in the late 1960s and early 1970s. White's contribution to relational analysis is manifold both methodologically (structural equivalence, positional and role analysis, block modeling) and in terms of the imprints it has left on various disciplines, including sociology, political science, and economics.

Units of Analysis and Methodological Tools

Because network analysis is explicitly interested in the interrelatedness of social units, network data are stored in a rectangular matrix where the columns generally contain the same variables as the rows. These can be individual actors, such as directors occupying positions on different company boards, or organizations, such as government departments or private corporate actors. The dependences among them are measured using structural variables. Compared with conventional attribute-based measures, a focus on such variables opens up a different range of possibilities for, and constraints on, data analysis and model building. Leaning on specific mathematical and algebraic procedures, the methods employed provide explicit formal statements about structural phenomena that might otherwise be defined only in metaphorical terms. Metaphors, present in much of the qualitative literature, include phrases such as webs of relationships, closely knit networks of relations, social role, social position, group, clique, popularity, isolation, prestige, prominence, and so on. In social network analysis, these can be quantified and made subject to interpersonal verification. Analysis normally starts with delimiting a particular group of people or organizations according to what is called boundary specification—a procedure following either a realist (based on snowball sampling techniques or reputational analysis) or a nominalist (based on the researcher's own conceptual framework and understanding) strategy. Indices and procedures most frequently used include measures of degree and betweenness, centrality, density, clique analysis, structural equivalence and block modeling, multidimensional scaling, hierarchical cluster analysis, and so forth. The most useful and widely diffused handbooks of network analysis are the ones by John Scott (1991), and Stanley Wassermann and Katherine Faust (1994). Important software programs for the storing, processing, and visualization of relational data include Ucinet, Gradap, Krackplot, Netdraw, Visone, and Pajek.

Networks in Sociology and Organization Theory

Sociology, management, and organization theory are the disciplines where network models have been employed most successfully. The fields of application and the main topics addressed by that literature comprise a whole range of different dimensions. These include, among others, the impact of urbanization on individual well-being, the world political and economic system, community elite decision making, social support, communitarian forms of collective action, group problem solving, the role of strong versus weak ties for group and intergroup cohesion, diffusion and adoption of innovations, corporate interlocking, belief systems, cognition or social perception, interfirm alliances, trust among competitors, forms of social and political exchange and power, and consensus and social influence. The volume of social network research in these fields has increased radically and exponentially in recent years, as presented in Figure 1, which shows articles indexed by *Sociological Abstracts* containing the words "social network" in the abstract or title.

Political scientists and network analysts interested in gaining insights from adjacent disciplines, where relational thinking is both more pronounced and longer established, are advised to consult the handbook on organizations edited by Joel Baum (2002). Comprising the contributions of some 50 influential international scholars, the volume's tour de force through intraorganizational, organizational, and interorganizational levels represents the state-of-the-art current research in that area. Networks figure prominently in this all-encompassing treatment where relations form the principal units of analysis throughout.

Political Networks and Policy Domain Networks

These developments have been noted relatively little in mainstream political science. Even scholars working on state–society relations and in international relations somehow remained unaffected by transactionalist thinking. In other words, although they were dealing with connections between entities and actors of different societal spheres, scholars treated these spheres separately. The reciprocal influence exerted by entities on relations and, vice versa, by relations on entities, has not formed an explicit part of these research programs for quite some time. A major breakthrough then occurred with the emergence of interorganizational research and the neo-corporatist paradigm in the late 1970s. Focusing on entities such as organized interests and the state, including the attributes of these entities, and on relations, especially in the form of interest intermediation and political exchange, neo-corporatist authors tended to adopt a transactional perspective. This was most obvious in their conceptualization of two logics to which associations of both capital and labor had to adhere in the interest of organizational reproduction and survival—the logic of influence and the logic of membership.

Not by chance, the first major attempt to empirically verify the relevance of large corporate actors in state policy making occurred at a time when the neo-corporatist debate reached its height toward the mid-1980s. It was Edward O. Laumann's and David Knoke's seminal study on *The Organizational State* (1987) that, for the first time, exposed the power of empirical network analysis to a wider public in political science and political sociology. The authors adopted a policy domain perspective—that is, they aggregated different policies and policy events in the health (e.g., drugs regulation, Medicare and Medicaid funding) and the energy domains (e.g., nuclear waste disposal, strip-mining control) to study the configuration, power, and behavior of diverse actors within these organizational fields. These actors' issue interests, monitoring resources, and influence reputation were treated as antecedent variables ultimately affecting positions in communication and resource exchange networks. Together, these five variables jointly affect the range of core organizations' efforts to influence the outcomes of policy events in the two domains. What was important was that the volume combined structural with dynamic analysis and took account of actors' beliefs, frame disputes, and reinterpretations, thus avoiding the indeterminacy present in much earlier work while at the same time anticipating parts of the research program of the advocacy coalition framework. The database used for these studies was impressive. After boundary specification and a reduction of the lists of resulting organizations to an empirically manageable number, the authors ended up with a total of 333 public and private actors, which were then approached with the help of questionnaires. The number of analyzed policy events was 166. Although interview schedules and lists comprised about 80 pages (see the appendix to the Laumann and Knoke volume), the overall response rate amounted to 92.3%. Figures like this remained unmatched by other attempts of comparing policy processes across domains and countries. At the same time, this also resulted in an initial reluctance of established types of research vis-à-vis network-analytic approaches. The sheer number of ties and relations, in terms of contacts and resource exchanges generated by such a high number of actors, together with the intricacy of analyzing them in algebraic terms led many scholars to question the benefit of and value added by such a painstaking procedure. Overall, the study of political and policy domain networks considers state and society in their complexity and comprises the entire range of policies, politics, and the polity. Its focus is essentially on influence and domination as determinants of different types of power (coercive, authoritative, egalitarian, persuasive) and, in its most advanced form, on the role of power differentials in the predictions of future policy outcomes and courses of action (Knoke, 1990).

Policy Network Analysis

Compared with the analysis of political networks in the broader sense, which share quite a number of questions and of terminology with organizational sociology, there is a considerably higher number of publications in the field of policy network analysis—a field that started to boom in the early 1990s. In logical terms, the latter actually represents a subcategory of the former. It also rests on a different research tradition, namely on public policy analysis. Beginning in the early 1990s, there has been a steady increase in the number of both qualitative and quantitative publications. Compared to the absolute figures of relevant publications in organizational sociology for the year 2000 (about 440), the development of policy network analysis (about 50) appears to be relatively modest. Within the narrower field of political science, however, its expansion is impressive.

In one of the first publications opening the debate on policy networks, a research program was sketched out that soon became a growth industry for the following two decades. It was most vigorously exposed in the contribution by Patrick Kenis and Volker Schneider (1991) to an edited volume on policy networks that assembled theoretical, methodological, and empirical contributions. The authors argued that policy analysis and network analysis possess an important potential for cross-fertilization. Network analysis was introduced as a technical tool applicable to any form of social or political exchange. At the same time, networks were also said to represent a kind of broad societal governance structure—that is, to reflect real changes in the way policy processes unfolded in highly modern settings. New modes of governance, characterized by an increasing blurring of boundaries dividing the public and the private spheres in a number of advanced countries, have indeed emerged more or less simultaneously with the network paradigm. After 20 years, since that early observation about a simultaneous occurrence in advancements in methods and transformations in empirical reality, the question must be asked as to whether such a compound understanding of networks has really enriched the new subdiscipline. At least, it has given way to an endless debate on the actual meaning of networks in politics and on the usefulness of the concept's application to concrete cases.

Views by most scholars today converge on the image of a semisovereign state of increasing ungovernability, of demand overload, and of the subsequent emergence of public–private alliances and networks in agenda setting, decision making, and the implementation of policies. For most of the 1990s, nonetheless, a large fraction of the literature became entangled in attempts at categorizing existing approaches, mostly according to rather subjective criteria, rather than embarking on the empirical study of specific policies. Networks were thought of by many as reflecting properties alternative to established organizations and forms of organizing social life and, hence, were held to be empowering, enfranchising, and socially desirable, thus, ultimately undermining inflexible, deadlocked, and irresponsive authority structures. One of the issues frequently addressed was the relationship between the so-called issue networks, policy communities, and policy networks—all concepts differently characterized and classified according to personal taste and proclivity. Another schism was linked to an assumed dichotomy of vertically versus horizontally structured configurations. While the governance school claimed networks to be equalizing instruments for the pursuit of efficiency enhancement in the delivery of public services, empirical analysis all too often found relational structures exhibiting power differentials and vertical forms of subordination of all sorts. Some authors treated networks as quasi-organizations, with a sort of membership statute and a corporate identity of their own, deliberately built up and, therefore, subject to network management strategies. Conversely, others maintained that networks could only be identified by an outside observer with the help of boundary specification and other empirical tools since sample members were frequently not aware of forming part of a network altogether. Finally, another view had it that policy networks would only emerge under very specific conditions most often linked to high degrees of societal modernization, while others claimed networks to be a ubiquitous phenomenon independent of any particular political environment.

Overall, no single review article has managed to structure the field in a coherent and empirically grounded way. This unsustainable condition has now been rectified. In a 2007 study, Leifeld takes both the extensive growth rates of the literature and the conceptual disorder characterizing the field as a rationale for presenting a systematic and empirically based classification. He draws on a structured bibliography of 1,014 publications related to political networks. With a view to empirical (nonconceptual) contributions alone (746 entries), the final analysis yields the following insights: In terms of decreasing relative frequency, the areas of inquiry most often addressed are governance/public policy; Europeanization; local, urban, and rural studies; nongovernmental organizations (NGOs) and social movements; international relations; electoral systems and voting; civil society; elite networks; social capital; globalization; and democracy. Regarding the policy domains studied by policy network analysts, the rank ordering is as follows: environment, health, agriculture, social policy, labor, telecommunications, economy, regional policy, domestic affairs, energy, research and technology, industry, science and education, gender issues, chemicals, migration, and transport. The bulk of empirical research focuses on Europe rather than the United States, with Germany and the United Kingdom attracting the most attention. Both of these are closely followed by studies of policy processes at the level of the European Union. Considering only strictly quantitative contributions, the author has found that the following methods and indices are the ones that are most often used (decreasing relative frequency): centrality, density, multidimensional scaling, block modeling, cluster analysis, and clique analysis. Administration, governments, and parliaments lead the list in terms of main governmental targets under scrutiny, while trade associations, trade unions, companies, NGOs, political parties, think tanks, and social movements figure most prominently in the category of private actors. The most frequently analyzed types of relations are information exchange, contact, cooperation, influence reputation, resource exchange, alliance, mutual issue interest, and conflict.

An extensive cocitation analysis of the quantitative policy-analytic literature, itself being pursued in a network-analytic fashion, reveals the existence of four clearly distinguished thematic clusters (i.e., epistemic communities or invisible colleges): first, political exchange in the organizational state; second, elite networks in North America and world systems theory; third, participation and social capital; and fourth, governance and interest intermediation. As Leifeld notes, a further and slowly emerging fifth cluster includes culture-based approaches essentially centered on the advocacy coalition framework.

Conclusion

Even if there should be something like a secular trend pointing toward an increasing relevance of relational research, it is far too early to speak of a comprehensive paradigm shift with respect to the growing attractiveness of network analysis. Mainstream political science, at least, continues to be concerned with heuristics, being more traditional, and prefers working within clearly delimited disciplinary boundaries that can be traced back to the perspectives of self-action and interaction. Nonetheless, the current move toward the study of new forms of governance, in conjunction with network models and approaches, may lay the foundations for a relational political science—or structural "politology"—capable of addressing the evolution of complex organizational ecologies (intraorganizational, organizational, and interorganizational) and forms of societal order (state, market, and society) at the subnational, national, European, and international levels. The theoretical and methodological bridges and connections for the emergence of such a theory, at least, are ready for use. They just need to be picked up.

NEUTRALITY

Neutrality refers to a fundamental foreign and security policy orientation of a state: A neutral state will not take part either directly or indirectly in any forthcoming war between third-party states. Neutrality consists of a legal core—neutrality law—and political guidance notes—neutrality policy. It contains both realistic assumptions about state survival and idealistic commitments to nonviolent means of conflict resolution. Until the rise of collective security, neutrality was seen as the only viable security policy alternative to membership in a military alliance available to small states. This entry begins with a historical overview and an introduction to neutrality law and neutrality policy. This is followed by a comparison of neutrality and collective security as well as some final reflections on the significance of neutrality in the modern era of globalization.

Historical Origin

Taken literally, neutrality means neither-nor (from the Latin *ne-uter*). Its origin as a foreign and security policy orientation dates back to a time when European nation states were commonly fighting each other. The concept of state sovereignty emerged in the same period. The right to wage war was constitutive of that international order. Neutrality correlated to this right: it offered the possibility of abstaining from war in an environment in which not taking sides would otherwise be viewed as opportunism or even cowardice.

Neutrality was mainly a survival strategy for especially small states, which were in permanent danger of being overrun by larger ones. Smaller states were not usually primary targets, but conquering them was a way of preventing them from either falling to one side or freely siding with the other. Thus, neutrality's original purpose was to help states defend their interests in an international environment marked by interstate conflicts. Besides this realistic perspective, neutrality has also represented a traditionally idealistic approach to international relations; a neutral state's claim to abstain from war was also a commitment not to add violence to existing conflicts. Even though it was originally conceived of as a survival strategy, neutrality inspired ways of thinking linked to a nonviolent approach to international conflicts. One example was the concept of neo-neutrality put forth by Georg Cohn in the period between World Wars I and II. It advocated active and collective disqualification of war parties by all neutral states, including the use of sanctions. Neutrals would stay outside the war, and it was stipulated that their sanctions should not be of a military nature.

This idealistic connotation of neutrality was reinforced through the tendency of neutral states to compensate for their military absenteeism by strengthening their political engagement to diminish the suffering caused by war. This engagement could take the form of humanitarian actions or attempts to end military conflicts. It was usually not pursued out of idealism or as a peace strategy but out of a perceived need to show solidarity with the war parties and the difficulties and costs they incurred.

Neutrality Law

The legal rights and obligations of neutrality are rooted in the Hague Conventions of 1907 and in the Geneva Conventions of 1949 on international humanitarian law. Neutral states are required not to participate in war either directly or indirectly. They should not support war parties with military means nor should they make their territory available to such parties, supply them with weapons or funds, or restrict private weapon exports in a one-sided way. Neutrals are also required to defend themselves autonomously against violations of their neutrality. Neutrality excludes the right to belong to a military alliance since such a membership would entail the exact opposite of neutrality: While neutrality raises the expectation that a state will not participate in a future military conflict, participation in a military alliance includes the obligation that a state will support its fellow members in a potential military conflict. Thus, according to international law, neutrality is a clearly and narrowly defined status. If a state adopts an extensive neutrality policy, this occurs out of political considerations and not out of legal obligations.

Neutrality Policy

To fulfill its function, neutrality demands acceptance by third parties. This leads to a minimum degree of credibility. Neutrality policy comprehends the measures a state takes to guarantee the efficiency and credibility of its neutrality. In contrast to neutrality law, neutrality policy is not legally regulated. Neutrality policy may be defined in line with the interests of each individual neutral state. States that qualify themselves as permanently neutral obligate themselves to conduct a foreign policy, even in peace time, that enables them to remain neutral in a potential conflict. This is based on what are called the pre-effects of neutrality.

Active neutrality refers to a policy stance that underscores that neutrality does not necessarily need to be equated with foreign policy abstention. Neutral states have often interpreted their neutrality as providing them with both an option of assuming and an obligation to assume specific tasks in international relations. Switzerland has followed a policy of so-called good offices since the end of the 19th century. Such offices attempt to bring parties in conflict closer together. They exert no political influence or pressure, striving instead to assume protective power mandates, provide conference space, or offer arbitration assistance. Other West European neutrals such as Austria, Finland, Ireland, or Sweden have a long tradition of active engagement with United Nations (UN) peacekeeping operations. During the Cold War, all neutral states played an important role in the Conference on Security and Cooperation in Europe. Together with the nonaligned states, they formed the so-called Neutral and Nonaligned group, which strived to be a third actor between the Western and Eastern blocs.

Neutrality policies have varied considerably across time and states. Switzerland has adopted a rather comprehensive neutrality policy. It did not even join the UN until 2002 because it saw the obligations of collective security as incompatible with its neutrality obligations. The other Western European neutrals, however, had no second thoughts about being members of that worldwide organization.

The situation was different in regard to the European integration process: With the exception of Ireland, no neutral Western European state joined the European Community (EC) during the Cold War. They considered this type of political and trade cooperation as incompatible with their neutrality policy. From a legal point of view, there would have been no obstacles as the EC was not a military alliance. After the Cold War had ended, Austria, Finland, and Sweden joined the European Union in 1995.

Neutrality and Collective Security

The core objectives of collective security and neutrality are similar: Both want to regulate and limit the use of force in interstate relations. But they differ in regard to the means: Whereas collective security builds on active commitment and participation of all states, neutrality is based on individual abstention.

Neutrality and collective security may be seen as concurrent concepts: If there were a perfectly working system of collective security, there would be no need for neutrality. The international community would deal with any international aggression. However, as no perfect collective security system has yet emerged, neutrality may be seen as complementary to collective security: The better collective security works, the less neutrality is needed, and vice versa. In history, this has repeatedly confronted neutral states with difficult choices.

With the emergence of the League of Nations in 1920, neutral states had to decide whether to join the newly created organization of collective security. All of them opted for participation in the League. Switzerland distinguished between its readiness to participate in the League's economic sanctions and its reservations toward potential military sanctions, for which participation was excluded. The term *differential neutrality* was coined to cover this nuance. After the failure of the League, the country returned to its *integral neutrality*.

Today, all neutral states are members of the UN. Military interventions led or approved by the UN are not considered as traditional interstate wars but as supranational police actions in which the international community sanctions the transgression of international norms by one or several of its members. Such measures do not qualify as traditional wars and therefore neutrality law does not apply to them. However, neutrality remains relevant in the case of international interventions that are not decided by the UN. Examples of such interventions were the NATO-led intervention in Serbia/Kosovo in 1999 and the U.S. Iraq intervention in 2003.

Neutrality and Globalization

Neutrality reflects an attitude toward military conflicts between third-party states. It does not apply to intrastate conflicts nor to transnational forms of conflicts such as terrorism. Neutrality is not relevant to global nonmilitary perils: It provides no answer regarding problems of global health, climate change, or international financial stability. Thus, neutrality has lost much of its traditional core significance in the era of globalization. It provides no guidance regarding some of the most relevant issues in international relations.

However, neutrality still qualifies as a foreign policy role conception: In countries with a neutrality tradition, it provides political legitimacy for the respective foreign policy inside the country. It also allows third parties to have certain expectations in regard to the country's foreign policy behavior: They may expect that a neutral state—compared with other countries—will have a stronger tendency to refrain from the use of military means in international affairs. A neutral state will also show a natural inclination to promote international conflict resolution. Owing to their track records, neutral countries have comparative advantages as honest brokers.

These attributes of neutrality and also its contribution to a nation's political identity build on neutrality's political core and not on its legal dimension. Neutrality was at the origin of both realistic and idealistic role conceptions. The first emanated from neutral states' military absenteeism, the second from the basic commitment of neutral states to regulate and limit the use of force. The relative importance of both categories depends on the international structure in which neutral states operate. In a state system characterized by a clear reduction in interstate military conflicts, the idealistic role conception has gained significance compared with the realistic one. Neutrality's role as a foreign policy identity provider has become its most important function since the end of the Cold War. It is based on what used to be neutrality's secondary function—namely, its idealism or missionary belief. Neutral states used to be experts in compensating for their lack of military force and engagement with other power and activity dimensions. Neutrality may keep this function as long as neutral states actively contribute to the promotion of peaceful international relations. It should not be seen as encouraging passive contemplation of injustice, violence, and oppression. Nor was neutrality defined as a neutral attitude toward attempts to prevent military conflicts.

NEW PUBLIC MANAGEMENT

New public management (NPM) is a general concept denoting a global wave of administrative reform that has had an impact on the public sectors of many countries for more than 2 decades. It is inspired by a broad neoliberal ideology and a particular set of normative values whose main focus is on increasing efficiency. In this sense, NPM is rather one dimensional and produces some tensions with other norms and values within the public sector.

The concept was launched by Christopher Hood in an article published in 1991. Most NPM reform efforts have had similar goals: to improve the effectiveness and efficiency of the public sector, enhance the responsiveness of public agencies to their clients and customers, reduce public expenditure, and improve managerial accountability.

Definition of NPM

One primary characteristic of NPM involves public organizations adopting the management and organizational forms used by private companies. It challenges two traditional doctrines of public administration: that public sector organizations are "insulated" from the private sector in terms of personnel, structure, and business methods and that they operate in accordance with a precise set of rules limiting the freedom of public officials in handling money, staff, contracts, and so on. In contrast, the NPM movement subscribes to the principle that the formal organization of the public and private sectors should be similar and that managers in public sector organizations should have discretion and leeway in their daily work, so as to make efficient use of allocated resources.

Even if NPM fundamentally espouses economic values and objectives, as a concept, it is loose and multifaceted and encompasses a range of different administrative doctrines. It offers a kind of "shopping basket" of different elements for reformers of public administration. The main components of NPM are hands-on professional management, which allows for active, visible, and discretionary control of an organization by people who are free to manage; explicit standards of performance; a greater emphasis on output control; disaggregation of units; and private sector management techniques. It also includes splitting up public organizations through horizontal specialization (single-purpose organizations) and vertical specialization (structural devolution); increased exposure to competition, contract management, and market orientation (contracting out, purchaser–provider models); increased emphasis on service orientation and user participation (citizen charters); and cost cutting and budgetary discipline. NPM is supposed to score high on managerial autonomy and *ex ante* control and low on policy autonomy and *ex post* control.

Ewan Ferlie distinguishes among four different NPM models: the efficiency drive, downsizing and decentralization, the search for excellence, and public service orientation. NPM promises to integrate these themes, linking efficiency and accountability. Other distinctions are between "hard NPM tools," which address accounting, auditing, and performance measurement, and "soft NPM tools," which include things such as human factors, user orientation, quality improvement, and individual development.

NPM in a Theoretical Context

NPM reforms are not based on one theoretical foundation but are a collection of reform elements sharing several common characteristics. When NPM reforms are said to be typically theoretical, this often means that contractualism and economic theories dominate. Examples are public-choice theories, principal–agent models, and transaction-cost models. NPM, with its economic performance and market focus, sees other values and considerations embedded in the civil service as more or less unproblematic and not generally threatened or negatively affected by the efficiency and economy focus of NPM.

The second set of ideas comes from the managerialist school of thought, which focuses on the need to reestablish the primacy of managerial principles in the bureaucracy. This concentration on enhancing the capacity of managers to take action requires attention to decentralization, devolution, and delegation.

The tensions arising from the hybrid character of NPM, which combines economic organization theory and management theory, are well known. These tensions result from the contradiction between the centralizing tendencies inherent in contractualism and the devolutionary tendencies of managerialism. NPM is something of a hybrid, advocating both decentralization (let the managers manage) and centralization (make the managers manage). NPM thus prescribes both more autonomy and more central control at the same time.

Many of the most important and problematic reform elements, such as the relationship between public managers and elected officials, reflect the potential tensions in the way these reform elements are combined. Through devolution and contracting out, NPM has sought to separate policy making more clearly from policy administration and implementation. Policy makers make policy and then delegate its implementation to managers and hold them accountable by contract.

Driving Forces Behind NPM

There is no one-factor explanation for the emergence of NPM. The driving forces behind such reforms are partly ideological, but they are also marked by administrative culture, characteristics of the political-administrative system, and the fiscal situation of the country in question. The institutional dynamics of reforms can best be interpreted as a complex mixture of environmental pressure, polity features, and historical–institutional context. These factors define how much leeway political leaders have in making choices about reforms—that is, they both further and hinder NPM reforms.

One school of thought regards NPM primarily as a response to external pressure. This environmental determinism can be of two kinds. In the first instance, a country may adopt internationally based norms and beliefs about how a civil service system should be organized and run, simply because these have become the prevailing doctrine. NPM had its origins in certain English-speaking countries and international organizations, like the Organisation for Economic Co-operation and Development (OECD), where a kind of reform myth took hold, became ideologically dominant, and diffused all over the world. This diffusion process implied isomorphic elements, creating pressure for similar reforms and structural changes in many countries.

In the second instance, NPM may be seen as the optimal solution to widespread technical problems—that is, it has been adopted to solve problems created by a lack of instrumental performance or by economic competition and market pressure. In this instance, NPM reforms were adopted not because of their ideological hegemony but because of their technical efficiency.

Another view holds that reforms are primarily a product of the national historical–institutional context. Different countries have different historical–cultural traditions, and their reforms are path dependent, meaning that national reforms have unique features. The reform roads taken reflect the main features of national institutional processes, where institutional "roots" determine the path followed in a gradual adaptation to internal and external pressure. This view stresses institutional autonomy and internal dynamics. The greater the consistency between the values underlying the reforms and the values on which the existing administrative system is based, the more likely that the reforms will be successful.

A third view emphasizes that different countries have different constitutional features and political-administrative structures and that these factors go some way in explaining how they handle national problems and reform processes. The main features of the polity, the form of government, and the formal structure of decision making within the political-administrative system may all affect a country's capacity to realize administrative reforms. From a structural or instrumental point of view, the reforms may generally be seen as conscious organizational design. This perspective is based on the assumption that political and administrative leaders use the structural design of public entities as instruments to fulfill public goals. The major preconditions for this are that the leaders have a relatively large degree of control over change or reform processes and that they score high on rational calculation or means–end thinking.

Thus, external reform components and programs are filtered, interpreted, and modified by a combination of two further nationally based features. One feature involves the national political-administrative history, culture, traditions, and style of government. The other involves national polity features, as expressed in constitutional and structural factors. Within these constraints political and managerial executives have varying amounts of leeway to launch NPM reforms via an active administrative policy.

NPM Diffusion: Convergence, Divergence, or Both?

According to the OECD, NPM represents a global change of paradigm concerning the control and organization of public service. This convergence thesis is, however, contested. NPM has led to major changes in the public sector in many countries. However, the process of reform has not been the same everywhere. In some countries there might be a strong element of diffusion of NPM ideas from outside, whereas in others the reform process might be more a result of national or local initiatives that have subsequently acquired an NPM label. Thus, the spread of NPM is a complex process, going through different stages and packaged in different ways in different countries, with each country following its own reform trajectory within a broader framework. NPM is not a neat package of reform elements having a specific starting point and following a specific path toward a common destination.

NPM ideas have been implemented to different degrees, at different paces, and with differing emphases on the various elements of the reform package in different countries and sectors. A general finding is that the degree of variation between countries and also between policy areas increases when we move away from the world of ideas, discussion, and policy programs and look at specific decisions, and this increase is even more apparent when we consider the implementation and impact of the reforms. It is debatable whether NPM has led to the convergence of administrative systems in different countries, but there is much to suggest that ideas and policy programs resemble one another more than the corresponding practices do.

Even though countries to some extent present their reforms in similar terms and support some of the same general administrative doctrines, closer scrutiny reveals considerable variation. Christopher Pollitt and Geert Bouckaert distinguish among four groups of NPM reformers: the maintainers, the modernizers, the marketizers, and the minimal state category. Countries such as the United Kingdom, Australia, and New Zealand fit the marketizer profile. Continental Europeans are more skeptical about NPM, except for the Scandinavian countries, which are somewhere in between.

Having begun in Britain, the reform wave has become strongest in Anglo-American countries. In Westminster-style parliamentarian systems, NPM reforms fell on fertile ground and were therefore implemented early and had far-reaching effects. This was due, on the one hand, to strong external economic and institutional pressure and, on the other, to few constitutional and administrative obstacles, a compatible culture, and parliamentary conditions that favored a radical strategy and reform entrepreneurs. By contrast, the Scandinavian countries were reluctant to implement reforms. Environmental pressure was weaker, their Rechtsstaat culture and strong egalitarian norms were less compatible with the values of NPM, there were more obvious constitutional obstacles, and parliamentary conditions often characterized by minority coalition governments made a radical reform strategy difficult to pursue.

Thus, there is no consistent movement toward a new isomorphic model of civil service systems. Most governments still share some main elements of the traditional system of public administration. However, some strong common trends in modernizing public services have emerged across groups of countries. One of these is a reduction in the differences between the public and private sectors. Nevertheless, the story is not only one of convergence, meaning that all countries are moving in the same direction, nor is it a story only of divergence, whereby all countries follow their own trajectories constrained by their specific context, legacy, and tradition. Instead, what we are seeing is a complex mixture of robustness and flexibility and of reform paths that can hardly be explained by using a single-perspective approach.

Variations in reform practice from one country to another are the rule rather than the exception.

Different countries and governments face different contexts, risks, and problems and start out with different values and norms. In other words, they have different starting points, are at different stages of reform, and face different external and internal constraints. What we might see is two trajectories. One is represented by civil services that have been modernized within state traditions and are therefore rather closed and resistant to external pressure. Here, the reform process is more hesitant and does not involve major shifts. The other trajectory is represented by civil services that are more vulnerable to external pressure and more open to NPM concepts, resulting in more radical reforms. The first instance is typical of the Scandinavian welfare state; the second characterizes Australia and New Zealand.

Effects of NPM Reforms

The main hypothesis of NPM reforms is that increased market orientation and management focus lead to increased efficiency, without causing negative side effects for other goals and concerns. But this hypothesis is far from having been confirmed as evidence-based knowledge. It might be right under specific conditions but not as a general characteristic of NPM reforms everywhere and at all times.

Effects are often assumed or promised, but there are few systematic and reliable studies of the effects of NPM reforms. Hard evidence is often lacking. Often strategies, plans, and selective success stories are the focus of attention rather than systematic analyses of results. Research has generally focused more on answering questions about why reform happens than on trying to reveal the effects of initiatives.

We know less about external political learning and societal effects than about internal administrative effects on efficiency. One finding is that vertical and horizontal specialization through structural devolution and the establishment of single-purpose organizations have led to fragmentation in public administration and thus increased coordination problems. Another finding is that NPM reforms in some cases can have positive effects on efficiency, but the efficiency gains also vary according to the tasks and services in question. Competition might bring savings on costs, more efficient production, and more flexible and user-friendly services. But there might also be negative side effects in the form of increased social problems.

The effects on efficiency are usually less than what reform advocates have predicted. This is partly because transaction costs as well as administration and operational costs of the new arrangements may not have been taken into consideration. NPM reforms have led to increased efficiency in some public sector organizations, at least in the short term. Responsiveness to users tends to be improved by NPM reforms, but there are also clear indications of a reduction in equality. It appears that improved efficiency and responsiveness have been achieved at the expense of equal treatment. On the other hand, NPM reforms have had a positive effect on the freedom of choice of services.

A fundamental dilemma for many NPM reforms is the tension between autonomy and control. Organizations should have enough freedom to be run in an efficient way, yet not be so free that superior levels of leadership lose power and control. The aim is to achieve more freedom and greater control simultaneously. Whether or not NPM strengthens political control and leads to better political steering is an open question. Some claim that NPM reforms will reduce political steering and control and transfer power and influence to state-owned companies and autonomous agencies, and there is some evidence for that. But there are also studies indicating that NPM tools like performance management have improved top-level executive control. The new organizational forms have led to changes in how public organizations are controlled. The traditional, *ex ante*, informal, internal, collegial, and trust-based forms of control are waning, and the more *ex post*, formal, external, professional, and distrust-based forms of control are waxing.

One conclusion to be drawn is that the design of various NPM reforms may vary considerably across countries, tasks, sectors, and administrative levels and will have consequences for effects studies. The implication is that discussions of the effects of reform must strive for exceedingly precise terminology and must not be conducted at a general level.

In sum, it is hard to say unequivocally what the effects of NPM reforms are. NPM's results are disputed and uncertain. The paradox as stated by Pollitt and Bouckaert is that these kinds of reforms do not seem to need results to fuel their onward march.

Future Development and Application

There is a need to look beyond NPM—what has been termed *transcending new public management*. The central question being asked is whether NPM is finished. While some, citing the crises that NPM has experienced, proclaim that it is indeed dead, others tend to support the view that this is by no means so. It has, however, been challenged: New types of reforms have been added to those already in place, and there have been some reversals, especially when it comes to the disaggregation components of NPM. The new reforms tend, however, not to replace the old. They represent readjustments, modifications, and supplements rather than radical change. Priorities have shifted from a drive to create agencies and autonomous bodies that enhance efficiency to a quest to find the right balance between accountability and autonomy by focusing on weak coordination devices, lack of governing capacity, and weak accountability mechanisms.

The reforms that were undertaken under the NPM label paved the way for further reforms and transformations in the post-NPM era. Market solutions and market ideology now seem to have become more or less institutionalized within the public sector, albeit without erasing major Weberian features of the Old System, and a certain amount of reregulation has taken place in recent years. The trend toward single-purpose organizations is another feature of NPM reforms that recent reforms have modified by introducing more coordination and collaboration across and within political-administrative systems. A third element of NPM was structural devolution, which resulted in the autonomization and agencification of public sector organizations. However, in recent years this has been countered by a reassertion of the center and a strengthening of central state capacity.

A main finding in the research in this area is that administrative reforms have not taken place along a single dimension. In practice, we face mixed models and increased complexity. It is fair to say that NPM is still very much alive in many countries and that NPM reforms have normally not been replaced by new reforms but rather revised or supplemented by post-NPM reforms. The pace and comprehensiveness of these trends has varied significantly from one country to another and from one policy area to another, and reform activities embrace a wide spectrum. Even though NPM in certain ways has been a success, it is too early to conclude that the old public administration model is unsustainable. It has considerable capacity to adapt and is both robust and flexible, even after a long period of NPM reforms and emerging post-NPM reforms.

Typical for the NPM reforms was that the formal structural system changed from an integrated to a fragmented one. The formal levers of steering were weakened, the distance to the agencies grew, political signals became weaker, and horizontal specialization increased according to different principles. The second generation of reforms uses formal structures to regain control or modify the loss of political influence by making them more centralized, complex, and varied.

Formal structural instruments have been used to modify not only devolution and vertical specialization but also horizontal fragmentation and specialization, especially in Australia and New Zealand. Vertical control and levers of control are increasingly being applied, while a "whole-of-government" approach uses new coordination instruments and cross-sector programs and projects to modify horizontal fragmentation.

The spread and diffusion of agency or regulatory agency forms across countries in the first wave of reforms may be seen as an institutional standard, script, or prescription with symbolic value. This applies just as much to the second generation of modern reforms, where the fashion is now to have "whole-of-government" or "joined-up government" models that foster more coordination and control. The question is whether these trends are more about symbols than about reality and whether they really constitute a clear break with NPM.

What kind of further trends might we expect in countries that have implemented elements of NPM? A first scenario is the idea of a linear process toward more market, management, and efficiency. A second scenario is a cyclical development implying that, after a period of NPM, there will be a reaction to the norms and values that the reform is built on leading to a return to some of the main features of "old public management" and a rediscovery of the Weberian bureaucracy.

A third scenario is a more dialectical process under which public services become more complex. Institutional change is a sedimentation process in which new administrative reforms do not replace old forms but supplement them. There is a layering and mixture of old public administration, NPM, and post-NPM reforms producing hybrid organizational forms. The changes we have seen in recent years tend to come closer to the third scenario than to the first.

NONGOVERNMENTAL ORGANIZATIONS (NGOS)

The origin of the term *nongovernmental organization* lies in the need for those drafting the United Nations (UN) Charter in 1945 to make a distinction between the procedures for the UN's relations with other intergovernmental organizations linked to the UN as specialized agencies and its relations with international organizations that had not been established by intergovernmental agreement. Under Article 70, the Economic and Social Council of the UN (ECOSOC) was to make arrangements for representatives of the agencies "to participate, without vote, in its deliberations," whereas under Article 71 NGOs would have a secondary status:

> The Economic and Social Council may make suitable arrangements for consultation with non-governmental organizations which are concerned with matters within its competence. Such arrangements may be made with international organizations and, where appropriate, with national organizations after consultation with the Member of the United Nations concerned. (Article 71 of the UN Charter)

Gradually the term *nongovernmental organization* passed from the diplomatic world into general usage. However, its meaning at the UN and its meaning in popular discourse are not the same.
