Political systems and their social environment are in constant communicative exchange. The basis of such communication is the aggregation and conversion of social interests into political decisions (interest intermediation) as well as the transmission of political values and norms into society (intermediation of politics). Political communication consists of the exchange of information about politically relevant topics. It can take place because constitutional regulations organize this exchange of information and groups of citizens take part in it. Political communication can also take place without the exchange of information being organized by the governmental system. Effective political communication is established if, from the side of the political system, there is a high degree of transparency of its institutions and decisions. Political communication is the basis of participation in political decision making and decision processes. Political communication acts as a socializing process if, in the system and the system environment, the efficiency of exchange of information between institutions and participants is ensured by steering processes (through norms, culture, sanctions, etc.).

Transparency, participation, and efficiency are regarded as the “magic triangle of social science.” They are principles of organization that determine the success of political communication. The relevance of the principle of participation determines the extent to which political communication enables the learning of participation skills.

As far as political communication is organized by a political system, its institutions act as agents for political socialization. The accomplishments in socialization are the result of the practice of organized political communication between the system and the environment of the system. Through passing on of prevailing norms and values and thereby the culture of the system (political culture, organizational culture, etc.), it allows the possibility of evaluation of the system output (laws, party platforms, etc.) and ensures the return of information (input) into the system, whereby innovation (e.g., political reforms) is made possible. The socialization of the political system thus increases the learning capacity of the political system and its facilities. It is the basis for a successful conveyance of politics.

Conclusion

The learning capacity of the political system and thereby its survivability depend on an organized exchange of information between politics and society as well as between political and administrative facilities and citizens. In a democracy, this exchange is organized by parliament and through intermediate actors of civil society (parties, organizations, associations, etc.). Their achievements are measured in terms of how far they are able to exercise political communication. In a democracy, the medium of political communication is the political public. In the medium of the political public, socialization obtains its empirical location, and from the political public, it derives its normative power.

POLITICAL SOCIOLOGY AS A FIELD OF STUDY

Political sociology deals with the nexus between social and political life. Traditionally, the political consequences of social arrangements are stressed, but attention has also been paid to the social consequences of political arrangements. Combining these two perspectives, political sociology studies links political and social phenomena; that is, it is an interdisciplinary endeavor combining social and political factors to explain distributions of power and dominance in state and society. Almost by definition, intermediary actors and institutions such as interest groups, political parties, and voluntary associations play an important role. The main research topics of political sociologists are voting behavior, new social movements, parties, civil society, and interest groups (usually input-oriented microlevel approaches), on the one hand, and state formation, transformations of political systems, and political reform processes (usually output-oriented macrolevel approaches), on the other.

In the past decades, the distinction between state and society gradually disappeared and has been replaced by a melding and blending of political and social phenomena. The rise of multinational corporations, international organizations, nongovernmental organizations (NGOs), and the spread of international interdependencies and supranational arrangements changes the position and nature of the state, whereas rising levels of education, welfare, social security provisions, secularization, and individualization imply similar changes for society. As a consequence, political sociology as a field of study seems to have lost much of its traditional position to more specific approaches. The first question to be dealt with here concerns the distinction between the use of social factors to explain political phenomena (a "sociology of politics") and the explanation of social phenomena using political factors (a "political science of society"). Political sociologists stress the reciprocal nature of these relationships and the need for integrated approaches. Second, the main theories used in political sociology—modernization theories, variants of Marxism, rational choice theories—are presented by following the debates since World War II. For each of these approaches, the major goals and attainments are presented and illustrated with a closer look at one or two seminal works. As will become clear, these newer approaches still rely on the presumption that a distinction—or at least an analytical distinction—between political and social phenomena makes sense. Finally, the consequences of the massive shifts in the relationships between state and society for political sociology as a field of study are scrutinized.

An Interdisciplinary Hybrid

Political sociologists study topics such as interest groups, state formation processes, old and new social movements, class-based power, public opinion, elites, trade unions, civil society, the spread of governance practices, and social and political participation. What do those very diverse subject matters have in common that arouses the curiosity of political sociologists? Ordinary answers to this question usually point to *power* and *domination* as core concepts to draw a line of demarcation. In this way, typical broad definitions of political sociology presented in social science encyclopedias refer to the "operation of power in social life" and the distribution of power at the various levels (individuals, organizations, communities, countries, etc.). Other definitions stress the "social causes and consequences of given power distributions" or the "study of power and domination in social relationships" as the defining characteristics of political sociology. In this way, it could include studies of the distribution of power in families, the mass media, universities, parliaments, trade unions, and so on. These broad definitions underline the wide range of topics studied by political sociologists. Referring to power and domination is certainly helpful to characterize the field in general terms, but the use of these terms is a necessary but not a sufficient condition to define political sociology. Since virtually every topic studied by social scientists is related to the operation and distribution of power, further specifications are required. Such a more specific definition of political sociology as a field of study implies, first, a closer look at the distinction between the political and the social and, second, a specification of the presumed causal directions in our explanations and interpretations.

Any study of the relationships between political and social life—between state and society—is based on the conjecture that these two areas, indeed, can be distinguished. Yet in the history of ideas, this is a fairly recent invention. In his essay on the origins of political sociology, Walter Runciman (1963) points to the national state and the rise of the bourgeoisie in the 18th century as the main factors stimulating a distinction between the political and the social. Exactly that distinction made political sociology possible and sensible, and it initiated a wealth of studies focusing on the relationships between state and society from a wide variety of perspectives. More recently, a distinction between state and society or between the political and the social has become increasingly problematic. The developments in the last few decades show a remarkable extension of politics and political power. Besides, the distinction between political and nonpolitical activities or areas became blurred or disappeared completely. Yet characterizing political sociology on the basis of a distinction between social and political life does not presume that these two areas can be distinguished empirically unequivocally. In fact, using this distinction analytically and conceptually allows political sociologists to point out the historical roots of their discipline and to analyze actual developments in terms of a melding and blending of political and social phenomena.

Accepting an analytical and conceptual distinction between social and political life gives rise to a second complication. Traditionally, specific demarcations of political sociology are obtained by drawing attention to the relationships between state and society. In this approach, political sociology deals with the ways in which social and societal factors have an impact on political phenomena, or vice versa, it deals with the ways in which political factors influence social phenomena. The first perspective might be labeled as a "sociology of politics" and is common among American sociologists. For instance, the major aim of the Political Sociology Section of the American Sociological Association is to promote activities of those concerned with a sociological understanding of political phenomena. The combined Committee on Political Sociology of the International Sociological Association and the International Political Science Association (IPSA) relies on a somewhat broader approach. In their view, since political sociology is about the nexus between social and political life, the focus is on organizations or individual acts that seek to take or influence political power. Both approaches share an unambiguous interest in the relationships between state and society—they differ, however, in the extent to which the focus is on social factors. Whereas a "sociology of politics" stresses the relevance of social factors for political phenomena, a "political science of society" reverses the argument. In practice, the disciplinary roots of sociologists and political scientists appear to be highly relevant for the selection of one of these perspectives.

In his seminal article on sociology, political science, and political sociology Giovanni Sartori (1969) explicitly rejects the idea that political sociology is characterized by one of these single-directional perspectives. For him, political sociology is an interdisciplinary hybrid whose main goal is to combine social and political explanatory factors as suggested by both sociologists and political scientists. It is not the direction of impacts presumed in the analyses (social factors explaining political phenomena vs. political factors explaining social phenomena) but, more generally, the nexus between social and political life that defines political sociology as a distinct subfield.

As in every major area of the social sciences, political sociologists do not agree on a straightforward definition of their activities or the objects they study. A minimum consensus, however, includes the focus on power and domination in the relationships between social and political phenomena. Political sociologists use this last distinction for analytical and conceptual purposes and presume a reciprocal relationship between political and social life—that is, between the state and society. Claims by either sociologists or political scientists to seize political sociology as an exclusive subdiscipline are not only gratuitous but also do not teach us much about the distribution of power and domination.

The Rise and Fall of Modernization Approaches

Although its roots go back to the work of 19th- and early-20th-century social scientists (Karl Marx, Alexis de Tocqueville, Émile Durkheim, Max Weber, and Vilfredo Pareto, to mention only a few), the heydays of political sociology started after World War II. The spread of modernization approaches especially contributed to this advance. These approaches consider the development of societies as an evolutionary progressive process that is driven by economic and technological forces. Its basic ideas were spelled out by early social scientists and philosophers (Herbert Spencer, Karl Marx). Every society evolves from simpler to more complex ones and passes through various phases or stages depending on the available resources and challenges confronted. In this way, "primitive" societies will gradually become more complex, heterogeneous, and differentiated. Political arrangements, especially state formation and nation building, develop accordingly and are attuned to the social requirements of each evolutionary stage or phase. Modern industrial society—with its capitalist ownership, market allocation, and division of labor—establishes the culmination of this progressive evolutionary process. Conceptualizing social and political developments in this way almost directly leads to the study of reciprocal relationships between social and political phenomena, that is, to the study of political sociology.

Modernization theories obtained their strongest impulses from the spread of structural-functional system theory as a universal framework for studying the evolution of societies. Mainly following the work of Max Weber, Talcott Parsons distinguished between four major social subsystems: the economic system, the political system, the community system, and the sociocultural system. These four subsystems are interdependent and each contributes to the persistence of the system as a whole by performing, respectively, four functions: adaptation, goal attainment, integration, and latent-pattern maintenance (the AGIL scheme). Approaching the relationships between the social and the political on the basis of the Parsonian system theory has many evident advantages. First, a universal framework is presented that offers (functional) explanations for the development of entire societies as an evolutionary process. Furthermore, political phenomena are handsomely conceptualized as a distinct subsystem whose features and developments are systematically integrated in the system as a whole. Third, Parsonian system theory underlines the progressive character of the evolutionary processes studied: A structural-functional explanation is offered to show that primitive societies inevitably will become more complex, heterogeneous, and differentiated. In the end, all societies will converge to a liberal-capitalist society of the U.S. and Western European type.

Early examples of the application of modernization approaches by political sociologists can be found, for instance, in the works of Gabriel Almond, Seymour Martin Lipset, Stein Rokkan, or Robert Dahl. These authors mainly focus on the consequences of social arrangements for the distribution of power to assess the chances for democracy in capitalist society. Major variants include elite theories, pluralist theories, and class-based theories.

The idea that specific groups obtain privileged and leading positions in society directly follows from the basic presumption of modernization approaches that societies increasingly become more complex, heterogeneous, and differentiated. As such, the rise to power of specific groups (elites) is well founded in these theories. Traditional examples can be found in the works of Gaetano Mosca, Vilfredo Pareto, and especially Robert Michels. For Mosca, the driving force behind societal developments is the continuous struggle between groups to gain dominance and power. As a result, society always consists of two groups only: the dominating and the dominated, the powerful and the powerless. As Mosca, Pareto considers elites to be unavoidable. Since human beings are very unequal, society is, by definition, not homogeneous—and elites will not be homogeneous either. Following this argument, Pareto concludes that social change is always based on elite circulation. The replacement of elites is also an important aspect of the work of Michels. Instead of continuous battles or circulation of elites, Michels presumes that a permanent amalgamation of members of old and new elites takes place. Elite amalgamation is ascertained in organizations, and so Michels focuses his attention on developments within organizations and, in particular, within political parties. On the basis of this work, he formulated his famous Iron Law of Oligarchy already in 1911: "Who says organization, says oligarchy."

Pluralist theorists accept the idea that in modern societies elites are inevitable. For pluralists, however, this does not imply that in each area of social and economic life the very same elite group is in power. In fact, increasing complexity, heterogeneity, and differentiation of societal arrangements make it highly unlikely that a single group would be able to dominate several different areas at the same time. Pluralist approaches presume, first, that modern societies are complex and highly fragmented and, second, that different elites gain power in each area. As a result, social life is characterized by conflicts between elites from various areas, which are based on different groups. Pluralists do not simply consider these elites or conflicts between elites as a threat to democracy. On the contrary, especially because of elite competition, progress is possible, and group interests will be taken into account. To avoid the destructive consequences of severe conflicts between elites, the social groups on which they are based should overlap; that is, they should not be completely distinct. If these structural arrangements are fulfilled, successful democratization will be the outcome of modernization. An example of a pluralist approach is the seminal study of Robert Dahl on the distribution of power in an American community in the early 1960s. Conscientiously, he studied decision-making processes in various policy areas in a small town (New Haven, Connecticut) and was able to show the existence of distinct, competing elites in different areas. The existence of these elites does not endanger democracy; it is an essential precondition for its functioning.

Most class-based approaches accept the idea that societies increasingly become more complex, heterogeneous, and differentiated. Instead of focusing on elites, class-based theories prefer a broader conceptualization of the consequences of ongoing modernization for power struggles between social groups and for the resulting social inequalities. Broadly speaking, *class* as a term to depict some group of people is used in two ways: by referring, first, to functional contributions in (industrial) production processes (e.g., *working class*) or, second, to positions in some hierarchy (e.g., *middle class* or *ruling class*). Directly following Marx, political sociologists in the Marxist tradition use class concepts based on contributions to the production process. Other social scientists—among them Max Weber—prefer relational concepts. Since positions in a production process and in a social hierarchy are evidently related, actual research usually deals with both class concepts. In his seminal article on the "social requisites of democracy," Lipset (1959) pointed to the fact that economic development is an important precondition for democracy. Modernization does not only result in complexity, heterogeneity, and differentiation but also implies massive expansion of production capacities and wealth. Increased wealth dampens class struggles and permits broad support for distributional compromises. Besides, a rising middle class will claim political rights and promote democratic values. These combined effects of modernization, Lipset argued, strongly favor democratization in countries with high levels of economic development.

Whereas Lipset searched for the mechanism behind democratization, Stein Rokkan attempted to explain the varieties of modernization in Europe. Political developments in Europe are, according to Rokkan, mainly a consequence of the deep-rooted cleavages that arose in the aftermath of several invasive events (the Reformation, nation building, the French Revolution, the Industrial Revolution). Since these events occurred differently in different places and times, European societies show both similarities and differences. Accordingly, political arrangements show similarities and differences too. Together Rokkan and Lipset analyzed these similarities and differences, especially for party systems and voter alignments in Europe: Evident similarities (such as the existence of social-democratic and Christian Democratic parties) are combined with striking differences (such as the spread of liberal parties). Rokkan and Lipset underlined the strong impact of cleavages by pointing out the fact that party systems and voter alignments in Europe remained "frozen" from the early extension of suffrage until the mid-1960s; that is, the impact of social factors survived two world wars and severe economic turmoil.

The closeness of political sociology to modernization theories in the first 2 decades after World War II provided the upcoming discipline with many advantages. Nonetheless, from the very beginning, modernization theories provoked strong criticism—criticism that applied also to political sociology as its main intellectual ally. A major concern of many critics is the idea that (American) capitalist society and liberal democracy should be seen as the end-stage of a progressive evolution of humanity. This teleological tendency in modernization approaches is rejected as being ideologically biased and epistemologically unwarranted. On a closer look, the presumed progressive evolutionary process in many societies appeared to be fragile, inconsistent, nonmonotonous, and not necessarily following a European or Western model. Furthermore, the basic idea that economic and political developments are interdependent was challenged and replaced by a much more open approach conceptualizing economic and political modernization as two distinct processes whose potential interdependencies should be studied carefully instead of simply being taken for granted. Furthermore, methodological criticisms were raised. Since modernization approaches are based on general frameworks and claims of universality, the usual methods applied were quantitative and comparative (typically, statistical analyses of cross-national data in large-*N* designs). Newer approaches challenged these ideas and considered in-depth historical analyses and case-oriented methods (usually hermeneutic-interpretative and cultural-historical approaches in small-*N* designs) as much more appropriate to the study of complicated reciprocal relationships between the social and the political.

Main Approaches

In a somewhat exaggerated way, one might regard many developments in political sociology in the last half century as attempts to present alternatives for the apparent limitedness, erroneousness, and ideological bias of the modernization approaches of the 1940s and 1950s. Alternative approaches challenge the capitalist distribution of power and its implicated social inequalities as well as the strong emphasis on structural-functional arguments. These disputes reflect a more general change in the social sciences away from social-scientific approaches (emphasizing causal explanations based on regularities and mainly applying quantitative, comparative methods) toward cultural-scientific approaches (emphasizing specific cultural meanings and constructions of meanings; mainly applying qualitative, case-oriented methods). The three major groups of alternatives presented for liberal-capitalist modernization approaches consist of Marxist theories, critical and conflict theories, and postmodern and poststructural theories. But agents of social-scientific approaches did not simply abscond from the battle field. Following mainstream microeconomic theory, deductive approaches based on the idea of human rationality resulted in the blossoming of rational choice approaches as the key to understanding social and political developments. Besides, a revival of modernization theories—based on social-scientific as well as on cultural-scientific approaches—can be observed currently.

Marxism

Liberal-capitalist modernization approaches emphasize structural-functional interdependencies between the political subsystem and other parts of the system. In this sense, American society is usually depicted as the end-stage of progressive evolutionary developments. These propositions have been challenged by political sociologists working in a Marxist tradition. According to these approaches, the capitalist state is not some "subsystem" that adjusts itself in neutral ways to the functional requirements of other subsystems. The genesis of the late-medieval idea of a "state," with its territorial-based claim on sovereignty, can only be understood by looking at the requirements enabling the accumulation of capital—that is, by looking at property rights and the protection of markets at home and abroad. In this way, social and political developments are based on developments in the production process and the accompanying arrangements to acknowledge rights and to legitimate the distribution of wealth. Like modernization theories, Marxist approaches depict liberal capitalism as a stage in the progressive evolution of societies. Contrary to many modernization theorists, however, Marxists regard capitalism and liberal democracy as a transitory phase and not as the end-stage of this evolutionary process.

The renaissance of Marxist approaches in political sociology reaffirmed the idea that politics is based on social, in particular on economic, developments. Two main areas of research benefited especially from this advance: (1) state formation and state building and (2) the distribution of power and social inequalities. In his detailed study on the *Social Origins of Dictatorship and Democracy*, Barrington Moore showed that various countries took different routes to come to the modern industrial world. According to his view, the power of bureaucracies in raising taxes and granting privileges was countervailed by the nobility and the upcoming bourgeoisie, which laid the basis for democracy in England and France. Since these countervailing forces were largely suppressed by a coalition of bureaucrats and aristocrats in Germany (Prussia), dictatorship was more likely than democracy in Central Europe. Although Moore did not concentrate on state formation, his book highly stimulated the revival of analyses dealing with that topic, gradually moving the emphasis from Marxist theories based on economic primacy toward more complex approaches. Charles Tilly, especially, attempted to overcome the limitations of retrospective arguments and the neglect of noneconomic factors in explanations of the formation of national states in Europe. In his view, nation-states proved to be the most effective way to mobilize and organize the resources required for the severe political conflicts and wars in medieval Europe; that is, arms and warfare strongly stimulated the rise of the state. The renewed debate also provided the opportunity to move well beyond the eurocentrism of many approaches and to strongly stimulate interest in state developments in Asia, Africa, and Latin America.

Economic causes also are at the heart of Marxist approaches dealing with the distribution of power in capitalist society and the implied social inequalities. George Domhoff, in a controversial publication, answered the question “Who rules America?” unambiguously: The country is dominated by political and economic elites. He stressed that the dominant pluralist approaches of the 1950s and 1960s tended to overlook class consciousness and class struggles in capitalist society and are slanted toward political decision-making processes instead of the resulting inequalities. Although he did not consider himself to be a Marxist, Domhoff’s approach and terminology clearly reflect the economic primacy characteristic of Marxist approaches.

Debates about the power structure in capitalist society were strongly influenced by the publication of Nicos Poulantzas’s work on classes and political power in the late 1960s. The capitalist state, he argued, is not simply an instrument in the hands of the capitalists who use it for their own interests. Instead, the capitalist state is a relatively autonomous actor ensuring the smooth operation of capitalist society. It is the structure of the system—not the short-term interests and preferences of the capitalist class—that works to the benefits of that class. Therefore, major problems in capitalist society consist of the clashes between the demands of various classes, on the one hand, and the need for the system to provide social stability to reproduce itself, on the other. Authors such as Claus Offe expanded this line of reasoning by focusing on the unavoidable tensions produced by the actions of capitalist states to overcome class divisions without endangering the long-term benefits of the capitalist class.

With the theories of Tilly, Domhoff, and Offe, we have left orthodox Marxism. The relevance of economic factors is almost universally accepted; likewise economic determinism and economic reductionism are widely rejected as being one-sided and insufficient. With a few exceptions, political sociologists focus on reciprocal relationships between social and political phenomena and try to avoid one-way lines of reasoning in explanations of power and dominance.

Neo-Marxism: Conflict Theories and Critical Theories

Neo-Marxism is a rather loose term referring to approaches that amend Marxist theory, usually by incorporating elements from other traditions to overcome the deficiencies of orthodox Marxism, especially economic determinism and reductionism. Major blends of neo-Marxism consist of combinations of Marxist approaches with conflict theories and critical theories. Conflict theories stress that resources are scarce. Therefore, conflict and competition, rather than cooperation and consensus are characteristic of human relationships in all societies. Struggles to maximize benefits and to defend interests depend on the ability and resources to exercise power and dominance in a society. Powerful groups use their power to exploit groups with less power—through brute force and suppression if necessary but also by securing ideological hegemony and structural advantages. Inevitably, permanent social struggles deeply affect the political and social order and imply societal and political changes. Conflict theories are unmistakably based on the work of Marx and Weber and are easily discernable in almost each and every political-sociological theory: pluralists, elitists, and class theorists all agree that conflicts and struggles between social or political groups are crucial to understand the reciprocal relationships between the social and the political. Conflict theorists, however, claim that these struggles are the exclusive driving force behind social and political developments.

Analyses of the distribution of power and dominance are the main objects of conflict theories. From this perspective, not only the work of Domhoff but also the classic study of C. Wright Mills depicting the American ruling class as a *Power Elite* can be seen as an important neo-Marxist and conflict-theoretical contribution to political sociology. In his book, Mills points out the strong overlapping of interests of the military, business, and political elites in the United States. Behind the façade of pluralism and interest differentiation, the aims of elites in various areas appear to be remarkably attuned and congruent to each other. By contrast, the ordinary citizen is perceived as relatively powerless and an easy subject of manipulation by those elites. Power, conflict, and social inequality, then, appear to be robustly related in the world's largest liberal-capitalist democracy.

Class provides the major way to distinguish competing social groups in conflict-theoretical approaches. As we have seen, Marxists define classes based on the functional contributions of groups in production processes, whereas many other social scientists use the concept to refer to positions of groups in a hierarchy. Both conceptualizations usually refer to deep and persistent social distinctions. Yet class is certainly not the only distinction offering a basis for conflicts and struggles between various groups. Race and ethnicity definitely play an important role in many societies and are a cause of virulent conflicts both within and between states. In a similar way, geographical and regional differences are used to define conflicting interests. Furthermore, the social definition of distinct roles for men and women (*gender*) and the resulting inequalities lead to various conflicts and struggles. For centuries, religion has proven to be an extremely vigorous basis for social and political conflicts. Religion, and not class, played the key role in the political history of many European countries, and numerous contemporary conflicts in the world are based on religion. The list of social distinctions that can be articulated in conflicts between groups for power and dominance is virtually endless. As we have seen, Rokkan's theory of long-standing social cleavages covers many diverse social distinctions and is an example of the openness of conflict-based approaches. In the early 1990s, Samuel Huntington advanced the proposition that world politics would be increasingly dominated by conflicts based on a *Clash of Civilizations*: People are likely to see "us" versus "them" in the relations between themselves and people of different ethnicity or religion. According to Huntington, the resulting clash will take place not only between people and groups within states but also between states and between groups of states.

Conflict theories and critical theories have a lot in common. The main difference does not lie in the depiction of capitalist society as conflictual and contradictory but in the emphasis placed on the rejection of the positivist background of modernization approaches and conflict theories. Positivists—especially logical positivists—attempt to understand and explain social phenomena by searching for regularities and general statements. Besides, they strictly observe a distinction between facts and values and consider the normative consequences of their work as exogenous. Critical theorists reject that model of science and support emancipatory (usually anticapitalist) causes; that is, emancipation, freedom, and decreasing domination are explicitly stated as the normative bases for social research. According to critical approaches, the social sciences are not concerned with isolated social phenomena but with society as a whole as well as its historical specificity. Consequently, critical theories cannot rely on work in distinct disciplines alone—understanding society requires the integration of all the major social sciences.

Critical theory originated with the Frankfurt School in the 1930s. In political sociology, important representatives are, among many others, Pierre Bourdieu and Jürgen Habermas. Bourdieu's main interests are the mechanisms that reproduce social hierarchies (inequalities). The reproduction of the social order and the simultaneous dominance of specific groups over others cannot be explained with economic factors only. Instead, Bourdieu stresses the relevance of educational and cultural factors for the active engagement of people in the (re)production of culture. In each society, people are struggling to reach their goals in distinct social arenas (fields such as the economy, sports, or the family). These struggles, however, depend not only on the objective conditions in each arena but also on the persistent skills and dispositions (habitus) of the people involved. The skills and dispositions generated are compatible with the objective conditions (including the development of different tastes for art or food in different arenas) and legitimize existing social structures. Moreover, they exclude improbable practices as unthinkable or unnatural. By focusing on the close interdependencies between objective and subjective factors, Bourdieu presents explanations for both the existence of social hierarchies as well as the reproduction of these hierarchies as social and political inequalities.

Already in the 1960s, Jürgen Habermas started his attempts to liberate critical theory from its Marxist and Frankfurt School roots. Whereas Bourdieu presents a sociological analysis of social processes of power distribution and the reproduction of inequalities, one of Habermas's main interests concerns the opportunities for democracy in the modern world. In his early study on *The Structural Transformation of the Public Sphere*, he explores the historical development of public contacts, characterized by an expansion of public interactions (from families to coffee houses and parliaments) and by a contraction through the market and bureaucracies. Public interactions, Habermas stresses, should enable people to interact with each other in critical ways on the basis of equality. Through self-reflection, critical knowledge can offer an important contribution to ascertain the public character of these interactions by enabling people to emancipate themselves from dominance. Basically, Habermas approaches modern society positively since its ongoing complexity and functional differentiation provide opportunities for democratic forms of self-organization. In other words, the very fact that complexity and differentiation make total control over social life in the modern world illusory enables people to gain control over their own life on the basis of mutual recognition and democratic interactions.

It is not always easy to distinguish between neo-Marxist, conflict-theoretical, or critical-theoretical approaches, and these labels are not used consistently. Moreover, many conflict theorists rely on critical approaches, whereas virtually every critical theorist stresses the importance of conflict between various groups in society. Yet they all dismiss Western-centered structural-functionalist modernization approaches as well as orthodox Marxism. Liberal capitalism is not seen as the end-stage of a progressive evolutionary process but as a system whose inherent social and political inequalities have to be confronted and battled against.

The Cultural Turn: Postmodernism and Poststructuralism

The rise of conflict and critical theories was mainly based on attempts to overcome the shortcomings of positivism, with its epistemological proximity to the natural sciences and its claims on normative neutrality. In addition, the economic determinism and reductionism of Marxism as well as the Western-centeredness of most approaches in early political sociology were criticized. Generally speaking, conflict and critical theories do not question the close interdependencies between structural (objective) and cultural (subjective) factors. Especially among French social scientists in the 1970s, attention shifted from structure to culture, and a new wave of post-Marxist approaches developed under labels such as postmodernism and poststructuralism.

Postmodernism and poststructuralism are part of the "cultural turn" in political sociology. In these approaches, cultural factors are considered to be more important for the study of power and dominance in a society than structural ones. The emphasis is shifted toward (the construction of) meaning, and culture is considered to be more relevant than politics or economics. The rationale for this "turn" lies in the developments in modern societies as they could be especially observed in the United States in the late 1950s and 1960s. According to postmodernists and poststructuralists, life is defined on the basis of cultural factors: The cultures of consumerism, leisure, lifestyle, fashion, arts, and so on are much more important than positions in the production process or in some hierarchy. The spread of mass media strongly stimulates these cultures, and these are, in fact, important parts of the fundamental changes in society. Exactly because modern society is characterized by complexity, heterogeneity, and differentiation, people increasingly rely on cultural factors to define their life and their position within society. As a consequence, no common or general distinctions between groups of people can be presumed or predicted—it is exactly the apparent lack of common and general distinctions that characterizes postmodern societies.

Almost by definition, it is hard to find a common understanding of postmodernism. Literally, the term refers to the passing of "modernism" only. A regular feature of many postmodernists is that they clearly criticize "modern" society as it developed in the Western world in the past 2 centuries, especially its claims of being based on universal principles of progress, equality, and freedom. Postmodernists do not challenge the meaning or importance of each one of these principles. Instead, they reject the possibility of universal, normative, and ethical judgments in general and stress the relative nature of all such statements. From this, it follows that truth and knowledge depend on the social and historical context. Depicting scholars as postmodernists is a difficult task since most of them reject such general labels as being inconsistent with their theories. Jacques Lacan, Michel Foucault, Jacques Derrida, Jean-François Lyotard, and Anthony Giddens are among the most prominent authors being typified as postmodernist. For political sociology, Foucault and Giddens probably are the most influential.

The nature and distribution of power and dominance in societies are the major concerns of Foucault. He studies these topics in various institutions (such as psychiatric hospitals and prisons) and introduces a number of new concepts to deal with power and dominance. The concept *discourse* refers to the way in which language is used to express acceptable, institutionalized ways of thinking; it defines what can be said about a topic with the vocabulary and expressions available. Since every idea is phrased in some terms, discourses affect our views on everything. In that way, discourses construct the phenomena about which we speak. In other words, ideas, concepts, attitudes, and ideologies do not only arise within specific contexts, but they also define the way in which we consider the various aspects of those contexts. The study of power and dominance, then, is the study of discourses about power and dominance (such as texts, speeches, policies, and practices) in various historical and social settings. Therefore, to understand power and dominance, it is necessary to study both power and dominance themselves and the systems of knowledge that are used to produce power and dominance. According to Foucault, power is not possessed by individual people or groups but is an activity that all people can engage in. Exercising power will always provoke resistance and competition by challenging the dominant discourse. Starting with the discourse concept, Foucault's actual work became the study of how knowledge is produced. Since knowledge production underlies the same principles of cultural conditioning and competing meanings as any other area, it cannot be based on structural determinants only. For that reason, these approaches are summarized under the label poststructural theories.

The interdependencies of structural and cultural factors also play an important role in the work of Giddens. With his theory of structuration he attempts to take into account that, although people are not free to do what they want and their knowledge is imperfect, there are acts of individuals that reproduce the social structure and enable social change. Therefore, what we call "society" can be understood neither as a set of institutions nor as a simple aggregation of all human acts. Relying more on Weber than on Marx, Giddens approaches social and political actions from the perspective that individual thoughts and behavior are structured by social institutions, conventions, and ethical codes. Besides, the social structure is reinforced and reproduced by the continuous repetition of human acts; that is, social action creates structures that, at the same time, make social action possible. In this way, individual acts also provide the key for understanding social change: If people start to break from repetitive acts, the social structure will be reproduced differently.

Like Foucault, Giddens rejects a distinction between structure and culture. But whereas Foucault considers the two hopelessly entangled by the very same discourse they rely on, Giddens returns to the notion of mutual dependency. The idea that actions are constrained by structures, which are, in turn, created and reproduced by those very actions, avoids the fallacies of social determinism and reductionism. In modern societies, new information constantly challenges and modifies social practices, altering their character constantly, too. Since a sound foundation for knowledge is missing and the expansion of the social sciences increasingly results in differences of opinion, people more and more "reflect" on their own situation and the social structures they live in. As a result, uncertainty gradually drives out confidence and certitude. According to Giddens, we are observing not the rise of some postmodern society but merely a "radicalized modernity."

The Economic Turn: Rational Choice

Neo- and post-Marxist theories revitalized theoretical thinking in political sociology and stimulated new directions. Postmodernist and poststructuralist scholars, especially, presented proposals for radically different approaches. Their extensive epistemological and ideological criticisms of positivist social-scientific theories and methods are accompanied by appeals for social-cultural approaches and the use of appropriate strategies. Yet research based on these approaches is usually characterized by rather narrow definitions of the actual objects studied in terms of power and dominance. Neo- and post-Marxists drew attention to the old questions about the relationships between structure and culture and did present new approaches to study these interdependencies. Not all social scientists are convinced, however, that approaches to deal with these questions necessarily have to be based on epistemological criticism, the rejection of positivism, or the application of radically new research methods.

Presumed causal links between social entities such as interest groups or states are difficult to analyze. What do we mean when we say, for instance, that "parties try to win elections" or that "economic development leads to democracy"? Usually, these phrases are not based on ontological presumptions about actual "behavior" of parties or economic systems but are shorthand for the activities of party leaders or middle-class people only. In fact, one could argue that causal explanations are only possible for human behavior—all other statements are interpretations based on the aggregation of the behavior of individuals and its consequences. By concentrating on the behavior of individual consumers, citizens, producers, and so on, macrosocial and macropolitical phenomena can be explained as aggregations of microsocial behavior. This so-called methodological individualism rescues the idea of regularities underlying social phenomena from neo- and post-Marxist attacks and reconfirms the search for regularities as an intellectually fruitful goal for the social sciences.

At least since the 19th century, deductive reasoning starting with straightforward axioms about individual behavior is the typical field of mainstream microeconomic theory. It is clear that many sociologists and political scientists are fascinated by the way in which economics proceeds and relies on rigorous deductive ways of thinking. This allure resulted in the rapid annexation of large parts of the social sciences by so-called rational choice approaches in the past decades. Individuals are presumed to have persistent "preference functions" that guide their actions: Each person attempts to reduce "costs" and maximize "gains" under specific constraints; that is, each individual tries to maximize his or her "utility." Rational choice approaches rely on methodological individualism and the presumption that individual behavior and its consequences can be aggregated by using formal modeling and mathematical reasoning. Most rational choice theorists do not use the rationality of individuals as a necessarily correct description of human behavior. Instead, they stress the need for strict deductive reasoning starting with elementary statements and leading to the formulation of falsifiable hypotheses. Successful hypotheses are not necessarily based on intuitively plausible presumptions; successful hypotheses are those that survive rigid empirical testing. In this way, rational choice approaches provide prescriptions for both theoretical arguing (deductive and formalized) and empirical work (falsification of hypotheses).

The application of rational choice theories in political science and sociology started in the 1950s and 1960s. Clearly working in the tradition of descriptive democratic theory presented by Joseph Schumpeter in his book *An Economic Theory of Democracy*, Anthony Downs argued that citizens vote on the basis of a rational calculation of which party is most likely to meet their preferences. Voting decisions are similar to those of consumers in a market who calculate the costs (taxes) and benefits (public services) of choosing one political party rather than another. To win elections, parties try to locate themselves and their policies close to the median voter. In this way, both the behavior of individual voters and the strategies and policies of political parties are explained. From a sociological perspective, the advantages of using deductive reasoning started with the idea of individual rationality evident in Mancur Olson's book, *The Logic of Collective Action: Public Goods and the Theory of Groups*, published in the mid-1960s. Why would rational individuals contribute to the production of collective goods that, by definition, are freely available to everybody? Olson argues that rational individuals will only join groups and contribute to collective goods if separate and "selective" incentives are provided that are strictly available for group members only. In other words, the provision of collective goods by rational individuals is only possible if the free rider problem is solved. Olson's work bridges the gap between economical and sociological explanations of joint actions and group activities. As did Downs's work on democracy, Olson's work initiated a wealth of research on the consequences of individual behavior.

Rational choice approaches provide the instruments to study the microfoundations of macrosocial and macropolitical phenomena in rigorous ways. Even clearer than neo- and post-Marxism—which usually focus on power and dominance—rational choice does not provide an object specification but a specific method and research strategy principally based on positivist epistemology. Due to this openness, rational choice approaches have been applied to an enormous variety of themes and topics, many of which are in the field of political sociology: voting behavior, bureaucracies, state formation, interest groups, new social movements, social mobility, class reproduction, participation, and social capital are only a few of the most prominent examples. The almost unrestricted opportunities to apply rational choice approaches to various questions are clearly underlined by the use of rational choice as a basis for Marxist theories of class and exploitation. Jon Elster, especially, strongly rejects the functional explanations typical of Marxism and many other social sciences. Instead, he uses the analytical tools of rational choice approaches (especially methodological individualism) to provide microfoundations for the explanation of social and political phenomena.

Rigorous deductive reasoning usually takes individuals as a starting point, but—as phrases such as *rational choice institutionalism* already suggest—this does not imply a restriction to psychological explanations only. However, it is clear that rational choice simply takes "preferences" for granted and runs the risks of being circular, nonfalsifiable, or even tautological. How can we tell when people are not acting in their own self-interest, and what counts as nonrational behavior? Some people define their preferences in terms of the public good and are prepared to risk their life for others and their own beliefs, but whatever they do, this can always be depicted as a "rational" calculation of self-interest. Critics of rational choice theories, therefore, do not reject the need for rigorous deductive reasoning in the social sciences but point to the limited advantages of restricting explanations of social and political phenomena to the consequences of individual behavior only. Preferences, interests, utility, or the application of rational strategies are all embedded in historical, cultural, political, and societal contexts and cannot merely be taken for granted and reduced to axioms in deductive arguments.

The Return of the State and Modernization Approaches

The cultural turn in political sociology mainly followed the general shift in many social sciences away from social-scientific approaches toward cultural-scientific approaches. Yet not every political sociologist was convinced by the arguments of neo- and post-Marxists to abandon modernization and positivism. Moreover, the cultural turn had taught us a lot about power and dominance in areas such as sexual relations and national identities, but it contributed relatively little to our understanding of the reciprocal relationships between the social and the political. Postmodern theorists usually simply reject the usefulness of such concepts, and many authors inspired by conflict and critical theories would consider the relationships between social and political phenomena as a relatively unimportant specimen of more general questions about power and dominance. By contrast, rational choice theories have proven their usefulness in many areas of human behavior but do not seem to offer much for the explanation of, say, the rise of the nation-state or civic engagement in revolutionary eras.

Criticism of structural-functional system theories and modernization approaches has not just led to a cultural turn of the neo- and post-Marxist type. In fact, some political sociologists continued to improve modernization theories and to apply them to social and political developments. A general feature of these approaches is that they are all highly stimulated by actual major social and political events in the past decades and not by the desire to contribute to epistemological and ideological debates or to develop a new research methodology. Faced with the wave of political unrest sweeping Western countries in the late 1960s, the collapse of the Soviet Union and the success of European integration in the 1990s, and the ongoing processes of economic and political globalization, political sociologists renewed their interest in evolutionary approaches. Furthermore, the nation-state apparently did not disappear but appears to be surprisingly flexible and able to attune itself to the new challenges of a globalized world and the rise of many competitors. Within states, ongoing complexity, heterogeneity, and differentiation do not seem to result in converging social and political arrangements but in perceptibly different ones. Between states, we observe a continuous rise in the number of states and a further differentiation of their nature all over the world.

Pursuing his goals with determination and well aware of the cultural turn proposed by neo- and post-Marxists, Ronald Inglehart has been urging for a very different cultural turn ever since he published his theory of postmaterialist value change in the early 1970s. Confronted with the startling wave of political unrest in many Western countries in the late 1960s, he points to the rise of a new generation with value orientations that are different from those of their predecessors. As a consequence of ongoing modernization, the generation born after World War II, especially, rejects authority, material advantage, and tradition. Instead, it gives priority to goals such as self-fulfillment, participation, and lifestyle issues. As newer generations replace old ones, deep-seated social and political changes will take place (a "silent revolution"). Evidently, Inglehart uses a modernization-theoretical approach and positivist methods, but he does not presume that developments in modern society necessarily will be progressive. Nor does he take value priorities for granted. The share of postmaterialists among new generations is likely to increase only if economic growth is secured and social unrest remains absent. Originally starting with a focus on new modes of participation in Western countries, Inglehart expanded his research to almost every country in the world and to many aspects of social and political developments. Using standardized comparative surveys of representative population samples, his work also shows that epistemological criticism of positivist approaches does not necessarily mean that highly interesting information about social and political developments cannot be obtained. Moreover, methodological individualism and deductive reasoning are not exclusive privileges of rational-choice approaches.

Modernization theories experienced a strong revival with the collapse of the Soviet Union and the rise of democratic political systems around the world in the early 1990s. At first, the question about the causes or favorable conditions for democratic changes attracted renewed attention. Was the old Lipset thesis about the social requisites of democracy still valid? On the basis of a strong correlation between democracy and economic development, many authors concluded that economic development provides sufficient (and probably also necessary) conditions for democracy. Yet deviate cases are easy to find. For instance, Nazi Germany was a dictatorship in spite of being economically advanced, and India is a vibrant democracy despite its socioeconomic problems, which casts doubts on the general validity of the argument. Economic development plays an important role, indeed, but is certainly not the only motivating force. Returning to the work of Tocqueville, Robert Putnam (1994) showed that democracy relies on an active "civil society" and much less on economic development. His theory unequivocally underlines the need for *social capital* (especially trust and confidence) to produce collective goods efficiently. As Tocqueville had observed in the United States in the early 19th century, voluntary associations are extremely important for the functioning of democracy since in these clubs, groups, organizations, alliances, associations, and the like, people develop and maintain social networks. Established social networks, in turn, facilitate social trust, which enables the production of goods without coercion. The functioning of democracy is such a major collective good. Putnam's research in Italy and the United States initiated a lively debate on the "social requisites of democracy"—depicting social capital as the crucial determinant and curtailing the importance of economic factors.

Whereas Putnam's work focuses on requirements for the functioning of democracy, the establishment of democracy is a different topic. Analyses of a transition (or transformation) of a political, social, and economic system require encompassing approaches based on explicit specifications of the reciprocal relationships between social and political developments. For the transition of authoritarian systems into democratic ones, evolutionary approaches distinguishing between distinct phases or stages of democratization rely heavily on Samuel Huntington's idea of a "third wave." The first wave of democratization (from the mid-19th century to the end of World War I) coincided with the rise of the nation-state, whereas the second one, starting after World War II through the early 1960s, was mainly the result of decolonization. According to Huntington, the third wave, from about 1975 to the end of the 20th century, consists of the spread of democracy in Latin America and Asia and the disintegration of the Soviet Union. Economic growth, the declining legitimacy of authoritarian rule, and the changing role of the Catholic Church as well as international structural factors such as the rise of the European Union and the agreement on human rights included in the Helsinki Treaty in 1975 all contributed to the spread of democracy. By the end of the 20th century democracy had reached all regions of the world. South America, all of Europe, and considerable parts of Asia and Africa have been turned into democracies. At the same time, it is clear that the three waves are characterized by different processes and that no general explanation for democratization is available. As Huntington and numerous other scholars have shown, democracy can be reached through many different paths.

Modifying the modernization framework of the 1950s proved to be very helpful in studying democratic transformations. The idea of evolutionary social and political developments with distinct phases or stages appeared to be even more helpful for the study of democratic consolidation. In each phase or stage, the changing relationships between social and political factors are specified. In the initial phase, opposition toward the ruling elite and undemocratic arrangements is mobilized. The request for more liberty is broadly accepted and generally seen as the main goal. The next phase is characterized by the establishment of institutional arrangements to replace the old undemocratic ones. A new constitution is adopted, and general elections are organized for the first time. An easy return to the Old System is no longer feasible. In the advanced phase, attention shifts toward the achievements of the new democracy to satisfy group interests, and economic performance becomes crucial. Finally, the phase of democratic consolidation is reached where the new arrangements are institutionalized, and the system is able to meet the demands and expectations of large parts of the population.

The study of democratic transformation and consolidation, once again, shows the advantages and pitfalls of modernization-theoretical approaches to study links between social and political phenomena. Especially, the use of phases and stages easily runs the risk of backsliding into teleological and ideological prejudices. Just as American liberal-capitalism was the highest stage of social development in the evolutionary modernization theories of the 1940s and 1950s, various transformation and consolidation theories implicitly take democracy as the "highest" or "most sophisticated" system. All other systems are lumped together as negative deviations from this ideal, under terms such as *illiberal democracy*, *pseudodemocracy*, *partial democracy*, or *defective democracy*. More recent approaches reject teleological interpretations and treat political systems with a mixture of authoritarian and democratic features not as "deviant" cases but as novel systems. Obviously, these approaches do not exclude the chance that the direction of democratization processes can be reversed. Only a close look at the reciprocal relationships between state and society can provide explanations for a return to authoritarian rule.

The introduction of concepts such as postmaterialism, social capital, or transformation and consolidation establishes a cultural turn in political sociology that is quite different from the cultural turn initiated by neo- and post-Marxists. The new variants of modernization approaches do not presume that increasing complexity, heterogeneity, and differentiation inevitably prepare the way for a liberal-capitalist society as the highest stage of human development; they do, however, presume that the opportunities for democratic transformation and consolidation strongly depend on the social and economic development of a society. Further, the revival of modernization approaches did not follow the shift in the social sciences from social-scientific approaches toward cultural-scientific approaches and its accompanying change in research methodologies. Discussions about the character of political systems are usually based on quantitative, standardized, and comparative indicators (e.g., the Freedom House Index or large cross-national surveys among populations), and terms such as *social capital* and the *third wave* clearly underline attempts to summarize divergent phenomena under general concepts and to stress regularities. In a similar manner to rational choice approaches, recent modernization approaches are not based on a rejection of positivism or appeals for a radically different epistemology.

The End of the State?

Political sociology has come a long way since its start in the 19th century. The heydays of modernization approaches in the 1940s and 1950s seemed to mark the definite breakthrough and establishment of political sociology as an independent subdiscipline. Yet the list of criticisms and objections against conventional political sociology is long, and many modifications and alternatives have been presented. Furthermore, the main object of political sociology—power and dominance in the reciprocal relationships between state and society—changed dramatically in the last few decades. As a consequence, political sociology has been confronted with the dual task of dealing with severe epistemological and ideological criticism and with deep-seated changes of its object at the same time. Several appeals for a paradigm shift, a new political sociology, and a political sociology for the 21st century have been presented. For instance, Kate Nash (2000) pleads for a new political sociology that should not be mainly concerned with states or class-based approaches to narrowly defined political phenomena but with cultural politics. These "politics" should be understood in the broadest possible sense, and the focus is on conflicts about social identities and structures and the opportunities to change them. Although this depiction does not exclude the state as a major object of political sociology, it is clear that power and dominance are the key features of such a new political sociology.

For discussions of actual and desirable modifications of political sociology, a reappraisal of the changing position of the state is required. Traditionally, political sociologists have a complicated relationship with the state as their pet topic. They celebrate the concept as the main subject matter of their studies of state formation, the development of the state (especially the nation-state), and the chances for democratic consolidation. They study the ongoing blending and melding of social and political phenomena within states and observe the blurring of the distinctions between the two in an era of radicalized modernity. Some of them examine the disappearance of the state in a world characterized by globalization and increasing interdependencies. Others observe the rise of new forms of the state (particularly in Europe) and study the evaporation of states confronted with powerful multinational corporations, criminal gangs, or NGOs. By the mid-1980s, the diminishing position of the state as a central topic for political sociologists was counterbalanced by attempts to "bring the state back in." Following appeals by Theda Skocpol and her collaborators, the state was rediscovered and reacknowledged as an autonomous actor. Formal political institutions, especially, attracted renewed attention as important factors for the distribution of power and dominance. Not only the behavior of politicians but also that of citizens or elites is relevant for the relationships between state and society: The constitutional framework, electoral laws, the composition of government, and many other institutional arrangements are evidently relevant as well. In short, institutions matter.

Among the divergent depictions of the position of the state, all agree that the domain of politics lost its characteristic features and government its preeminent position in the distribution of wealth and the management of public services in society in the past decades. For many, the distribution of power and dominance changed fundamentally with the changing nature and position of the state. The observation that nowadays there is no escape from politics is correct but does not imply that the social and the political cannot be distinguished analytically and conceptually. With its traditional focus on the reciprocal relationships between the political and the social, political sociology is essentially open to all these observations and interpretations. The question remains, however, as to whether the changes in the nature and position of the state require a new political sociology—and if so, what such a renewal should look like.

The rapid and permanent changes of the relationships between state and society are highly relevant for political sociologists, and none of the processes referred to can or should be abandoned as study topics. Examining the consequences of these developments, Irving Horowitz (1999) observed that classical political sociological approaches are not very useful since we are confronted by a "larger scale," which lies very far beyond anything that could have been imagined by Montesquieu, Tocqueville, Durkheim, or Weber. Although important, the idea of differences in scale between traditional and actual states and societies does not cover the fundamental changes experienced. Studying these changes and their implications for the relationships between state and society is only possible if political sociologists stick to a broad conceptualization of the political and the social and avoid any a priori restrictions. Major developments relevant for making political sociology more amenable to study are discussed as follows.

Identity

The consequences of the ongoing process of blending and melding of social and political phenomena for citizens are hard to summarize. Many authors have pointed out changes in social identity—that is, the ways in which individuals label themselves as members of particular groups. Social identity can be based on nation, class, ethnicity, gender, and so on and has important consequences both for the individual concerned and for the distribution of power and dominance in society. For political sociologists, the fact that societies increasingly become more complex, heterogeneous, and differentiated always implied a constant change in social groups. Especially, critical theorists emphasize that in postmodern societies, the development of social identities cannot be explained by structural factors alone. Instead, it is the process of acquiring identities itself that has changed. Although usually starting with quite different assumptions, much of the work on social capital and political culture is also based on the recognition that blending and melding of social and political developments have radically changed the ways in which people identify with groups. Social identity—and not the structural aspects of the social or the political—becomes increasingly relevant for political sociology.

Civil Society

Closely related to the rising relevance of social identity is the need for a reassessment of the role and function of groups and associations in societies, where social and political processes are hard to distinguish. Considered to be intermediaries between state and society, groups and associations have been textbook topics in political sociology for a long time. More recently, several authors point to the fact that a shift from state-centered governance toward self-governing associations in civil society can be observed. Groups and associations still perform many of their traditional functions—such as interest mediation and mobilization—but instead of being participants among many other participants, they gradually developed into more independent entities, claiming to be essential elements of the fabric of domestic society. Clearly, in the spirit of many political sociologists, starting with Tocqueville and Marx, democracy and civil society are seen as two sides of the same coin. In a world characterized by the blending and melding of the social and the political, the rise of civil society and its drive to replace conventional interest groups and associations is one of the most interesting challenges for political sociologists.

States and Other Actors

Acknowledging the end of the dominant position of the state implies the recognition of the increasing relevance of other actors and participants. This expansion can be easily accepted and discussed in terms of the erosion of sovereignty or the loss of regulatory control by the state. Important aspects include struggles between states and big companies (limits of private initiatives, antitrust legislation, etc.) and competition between multinational corporations. The most threatening danger here is that the main advantage political sociologists realized in the past few decades—the rejection of attaching a priori causal direction to either society or the state in their analyses—is given up effortlessly and replaced by a fashionable depiction of the state as the main loser in a world controlled by multinational corporations and NGOs. Unless political sociologists come up with fruitful conceptualizations of the relationships between states and other actors, we will see a revival of society-centered approaches and a relapse to a sociology of politics of the pre-Sartori era.

Democracy

Democracy is closely linked to the rise of the national state and clearly defined within its borders. States can do very well without being democratic, but so far, it has taken the organized and limited forms of political power of the conventional state to promote democracy: no state, no democracy. Furthermore, democracy continues to spread around the world. Freedom and liberty are not restricted to wealthy countries, and many poor and developing states have a record of respecting political rights and civil liberties. The problem with this development, however, is that it appears to be rather easy to create a blend of formal democracy and political corruption, civil rights abuses, and autocratic rule. While only a few countries have slid backward into military rule, many more seem to reach a standoff or cease-fire between democratic and nondemocratic forces, where elected governments fail to regulate or take control of the most powerful social and economic groups in society. For political sociologists, very interesting cases and questions develop that bring us back to the heart of the traditional discussions about social conditions for democratic rule—and for undemocratic rule.

Globalization

Since democracy is closely linked to the nation-state, many scholars emphasize that globalization presents new challenges to the study of the reciprocal relationships between state and society. If political power is no longer concentrated in states, then democratic control should be expanded beyond the borders of the state. A global civil society is presumed to fill the gaps here. The struggles between competing groups in a globalized world, however, are a familiar topic for political sociologists, and no radical changes are required to deal with questions about democracy and globalization. Yet the old focus on reciprocal relationships between the social and political within states is no longer appropriate, and the global connections and interdependencies of social, economic, and political actors should also be considered.

New Technologies

It is not just advocates of modernization approaches who presume that technical developments in communication and transportation have a clear impact on power and dominance between individuals and groups. As the cliché goes, the world has become smaller in many respects in the past few decades. Important consequences of this development are already included above under headings such as changing identities and globalization. New technologies further reduce the traditional lines of demarcation between social and political phenomena by making information universally available and communication a routine matter. There does not seem to be much need to expand studies on the impact of technological innovations in general, but political sociologists should include the spread of new technologies as an important aspect of each of the aforementioned five topics.

Recent social-end political developments—the rise of postmodern civil society, democratization, globalization, and new technologies—have important consequences for political sociology because they fundamentally change the distribution of power and dominance. The conventional distinction between the social and the political as the main object of interest for political sociologists, however, is absolutely indispensable for analytical purposes. Precisely because the state appears to change its nature and position rapidly, a coherent conceptual framework is required to study these developments. Appeals for a new political sociology lay too much emphasis on the ways in which the world is changing and tend to undervalue the analytical and conceptual clarity provided by the old approaches. New directions for political sociology, then, should be based on the acceptance of fundamental changes and of evident continuities in the role and position of the state as well as on the recognition of the need for theoretical and conceptual innovations and on the demonstrated usefulness of available approaches.

Political Sociology as a Field of Study?

The heydays of political sociology appear to be over at first glance. Newer approaches and variants—such as neo-institutionalism, comparative sociology, political economy, comparative politics, and postmodernism—gradually seem to seize the intellectual arenas that used to be reserved for political sociologists. The almost euphoric postwar period of widely shared structural-functional modernization approaches was followed by vivacious controversies about the object of the discipline as well as its epistemological foundations and methodological performance. Two cultural turns, one economic turn, and a renaissance of modernization theories apparently left the field dispersed and divided. Feasible accounts for this ostensible decline are, first, the disappearance of a clear-cut distinction between the social and the political and, second, a general move toward more specialized subfields in the social sciences.

Already, Runciman depicted the enormous "expansion of the political" as the most important change in the history of the modern state. This development still continues. Important as this extension is in quantitative terms, we experience not only a strengthening of the position of the state but also a change in the nature of the relationships between the social and the political. The distinction between state and society—the main premise of political sociology—has gradually disappeared with the expansion of the state and has been replaced by a much more ambiguous melding and blending of state and society. The reluctance to deal with the changing distribution of political power within and between states probably contributed considerably to the decline of political sociology as a self-reliant field of study. Power and dominance can be studied in many spheres of life—hospitals, neighborhoods, executive boards, and so on—without referring explicitly to some reciprocal relationships between the social and the political. However, it is precisely the disappearance of a clear distinction between state and society that makes the study of power and dominance much more interesting and relevant by focusing on the connections between the two phenomena; that is, power and dominance are not the main objects of interest in themselves but as part of the processes underlying the dissolution of the conventional distinctions between state and society. Political sociology as a field of study offers excellent opportunities to deal with the melding and blending of the social and the political.

A second explanation for the apparent decline of political sociology is related to the move toward more specialized subfields in the social sciences. This change is part of the more general change away from social-scientific approaches (emphasizing causal explanations based on regularities, mainly applying quantitative, comparative methods) toward cultural-scientific approaches (emphasizing specific cultural meanings and constructions of meanings, mainly applying qualitative, case-oriented methods). With the economic turn and the renaissance of modernization approaches, this general change is counterbalanced. As a result, many subfields flourish, while the label *political sociology* increasingly appears to be too unspecific. The apparent decline of political sociology as a field of study, then, is at least partly due to the evident accomplishments of the initial enterprise: If many more specialized subsubfields carry on successfully, the broader idea loses much of its appeal.

Political sociologists continue to contribute to our understanding of the distribution of power and dominance in society. Many of the actual topics suggested by advocates of new approaches—identities, citizenship, new social movements, and so on—do not differ from topics studied by traditional envoys of political sociology. Instead of debating claims for new approaches or paradigm shifts, the consensus about the selection of relevant topics should be stressed. Political sociologists have been mainly concerned with input-oriented microlevel approaches (voting behavior, new social movements, parties, interest groups, etc.), on the one hand, and with output-oriented macrolevel approaches (state formation, transformations of political systems and political reform processes, etc.), on the other. The very rapid spread of rational choice approaches in many social sciences in the past few decades reflects a need for more precise theoretical arguments than is usually provided by available approaches. Therefore, the most important theoretical enhancements in political sociology as a field of study focus on the reformulation of existing approaches in more rigorous ways—that is, in more deductive ways. Note that this does not necessarily imply a reduction of all behavior to naive utility maximizing nor does it require the use of formal modeling or quantification. Institutions, norms, and values; historical peculiarities; collective goods; and frustrations all can have a place in deductive theories attempting to provide microfoundations for macrophenomena. Forthcoming theoretical approaches in political sociology as a field of study, then, will mainly consist of attempts to provide these foundations.

POLITICAL SYSTEMS, TYPES

The term *political system* is an abstract concept and is used widely and often with different meanings. In this entry, a political system is defined as a form of governing society that is embedded in a legal (constitutional), economic, and cultural environment. The essence of a political system relies on the interdependence of its institutions (rules of the political game) and collective actors (political parties, organized interests, governments, and bureaucracies) that operate within such a system. From this definition, it follows that political systems are seen as a whole: Authority is exercised over a territory through the body politic, including its state format, organization of public decision making, and related processes of policy formation. The study of types of political systems is—almost by definition—comparative by means of developing typologies. One can distinguish between two directions in the study of types of political systems: one, the descriptive approach and, two, the analytical approach by developing typologies.

The descriptive approach has a long-standing history in political science and focuses on typologies of political systems—often on the basis of taxonomies, that is, a (more or less) logical ordering of types that are hierarchically organized. An example of such a taxonomy is Aristotle's classification of political regimes. On the one hand, Aristotle divided the politics of his time into two types: good versus corrupt governance. Many of these typologies have been developed over time, and more often than not, they were directed by normative ideas (e.g., Montesquieu, the separation of powers). Other typologies have been driven by forms of culture, economic systems, or stages of societal development, and so on. All these classifications are not only subject to normative belief systems but are also limited, as they describe the state of affairs rather than explain how and why these differences have emerged or what they pertain to.

The analytical approach aims at developing comparative typologies that are not only (or only indirectly) normative but also evidence based. One of the earliest attempts was made by Lord Bryce, who compared the democracies of his time by means of seeking the commonalities between democratic systems that made them different from other political systems (e.g., direct vs. indirect forms of representation and decision making). Others tried to develop classifications on the basis of theory (e.g., Max Weber's trichotomy of traditional, charismatic, and rational rule and Gabriel Almond and Sidney Verba's idea of variations in political culture) or by means of evidence-based induction (e.g., Arend Lijphart, 1999).

The use of typologies in political science is widespread and considered as useful for theory development, descriptive analysis, and reducing. This entry first elaborates the method of typology construction and offers some examples. As will become clear, the use of a typology is more often than not an instrument for analysis in comparative political science (see also Paul Pennings, Hans Keman, & Jan Kleinnijenhuis, 2006). Second, this entry discusses a number of existing typologies of political systems that can be labeled as *descriptive* and have figured in comparative political science. Third, the focus is on typologies where the aim is to explain the patterned variation in politics that emerges from empirical investigation. For example, Robert Dahl and Arend Lijphart have developed typologies to highlight the intradifferences within democratic polities. Whereas the former focuses on the institutional configuration of rules and rights resulting in polyarchy, the latter developed a typology (i.e., majoritarian vs. consensus democracy) to understand the actual working of a democratic political system. Finally, the entry moves to a specific approach in political science: *A Systems Analysis of Political Life* (1965) as developed by David Easton. This approach is deductive and claims to explain the variations across diverse systems. In this approach, the organization of government is the core of each system. This approach is elaborated by examining patterned variations of government.

Developing a Typology

Although typologies are not exclusive to comparative politics, they are frequently used in this subdiscipline to sustain and develop arguments as regards the organization and institutional design of political systems. This is not surprising since political systems are seen as closed entities (like states, polities, governments, etc.). To reduce the real-world complexities, comparativists have always made attempts to translate their ideas on political systems into typologies. Aristotle did so, as did Polybios (comparing various Greek city-states) and, later, Montesquieu and Lord Bryce.

Typologies are seen to be useful as a prototheory. They are used not only to reduce complexity but also to inspect certain (hypothetical) relationships. For instance, one can develop a typology that combines two dimensions such as democracy (yes/no) and economic development (high/low) and inspect the hypothesis that democracy and welfare correlate. It is easy to understand that such relatively simple typologies are more often than not victim of the choices made by the researcher and, therefore, lead to biased perspectives. However, as a proto-theory, a typology can certainly help refine and develop concepts. Furthermore, a typology assists in observing to what extent concepts function empirically. In short, a properly developed typology is conducive to concept formation, theory development, and validation in view of empirical evidence (Mattei Dogan & Dominique Pelassy, 1990).

Typology development is in some ways a Scylla and Charybdis problem: On the one hand, simple typologies can enhance clarity in a systematic fashion; on the other hand, however, overelaboration lurks around the corner (by developing too many categories or subdivisions within one category). Although a refined typology can be useful and points to all logical possibilities, it also tends to produce confusion and complexity. There is no solution to this problem other than empirical verification. As a methodological principle, the researcher has to follow as a rule of thumb that a classification scheme as applied to a typology should include as many real cases as feasible, and at the same time, these cases should exclusively fit only one of the cells of the typology. This means that arbitrary cases are to be avoided as much as possible. This not only avoids confusion but also prevents the occurrence of hybrid systems.

Take for example Lijphart's typology of democracies (Lijphart, 1968). There are two dimensions: (1) elite behavior (cooperation vs. competition) and (2) whether society is divided or not (homogeneous vs. fragmented societies). This leads to a 2 × 2 typology with four types: centripetal, centrifugal, depoliticized, and consociational. In this typology, the basic argument is that under divisive societal conditions—where sociocultural cleavages are politically organized (by parties or organized interests)—the key condition for stability is elite behavior (being the first dimension of the typology) to regulate political behavior at the mass level. Lijphart argues that whether elites produce stability depends on the type of conflict in plural societies.

So far, so good: There is an explanation, and it appeared plausible (at the time). However, others have also attempted to use this typology for other systems and found it difficult to decide for *all* relevant cases where to locate them in this fourfold table or to accept that the proposed mechanism did indeed explain the political process for all the cases in each separate cell. This is not the place to discuss Lijphart further. The main point is that typologies often flounder in view of empirical evidence or are biased in terms of case selection and measurement problems. In addition, one problem with this is that many typologies tend to be exclusively focused on the commonalities among the cases rather than taking into account the differences that exist. Finally, sometimes cases do not fit the defined cells because of additional circumstances that defy the hypothesized relationship. In other words, typology construction is certainly a useful tool for comparing political systems, but it is also vulnerable to misplacement and biased results.

In summary, typologies are considered as a useful instrument to develop a proto-theory or a conceptual design and can serve as operational controls on how far they travel in reality. In addition, typologies help reduce the complexities of researching political systems in order to create a systematic account of how the real world can be ordered. Even taking into account the pitfalls and the caveats mentioned here, the typology has been and continues to be one of the foremost tools of comparative political science. Hence, and this is the topic of the next section, typologies are an essential analytical step to analyze and investigate types of political systems.

Descriptive Typologies of Political Systems

Throughout the development of political science, classifications have been developed, and those of Polybios, Aristotle, Montesquieu, and others have already been mentioned. A number of these are basically (unidimensional) listings according to a feature considered to be a central one, such as, for example, the "state" or "forms of government," as has been developed by Samuel Finer (1997). Other examples are developmental classifications that define historical stages of society, each producing a specific type of political authority.

A classic example is Friedrich Engels's description of the change and development from a primitive society to a communist society. This anthropological approach related the production/consumption patterns of society to political authority (from absence of rule to authoritarian rule to self-rule). This teleological model can be seen as an almost conditional set of political-economic stages predicting the type of political system to emerge in the course of history, based on Marxist ideas regarding societal development culminating in "classless communism."

Max Weber, a famous German sociologist, has earned a reputation by defining the state as well as developing a typology of ruling systems. Whereas his definition of the state essentially rested with the exercise of (legitimate) power over a territory, his typology concerned an ideal type that served as a proto-theory, arguing that the degree of state development is associated with a certain type of political rule, of which the rational-legal rule (i.e., bureaucracy) is the modern one.

Contrary to Engels's teleological approach, the Weberian approach can be considered as a proto-theory. Most approaches before the 1960s were in fact descriptive, were based on broad—if not vague—analytical distinctions, and often tended to be close to teleological reasoning (i.e., a future goal-oriented argument). In particular, developmental studies focusing on the poorer regions suffered from this bias.

More recently, classification-based typologies of wholesale political systems are becoming less popular among comparativists. The analytical focus of researchers concerned with the study of political systems has shifted to highlighting specific features of political systems. This change in focus also meant that typologies were confined to specific types of systems such as democracies. Examples are party systems, electoral systems, cleavage systems, parties, governmental features, and so on (see, e.g., Dogan & Pelassy, 1990).

Jean Blondel (1982) developed, for instance, a simple comparative typology of party systems by counting the number of parties that are represented on average (from a two-party system to a multiparty system). This would explain the differences between legislatures in terms of interactions between parties and government. His contemporary, Maurice Duverger, argued that the effect of a party system is related to government stability: The fewer the number of parties, the more stable party government would be. Hence, according to Maurice Duverger, the nexus between the electoral system and the party system could be considered as a predictor of how a (democratic) political system would function. In fact, Duverger's law (as it is also known) is conducive to a typology of electoral laws and system stability. The so-called first-past-the-post electoral system would be superior to proportional representation because it produces a stable single-party government as opposed to an unstable coalition government. Most of the classifications made regarding electoral and party systems, however, remain simple, but as regards questions of voting and party behavior, they are merely descriptive.

Stein Rokkan is also well-known and respected for his work on modeling (the term *Rokkan* is used for developing a typology of political systems) the emergence of national states in Europe. His concern was to understand how political systems developed to take on the contemporary shape and organization of the nation-state in Europe. To this end, he developed grids of reference or, in fact, dimensions to account for the functional and territorial differentiation across the European area from a historical perspective. In his view, the only way to do so is to make macromodel comparisons that are subsequently specified by means of region-specific models and highlighted by individual cases.

Rokkan's typology (see Peter Flora, Stein Kuhnle, & Derek Urwin, 1999) contains, first, a trichotomy: economy–territory–culture. From these master dimensions, specific indicators to analyze pathways to the contemporary form of the state are developed: religious diversity, linguistic variation, ethnic distinctiveness, dispersal of land ownership, urbanization, industrialization, trade, geographical location and size (including center/periphery situations), (de)centralization of authority, and polity formation (constitutional development). This grid of reference served the purpose of accounting for the cross-system variation of state formation over time and ultimately of explaining the Europe-wide democratization within the emerging nation-state.

Rokkan's model is—in retrospect—less a model and more a typology since the classification is conducive to certain types (or paths) of democratization that are more favorable than others (earlier fully accomplished democratization). It enables the researcher to examine both the similarities and the differences in the development of political systems (in Europe). In addition, it was the basis for understanding not only how political systems emerged but, foremost, how they shaped the democratic state in the early 20th century. Although Rokkan's work is widely acknowledged, it is nowadays more often politely referred to than actually used.

Another attempt to develop a diachronical typology of political systems stems from Finer (1997). His attempt focused on regime types that identify over time the organization of political authority (or who governs). Finer listed four "pure" types: palace, forum, nobility, and the church, representing the type of rule. In addition, the four types could well develop as hybrids. The resulting 10 cells serve as an empirical grid to be filled by real-world cases; for example, the pure church category only concerns two cases: the Vatican and Tibet, whereas forum includes all modern, secular democracies. However impressive Finer's book is, the typology is purely descriptive and fails to pass the mentioned methodological rule of thumb on typologies: In many cases, one may question whether there are overlaps in the located position of cases or whether cells remain (almost) empty.

The typologies presented so far are mixtures of description and modest explanation. Second, they represent either whole-system approaches or systemic (intrasystem) typologies (e.g., electoral systems or types of government). Third, it must be noted that many of these typologies of political systems are often forgotten or only sparsely used at present. Yet there is an exception to this: In 1996 (originally 1989), Denis and Ian Derbyshire published *Political Systems of the World*. In this monumental and ambitious book, the authors set out to cover *all* existing political systems ($N = 192$ at the time), classify them according to social and economic influences, and highlight a number of particular political features common to many but not all: a constitutional design, an ideological base, executive/legislative relations, an electoral system, and political parties. In other words, Derbyshire and Derbyshire follow the traditional pattern of descriptive analysis of political systems (i.e., the unit of comparison is the independent state). Although the book contains some cross-tables that hint at more elaboration, most of the (useful) information is based on one-dimensional classifications. In fact, it concerns a kind of political map of the (contemporary) world, and only the sections on ideology and political parties can be considered analytically novel.

The authors argue that, in addition to parties competing for office or representing the population as a whole (as under communist rule), there are pressure groups and interest groups that are functionally equivalents of parties within the political system. Therefore, Derbyshire and Derbyshire introduced the concept of corporatism as an alternative mode of interest representation vis-à-vis pluralism. In fact, they introduce a new type of state: the corporatist state. Apart from the fact that this type of state (as far as it [has] existed) is limited to Western Europe with some similar practices elsewhere, it is questionable whether or not this type of polity is relevant to understanding political systems all over the world in a comparative perspective.

The ideological base of a political system is considered by Derbyshire and Derbyshire (1996) as "a body of ideas which reflects the beliefs and values of a nation and its political system" (p. 23). Hence, in their view, the ideological base of a political system (i.e., national state) refers to a (often underlying) shared belief system on dominating values within a society (including religion). As the authors admit, the labeling of nation-states by ideological base is bound to be arbitrary, and hybrid forms are to be found as well. Nevertheless, it is interesting to examine how this dimension is distributed across the world.

Derbyshire and Derbyshire distinguish eight different ideological bases (see Table 1). In fact, some of these are closer to being a type of state than a belief system per se. In this table, the ideological divisions by Derbyshire and Derbyshire are reported in connection with socioeconomic factors and indicators of quality of life. The idea is obviously that there is a relation between economic development and social conditions, on the one hand, and the ideological base of a state, on the other.

As is known from the literature, the relationship between types of political systems and social and economic development is not straightforward, nor is it that statistically strong (Keman, 2002). The only solid observation is that fully fledged democratic systems are almost always among the prosperous countries and are highly developed in socioeconomic terms. The other categories may

Table 1 Distribution of Ideological Base of the State and Social and Economic Development

Ideological Base	*No. of Political Systems*	*Gross Domestic Product (% World Share)*	*GDP per Capita ($)*	*Literacy Rate (%)*	*Human Rights Index*
Liberal democratic	73 (38.0%)	86.1	8.475	88	80
Emerging democratic	73 (38.0%)	8.0	1.490	66	63
Communist	5 (2.6%)	2.4	810	87	25
Nationalist	8 (4.2%)	0.6	1.500	57	45
Religious	3 (1.6%)	0.6	1.200	39	25
Authoritarian[a]	20 (10.4%)	0.7	490	60	40
Absolutist	10 (5.2%)	1.0	8.235	66	44

a. Distinction military and authoritarian collapsed by this author.

perhaps tell us something about the background of the form of government that has emerged around the world, but—given the broad categories—very little more. In addition, the defining categories remain vague (what distinguishes *nationalist* from *authoritarian*?). Probably, there are various cases that are hybrids or that simply overlap (e.g., Kenya appears to be authoritarian and nationalist, whereas Tanzania is labeled as socialist and nationalist by the authors).

In particular, the distinction between liberal democracies and emergent democracies is confusing and debatable. First, the definition tells us little about what the ideological differences are between the two (apart from the fact that the former have had an undisturbed history [as a state] in terms of coups d'état, whereas the latter emerged in the various postwar waves of democratization and often experienced political disruption). Second, comparing the listings of Derbyshire and Derbyshire (1996) with others, it appears that a number of cases are misplaced as regards being democratic, or emerging or not. All in all, classifications as developed by Derbyshire and Derbyshire are certainly useful as reference sources but have little added value in terms of understanding the differences between types of political systems and are limited in their descriptive-analytical value (e.g., as a proto-theory or in explaining comparative differences). In some scholars' view, a typology should add to existing knowledge rather than only recycle existing knowledge regarding the similarities of and differences between political systems. Hence, typologies are useful but only if they are systematic, two- or multidimensional, and related to a theory-driven research question (e.g., Lijphart's typology of democratic variations and Rokkan's models of state development).

This section has discussed various types of typologies as they have been developed and elaborated in comparative political science. On the one hand, pure descriptive classifications and typologies have been presented (Finer; Derbyshire & Derbyshire). On the other hand, a number of analytical typologies have been put forward. It should be noted that typologies either aspire to classify *all* political systems of the world (like Finer) or confine themselves to regions—such as Europe (Rokkan)—and to specific regime types—for example, democracies (Lijphart). In addition, it was argued that after the 1970s, another kind of typology emerged in the form of systemic or intrasystem classifications (e.g., party systems and type of government; see Blondel, 1982).

Hence, the present strategy for developing types of political systems involves going from descriptive to analytical approaches and from focusing on whole systems to attributes of political systems. The focus on attributes of political systems can be applied to comparative politics and enhance insight for the student regarding both the cross-system and intrasystem variation around the world or within certain regions or regime types. One useful way of developing further theory-driven typologies is to derive them from Easton's *A Systems Analysis of Political Life*.

Variations of Political Systems: Types of Political Governance

Systems theory is derived from evolutionary biological models that emphasize the interdependence of the elements that are considered to be essential for the survival of the system. Systems theory applied to analyze political systems is in the form of a set of interactions between political actors whose behavior is structured by institutions and is embedded in a wider environment. It departs from the idea that these institutionalized interactions shape the dynamics of a system toward more or less an equilibrium situation. This approach was already developed in the 19th century (e.g., Herbert Spencer) and has been applied to political science since the late 1950s. Easton (1965, 1981) has been the main advocate of this approach, and others like Almond and Verba applied it to compare polities (institutionalized rule of a society).

Easton conceived of politics in terms of its relationship with society by means of the authoritative allocation of material and "immaterial" for a society (i.e., by means of public policy formation). The political system receives inputs from society in terms of demands and support, such as policy preferences of organized interests and political parties, and electoral support, for example, for parties in government or the junta in power. The political system converts these into outputs in the form of decisions and enforceable policies that feed back to society. If and when demand and support are (more or less) in balance, it would imply an equilibrium situation—that is, political stability. Of course, this process is not an automatic one but is driven by the types of institutions and political actors. Gatekeepers, like parties or interest groups, cumulate various preferences from the public and direct the system of governance (i.e., the conversion process). The resulting outputs (policy) feed back into support and demand for the actors that are responsible for government.

More often than not, the Eastonian approach of systems theory has been criticized for being mechanistic, teleological, static, and not fit for empirical analysis. However, the practitioners of comparative politics have helped refute these criticisms. First, they applied systems theory to compare countries as political systems; second, by elaborating Easton's model by specifying political actors and institutions, they analyzed the "black box" of the conversion process (or governance); third, with the data available now, which allow for closer scrutiny while comparing political systems, they developed whole-system and systemic classifications of political systems.

In the remainder of this section, the differences and similarities between political systems are elaborated by means of the Eastonian approach to demonstrate the extent to which types of political systems do vary. This allows for assessing the extant typologies. Recall that a distinction was made between descriptive and analytical typologies, on the one hand, and between whole-system comparisons and systemic or intrasystem typologies, on the other. The Eastonian approach allows for an analytical systemic typology.

In what follows, the focus is first on the institutional variation of polities (in this case, the countries of the world) in terms of their types of political rule, both representative and nonrepresentative.

Institutional Variations of Political Systems

As we have observed, there have been and always will be classifications of political regimes. The term *regime* simply means a system of ruling society. Numerous indicators are used, but here we shall concentrate on the institutional configuration of government. As has already been stated, political institutions are basically the rules of the political game, and these rules shape and direct the behavior of the players involved (e.g., parties, movements, interest groups, bureaucrats, people, and also the members of government) with respect to the political process of governing. The main types of representative government are introduced in the section that follows. In addition, the nondemocratic types are also discussed. This enables us to define the relationship between government as the conversion agency (making decisions on policies) and the eventual policy performance in terms of its societal impact (or feedback process).

Representative Government

This type is related to the political-ideological basis regarding the "liberal-democratic" and "emerging democratic" types of governance (see Table 1). The connection lies with the idea of democracy. Central to democracy is that the executive is elected indirectly by the population and, thus, the population (or more precisely, the electorate), through its representation in the Assembly, directs and controls government. Hence, the way in which the relationship between the executive and legislative is institutionalized shapes the role and position of government. This relationship is constitutionally driven almost everywhere or laid down in a basic law. In addition, there are the "conventions" that shape the structure of representative government. Hence, institutions are determining the "room for manoeuvre" for government and more often than not, will be conducive to its "leadership and optimisation" (see Blondel, 1982). For instance, differences in the formal relationship between the executive and legislative, on the one hand, and the type of electoral system, on the other, influence the composition of government and its policy-making capacities. Four types of government can be distinguished within the category of representative government:

1. presidential government,
2. parliamentary government,
3. dual-power government, and
4. single-party government.

According to Derbyshire and Derbyshire, the cross-national distribution of these types is as shown in Table 2.

The parliamentary type of representative government is quite dominant in Europe. Only one out of five government types outside Europe is parliamentary. Presidential government is the dominant type within both the consolidated and the emergent democracies in the rest of the democratic world. Yet since the late 1980s, the number of dual-power governments has doubled (particularly in Central and Eastern Europe). This typology of representative government is driven by the constitutional features of the polity.

Presidential Government. The role and position of the head of state is crucial for each type. Although most states have a president as head of state, in most cases, the presidency is merely symbolic, and its main function is to represent the sovereignty of the nation and government. In this sense, presidents are comparable to constitutional monarchs. However, in other systems—for example, the United States—the president has been assigned the role of executive (as head of government), and the related power is separated from the legislative powers of the (elected) assembly. In most cases, the executive head of state cannot be removed by the legislative (he or she appoints the other members of government) and derives his or her legitimacy from popular election to office (i.e., elected leadership).

The foremost feature is that of the one-person executive who dominates the politics of government. He or she can call on the public, by whom he or she is elected, and represents national government at home and abroad. This feature of a one-person executive also reinforces the position of the bureaucracy, which, at least in many cases, is indirectly subservient to the president. Of course, this differs from system to system, but if

Table 2 Types of Representative Government

Region	*n*	*Presidential*	*Parliamentary*	*Dual Power*
Europe	49 (31%)	15 (30%)	24 (48%)	10 (22%)
Americas	43 (27%)	29 (58%)	12 (35%)	2 (7%)
Rest of the world	67 (42%)	43 (64%)	19 (28%)	5 (8%)
Totals	159 (100%)	87 (52%)	55 (36%)	17 (12%)

Note: Percentages of types of representative government are row totals.

well organized, the president can direct the bureaucracy effectively and even strengthen the coordination of policy implementation.

Typical for presidentialism is the executive command of the head of state, who is also head of government. Conversely, parliament plays an indirect role by exerting legislative control. It is clear that the structure of presidential government is characterized by quite a few lines of command. Conversely, the lines of control are either reciprocal or indirect. This implies that the institutional configuration of presidential government can be, and often is, conducive to conflict (e.g., think of "divided government"—i.e., the political "color" of the president is different from the majority in the legislature) and considered to be prone to political instability.

Parliamentary Government. Parliamentary government is organically linked to the legislature, or parliament. The government emerges from the assembly and can be dismissed by a vote of no confidence (and often also needs a vote of investiture by the same parliament). At the same time, government can—often after consultation with the head of state—dissolve parliament and call for a new election. Whereas presidential government appears strong and relatively independent, parliamentary government is often considered to be weak because of the mutual dependence of the executive and legislature. In other words, a typical consequence of parliamentary government is that both powers are fused and bargaining eventually directs the outputs of the system. Hence, the institutional means of command and control are distributed across the executive and legislative.

Given these differences from presidentialism, it is usual to differentiate between parliamentary governments by means of their conventional shape and working. On the one hand, there is the one-party government, where the majority party in parliament forms the government (e.g., in the United Kingdom until recently). On the other hand, there is the coalition government, where a combination of parties forms a government that is supported by a majority in parliament. A subtype is the minority governments (one-party or coalition, occurring often in Scandinavia). In short, in parliamentary types of government, the political representation is mediated by means of parties.

All in all, in parliamentary systems, government is structured differently from presidential government. The formal powers of the executive and legislative are largely fused; consensus formation between parties in government and in parliament is a prerequisite to make policies, and therefore, negotiations take place in both government and parliament, where, in the final instance, parties do really matter.

What should also be clear is that the electorate only indirectly influences government. Hence, as is often argued, parliamentary systems of governance are indeed an indirect form of democracy. Whereas in presidential systems the head of government is primarily directly elected, this is not the case in parliamentary systems. To push this argument farther, in parliamentary democracies, parties are the key factor linking the electorate to parliamentary government.

Dual-Power Government. This type of government has often been considered as an anomaly or as a residual category. But, as a consequence of the criticisms raised versus both presidential and parliamentary government, dual-power government is taken much more seriously nowadays, and more attention is paid to this type of government (usually labeled *semipresidentialism*) as an alternative to both presidentialism and parliamentarism. The majority of the cases can be found in Europe: France, Estonia, Lithuania, Slovenia, and, to some extent, Portugal, Finland, the Czech Republic, and Poland. It should be noted that most of these states have developed this dual system only recently. This may well be an expression of a growing dissatisfaction (given the apparent disadvantages) with both the straightforward presidential and parliamentary systems of democratic and constitutional government. The third type of representative government is presented in Figure 1.

Dual-power government is strongly influenced by constitutional rules (the direct arrows in Figure 1) and the multiple relations that exist. The main disadvantage is the delicate interrelations in terms of command and control between all powers. This may well imply that imbalances and disruption lead to stalemates, gridlocks, and, thus, governmental instability. However, the fact that the electorate has a more direct influence on both the executive and the legislative than in the other

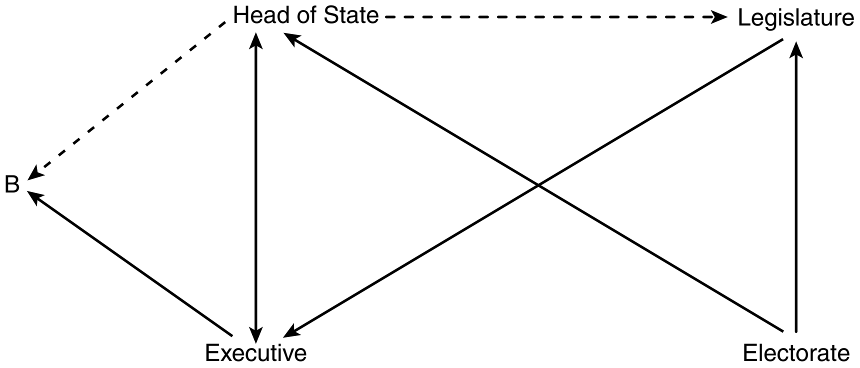

Figure 1 Dual-Power Government

Note: Dotted arrows represent indirect forms of command or control.

types of representative government appears to be an advantage.

Nonrepresentative Government

These types of government overlap to a large extent with the ideological bases that have been distinguished in Table 2 and that do not belong to the democratic family. Here, the distinction between one-actor government and autocratic governance is made. The first type is characterized by the fact that one political actor—be it a party, movement, or a (charismatic) leader—rules the state in the name of the whole nation. Often, these regimes are ideologically inspired by communism or variations of nationalism. Autocratic governments can also be characterized by one political actor who rules but not in the name of the collective interest. The same line of reasoning can be applied to military and religious rule. The polity is not the framework of reference, but rather, a specific interest or idea provides an ideological basis of and justification for autocratic rule. Autocratic government concerns about 15.6% of all regimes in the world, and together with the one-actor government, this covers 24% of all the regimes of the world.

One-Actor Government. The basic feature of a one-actor government is that a party or movement or, eventually, a leader represents the "will of the people" and governs for the people but by no means is the state governed by the people. Hence, insofar as there exists representation, it is limited to a "top–bottom" type of indirect representation (see Figure 2). In most cases, these ideas are laid down in a constitution or in a set of basic laws by one party or movement. In addition, the constitution preamble serves to justify the nature of the system in terms of ideology (e.g., socialism or patriotism) and the need for a unified actor steering the state and society. In essence, this implies that both the executive and the legislature (which almost always formally exist in this type of government) are formed by the same party or movement (hence, there is no competition between parties). In fact, government is formed by an "elite" that is either confined to party membership (like in communist regimes) or to having a function in the movement. In particular, this pattern can be observed in the developing and postcolonial world.

It would appear that the charismatic style of leadership, the avoidance of personality cults, and self-interested behavior of the elite are requirements for smooth change and adequate societal performance by means of such a type of government. If these requirements are not met or external pressure mounts, a fundamental regime change is almost inevitable. Many of these changes (in particular, in the past decades) are going in two directions: either toward emergent democracy or toward an autocratic type of government.

Autocratic Government. The fundamental features that shape this category of governance are that not only is it not representative but also that there is no explicit link with society at large and hardly any formal or constitutional organization of the polity. Instead, the ideological basis is often derived from

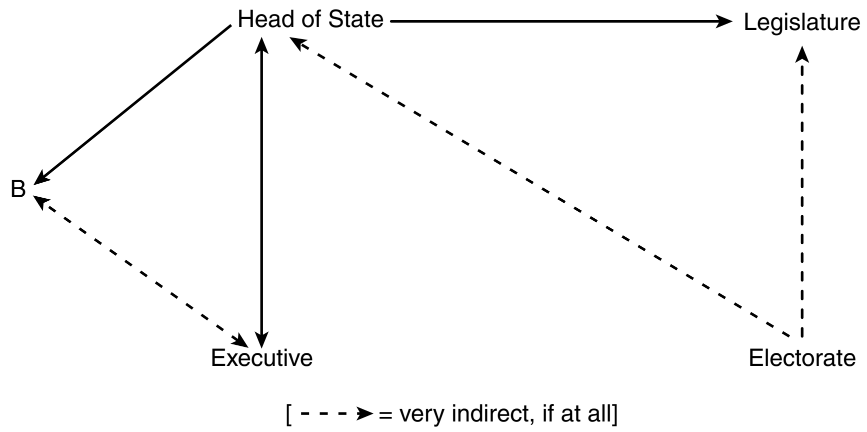

Figure 2 One-Actor Government

absolutism or religion, on the one hand, or based on military rule (operating by suspending the basic laws), on the other.

The structure of this form of government is that it is completely self-organized, and command and control are organized by force, ruling out any form of political and civil rights for the population. The most extreme form is tyranny, more often than not by means of (personalized) dictatorship (e.g., Joseph Stalin [Iosif Vissarionovic Dzugasvili]). This means that government equals the "rule of the day" and that force and fear prevail over the well-being of the nation and its population. At the end of the day, neither the leadership nor its subservient elite is accountable to anybody but itself.

Nonrepresentative government is hardly structured by formal rules. Informal rules tend to be beneficial and shaped by the leadership and its concomitant elites and are often insufficient for stable and enduring government. The major difference between both types distinguished here is the absence of abuse and outright perversion of human rights in combination with attempts to enhance the public welfare of the nation by one-actor governments. Yet in reality, it is difficult to draw a line between the two types. Often the one develops into the other.

Toward a Typology of Contemporary Forms of Governance

The different forms of government that have been discussed are all derived from one theoretical model: Easton's systems theory of political life. The focus has been on the institutional configuration of each type: presidential, parliamentary, dual power, one-actor, and autocratic government. It has been shown how the central actors representing the systems of governance are interrelated (directly, indirectly, or not) through the institutions that are typical for each political system. In this way, one can fill in the real cases that belong to each type as well as consider how in each of these political systems, the central actors are ordered in terms of (supposed) influence and their powers to command or control (or both).

Of course, not all systems within each category are perfectly the same; there is variation in presidential systems as there is in autocratic systems. In addition, all systems are more or less in flux: Institutional arrangements are changed and sometimes completely altered (e.g., the transition of the Fourth French Republic to the Fifth in 1958 or the degradation of Kenya from a one-party state to an autocratic system in the 1980s). Finally, there are cases that tend to be hybrids—that is, some features of two of the main types appear in one system: Finland, for example, showed strong features of presidentialism until the 1980s, but at the same time, it could well be considered to have a parliamentary type of representative government. Finally, it is fair to say that in reality, it is a thin line that separates autocratic systems from one-party systems (think of the absolutist kingdoms that exist in the Arabic world).

At the end of the day, it is up to the comparative political scientist to make a decision on the basis of evidence, on the one hand, and depending on the research question asked, on the other. This could well mean that a specific typology is developed, for instance, to describe how democratic a political system is or how well different systems perform (Keman, 2002). Developing typologies of political systems can help answer such questions and enhance comparative analysis.

Conclusion

The different types of political systems have been discussed throughout history, and many typologies have been developed. The construction of a typology is more challenging if the researcher not only wishes to use it as a descriptive tool to systematically reduce the comparative complexities but also aims to arrive at an analytically driven typology. As a methodological rule of thumb, this entry emphasized that a proper typology of political systems should contain those cases that not only belong in one cell but are also empirically mutually exclusive across cells. In addition, this entry distinguished between typologies that are whole-system oriented or intrasystem focused. Whole-system typologies of political systems had been quite frequent up to the 1970s, whereas the intrasystem ones came more into use after World War II.

The variation in both descriptive and analytical typologies of political systems was also treated. In addition, this entry also discussed that types of political systems may well be enhanced on the basis of Easton's idea of systems analysis of political life. To this end, systems of representative and nonrepresentative government were discussed as an example of constructing a typology of political systems in terms of their institutional design. This resulted in an analytical typology that is neither static nor teleological and allows for interpreting the process of government as the crucial component of any political system together with its systemic features.

POLITICAL THEORY

Theory is defined as a set of propositions that is internally consistent and based on a certain set of axioms and assumptions. Theory must be logically derivable in all cases. It must be politically persuasive, especially when it deals with norms. It must be empirically verifiable when it deals with reality. Therefore, *political* theory is defined as a set of propositions about "who gets what, when, how" (Harold Lasswell) and "the authoritative allocation of values in society" (David Easton). Thus defined, political theory covers a very wide range of subjects in the form of propositions.

In what follows, first the origins and types of political theory are examined. Among the types of political theory, this entry takes into account the following three: (1) classical philosophy, (2) empirical political theory, and (3) formal political theory. Next, this entry examines schools of political theory and their evaluation. Under this heading, 10 schools are evaluated: 4 schools of normative political theory (conflict, shared values, exchange, and coordination) and 6 schools of empirical political theory (systems theory, behavioralism, rational choice theory, institutionalism, neuroscience, and globalism). Third, this entry discusses the need to enhance conversations between normative political theory and empirical political theory, or between "ought" and "is." In other words, normative political theory should talk more about the plausibility, feasibility, and self-sustainability of the normative order it advances, and empirical political theory should discuss normative implications more seriously. With the aim of providing for more conversations and interactions within political theory, concise and concrete illustrations of such proposed conversations and interactions are given.

Origins and Types of Political Theory

Although political theory as a part of the modern discipline of political science emerged only in the 20th century, the origins of political theory are unquestionably in ancient thought—whether in the philosophy of Greece, Mesopotamia, Egypt, India, or China. One can cite passages from Aristotle, Kautilya, or Confucius easily to demonstrate that they are political scientists indeed and that political science, although modern, has very ancient roots. One of the major differences the discipline of political science can claim to have vis-à-vis other social science disciplines such as economics and sociology is that the ancient versions of political science, such as those of the three philosophers mentioned above, retain much power and relevance to the current reality in politics. Aristotle is often mentioned in contemporary writings on politics and political science. Kautilya is referred to in discussions on rulers' state craft both at home and vis-à-vis their rivals. Confucius continues to be taken up as providing possible versions of authoritarian politics. It is rare for Aristotle to be discussed in relation to economics, although his ideas on this subject are significant for the history of economics. All these disciplines are relatively young, since they have grown as modern social science disciplines in the West, especially in the 20th century. Yet one can argue that political science has retained its ancient origins even at the dawn of the 21st century. Thus, its development is very complex.

In Western Europe, the major distinction between the sacred and the secular was made gradually but quite steadily during the Enlightenment and the Reformation, and it diffused to European settlements and later to the rest of the world as well, at least superficially; secularism is therefore closely related to Western cultures. Religion and politics are said to have been distinguished in the West since the modern age. The same can be said about the relationship between religion and science. William of Ockham gave an early epistemological foundation for what would be called modern science by making a clear distinction between realism and nominalism. Realism refers to the school of thought that believes that God does exist in reality and that reality was conceived as the basis of that knowledge; nominalism refers to the view that God exists insofar as the concept of God is imagined. With this stance, science was able to separate itself from the cosmos of the sacred. With this separation, modern science was able to make spectacular progress in the West.

Needless to say, the separation between God and science and between God and politics did not come about so neatly or once and for all; rather, the picture is complex. The separation between religion and politics has been tenuous at best. At any rate, for our purposes, the separation of politics from God was a step forward in distinguishing political theory from philosophy. Also the separation of science from God was a step forward in distinguishing political theory from political philosophy. This distinction tries to separate God's judgment from that of scientists or political leaders.

At the crux of political theory is the mixture of the normative and the empirical—that is, what ought to be versus what is. The normative has to do with the judgment by which a verdict on justice is determined. While in medieval times, such judgments came from the Catholic Church or, in some cases, duels were fought between opposing parties, in modern times, they come from the courts where secular matters are concerned. Courts have been conceived like God. The concept of the empirical refers to something that can be experienced or tested in the daily lives of people. It was not until modern times, with the increasingly sharp distinction between the sacred and the secular—which made "reality checks" possible—that empirical testing became common.

Political theory comprises all this under one umbrella, including both classical philosophy and empirical political theory. To complicate matters further, political theory contains within its territory what is called formal political theory. Classical philosophy refers to prescientific and pre-empiricist statements about what justice is, how it should be achieved, and how it should be conceptualized. Empirical political theory refers to statements made from the scientific and empiricist viewpoints on how politics is played out. Formal political theory refers to logically and/or mathematically derivable statements that may or may not be amenable to empirical testing. Dealing with the normative and the empirical is inherently not easy. Compounding the problem is the recent tendency toward overspecialization and mutual isolation, rather than mutual engagement, among political scientists dealing with the normative and the empirical. Mutual isolation between classical normative theory and empirical theory has gone sometimes too far as their borderlines are not always very clear.

In practice, normative political theory and empirical political theory are far apart for several reasons. First, their knowledge base differs. Classical political theorists often are concerned with philosophy, theology, and intellectual history, whereas empirical political theorists are often interested in other empirical social sciences such as economics, sociology, and social psychology or in other applied empirical sciences such as neuroscience in politics. Second, their methods of training are very different. Classical political theory focuses on text critique and robust argumentation. All study is based on careful reading and argumentation. Empirical political theory focuses on hypothesis testing conducted according to positivistic practices or a systematic reality check. Yet these differences are not strong enough to undermine their disciplinary identity as political science and to split it into two or more subdisciplines. Although no solid and systematic evidence exists, it looks as if the shared fascination with how power is built and exercised seems to give many political scientists identity and solidarity to band together.

The types of political theory—classical philosophy, empirical political theory, and formal political theory—are discussed in turn in the remainder of this section.

Classical Philosophy

Classical philosophy comprises almost everything from the normative to the empirical, the prescriptive, and their mixture. In *The Great Learning (Daxue)*, one of the famous Confucian teachers instructs his disciples to do the following: "Tackling things, seeking truth, nurturing yourself (morally), sorting the family, governing the state, and pacifying the world under heaven." This sentence instructs the disciples that to stand above people they must start studying many things and knowing a lot. Then, they must discipline themselves morally. That leads them to sort out things in their family, and this process becomes the basis of governing the country. Only by going through all this can disciples envisage "pacifying the world under heaven."

This philosophical statement is described in a number of ways: (a) the authoritarian conception of governing by the sage, (b) the moralistic conception of governing, and (c) the familial conception of the state. The way in which the argument is constructed is bottom up. But the argument itself is replete with authoritarian, paternalistic, and personalistic overtones.

The no less famous classical philosophy of Niccolò Machiavelli, author of *The Prince*, is also prescriptive and empirical. He warns his readers that politics is determined by virtue and fortune. By virtue is meant a range of strengths including moral strength. Such an exercise of strength is needed to deal with the effects of fortune. This classical philosophy was meant to teach the monarch to act properly and prudently. Thus, it is largely prescriptive. At the same time, it is sometimes speculated that since Machiavelli was republican, his preaching was meant to subvert monarchism by deliberately encouraging the monarch to act most "monarchically"—that is, always assuming one's superiority, not trusting anyone but oneself, and acting mostly on the basis of strength—thus undermining the basis of popular support, which was becoming increasingly significant.

Classical philosophy includes the *Federalist Papers*, in which precursors of empirical political theory are often found. The view that federalism is a viable alternative to a unitary state is an example. This proposition has generative affinity with the work of William Riker (1964) and his Rochester School on formal political theory. Riker's brand of formal political theory on democracy and democratic choice has some affinity with both classical philosophy and empirical political theory.

Immanuel Kant's famous essay *Perpetual Peace* has been empirically tested lately, with quite stimulating debates arising from such efforts. In 1795, Kant argued that three conditions should be nurtured to bring about eternal peace. First, commerce should be invigorated, with free passage and free trade ensured among nations. Second, one should encourage the republican form of politics rather than the monarchical form, to make war more difficult. Third, international institutions should be created to allow for the expression of voices of varying assertions, to facilitate discussion, and to come up with formulas for conflict resolution. Kant's formulation has been reformulated in the tradition of empirical political theory by Michael Doyle, Bruce Russett, and others. The first is called *liberal peace*. The second is called *democratic peace*. The third is sometimes called *peace by consortium*. The second is the most popular, and U.S. Presidents Bill Clinton and George W. Bush used this doctrine to justify U.S. military interventions. Kant's affinity with empirical political theory is abundantly clear, even if it is not universally accepted as such.

Thomas Hobbes is arguably the most frequently mentioned author in relation to the state in the social sciences, along with Max Weber and Karl Marx. Facing what he saw as anarchy both at home and abroad in 16th-century England, Hobbes argued that absolutism and an absolutist state should be the answer to these anarchies—what people wish to achieve cannot be accomplished unless anarchical situations are overcome. In discussions of failed states and rogue states, therefore, Hobbes is one of the philosophers most frequently referred to. Describing and analyzing what is seen as anarchy in places and time points such as Cambodia in the 1980s and 1990s, Somalia since the early 1990s, Sudan in the 1990s and 2000s, Afghanistan for the past 40 years, the Democratic Republic of Congo for most of the 1990s and 2000s, Rwanda in the 1990s and 2000s, and the West Balkans in the 1990s and 2000s, many authors point to the need to establish a monopoly of violence and the legitimate use of power in the initial and yet critical phase of state building, along with the concord forged with the international community. A similar diagnosis and prescription are offered to show the process of state building that may evolve from a democratic spirit and under globalizing circumstances and the process of absolutism arising from claims of state sovereignty. Needless to say, the yearning for state sovereignty cannot be suppressed fully—one form of which is expressed by the concept of "sovereign democracy" coined by Vladislav Surkov, chief of staff to former Russian President Vladimir Putin and now President Medvedev. Sovereign democracy implies a sovereign state whose representative heads are chosen democratically but that disallows foreign interference from abroad, even if by democratic means—for example, the attempts at "colored revolutions" in Ukraine, Georgia, and Kyrgyzstan. Chinese leaders view "peaceful change" (*heping yanbian*) as anathema because it means foreign interference to force a regime change on the basis of human rights and democracy as universally shared values. Thus, on the anniversary of the Tiananmen massacre (June 4, 1989), China was placed under high-level alert. In short, Hobbes is just as relevant now, at the dawn of the 21st century, as in 16th-century England.

Empirical Political Theory

Empirical political theory aims at generating hypotheses that can be empirically tested and that are also capable of generating a higher level set of generalizations. In other words, empirical political theory places utmost importance on two aspects of research: (1) empirical validation (or falsification) and (2) empirical generalization (or theorization). Thus, empirical political theory first proposes an empirically verifiable hypothesis and then tests it. If it is confirmed, it can then be generalized. A good example of this type of theory is voting in U.S. presidential elections. To link with political theory, the characteristically American utilitarian model of electoral victory based on the death toll of American troops in combat situations and on per capita net income level change over the preceding year(s) serves as an example. As pointed out by

Douglas Hibbs (1989), the question of whether the candidate of the party that occupies the executive office is elected in the presidential elections is likely to be determined by the combination of the death toll of U.S. troops in combat situations and per capita net income level change over the preceding year(s). This model hypothesizes that voters yearn for peace (i.e., having no Americans killed in combat) and for prosperity (i.e., increasing income). If one considers the 2008 U.S. presidential race, two *S*s were important: Operation *S*urge in Iraq and *s*ubprime housing loans. Operation Surge reduced the death toll of American troops from the summer of 2007 through Election Day. How this affected the voter equation is one of the key points. The other *S* is the economic setback triggered by the subprime housing loans crisis. Not only were stock prices going down, but the U.S. dollar also lost value. Whether the government could prevent a recession by stimulating the economy through pumping a massive amount of money into it was also a key issue in the voter equation. Expecting the economy to recover seemed premature. This worked against the Republican presidential candidate, John McCain, who did not support such an economic stimulus.

A number of studies suggest that trust and health are quite significantly related. Those who hold concerns about social institutions such as social insurance are more likely to report bad health. Similarly, those who do not trust others very much tend to report their own bad health. The reasoning is as follows: Those with lower vertical trust, that is, those who do not place much confidence in social institutions, cannot enjoy the benefit of making the best use of them, one of the consequences of which is the loss of health. In a similar vein, those with lower horizontal trust, that is, those who do not place much confidence in other persons, cannot enjoy the benefits of working together, one of the consequences of which is the loss of health. Loss of health is measured by self-reported health using the World Health Organization's Quality of Life questionnaire. This proposition is interesting from a public policy perspective in that keeping public confidence in social institutions is important in itself. Otherwise, the service that can be supplied by social institutions cannot be fully provided. Thus, from a more conventional public policy perspective, public policy performance is a dependent variable and is to be explained by a number of factors. However, from the version of public policy perspective, the dependent variable is something individuals can experience physically, such as health, or emotionally, such as happiness and honor.

The electoral system can be either divisive or cohesive. In the political theory of representative democracy, how to choose electorates is of key importance. Representative democracy takes into account at least two forms of justice. "Representative democracy requires two conditions to be successful": (1) fair representation, reflecting electors' preferences, and (2) government stability, enabling government to execute policy pledges to the electorate. Two major systems exist: (1) *proportional representation*, whereby parliamentary or legislative seats are awarded according to the percentage of votes polled by a party, and (2) *first pass the post*, in which the person from a district who receives the highest number of votes is awarded the seat; this method awards a disproportionate number of seats to parties that get a larger number of votes and reduces the number of seats awarded to parties with a smaller share of votes. The proportional representation system is said to give fair representation but not regime stability, whereas the first-past-the-post method is said to give moderately unfair representation but regime stability. The latter is widely adopted in many English-speaking countries, such as the United States, the United Kingdom, Australia, Canada, and, until recently, New Zealand. The former is widely adopted by Continental European countries. Lately, the mixed system combining both methods has become more popular, especially in non-European regions such as the Asia-Pacific region, and seems to provide fair representation and regime stability to a reasonably satisfactory degree.

Proportional representation can be very divisive, as, for example, in Israel or in Iraq. The state of Israel is sometimes said to have committed two institutional mistakes in its founding days: First, it was unable to promulgate a constitution, largely because of the fundamental cleavages manifested on the issue of religion and the state, and, second, it adopted proportional representation as the mode of election. Parenthetically, there are only three states in the world that do not have a constitution: Israel, the United Kingdom, and New

Zealand. The United Kingdom does not have a written constitution, except for the Magna Carta, and it seems that New Zealand has inherited that tradition. Interestingly, the Iraqi constitution adopted a proportional representation electoral system, whereby ethno-religious cleavages have been amplified and invigorated. The one-person-from-one-district, or first-pass-the-post, system, common in the United States and the United Kingdom, tends to exaggerate the number of votes the winning party gets to obtain parliamentary seats. In other words, more proportional strength is given to the winning party so that government can enjoy at least a minimally stable majority.

Formal Political Theory

Formal political theory is a set of propositions that are logically derived from a set of assumptions about politics. A formal political theory of electoral democracy was first formalized by Anthony Downs (1957). This theory relates the statistical distribution of electorates' ideological and policy positions on a number of dimensions to the policies parties make to capture more votes. In other words, political parties shape their positions according to the number of voters who are likely to vote for them. Anthony Downs propounded an economic theory of democracy that has become very influential for those political scientists who believe that political science should be able to generate theories from which empirical claims about political phenomena can be deduced (after the theories themselves have been tested as described above). Downs's key insight into spatial economics is illustrated by his example of gas stations, which he explains are located close to each other because the spatial distribution of consumers of gasoline is that of a statistically normal curve. In other words, rather than opening a gas station miles away from another gas station, one might as well open it close to the other one, with the chance of getting many more customers for both. Downs applied this insight to the dynamics of electoral democracy. Suppose there are two major parties, one right-wing and the other left-wing. Further suppose that voters who support extreme views are fewer than voters who support moderate views, statistically speaking. To gain more votes, candidates will moderate their views, whether about war and peace, bread and butter, or honor and humiliation. The consequence is that the two major parties move closer to each other. As a result, such parties start to look alike. Many empirical efforts have been made to validate or invalidate empirically this Downsian theory of party competition. Thus, formal political theory has been quite well linked in many ways to empirical political theory. By using the statistical distribution patterns of electorates in a multidimensional space, this formal political theory shows that under representative democracy, electorates are sovereign whereas candidates or political parties are the subjects. This analysis is one example of how formal political theory has been applied to explain empirical phenomena.

Politics is played out most commonly in and among organizations. How people react to the decline of organizational life is one of the key questions in politics. Albert Hirschman (1970) formulated the model of exit, voice, and loyalty. The binary choice is between loyalty and exit. These binary choices are most commonly observed in the market: One's choice is between purchase and nonpurchase. In organizational life, if one is loyal, one will remain with the organization in spite of decreasing rewards. The exit option is to get out without procrastination. Between the two options is a third, more common one: raising one's voice to ask others to join forces in improving organizational life. This is more common in politics. But when one starts thinking about the major consequences of each option, it is much more complex. Consider an exit-prone country whose income has not increased dramatically in a long time, such as the Philippines. Filipinos earn a substantial amount of income through emigration—by sending doctors to the United States and maids to the Gulf countries, as they bring back a substantial amount of their earnings to their country. One can speculate that a consequence of a large migrant population is the lack of momentum for endogenous development. In contrast, in a loyalty-prone nation such as Japan, not leaving the country is a common response to the decline of organizational life, so migration rates are low. At the height of organizational decline, as conditions become intolerable and such loyalty fails to attract attention or admiration, loyalty may take on the character of voice. This is a formal political theory, but it could be an empirical political theory as well. The theory of exit, voice, and loyalty touches on complex manifestations of organizational life and varied options of human endeavor to improve it. In other words, the exit option is based on conflict, the voice option is based on coordination, and the loyalty option is based on loyalty.

Other than classical philosophy, empirical political theory, and formal political theory, there are two major genres that can be sometimes treated under the umbrella of political theory: epistemology and methodology. Epistemology refers to the study of how human beings recognize what they see and hear as knowledge. René Descartes, a French philosopher, most famously in *Le Discours de la Méthode*, laid down what might be called the modern positivistic method. It is a set of advice and instructions that would be helpful to obtain a clearer understanding of what one observes. Methodology refers to the study of various instruments through which reality can be observed and analyzed effectively.

Schools of Political Theory

Schools of political theory are sometimes messy in part because empirical political theory has grown, at least initially, out of other disciplines such as psychology, psychiatry, sociology, economics, and anthropology. One of the direct origins of empirical political theory is to be found in the deep transformations and the new needs following World War II. The application of methodologies and concepts from these disciplines to political science was first done by Samuel Stouffer and Harold Lasswell. For empirical political theorists, historical and institutional descriptions were the only methods used in their research. With the new methodologies and concepts, empirical political theory expanded its scope dramatically. Observing, measuring, and assessing in a generalizable fashion became conventions in political science, which allowed schools of empirical political theory to proliferate. Prior to World War II, the discipline of political science was concerned mostly with constitutions and institutions, on the one hand, and political philosophy, on the other. World War II was also a catalyst for empirical political theory, because governments were interested in measuring and assessing the morale of their troops and the effectiveness of propaganda and of military actions. Stouffer and colleagues conducted a morale study that contributed immensely to the development of survey research. Similarly, Harold Lasswell, Ithiel de Sola Pool, and colleagues advanced a propaganda study that contributed immensely to the development of intelligence analysis. Robert MacNamara and colleagues developed a bombing effects study that contributed immensely to the development of strategic analysis of costs and benefits associated with strategic options. Another example is the military occupation study by Ruth Benedict, which was instituted through a psychocultural analysis of the Japanese people. It took more than two decades after World War II for political science to come into its own with empirical political theory.

With regard to normative political theory, schools are commonly linked to great philosophers like Aristotle, Machiavelli, John Locke, Karl Marx, Michel Foucault, and Jürgen Habermas. But the increased interactions with other disciplines and related methodologies and concepts have also helped advance schools of normative political theory. One of the schemes adopted here is that of Russell Hardin, which distinguishes four schools of normative political theory.

Four Schools of Normative Political Theory

Hardin classified normative political theory in terms of theory based on conflict, on shared values, on exchange, and on coordination.

Conflict

Normative political theory focusing on conflict of interest includes the work of Carl Schmitt (1922/1985). Schmitt defines politics as a friend–foe relationship within and across nations. His theory is commonly categorized as ultra-conservative and sometimes fascist. Its explanatory capacity is high under conflictual situations such as wartime but not in more peaceful contexts. Although it is not necessarily categorized as work in the area of normative political theory, Carl von Clausewitz's *On War* has a strong normative affinity with the notion of the friend–foe relationship. Clausewitz defines war as no more than the continuation of politics by other means. In a similar vein, Field Marshall Boris Shaposhnikov defines peace as no more than the continuation of war by other means. The fact that both Clausewitz and Shaposhnikov were military officers may mean that their theories may be regarded not as normative political theory but as a technical guide for action, but the simplicity and clarity of their works may appeal to those studying war and conflict. Turning to a Marxist work that tends to focus on class conflict, Barrington Moore's (1966/1993) book, *Social Origins of Dictatorship and Democracy*, can be regarded as normative political theory focusing on class conflict. His argument is that agriculture is pivotal. The rise of democracy, fascism, and communism in the 20th century may be explained by studying the evolution of agriculture: Commercialization of agriculture led to its advancement, as in England and France; agriculture stagnated due to the indifference of the land-owning class, as in Germany, Japan, and Italy; and agriculture was overexploited by state-led capitalism, as in Russia and China—which corresponded to the advent of democracy, fascism, and communism in these countries, respectively.

Shared Values

Normative political theory focusing on shared values was dominant in the 20th century, especially after the Cold War. The ascendancy of shared values as a normative political theory has much to do with the rise and spread of liberal democracy since the past century. Liberalism is based often on the utilitarian calculation of free individuals, as John Rawls argued (1971). Democracy is based on the aggregation of the preferences of citizens, as described by Downs (1957). In a sense, liberal democracy demands a regime in which shared values are key. As long as liberal democracy is premised, the type of normative political theory focusing on shared values flourishes. Even the latest definition of politics by Robert Goodin (2009), as the constrained use of social power, reflects this. It is important to note that liberalism does not require either the knowledge or the sharing of values of other individuals. Downs's *An Economic Theory of Democracy* is a formal political theory with normative implications. Values are often illustrated by the left–right ideology. In a two-party system, the two parties tend to move toward the center from both directions, that is, from left to center and from right to center. Moderate or "centrist" citizens share values, whereas extreme or fringe citizens have few fellows. To win votes, the two parties target the numerically large central point. This leads the parties to adjust their ideological and policy positions and to compete to attract the large number of citizens located at the center. The explanatory capacity of normative political theory on the basis of shared values is high, especially when the tide of globalization weakens the intermediate and high-level organizations within the national body politic, so that individual citizens become more important than ever before.

Exchange

Normative political theory based on exchange is represented by Adam Smith. It is well known that of Smith's two major works, *The Theory of Moral Sentiments* and *The Wealth of Nations*, the former explains the sources of the human ability to make moral judgments. His key concept is sympathy, whereby the act of observing others makes people aware of others' behavior and the morality of their own behavior. Without sympathy in interpersonal relations, exchange loses its solid base. Even when it is writ large in national and global markets, exchange functions well only if it is grounded in sympathy in social relations. Sympathy is sometimes called social capital by authors such as James Coleman and Robert Putnam, among others. It is not necessary to note that human life cannot function sufficiently well if it is equipped only with exchange instruments and mechanisms. As long as the system of numerous exchange relationships called markets functions well, those normative political theories can be evaluated highly. More frequently, political life calls for schemes and instruments that go beyond exchange. To the extent that exchange helps resolve conflict, normative political theory based on exchange does have good explanatory capacity.

Coordination

It may be surprising to find that the notion of coordination has not played a major role in the development of normative political theory. It is natural that normative political theory based on conflict abounds, given that all politics is regarded as dealing with conflict-of-interest situations and friend–foe relations. It is also natural that normative political theory based on exchange abounds because conflict resolution can be achieved often by making use of exchange on a small to large scale. Hardin (2009) points out that normative political theory on the basis of coordination has been insufficiently advanced, perhaps because of a lack of awareness of coordination as a scheme and instrument of politics in a normative political theory framework. Even Hobbes's argument on absolutist rule by a sovereign king can be rendered as normative political theory articulated by the notion of coordination if Hobbesian theory is reformulated within a multilevel, multistage framework. In such a framework, a powerful concept is strategy. Determining how to coordinate when you take Strategy A and your adversary takes Strategy B is complex. Implementing a two-party coordination based on multilevel and multistage strategies makes normative political theory more complex. Yet this line of theorization has been conducted since the mid-20th century in other disciplines, such as military science, business management, and different branches of engineering, often in the form of game theory. Normative political theory with coordination as a key concept is bound to grow, since politics relies heavily on coordination.

Six Schools of Empirical Political Theory

As noted before, schools of empirical political theory are difficult to classify (see Robert Goodin, 2009; Robert Goodin & Hans-Dieter Klingemann, 1996; Fred Greenstein & Nelson Polsby, 1975). Two yardsticks are the behavioral revolution (the 1950s through the 1960s) and the postbehavioral revolution (the 1970s through the 1980s), followed by the "perestroika" movement in the American Political Science Association (the 1990s through the 2000s). With the behavioral revolution, systems theory and behavioralism became prominent. With the postbehavioral revolution, new attempts were made beyond the behavioral revolution in political science. The postbehavioral revolution and the perestroika movement tried to make political science more interpretative, reflective, context sensitive, and path dependence attentive, on the one hand, and more focused on institutions as contrasted to individuals, on rigorous utilitarian calculus versus culturally derived motivations, on neurophysical movement as opposed to manifested human behavior, and on a global outlook as against the perspective of the national organic whole, on the other.

Systems Theory

Dissatisfied with the state of political science in the 1940s, which was very different from what it is today, Easton attempted, during the 1960s, to make political science a scientific discipline whose theories are derived from empirical testing of theoretically formulated hypotheses on the basis of systematically generated data. By so doing, Easton aimed at creating a "general theory" of politics with a systems theory framework. Easton's famous definition of politics as the "authoritative allocation of values for a society" was born of this systems theory thinking. It was refreshing to those political scientists who were dissatisfied with the political science of that period, with its focus on constitutions and institutions on the one hand and ideas and ideologies on the other. Easton, with Jack Dennis, embarked on the study of a political system in terms of the political socialization of children, whereby children learn about politics from parents, peers, teachers, and preachers. Norms, values, and rules are those components that are channeled from one generation to another in a political system. What was probably felt by those self-claimed systems theory–influenced political scientists was that the political system is a vastly complex set of interactions of actors under a vast array of rules and norms and that theorizing it at a systems level on the basis of empirically derived evidence is definitely a daunting task. The behavioral revolution was raging in the United States concurrently with the acceptance of systems theory thinking. Then came a mild disillusionment with both systems theory and behavioralism in political science, concurrent with the turmoil in the world during the late 1960s and early 1970s. In other words, the limitations of systems theory thinking were deeply felt. Easton himself confessed later that his systems analysis and behavioralism had clear limits.

Behavioralism

Calls for behavioral persuasion were hailed as revolutionary by enthusiasts, who proclaimed that it would transform political science from an old, rusty discipline to one of the newest, acclaimed disciplines, with its focus on action rather than intention and motivation and on analysis rather than interpretation. Despite the short-lived enthusiasm for behavioralism, the spirit and style of behavioralism were consolidated in highly reputed journals. Returning to the explanatory capacity of empirical political theory, we can take up Bruce Russett's (1993) democratic peace theory. The hypothesis tested is one of the arguments made first by Kant: A republican regime (as contrasted to a monarchical regime) is less prone to waging war against another republic than against a nonrepublican regime. In contemporary parlance, the hypothesis states that democracies rarely fight each other. Russett made use of pooled time-series data composed of pairs of all the sovereign states each year from 1815 through 1989.

Rational Choice Theory

Rational choice theory was born of formal political theory. Yet it is normally attached to the testing of propositions that are logically derived from a certain set of assumptions and axioms. Its rise was due in part to the steady influence of economics in political science. Also, among the subdisciplines of political science, political economy, in which economics-trained academics like Anthony Downs (1957), Mancur Olson, and Gerald Kramer exerted considerable influence, was widely studied in the 1970s and 1980s. It was also due in part to the reaction against the kind of behavioralism that was criticized as blind and barefooted empiricism. Daran Acemoglu and James Robinson's (2005) *Economic Origins of Dictatorship and Democracy* is an example. It starts with the presence of different social groups. They prefer different political institutions with different ways of allocating power and resources. The highly resourceful groups want to monopolize power. The rest want democracy. In due course, democracy prevails because the majority wants it. In Thailand, the old elites and the newly growing masses fight each other intermittently, using violence. The old elites have not acquiesced in the capture of power by the masses and have recaptured power by resorting to a military coup d'état. But their reasoning is lucid and general, unlike the largely descriptive political science accounts of such struggles between democracy and dictatorship.

Institutionalism

As distinguished from the institutionalism of the past, institutionalism today is called neo-institutionalism. Its key features are (1) a strong empiricism using detailed institutional mechanisms and (2) an ardent comparativism of institutions, which is used to highlight the strength of the argument being made. The following contrast is intended to make the general orientation and product of institutionalism much clearer. If Acemoglu and Robinson are the representative authors of rational choice theory, John Ferejohn is the representative author of institutionalism. Acemoglu and Robinson formulate and test in a more general way. Ferejohn formulates and tests in a more comparative fashion, making the best use of a comparative exercise in hypothesis formulation and testing. These features are forcefully presented in his work on federalism and on war and state building. The limit of institutionalism can be said to depend on the scope and angle of comparative institutional screening and investigation,whether it examines the electoral consequences of electoral rules such as proportional representation and one-person-from-one-district or the social policy consequences of the taxation system.

Neuroscience During the revolutionary period of behavioralism, Easton's *A Framework for Political Analysis* and *A Systems Analysis of Political Life* may be called the bible of behavioralism. Another work that might be considered seminal is Karl Deutsch's (1963) *The Nerves of Government*. It highlights the importance of the nerves of the body politic, which enable flows and feedbacks of information. The work can be regarded as a forerunner of the neuroscience school of politics in a sense, although his framework did not delve into neurons and other neurophysical components and functions. Since Deutsch's interest moved from social communication and nationalism in a divided country to regional integration across the Atlantic, he is often categorized as a behavioralist. The steady advances in neurophysical science since the 1990s may make Deutsch a true forerunner of neuroanalysis. If Tip O'Neill is right when he says, "All politics is local," a neurophysician is right when he or she says, “All politics is neural.” Neuroanalysis is sharply contrasted to behavioral analysis in that the former focuses on intention and motivation as revealed by changes in the neurons in the brain whereas the latter focuses on concrete, visible action. The former does not probe into real intentions and motivations. Scientific advances such as magnetic resonance imaging and other devices have made it possible to interpret and understand human intentions and motivations. In detecting suspected criminals, both assembling material evidence and deciphering the motivations of crime suspects are indispensable. Neuroanalytical data are increasingly used to fathom politics. Giacomo Rizzolatti and Corrado Sinigaglia’s (2008) *Mirrors in the Brain: How Our Minds Share Actions, Emotions, and Experience* reveals how political science can benefit from neuroanalysis. Although neuroanalysis is not limited to political science, its use is bound increase because, after all, the complexity of politics lies in the fathomability of the movement of brain neurons.

Globalism

Political science at the dawn of the 21st century is moving in two opposite directions simultaneously: One is a neuronal direction, while the other is a global direction. Advances in science and technology have enabled human beings to connect with each other far and fast in order to “macrograsp” politics and dig deep into the brain in order to “micrograsp” politics. The tide of globalization was energized by the technological advances in the 20th century. One of them is the electronic revolution in communications, which enabled the movement of money to go “mad,” in the words of Susan Strange. It now moves incredibly fast, and along with money, many other things (e.g., commodities, education, medicine, migrants, viruses, crimes, drugs, weapons, and information) move fast on a global scale. Politics is not an exception to this irresistible and irreversible tide of globalization. David Held (1995) is the representative globalist. His *Democracy and the Global Order* builds the normative stand of cosmopolitan democracy founded on various democratic theories. The extent to which normative political theory is really universal and global at the same time was questioned until recently because a large bulk of normative political theory originated from modern Europe, where state building and political theory construction were both carried out mostly on a national scale.

Conversations Between Normative and Empirical Theories

So far, this entry has summarized three kinds of political theory: classical, empirical, and formal. It has also shown that they are intimately related to each other. In this section, a few illustrations are used to show that normative and empirical political theories can conduct fruitfully their conversations in ways that would help articulate them more sharply and precisely and identify their blind spots, thus enriching each other. Examples drawn from to make this point include warlike democracies and bottom-up regime typology. Both of these draw their propositions from classical political theories, such as those of Kant, Machiavelli, Aristotle, and Charles de Montesquieu, and conduct empirical testing of such propositions to see how much revision is desirable in both classical and empirical theories.

Normative political theory is meant to transcend the particular time and space in which it is generated in its argument about how justice is to be achieved. That is its raison d’être in a sense. At the same time, it is recognized that in normative political theory, issues based on conflict, shared values, and exchange tend to dominate. Those based on shared values have been especially numerous. This is in part because in the latter half of the 20th century, political science publications and their readership have been dominated by academics in the United States who have shown an enduring affinity with liberalism. Empirical political theory is also meant to go beyond the particular temporal and spatial settings so as to be valid under universal circumstances. At the same time, it is recognized that the bulk of empirical political theory has tended to be focused on the latter half of the 20th century and on the United States and the European Union. These two facts together represent a serious problem: Empirical political theory is heavily biased to present the West as a fountain of universal truth and justice.

It is remarkable that Kant, living in Koenigsberg his entire life and witnessing the vicissitudes of life in European environments, grasped the wave of the future in a most succinct way. Although democracies are peace loving among themselves, they are war prone toward nondemocracies, which they fear are a threat to their existence. The right-wing Kantians were born in the 2000s, in the wake of the September 11, 2001, terrorist attacks on the United States and the Afghan and Iraq wars. They argued that if Kant had been alive and had observed these events, he would have supported the Iraq war to prevent the weapons-of-mass-destruction (WMD) state of Iraq from exploding externally. They argued that democracies cannot be just passive, sitting idly by while innocent civilians are being killed and when democracies are challenged by the threat of force. Instead, democracies should fight against antidemocratic forces. In stark contrast to the democratic interventions of right-wing Kantians, the left-wing Kantians called for democracy that rejects interference from outside in the internal democratic affairs of a country, termed *sovereign democracy* by Vladislav Surkov. This refers to the incidents that took place in relation to the democratization and secessionist movements in those societies that used to be united in the former Soviet Union, such as Chechnya, Georgia, Ukraine, and Kyrgyzstan.

In the late 18th century, Europe saw the French Revolution and the Napoleonic War. Kant believed that the advent of a republican regime, free trade, and multilateral treaties and international organizations would herald eternal peace in a fledgling form. It is clear that Kant's ideas are surely bound by time and space. In the dawn of the 21st century, we saw the 9/11 terrorist attacks and the Afghan and Iraq wars, leading the right-wing Kantians and the left-wing Kantians to argue as to whether humanitarian interventions are justified (the right-wing Kantians) or not (the left-wing Kantians) to propagate democratic regimes from the outside. Thus, we can conclude that normative political theory has, not surprisingly, a context boundedness.

Along a different line of argument, Kant's republics have two types of checks-and-balances mechanisms, according to John Ferejohn and Frances Rosenbluth (2008). *Horizontal checks* are those mechanisms working at the higher level of the legislature and the executive. Lawmakers and law executors are different and separate. Neither can dictate to the other, and thus, a regime's restraining mechanisms work better than otherwise would be the case. *Vertical checks* are those mechanisms working between the elite and citizen levels. Kant's republican democracies distinguish between the decision-making elites and the decision-shaping citizens but only on the condition that they interact with each other. In other words, elites take into account citizen preferences in their decision making, while citizens express their preferences verbally and demonstrably to elites in their decision shaping. Ferejohn and Rosenbluth argue that Kant must be differentiated from Machiavelli in that the republican democracies equipped with checks-and-balances mechanisms in Kant's argument prescribe tangentially against Machiavelli's democratic mobilization theory and, thus, his war-prone democracy theory. Machiavelli's argument is based on the comparison between republican Rome and monarchical Florence. Republican Rome was endowed with soldiers whose war-fighting motivation and capacity were high because it was a politically inclusive regime. Monarchical Florence was plagued by mercenaries whose war-fighting motivation and capacity were not high. Ferejohn and Rosenbluth use Machiavelli to make sense of war-prone democracies as witnessed in the late 20th and early 21st centuries. Therefore, according to them, peace-loving and war-prone democracies are not separate but different sides of the same coin.

In 1835, focusing on the armed forces in democracies, Alexis de Tocqueville observed and pointed to the inherent danger of the military conducting activities that might give a bad reputation to democracies. Tocqueville observed that the army in America defended the invaders, who plundered the land originally possessed by natives and broke armistice and peace treaties with the natives. The army was hugely supported by the Americans, who advanced to the west from the initial patches of land on the Atlantic coast as if it were their "manifest destiny," before this phrase was coined later. Tocqueville was apprehensive of the danger of the military having its conduct legitimated by democracies whose ideas he emphatically approves and expressly admires. In the wake of 9/11 and the acts of revenge the United States engineered, Reiji Matsumoto sensitizes this aspect of American democracy fully, citing Tocqueville. In other words, democratic peace and war proneness are different sides of the same coin.

American authors like Max Boot and Robert Kagan make the same set of observations of American being prone to the use of force in settling conflicts of interest abroad even before its independence from England. Both authors are called neoconservative in the United States; in Russia, they are called the Bolsheviks of the 21st century. The American neoconservatives and the Russian Bolsheviks led by Vladimir Ilyich Lenin during the previous century have two things in common: They are idealists, pursuing their ideals with commitment and compassion, and they are realists, legitimating the use of force if their casus belli is deemed justifiable in light of their ideals, such as democracy and human rights. Perhaps Tocqueville was right in his instinctive apprehension since he had experienced democratic imperialism in Europe in the form of the revolutionary war waged by Napoleon Bonaparte.

Classical political theorists often talk about regime types. Aristotle, in his *Nicomachean Ethics*, argues that ethics is the basis of politics. Thus, depending on the prevailing ethics in society, three regime types are identified: monarchy, aristocracy, and *politeia*. Monarchy is shaped by the kind of ethics that prevail between a father and a son; aristocracy is shaped by the kind of ethics that prevail between a husband and a wife; and *politeia* is shaped by the kind of ethics that prevail between an elder brother and a younger brother. Aristotle's theory is monadic in the sense that once the prevailing ethics is identified, the regime type is automatically determined. Montesquieu's (1748) *Spirit of Law* is also monadic. Three regime types—republicanism, monarchy, and autocracy—are determined by the driving spirit of a regime. Republicanism is driven by virtue, aristocracy is driven by honor, and autocracy is driven by fear. It is clear that the relationship between citizens and the state is monadic and that once the regime type is specified, the prevailing ethics of citizens is also specified. In the late 19th and early 20th centuries, Weber talked about regime types via means of regulation—that is, charisma, force, and legal rationality. Again, the monadic determination is assumed. Once the means are specified, regime types are determined, and vice versa. The state of affairs has not changed much even in the late 20th and early 21st centuries. For instance, Stein Rokkan, during the 1960s, articulated the formation of democratic states in European history. Yet Rokkan talks about only regime types, not citizens. One may wonder why there has been little interest in citizens and their relationship with the state when opinion polls are conducted all over the world, including in many authoritarian societies. Until recently, one could explain the paucity of discussion on citizens in theories about the state as the main theories deal with the institutions rather than with the social actors.

Aristotle's *Nicomachean Ethics* makes ethics shared and practiced by a certain set of people the determinant of regime types—thus his regime types of monarchy, aristocracy, and *politeia*. Within *politeia*, he has three regime subtypes: autocracy, oligarchy, and democracy. How are the three regime subtypes of politeia determined? Some scholars conjecture that those regimes subtypes are not well "disciplined" by a certain set of ethics the way monarchy and aristocracy are determined by what is called the societal regime prevailing at the bottom. Ethics here is broadly understood as the prevailing political culture, whose key components are defined as identity, confidence, and satisfaction. These few societal regime types are not quite formulated at an abstract level that may be comfortable to some political theorists. But it is important to stress the need to initiate conversations. The classical theorists may start from anywhere they wish. The empirical theorists may start from the point where they are most comfortable. What is important is that they must move in new directions, which could bring them to carry out conversations tête-à-tête, instead of digging holes on both sides of what might be called the Maginot line of both schools of theorists.

With survey and nonsurvey data being continuously collected, empirical political theorists must grapple with the bottom-up determination of a regime type. So must normative political theorists. Neither normative nor empirical political theorists should discuss a regime type without examining the bottom level, that is, the citizens. The theoretical problem does not end here. Even in the general discussion of a regime type, say democracy, fuzziness abounds in the usage of this term.

POLITICIZATION OF BUREAUCRACY

Politicization of the bureaucracy is best understood in reference to two phenomena that are sometimes related. The first is the attempt of political principals to exercise control over the bureaucracy. Because politicization thus understood is in the first place an aspect of particular institutional structures, it may be called *institutional politicization*. The second form of politicization occurs when this control is exploited—that is, when the bureaucracy behaves in a manner responsive to politicians. Because the entailed notion of politicization refers primarily to patterns of behavior rather than features of institutions, it is significantly distinct from institutional politicization. This second notion is called behavioral politicization. Although both types of politicization are often criticized, their social consequences vary. Thus, while a given instance of politicization can be evaluated, a broad a priori claim about politicization of the bureaucracy is difficult.

Institutional Politicization

Politicians have many means at their disposal for influencing and controlling the bureaucracy. These include administrative procedures, budget controls, oversight, and prior review of agency action. The mechanism most commonly associated with politicization is staffing an agency with appointees chosen by politicians, usually in the executive branch; the higher the proportion of political appointees within the agency and the greater the extent of their penetration of the agency hierarchy, the more politicized the agency is. Thus, the United States Office of Management and Budget, with more than 7% of its staff appointed by the executive, is more politicized than the United Kingdom's Treasury Ministry, with only seven political appointees, or 0.5% of its staff. This entry focuses on political appointees rather than the other mechanisms of institutional politicization.

A politicized bureaucracy can be contrasted with one that is neutral, autonomous, or insulated—that is, one free from influence by the political branches and able to pursue its own agenda. Agencies may be free to do so by virtue of stalemates between political actors, each actor seeking to influence agency decisions, having cultivated a sufficiently influential constituency of its own, or monopolizing the information necessary for effective oversight. Political appointees within the bureaucracy can also be contrasted with careerists who enter the civil service and work their way through its ranks. This distinction is particularly important because careerists typically enjoy tenure, promotion, and salary protections. Careerists are thus not chosen by politicians. Rather, they are typically selected on the basis of objective measures, such as a competitive exam or special education (e.g., the *Ecoles Nationale d'Administration* and *Polytechnique* in France), and are insulated from politicians. This insulation should not, however, be overstated: Politicians can still influence careerists within many systems by offering transfers to prestigious posts and manipulating budgets.

There are two general motivations for institutional politicization. The first is patronage, where political appointments are created and filled as rewards to political allies or in exchange for favors. Patronage appointments are often "spoils" distributed by winners to those who aided in the campaign. The second is policy oriented. Politicians, usually executives, can politicize an agency to acquire greater control over it, staffing it with personnel of their choosing and whom they can dismiss. In this manner, politicization is a means by which executives steer policy. Similar reasoning informs the extent of institutional politicization when programs are enacted or implemented. If they anticipate losing political control, supporters of a new bureaucratically administered program may try to place it in an insulated agency dominated by careerists, whereas opponents may do the opposite, favoring increased politicization of the agency as a means of managing the program when they come to power. Similarly, a legislature faced with a hostile executive may prefer careerist administration of policy rather than politicization as a means of cabining the executive's influence.

Behavioral Politicization

Institutional politicization is frequently a determinant of behavioral politicization; structures that grant politicians influence over the bureaucracy will make it more responsive to them. Institutional politicization is not, however, a necessary precondition of behavioral politicization. The bureaucracy can adjust its behavior out of an internal norm, for example, or in anticipation of a threat of institutional politicization. Likewise, as indicated by the patronage motivation for political appointments, institutional politicization does not always lead to or seek to implement behavioral politicization. Institutional and behavioral politicization, as defined here, have a close relationship, but one does not necessarily imply the other.

Analytically, behavioral politicization can be further divided into two types. Behavioral politicization can indicate a shift in policy mediated through the bureaucracy. A new administration can usher in a new set of priorities and programs, and agencies may alter their behavior to better realize these goals. It can also indicate using agency discretion for purely political ends, such as directing government funds toward political allies or targeting opponents for investigation and scrutiny by enforcement agencies. The first, more general type of behavioral politicization is not normatively suspect, while extreme or egregious examples of the second are often made unlawful, such as under the Hatch Act in the United States, which forbids many government employees from using their official authority to influence or interfere with elections. An a priori normative evaluation of behavioral politicization in general is therefore difficult.

Effects of Institutional Politicization on Agency Performance

Some research indicates that increased institutional politicization in the form of political appointees decreases agency performance. However, this finding hinges on the presence of several key conditions. First, it requires that bureaucratic management expertise is site specific, so that it is not enough that the manager understands the policy area, the political environment the agency operates within, and so on. Instead or in addition, it assumes that an effective agency requires staff with particular knowledge about agency structure, budget, internal culture, and so on. A variation on this assumption is that public management is idiosyncratic, so that other management experience—which political appointees tend to have—does not transfer well. The contention is that appointees are generally less familiar with navigating the bureaucratic environment or marshaling coalitions to support their agenda. The second condition is that appointees with the relevant expertise and experience cannot be found or that the costs of doing so are unreasonably high. The third is that political appointees do not offer their own countervailing advantages. The alternative being assumed away is, for instance, that a political appointee, who is far more likely to have served in the White House or Congress, could not use those connections to facilitate achieving the agency's goals within its political environment.

If all these conditions hold, then ceteris paribus, the greater the extent of institutional politicization through political appointees, the less effective the agency will be at its allotted tasks. But these conditions are demanding. While there exists some empirical support for the first and second conditions, they may not hold universally even in the archetypal case of a patronage appointment where a neophyte is given a position as a reward or political favor. Furthermore, the alternative—careerist bureaucrats—can have its own drawbacks. Careerists, especially if they are insulated from political principals, can shirk their duties, become captured by the interests they are charged to regulate, or cultivate their own influence over policy.

Civil service career protections may help encourage bureaucrats to develop expertise, which alone would support concerns about institutional politicization. However, the most systematic arguments for this view demonstrate that bureaucrats only develop expertise if they have policy preferences and are given some control over such issues. This implies that perhaps the ideal system is a hybrid of institutional politicization and the civil service protections typically enjoyed by careerists: Politicians can staff agencies with those who care about the relevant policies, rather than using an objective staffing mechanism such as an exam, and then provide agency employees with job protection. So long as the bureaucrats are given some influence over policy, they will invest in developing expertise.

Politicization and Democracy

In addition to its possible impact on agency performance, institutional politicization can strengthen democratic control over policy by making the bureaucracy more responsive to (elected) politicians. There is thus the potential for trade-offs between efficiency or expertise and democratic accountability.

As previously noted, institutional politicization can lead to behavioral politicization. If voters exercise effective control over their representatives, then behavioral politicization does not threaten democratic control. The politicized bureaucracy is responsive to politicians and acts accordingly, and in this case, the politicians are in turn responsive to the voters. The result is essentially the same as if the bureaucrats were elected directly. Put another way, if the principal–agent problems between the voters and elected officials are resolved, then politicization need not undermine democratic control of policy. Institutional politicization is a possible means of resolving the principal–agent problems between politicians and bureaucrats, so that the politicized bureaucracy's behavior (i.e., behavioral politicization) is ultimately responsive to the voters.

This analysis assumes, however, that bureaucratic policy is a salient issue for voters, that is, that they are willing and able to condition their vote for the political controller of the agency on the bureaucracy's actions. If out of ignorance or other reasons they cannot, then behavioral politicization can be used to deliver targeted benefits (penalties) to allies (enemies) in order to gain political advantage.

POLITICIZATION OF CIVIL SERVICE

The term *politicization of civil service* refers to the introduction of political considerations into actions traditionally carried out by the civil service, thus changing political-administrative relations. There are three established ways of studying this process, reflecting somewhat different understandings of the basic concept. The first tradition concerns how civil servants are appointed and promoted. In politicized appointment and promotion processes, merit-based criteria are replaced by political criteria. Scholars in the second tradition study the political preferences of civil servants, often using attitudinal data, with the aim of answering questions such as whether the civil service is dominated by the political left or the political right. In the third tradition, the actions of civil servants are analyzed to assess to what extent civil servants are directly involved in political decision making. If they are involved, it is seen as an indication of politicization. In this entry, political-administrative relations are first described generally, followed by a discussion of the three traditions just mentioned.

Underlying the concept of politicization is the normative ideal of the separation of politics and administration. The argument is that to prevent corruption and patronage and to shield the expertise of the civil service, the two spheres should not be merged. The scholarly interest in political-administrative relations dates back to the late 19th and early 20th centuries, when influential authors such as Woodrow Wilson and Max Weber advocated a clear distinction between policy making and administration. The dominant view at the turn of the 20th century was that politicians should be responsible for policy making, while civil servants should execute the decisions taken.

The sharp distinction between the activities of politicians and civil servants has been questioned by many scholars. It has been pointed out, for example, that elected politicians have a legitimate interest in controlling what government organizations do. From a politician's point of view, having party loyalists implementing policies ensures that policies are not changed, or in any other way obstructed, on the way from decision to implementation. The basic idea of this line of argument is that neutral competence is not the only important virtue of the civil service in a democratic society. The neutrality should be complemented by responsiveness to democratically elected leaders. From this point of view, some degree of control, even if it is imposed by politicization of the civil service, could therefore very well be advocated.

However, although it has been claimed that the distinction between politics and administration has been overstated, the ideal of a separation of activities for politicians and civil servants is still very important. Most students of political-administrative relations would today agree that a collapse of political and administrative activities would have severe consequences for both democracy and the efficiency of the civil service.

Political Appointments

The common view is that political appointments and promotions have increased dramatically during the past decades. There have been numerous reports from countries belonging to different Western administrative traditions, for instance, the

United States, Sweden, Belgium, and the United Kingdom (UK), of an increasing politicization of the civil service. There is also evidence pointing to widespread politicization of the civil service in the developing world. These studies have created a growing and often critical debate regarding the move toward a more politicized civil service, which has engaged also international organizations such as the Organisation for Economic Co-operation and Development (OECD) and the World Bank.

Nevertheless, even if scholars have suggested that there is a common trend of politicization of the civil service, one should be aware of the large differences among countries in terms of the methods, levels, and trends of politicization.

Generally, there are two methods of imposing political control over the civil service using political appointees. The most common method in the Western world is not to directly replace civil servants with political appointees but rather to add a layer of political appointees to the civil service. Political appointees within this new layer take on advisory, public relation, or managerial functions. These functions could otherwise have been carried out by the civil service. In some cases, for example, during the Blair administration in the UK, political appointees mix these roles and serve as spin doctors involved in policy-making processes, the implementation of policies, and public relations. The system with a layer of political appointees has a long tradition in the United States, historically rooted in the so-called spoils system, where party loyalists fill important functions in the executive branch and in federal agencies. Another example of a similar strategy is found in Belgium, where ministers in the government have large private offices, so-called ministerial cabinets, that duplicate civil service functions and give ministers a political apparatus to turn to for advice. There are, however, also examples where political appointments are used directly within the civil service. Germany has, for example, the institution of political civil servants, which refers to the top two ranks of the civil service in Germany. Other examples with a more widespread and direct substitution of civil servants can be found in Southern European countries such as Greece, Portugal, and Spain and on the African continent.

Not only do the methods differ among countries but also the levels of politicization of the civil service. Generally, the levels of politicization of the civil service are higher in developing societies, the two main reasons being a political demand for a committed civil service and the fact that the civil service not only functions as a provider of public goods but is also a valuable asset for the employee. Scholars studying administrative reforms in India have, for example, observed that the neutral civil service was seen as “a hindrance rather then a help” and noted the politicians’ demand for a more committed civil service. Another example can be found in sub-Saharan Africa, where the state often is the main employer. Some scholars argue that the primary objective of the civil service in sub-Saharan Africa is not to provide service to the general public but to give rewards to the supporters of the political leader. Turning to the Western democracies, they can be divided into several administrative traditions with different levels of politicization. Countries such as Italy and Belgium, which are influenced by the French administrative tradition, have the highest levels of politicization. This group is followed by countries in continental Europe that are influenced by the German administrative tradition. Then, there are the Scandinavian countries, together with countries belonging to the Anglo-Saxon administrative tradition, such as Ireland, New Zealand, and the UK, with relatively low levels of politicization. There are, of course, several exceptions to this very general observation, but it should especially be noted that the United States, belonging to the Anglo-Saxon administrative tradition, is fairly politicized in comparative terms.

Political Attitudes

Studies of the political attitudes of civil servants have been used as an indication of the politicization of the civil service. There are at least two different ways in which the attitudes of civil servants are important in the political process. First, the civil service can make up a substantial part of the electorate and therefore be an important actor if it is politically mobilized. Second, and maybe more important in this context, the attitudes of civil servants might sometimes conflict with the attitudes of the political party in government, and this can create obstacles for policy implementation even if the civil servants are not mobilized. Sweden can serve as an example. In 1976, for the first time since 1936, a government not led by the Social Democratic Party was elected. It is often claimed that the new center-right Swedish government had problems implementing new policies because of the social-democratic attitudes of senior civil servants (even if they were not politically appointed). To avoid similar situations, most countries have subsequently created some kind of legal or normative framework stating the political neutrality of the civil service and/or limiting the political involvement of civil servants. Another example, from the Thatcher years in the UK, can, however, illustrate that conflicts between the political leadership and the civil service are not always about party politics. The Conservative Prime Minister Margaret Thatcher tried to implement a radical reform program in the public sector. Studies have shown that the civil service was not trusted to carry out these reforms, and therefore, civil servants in key positions were replaced by persons committed to the reform program. Politicization was based on attitudes to that reform program rather than to the Conservative Party.

Political Actions

It is inevitable that civil servants take part in the political processes to some extent, since they are parts of politically led machineries. In most countries, top civil servants are also, to some extent, involved in giving policy advice to ministers. However, there are large variations in how the civil service is involved in political actions.

Participation in the policy-making process is regarded as a critical indication of politicization. Generally, the civil service can participate in three different ways: (1) directly, (2) indirectly as actors in the political decisions, or (3) as advisors to the elected politicians.

One example of direct involvement is the Japanese tradition, where the civil service does not limit its role to policy implementation or technical advice but is considered to be a powerful actor in the policy-making process. Until the end of the 1990s, top civil servants even took part in discussions in the Japanese legislature, the Diet, something that would be unthinkable in most other countries. In Spain, civil servants are indirectly involved in the policy-making process. Spain traditionally has a close connection between the political and administrative elites. The political elite is largely recruited from the Spanish administrative corps. It could, therefore, be argued that the civil service is involved in the policy-making process, although not in the same direct way as it is in Japan.

A third example, illustrating the advisory functions of the civil service, can be found in Denmark. It is one of the countries in the world with the fewest political appointments in the civil service. This puts the politically elected leaders in a situation where the civil service is the only body outside the party organization where they can turn for advice. Civil servants in Denmark, therefore, play a significant role in the policy-making process as advisors, and this is paradoxically due to Denmark's low-level, rather than high-level, political appointments.

POLITICS OF LANGUAGE

Political language narrowly defined refers to a specific use of language for political means. In a broader sense, political language refers *to language policy* or *political linguistics*—that is, the ways in which governments attempt to shape the linguistic structure of the society or the claims issued by linguistic groups to change existing language arrangements or legislations. Neither of these working definitions fully captures the relevance of language issues to politics and political science. This entry therefore reviews three types of related but not overlapping issues: (1) the way social sciences address the relationship between language and politics, (2) classical language policies and legislation, and (3) the "normative turn."

Until recently, language matters in social sciences have been addressed in anthropology, sociolinguistics, and sociology, focusing almost exclusively on language *identity* (class or group identity) and language as an expression of a specific culture—hence its intrinsic value as a unique cultural vehicle. These approaches are consequently committed to language diversity. But language diversity generally hinders efficient political administration, and comparative politics have shown that the most classical sequence of nation building is language rationalization, that is, the imposition of one or more official national languages. Monolingualism is not the norm; most countries have to manage language diversity, either by admitting a set of official languages or by tolerating language diversity.

Language and Politics

To the Greeks, language and politics are so closely related that the practice of democracy is impossible without a theory of language. "Nature makes nothing in vain . . . man is the only animal with the gift of speech" (Aristotle, *Politics*, I, 2). Politics *is* language, because language enables deliberation and debate and rules out violence, as Norbert Elias has shown in his *Civilizing Process*. Language is therefore central to any political activity.

Language is also central to social interaction, and social scientists have been indebted to pioneer linguists such as Ferdinand de Saussure, who claimed that language is the epistemological model of society. In other words, society is structured like a language. Structuralism indeed claims that there is a "social grammar," and social sciences in general became fond of the idea that the implicit and explicit code ruling society resembles a constraining grammar of interaction. Social theory in the 1970s understood social action as either conforming to that grammar or violating its rules.

Three main movements characterize the past decades of research:

1. The first is the reception of nominalism in analytical philosophy and its durable influence on constructivism in general. Nominalism holds that there are no universal concepts, only empirical observations; referred to language, reality pertains to our ways of constructing/naming it; John Austin's illocutionary acts, for instance, are means of "doing things with words": A minister saying, "I baptize this child," ipso facto baptizes it.

2. The second involves studies on language and domination, with two subfields. One is concerned with routinized forms of domination, as in Pierre Bourdieu's *Language and Symbolic Power* (1982, 1991), for whom the linguistic market is similar to any other market, or Basil Bernstein's *Class, Codes and Control* (1971), where a sharp line is drawn between the "elaborated speech codes" of the middle classes seeking social mobility and the "restricted speech codes" of the working classes. Speech responds to strong cultural pressures: An elaborated code summarizes general social means and ends, whereas a restricted code is limited to local means and ends. The other subfield is concerned with the exacerbated form of domination: propaganda and totalitarian language. George Orwell depicts the deterioration of language in his novel *1984*, and Viktor Klemperer's diary (*Lingua Tertii Imperii*) describes the sheer truth of how the Nazis systematically destroyed the German language, not only by evacuating the bald words but by substituting them with euphemized codes, such as "final solution" or "special treatment."

3. The last movement is a legacy from philosophy and anthropology and relates to the profound skepticism concerning the written form of language and its potential link to illiberal policies (Plato, accusing the logographs, wrote that script

lies and that speech is sincere; script is compared to a *pharmakôn*—poison and medicine alike). Anthropology confirms that script is historically linked to despotism, as the original use of script was for accountability and domination of vast territories, not poetry. Classification might be a natural property of language; it enables governments to control society through rules enabled by script.

Language Policies

Language policy is an attempt to weigh collective language choices by institutional means, to prescribe the public use of one (or more) language(s), and to adopt language legislation. Historically, creating, rationalizing, or maintaining a language is the classical (European) sequence of language policy, mostly congruent with nation building in the 19th century. Official languages are not always national languages (an official language can coexist with a set of national languages), and substate national communities or groups with a strong regional identity may challenge the official language and make new language claims. Official- and national-language policies are only efficient alongside compulsory education, a wide interest in learning and using the official/national language, and some kind of reward for doing so (professional, symbolic)—the latter is particularly true for national-language policies: "What the eye is to the lover, language is to the patriot" (Benedict Anderson, 1983, p. 154).

The French example is telling. From the 16th century (the Édit de Villers-Cotterets, 1539) to the 1992 constitutional revision, France has always aimed at rationalizing, spreading, and maintaining the French language as a symbol of common belonging, a means of effective administration in a centralized state, a key element of republican identity, and a sign of equal citizenship. Ironically, it was an abbot during the peak of the French Revolution (1790–1794), Grégoire, who was convinced that revolutionary ideas could only be thought of in French and who implemented the first true language policy: Political praxis and language practice are inseparable.

Language Legislation

The next step is language legislation and consequently language rights. All states "speak," issue laws, and administer; language, therefore, cannot be benignly neglected as religion, for instance. In monolingual settings, the public sphere is entirely ruled in/by one language. In multilingual states, mostly federations, legislators have a choice between two principles: the territoriality and the personality principles. The first, and most widespread, principle is based on territorial rights (Belgium, Switzerland, and Cameroon): It legally recognizes a monolingual territory. Variants are territorialized individual rights (Catalonia and South Tyrol), special policies for minorities (Australia, the United States, and Germany, Hungary), and territorial bilingualism for minorities (Estonia, Bosnia, and Pakistan). Territoriality is usually associated with administrative bilingualism (civil servants speak all or part of the official languages) to ensure statewide communication; it provides language stability and language security (small languages are protected on their territory, and language scales are relatively stable) but obliges all to speak the official language in its territory of reference. Territoriality generally leads to juxtaposed unilingualisms and may disrupt intercommunity communication, such as in Belgium. The personality principle, on the other hand, is best described by institutional multilingualism: The state acknowledges and recognizes individual language choices. Regardless of where one is in the territory, civil administration has to cater to the individual's language choices. Most of Canada follows this principle, with both French and English as official languages; however, in response to Québec's desire to preserve the French language, legislation (Bill 101, 1977) was passed that makes French the sole official language in the province.

Language legislations are mostly a blend of different types of territoriality associated with individual rights. Strategic multilingualism in India or South Africa hints at political rather than linguistic difficulties in a postcolonial or postapartheid era, respectively. Very few states have achieved "liberation" from the colonial tongue. The Arabization movement in Algeria (the return to Arabic as the only official language) was a linguistic and political failure: The Algerian upper classes continued to speak French, the token of upward mobility. One interesting feature of language policy is internationalization (spreading a national language worldwide). Colonial empires did so in Africa, Australia, and India; and half a century after decolonization, means of social mobility are still linked to "colonial" language skills.

Almost all states enforce linguistic assimilation policies, and very few states decide not to intervene in language matters, favoring as such the dominant group(s). A complete language shift is generally achieved in the third generation; diglossia and bilingualism are common among immigrant children.

Language and Fairness

Noam Chomsky's theory about the grammatical similarity of all languages within a universal mind-brain set had expelled sociolinguistics and diversity studies from the linguistic departments in the 1970s. A similar change of paradigm took place in the 1990s with the normative turn in language studies. Until recently, and despite a fair amount of language conflicts, normative literature in political science had not paid much attention to language and even less to the linguistic dimension of democracy. Post-Rawlsian political theory has been discussing many culture- or identity-related topics but has barely considered language. Neither liberals or liberal-culturalists, nor communitarians have really addressed language equity. It is only in the 1990s that scholars in comparative politics and economics started to invest in language issues. However, shedding a new light on linguistic diversity and linguistic justice in a system dominated by powerful global languages rapidly led to a wider discussion on the usefulness and the threats of a common language, a lingua franca (in Europe but also in multilingual societies and sometimes even on a global level), the founding idea being that somehow a healthy democracy depends on a common tool of communication. The path taken by recent literature is an attempt to reconcile the polity's systemic and linguistic capacity alongside the citizen's effectiveness or voice. The "deliberative turn" of the 1990s and the following "talk-centric" theories of democracy indeed focused on communication and debating rather than on voting but without mentioning the precondition of a successful public debate: a common language. The discussion on such a common language as a necessary condition of a more substantial democracy has been particularly vivid in Europe and poses interesting questions: Do we need a common language for a supranational or even a global democracy? Do we need a common tool to discuss global concerns (environmental issues, for instance)? Would social mobility and employability be enhanced if we all spoke the same language? The possible answers are contained in three different models. The identity model argues for some kind of restorative justice after centuries of nation building and linguistic rationalization: The claim for language diversity is morally relevant, and states ought to acknowledge those claims instead of reducing language variety by imposing global/official languages. The procedural model is not outcome oriented: People should fairly discuss the language choices of their polity. The economy or utility model focuses on the social and economic usefulness of one or more linguae francae, the costs and benefits of learning/spreading common language(s).

Many political theorists would argue that given the huge translation costs in the European Union, the most efficient policy would be a fair combination of three official languages (English, French, and German) and a three-communication-languages repertoire, including one of the official languages. Such a language coordination policy would rest on an official language set and a free language market for the citizens; it would cost less, enable governments to invest in language training, enhance the possibilities of communication among European citizens, and maintain the possibilities of connecting European repertoires with extra-European language constellations.

POLITY

See Political Systems, Types

POPULAR CULTURE

The term *popular culture* has three levels of meaning, which though interrelated are mutually distinct. It refers first, in a generalized way, to the form taken by the totality of everyday practices followed by a society or a group within a society. In this sense, the term is, from the cultural history perspective, a descriptive one, devoid of any further theoretical implications. Historically, a second, more narrowly defined meaning of popular culture first came into use. It was applied to the culture and lifestyle of a population's lower social strata and referred—mostly within a historical perspective—to the perceived polarity between the culture and lifestyle of the general population, seen as the uneducated masses, and the dominant high culture of the elites. The third meaning of the term *popular culture*—which, in the English-speaking world in particular, equates *popular culture* with *pop culture* and thus denotes cultural industry products distributed by the mass media unrelated to the canon of classical high culture—arose from the specific dynamics of the breakdown of Marxist class antagonism in the intellectual circles close to the Birmingham Centre for Contemporary Cultural Studies (established in 1964). In effect, the vertically and hierarchically conceived juxtaposition of two cultures was now replaced by a horizontal array of multiple equal-status "cultures" subsisting within the polarities of class, race, and gender. Below, the historical developments and the interaction of these concepts are discussed.

Early Developments

The concept of a (popular, indigenous) "folk" culture (*Volkskultur*) existing in its own right originated in the second half of the 18th century, born partly of the physiocrats' interest in the population at large and partly of the romantic notion of a "folk soul" (*Volksseele*) characterized by supra-individual, nation-specific features. During the Napoleonic period, and in the context of the nascent discourse of nationalism, this concept of *Volk* underwent reformulation; the relationship between popular culture and high culture came to be conceived of as an organic unity, its elements defined in terms of each other. Yet at the same time, in the context of industrialization and of the developing social crisis, the mutual antagonism of the two cultural levels became an increasingly prominent feature of socialist and Marxist cultural theory. The origins of the concept of popular culture at the time of the Enlightenment are linked to the physiocratic interest in resources, generally—to agricultural production, mineral resources, and proto-industrial production—linked ultimately, that is to say, to the discovery of the productive capacity of a territory's working population to increase its wealth. Michel Foucault used the term *biopolitique* (biopolitics) to denote this new, calculating concern with the productivity potential of the population as a feature of the new power structure, directed against the ancien régime.

This same interest was accompanied, and dignified ideologically, by the notion of a productive national soul (*Volksseele*), in which the quintessential nature of a people was supposed to find its expression. It was this latter notion, too, that underlay the romantic preoccupation with collecting nation-specific texts—folksongs (Johann Herder, William Wordsworth), fairytales (Jacob & Wilhelm Grimm), proverbs, and diverse idiomatic materials. Among those thinking in terms of the nation-state, from about 1800 onward, the biopolitical interest became ideological: The idea of a nation as an entity, at one with itself and clearly distinct from other nations, was no mere matter of drawing geographical frontiers. Much more important, it called for cultural demarcation to take place—a process complicated by the conflicting pulls of a nation's high culture and its "cultural substrate" (Friedrich Jahn and Wilhelm Riehl). The term *folklore*, coined by William Thoms in 1846, denotes the attempt to record the cultural substrate of individual nations, national minorities, or groups in genealogical form and to subject the recorded materials to comparison with a view to identifying what is universal in human socialization, along with what is specific to the respective groups. The positivist collector activity focused on folklore was now accompanied by scientific analysis and sorting of the material under the disciplines of ethnography and ethnology. During the ensuing development of the cultural and social sciences, the culture of the people (*Volk*), of "the nameless masses," was identified for the first time as a subject meriting research. As such, it embraced the material and ritual-performative patterns of existence and action peculiar to the lower social strata of people or genealogical groups and their ideas on religious, juridical, and everyday practical matters, along with their approach to positioning the individual in society (relative to ancestral descent, family, and sequence of generations).

Depending on the political and social conditions prevailing in national groups, cognizance of the everyday perspectives and material culture of the lower strata will tend toward one or the other of two postulates: comparative and open-minded or ethnocentric and hypostatizing. It is unlikely that there has ever been a clearer example of the latter than the direction taken by German ethnology from about 1900, which amounted to disowning the tradition of a comparative ethnology or anthropology concerned both with industrialized societies and with nonstate groups. However, neither line of development succeeded in demonstrating a robust link between high culture and cultural substrate. It was only 20th-century sociology that first developed sophisticated models for such a linkage. The behavioral standards in Norbert Elias's theory of the civilizing process and the habitus variants represented by Pierre Bourdieu must both be seen as distinction-drawing processes, as deliberate differentiation of the elites from the "broad masses"—though this was later rationalized from the psychological angle in the contexts of social, medical, or public hygiene debates.

Nationalist and Marxist Approaches

Thus, in its early stages and subsequent development, the concept of popular culture marked off the sociocultural living patterns of what was initially the agrarian, peasant population, and later included the proletariat and lower middle classes, as separate and distinct from those of the higher and socially influential classes. Two conflicting inheritances can be traced, one nationalistic and focused on origins, the other Marxist and antagonistic. The nationalistic, origins-focused line reaches its culmination in National Socialist ideology; here, the existence of cultural antagonism within a society is denied, and a countermodel, based on ideas such as national character and the "bonding" of a nation's various cultural levels, is proclaimed: the *Volksgemeinschaft*. This was seen as a closed continuum, within which cultural substrate and high culture cross-fertilize and interweave, since both are rooted in the same humus and are inseparably linked. The soil metaphor is complemented by that of blood—*blood* standing here for the vitality and strength of the current generation at any given time.

The background to this blood-and-soil fixation can be traced to 19th-century organic models of society: Nationalistic thinkers generated, for the benefit of the nation's imagination, the self-image of a solitary tree, its roots reaching deep down to the first beginnings of the nation's separate cultural identity and the new blossoms seen on it each year (i.e., individuals who have to put the community before themselves) representing national uniqueness and vigor. In this figurative thinking, every nation constituted a self-contained entity, a clearly demarcated "body" of the people. Being the social stratum seen as tillers of the soil and as essentially enduring, farmers became the ideological standard-bearers for this ideology of *Volkstum*, or national distinctiveness, which postulated a continuity stretching from early origins to the present level of development. The continued efficacy of the strength-giving pure origin was exposed to many and various dangers: nonrecognition and relinquishment of the We as a consequence of fascination with the Other (or Alien) or the sustained infiltration of the "body" of the people (or nation) by "alien elements," the existence of which was perceived as parasitical (e.g., anti-Semitism). It has to be emphasized that all postulates of *Volkstum* and folklore regarding industrialized societies and the research on them, both the more radical and the moderate variants, are ideologically motivated. While it is true that this readiness of the upper strata of society to turn to the *Volkstum* and folklore of the lower strata embraces a certain element of compensation for modernization *Angst*, the ideologically transmitted postulate of pure origins with minimal contamination from outside is nevertheless preeminent. In other words, the everyday perspectives of the lower social strata were almost lost from sight in the ideological canon centered on origins and race.

The Marxist approach, focused as it was on class antagonism, led to the evolution of the theory of "two cultures" in "the same society" (Lenin). The antithesis inherent in the power disparity will prove to be a productive stimulus for both sides; high culture, having become weak and decadent, will be goaded into repressive action, while proletarian counterculture, with hitherto untapped reserves of energy to draw on, will indeed lose some of its impetus but will prove unstoppable in the long run. With the concept of the struggle for cultural hegemony as outlined by Antonio Gramsci, this black-and-white characterization of the cultural confrontation (subordinate to the economic) becomes less simplistic and more applicable empirically. So Gramsci's concept of cultural hegemony being "negotiated" within society after the demise of both the origin-focused and the class warfare–motivated models of national culture was to prove exceptionally fruitful in both historical and contemporary social research.

Modern Approaches

Inquiry into such negotiation (there are a host of parallel developments besides those of Gramsci) implies knowledge of the specific thinking of the actors concerned. Thus, while the special fascination of the term *folklore* lay in its inbuilt tension between "knowledge of the people" and "the people's knowledge," the need that now arose for empirical study of the multifarious "culture and way of life" of the population's lower strata ensured that it was their viewpoint that now became the central concern. The common feature of all these more modern approaches is that they seek to collect and to focus on the inside views peculiar to the various social environments and thus—here revealing an anthropological cast of mind—to supplement the "grand historical narratives" with detailed studies at the grassroots level (microhistory). The now widely established pursuit of historical research on popular culture owes much to a history that started from the bottom.

Among the points of departure for this historical anthropology was the school that developed around the French journal *Annales d'histoire économique et sociale* (launched in 1929). Its founders, Marc Bloch and Lucien Febvre, announced a historiography that would subordinate event history to a structural history concerned with everyday life and the mentalities that it engendered. The long duration (Ferdinand Braudel's *longue durée*) of production methods, ideas, and behavioral patterns now became no less a central focus than single events: violently erupting rebellions (as described, e.g., by E. LeRoy Ladurie, *Carnival in Romans*) or ideas about the nature of the world, put forward at Inquisition hearings but running counter to contemporary trends (e.g., the worldview of a miller around 1600 in the *benandanti*, the work of Carlo Ginzburg). The ethnological line taken by the Prague School applied the structuralist method of meaning-constitutive opposition—this was still before Claude Lévi-Strauss—to elements of popular culture (P. Bogatyrev). Mikhail Bakhtin, with a background in Russian formalism, developed his theory of folk laughter in late medieval popular culture from the antithetical pairing of work culture and feast-day culture.

Particularly in academic research in the fields of family, childhood, women's, and gender studies (and, not least, feminist studies), but also in the field of everyday living patterns and of power relationships in agrarian, early-modern urban, and proletarian industrialized cultural phenomena, popular culture researchers have set new and lasting standards in historiography. In its early stages, still adhering to the Marxist class antagonism concept, the Birmingham School of Cultural Studies later came to place the dynamics of the hierarchically subordinated cultural forms qua counterculture and subculture, possessing their own symbolic language, at the very heart of its activities: "culture as a whole way of life" (R. Williams; R. Hoggart). This assumed the recognition of individual identity positioned on criteria of social background, occupation, and philosophical-political, religious, and sexual orientation as a decision in favor of a form of living that constitutes a cultural sector in its own right. Under the influence of Gramsci's theory of hegemony, the counterculture and subculture theory evolved—with youth culture and music culture in the forefront—into a new theory that accords parity of status to a range of cultures; the erudition-laden high culture of earlier times is now just one culture among many.

The most complete transformation has been in the area of mass media cultural products. The Adorno/Horkheimer thesis of a culture industry manipulating the scene from the top has been challenged, in S. Hall's encoding/decoding model, by consumer appropriation of the narrative. John Fiske, taking all categories of mass media–transmitted pop culture products into his purview, demonstrated the creative resistance potential of this appropriation process. From a feminist perspective, Angela McRobbie has emphasized the gender specificity of the manner of appropriation. Cultural studies had already gone separate ways by the time the Birmingham Center was wound up in 2002. Influenced by accelerated media transmission and communication, by the increasing dominance of the visual in cultural output, by consumer-centeredness (among young shoppers no less than others) in the developed societies contrasting with abject poverty in the underdeveloped world, and by the enormous differences globally with regard to women's autonomy of action, the lines of research pursued today in cultural and postcolonial studies are characterized by a bringing together of class, race, and gender.

A detailed study of popular culture (Facebook, blogs, discussion forums, etc.) on the World Wide Web is beginning, but it will take time until web culture research becomes an established discipline in its own right.

POPULISM

See Populist Movements

POPULIST MOVEMENTS

A distinction must be made between more or less coherent populist movements on the one hand and populism as a generic theoretical concept referring to a variety of demagogic messages and attitudes on the other. In the following, the various phases of populist movements and ideas are discussed in their historical contexts. The conclusion points to current concerns.

Phases of Populist Movements

Scholars conventionally identify the first historical manifestation of populism in the Russian intellectual populism of the late 1840s *Narodnikis* (i.e., populists in Russian; the word *narodnitchestvo*—populism—appeared in the 1870s). Influenced by the ideas of Aleksandr Herzen, Mikhail Bakunin, and Nicolai Tchernichevski but devoid of any elaborate ideology, these *Narodnikis* emerged as a revolutionary movement adhering to some kind of idolatry of the peasantry and the rural village (*obchtchina*). They were ultraleftist, prone to the use of violence and even political assassinations.

This led, later on, to nihilism—terrorism as propagated by Nicolai Nekrassof and Sergei Netchaiev. They were also fiercely anti-Western (Orientalists) and proslavist (an extremely radical variety of revolutionary slavophiles).

Thereafter, during the last quarter of the 19th century, populism made a second appearance in the very different world of the European and North American industrialized societies. It thoroughly transformed itself into an anti-elitist, antiparliamentarian, and nationalist-chauvinistic movement, especially in France between 1886 and 1889 (Boulangism, derived from the name of its charismatic leader General Boulanger) and in the United States during the 1890s (with the xenophobic Protestant and anticapitalist People's Party of the small White Anglo-Saxon Protestant [WASP] farmers and miners). Under these circumstances, populism shifted from the most extreme Left to the radical nationalist Right, appearing to some extent as the ancestor of today's xenophobic and anti-immigrant Western European populist parties. Both French and U.S. populism of this second period only enjoyed a short time span. In this way, they introduced a feature of populist movements that remained for a long time quite typical—that is, their short duration, due to the ephemeral excesses of popular fever generated by a recurrent hostility to the existing ruling elite or to a newly established democratic government (in Europe of the late 19th century in particular). They also inaugurated populism as an unsteady form of mass electoral movements cemented by an orientation toward the "citizens of true stock."

Between 1925 and 1955, populism made a third appearance. This time, it emerged in Latin America, with the semidictatorships of Getulio Vargas in Brazil and Juan Peron in Argentina (notwithstanding other populist governments, e.g., Carlos Ibañez's in Chile or General Rojas Pinilla's in Colombia, alongside their much more recent revival in Hugo Chavez's Venezuela or Evo Morales's Bolivia). In this region, populism seems to revive in part the older tradition of caudillismo, that is, that of a predestinate Savior of the People, wielding power by virtue of Providence against the lofty and corrupt oligarchy of big landowners. This inheritance did not prevent Latin American populism from becoming the most accomplished of all populist manifestations till now, a complete political regime of some sort, offering an actual alternative to West European or North American representative democracy. This alternative could be called "incarnate democracy," considering its embodiment of the Sovereign People by a charismatic leader. Institutionally, these regimes are based on state-controlled labor unions for the incipient working class rather than on a single party inspired by European totalitarian states. Though rather authoritarian and by no means liberal, they, indeed, introduced for the first time some kind of political participation of the Latin American masses into the political arena to gain support from this popular base. They did so to such an extent that they deserve to be considered in some countries as the real forerunners of democracy in this part of the world. This particularity makes Latin American national populist regimes unique.

After World War II, other forms of even more dictatorial charismatic populism occurred in East Asia (Kusno Sukarno in Indonesia, Ferdinand Marcos in the Philippines) and in the decolonized countries of Africa (Gamal Abdel Nasser in Egypt, Ahmed Sekou Touré in Guinea, and Kwame N'Krumah in Ghana). These personalized regimes generally gave birth to a Third World populism in which the unity of the nation was expressed in a single party).

In a fourth period, populism has dramatically evolved in Western Europe during the past 30 years. Between 1980 and 2000, it first resuscitated and modernized at the same time the hitherto customary form of factious agitators acting as outsiders opposing the "political correctness" and hypocrisy of representative democracy. In Denmark and Norway, to begin with, "progress" parties were born as antitaxation groups committed to denounce the excessive fiscal pressure of the Scandinavian social-democratic welfare states. Later on, mainly in Jean-Marie Le Pen's France, Jörg Haider's Austria, Christoph Blocher's Switzerland, Bruno De Winter's and Vlaams Belang's Belgium, or Pim Fortuyn's Netherlands, this precursory kind of populism, whose slogan was "less state," turned principally xenophobic. It depicted the dangers of an extra-European "invasion" and denounced multicultural values and devotees.

These xenophobic parties now have toned down their discourse in many cases. Some of them at least, particularly in Scandinavia, are trying to get a better position inside the democratic party system. To this end, they do their best to touch a more sympathetic chord in the middle classes and authenticate the new political respectability they are trying to gain. Simultaneously and more interestingly, a number of established politicians belonging to the great parliamentarian parties now imitate a part of the campaign techniques of the formerly infamous populists (without admitting it, of course). This is the great novelty that makes the populist performance becoming commonplace instead of being irregular, temporary, and subversive. In a first mutation, a few respectable politicians claimed to do so in order to fight the populists of an orthodox persuasion with their own weapons (this partly was the case with Jacques Chirac in France or the People's Party [Österreichische Volkspartei, ÖVP] in Austria). But now, they are geared to use these methods indiscriminately in order to face the competition of any other party—whether populist or not. From 1994 onward, Silvio Berlusconi in Italy outperformed everybody else in this unprecedented art of improving his popularity by giving up the condescension of old-style politicians. Later on, the 2007 French presidential campaign spectacularly went along this path, even though Tony Blair's and Edmund Stoiber's 2002 electoral campaigns can be considered as the first examples of this populist contagion in Britain and Germany.

Current Concerns

The term *populism* has so often been misused as an insult by pouring scorn on almost any politician capable of winning an election that difficulties arise to define it more strictly as a social science concept. If we do so, we would argue that its core classical feature relates to the strong and emotional direct relationship that exists between the mass of a population and the populist charismatic leader—or sometimes a party as in Mexico before 2000—who pretends to embody the People and whose ideas and feelings are supposed to correspond to the People without any mediation of representative democracy. According to Max Weber, the term *charisma* applies to a certain quality of a personality, by virtue of which this person is treated as endowed with exceptional powers or qualities. "We believe in the common sense of the common people," as stated on page 9 of the Reform Party of Canada's *Principles and Policies: The Blue Book* in 1991. Populism is also antipolitical inasmuch as it assails the art of using time as a resource for delaying and cooling down premature or counterproductive popular demands, an art that commonly represents the core technique of moderate liberal governments. In this way, populist leaders dismiss the "pseudodemocratic" classical management of the political agenda by professing that they are able to keep their promises overnight. Furthermore, Ghita Ionescu, Ernest Gellner, and Edward Shils in particular distinguished a number of additional features for a description of populism in general:

1. Populism is moralistic rather than programmatic.
2. Populism is generally loosely organized and ill disciplined, a movement rather than a party.
3. Populism is based on a state of mind rather than on an explicit doctrine or ideology.
4. Populism is anti-intellectual.
5. Populism is strongly opposed to the Establishment and to the alleged treachery of the elites, most commonly with an anticapitalist pretence.

In addition, populism is first of all a polemical style of political communication that places emphasis on the alleged will of the "True People" and that defends a culture of decency against a culture of irresponsibility. This is perhaps the reason why it increasingly permeates the behavior of politicians and the political stage of the old democracies. Since for inhabitants of emerging countries often a revolution in practical lifestyles has priority over general human rights and political freedom, it seems reasonable to reckon under such conditions that populism still has a promising future in the postindustrial societies as well as in the less affluent parts of the world.

Positive Peace

Positive peace implies more than the absence of war. It suggests creating social relationships that contribute to mutual well-being and human flourishing. The concept goes beyond the negative definition of peace as the absence of war, which is upheld in international law. According to Johan Galtung, the Norwegian sociologist and father of peace studies, peace is not necessarily the opposite of war. Indeed, peace and war are not necessarily exclusive states. Galtung's innovation was to define *negative peace* as the absence of direct violence and *positive peace* as the absence of structural violence or, to put it positively, the presence of conditions in which people can realize their potential. This wider understanding of peace has been controversial but has fostered an enriched understanding of the relationship between building peace and ending war.

Concepts of Positive and Negative Peace

A positive understanding of peace has been implicit in the term for *peace* in many cultures. The Greek word *eirene* meant not only the cessation of hostilities between states but an organized common peace. The Roman *pax* meant an order governed by laws and common citizenship. The Hebrew word *shalom* comes from a root meaning "wholeness" and has connotations of well-being, social peace, and living in accordance with God's will. The Christian sense of the *peace of Christ* carries this forward and evokes the idea of the community of Christendom. The close idea of reconciliation means "to make whole again." The Muslim word *salaam* also echoes the Hebrew concept. It means peace with Allah, with one's neighbors, and oneself. The Indian *shanti* embraces inner harmony and avoidance of harm, while the Chinese *heping* denotes harmony in society and with nature. A positive, though variously interpreted, meaning to peace seems to be part of our common heritage.

As Europe became secular and organized in sovereign states, the understanding of peace began to change. At the domestic level, *the king's peace* implied a state of law and order. Between states, relations were either in a *state of war* or a *state of peace*. Hugo Grotius elaborated this distinction and international law embodied it. Complete peace became a distant goal. While Desiderius Erasmus had sought to ground peace and tolerance between Lutherans and Catholics on reason and common Christianity, Immanuel Kant looked to a future state of perpetual peace, outside the frame of existing state relations. Peace required voluntary consent to an agreement to abstain from wars between states, on the basis of reason and a moral imperative. Thomas Hobbes similarly saw peace as far from the present state of affairs. Peace meant only the time when states were neither fighting nor being predisposed to fight. Given the nature of sovereignty, this predisposition was ever present in anarchic systems, and so the normal state of Europe was one of war. Thus, political theorists relegated positive peace to a remote future in which people either consented to renounce war or accepted a common sovereign.

In the deadly context of European wars, however, negative peace seemed enough to strive for. A generation shocked by the destruction of World War I founded international relations as an academic inquiry into the conditions of war and peace. They wanted to understand the causes of wars and find a basis for peaceful settlement of disputes and peaceful change. After World War II, when realists became dominant in international relations, this became the central research question for peace studies. The most urgent concern was how to prevent a global war, wrote the editors of the *Journal of Conflict Resolution*, in the first issue in 1957. Researchers on the correlates of war aimed to reduce the frequency of wars. Others, such as Anatol Rapoport, aimed to eliminate war as an institution. In the early years of the nuclear age, when warfare appeared to threaten human survival, the top priority was to secure the absence of war.

But critical voices in peace studies questioned this emphasis on negative peace. They pointed to the war of "pacification" in Vietnam and the widespread inequalities and injustices between the developed and the developing worlds. Was peace between states real peace if it rested on relations of dominance between hegemonic powers and their clients and coexisted with exploitation of the poor by the rich? Could a cold peace be acceptable if it was maintained by the threat of nuclear weapons? It was in the context of such criticisms that Galtung launched his idea of positive peace.

Galtung had already put forward a first notion of positive peace in 1964, in his editorial to the first edition of the *Journal of Peace Research*. Here, he saw negative peace and positive peace as two dimensions, with the task of peace research to understand progress in both dimensions—both to eliminate war and to secure solidarity, community, and empathy—in short, "the integration of human society." In 1969, he sharpened this idea with his distinction between direct and structural violence and their opposites, negative and positive peace. Galtung retained the idea of peace as absence of violence but broadened the meaning of violence to denote the difference between the actual and the potential. Any deprivation of life chances, whether deliberate or not, constituted a form of violence. Direct violence is harm directly imposed by an actor on a victim. Indirect or structural violence is imposed by a whole social system, with no conscious intention to harm. Negative peace is the absence of direct violence and positive peace, the absence of structural violence. Galtung left the relationship between positive peace and negative peace indeterminate. His goal was general and complete peace, achieved by peaceful means, but progress could be made in either dimension independently.

Galtung later added *cultural violence* to direct and structural violence. The corresponding state of absence of cultural violence was a culture of peace in which people regard each other with respect and understanding. Feminists insisted that an understanding of positive peace also needed to include equal relations between men and women and the upholding of human rights. Thus, positive peace is emancipation from oppression, in gender as well as in other social relations. Others extended positive peace to balance with the environment. Peace between people could hardly be at the expense of other species; so *Gaia peace* was juxtaposed with ecological violence. Finally, *inner peace* was included as the opposite of violence against oneself. All of this gave a rich spectrum of meanings to positive peace but at the same time made its achievement an all-encompassing task.

Critique of Galtung's Concept of Positive Peace

The main critique of Galtung's idea of positive peace came from the British political scientist Peter Lawler. Lawler argued that Galtung's definition of structural violence was intrinsically value laden and devoid of substance. It could be taken to mean anything one dislikes. To define peace as the full realization of human potential and the absence of war was tantamount to making the study of peace a quest for nirvana. Instead, he argued, it was more important to focus on direct violence and to see peace studies as a way of articulating wider developments in social and political theory with the narrower analysis of violence and its conditions. Lawler argued that the concept of positive peace made peace studies "a black hole" from which nothing could be excluded and left it with no distinctive identity or purpose. The economist and peace researcher Kenneth Boulding made a similar point when he argued that poverty and violence were distinct phenomena with different causes. It blurred the distinction between them to extend the meaning of violence to cover both. The Peace Research Institute at Oslo (PRIO), which Galtung had founded, resisted his broad agenda and continued to focus on the causes and conditions of wars.

Positive peace has remained controversial and is interpreted in different ways. Critical theorists argue that peace depends on a form of emancipation that must include liberation from discourses based on power and hegemony. Peace is constituted by an intersubjective dialogue in which the Other is included. Some poststructuralists see it as a pluralistic encounter through agonistic dialogue between actors who recognize and accept their differences.

The Way Forward

The notions of positive and negative peace had a strong influence on the literature on peace building, which combines the aim of avoiding a return to war with the need for new institutions, relationships, and structures on which to found a durable peace. It was clear that effective peace building could not be limited to the repression of fighting but must involve the creation of positive associations and healing of social injustices.

This highlights the importance of understanding the relationship between steps toward positive peace and the ending or prevention of wars, which returns to the earlier preoccupation with the causes and conditions of wars. Most schools of thought in international relations accept that peace must be more than the absence of war. Even realists emphasize the importance of establishing a stable and legitimate international environment that reflects the realities of power but allows for peaceful change. The issue that divides different schools in international relations is what conditions are necessary for durable peace—or to put it in other terms, what the constituents of positive peace really are.

A way forward beyond the terminological disagreements is to consider the idea of peace not as a state but as a process in which initiatives or "seeds of peace" have peaceful consequences. The philosopher Gray Cox suggested that peace is a practice of cultivating agreements. Adam Curle, Professor of Peace Studies at Bradford University, argued that peace involves the coming together of people to achieve goals they could not have achieved separately. In this sense, positive peace is a process in which responses to other people and to suffering lead to greater empathy, cooperation, and solidarity (following Galtung's 1964 definition). If this becomes self-sustaining, it constitutes a form of peace that can be created, even at times of war. Such associative and integrative processes also limit the incidence of violence. Seen in these terms, the relationship between peaceful processes and the ending of war is a matter for research and analysis and not only a matter of definition.

POSITIVISM

The concept of positivism has had different careers in the philosophy of science and in the social sciences and political science. Whereas in the philosophy of science, it is often used to denote a specific school in the history of philosophical thought of its *époque*, the concept is still used in the social sciences to refer to a broad range of theses, attitudes, and dispositions generally associated with the scientific method. As a school in the history of philosophical thought, positivism is usually characterized by its research of the identification and explanation of universal laws in unity, or in conformity, within the practice of the natural sciences and especially physics. These laws should be discovered not through induction but by theoretically oriented experimentations. In the social sciences, there is a tendency among some tenants and critics of positivism to characterize it as a homogeneous epistemological tradition. This entry nuances this social representation.

Auguste Comte and the Early Positivist Program

Many thinkers (Francis Bacon [1561–1626], Madame de Staël [1766–1817], Henri de Saint-Simon [1760–1825]) have been associated with different philosophical and epistemological positions later associated with positivism. However, it is generally the French sociologist Auguste Comte

(1798–1857) who is regarded as the father of positivism. In the history of philosophical thought, late-19th-century positivism was a theoretical movement in reaction to different branches of idealisms, Kantism, and Hegelianism, to which it proposed a greater emphasis on empirical knowledge. In his *Cours de philosophie positive* (*The Course in Positivist Philosophy*, 1830–1842), Comte described his positivist perspective as an approach seeking to ground theoretical models on empirical knowledge and observations. Once acquired through cognitive processes, knowledge had to be verified through empirical testing. Empiricism, therefore, was brought back to the forefront of epistemology. To the extent that it was led by an adequate conception of science, *un esprit positif* (a positive spirit), Comte was tremendously confident as regards the future of modern societies. His writings were no stranger to a national context that had celebrated a *culte de la raison* (cult of reason) after the Revolution. One could still find a similar optimism in the work of Marie Curie (1867–1934).

Comte's philosophical project was much broader than a mere philosophical or epistemological intervention. Following Staël and many of his contemporaries, Comte's conception of science was embedded in a teleological philosophy of history where the triumph of science was linked to the triumph of humanity. The core of his philosophy of history comprised the description of three evolutionary stages: theological, metaphysical, and positivist. With the last stage, humanity was seen as realizing its full cognitive and political potential with the elimination of anterior, primitive, or chimerical schemes of cognition. Positivism's political project was also conceived as an antidote to social "disorder," the latter being an important preoccupation for the emerging social sciences of the late 19th century. Comte's espousal of a form of social evolutionism was not unusual in this context. Social Darwinists such as Herbert Spencer (1820–1903) had a similar conception of history, and so did Karl Marx (1818–1883), Ferdinand Tönnies (1855–1936), and Max Weber (1864–1920), who adopted a teleological reading of history, even though they did not locate the motor of history in the same social processes. Comte spent the end of his life trying to build a religion of humanity in accordance with positivist principles.

Historically, positivists have been accurately depicted as the tenants of an opaque opposition between sentences of fact and sentences of value. Social and political scientists, according to the tenants of this opposition, should hold back from deriving normative propositions from factual ones. Positivists, however, have not been alone in defending this standpoint. In the philosophy of social sciences, the neo-Kantian sociology of Max Weber shares it without agreeing with an epistemological position hostile to the development of interpretative strategies in the social sciences.

Another important posture generally associated with positivism is the adhesion to the project of a unified scientific program, or the defense of a unity of science. As a philosophy of the social sciences, therefore, positivism is usually associated with a commitment to either methodological naturalism or ontological naturalism. While methodological naturalists argued that the social sciences should adopt the same methods as the natural sciences, ontological naturalists, or physicalists, defended the naturalization of the social sciences. Through the 20th century, different variants of this program or project have been formulated via different epistemological or ontological positions, not all of which were enunciated by positivists.

Toward the dawn of the 19th century and the beginning of the 20th century, the optimistic philosophy and teleology of history at the core of Comte's *Cours de philosophie positive* had been given up by several European practitioners of positivist methods and other philosophical currents such as romanticism and phenomenology. The German philosopher and historian Wilhelm Dilthey (1833–1911) is among the important figures to have defended an antipositivist dualism between the human and natural sciences in this context. Among other things, Dilthey developed two arguments often found in the camp of the tenants of such a dualism: (1) the rejection of evolutionism as an adequate prism to analyze social processes and (2) an emphasis on the category of meaning and the use of interpretative strategies in the social sciences.

The often heard claim that the triumphalist conception of social and cognitive progress was a shared feature of modernity in general should be nuanced. Positivism was an important chapter of the intellectual history of the 19th century. Yet it was fostered by specific social and intellectual contexts that do not represent a complete picture of the contradictory intellectual trends of the modern era. It remained influential and a source of political inspiration in parts of the world where local liberal movements sought to overcome traditional religious elites by importing France's institutions.

The Vienna Circle

In 1929, a handful of scientists and philosophers of science (Moritz Schlick [1882–1936], Rudolf Carnap [1891–1970], Otto Neurath [1882–1945]) published a manifesto titled *Wissenschaftliche Weltauffassung: Der Wiener Kreis* (*A Scientific Conception of the World: The Vienna Circle*). The manifesto became a central artifact in the history of positivism and the platform of logical positivists. At the confluence of the empirical tradition and the analytical philosophy of Bertrand Russell, logical positivism was characterized by three elements: (1) its critique of speculative metaphysics, (2) its quest for a foundation of empirical sciences, and (3) the project of unifying the scientific language (Robert Nadeau, 2000).

Logical positivists adhere to a theory of meaning grounding the meaningfulness of a sentence on its empirical conditions of verification. As a corollary, all propositions whose conditions of truthfulness could not be described were considered "meaningless." This argument was notoriously put forward by Rudolf Carnap (1891–1970) in *The Elimination of Metaphysics Through Logical Analysis of Language* (1959). This position was a declaration of war against Martin Heidegger, his disciples, and idealists in general. During the following decades, most of the core elements associated with logical positivism were contested in turn by its former exponents or by its heirs. Carl Gustav Hempel (1905–1997) explicitly renounced the program of a scientific unity of science. He gave up the belief that specific theories could be captured through the same analytical vocabulary as broader general theories (ontological naturalism).

Even though the tenants of logical positivism were against the idea that science was morally or politically laden, several signatories of the manifesto believed that the struggle against metaphysics was entirely reconcilable with socialist political views. Therefore, while logical positivism is associated with a reaffirmation of the fact–value dichotomy, in practice several members of the circle were socialists and critics of the characteristically metaphysical ethos of the German and Austrian nationalist jargons. Unsurprisingly, the Circle was banned by the Nazis in 1938.

The Rejection of Verificationism, Popper, and Critical Rationalism

Neo-positivism, or critical realism, is an epistemological posture that was developed by Karl Popper (1902–1994) as a critique of some of the weaknesses of the logical positivism associated with the Vienna Circle. Among other things, it sought to address the problem of induction, or raw empiricism, unsatisfactorily dealt with by the logical positivist theory of verification. Popper revolutionized the positivist tradition by adopting the principle of refutation, or falsifiability, instead of the principle of verification. This epistemological model distinguishes theoretical from experimental laws. Theoretical laws are formulated as universal laws. They are of a higher level of abstraction. Experimental laws direct how to carry out an experiment so that it leads to an eventual validation or invalidation of the theory's predictions. A theory is articulated by means of an ensemble of interlinked propositions, the theoretical laws, via logical connectors. Theoretical laws can only be put to the test through the experimental laws that are derived from them. To be falsifiable, a theory must be potentially false. That is, there must be potential empirical cases, the observation or occurrence of which would go against the predictions provided by the theoretical frame. If it is not possible to point to a fact whose occurrence would mean the invalidity of the theory, the theory is not falsifiable and is thus not part of the scientific domain. According to Popper, one cannot prove that a hypothesis has been verified as true; one can only contend that it has yet not been falsified. For instance, the empirical observation of one white swan does not prove the conjecture that all swans are white. On the contrary, this proposition would be refuted by the occurrence of a black swan. To "test" this theory is a question of looking for a nonwhite swan rather than accumulating the occurrences of white swans. As the author of *The Logic of Scientific Discovery* puts it, "Now I hold that scientific theories are never fully justifiable or verifiable, but that they are nevertheless testable. I shall therefore say that the objectivity of scientific statements lies in the fact that they can be intersubjectively tested" (Popper, 1992, p. 22).

Science, therefore, according to Popper had to be conceived like a never-ending process of attempts to falsify conjectures. Accordingly, a scientific theory had to be considered "true," along a regulatory concept of truth, until it had been definitely falsified. He attributes a character that is in principle objective, universal, and intersubjective to the results of research, insofar as each subject must be able to achieve the same results through experimentation. The principle of falsifiability remained consistent with the positivist objective of achieving a unity of science. Here, the ground of this unity was not ontological naturalism, or physicalism, but methodological naturalism. Thus, the unity of science resides in a specific methodology: falsificationism. It relies on a processual conception of truth rather than a physicalist ontology. As a philosopher of the social sciences, Popper thought that sociology was the discipline more apt to achieve such a methodological unity. He was suspicious of behaviorism in psychology, which he deemed incompatible with his epistemology.

Popper was not an apolitical animal. He developed a conception of liberalism in continuity with his epistemology and with liberal theories of totalitarianism. His feelings for Marxism were the complete opposite of those of some members of the Vienna Circle and especially from those of the sociologist Otto von Neurath. In *The Open Society and Its Enemies*, published in 1945, Popper argued that Plato, Hegel, and Marx had formulated proto-totalitarian philosophical systems. The core philosophical assumptions of their political thought, he argued, were teleological and could not be submitted to falsifications. Hegel, here, was presented as an inspiration of National Socialism. It is generally admitted today that there was something naive and polemical in Popper's crusade against these three pillars of Western philosophical thought, not only because few research programs in the social sciences would survive the criteria put up front by Popper's philosophy of science but also because some have raised serious doubts regarding the adequacy of Popper's philosophy of science to describe the practices of natural science itself (Thomas Kuhn, 1996). Critiques of the adoption of Popper's standards in the social and political sciences have argued that whereas in the natural sciences there are situations where only one research program is in a position of quasi monopoly in a given discipline, thus creating the conditions of possibility of a period of normal science, in the social and political sciences, it is very unlikely that only one theoretical paradigm could dominate the entire discipline. Social and political scientists have come to accept that this theoretical pluralism is an important characteristic, rather than a weakness, of their discipline.

Neo-positivism had its hours of glory after the translation and publication in English of *The Logic of Scientific Discovery* in 1959. More important, it dominated the perceptions that some social scientists had of the natural sciences until even later. When the international relations theoretician and father of neorealism, Kenneth Waltz (1924–) formulated his critique of induction and of the criterion of predictability in the literature on international relations, he was very close to Popper's conception of science. In the field of Anglo-American international relations, the multiplication of contending approaches to the mainstream of the discipline was labeled as a "postpositivist" era by several observers (Steve Smith, Ken Booth, & Marysia Zalewski, 1996). Most of the time, what was at stake was less the rejection of positivism, as traditionally understood in the philosophy of science, than the rejection of a narrowly conceived definition of the discipline and its methodology by neorealism and institutional neoliberalism.

From the *Positivismusstreit* to Theoretical Pluralism in the Social Sciences

While the end of the positivist hegemony in the social sciences is often associated with the rise of postmodernism, it would be more accurate to locate it within the debate notoriously labeled the *positivismusstreit*, or the German dispute in social sciences (1961–1969). During the dispute, Popper's conception of the philosophy of the social sciences, critical rationalism, was challenged by, among others, Theodor Adorno, Ralf Dahrendorf, and Jürgen Habermas. It is not possible here to summarize the block of arguments that were raised against Popper in the context of this epic disagreement. They often came from different, and contradictory, traditions of the social sciences from scholars of different political inclinations. What matters, however, is that most of the epistemological positions that were injected in the dispute were developed and, sometimes, radicalized during the 1970s and 1980s. Since then, there has virtually been no pause to the development of new arguments in defense of historicism, of interpretative strategies or hermeneutics (Hans-Georg Gadamer, 2004), of standpoint epistemologies (Sandra Harding, 2004), of a critique of the relation between positivism and social engineering and power (Michel Foucault, 1980), or of a more reflexive approach to the social sciences (Pierre Bourdieu, 2004). Moreover, most epistemologists and methodologists have abandoned the idea that to practice good science, social and political scientists should imitate the natural sciences. For a few decades, one of the epistemological controversies emerging in political science has been to what extent political scientists should borrow the methods and models of the economists, not of physicists.

One of the central critiques of the covering law model often associated with tenants of positivism is that it cannot escape reifying the observable regularity of a specific historical context resulting from petrified relations of power. What if, for instance, the concepts of state, nation, sovereignty, or power meant very different things in different sociohistorical contexts? What if the theoretical hypotheses of a general covering law model in the social sciences were guiding social researches in systematically ahistorical directions (Habermas, 1988)? And what if these intellectual practices had the impact of silencing, marginalizing, or negating alternative social experiences and modes of being? Are positivists not guilty of an implicit favoritism in favor of a defense of a given social order? These are some of the questions that recent scholarship by critical theorists, postmodernists, feminists, and postcolonial scholars has raised.

One should note that the critique of positivism has been especially important during the 1980s and 1990s in the subfields of the discipline of political science where the use of quantitative methods had become synonymous with real science. The tradition of American international relations, for instance, is one subfield where the critics of positivism have been notoriously active in the 1980s and 1990s. In the field of development studies, researchers working with the dependency theory have been extremely skeptical regarding the application of ahistorical and nation-centered models of economic and political developments along the lines of modernization theory. Among other things, they have argued that the idea that economic and political development can be reproduced with the precision of a laboratory experiment was a problematic remnant of a positivist conception. Against this conception, they have argued that economic and political institutional developments had to study within the broader context of the global historical development of capitalism, where specific national institutional developments never occurred in national conceits.

Today, most philosophers of science have given up the concept of positivism. The different lines of demarcation that several philosophers of science have historically tried to draw between science and nonscience have not proven decisive. Among the core arguments underlying a certain conception of positivism, the claim that there could be a clear line of demarcation between judgments of facts and judgments of value has been under heavy fire (Hilary Putnam, 2002). Some philosophers of science and social scientists, notoriously scientific realists, have also challenged the positivist emphasis on directly observable entities, leading to an inversion of the hierarchy between ontology and epistemology (Roy Bhaskar, 1989). The former argued that if one had to rely only on a methodology with an emphasis on direct observation, one would have to reject the validity of new scientific territories where the progress of knowledge depends on the observation of the effects of unobservable entities on other entities.

Even though positivism does not have the intellectual authority that it once had, one cannot conclude from what precedes that the positivist tradition did not have an important impact on contemporary research practices and methodological dispositions in social and political sciences. Most practitioners of political science are still working along standards that were developed by the positivist tradition. For instance, few practitioners would give up the idea that the theoretical laws of a theory have to be internally consistent.

Furthermore, practitioners of the social or political sciences by and large agree that a theory that fails to find support in empirical evidence should be either revised or abandoned. In addition, the argument that the result of social research should be accessible through intersubjective processes remains a central claim held by the majority of social and political scientists. Along this line, while most tenants of reflexive social theory would renounce the quest for an opaque line of demarcation between judgments of fact and judgments of value, they tend to agree that judgments of value should be submitted to a similar intersubjectively oriented ethic of discussion rather than judgments of facts. However, the early positivist claim that the development of science and technology will necessarily lead to the achievement of a greater humanity has been thoroughly challenged by the history of the 20th century.

POSTCOLONIALISM

There is no consensus regarding what the term *postcolonial* connotes; indeed, both the range of meaning of the term and of the issues covered by it are immense. However, despite the contestations around the range of meaning and issues, certain fundamental assumptions are subscribed to postcolonialism. First, postcolonialism suggests that the colonial juncture played a critical role in the shaping of the modern world. Second, although there have been both continuities and ruptures from the world of classical colonialism, its presence, legacies, and hierarchies still endure in the modern world. It is thus important to note that the *post* in postcolonialism does not allude to an era in which colonialism is dead. Nor does it imply an uninterrupted classical colonialism. Rather, postcolonialism suggests that the modern world exemplifies both historical continuities and ruptures with classical colonialism. This entry provides an introduction to the ways in which these complex shifts and continuities manifest themselves in the variety of meanings assigned to postcolonialism, its genealogy, and the criticisms leveled against it. Finally, it discusses the usefulness of postcolonialism for understanding the politics of the modern world.

Meanings, Controversies, and Criticisms

Although it is unusual to begin the discussion of a topic with the controversies and criticisms surrounding it, highlighting at least three controversies that haunt postcolonialism will help clarify what postcolonialism means. The first controversy focuses on the dissimulations and the political acceptability of the term *postcolonial* in Western academic circles. Some scholars suggest that the prefix *post* in postcolonial implies that we are now past the era of colonialism, global dominance, and hegemony. The term is thus preferred and has gained currency in Western academia because it is politically less threatening than terms such as *neocolonialism*, *imperialism*, and the *Third World*. Postcolonial scholars have challenged this misconception and stated in no uncertain terms that postcolonial does not imply the end of colonization: Rather, postcolonialism enables us to examine both the historical continuities and ruptures with classical colonialism.

The second controversy raises questions regarding the spatial parameters of postcolonialism. Should all societies that were once colonized be included under the umbrella term *postcolonial*? Should the United States, Australia, and South Africa, which had an experience of being both colonized and colonizers, be included with other postcolonial societies such as India, Senegal, and Brazil? In other words, are there specific features of the "truly" postcolonial countries that help us distinguish them from non–postcolonial ones, or is *postcolonial* a catchall word? On this issue, some postcolonial scholars suggest that while it is important to discuss the differences in the particular colonial histories, all colonizing practices, including the contemporary colonizing practices of nation-states, can be included under the term *postcolonial*.

The third controversy focuses on the allegedly culturalist focus of the postcolonialists and their neglect of materialist concerns. Critics accuse postcolonial scholars of neglecting traditional Marxist issues such as capitalism, poverty, and inequality and focusing too much on issues of concern to the poststructuralists, such as representation, identity, and culture. While some postcolonial scholars are guilty of focusing solely on culturalist concerns, most suggest that culturalist and material issues are mutually embedded. For them, isolating materialist from culturalist concerns would be a serious analytical shortcoming of any scholarship. For example, scholars like Edward Said, demonstrating the cultural underpinnings of classical imperialism, have suggested that the success of imperialism would not have been possible without the dissimulations affected by the cultural constructions of African, Asian, and American peoples as the savage, uncivilized "others." Calls for *mission civilisatrice* (the civilizing mission) and "the White man's burden" not only obscured the violence and exploitation engendered by colonization, they were also successful in legitimizing the colonial enterprise.

Even as postcolonial scholars continue to be influenced by Karl Marx, they seek to wrest Marxist analysis from its heavy Eurocentrism. Postcolonialism "historicizes" Marx. In other words, it contextualizes Marx's scholarship in the changes of 19th-century Europe and argues that despite the usefulness of Marxist analysis, Marxism cannot be imported in its wholesale Eurocentric form to other situations. For example, the focus on class in Marxist analyses, which subsumed other categories of social stratification, has led to the neglect of important factors such as race, gender, caste, and ethnicity. Offering a corrective, postcolonial scholars stress the importance of these categories of analyses, at the same time stressing their mutual imbrication with each other and class.

The Genealogy of Postcolonialism

The origins of postcolonialism cannot be traced to a single event or a single author. Scholars trace the origins of postcolonialism from the postcolonial fiction of writers from ex-colonial countries, such as Chinua Achebe, Ngugi W'Thiongo, Wole Soyinka, and Ousmane Semebene; through the literary criticism of the 1980s and 1990s; to the new historiography of the Subaltern Studies Group. In addition, others point to certain events in decolonization such as the Bandung conference of 1955 and the anticolonial movements in Egypt, Ghana, India, Cuba, Vietnam, and China as foundational to the emergence of postcolonialism.

The anticolonial movements of the 20th century are among the first organized institutional challenges to European myths about European superiority, laying the foundations for postcolonial scholarship. For example, Mohandas Karamchand Gandhi's challenges to British imperialism are as foundational to postcolonialism as are the Marxist/Maoist-inspired liberationist movements of Cuba, Vietnam, and China and the Algerian anticolonial revolution in which Frantz Fanon participated. These decolonization movements are foundational to postcolonial narratives as they systematically challenge European narratives of modernity, race, gender, and the like. Several key figures of the decolonization struggles, like Gandhi, Fanon, and their counterpart Albert Memmi, recognize that the decolonization struggle is not merely the physical removal of the colonizers from colonial territory—it should also include the struggle for cultural decolonization. They suggest alternative paths for nationalist futures, recognizing that breaking from the stranglehold of the colonial imagination is difficult. The postcolonial condition is marked by a paradox; the colonized both fear/loath and admire the colonizers. They want to exhume the presence and memories of colonization, yet they desire to become "modern" like the colonizers. These insights frame postcolonialism.

The postcolonial fiction of writers from ex-colonial countries is also critical in the genealogy of postcolonialism. Since colonial occupation rested on racialized and gendered constructions/representations of Africa, Asia, and Latin America, the first wave of postcolonial fiction sought to both deconstruct received national identities as well as to reconstruct them in more "positive" ways. This project of forgetting and recovery was complicated, and it continues to be so, by several legacies of colonization. First, the politics of using a colonial language to re-create national identity haunted several postcolonial writers; some like Soyinka opted for local languages, while others like Sembene opted for making films in local languages. Second, the desire for modernity, as defined by the West, in the nationalist imagination has led to mimicry as well as hybridity, both of which are discussed later in this entry.

The iconic scholarship of Edward Said has been enormously influential in shaping postcolonialism as it has brought to the forefront the importance of discursive formations to the imperial project. Influenced by Michel Foucault and Antonio Gramsci, Edward Said's *orientalism* highlights the mutual imbrications between colonial/Eurocentric knowledge and colonial/Western power. According to Said, intellectual and cultural activity regarding the "Orient" is intimately linked to the "West's" colonial project of producing, managing, and controlling the Orient. These cultural productions not only are critical in the production of the orient in the Western imaginary, they are also central to the production of Western identity that is produced in opposition to the non-Western world. Postcolonial debt to Said's scholarship on the imbrications of knowledge with power; the sociality and materiality of texts, which suggests that all texts are political and social commentaries and are embedded in relations of power; the salience of discourse to ideological formations; and the importance of agency to resistance cannot be underscored enough.

The influence of the school of Subaltern Studies on postcolonial scholarship has also been significant. Influenced by Antonio Gramsci's scholarship on the subaltern classes (those who are at the margins of state power such as peasants, the working class, etc.), this school was created by historians of South Asia to produce an alternative to the elite focus of South Asian history. Although the many volumes produced by the Subaltern Studies project have provided inspiration, it has also raised important questions about subalternity that are discussed in the following section.

What Is Postcolonialism?

Although it is not possible to identify a singular postcolonial approach, there are certain foundational characteristics that can be ascribed to postcolonialism. The following section identifies characteristics of postcolonialism, including postcolonial feminism, that may enable us to think about what postcolonial scholarship, in all its variance and vitality, means. Clearly it is not possible to highlight every key postcolonial/postcolonial feminist concept in such a brief space. The following points highlight what many postcolonial scholars consider some of the more prominent concepts in postcolonialism. It is important to note that the discussion under each concept is limited in scope as the length constraints of this entry do not permit a detailed discussion.

1. Postcolonialism begins with the assumption that the imperialist juncture was critical in the shaping of the modern world. Although the modern world exhibits both continuities and ruptures from its colonial past, what is clear is that the legacies of imperialism continue to haunt us.

2. Postcolonialism focuses on the imbrications of knowledge with power; For example, it suggests that what passes for expert and universal knowledge in the humanities, social sciences, and other disciplines is deeply embedded in the colonial enterprise and is essentially Eurocentric. This body of knowledge developed in juxtaposition with colonization and was used (and continues to be used) in instrumental ways to bolster Euro-American power. The aim of postcolonial scholars is to "provincialize" this knowledge—that is, to uncover its universal pretensions and to always historicize and contextualize these claims.

3. The interconnections between European political and material power and their power to represent "the other" is highlighted by Edward Said, Chandra Mohanty, Gayatri Spivak, and Trinh Minh-ha, among others. In her classic "Under Western Eyes: Feminist Scholarship and Colonial Discourses," Chandra Mohanty suggests that a discursive colonialism, a sort of neo-orientalism, is at play in some Western feminist texts discussing the "Third World woman." In many such discourses, a monolithic image of the poor, victimized, oppressed, and other such "Third World woman" is created in contrast to the Western, liberated, educated woman, who is free and in control of her own destiny. The authoritative power of these representations is enormous, as is their influence. As stated earlier, the allegedly civilizing mission of the colonizers was seen as legitimate in part because of the success of the racialized and gendered images of inferiority and savagery that came to be associated with the peoples of Africa, Asia, and Latin America. Similarly, images of Third World women are contemporarily used to legitimize various types of interventions into the Third World.

4. Despite, and maybe because of, their Marxist leanings, many postcolonial scholars focus on the importance of race, ethnicity, gender, caste, religion, nation, and class in the construction of colonial, postcolonial, and national power. Interrogating these constructs of stratification and their deployment by global, national, and local structures of power enables postcolonial scholars to "world" these issues—that is, to interrogate the ways in which dimensions of power are embedded in global, national, and local discourses.

5. Some scholars prefer to identify postcolonial theories as interrogations of modernity. Postcolonial and other scholars trace the origins of modernity to the ideas that emerged in Europe during the Renaissance, their consolidation in Europe during the 16th century, and efforts at spreading them throughout the world during European colonization of Africa, Asia, and the Americas. The use of modernity in colonial discourse can be seen in its efforts to explore, conquer, categorize, and map the peoples of Africa, Asia, and America. The discourse of modernity is thus associated with historical developments in Europe and North America. In this discourse, modernity also becomes a tool for the construction of new identities; to be modern is to be superior, more rational, more in charge of one's own destiny, and more Western than one who is described as traditional. In addition, the identity of the "modern" West, the "developed" world, is contrasted to the "traditional," "underdeveloped," or "developing" world. In addition, the idea of modernity has become a tour de force for nationalist dreams and aspirations as well as the spread of globalization. Postcolonial scholars interrogate the discourse of modernity to highlight its seductions as well as its slights and marginalizations.

6. The concepts of nation and nationalism are important in the lexicon of postcolonial scholarship. The first wave of postcolonial scholarship focused on decolonization and the creation of independent nations, the recovery of national identity through the creation of nationalist histories that challenged colonialist representations and histories, and the development of nationalist consciousness. However, as the euphoria of national independence subsided and it became obvious that the newly independent nations bred their own exclusions, the very idea of nation came into question. Contemporary postcolonial scholarship highlights this disillusion with the nation. Focusing on the social construction of nation as an "imagined

community," postcolonial scholars, like many scholars of nation and nationalism, suggest that this community is forged around certain markers of identity such as ethnicity, religion, race, gender, and sexuality. However, these same markers are also used to identify those who do not belong or are marginal to the body of the nation. According to Partha Chaterjee, this dynamic of inclusion/exclusion, corresponding with the liberal and illiberal faces of the nation, reflects the inherent contradiction within the nation as it is currently imagined.

The construction of nationalist discourses is critical for the creation and maintenance of nations. Dominant, idealized, and elite narratives of the nation's history, including the history of decolonization and originary myths, are often constructed that leave out the histories of subaltern groups within the nation. The Subaltern Studies collective and postcolonial scholarship focus on highlighting the histories and lives of the subaltern within the nationalist project. According to Homi Bhabha, there are two types of nationalist discourses that work simultaneously to construct the undivided, unified nation: pedagogical and performative. Pedagogical discourses about the nation claim a fixed origin for the nation and an essentialist national identity. These discourses establish the nation as an unquestioned and legitimate political, social, cultural, and so on, unit in which people, as national subjects, "naturally" belong. In these discourses, nation, national subjects, and their histories are genealogically developed, linking in a "natural way" the past with the present. In contrast, performative nationalist discourses refer to the need for nationalism to be constantly created and recreated, or in other words, nationalism needs to be constantly performed. While performative modes may reinscribe old nationalist symbols and signs, they may also provide an apertura in which the subaltern may be able to perform new counternarratives about the nation that disrupt its essentialist identities. This is what Bhabha calls the "disruptive double narrative movement."

7. Hybridity and mimicry are two interrelated and widely used concepts in postcolonial scholarship. As stated in Point 4, there is a growing disillusionment within some postcolonial scholarship with a nationalism in which cultural essentialisms and difference become the basis for national identity and national borders. For example, while an anticolonial narrative with its rigid national essentialisms may be "strategically essential" for subverting the colonial narrative, many postcolonial scholars like Fanon, Said, and Bhabha are uncomfortable with the simple and exclusive identitarian politics this may engender. These scholars suggest that rather than being based on exclusions and uniqueness, cultures of the colonized and colonizers are also mutually embedded. For Bhabha, the cultural impact of colonization (and globalization) may manifest itself in mimicry and/or hybridity. While mimicry may appear at a very basic level to be imitation, it may also include some form of mockery and can work to subvert colonial power. Hybridity is seen as an in-between stage, in which colonial and/or globalization narratives/texts are "adopted" but in new forms that reflect the intermixing of the global and local.

8. While the commitment of postcolonial scholars to resistance and agency is strong, their focus varies. As stated earlier, for the first wave of postcolonial scholars, resistance and agency not only meant participation in decolonization struggles, it also meant the development of counternarratives to recover history, identity, and the "native" self from the degenerative effect of the colonial narrative. For the "postnational" wave of postcolonial scholars disenchanted with the marginalizations engendered through nationalisms, it has meant recuperating the stories of the subaltern as well as arguing for a postnational, global politics. However, the politics of recuperating subaltern histories and voices became the subject of controversy when Spivak raised the fundamental question, "Can the Subaltern Speak?" While some have focused on the conclusion by Spivak to support or critique her argument that the subaltern cannot speak, others have suggested that her question is better understood as rhetorical and an effort to make researchers aware of the difficulties inherent in representing the subaltern "other." For example, through this question Spivak alerts us to several questions regarding voice, authority, representation and the subaltern: Who is the "authentic" subaltern? Is it possible for the researcher to avoid presenting himself or herself as the authoritative voice of the subaltern? Can the voices of the subaltern be heard through these authority claims?

Politics and Postcolonialism

Although postcolonialism has only recently started to assert its presence in the field of politics and international affairs, the essentially political lenses of postcolonialism provide critical vantage points from which to understand politics. As the discussion above demonstrates, postcolonial approaches provide essential tools for interrogating, among others, the politics of race, class, and gender in the making of the modern world. In addition, they help us understand the inclusions and exclusions of nation and nationalism, modernity, globalization, and diaspora. Most of all, postcolonialism's focus on the interface between materialism and culturalism in the maintenance of power provides us with a more holistic understanding of the exercise of power globally. All these insights from postcolonialism are fundamentally political treatises about power and hegemony that deepen our understanding of the "modern" world.

POSTCOMMUNIST REGIMES

The concept of postcommunism is disputed because it merely describes the *previous* regime in a given country and says nothing about the newly formed regimes subsequent to the collapse of communism. As such, the concept of postcommunism is imprecise, both as a descriptive and as an analytical category in social science. It can be applied only to the relatively short period of time between the collapse of the old and the establishment of the new regime—in other words, to the period in which the social and political relationships are defined far more by the legacy of the previous regime than by internal and external factors. The essence of postcommunism is to stress the domination of a nondemocratic political legacy in new settings after dictatorship. It is for this reason that the concept had been used, first and foremost, in the international political science literature in the 1990s. This entry discusses the uses of this concept and its reduced utility in recent years.

Communist regimes operated in the countries that are now termed *postcommunist*, representing a systemic alternative to liberal democracies. These regimes were based on Marxist–Leninist ideological foundations, or referred to these ideologies, while striving to attain global communism vis-à-vis Western capitalist democracies. The Cold War era, which emerged after 1945, was characterized by the confrontation between "two world systems" and the potential threat of a third world war. The "First World," led by the United States, saw the systems of Soviet Union and China, who dominated the "Second World," as communist.

The extent to which these regimes were communist in the original, Marxist sense is disputable, given that market coordination was not replaced by the voluntary collaboration of social communities but rather by the domination of the party-state. Left-leaning critics of these regimes, precisely for this reason, claimed that the systems that had emerged in the Second World were not in fact communist but rather state-capitalist. Others had considered these systems as state-socialist, arguing that nationalization had only represented the first step in building communism, after which the process of social reconstruction would have to follow. One could speak of communist systems, collectively, in the sense that the political leadership in these countries had referred to themselves as Communists: They shared similar ideologies; employed similar political, police, and military methods; and endorsed similar goals for social transformation. Attaining these goals had failed not due to a lack of will but because these political goals were simply unrealistic.

A study of posttotalitarian systems reveals that despite the fact that the term *postcommunism* is imprecise, it has nonetheless achieved a successful career in the international political science literature; the same cannot be said for the term *postfascism*. Often, many ex-communist countries, even 20 years after the democratic transition, are still called postcommunist; however, it can be recalled that ex-fascist countries 20 years after World War II were not labeled postfascist. The evolution of these two terms is clearly related to the Cold War and the confrontation of the two world systems, in which the majority of the once-fascist regimes had become democratic and joined the Western political and military organizations, thus confronting the Soviet Union–led political and military bloc. Fascist regimes were relatively short-lived, and their collapse was followed by the global confrontation between the forces of communism and democracy. Communist systems, by contrast, endured for longer periods, and their collapse was not followed by a confrontation that generated a threat of a world war. The image of a common enemy and the lack of alternative world systems enabled the perception of the legacy of communism to endure, which in turn gave space for the term *postcommunism* to blossom. East Germany was the first among the ex-communist countries to shed the stigma of postcommunism and in 1990, with the reunification of Germany, ceased to exist as an independent state. It is interesting to note that researchers do not label Germany as postcommunist, and the integration of the East German territories appears as a domestic policy issue, much more so than a question of political system.

In the 1990s, the international political science literature used the terms *postcommunist countries* and *new democracies* interchangeably, which for a long time nourished the hope that the end of communism would eventually lead to democracy in all ex-communist countries. It took nearly a decade for researchers to arrive at a consensus and agree that postcommunist countries cannot be treated as a unitary bloc. The expression *postcommunism*, as the term *communism* had in the past, highlighted the fundamental commonalities among countries ranging from Poland to Mongolia, or from Slovenia through Turkmenistan. In other words, it harnessed a false image that the political structures in these countries were essentially similar. For this reason, the concept of postcommunism could not evolve to become a valid analytical category for all countries that for shorter or longer periods had experienced regimes based on communist ideologies. The concept suggested that there are far greater similarities between these countries than differences. Moreover, as we know today, existing similarities do not necessarily stem only from the communist legacy: Precommunist historical traditions, and their long-term consequences, are equally important.

Nevertheless, some fundamental commonalities, at least in the beginning, could be observed. In addition to the transition from communist rule, a fundamental restructuring of the economic and social systems, and thus a "triple transformation," has been taking place. All this had to be done in a relatively short period of time, and indeed, in the apt formulation by Jon Elster, Claus Offe, and Ulrich Preuss (1998), it required "rebuilding the ship at sea." This, generally, went into the direction of more market-oriented capitalist economies but with distinct forms of transferring state-owned enterprises into private hands. Not rarely, this was accompanied by the emergence of "newly rich" and "oligarchs" who benefited from their positions in the old regimes in these transformations. By contrast, the populations at large often suffered from deindustrialization processes, increasing unemployment, and rising costs of living, contributing to the emergence of strong social inequalities on a scale that was unknown before in these societies.

Similarly, different ways of coping with the communist past and often considerable human rights violations by the security apparatuses of the previous regimes created new tensions. In a number of countries, "lustration" procedures (i.e., procedures for screening persons seeking public positions in the new democratic government to avoid inducting former communists, especially those who worked for the secret police in previous regimes) were carried out. In others, former perpetrators of human rights violations and those politically responsible remained largely untouched. The former communist parties often acted under new labels such as "socialist" or "social democratic" ones. In the course of time, however, they became integrated in the new parliamentary systems. At the other side of the political spectrum, some strongly nationalist parties emerged. On the positive side of the communist legacy, a high level of literacy of the population and of education in general must be noted. Nevertheless, levels of political interest and participation still show a rather mixed picture.

The use of the expression *postcommunism* subsided somewhat after the change of the millennium. This decreased popularity of the term can be linked to events such as the September 11 terrorist attacks in New York and Washington, D.C., in 2001, the ex-communist East-Central European countries joining NATO (North Atlantic Treaty Organization), or the accession of 10 ex-communist countries to the European Union in 2004 and 2007. Today, the new member states of the European Union, which include Bulgaria, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia, are usually no longer described as postcommunist countries but rather as new member states. Freedom House has classified these countries as full democracies for more than a decade, and according to the Human Development Index, they belong to the most advanced group of countries on a global scale. Most of the Balkan countries, with the exception of Bosnia and Kosovo, are on their way in joining the league of the Baltic republics and the Central European countries in terms of democratic development. These countries have become, or are increasingly becoming, a part of Western political, military, and economic integrational frameworks, in a world in which religious fundamentalism and large-scale immigration from Third World countries have become important issues. Faced with these challenges, the West has found allies in the East-Central European countries, enabling them in turn to shed the term *postcommunism* and its derogatory connotations.

The term *postcommunism* continues to be employed widely across those countries in which the process of democratization was stalled, or had been reversed, after 1991. For the most part, these countries had been part of the ex–Soviet Union: They range from Belarus to Kazahkstan, Georgia through Kyrgyzstan, and Russia to Armenia. When applied to these countries, the term *postcommunism* not only serves to describe a common past, it also highlights the fact that the process of democratization has come to a halt. The term *postcommunism* here indicates the most convenient common denominator, based on which the various new, hybrid regimes, ranging from electoral democracies through competitive authoritarianism to almost full authoritarian systems, can be mentioned. The systematic study of these regimes began only after the year 2000 and had produced significant findings in understanding and describing the political and economic transformations in the Caucasian states and the Central Asian countries as well as in Ukraine and Russia. Yet again, the concept of postcommunism has proven imprecise and much too broad an umbrella term, by bringing very dissimilar, nondemocratic systems under the same rubric. Until a broad consensus concerning the academic classification of the new hybrid regimes emerges, it is likely that the concept of postcommunism will continue to be applied to these countries.

The concept of postcommunism cannot serve as a legitimate analytical category for a comprehensive description of consolidated regimes. However, as a modifier it can be broadly applied for a better understanding of certain social and political processes. Contemporary historians, political scientists, and sociologists will most probably analyze, for a long time to come, the various aspects of the historical transformation, which as a modifier can be labeled as postcommunist transition and which in scientific thinking and historical awareness will doubtlessly remain one of the fundamental historical narratives of the 20th century.

POSTMATERIALISM

The term *postmaterialism* refers to a specific set of modern values that form a contrast to traditional "materialistic" values. In his seminal work *The Silent Revolution: Changing Values and Political Styles in Western Publics*, Ronald Inglehart introduced this term to the scientific discussion about changing value orientations in advanced industrialized societies. In earlier publications, Inglehart had initially used the term *postacquisitive values* instead of postmaterialism. Postmaterialism primarily covers values such as environmental protection, quality of life, citizen participation, gender equality, autonomy, and self-actualization. In contrast, materialistic or acquisitive values focus on internal and external security, obedience, material affluence, and economic growth. In Inglehart's understanding, the term *postmaterialism* (as well as the term *materialism*) concerns *social* and not *private* values. Values are defined as conceptions of the desirable; therefore, postmaterialism describes a specific concept of a desirable type of society and not a concept of the desirable order of private life. As abstract conceptions, social values are not part of the belief systems of individuals. They are cultural objects that exist independently of their supporters. But individuals can internalize such values, so that they become individual *value orientations*. A value orientation then is a value that a person has accepted as a moral guideline. In contrast to attitudes, value orientations are conceptualized as being more central and more deeply rooted in the belief systems of individuals. Thus, value orientations determine attitudes and are more resistant to change. This relative stability of value orientations is one of their most central definition elements. In this entry, the essentials of Inglehart's theory of the silent revolution are presented first. This is followed by a short description of the most important survey instrument for the measurement of postmaterialism. Finally, the main arguments of Inglehart's critics are summarized.

Inglehart's theory claims that postmaterial value orientations became gradually more widespread among the publics in advanced industrialized societies after World War II. His theory is based on two simple hypotheses: the *scarcity hypothesis* and the *socialization hypothesis*. The first states that an individual's priorities reflect one's socioeconomic environment, while the second postulates that to a large extent, one's basic values reflect the conditions that prevailed during one's preadult years. To put Inglehart's theory in a nutshell, the need structure of human beings develops as Abraham Maslow predicts in his theory of the need hierarchy. There are lower needs, such as hunger, thirst, and the need for housing and security. Inglehart calls these needs *material*. Furthermore, there are higher needs, such as the desire for social integration, esteem, and self-realization. Inglehart calls these needs *postmaterial*. In the logic of the need hierarchy, higher needs do not gain priority as long as lower needs are not satisfied. Inglehart further assumes that in the preadult years, the fundamental need structure of a person is cognitively transformed into social value orientations, which remain relatively stable in the adult years. The next step in his argument is that after World War II, the great majority of the population grew up under conditions of peace, security, and economic prosperity. Their material needs were satisfied, so they developed higher order needs that were cognitively transformed into postmaterial value orientations. Even if Inglehart allows for period effects, that is, short-term value fluctuations in response to altered environmental circumstances, he sees the major force of value change in the generational change. In his theoretical perspective, the postwar generations are the demographic basis of postmaterialism, and when the older generations disappear, the society as a whole develops toward postmaterial values. Inglehart calls this process the "silent revolution" because generational change works only slowly.

One important peculiarity of Inglehart's theory is that it deals with value priorities. Inglehart is not interested in the *absolute* importance people give to different values but in their *relative* importance. He is especially interested in the question whether a person gives greater priority to material or to postmaterial concerns. This focus on value priorities has several causes. First of all, it follows directly from the Maslowian need hierarchy, which is the theoretical basis of Inglehart's argument and deals with relative priorities. Further, Inglehart argues that in the field of politics, priorities are crucial. Most people will find material and postmaterial concerns important: They want to have economic growth *and* a clean environment, wealth *and* greater possibilities to participate in politics. But because politics is about choices and it is not possible to have everything—so goes Inglehart's argument—people have to decide between different desirable political goals. The fact that Inglehart's theory deals with value priorities implies that the value space in his concept is necessarily a one-dimensional continuum with the poles of materialism and postmaterialism. People are either materialists or postmaterialists, but they cannot give priority to both material and postmaterial values.

The most important and widespread survey instrument for the measurement of postmaterialism is the so-called Inglehart Index. Inglehart constructed it to measure value priorities in which he is primarily interested. For that reason, the Inglehart Index forces respondents to rank order four political goals, each of which by itself would be rated as very important by the respondents. The underlying assumption is that the respondents rank order these goals according to their basic value priorities. This instrument has been regularly included in the biannual Eurobarometer surveys of the European Commission since the beginning of the 1970s. In the Eurobarometer surveys, the Inglehart Index is implemented in the following form:

> There is a lot of talk these days about what [name of the Nation]'s goals should be for the next ten or fifteen years. On this card are listed some of the goals that different people say should be given top priority. Would you please say which one of them you yourself consider to be most important in the long run?
>
> ○ Maintaining order in the country
> ○ Giving the people more say in important government decisions
> ○ Fighting rising prices
> ○ Protecting freedom of speech
>
> And what would be your second choice?

In the empirical analysis, respondents who give top priority to the two materialistic goals (first and third goal) are classified as materialists, while those who give top priority to the two postmaterial goals (second and fourth goal) are coded as postmaterialists. Finally, respondents who name a material and a postmaterial goal on top of their priority list or vice versa are classified as a mixed type.

Inglehart's numerous books and articles on postmaterial value change as well as his measurement instrument have been extremely influential in the scientific discussion about changing value orientations in Western publics. Nevertheless, Inglehart's work generated a lot of theoretical and methodological criticism. From a theoretical point of view, it was criticized very early that Inglehart did not distinguish clearly between the concepts "individual need" and "social value orientation": Maslow's hierarchy of needs, which is a psychological model of personality development, may not necessarily be adequate for the analysis of the escalation of public wants and political demands. Furthermore, there is no reason why individuals must set priorities among material and postmaterial goals and values, since these options are not at all exclusive of each other in real-world politics. There is, for instance, no natural trade-off between giving people more say in government and fighting inflation. In addition, there is a lot of empirical evidence that value orientations can and do change over the life course and that they do this in a predictable manner. Inglehart's socialization hypothesis has therefore been repeatedly challenged by a rival life cycle hypothesis. Finally, the validity of the Inglehart Index cannot be taken for granted. When there is no natural trade-off between material and postmaterial goals, forcing the respondents to rank order these political goals is not appropriate. Empirically, the Inglehart Index reacts very sensitively to the rate of inflation: When the inflation rate is high, the percentage of materialists in a country is high too; when the inflation rate is low, the issue "fighting rising prices" is not of importance and the percentage of materialists is consequently low. These short-term fluctuations do not fit in with the theoretical status of value orientations as relatively stable constructs. So, possibly the Inglehart Index does not measure value but issue priorities.

During the past 2 decades, the focus of Inglehart's work has gradually shifted away from postmaterialism. He now interprets postmaterial value change as an important but by far not the only component of a broader process of postmodernization. In his latest work coauthored with Christian Welzel, he puts postmaterialism in the even broader context of the so-called human development sequence.

POSTMODERNISM IN INTERNATIONAL RELATIONS

Postmodernism names an increasingly varied set of intellectual strategies that, in contradistinction to the rational empiricist method of mainstream international relations thinking, in particular, and political science, in general, foregrounds the interpretive, ethical, and/or political nature of international relations scholarship (see particularly, Robert Walker, 1993). Its general aim is to test the limits and assumptions of our forms of knowledge of the political world and open up alternative ways of conceiving and practicing the political. With its focus on contingency, uncertainty, and plurality, postmodernism considers itself an appropriate form of political thinking for a global political age. In comparison to the schools of liberalism, realism, and Marxism in international relations theory, postmodernism does not present a school of thought however. According to David Campbell (1998), no scholar of a postmodern disposition accepts the term uncritically, and a wide variety of practices are covered by the term. That said, the above definition underscores, in Wittgensteinian terms, a basic "family resemblance" between the arguments of these scholars. This resemblance has allowed the concept of "postmodernism" to acquire in the past 25 years intellectual consistency in the disciplinary field of international relations (IR) and to designate something like a specific approach to IR. In this light, the following considers (a) the intellectual origins of the term and its application to the discipline of IR, (b) its major strategies and engagements within the field, and (c) future perspectives.

Origins

Postmodernism in IR can be traced back to the major moves of French thought in the 1960s and 1970s. Amalgamating a set of arguments from modern linguistics, anthropology, psychoanalysis, post-Kantian philosophy and phenomenology, and literary theory, intellectuals like Jacques Derrida, Gilles Deleuze, Michel Foucault, Jacques Lacan, Jean-Francois Lyotard, Julia Kristeva, and Roland Barthes launched a series of critiques of the major tenets of humanism in the humanities and soft sciences. They questioned, in particular, the authority of the modern subject qua the ground of modern knowledge, ethics, politics, and aesthetics; representative theories of truth and reality; and progressive theories of history. Although these critiques were different in kind and, at times, mutually incompatible, all the above thinkers engaged, to greater or lesser degrees, with the following: to look to differences, otherness, and the nonhuman where the modern period, within a larger metaphysical movement or not, secures identity through reason; to undermine any straightforward correspondence between representation and reality, the knowing subject and the known object; and, by showing the constructed nature of our representations of the world, to prise open the limits of these constructions and allow marginalized and alternative voices to emerge. All have been concerned, in other words, with undermining and transcending Cartesian-inspired epistemology, with expositing forms of critique that do not rely on a final instance of truth (God, humanity, the modern subject, the proletariat, and nature), and with rehearsing a distinction between ethical transcendence and political determination. (The work of Jacques Derrida and Michel Foucault—together with the that of the Heideggerian philosopher Giorgio Agamben—has foremost importance in this respect.)

From the 1980s onward, this thought began to influence the subdiscipline of IR within political science. Scholars like Richard Ashley, David Campbell, James Der Derian, Michel Dillon, Jim George, Michael Shapiro, and Robert Walker are important figures in this translation. The aforementioned critiques of language and representation help, notably, to critique the empirical rationalism of mainstream IR thought: The belief that theory describes the world and is validated through empirical evidence. The above refusal of an ultimate referent in language and of the concomitant "performative" nature of all knowledge allows IR scholars, on the one hand, to historicize the dominant objects of international relations thought (interstate relations, the sovereignty of the state, security, peace, and interdependence) contra the perceived abstractions of rational choice theory and the empirical research methods of neorealism and neoliberalism. On the other hand, it allows them to reveal relations of interest and power within *any* theoretical construction of political reality. Since knowledge is not neutral (representing its object as such), it always already involves hierarchies of interpretation. As a result of these two gestures, the field of international relations is pulled away from explanatory analysis and related back to political theory and political sociology, and its objects are, in principle, opened up to alternative possibilities of political knowledge, power, and organization.

Engagements

Since the establishment of these strategies within IR theory, postmodern IR thought has increasingly weighed theoretical understanding with empirical investigation. Some standard themes and authorships are briefly listed here. Postmodern topics in IR range from genealogies and deconstructions of the IR tradition (Walker, Campbell), through focused attention on modern delimitations of sovereignty (Ashley, Walker, Shapiro), to theorizations of contemporary modalities of warfare and security (Michel Dillon and Julian Reid, Maja Zehfuss), of "liberal" regimes of governance and surveillance (Didier Bigo, Claudia Aradau, Louis Amoore, and Marieke de Goede), of American and British foreign policy (David Campbell, Michael Hardt, Toni Negri, and Michael Shapiro), of "humanitarian" interventions (Michel Dillon and Julian Reid,), and of migration, asylum, and refugeeship (Jenny Edkins). Since postmodern approaches to these topics simultaneously open up questions of patriarchy and Western domination, they have also dovetailed with respective concerns in IR with feminist and postcolonial issues (e.g., Kimberly Hutchings and Vivienne Jabri). Given constraints of space, rather than expositing these arguments, this entry focuses on the topic of "modernity" as such in postmodern IR theory. All the above engagements presuppose something like a common approach to it. To understand the "how" of these postmodern positions in the field of IR entails, in other words, first understanding this presupposition.

In its strongest formulations, the "post" of "postmodern" designates neither an "after" nor an "against" of the modern period, of modernization processes, or of the general descriptive "modernity." It refers, rather, to a critical, ambiguous relation to the general tenets of the modern. These well-known tenets consist in a belief in progress, in the emancipating powers of reason, in the political centrality of subjectivity, and in ethical and—in historical tension with nation-state particularism—political universalism. Together with these tenets, the discourse of modernity affirms the exemplarity of Western processes of modernization: the distinction between religion and the state, the separation of civil society from the state, the emergence of the individual and the categories of ethical and political personality *and* solidarity, democracy and the rule of law, industrialization and urbanization, and so on. For postmodern thought, following Foucault (1980), these processes dominate and discipline the individual as much as they individualize and empower him or her: Subjectivity implies, also, subjection. Following Derrida (1992), modern law is considered to cover over its own violent emergence and is consequently unable to reflect on its own ethical and political limits. Liberalism affirms, for example, universal tolerance and general assembly. But the spaces of both are necessarily exclusive and violent, organizing the "others" of liberalism in self-legitimating ways. Finally, for postmodern thought, following Emmanuel Levinas's attention to ethical singularity, the immanent relation between theoretical and practical reason in modernity codifies ethics and turns the Enlightenment principles of freedom into those of abstract domination with little eye to locality and contingency (the major critique of Western interventionism). In these three respects, modernity's promise of a generalizable axiomatics of freedom hides practices of discipline and domination. Modernity is to be neither avoided nor transcended; its limits of violence are, however, to be critiqued and negotiated.

Within the field of IR this kind of argument has meant the following. IR turns on the "anarchy" of relations that befall the state outside the parameters of its own sovereignty. For postmodernists, sovereignty and anarchy are mutually constitutive, violent constructions whose respective delimitations suppress the multiple differences and pluralities of the real. Modern political organization does wrong to these differences. *Contra* cosmopolitanism, however, postmodern IR thought does not affirm either the individual against the modern state or the transnational human rights regime that increasingly underpins supranational juridical personhood. For the limits of the individual are as constructed as those of the modern state. Modern liberal individualism and its international equivalent, cosmopolitan liberalism, codify subjects in particular ways as bearers of rights, as fully delimited and conscious persons, as beings prior to social interaction and meaning. These philosophies risk depoliticizing social agents. Therefore, aware of the freedoms gained through modernity (in distinction to the hierarchies of the premodern age), postmodern IR thought considers the state as only one actor in the plural fields of global politics and sees the individual and universalism as the legacies of *Western* Enlightenment. This legacy is particular. It cannot consequently theorize for humanity as a whole. When it does, non-Western social actors risk being perceived in a nonpolitical context; the consequences of universalism can be utterly self-contradictory (see particularly Mahmood Mamdani, 2009). Postmodern thought converges here with neo-Marxist and postcolonial critiques of Western imperialism. Modernity cannot be a straightforward counterforce to such imperialism, for, however much it distinguishes itself from authoritarianism, it is also complicit with strategies of domination.

What emerges from the postmodern analysis of modernity? Any countersubject to replace Western modernity would simply reproduce the tenets of modernity. Postmodernists do not consequently seek a new political subject. They seek to untie and foreground what is repressed by political subjectivity as such, hence their practical concern with the excluded, the marginal, the dissenting, and an (often too) implicit engagement with political organizations that are more inclusive, less exclusive. Postmodern thought's ultimate concerns are, therefore, with ethics and (more long term) with the overall rethinking of modern political categories. The former ethics is not that of rational universalism, however; it addresses, as reasonably as possible, what political reason and subjectivity will necessarily exclude. It is an ethics of contingency, of uncertainty, of singularity in the interstices of political arrangement and institution. Given the recent economic and technological globalization, postmodernism in IR befits, it is argued, a global age. For in this age, plurality and difference are increasingly critical values. The postmodern engagement with modernity leads, as a result, to critical and dissenting approaches to all international topics, approaches that anticipate, some way down the road, a new politics of freedom.

Immediate Futures

Postmodernism is now settled within international relations theory. Its position remains, however, marginal. Just as French thought has been unable to dislodge scientific rationalism in the social sciences (remaining effective in the humanities and soft social sciences alone), so postmodern thought in IR has not perturbed, let alone dislodged, mainstream IR thought (political realism, rational choice theory, game theory, and empirical research methods in general). Although its present critiques of domestic and global liberal regimes are important, future perspectives for postmodernism in IR should be considered in this light. Two possibilities seem convincing here. Given its postpositivist roots and ethical orientation, postmodernism in IR will refuse to become more "mainstream," resisting empirical procedure and attending to the marginal—postmodernism will remain a marginal critique in this sense. Or it will theorize how to think and practice less violent political organization in an age of globalization and fragmentation. Although both options are intellectually justifiable, the second requires on the part of postmodern scholars more rehearsal of postmodernism's own assumptions (especially around the concept and practice of freedom). This entry concludes with two examples. First, if all theory is interpretive to a greater or lesser extent, the criteria by which one theory is interpretatively better than another should be formalizable and, therefore, testable. If so, at the methodological level, postmodernism and empiricism could talk to each other. At the political level, postmodernism could exposit more what the lesser violence entails in global political life. Second—and consequently—for postmodern theory, freedom tends to be situated beyond liberal law, with the latter seen as coercive, disciplinary, and, at worst, depoliticizing. A clearer negotiation with the *inextricable* relation between freedom and law is, however, needed if postmodern thought is to help foster more progressive forms of governance. In an age of uncertainty regarding the future of global political configurations, both positions are of interest to progressive reorganizations of international relations. The future of postmodern thought in IR will probably depend on a careful balance struck between the two.

POWER

Power is a concept broadly used both in personal and political communication and in scientific discourse. Everybody claims to know what power is. Yet looking at the wealth of meanings given to this concept in everyday life and among social scientists, the confusion is striking. There are several reasons for this confusion. By way of introduction, only two reasons need to be mentioned.

One reason for this confusion is that the use of the concept of power in common and scientific language is highly morally loaded. Power researchers committed to the Weberian epistemological norm of *Werturteilsfreiheit* (freedom from value judgment) are under extreme pressure both from the members of their own scientific community, who follow the contrary norm of critical analysis, and from the public to take a clear moral position on power. Critical theorists who have committed themselves to fighting power with the means of science, on the other hand, have been accused of normative bias when dealing with power analysis. Ever since power has been on the social scientific research agenda, it has provided one of the most prominent battlegrounds for conflicting epistemological approaches, political interests, and cultural beliefs. What is left after all these battles is not easy to put together again into one picture of social scientific power research.

There is a second reason why power research constitutes a particularly slippery ground for social scientists. Scholars of power are, like laymen in general, prone to being influenced by cultural images and ideologies of power. In Western culture, there are mainly two contrasting images of power that have left their imprint on social scientists' efforts to deal analytically and empirically with this widespread phenomenon. According to the first image, power is a negative phenomenon. It is seen as a social force suppressing the weakest members of society and making them dependent on the power holders. According to this cultural image, power is considered "bad" because it is believed that the concentration of power undermines generally accepted social norms and values of democracy and disturbs the smooth functioning of its institutions. Popular Western culture continually feeds this negative image of power. Western mass media produce and reproduce stereotypes of bad power: The power holders are mainly males, meeting other powerful men in secret sessions and gathering around the top power holder, their boss. Violence is their ultimate power resource. Implicit in this stereotype of bad power are the beliefs that secret power in general is stronger than public power, that power has a gender bias in favor of the males, and that the strongest power resource is violence.

The imprint left by this cultural stereotype on social scientific research is threefold. First, following the first element of the cultural image of power according to which "real" power is invisible, scholars of power have insisted on the imperative to discover hidden power as their main research goal. Second, the gender bias implicit in the cultural image of power is reproduced by power research. Power is mainly a male affair. The overwhelming majority of power researchers are males, and their research subjects, the power holders, as a rule are males as well. There is practically no research on female (political, social, economic, cultural, and religious) power and their peculiarities, if any, as to its exercise. There is a third and contradictory imprint that the popular image of power has left on power research in the social sciences. Although it is generally believed that physical muscular components are the ultimate instruments of power, analyses on violence do not constitute a self-evident part of conventional power research. Leaving aside those cases when force and violence represent the last instance, as in riots, revolutions, and war, conventional power research has usually explored cases in which the exercise of power appears to be a bloodless, largely psychological, and mainly intellectual affair.

Whereas the negative image of power is strongly represented in Western cultural industry, its counterpart is less pronounced. When power is considered "good," it is generally associated with a small group of gifted and qualified men constituting an elite in a specific societal segment. As long as these fragmented elites do not coalesce into one and the same elite, they produce the positive effects of power: know-how, expertise, trust, and vision. If power is good, it works on the basis of nonphysical and mainly intellectual means of convincing others. According to the institutionalized division of labor within the social sciences, elite research is separated from power research. This illustrates that the cultural image of positive or good power is underrepresented not only among laymen but also among students of social science.

All said, it becomes quite easy to understand why power is one of the most elusive, yet most widely used concepts in the social sciences. Some scholars have suggested getting rid of it, but the concept of power is and remains an essential tool of analysis. Power has always been the object of many controversies, both definitional and analytical. Accordingly, there are many different ways of how to define this concept and how to study power.

Definitions and Constituent Elements

As for many other social science concepts, Max Weber (1978) provides an excellent point of departure: "'Power' (*Macht*) is the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance, regardless of the basis on which this probability rests" (p. 53). Weber stresses that there are a wide variety of power bases: "All conceivable qualities of a person and all conceivable combinations of circumstances may put him in a position to impose his will in a given situation" (p. 53). It is with reference to this wealth of possibilities to mobilize and exert power that Weber has qualified this phenomenon as "sociologically amorphous."

Departing from Weber's definitions, four constituent elements of power can be distinguished: first, power is *relational*; second, it is *intentional*; third, it is based on social *resources*; and fourth, power is related to specific *contexts*.

Relational

Many authors have followed in Weber's footsteps and see power not as a specific quality of a person but as a relation between two actors (A and B) or entities. For instance, according to Richard Tawney (1931), "power may be defined as the capacity of an individual, or group of individuals, to modify the conduct of other individuals or groups in the manner which he desires" (p. 230). Robert Dahl's (1957) elegant definition highlights the relational character of power: "A has power over B to the extent that he can get B to do something that B would not otherwise do" (pp. 202–203). If power is understood as a relation in which not only can A modify B's intentions and will, the question arises of how B can "relate" to A. On its part, B can try to resist A's will by mobilizing counterpower. According to Heinrich Popitz (1992), the ultimate chance to break A's power consists in B physically withdrawing from the power relation either by escaping from the situation, by committing suicide, or by being prepared to be killed. The willingness to die or to commit suicide is the strongest counterpower B can mobilize against A. Both in conventional and in terrorist warfare, it is a commonly used weapon.

Intentional

The definition of power is limited to cases in which A intends to carry out his will vis-à-vis B. In contrast, if B conforms with A's wishes even without A's intention to impose them on B, we are dealing with the phenomenon of *influence*. However, the borderline between influence and power is fuzzy. Carl Friedrich (first articulated in 1941, then in 1963) has suggested that a power relationship may exist even when no visible pressure or influence is applied. There may be cases when B seems to implement A's will without pressures being put on B. B does so because, on the basis of B's and others' previous experiences, B is aware that A desires that specific type of behavior and is in a position to impart sanctions if it is not fulfilled. For instance, a U.S. senator votes in a certain way, contrary to his or her previously manifested views, because he or she knows that otherwise the president has the power to punish any contrary behavior by withdrawing some precious resources and/or acting in such a way as to exclude him or her from prestigious positions and appointments. Behaviors of this type are, in Friedrich's language, instances of "anticipated reactions."

Not all scholars agree that (manifest or anticipated) intentionality is the definitional distinction between influence and power. As shown below, a heated debate has taken place from the mid-1950s to the 1970s focusing on, among other things, this distinction. Other controversies have dealt with the question of how the *intention* to use power manifests itself. Generally speaking, the expression of one's intention to use power depends on the type of resources available and the type of sociopolitical context in which power relations take place. Political scientists have given special prominence to the realm of decision making. Harold Lasswell and Abraham Kaplan (1950) define power as "participation in the making of decisions: G has power over H with respect to the values K if G participates in the making of decisions affecting the K-policies of H" (p. 75).

Control is another concept often used synonymously with the concept of power. The distinction between these two concepts, however, is important and useful for grasping two different phenomena. The powerful person or entity uses different resources including, if necessary, violence to enforce his or her intention. In contrast, the concept of control is used when the other's behavior is supervised and/or guided without wanting to change it. In politics, both informal and formal mechanisms of control are at play. Among the latter ones, the institutionalization of competition between political parties and the institutionalization of opposition to the governing party or party coalition are of crucial importance for making democracies work. The institutionalization of control mechanisms has the function to prevent the abuse of power and to stimulate power holders to use their resources according to the generally accepted goals and values. However, there is a tricky relationship between control and power.

Control without power can turn out to be inefficient when it is confronted with strong power holders. But who controls the controllers if they are given power resources? On the other hand, powerless controllers typically run the risk of being drawn into the very power constellation they have been given the function to supervise. United Nations peacekeeping and observer forces, for example, have often enough become part of the conflicting groups they were supposed to control. Obviously, a necessary precondition for control mechanisms to perform their function of limiting power abuses is the knowledge of who uses power where and when. But, evidently, not all power relations are open and accessible. Secret power networks infiltrating official power centers are difficult, if not impossible, to check by institutionalized control mechanisms. If power works in the underground, also controllers have to move underground, taking the role of spies, concealed investigators, or secret agents. The power of power vis-à-vis its controllers consists in its capacity to dictate the means of control. Just because the relationship between power and control is so highly flexible, it is important to keep these two phenomena conceptually apart from each other.

The *intention* to exert power can also be expressed explicitly as an order to obey. This is especially the case when and if the power relation takes place within a system of authority. In this sense, David Easton (1965) speaks about the "power of the authority roles" (p. 207). In more informal social contexts, the powerful person can express his or her intention with the help of more or less subtle means of body language, with a sign of the hand or a raise of the eyebrow (Erving Goffman, 1963). Typically, only a limited range of persons are able to interpret these signs according to the intentions of the power holder. The intention to use power and the translation of this intention into action can be divided between A, the power holder, and persons who function as the staff of A. If this division of "labor" is given, power analysis has to shift from the analysis of dyadic relations between A and B to the analysis of triadic relations between A, C, and B. Whenever dyadic power relations are transformed into triadic power relations, power is undergoing the first stage in its transformation into authority (*Herrschaft*; Popitz, 1992, p. 232).

Resources

According to Weber, power relations can be built on a variety of possible resources. Efforts have been made to classify the types of resources that lend themselves most likely to be exploited as power bases. M. Rainer Lepsius (1968, 1990) has proposed three different bases of power: the market, the association, and the state. Power based on the *market* refers to Karl Marx's insight into the power potential related to the ownership of the means of production. Understandably, the owners of the means of production in general have a higher chance to press through their will on others than nonowners do. Power based on *association* or organization refers to the chances A has to realize his will if this will has been transformed into an organizational goal of a political party, trade union, or voluntary association. Another lively debate fought out in the 1960s and 1970s refers to the role performed by organizations as a power basis. As Elmer Schattschneider (1960) aptly put it, "Organisation is the mobilization of bias" (p. 71).

Power based on the *state* refers to the (legitimate) use of violence as the ultimate means of compliance. Power can be strengthened if it is based on a combination of all three power resources. Actors who are situated in a privileged market position, whose power intentions are organized, and who have access to (legitimate) means of violence have a greater chance to succeed than nonorganized actors in an unprivileged market situation without access to (legitimate) means of violence. Strong power resources have the tendency to attract each other, whereas weak power resources tend to remain fragmented. Different patterns of power distribution within a society have been identified. Two extreme models of power distribution, the "elitist" and the "pluralist," have especially attracted the attention of U.S. scholars and been in the focus of a highly ideologically loaded controversy. Although this debate has taken place more than 4 decades ago, it is still of importance, especially for scholars dealing with the tension between democracy and power.

Taking into consideration the plurality of power resources and the ubiquity of power in social interaction processes, system theorists have conceptualized power more abstractly. Within his complex structural-functional framework, Talcott Parsons (1969) has suggested treating power "as a specific mechanism operating to bring about changes in the action of other units, individual or collective, in the processes of interaction" (p. 353). Even more abstractly, system theorists also speak about power as a medium of communication comparable with money in economic relations. As such, it structures social relations by selecting the types and limiting the amount of action alternatives. Power conceived of as a medium of communication has the function to regulate the dynamics of interaction processes (see the classic study by Peter Blau, 1964). Like money, power obeys the law of diminishing returns. If inappropriately used, it can be wasted and may lose value. There is no fixed relationship between the increase in power and the increase in the selection of action alternatives. The system theoretical point of view of power allows for opening the scope of power analysis and integrating both positive and negative functions of power understood as a resource of the system into the empirical research.

Context

Power relations vary according to the type of the context within which they take place. These contexts can be more or less formal and/or have more or less systemic character. In informal contexts, the values, norms, and sanctions regulating power relations are not defined precisely and explicitly. Therefore, they tend to be more arbitrary, and the risk is that they will escape the control of both power holders and subordinates. If it is left to the personal whims of a powerful person how and when to press through his or her will, then the subordinates have no chance to appeal to common values, norms, or sanctions in order to limit the scope of their submission. In these cases, power tends to become "despotic." The more the context is formalized and the more it is constituted by systemic characteristics, the more the power relations become predictable and, therefore, manageable.

Weber's (1978, p. 212) famous distinction between three types of authority has been used to distinguish between three types of contexts within which power relations develop: (1) the context of *charismatic authority*, (2) the context of *traditional authority*, and (3) the context of *rational or legal authority*. In all three cases, the decisive criterion of distinction between power and authority is the claim on legitimacy by A and the belief in legitimacy by B. Speaking in terms of ideal types, B who is confronted with A's power has to comply willy-nilly with A's intention; B who is confronted with A's authority obeys A's order because B believes in its legitimacy.

In addition to the type of context within which power relations take place, it is also important to specify on which level power is studied: on the microlevel of power relations in everyday life, on the medium level of power relations in communities, or on the macrolevel of power relations on the top of authority systems or regimes. The more the power relations are globalized, the greater the need for power analyses both (horizontally) between different power centers and (vertically) between different interconnected levels of power.

In summary, it can be said that the concept of power consists of four constituent elements:

1. it is relational,
2. it is intentional,
3. it is based on resources, and
4. it is related to specific sociopolitical contexts.

The concept of power has two counterconcepts, influence, on the one hand, and authority, on the other. The distinctive criterion of definition between influence and power is the intention to exercise power; the distinctive criterion of definition between power and authority is the claim and the belief in the legitimacy of power. These distinctions help in presenting some of the most important debates among mainly American scholars of power and their contributions to power analysis and research.

Debates and Controversies

Between the 1950s and the 1970s in the United States, heated controversies concerning power raised significant questions from both substantive and methodological perspectives. In the research on power, substance and methodology have proved to be intimately connected with each other and have to be taken into consideration simultaneously in the presentation of these debates. Political scientists have applied three methods: the reputational, the positional, and the decisional. With reference to the patterns of distribution of power resources, two outstanding models have been formulated: the elitist and the pluralist.

To discover the powerful ones in a community, Floyd Hunter, who is positively responsible for launching the wave of research and controversies, resorted to the *reputational* method. In 1953 he asked a panel of persons supposedly possessing a fair amount of information concerning the city of Atlanta the names of who they thought were the most powerful individuals in the affairs of the city. Though he supplemented the information obtained this way with his own acquired knowledge, his method was criticized as having several drawbacks. Not necessarily are those who are visible automatically powerful. Not always will prestige be translated into power. Moreover, often the very powerful ones succeed in keeping themselves out of the limelight. Interestingly, however, he reached the conclusion that, indeed, in the city of Atlanta, a few powerful individuals, most of them not necessarily occupying political or other types of office, were considered capable of guiding and controlling significant activities. There was a dominant elite. Aware of some of the pitfalls of the reputational method, other scholars decided to rely on the *positional* method. That is, they acquired information on all those individuals occupying important offices in the city government, in the business community, in the mass media, and in religious associations. In a few cases, they found some overlapping. In general, their conclusion was that many of those holding important offices, political offices as well, could influence in a significant way the activities of their community. There did not exist a single unified and dominant elite but groups of elites in competition. Hence, the structure of power could be defined as pluralist. The positional method too was subject to well-founded criticism. Wealthy people, especially, may neither need nor want visible offices. In many cases, the politicians may appear in charge, but they are to a great extent dependent on individuals who, for instance, finance their electoral campaigns; who control the most important economic activities, as occurs in many company towns; and who manipulate the mass media and the presentation of special technical knowledge indispensable to justify some choices and to defeat opposing alternatives. The positional method was accused of almost inevitably but unconvincingly leading to a pluralist conclusion.

Largely relying on the positional method, a highly provocative book made a thunderstorm irruption into the debate. Rightly and wrongly, *The Power Elite* by C. Wright Mills (1956) was intended to challenge the received wisdom of the common perception that the U.S. republic is based on an irrepressible, competitive, and fruitful democratic pluralism. In the wake of McCarthyism and in the midst of the Cold War, Mills bluntly stated that the decision-making process at the federal level was dominated, if not monopolized, by a restricted combination of politicians (chief executives), military officers (warlords), and businessmen (corporate rich): the power elite. Interestingly, when leaving the presidency in 1960, former General Dwight H. Eisenhower himself warned against the exaggerated power of the "military-industrial complex." The question raised and the conclusions reached seemed so important and delicate that the response to Mills's analysis was provided by a score of the most outstanding social scientists of that period: Talcott Parsons, Daniel Bell, and Robert Dahl.

Indeed, Dahl and some of his students, especially Raymond Wolfinger and Nelson Polsby, engaged in a prolonged battle against both the method used by Mills and the implications of his substantive analysis. The battle was continued by several scholars well after Mills's death in 1962. At issue were two extremely important political and methodological problems. The political problem concerned the very nature of American democracy: Was it still open and pluralist, as Dahl and his disciples attempted to prove, or it had come to be dominated by a few groups as maintained by Mills (and the neo-Marxists)? The methodological problem was how to test the distribution of power and the way power was being exercised.

In response to Mills's *The Power Elite*, Dahl formulated the *decisional* approach to the study of political power. Focusing on one community, New Haven, Connecticut, where his university, Yale, is located, he chose three issue areas that he considered the most important ones: political appointments, public education, and urban redevelopment. The guiding assumption was that if a cohesive power elite existed in New Haven, its members would always be present and prominent in all three areas. If different groups of decision makers were present and influential only in some of the three issue areas, but not in all of them, the theory of the pluralists would be vindicated. At the end of a long and detailed study, Dahl (1961) came to the conclusion that there was no or little overlapping among the decision makers and that no single group of elites controlled political power in New Haven. The decisional approach seemed to be more appropriate than both the reputational and the positional in identifying those effectively holding and exercising political power. According to Dahl, it was also superior and preferable to the other approaches because it provided for better empirical testing. Nevertheless, the debate was by no means exhausted and closed.

In an article published in the *American Political Science Review* (originally in 1962, then collected in a book in 1970), which became the single most quoted one, Peter Bachrach and Morton Baratz questioned the method and the conclusions reached by Dahl and by the pluralists. Their fundamental thesis is that there are "two faces of power." One is a visible face that finds expression in decision-making activities. It is not necessarily the most influential. There is a second face that may often be decisive and that the decisional method cannot illuminate. It is the invisible face that prevents important, perhaps the most important, issues from coming before the decision makers. Therefore, those issues cannot be discovered by the decisional method because they imply or are "nondecisions." Nor will the powerful ones be easily identified exactly because they operate, so to speak, in the dark.

Bachrach and Baratz's critics immediately pointed out two problems concerning their approach and conclusions. Who is in a position to convincingly claim that there are important issues in community life that are not even taken into consideration? The pluralists argued that all truly important issues are eventually articulated. In any case, as to the method, how can scholars study nondecisions? Inherently, nondecisions are not researchable and not subject to any empirical test.

The contrast between elitist and pluralist thinking about community power is very stark and revolves around all the most important aspects of the ownership, distribution, and exercise of power. The pillars of the two competing views have been summarized in an excellent and impartial manner, without any bias either political or methodological, by T. R. Dye (1970, pp. 36–37; but see also Andrew McFarland, 1969). The following paragraphs provide a comparative synthesis of the two views (Dye, 1970, pp. 36–38).

Whereas elitists believe that "political power is inextricably bound together with social and economic power" (Dye, 1970, p. 36) and, therefore, it is likely that "men of wealth and social position in the community are also men of power" (p. 36), pluralists consider power an attribute of individuals that finds expression in the ability to induce other individuals to act in ways they would not otherwise do if power were not applied. Where elitists stress that power is "structured" and, therefore, bound to last as long as the men having power continue in their roles, pluralists believe that power is bound to pass and that, in any case, it may lapse away after some specific decisions are made.

Whereas elitists state that there is a clear and persistent distinction between the elites and the masses and that the members of the masses will rarely succeed in joining the ranks of the elites, pluralists almost rule out the distinction between elites and masses and believe that it is possible for many individuals to exercise decision-making power at different points in time. Elitists stress that power derives fundamentally from the unequal distribution of economic resources and that politicians enjoy limited autonomy vis-à-vis business and financial leaders, while pluralists hold that the power to participate in decision making derives from the amount of interest individuals have in some specific issues.

Elitists consider that the powerful are a small group in any and all communities because political power is correlated with higher degrees of education, higher levels of income, and more prestigious occupations; in contrast, pluralists believe that power is acquired through superior leadership skills, greater managerial capabilities, and better knowledge of the democratic process. Wealth may help, but it is never decisive. For elitists, the image of power in a community is that of a pyramid: very few on the top having very much power. For pluralists, power is better depicted in the shape of an onion: a limited concentration of power on the top, much power given to those in the large middle of the onion, and very few powerless individuals at the bottom. For elitists, men of power share the same basic values and outlook, while pluralists point at the existence of a competition among different leaders seeking divergent policies and being obliged to bargain and to compromise.

Finally, according to elitists, the elites do not have to be responsible to the masses, who are misinformed and unable to exert pressures on the elites. To avoid potential tensions and conflicts, however, the elites may behave in a benevolent manner out of a sense of duty to their respective communities. According to pluralists, however, community leaders are responsible to a variety of associations. Elections enforce an additional sense of accountability and allow some elite circulation.

The next stage of the debate focused on the question of how nondecisions could be defined more precisely and whether they could in fact be identified and made amenable to empirical research. To rescue the idea lying behind nondecisions, Frederick Frey (1971) suggested speaking of "suppressed issues," that is, issues that do exist, are important, and would deserve attention. However, dominant groups are capable of vetoing them and preventing them from even getting on the agenda, for fear of diverting their political path. The implication is that the *structure of power* in a given community would make it rather unlikely or well-nigh impossible that some controversial issues be raised and find a place in the decision-making process. Avoiding any reference to Marxist scholars, the authors engaged in stressing the possibility of nondecisions have been fond of quoting a sentence by Schattschneider (1960):

> All forms of political organisation have a bias in favour of the exploitation of some kinds of conflict and the suppression of others, because *organisation is the mobilization of bias*. Some issues are organised into politics while others are organised out. (p. 71)

Of course, not even the recognition of the possible existence of a mobilization of bias offers a completely satisfactory solution key to the analysis of the suppressed issues of when, how, by whom, and with what consequences. A convincing explanation is still required of why there is a specific structure of power, how it came into being, and how it succeeded in consolidating itself and in persisting. If the answer is that the structure of power itself has come into being thanks to the suppression of some not visible alternatives, then scholars would find themselves engaged potentially in an infinite regress. It will also be of not minor interest to know whether and how that structure of power has withstood what kind of challenges and whether and how it has been transformed.

Reanalyzing and summarizing the entire debate in an incisive essay, Steven Lukes (1974) tried to go beyond both approaches. He referred to the decisional approach as one-dimensional, to the nondecisional approach as two-dimensional, and then he offered his own three-dimensional view. Lukes's view (1974) combines and redefines all the elements of the two other approaches, focusing on "(a) decision-making and control over the political agenda (not necessarily through decisions); (b) issues and potential issues; (c) observable (overt or covert) and latent conflict; (d) subjective and real interests" (p. 25). This highly ambitious blueprint has not found any practitioner so far. Moreover, one cannot refrain from remarking that, since Lukes refers to covert and latent conflicts and to subjective and real interests, his research proposal automatically falls under the criticism of all scholars who consider of the utmost relevance the identification of power through observable behavior and the drafting of an operational definition.

In a way, however, though unwillingly, Lukes exemplifies the major problem involved in the analysis of power. There are many faces of power. While the one that refers to decision making is easy to identify, scholars know that decisions are only the last stage in a long process/procedure. At the beginning of that procedure, power may be expressed in writing the agenda and in initiating or vetoing some issues. Of course, this face of power requires the difficult acquisition of information that the powerful may want to suppress and may succeed in doing so. Therefore, the scholarly (and the political) attention should turn to the analysis of the overall social and political structure to detect whether that structure has incorporated some bias and, in case it has, what kind of bias it is. The inescapable conclusion is that power must be studied with reference to an existing system (political, social, economic, religious, cultural, and media). As a consequence, the overall characteristics of the system acquire major importance in drawing the boundaries of its exercise and in assessing its impact.

Power in the International System

At this point, a digression is needed to briefly address power in the international system. Unfortunately, the interaction between political scientists interested in the distribution and exercise of power within specific political systems and international relations analysts has been poor, infrequent, and sterile. However, it should be clear that power among nations constitutes a significant field for analysis. For more than a century, the debate among historians on what kind of equilibrium existed in European politics was dominated by the expression and the theme of "balance of power." That such a balance existed so that no single European state should acquire control of Europe was, indeed, the goal successfully pursued by the United Kingdom throughout the 19th century. Historians and international relations analysts are perfectly aware that the ways some states exercise power over other states; control, overtly and/or covertly, their behavior; shape the international agenda; and organize the international system are all themes worthy of analysis in terms of power. Some (see, especially, A. F. K. Organski & Jacek Kugler, 1980) have also come to the realization that even in the domain of international politics, power is neither simply nor exclusively a matter of physical resources. It consists more specifically of the capability in mobilizing, organizing, deploying, and orienting those resources. Not surprisingly in war, democracies have shown more power than expected: far superior to the supposed power of authoritarian regimes of all varieties.

Several of the tools and the approaches used in national contexts can be put to work when dealing with the international system. Some truly significant historical phenomena affected by the resort to power and that cannot be convincingly explained without taking into account several forms of power are, for example, colonialism and imperialism.

The reappearance of a debate on whether and how the United States, revealingly defined as a superpower (the only remaining one), can be characterized as an empire or not has brought to light a distinction between *hard* power and *soft* power (Joseph Nye, 2004). Hard power is based on military force leading to outright war; soft power relies on diplomacy, persuasion, manipulation of circumstances, and cultural influence. A superpower may launch and perhaps win some or even most battles, but it will be unable to conquer the minds of individuals if it resorts only to violent actions. On the contrary, hard power is likely to arouse and excite hatred. Though from many points of view the United States is, indeed, a superpower, in the not too distant future likely to be challenged in terms of power by China, there are scholars who believe that at the international level it has become quite difficult to identify who really has power. Globalization seems to a be a process dominated by impersonal factors and hidden protagonists, affecting, of course, in very different ways, all states and actors, whose responsibility and power cannot be easily (or at all) ascertained and attributed (Susan Strange, 1996). Even at the level of the international system, power seems to be everywhere, but its detection and its analysis have become and remain extremely complicated tasks. And, of course, when dealing with events taking place at the level of the international system, there are scholars who believe that most events are affected by one player, the United States, and scholars who believe that the situation is extremely complex and that there are a plurality of actors, including several international organizations, affecting the distribution and the exercise of power in the international system.

There has always been another important sector of power research, identified mainly in Europe in the late 1960s. It is less ideologically loaded than the debates among U.S. scholars and more aimed at a historical and sociological understanding of the functioning above all of totalitarian regimes in the past. This research has been focused on regime types—democratic, authoritarian, and totalitarian, roughly—and on the formal and informal rules presiding over all the processes from the acquisition to the transmission of political power. Especially noteworthy in the three regime types must be considered the relationship between power and the existence of organized groups and their competition and transformation through time. The dispersion of power among several competing groups is a crucial feature of democratic regimes. Limited, not competitive, and not responsible pluralism, as defined by Juan Linz (1964), is the hallmark of authoritarian regimes, while the power monopoly of one actor, the single party, characterizes totalitarian regimes.

With reference to the Nazi regime, M. Rainer Lepsius (1968) has analyzed the structure of intermediary groups and its relation to charismatic leadership. The process the Nazis called *Entmachtung* (de-powerization) “meant a double process of reducing and relocating social power in society” (p. 297). Powerful interest groups were destroyed, and the remaining less powerful ones transformed into agencies of the Nazi party competing with each other for their survival. Under the condition “that there exists an atmosphere of competition and suspicion” (p. 63), no bonds of solidarity between the different power groups were created, thus leaving a space of direct control to the charismatic leader. The combination of a fragmented and weak power structure on the intermediary level with the centralization of power on the top level of the regime was the structural precondition for the excessive and arbitrary (mis)use of power by Hitler.

When looking at more complex chains of power structures on the international level, an interesting observation has been made by, among others, John Gerard Ruggie (1998). Along with the formation of international regimes, the role of power has changed. In international regimes, the capability to cooperate and to make compromises has become more important in making politics than the capability to mobilize power resources and to exercise power. Accordingly, power research has been integrated into game theory, bargaining theory, and theories of rational choice. This is why it may seem that power research has disappeared from the social-scientific agenda. But with the change of the role and the appearance of power, social-scientific research on power also has changed its theoretical approach and conceptual labels. The more power is spread worldwide into “multiple overlapping and intersecting socio-spatial networks of power” (Michael Mann, 1986, p. 1), the more also power research is spread into multiple overlapping research areas. The question “Who has how much power over whom?”—which had dominated power research in the last decades of the 19th century—has been replaced by the questions: “Which intended and unintended effects does power have?” and “Which functions does power fulfill for the development of complex, interrelated supranational regimes?” The integration of nation-states into supranational systems can have the effect of neutralizing the power the nation-state has over its citizens. This is, for example, the case when the European Court of Justice intervenes in the domestic legal practices of its member states. The principle of "subsidiarity" can be understood as the member states' attempt to institutionalize counterpower against what Christopher Booker (1996, p. 203) polemically has coined the "new totalitarianism" of the European Union (EU). This principle is, however, overruled by the European Court of Justice. With the increasing importance of supranational systems, power research is confronted with the demanding task of analyzing two- and multiple-level power games (Andrew Moravcsik, 1996, p. 299). What is gained in terms of power on one level can be lost on the next level and vice versa. The possibility of binding allocation of power may get lost in multilevel power games. Moreover, the example of the history of the formation of the EU shows that successful bargaining power can produce unintended consequences and even paradoxes. In this sense, Fritz Scharpf has coined the concept of the "joint-decision trap": "What is missed is the possibility that authority might not be allocated, in zero-sum fashion, to either one or the other level of government, but it might be shared by both" (1996, p. 271). The institutional development of the EU is, according to Scharpf, blocked by joint-decision traps. Although Parsons did not develop his idea of power with relation to the empirical case of the institution building of the EU, his insights about the positive function of power can be applied to this example. If the institutional context fails to allocate power in a binding way, power cannot function as a mechanism to reduce action alternatives and to speed up the decision-making process.

The study of power on and between levels of complex political regimes makes it possible to liberate the notion of power from its negative normative bias, which characterized the debates in the 1970s. Power was mainly seen under the perspective of its threatening potential for democratic institutions. There is no doubt that power research under this critical perspective is necessary if social scientists desire to fulfill their task and to detect violations against the institutionalized norms and values of democratic rule. But it is equally important for social scientists to investigate the conditions under which binding power allocation fails and prevents the working and development of institution building.

One must recall Max Weber's realist definition of politics: "He who is active in politics strives for power either as a means in serving other aims, ideal or egoistic, or as 'power for power's sake,' that is, in 'order to enjoy the prestige-feeling that power gives'" (Hans Gerth & Charles Mills, 1948, p. 78). A realist approach to the study of power should take into consideration the multiple functionality of power for complex political regimes. This is especially urgent under the conditions of globalization. Curiously, the processes of globalization have seemed to suggest that economic and political power exists and manifests itself in significant ways and doses but that it cannot be precisely located and assessed. The truth of the matter is that the power of power consists also in being and remaining quite, if not substantially, elusive.

POWER AND INTERNATIONAL POLITICS

Different aims inform the study of power. Simplifying somewhat, power plays a role in two distinct, if related, domains. In the field of political theory as understood here, the purpose of analyses of power is to capture the nature of the polity in which questions of the organization of (organized) violence, the common good, and freedom are paramount. In these studies, power stands for "government" or "governance" and political "order," as well as personal "autonomy." The logic in the field of explanatory theories, on the other hand, is to think of power in terms of a theory of action first and a theory of domination subsequently. Here, power is central to the explanation of behavior and the outcomes of social action. It refers to "agency" and "influence," if not "cause," and to rule or domination. This entry considers various conceptions of power in international relations, including the realist, institutionalist, structuralist, and constructivist views, and discusses how they approach the nature of the polity and the explanatory use of the concept of power.

Classical realists argue that because there is no mechanism for controlling the competition among sovereign states, power is simply the possession of resources and their use to exercise control at the international level. For classical realist thinkers in international relations (IR), the particular context of world politics suggests that these domains could be fruitfully merged—if there is no governance at the international level, the first description of power as a political order can be merged with a theory of action. With no world government, the international system seems to lack not only an ordering authority but a polity altogether. In a sense, therefore, it is possible to think of world politics as the simple aggregation, and balance, of agent capacities to influence, such that no further theory was needed. In the explanatory domain, power then becomes a central variable in a double causal link. Power understood as resources or capabilities is an indicator of the strength of actors and, consequently, of the capacity to affect or control events. Likewise, a general capacity to control outcomes has been used as an indicator for the ruling of the international system. Rather than seeing the two domains as separate, the special nature of world politics could combine them in an explanatory sequence: By knowing *who can be expected to win conflicts*, we would also know *who or what governs international politics*, which, given the absence of a world polity, is all there is to know about power as order and government.

Power analyses in recent decades have challenged these tacitly assumed links and ultimately also the neglect of the concerns of political theory. Criticizing realism's "lump" concept of power (according to which all the elements of power can be combined so that the degree of a state's power can be measured by a single indicator), neo-institutionalism has tried to redefine the link between resources and outcomes. Similarly, with regard to the understanding of "rule" and "governance," different structural power approaches have demonstrated the need to conceive of more encompassing power concepts so as to capture important but otherwise neglected facets of international rule. Poststructuralist and constructivist approaches focus on power as authority and legitimacy, established not through an open social contract but in the habitual working of discourses and practices that disempower/empower agents. When aiming at an understanding of the world polity, they also refer back to the domain of political theory. But by starting from a historical reconceptualization of politics and order, they do this by stepping altogether outside an analysis in terms of these two tacitly assumed links.

The Concept of Power in Realist Theories

Although classical realism does make strong political assumptions about human nature and the role of power in politics, the two-step analysis of power mentioned above, which is driven by the explanatory domain, has become dominant. There, on the macrolevel, realist theory relies on the concept of the balance of power. This presupposes a common denominator for power in which all its aspects can be coherently aggregated. On the microlevel, realist theory relies on the idea that states are interested in relative gains in power. Each of these concepts presupposes that power is measurable. Indeed, such theories require a concept of power akin to the concept of money in economic theory. In this analogy, the striving for utility maximization expressed and measured in terms of money parallels the national interest (i.e., security) expressed in terms of (relative) power.

This central assumption has been challenged by early realist critiques and more recent institutionalist approaches. In an early argument that also anticipates and implicitly criticizes the economic analogy in neorealist theory, Raymond Aron opposed this aggregated concept of power and the underlying power–money analogy. The different degrees of the fungibility of money and power resources make this impossible. The term *fungibility* refers to the idea of a moveable good for which another good in the same class can be freely substituted. Fungible goods are universally applicable or convertible, in contrast to those that retain value only in a specific context. Whereas fungibility seems a plausible assumption in monetarized economies, it is not so in world politics; even apparently ultimate power resources such as weapons of mass destruction may not be of great help in getting another state to change its monetary policies.

Aron recognized that economic theory can be used to model behavior on the basis of a variety of conflicting preferences. But for him, with the advent of money as a general standard of value within which these competing preferences can be situated on the same scale, compared, and traded-off, economists were able to reduce the variety of preferences to one utility function. Because power in world politics lacks a real-world fungibility, it cannot play a corresponding role as a standard of value. Therefore, power cannot be the currency of world politics, and national security in terms of power is not equivalent to a utility function.

In response, realists insisted that diplomats had repeatedly been able to find a measure of power, and hence, the difference is just one of degree, not of kind. Yet even if actors can agree on some approximations for carrying out exchanges or establishing power rankings, this is a social convention that by definition can be challenged and exists only to the extent that it is agreed on. Power resources do not come with a standardized price tag.

With the link between resources and outcomes forgone, the realist chain of causes for understanding the international structure is broken, for a single international power structure relies either on the assumption of a single dominant issue area or on a high fungibility of power resources—neither of which are realistic.

Neo-Institutionalism: Redefining the Link Between Resources and Outcomes

When the United States lost the war in Vietnam, some scholars tried to explain this power paradox away by identifying the lack of "will" on the part of the United States to use its resources—that is, so-called conversion failures. According to such an explanation, the war did not indicate the relative weakness of the United States (in spite of its military capabilities) but simply its inability to use its strength. Obviously, such an explanation can reinterpret any outcome *ex post* to suit any power distribution. Often, the trouble with this type of power analysis is not that it is wrong but that it cannot go wrong. Neo-institutionalist analysis offers two responses.

One conceptual way out consisted in accepting the apparent lesson of the Vietnam War. Consequently, control over resources, even issue area–specific ones, does not necessarily translate into control over outcomes. Power no longer functions as a determining cause. In Robert Keohane's analysis, for instance, determinacy in the explanation shifts from interests defined in terms of the distribution of power to rational choice made on the basis of given interests defined in terms of power, expectations, values, and conventions. Hence, only predictions of a very limited kind are possible, with a secondary role for power.

Another solution to the paradox of unrealized power has been proposed by David Baldwin, who has taken the issue of power fungibility most seriously. His approach keeps a strong causal role for power by further specifying the relational and situational context that defines which policy instruments can count as actual power resources in the first place. Baldwin's conception is shaped by his relational understanding of power. If power is about the capacity to get someone else to do what he or she would not have otherwise done, then threatening a suicide candidate with a gun implies that the person holding the gun has no power. In other words, power resources have no intrinsic value or effect but depend on the actual value systems of human beings in their relations with each other.

Hence, the major difference from utilitarian action theories is that personal value systems cannot be simply assumed in the empirical power analysis. Instead, the researcher has first to analyze the value systems of the interacting parties in order to establish whether there are any power resources in the first place. For this reason, Baldwin insists that one can only study power if understood as a causal variable in well-circumscribed policy contingency frameworks. Any assessment of power independent of such situational factors is erroneous, and any generalization beyond such cases is contingent and has to be established separately.

The price for this, however, is that power analysis must potentially be very narrowly confined to particular instances, where no prediction is possible. Whereas Keohane's institutionalist move retained, in a limited way, the predictive capacity of a theory based on rational choice and not on power, Baldwin's move saves a central causal role for power at the price of predictability in IR/IPE (international political economy). Keohane's solution points to the direction of a rationalist neo-institutionalism and Baldwin's to a less generalizable, contingent, and situational solution to historical institutionalism.

Structural Power in the Global Political Economy

With the link between resources and control weakened, the micro–macro link between control over outcomes and international rule might not be worthwhile studying at all. Yet this is where international political economy (and constructivism and poststructuralism; see below) have made their most important contributions to the analyses of power. In fact, concepts of structural power redefine the context within which strategic interaction takes place, the resources considered important for assessing capabilities in the first place, and the outcomes that should be included in power analysis. Their common claim is that the *sole* reference to the first link, as made by neo-institutionalists, is insufficient, if not biased, for understanding rule in the international system. It is the second link, between outcomes and rule, that becomes the starting point in analyses of power.

A first version of structural power might be called *indirect institutional power*. This refers to the conscious manipulation of the institutional setting within which bargaining relations take place. Many important issues are decided before they reach the bargaining stage—indeed, often because they never reach it. For understanding the distribution of power, it is as important to see who prevails in decision making as it is to analyze which "nondecisions" were made. Despite occasional claims to the contrary, this version is perfectly compatible with neo-institutionalist approaches.

Structural power has also been conceptualized as *nonintentional power*. Susan Strange's concept of structural power stresses both the diffusion of the origins of power (and the variety of power resources) and the diffusion of its effects. Here, there is no reason to exclude from power analysis all those crucial effects that might not have been intended. As an old Chinese saying has it, it makes little difference to the trampled grass beneath whether the elephants above it are making love or war. This analytical shift from intentions to effects diminishes the importance of the neo-institutionalist approach for understanding power based on resources, interests, and rationality. It focuses on the systematic and structural aspects of power, not on the chosen ones.

Third and finally, structural power can also be understood as *systematic bias* or *impersonal power*. This refers to an impersonal "mobilization of bias" whereby social structures systematically favor certain agents. Such an understanding of power is common currency in both Marxist and non-Marxist writing on dependency, as well as in neo-Gramscian approaches; it also applies to constructivist and poststructuralist approaches that emphasize nonmaterialist structural biases (see below). Such a conceptualization has been criticized for deducing power from rewards, the so-called benefit fallacy of power. We usually do not consider a free rider powerful because the free rider typically has no control over the systematic arrangement that makes free riding possible. But the benefit fallacy exists only within a causal framework. To say that a system systematically benefits certain people does not mean that they have created that benefit or that they control it. It simply means that to understand power in a social system, we need to take into account the links between rules and outcomes that systematically benefit some actor.

Structural power analysis in international political economy tries to overcome the difficulty of conceiving power along the resource–outcome–rule line by starting from the other end. These approaches run into two types of problem, however. First, they tend to overplay the causal strength of their analysis. Moving backward from rule to outcomes faces similar problems to moving from resources to outcomes. "The United States won because of its structural power" faces the same translation or conversion questions as classical resource-based analysis. It often appears to offer an answer when in reality it begs the question. The second risk is related to this. IPE approaches tend to understate the nonmaterialist aspects of rule or governance, particularly values and beliefs, and, indeed, the extent to which structures affect events only though the meaning given to them.

Rule in World Politics: The Social Construction of Legitimacy and Order

Still staying with IR's emphasis on the explanatory domain of power analysis, constructivism redefines power at the systemic and agent levels in IR. Its systemic analysis of power often looks at the origins of consent in terms of practices of tacit legitimacy. It is therefore close to power concepts of the family of "authority." But rather than looking at formal or institutional authority, constructivism is interested in the intersubjective *practices* of power—not in the position of authority, therefore, but rather in what "authorizes," "legitimates," or "empowers" it. Moreover, it is not necessarily looking at intentional or agent power but at the impersonal effects of discourses and/or habits for the production and reproduction of order, particularly in cases where practices go without saying, appear natural, and are therefore, perhaps, the most effective power relations there are.

At the actor level, such a view implies an emphasis on the process of interest formation as a primary locus for power relations. For constructivists, interests cannot be understood outside their intersubjective contexts in terms of shared constitutive norms, of shared knowledge and understandings, and also through the effects that practices have on self-understandings or identity. For constructivists, what we want follows from who we are (or want to be).

One larger power research agenda therefore concerns the background knowledge or constitutive "rules of the game" that mobilize certain biases and define the competent players and their effective moves. Naturalized understandings evoke certain actions and empower certain agents. Understanding an event as analogous to "Munich" mobilizes a collective memory that authorizes some actions and undermines the legitimacy of others. Whether or not the end of the Cold War has ushered in a "clash of civilizations," such an understanding mobilizes and is empowered by preexisting Cold War scripts in which totalitarianism has been replaced by fundamentalism in security discourse. It gives it the potential to become a self-fulfilling prophecy. Just when the security sector started to be demilitarized, the increased use of private military companies such as Executive Outcomes gave them "epistemic power" because their practices shape the understanding of security and the self-understanding of its actors. These practices have the effect of authorizing an increasingly technical and military understanding of the field while being, in turn, authorized through them.

With regard to their focus on identity, constructivist scholars have looked not only at the impersonal effect of discourses and/or practices on self-understandings but also on the "power politics of identity." If identity is crucial for interest formation, then it is only a small step to analyzing how diplomatic practices, sometimes intended, can be used for blackmailing actors by profiting from the contradictions in the actor's self-representations.

As a result, some constructivist research agendas converge with Foucauldian approaches in their understandings of order as diffused practices of rule rather than as clear and/or formal hierarchies. Such convergences can be seen, for instance, in the analysis of how international standards, which are often established by private actors, are practices of rule once they become accepted convention and interact with the actors and issues they were supposedly only neutrally measuring (e.g., credit rating).

But at the same time, such analyses link power in explanatory theory back to political theory or, particularly in the post-Foucauldian vein, actually put the latter first. The understanding of power is not primarily about cause and effect, or influence and outcomes. Instead, it embeds power in a historical analysis of the changing nature of the modern and liberal order, which, so the thesis goes, increasingly works by making the subjects of order active subjects of their own ordering. Ole Jakob Sending and Iver Neumann, for instance, analyze the role of nonstate actors in this vein, understanding them not so much as civil society in opposition to the political power of states but as part and parcel of a decentralized and self-disciplining logic of a global order (i.e., governmentality).

The Politics of Power Analysis

Even if careful scholarly discussion can discard some conceptualizations of power, there is no one root concept that we can unravel simply by digging deeper, neither in the domain of political theory nor in explanatory theory. Power concepts derive their meanings from the theories in which they are embedded, and there they meet the metatheoretical or normative divides that plague and enrich our theorizing. At the same time, the debate has come full circle. Initially, realist writings combined the domains of political theory, centered on the understanding of order in the polity, with the domain of explanatory theory by assuming that in the absence of a genuine world polity the analysis of capabilities and influence was all there could be. By attacking the double link between agent influence and the balance of power, later studies redefined a more or less causal role for power, be it at the agent or the structural level. Hence, they stressed the explanatory domain of power at the expense of the political theory of power. But this can work only so far, since the two domains intrude into each other; structural power is necessary to understand not only outcomes but also autonomy in a polity; inversely, the analysis of the changing nature of global governance and order provides the background against which the very processes of power can be understood in the first place. So, to close the circle with the poststructuralist and constructivist turn, the analysis of power returns again to show the links between the two domains. But contrary to early realism, it does so by assuming the existence of a genuine world polity within which power has to be understood. Yet so far it cannot pretend to have a theory of power capable of combining the two domains.

Finally, power analysis is not only tied to the understanding of politics; it is itself political. The reason is that concepts such as power have a special status in our political discourse. They are used for a variety of purposes. For power, two are particularly important. Power is used in practical contexts in which we are interested in what we can do to others and what others can do to us. It is also important in moral and legal contexts where it functions as an indicator of effective responsibility: If actors could not have done an act (if they did not have the capacity to do so), they cannot be found guilty of it. The first indicates the realm of action: Power becomes an indicator of politics as the "art of the possible." The second assesses possible blame. Since power is often conceived of as a counterfactual—that is, about things that could have been otherwise—invoking power is to call for a justification of why things were done the way they were. As a result, choosing concepts of power that are relatively narrow diminishes the realm where "something can be done" and in which action needs to be justified; unintended effects, for instance, are handled as regretful but unavoidable collateral damage. Inversely, wider concepts of power suggest realms for action even where there may be none. The fundamental point for such a *performative* analysis of power—not what it means but what it does—is that invoking the presence of power *politicizes* issues.

This also explains a curious paradox. Scholars and practitioners often engage in debates about where power "really" lies, for example, whether it is hard or soft. By doing this, they must appeal to an underlying idea that we can know this in a somewhat objective manner. If power were measurable, however, such debates would be quite pointless. Precisely because power is not as fungible as money and its understanding is to some extent conventional, observers try to shape the common understanding and fix the meaning of what power is and where the power really lies: For such understandings have authoritative effects on national security and foreign policy doctrines when used to define the national interest, as well as on actual political rank and standing when an actor's main potential power resource comes to be considered insignificant.

PREDICTION AND FORECASTING

Political forecasting and prediction refers to any effort to anticipate events that will occur at a future point in time, usually with the intention of determining actions that will either exploit or mitigate the effects of those events. Forecasting is implicit in almost all political decision making, but the techniques vary widely in their level of explicitness, ranging from simple intuition to detailed historical analogies to elaborate statistical models. This entry discusses the sources of regularity in political behavior; conditional and unconditional forecasts; the concepts of forecast horizons, windows, and specificity; modes of traditional (nontechnical) forecasting; and simulation and statistical approaches to technical forecasting.

Evidence for the importance of forecasting to political elites can be found in some of the earliest available records of organized human behavior, such the biblical story of Joseph interpreting the dreams of an Egyptian Pharaoh found in Genesis 41. A wide variety of divination methods—for example, augury, astrology, dream interpretation, and consultation with oracles—were nearly universal across cultures in premodern times, and practitioners in these fields often enjoyed high official status. These supernatural techniques were gradually supplemented with the use of historical analogies and collections of aphorisms or “wisdom literature,” but prediction techniques remained nontechnical until relatively recently.

The prospect of systematic forecasting of political behavior became attractive following the development of highly accurate forecasting models of physical phenomena, particularly the example of Isaac Newton’s laws of motion in the 17th century, and the next 2 centuries saw the production of a number of works on “laws” of political and economic behavior that were effectively forecasting models. However, the systematic development of reasonably accurate numerical forecasts did not occur until the development of modern statistics in the early 20th century. With the increase in communication and computing power, accurate technical forecasts in some domains, most conspicuously election outcomes, were common by the late 20th century, and the methods are now being extended to other types of behavior, notably forecasts of political instability.

Forecasting in Political Decision Making

Forecasting is ubiquitous in political decision making for the simple reason that to decide between multiple courses of action, a decision maker must have some sense of the likely outcome of each option. These outcomes are rarely deterministic—that is, entirely determined at the time the choice is made—and predictions are further complicated by the fact that many political decisions occur in a context where actors are working to achieve opposing objectives (a topic explored in detail in game theory). Political forecasting may be dispersed throughout an organization, with every agent responsible for assessing the likely consequences of policy choices, or there may be specialists in forecasting, for example, intelligence agencies projecting the future behavior of other states or the emerging commercial field of political risk analysis, which assesses the possible economic impacts of political changes (e.g., whether a country will default on a loan).

Because humans exhibit free will and are capable of a wide range of behaviors, human behavior (political or otherwise) will always remain less predictable than the behavior of a closed physical system such as an object travelling through the vacuum of space, which can be predicted to a high level of accuracy decades in advance. However, political behavior tends to be constrained in ways that makes it considerably more predictable than, for example, deciding what a randomly chosen household will be having for dinner.

Three factors are particularly important in establishing predictability. First, most political activity is strongly constrained by material circumstances. For example, an unemployed plumber deciding to run for mayor has a considerably different set of options than does a billionaire running a third mayoral campaign. Second, political forecasts frequently deal with mass behaviors, and these have a substantially lower probability of changing rapidly than does the behavior of a single individual: If a candidate is leading by 20% in the polls, the probability of a set of individual decisions (or polling errors) that would cause a loss is considerably less than if they are leading by 0.5%. Likewise, the likelihood that a critical mass of individuals will decide to rise in rebellion against a democratically elected government with a stable economy is considerably less than the probability of rebellion against an aging ruler in the midst of an economic crisis. Finally, many political institutions that are stable over long periods of time—notably bureaucracies and legal systems—are explicitly designed to produce predictable behavior: A set of given inputs to the organization is expected to produce a consistent outcome.

Unconditional and Conditional Forecasts

Forecasts can be divided into "unconditional" and "conditional" forecasts. An unconditional forecast is one that assumes nothing important in the information used to make the forecast will change. The nature of that information may or may not be explicitly specified in nontechnical forecasts; it is usually explicit in the variables and equations found in technical forecasts. A conditional forecast, in contrast, assumes that certain things will change: The most common use of conditional forecasts is for what-if analyses of the possible changes projected to occur if a specific policy is adopted. For example, a model might attempt to predict the change in unemployment in a city if the city does or does not receive funding for a job training program.

The accuracy of conditional forecasts is closely linked to the issue of causality. The high degree of accuracy of Newton's laws of motion is due to the fact that within a known set of boundary conditions (e.g., Newton's equations break down for an object travelling near the speed of light), they completely specify behavior. In contrast, forecasts of political behavior usually have a much higher level of uncertainty than that found in *simple* physical systems, though not necessarily less than the uncertainty of *complex* physical systems; for example, many political forecasts are considerably more accurate than weather predictions at comparable time horizons.

Three key factors affect this accuracy. The first is the well-known observation that correlation does not imply causation: The fact that two variables covary does not mean that one necessarily causes the other. If both are caused by a third variable, the correlation may be very useful for prediction—that is, the existence of the correlation supplies information that increases forecast accuracy—but unless there is a true causal linkage, changing one of the variables will not change the other. For example, for a number of years the linkage between cigarette smoking and lung cancer was dismissed as simply correlation; both were assumed to be linked to other lifestyle issues (e.g., individuals working in polluted industrial environments were more likely to be smokers), and only after extensive research isolated smoking as a near-certain causal factor were changes made in public policy.

A second issue is the degree to which the projected change is within the range of prior experience with the system. A forecast for the effects of increasing the funding of a job training program in a city that has previously had a series of such programs at a variety of levels of funding is more likely to be accurate than the forecast for a city where no job training programs had ever been tried.

A third source of error is the possibility that the human object of the prediction will change its behavior to either reinforce or negate the prediction, a possibility not occurring in physical systems. Such situations are generally known as "self-fulfilling" and "self-negating" predictions. Consider the case where an intelligence agency makes a widely publicized prediction that the government in a country is likely to fail. If, as a consequence, allies of the government withhold aid and rebel groups inside the country are emboldened and increase their activity, the government may fail in part because of the prediction itself: a self-fulfilling prediction. This makes the prediction conditionally accurate, but not unconditionally accurate, since in the absence of the prediction itself, the government might have survived. Conversely, in response to the prediction, the threatened government might change its policies and, as a consequence, not fail: a self-negating prediction. In this case, the prediction appears incorrect, even though unconditionally it may have been correct.

The possibility of predictions influencing outcomes is particularly critical in election forecasting, where predictions can have the effect of suppressing or increasing turnout, increasing the amount of campaign contributions to the projected winner, or decreasing the vote for candidates who are likely to lose. As a consequence, many democracies prohibit the publication of polling results during some period prior to an election or on polling day. Similarly, intelligence projections of possible instability in other states, particularly allies, are often considered politically sensitive and thus classified.

Forecast Horizons, Windows, and Specificity

All forecasts—either implicitly or explicitly—have three characteristics: a horizon (how far ahead in time the forecast is being made), a window (the period of time for when the forecasted event will occur), and specificity (the extent to which an exact prediction is made). In general, the accuracy of forecasts will decline with longer forecast horizons because insufficient information is available on the effects of current variables on the future, and unanticipated events may occur to substantially change the projected outcome. For example, the accuracy (and specificity) of an election forecast typically will be lower 6 months prior to the election than the day before the election, and even a short-term forecast could become irrelevant if the projected winner dies before the election. Many statistical forecasting models provide explicit estimates of this uncertainty.

For some forecasting problems—notably elections—the time horizon is simply determined by the known date of a future event. In some other domains—for example, policies affecting long-term public health or the environment—the horizon may be on the order of decades. However, the typical policy-relevant time horizon is on the order of 6 months to 5 years: Shorter times are irrelevant because a policy will not have had time to be implemented and take effect, and longer times tend both to accumulate uncertainties and may be beyond the professional interests of those concerned with the forecast (e.g., elected officials).

The forecast window is only relevant in situations where there is uncertainty as to when an event might occur. Predicting the term of office for a prime minister in a parliamentary system, predicting whether a government will be overthrown in a revolution, or predicting when a country will suffer a major currency crisis would be examples. In some cases, a change is inevitable—no prime minister is immortal—and in others, the projected event may never occur.

Finally, predictions differ widely in their specificity. The predictions of oracles and astrologers were notorious for their lack of specificity: The classical Greek historian Herodotus reports the Delphic Oracle advising the Lydian king Croesus that if he attacked the Persians, "a great empire will be destroyed." On this advice, Croesus attacked, but the Persians destroyed *his* empire: The oracle showed good accuracy, but from the perspective of Croesus, the advice was less than optimal in terms of specificity.

Beyond this extreme, many nontechnical forecasts are relatively vague as to exactly what has been predicted, because of the informality of the techniques and the use of natural language in reporting the predictions. Technical forecasts, in contrast, are usually much more precise, with complete probability distributions across a range of possible outcomes, whether a numerical range such as forecasting the percentage of votes for a candidate or the range of probabilities across a fixed set of categorical outcomes, such as whether or not a government will remain in power. This precision does not necessarily translate into accuracy but at least allows competing technical forecasts to be unambiguously compared and, after the time of the forecast horizon, their accuracy to be calculated.

Nontechnical Forecasting

Nontechnical forecasting predominantly takes three forms: (1) intuition, (2) the use of rules of thumb or aphorisms, and (3) the use of narrative archetypes and historical analogies. Intuition is the use of subcognitive mental processing—the brain is engaged in a great deal of work, typically pattern recognition, but this occurs in a manner that the thinker is not consciously aware of (much as an uneducated native speaker of a language will have perfectly mastered the complex grammar of the language but cannot systematically articulate its rules). A typical explanation for an intuitive forecast is "I have a feeling . . ." or "I know it when I see it." While social pattern recognition in humans and other primates is highly developed and hence frequently accurate, the disadvantage of the intuitive forecast is that it is dependent on the skill and experience of the individual making the forecast, and only the forecast itself, not the process of determining the forecast, can be shared and evaluated. To the extent that they were successful in making unambiguous forecasts, oracles, astrologers, dream interpreters, and other premodern forecasters were probably good at intuitive methods.

Aphorisms and rules of thumb are a form of succinct and very general if–then models that link specific observable situations with outcomes and summarize frequently observed regularities; all cultures have a large number of these for dealing with common social situations. Unlike intuition, aphorisms are explicit, though the evidence backing them is usually not. The disadvantage of aphorisms is that multiple aphorisms frequently contradict each other—for example, the common English-language aphorisms "Birds of a feather flock together" and "Opposites attract"—and aphorisms are often vague in both their antecedents and their consequents.

Narrative archetypes and historical analogies are the most sophisticated of the nontechnical forecasting methods and are very commonly (if often implicitly) found in policy analysis and political rhetoric. In both approaches, a set of observed events and circumstances is matched to a set of events and circumstances in a series of idealized narratives or historical cases, and a prediction is made on the basis of the outcome that occurred in the best matching case. Historical analogies use situations that actually occurred in the past (perhaps with adjustments for technological and cultural changes); with an archetypical narrative, the comparison is with a hypothetical event that has the general characteristics of a large number of historical cases (e.g., "peasant revolt," "populist electoral campaign") or a counterfactual that seems plausible but has never actually occurred ("crisis leading to a nuclear missile exchange").

Nontechnical forecasting is widespread and prior to the availability of statistical methodologies and computers was virtually the only form of forecasting used in political analysis. Systematic research has shown, however, that it is not particularly accurate: Many "experts" do barely better than chance on difficult forecasting problems, and the expert's self-confidence and public reputation is sometimes negatively correlated with their accuracy. These failings have long been recognized, and a wide variety of methods have been suggested for improving the accuracy of nontechnical forecasts, particularly by gaining improved accuracy through aggregation of the forecasts of multiple experts. Among the better known of these are the Delphi method, devil's advocate, brainstorming methods, and, recently, prediction markets.

Simulation

Simulation is a method of forecasting that bridges the nontechnical and technical approaches. In the earliest versions, pioneered by the war games of the Prussian military in the 18th and 19th centuries, individuals play the roles of various actors, constrained by an oftentimes elaborate set of rules. These "games" can be as simple as those played on a table or as elaborate as extended field exercises involving real persons and equipment. The method is still widely used, although now it usually combines training and experimentation with specific tactics rather than being used for strategic forecasting.

From the 1960s forward, computer simulations have been used: The two most common methods are (1) systems dynamics, where equations are specified for the aggregate behavior of key variables in the system, and (2) agent-based models, where equations or algorithms are specified for the behavior of simulated individual actors in the model, and the behavior of the system as a whole is derived by simulating a large number of these. Both forms of simulation usually involve multiple runs with different values for random variables so that a full probability distribution of the predicted outcomes can be obtained. The advantage of simulation is that systems of almost unlimited complexity can be specified and evaluated; the disadvantage is that determining the appropriate values of the parameters of the equations is very difficult, and in some simulations those results are largely determined by a small set of key parameters.

An important type of sensitivity that affects dynamic simulations containing nonlinear interactions is the effect of chaos theory, where the predictions of a model can be highly sensitive to values of critical parameters and to the initial values of some variables. In such models, some combinations of parameter values and initial conditions can differ by arbitrarily small numerical amounts—differences far more precise than could ever be estimated from actual data—and yet produce widely divergent outcomes. Even chaotic systems, however, may provide some level of predictability—these usually exhibit multiple "basins of attraction" where the system is likely to find a long-term equilibrium—and systems that are chaotic for some parameter values can be well behaved and predictable for other values.

A comparable problem can be found in agent-based models when the simulated agents continually adapt their behaviors to the strategies of other actors, and consequently patterns of behavior found in one period of time may be completely different from those found in another because of the different strategies being used. This phenomenon has been observed empirically in stock market trading strategies and in military strategies—a new technique that is highly successful when first introduced will become less effective over time as other actors adapt to it. In evolutionary biology, this is known as the Red Queen hypothesis—named after the eponymous figure in Lewis Carroll's fantasy *Through the Looking Glass*—whereby organisms continually have to adapt their strategies to maintain the same level of fitness vis-à-vis their competitors. Such systems may be predictable in the short term—some adaptations are more likely to be successful than others—but the nature of the regularity can change substantially at longer horizons.

Statistical Forecasting

By far the most common form of technical forecasting involves the use of statistical models. Models used in political forecasting were originally borrowed from basic mathematical statistics and then adopted from economics, and now increasing use is made of models originally developed for the prediction of medical outcomes, as well as some models developed specifically for political and policy analysis. A wide variety of statistical methods are now in use, and many can be estimated using standard statistical packages, though some require specialized time-series analysis software. Among the more commonly used methods are

- autoregressive time series, which predict future values of a variable based on a linear combination of past values—common approaches include autoregressive moving average (ARMA) and autoregressive integrated moving average (ARIMA) models;
- autoregressive conditional heteroskedasticity (ARCH) models, which predict the future *variance* of an indicator rather than specific values—these are useful in predicting future uncertainty;
- event history or survival models, which predict the probability of a specific event as a function of time—variables are assessed on the degree to which they are risk factors that raise or lower these probabilities;
- vector autoregression (VAR), which predicts the response to specific numerical shocks to the system; and
- cross-sectional time series, which takes into account variation both across time and within groups of cases.

The advantage of statistical models is that they are completely transparent in their specifications, they are replicable, and they are grounded in a formal theory of statistics and probability. Statistical models also provide forecasts with a high level of detail—for example, probabilities of a specific numerical or categorical outcome at a specific point in time. The disadvantage is that they may require a great deal of data (which may vary in quality and availability) to be accurately estimated and they are completely dependent on the appropriate specification of both the mathematical form of the model and the variables used as input to the forecast.

Three other issues are relevant to statistical time-series models. First, the accuracy of a model on the data used to estimate the model—the in-sample accuracy—is usually higher than the accuracy on new data—the out-of-sample accuracy.

Furthermore, raising the in-sample accuracy to account for all of the idiosyncratic data points—fitting the error—will usually decrease out-of-sample accuracy. Consequently, the development of robust statistical models may require a great deal of experimentation, and determining the "best" model for forecasting the out-of-sample future requires elements of art as well as science.

Second, many political variables are strongly autoregressive—their values change little (or change very predictably) from time point to time point. This means that the models are very accurate, but departures from the autoregressive pattern—for example, a sudden swing in public opinion or unemployment—are difficult to predict. Such changes, however, are likely to be of greatest interest to analysts. Granger causality analysis, for example, looks at the effects of variables only after the autoregressive factors have been taken into consideration.

Finally, in some domains, particularly those involving major political or economic crises, the number of observations of the event of interest is very small—this is referred to as a rare-events estimation problem—and it is difficult for a statistical model to extract sufficient information to predict such occurrences. Because of the importance of rare events, this is an active research area and mathematical methods can be modified to at least partially adjust for this, but the problem is not fully solved.

PREEMPTIVE WAR

The concept of preemptive war refers to a legitimate anticipatory war waged by a state in order to counter a threat emanating from an adversary. Like many other notions used as much by politicians as by scholars, preemptive war is an essentially contested concept, all the more so as it cannot easily be dissociated from the concept of preventive war.

The idea of a legitimate anticipatory war goes back to the founders of the modern just-war tradition in the 17th and 18th centuries. Writing about the lawfulness of wars, Hugo Grotius and Emer De Vattel claimed that natural law as well as the law of nations permitted states to repel force by force in order to defend themselves against danger. They acknowledged two types of danger: First, a state is in danger once it has been attacked, and in this case resorting to arms is legitimate for the sake of self-defense; second, a state is in danger when an attack against it is imminent, and in this case resorting to arms is legitimate to forestall the intended attack. The criteria put forward by Grotius and De Vattel introduced a breach in the then prevailing Hobbesian conception of international politics—considering any war to be justified per se and postulating that a danger, and an ensuing right to prevent such a danger, existed as soon as there was a real or a perceived increase of another state's power capacities. During the so-called Caroline incident opposing the United States and the British empire at the Canadian border in 1837, the criteria put forward by Grotius and De Vattel were revisited by U.S. Secretary of State Daniel Webster; according to Webster, an anticipatory war could be considered to be legitimate on the condition that it was undertaken as a necessity of self-defense, instant, overwhelming, and leaving no choice of means and no time for deliberation.

From that time on, it has been generally acknowledged that a distinction must be made between legitimate anticipatory wars, called preemptive wars, and illegitimate wars, called preventive wars. Although both relate to the same better-now-than-later logic and designate an anticipatory and winnable war waged by a state eager to forestall a threat at time t in order not to have to wage a riskier war under less favorable circumstances at times $t + 1, t + 2, \ldots, t + n$, the material dissimilarity of the threat concerned induces a normative difference between them.

Concerning the material dimension, the first difference lies in the temporality of the threat countered by an anticipatory war; a preemptive war is undertaken to confront a threat perceived to be imminent, whereas a preventive war aims at forestalling a threat likely to become effective only after a certain period of time. In other words, a preemptive action is a tactical riposte to a short-term threat, while a preventive action is a strategic reply to a long-range threat, such as a future imbalance of forces. The second material difference, complementary to the first one, relates to the source of the threat. In a preemptive war, State A faces an irresistible threat: It attacks at the point in time t when an adversary, State B, is about to mobilize actual military capacities against A, whereas a preventive war launched by State A seeks at time t to impede State B from building up military capacities that might be mobilized against A at times $t + 1, t + 2, \ldots, t + n$. In other words, a preemptive war aims at countering a real threat, whereas a preventive war strives to forestall a hypothetical threat.

A normative opposition ensues from these material differences. In the legalist paradigm underpinning the United Nations (UN) Charter, resort to war is permitted only under two narrow conditions. The first is the traditional—both individual and collective—self-defense principle according to which a country that is attacked has the right to defend itself in a defensive war in order to repel its attacker and to secure its security and survival, either alone or with the help of other states joining in such a defensive war to guarantee the respect of the prevailing norms of appropriate international conduct. The second type of legitimate resort to arms refers to preemptive war, considered to be the only kind of legitimate anticipatory war precisely because it is a war launched in response to a threat that is at once overwhelming and so imminent as to allow no time for deliberation and no choice of means. Conversely then, resorting to preventive war is viewed as illegitimate, as was made clear by the diverging reactions in the world to Israel's air strikes against Iraq's Osirak nuclear plant in June 1981 and against Egyptian and Syrian military airports in June 1967. The 1967 attack was considered to be a legitimate preemptive strike, because the Israeli government knew with certainty that the Egyptian and Syrian military air forces were about to bomb Israel's territory: Tel Aviv could not afford to rely on diplomatic negotiations; the only option at its disposal was to destroy its enemies' bombers on the ground before they could take off. The situation was totally different on June 19, 1981, when the Security Council of the United Nations in its Resolution 487 condemned the military attack by Israel in clear violation of the norms of international conduct. Though Iraq was allegedly building a nuclear facility that might one day be used to produce nuclear weapons likely to threaten Israel's security, such a threat was neither imminent nor overwhelming at the time the Israeli government decided to launch its bombing campaign.

This consensus was broken on the occasion of the decision by the United States and some of its allies to go to war against Iraq in 2003. In September 2002, the National Security Strategy of the United States claimed that the United States has long maintained the option of preemptive actions to counter a sufficient threat to its national security; it also announced its intention to act preemptively in order to forestall hostile acts by its enemies. In March 2003, the United States undertook such an action, launching Operation Iraqi Freedom, which it justified as a preemptive war, given that the only course of action against terrorists was to defeat them abroad before they attacked America at home. The vast majority of scholars reacting to the military action against Saddam

Hussein's regime, however, refused to label Operation Iraqi Freedom as a preemptive war. In September 2002, Michael Walzer wrote that a possible war undertaken by the United States against Baghdad would be a preventive rather than a preemptive war. Commenting on the war in 2008, Michael Doyle asserted that the so-called Bush Doctrine of preemption actually was a doctrine of prevention.

In light of the values shared by the members of contemporary international society, there is little doubt, among the majority of scholars as well as international observers, that Operation Iraqi Freedom did not match the criteria of a preemptive war. On the one hand, the United States faced no instant or overwhelming threat emanating from Iraq, neither against itself nor against its regional allies. On the other hand, it could have chosen other means to cope with Iraq's revisionist behavior, such as a vigilant containment strategy. After all, inspections by agents of the International Atomic Energy Agency (IAEA) were taking place on the Iraqi territory to find a pacific solution to the problem of the possible weapons of destruction possessed by Baghdad, and the pursuit of diplomatic negotiations within the legal UN framework was favored by many states, including the allies of the United States. The Bush administration, while eliding the differences between preemption and prevention, did not ignore the criteria defining a legitimate anticipatory war, all the more so as Jeane Kirkpatrick, its UN ambassador during the Osirak crisis, had voted for the resolution condemning Israel's air strike and as in 1986 the International Court of Justice had refused to consider that the United States had acted in collective self-defense of El Salvador when it had used force against Nicaragua, accused of providing weapons to Salvadoran rebels. Actually, the United States consciously proposed a new conception of preemption, based on the idea of the necessary adaptation of the concept of imminent threat to the objectives and capacities of unpredictable rogue states and terrorist networks likely to target civilian populations and to use weapons of mass destruction rather than to resort to those conventional means enumerated in the traditional preemption doctrine, that is, visible mobilizations of armies, navies, or air forces.

Beyond the Iraqi Freedom case, what is at stake today in the preemption versus prevention debate is the potential emergence of new norms of state conduct. Such an evolution would not merely be tantamount to a departure from the prevailing just war tradition because of the weakening of moral restraints. It would also break with those *realpolitical* considerations that in the past led policymakers such as Otto von Bismarck to equate preventive war with suicide from fear of death and to reject it as a rational means of foreign policy given that it is impossible to know things beforehand. If indeed the Bush Doctrine were adopted universally, it would probably permit any state to resort to arms by invoking its own definition of imminent threats. International instability would be the logical result of a universal diffusion of Bush's unilateral way of foreign policy making.

This said, international norms are not laid down once and for all; their meaning is fixed by usage. While ultimately reflecting power distribution, they are what states, and actors shaping states' behavior, make of them. Many researchers believe that international adoption of a new doctrine of legitimate anticipatory war will require that such a doctrine be revisited and accepted within the United States.

PRESIDENTIALISM

Presidentialism is one of the three major organizational models for government institutions in contemporary representative democracies. This entry discusses its conceptualization, reviews its origins and diffusion, summarizes its different varieties, provides an outline of the debates about its advantages and disadvantages, and evaluates its current relationship with democracy.

Definition

Presidentialism can be defined by the simultaneous presence of three characteristics. The first is the existence of two agents of the electorate: a chief of government—known as president—and a legislative assembly—usually known as congress—both of which are elected separately and by popular vote. The second characteristic is that both the president and members of congress are elected for preestablished fixed terms, which means that each agent's survival does not depend on the other's confidence. The president cannot be removed by a legislative vote of no confidence on political grounds. While the president can be removed through impeachment proceedings, impeachment is intended as an exceptional response to illegal or improper presidential behavior, and it requires the support of a qualified congressional majority. Likewise, the president cannot dissolve the legislative assembly and call for parliamentary elections at his or her discretion.

The third characteristic of presidentialism is the blending of the roles of head of government and chief of state in the same institution, the presidency. As the head of government, the president has authority over the overall direction of government, appoints cabinet ministers and the upper echelons of public bureaucracy, may influence the legislative process through the introduction of bills, and has veto and decree powers. As head of state, the president is also the symbolic representation of the state, signs international treaties, commands the armed forces, and has the authority to grant pardons.

Under parliamentarism and semipresidentialism, the chief of government is not directly elected and does not serve a fixed term. Rather, the chief of government is chosen by a legislative majority and remains in power subject to maintaining the confidence of such a majority. In addition, in these two systems the government can dissolve (or ask to dissolve) the parliament and call for legislative elections before the legislative term ends. The combination of these mechanisms functionally provides that the party or coalition that enjoys a parliamentary majority is also the one in charge of government. In contrast, under presidentialism, situations of "divided government" can exist, in which the party (or coalition) of the chief of government—the president—does not enjoy a majority in congress. Under divided government, cooperation between the executive and the legislative majority is crucial to avoid deadlock and stalemate.

In addition, both parliamentarism and semipresidentialism are dual-executive systems. Under both arrangements, the prerogatives of the executive are divided between a chief of government (usually called a prime minister) and a chief of state (a monarch or a president with limited and/or symbolic powers under parliamentarism and a president with extensive powers under semipresidentialism).

Origins and Diffusion of Presidentialism

Presidentialism's origins can be traced to the constitutional convention that took place in Philadelphia and produced the U.S. Constitution of 1787. The main theoretical underpinnings, motives, and aspirations of the constitution were expressed by the writings of Alexander Hamilton, James Madison, and John Jay, published as *The Federalist Papers*.

The most important elements of this institutional design were novel at the time: a written constitution that aimed at defining and limiting political authority, a government based on popular sovereignty, a chief of state named "president" instead of a hereditary king, and a system of checks and balances between the executive, legislative, and judicial branches designed to guarantee order and security and avoid tyranny.

The inspiration that grew from the origins and characteristics of the U.S. Constitution legitimized later ruptures with other premodern monarchical regimes that came soon after the American struggle for independence. Indeed, the presidential model expanded widely throughout Latin America with the end of Spanish rule, the advent of wars of independence (1808–1824), and the process of state formation that followed. Outside the Americas, presidentialism never found the same conditions to expand and thrive. In fact, Latin American is really the continent of presidentialism today; there are only a handful of non-American countries employing the system, including Benin and Nigeria in Africa and the Philippines and South Korea in Asia.

Types of Presidentialism

The term *presidentialism* does not necessarily imply that the executive is always and in all cases the most powerful of the branches of government. Researchers have identified different types of parliamentary governments depending on the primacy of the government or the parliament (i.e., cabinet government, *Kanzlerdemokratie* [chancellor democracy], or assembly government). A similar distinction can be made between at least two types of presidential systems: those based on "equilibrium among branches" and those based on "executive dominance." Three variables differentiate these categories: (1) the powers of the president vis-à-vis congress, (2) the role of the Supreme Court as an arbiter of executive–legislative conflict, and (3) how parties and the party system are structured. The United States is the paradigmatic example of presidentialism based on "equilibrium among branches," while most of the other cases fall into the "executive dominance" category.

The U.S. president faces a powerful legislative branch with significant legislative and oversight prerogatives and complete autonomy with respect to its agenda and its session calendar. On the other hand, the majority of the remaining presidential constitutions establish a more powerful president and a weaker legislature than exists in the United States. In contrast to the U.S. president, Latin American presidents not only enjoy reactive powers (such as veto power) but also proactive and agenda-setting powers. Among the latter are the following: (a) power to legislate through emergency decree powers, (b) exclusive right of legislative initiative in some areas (such as the budget or the organization of public administration), (c) ample powers over the budgetary process, (d) authority to initiate a referendum on general topics or specific laws, (e) authority to convene congress for special sessions, and (f) authority to ask congress to prioritize executive initiatives. Notwithstanding these powers, Latin American legislatures are not mere rubber stamps. They do exercise their legislative and oversight powers but to a lesser extent than their U.S. counterpart.

In addition, the Supreme Court historically has played a crucial role in the working of U.S. presidentialism, acting as arbiter in conflicts between the executive and the legislature. The combination of the Court's recognition as an arbiter of interbranch conflict and its significant institutional prestige has resulted in the Court operating as a third branch of government. This is distinct from other presidential countries where Supreme Courts have often been unable to adequately exercise their role as arbiter due to undue influence from the executive.

Historically, in executive-dominant presidential systems, the usual way of limiting presidents' power has been through the adoption of nonreelection clauses (either lifelong or nonimmediate). These measures produce presidents with ample ruling powers but without the ability to extend their terms of office. In spite of term limits, a number of Latin American presidents have attempted to remove these clauses, provoking an increase of executive–legislative conflict, a weakening of the mechanisms of horizontal accountability and oversight, and, more generally, increased levels of political instability.

The nature and structure of parties and party systems also differentiate the types of presidentialism in functional terms. Two-party systems with low internal party discipline such as that of the United States not only provide the president a wider margin to rule under divided government conditions but have also contributed to limiting the power of presidents who enjoy a majority in congress. In any case, while the existence of a two-party system with weak parties might allow presidents to more successfully push their agendas, it also obliges presidents to pay careful attention to congressional autonomy, power, and will.

On the other hand, presidential forms of government that coexist with multiparty systems or two-party systems with disciplined parties, as is the case in much of Latin America, have produced both cases of executive dominance and cases of compromise between executive and congress.

Clear examples of dominance situations include those cases in which presidents, supported by a disciplined legislative majority, take full advantage of the situation and push their own agendas without seeking agreements with opposition parties. Presidents who lack congressional majorities may also decide to use (and abuse) their proactive powers and rule alone, circumventing congress. Alternatively, presidents facing a minority situation can build coalitions to avoid deadlock and stalemate, offering cabinet positions to parties with legislative representation in exchange for legislative support for executive initiatives. This is an example of consensual interbranch relations.

Criticisms and Debate

During the 1980s, a large number of countries (first in Latin American and then in Eastern European) moved toward democracy, requiring them to restore, modify, or even create constitutions and rules for political competition. This context provided an opportunity to discuss different government designs, to compare the advantages and disadvantages of presidentialism and parliamentarism, and to revise and eventually modify how political institutions were organized. The political scientist Juan Linz occupied a prominent position in this debate as he took the lead in a fierce scholarly criticism of presidentialism, basing his criticism on the numerous presidential democracies in Latin America that underwent institutional crises and eventually broke down during the 1960s and 1970s. In short, critics argued that presidentialism was less efficient than parliamentarism in guaranteeing political stability and democratic governability. They identified four perils or problems inherent in the logic of presidential design.

First, the dual legitimacy created by presidentialism is prone to deadlock and stalemate. Under presidentialism, both the agents of the popular vote (the president and the legislature) have a legitimate claim to power and popular support without an official procedure to solve conflicts between the two. Situations of divided government constitute a serious difficulty as opposition parties in congress have few incentives to cooperate if credit for success is not attributed to them, while at the same time they will likely bear the cost of failure. Presidents may even encounter problems in marshaling support from their own parties, as legislators of the president's party can resist or reject bills from the executive, risking neither their positions nor the dissolution of congress. This problem does not exist under parliamentarism, where governments can maintain themselves in office only if they enjoy legislative support.

A second problem with presidentialism is, according to its critics, the rigidity implied in fixed terms. Fixed terms make institutional responses to critical situations much more difficult. The possibilities for replacing an unpopular or moribund president (e.g., resignation, impeachment) are complicated, and the mere intention of applying them might result in further complications and a deepening of the crisis. On the contrary, under parliamentary arrangements, the replacement of government and the call for anticipated elections are normal institutionalized political solutions that are always available and easy to use in times of crisis.

The third shortcoming of presidentialism is the majoritarian and zero-sum character of presidential elections: Elections with only one winner generate strong political tensions. What makes the zero-sum nature of presidentialism even more serious is that under certain electoral rules, a candidate with little popular support or one who is strongly deviant from the median voter can win, potentially generating crises of legitimacy and situations of conflict, polarization, and/or crisis. Critics of presidentialism invoke as the quintessential example the Chilean elections of 1970: The leftist candidate Salvador Allende won the presidency with only 36.2% of votes against the center-right candidate Jorge Alessandri with 34.9% and the Christian Democrat candidate Radomiro Tomic with 27.8%. Despite this close margin of victory, and facing a hostile congress, Allende began to carry out radical policies. In a context of increasing political polarization, the government of President Allende was overthrown by the military in a coup d'état on September 11, 1973.

The last shortcoming that critics note is the dual character of the presidential office, generated by the system's fusion of the roles of head of state and head of government. The symbolic and/or ceremonial duties of the chief of state often collide with the tasks of a head of government. To its critics, the symbolic functions of a chief of state are less legitimate when carried out by an individual who is the leader of a party and therefore involved in partisan power struggles.

The contributions of Linz and other critics of presidentialism sparked a revival in interest in governmental institutions and their effect on stability and democratic performance as well as several responses that challenged Linz's argument. For example, scholars like Scott Mainwaring and Matthew Shugart, while admitting some difficulties associated with presidential systems, presented counterarguments noting some of the advantages of presidentialism over parliamentarism.

First, according to these scholars, presidentialism offers more electoral options to voters, who can cast votes for both the legislature and the executive and can decide to split their vote, a possibility parliamentarism precludes.

Second, presidentialism offers citizens more opportunities to exercise accountability and express their preferences in public policy neatly. Under presidentialism, citizens can choose between at least two clearly different alternatives (the incumbent and the opposition) for president and a number of alternatives from among which they can select the candidate closest to their preferences for congress. In contrast, in Westminster-type parliamentarisms, government and opposition are clearly defined and it is possible for voters to determine governmental responsibility for policies, but there is no room for minority representation. Under multiparty parliamentarism, the exact opposite takes place: Citizens do not know in advance how their vote will reflect on the final composition of government. In these cases, changes in the partisan composition of the ruling coalition can take place even between elections, and parties originally in the opposition might be invited to join the government.

The third argument in favor of presidentialism is that it better facilitates legislative control over lawmaking and oversight of the executive. As the survival of government is not at stake, members of congress enjoy wider margins of maneuver to adequately analyze bills and look for broader support for an initiative, ultimately having a greater effect on legislation.

Fourth, presidential fixed terms generate higher democratic stability in countries with governability problems due to weak parties or highly fragmented or polarized party systems, where it would be difficult to form coalitions in a parliamentary context.

Finally, some scholars argue for caveats to the notion of the zero-sum nature of presidentialism. The existence of two agents of the electorate results in the possibility of more than two winners. A party that does not win the presidency but obtains a considerable number of seats in the assembly can limit the executive and block its initiatives, especially if the president possesses only reactive legislative powers (or limited proactive and agenda-setting powers). In contrast, Westminster-style parliamentarisms are good examples of one party taking a dominant position in both branches of government and exercising power with few limitations.

Presidential Democracies Today

For many years, the combination of presidentialism and democracy only succeeded in the United States. In no other place did presidentialism coexist with a stable democratic regime. For example, at the beginning of the 1980s, only three Latin American countries were ruled by presidents elected in competitive elections: Colombia, Costa Rica, and Venezuela. The remaining countries were ruled by different varieties of nondemocratic regimes, including hegemonic party systems (Mexico) or military dictatorships (Argentina, Brazil, Chile, and Uruguay).

In 2010, however, presidential democracies prevailed across the Americas. Many of them have suffered periods of political crisis and instability, but all of them have shown unanticipated resilience in recent years. There have been major setbacks, such as the *autogolpes* (self-inflicted coups by ruling presidents to close the congress) by the Peruvian president Alberto Fujimori in 1992 and by the Guatemalan president Jorge Serrano in 1993. In other cases, presidential democracies survived thorny circumstances including presidential impeachments, as was the case in Brazil (1992) and Venezuela (1993), or presidential resignations amid usually violent social protest and uprisings, as in the case of the Paraguayan president Raúl Cubas Grau in March 1999, the Ecuadorian Jamil Mahuad in February 2000, the Argentinean Fernando de la Rúa in December 2001, and the Bolivian Gonzalo Sánchez de Lozada in October 2003.

In spite of scholarly suggestions and initiatives by some politicians to modify presidential arrangements, all the constitutional conventions convened throughout Latin America since the late 1980s have maintained or strengthened presidentialism's basic logic and tenets. As a consequence, today the combination of presidentialism and democracy is not an oddity but a common feature of the political systems of a large number of countries.

PRINCIPAL–AGENT THEORY

Principal–agent theory (PAT) was developed in the field of economics in the 1970s to understand the prevailing problems that appear every time Person A (the "principal") asks Person B (the "agent") to do something on his or her behalf for a given price. The basic assumption of PAT is the existence of a double asymmetry between the principal and the agent, since they have different preferences (e.g., the customer/principal wants healthy teeth, while the dentist/agent wants to receive good pay) as well as different levels of information (e.g., the customer/principal can observe the outcome but not the costs of the action that the dentist/agent takes). The solution to this double asymmetry is an outcome-based contract in which it is stated that the agent receives a bonus in case a certain outcome is reached. PAT explores how these contracts should be designed according to the variations in the informational asymmetries between principals and agents in different settings.

Similar to many other economic tools, PAT has been incorporated into political science with the general aim of creating more parsimonious models. Ironically, PAT has only marginally been used for understanding one of the most important principal–agent relationship in politics—the one between citizens, or constituencies (as principals), and elected politicians (as agents). The reason is that the nature of this relationship differs too much from the basic premises of PAT, in which the principal holds a dominant position and is endowed with all the bargaining power. As a consequence, the principal makes a take-it-or-leave-it offer to the agent, which becomes the main object of study for the standard PAT. On the contrary, in the central political delegation chain, the citizen/principal has a subordinate role vis-à-vis a politician/agent, who can single-handedly write or, at least, substantially modify the terms of the "contract" between them. In simple words, governments are the only agents in the world that tell their principals what to do.

PAT has nevertheless been applied extensively for understanding the second delegation chain in a polity—that of politicians as principals and bureaucrats as agents. The main reason is that bureaucracy is one of the fields in political science that has resisted more theoretical progress, and PAT offers a useful tool to develop highly analytical models with clear testable propositions. In addition, PAT seems particularly well suited to address one of the most long-lasting puzzles in bureaucratic politics: the so-called Weberian asymmetry. As Max Weber indicated, a profound problem of democratic polities is that "political masters" find themselves in the position of dilettantes who stand opposite of expert bureaucrats. This asymmetry has initiated recurrent scientific and ideological debates—most notable among them being the discussion on "state failures." For the public choice literature in general, and for Willian Niskanen in particular, bureaucracies are too big and too inefficient.

Since it was imported from economics in the early 1980s, PAT has offered creative answers to these debates surrounding public bureaucracies and, while answering them, has also undergone an important evolution. This entry surveys the main aspects of this transformation of a fundamentally economic PAT into a more political theory.

From *Ex Post* to *Ex Ante* Theories

The first setting in which PAT flourished was the American literature on congressional control of bureaucracy. Prior to PAT, the prevailing view was that of an unresponsive bureaucracy—based on the fact that Congress devoted only a small fraction of its resources to the direct oversight of bureaucratic actions. Against this perspective, PAT authors argued that the lack of monitoring activity was actually a signal that control was working properly. It is the possibility of *ex post* sanctions (e.g., hearings, investigations, limited budgetary appropriations) that acts as an effective incentive for the bureau to serve congressional interests. Similar to how a car lot owner's properly designed commission system can ensure that a car sales agent performs well without any need for direct monitoring, Congress may possess sufficient *ex post* rewards and sanctions to control public bureaucracies.

This "congressional dominance" approach contributed to the bureaucratic literature by providing numerous empirical tests derived from rigorous theoretical predictions—mostly showing the congruence between federal regulatory agencies and changes in congressional ideological preferences. The ultimate empirical proof that bureaucratic agents follow legislators' preferences would be the latter's high incumbent reelection rate (more than 90% in the U.S. House of Representatives, according to some calculations/estimations).

Nevertheless, many authors have cast doubts about the usefulness of *ex post* PAT sanctions in the political sphere. Unlike what happens in the private sector, where the principal may openly expose an agent's misbehavior, a politician who denounces bureaucratic noncompliance runs the risk of being accused by the electorate of lack of previous monitoring zeal. Since politicians cannot credibly rely on *ex post* controls, they may develop *ex ante* mechanisms of bureaucratic oversight, such as imposing detailed administrative procedures that "stack the deck" in favor of congressional constituencies. For example, members of Congress can establish transparency requirements or order the bureau to consult some interest groups before entering into any relevant decision. That would also be the PAT explanation of the 1946 Administrative Procedure Act that was burdened with multiple requirements that limited *ex ante* bureaucratic discretion. In general, PAT arguments, based on politicians' electoral interests, challenged the prevailing view in the law and economics literature that had traditionally explained administrative procedures as being the result of normative concerns for fairness and equity. This shift of focus from *ex post* to *ex ante* mechanisms represents the first step away from economic orthodoxy in the political evolution of PAT models of bureaucracy.

From Dyadic to Complex Theories

PAT, as directly imported from economics, initially focused on the dyadic relationship between Congress and bureaucracy. Nevertheless, from the mid-1980s onward, more realistic models of political control of bureaucracy were developed in which the dyadic relationship became a more complex one, with Congress sharing, and frequently competing for, bureaucratic oversight with other principals, such as the presidency, federal and state courts, and interest groups.

The main picture that is emerging from these complex models—some of them involving up to 14 principals—is more pessimistic than the one from the early dyadic PAT models of congressional dominance. In general, political control of bureaus is poor because they can play some political principals (e.g., a Republican Congress) off against others (e.g., a Democratic president). In addition, the political control hypothesis seems to fail even in the most favorable conditions, which has been demonstrated by the case of the probusiness Reagan administration and the Environmental Protection Agency (EPA). Despite that all possible political control tools were mobilized, the Reagan administration was unable to significantly reduce EPA's activities.

From Control to Organizational Theories

Most public administration scholars agree that while PAT has successfully explored the issue of political control of bureaucracies, it has been at the expense of treating bureaucracies as black boxes that mysteriously transform inputs into outputs. The (extremely varied) organizational characteristics of bureaucracies have been mostly left out. One reason is that PAT, which emerged in the congressional control debate, initially became more of a theory of legislatures than a proper theory of bureaucracies. Nevertheless, researchers started to acknowledge that the study of the political control of bureaucracies presents serious problems of scientific validity, chief among them being the dilemma of "observational equivalence." The same empirical observation, the lack of political monitoring and sanctions for bureaus, may be an indication of bureaucratic independence and, at the same time, of its exact opposite—that is, a bureaucracy so compliant that there is no need for supervision.

Accordingly, in what has been considered to be the most important single development in the modern theory of bureaucracy, PAT scholars have increasingly shifted their attention from how politicians control bureaucrats to how politicians design bureaucratic organizations. One of the most explored organizational features is the variance in the autonomy of public employees: why some public bureaucracies are like their private counterparts—that is, the principal (government) is free to choose its agents (public employees)—and, on the contrary, other (most, but far from all) public bureaucracies have autonomous civil service systems that limit the capacity of government to choose the public employees that are working for it. The study of this puzzle has forced PAT scholars to seriously question the source and nature of the problems that exist in a principal–agent relationship.

From Agent-as-the-Problem to Principal-as-the-Problem Theories

The canonical-economic PAT had focused on the problems created by the agent, who may take advantage of his or her "hidden information" and "hidden actions." The credible commitment problem of a car lot owner (principal) not paying the promised commission to a salesman (agent) is quite unrealistic in the private sector, given the existence of an external third party (public institutions) with the ability to enforce contracts. Nevertheless, in politics, the principal is at the same time the third party—or, at the least, may be able to affect the third party's behavior through legislative measures. As numerous scholars have shown, the problems of credible commitment created by all-powerful principals may overshadow the traditionally explored informational advantages of agents. One of the most significant examples is monetary policy, where governments, no matter how benevolent they may appear, face an unavoidable problem of credibility in the eyes of investors. Just before elections, governments will *always* find an advantage in granting opportunistic short-term benefits to their constituents.

A more political strand of PAT has explored how different mechanisms, such as the delegation of monetary policy to an agent that is *known* to have different monetary preferences, may mitigate this inherent problem of credibility. One paradoxical result of this literature is that multiple principals overseeing a bureaucracy, considered as a recipe for disaster by the standard economic PAT, actually have beneficial effects for monetary policy because a safe "core" of economic policies is protected from politicians' opportunism. The loss of political control over the bureaucracy—at least over bureaucracies dealing with potentially time-inconsistent policies—can thus be a socially desirable outcome.

All in all, two main patterns emerge from this review of the influence of PAT in political science. First, the parsimonious models of PAT have revolutionized the study of politics and particularly of public bureaucracies, illuminating numerous empirical puzzles. At the same time, the study of politics has also changed the core assumptions and predictions of canonical PAT. In sum, thanks to the importation of the economics-born PAT, political science has evolved into a more economic discipline, but economics has also become more political. As a result, the accumulated knowledge in both disciplines has benefited extensively.

PRISONERS' DILEMMA

The prisoners' dilemma (PD) is usually presented with the following narrative. Two men are arrested after committing a crime. Only a confession by one or both of them can lead to a conviction for the crime. If both of them remain silent, each will be charged with a lesser offense and serve a light sentence. If one confesses while the other remains silent, the one who confesses will be set free in exchange for his testimony against the other, and the one who remains silent will be convicted of the crime and receive a full sentence. If both confess, both of them will be convicted of the crime but will receive a reduced sentence. The *dilemma* here is that regardless of what the other chooses to do, it will be better for each of them to confess. However, if they both confess, they will be worse off than they would have been if both of them had remained silent. In this entry, various game-theoretical strategies and possible applications in political science are discussed.

The basic structure of the game is presented in Table 1, a 2 × 2 matrix that specifies the payoff each player receives, where $T > R > P > S$.

The game, thus, has a unique equilibrium in which both players defect and receive payoff P. They would have received a higher payoff, R, had each of them chosen "cooperate," but this is not possible since each of them has a *dominant strategy* to "defect."

In a repeated PD, the choices made today not only determine today's outcome but can also influence the choices made in the future. If the players were to repeat the game for a finite and known number of times, backward induction would imply that both players defect in every round. In the last round, neither player fears the consequences of current choices, so they will both choose "defect." As a result, both players end up choosing "defect" in each round, expecting the other player to "defect" in the following round. However, if the players were to play an infinitely repeated PD or a finite repeated PD for an unknown number of times, backward induction no longer applies. When a game is repeated infinitely or repeated for a finite but unknown number of times, players use weighted-average payoffs to determine which strategy to choose. To calculate the weighted-average payoffs in a given round, future payoffs are multiplied by a *discount factor* q, either to reflect that future payoffs are valued less than present payoffs or as a probability that there will be another round in the future. The value of cooperation in a given round depends on the value of q, increasing as q approaches one. As long as q is not zero, both players are better off if they both choose "cooperate" in every round.

Source: Axelrod, R. (1984). *The evolution of cooperation.* New York: Basic Books.

There is an equilibrium in which both players defect in every round because each player chooses a strategy to "always defect" and such an equilibrium exists for any value of q. However, it is no longer the only possible equilibrium outcome for both players to defect in every round because players can play reciprocal strategies that condition their choices in a given round on the course of the game. For instance, players can choose to play a grim trigger strategy, which punishes the defector by playing defect for all future rounds of the game. This reciprocal strategy can produce an equilibrium in which both players cooperate in every round for certain values of q. In fact, according to the Folk theorem, a wide range of payoffs can be supported in infinitely repeated games or repeated games with finite but unknown number of rounds as long as q is not zero, and consequently, the set of strategies that support mutual cooperation in every round can be quite large depending on the value of q. There exists as yet no consensus with respect to the reasons that may be invoked for favoring one reciprocal strategy over the other when any of them can support mutual cooperation in every round.

Games of incomplete information offer another scenario in which players might achieve mutual cooperation even in a repeated PD with a finite and known number of rounds. For instance, suppose there is a probability z that Player 2's payoffs are different from those depicted in Table 1 and that his dominant strategy is a tit-for-tat strategy. A tit-for-tat strategy player cooperates in the first round and then does whatever his or her opponent did in the previous round. When this uncertainty is introduced, a "cooperate" by Player 2 in a given round may be interpreted as a sign that Player 2 is a tit-for-tat strategy player. If Player 2 is a tit-for-tat strategy player, Player 1 is better off if he or she chooses "cooperate" in the following round and achieves mutual cooperation in future rounds. There is a chance that the "cooperate" choice by Player 2 is a mistake and that Player 2 will choose "defect" in the following round. Then, Player 1 will receive S, which is worse than the P that he or she would have received if he or she had kept on playing "defect." However, if z is high enough and there are enough rounds left in the game, Player 1 will be willing to risk this possibility. At the same time, there is an incentive for Player 2 to pretend to be a tit-for-tat strategy player even if he or she is not when Player 1 faces such an uncertainty because then both players can achieve mutual cooperation and receive payoff R for some rounds. As they near the last round, they will be less willing to choose "cooperate" since the fact that they will both choose "defect" in the last round has not changed. They will not be able to achieve mutual cooperation in every round, but they will be able to achieve mutual cooperation in some rounds.

Since Merrill Flood and Melvin Dresher devised PD as part of a RAND Corporation experiment on game theory, experiments have been a major part of PD literature. The most frequently examined dependent variable in PD experiments is the number of mutual cooperations achieved relative to the number of games played. However, the results will vary depending on the specific environment of the experiment. It has been established that that share is never zero, but it is never 100% either. The fact that observations of real people have shown that people usually manage to achieve mutual cooperation even in repeated games with a finite and known number of rounds motivated the research on finitely repeated PD with uncertainty, which appears to be more consistent with the experimental results.

Computer simulation is another way researchers experiment with PD games. They are particularly useful in exploring the evolutionary aspect of repeated PD, such as the best strategy for players' survival, the change in strategies among populations, or the stability of strategy composition. Robert Axelrod's computer tournaments conducted in 1980 are part of a study on the emergence of cooperation. A number of strategies were submitted to a tournament of repeated PD, in which each strategy was matched against all the other programs submitted, against itself, and against a program that chooses cooperation or defection randomly. Axelrod tallied how well each strategy did, and the winner was a tit-for-tat strategy.

The PD is generally applied to demonstrate the difficulty involved in achieving cooperative outcomes when there exists an incentive to cheat and take advantage of the other. International politics has been an area in which PD has been applied actively because states engage in bilateral interactions without a formal enforcement mechanism. For example, it is difficult for two states in an arms race to make and implement an agreement to stop the arms race, although they will be worse off than if they are able to cooperate and stop it. Each state fears that it will be taken advantage of should it stop while the opponent continues. Each state is also tempted to take advantage of the opponent that stops by continuing to accumulate arms. The same logic applies to any international relations in which states can achieve favorable outcomes through international agreements but will be tempted to cheat on implementation. It can also been applied to civil conflict situations.

Although PD is generally applied in the context of a two-player game, games with the payoff structure of PD have been applied in the context of an n-player game (i.e., $n > 2$). For example, some have interpreted a game of common-pool resources with n players who have PD incentives to be what Garrett Hardin referred to as the *tragedy of the commons*. All the people in a community have a collective interest in sustaining common resources. However, as people are self-interested, each will be tempted to overexploit the resources. The tragedy arises because, at any point in time, each individual finds it in his or her interest to exploit the common resources (i.e., "defect") no matter what the others do. This can be seen to explain the need for and the emergence of a formal enforcement device, government or a government agency in most cases, to provide public goods or to enforce contracts among individuals. Work by the Nobel Prize winner Elinor Ostrom and her collaborators explore other, private ways in which individuals can solve the common-resources problem.

PRIVATIZATION

According to Stuart Butler, one of its chief advocates, privatization can be thought of as the shift of a function in whole, or in part, from the public sector to the private sector. This can refer to a variety of policies, including the sale of state assets, the contracting out of public services to private providers, the deregulation of various market-based activities, or even the affixing of user fees for places that might earlier have been open access (parks, museums, schools, or highways). This entry discusses alternative conceptions of privatization, assesses the arguments for and against privatization, and examines some attempts by governments to withdraw from involvement in some aspects of their economies.

Alternative Conceptions of Privatization

Privatization is not a new phenomenon. While most economists have normally assumed the private sector to be something like a default position, with government activities being invented, added on, and often at the expense of the private sector, in fact the reverse is the case. Oliver Letwin, a British conservative theorist, observed that the private sector had to be invented. This occurred with the creation of the great European trading companies, such as the British and Dutch East India companies, founded in the 17th century. Notions of property before the Renaissance assumed that different actors had different relations to the same property. Manorial estates were, true enough, the domain of the local lord, but he was required to provide security, order, and justice to the inhabitants of the domain, while they had certain rights to the usufructs of the property and owed the lord fealty and obedience. The lord in turn owed fealty to the king. This changed slowly. For example, only with the rise of the enclosures of common pastureland did Britain develop modern notions of property. Private property did, of course, exist in earlier eras, and much of its modern conception is owed to the rediscovery of Roman law, which had a well-articulated set of rules governing such property. However, as the economic abuses associated with the collapse of communism demonstrate, private property cannot exist without a political system that defines its existence, its use, and the conditions of its exchange. That is, private property is defined by and exists only because of politics.

Although state asset sales occurred in many European countries during the 1950s, when conservative parties took over from left-of-center parties, these were relatively limited in scope. Privatizing government assets and services became a major policy fashion in the 1980s and continued through the first decade of the 21st century until the financial crisis of late 2008, when many of the conservative policy trends of the late 20th century were called into question. This is not to say that only conservatives advocated privatization. Regimes as different as Margaret Thatcher's Britain, Bill Clinton's United States, and François Mitterrand's France all actively pursued privatization policies. They often had different reasons for pursuing such policies, and these are explored as follows.

At the end of the 20th century, the privatization movement was rooted in the collapse of Keynesian economics in the late 1970s. The oil crises of 1973 to 1974 and then 1979 were followed by periods of economic stagnation and high inflation. Keynesian orthodoxy saw employment and price levels as trade-offs, described by what was called the Phillips curve. Keynesians thought that inflation only occurred in economies experiencing full employment and had no explanation for the stagflation that followed the oil crises. Their inability to explain the behavior of the economy created a window of opportunity for neoclassical economists to step in and stipulate that these problems were due to public sector distortions that had accumulated over the postwar years. The solution to economic stagnation was, they asserted, less government. These were the advocates of privatization.

Arguments for and Against Privatization

Belief in the superiority of markets became widespread as the best way to organize not only the production but also the allocation of all goods and services, with "market failure" being considered rare and the only justification for public intervention. Even governments were thought to work better if they were organized using market principles. This latter version of privatization became known as "the new public management." Here government was to be organized as a private enterprise, while citizens were to be treated as "customers."

While privatization was something of an international trend in the late 20th century, it was not adopted everywhere for the same reasons. Harvey Feigenbaum, Jeffrey Henig, and Chris Hamnett (1998) argued that privatization was essentially a political phenomenon and that one could distinguish three types of privatization policies. The types of privatization were differentiated by the motives and intentions of the policymakers. The least political kind of privatization might be called "pragmatic." Pragmatic privatizations fill immediate needs without political motives, such as selling a state asset to fill an immediate budgetary shortfall or contracting out to a private provider because the government simply lacks the expertise. "Tactical" privatizations serve short-term political goals, such as rewarding supporters by awarding a no-bid contract or offering discounted shares in a public enterprise privatization to allies of the party in power. "Systemic" privatizations are intended to permanently transform the political landscape: The sale of public enterprises to create a nation of share holders was intended to create new and enduring constituencies for the Conservative Party in Britain, while "shock therapy," the rapid sale of public enterprises in Russia, was intended to permanently block a return to socialism by selling off most of the state's assets. In developing countries, the impetus for privatization often comes from international aid and lending institutions that require the policy as a prerequisite to aid. These institutions usually favor privatization because they are staffed by neoclassical economists or influenced by large, conservative contributors such as the United States. In other cases, international lenders are simply seeking to pragmatically avoid nepotism and other inefficiencies in recipient countries.

Often, of course, privatizations are supported by different groups for different reasons. Bureaucrats might favor a particular privatization for pragmatic reasons; the ruling party might see political advantages, while outside consultants based in think tanks might be motivated by ideology. Thus, the typology offered above might be better thought of as Weberian ideal types rather than hard and fast categories in the real world.

Government Attempts to Withdraw From Economic Involvement

Whatever the motives of the privatizers, the impact of privatization has also been quite varied. The goals may have been, as stated by Daniel Golden, a one-time administrator of the U.S. National Aeronautics and Space Administration, "faster, better, cheaper!" However, realistically, privatization policies could at best accomplish two out of the three. While there were some successes at the municipal level, cost savings due to privatization were rare. Where they were achieved, this was often because the private providers had hired lower-wage workers. Hence, privatization policies have normally been opposed by labor unions.

In a number of cases, privatization policies drove up costs and reduced service. The privatization of British Rail led to significant reductions in service, though part of this was because the Conservative government had anticipated privatization and necessary investments in infrastructure were not made before the railroad was sold. Privatization of water utilities in Britain followed a similar pattern. Perhaps the most spectacular increases in cost were associated with privatization in the military. Profiteering often accompanies military contracts and is alleged to have reached spectacular proportions in the case of U.S. contracts during the Iraq War. It should be noted that privatization of the military may be pursued not because the governments have any illusions about efficiency but because the use of private contractors is an expedient way to expand unpopular military activities.

Experience with privatization since the 1980s suggests that there is less abuse where privatization leads to a genuinely competitive market, where private service providers are carefully supervised by public authorities, and where well-articulated systems of accountability are in place. Even when these conditions obtain, privatization does not necessarily result in greater efficiencies or cost savings, although this is a matter continually under debate. It also seems clear that privatization policies frequently have serious distributional consequences. Thus, cost savings due to new efficiencies are frequently negated by the need for new subsidies to those citizens adversely affected.

In recent times, privatizations have not had the popularity that was evident in the 1980s and 1990s. This is partially because there is now significant experience with privatization and the promised savings and efficiencies have not been realized. Moreover, the shocks occurring in financial markets after the collapse of Lehman Brothers in September 2008 have led to a serious reevaluation of the philosophy that underpinned the privatization movement.

PROCESS TRACING

Process tracing is a key method of qualitative analysis of case studies. As discussed in this entry, it is defined as the empirical analysis of the hypothesized observable implications of alternative theoretical processes that purport to explain the outcome of a single case. As such, it is a method of within-case analysis that can be used to develop and test a historical explanation of an individual case, although it can also be used together with cross-case comparative methods to assess whether similar or different processes are at work in different cases. This entry reviews the epistemological and methodological context of process tracing, discusses standards of doing it well, and identifies its limitations as a means of causal inference.

The Epistemology and Methodology of Process Tracing

As outlined by Alexander George and others, process tracing can be used to develop and test historical explanations of a single case. George and other proponents of process tracing often use the metaphor of detective work to illustrate the technique. Just as a detective assesses alternative suspects' potential means, motives, and opportunities to have committed the crime under investigation, a social science researcher can use evidence to assess the alternative explanations proposed for the outcome of a historical case. This involves close attention to the hypothesized causal mechanisms, processes, and sequences that alternative theories predict must be evident in the history of a case if these theories are to explain the outcome of the case.

The emphasis that process tracing places on causal processes and mechanisms makes its epistemological assumptions similar to those of the scientific-realist school of thought in the philosophy of science. As Fred Chernoff has noted, there are many variants of scientific realism. Most self-identified scientific realists agree, however, that there are entities in the world with causal powers and that these entities act through causal mechanisms to generate the phenomena that we observe. In this view, although causal mechanisms are ultimately not directly observable, our hypotheses about how these mechanisms operate generate observable implications that we can test against actual observations to make (potentially fallible) inferences on the validity and scope conditions of our hypotheses. The observable implications of hypothesized causal mechanisms and processes may concern predictions on population-wide patterns, which can be assessed through statistical means. According to Henry Brady and David Collier, this analysis involves inferences from "data set observations" or from measurements of variables across many different cases. The observable implications of hypothesized causal mechanisms may also involve detailed predictions about processes and sequences of events within individual cases. It is these within-case observable implications that process tracing assesses through what Brady and Collier term *causal process observations*, or evidence on sequences and events within a single case.

Process tracing proceeds through a combination of deduction and induction, with the mix varying depending on the state of development of theories on the phenomenon under study and the availability of relevant evidence. Deductively, the researcher uses extant theories to generate observable implications within a case, which can then be tested against the evidence. In this mode, the researcher asks questions such as "Who should have known or who did what, where, when, and how if this explanation of the case is true?" Inductively, the researcher develops detailed knowledge of the sequence of events in a case and uses this knowledge to generate additional potential explanations of the case. These inductive explanations, once translated into more rigorous and deductive theories, can generate additional testable implications within the case or within other cases, thereby helping the researcher guard against confirmation bias. Even when the outcome of a case is already known, there are usually many details about processes and sequences within the case that are unknown to the investigator prior to undertaking process tracing. These previously unknown details can provide an independent check on the investigator's theoretical assumptions.

Process tracing also proceeds through both affirmation of theories that prove to be consistent with evidence from the case and eliminative induction of theoretical explanations that prove to be inconsistent with the evidence. In this sense, process tracing is similar to Bayesian analysis, in which the analyst uses evidence to update prior expectations on the relative likelihood that alternative theories or explanations are true. As in

Bayesian analysis, a single piece of evidence might be consistent with one explanation of a case while simultaneously disproving many alternative explanations. The more an observable implication is likely to be true if one explanation is true, and the more unlikely it is to be true if any of the alternative explanations is true, the more this evidence, if found, would increase our confidence in the one theory it fits and decrease our confidence in the alternatives. Thus, whether an instance of process tracing is convincing and determinate in narrowing the field to one explanation of a case depends not on the number of cases, pieces of evidence, or alternative explanations but on the probative value of the evidence regarding the alternative explanations.

Thus, even though it involves only one case and potentially includes many variables and explanations, process tracing does not raise a "degrees of freedom" problem, which arises in statistical analysis when there are too many variables and too few cases to assess alternative explanations with any confidence. Process tracing does face the more general problem of indeterminacy, of which the degrees of freedom problem is one variant, as process tracing may be indeterminate if several incompatible explanations are equally consistent with the evidence of a case. This is an inherent problem because there are always potential additional explanations that the researcher may not have conceived of or examined, a challenge that Bayesians refer to as identifying the "catchall factor," or the probability one should place on the possible truth value of *all* alternatives to the explanation of interest. For these reasons, many researchers who use process tracing would agree with Bayesians that one should never put 100% confidence in a theory or explanation.

Although it is a within-case method of analysis, process tracing can supplement cross-case comparisons and compensate for some of the limits of such comparisons. For example, a most-similar case comparison involves the comparison of two cases that are similar in all but one independent variable and that differ in their outcomes. A standard challenge in this research design is that cases are never perfectly matched on all but one independent variable. Process tracing can help determine whether the difference in the independent variable of interest is related to the outcome, and it can also help assess whether the residual differences between the two cases might also, or instead, contribute to the differences in their outcomes.

Two contentious issues are whether process tracing can lead to generalizable knowledge and whether it is suited to interpretivist or constructivist epistemological assumptions. Nathaniel Beck has critiqued process tracing for producing only explanations of individual cases rather than generalizable knowledge. Defenders of process tracing respond that the explanation of cases of historical significance is an important goal in its own right and that inferences based on statistical inferences are more convincing if they can be shown to be consistent with the mechanisms and processes of individual cases. Moreover, they argue that while the explanation of an individual case may not generalize to other cases, it is also possible to use a combination of induction and deduction to uncover explanations via process tracing that may prove widely generalizable. Charles Darwin's detailed examination of a few species, for example, led to hypothesized causal mechanisms on evolution and natural selection that should apply not just to the species he studied but to all living things. It is nearly impossible to know whether an explanation of a case will prove generalizable, however, until one has first developed and tested that explanation through process tracing.

Coming from another perspective, Jeffrey Checkel has critiqued process tracing as being too neo-positivist and insufficiently attuned to the recursivity of social agents and social structures. Proponents of process tracing would respond that it has much in common with some forms of narrative analysis, event history analysis, and discourse analysis but that it does aspire to verifiable and generalizable explanations. If one believes that agents and structures are inherently recursive and mutually constitutive "all the way down," no matter how finely one slices time or space, then one is likely to remain skeptical of process tracing and all other forms of inference that aspire to causal explanations.

Standards of Good Process Tracing

There are many excellent examples of process tracing in the social sciences, a number of which are discussed in the Further Readings. Good process tracing shares several characteristics. First, it considers a wide range of the potential explanations of a case proposed by theorists, historians, journalists, and participants, and it gives a balanced assessment of the evidence for each. Second, it provides a fairly continuous explanation of the major events in the case, with a convincing explanation of each important turning point. It is both impossible and impractical, of course, to give a *fully continuous* account of *everything* in a case, and even on important turning points, the relevant evidence may be inaccessible, but the more the critical steps and potential anomalies can be convincingly explained, the better it is. Third, good process tracing weighs the probative value of evidence relative to alternative explanations and takes into account the potential biases of the sources of that evidence. Fourth, and similar to Bayesian analysis, diversity of evidence—analogous to a detective's search for evidence on means, motives, and opportunities—helps provide more convincing explanations via process tracing. Finally, the use of evidence that has "use novelty," or evidence that was not known or observed by the investigator prior to deductively predicting its expected value or measurement, provides protection against confirmation bias.

The Limits of Process Tracing

Like all forms of causal inference, process tracing is potentially fallible. A researcher can never be fully confident of having thought of all the relevant alternative explanations. Process tracing also usually requires a great deal of information and research and can be intensely time-consuming. Even with the most diligent research, there may be gaps and biases in the availability of information on key steps in a hypothesized process, especially on sensitive political issues on which actors have an incentive to hide their actions and motives. The results may be indeterminate if incompatible explanations are equally consistent with the evidence. Extant theories are often not sufficiently developed to make detailed predictions on the processes we should expect to find in individual cases, and different theorists might predict different processes within a case using the same theories. The results of process tracing may not be generalizable beyond the individual case in any particular study, and whether the results will prove generalizable cannot be known with confidence at the outset. Finally, there is no simple answer to how much process tracing is enough. How detailed should one be in explaining a phenomenon, or how far back should the researcher go in time? Only a pragmatic Bayesian answer is possible: One stops when one is confident that the currently accessible additional evidence would not markedly change one's confidence in the alternative explanations.

Conclusion

All methods of causal or explanatory inference, including process tracing, are potentially fallible. Despite its limitations, process tracing remains an important method for developing and testing explanations of individual cases. As methodologists continue to develop techniques of process tracing, they might focus on three areas. First, they might work out more fully the similarities and differences between process tracing and Bayesian inference. Second, they might address more fully critiques on whether and how the results of process tracing can be generalized and how process tracing relates to interpretivist and constructivist methods. Third, they might work out more specific guidelines on the kinds of evidence to look for to assess and adjudicate among different kinds of explanations, including rational choice, social-constructivist, power, institutional, and psychological explanations.

PROPERTY

If for more than 2 centuries the concept of property appeared to be understood, it is no longer possible to act as if this were the case. In common language as much as in the language of jurists and economists, the term *property* was associated with the notion of *the absolute and exclusive right of a person over a material thing*. This definition is no longer accepted by experts, a fact that led Thomas Grey to formulate the hypothesis of the *disintegration of property*.

Therefore, the notion of property has presumably suffered a rapid philosophical decline. Until recently, it was considered essential to the relevance of public and political institutions, a core component of the debate surrounding the legitimacy of capitalism—so central that the origins of the main ideologies and schools of thought that still largely structure our political world could be traced back to it. Today, however, property rights are not seen as central to issues such as the legitimacy of liberal democracies and the institutions of mature capitalism; instead, protection of individual rights and of the rule of law is seen as a primary concern in establishing such legitimacy.

It seems hardly questionable that the notion of property as the absolute right of a person over a material thing has lost both its technical relevance and its philosophical importance. But it is equally incontestable that the contemporary evolution of large legal systems tends toward *proprietarization*, a term that describes the expansion of the range of objects that can be owned, the spread of ownership mechanisms, and the strengthening of legal protection offered to owners. If the aforementioned notion of property has indeed disappeared, property itself remains central, although in new forms, to how institutions of mature capitalism function.

History of the Contemporary Notion of Property

The history of the contemporary notion of property can be divided into three stages: (1) rise, (2) triumph, and (3) fall. The emergence of the notion of property can be traced back to the Second Scholastic, which took place during the 17th century following and commenting on the Renaissance. Its final definition as the natural, absolute, and exclusive right of a person over a material thing was formulated by modern natural law theorists, especially by Thomas Hobbes and Samuel Pufendorf. A more legal, less philosophical genealogy could recount the slow rejection of the divided-ownership theory (which distinguishes between direct and eminent owners) and would put forward the ideas of French jurists such as Francois Hotman, Jean Donneau, or Charles Dumoulin. In any case, the idea of property as an absolute right nourished physiocratic writings and, at the end of the 18th century, became a truism of legal thinking, made famous by Robert-Joseph Pothier or William Blackstone's well-known phrase in Book 2 of the *Commentaries on the Laws of England*: "the right of property . . . that sole and despotic dominion which one man claims and exercises over the external things of the world, in total exclusion of the right of any other individual in the universe."

An individual's subjective property rights are acknowledged by the Fifth Amendment of the U.S. Bill of Rights ("No person shall . . . be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation"), by Article 17 of the Declaration of Human Rights of 1789 ("Since the right to property is inviolable and sacred, no one may be deprived thereof, unless public necessity, legally ascertained, obviously requires it, and just and prior indemnity has been paid"), and by Article 544 of the Napoleonic Code ("Property is the right to enjoy and dispose of things in the most absolute way, provided this usage is not prohibited by laws or regulations"). In 19th-century Europe, Article 544 became the symbol of a unitary and centralized conception of property. After 1804, the consensus about property, at least in continental law, was broad enough to raise this notion to the level of a legal dogma. On that basis, a general theory of property was progressively constructed, defining property as a subjective, unitary, complete, and perpetual right over material goods that gives the owner, directly and without any personal mediation, the power to exclude anyone else and to use those things both physically and legally. Moreover, this dogmatic consensus was coupled with a very large political consensus about the legitimacy of the institution of property.

Not until 1840 and Pierre Joseph Proudhon's famous pamphlet *What Is Property?* did this political consensus collapse, quickly giving rise to a violent dispute—which turned into civil war—between the supporters and despisers of property. This dispute concerned the origins (natural or conventional), limits, distribution, and legitimacy of property but was based on the same dogmatic definition of this institution. In his pamphlet, Proudhon himself wrote that property was the "*absolute, exclusive, autocratic domain of a man over a thing.*" The political dispute did not weaken the prestige of the legal dogma.

It was only at the end of the 19th century that the canonical definition of property was finally put into question because of the evolution of property law itself. Although this evolution is quite complex, some of its aspects should be highlighted:

- *The strengthening of statutory and judicial limitations related to property law*—the concept of the abuse of right, the development of urban regulations, the expansion of state powers of expropriation and regulatory takings, and so on. This evolution leads some authors to conceive of property as a social function more than a subjective right.
- *The emergence of so-called corporate properties or large companies' collective properties, especially after World War I*—recorded by Adolf Berle and Gardiner Means in a well-known book *The Modern Corporation and Private Property*, published in 1933. According to the authors, the switch from individual property belonging to physical persons to social property belonging to legal bodies leads to a dissociation between the owner and the manager—the property and the power of control that it bestowed.
- *The dematerialization of property*—forcing legal theorists to conceive of property as an intangible object. Gradually, the rights of authors and inventors over their creations and inventions have come to be characterized as a "property right."

Evolutions specific to mature capitalism have in fact jeopardized the property dogma. At the end of the 20th century, it became obvious that this dogma did not reflect the reality of property rights "in action." Or is it that we no longer know what property is?

Theories of Property

In law, a theoretical definition is self-fulfilling only if it slowly brings about a consensus. Equally, a theory of property will be empirically validated only if it is commonly accepted and applied by political representatives, judges, lawyers, and academics. As of today, we do not have such a theory at our disposal. Reconstruction projects are numerous, often ingenious and exciting (the work of Charles Reich, Richard Posner, Margaret Radin, Jeremy Waldron, and Stephen Munzer, among many others, should be mentioned here), but none of these projects has succeeded in imposing uniform beliefs and practices on legal actors, and some researchers such as Duncan Kennedy doubt that it is even worth trying.

However, the term *property* has not completely lost all significance, even among experts. Its meaning can be established by enunciating the specificities of property rights according to their (a) contents, (b) characteristics, (c) object, or (d) holder.

Contents

Property is frequently associated with the triptych *usus*, *fructus*, *abusus* (use, enjoy the fruits of, abuse) in Continental law or still sometimes with the right to occupy, exclude, transfer, or transmit, to refer to one of Jeremy Bentham's expressions. Even more frequently, a Hohfeldian nomenclature has been used to enable the contents of the rights to be analyzed according to the following four fundamental legal relationships of opposition and correlation:

1. claim-rights (≠no-rights) and duties,
2. privileges (≠duties) and no-rights,

3. powers (≠disabilities) and liabilities, and
4. immunities (≠liabilities) and disabilities.

Having a claim-right means being able to demand something from another, with the latter having a duty to meet the demand; a privilege exists where there is no duty; a power refers to the capability of creating legal relationships (e.g., marriage); and a person has immunity when he or she has no duty to follow a command from another.

Property should therefore be considered as a *bundle of rights*, a defined set of rights and duties, privileges and no-rights, powers and liabilities, and immunities and disabilities. Thus, according to Wesley Hohfeld, with absolute ownership over land (*property in fee simple*), the owner has the *right* to exclude anyone else, as well as some legal *privileges* (e.g., the right to use the land) and the legal *power* to alienate his or her property or some of its uses by giving legal privileges to third parties (e.g., by giving temporary access to a neighbor). Finally, he or she benefits from legal *immunities (*e.g., the property cannot be expropriated except through a specific procedure).

This nomenclature reveals the difficulty of giving a general definition of property, since it is impossible to specify rights, privileges, powers, disabilities, and immunities that could be universally and necessarily stated in every relationship characterized by legal actors as a property relationship. The best one can do is to note that the composition of the bundle of rights varies considerably according to situations and the objects concerned. Certainly, it might be useful to try to identify "types of bundles" in similar legal situations—"forms" of property—but to date, no theoretical proposition has succeeded in establishing, in a largely convincing way, one of these forms as an ideal type (as defined by Max Weber) of the institution of property.

Indeed, the notions of property and exclusivity are frequently associated. But there are good reasons to doubt that this association is both universal and necessary. First of all, exclusivity is sometimes only relative (some collective properties exclude third parties but not co-owners). Some rights of ownership are *inclusive* (the holder of these rights is given a no-right to exclude any third party): for example, in French administrative law, public property of things assigned to free public use or even creative commons licenses—share-alike or free software—that allow the creator of the initial software to give third parties the right to access and transform the initial software, coupled with a no-right to forbid access to and transformation of the upgraded version (this amounts to giving the creator of the upgraded version a no-right of exclusion for this version, even though he or she owns it).

Similarly, property and free use are often associated. Generally, property rights are composed of legal privileges, including the right to use the thing, to benefit from it, and so on. However, there are numerous forms of ownership that do not include free use and even sometimes exclude it. In French law, this is the case when a private body owns something that belongs to the public domain and is either open to free public use or assigned to a public service holding a no-right to use the thing in a way contrary to its intended purpose (e.g., Paris airports). It is then possible to conceive of a form of private ownership that would be applied to things that are strictly inalienable.

Characteristics

In Richard Posner's version of the economic analysis of legal rules, the focus shifts from their contents to the conditions that they must fulfill for a system of private property to function efficiently—these conditions being the exclusivity, universality, and transferability of property rights. This position is under debate, and some questions have been raised about the real efficiency of such a system, the relevance of the efficiency criteria, and the benefit to be derived from the widespread use of such a model, given that the model only applies to certain specific situations in which ownership rights meet the required conditions and that—after all—those situations might not be so frequent.

Object

The impossibility of defining property according to the rights it confers or these rights' specificities leads some authors, such as Charles Donahue, to state that what distinguishes property law from all other jural relationships is that property law deals with things. This statement has been criticized on the basis that almost anything can legally qualify as a "thing." Depending on legal systems and existing laws, manpower, ideas, the moon, traditional dances, and human DNA are, could be, or are not "things," which results in a "thing" being *legally* a thing only when it is owned. Therefore, the object of a property right is a thing but a thing defined, according to the terms of the law, by the fact that it is owned.

This was not always the case. There was a time when things were considered things *by nature* and what distinguished them was the fact that they were tangible. But slowly, jurists have designed complex legal mechanisms for the ownership of intangible objects—rights (e.g., stocks ownership has been a constitutional right in France since 1982), status (e.g., a person owns his or her retirement pension according to the European Court of Human Rights), and even, in memory of the late Jeremy Bentham, future things or legitimate wishes (which have been recognized as things by the European Court in its 2004 decision in the *Kopecky v. Slovakia* case). If even a purely "imaginary" thing can be owned, anything that can be somewhat useful to someone can be the object of property rights. This approach brings to an end the property "dematerialization" process that started in the 19th century and in fact amounts to replacing the notion of "thing" with the notion of value. But since it is truly possible to own a thing without value, this distinction does not help advance a new and satisfactory definition.

Holder

A strong philosophical current associated with the political tradition of "possessive individualism" has tried to equate subjective freedom, personal identity, and self-ownership, property rights being consequently the proper expression of individual freedom. During the first half of the 19th century, it was even common to consider that ownership of property, beyond being a right, was a real political and moral status that gave access to active citizenship (the right to vote) and privileges before the courts ("The master is believed on the basis of his own affirmation," Article 1781 of the Napoleonic Code).

In contemporary law, the full legal ability, the right to have rights, including the right to property, constitutes the freedom of the subject. But legal theory and legal practice have created mere rights holders, meaning subjects capable of enjoying rights that they are unable to exercise (minors, the mentally disabled, animals, corporate owners, etc.). Legal imagination has even produced properties without owners through the notion of patrimony of affectation (patrimony dedicated to a specific legal entity/*Zweckvermögen*), invented by the German doctrine during the second half of the 19th century. Therefore, we cannot make the distinction between private, public, or collective forms of ownership by only taking into account the jural character of the rights holders.

At most, we can say that the notion of property is frequently associated with exclusivity and free use, even with universal opposability and transferability; that the definition of its object refers to the notions of thing and/or value; and that it is often presumed to take root in the subjective freedom of owners. It is also possible to try to pinpoint the coexistence, within the same legal system, of several contradictory conceptualizations of property, all of which are used by legal actors simultaneously (and often implicitly) in their reasoning and argumentation, or even more generally to link certain forms of property to certain trends (unitary ownership and the unlimited power of wealth accumulation, private property and selfishness, collective property and inefficiency, etc.), although these associations are quite often disputed because of their ideological bias.

We might then conclude that property is not a purely technical notion (neutral and objective) but rather a "floating" concept whose applications are always both technical and ideological. From this point of view, the expression *bundle of rights* is helpful because it expresses the various types of rights that the term *property* can imply. It might then be advisable to stop wondering *what property is* and instead try to determine *the purpose of calling certain legal prerogatives "rights of property."*

Why Do We Talk About "Property"?

Legal actors who make abundant use of the word *property* have goals that are simultaneously technical and ideological, as shown by the history of copyrights (but there are other examples such as modified living organisms, material cultural goods, human body parts, etc.).

Since the 18th century, it has been acknowledged that authors own an exclusive right to reproduce their scientific and literary productions and that this right can be transferred to a third party at the will of the author—for example, to distributors for a percentage of the income generated by the sales of these copies. Copyright is limited in time as far as the commercial applications are concerned; its object is intangible (the work is an "original expression"), and multiple holders have simultaneous rights over it (the author owns the copyright and, in continental law, the moral rights; the public enjoys its intellectual utilities). In the past, this has led some to conclude that copyright was not a property right, the latter being an exclusive and perpetual right over a material object (Augustin-Charles Renouard defends this position in his *Traité des droits d'auteur, dans la littérature*, *les sciences et les beaux-arts* [Treaty of copyright, in literature, science and fine arts], Paris, 1838–1839)—or even that it was an imperfect property right that could be perfected by granting authors a copyright for perpetuity, as suggested by Charles Comte in his *Traitè de la propriètè* [Property treaty] of 1834. That copyright should be characterized as a "property right" was therefore not a benign transformation; it tended to integrate legal copyright rules into the general system of property, as it was understood by most legal actors. In the 19th century, this general system included rights in perpetuity.

Since today it is quite possible to conceive of temporary property rights, the designation of copyright as "intellectual property" is no longer related to the question of unlimited duration but rather to a willingness to increase the level of legal protection for copyright holders to the level of protection enjoyed by owners of tangible things, to slowly unify all the legal rules pertaining to various intangible creations (works of arts, inventions, trademarks, etc.), and to extend the scope of these rights to new objects (publicity rights, business methods, etc.)—in other words, to reinforce third-party exclusion mechanisms, to add new legal privileges for owners, and to expand the range of intangible things that can be owned. Moreover, using the term *intellectual property* when referring to copyright helps promote a political belief in the legitimacy of property. Property being a prestigious institution that is commonly associated with individual freedom, the "property of authors" is an easier cause to defend than the cause of their "temporary monopoly." In turn, some experts refuse to talk about property when it comes to copyright, either because they reject the conception of law that supports those rights or because of the collective character of works and the public's right to access them freely.

The strength of these critical trends has reignited the "property dispute" by reintroducing the notion of "positive community," which has theological origins. It has contributed to the creation of legal settings of "nonownership," even of "antiownership," as is the case for some software with *freeware* or *creative commons* licenses.

Today, property law is characterized by the disintegration of the idea of an absolute right of a person over a tangible thing and by the number of definitions used to designate the institution of property and the diversification, expansion, and spreading of ownership mechanisms. Is there a link between the destruction of the dogmatic framework that stands around the notion of property and the current growing trend of proprietarization? As long as it was collectively impossible for legal actors to imagine the ownership of intangible objects, property was limited to material things. As long as property was conceived of as a unitary right, concentrated in the hands of a single owner, legal ownership mechanisms remained basic and did not allow the ownership of intangible or future things. Today, the ownership of any object is legally imaginable; what might be difficult to imagine are the limits of this proprietarization trend. For some, this might be good news, and they may welcome the advent of a broad and efficient private property rights system. For others, this might be unfortunate and may require the design of a new dogmatic framework to stop the expansion of ownership. A third position may be that if the legal imagination has largely played its role these past few years in inventing original ownership mechanisms, it may work to conceive and establish a large number of human activities outside the legal preserve of property.

PROSPECT THEORY

This entry discusses the most prominent psychological theory of decision making under conditions of risk, called *prospect theory*. It was developed by the psychologists Daniel Kahneman and Amos Tversky to explain decision making under conditions of risk, originally published in 1979 in *Econometrica*. Kahneman won the Nobel Prize in Economics in 2002 for the work he conducted in this area with Tversky, who died in 1996. This work represents the apex of models of cognitive psychology in both timing and importance. The model has been imported into a number of fields and has been used to analyze various aspects of political decision making, especially in international relations.

Prospect theory was developed in explicit opposition to theories of rational choice based on more normative assumptions. The intuition that guided the original work grew out of insights into the nature of bounded rationality and a desire to explore the nature and limits of those constraints. Prospect theory was based on a series of experimental empirical demonstrations of actual human choice behavior; it was explicitly developed to present a descriptively accurate model of human decision making. Nevertheless, the domain in which prospect theory explored human decision making was primarily based on choices among a series of financial bets and gambles. It was not originally intended to provide wider generalization beyond that domain, although it has subsequently been invoked to explain a wide variety of phenomena across many fields, including law, political science, and economics.

Prospect theory states that decision making depends on choosing among options that may themselves rest on biased judgments. Thus, it built on earlier work conducted by Kaheman and Tversky on judgmental heuristics and the biases that can accompany assessments of frequency and probability. Such judgments involve evaluations of the external world; decisions involve more fundamentally internal choices across values. Thus, the essence of decision making involves a trade-off between values. Prospect theory encompasses two distinct phases: (1) an editing phase and (2) an evaluation phase.

The editing phase refers to the way in which individuals characterize options for choice. Most frequently, these are referred to as framing effects. Framing effects demonstrate the way in which, contrary to the axiomatic assumptions of expected utility models, which argue that choice should remain invariant, the substance of people's choice can be affected by the order, method, or wording in which it is presented. The classic demonstration of this effect took place in the so-called Asian flu paradigm, in which people were asked to make a choice among public policy plans for responding to an endemic disease. Although the actual statistical probabilities remained identical, the percentage of people supporting a given plan changed dramatically based on whether or not the outcomes were presented in terms of the number of people who would live versus the number of people who would die. In perhaps the most dramatic demonstration of this effect, real-world patients suffering from cancer made different choices of whether to undergo surgery or chemotherapy for treatment of their illness based on whether the outcome percentages were presented in terms of survival or mortality. Once people are presented with both choices side by side, they can easily see that the substance of the decision remains the same, even if the psychic pull to perceive them differently remains.

Once choices are framed for decision, prospect theory enters its second, evaluation phase. This phase involves two component elements, similar in function, but not identical in conception, to the notions of utility and probability in expected utility models. The first element is graphically represented by the value function. This function differs from standard normative models by including a left-hand side to the graph that represents how people respond to loss. In this way, prospect theory differs from standard economic models that always encourage prudence as the better part of valor. Regardless of the normative imprimatur of such advice, this does not accurately characterize how most people make decisions. There are three important aspects to the value function that effectively distinguish it from expected utility in particular. First, the model examines the way in which value is related to the original reference point, or the start of action or choice. In most situations, this reference point is assumed to refer to the person's current status quo position, but this is not necessarily required within the confines of the model. Rather, the operative reference point can be defined by some future level of aspiration or some kind of social comparison. But the key insight of the model is that the hedonic value of choice options is assessed by the way in which people evaluate change, movement, distance, or difference between where they are, or where they want to be, and the outcome offered by a particular choice. In other words, relative outcomes matter more than absolute outcomes. This intuition clearly reflects the realist world of international relations over, for example, the more cooperative image supplied by neoliberal models.

The second important insight offered by the value function relates to the central prediction of the model. People tend to be more risk-averse when in a domain of gains, where things are going well and appear to be likely to continue to improve or where actors confront primarily opportunities for gains. Simultaneously, actors tend to be much more risk seeking in the realm of losses, where they are much more likely to take risks in order to recoup previous losses or to recover from a loss in order to revert to a previous position.

The last important element of the value function recognizes that losses hurt more than equal gains please. Loss aversion has indeed become the most robust finding in the entire model. In general, people have to be offered about two and a half times as much as a loss in order to prove willing to take a risk for the chance of a gain.

The second element of the evaluation phase is characterized by the weighting function. This function contains two critical insights. First, people treat outcomes that are deemed to be either certain or impossible very differently than those whose changes take place in the midrange of probability. In other words, people simply assign more psychological weight and importance to outcomes that they can characterize with greater certainty. While this is not justifiable from a normative perspective, most people treat quite unlikely events as though they were impossible and quite likely events as though they were certain to occur. Second, people tend to overweight, or attribute more importance than normatively justified, to low-probability events. They simultaneously apply less psychological weight to medium- and high-probability outcomes than are normatively warranted.

The interaction of the value function and the weighting function lead to some very interesting and counterintuitive explanations and predictions for phenomena such as insurance (taking a sure loss against the small possibility of a larger loss) and lotteries (taking a sure loss against the even smaller possibility of a large gain). Because people overweight small-probability events, the main prediction of prospect theory reverses close to the reference point as individuals become risk seeking in gains (lotteries) and risk-averse in losses (insurance).

Applications in Political Science

Prospect theory has been applied to a number of cases in political science, particularly in the area of international relations, and also in the realm of comparative politics. In international relations, the theory has been invoked to try to explain decision making involving seemingly irrational risks, such as continuing to engage in sunk costs. In this way, prospect theory has been invoked to help explain the rescue mission of the hostages in Iran and the Cuban missile crisis, among other cases. In addition, in comparative politics, it has been used to explain the nature of risk in economic restructuring in Latin American countries.

The primary criticisms of prospect theory in political science regard the failure to provide an adequate theory of framing that explains how and why actors generate, seek, and employ the frames they use. Additional concerns relate to the external validity of the original experimental paradigm. This point would certainly find agreement among the original designers; Kahneman, at least, did not intend the work to be applied more broadly outside the narrow economic domain in which it was originally investigated. More recent critiques within psychology have focused on the way in which prospect theory provided a limited representation of human emotional and affective responses. Kahneman's more recent work has delved more heavily into the more hedonic aspects of human decision making, emphasizing well-being and happiness.

Some work has attempted to compare the predictions offered by rational choice and prospect theory models to anticipate the outcome of real-world political events, such as the outcome of the Northern Ireland Good Friday peace accords. Other recent work has attempted to synthesize and integrate the more cognitive approach advocated by prospect theory with a more evolutionary understanding of the sources of risk-variant preferences. Based on risk optimal foraging theory, subsistence goals may indeed be maximized by pursuing a strategy that prioritizes risk seeking under conditions of threat to survival in particular.

PROTECTIONISM

Protectionism refers to trade policies that attempt to restrict the inflow of foreign goods into a domestic market. These policies generally fall into two categories: tariff and nontariff barriers (NTBs) to trade. Protectionism diverges from the logic of maximizing economic efficiency characteristic of classical economic liberalism, instead focusing on advancing individual national interests more characteristic of classic mercantilism.

Historically, protectionism has been the norm in the international political economy. Most early-modern European states followed the principles of mercantilism, starting in the 16th century by attempting to maintain positive balances of trade with their trading partners, most readily reflected in their gold reserves. A large stockpile of gold meant that the state was a winner, while others were losers in this zero-sum approach to trade and national power. Great Britain's repeal of the Corn Laws in 1846 is often seen as the first significant step toward free trade. Thereafter, protectionist policies waxed and waned, often in response to economic crises such as the Great Depression or the need by late industrializers to catch up in the development of their economies. The use of tariffs declined significantly after World War II, as the

United States and its allies launched the General Agreement on Tariffs and Trade (GATT) treaty framework, which would eventually become the World Trade Organization (WTO). The GATT and WTO have successfully reduced tariffs in most areas of trade and now concentrate on combating the rise of nontariff barriers to trade.

Theories of Protectionism

Most theories of protectionism focus on the demand for protection raised by pressure groups. In pressure group models, groups seek protectionism from the state to increase their incomes. The task for scholars has been to try to explain more specifically which groups will seek protection and under what conditions they will be successful in getting it. The theoretical basis for the source of trade preferences is usually traced to one of two models: Heckscher-Ohlin or Ricardo-Viner. The Heckscher-Ohlin model argues that factors of production (land, labor, capital) have very low specificity—thus, they move freely among sectors. If a country moves from free trade to protectionism, the income of factors in which a country is relatively scarce will rise, while the income will decline for factors in which a country is relatively abundant. According to the Stolper-Samuelson theorem, scarce factors will then demand protectionism, while abundant factors will oppose it. The Ricardo-Viner model posits that factor specificity is very high, thus factor income is industry or sector specific. The factors involved in import-competing sectors will therefore lose from free trade, while those attached to export-oriented sectors will gain income from free trade. Unfortunately, neither model explains how trade policy preferences are actually translated into political action.

Pressure group models require more than similar interests in increasing income to overcome the collective action problem associated with securing protectionism. If collective action were not a problem, then consumers who largely gain from free trade should easily organize to defeat any movement toward protectionism. Olson has suggested that small groups with specialized interests are easier to organize to secure rents from the state than large groups with diffuse interests, such as consumers. Geographic concentration and firm concentration are sometimes seen as useful proxies for collective-action costs, since spatial proximity may reduce the costs of organizing to secure protectionism.

The supply of protectionism from the state is also a crucial piece of the puzzle, since it may help identify the conditions under which pressure groups may be successful in obtaining protection. Institutional features of the state along with policymaker preferences also affect the supply of protectionism. Studies have shown that policymakers' beliefs or ideas are critical in determining whether they will pursue protectionist policies. Others have shown that the state of the economy is critical in influencing the supply of protection from policymakers. A number of institutional aspects of the state may also influence the supply of protectionism, including the size of electoral districts, whether a country has a proportional representation or a majoritarian system, and whether a country has a parliamentary or a presidential system. Large electoral districts, proportional representation, and parliamentary systems are thought to insulate policymakers from protectionist pressures. The nature of the party system may affect changes in the status quo on trade policy as countries with highly fragmented or polarized party systems may be unable to initiate trade reform. Protectionism may also be more likely in presidential systems characterized by divided government—when one party controls the legislature and another, the executive. The administrative capacity of a state may affect its proclivity toward protectionism, as developing countries with poor capacity to extract direct taxes from their populations often rely heavily on trade taxes, which are much easier to collect from limited ports of entry. Some have also argued that democratic and autocratic regimes may have different proclivities for protectionism, though empirical studies are mixed.

Adherents of strategic trade theory argue that the state need not accept the dictates of comparative advantage under conditions of free trade. States might try to manipulate comparative advantage to produce a competitive advantage in a certain industry. This could involve the formulation of an industrial policy and the use of protectionism to support domestic producers in an imperfect market such that they will reap the benefits of production and yield spillover effects in the domestic economy. This type of policy falls under the general category of neo-mercantilism, with the state taking an active role in selecting industries, often so-called infant industries, that need protection as they mature to compete in global markets. Many developing countries experimented with import substitution industrialization (ISI). The logic was to produce a domestic industry in some sector where one did not previously exist in any meaningful way. The main problem faced by these neo-mercantilist approaches is that it is often hard for a state to know how to pick an industry that will eventually be competitive. Many ISI ventures ended in mounting government debt and inefficient industries that never could compete on the world market. Once protectionism is supplied to support such ventures, the demand for them also tends to be locked in place, since they will be reluctant to relinquish the economic benefits.

Types of Protectionism

Despite the decline in the number and costs of tariffs due to multilateral efforts organized under the GATT/WTO, a number of other forms of NTB protectionism remain, including subsidies, quotas, exchange rate manipulation, and labor, health, and quality control protections. Despite the general reduction in tariffs, countries are often still able to enact policies to protect their own nation's industries from foreign competition.

Tariffs

Tariffs are the most common and best known form of protectionism. A tariff artificially increases the cost of a good. The most common form of tariff is an import tariff. Import tariffs put an additional price, either a percentage of the good's value or an absolute amount, on foreign imports. This increases the costs of foreign goods and provides domestic firms with an advantage in cost production. Since domestic products do not face this tax, they are able to sell products at a lower price and for more profit than foreign competitors.

Subsidies

Subsidies can also be used as a form of protectionism. The two basic forms are direct or indirect subsidies. Direct subsidies are payments from the government directly to producers. Indirect subsidies include government price guarantees, tax exemptions, and other forms of payment that are not direct subsidies. This allows producers to sell products at a lower price than foreign competitors, making them artificially competitive.

Quotas

Quotas are quantitative limits to the number of items that are permitted to be imported by a country. Quotas can be compulsory or voluntary. Compulsory quotas are enforced by government officials. Actors who attempt to exceed the quota are smugglers. Voluntary quotas are agreements between a government and foreign manufacturers of a specific number of goods that are to be sold within a country. Foreign producers may agree to this in order to extract large rents from the limited quantity of goods or in order to have access to the market for fear of even greater protectionist policies. Domestic interests may agree to quotas to limit the overall competition. Voluntary quotas are sometimes known as voluntary export restraints (VERs).

Exchange Rate Manipulation

Countries that do not have floating currencies can artificially depress or inflate the value of their currency. Long-term attempts to depress currency make it more difficult for foreign competitors to compete with the low costs of domestic goods while at the same time increasing the costs of foreign goods.

Labor, Health, and Quality Controls

Labor, health, and quality controls can also be used as a form of protectionism. These standards are sometimes used as ways to restrict foreign competition from entering a domestic market. Claims of mistreatment of labor can be used by domestic labor groups to pressure the government to restrict the importation of goods. Health standards may be employed even when there is dubious scientific risk associated with the imported products. Quality control measures can be similarly employed. In addition, quality control units may be understaffed, protracting the length of time between a product's arrival and its sale. While each of these reasons can be used by countries in a justifiable manner, it can often be difficult to parse out the difference between such instances and the occasions when states create artificially high standards or requirements to restrict or eliminate foreign competition.

Many of these different types of protectionism are quite controversial. As was stated with labor, health, and quality controls, it can sometimes be quite difficult to differentiate between malicious and virtuous intentions. Furthermore, different countries have differing values; standards or assistance at a level that is acceptable in one country may be perceived as clearly subversive among trade partners. As such, each of these is a major point of contention in trade negotiations.

Last, differing types of protectionism may be employed in different sectors. Nearly all countries limit foreign competition in areas of national interest. What those national interests are varies by country. These can include, but are not limited to, areas related to national defense, agriculture, resource extraction, and others.

PSYCHOLOGICAL EXPLANATIONS OF INTERNATIONAL POLITICS

Psychological explanations of international politics focus on the impact of cognition and emotion on choice. Through the analysis of decision making, political psychologists have explored a wide range of topics that are central to international politics: the onset of war, nuclear strategy, deterrence and reassurance, signaling and bargaining, conflict management and conflict resolution, and peace. Recent neuroscientific research on emotion is changing the analysis of foreign policy decision making and rational choice. This entry looks first at psychological theories of decision making. Second, it examines the consequences of new understandings of decision making for strategic models of interaction. Third, the entry looks at the contribution of psychological explanations to the analysis of collective beliefs and moods on international political issues.

Cognition and Emotion in Decision Making

The Cognitive Revolution

Forty years ago, psychologists started a "cognitive revolution" as they rejected simple behaviorist models and looked again at the way cognition shaped the choices people make. Although this was not its original purpose, the cognitive revolution can be understood largely as a commentary on the limits of rational choice. Much of the early work accepted rational choice as the default position and then demonstrated its boundaries. Research has now cumulated to show that people rarely conform to the expectations of the rational model and that these deviations are not random but systematic.

Cognitive psychology has demonstrated important differences between the expectations of rational decision models and the processes of attribution, estimation, judgment, and choice that people frequently use. It explains these differences by the need for simple rules of information processing and judgment to make sense of environments that are both uncertain and complex. People have a preference for simplicity; they are averse to ambiguity and dissonance; and they misunderstand fundamentally the essence of probability. And people have risk profiles that depart from what models of rational choice would expect; according to Daniel Kahneman and Amos Tversky, we are far more averse to loss than we are to gain-seeking. Together, these attributes compromise the capacity for rational choice.

Robert Jervis posits that political leaders making decisions about the world need to order their world and make a very complex world somewhat simpler. When they look to the past to learn about the future, political leaders tend to draw simple one-to-one analogies without qualifying conditions. In 1991, President George H. W. Bush called Saddam Hussein "another Hitler," with little attention to what was different either about the two men or about Iraq in 1990 and Germany in 1938. Yet fitting Saddam into an existing frame through the use of analogical reasoning gave the president a readily accessible script about how to respond to Iraq's invasion of Kuwait.

Cognitive psychologists have produced robust evidence that people strongly prefer consistency, that they are made uncomfortable by dissonant information, and that they consequently deny or discount information that is inconsistent with their beliefs to preserve them. This drive for consistency impairs the processes of estimation and judgment. The well-established tendency to discount inconsistent information contributes significantly to the persistence of beliefs. Political leaders in the United States were generally resistant to changing their beliefs about the Soviet Union after Mikhail Gorbachev came to power with a reform agenda. Three years after he became the general secretary, senior policymakers were arguing that his strategy was to lull the West while the Soviet Union recovered.

Cognitive processes of attribution can also confound policy making. One of the most pervasive biases is the fundamental attribution error, where people exaggerate the importance of dispositional over situational factors in explaining the disliked behavior of others but explain their own behavior by the situational constraints that they face. When explaining behavior that they like, they simply reverse the pattern of inference. When the government of North Korea makes a concession in the talks about its nuclear program, leaders in Washington see that concession as a function of the situational constraints Pyongyang faces but explain their own willingness to participate in the talks as evidence of their disposition to search for a peaceful compromise. The double standard in reasoning is clear.

Cognitive psychology has generated robust evidence that loss is more painful than comparable gain is pleasant. Daniel Kahneman and Amos Tversky found that leaders tend to be risk-averse when things are going well and relatively risk acceptant when things are going badly, when they face a crisis in which they are likely to lose or have lost something that matters to them. Leaders are also likely to take greater risk to protect what they already have—the endowment effect—than to increase their gains. They are also likely to take greater risk to reverse losses, to recapture what they once held, than they would to make new gains. And when decision makers suffer a significant loss, they are far slower to adjust to these losses than they would be to incorporate gains. These general findings apply directly to foreign policy choices. President Sadat of Egypt, for example, never "normalized" for the loss of the Sinai to Israel in 1967. Even though Israel had an obvious advantage in military capabilities, Sadat was undeterred and highly motivated to recapture the Sinai; thus, he launched a high-risk war in 1973, which was designed to begin a political process of negotiation with Israel that would restore the Sinai to Egypt.

Emotion, Cognition, and Choice

New research in neuroscience is revolutionizing the understanding of the relationship between emotion, cognition, and decision. Two results stand out. First, many decisions seem to be the result not of a deliberative thought process but of preconscious neurological processes. Second, emotion is primary and plays a dominant role in choice.

Emotions are adaptive programs of action that have evolved over time to ensure survival and then reproduction. A useful way of thinking about emotion and cognition is to see affective processes as those that address the go/no-go questions, while cognitive processes are those that answer true/false questions. Choice clearly invokes both kinds of processes. Establishing truth claims about states of the world is usually not enough for people to make a choice. What people value is an emotional as well as a cognitive process, and both are important in whether they decide to approach or avoid making a choice. Hence, emotion carries utility. The new field of neuro-economics is beginning to conceive utility as something one experiences subjectively.

There is an ongoing and vigorous debate among psychologists, neuroscientists, and behavioral economists about the relationship between affect and cognition. Three approaches are particularly relevant. The first is the somatic marker hypothesis, the second is the affect-as-appraisal hypothesis, and the third is affect-as-information. Each understands the relationship between emotion and cognition differently.

The first argues that the information people receive through their senses, which they experience physiologically, creates emotions that then cue decision and action. These physiological experiences, or somatic markers, create learned emotional responses that allow people to decide quickly what should be approached and what should be avoided, notes Antonio Damasio. In the early stages of decision making, emotions are primary.

The appraisal approach to emotion is quite different. It reflects the long-standing view that cognition precedes emotion. It is thoughts that evoke feelings. The cognitive process of appraising—a treaty, a leader, a new institution—as good or bad elicits an emotion. This approach is inconsistent with that of neuroscientists who see emotion as primary and as the carrier of value.

A third approach, presented by Gerald Clore and Karen Gasper, treats affect as information. Emotions carry information to people about their unconscious processes, which then become conscious thoughts and feelings and an input into the decisions they face. In this sense, emotion does not follow cognitive appraisal but creates appraisals through the information it provides.

Affective and cognitive processes can collaborate or compete. At low levels of intensity, affect appears to play a largely "advisory" role; it provides information about cognitive processes. At intermediate levels of intensity, people begin to become conscious of a conflict between cognitive and affective inputs and the struggle for self-control. At high levels of intensity, affect can be so powerful that it short-circuits thought and moves to action. Emotion precedes cognition and can swamp cognition. Only after the fact can people reflect on the choices that they made.

Emotion and Cognition as Explanations of Strategic Interaction

Emotion is a core driver in theories of decision making, with significant consequences for the understanding of foreign policy decision making. Psychological explanations of foreign policy choice have been extended to strategic interaction in international politics. The credibility of signals, an essential component in theories of deterrence, compellence, and bargaining, is not only a property of the sender, as some formal models of signaling suggest, but also a function of the beliefs of the receiver, notes Jonathan Mercer. These beliefs are not only cognitive but emotional as well. The emotional cues that signals evoke—such as fear and anger—matter insofar as these emotions then prompt beliefs and action in turn. Research demonstrates that fear prompts uncertainty and risk-averse action, while anger prompts certainty and risk acceptance. Threats that evoke fear are likely to prompt hesitancy and a risk-averse response; that is the purpose of most deterrent threats. Frightening threats are less likely to be successful, however, when they are designed to compel adversarial leaders to act. And threats that humiliate are likely to evoke anger and provoke the risk-acceptant response that a threat-based strategy is designed to avoid. Threat-based strategies consequently become much more complex and dangerous to design and implement.

Research also demonstrates that credibility, a fundamental component of theories of action in international politics, is emotional as well as cognitive. Credibility is not simply a function of either the cost of the signal or past behavior, as some theories of bargaining claim. It is an emotional belief that is held by its intended receiver. Russia's credibility is not only a function of what its leaders say and do, or have said and done, but what

Georgia's leaders believe Moscow will say and do. Psychological explanations call into question reputational models based exclusively on the past behavior of states or on the costliness of signals. They give theoretical weight to the pattern of inference leaders make and build in emotion as the primary driver of assessment in the early stages of decision making.

Emotion, Cognition, and Collective Beliefs

Psychological models explain not only leaders' choices and the interactive sequencing of these choices across a range of domains in international politics but also collective beliefs and moods. Epidemiological and viral models help explain the diffusion of emotion from an individual to a larger group. The spread of emotions from one individual to another is similar to other contagious processes.

Trust and confidence are central to workings of the international order. Confidence and trust are emotional states, an indicator of optimism about the future. They are also cognitive, one person's sense of how confident others are and their perceptions of how confident still others are. An individual's mood is in part a function of the mood of others, and in this sense, it is as reasonable to speak of a collective mood as it is to speak of shared norms. Psychological models speak to both collective beliefs and collective moods. Emotions, political psychologists argue, constitute feelings and moods that can be powerful spurs to action in international politics or can lead to panic and withdrawal.

Nationalism is an emotional belief, an attachment to one's society that is evoked by emotional cues and expressed through emotional identification with the collective. Mobilizational appeals to nationalist loyalty for both constructive and destructive purposes are emotional, phrased as "love of the motherland [or fatherland]." Slobodan Milosevic's appeal to Serb nationalism, for example, invoked past humiliations and grievances in an effort to mobilize anger and support for action. The onset of ethnic war in the former Yugoslavia cannot be understood without referencing the "emotional entrepreneurship" of the Serbian political leader.

Psychological models explain both individual and collective behavior in international politics. Research in neuroscience is bringing emotion back into the analysis of international politics across a wide variety of issues. The research challenge will be to connect psychological processes to political and institutional streams and to identify and explain the amplifying feedback loops.

PUBLIC BUDGETING

Public budgeting allocates public resources. This allocation function means that budgeting lies at the very heart of politics. Who gets what and when from the government in financial terms is what politicians and publics alike care about. It is distinct from "private" budgeting in several respects. First, in all but one-person dictatorships, public budgeting is a collective decision. The processes used to make decisions vary. Second, decision makers do not spend their own money. They must raise these funds somehow. The most common device is taxation. Governments may also make money from the management of public property, such as land or firms, as well as from profits that arise from the sale of public resources, such as copper or oil. They may also borrow money to fund current expenses. Finally, the question of whether budgeted funds are being used in the public interest is an ongoing theme that a private individual or firm does not usually confront.

Decision Making in Public Budgeting

The fact that public budgets arise from a collective decision presents several challenges. First, consider the lessons from the formal theory literature about the multidimensionality of a policy space. A policy dimension, to be clear, is simply one line on which one can rank a given option. The traditional dimension used in many studies is a simple left–right one, but in budgeting, one can imagine many such dimensions that correspond to spending on a given subject. One person may want the government to spend a lot on health care but only a little on defense, for example. The formal theory literature tells us that when one can line up the preferences of actors along one dimension, there is a stable outcome that arises from a simple majority vote. When one has multiple dimensions, however, several outcomes are usually possible. Moreover, these outcomes are not "stable"; that is, they will lose to one or more other feasible outcomes, which in turn are not stable either.

All this means that the rules that structure the way decisions are taken on the budget are crucial. If the rule is to stop consideration of the budget after just one vote, then one would want to know who gets to decide the content of that vote. This "agenda setter" will have the ability to select an outcome closest to his or her preferred outcome even though there may be other outcomes that can beat it in a one-to-one majority vote. To move beyond this rather abstract discussion to practical implications, a student of public budgeting will want to know who has the right to propose a given budget, what the rules are to change the budget, how high the threshold is to pass the budget, and what happens if the institutions fail to pass the budget. For example, the president may propose the budget, a congress will then consider the budget, and the budget may then have to be passed with only a simple majority to become law. In a country such as Chile, the president does propose the budget, the congress does not have the right to make amendments that raise aggregate spending beyond what the president proposes, it takes a simple majority in congress to pass the budget, and the president's budget simply becomes law if the congress cannot pass it. In this case, the president is easily the most important player in the budget process. This contrasts with a country such as Paraguay, where the congress can make whatever amendments it wants to the president's budget and where the default budget is the previous year's budget rather than the one the president proposed. In this case, the congress has a stronger hand to play.

The decision-making rules have additional importance when one considers that government is spending not its money but someone else's money. Assume that politicians do a simple cost–benefit analysis for the people who support them. The politician cares about the benefits of additional spending and the costs of additional taxation only with respect to his or her constituency. Assume as well that taxes go into a common revenue pool and do take the form of "user fees" so that there is a direct correspondence between spending and costs. Under such conditions, one can imagine a situation where a given constituency receives the benefits of spending but pays only a tiny fraction of the costs. For example, consider an agriculture minister who worries only about the interests of farmers. The government provision of subsidies to the farm industry may equal $1 billion, but the total additional tax the farmers pay for this is only $10 million. In the literature, this situation is known as a "common pool resource problem."

Once again, the decision-making process is crucial. If the agriculture minister determines spending programs for farmers, he or she will allocate more spending than in the case where he or she considers the full tax implications of his or her decision. If the budget is then simply the sum of the requests of ministers who worry only about narrow constituencies, spending will be higher than the ministers themselves would want if they could make the entire budget on their own. One can imagine a different outcome if there is an actor in the process whose job is to worry about the entire tax burden and not just the burden on a specific constituency. In practice, this person is usually the finance minister. But it is not strictly necessary to give all budgetary power to a finance minister. Negotiations among decision makers can also lead to full consideration of the tax burden so long as they do not take the form of "logrolls" of different proposals, that is, so long as the parties involved consider the full burden of their spending decisions and do not simply vote for each others' proposals.

One technique to centralize the budget process that one sees increasingly is top-down budgeting. The idea is that one should first vote on a total amount of spending before deciding on the distribution of that amount according to different spending categories. This is in contrast to bottom-up budgeting, where one votes on each item and then simply aggregates them all to get the total budget. The top-down system, for example, was instituted in the Swedish parliament in the mid-1990s for all budget votes. Whether this procedure really leads to lower spending and—as a consequence—better aggregate fiscal discipline is open to question. In an influential theoretical article, John Ferejohn and Keith Krehbiel illustrate that the combination of preferences among the relevant voters decides whether the top-down or the bottom-up process leads to a smaller aggregate budget.

There is less controversy about the desirability of budget transparency. When it is easy for the public to follow what the government is doing, it is difficult for policymakers to use "tricks" to make figures appear rosier than they really are. It is also easier to cut spending if one knows about it. James Alt and David Dryer Lassen indicate that the way states provide information on the budget, whether there is independent verification of budget figures, whether there is use of arbitrary language, and whether there is required text that justifies different parts of the budget, are connected to fiscal outcomes. Countries with more transparent budget systems have higher levels of fiscal discipline.

Public budgeting also involves a temporal element where institutions also play a role. For example, it is common for politicians to promise immediate spending but to delay the "pain" of the costs. One way to do this is through public borrowing. The government in this case runs a budget deficit and carries debt on its books that it will have to repay later. Another way the temporal element matters is when a benefit is promised to a specific group that is small at first but that is projected to grow over time so that the costs also grow. Public pensions are a prime example of this dynamic. Many countries have populations that are aging. The number of people who will be entitled to a public pension will increase while the number who will be paying into a given system will decline. Such a scenario is one where the pension system is designed as "pay go," where workers pay for a benefit that is given today in the expectation that they will receive that same benefit at some future date. Public budgeting involves decisions about how to structure such systems. Australia, for example, created a type of sovereign wealth fund that invests public money today in the expectation that it will be able to cover the pensions of an increased number of retirees tomorrow.

An increasingly important part of budgeting therefore involves multiannual planning. Annual budgets with no planning encourage short-sightedness and overspending for the reasons given above. They also tend to make a government fairly conservative in its assessment of what it is doing—one cannot recognize the future impact of today's incremental changes. There are also types of spending that are inherently multiannual. Capital expenditures, for example, are often on items that take several years to build. There may also be contingencies, such as loan guarantees or bank recapitalizations, that do not appear in an annual budget but that should be included in decision making. The traditional way to plan would be to set multiyear plans with fixed projections. The plan in this case is indicative only; that is, it forecasts what will happen if there are no changes in current spending obligations.

Trends in Public Financing

A trend in the public finance field is to move planning toward medium-term expenditure frameworks (MTEFs). One first determines an overall constraint for the period that is based on anticipated revenues. One then looks at the expected spending at the agency/ministerial level. There should be a clear distinction between ongoing and new programs. There should also be measures to produce savings in low-priority areas that can create fiscal "space" for ministries to reallocate funds where appropriate. A good example is that of the Australian government, which begins with a baseline projection and provides forward rolling estimates of spending for the next 3 years. The country's Department of Finance then updates these plans. While the goal is to get decision makers in government to consider the temporal implications of their actions, the law also requires the government to provide an update of this framework to voters 3 months before an election.

While several international economic organizations, such as the International Monetary Fund, have suggested that countries adopt such medium-term expenditure frameworks, one should also be aware of the prerequisites for such planning. A country needs to have enough macroeconomic stability so that revenue and expenditure predictions can be made with some accuracy. Politicians have to agree to use the frameworks. There also has to be core capacity in different ministries to do the planning.

The focus so far has been on the decision-making process that is involved in making the public budget, but how the money is spent is another important topic that is increasingly making its way into even the initial decision-making stages. This brings us to the standards that one uses to make the evaluation. The first standard is usually a fiduciary one, namely, whether the budget upholds fiscal discipline and, ultimately, whether the state is solvent. The second standard concerns allocative efficiency. Does the state budget reflect government priorities? The third standard is operational efficiency. The state should not pay too much for the services and goods it provides its citizens.

This then begs the question of what one should evaluate. One can assess a budget according to its inputs, or how much is spent on each budget category, but increasingly governments are assessing budgets according to their outputs, or even outcomes. The examples here illustrate the differences among the three concepts. The amount of money a city spends on its police force is an input. The number of police personnel would be the output, while the overall crime level would be the outcome. Concerns about fiscal discipline usually focus on inputs and discuss the budget balance as well as the debt burden of the state. Here are some of the questions regarding fiscal discipline that one may need to answer: Who finances any debt that is generated? How much interest does the state pay on that debt? Is the government credible enough to be able to repay it at some point in the future? Discussions of allocative efficiency can also look at inputs, but generally, a detailed discussion of both forms of efficiency requires some knowledge about both outputs and outcomes.

"Performance budgeting" is perhaps *the* hot topic in budget circles these days, and countries have in practice adopted different techniques under this heading to get at output and outcomes. The simplest form of this technique is when information on targets or results is included as part of the budget documentation, but it is really only background information in practice. Performance-informed budget, in contrast, means that information enters the budget process but it does not have any real effect on how resources are allocated. A true direct-performance system allocates future resources depending on the achievement of specific goals. For example, there may be an expectation that a school district educate a minimum number of students, and if it does not, it will lose funds to districts that educate more students.

A historical example illustrates how the system can work. In the 1950s, the different branches of the U.S. military generally decided how many tanks, aircraft carriers, and other equipment they needed. President John F. Kennedy's defense secretary, Robert McNamara, instituted a new budgeting system known as the Planning, Programming, and Budgeting System (PPBS). It extended the planning horizons from 1 to 5 years. It also instituted planning that asked what the threat was the U.S. military was supposed to address, what the appropriate force mix should be given the threat, and what funding should be allocated to develop that force mix. While there has been some retrenchment on this system, it had a practical political effect of moving some of the "power" from the joint chiefs of staff, which was composed of the heads of each branch of the military, to the civilian leadership in the Department of Defense.

Some variation of performance budgeting has appeared in many countries over the past 2 decades, and their experiences have raised a series of challenges. One issue concerns the information that is needed to do performance budgeting. It is often costly to generate, and some items are easier to assess than others. Moreover, one would ideally like to have information that allows one to estimate whether different levels of expenditure generate different levels of results, and such information is hard to get. Finally, there are monitoring issues. If it is in the best interests of a given school to project good performance, for example, and the school authorities collect the information themselves, how can one be sure that the less flattering information is indeed passed along to policymakers?

The number and type of output- or outcome-based targets can also overwhelm policymakers. Richard Hughes indicates that the United Kingdom (UK) had more than 300 performance targets and more than 600 specific targets when it introduced the Labour government's version of performance budgeting in 1998, and politicians and bureaucrats alike were overwhelmed. Prime Minister Tony Blair decided to focus on the 35 he found the most important, and in practice, the number of targets has declined after each spending review to only 30 in 2007. While France included more than 1,000 targets in its first budget after it adopted performance-based budgeting in 2006, one suspects that the number of targets ultimately will decrease in this country as well.

Finally, to collect all the data necessary to do performance budgeting, to evaluate performance, to adjust spending given that performance, and to update targets takes a professional, and competent, bureaucracy. Countries that have adopted performance budgeting and that have generally found the approach worthwhile have had some of the best bureaucracies in the world. As Allen Schick notes, such countries generally have decent budgeting systems anyway and are probably the least in need of performance budgeting in the first place. According to Salvator Schiavo-Campo, Ghana is one country where such budgeting techniques may have been doomed from the start. The African country set more than 2,500 targets in the late 1990s, or several times the number of accountants in the public sector, and the most important item in the budget, personnel expenditure, was not included at all.

Joining performance budgeting are other trends, such as private finance initiatives, that blur the difference between "public" and "private" budgeting. Consider who should pay for the construction and maintenance of a bridge. Traditionally, the government would build the bridge, maintain it, and—if it chose to charge a toll—receive any revenues. This meant that the government was responsible for raising the money for bridge construction. It also bore any risks associated with the bridge, be they bad weather that delayed the finish date to the effects of saltwater on the durability of the materials used. The government faces a constraint from its revenue base on how many investment projects it can build and maintain. In recent years, private finance initiatives have brought the private sector into such projects. Generally, the private sector arranges the financing from private capital markets. It also bears the risks from the construction phase onward. Many such arrangements also assign the maintenance of the investment to the private sector. In exchange, the private part of the arrangement gets the revenues from the investment for a fixed amount of time.

Such private finance initiatives have become widespread in the UK, but one also finds them in other countries, such as Germany. Because the arrangements do require fairly large-scale private financing, they depend on stable, and liquid, capital markets. The financial crisis that began in 2007 put some of these arrangements in jeopardy, and in the UK, the state had to bail out the private sector and assume the remaining risk from a given project. This development begged the question about how "private" such initiatives are in practice.

PUBLIC EMPLOYMENT

Public employment has many aspects depending on the level one is considering. It has a role in national economy and national employment, in the public sector generally, and at the level of public institutions such as ministries and agencies. This entry describes the nature of public employment and its significance in government and society.

Public Employment in the Economy

The role of public employment varies substantially depending on the role of the state in society. In countries following the model of a welfare state, such as the Nordic countries, the share of public sector and public employment can be quite high—30% of the national economy or even higher. Any numerical estimation of the size of public employment involves a number of assumptions. For example, it is important to know what percentage of public employment is composed of those employed by the armed forces, because this share of employment is considered to be outside the working force. Also, given the complex relationships now involved in the delivery of many public services, it has become more difficult to determine who is in the public sector and who is outside.

In less developed countries, the role of public employment in the national economy is usually much smaller, in part because it fulfills different functions. On the one hand, the public sector plays a more significant role in development functions such as education and in social and health policy. On the other hand, the limited resources available to the public sector do not permit these countries to employ many public servants. Also, patronage and clientelism in many of these systems may prevent hiring of employees through the merit systems that are more typical of industrialized democracies. The politicization of public service creates both management problems and difficulties in providing equitable public services.

Public Employment in the Political System

The structure of the public sector determines where the bulk of public employment will occur. In federal states, the central government may be relatively small compared with that found in unitary systems. For example, in Germany, the central government has small policy-making ministries. On the other hand, in a centralized regime such as France, central government employees include elementary and secondary school teachers.

Public employment reflects the internal structure of the policy sectors in the public sector. Under each ministerial sector, there are agencies, regional units, and local units, which together form administrative sectors. For instance, under the Ministry of Interior, there are the police forces, the front guards, and different kinds of organizations that are responsible for the security of the country. These organizations have employees, such as police and fire personnel and the like, who belong to the public employment sector. The number of ministries and associated functions vary among countries, but typically, the number of ministerial sectors ranges from 10 to 20. The size of employment varies greatly from sector to sector. In welfare states, the largest sectors are social affairs, health care affairs, and education (schools and universities). As each country has developed, the size of its ministerial sectors has also changed as a result of the modernization or development process. For instance, during the initial period of rail and public road construction, the number of public employees in the traffic and communication sectors was very high, but today it has decreased. Thus, public employment to some extent can be used as an indicator of the priorities of government and the desire of the public sector to control important policy sectors.

General rules and steering systems within the public sector and governments have organized public employment into a common system. These public employment systems generally contain several categories of public employees, which are more or less governed by formal rules. In these systems, civil servants play a major role. These employees tend to be in a defined career and to be governed by laws that are distinct from other labor laws in the society. Unless they fail woefully in their tasks or are guilty of malfeasance, civil servants in particular may have secure employment for a lifetime. In many civil service systems, rewards for office are also strictly defined by law. This more secure position of the civil servant follows Max Weber's model of neutrality of civil servants.

Additionally, there are other public employees whose position in the public employment system is not as legally formalized as that of civil servants. School teachers, nurses, and doctors usually belong to this group of public employees. These employees may have some of the protections of civil service law but often are employed either as professionals or under ordinary labor law. Furthermore, many of these employees have only a tenuous relationship with the public sector because the institutions for which they work (e.g., hospitals, universities, etc.) are managed as autonomous organizations rather than as components of the public sector per se.

Since the 1970s, in modern national states such as most European countries and many others around the world, national-level steering systems have been created to tackle public employment policy issues. In the most developed countries, the formal rules of public employment may be controlled by both legislation and negotiation systems. These systems, which include rules for negotiating salaries and other work conditions of public employees, complement civil service laws that fix the legal position of public employees. These systems help develop better relationships between public employer organizations and trade unions for negotiations. In many countries, such negotiation systems have provided not only public employees but also civil servants the right to strike. Traditionally, civil servants did not have the right to strike.

Especially since the 1980s, new public management (NPM) has created a more flexible framework for public sector employees. The number of ordinary civil servants has decreased, while at the same time, greater numbers of public employees have been hired on contracts, following private sector labor laws. In many countries, with more people moving in and out of the public sector, there is a decline in the number of people opting for a career in civil service. This has meant increasing similarities and closer contacts between public and private working life, which has resulted in a better understanding of the obligations of public employees.

In fact, a small core group of civil servants, and the legislative systems built around their position, provides a national profile for public employment. In developed countries, there are competing profiles of the core civil servants. The British system is famous for its civil servants, who are politically neutral but are increasingly being managed by rules more similar to those in the private sector. The French system is widely known for its career civil servants, who are educated in the best Parisian lyceums and universities and have received training at the publicly run École Nationale d'Administration (ENA). One can also distinguish the German profile, in which a legal education and the organization culture of *Rechtstaat* have played a prominent role. In the Nordic countries, the neutrality and legal basis of civil servant activities are emphasized, but recruitment and career development are moving toward open hiring, by which anyone who has the necessary qualifications can be appointed to the civil service.

In addition to the issues of politicization in public employment mentioned above, the issue of representativeness also can undermine the effectiveness of the public sector. Especially, for street-level bureaucrats in contact with clients, the extent to which the public bureaucracy is representative of society in social and gender terms will influence the success of government in delivering programs as well as the legitimacy of the political system.

Administrative Traditions and Public Employment

Public employment systems vary from continent to continent. The traditional system in Europe has, however, had a wide impact on the general development of public employment traditions all over the world. Colonialization has also had a role in spreading European public employment systems, especially in the African and Asian countries that once belonged to the British Empire or had been under the regime of France. The British tradition of civil service, however, had a wide impact in countries that have similar or related administrative traditions, such as the United States, Canada, Australia, and New Zealand.

In today's world, the development of public employment is often identified with the British (including that of the British Empire and its former colonies) and the continental European traditions. In wider historical consideration, one must not forget the Chinese mandarin tradition, the traditions of Egypt, and those of ancient Greece or Rome. Historical traditions of France, traditions from the Great Revolution and the so-called Napoleonic tradition, have also had a great impact in the development of modern public employment traditions. The fundamentals of modern public employment from cameralistic administrative arts to Weberian *Rechtstaat* are derived from German traditions. The Nordic welfare state ideal has brought into the public employment tradition the demands of public service orientation and the role of civil servants as service-oriented staff responsible for high-quality public services in social and health care and in education.

PUBLIC GOODS

Unlike private goods, which the market can produce and sell, public goods are ones that people can freely use and share with others. A pure public good is nonexcludable (people cannot be excluded from its use) and joint in consumption or nonrival (use by one person will not reduce its availability to others). This entry describes the nature of public goods and contrasts the approaches to them taken by economists and political scientists. When allocating public or semipublic goods by means of the coercive powers of the state—legislation, budgeting, and taxation—governments have to handle the problematic of these goods, including tax evasion (free riding), oversupply (rent seeking), and undersupply (preference distortions), as well as allocation and distribution in trade-offs. The entry examines these phenomena and concludes with a look at the allocation of common goods in a global context.

Public Goods and Public Finance

Since the identification and conceptualization of this special set of goods or services by Italian public finance scholars in the 19th century, public goods have attracted a lot of theoretical interest from both economists and political scientists. Whereas in economics the question of the optimal supply of public goods has dominated the concern with these goods and services, which differ from private goods as conceptualized in market theory, political scientists have looked at how goods and services with the characteristics of public goods are allocated in domestic as well as international political systems. The political preoccupation with public goods has led to inter alia theories of collective action, free riding, and transaction costs.

The theory of public goods offers an economic approach to public policy making and implementation, suggesting criteria that public programs should fulfill, derived from conceptions of market failure and collective-action difficulties. It targets the allocation of public services as well as the regulation of the economy, disregarding distributive aspects. Although its basic model of an optimal supply of public goods offers an ideal-type construction bypassing transaction costs, opportunism, and bounded rationality, it still captures the essence of the state as the guardian of law and order, financing its operations with taxation.

Nature of Public and Semipublic Goods

A pure public good is characterized by nonexcludability and jointness in consumption, or "lumpiness," meaning that people can enjoy it without paying for it and share it whole with others. The two properties of nonexcludability and lumpiness create market failure, as pure private goods are excludable by the price mechanism and completely appropriable. Impure or mixed public goods have either nonexcludability or nonappropriability but not both. Nonexcludability is also called externality (external effects), and nonappropriability involves economies of scale (natural monopoly). Public safety and defense are pure public goods, whereas environmental resources ("common pool" goods), such as water in a river, which are open to all but can be depleted by use, are semipublic goods, as are those supplied through infrastructure ("common club" goods), such as toll roads—individuals must pay for access, but use does not deplete such goods. According to Richard Cornes and Todd Sandler (1996), there are both positive and negative externalities, and the extent of scale economies varies, as one speaks of global, national, regional, and local public goods.

Problematic With Public Goods

No single person has any incentive to supply public goods, since he or she cannot internalize all its benefits. And once a public good has been supplied, the best strategy for an individual is to free ride on it. Since the allocation of public goods faces market failure, they invite government intervention. The key question is "How and in what form should government support or manage the allocation of public goods?" Government tends to allocate pure public goods through its bureaucracy, in order to regulate the externalities by agencies and to undo natural monopolies by policies of deregulation, privatization, and leveling the playing field. However, when government corrects for market failures, then the risk of government failure arises, as the public good is captured by rent-seeking actors.

Optimal Supply of Public Goods

Efficient allocation of public goods requires that the willingness of people to pay for the lumpy good cover the cost of its provision. This can be achieved only by summing individuals' willingness to pay through some process of aggregation. A voluntary supply of public goods is theoretically imaginable (by way of demand revelation schemes, through which people indicate their desire for a good by indicating how much they are willing to pay for it), but when the number of people demanding the public good increases, then transaction costs quickly become prohibitive. To avoid free riding and preference distortion as well as delaying tactics, government replaces the voluntary mechanism with state authority. One may argue that the first theoretician of public goods was Thomas Hobbes, who regarded safety as a country's most important public good.

Real-Life Distortions With Public Goods

The allocation of public goods—pure or impure—is in practical terms at the core of the political process, as government at various levels in the political system engages in policy making and implementation of programs having the characteristics of public goods. The aggregation procedure for summing up the willingness to pay for public goods is in reality the democratic procedure, or elections as well as legislative budgeting and taxation. Thus, party politics and coalition politics basically provide the set of possible demands for public goods, whether pure or impure.

In democratic politics, the allocation of public goods may be combined with distributional policies, with policy combinations that are conducive to fiscal illusions involving the over- or undersupply of public goods. The rational strategy for the citizen is to free ride on the supply of public goods, minimizing as much as possible his or her contribution to covering their costs. The efficient prices for public goods—"Lindahl tax prices"—are not feasible due to preference revelation distortions and free riding. Thus, government imposes taxes and borrows money as needed to pay for the lumpy goods allocated to the entire political community. There is no guarantee that what a citizen is willing to pay will equal what he or she is forced to pay—the Lindahl tax price. The allocation of public goods has distribution consequences with regard to both their benefits and their costs. Thus, public goods involve more political than strictly economic concerns. This is true for both supply and demand.

On the supply side, public goods contracts tend to be lucrative for private entrepreneurs. Deciding how to allocate these contracts, worth millions or billions of dollars, involves a tendering/bidding process that is very difficult to fully institutionalize in accordance with a transparent competition regime. Politicians are easily "captured" by various enterprises, looking for rent in the construction of lumpy goods—see, for example, Robert Caro's (2002) descriptions of Lyndon Baines Johnson's rise to power and Senate dominance. Charles Rowley, Robert Tollison, and Gordon Tullock's (1988) theory of rent seeking suggests that government contractors are willing to pay almost all of the economic rent captured in campaign contributions and the like.

Externalities (Nonexcludability)

External effects call for public policies, demoting negative ones and promoting positive ones. Since the social benefits or costs are not captured by market prices, there is market failure and thus a reason for government intervention. The key question is how much should government spend on generating social benefits, and how much should it impose as social costs? The theory of cost–benefit analysis was intended as a rational answer to this query, but it has proven difficult to target policy making so that social benefits or social costs are handled in an efficient manner. The problem is that there may be no limit to what government should do using externalities as the criteria. However, specific measures such as vaccination or control of contagious deceases are clearly defensible public goods policy. Externalities may be promoted as national public goods or local public goods depending on the size of the community involved.

Club Goods (Jointness)

The theory of clubs is an attempt to devise a rational approach to the problem of dividing competences between various levels of government, taking into account the capacity of a political community of a certain size to internalize externalities as much as possible, especially when benefits taper off or congestion arises. Federalism is one version of such a club theory about creating jurisdictions that are capable of internalization of as many externalities as feasible. It has received a novel interpretation in the theory of multilevel governance, including new regional organizations such as the European Union (EU).

Infrastructure (Scale Economies)

The public goods aspect of infrastructure used to be analyzed as natural monopoly regulation with a call for government intervention. However, with the deregulation and privatization starting in the late 1970s, both monopoly regulation and antitrust policy have lost some of their credentials. Again, it is capture theory in one version or another that favors a level-playing-field policy orientation with maximum open entry in enlarged markets beyond national borders. Today, regional competition policies, such as the EU regime with its commissioners, are considered appropriate to undo monopoly and invite competition. The occurrence of economies of scale is no longer considered a natural phenomenon but a market-related one. Increasing the size of the market is a better response to this type of market failure with club goods than entry regulation and price setting. The size of the market is a function of the extension of the law or common legal institutions between countries, such as EU law.

Global Public Goods and Commons (Rivalry)

Governments may handle the collective-action problems that arise concerning the allocation of public goods in their own domestic countries. Instead of relying on a voluntary mechanism for the supply of national or local public goods, governments employ state authority to make budgets, laws, and taxes. But the problems with a voluntary supply of public goods resurface on the global scene, where externalities such as global warming, carbon emissions, and the environmental destruction of common pools such as the oceans and endangered species call for a global ecology policy. Kyoto I was meant to set up such a global common pools policy, but it ran into the typical collective problems of preference misrepresentation, free riding, and reneging. Negotiating a new global policy runs up against the tremendous transaction costs typical of a voluntary approach to public goods provision. Elinor Ostrom (1990) has argued that small groups may overcome the collective-action difficulty of protecting a commons, but in most such examples, the state helps the groups reduce transaction costs by somehow or indirectly enforcing the rules allocating the common pool goods. In the global arena, there is no world government or voluntary coordination scheme to do just that.

Political Relevance of Public Goods

While economists analyze the question of a voluntary supply of public goods and its optimality, political scientists know that such schemes will hardly be practical. Thus, they concentrate on understanding the allocation of public or semipublic goods by means of the operations of state institutions. In a representative democracy, political parties handle the demand and supply of public and semipublic goods. Due to bounded rationality, opportunism, and voter myopia, the political process will not arrive at an optimal allocation of these goods, where each individual's marginal benefit equals his or her marginal cost (Lindahl equilibrium). It is widely recognized that the allocation of public goods does have distributional implications and that it is the mixture of allocative efficiency and justice in distribution that makes public or semipublic goods inherently political.

PUBLIC OFFICE, REWARDS

The term *rewards* refers to any kind of tangible income and intangible compensation or honor attached to public office. Rewards are relevant in political science because they link the adequate compensation of our rulers with their performance. On the one hand, in democratic systems, proper compensation includes the reward level and the transparency of the reward structure for public scrutiny. Concerns of transparency, corruption, and public trust in rulers are relevant for creating a proper reward system. On the other hand, the performance of public officials relates to achievement at the individual and organizational levels, which in turn are linked to the legitimacy of democracy. These dimensions have been tackled by normative and positive political theories.

Normative theories prescribe what political choices ought to be made according to some philosophical values, such as representativeness, competitiveness, and functionality of rewards for public officials in relation to the rest of society. Positive theories try to explain the particular political choices made for rewarding public officials. Different theories emphasize the role of institutions and past legacies, cultural values, or the rent-seeking strategies of individuals in accounting for the achieved reward level, visibility, and value of the different parts of the reward structure.

The structure of rewards covers financial (salary), material (with monetary value), and intangible elements. The combination of these elements varies among different categories: countries; public officials from the legislative, the judiciary, or the executive; the legal nature of institutions (regulatory agencies, independent national banks, bureaucracies);

or policy areas (public safety, education, health, etc.). Managerial public sector reform trends and the role played by democratic values are likely to have an impact on how the structure of rewards changes for different public officials.

This entry is further developed into four sections. First, the main normative and positive theories are described. A second section shows the elements of the reward structure. The third section is devoted to the recent emphasis on managerialism and performance-based pay. The final section links rewards to transparency.

Political Theories on Rewards

Normative Theories

Normative theories of the 18th and 19th centuries define how public officials should be rewarded. Three different sets of values have been promoted. First, individualistic values have been fostered more frequently. Adam Smith (1723–1790) advocated for the exclusive link between payment and performance, although he did not propose a specific reward system. Jeremy Bentham (1748–1832) devised a more nuanced system for rewarding performance, indicating the degree of transparency required in defining the whole reward package, how potential corruption practices should be avoided, and the like. Frederic Taylor (1856–1915) also supported the idea of paying for performance when advocating his "scientific method" of work in mass production. Second, Georg Hegel's (1770–1831) view on rewards was more functionalist, suggesting a level of pay that would make neutral and expert public servants focus on the general interest rather than the interest of a few. Sufficient pay was needed to avoid corrupt practices. A similar view was held by Max Weber (1864–1920). Third, Alexis de Tocqueville (1805–1859) hypothesized that the strengthening of democracy would result in a decline in the rewards of public officials, thus making them more representative.

These normative prescriptions coincided with the initiation of macroprocesses such as industrialization, the consolidation of modern public bureaucracies, recognition of individual universal rights, and the introduction of democracy. These disparate movements, with different emphases across countries, are likely to have led to the emergence of the aforementioned criteria on rewards. The introduction of mass production systems brought about a concern with performance and private sector benefits. Unlike in aristocratic times, the advent of democracy introduced issues of public accountability and representativeness, with the growth of the bureaucracy creating problems. The consolidation of public administration and its neutral competence entailed the implementation of a merit system to fight politicization practices, derived from democratization. Around the same time, the Northcote-Trevelyan report (1854), the Pendleton Act (1883), and other such regulations in Western societies tried to abolish the favoritism of political appointments and to replace them by merit systems.

At present, normative issues concerning rewards are ingrained in empirical research. The work of Christopher Hood and Guy Peters in the 1990s offered three different criteria, as expounded in earlier philosophical texts, against which the level of rewards and their contents could be decided on. First, a more egalitarian approach recommends that rewards of public officials, especially those holding high office, be representative of the population at large, that is, they should take into account the composition of the population according to the most obvious criteria (e.g., race, language, ethnicity). A second, more functionalist approach advocates paying a sufficient reward to prevent officials from engaging in corrupt practices. Finally, a market approach suggests that the level of rewards should be on par with the salaries for similar positions in the private sector. None of the approaches can be found in its pure form in any country, although some countries seem to have more representative rewards, while others use the functional principle of sufficient compensation. In any case, the introduction of managerial practices in the executive during the 1990s and 2000s has apparently caused a shift toward more individualistic and market-based practices.

Positive Theories

Since the early 1990s, political theories focusing on rewards have developed explanatory arguments trying to decipher why some systems have made particular choices when deciding reward levels for public officials and to describe the particular composition and the transparency of the reward structure. Christopher Hood and Guy Peters have fostered several publications in which three types of explanations have been considered: (1) institutional, (2) political economy, and (3) cultural theories.

Institutional theories claim that formal and informal rules account for the particular evolution of reward systems. Rules define whether pay is determined through collective bargaining, independent review, market mechanisms, or specific regulation. Rules also set the level of pay at national, sectoral, or agency levels. Moreover, the proportion of the salary structure is decided by rules considering the basic pay and other allowances and the degree of transparency. Institutional theories are designed to explain the continuity in the working of certain institutions but have more problems in identifying when a change takes place, because the institutions by themselves, without the contribution of actors, are noncredible energizers of institutional change.

Economic theories of politics consider the constrained institutional settings of individual strategies, but they focus on individuals as benefit maximizers, that is, making their rewards as large as possible. Those theories are normally crafted as games for which two sets of actors have different preferences and strategies. To study rewards, games can be modeled to confront the (dis)trust strategies of citizens in relation to the strategies of public officials, who are more or less transparent in getting their rewards. Games can also model to what extent senior civil servants have more or less individualistic pay strategies than civil servants of lower hierarchical levels. Although embedded in institutional settings, political economy theory tends to consider the preferences of individuals as exogenous to the institutions and somehow universalistic—that is, shaped outside the institutional context in which they operate.

Cultural theory, dismissing this universalistic view of exogenous preferences, goes beyond the classic idea that national cultures matter in anchoring political phenomena to cultural views. Christopher Hood, either alone or with others, has contributed extensively to apply cultural theory to the evolution of rewards pattern over time. This theory is based on the "grid group" concepts of Mary Douglas. "Group" refers to what extent individual choices are determined by the groups in which individuals are incorporated. "Grid" indicates the role of external rules and prescriptions in determining the life of individuals. The combination of high–low grid and high–low group offers four dominant cultural types: (1) hierarchical, (2) individualistic, (3) egalitarian, and (4) hazardous.

Hierarchical systems are based on the predictability and automaticity of rewards progression within organizations. Individualistic systems are characterized by the rent-seeking behavior of public officials, which normally operates on the variable parts of the salary or on other perks of substantial monetary value, discarding the automaticity of rewards. In egalitarian systems, monetary rewards are accommodated at lower levels than what the individualistic behavior would predict because other intangible rewards are obtained. Hazardous cultural patterns imply the introduction of chance elements in the way in which promotion and rewards happen, making them nonautomatic and unpredictable.

Comparative work has used a combination of the three "lenses," as they are not entirely alternative explanations of how rewards evolve. Most country case studies have a predominant institutionalist bias, which accounts for the creation of reward systems following traditional models. The introduction of changes in this account is normally referred to as a minor adaptation of traditional practices. In any case, institutionalists have difficulty explaining why there are shifts within the same society from more egalitarianism (or hierarchism) toward more individualism over time in the rewards of senior civil servants or why the salaries of lower level civil servants erode over time, while the monetary rewards of senior civil servants increase. Political economy theorists were not able to explain the erosion of the wages of politicians in several countries, in spite of them trying to maximize their rewards. Cultural theory seems to explain the shifts throughout time, using both institutionalist and political economy reasoning. Further research is needed to test these theoretical lenses.

The Structure of Rewards and Its Level

The list of components of a reward system is considerable and varies across countries and types of public officials. The first distinction is between financial rewards, material rewards with monetary value, and intangible rewards. Financial rewards constitute the pay received by public officials. They can be classified into basic pay and other fringe benefits. Basic compensation is the salary paid for a position that includes insurance, tax deduction, and deferred compensation. Fringe benefits include considerations pertaining to the level or grade of the post, risk or abnormal working conditions associated with the post, acknowledgment of seniority, special duties or responsibilities, and performance bonuses. These allowances are directly linked to the job performed. However, the particular amount is not included in the basic pay in some cases because they compensate the job particularities associated with a particular post. In other cases, these allowances are not consolidated in the basic pay so as not to be included in the calculations of the future pension, which will burden the public budget.

Material rewards, or in-kind benefits, that have direct and substantial monetary value include variegated items such as promotion, inter- and/or intramunicipal transportation, housing, meals, travel, tax deductions, and private health insurance, to list the most popular items across countries. In most cases, these rewards are tax free.

Some rewards such as promotion, pension, and employment in a better paid job in a private or (semi)public corporation are deferred in time and enjoyed in the future. Traditionally, public officials were compensated for good performance by promoting them to higher positions with a hike in salary. As there are now not enough positions to promote high-performing officials, good performance is rewarded with extra compensation. Employment in a more lucrative position may constitute a typical path in the system but is at least subject to some kind of ethical code.

Finally, public recognition, delegation of authority, social respect, job security, some social privileges, or reputation are typical examples of intangible rewards. They are subjectively and contextually defined. Individuals bestow subjective recognition on some potential rewards, and the context may deem some rewards very important or irrelevant. For instance, in some countries, civil servants have high status and are well respected, while in other countries, this is not so. Unless they are misused, these rewards are not a matter of concern for public accountability.

Compensation for public officials includes many different financial supplements and other benefits, also colloquially known as perks, that make its analysis complex. The various financial rewards and in-kind tangible benefits, presently enjoyed by public officials or deferred to the future, belong to items subject to more or less transparency and individual negotiations. The managerialist trend in the public sector in the past 30 years has also introduced the relevance of performance bonus.

Managerialism, Rewards, and Performance

Managerialism implies more pay flexibility, that is, the ability of public sector organizations to match market rates, to compete for scarce skills and good candidates, and to reward individual efforts. The managerial reforms that started in the 1980s, inspired by private sector practices, have stressed the value of more flexible pay arrangements as well as the use of performance pay. The creation of agencies and organizations with a management ethos that is different from that of traditional ministerial departments and the possibility of hiring personnel under distinct contractual conditions has allowed for the introduction of a more managerial culture in some parts of the public sector. In these organizations, where direct entry from the private to the public sector has been possible, several countries have tried to match private sector rewards, although unsuccessfully.

Apart from uniform pay scales, performance pay is another flexible means of compensating individual or group productivity. When properly done, performance pay is not consolidated in the salary. Extra performance is explicitly recognized either through the comparison of achievements against predefined targets or through the appraisal negotiations between managers and subordinates. This financial bonus is said to motivate workers to higher levels of performance, according to normative theories.

Expectancy and reinforcement theories have been associated with performance pay. Expectancy theory predicts that employees' motivation is led by their belief that making an effort will affect organizational performance. This increase in performance will lead to an increase in the monetary benefits of the employee, who specially values these benefits. In a nutshell, higher performance–related salary motivates employees. Reinforcement theory states that individuals are likely to choose responses associated with positive outcomes of the past. In positive reinforcement, valued behavior will be preferred and repeated over time because it yields positive results, such as higher salary.

Managerialism, present in many countries, influences differently systems and groups of public officials. Its practices have likely resulted in greater pay differentials between civil servants and politicians, agency chief executives and senior civil servants, and senior civil servants and lower level civil servants. However, empirical research has often found a mismatch between the potential benefits of performance pay for individuals and for the organization and staff motivation. An overwhelming majority of studies reviewed by James Perry do not show evidence of positive effects of performance pay, especially for organizational performance and for higher managerial posts, where jobs are complex and tasks are not normally routinely defined. Positive effects in the more routine jobs are due to the easiness of establishing clear goals against which performance can be measured.

Several reasons explain this mismatch. First, civil service laws and procedures try to be uniform, while individual performance pay implies exceptions to uniformity. Second, budgetary allocations for performance pay cannot grow at the pace of performance. Unlike the private sector, higher performance does not necessarily mean concomitant higher financial benefits for the organization. Third, organizations do not invest much energy in performance appraisals, which results in unsatisfactory performance assessments. Fourth, individual performance cannot be properly rewarded if organizational goals are not clearly defined, as is the case in many public sector bodies with multiple stakeholders. Finally, transparency apparently makes performance pay less workable in the public sector, as there are some indications that secrecy in private organizations is helpful for performance schemes to succeed. Furthermore, transparency does not allow for a substantial increase of performance bonuses as this may cause a public outcry. In sum, performance pay does not seem to have increased greatly staff motivation. Therefore, public service motivation is analyzed by including other nonfinancial components. Success stories of performance pay have been more prevalent when individual and organizational goals were aligned.

In any case, there has been a general shift away from the fixed scales advocated by the functionalist approaches, which believe in the principle of adequate compensation and the need for a uniform reward system across the board for similar levels of public employees. This general shift has represented more individualization of salaries for senior civil servants in the executive, but not so much in the legislative and the judiciary. In spite of the limited success of pay for performance, pay differentials among groups have materialized. Civil servant salary levels have surpassed parliamentarian salaries in many countries, and the differences in compensation between senior civil servants and civil servants at lower levels have widened.

Rewards and Transparency

Transparency refers to the publicity and availability of data on rewards of public officials for public scrutiny. The gradation of transparency depends on the number of components of the reward structure that are open to scrutiny, the degree of publicity of this information without being demanded, and, alternatively, the availability of the data on request by individuals.

Lack of transparency is related to at least two different sets of practices. First, while basic pay may be frozen or pegged to annual inflation rates, other variable parts or perks may be kept away from public scrutiny. Second, there may be a potential for unethical behavior by claiming expenses that are unrelated to the incumbency of a public office, as the mass media are occasionally revealing in different countries.

Normative criteria for the level of transparency of a system are similar to the three different visions of the cultural theory. For egalitarians, rewards should have maximum visibility, and the amount of hidden perks should be kept to the minimum. Functionalists suggest that rewards should reflect the activities pertaining to the position. If travel or special risks are associated with the job, these should be paid separately in tax-free allowances. There would then be a certain justification for less visible rewards. Finally, a market approach would link reward to performance. Workable individual performance pay seems to be better adapted to nontransparent organizations, as in the private sector.

Empirical research in Western societies shows that the levels of transparency seem to be declining over the years. Transparency level differs for distinct types of public officials. While rewards for parliamentarians seem to have become more transparent with time, the availability of data for civil servants, especially senior civil servants, seems to be decreasing. Furthermore, the analysis of salaries in Latin American and Australasian countries does not support the functional theory that high rewards for public officials entail lower levels of corruption in the system. Further research is needed, as it is difficult to find meaningful connections between aggregate figures of corruption levels and the general levels of rewards. This hypothesis should be tested for specific groups of public officials (local officials, security forces, teachers, etc.).

Managerialism and decreasing levels of transparency might have caused the increase in civil servants' rewards compared with the reward levels of parliamentarians. There seems to be an implicit trend whereby in democracies, the rewards for politicians tend to be more representative or reflect the ideals of representation, with few possibilities of being rewarded for performance, except for the intensive use of per diems as a consequence of being appointed to different commissions, whose attendance, away from their constituency, allows for extra perks. Civil servants, especially senior civil servants, have found different functional and homogeneous ways to raise their salary level. In some countries, a senior civil service category has been created, separate from the rest of the civil servants. Further, individual performance pay has been introduced, although its success has been questioned, and the creation of arm's-length agencies has fostered higher rewards for their managers. Despite a general increase of salaries in the executive, salaries of private sector enterprises have not been matched, even in those countries where such efforts have been more persistent.

Research on public sector rewards has been fostered in the past 20 years in political science, but further analysis is required. Comparative country studies should give way to other comparisons, especially among public officials working for agencies of different types (hospitals, regulatory agencies, independent banks, bureaucracies) and from different policy sectors (safety, education, health, etc.). The differences and similarities across countries within these sectors could yield further results and inputs for political theories.

PUBLIC OPINION

Public opinion is a notion that is frequently invoked, not only in everyday parlance but also in political and scholarly discussions. Yet it is a concept that is extremely ambiguous and difficult to define—indeed, it seems that a common definition does not exist. When the scholar Harwood Childs attempted to reconstruct the principal meanings of public opinion in the 1960s, he identified more than 50 different definitions. Since then, the frequency of use of the concept has grown substantially, together, probably, with the number of meanings attributed to it. This diversity of meanings—or polysemy—is implicit in the denomination of the concept, which associates two distinct, and somewhat conflicting, ideas. "Opinion" refers to the individual sphere, to reputation, evaluation, and judgments of value; hence, it is open to question, or debatable. "Public" refers to the collective dimension, to subjects and places accessible to all, of common interest, adopted by recognized and, therefore, "public" authorities. And here arises the question at the very heart of the debate that has always surrounded the topic: how to render compatible, consistent, and coinciding aspects that are both individual and collective, singular and common, subjective and objective. The question is further complicated by the increasingly widespread and entrenched tendency to consider public opinion as a unitary concept—an "objective" and "natural" basis for political choices and/or institutional decisions, in competition with the electoral response—and the tendency to consider public opinion as an indication of, or even synonymous with, the "will of the people." This entry discusses these various meanings and their implications for contemporary democracies.

Definitions of Public Opinion

Looking beyond the meanings attributed to public opinion, it is important to note that the concept is linked to democracy and its affirmation. Democracy becomes a condition of public opinion, a component and a method. Democracy affects and characterizes the viewpoint, the language, and every discussion surrounding public opinion. Consequently, its definition in some measure also involves democracy.

Among the various definitions of public opinion that have developed and intersected over time, three prove particularly significant, in that they allow one to delineate the main interpretive elements, which are substantially distinct and competing.

The first approach takes its inspiration from the Enlightenment and first and foremost identifies public opinion with the "public sphere" (the theory of Jürgen Habermas), the area in which the "enlightened classes" exercise criticism of and provide a check against the action of power. In other words, the public sphere is the open debate around the decisions and issues of public interest. Public opinion accompanies the formation of bourgeois society and mediates the separation of the state from the publicly important "private sphere" of "civil society." It promotes the advent of the "market," of rational thought, and of "liberty" and is a necessary condition of democratic systems that have been established in the West alongside the great economic and national revolutions. According to this reading, public opinion is not the sum of individual opinions, as other interpretive currents sustain; rather, it is a context of relationships and communication that develops at the collective level (as several authors, from the Chicago School to Herbert Blumer, argue). It is a "public" discussion about emerging problems that involves different actors and arrives at producing a common shared position.

The second approach considers public opinion as an effect of the influence exercised by actors and agencies that control the channels of information and the formation of ideas. Consequently, the prevailing opinions in society, the images of reality that people express, actually would not correspond to reality; they do not emerge from free discussions and from debate among intellectuals but would instead depend on the pressure exercised by the media and by propaganda. Public Opinion (which Walter Lippmann writes in capital letters—and not by chance), hence, is fueled by stereotypes and prejudices. It evokes a sort of conformism: the adaptation by the masses to prevailing thought. To a certain extent, this interpretation is echoed in the model of the spiral of silence proposed by Elisabeth Noelle-Neumann, based on the analysis of electoral behavior in Germany in the 1960s and 1970s. The study reveals that large segments of the electorate who did not express their preferences during the electoral campaign in the end aligned themselves with the positions of the candidates and parties favored to win and voted accordingly. In other words, their silence reflected not only uncertainty and indifference but also the fear of deviating from what was considered to be the predominant orientation. Interviewed by the polling agencies, they preferred to remain silent rather than contradict the beliefs expressed by the majority and emphasized by the media and in the public debate. That is, to use the language of Noelle-Neumann, they preferred to conform to the "climate of opinion" that characterizes society during that time period. This explanation evokes the idea of *common sense*, this being another polysemic term possessing very deep historical and cultural roots. It is discussed and thematized by, among others, Antonio Gramsci, who cites *The Betrothed* by Alessandro Manzoni, observing that "there was even someone who didn't believe the plague-spreaders, but couldn't support his opinion against widespread popular opinion," because, as Manzoni writes, "good sense was there, but it remained hidden in fear of common sense" (or general—i.e., public—opinion) (Gramsci, 1975, p. 216).

For some authors, however (in particular, Niklas Luhmann), public opinion constitutes a functional necessity, put into action by the political (sub)system to reduce social complexity. In this case, it is an area that is structured around relevant and important themes, conditioned and/or imposed by public communication. This reasoning appears exactly symmetric, and in many ways contrary, to that of Habermas, who holds that public opinion coincides with the public sphere generated from "below," by civil society and by intellectuals. Instead, this reasoning stresses the role of the institutions of power, political actors, and the media, which aim to influence and direct public opinion.

The third interpretation is defined by some as populist and by others as methodological. It does attribute great importance to people's popular opinions and at the same time to the possibility of studying them through the technologies of public opinion research (polling). Public opinion, in this case, is made to correspond with the sum or collection of individual opinions gathered and analyzed by means of surveys conducted on representative samples of the population. The first and most influential exponent of this position is George Gallup, who began conducting his public opinion polls in the 1930s in the United States, correctly predicting the outcome of the 1934 presidential elections. Gallup felt that polls are useful—and reliable—instruments that measure the will of citizens and are in some ways better than voting for discovering and understanding citizen demands, because surveys are able to articulate issues and demands, taking into account individual, social, cultural, and ecological characteristics. The only problem is to construct a sample that is truly representative of the population and to perform surveys through well-formulated questionnaires and well-conducted interviews. Public opinion, in this way, is traced back to the empirical sampling of aggregated individual opinions, whose meaning is summed up according to a majoritarian logic, as in elections where the popular will is deduced from the vote of a fraction. This may be majoritarian but is not necessarily the majority—and is often far from the totality of the population and/or voters.

Normative Orientations

The three ideas that orient the conception of public opinion are summarized by three different normative orientations that aspire to prevail as descriptive or real. They reflect three different ways of understanding the relationship between citizens and power, between society and institutions, in representative democracies. In the first case, public opinion is conceived of as a *jury*, an instrument by which the informed citizen judges decisions and those who make the decisions. In this case, public opinion is a space that renders "public" the exercise of authority, opening up to all those who so wish the chance to supervise and participate. In the second case, public opinion is conceived of as a *consensus*, the method by which to conform the orientation of citizens to the values and wishes of those who govern, or as a climate of opinion, or common sense—an assemblage of stereotypes and prejudices that inhibit critical thought and push the less aware and informed members of society to conform to dominant beliefs. In the third case, public opinion is considered truly as such, which is to say, as a *fact*, a given, an actual entity that coincides with society, voters, and citizens, without any distinctions. And it sums them up according to their individual opinions into an undifferentiated aggregate, recognized as having the value of "reality" because it is observed and observable, measured and measurable, by using polling technologies.

These three ways of understanding public opinion continue to coexist and interact over time. Media and public opinion agencies compete to shape public opinion from above. Influenced or commissioned by the centers of the political and institutional system, they seek to conform citizens' opinions to the prevailing values and to strengthen consensus with the view of the elite.

In the same way and at the same time, public opinion is a critical space. It intervenes via groups, newspapers, social movements—and, in more recent times, through the web, via Internet blogs and social networks—to counter and affect public choices. In addition, public opinion also takes on an active role itself in forming individual opinions to shape the general beliefs.

Undoubtedly the public opinion polling and populist conception of public opinion is that which has progressively won out and today tends to dominate over the others, thanks in part to the contribution of the media—especially newspapers and television. The media have amplified and legitimized polls and have presented and imposed them as "reality." In turn, the media and other actors that participate in presenting the polls—the pollsters, journalists, political commentators, and politicians themselves—have gained and continue to gain legitimization from the surveys, which additionally offer the chance for a "show," while the political scene itself appears more and more spectacular, as we will see further on.

Public Opinion and Democracy

At this juncture, it is useful to shift our reflection to the relationship between public opinion and democracy. As we have already mentioned, this is a close and inextricable relationship. Public opinion gains importance with the establishment of democracy. First of all, it is considered as a condition, in that it is an area of control and also of public discussion. It is also an arena for the conquest of consensus, a field in which different actors compete and clash as they aim to impose their issues and dictate the agenda of problems to tackle, to influence the priorities and preferences that characterize the vision of life and society among voters and citizens. Ultimately, public opinion becomes a functional equivalent of the electorate, a synonym for the people, to be systematically polled so as to understand fundamental orientations and to constantly verify the degree of consensus enjoyed by politicians and their policies. It could almost be considered an election that takes place each and every day.

Therefore, the connection with democracy seems to be strong—a sort of symbiosis that in recent decades has become systematic and constitutive. In this regard, we can cite Bernard Manin's analysis of the principles of representative government. In proposing a periodization, Manin indicates how the "democracy of the public"—or of the audience—has been established in the most recent phase.

Wherever communication takes the place of organization and participation, people assume greater importance than political parties—or they become the main reference of the parties—where the mechanism of the internal relationship among the different levels of the party and the relationship between the state and society is specifically and especially entrusted to the polls. The voters become "the audience" as they react to political propositions that escape their control; citizens become public opinion. Manin notes that public debate remains a condition of representative government. However, in reality, public opinion is ordinarily evoked to legitimize and measure the consensus—or dissent—concerning political actors. It is forced to coincide with the practically inseparable duo of the media and the polls. This brings about the problem of not taking for granted what actually cannot be—of not accepting the idea of public opinion that is dominant among such limited social components as the only possible public opinion.

Conversely, if public opinion is summed up through surveys communicated by the media, then it is impossible to avoid confronting the fundamental criticisms expressed in this regard. First and foremost among these criticisms is that expressed by Pierre Bourdieu in his noted 1973 essay, with the absolutely explicit title "L'opinion publique n'existe pas" [Public opinion does not exist]. The target of his unequivocal critique of the concept of public opinion is the presumption of forming it on the basis of surveys, which are imperfect tools for numerous reasons. However, his strongest criticism was of the claim, considered epistemologically untenable, of producing a "general" vision based on "individual" opinions: individual reactions to questions posed by strangers (the interviewers), during interviews dealing with mostly "unfamiliar" subject matters, posed to people who are for the most part not very interested or who may be completely extraneous to politics and the issues of the public debate. For this very same reason, it is considered improper to use an aggregate of opinions to replace something that should instead emerge from public debate and the initiatives of social actors.

It is considered arbitrary—or even worse, deviant—to treat the responses of interviewees as equivalent, without distinctions that take into account the differing degrees of involvement or expertise of the people surveyed. It is as if everyone were an expert in all matters; as if there were no people who possessed a greater degree of expertise; and, most important, as if some people were not more involved and influential—over the "opinions" of others—on certain specific topics.

Polling as a Basis for the Concept of Public Opinion

Limitations of Polling

We can better articulate the limits imposed by a concept of public opinion—and by a democracy—based on polls by referring to a number of technical, methodological, and substantive problems. First, there is the question of the limits of representativity of the survey samples, which increasingly include fewer numbers, are stratified by quotas, and are distorted by the process of acquiring the information where the share of people who refuse to be interviewed is growing larger and larger. The techniques of weighting the data, during the data analysis phase, should serve to adjust the sample to the "real" makeup of society. However, these techniques tend to distort the representativity yet again, to the point of transforming the conclusive data into artificial products of sophisticated mathematical models.

The second problem to contend with is the methods and instruments of the interview. Surveys are now conducted mainly by telephone, to reduce time and costs. Thus, the interviews are conducted in an impersonal way, often by specialized marketing centers with little expertise in the subjects being considered. Furthermore, the home telephone, or landline, is becoming less and less popular, and so other means are used to conduct surveys—for example, by Internet, through the use of e-mail and social networks, or via mobile telephones. These new means create new problems that are difficult to resolve. Surveys conducted using the Internet are still not able to reach "representative" samples of the population, for the simple reason that the population segments that use the Internet are still quite specific—despite the fact that they are large and continue to grow. Certain segments of the population, in particular the elderly and those with less education, are largely excluded. Telematic interviews pose problems with interpretation (they are not conducted directly, nor do they take place in a shared conversation). And last, with regard to mobile telephones, complete lists of numbers are difficult to obtain (given the numerous providers) and even more difficult to use (as access to the numbers is rightfully limited by strict privacy laws). Furthermore, interviewing people via mobile telephone brings with it certain inconveniences (the locations and conditions in which the interview takes place are unpredictable). And in any case, the responses are obviously conditioned by the questions asked, by the style of the interview, and by the length of time required of the interviewees. To sum up, it is very difficult to consider the results of surveys as "faithful" and representative of the population's beliefs.

The third problem raised is that the methods of data elaboration and analysis naturally and inevitably influence the results. The methods of weighting the data, as previously mentioned, increase the discretion of the researcher and the statistician. Furthermore, adequate attention is not always given to the absence of responses or the reticent responses that often affect the "valid" interviews to a great extent. Finally, in reading the results, there is the tendency to present the distribution of the responses according to a majoritarian logic, which is to say that the beliefs expressed by the majoritarian segments are emphasized, though they may not be those of the majority of the population. For example, an issue favored by one third of a sample, when other issues are chosen by lesser shares of interviewees, risks being amplified by media communications as the will of the people.

Methods for Addressing Technical Problems

To limit these technical problems that invalidate the claims of representativity and significance of polling, certain methods of weighting have been proposed, as well as specific and alternative means of conducting the polls.

To begin with, there is the practice of introducing some questions at the end of the interview or after a few questions, in order to determine the expertise or, at least, the significance interviewees attributed to the issues and questions posed. It was James Fishkin who elaborated a different method of conceiving and conducting surveys, known as *deliberative polling*. It entails that surveys are constructed in such a way that the "sample" of those interviewed can actually be informed about the subjects of the research and takes into consideration the different theories and interpretations that relate to it. The polling is carried out in such a way that those being interviewed can dialogue and discuss among themselves, which permits the "raw" opinion to be registered, as well as the "refined" opinion (following the process of information and discussion). This method seeks to reconstruct the foundations of public opinion at its origins, recognized by Habermas as the bourgeois public sphere and by others as the Athenian Polis in the age of Pericles.

However, the correctives proposed have only been employed conservatively and episodically. In the case of the techniques of self-verification, this has been true more out of carelessness and methodological negligence than for problems related to time and cost. Inserting qualitative questions to clarify the significance and the motivations of the quantitative responses would complicate polling. This is even more so the case following the widespread use of computerized techniques in telephone interviews. As for deliberative polling, it has been carried out in close relationship with experiences of deliberative democracy, therefore, where discussion with citizens is valued in decision making, especially at the local level. But the same critical principle that inspired this design at the same time constitutes a limit inasmuch as deliberative polling is a means of forming opinions, in a conscious way. Those who conduct and commission surveys, however, are interested in finding out everyone's opinions rapidly—especially the opinions of the less well-informed.

All in all, polls are imperfect methods of learning individual opinions, which assume greater value and general importance. Polls serve and are used to "objectify subjective opinions." For this reason, polls are important in democratic play. They are important not so much—or not only—because they define public opinion, but because they help (a) orient individual opinions, (b) impose a version of reality, and above all (c) establish the myth of a public opinion that actually exists, is scientifically based, and is therefore measurable. They assume and impose a substantial equivalence between opinions and people, between opinions and voters, and between opinions and votes.

Polling, Media, and the Market

However, polls and the surrounding media, unlike traditional methods of propaganda entrusted by mass parties to functionaries and internal specialists or to those with political affinities (militants and sympathizers), are conducted by professionals who operate in the market and who consequently respect, and are subject to, the rules of the market. This means that they are sensitive to the needs of their employer. Polling agencies and the media are businesses that are often under the control of economic groups or influenced by political entities of the government (and others).

Thus, public opinion based on the media and their polls is very different from the public opinion to which social and political actors contribute, in that it does not constitute an arena, or the result of the potentially conflictive interaction between different and distinct parties. Rather, it aims to coincide with reality, to represent and measure the real situation, because it is produced by technologies and technicians (who in turn, however, are the focus of pressures and involved in political and economic relationships).

Consequently, the field of public opinion is complex and cannot be traced back to a single subject. The interests of political and economic actors in particular are in competition and often in contrast with those of the media, cultural and scientific actors, polling professionals, political scientists, and journalists—who, in turn, derive economic compensation, prestige, and power from their roles as "experts" and witnesses of public opinion. At times, it is difficult even to determine the different interested parties and their roles: The politicians need—and at the same time fear—the polls and the media; just as the media and polling professionals need the politicians to be able to exercise their influence in order to reach their audience and achieve legitimacy. In this way, they themselves also become political actors.

Public Opinion as a Social and/or Political Construct

This suggests a further, and different, phenomenological interpretation, which holds public opinion as a social and/or political construct, whose purpose is not so much to guide the opinions of citizens but rather to impose a representation of public opinion that is recognized as true. This happens by fixing fundamental references around which it is structured: personal or social uncertainty, fear of others, and the vulnerability of the economy or employment. Thus, the political contest becomes a contest between differing and competing models of public opinion, which are proposed and even more so imposed as the only ones possible. These ways of creating a vision of reality, taken for granted as such, in turn influence relationships with power, relationships with institutions, and political and electoral choices.

The game played around public opinion is thus complex, and the number of players participating in the game contributes to the complexity. It suggests that in the era of democracy of the public, the political struggle is primarily a symbolic struggle, in which the fight is to prove a specific vision (or "narration") of reality, inspired by specific values and by specific images. The weapons employed are marketing and communication techniques, which use the media and polling to erase the distance between everyday life and public life.

It suggests, finally, that the issue at stake is not only public opinion but also the very meaning of democracy. On the other hand, democracy has become personalized, and communication with citizens happens more and more through the media, which transforms them into an audience, into spectators. The understanding of social demands and orientation happens not so much through participation but through polls, which convert people into opinions. Therefore, it becomes difficult to isolate the discussion—and criticism—around the prevailing definition of public opinion, without involving democracy itself, whose prevailing "version," in this phase, uses public opinion as a base, a constitutive principle—as a "fact."

Q

QUALITATIVE COMPARATIVE ANALYSIS

Qualitative comparative analysis (QCA) was first introduced to the social sciences by Charles Ragin to identify complex patterns of causation by processing social science data with Boolean algorithms. By conducting a formalized comparison, QCA introduces the logic of qualitative research to the study of a larger number of cases than are usually examined with qualitative methods. QCA usually is employed with a middle-sized number of cases (10–30).

The approach taken by QCA has been described as a middle course between case-oriented and variable-oriented methods. In his initial presentation, Ragin (1987) argues that variables should not be examined detached from the cases, as this is done in purely variable-oriented approaches. Based on the assumption that a causal explanation of social phenomena always must include considerations about contextual factors as well as the possibility of conjunctural combinations of relevant conditions, QCA does not process individual variables but includes cases as configurations in the analysis to arrive at causal explanations. Described here is how QCA seeks to identify the necessary and sufficient conditions of a specific phenomenon ("outcome" in QCA terminology) as well as to achieve the most parsimonious explanation for all instances of the phenomenon.

Since the publication of *The Comparative Method* (Ragin, 1987), a series of techniques based on the ideas of QCA have been developed, which can be subsumed as "configurational" comparative methods. This entry first focuses on the ideas of the original crisp-set qualitative comparative analysis (csQCA) technique based on binary data and then briefly introduces recent developments.

Crisp-Set QCA

Originally, QCA performed calculations on Boolean, that is dichotomized, data only. In terms of set theory, this means that QCA deals with "crisp sets" as opposed to "fuzzy sets." All data included in a csQCA analysis must therefore be coded dichotomously, which means that it has to be considered for each case whether the case fulfills the condition or not. The outcome has to be coded dichotomously as well. By convention, in csQCA, an uppercase notation indicates the presence of a condition, whereas a lowercase notation signifies the absence of this condition. By using Boolean algebra, the configuration for a case can then be written by concatenating the values for all the conditions included in the analysis. For example, in a study concerning the conditions of development of new ecological parties in Western democracies in the 1980s, it is theoretically feasible that the success of these parties depended on conditions such as the electoral system (proportional representation or not), a high level of socioeconomic development (measured by gross national product [GNP]), the construction of nuclear power plants, and the density of the population. In the case of

Norway, for example, a high level of socioeconomic development can be observed, as well as a system of proportional representation; these two conditions are met, but there are no nuclear power plants, and the density of the population is low. Thus, for Norway, the configuration can be written as *VOTING * GNP * nuclear * density* (* indicating the Boolean AND).

In the first step, all cases with the same configuration are grouped together. For each configuration, the outcomes of the cases included are compared. If all cases show the same outcome, the common value (positive or negative) is assigned; if not, the configuration is marked as contradictory. In the second step, for all configurations with the same outcome, the minimization rule is used to identify conditions that are not relevant for the outcome to occur: "If two Boolean expressions differ in only one condition yet produce the same outcome, then the causal condition that distinguishes the two expressions can be considered irrelevant and can be removed to create a simpler, combined expression" (Ragin, 1987, p. 93). So if, for example, all cases with the configuration *VOTING * GNP * nuclear * density* and *voting * GNP * nuclear * density* show the same outcome, the condition *VOTING* can be considered to be superfluous. The minimization rule is applied iteratively to the identified simpler expression, minimizing the included logical expression as far as possible. This produces a number of "prime implicants," each explaining only cases with the outcome examined.

To exemplify the use of the minimization rule, a data set with three conditions *a, b,* and *c* and an outcome *o* is used here. Each possible configuration is found in exactly one case, producing the truth table (Table 1).

Table 1 Exemplary Data Set

Case	*A*	*B*	*C*	*O*
C1	0	0	0	0
C2	0	0	1	0
C3	0	1	0	1
C4	0	1	1	1
C5	1	0	0	0
C6	1	0	1	1
C7	1	1	0	1
C8	1	1	1	1

To obtain the prime implicants for cases with Outcome 1, the minimization rule is applied to all pairs of configurations with this outcome. Each configuration in Table 1 with Outcome 1 is represented in the left column of Figure 1. For each pair of entries in this column, the minimization rule is applied, and if the two expressions differ in the value of only one condition, the minimized expression resulting from the minimization step is listed in the middle column (the minimization steps are indicated by the arrows). This procedure is iteratively repeated for the shorter expression that is produced. *B* is the only prime implicant consisting of one condition. Prime implicants are finally identified in Figure 1 as implicants that have not themselves been included in a minimization step (as *aB* and *AB* have generated *B*, they are not prime implicants). Here, *AC* and *B* are the prime implicants for Outcome 1.

When only configurations with empirically existing cases are included in the minimization, the limited diversity found in comparative research can pose a problem. A large number of logically possible configurations may exist, which are not included for either outcome. To allow more parsimonious results, csQCA can include such logical remainders in the minimization process, which makes further minimization possible. Such logical remainders must, however, be included with caution, as doing so implies the assumption that this configuration does not contradict the examined

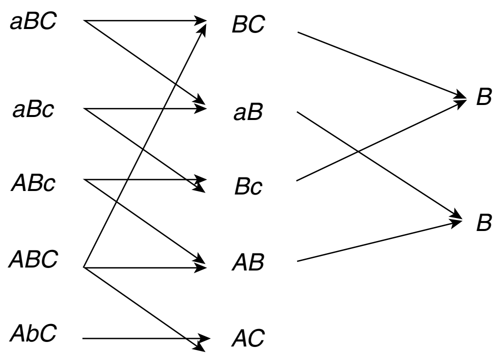

Figure 1 Minimization Steps

outcome; see Charles Ragin and Benoît Rihoux (2004) for possible strategies on how to deal with this problem.

In the next step, csQCA arrives at a solution covering all configurations with their respective outcomes by combining prime implicants with a logical expression that is as parsimonious as possible. This provides a short logical explanation for all cases found in configurations with an unambiguous outcome but does not include cases with contradictory configurations.

In the example, the solution for Outcome 1 would include both prime implicants and would be written as $B + A * C \rightarrow O$, where + indicates the Boolean OR and * indicates the Boolean AND in Boolean algebra. The solution is read as "the presence of B or the presence of A combined with the presence of C leads to the outcome O."

Necessary and Sufficient Conditions

One key feature of all QCA procedures is the identification of necessary and sufficient conditions. A condition is considered necessary for an outcome if the condition is present in all configurations showing the outcome and does not occur in any configuration without this outcome. A condition is sufficient for an outcome to occur if the outcome occurs in all configurations with this condition. Nonetheless, other conditions may produce the outcome, too, so a sufficient condition does not have to occur in all cases with the same outcome. The analysis of the conditions of success of green parties in the 1980s, for example, produces the csQCA solution:

$$\begin{aligned} SUCCESS = {} & VOTING * NUCLEAR * GNP \\ & + VOTING * DENSITY. \end{aligned}$$

This means that the presence of proportional representation combined with the construction of nuclear power plants and a high GNP are conditions that did lead to the presence of a successful green party, as did the presence of proportional representation combined with the presence of high population density. Here, the presence of proportional representation can be identified as a necessary condition, as all configurations of cases with successful green parties share this condition. In the solution for countries with no successful green parties, a number of sufficient conditions for the failure can also be identified:

$$\begin{aligned} NO\ SUCCESS = {} & voting + gnp \\ & + density * nuclear. \end{aligned}$$

Here, the absence of proportional representation *or* the absence of a high GNP *or* the absence of high population density combined with the absence of nuclear power plants did lead to the absence of green parties. Thus, the absence of proportional representation as well as the absence of a high GNP was sufficient to explain the absence of successful green parties; see Lasse Cronqvist (2007) for details.

Although sufficient and necessary conditions can be identified with csQCA, many conditions found in csQCA solutions are INUS conditions, which are insufficient but necessary parts of a condition, only contributing to the explanation of an outcome together with other (INUS) conditions.

Within groups of cases with the same configuration, due to the deterministic procedure used to create truth tables, csQCA is sensitive to single cases that conflict with the outcome of the other cases within the group. As a configuration is defined as contradictory even if only one case differs from the outcome of the other cases, larger data sets may contain a greater number of contradictions, though only a small proportion of cases may show a different outcome. Here, the minimization process still produces a solution, but it includes only relatively few cases. These contradictions, therefore, should be reduced by adding more conditions or employing more refined procedures such as multivalue qualitative comparative analysis (mvQCA) or fuzzy-set qualitative comparative analysis (fsQCA).

Further Developments

Another problem related to the use of csQCA is the compulsory dichotomization of data. A condition with interval-scale raw data can only be dichotomized by the use of an often artificial threshold. Two approaches have been developed that share the main ideas of csQCA but allow the use of nondichotomous data: Whereas fsQCA seeks to identify necessary and sufficient conditions by applying measurements of coverage and consistency to the relationships between interval-scale conditions and also allowing for the analysis of larger data sets, mvQCA changes the minimization procedure used for csQCA to allow the use of multivalue conditions but retains the main features of csQCA.

QUANTITATIVE METHODS, BASIC ASSUMPTIONS

The use of quantitative methods in political science generally means the application of a statistical model to political science data, and a statistical model is simply a set of compatible probabilistic assumptions. Fundamentally, assumptions are modeling choices made by a researcher concerning the distribution of the data to be modeled, how the parameters of that distribution change over observations or time, and the dependence of one observation on another. The assumptions serve the dual purpose of reducing the number of parameters in the model that must be estimated and imbuing potential estimators with certain properties. The goals of the modeling process are description and inference, and how well a model accomplishes these goals is a direct function of how appropriate its assumptions are for a particular data set.

The structure of the entry proceeds as follows. First, the relationship between assumptions, models, and estimators is discussed. Second, the assumptions of the linear regression model are discussed in detail as more complex models are often defined as departures from this set of assumptions. Particular attention is paid to the assumptions necessary for attaining correct coefficient estimates and standard errors. Threats to these core assumptions are assessed in terms of their effects, both in theory and in practice. A brief discussion of possible remedies follows. The final sections discuss the degree to which the assumptions of the linear regression model are modified for use in the generalized linear model (GLM) and how the assumption of a random sample is dealt with in a discipline where random samples are rare.

Assumptions, Models, and Estimators

A statistical model is a mathematical representation of the actual process in the world that generated the data (known as a data-generating process, or DGP). The point of creating a statistical model is both to describe the data produced by the DGP and to make inferences about features of the DGP that are unknown. As noted above, the model itself consists of a set of assumptions. This account makes it clear that assumptions are characteristics of models and not characteristics of data, and the question to ask of a model is not whether it is true or false but how descriptively useful is it. Models are more or less useful in describing a given data set, and when an assumption fails to be useful in the process of description, the error lies with the model, not with the data.

Once a model has been selected, then an estimator (a function of the sample data that provides an estimated value for an unknown parameter) is chosen. Many common models can be estimated by any number of estimators, and the choice among estimators is driven by the model's assumptions, which imbue the estimators with various properties. An estimator with good (or better) properties under the assumptions of the model is chosen over an estimator with bad (or worse) properties under the assumptions of the model. The reference to "good estimators" and not to "good estimates" is by design. In frequentist statistics, a good estimate, by definition, is one produced by a good estimator. Properties of estimators that are considered good include unbiasedness (the estimator is on average neither high nor low), efficiency (the estimator has a small variance around the true value), and consistency (the estimator is near the true value almost all the time when the sample size is large). Often these properties are assessed in the aggregate, as a slightly biased estimator with a small variance may be preferred over an unbiased estimator with a larger variance.

The practice and art of data analysis lie in understanding which assumptions, and therefore which models and estimators, are appropriate for a given data set. This understanding comes from three sources: (1) the data themselves, (2) theory, and (3) substantive knowledge. Some assumptions can be tested, but such tests are often inconclusive, work only under specific conditions, and rarely provide anything more than vague recommendations. Information drawn from theory and substantive knowledge of the process being modeled are far more reliable guides. The discussion that follows necessarily abstracts from the particulars of a specific data set, but the importance of using information from outside the data should be kept in mind.

Assumptions and the Linear Regression Model

Most discussions of model assumptions begin with the linear regression model. Although linear regression is no longer the workhorse of political science—pride of place goes to the GLM—the linear regression model serves as a good starting point as the various roles that the assumptions play in the model are clear and some simple results can be established.

The discussion of the linear model centers on the equation

$$y = X\beta + \varepsilon,$$

where y is a $n \times 1$ vector of observations on the dependent variable, X is an $n \times K$ matrix of regressors (including a constant), β is a $K \times 1$ vector of coefficients, and ε is an $n \times 1$ vector of disturbances. The data represent a random sample from a population of interest.

The discussion also centers on the most common estimator of the linear regression model, the least squares estimator. Replacing the vector of unknown coefficients β with an estimate $\hat{\beta}$ defines a vector of residuals

$$\hat{\varepsilon} = y - X\hat{\beta}.$$

The least squares estimator is found by choosing $\hat{\beta}$ to minimize the sum of squared residuals, or $\hat{\varepsilon}'\hat{\varepsilon}$. The first step in this process is to take the derivative of the sum of squared residuals with respect to $\hat{\beta}$:

$$\begin{aligned} \frac{\partial \hat{\varepsilon}'\hat{\varepsilon}}{\partial \hat{\beta}} &= \frac{\partial (y - X\hat{\beta})'(y - X\hat{\beta})}{\partial \hat{\beta}} \\ &= \frac{\partial (y'y - 2\hat{\beta}'X'y' + \hat{\beta}'X'X\hat{\beta})}{\partial \hat{\beta}} \\ &= 2X'X\hat{\beta} - 2X'y. \end{aligned}$$

The second and final step is to set the derivative equal to 0 and solve for $\hat{\beta}$:

$$\hat{\beta} = (X'X)^{-1}X'y.$$

On its own, the result of the least squares procedure has no properties; it is simply a method for fitting a line to data. The least squares method produces an estimator when paired with a statistical model that makes certain assumptions. Five assumptions commonly make up the linear regression model:

1. No exact linear relationships exist among the regressors (X has full column rank).
2. X is nonstochastic (the regressors are fixed in repeated samples).

3. The expectation of the disturbance term is zero ($E[\varepsilon] = 0$).
4. There is homoskedasticity but no autocorrelation (spherical disturbances, $E[\varepsilon\varepsilon'] = \sigma^2 I$).
5. The disturbances are normally distributed $\left(\varepsilon \sim N\left(0, \sigma^2\right)\right)$.

The linear regression model makes these assumptions not because they are substantively likely to describe a data set (more on this later) but because they imbue the least squares estimator with certain properties that are considered good, namely, unbiasedness and efficiency. The technical reasons for these assumptions are discussed first to reinforce the point that this particular set of assumptions is driven by the choice of the estimator and not by the demands of the data.

Technical Reasons for the Assumptions

The five assumptions of the linear regression model are chosen for technical reasons, but they also have substantive implications. This section describes what part each assumption plays in deriving the good properties of the estimator, and the next details the substantive commitments their use demands.

The first assumption, that no exact linear relationships exist among the regressors, allows the computation of the least squares estimator:

$$\begin{aligned} X'X\hat{\beta} &= X'y \\ \hat{\beta} &= (X'X)^{-1}X'y. \end{aligned}$$

If an exact linear relationship did exist among the regressors, it would be impossible to solve for $\hat{\beta}$ by premultipling both sides of the above equation by the inverse of (X′X). The inverse of a square matrix exists only if the columns and rows of that matrix are linearly independent.

Assumptions 2 and 3—X is nonstochastic and the expectation of the disturbance term is zero—allow the claim that the least squares estimator is unbiased (technically, the expected value of the estimator equals the parameter, or $E[\hat{\theta}] = \theta$). To see this, substitute $X\beta + \varepsilon$ for y in the estimator above, and write it in the following form:

$$\begin{aligned} \hat{\beta} &= (X'X)^{-1}X'y \\ &= (X'X)^{-1}X'[X\beta + \varepsilon] \\ &= \beta + (X'X)^{-1}X'\varepsilon. \end{aligned}$$

The estimator is unbiased if the second term above goes to zero. Taking the expectation of the estimator gives

$$E[\hat{\beta}] = E[\beta + (X'X)^{-1}X'\varepsilon].$$

The expectations operator passes through β because it is a constant. Assumption 2 allows the operator to pass through X as well, giving

$$E[\hat{\beta}] = \beta + (X'X)^{-1}X'E[\varepsilon].$$

Finally, Assumption 3 causes the second term above to be zero, and the claim that the least squares estimator is unbiased follows, $E[\hat{\beta}] = \beta$.

Assumption 4—homoskedasticity and no autocorrelation—allows estimation of the estimator's variance. As variance is defined as $E[(X - E[X])^2]$, it is necessary to get the estimator in this form. Begin with the estimator in the form above, and move the parameter to the left-hand side of the equation:

$$\begin{aligned} \hat{\beta} &= \beta + (X'X)^{-1}X'\varepsilon \\ \hat{\beta} - \beta &= (X'X)^{-1}X'\varepsilon. \end{aligned}$$

Square both sides (remembering that the inner product is the sum of squares and the outer product is variance/covariance matrix), and take the expectation (remembering that X is nonstochastic):

$$\begin{aligned} \mathrm{Var}(\hat{\beta}) &= E[(\hat{\beta} - \beta)(\hat{\beta} - \beta)'] \\ &= E[(X'X)^{-1}X'\varepsilon\varepsilon'X(X'X)^{-1}] \\ &= (X'X)^{-1}X'E[\varepsilon\varepsilon']X(X'X)^{-1}. \end{aligned}$$

The expectation on the right-hand side includes *n* variances and *n(n* − 1)/2 covariances:

$$E[\varepsilon\varepsilon'] = \begin{bmatrix} \sigma_1^2 & \sigma_{12} & \cdots & \sigma_{1n} \\ \sigma_{21} & \sigma_2^2 & \cdots & \sigma_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \sigma_{n1} & \sigma_{n2} & \cdots & \sigma_n^2 \end{bmatrix},$$

as $E[\varepsilon_i^2] = \sigma_i^2$ and $E[\varepsilon_i\varepsilon_j] = \sigma_{ij}$. It is not possible to estimate this many variances and covariances with only n observations. Assumption 4, however, reduces the number of items that must be estimated from $n + n(n - 1)/2$ to one, making estimation possible. Assumption 4 states that the variances are uniform, $E[\sigma_i^2] = \sigma^2$, and that the covariances are zero, $E[\varepsilon_i\varepsilon_j] = \sigma_{ij} = 0$. The expectation above then simplifies to

$$E[\varepsilon\varepsilon'] = \begin{bmatrix} \sigma^2 & 0 & \cdots & 0 \\ 0 & \sigma^2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sigma^2 \end{bmatrix} = \sigma^2 \mathrm{I},$$

and the expression for the variance is then

$$\begin{aligned} \mathrm{Var}(\hat\beta) &= (\mathrm{X}'\mathrm{X})^{-1}\mathrm{X}'E[\varepsilon\varepsilon']\mathrm{X}(\mathrm{X}'\mathrm{X})^{-1} \\ &= (\mathrm{X}'\mathrm{X})^{-1}\mathrm{X}'\sigma^2\mathrm{I}\mathrm{X}(\mathrm{X}'\mathrm{X})^{-1} \\ &= \sigma^2(\mathrm{X}'\mathrm{X})^{-1}. \end{aligned}$$

These four assumptions are enough to prove the Gauss-Markov theorem, which states that the least squares estimator is the most efficient estimator among the class of linear and unbiased estimators. The theorem does not say that the least squares estimator is the most efficient estimator; there exist estimators that are more efficient, but they happen to be biased or nonlinear, or both.

Finally, Assumption 5—normally distributed disturbances—allows derivation of the sampling distribution of the least squares estimates. Because the estimated coefficients are linear combinations of normally distributed disturbances, the estimated coefficients are normally distributed:

$$\hat\beta \sim N(\beta, \sigma^2(\mathrm{X}'\mathrm{X})^{-1}).$$

Correct t tests, F tests, and χ^2 tests follow.

Substantive Implications of the Assumptions

While the five assumptions discussed above are primarily used to imbue the least squares estimator with good properties, the same assumptions have very specific substantive implications for the data being modeled. Rarely, however, do these assumptions accurately describe the data used by political scientists.

The assumption that no exact linear relationships exist among the regressors means that no regressor or set of regressors can be a linear combination of any other regressor or set of regressors. Not violating this assumption is mostly a matter of asking meaningful questions of the data. Problems with this assumption most often result from the careless use of dummy variables. As an example, consider a regression of the difference in votes obtained by two presidential candidates in a district on an intercept and a set of independent variables. The regressors include a dummy variable for districts in southern states and a dummy variable for districts in nonsouthern states. The regression, in part, asks the question "How do districts in southern states and districts in nonsouthern states differ from other districts?" The substantive problem, of course, is that there are no other districts (all districts have to be in the South or the non-South). The question is not a meaningful one. (The technical problem is that these dummy variables would be collinear with the intercept.)

The assumption that the regressors are fixed in repeated samples is equivalent to assuming that the analyst has performed an experiment where she has control over the inputs to the experiment. Thus, the experiment could be rerun many times with exactly the same values for the regressors, but with new values for the disturbances and therefore new values for the dependent variable. Each time the regression is rerun, the different values for the dependent variable would produce different estimated coefficients. Discussion of the distribution of the estimated coefficients is therefore possible.

The "fixed X" assumption fails to describe all but a very few political science data sets. The assumption can easily be relaxed, however, either by assuming the regressors to be exogenous and conditioning on them or by assuming stochastic regressors. What is important is how the "fixed X" assumption interacts with the assumption that the expected value of the disturbances is zero, $E[\varepsilon] = 0$. Combined, the two assumptions imply that the regressors are uncorrelated with the disturbances. The lack of correlation between the regressors and the disturbances is the key assumption in regression analysis. When the assumption holds, the least squares estimator is unbiased. When the assumption does not hold, the least squares estimator is biased. Unfortunately, there are a variety of substantive reasons why this key assumption is unlikely to hold. The three biggest concerns—measurement error, omitted variables, and simultaneity—are discussed in depth in the next section.

The assumption of homoskedasticity and no autocorrelation is perhaps the assumption least likely to describe a political science data set. The assumption implies that all the unmeasured factors in the disturbance affect different observations in exactly the same way. It implies that observations drawn from physically adjacent areas are no more alike each other than observations drawn from nonadjacent areas. It implies that political processes that are observed over time are not sticky or sluggish. Finally, the assumption implies that the model has not been misspecified in important ways. Few of these implications accurately describe the majority of political science data sets. A detailed discussion follows.

Getting the Coefficients Right

When estimating a statistical model, political scientists are concerned with getting the estimated coefficients right. That is, a researcher would like his or her estimated coefficients to be close to the population parameter values. Unfortunately, there is no way to know whether an estimate is close to the true parameter value (short of adopting a Bayesian perspective, which is yet to be done by the majority of political scientists). All that can be done is to ascertain whether the estimator is good—and then assume that a good estimator produces a good estimate.

As noted above, there are two ways to think about a good estimator in this sense. One way is to say that an estimator is good if it is on average neither high nor low, a property that is known as unbiasedness. Formally, an estimator is unbiased if its expectation is equal to the population parameter, $E[\hat{\beta}] = \beta$. The other way is to say that an estimator is good if it is near the true value almost all the time when the sample size is large, a property that is known as consistency. Formally, an estimator is consistent if its probability limit, or plim, is equal to the population parameter: $\text{plim}\ \hat{\beta} = \beta$.

Of the two definitions of the term *good,* the latter is closer to what political scientists actually mean. An unbiased estimator only gives information about the average estimate, not the estimate actually calculated. Consistency, on the other hand, is the minimum requirement for any estimator; with a large sample size, the calculated estimate should be close to the truth.

A definitive statement choosing between unbiasedness and consistency is not necessary, however, as the major condition for achieving both is the same. The key assumption is that the disturbances have mean zero and are uncorrelated with each regressor or $E[X'\varepsilon] = 0$. (This condition is weaker than assuming the independence of X and ε. Independence implies a correlation of zero, whereas a correlation of zero does not imply independence.) Given the importance of this assumption, it would seem that testing this assumption would be the first step in marshaling evidence for the statistical adequacy of a proposed model. The unknown disturbances, ε, could be estimated with the least squares residuals, $\hat{\varepsilon} = y - X\hat{\beta}$, and then correlated with each regressor. Unfortunately, this test is uninformative. The least squares residuals are, *by construction,* uncorrelated with the regressors. A simple manipulation of the least squares estimator demonstrates the point. Multiply both sides of the least squares estimator by X′X, and then substitute $X\hat{\beta} + \hat{\varepsilon}$ for **y** on the right-hand side:

$$\begin{aligned} \hat{\beta} &= (X'X)^{-1}X'y \\ X'X\hat{\beta} &= X'\left(X\hat{\beta} + \hat{\varepsilon}\right) \\ X'X\hat{\beta} &= X'X\hat{\beta} + X'\hat{\varepsilon} \\ X'\hat{\varepsilon} &= 0. \end{aligned}$$

As this critical assumption is not directly testable, we need to consider the ways in which the assumption could be violated. The three most common violations include measurement error, omitted variables, and simultaneity. We will examine each in turn.

Measurement Error

Measurement error in political science arises from the difficulty of measuring the theoretical constructs to which political scientists often refer in their work. Concepts such as power, democracy, and ideology can be measured in a variety of different ways, but each measure is an approximation of an abstract idea. Good measures include significant parts of the construct of interest, but invariably, they also include parts of other constructs (systematic bias) as well as random error. Measurement error is likely the rule, and not the exception, in most political science data.

Theory. Let the DGP include a single regressor:

$$y = x\beta + \varepsilon.$$

Assume that the single regressor has been measured with some error. That is, the variable that is actually available to us is not x, but w:

$$w = x + u,$$

where u is the random error and w thus comprises the true value, x, plus an error component. In addition, assume that u has mean zero, is uncorrelated with ε, and is uncorrelated with the single regressor, x. If we write x as a function of w and u, the model we actually estimate is

$$\begin{aligned} y &= (w - u)\beta + \varepsilon \\ &= w\beta + \nu, \end{aligned}$$

where $\nu = \varepsilon - u\beta$. The least squares estimator for this model is

$$\begin{aligned} \hat{\beta} &= (w'w)^{-1}w'y \\ &= \beta + (w'w)^{-1}w'\nu. \end{aligned}$$

The problem here is that w and ν are both functions of the random error, u. Thus, w and ν are correlated, which violates the assumption that guarantees consistency and unbiasedness.

In the special case just discussed (a regression with a single mismeasured regressor), the effect of measurement error is straightforward. w consists of a systematic part, x, and a random part, u. The random part of w is uncorrelated with the dependent variable by construction. The larger the variance of the random part grows relative to the systematic part, the closer the estimated coefficient is to zero. This effect is seen in the expression for $\hat{\beta}$'s inconsistency,

$$\operatorname{plim}(\hat{\beta} - \beta) = -\frac{\beta\sigma_u^2}{\sigma_x^2 + \sigma_u^2}.$$

The inconsistency is negative, which accounts for the bias toward zero. The inconsistency is small only if σ_x^2 is large relative to σ_u^2. As the latter term increases in size, the greater is the attenuation.

Practice. The case just discussed is highly stylized and is unlikely to be encountered in practice. The comforting conclusions of these kinds of theoretical discussions—for example, that the effects are attenuated—generally do not hold in more realistic situations. First, most regressions are likely to include multiple regressors, with some subset being measured with significant error. In this situation, it is difficult to know the effects of measurement error. Even if the measurement error is confined to one variable, it affects the estimated coefficients of the variables measured without error. Second, the error in the above discussion is random error; it is uncorrelated with the disturbance, ε, and uncorrelated with the lone regressor, x. Actual measurement error is far more likely to be systematic. Any operational definition of a difficult to measure theoretical construct, such as power or democracy, is likely to pick up elements of other, unwanted constructs. The problem can be severe. It has been demonstrated, for example, that correlated measurement error between two variables can lead to an incorrect sign on an estimated coefficient. Including long lists of unevenly measured control variables in a regression, therefore, makes little sense. Third, measurement error can also appear in the dependent variable. This case is often ignored, as random error in the dependent variable is simply added to the error component of the model, and consistency is unaffected. Again, systematic error that is correlated with the included regressors is more likely, and the result is inconsistency and bias.

Omitted Variables

Hidden within the assumption that the regressors must be uncorrelated with the error term is the claim that we have all the important variables that affect the dependent variable accounted for in the model. More specifically, the claim is that the model includes all the important regressors that are correlated with the other included regressors. Omitted variables, like measurement error, are probably the rule rather than the exception in political science research.

Theory. Let the true DGP be

$$y = X_1\beta_1 + x_2\beta_2 + \varepsilon,$$

where X_1 is an $n \times k - 1$ matrix of regressors and x_2 is a single regressor. Assume that x_2 is omitted from the model either because it cannot be measured or because it is unknown. The model actually estimated, then, is

$$y = X_1\beta_1 + \varepsilon^*,$$

where $\varepsilon^* = x_2\beta_2 + \varepsilon$. This expression makes the problem clear. The new error term, ε^*, includes x_2. If that variable is correlated with the included variables, X_1, the assumption that the regressors are uncorrelated with the disturbances no longer holds.

To see this, begin with the least squares estimator of the misspecified model, and substitute the right-hand side of the true model for y:

$$\begin{aligned}\hat{\beta}_1 &= (X_1'X_1)^{-1}X_1'y\\ &= (X'X_1)^{-1}X_1'(X_1\beta_1 + x_2\beta_2 + \varepsilon)\\ &= \beta_1 + (X'X_1)^{-1}X_1'x_2\beta_2 + (X_1'X_1)^{-1}X_1'\varepsilon.\end{aligned}$$

Taking the expectation under the assumption that the included variables are uncorrelated with the disturbance term, the result is

$$E[\hat{\beta}_1] = \beta_1 + (X'{}_1X_1)^{-1}X_1'x_2\beta_2.$$

Thus, the difference between the expectation of $\hat{\beta}_1$ and the truth depends on two kinds of values. The first are the coefficients from the regression of the excluded variable on the included variables, $(X_1'X_1)^{-1}X_1'x_2$. The second is the true effect of x_2, β_2. Using this information, it is possible to identify the direction of the inconsistency and bias.

Including irrelevant variables in a regression is considered a lesser problem. Let the true DGP be

$$y = X_1\beta_1 + \varepsilon$$

and the estimated equation be

$$y = X_1\beta_1 + X_2\beta_2 + \varepsilon.$$

The variables in X_2 are irrelevant and thus have no effect on the dependent variable. When this equation is estimated, least squares correctly estimates $\hat{\beta}_2$ as zero, and the estimator of β_1 is consistent. The only downside usually noted is that the variance of β_1 in the estimated equation,

$$\sigma^2(X_1'M_2X_1)^{-1},$$

where $M_2 = I - X_2(X_2'X_2)^{-1}X_2'$, is always as large as, or larger than, the true variance,

$$\sigma^2(X_1'X_1)^{-1}.$$

This increase in the variance is considered to be a fair price to pay for the promise of avoiding inconsistency and bias caused by omitted variables.

Practice. As is true for measurement error, the theory and practice of omitted variables diverge, and comforting conclusions regarding the direction of the bias or inconsistency apply only in very special cases. For example, it is unlikely that a single variable is omitted from a regression. A set of omitted variables is more likely, making the expectation above

$$E[\hat{\beta}_1] = \beta_1 + (X_1'X_1)^{-1}X_1'X_2\beta_2.$$

Even more likely than a set of omitted variables is the situation where the researcher is deciding whether to include a known group of previously omitted variables while still omitting a group of unknown or unmeasured variables. This situation can be expressed using the following DGP and two misspecified models. Let the DGP be in scalar notation:

$$Y_t = \beta_0 + \beta_1X_{t1} + \beta_2X_{t2} + \beta_3X_{t3} + \varepsilon_t$$

and the two misspecified models be

$$\begin{aligned}\text{Model 1}: &\quad Y_t = \beta_{01} + \beta_{11}X_{t1} + \varepsilon_{t1},\\ \text{Model 2}: &\quad Y_t = \beta_{02} + \beta_{12}X_{t1} + \beta_{22}X_{t2} + \varepsilon_{t2}.\end{aligned}$$

Model 1 omits both X_2 and X_3, and Model 2 omits just X_3. The prevalent view in political science is that the bias on $\hat{\beta}_{11}$, the estimated coefficient on X_1 in model 1, is always greater than the bias on $\hat{\beta}_{12}$, the estimated coefficient on X_1 in model 2. Letting the bias on $\hat{\beta}_{11}$, $E[\hat{\beta}_{11}] - \beta_1$, be denoted as $b(\hat{\beta}_{11}, \beta_1)$ and the bias on $\hat{\beta}_{12}$, $E[\hat{\beta}_{12}] - \beta_1$, be denoted as $b(\hat{\beta}_{12}, \beta_1)$, the mathematical argument is that

$$|b(\hat{\beta}_{11,}\hat{\beta}_1)| \geq |b(\hat{\beta}_{12,}\beta_1)|.$$

This conclusion, however, does not hold in general. It can be demonstrated that the inclusion of additional relevant variables can increase or decrease the bias on the X_1 coefficient. Without knowing the effects of the still omitted variables on the newly included variables, it is impossible to know whether the newly included variables increase or decrease the bias and inconsistency.

Simultaneity

Simultaneity is the third major way in which the key assumption necessary for unbiasedness and consistency—the regressors and the disturbances are uncorrelated—can be violated. The problem of simultaneity arises when one of the right-hand-side regressors is determined simultaneously with the dependent variable.

Theory. Let the true DGP consist of two equations with two dependent variables, y_1 and y_2, each of which is a function of the other. The equations also include two exogenous regressors, x_1 and x_2, and two sets of disturbances, ε_1 and ε_2,

$$y_1 + \beta_{12}y_2 + \gamma_{11}x_1 = \varepsilon_1,$$
$$y_2 + \beta_{21}y_1 + \gamma_{12}x_2 = \varepsilon_2.$$

To see the problem in estimating these equations consistently, rewrite the first equation as

$$y_1 = Z\delta + \varepsilon_1,$$

where $Z = [y_2 \ x_1]$ and $\delta' = [-\beta_{12} \ -\gamma_{11}]$. The usual ordinary least squares (OLS) estimator is

$$\hat{\delta} = (Z'Z)^{-1}Z'y_1.$$

Substituting $Z\delta + \varepsilon_1$ for y_1 into the above equation and taking expectations, it is easy to see that the expected value of $\hat{\delta}$ does not equal δ:

$$E[\hat{\delta}] = \delta + E[(Z'Z)^{-1}Z'\varepsilon_1].$$

The expected value on the right-hand side of the above equation does not approach zero because Z contains an endogenous variable y_2, which is jointly determined with y_1 and thus is correlated with ε_1. The result is bias and inconsistency because the main condition for achieving unbiased and consistent estimates, that the columns of Z be uncorrelated with the disturbance, ε_1, is violated.

Faced with the above situation, it is possible to estimate an equation known as the reduced form by rewriting the original two equations as

$$By + \Gamma x = \varepsilon,$$

where

$$B = \begin{bmatrix} 1 & \beta_{12} \\ \beta_{21} & 1 \end{bmatrix},$$
$$y' = [y_1 \quad y_2],$$
$$\Gamma' = [\gamma_{11} \quad \gamma_{21}],$$
$$x' = [x_1 \quad x_2],$$
$$\varepsilon' = [\varepsilon_1 \quad \varepsilon_2].$$

Provided B is nonsingular, the equation can be solved in the following way:

$$\begin{aligned} y_t &= -B^{-1}\Gamma x_t + B^{-1}\varepsilon \\ &= \Pi x + \nu, \end{aligned}$$

where $\Pi = -B^{-1}\Gamma$ and $\nu = B^{-1}\varepsilon$.

Most of the time, however, political scientists are interested in obtaining estimates of the original coefficients, not of the reduced-form coefficients. The big question is whether estimates of the original coefficients can be recovered from the reduced-form estimates. Consider the model given above, but this time premultiplied by a nonsingular matrix G:

$$GBy + G\Gamma x = G\varepsilon.$$

Solving this equation for the reduced-form coefficients produces exactly the same coefficient estimates as the model that is not premultiplied by the G matrix:

$$\begin{aligned} y_t &= -B^{-1}G^{-1}G\Gamma x_t + B^{-1}G^{-1}G\varepsilon \\ &= \Pi x + \nu, \end{aligned}$$

where $\Pi = -B^{-1}\Gamma$ and $\nu = B^{-1}\varepsilon$.

It is impossible, then, to recover estimates of the original coefficients because both models produce exactly the same reduced-form coefficients. The equivalence of these two models is known as the identification problem, and much of the practice of simultaneous equations is devoted to solving it. Systems of equations where estimates of the original coefficients can be recovered from the reduced form are identified. Systems where recovery is not possible are unidentified.

Practice. In the context of simultaneous equations, the identification problem concerns the ability to recover estimates of the coefficients of interest from the reduced-form coefficients. Ensuring that a system of equations is identified generally requires the use of a priori nonsample information. Such information most frequently comes in the form of exclusion restrictions—a specification that certain endogenous variables and certain exogenous variables do not appear in certain equations. The point is to make it harder, and eventually impossible, to find a G matrix that produces the same set of reduced-form coefficients as the original model. If no such matrix is found, then the system of equations is identified.

Where does the nonsample information come from? As the necessary information cannot be deduced from the data, it has to come from theory. Unfortunately, little theory in political science is detailed enough to provide justifiable exclusion restrictions. Decisions about restrictions, then, are often made on ad hoc grounds. The consequences of making false exclusions are the familiar ones of bias and inconsistency.

Finally, it should be noted that the three major sources of endogeneity—measurement error, omitted variables, and simultaneity—do not occur in isolation from one another. Systems of equations use more variables than single-equation models and are therefore more likely, ceteris paribus, to suffer from measurement error. The use of false exclusion restrictions leads to omitted-variable bias. Any real-life data analysis situation is likely to suffer from all three problems, making any attempts to determine the direction of bias futile.

What Does Not Need to Be Assumed

Getting the coefficients "right" requires one major assumption, the disturbance has mean zero and is uncorrelated with each regressor, $E[X'\varepsilon] = 0$, and one minor assumption, no regressor or set of regressors is a linear combination of any other regressor or set of regressors, or X has full column rank. The list of assumptions that do not need to be made is much longer. For example, it is not necessary to assume normality of any variables, dependent or independent. It is not necessary to assume that the independent variables are uncorrelated with one another or correlated at low levels. It is also unnecessary to assume anything about the variance/covariance matrix of the disturbances. Neither heteroskedasticity nor autocorrelation affects the bias or consistency of the estimator.

Getting the Standard Errors Right

Getting the standard errors right is not necessary for getting the coefficients right. The reverse, however, is not true. The problems that can plague estimates of the coefficients—measurement error, omitted variables, and simultaneity—can affect the standard errors. When trying to get the coefficients right, it is often difficult in practice to know the direction of the bias or inconsistency. The same is not true for the standard errors, however. In most cases involving endogeneity, the estimated standard errors are too narrow, leading to overconfidence in the results of the analysis.

Consider the omitted-variable case. When the true DGP is

$$y = X_1\beta_1 + X_2\beta_2 + \varepsilon,$$

the true variance of β_1 is $\sigma^2 (X_1'M_2X_1)^{-1}$. If the variables in $\mathbf{X}_2$ are omitted from the estimated model, the variance of β_1 is $\sigma^2(X_1'X_1)^{-1}$, which is always as small as, or smaller than, the true variance. A similar demonstration can be made in the case of measurement error. As the amount of random error in x increases, the estimated standard error on the coefficient of x decreases. The problem is that the analyst thinks he has more information than he actually does.

The discussion that follows assumes that endogeneity problems do not exist, so that the other issues that lead to incorrect standard errors can be examined. It is important to remember, however, that the estimated standard errors are likely to be too small even before these additional problems are discovered.

Getting estimates of the regression coefficients right is a matter of making a single, albeit very important, assumption: $E[X'\varepsilon] = 0$. Getting the standard errors right requires making another very important assumption involving the disturbances. This time the assumption is that the squared disturbances are uncorrelated with each regressor, its square, and all cross-products. Formally, the assumption is that $E\left[\varepsilon^2 X'X\right] = \sigma^2 E[X'X]$, where σ^2 is the expectation of ε. This assumption is implied by the more common assumption that the expectation of the squared disturbances is constant $E\left[\varepsilon^2\right] = \sigma^2$. Under this assumption, as well as the two previous assumptions—X has full column rank and $E[X'\varepsilon] = 0$—the OLS estimator of $\hat{\beta}$ is normally distributed, and the standard errors, *t* statistics, and *F* statistics are asymptotically valid.

As with the previous big assumption, however, violations of the new assumption are both common and likely.

Heteroskedasticity

The assumption of homoskedasticity means that each of the disturbances is drawn from a distribution with the same variance as the other disturbances. In conjunction with previous assumptions, the homoskedasticity assumption is $E\left[\varepsilon_i^2\right] = \sigma^2$. Violations of this assumption can occur in one of two ways: as a result of misspecification or as a result of the data themselves.

Misspecification. Heteroskedasticity due to misspecification can arise in a number of different ways. If the true DGP is

$$y = X_1\beta_1 + X_2\beta_2 + \varepsilon,$$

and the analyst omits the variables in X_2 from her model,

$$y = X_1\beta_1 + \varepsilon^*,$$

then the error term is a function of the omitted variables, $\varepsilon^* = X_2\beta_2 + \varepsilon$. As the omitted variables vary, so does the error variance.

An incorrect functional form can also cause heteroskedasticity. If the true DGP is nonlinear,

$$y_i = \beta_0 + \beta_1 x_i^2 + \varepsilon_i,$$

and the analyst estimates a linear model,

$$y_i = \beta_0 + \beta_1 x_i + \upsilon_i,$$

then the disturbance is again a function of x, $\upsilon_i = f\left(x_i^2, \varepsilon_i\right)$. As x varies, so does the error variance.

A coefficient that varies across observations can also be a source of heteroskedasticity. Consider a data-generating process where

$$y_i = \beta_0 + \beta_i x_i + \varepsilon_i$$

and β_i varies randomly around some fixed β: $\beta_i = \beta + \upsilon_i$. Application of OLS estimates the model:

$$\begin{aligned} y_i &= \beta_0 + (\beta + \upsilon_i)x_i + \varepsilon_i \\ &= \beta_0 + \beta x_i + (\upsilon_i x_i + \varepsilon_i), \end{aligned}$$

and once again, the error term is a function of x.

A multiplicative error term and an incorrect data transformation are other specification issues that could cause heteroskedasticity.

Data. The data can also be a source of heteroskedasticity. In the simplest case, an influential outlier can cause heteroskedasticity. By the same token, a heavily skewed regressor can also cause a nonconstant error variance.

Specific kinds of data can be a source of the problem. Aggregate data are a common source of heteroskedasticity. If the dependent variable is an average or a proportion, the variance is a function of the number of observations being aggregated in the different units. If the estimated model is based on an average,

$$\bar{y}_j = \beta_0 + \beta\bar{x}_j + \bar{\varepsilon}_j,$$

where $\bar{\varepsilon}_j$ is an average for the *j*th unit over *i* individuals, the variance of the error term is

$\mathrm{Var}(\bar{\varepsilon}_j) = \sigma^2/N_j$. The error variance, then, clearly varies with the size of the group. A similar demonstration can be performed for a dependent variable based on a proportion.

Finally, heteroskedasticity most commonly occurs with cross-sectional data where units of different sizes, whether they be individuals, firms, industries, or states, are taken together. It is easy to imagine larger units having larger absolute error terms. A $900 billion economy is more likely to see an absolute error of $10 billion than a $100 billion economy.

Autocorrelation

The assumption of no autocorrelation means that the disturbance associated with one observation is unrelated to the disturbance associated with any other observation. Formally, the assumption is $E[\varepsilon_i\varepsilon_j] = 0$ for $i \neq j$. As is the case with heteroskedasticity, violations are the result of misspecification of the data themselves.

Misspecification. Like heteroskedasticity, autocorrelation can be the result of omitted variables, incorrect functional form, or data manipulation. An omitted variable that happens to be autocorrelated causes the disturbances to be autocorrelated. A special case of this result occurs when the omitted variable is the lagged value of the dependent variable. Autocorrelation arises in this case due to the influence of the lagged value on the current value. If a linear functional form is used to model a nonlinear relationship, there will be sections of the relationship where the estimated regression line consistently underestimates or overestimates the relationship. Finally, smoothing techniques such as moving averages can induce a periodicity in the disturbances that did not exist prior to the smoothing.

Data. Autocorrelation is, somewhat obviously, most likely to occur in data that are observed over time. Such variables often display a “stickiness” and only change in small increments over time. State budgets, for example, only change marginally from year to year. Successive observations, then, are likely to be correlated. Similarly, random shocks to a system, such as war or a market crash, have prolonged effects across time periods, leading to correlated disturbances.

A more subtle form of autocorrelation arises from cross-sectional data. Spatial autocorrelation can occur when observations are taken from units that are physically adjacent to one another, such as states or countries. The behavior of individuals from adjacent West European countries is likely to be affected by similar unmeasured factors, which leads to correlated disturbances.

What to Do

The conclusion to draw from the discussion above is not that regression can never be trusted. All the problems that have been detailed have solutions that are examined elsewhere in this encyclopedia. The discussion that follows outlines a few broad approaches to addressing the common assumption violations encountered by political scientists using the linear regression model.

Endogeneity problems can often be dealt with through the use of instrumental-variables regression. Mismeasured variables, for instance, can be replaced with “instruments,” which are alternative variables that are uncorrelated with the disturbance term and yet are still correlated with the mismeasured regressors. Any regressor that is uncorrelated with the disturbance term can serve as its own instrument.

Let the matrix of instruments be Z, which has at least as many columns (regressors) as the orginal matrix of regressors, X. Next, premultiply the usual linear regression equation by Z′,

$$Z'y = Z'X\beta + Z'\varepsilon,$$

where the variance of $Z'\varepsilon$ is $\sigma^2(Z'Z)$. The instrumental-variables (IV) estimator is, then,

$$\hat{\beta}_{IV} = (X'Z(Z'Z)^{-1}Z'X)^{-1}X'Z(Z'Z)^{-1}Z'y,$$

with variance $\mathrm{Var}(\hat{\beta}_{IV}) = \sigma^2(X'Z(Z'Z)^{-1}Z')X)^{-1}$. Estimates are easily calculated by noting that $\hat{X} = Z(Z'Z)^{-1}Z'X$ are the fitted values from the regression of X on Z. The instrumental-variables estimator, then, is just

$$\hat{\beta}_{IV} = \left(\hat{X}'\hat{X}\right)^{-1}\hat{X}'y.$$

It can be easily shown that the instrumental-variables estimator is consistent and, therefore, it is possible to get correct coefficients. The trade-off for this gain in consistency is loss of precision.

Problems relating to the error term, such as heteroskedasticity and autocorrelation, can be dealt with either through feasible generalized least squares or through calculation of robust standard errors. In the case of heteroskedasticity, the challenge is to estimate the correct variance/covariance matrix, which is

$$\begin{aligned}\operatorname{Var}(\hat{\beta}) &= (X'X)^{-1}X'\sigma^2\Omega X(X'X)^{-1}\\ &= \frac{1}{n}\left(\frac{1}{n}X'X\right)^{-1}\left(\frac{1}{n}X'[\sigma^2\Omega]X\right)\left(\frac{1}{n}X'X\right)^{-1}.\end{aligned}$$

Estimating $\sigma^2\Omega$, the dimensions of which are $n \times n$, is impossible with n observations. Estimating $\left(\frac{1}{n}X'[\sigma^2\Omega]X\right)$, however, is not impossible, as its dimensions are only $K \times K$, where K is the number of regressors in X. It can be shown that this expression is equal to

$$\frac{1}{n}\sum \sigma_i^2 x_i x_i',$$

and the above can be consistently estimated by

$$S = \frac{1}{n}\sum \hat{\varepsilon}_i^2 x_i x_i',$$

where $\hat{\varepsilon}_i$ is the residual for the ith observation. The correct variance/covariance is consistently estimated by

$$\operatorname{Var}(\hat{\beta}) = n(X'X)^{-1}S(X'X)^{-1}.$$

It is important to remember that these techniques bring with them their own sets of assumptions, which may or may not be more plausible than the assumptions of OLS. The key assumption of the instrumental-variables procedure is that the instruments are uncorrelated with the disturbance. This assumption cannot be tested, and the use of "quasi instruments," instruments that are only approximately uncorrelated with the disturbance, can produce incorrect inferences. Strong theory is required to make such assumptions plausible.

Assumptions and the Generalized Linear Model

As noted in the introduction to the linear regression model discussion, GLM replaced the linear regression model as the workhorse of political science. A GLM is one that assumes a distribution included in the linear exponential family. These distributions include, among others, the normal, the Bernoulli, the exponential, and the Poisson. These models are estimated by maximum likelihood, and their good properties only hold asymptotically.

GLMs require very strong distributional assumptions. In addition, they require many of the same assumptions as the linear regression model. Some of these assumptions, however, work very differently in this setting. Consider the probit model. The model is derived by assuming that a latent or unobserved variable **y*** is a function of some regressors and an error term:

$$y^* = X\beta + \varepsilon.$$

All that is observed of the latent variable is whether it is greater than zero:

$$y_i = \begin{cases} 1 & \text{if } y_i^* > 0 \\ 0 & \text{if } y_i^* \le 0. \end{cases}$$

Given the above, the probability of observing a one is

$$\begin{aligned}\Pr(y_i = 1) &= \Pr(y_i^* > 0)\\ &= \Pr(x_i\beta + \varepsilon_i > 0)\\ &= \Pr(\varepsilon_i > -x_i\beta)\\ &= \Pr(\varepsilon_i < x_i\beta)\\ &= F(x_i\beta),\end{aligned}$$

where $F()$ is the cumulative distribution function of ε. The probit model comes from assuming that ε is distributed normally.

The probit model makes the same key assumption that the linear regression model does: ε and the regressors must be uncorrelated with one another. Unfortunately, not all the lessons learned in the linear regression case are applicable to probit models. For example, the linear regression model does not require normality for consistency. The probit model, however, does. The ε_i must be drawn from independent and identically distributed normal distributions. For the linear regression model, the OLS estimator is unbiased and consistent when a relevant variable is omitted from the regression, provided that the omitted variable is uncorrelated with the included variables. This result does not hold for probit models. When a relevant variable is omitted from a probit specification, the estimated coefficients on the included variables are biased and inconsistent whether or not the omitted variable is correlated with the included variables. By the same token, robust standard errors are often a useful way of dealing with heteroskedasticity in the linear regression model. Robust standard errors, however, make little sense for the probit model. If the model is correct, so are the standard errors. If the model is seriously misspecified, use of robust standard errors provides asymptotically correct variance estimates on wrong coefficient estimates. Robust standard errors, then, are of little help in this context.

The lessons learned from the linear regression model have, at best, heuristic value when it comes to more complex models such as GLMs. New assumptions have to be made, and old assumptions often have to be revisited and reevaluated. Solutions to problems that work for the linear regression case may not work for GLMs. It is important to remember that complex models are more than just fancy linear regressions.

Assumptions and Inference

Of the two goals of quantitative modeling in political science mentioned in the introduction—description and inference—the latter is more difficult to achieve. The reason for this inequity is that inference depends on assumptions that are far stronger than the assumptions on which consistency and unbiasedness rest, and as argued above, these assumptions rarely hold in political science data sets. Although these assumptions can be relaxed with the use of more complicated statistical models, the fact remains that the model has to be nearly right for correct inference, and that is a tall order in political science.

Of all the assumptions needed for correct inferences, the most fundamental is yet to be discussed. When introducing the linear regression model, a random sample of size *n* from a population of interest was assumed. This assumption is standard in statistical analysis and allows traditional statistical inference to work. In very few situations, however, do political science data sets resemble anything even close to a random sample drawn from a population. The question then becomes "To what are political scientists making inferences?" Whether the data comprise a set of international wars, American states, or Western European democracies, there is no actual population to make inferences to, and these samples are rarely treated as populations in and of themselves. Political scientists pay little attention to this issue, and most articles that make use of quantitative modeling in the discipline make no mention of the population of interest, how the sample was generated, or to what the statistical inferences refer.

The real question that needs to be addressed concerns the source of the randomness in the data. In what is known as design-based inference, the population is seen as fixed, and the sample is the result of a stochastic process such as simple random sampling or stratified random sampling. Inferences are made in traditional fashion from the sample to the population from which it was drawn. In what is known as model-based inference, the observed values are seen as realizations of random variables and therefore constitute realizations of a random process. Most political scientists practice model-based inference as true random samples from known populations are relatively rare in the discipline.

Model-based inference comes in two versions. Political scientists, when asked what population they are making inferences to, often respond by talking about a superpopulation. A superpopulation is an imaginary population from which the data could have been randomly drawn had the imaginary population existed. A researcher first assumes the existence of an imaginary population (the superpopulation) and then assumes that the sample at hand is drawn randomly from the imaginary population. There are situations in the sciences where assuming a superpopulation makes sense. To borrow an example, it might be sensible to consider the hurricanes generated in the Atlantic Ocean in a given year under certain meteorological conditions as a random draw from the population of hurricanes that could have been produced in the Atlantic Ocean in that year. There is, in such a circumstance, a real stochastic process that generates the observations. The same cannot be said of, for instance, election data. Political scientists are fond of saying that the world could have turned out differently, and thus, the data are like a random draw from the superpopulation of elections across different worlds. Unlike the process that generates Atlantic hurricanes, however, there is no actual stochastic process that could generate these imaginary elections.

The second version of model-based inference is closer to what political scientists actually do. In this version, there is no population, and no pretense is made about making inferences to a population. Instead, a model is proposed that accounts for the way nature produces the data. Inferences are then made back to features of the model. The sample design is irrelevant under model-based inference, which is why it fits well with political science. The downside of model-based inference is its dependence on a model, which may be misspecified in any of the ways discussed earlier. If the model is bad, so are the inferences based on it. An awareness on the part of political scientists that they are engaged in model-based inference is important because it highlights just how fundamental models and their constituent assumptions are to the practice of data analysis in political science.

QUANTITATIVE VERSUS QUALITATIVE METHODS

Perhaps no division in the social sciences is so persistent, nettlesome, and poorly understood as the division between quantitative and qualitative ways of knowing. The cleavage can be traced back to the first applications of statistics within the disciplines of economics, political science, and sociology, and it became increasingly acute in the late 20th century as quantitative approaches gained in stature, grew in complexity, and pushed qualitative empirical analysis out of the limelight. During this period, the division between qualitative and quantitative methods became associated—perhaps inappropriately—with the rival epistemological positions of positivism and interpretivism. Charles Smith (1989) summarizes the now familiar standoff:

> On the one hand, there are those who argue that only through the application of quantitative measurements and methods can the social sciences ever hope to become "real" sciences; on the other hand, there are those who claim that the subject matter of the social sciences is simply not amenable to quantification and all attempts to impose such measures and methods upon social behavior is just so much nonsense. (p. 29)

This entry looks at the strengths and weaknesses of both positions in terms of their contributions to the *comparability* of findings.

Debate Positions

While there have been many attempts to shed light on this persistent division in the social sciences, work on this question is generated primarily by writers who occupy one of the two camps. These writers tend to be either strong partisans or visceral opponents of the quantitative worldview. A chronic dualism besets many of these debates, in large part because the distinction between quantitative and qualitative forms of descriptive and causal inference has been folded into the much larger and more "philosophical" debate between positivism and interpretivism. Positivists (or naturalists), usually identified with quantitative methods, present their perspective as hegemonic: There is, or ought to be, only one logic of inference. The conclusion of these scholars is that either there are no important distinctions between qualitative and quantitative work or, to the extent that such distinctions exist, they are to the detriment of qualitative scholarship. "When possible, quantify" is the motto of this camp. Where quantification is not possible, this camp encourages qualitative scholars to follow the logic of quantitative reasoning. Defenders of qualitative work typically emphasize the limits of quantification and the insights that can be gained through an interpretive approach to social action. Rather than a unified logic, interpretivists suggest that there might be multiple logics at work in the social sciences. These multiple logics stem from epistemological or ontological commitments, which may themselves be culturally prescribed and political or historical in origin.

A third position runs orthogonal to this debate. According to this view, the qualitative/quantitative division is inherently ambiguous and, hence, a distraction from the real work of social science. In this spirit, a recent lexicon focused on qualitative inquiry notes, in the entry for "Qualitative," that "the adjective does not clearly signal a particular meaning" (Thomas A. Schwandt, 1997, p. 129). Rather, it is used as a "blanket designation for all forms of [hermeneutic] inquiry including ethnography, case study research, naturalistic inquiry, ethnomethodology, life history methodology, narrative inquiry, and the like." In sum, concludes the author of this dictionary of qualitative methods (with no apparent sense of irony), "'qualitative research' is simply not a very useful term for denoting a specific set of characteristics of inquiry" (Schwandt, 1997, p. 130). The inherent fuzziness of the concepts "qualitative" and "quantitative" thus prompts some scholars to argue that the so-called debate must be a red herring, that is, a distraction from the real issues of social science methodology.

Thus, one finds three well-articulated positions: (1) naturalism (one logic of inquiry, based implicitly on the quantitative template), (2) pluralism (multiple logics of inquiry, with qualitative and quantitative work founded on different epistemologies), and (3) agnosticism. Many scholars are sympathetic to the naturalist goal of a single, unified logic of inquiry; only in this fashion can the scientific objective of knowledge cumulation be achieved. However, others are dubious whether the quantitative template provides an adequate framework for work across the social sciences. While the agnostic position is attractive, it seems to be mostly rhetorical. Scholars continue to divide themselves into camps—for example, departments, journals, editorial boards—and these camps are often classifiable as predominantly qualitative or quantitative. These two concepts refuse to be banished, suggesting that there must be something somewhere.

As a way of cutting into this subject in a new fashion, this entry proposes a new way of thinking about these issues: The principal factor separating qualitative observations from quantitative observations is the assumed *comparability* of the evidence at hand. Quantitative observations presume a population of things that can be readily measured, counted, and hence compared. Qualitative observations, in contrast, presume an empirical field where individual pieces of evidence are not directly comparable with one another, at least not to the extent that they can be precisely measured. In this sense, quantitative work is appropriately labeled "nomothetic" and qualitative work, "idiographic." The key point is that the difference between these two kinds of observations rests on the presumed comparability of adjacent observations, not (at least not directly) on the size of the sample, the style of presentation (numbers or narrative), epistemology, ontology, or the formal structure of the method.

The purpose of this entry, it should be stressed, is not to reinforce existing cleavages in the social sciences. Rather, it intends to draw attention to an important underlying issue in these debates, an issue that has not received much recognition in the literature. This is not the only issue underlying the qualitative/quantitative divide, but it is a fundamental issue. If analysis is based on comparison, the central methodological question is what researchers can reasonably compare and how precise those comparisons can be. In this case, there are legitimate differences of opinion, and they are not the sort that can be empirically proven.

Comparability

Comparable observations are understood as members of the same population and therefore potential members of the same sample. They are examples of a similar phenomenon. They are apples and apples, rather than apples and oranges, to use the time-honored metaphor. Note that comparing apples and oranges is not prohibited; however, to do so one must adopt a higher-order concept—such as fruit—according to which apples and oranges are similar. This commonsense meaning of comparability is widely understood and agreed on. But what does it mean for items to be comparable within the context of social science research? Surely, it is more than shared membership in an arbitrary linguistic category.

First, comparable observations must share a set of relevant descriptive attributes (dimensions). This is what makes them comparable. The observations need not demonstrate the same values for those attributes. Each observation in a sample may "score" differently on each attribute in either quantitative or qualitative terms—high/low, present/absent, and so on. But each observation must be *scaleable*, and the attribute must have the same meaning (roughly or precisely) across the contexts in which it is being compared. This can be labeled *descriptive comparability*, suggesting that it is a fundamental feature of conceptual validity. The defining attributes of a concept must be valid across the designated observations. Otherwise, the concept is being "stretched."

A second kind of comparability refers to the interrelationship of two factors in a causal analysis, the cause (or vector of causal factors) X and the outcome Y. The specified X/Y relationship must hold across the chosen observations. This is labeled *causal comparability* (a looser version of *unit homogeneity*).

Thus, there are two kinds of comparability: descriptive and causal. The first is presumed in the second. If a sample of observations is assumed to be causally comparable, then it must also be descriptively comparable. In statistical research, the assumption of unit homogeneity makes this explicit, but it must also be true more generally, for causal comparability can exist only in the presence of descriptive comparability.

Precision and Explicitness

The underlying issues in the enduring qualitative/quantitative debate are tethered to the problem of comparability, as defined above. To "quantify" an observation is to formulate it in terms that can be *explicitly* and *precisely* compared across a large number of observations, that is, where a concept can be expressed on a numerical scale, a metric, or a variable (herein these three words are used interchangeably). Quantitative observations combine natural-language words (nouns, verbs, or adjectives) with numbers according to some preassigned metric. It is a question of measurement, which can be regarded as the assignment of numbers to phenomena in accordance with some uniformly applied rule.

Let us begin with a discussion of the concept of precision. Note that to simply recode a dichotomous natural-language category as a series of binary numbers does not make it any more precise. Thus, 0/1 is no more precise than pregnant/not pregnant. However, numerical scales offer the possibility of greater precision when the number of categories surpasses the categories inherent in natural language, as well as in circumstances where these categories can be understood as positions on a continuous (interval) scale. To say that one room is warmer than another is comparative, but it is less precise than saying that one room is 21 degrees Celsius and the other is 16 degrees Celsius. Thus, in many situations, the use of a quantitative idiom allows for more precise comparisons across units. In all situations, the use of a scale is *at least as* precise as natural language (in the sense that no precision is lost in the translation of words to numbers). Again, to use a quantitative idiom does not entail great precision; it entails the *possibility* of great precision (as well as a more explicit set of comparisons).

Precision should not be confused with *certainty*. Quantitative or qualitative statements may be uttered with more or less confidence. For example, one might say, "I would guess that the room is 21 degrees Celsius" or "I would guess that the room is warm." With quantitative statements, a mathematical indicator of uncertainty may accompany the point score. The statement that quantitative observations are more precise refers to the point estimate, not the degree of uncertainty (or dispersion).

Quantitative statements are both more precise (at least potentially) and more *explicit*. This is because the very act of creating a numerical scale requires a set of explicit comparisons and an explicit comparison set—a domain. Scales cannot be developed in highly specific contexts. Suppose that we classify the terrorist attacks on September 11, 2001, as a single event consisting of four jointly organized attacks. If we treat the attacks of September 11 as a single event rather than four separate events, the idea of developing a barometer for 9/11 is nonsensical because there is nothing to which to relate it—scales make sense only relative to classes of events (unless, of course, that event is being used as a metric for understanding other events, in which case it becomes a comparative metric). Weather can be measured precisely because, for one thing, there is lots of weather to measure, and temperature is thought to have the same general meaning in many different contexts. Granted, all scales are bounded; there is no universal scale (a scale applying to everything). Some things, such as metaphysics, have no temperature; the concept of temperature (and whatever scale might be used to measure it) does not apply in this domain. The point is that relative to words, which are only loosely and implicitly comparative, scales are precisely and explicitly comparative, and their range is usually quite broad (otherwise, why bother to develop a systematic scale?).

Now, it is true that some natural-language adjectives, such as *warm*, are explicitly comparative. But most words are more ambiguous. This is apparent in the extra locutions that are necessary to render ordinary language comparative. One must clarify "warmer than," "more chairlike than," and so on; whereas, to append such judgments to a numerical scale is redundant. (One does not say, "The temperature is 21 degrees Celsius, warmer than 18 degrees Celsius.") Numerical scales are already comparative, and no matter what one does with a numerical observation, it cannot lose its precise, explicitly comparative quality.

To be sure, if one labels an object with a noun—for example, *chair*—one is implicitly (if not explicitly) comparing it with other objects: *nonchairs*. Language has this universal aspect; if we call something X, we imply that other things are not X, or less X or more X. However, the comparisons are vague. It is unclear, for example, where a chair leaves off and a stool begins, for few words—and very few key words in social science—have crisp boundaries. More important, most words are multivalent; they have more than one attribute and, consequently, can mean more than one thing. Thus, to say that an object is "not A" could mean a number of different things, depending on the attribute(s) that is intended by the author or understood by the reader. Moreover, a word usually gains meaning by its context, and this context is undefined in settings other than what the author is studying. Additionally, the other objects that are not X are typically not defined, in which case the larger population of cases (the domain of the inference) remains implicit. Finally, words are contingent on a particular natural language, and this imposes another sort of contextual boundary against comparison. (In contrast, the numeral "5" and the operator "=" mean the same thing everywhere—since the adoption of a uniform language of mathematics—and they also mean the same thing in all the contexts that they might be employed.)

Frequently, natural-language comparisons are without any obvious comparative reference point. The statement "Caesar crossed the Rubicon" is comparative in so many possible ways that it might be considered noncomparative: He did not cross it, he did not cross the Tiber, it was not Brutus who crossed the Rubicon, and so on. If this is comparative, it is so in the most minimal sense. Yet it is important for the purposes here to recognize that comparison is a matter of degree. Qualitative observations can be more or less comparative, but quantitative observations are almost always more precisely and explicitly comparative.

One final clarification is in order. This entry has stated that all quantitative statements about the world invoke a class of events; these form the basis for the metric. However, it does not follow that quantitative statements about the world are necessarily broader in scope than qualitative statements. Indeed, the very fuzziness of natural language gives us the license to generalize—for one can avoid saying anything very specific—while the exactness of quantification may rein in the temptation to generalize. It follows that qualitative statements can be either very restricted in scope (as in the previous example about the singular event of 9/11) or extremely broad. Saying something in words does not affect the scope of the inference. Saying something with a metric, however, presupposes a class of referents, which is to say it must make reference to more than one discrete event (and these reference points must be fairly precise and explicit).

Trade-Offs: Thick and Thin Description

In principle, any qualitative observation can be converted to quantitative form, as attested by the plethora of methods and software designed to perform this function, for example, NUD*IST software, Computer-Assisted Qualitative Data Analysis Software (CAQDAS), and various narrative-based methods, as well as more generic forms of content analysis. There is no such thing as a nonquantifiable observation because any single statement that can be made about one phenomenon could also be made about another phenomenon, thus providing the possibility of some sort of scale.

Yet it is not clear that one would always want to make this transposition from words to words-with-numbers (variables). Indeed, there are usually costs associated with this conversion. The trade-off may be understood in terms of precision and explicitness on the one hand and depth (or richness) on the other. More concisely, the analyst has the option of describing *thinly* (with less depth) or describing *thickly* (with more depth). The fact is that words are usually multivalent; they generally carry a variety of attributes, some of which may not even be logically consistent. This is particularly true of key words in social science—for example, democracy, justice, corporatism, political party. When one of these words is converted to a measurable variable, which is to say to a precise scale, the researcher is generally forced to drop one or more of its attributes. For not all these attributes will be precisely applicable to the class of phenomena that the concept is now (quite explicitly) intended to cover. This does not necessarily refer to an expansion in scope, for natural language can reach as far as mathematical variables. But in making the comparison precise and explicit, it is usually necessary to narrow the definition of the natural-language concept. It could be that the intension of the natural-language concept is also quite a bit narrower than the full set of attributes normally (in ordinary language) associated with the term. An author is free to define a term as he or she sees fit; qualitative work is not wedded to ordinary language. The point is, in creating a variable, one is forced to make explicit choices about which definitional attributes apply properly to a class of phenomena and which do not. This is likely to prompt some narrowing of the semantic options. And this is why the choice to quantify a concept is considered a move toward thin description. More explicit comparisons can be made, but they are narrowed down to one or several dimensions (the chosen attributes of the core concept).

Similarly, if one chooses to particularize rather than to generalize, natural language is the obvious vehicle of choice. As previously pointed out, it is inappropriate to construct a scale when the class of instances under investigation is one or several. A scale presupposes a population. In contrast, a word can be used in a highly specific context; it does not presuppose an explicit comparison with other instances. This means that in describing the singularity of an event, one is drawn toward the implements of natural language. The lack of perfect commensurability between words used in one context and the same words used in another context allows the researcher the facility to elucidate what is different—categorically (qualitatively), not marginally (quantitatively)—about that phenomenon. A very high score on some scale can be (indeed, must be) indicated with a quantitative metric. But a very different kind of score requires a word, perhaps a series of words.

In short, there are gains and losses in the transposition of words to numbers, and vice versa. What is interesting about this classic debate is that both may be described as "reductionist." Quantitative studies are often accused of reducing reality and, in the process, distorting that reality to fit the austere requirements of the quantitative format. Each piece of reality must be sliced up into variables, and these must be comparable across all observations. Qualitative studies are accused of a different kind of reduction, in which a subject is shrunk down to a highly particular context—the country, neighborhood, or event of special interest.

These contrasting notions of reduction and expansion are best understood as arguments over comparability. Scholars inclined toward the tools provided by natural language are often keen to explore a wide variety of different aspects in a particular setting. They wish to explore multiple dimensions of one thing. (*Dimension* is employed as a synonym for *variable* in this context.) Qualitative analysis is thus often focused inward, like a vast funnel. Many comparisons are made, but they are all understood as features of the same general topic, existing in one time and place. Natural language is adept for this purpose, for it is rich, textured, context specific, and multivalent. It elucidates a wealth of details about a person, event, or situation. This is why some scholars find a natural affinity between qualitative tools and ethnographic, historical, and—more broadly—interpretivist styles of research. In contrast, scholars inclined to a numerical understanding of the world are drawn to comparisons that are broad and thin. They intend to explore one particular dimension of many things.

The interesting aspect of this familiar contrast is that both qualitative and quantitative scholars perceive their work as conforming to the natural bend of the universe. Qualitative scholars usually assume a *case-centered* approach. Different aspects of the same cases are grouped; they go together. Quantitative scholars are drawn toward a *dimensional* approach to comparability. A single aspect (dimension) of an entity is assumed to be comparable across multiple cases. This is sometimes referred to as *variable-centered* analysis. While for a qualitative scholar it would seem natural to explore everything about A, for a quantitative scholar it would seem more natural to explore one thing about A, B, and C. Underlying scholars' choices of method are certain assumptions about cross-case comparability. The tools scholars choose—words or numbers—are, in part, the expression of their relative confidence in the ability to compare across entities in a given research context. This is not to deny that many scholars use both words and numbers. The point is that, within a given context, the likelihood of choosing one or the other strategy is influenced by assumptions about case comparability.

Construing Meaning Versus Analyzing Behavior

The importance of comparison is illustrated in one of the most common defenses of qualitative work in the interpretive mode. It is often said that qualitative analysis focuses on human meanings, while quantitative analysis focuses on the behavioral components of human reality—that is, actions, institutions, or events. From the interpretivist perspective, the business of social science is one of construing meaning, not analyzing behavior. Yet one might reasonably inquire, why not study human meanings quantitatively—that is, with scalar measures—in addition to studying them qualitatively?

One rationale is that human meaning is constructed through language (which establishes the categories by which we understand the world); therefore, it makes sense to study these linguistic categories through other linguistic categories rather than the (somewhat alien) categories of numbers. Herbert Blumer (1969) concludes,

> The crucial limit to the successful application of variable analysis to human group life is set by the process of interpretation or definition that goes on in human groups. This process, which I believe to be the core of human action, gives a character to human group life that seems to be at variance with the logical premises of variable analysis. (p. 132)

The problem, though, is not that the analysis of linguistic phenomena must be carried out with linguistic tools; after all, the contemporary discipline of linguistics is heavily quantitative. Indeed, quantitative observations are necessarily rooted in language because all scales must be expressible in a linguistic category; every variable must have a name. What is it, then, that seems so problematic about collecting quantitative observations about semantic realities? Why is there no quantitative hermeneutics?

The problem is at the core of the qualitative/quantitative dispute: the problem of representing human meaning across diverse contexts in an explicit and precise fashion. It is a problem of comparability, not of language per se, that is at issue. And what makes it so problematic is a basic feature of human life. The ways in which we make sense of our lived experience are extraordinarily diverse—through time, across cultures, and across individuals. It is difficult to reduce this complexity to standard categories, as quantitative knowledge requires.

Consider the question of human happiness (variously understood as welfare or quality of life), which has attracted increasing attention on the part of psychologists, sociologists, and economists. The following scale was developed by the U.S. Bureau of the Census to measure the quality of life: (a) *terrible*, (b) *unhappy*, (c) *mostly dissatisfied*, (d) *mixed*, (e) *mostly satisfied*, (f) *mostly pleased*, (g) *delighted*. The question we might ask ourselves is whether human happiness is accurately captured in these categories. This is to say, does a person who answers b = *unhappy* have a lower quality of life than a person who responds with d = *mixed*? There are potential problems of conceptual validity, and the issue is not simply a lack of sophistication on the part of researchers. More fundamentally, the problem is that human meanings—such as happiness—are resistant to uniform comparisons across diverse subjects. One feels much more comfortable with imprecise comparisons expressed in the looseness, and contextual specificity, of natural language. We might say, for example, that "Smith is happy," implying that across some undefined population, Smith's level of happiness is, let us say, somewhere above the mean. However, we are probably reluctant to assign a precise score to Smith's happiness, because such a score would presume a precise comparison with all others in the population.

This is not meant to imply that all human meanings are unquantifiable. Nor is it meant to imply that social scientists should abstain from quantifying difficult and ambiguous emotions such as human happiness. There may be much to learn from the quantification of abstract concepts that summarize a great deal of information about human experience. The point is simply that the profitability of quantifying varies with the topic, and the core issue is the comparability of the phenomena across the chosen population. Certain topics are more recalcitrant, and these tend to be tied up with the generation of meaning (values, ideas, intentions) rather than observable behavior. It is noteworthy, for example, that some human intentions seem to be more quantifiable than others, and these tend to be those where a high level of comparability across individuals or across cultures can be assumed. Thus, scholars routinely measure the concept of "economic voting" because the notion "pursuing material interests" seems comparable, and hence valid, across individuals and populations. In contrast, the measurement of religious influences on voting behavior is much more difficult to quantify because it is more difficult to compare.

Conclusion

Approaches in the social sciences are often understood as qualitative or quantitative. Scholars differ in their opinions about the utility of this distinction. Some dismiss it as a red herring; others feel that there is good justification for the division. Still others suggest that there is no plausible way of discarding the distinction but that it is greatly misunderstood, and the key to this misunderstanding is to be found in assumptions about comparability.

There is indeed a difference in basic-level assumptions between statements that are quantitative (i.e., understood through a numerical scale, a metric, or a variable) and those that are qualitative (i.e., expressed in natural language). Quantitative descriptive statements presuppose a class of cases that can be compared in an explicit and precise manner. To measure phenomenon X is to impose a very specific metric on it, one that is explicitly comparative (since other phenomena in this same category are assumed to be scoreable). Qualitative descriptive statements do not make any such presuppositions. There may or may not be an identifiable class of comparable cases that can be measured along some set of dimensions. Often, the assumption is quite the reverse—particularizing rather than generalizing. Thus, to quantify something is to compare in an explicit and precise manner. To qualify is to leave such comparisons open; one may or may not engage in explicit comparisons with adjacent cases, and any comparisons made are unlikely to be very precise. While this might seem to indicate a distinct advantage for quantitative work, this entry also shows that there are costs to assuming a quantitative idiom. Not only must the cases be (actually) comparable, but there is usually some loss of information since words are usually multivalent and metrics are usually unidimensional (or at most combine several dimensions). It is not clear that scholars always gain in analytic leverage by moving from words to numbers. They do, however, make different sorts of comparisons.

The choice between math and natural language as tools of social science is, therefore, a highly consequential choice. Methodological tools help us reconstruct the empirical world; they are not theory neutral. In this respect, the division between math and language is akin to the influence that the early anthropologists and linguists assigned to language. Different languages divide the world into different packages; they encourage us to visualize things in different ways. So, arguably, do the different "languages" of mathematics and ordinary speech. Quantitative tools help us compare and, hence, generalize; qualitative tools encourage us to differentiate.

It is quite another thing, however, to disentangle the causal priority of methodologies and ontologies. Do cultural anthropologists use qualitative tools because they envision a lumpy universe, or do they see a lumpy universe because they perceive it with qualitative tools? About all one can say with any degree of confidence is that there is a strong synergy between methods and ontologies. One can presume that they are, at the very least, strongly reinforcing. This may help account for the virulence and endurance of this central cleavage in the social sciences today.

It is not merely a matter of numbers versus words or a debate about what can or cannot be quantified. More fundamentally, the venerable debate represents fundamental disagreements over how precise, explicit, and extensive social science comparisons ought to be. Those who resist numerical analysis are dubious about the validity of comparisons. They see no need to enhance the precision or explicitness of comparisons because they do not seek to compare in the first place, or they seek a more restricted ambit of comparative reference points. Those who embrace quantification are more comfortable with such comparisons. This debate has been engaged at many levels—across individuals, levels of government, cultures, and time periods—and over many years. It shows no sign of dissipating.

R

RACISM

Racism is a set of beliefs, practices, and social structures that treats groups of human beings socially defined by unalterable, often physical, attributes (races) as inherently unequal. Racism is a form of subordination and exclusion. It is a part of the power structure of institutions and social relations. Racism is sustained by coercion and consent, and it is expressed in prejudice, discrimination, oppression, violence, or, in some extreme cases, genocide. This broader perspective on racism, epitomized in the work of William Edward Burghardt Du Bois (1868–1963), is dominant in political science, sociology, and social anthropology.

In social and political psychology, the term is used more narrowly to describe a set of beliefs or attitudes. William Graham Sumner (1840–1910) took such an approach, identifying racism as a specific form of ethnocentrism related to the perception of ingroup/outgroup relations. Racism is a set of prejudices that enables and legitimates exploitation and scapegoating based on the "overgeneralization" that the different capacities and characteristics of a human being are determined by his or her belonging to a group. This standpoint is often associated with the work of Gordon Allport (1897–1967).

In everyday life, the term *racism* is often used loosely with respect to subordination or hostility toward a group.

From a historical perspective, racism is considered as a modern phenomenon. Besides the discussion on the existence of "proto-racism" in ancient Greek or Rome, the emergence of modern racism is connected to the Enlightenment and the appearance of scientific theories of the evolution of humankind. The search for the biological foundation of human behavior led to essentialist interpretations of the differences between groups of human beings, although the analytical distinction between biology and culture was increasingly used: One of the characteristics of racism is that the cultural characteristics and potentials of groups are seen as basically determined by biological differences.

Politically, racism is associated with conquest, colonialism, enslavement, and genocide. With the emergence of nationalism, racism became part of the social construction of national homogeneity. The emphasis on the cultural uniqueness of a nation-state led to certain types of culturally based exclusionary ideologies—for example, in romantic nationalism, often associated with the ideas of Johann Gottfried Herder (1744–1803). The democratic revolutions on both sides of the Atlantic led to the first attempts at emancipation of Blacks from slavery and Jews from the ghettos. Contrary to those efforts at emancipation, racism as a system of beliefs became further elaborated, as exemplified in the work of Arthur de Gobineau (1816–1882). He combines the idea of there being essential differences between human "races" with the legitimization of the political subordination of one group to another and the idea that "race mixing" contributes to the decline of humankind.

At the turn of the 20th century, scientific racism became an accepted part of academia, associated with new sciences such as eugenics (Francis Galton, 1822–1911) and the development of intelligence tests. Especially, newly developed statistical methods were used to "prove scientifically" the worth of different races. At the same time, racist political regimes stabilized, such as the institutionalized system of racism embodied in the "Jim Crow" laws of the U.S. South. The cruel climax of such racist political regimes was Nazi Germany, with its legally implemented idea of "race purity" (Nuremberg Laws of 1935; German: *Nürnberger Gesetze*) and the attempt to exterminate an entire part of the German population.

The word *racism* came into use in English in the 1930s; at first, it was used mainly to describe the Nazi regime. After World War II, it was increasingly used to describe colonial relations, especially between Africans and Europeans, and Black–White relations in the United States and South Africa. During the period of moral revulsion against racism after World War II, scientific racism was finally largely disavowed. International organizations such as the United Nations Educational, Scientific and Cultural Organization (UNESCO) started to mobilize against racism. In 1950, UNESCO declared in the statement "The Race Question" that it is one of the central goals of the organization to fight racism and suggested abolishing the term *race* altogether:

> National, religious, geographic, linguistic and cultural groups do not necessarily coincide with racial groups; and the cultural traits of such groups have no demonstrated genetic connexion with racial traits. Because serious errors of this kind are habitually committed when the term "race" is used in popular parlance, it would be better when speaking of human races to drop the term "race" altogether and speak of ethnic groups. (UNESCO, 1952, p. 99)

As noted by Ashley Montagu (1998), this report was influenced by the work of the anthropologist Franz Boas (1858–1942), who defined race as a purely social construct. Antiracism became an integral part of social movements such as the anticolonial Black liberation movement and the anti-apartheid movement. The disaggregation of the American South and the abolition of apartheid were important victories in the antiracist struggle.

Contemporary Approaches to Racism

Today, the following four different foci in political research on racism can be seen:

1. The changing faces of racism entrenched into the global order constitute an important topos. Racism as a transnational process has been a common theme in political analysis since the 19th century. Today, global communication and economic networks, together with the heritage of colonialism, contribute to the diffusion of what is sometimes called the "American model of race relations." In this model, races are seen as stable internal differentiations of the nation-state, a structure in the United States famously called by David Hollinger (1995) the "ethno-racial pentagon" (Blacks, Whites, Asians, Hispanics, and Native Americans). This model is often associated with neoliberal ideals. Its emphasis on individual responsibility contributes to phenomena such as "color-blind racism." Colorblind racism sustains racist structures through the denial of the importance of racism for social inequality. The concept of symbolic racism is used in political psychology to denote the opposition to policies designed to support specific racial groups.

2. Although scientific projects such as the human genome project emphasize the genetic unity of humankind, new types of biologically based benevolent racism have emerged—for example, in the advertising on drugs for assumed racial groups and the interrogation of these groups for the betterment of medical treatments. Connected with the rapid advances in genetics, we have reached a new phase of research on the biological bases of human behavior, strands of research that can be easily incorporated into racist ideologies. Further, as pointed out by Nadia Abu El-Haj (2007), new questions are raised on the very notion of "nature" in its relation to culture.

3. A disturbing facet of racism today is that it works as an ideology and practice often without legal or institutional support, expressed, for example, in ongoing segregation or discriminatory employer practices. These topics, together with investigations into the political successes of right-wing parties and right-wing movements, are an ongoing important line of discussion. Research here is based on a long tradition of attempts to measure racial prejudice and right-wing political attitudes, starting with the famous work of

Theodor W. Adorno (1903–1969) and a group of social psychologists on the "authoritarian personality" and continued in works such as Bob Altemeyer's study of right-wing authoritarianism in the 1980s. Today, as noted by Leonie Huddy and Stanley Feldman (2009), the concept of racial stereotypes is one way to conceptualize more clearly the relation between racism and politics.

4. The analysis of racist beliefs, practices, and social structures has led to studies of whiteness and the different dimensions of identity politics. In this context, racial prejudices are also taken into account but more as hidden or subtle forms of racism. The concept of "unconscious racism," advanced by Hart Blanton and James Jaccard in 2008, is one promising attempt to measure these types of beliefs. The mechanisms of social and political exclusion are interrogated in the intersection of different dimensions of inequality, such as class, gender, and nationality. The complexities of racism ingrained in modern institutions, giving unequal access to goods, services, and opportunities, are thematized under the rubric of "institutional racism." So one of the central questions in current political research is how racism and racial discrimination are reproduced on the national and the world level irrespective of the intentions of the actor.

RADICAL ATTITUDES

Like many other concepts in political science, the notion of radicalism dates back to the political conflicts of the late 18th and early 19th century. Even then, its content depended on the political context and was far from well defined. Consequently, being "radical" has meant different things to different people at different times in different countries. Moreover, radicalism is closely related, if not identical to, a number of (equally vague) concepts, such as extremism, fundamentalism, and populism. As of today, there is no universally accepted definition of radicalism and, by implication, radical attitudes.

There is, however, a core meaning of radicalism: Radicals are willing to challenge the ground rules of politics to get to the root (Latin: *radix*) of what they perceive to be the most pressing political problems. In any given context, radicals will confront the political establishment and will support policies whose implementation would trigger systemic change. In this entry, the various historical contexts and attempts at measurement of this concept are discussed.

Radicalism in the 18th and 19th Centuries

In the last third of the 18th century, a heterogeneous group of philosophers, writers, and politicians began to campaign for a thorough reform of Britain's political system. Among the goals of this movement were abolition of slave trade, reform of the electoral laws, and better protection of citizens' rights. They soon gained support from the emerging middle and working classes. The parliamentarian Charles James Fox is often credited with coining the name for this new movement when he demanded a "radical reform" of the electoral system in 1797, and by 1819, the "radicals" had established themselves as a separate political force that inspired the Chartist movement and played an important role in the creation of both the Liberal and the Labour parties.

Similarly, after the restoration of the monarchy in 19th-century France, supporters of republican principles called themselves "radicals." Over the last third of the century, they drifted to the left and were instrumental in the foundation of the country's first modern left-wing party, the Republican, Radical and Radical-Socialist Party, in 1901.

In Germany, *radical* was initially a political label chosen by those liberals who, in the spirit of the French Revolution, demanded civil liberties, universal male suffrage, and parliamentary representation. In the second half of the 19th century, this label was applied to those members of the workers' movement who favored a revolutionary change of government (i.e., the end of the authoritarian monarchist regime). In a similar fashion, in many other European and Latin American countries, "radicalism" became shorthand for a subtype of liberalism that could be located either to the left or to the right of the political center. To the present day, "radical" parties exist in many countries, including Argentina, Chile, Denmark, Ecuador, France, Italy, Paraguay, and Switzerland. Most of them are today classified as either liberal or socialist/social-democratic.

Radicalism in the 20th Century

The gradual spread of liberal democracy and its crisis during the interwar period changed the meaning of the concept of radicalism. In the wake of the events in Germany, Italy, Russia, and many other European countries, radicalism became a collective term for the forces at the poles of the political spectrum, which had formerly been known chiefly as "ultras" and had threatened to overthrow liberal democracy: Communists on the one side, Fascists and National Socialists on the other. Consequentially, radicalism was transformed into a primarily spatial term (location on the left–right axis) with a connotation that was directly opposed to its original meaning. While the original radicals had been champions of freedom and democracy, the radicals of the 20th century were, by virtue of their ideological preferences, opposed to these values. Under the postwar consensus of the 1950s, this perspective on radicalism became dominant.

However, less than 2 decades after the end of World War II, Seymour Martin Lipset challenged the prevailing view of the connection between centrism and support for democracy. In his seminal study *Political Man*, Lipset (1960) claimed that fascism and national socialism were neither left-wing nor right-wing ideologies. Rather, they constituted an "extremism of the centre." While this statement is problematic if interpreted in purely sociological terms—fascism and national socialism appealed both to the middle and to the working classes—it reflects the ambiguous location of these regimes on the traditional left–right spectrum. On the one hand, they violently suppressed the left-wing unions and parties. On the other hand, they were hardly champions of a free market economy: Fascism and national socialism insulated farmers and small businesses from competition, engaged in large-scale economic planning, and raised government spending on welfare to unprecedented levels.

More generally, Lipset argued that attitudes toward the economy and attitudes toward democracy could vary independently. In his view, any position on the left–right spectrum—radical or centrist—can be combined with "the repression of difference and dissent, the closing down of the market place of ideas" (Lipset & Raab, 1970, p. 6). This "tendency to treat cleavage and ambivalence as illegitimate" (p. 6) is what Lipset called *extremism*.

Lipset fruitfully applied this concept to right-wing extremism in the United States. In his view, the insistence on free market principles makes this particular breed of extremism "right-wing," whereas anti-Semitism, homophobia, racism, religious intolerance, and xenophobia are simply manifestations of the same underlying generic phenomenon. Indeed, in a separate work, he convincingly demonstrated that these traits are also prevalent among members of the working class, whose criticism of free market principles marks them as left-wingers.

Lipset's notion of extremism is so broad that it resonates with the even more general concepts that were developed around the same time by psychologists such as Hans Jürgen Eysenck ("tough-mindedness") and Milton Rokeach ("closed-mindedness," "dogmatism") and refer to a tendency to unconditionally accept norms, prejudices, and authorities. Like Lipset, Eysenck, and Rokeach, many other scholars treat political preferences in general and political radicalism in particular as an essentially two-dimensional phenomenon. However, while Lipset argued that left–right ideology and support for democratic values and institutions can vary independently, other authors disagree.

In work that was partly inspired by Lipset, Uwe Backes and Eckhard Jesse claim that there is a U-shaped link between ideological radicalism and antidemocratic extremism. Although they acknowledge that radicalism and extremism are conceptually different, they argue that radical ideological positions have implications that render them incompatible with liberal democracy as defined by the core values of the French Revolution: liberty, equality, and fraternity. According to Backes and Jesse, left-wing radicalism (communism) overemphasizes equality to the detriment of freedom, whereas traditional European right-wing radicalism (fascism) as well as American right-wing radicalism disregards equality in favor of either fraternity or liberty. In Backes's and Jesse's view, centrism is conducive to liberal democracy, while radicalism is a necessary and sufficient condition for extremism. In a sense, the 20th-century view of radicalism has come full circle in their work, which has influenced many European scholars directly or indirectly. However, empirical evidence for the U-shaped link between radical ideological positions and opposition to liberal democracy is sparse.

Measurement Issues

If radicalism is interpreted in a purely spatial sense, it simply refers to the end points of the ideological spectrum. The most common instrument in this context is the general left–right scale employed in countless comparative and single-country studies. Since the left–right scale is still interpreted chiefly in economic terms, other, more specific scales that refer to the appropriate degree of government intervention in the economy, state control of prices and wages, or the importance of trade unions have also been used. On the other hand, more inclusive attempts at measuring radicalism include preferences on "postmaterialist" issues such as the environment, minority rights, and direct democracy.

The logical implications of extreme positions notwithstanding, most researchers would agree, however, that a position at the end points of any policy scale is in itself of little importance because people frequently hold inconsistent and contradictory attitudes. Therefore, a number of items and scales have been proposed to directly capture support for liberal democracy.

Arguably, the most influential among these were developed by Herbert McClosky in his work on democratic values. In his 1964 article, McClosky distinguishes between three subdimensions of democratic values: respect for the "rules of the game" and support for freedom of expression as well as support for political, economic, social, and ethnic equality. McClosky's first dimension primarily refers to formal compliance. As long as a majority of citizens have internalized these rules, they will support democratic institutions even if their grasp of the underlying principles is patchy. His second and third dimensions, however, refer precisely to these principles.

A model (liberal) democrat would subscribe to both the principles and the rules, whereas an antidemocrat would despise both. Real-world citizens usually find themselves somewhere in between these two poles: They agree with the rules and abstract principles but sometimes struggle with their application. Some items on McClosky's scale were specifically designed to capture these conflicts. For instance, 90% of his respondents believed in "free speech for all no matter what their views might be," yet 50% agreed that books containing "wrong political views" did not deserve to be published and 25% were ready to suspend due process for "dangerous enemies like the Communists."

To the present day, McClosky's work has had a tremendous impact on the field, but there are some basic problems with his and all subsequent attempts to measure support for democratic values. First, the items inevitably reflect the political and historical context within which they were devised. For McClosky and many of his successors, communism was the main threat to liberal democracy.

With the advent of new ideological challenges such as Islamism and right-wing populism, this is obviously no longer true. Second, the rules and sometimes even the principles that constitute liberal democracy are bound to change gradually over time. Political behavior and issues from the New Politics agenda that were considered "radical" in the 1960s—minority rights, the environment, sit-ins and human chains—are now well within the political mainstream. Therefore, finding items that work well in all countries at all times is conceptually and empirically next to impossible. Third, even if these attitudinal scales generate measurements that are valid across time and space, they lack a natural cutoff point. At best, they are able to identify the most radical persons in society. Where the boundary lies between democrats and radicals, however, is an entirely different question.

RATIONAL CHOICE

Rational choice, or *rationality*, has two meanings. First, in a technical sense, rationality implies that an individual's preferences over choices possess two properties: completeness and transitivity. The first property holds that the individual's preferences are well defined for any two possible alternatives in the set of available choices: Given any pair of alternatives x and y, the individual prefers choice x over y, prefers choice y over x, or is indifferent between them. The second property maintains that if the individual prefers alternative x to y and y to z, then the individual prefers x to z.

Most commonly, when scholars mention rational choice, they refer to the broad set of work—the rational choice school—that builds on this technical definition of rationality. Although derived, at the core, from this single technical definition of rationality, the rational choice school is commonly associated with a number of additional views about human behavior. Notably, rational choice is commonly associated with self-interested behavior. This association reflects a common set of assumptions about the structure of individuals' preferences, such as that people care only about their own personal welfare, not the welfare of others. This orientation leads many critics to juxtapose rational choice with theories in which individuals behave in other-regarding ways—for example, a Rousseauean citizen who strives for the common good. This, of course, puts aside the thorny issue of how to define or determine the "common good."

Second, rational choice is closely associated with the idea of human interdependence and with a subfield of economics known as game theory. Game theory provides a set of tools for studying the interactions among people. Crucially, game theory recognizes that one individual's choices often depend on the behavior of other individuals. For example, if an individual is stopped at a four-way stop sign, his or her decision of whether to wait or to proceed depends on whether he or she expects the other cars stopped at the intersection to wait or to proceed.

Rational Choice: A Social Theory of Human Behavior

Although rational choice theory builds on *individual* decisions, it is fundamentally a *social* theory of human behavior. Indeed, part of the reason for simple assumptions about individuals is to build tractable models of social interaction. Rational choice theory is social in its approach to understanding individual decisions, contending that we condition our behavior on the anticipated behavior of other people. In addition, it is social in that it allows us to understand how groups of individuals reach collective decisions and produce social outcomes.

Human Behavior Is Interdependent

Most rational choice theories emphasize the interdependence of individuals: The behavior of one individual depends on how this person expects other people to behave. This fundamental insight has been applied by scholars to a wide range of questions in economics and political science, from the entry of firms into new markets to agenda setting and voting in Congress.

Charles Cameron, for example, studied the presidential veto in a rational choice framework. As an empirical fact, American presidents rarely veto legislation from Congress. This observation led many scholars to view the veto as unimportant to the legislative process. Congress, they argued, dominates the legislative process, and the president has little say over the content of any legislation. However, Cameron saw that the veto often has a profound influence on legislation. Members of Congress, he observed, anticipate that the president will veto a bill if it is too far from his preferred policy. Members of Congress design legislation so that it is sufficiently close to the president's preferred policy to avoid a veto. Using rational choice theory, Cameron demonstrates how the veto influences public policy outcomes, even if the president rarely exercises the veto.

In another application, scholars study the policy-making behavior of executive agencies in the American separation-of-power system. The statutes passed by Congress often delegate to agencies—such as the Food and Drug Administration or the Environmental Protection Agency—considerable discretion in implementing the law. Some observers have called such delegation of power to agencies an abdication of power by Congress, leading them to question policy making by unelected bureaucrats. In contrast to this conventional perspective on agencies, rational choice scholars such as John Ferejohn, Charles Shipan, and Mathew McCubbins observe that agencies must anticipate the behavior of Congress. Just as Congress delegates authority to agencies, Congress can trim this authority, transfer it to another agency, withhold budgets, or invalidate the statute wholesale. If the agency implementation of a statute is sufficiently unsatisfactory to Congress, it is likely to override the agency. To avoid costly interaction with Congress, agencies must anticipate the possible reactions by Congress, adjusting policy to avoid negative treatment by the parent institution.

This example of congressional delegation is an instance in a broader class of interactions studied by rational choice scholars, known as *principal–agent problems*. This type of interaction is characterized by a principal (e.g., Congress) attempting to induce an agent (e.g., the executive agency), which often possesses divergent preferences from the principal, to perform some task (e.g., implement a statute). Principal–agent problems have wide applications in political science, including delegation of authority by citizens to elected officials, by officials to bureaucrats, and by the military to subordinates.

Social Outcomes as Products of Individual Choices

One of rational choice's most important contributions is the idea of a *social dilemma*. Individually rational decisions often have unintended social outcomes; paradoxically, individual maximization often leads to socially suboptimal outcomes. Rational choice has been instrumental in identifying and clarifying these social dilemmas as well as in proposing solutions to them.

Scholars have long recognized the problems inherent in aggregating individual preferences into social outcomes. In the 18th century, the Marquis de Condorcet noted that decisions made by majority vote "cycle"; that is, they display intransitivity. Consider a simple version of this cycling. Suppose a polity exists with three voters, 1, 2, and 3, and three policy alternatives, A, B, and C. The voters have the following preferences: Voter 1 prefers A to B to C, Voter 2 prefers C to A to B, and Voter 3 prefers B to C to A. As an initial social choice, consider a vote between Alternatives A and C. In this case, Voter 1 votes for A, and Voters 2 and 3 vote for C, giving Alternative C a majority vote. Thus, on the basis of majority vote, the polity appears to favor C to A. Now consider a vote between B and C. Given these alternatives, Voters 1 and 3 prefer B, and Voter 2 prefers C. A majority, therefore, appears to favor B to C. Finally, consider a vote between A and B. With this choice set, Voters 1 and 2 prefer A, and Voter 3 prefers B; the polity prefers A to B.

These votes result in an intransitive social preference ordering. A majority prefers C to A, B to C, and A to B. This roughly equates to saying that C is greater than A, B is greater than C, and A is greater than B. This social intransitivity occurs despite the fact that the individuals in the polity have well-defined preferences over the alternatives. Technical studies of voting show that this example is not an aberration but typical. As William H. Riker explains, it is difficult to discuss the "democratic will," for example, if the social preference ordering cycles through alternatives.

As troubling as it is, Condorcet's cycling result is derived purely from the structure of individuals' preferences and a simple voting rule. His result does not depend on individuals' *strategic* behavior.

In contrast, a large number of other rational choice applications derive social dilemmas on the basis of strategic interdependencies. We will consider four canonical examples of such social dilemmas illustrating strategic interdependence.

The prisoners' dilemma is perhaps the longest-recognized strategic dilemma, recorded by Thomas Hobbes in the 17th century. As a simple example, consider an environment with two individuals, A and B, who face two choices, to farm (F) or to defect (P). The value for Individual A of farming or preying on the other person depends on whether Individual B farms or predates (and the reverse). Using numbers to simplify the example, we have the following:

		Player B	
		F (x, y)	*P (x, y)*
Player A	F (x, y)	(3, 3)	(0, 4)
	P (x, y)	(4, 0)	(1, 1)

where (x, y) represents the payoffs for Players A and B, respectively.

Each player must decide between F and P. If both players farm, they both receive a payoff of 3, maximizing social output. However, both players face a unilateral incentive to *defect* from farming: While the other player does the hard work of farming, the first player preys on his crops. This unilateral defection produces a payoff of 4 for the player who predates and a payoff of 0 for the player who is victimized. Because both players face the same incentives, neither will farm. The only stable outcome of the prisoners' dilemma is where both players predate and both receive a payoff of 1.

In Hobbes's view, the prisoners' dilemma modeled a world in which life is short, nasty, and brutish, in which all prey on all. One productive way to think about the prisoners' dilemma is in terms of the ability to *commit* to a certain course of action. Both players prefer to live in a world in which both members farm, but they cannot commit to farming in the face of incentives to prey on the other player.

The social outcome—a world of all preying on all—differs from the social outcome that every individual wants to occur. Nevertheless, the social outcome is a product of individually rational decisions: Each member acts in his or her best interest yet produces a social outcome that is not in his or her best interest.

The *common pool problem*, first articulated by William Foster Lloyd in the 19th century and sometimes referred to as the tragedy of the commons, is another social dilemma. Consider a common resource, such as land for grazing cattle, available to a society. Each individual unilaterally decides how many cattle to graze on the land, receiving some benefit for each animal he or she grazes. But individuals pay only part of the cost of grazing each animal: The cost of maintaining the land is divided among all members of the society. This structure of costs and benefits provides strong incentives to exploit the common land, grazing as many cattle as possible. When all the individuals do so, however, overgrazing occurs, which depletes the quality of the land. Common-pool problems have an enormous range of applications, including the growth of government, pollution, population growth (Lloyd's initial concern), and the overuse of public roads.

Another class of dilemmas, known as *collective action problems*, studied by rational choice theorists focuses on public goods, or goods that are not excludable (no one is prevented from benefiting from them) and are nonrival (one person's consumption does not influence the ability of another person to consume). "Common goods," such as grazing land, differ from "public goods." A public good is characterized by nonrivalry—for example, clean air. In the case of common goods, one person's consumption influences the ability of others to consume the good. Grazing land, for example, becomes depleted.

Examples of collective action problems include national security and clean air. The fundamental difficulty in a collective action problem is that the ability of an individual to consume the public good is not linked to any effort to provide the good. For example, regardless of whether an individual pays taxes, he or she benefits from the national security provided by the standing army. This decoupling of benefits and costs creates an incentive to *free ride* off the contributions of others.

Collective action problems, therefore, represent another type of social dilemma. One implication of collective action problems is that societies often face shortages of public goods. Even though almost all members of a society would benefit from these public goods, such as stronger border security, preventing raids from the neighboring society, the incentive to free ride results in an underfunded, anemic security apparatus. The problem of an underdeveloped security apparatus was endemic for most of human history. Only recently, with the development of the institutions of the modern state, have security forces become well funded—too well funded in the eyes of some.

As a final example of a class of problem studied by rational choice theorists, consider *coordination problems*. In this type of problem, the members of a society benefit from acting in concert and suffer when they fail to do so. A classic example of a coordination problem is the choice of whether to drive on the right or left side of the road. If we all drive on the left, then we move about safely; the same holds if we all drive on the right. However, if people fail to drive consistently on the left or the right, driving becomes extremely hazardous.

Political science has applied the coordination problem to a wide range of political questions. Consider the choice of whether to protest or actively work against an authoritarian regime. If all the citizens who dislike the regime act simultaneously, they can overthrow the regime. However, if they act at different times, with only small groups on the street at any time, the police will suppress their movement. The group of discontented citizens faces a *coordination problem*. If they coordinate on a time and location, they benefit from a political transition to democracy; if they fail to coordinate, they receive a beating by the police.

Although we have focused on the problems that rational choice theory has helped us understand, this perspective has also generated a wide range of solutions. Studying collective action problems, Mancur Olson observed that members of groups have the incentive to free ride off the hard work of others. As a partial response to the problem of free riding, Olson argues, some groups provide "selective benefits"—benefits to those who provide their share of the collective good. Elderly people, for example, have a shared interest in lobbying Congress to pass laws that promote health care and various other forms of public policy beneficial to older Americans. However, due to free riding, older Americans benefit from these lobbying efforts even if they make no effort to support them, such as paying dues to the American Association of Retired Persons (AARP), a principal interest group for the elderly. To combat the incentive to free ride, the AARP offers a number of benefits that accrue only to AARP members who pay dues, such as newsletters, discounts on medication, magazines, and other consumer products. Thus, selective benefits offer a partial solution to some collective action problems.

In another example, constitutions can help resolve coordination problems. As noted above, the choice of whether or not to protest against a regime is fraught with danger: Coordinate on a time, and the protestors often win; fail to coordinate, and the protestors often face suppression by the police. The rights enumerated in a constitution serve as a *coordinating mechanism*. When a regime violates a constitutional right, the citizens collectively understand that a transgression has occurred, and this triggers coordinated action to reverse the transgression. Without the enumerated rights, citizens will have difficulty determining what counts as a transgression, and they will face the real possibility of coordination failure and all its attendant dangers.

Objections and Limits to Rational Choice Theory

Rational choice theory is subject to several criticisms, which fall into three categories. First, critics suggest, rational choice theory is unsuitably restrictive because it typically assumes that people behave in a narrowly self-interested way. Critics observe that, in contrast to this common perspective, human motivations are often far more complex, reflecting a concern for other people.

A second criticism holds that rational choice theories are not sufficiently constrained. After an initial set of assumptions about the structure of preferences and the interaction between individuals, rational choice theories contain rigorous, highly constrained, internally and logically consistent analysis. However, scholars have discretion in their assumptions about the preferences and how they model the interaction between individuals. For example, altering the sequence of the interaction—allowing Player A to move before Player B, say—often appears innocuous, but it can have profound implications for the results of a rational choice theory. Similarly, the structure of individuals' preferences—not only what they care about but also how their payoffs respond to increases or decreases of what they care about—can dramatically influence the predictions of a theory. In this way, despite the appearance of rigor, rational choice theories have arbitrary elements.

A third common criticism notes that rational choice theories cannot explain important elements of human behavior. Voter turnout, for example, is exceptionally difficult to explain in terms of rational choice theories. Each voter has only a trivial influence over the outcome of an election: If any single voter decides not to turn out to vote, the probability that the outcome of the election will be altered is impossibly small. And yet, regardless of whether or not an individual's vote can influence the election outcome, each voter pays some cost for voting—the time and effort it takes to vote. The combination of highly uncertain benefits with certain costs suggests that voter turnout is a rare event. Yet people clearly vote in elections. Thus, rational choice theories fail, in this criticism, because they cannot account for important aspects of human behavior.

In response to these criticisms, rational choice scholars often provide two observations. First, although it is common to assume the narrow self-interest of individuals, this assumption is not necessary. Rational choice theory can also assume that part of an individual's welfare depends on the welfare of other people. For example, many people value a measure of equality in the distribution of wealth, and this preference often induces people to give to charity or to support programs that redistribute income. Donations to charity and other apparently selfless acts do not necessarily represent irrational behavior. Similarly, the rational choice perspective easily models these settings where people attach some value to being viewed as good citizens or value the welfare of their fellow citizens.

The second point is methodological. The goal of rational choice theory is to provide a way of understanding human interaction and social outcomes. Models are useful because they capture important elements of human behavior in a parsimonious way. Creating a useful model necessarily involves focusing attention on certain motivations to the exclusion of others. As the examples discussed above indicate, rational choice theory helps us understand problems of social importance. This contribution is possible because of—not in spite of—the narrow focus of rational choice theories. Moreover, as rational choice theories matured, they gradually expanded the focus to include less restrictive assumptions. The core insights, however, almost always derive from the study of a highly *modeled* environment that is unrealistic in a variety of ways.

The most serious criticism of rational choice theories is that they are not sufficiently constrained. As suggested above, modeling choices about preferences or the structure of interaction crucially affect the model's implications. The strongest rational choice models, therefore, are those that build on others, by which a consensus emerges on how to study a given problem, such as the assumption that elected officials maximize the probability of reelection.

Frontiers

Rational choice scholars extend this approach in a variety of new and exciting directions. For example, an important literature focuses on problems related to information—who knows what and when they make a choice as well as the incentives for a player to misrepresent himself. In the interest of space, we focus on just one important innovation: behavioral choice.

Students of behavioral choice attempt to combine insights from psychology with standard rational choice theory. They question whether it is possible for humans to process information in the way implied by traditional rational choice theories or whether emotions or cognitive constraints systematically bias choices away from purely rational ones. Rather than calculate every contingent possibility, for example, behavioral choice scholars suggest that people use heuristics and rules of thumb to reach decisions. Similarly, the way in which a choice is presented to individuals appears to influence their ultimate choice. For example, whether people are asked to opt in or opt out of a program can control whether they join the program, a finding that is difficult to square with conventional rational choice theory. This approach remains in its infancy, but it promises important extensions and generalizations of the rational choice approach.

Conclusion

Rational choice theory relies on simplifying assumptions about individuals in large part because it is a theory of social interaction. Assumptions of individual rationality, as we have seen, lead to many important and unobvious conclusions about the behavior of groups of individuals or societies. As illustrated by various social dilemmas, maximizing individuals do not imply social maximization.

RATIONALISM, CRITICAL

Critical rationalism is a school in the philosophy of science and in political philosophy centered on the works of the Austrian-English philosopher Karl R. Popper. The Social Democrat Popper fled from Vienna and the Nazis in the late 1930s to New Zealand and established himself in London after the war. Critical rationalism is characterized by the method of trial and error, applicable in all scientific disciplines, philosophy, or politics according to its adherents. In a problem situation, a tentative theory is advocated to solve the problem. Thereafter, all efforts should be directed toward demonstrating the falseness of this theory (falsification, error elimination), and when this has been done, we are in a new problem situation but with increased knowledge. We have learned from our mistake. This optimistic belief in the possibility of the growth of knowledge justifies the label "rationalism." Moreover, this rationalism is "critical," since a prevailing theory should always be exposed to a maximum of criticism. This is a particularly demanding requirement for the theory constructor; however, it is a crucial purpose of critical rationalism to depersonalize research and its theories. This entry presents the basic tenets of critical rationalism, reflecting the mainstream of contemporary social science and beyond.

In a political science perspective, critical rationalism is crucial both from a methodological viewpoint and as a substantial political philosophy.

Moreover, critical rationalism indicates how the political scientist can make himself or herself useful to society. Although it is a challenge to follow them in actual research, the prescriptions of critical rationalism have become mainstream in political science or social science methodology textbooks, even if they are occasionally contested. Further, Popper's work on the "open society and its enemies" is an important ingredient in the political philosophy of the 20th century, known mainly for its attacks on the prophecies and societal utopias of Plato, Georg Wilhelm Friedrich Hegel, and Karl Marx. It is actually in the spirit of critical rationalism that not even a classic Greek philosopher like Plato, normally over and above criticism, is spared. Subjecting his thought to criticism is a way of taking it seriously, according to critical rationalists. No historical or spatial barrier should protect against criticism. This side of Popper's work belongs to normative political theory. As shown below, these two aspects of Popper's philosophy, even though dealing with widely different matters, are well integrated in his own thought as they follow from a few basic assumptions.

It is not unreasonable to structure 20th-century philosophical debates around Popper: Popper versus the positivists (empiricists), Popper versus the relativists (the idealist philosophy of language or Thomas Kuhn's philosophy of science), and Popper versus the Marxists and Neo-Marxists. Critical rationalism encompasses not only Popper's philosophical followers (e.g., J. W. N. Watkins, David Miller, Hans Albert, William Bartley, and Imre Lakatos) but also many natural scientists and social scientists. Seven theses of critical rationalism are formulated below and put in their proper context. Their relevance for political science and its debates are then briefly discussed.

1. ***Reality exists "out there" (philosophical realism).*** Philosophical realism asserts that reality exists independently from our language and theories about it. A corollary of realism is the correspondence theory of truth: Truth means a statement's correspondence with reality (as opposed to the coherence theory of truth, which stresses its coherence with previous knowledge, and the pragmatic theory of truth, which emphasizes its practical usefulness). This conception of truth is very commonsensical: Statements are *about* something, and if they fit with this something, the statements are true; otherwise they are not. This theory of truth makes it meaningful to compare theoretical expectations with observations of the relevant segment of reality, meaning that theories can, in principle, be evaluated and compared mutually as to how well they match reality. Therefore, some theories can be seen as better than others; one theory may represent progress in relation to another. This is a privilege compared with epistemologies, according to which theory and reality cannot be disentangled and therefore do not allow for any confrontation between them.

Occasionally, the school of realism in international relations, focusing on states and their relative power, is mistaken for philosophical realism as described here. Some international relations realists are indeed philosophical realists, whereas others are not, and for still others it is hard to tell. It is more obvious, however, that linguistically oriented schools such as poststructuralism, postmodernism, or constructivism are nonrealist in the philosophical meaning of the term. Studying the narratives of different political actors, the issue is not which of them is most "true" but their pragmatic functioning in the actors' respective contexts. Analysts may have their own narratives in the name of science, but decoding their pragmatic or political agendas is crucial. Objective "truth" is uninteresting, if it exists at all. Relativism prevails.

2. ***Life is too short to quarrel about the meaning of words or concepts (anti-essentialism).*** A consequence flowing from the above disentangling of language and reality is that words or concepts can be defined by the analyst. They are decisions, although they are not arbitrary. Research strategic considerations may decide how to define a concept. Concept essentialism is thereby discarded: There is no such thing as what a concept "really" means. Popper did not want to quarrel over words. Assertions about reality are important and should be disputed—not the meanings of words or concepts. In other words, the theory that poverty causes revolution is significant and should be discussed and disputed, not the meanings of the concepts of "poverty" and "revolution."' What is the essence of poverty or the real meaning of revolution are fruitless questions. These definitional questions should be decided relatively quickly as a

preliminary step toward the interesting discussion concerning the causal *relation* between poverty and revolution.

Whether and how politicians use a concept is a part of political language and thereby reality. However, that should not affect whether and how political scientists use the concept for analytical purposes. For instance, it may be reasonably argued that the concept of "security" is worn out for analytical purposes. There is no deeper meaning in such an argument, only the practical consideration that the concept has been used in so many different senses that it no longer conveys any clear meaning but rather spreads confusion. Politicians' use of this concept should be seen as political language with other purposes than analytical ones (things can be done with words [performatives], but that requires that they be spoken from a position of power and responsibility). Such use is interesting as an empirical object of study, but it is irrelevant for the analyst's conceptual equipment. This thesis of critical rationalism stands in direct opposition to the "linguistic turn" of political science, including international relations, that took place from the 1990s onward in the form of poststructuralism, postmodernism, or constructivism.

3. ***Even though reality exists, it is difficult to grasp; there are no "facts" in themselves (antipositivism or anti-inductivism).*** Although reality exists independently of our theoretical constructs (Thesis 1), it can be grasped, according to critical rationalism, only through our conceptual lenses (critical rationalism thereby belongs to the philosophical tradition of Immanuel Kant). This means that there is no such thing as facts in themselves—apart from trivialities such as the numbers in a telephone directory. All interesting observation is theory impregnated. A good many of Popper's philosophical efforts have been directed against the positivist quest for certainty, that is, that theory should be built inductively "from below" on a secure foundation of indisputable facts (this includes naive realism, i.e., that things are what they look like and that truth is manifested through them). Knowledge cannot start from nothing, from a tabula rasa, or yet from observation. The growth of knowledge consists mainly in the modification of earlier knowledge. Such knowledge should not be understood in any puristic sense. Even if political science hardly encompasses established theories, there are general explanatory principles at our disposal, such as role, rationality, or inertia, that can be integrated into theoretical constructs. The main thing is that the expectations that we attempt to falsify (cf. Thesis 5) are theory derived, that is, derived from explicit sets of general justifications. In other words, a priori reasons should be formulated as to *why* we believe in the expectations.

In political science epistemological debates (positivism vs. the neo-Marxism of the 1970s and 1980s or, more recently, positivism vs. poststructuralism or other linguistic orientations), Popper has often been lumped together with the positivists. As should be apparent, this is erroneous. His criticism of inductivism obviously hits correlationally oriented branches of political science. For instance, a major problem with U.S. comparative foreign policy studies was their lack of explicitly formulated reasoning as to why various hypotheses deserved to be tested. Such explicitness would have increased the opportunities for learning from falsifications.

4. ***Theories should be parsimonious; among two theories with equal explanatory power, the simpler one should be preferred (the virtue of simplicity).*** Theories should preferably be simple (parsimonious): They should be able to explain much by little—by one or a few unifying explanatory mechanisms (be it rationality, role, or a unitary actor). We need a relatively simple starting point for inquiry into the "world of chaotic variety" (Marx's formulation). Parsimony urges one to include only those factors in a theoretical construct that a priori seem able to account for a considerable part of the empirical variance. Critical rationalism demands bold conjectures in relation to what we already know (our background knowledge); in other words, science should aim at interesting truth rather than just truth. This demand follows from the virtue of simplicity: What is usually called the simplicity of a theory is associated with its logical improbability and, hence, its boldness.

In the field of international relations, the preference for parsimonious theory characterizes the work of Kenneth Waltz, for example, who is one of its most influential authors. However, as emphasized by Waltz's critics, his assumptions do not correspond sufficiently to reality (Thesis 1), and the falsifiability of his theory is questionable (see Thesis 5). Climbing down the "level ladder" in foreign policy explanation is also based on respect for parsimony: starting out with the simplest systemic or geopolitical explanation, which—if unsuccessful—is supplemented by factors of domestic politics or, if necessary, by factors in the decision-making process. In other words, if the most parsimonious explanation does not sufficiently account for reality, one proceeds—with some resignation—toward less simple modes of explanation.

5. ***Theories, to be scientific, should in principle be falsifiable (falsificationism).*** It is not important how a theory is invented or discovered by a researcher; it may be inspired by societal developments or by specific academic colleagues, or it may be dreamt at night. Therefore, research psychology and the sociology of knowledge are redundant disciplines from the viewpoint of distinguishing good from bad theories or scientific from nonscientific ones. Only one thing counts: the theory's falsifiability. It is easy enough to find "confirming" instances of almost any theory. If it is to be considered a scientific theory, however, it should run the risk of being false—unlike Sigmund Freud's psychoanalysis, for instance; in short, it should be falsifiable. This thesis is probably the most famous in the methodology of critical rationalism. The bolder the conjectures (Thesis 4), the greater the a priori likelihood that they are mistaken and, hence, the more falsifiable they are. Science should progress through a series of falsifications, each time leading to the formulation of a better theory incorporating what has been learned from previous falsifications—that is, learning from past mistakes.

The doctrine of falsificationism was developed in opposition to the positivists' verificationism and, as the latter failed, their skepticism toward the growth of knowledge. Whereas it is impossible to verify the law "All swans are white" on the basis of the observation of a finite number of swans, it is possible to falsify it by observing only *one* colored (nonwhite) swan. Of course, the supporter of this law may object, for instance, that the swan in question has been painted; such auxiliary hypotheses, however, should be used with the utmost restraint and only in the most obvious cases. Even though followers of Popper such as Imre Lakatos have refined falsificationism, it has faced criticism in philosophy, the natural sciences, and the social sciences. Not surprisingly, theory constructors often advocate a more lenient course vis-à-vis theories than that of falsification. Rather than consciously seeking to kill theories at the first occasion, they should be given a fair chance of "peaceful development," at least at the outset. The prevailing view in political or social science today seems to be that a certain initial "protectionism" of theories is justified.

6. ***The development of society should be explained neither on the basis of traits or motives of individuals or groups within it (reductionism) nor on the basis of emergent properties of society as a whole (holism).*** Instead, revealing unintended consequences is the way forward for social and political science. Reductionism means that unit-attributes are used to explain developments of the whole, the system. A special version of it is psychologism, meaning that attributes or motives of individual human beings are used to explain societal developments. Conspiracy theories are reductionist. Popper repeatedly warned against conspiracy theories that claim to explain various unfortunate societal developments on the basis of the characteristics or motives of individual human beings or a specific group, functioning as scapegoats (the Jews, immigrants, the Communists, etc.). However, we should not, according to critical rationalism, jump to the opposite extreme and seek to explain social phenomena solely on the basis of emergent properties of the whole (holism). The target here could be functionalism in sociology or political science, explaining developments on the basis of societal "needs" or "functions." Instead, the preferred explanation of outcomes in the social sciences should refer to mechanisms producing consequences that were unintended by the individual or societal actors involved (as distinct from conspiracy theories dealing with the intended consequences of "evil" actions). For instance, rational choice theory or game theory, often used in international relations, may be an excellent instrument to understand such unintended consequences in the interaction of nation-states. Each state in a conflicting dyad proceeds from its own situational logic and wishes to safeguard its own security. An expensive arms race, further threatening the security of both sides, is the unintended consequence of

each actor following its own situational logic in order to be "safe." Or, to take another example, international organizations may persist, although their original good purposes have been fulfilled or are no longer relevant. This is because some nation-states have vested interests in the persistence of these organizations, typically unintended at the time of their creation.

Both Popper and Hans Albert took up a fight on these issues in the so-called *Positivismusstreit* in German sociology in the late 1960s. The opponents were primarily the Neo-Marxists of the Frankfurt school, including Jürgen Habermas, but it was likewise seen as vital to keep a distance from positivism.

7. ***Belief in historicist laws is the basis of modern totalitarianism, be it of a Marxist or a fascist nature.*** In contrast, reform of the open society should be guided by piecemeal social engineering. Even worse than functionalism, holism may lead to historicism, the view that the whole develops deterministically according to its own immanent law of historical development (in contrast to scientific laws of the if-then type). A process law exists for the solar system because there are few, if any, factors disturbing the system. A human society, however, is a much more complex system, which cannot be explained by such a historicist law. There will always be disturbing factors, be they external or internal. From this methodological reasoning, Popper develops his political philosophy. Its target is totalitarianism operating within stages of human society, through which a determinist development will allegedly lead to a final utopia (such as the classless society or Hitler's Thousand-Year Reich). Characteristically, *The Poverty of Historicism* (Popper, 1957/1972), the book in which these thoughts were formulated during World War II, was dedicated to the "countless men and women of all creeds or nations or races who fell victims to the fascist and communist belief in inexorable laws of historical destiny." Perhaps it was unfair to ascribe this determinist belief to Marx personally in *The Open Society and Its Enemies* (Vol. 2). However, it can in any case be ascribed to much of the political Marxism that prevailed in the 20th century.

Popper, in the preface to *The Poverty of Historicism*, has added a further argument that should refute historicism: The course of human history is strongly influenced by the growth of human knowledge. Since we cannot predict, by rational or scientific methods, the future growth of this knowledge (then we would already have it!), it is impossible to predict the future course of human history.

The "closed society" is held together by "semi-biological ties—kinship, living together, sharing common efforts, common dangers, common joys, and common distress" (Popper, 1945, chap. 10, para. 1). It is a semi-organic unity, to which the "so-called organic or biological theory of the state can be applied to a considerable extent" (Popper, 1945). The closed society is characterized by elite rule and the belief in magical taboos, including dreams of a future utopia, while the open society is one in which men have learned to be, to some extent, critical of taboos and to base decisions on the authority of their own intelligence—after discussion. The change from the closed to the open society is a step from tribalism, xenophobia, and nationalism to humanitarianism.

The open society is modeled after good science, with its free and critical discussion. Rather than a belief in process laws, reform of the open society should be based on "piecemeal social engineering." (This label turned out, of course, to be a public relations failure: Few social or cultural scientists or debaters like to be associated with such a "simplistic" activity as engineering.) The role of social or political science would be to provide the inputs to this engineering. Notably, knowledge of unintended mechanisms would be valuable in the process. It is less important in the big picture, which specific ideological shading Popper's open society should have. With his emphasis on social engineering, however, it seems to be social democratic or social liberal rather than liberal or conservative. The unique feature of critical rationalism is probably the link between sophisticated epistemological reasoning and a forceful political philosophy. Distinct from his positivist colleagues in the Vienna Circle, with whom he also had serious epistemological disagreements, Popper wished to connect his reasoning to the ominous political developments taking place outside the seminar room.

RATIONALITY, BOUNDED

Bounded or *limited rationality* is a term coined by Herbert Simon in his theory of decision-making processes in administrative organizations. It focuses on the different types of limitations that actors or decision makers in formal or administrative organizations have when they make decisions. Decision makers have to make a selection of decision premises—goals, preferences, problems, solutions/alternatives, and potential consequences—to cope with these limitations when making decisions. The concept of bounded rationality relates to what kind of limitations actors have, how they can cope with these limitations, and what the effects of bounded rationality are. Bounded rationality is connected to the concept of "administrative man" and can be seen as a critique of and modification of the concept of "economic man"—in other words, the theory of full rationality. Bounded rationality relates to the concept of "satisficing," meaning that decision makers are choosing decision premises that are "good enough," while economic man is about maximizing or choosing the "best possible" action.

Many studies of decision making show quite clearly that decision-making processes are characterized by actors not having all goals and preferences available or unambiguously defined, not having all potential problems exposed, not having all alternatives or solutions lined up, or not having all potential consequences defined. Actors in the real world seem to decide based on a few selected goals/preferences, problems, solutions/alternatives, and consequences. Actors, according to the concept of bounded rationality, intend to be rational, although they are constrained in these efforts by limited cognitive capability and incomplete information.

Limitations on Decision Making

One important type of limitation on actors is *problems of attention*. Decision makers have problems related to time and capabilities. They have too many decision signals to attend to from internal and external sources; too many tasks to work with; too many strategies, plans, and policies to attend to; and too many contacts to cope with. And some information and decision-making premises are not ready available, so they have to search for them. Therefore, how they allocate their scarce resources is a critical factor. They are often part-time participants in many decision-making processes because they move around between decision opportunities depending on what is brought to their attention. And when they focus on some problems, solutions, and decisions, they have to defocus on others because of limited capacity. All these limitations indicate that decision theories should be centered more on theories of attention and search than on theories of choice among readily available goals, preferences, alternatives, and consequences.

Another set of limitations concerns *problems of memory*. Both individuals and organizations may have problems in storing and retrieving information. Individuals may forget or may have problems of capacity concerning keeping records of actions and experiences, or their memories may be distorted. Organizations may have problems in systematically collecting information, interpreting and storing it, and retrieving information or making it fully available throughout the organization because of lack of capacity and competence or organizational barriers.

A third set of limitations is *problems of comprehension*. Individual actors and organizations may have problems of capacity concerning aggregating, organizing, using, and inferring from information. It's therefore often difficult to learn from history about the relationships between actors and events, not to mention predicting further development. The information may be there, but actors may fail to put it together in a comprehensive way. The more complex the society and the organizations themselves, the more prevalent such problems will be. Actors may also compete in defining and learning from history, partly because they have experiences from different parts of an organization or see their experiences through different lenses of norms and values—for example, related to higher education and professions. There may also be some wishful thinking or superstitious learning going on. Actors may think that what happened had to happen or that all good things in their organization are related to their own actions and all bad things to the actions of other actors.

A fourth set of limitations deals with *problems of communication*. The more complex and specialized information and knowledge are, the greater the problems of communicating information. It's difficult to share information and knowledge across generations, cultures, organizations, levels, tasks, professions, and organizational units. Specialized formal structures may be good at handling information internally but not at communicating and sharing their experiences externally. Different units or groups in an organization may use different information or different methods to simplify the world surrounding them.

March's Dynamics of Decision Making

A key to understanding bounded rationality is to understand that decision makers are selecting decision premises to simplify the decision situations and make them easier to cope with, so a major question is how they are able to make such a selection. James G. March, in interpreting several psychological studies of individual decision making, says that there seem to be several ways to react to cognitive limitations and constraints. One is to use stereotypes to interpret actors and events. Decision makers construct patterns of attitudes or traits and accordingly interpret other actors' behavior based on the typologies. They imagine and define intent based on observing other actors' behavior or the consequences of that behavior. They define certain aspects or elements of a problem as crucial and ignore the other elements. Their understanding is based on socially developed theories, scripts, and schemas, where missing information is filled in based on interpretations of events, and they tend to ignore inconsistencies in their models of thought and action. All this makes it easier to comprehend information and to act systematically.

The simplified interpretations of problems, solutions, and actors that decision makers have is often path dependent, because their search for information is often biased and limited, meaning that they search where they recently have found problems and solutions. In this way, they save resources and modify their capability restraints. They see what they like to see, and like what they see, and overlook information and events that do not fit into their simplified world. In that respect, they often get their image of the world confirmed.

March summarizes the studies on simplification processes by describing four types of simplifications that decision makers use. One type is *editing*, meaning that actors tend to edit and simplify goals, preferences, problems, alternatives, and effects before entering into a decision process or making decisions, leaving only a small number of premises or decision elements left, which are combined in a simple way. Some information is overlooked or not processed, decision premises and alternatives are attended to in a sequential way, or decision elements are weighted unequally. Sequential attention may solve problems of consistency in the short run but increases long-term consistency problems.

The second simplification method is *decomposition*, meaning that actors decompose complex problems and alternatives into simpler elements that are easier to cope with. The expectation here is, of course, that attending to the separate elements will eventually lead to an acceptable common outcome. One way of decomposing is to work backward, because some problems are easier to solve that way as it gives actors the opportunity to define an end state and come up with reasons for that to happen; that is, they can reconstruct history or make a rationalization afterward. Decomposing is often easier to enact in a loosely coupled world where actors, problems, and solutions are mostly separate—for example, when organizational units are semi-autonomous, as in a large university.

The third method is labeled *heuristics*, meaning that decision makers see patterns in a decision situation and apply rules or procedures for appropriate behavior that match those situations. Heuristics are rules of thumb that are related to calculating probabilities in complex decision situations, and the more differentiated this calculation is the more easily actors may cope with limitations of cognition and information.

The fourth of March's types is called *framing*, meaning that decisions are framed by ideas, attitudes, and beliefs that define problems to focus on, information to collect, and dimensions to attend to. Actors have paradigms that focus and simplify preferences and options, something that makes sense of the decision situation. A problem may be framed in a narrow and local way, with limited trade-offs, to find a set of sufficient conditions for solving it. Frames of beliefs and cognition are part of both the conscious and the unconscious repertoires of decision makers. Frames are also path dependent and have a tendency to be used again and again, something that increases the competence of an actor and often the actor's ability to convince other actors.

Effects of Formal Structures on Decision Making

Decision makers operate inside formal organizations, and the formal structure is an important element in understanding the existence of and coping with bounded rationality. The formal structure both helps and limits decision makers at the same time. It helps them look at the world in a simplified way but at the same time limits their ability to see connections and complexities, which would make them better equipped to have a broader perspective on their own tasks and roles. So where decision makers are situated in a formal organization determines what kind of limitations they are experiencing. Leaders are supposed to design the formal structure not only to use specialization to limit cognitive problems but also to have a more holistic perspective on how the specialized roles and units fit together to achieve collective goals.

Luther Gulick, in his seminal work on the design and organization of the federal governmental apparatus in the United States, pointed to the fact that there are two major principles of formal organizations, namely, specialization and coordination, two factors that are in a dynamic relationship. Specialization has a vertical and horizontal dimension and also an intra- and interorganizational dimension. Combining the two dimensions gives us four types of specialization: (1) intra-organizational vertical specialization means the hierarchy inside an organization and the way authority is allocated among leadership levels, (2) interorganization vertical specialization is exemplified by the specialized relationship between ministries and agencies in the public sector, (3) intra-organizational horizontal specialization denotes the specialization of roles and tasks/functions on each level inside a formal organization, (4) and interorganizational horizontal specialization is exemplified by the specialization among ministries or agencies.

Organizational Levels and Bounded Rationality

The relevance of this typology for bounded rationality should be evident. As regards the first type—intra-organizational vertical specialization—James Thompson makes a distinction between three levels in an organization: (1) the institutional or leadership level, characterized by much discretion because of many partly competing or ambiguous formal and informal norms and values; (2) the middle-managerial level, characterized by cross-pressure between demands from both the leadership level and the grassroots level; and (3) the operative or grassroots level, characterized by street-level bureaucrats often following formal rules. On the top level, leaders have both more discretion and more authority to define their own roles than on the other levels, but at the same time, there are often more acute constraints on their rationality because of their having to attend to a more complex set of goals, preferences, problems, alternatives, and consequences. On the middle level, leaders have less discretion to enact their roles than at the top level but more than for actors at the operative level. But their limitation of rationality may be rather problematic to cope with because they are in a cross-pressure between the top and lower levels. The operative bureaucrats occupy a role with much less discretionary space. This makes their rationality limitations much easier to cope with, even though they may have problems seeing their roles in a more holistic perspective.

Vertical interorganization specialization, as exemplified by specialization between ministries and agencies, may also illustrate bounded rationality. Studies of such public organizations have shown that ministries, being on the highest hierarchical level, have the broadest and most comprehensive tasks, such as strategic and policy-oriented tasks, meaning that they, like Thompson's institutional-level leadership, will have to cope with the combination of wide discretionary space and challenging limitations on their rationality. Agencies have more of narrow and technical tasks, based on highly specialized professional competence, making their discretionary space narrower but probably their rationality limitations less challenging.

Gulick defines four principles of horizontal specialization—based on (1) purpose (e.g., education or defense), (2) process (e.g., specialists in part of a process or coming from a particular higher-education group), (3) clientele (e.g., patient groups in hospitals), or (4) geography (certain levels or areas). In each case, the different principles afford both certain rationality constraints and opportunities. Civil servants working with a specialized policy will have advantages concerning cognitive limitations, because they are defined as specialists in, for example, education, defense, health, or social services. Civil servants such as jurists working on rule development will have the same advantages, as will professionals catering to certain client groups. And bureaucrats attending to control tasks on lower levels or to developing certain geographical areas will also operate under the same type of logic. The limitation problems for all these specialized bureaucrats may, of course, be related to having an overly narrow perspective when there are demands for a wider perspective and collaboration across tasks and sectors. Specialization among ministries and agencies also exemplifies the same logic.

According to Gulick, coordination is related to either formal organization or ideas. Organized coordination could be divided into hierarchical and collegial coordination, both having intra- and interorganizational features. Hierarchical coordination is the mirror image of vertical specialization; that is, what is vertically specialized must also be coordinated to secure superior central control and steering. With respect to cognitive capacity and eventual limitations, the advantage of leaders on a central level is that they can see how the different organizational levels, roles, and tasks are fitting together. The limitations are, of course, related to capacity and knowledge about what is going on at the lower levels; the more complexity there is across levels, the larger are the challenges of rational calculation. Related to new public management (NPM) as a reform wave, there has, for example, been a lot of discussion on the delegation of authority and functions/tasks to lower levels. Such delegation may potentially threaten the information basis of higher-level leaders and therefore increase their cognitive challenges, something that may limit their collective efforts. Delegation of autonomy increases the participation of lower-level actors and may change the patterns of influence to the disadvantage of the top leadership.

Collegial coordination poses other challenges. Here, there is no hierarchical tension and knowledge distance, but there is the problem of heterogeneity and different interests horizontally inside or across organizational units. The challenges concerning rationality limitations and constraint are greater across than within organizations, and the larger the organization, the more heterogeneity there is in tasks, roles, and professional expertise. The different ways to reach a decision under such circumstances also give insight into bounded rationality. One way is to vote, making winners and losers, or majorities and minorities. This may create unambiguous solutions but also more problems of legitimacy, thereby resulting in problems of implementation, so the solutions will be bounded accordingly. Compromise may lead to increasing support but also to more ambiguous solutions, making for cognitive challenges to implementation. Sequential attention to goals and solutions, and quasi solution of conflicts, may solve pressing and current problems of consistency, but it will also create long-term challenges of consistency, probably posing the largest problems of cognitive limitations for leaders.

Role of Organizational Culture

Coordination through ideas may mean a strong organizational culture, as illustrated by Herbert Kaufman's seminal book on forest rangers in the United States, which described how rangers in different geographical locations held approximately the same cultural views, norms, and attitudes. The cultural part may imply that information and cognitive limitations are modified, because actors intuitively know how to act in a culturally appropriate way. A strong culture may imply "trained incapacity," a lack of ability to adapt to new conditions, as well as potential tension with norms related to formal structures. In a modern setting, however, a culture may appear strong because of the prominence of myths and symbols that bind members together, while in fact these elements may be superficial rather than actually influencing behavior and decisions. Myths or symbols have the advantage as rules of thumb to simplify the world, as shown in NPM concerning scripts such as competitive tendering, benchmarking, marketization, or privatization. Scripts or concepts may result in real problem solving but often function as window dressing, creating images of the organization.

Organizational Slack

Theorizing about bounded rationality has something to do with slack in formal organizations, with slack defined as the distance between available resources and demands. High slack means that performance exceeds goals; that is, demands are satisfied, and the organization has still more resources to use. This means often that the search for new alternatives is modest, slack is increasing, and aspiration is decreasing. But in such situations, slack can be used for innovation or experimentation, which makes it easier to respond to later crises without severe problems related to cognitive limitations. Low slack, meaning that performance is worse than expected, will stimulate a search for alternatives and new solutions, but the resources available for the search are few, increasing the possibility of severe information and cognitive limitation and eventually failure.

Bounded rationality may also be related to whether leaders and formal organizations are experiencing routine situations or crisis, turbulence, and unexpected events. In routine situations, the pressure on information and cognitive limitations is rather low, and traditional procedures and solutions can be used without too much use of resources. But crises and turbulence impose much more pressure on rational calculation. Leaders can try to use procedures and solutions developed for emergencies to simplify the challenges but will often have to improvise because the fit between ready-made solutions and the crises is problematic. In improvising, they can choose from a repertoire of alternatives and solutions, which is better than starting from scratch, but there is no guarantee that the responses will reflect successful adaptations to the turbulent conditions.

In political-administrative decision processes, it is often the case that saliency is important, meaning that political and administrative leaders will use more resources and expertise to attend to some processes and issues rather than others. This often means that the challenges of information and cognitive limitations are better attended to. But what is politically and administratively important may vary over time, and it is challenging to refocus on issues and cases that have been defocused. This returns to the question of slack and whether the organization has the resources to face such challenges.

Effects of Using Bounded Rationality

What are the effects of using bounded rationality as an important principle or logic in formal organizations? First, bounded rationality has the potential for increasing both efficiency and effectiveness, because preferences, goals, problems, solutions, and effects are framed in such a way that these can be handled satisfactorily. And bounded rationality may imply that one is going to the core of policies and issues in a complex world, without wasting resources on unimportant factors and aspects.

Second, bounded rationality may be related to developing a logic of appropriateness and a certain cultural path. Leaders participate in defining the appropriate aspects of a matter, which sets the stage for other actors to behave accordingly in an appropriate way.

Third, bounded rationality may also make it easier to use symbols and myths to enhance the legitimacy of leaders, institutions, and processes. The simplification and selection of decision-making premises may make the "pedagogical challenge" less severe when relating to other actors or a wider audience.

Three critical remarks could, however, be added. In fact, bounded rationality may lead to ineffectiveness and inefficiency. The reason for this may be (a) lack of enough knowledge to make the selection of the "right" preferences, goals, solutions, alternatives, and potential consequences or (b) that such elements are more the result of a negotiation process than an analytical process, making it harder to handle the decision processes and implement policies. The focus may be more on certain minor or deviant aspects of a complex problem and not on the core, which may lead to reruns of the processes and a lack of stability in solutions. In addition, if this is the case, the developing logic of appropriateness may lead to dysfunctions or increasing tension and conflicts with the environment. Moreover, a "failure" in the process of selection and modification of limitations on rationality may be covered up with extensive use of symbols, thus potentially eroding popular support for the leaders and making the followers more critical and cynical. A counterargument to these three critical points would, of course, be that there is no such thing as objectivity concerning the selection of decision premises in the logic of bounded rationality.

Garbage Can Theory

Bounded rationality is the central part of instrumental decision-making theory and is often contrasted with a more economic man–oriented rational theory. One can, however, also make another and different connection for the relevance of bounded rationality. Garbage can theory, developed by Michael D. Cohen, James G. March, and Johan P. Olsen in the early 1970s, stresses that decision makers are part-time participants and decision situations represent diverse and ambiguous stimuli, resulting in unpredictable decision-making processes with participants, problems, solutions, and decision opportunities coming and going, selected and coupled in unexpected ways. This type of theory could be seen as an extension of the cognitive parts of bounded rationality; that is, the rationality of actors may be so bounded or limited that "organized chaos" is the result. Whereas bounded rationality stresses the importance of formal structure for the views and thoughts of actors, garbage can theory focuses more on the relative lack of such structures, creating more of an "organizational irrationality."

REALISM IN INTERNATIONAL RELATIONS

The concept of realism was developed in the 1930s and 1940s as an alternative to attempts to understand and conduct international relations based on international law. Its founders, Nicholas J. Spykman, Edward Mead Earle, Frederick Schuman, E. H. Carr, John Herz, William T. R. Fox, and Hans J. Morgenthau, asserted the realism of their power-based approaches to foreign policy, in contrast to what they described as the dangerous idealism of their predecessors. Writing in response to the appeasement of fascist Italy and Nazi Germany, which they held responsible in large part for World War II, realist arguments had great resonance.

In the United States, realism appeared to offer intellectual justification for the Cold War and a range of policies pursued by the Truman, Eisenhower, and Kennedy administrations that were otherwise at odds with proclaimed American values. By the mid-1950s, realism had become the dominant paradigm in international relations and remained so until the Berlin Wall came down. Since the end of the Cold War, realism is at best *primus inter pares*, as liberalism, constructivism, feminism, philosophical realism, and poststructuralism have all become more prominent. Realism arguably remains the dominant frame of reference for policymakers, although even here, liberalism especially has made important inroads.

Three Waves of Realism

Looking back on the post–World War II era, we see three waves of realism, each with important implications for the study and practice of international relations and foreign policy.

The First Wave: Hans Morgenthau

The first wave, represented by the writings of the realists mentioned in the paragraph above, was far and away the most influential. Hans Morgenthau's *Politics Among Nations*, its principal text, was first published in 1948 and went through six editions, the last two published posthumously in 1985 and 2006. Within the United States, and to a lesser extent in Europe, it became a core reading in undergraduate international relations courses. Morgenthau became a prominent public figure in the United States and achieved a certain notoriety for his early support of the civil rights movement and opposition to the Vietnam War. In "The Purpose of Political Science," Morgenthau (1966, p. 77) lamented that the makers of American foreign policy had "overlearned" the lessons of realism and lost sight of the appropriate moral and legal limitations on the use of power.

In the first edition of *Politics Among Nations*, Morgenthau (1948) maintained that power is the currency of politics and should be the first concern of states. He divided the world into status quo, revisionist, and prestige-seeking states (pp. 21–25). Status quo states were intent on maintaining existing territorial divisions and revisionist states on overturning them. Prestige-seeking states sought to demonstrate their power to gain more influence. Morgenthau insisted that state goals were not essentialist but changed over time and were not always apparent to outside observers. He thought that peace was most likely to be preserved when status quo powers were more powerful than their revisionist challengers and that the power of either group could be enhanced through alliances. Morgenthau, and realists more generally, speak of the balance of power, which can mean the distribution of power in the system at any given moment, the balance between status quo and revisionist states, or an advantage in favor of the former. Morgenthau used it all three ways, to the consternation of his critics.

The balance of power assumes some capability of measuring power and its distribution. This has proven difficult for realists of all persuasions. Morgenthau conceived of power as an intangible quality that had diverse material *and* political components, among them territory, population, national resources, industrial capacity, military preparedness, national character, morale, and the quality of diplomacy and government. None of these attributes translated directly into power because power was "a psychological relation[ship]" that gave those who wield it control over certain actions of others "through the influence which the former exert over the latter's minds." In *Politics Among Nations*, first edition, Morgenthau (1948) asserted that "of all the factors which make for the power of a nation, the most important is the quality of diplomacy" (p. 14). The other attributes of national power are the raw materials out of which the power of a nation is fashioned. Diplomacy "combines those different factors into an integrated whole, gives them direction and weight, and awakens their slumbering potentialities by giving them the breath of actual power" (p. 105).

Morgenthau described his theory as scientific, but his description of the nature of power and the balance of power indicates that the measurement and exercise of power and the construction of a successful balance of power is more art than science. This is most evident in his analysis of bipolarity and its consequences. The term *bipolarity* was coined by William T. R. Fox in 1944 to describe the domination of the postwar international system by two "superpowers": the United States and the Soviet Union. Morgenthau recognized the world as bipolar in the mid-1950s because the power of these two states had become so "overwhelming" in comparison with allies and third parties that "through their own preponderant weight they determine the balance of power between them." The balance of power could no longer be "decisively affected" by changes in the alignments of their allies, at least in the foreseeable future. Nor could lesser powers easily defect from alliances, because "the two giants" had the power to "hold them there even against their will" (Morgenthau [*Politics Among Nations*], 1948, pp. 270–274; 1951, pp. 48, 52–54). The flexibility of the balance of power and its restraining influence on the power aspirations of the main protagonists had disappeared. The superpowers were free to define their respective positions as vital interests and engage each other with every means at their disposal in every arena in which they competed. In this novel situation, "the give and take of compromise becomes a weakness which neither side is able to afford" (*Politics Among Nations*, 1962 edition, p. 285).

Morgenthau was clearly uncomfortable with the pessimistic implications of his analysis and sought to hold out a ray of hope for the future. In the first edition of *Politics Among Nations*, Morgenthau (1948) argued that "the changed structure of the balance of power has made the hostile opposition of two gigantic power blocs possible, but it has not made it inevitable." Bipolarity has the potential for "unheard-of good as well as for unprecedented evil" (pp. 285–286). In the last resort, peace does not depend on the nuclear balance but on the moral quality of leaders and their willingness to place the common goal of survival above the pursuit of unilateral advantage. Morgenthau's theory, in contrast to those of his neorealist successors, stresses the independent power of agency.

In the third, 1962, edition of *Politics Among Nations*, Morgenthau recognized additional incentives for superpower restraint. He speculated that the experience of the Korean War may have taught Moscow and Washington that they have to adapt their policies to the wishes of their allies "if they wanted to draw the maximum of strength from their support" (pp. 351–352). The emergence of a number of newly independent and unaligned states might also serve the cause of restraint. The third edition continued to describe bipolarity as on the whole inimical to peace (pp. 362–363). In the fifth edition, published in 1972, Morgenthau expressed cautious optimism (pp. 355–356). Détente, explicit recognition of the territorial status quo in Europe, a corresponding decline in ideological confrontation, the emergence of third forces (e.g., Japan, China, West Germany), and the damaging effects of the Vietnam War on American power had made both superpowers more cautious and respectful of the status quo. For all practical purposes, the de facto acceptance of the postwar division of Europe had ended the Cold War.

For Morgenthau, the success of the balance of power for the better part of three centuries was less a function of the distribution of capabilities than it was of the underlying values and sense of community that bound together the actors in the system. When the European value consensus broke down, as it did from the first partition of Poland through the Napoleonic Wars, the balance of power no longer functioned to preserve the peace or integrity of the members of the system. The consensus broke down again in the 20th century, with even more disastrous consequences. At midcentury, Morgenthau was deeply pessimistic about the future. The balance of power was at its nadir. There were two great powers instead of many, Britain no longer had the capability to play the role of balancer, the colonial frontier had disappeared, and one of the principal powers rejected the very premises of the international order. International politics had been reduced "to the primitive spectacle of two giants eyeing each other with watchful suspicion" (Morgenthau, *Politics Among Nations*, first edition, 1948, p. 285).

Morgenthau's theory is descriptive and prescriptive. "Realism," he insists, is superior to "idealist" approaches on both counts. It is more rigorous because its axioms are logically derived from its starting assumptions. It is empirically valid because "the facts as they are actually lend themselves to the interpretation the theory has put upon them" (*Politics Among Nations*, 1962 edition, p. 1). Morgenthau has been accused of making contradictory claims: He justifies his theory on the grounds that it provides a better description of reality, but at the same time, he criticizes French and British policymakers in the 1930s, and their American counterparts in the 1960s, for acting in sharp violation of its principles. He dismissed this criticism as beside the point. *Politics Among Nations* did not aim at an "indiscriminate description of political reality" but was an attempt to develop a "rational theory of politics." The balance of power was "an ideal system," and in his more pessimistic moments, Morgenthau was willing to admit that it was "scarcely found in reality." Realism provided a benchmark against which actual policies could be understood and evaluated. For the same reason, it contained a strong normative element. It was a "theoretical construct" of a fully rational and informed foreign policy that "experience can never completely achieve" but that can be used as a guide for making and assessing policy (p. 8).

The Second Wave: Neorealism

Neorealism or structural realism, developed by Kenneth Waltz (1979), represents an attempt to purge the tensions and contradictions of Morgenthau and other realists of his generation to construct a more scientific theory based entirely at the system level. The starting point for Waltz is the alleged anarchy of the international system, which makes it a "self-help" system. Anarchy requires states not only to make the acquisition of power their first goal but, as Waltz's disciple John Mearsheimer (2006) insists, to accumulate sufficient economic and military capabilities "to make sure that no other state sharply shifts the balance of power in its favour" (p. 72). For Neorealists, the yardstick of power is relative not absolute power because states must assess their power relative to that of other political units.

Drawing on Nietzsche and Weber, Morgenthau attributed conflict at every level of social aggregation to human nature: People were driven by a desire to dominate others (*animus dominiandi*) and to use them for their own ends. This behavior was less constrained at the international level due to the relative absence of institutions, rules, and mechanisms for channeling this drive into more socially acceptable channels. Neorealists find the explanation for interstate conflict entirely at the system level. They invoke the "security dilemma," a phenomenon first described by John Herz, another prominent first-generation realist. The uncertainty of the international environment encourages states to seek a margin of safety in their military power. Their buildups and deployments threaten other states, who respond the same way. Because of the security dilemma, international conflict would arise even in a system in which every power had only benign intentions. Unlike Morgenthau, for most neorealists, regime type and regime goals are irrelevant. As the system itself causes conflict, actors, in the words of Mearsheimer (2006), can be treated as "black boxes."

For Waltz (1979), the number of actors and the distribution of the power in the system are the key variables for understanding international relations as they determine the polarity of the system. Unipolar systems, dominated by a single hegemon, are the most stable because the hegemon has enough power to enforce order, as Rome did for centuries throughout the Mediterranean basin. Bipolar systems also have a degree of stability because each of the two dominant powers is strong enough to protect itself against any possible combination against it and is accordingly less worried about the addition or defection of allies than great powers in a multipolar system. Multipolarity is the least stable system because there is not that much difference in strength among the leading powers, making alliances, and additions to and defections from them, critical to the balance of power. The balance between opposing alliances is also much more difficult to calculate because it requires estimates of the strength and intentions of multiple powers. Miscalculation becomes an additional source of war in a multipolar system.

Neorealism is not monolithic. Its adherents differ in important respects. In contrast to Waltz's commitment to a parsimonious system-level theory, Steven Walt (1987) maintains that states balance against perceived threats, not power. The United States, he contends, never worried about

British or French nuclear arsenals, only about Soviet and Chinese arsenals because both were considered as adversaries. Mearsheimer (2001), author of his own theory of international relations, builds on the distinction between offensive and defensive realism. Traditional realists, whom he describes as defensive realists, maintain that other powers will balance against any state that becomes relatively too powerful. Mearsheimer advocates offensive realism on the grounds that other powers often bandwagon (make an accommodation with the dominant power) or buck-pass (sit on the sidelines) in preference to joining a balancing coalition. This behavior and offensive dominance—the likelihood that states who start wars will win them—create strong incentives for aggression.

Realists and neorealists disagree about the implications of nuclear weapons. Whereas Morgenthau recognized that they had revolutionized warfare, and with it, international relations, Waltz (1981) regarded them as an unalloyed benefit as they had a powerful deterrent effect. Other realists, such as Scott Sagan, stressing the problems of command and control and the fear of being the victims of a first-strike attack, saw them as potentially destabilizing.

Critics have identified numerous conceptual and empirical problems with neorealism. Alexander Wendt (1992) argued that anarchy does not automatically lead to a self-help system; the character of the international system depends very much on how states respond to anarchy. Richard Ned Lebow (1994) argues that neorealism's definition of power is as problematic as Morgenthau's. Waltz (1979) offers a definition of power almost identical to Morgenthau's. He then asserts the overwhelming importance of material capabilities, especially military capabilities, because "force remains the final arbiter" of international affairs (p. 131). The superpowers are "set apart from the others . . . by their ability to exploit military technology on a large scale and at the scientific frontiers" (pp. 180–181). He insists that the determination of polarity can be answered by "common sense" and that the world was bipolar in 1945. Efforts by scholars to determine when bipolarity began range from Waltz's 1945 estimate to Morgenthau's mid-1950s estimate, as well as assertions by some that the postwar world was never bipolar. The end of the Cold War has created a similar controversy, with Waltz (1990) arguing that the world is still bipolar, Mearsheimer (1990) that it has become multipolar, and other realists (e.g., Charles Krauthammer, William Wohlforth, and Michael Mastaduno) contending that it is now unipolar.

The most fundamental problem with Waltz's theory is that it is, by his own admission, a theory of international relations, not of foreign policy, and thus says little to nothing about how individual states will behave. Its principal substantive proposition is that multipolar systems are less stable (enduring) and more prone to war than bipolar ones. Such a proposition is not testable because we would require a large sample of both kinds of systems and there have been very few bipolar systems in history. It is also meaningless because what anyone is really interested in is the likelihood of war in a particular system, and no inferences can be made about single cases from statistical distributions.

Mearsheimer's theory, elaborated in his 2001 book, *The Tragedy of Great Power Politics*, has also encountered strong criticism. Offensive dominance has little empirical support. According to the critics, it is simply not true, as Mearsheimer claims, that initiators win most of the wars they have begun. Lebow shows that in the 30 wars fought since 1945, the initiators won only 7. Mearsheimer's (1990, 2001) predictions that NATO would not survive the end of the Cold War and that Germany and Japan should and would acquire nuclear weapons have (fortunately) not come to pass.

Third Wave: Classical Realism

The third wave—classical realism—was ushered in by the peaceful end of the Cold War, which appeared to contradict the expectations of neorealism. Classical realism was also a response to the widespread recognition that problems of identity, globalization, justice, and world order were at least as important as the balance of power for understanding contemporary international relations. Scholars have accordingly revisited the works of Thucydides (Lebow, 2003), Hobbes (Michael Williams, 2006), and Morgenthau (Lebow, 2003; Williams, 2007) in search of insights relevant to these problems.

Lebow's *The Tragic Vision of Politics* (2003) is perhaps the most extensive attempt to reconstruct the wisdom of classical realism through hermeneutic readings of the texts of Thucydides, Carl von Clausewitz, and Morgenthau. He contends that all three authors wrote in the aftermath of destructive wars and sought to reconstruct order by drawing on the best of old practices and the most promising new ideas. In sharp contrast to neorealists, they recognized that the principal threat to world order came from dominant powers who succumbed to hubris and overreached themselves. Such powers were more effectively constrained by domestic restraints and external practices and institutions than by the balance of power. Support for this contention also comes from Stuart Kaufman, Richard Little, and William Wohlforth's comprehensive 2007 study of the balance of power in the ancient world and non-Western systems. They find that it rarely worked to preserve the peace as most realist theories suggest.

Lebow further contends that classical realists were more interested in influence than in power. They recognized that material capabilities were only one component of power and power was only one source of influence. Influence is relational, and the least efficient way of exercising it is through threats and rewards. Rewards consume resources, and threats generate antagonism because they make other actors aware of their subordination. Influence is most effectively exercised through common projects that respond to common needs and build common identities. Influence of this kind is limited to projects considered to be in the common interest, and repeated efforts to advance common interests can earn honor for dominant powers and the corresponding willingness of others to accept their leadership. In a more recent work, *A Cultural Theory of International Relations*, Lebow (2008) explores the role of honor and develops a constructivist theory of international relations, but one that incorporates the key tenets of classical realism.

Morgenthau (1962) thought that nuclear weapons and environmental degradation were problems that could not be addressed by nation-states acting unilaterally. To address them, the world required "a principle of political organization transcending the nation-state and commensurate with the potentialities for good or evil of nuclear power itself" (p. 76). While Waltz and the neorealists sought to explain the status quo, Morgenthau looked beyond it. The principal task of international relations theorists was to facilitate the research by laying the groundwork "for a new international order radically different from that which preceded it" (p. 76). Thucydides, Morgenthau, and Herz are attractive to classical realists above all because of their concern for justice and the transformational nature of their projects.

REDISTRIBUTION

The term *redistribution* refers to the criteria and the mechanisms shaping the authoritative allocation of valuable assets in a given society. In the narrow sense used in political science, it refers to the value-driven, commanding intervention of the state in society to extract resources from some groups (mainly in the form of taxes) in order to give them to other groups (using public expenditure and other redistributive mechanisms). Thinkers on the left of the ideological spectrum argue that the state should play an active role in this process, while those on the right hold that interaction in a free market is the most efficient mechanism of distribution. In what follows, there are clarifications on the scope and scientific usage of the term *redistribution*, an account of the historical evolution of the concept, a classification of political science's main theories on the role of the state and the dynamics of competition among groups, and a brief discussion of the empirical indicators of redistribution.

The Concept of Redistribution

In the social sciences, the concept of redistribution refers both to the normative questions about the ideas, values, and criteria of justice that ought to illuminate the pursuit of fairness in a given society (from whom to collect? to give to whom? why?) and to the practical question about the means by which authorities should reallocate resources and valuable goods (the most common mechanisms being tax exemptions, public expenditure, cash transfers, subsidies, and social programs). The comprehensiveness of the term cannot be separated from the meaning of its predecessor, *distribution*. While distribution is an economic concept that refers to the allocation of resources that occurs in society as a result of the free interaction between private agents (mainly in the market but also by means of philanthropy, community organization, international cooperation, etc.), the term *redistribution* indicates the intervention of the state, as a public authority, in the sanction of the criteria to redistribute and in the administration of the mechanisms of redistribution. In the narrow usage of their respective disciplines, economists tend to focus on the distribution of monetary income (salaries), while political scientists and sociologies adopt a broader approach, looking at the redistribution of wealth, including not only material assets but also other opportunities in life such as health and education as well as entitlements and rights.

Another conceptual distinction between these two terms is that distribution occurs when there are changes or there is reallocation of resources within the existing rules of the game (e.g., compared with retailers, farmers obtained more income than they did in 2009), whereas redistribution takes place when there are changes in the rules of the game (e.g., Congress passed a law granting tax exemptions to farmers).

Explaining Redistribution

Concerns about establishing norms for the redistribution of valuable goods have accompanied humanity since agriculture replaced nomadic hunting as the principal food source, calling for an unprecedented level of organization of tasks including the division of labor, accumulation of stocks, and redistribution of the benefits. Formulas for fair distribution of goods and concern for the weakest are present in the foundational writings of all religions, placing the judgment of fairness on the will of a divine god and offering detailed instructions to mortals on how to implement that justice. The return to humanism and the emergence of the secular state in the Renaissance period put both the judgment and the responsibility of redistribution in human hands, setting the stage for a debate that would prevail throughout modernity: the discussion between those arguing for active intervention of the state in the redistribution of wealth and those arguing that the state should have a limited role. Philosophers and economists such as Adam Smith, Thomas Malthus, and Karl Marx led the scholarly debates on distribution and redistribution during the birth of the Western nation-states, which were built on the foundations of the egalitarian beliefs consecrated by the French Revolution of 1789.

The initial success of the communist alternatives in the Soviet Union and China in the early 1900s, the horror of World War I, the emergence of authoritarian regimes in Central Europe, and the economic crises of Western capitalism in 1929 prompted questions about the political and institutional dimensions of human organizations. New covenants of coexistence and new models of interaction between the haves and the have-nots were needed to redress the previous concentrations of wealth resulting from the aristocratic governments of the 19th century at the domestic level and by the colonial exploitation of Africa, the Americas, and Asia at the international level. The development of the welfare state can be situated between the late 19th century and the 1980s, with the most archetypical examples located in the Nordic countries of Sweden, Norway, Denmark, and Finland. Finns, for instance, enjoy state-funded education, health, and welfare services, as well as unemployment insurance and retirement benefits, at no cost for the families other than the general taxes. The long-lasting impacts of these universal provisions are still evident. According to World Bank's 2002 World Development Indicators, at the beginning of the 21st century, 48% of the national income in Brazil was concentrated in the richest 10% of the population, while the figure was 30.5% for the United States and 21.6% for Finland. The presidency of Ronald Reagan in the United States (1981–1989) and the prime ministership of Margaret Thatcher in Great Britain (1979–1990) marked the return of a neoliberal ideology that attacked the welfare state, denouncing its overspending and inefficiencies and shrinking it in favor of privatized and market-like social services.

The early 20th century marks the starting point for defining a specific political science approach to redistribution, the use of systematic scientific research to address the impact of power, politics, and institutions on the redistribution of public resources or "who gets what, when and how," as Harold Lasswell put it in 1936. The New Deal implemented in the United States by President Franklin Roosevelt as a response to the economic crisis of 1929 represents a paramount object of study for those interested in the dynamics and outcomes of public redistribution of wealth. More specific questions on redistribution address the allocation of the annual budget to different governmental programs; the redistribution of revenues among subnational governments (states or provinces); the redistribution of resources across demographic, ethnic, religious, or tribal lines; and the way in which different groups in society use their power to influence the outcomes of those redistributions in their favor. To describe these processes of redistribution, political scientists have looked at forms of governments (Are they democracies or authoritarian regimes?), constitutional and legal frameworks (Is it a republic, a constitutional monarchy, or a popular republic?), organization of the territory of the state (Is it a federal or a unitary system?), tax systems and laws (Are they progressive or regressive?), electoral provisions and enfranchising (Who is entitled to stand for election and to vote?), groups' strategies of influence and lobbying (How permeable is the political system to the organized pressure of interest groups?), the welfare state and public expenditures (How much is spent on social programs?), the aim and scope of social programs (Are they universal or focalized? who are the beneficiaries?), and so on.

There are three major theories in political science on the role that the state plays in redistribution. The first group of theories derives from the neoclassic economists of the 17th and 18th centuries (e.g., Adam Smith, David Ricardo) and argues that free agents pursuing their self-interests in free markets will achieve the best possible distribution of resources, therefore the state should limit its intervention to guarantee national defense, respect for private property, and the administration of justice. On the other hand, a group of theories in the tradition of Thomas Hobbes and Jean-Jacques Rousseau argue that the market is full of imperfections that justify broad intervention by the state in the economy, including the planning, regulating, and implementing of large-scale economic plans. While liberal thinking prevailed in the 18th and 19th centuries, the 20th century was dominated by the broad intervention of the state both at the domestic and at the international levels; after World War II, most European nations and the United States engaged in state-sponsored recovery plans, centralized planning, rigid regulation and intervention in the most productive economic sectors, and comprehensive social programs to help the poor—in other words, the welfare state. A third voice in this debate was contributed by the early utopian socialism of Henri de Saint-Simon and Charles Fourier and later on by Karl Marx and Friedrich Engels, who saw the history of humanity as a permanent class struggle and proposed the abolition of private property, termination of the state, and its replacement with the commons, in an ideal communist society in which the guiding principle of redistribution would be "from each according to his abilities, to each according to his need."

Another set of theories in political science focuses on competition between groups to influence redistributive outcomes in their favor, to get a bigger portion of the pie. The iron law of oligarchy, as formulated by Robert Michels, affirms that no matter how many laws or institutions are in place to regulate access to public decisions, there will always be a small group of rich and resourceful people who will manage to access key decision points and bias public policy outcomes in their favor. An alternative interpretation, called power resources theory, championed by Gøsta Esping-Andersen and others, suggests that the level of inequality and the redistributive outcomes in a given society are the result of the organizational resources of the working class and its mobilization. A third argument on the accessibility and dynamics of redistribution is offered by Philippe Schmitter's theory of corporatism and its American variation, pluralism, initiated in the writings of the Founding Fathers of the United States and most recently reformulated by Robert A. Dahl; these theories hold that the greatest influence on the redistributive outcomes of the state are exerted neither by the people nor by the elites but by the organized activity of interest groups and factions. A fourth proposition is advanced by the institutionalist (Karl Deutsch and David Easton) and neo-institutionalist (Walter W. Powell and Paul J. DiMaggio) approaches, which combine rational choice theory with institutional analysis to conclude that there is a dialectic influence between society and its political institutions so that the latter mirror the balances of power of the former but at the same time limit its freedom.

Even when the most fertile studies on redistribution combine cultural, economic, and political approaches, cross-disciplinary efforts have been scarce, due to the difficulty of defining solid indicators, the scarcity of reliable and comparable data, and the excessive specialization of the disciplines. The Gini coefficient and Theil index of inequality are used as proxies to analyze the results of the redistributive outcomes of the state, but more accurate indicators of redistribution are the share of income and consumption of the richest (or the poorest) deciles of the population and indicators of the health (life expectancy and infant mortality) and levels of education (literacy rate and school attendance) of the poorest social groups. Political scientists also look for indicators of political participation (voting, petitions, participation in rallies, and involvement in advocacy groups) as proxies to deduce the capacity of citizens for influencing the state and, conversely, the share of public resources that they obtain from it.

REFERENDA

A referendum is a device of direct democracy by which the people are asked to vote directly on an issue or policy. It differs from an election, which is a vote to elect persons who will make decisions on behalf of the people, or a recall, by which citizens are given the opportunity to remove from office an elected representative. Although this distinction between issue voting and person voting is apparently clear, it may be questioned, such as when the referendum is, formally or de facto, a vote of confidence or about the accession or permanence in power of a person. This is often the case in authoritarian regimes, but it also happens in democratic contexts (e.g., the use of referenda by de Gaulle in France). Such referenda are often qualified as "plebiscites," although the word, which goes back to ancient Rome, literally means "a law enacted by the common people" (*plebis scitum*). Because a plebiscite is commonly regarded as highly manipulative, the term has a negative connotation. The use of a plebiscite is sometimes extended to all government-initiated referenda, especially if ad hoc, insofar as they would automatically trigger a vote of confidence. But the word has also traditionally been used in a more neutral way, to refer to popular votes on sovereignty issues (e.g., the plebiscites proposed by the League of Nations after World War I to settle boundary disputes). The word *referendum* appeared much later, possibly in 16th-century Switzerland, to indicate the procedure by which delegates to cantonal assemblies submitted certain issues to their constituents for ratification (*ad referendum*).

Typologies

A distinctive feature of the referendum is the great variety of forms that it can take. This introduces problems of comparability and makes general statements about the device difficult. Among the numerous modalities of the referendum, the one called *initiative* is considered to be the most important, as it indicates the maximum extent to which legislative power is delegated to the people. Most typologies of referenda are indeed based on this criterion and distinguish between mandatory (also termed compulsory or obligatory) referenda, on one side, and optional (or facultative) referenda, on the other, with a fundamental divide within the latter category between referenda initiated by institutional actors such as the executive, the legislative branch, or a parliamentary minority and popular initiatives. Many authors use the word *referendum* for mandatory referenda and referenda initiated from within institutions, while votes demanded by popular minorities are referred to as *initiatives*. Others use *referenda* for votes on legislative texts (current or pending legislation), whether they are initiated by institutional actors or by popular minorities, and *initiatives* for popular initiatives that are propositional (i.e., dealing with proposals for future legislation). The formal object of the referendum (current, pending, or proposed legislation), the category of legislative act it deals with (e.g., ordinary legislation, constitutional reform, international treaty), the subject (e.g., institutional, territorial, moral, economic), the legal consequences of the vote (consultative—also termed *advisory*—or binding), and the territorial level at which it is organized (e.g., local/regional/national) are other frequent variables included in the typologies, creating numerous designations for the referendum. Here, we use the word *referendum* in a general sense, which includes all types of popular votes bearing formally on an issue. This entry does not consider agenda initiatives, whereby a number of citizens can submit a proposal that must be considered by the legislature but is not necessarily put to a vote of the electorate.

History

The history of the modern referendum is generally associated with three countries. On one side are Switzerland and the United States and on the other, France. In the first two, the practice of referendum has its roots in a tradition of direct democracy by popular assemblies at the local level (the American town meetings and the Swiss cantonal *Landsgemeinde*), dating back to the Middle Ages in the case of Switzerland. In America, the referendum experience was initiated with the submission of state constitutions to the people (the first case was the rejection of the Constitution of Massachusetts by the people in 1778) and the introduction in many states of the obligatory referendum on constitutional amendments proposed by the legislature. But it was never extended beyond the state level, neither in the federal constitution nor in practice. In Switzerland, the first major development of the referendum occurred at the cantonal level, under the impulse of the democratic Liberals in the 1830s, although early forms of referenda were found before this period (as mentioned above). At the time, it appeared as an acceptable substitute for the direct democracy assemblies, which had become impractical. In addition, the examples of the United States and France were very influential in promoting the constitutional referendum (the first nationwide referendum had actually been held in Switzerland in 1802 to approve the Napoleonic constitution). During these years, all cantonal constitutions, with the exception of Friburg, were approved through referenda, and provisions for popular initiatives, on constitutional or legislative matters, were introduced in many of them. The 1848 federal constitution was also submitted to the people in a majority of cantons, which included the obligatory referendum for amendments to the constitution as well as the constitutional popular initiative for total revision of the constitution. In both countries, a decisive extension of the referendum was achieved under the influence of political reform movements in the second half of the 19th century: the Democratic Movement in Switzerland (the 1860s) and the Progressive Movement in the United States (1890–1920). As a result of these movements, provisions for popular initiatives were enhanced in the Swiss federal constitution (1874: the initiative on laws within 90 days of their publication; 1891: the constitutional initiative for partial revisions) and introduced in many American states, especially in the west (more than 80% of the 24 states that have the popular initiative adopted it during the Progressive era). In the two countries, these movements drew support from the popular dissatisfaction with representative democracy, with politicians being accused of corruption and of fostering the interests of only the richest sections of the population. France has a different story as it had no tradition of direct democracy. Nevertheless, its referendum experience started much as it did in the United States, with referenda on the revolutionary constitutions of 1793 and 1795, following the end of monarchic rule. Moreover, the 1793 constitution greatly advanced democratic principles by introducing universal male suffrage and a popular initiative on laws within 40 days of their adoption. This constitution was actually a great source of inspiration for Switzerland. Ultimately, however, it was never applied, and the only form of referendum that found its way into France was the constitutional referendum. Overall, France would soon take a different road with the plebiscitary use of the referendum by Napoleon I and Napoleon III, to some extent perpetuated by the presidential use of the referendum under the fifth republic.

Constitutional Provisions

As suggested by existing data sets on referenda (see IDEA and c2d), in 2008, only a small minority of countries (about 20% of the 193 countries deemed independent by Freedom House) had no provision at all for referenda at the national or subnational level; these were mostly in Asia (e.g., China and India), the Middle East, and Central America. Provisions for nationwide referenda are much more widespread (80% of the countries) than provisions for subnational referenda (40% of the countries). At the national level, mandatory referenda and optional referenda (the latter category including in our data set citizens' demands on existing or pending legislation) are much more prevalent (54% and 60% of all countries, respectively) than citizens' initiatives for future legislation (16%). Twenty percent of the countries have popular initiatives (either citizens' demands or citizens' initiatives). As may be expected, more free countries (by Freedom House ranking) have provisions for referenda (only 13% have no provisions of any kind at any level) than the other countries (24% have no provisions for referenda). This is partly due to differences with regard to popular initiatives: 23% of free countries provide for them compared with only 15% of not free and partially free countries (at the national level). It is remarkable, however, that such a device to challenge political authorities can be found in the constitutions of countries such as the Russian Federation, the Asiatic republics of the former USSR, Togo, or Uganda, although it is never used. But the major difference concerns provisions for subnational referenda, which are much more prevalent in free countries (55%), where they have tended to increase in recent years, than in the other countries (26%).

Practice Around the World

It is much more difficult to assess the effective practice of referenda, especially at the subnational level, for which no exhaustive data set exists. However, over the 1980 to 2008 period, it is possible to classify countries according to the intensity of their practice of national referenda. A preliminary observation should be that frequent use of the referendum is associated with the popular initiative and its practice on a wide range of issues (not strictly constitutional or of special importance). A first group of very frequent users includes Switzerland (246 referenda), with Italy (60), Liechtenstein (38), Ecuador (33), and Micronesia (31) far behind. All these countries have provisions for popular initiatives, which represent the bulk of the practice in Switzerland, Italy, and Lichtenstein. The second group consists of frequent users, such as Ireland (21), with its practice of mandatory constitutional referenda, Palau (19), Colombia (19 since it became free in 1990), and Lithuania (18 referenda since independence), the latter two showing occasional use of the popular initiative. The third group, consisting of medium-frequency users (7–13 referenda), has 16 countries, among which are some occasional practitioners of the popular initiative (e.g., Bolivia, Hungary, Slovakia, Slovenia, New Zealand) and a more frequent user (Uruguay). Unlike the previous groups, this set of countries also includes not fully free countries (6), such as Egypt, Belarus, and Morocco. Nonfree countries are more prevalent in the next two groups of occasional users (23 countries with 4–6 referenda) and rare users (71 countries with 1–3 referenda), which include only a small minority of free countries (and only 3 countries with some practice of the popular initiative: Venezuela, Latvia, and Macedonia). This suggests that the sporadic use of the referendum often has to do with the quest for popular acclamation of authoritarian policies. It should be added that it is often difficult in the case of nondemocratic countries to assess whether a referendum has been mandatory, optional, or ad hoc. A prevalence of authoritarian regimes is not, however, found in the last group, consisting of nonusers (70 countries), which has comparable proportions of free countries and partially free or not free countries. Among the most prominent nonusers of the referendum are the United States, Germany, China, India, Japan, and Israel. The United States and Germany, however, have an intense practice of referenda, especially popular initiatives, at the state level, albeit with important differences from one state to another. Regarding subnational referenda, it should be noted that federal countries and decentralized countries actually have a major propensity for them (Switzerland being an exemplary case). It is also probably true, at least in democratic countries, that the decrease in territorial level (from nation to region or from state to city) will likely correlate with a higher number of referenda. From a dynamic perspective, a general trend toward an increase in the practice of referenda is clearly observable. The number of nationwide referenda between 1980 and 2008 (close to 900 referenda) is almost three times the number registered for 1950 to 1979 (362 referenda). Moreover, the use of referenda dramatically increased during the 1980 to 2008 period. As a matter of fact, in the postwar period, there was a twofold increase in the use of referenda, and in the 1970s and 1990s, it more than doubled (compared with the previous decade). This does not mean that the referendum has become more frequent in every country or is practiced with the same intensity everywhere. For example, in Western Europe, the increase in referendum use has been much more marked in Switzerland, Italy, and Ireland than in other countries. Nonetheless, the referendum has become more prevalent in many countries where it had never been practiced before (e.g., Great Britain, the Netherlands), where it had not been practiced since 1940 (e.g., Finland, Luxembourg, Norway), and where it had not been practiced in a democratic context (e.g., Austria, Greece, Portugal, Spain). Much of this has had to do with the submission to the people of the different steps of European integration or of new, cross-cutting issues such as civil, nuclear, or so-called moral questions. Clearly enough, from a world perspective, the increase in referendum use in the 1970s and 1990s also reflects the rise in the number of independent countries and the use of the referendum during the process of nation-building in these countries, as well as the spread of democratic regimes around the world.

Empirical Evidence: Causes, Democratic Quality, and Effects

Why referenda are held and why their use has spread around the world, however, are matters for which no general theory has been articulated up to now. Only partial theories regarding specific countries or types of referenda (e.g., government-initiated referenda) have been formulated. For sure, the reasons for the use of referenda are different in democratic and in nondemocratic countries, and they are also not the same in new and in old democracies, where the recent increase has more to do with the crisis of representation and the rising expectations of democracy than with the legitimation of the new state or political regime. The absence of a general theory also characterizes more traditional concerns of the literature, like those pertaining to the democratic quality of referenda or their policy and political effects. Thus, the extent to which and the conditions in which referenda can be democratic, that is, promote policies that accurately reflect the popular will on the question raised, remain problematic. Some authors believe that representative democracy would be better than direct democracy at producing such policies, or at least better than semidirect democracy, to which, strictly speaking, the referendum belongs, as it is only a mechanism of popular decision, not of collective elaboration of policies (unlike citizens' assemblies). Because of this, people would almost inevitably approve legislation reflecting the views of a few policymakers rather than their own preferences. Social choice theorists also point to inherent structural problems that would dispose referenda to produce only arbitrary majorities, while others believe that such a limitation is generic to all voting procedures and so affects representative democracy as much as direct democracy. From a different point of view, it is often argued that referenda result in minority decisions because of abstention, which has proved to be high when their use becomes frequent; because of manipulation by minorities; or simply because voters answer to a different question from the one formally asked, as typically occurs when they express a vote of confidence in the incumbents. To a large extent, the capacity of the referendum to produce true majority decisions is related to the level of interest and competence of voters on the issue, which itself depends on the frequency of referenda (or the number of propositions on the ballot), the type of question (its complexity, saliency, importance to daily life, etc.), or the fairness and quality of the campaign. But there is no articulated empirical theory on the influence of these variables. Studies on voting behavior at referenda, which form the bulk of the empirical works, rarely go beyond the assessment of voting motivations or the influence of party recommendations at specific polls. Research on the effects of referenda is even less developed. Little is known, beyond particular country cases, about their policy effects. Do referenda favor the status quo and hinder change, as is often argued with reference to the Swiss experience? Do they have a structural bias in favor of the "No" votes, for they would more easily aggregate dissents than create consent? Similarly, does the referendum harm minorities, and is it bound to do so because it "knows nothing about compromise," as Max Weber pointed out? Those who believe so generally also doubt that referenda can lead to more legitimate decisions and solve conflicts. Rather, referenda are believed to enhance divisions. Finally, do referenda lead to incoherent and incompetent policies, as their opponents most prominently denounce? The political effects of referenda are no better ascertained. A classical argument against them is that they weaken representative democracy by undermining the role and responsibility of political parties and elected representatives and that when used too frequently, they generate voter fatigue and low electoral participation. Moreover, it is argued, popular initiatives would overload the political system by continually introducing new demands. Supporters of referenda, on the contrary, view them as usefully complementing representative institutions, by making them more democratic and more legitimate. Referenda would enhance both citizens' participation, in a large sense, and citizens' education. Moreover, popular initiatives provide an alternative channel for raising issues and, as the example of Switzerland shows, encourage representatives to be more responsive and more accommodative in the preparation of laws, which would result in creating a stronger attachment of the people to the political system. Altogether, the debate on referenda remains largely inconclusive, due to the lack of a truly comparative study dealing with a sufficient number of cases and variables. Admittedly, such a theory is difficult to formulate because of the great variety of the forms of referenda and the contexts in which they are held, which stands as an impediment to any kind of generalization. For the present, it should be noted that the prevailing view among political scientists is not very favorable to referenda. This is explained by the fact that they are criticized by both elitists, in the name of representative democracy, and "participationists," in the name of pure direct democracy, which is regarded as superior because it allows the collective elaboration of policies as well as more compromise and deliberation, leading to more enlightened decisions. Proponents of the referendum argue that it should not be evaluated against the ideal of direct democracy but against the actual performance of representative democracy, which can be more severely criticized on the same grounds as referenda. In conclusion, further research on referenda is all the more needed since they have become more frequent, and the issue is raised today of whether they should or should not be part of the current development of participatory mechanisms. In such a perspective, recent efforts by think tanks and institutes specializing in the improvement of democracy to advance referendum "best-practice" proposals that incorporate particular institutional designs and rules for their implementation deserve to be mentioned. Ultimately, as with elections, the correctness of referendum practice is to a large extent a matter of rules and of the democratic quality of the regime in which it occurs.

REFORM

Modern societies are highly dynamic. Unlike static traditional societies, they constantly evolve, and progress is the principal goal. Consequently, a central concept in these societies is that of *reform*, meaning an intended change of institutions or policies designed to overcome perceived deficits or to achieve particular goals. If successful, the change leads to a positive development: improvement of an existing situation or better performance. Reforms can refer to a government as a whole or its institutions and policies, but political science is also interested in the restructuring of nongovernmental organizations such as associations or firms. In all these settings, modernization is tantamount to reform.

The concept of reform is used to designate extraordinary political decisions, as distinguished from ordinary decisions, by the degree of change involved. Moreover, reforms break with routine. As a rule, political leaders announce a reform to gain public attention and prove their ability to govern. In this way, they exploit the positive connotations of the term for political gain. In view of the dynamics of modern societies and technologies, even conservatives no longer defend the status quo but propose reforms to avoid negative developments. The ability to reform has become an indication of effective governance, while stalemate and stagnation are commonly identified with governance failure. Nevertheless, an analytical distinction between reform and ordinary decisions is difficult. If *blockade* is used as the antonym for reform, the concept is too broad for analytical purposes, because not all policy change can be construed as reform and not all opposition to such change can be construed as obstructionist. For this reason, reform should be defined as a policy that is particularly ambitious with regard to change, that is highly relevant for the promoters or affected actors, and that attracts special attention, often among the general public and the media.

In contrast to revolutionary change, reform policies maintain a legitimized system of governance. Institutions or policies are not abolished but transformed in a more or less incremental process. This process follows existing rules, which usually stipulate the participation of actors that have a stake in the reform. As a consequence, the intended change causes conflicts, and every reform is confronted with the resistance of actors interested in maintaining the status quo or expecting to lose power. On the other hand, actors who push for change may veto a reform if they are not satisfied with the outcome. For these reasons, the challenge of a reform is to find sufficient supporters and arrive at decisions on change, whereas revolutions generate a self-enforcing dynamic that is difficult to control.

Reform is an intended change effected by explicit decisions and actions of responsible policymakers. Usually, reformers pursue a design of renewed institutions or policies; at least they have ideas about the direction of change. Thus, a reform, concerning the formal institutions, rules, or procedures, differs from changes driven by ongoing interaction or interpretation of existing norms and practices. However, emergent patterns of interaction and interpretation influence the outcome of reforms. In political systems, as in the private sector, reform policies are often guided by designs derived from theories or copied from those of other governments or organizations. But more often than not, these plans fail due to open opposition from actors attempting to maintain their powers or due to the endogenous dynamics of collective action interfering with the intentions of reform policies. It is the interplay of intended and unintended change that explains the outcome of reforms.

Depending on the specific situation or the desired objectives, the challenges and difficulties of reforms vary. Comprehensive constitutional reforms rarely meet with complete success. As the theories of historical institutionalism explain, changes in complex institutional settings are “path dependent”; that is, they are constrained by previous decisions on constitution making or creation of political systems. Moreover, because reforms affect the allocation of power in political systems, they give rise to intense conflicts and provoke strong resistance by actors who want to maintain their position or who profit from the existing rules. Rules of constitutional amendment require decisions with qualified majorities either in parliaments or through referenda, if not both. These rules favor coalitions of actors opposing a reform. According to institutionalist reasoning, we can expect “implicit change” of constitutional norms through court decisions or reinterpretation of rules by governments. Also possible are limited amendments designed to adjust constitutions to the development of prevalent values or power structures in a society. But major constitutional reforms should be regarded as unlikely events.

Reforming an organization gives rise to similar problems, even if a reorganization can be planned and enacted by political leaders. Administrative reforms, for example, often are initiated by governments or parliaments. By using their power to decide on competences, procedures, personnel, and the budget of administrations, they are able in principle to control reform processes. However, radical intervention in existing structures can destroy standard operating procedures or undermine the motivation of civil servants. Reforms enforced from above often thwart the collective "spirit" or culture of an organization, which is key to maintaining its performance. In this case, those affected by the change may resort to subversive activities or react by work-to-rule. At the end, governments may bring about changes to formal organizations but may fail to achieve the expected improvements.

Reforms related to policies face resistance from affected interest groups, but mostly, they get the support of groups profiting from the change. Whether they succeed or not depends on the comparative power and influence of these groups in the political system. As George Tsebelis has argued, intended policy change can be explained as a bargaining process the outcome of which is determined by the status quo, the preferences of the actors or coalitions involved, and their veto powers. Simply put, reforms are more likely to succeed in changing an existing policy the lower the number of veto players.

Although institutionalist and actor-centered theories often explain the failure of reforms, they do not tell us much about the conditions of change. Empirical research on organizational change has shown that the powers and preferences of actors and the history of institutional development play an important role in reform processes, but no less important are the ideas promoted by the advocates of change. As a rule, reform processes start with discussions leading to new perceptions of problems and new goals and proposals for renovating institutions or policies. If the different opinions merge into a new "paradigm," or ideas shared among the players in the politics of reform, change in the proposed direction is likely. Moreover, strong "advocacy coalitions" or "change agents" are critical to trigger reforms.

The variables emphasized by different theories have impacts on reforms at different stages of the process. This is why we regularly can observe a cyclical development. Reforms are triggered by new ideas, elaborated and communicated by advocates of change. Public discussions in the concerned policy area cause a shift in perceptions, which tend to exaggerate the problems. Furthers, they generate concepts for new designs and create positive attitudes for change. Attention from the media and discourses in science have strong impacts at this stage of the reform process. If responsible reformers exploit the opportunities provided by this development with bold initiatives, they can achieve significant formal changes. However, such decisions provoke reactions by those actors that oppose the change; and the more ambitious the agenda, the more intense is the response. This stage of the process is characterized by conflicts, bargaining, politicking, and increasing negative assessments of the consequences of a reform. As the media begins losing interest in the issue at stake, reformers revise their ambitions, reduce their engagement in reform policies, and shift their attention to other tasks. At the same time, the actors defending their interests or positions gain influence, obstructive behavior increases in organizations or policy areas, and the formal changes are adjusted to emergent rules and patterns of interactions. This reform cycle can end in the restoration of former structures and policies, but in most cases, it results in moderate changes.

In view of this up-and-down nature of reform processes, scholars have debated on appropriate strategies of reforms. According to one opinion, successful reforms require strong leadership, clear goals and designs, bold strikes shaking up existing structures of powers and routines, and fast action in favorable situations. Others argue that good preparation of reforms, a broad consensus, participation of the affected actors, initiatives from inside organizations, and perseverance in long-lasting processes are decisive factors. Presumably, the strategies of reforms have to be adjusted to institutional frameworks and situations. Moreover, comparative studies have yielded ample evidence for the assumption that majority democracies can achieve more change through policy reform while consensus democracies tend toward incremental adjustment. Whether this finding also holds for institutional or constitutional reform is still an open question. There is also debate as to whether crisis situations favor or constrain reforms. In fact a severe crisis increases the need for change and even can turn into a "critical juncture" if existing institutions break down or existing policies no longer work. But it also reduces the leeway for reform policies due to the pressure for immediate action. Experiences and comparative studies in administrative reforms have revealed that fiscal crises limit the opportunities to reform organizations. On the other hand, an abundance of resources reduces the need for change and can lead to increasing conservatism. Competition between governments or private organizations may stimulate reform processes, in particular if policymakers enter into an exchange of best practices. Nevertheless, the transfer of reform blueprints or abstract concepts can have negative consequences on the reform process if the particular conditions or cultures of governments or organizations are ignored by promoters of change. Again, the administrative reforms of the past decades provide examples of such developments.

Regardless of these debates, in modern states and in complex organizations, reforms evidently arrive within limits. Hardly any reform follows its initial aims or ideas. However, in view of the interplay between change of formal rules and the dynamics of emergent interaction, what reformers intend cannot be taken as an adequate standard for evaluation; rather, it is the way they manage conflicts and turn initiatives into a process of collective learning among affected actors. In the end, reforms can be regarded as successful if they balance change and stability and if the cyclical development leads not to restoration of the *status quo ante* but to ongoing evolution. Every reform is embedded in the dynamics of institutions and policy making. It never determines change.

REGIME (COMPARATIVE POLITICS)

Regimes are the various types of political systems found in the sovereign countries of the world. These can be defined as specific individual regime types or as contrasting types. In comparative politics, the concept of a political regime refers to the formal and informal structure and nature of political power in a country, including the method of determining office holders and the relations between the office holders and the society at large. These relations could or could not involve accountability of office holders to the *demos* and likewise could involve various freedoms granted to society or, conversely, none at all. The distinction as to whether a country is a democracy or not is thus a regime distinction—and indeed (as we shall see) the central regime distinction.

The first use of the concept in modern political science was by David Easton. Easton contrasted the regime with the ongoing political community (the country), emphasizing that there can be and have been fundamental changes to a political system (producing a different regime) even while the political community remains basically constant. This entry defines a regime; discusses the key distinction within a regime, that is, if it is a democracy or not (or how much democracy it has); and presents more generally the cases of ambiguity.

What Is a Regime?

Regime is a midrange concept, falling between the concept of specific governments (of individuals) and the concept of the state (the broader administrative-legal structure that has sovereign control over a country and the power to extract resources from it). That is, governments may vary (e.g., the shifts back and forth between Conservative and Labour governments in the United Kingdom), or presidential administrations may change (e.g., from George W. Bush to Barack Obama in the United States), but these are not changes of regime; the democratic regimes in each case remain. Thus, over time a given regime may involve many governments. Following from the above, for there to be a regime change, the political "rules of the game" must change in a systemic way, not merely the winner of the game. Thus, South Africa in 1994 underwent a regime change from a racial oligarchy to a liberal democracy; since then, there have been several presidents, starting with Nelson Mandela, but the regime has remained the same. Conversely, a change of regime may occur in a specific state, but the state itself normally remains the same (of course, states do get formed and dissolved, but the point here is that over the very long haul, a stable state is likely to experience multiple regime types). Key state institutions and actors (the bureaucracy, the judiciary, the military, etc.) thus tend to carry over from one regime to another, for example, from Imperial Germany to the Weimar Republic—in this example posing problems for the latter. Sometimes, though, a regime change will involve the creation of entirely new state structures, such as with the creation of the Soviet Union (the new communist bureaucracy, the Red Army instead of the Imperial Army, etc.). Finally, one must distinguish between public policies that speak to the nature of the regime (such as the extent of civil liberties) and more general socioeconomic policies, such as economic policy, health care, or same-sex marriage—the latter types of policies can change (and may well change with different governments) but do not involve regime change.

It should be noted that the word *regime* is sometimes used as the equivalent of "system," for example, a parliamentary regime versus a presidential regime. However, this is too broad a use of the concept of regime. Thus, if a democracy changes from, say, a parliamentary system to a presidential system, as Gambia did in 1970, it is *not* a regime change. A similar point can be made about unicameral versus bicameral systems or unitary versus federal systems.

The Key Regime Distinction: Democracy or Not (or How Much of It)?

There are many different specific political regimes in the world, but the initial assessment of a regime normally begins with whether or not it is democratic. In the contemporary world, a democratic regime has three basic aspects: competitive elections, more or less universal suffrage, and a responsible government—that is, those elected in competitive elections both are accountable to the people (the voters) and have the actual power to govern, as opposed to effective power being in the hands of a monarch, the military, or a clerical figure. (Implicit in this definition of democracy is some sort of functioning state.) The opposite reality here is that of an autocratic regime. That said, since there are key differences among autocratic regimes, these are normally identified more precisely, as specific regime types. The main types of autocratic regimes are totalitarian regimes (involving a ruling ideology, mass mobilization, and total state control), such as Nazi Germany; posttotalitarian regimes (involving less emphasis on ideology and somewhat greater freedoms), such as the Soviet Union under Mikhail Gorbachev; sultanistic regimes (involving the personal rule of an individual and his or her family), such as Iraq under Saddam Hussein; traditional authoritarian regimes (involving rule by a monarch), such as Imperial Russia; military authoritarian regimes, such as the one ruling Myanmar; theocratic authoritarian regimes, such as the one in Iran (at least through 2009); and electoral authoritarian regimes (more on this type below). There are some autocracies, however, that straddle these specific regime types; for example, Cuba and North Korea have elements of both totalitarianism and sultanism.

Viewed as a simple dichotomy between a democratic regime and an autocratic regime, a clear majority of the 194 or so countries in the world today have democratic regimes. However, a standard further distinction is made between electoral democratic regimes and liberal democratic regimes. Electoral democracies have the three basic features given above. Liberal democracies have these as well (and thus all liberal democracies are also electoral democracies), but they additionally have the liberal features of broad civil liberties, a strong rule of law (e.g., an independent judiciary), horizontal accountability of elected officials to other state actors (e.g., ombudsmen and state auditors), and a well-functioning state with limited if not minimum corruption. There are, thus, many democratic regimes that are electoral but not liberal. This is especially true in Africa and Latin America. The fact that the liberal democratic regimes of the world are overwhelmingly found in Europe, European settler societies, and the former Anglo-American colonies has led to the criticism that this is a Western rather than a universal concept.

By placing liberal democracies ahead of electoral democracies (which in turn are ahead of autocracies), the dichotomy between regimes has been transformed into a continuum. Indeed, most scholarly and related analyses use some sort of continuum of regimes. In terms of global assessments, Freedom House (an international nongovernmental organization that conducts research and advocacy on democracy, human freedom, and human rights) distinguishes among free, partly free, and not free regimes, based ultimately on 7-point scales for each of political rights and civil liberties. (Freedom House also has a separate dichotomous list of electoral democracies.) The Bertelsmann Transformation Index uses a 10-point scale that ultimately produces a continuum of five categories: democracies, defective democracies, highly defective democracies, moderate autocracies, and autocracies. However, it classifies failed states separately (within the broader autocratic area).

Continua can also be used for the submeasures of democracy. There are various measures of the rule of law, including that of the World Bank. Transparency International, a nongovernmental organization, publishes a Corruptions Perception Index. Yet these measures do not claim to make a clear distinction among regimes, perhaps because they deal with aspects of liberalism rather than democracy. Regime distinctions can be made based on the extent of the right to vote; this would lead to pre–World War II Belgium and France, for example, being classified as male democracies due to the absence of female suffrage. Of course, in the contemporary world, the vast majority of countries have more or less universal suffrage for both genders, so suffrage is now a limited measure for defining regimes. In terms of responsible government, scholars have produced measures of the extent of monarchical control, and especially of military control. There are potential gray areas here, especially with situations of monarchical or military tutelage; normally these are seen as being democratic regimes, but just so.

Without a doubt, however, the one submeasure of democracy where there are specific continua leading to regime classification is the extent of free and fair elections. By "free and fair elections," one means many things: the ability of most, if not all, people and parties to run for election; access of candidates to voters; equal treatment of candidates and parties by state actors such as the police and courts; media pluralism so that opposition candidates have media access (as opposed to the media being controlled by government); secret ballot; no coercion of voters; neutral and transparent ballot counting with independent monitors allowed; no major or "mysterious" delays in reporting the full results; and impartial resolution of disputes. In a democratic regime, these factors exist sufficiently to allow a real opportunity for the government to be defeated; in contrast, in an autocratic regime, the government will tilt the playing field so that it has an insurmountable advantage and/or will simply fabricate the results (as presumably happened in Iran in 2009). Yet the dividing lines here are not always clear and decisive. Certainly if a government is defeated and hands over power, then one assumes that the elections were fair and the regime is democratic. However, if a government or president is reelected, does that reflect unfairness or simply the voters' desire to reelect them? One point here is whether the opposition cries foul or accepts the results as legitimate. However, in some cases, the opposition may not bother to cry foul if it sees no point in protesting.

Even if the opposition is not allowed to win by the powers that be, they may still have some electoral success. At a minimum, they are allowed to exist. This gave rise to the concept of an electoral authoritarian regime, which conceptually is a relatively new regime type. In such a regime, multiparty/multicandidate elections are held but with no chance of the incumbents losing power due to the lack of fairness and perhaps freedom as well. Yet it is the very reality of election "victory" that is used to give legitimacy to the regime, if not indeed to claim it as a democracy. Singapore is a classic case here. These electoral authoritarian regimes can be contrasted with fully closed regimes, where no opposition is allowed to exist (e.g., totalitarian and sultanistic regimes or certain traditional authoritarian regimes such as Saudi Arabia). On the other hand, in some autocratic regimes elections are not just a rubber stamp, and election outcomes are of concern to the government. Opposition forces may win a significant minority of the seats or even some control of regional/local governments. Even if the playing field is not level enough, or fair enough, for the government to be defeated overall, it can still experience a worse or better result from election to election. Malaysia for decades (through the time of writing) fits this situation. Thus, scholars have developed the concept of a competitive authoritarian regime that, although clearly authoritarian as opposed to democratic, allows much more competition and pluralism (including media freedom) than (hegemonic) electoral authoritarian regimes, not to mention fully closed regimes. The concept of a competitive authoritarian regime thus overlaps with the Bertelsmann Transformation Index's notion of a moderate autocracy. It is thus possible for such competitive authoritarian regimes to become competitive enough to produce a transition to democracy, as happened to Ukraine when the amount of vote rigging needed to produce victory for the regime's presidential candidate in 2004 led to the Orange Revolution and the ushering in of a democratic regime.

These distinctions among democracies, competitive authoritarian regimes, hegemonic electoral authoritarian regimes, and fully closed regimes essentially or ultimately reflect the electoral success of the opposition. To repeat, in democracies the opposition has a realistic chance of defeating the government (and if this does not happen in an individual election, it is the result of voter preferences and/or poor opposition strategies rather than an unfair playing field), in competitive authoritarian regimes the opposition is able to win a reasonably large number of seats (and thus also hold the government to some account in the legislature), and in hegemonic electoral authoritarian regimes the opposition wins only a tiny and largely irrelevant number of seats (but it still exists, unlike in fully closed regimes). These differing regime classifications thus draw heavily on election outcomes, but the general level of freedom in a country (such as its Freedom House score) usually is related reasonably well to this specific indicator of election outcomes. There are also liberal autocratic regimes where the civil rights are much greater than the effective political freedoms, such as Monaco and Tonga; that said, in these countries the autocracy stems from a lack of responsible government (and thus "relevant" elections) rather than unfair elections per se.

All of this also raises the question of whether empirically there is a maximum level of support for a government/incumbent beyond which the result is not credible and the regime cannot be considered a democracy. Usually, something like 70% of the vote is suggested here. Yet in countries broadly considered to be democratic, such as Botswana and Namibia, incumbent parties have won over 70% of the vote in elections (however, in South Africa the African National Congress has never reached this level of support, its best result being 69.7% in 2004). In part, this may reflect the exceptional support given to parties that led the nation's struggle for independence. Certainly in Western democracies, parties (or presidential candidates) competing in national elections never get much more than 60% of the vote, even in the most successful cases. Indeed, presidential elections in the United States are interesting in this regard, since there does appear to be an effective "ceiling" just above 60% of the vote. In descending order, the largest vote shares in such elections have been 61.1% (Lyndon Johnson in 1964), 60.8% (Franklin Roosevelt in 1936), 60.7% (Richard Nixon in 1972), and 60.3% (Warren Harding in 1920)—all very close values. Outside the United States, one can note the vote share of 64.7% that José Figueres got in Costa Rica in 1953—an undisputed outcome in a democratic regime. Consequently, it seems clear that a result of 90% or 80% cannot be consistent with democracy. That said, many dubious/nondemocratic outcomes are based on much less lopsided "official" results, such as 63% for President Ahmadinejad in Iran in 2009, 51% for President Salinas in Mexico in 1988, and 47% for President Kibaki in Kenya in 2007—all of which were nevertheless (at best) competitive authoritarian regimes.

Ambiguous and Hybrid Regimes

Regardless of how many categories there are in a continuum of regime types, one needs to ask whether this continuum could be collapsed into two categories—democracies and autocracies. In other words, is every country ultimately considered to be a democracy or an autocracy, or is there some unclear middle ground? Scholarly and related research differs as to whether or not there is ever any such unclear middle ground. There are two rather different problems here. First of all, a country could have a fluid or unstable political system, making it hard to pin it down. In this case, one option is the concept of a transitional regime. Conversely, the previous regime could be deemed to remain in place (and the country be classified as such) until there is a clear shift to a new regime. Second, there could be genuine scholarly disagreement about the political reality in a country, with independent analysts having differing opinions as to, say, the level of competitiveness. This divergence is most common where the government/incumbent is reelected, and seems to be genuinely popular, but where there are (serious) procedural issues—for example, Russia under Vladimir Putin or Venezuela under Hugo Chávez. Such polities could be considered ambiguous regimes, at least until there is a reasonable consensus on their regime classification (which incidentally tends to be that they are authoritarian, leading to a related debate as to the point at which democracy broke down). A variant of this dilemma is where a country just places into a category. For example, the Bertelsmann Transformation Index refers to highly defective democracies as barely meeting its minimum criteria for democracy. It also acknowledges a gray area between democracy and autocracy.

These situations all involve ambiguity in classification. The resulting notions of ambiguous regimes or transitional regimes are meant not to be precise categories but rather to reflect the inability to be precise. Conversely, the notion of a hybrid regime involves combined aspects of democracy and autocracy in a fairly stable, ongoing way. This concept is more likely to be used if more aspects are included in the assessment. Narrow(er) assessments that focus on just competition and responsible government are likely to place every country on one side or the other of the divide—that is, as either a democratic or an autocratic regime. However, if there are multiple criteria—and if these are weighted equally—then the reality arises of countries that are democratic in some aspects and autocratic in others or that average out as being in the middle. This is the reality of, for example, the Economist Intelligence Unit's Index of Democracy, which has five aspects including political participation and political culture—indeed, what this really seeks to measure is consolidated democracy. Consequently, a substantial number of countries fall into its hybrid regime category, defined as having a score from 4.0 to 5.9 out of 10. Decomposing their components would categorize the vast majority of these countries as either (unconsolidated) electoral democracies or competitive authoritarian regimes, with a few countries scoring as they do because of a lack of sufficient stateness.

REGIONAL INTEGRATION (SUPRANATIONAL)

When examining the macrostructure of the global system, three observations appear highly salient. Politically, the world is organized into 200 or so sovereign nation-states, each an aspiring zone of exclusive authority. Economically, there is a single though differentiated world economy, especially since the decline of the global socialist bloc. What lies in between these states and the world economy are numerous international institutions, many of them organized on a regional basis. *Regional integration* refers to the process of increasing political and economic cooperation among states in close geographic proximity to each other. The growth in the number of regional organizations is dramatic. While numerous regional organizations were reported to the General Agreement on Tariffs and Trade (GATT) in the 4½ decades after World War II, an even more dramatic growth spurt has taken place starting in 1992. While the number of new regional organizations leveled off, that level remained very high in comparison with all years prior to 1992.

This worldwide trend toward regional integration presents two important puzzles. First, scholars debate the reasons for this tendency toward regionalism in an era of globalization. Economic theory pushes in the direction of larger units, while the demand for sovereignty and identity suggest smaller units. Second, why does one experiment in regional integration, the European Union (EU), stand out, distinguished not so much by the level of economic integration as by the breadth and depth of its political institutions? The distancing of Europe from other regional organizations has had the unfortunate consequence of compartmentalizing scholarship. Today, comparative studies of regional integration with the EU as one case are rare.

The New Regionalism in a Comparative Perspective

The New Regionalism

Regional organizations and agreements are proliferating all over the world, and more than 50% of international trade is now conducted within preferential trading agreements organized at the regional level. Regional integration has proceeded in waves, the most recent of which began in the wake of the Cold War in the early 1990s. The EU's single market was completed in 1992, and the treaty at Maastricht that year set the timetable for achieving economic and monetary union by 1999. The North American Free Trade Agreement (NAFTA) was signed by Canada, Mexico, and the United States in 1992. The Asia-Pacific Economic Cooperation (APEC) was established in 1989 with the goal of becoming a free trade area (a goal not yet realized), and the Association of South East Asian Nations (ASEAN), though established in 1967, created a free trade area in 1992. It expanded its membership and its integration activities in the 1990s, and since the East Asian financial crisis of 1997. The three regional powers—China, Japan, and South Korea—have been included in regular ASEAN summit meetings.

These three sites of economic regionalism—Europe, North America, and East Asia—are home to the majority of the world's intraregional trade and the most robust regional institutions, but steps toward regionalization have been taken elsewhere as well. There are regional organizations among states in the Middle East (Gulf Cooperation Council), Africa (South African Customs Union, West African Economic and Monetary Union), and South America (Southern Common Market [Mercado Común del Sur, MERCOSUR], Andean Community), and there are free trade agreements in regions all over the world. As of July 2010, more than 474 regional trading agreements had been reported to the World Trade Organization (WTO). Of the agreements already in force, over 90% are free trade agreements. Almost every WTO member is party to at least one regional trade agreement, and these agreements often intersect in complex ways. At the same time, the depth and scope of regional integration are highly diverse, with the EU representing a level of both economic and political integration not seen elsewhere on the globe, while many regional agreements are little more than symbolic acts that have not generated any meaningful regional economic or political cooperation.

Given the institutions already in place at the global level to facilitate multilateral trade, and the widespread membership of states in these institutions, the "new regionalism" of the early 1990s is an interesting puzzle, for which scholars have provided several explanations. At the international level, some scholars point to the end of the Cold War as a catalyst for the sudden rise in the number of regional agreements signed by states in the early 1990s. According to these arguments, the move from a bipolar world characterized by stark political divisions to a multipolar world characterized by increasing global economic competition removed many of the constraints that had once operated on states' foreign policies, both politically and economically. The end of the bipolar division restored regional sovereignty and allowed regional powers to develop. Asia, for example, had been geographically split along ideological lines, and with the end of the Cold War, countries such as China and Vietnam have been gradually integrated into regional institutions. The prospect of a more multipolar world and fears of "Fortress Europe" encouraged states to organize regionally to counter the growing economic weight of the EU and NAFTA.

Another line of argument focuses on the role of hegemony. Some theorize that the primary role of a global hegemon is to provide public goods; in the post-hegemonic international system, states began turning to regional organizations to overcome collective-action problems. As a hegemon, the United States influenced economic relations all over the globe, and it traditionally encouraged bilateral trade relationships in Asia, whereas in Europe, it supported multilateral integration efforts. The relative decline of U.S. hegemony in certain regions since World War II has afforded these regions more freedom to pursue their own integration projects. For example, in the early 1990s Japan overtook the United States as the leading provider of foreign aid in Asia, and it began to challenge U.S. dominance in trade and foreign direct investment within the region. With the strong economic linkages formed during this time between Japan and the newly industrializing economies in Asia, the door was opened for the development of stronger regional cooperation.

The third reason why states may have been motivated to pursue regionalism was difficulties reaching agreement in multilateral trade negotiations in the early 1990s. The GATT Uruguay Round is the most comprehensive trade agreement negotiated to date, and it was extremely frustrating for the participants, taking 8 years to complete and leaving many developing states unsatisfied. During this same time period (1986–1994), NAFTA, MERCOSUR, APEC, and the EU's single market were initiated and completed in less time than it took to complete the Uruguay Round. These agreements were not only achieved more quickly, but also they provided solutions to issues that had come to a standstill in the GATT negotiations.

Comparative Regional Groupings

While regionalization is a process taking place all over the globe, there is considerable variation in the institutional design of regional agreements, in the depth of integration they achieve, and in the success with which they meet their stated objectives. The EU is exceptional for its high level of both economic and political institutionalization. In North America, the three parties to NAFTA succeeded in creating a free trade area that is wide-ranging in its trade liberalization agenda; deep in its level of institutionalization, especially with regard to dispute resolution mechanisms; and prominent as a focal point for other subregional agreements that have sprung up among Latin American countries. MERCOSUR is the largest South American trading bloc, but it remains largely intergovernmental in nature, with weak implementation of basic integration measures and a continued preference for bilateralism among some of its members. There are many subregional trading agreements in place among African states, although the low level of economic development and the absence of large cost differences in tradable goods across much of the continent make successful regional economic cooperation exceedingly difficult.

East Asian Regionalism

One of the world's most important economic regions, East Asia, has been a relative newcomer to the process of regionalization. Until very recently, scholars commonly described this region as "under-institutionalized" when compared with the other two regional economic heavyweights, North America and Europe. While the EU is known for its robust multilateral and supranational institutions, in East Asia cooperation has taken a more bilateral and intergovernmental form in both economic and security areas. ASEAN has played an important role in relations among Southeast Asian countries since its founding in 1967, but it wasn't until the late 1990s that ASEAN expanded to meet regularly with China, Japan, and South Korea, the three regional powers. The other prominent regional organization in Asia, APEC, has 21 member states from both sides of the Pacific Ocean, but its efforts at trade liberalization have stalled in recent years and left it largely on the sidelines. In addition, Asian countries have been notably reluctant to create supranational political institutions at the regional level. Instead, cooperation is largely limited to the economic realm, and it is informal, often led by transnational business networks. This informal, business-led form of economic cooperation in Asia has come to be known as the "ASEAN Way."

Some argue that the diversity among East Asian states in their levels of economic development and government capacity to implement integration measures have hindered meaningful cooperation efforts at the regional level. Still others contend that the delayed regionalization in East Asia reflects the traditional U.S. preference for bilateral cooperation in this region. While the United States supported multilateral integration in Europe in the postwar period, it pushed the development of bilateralism in Asia, partially as a way to maintain its hegemony in the region. In the post–Cold War period, the continued political heterogeneity across East Asia has made integration difficult. In addition, Japan, a potential regional leader in the early 1990s, prioritized its relationship with the United States over the pursuit of a multilateral integration agenda with its neighbors. Bowing to U.S. pressure, Japan neither led integration efforts nor lent its full support to proposals by other Asian states for greater integration in East Asia.

The situation in East Asia dramatically changed after the crippling economic crisis in 1997. The crisis made it clear to Asian political leaders just how vulnerable their economies were to the flight of global capital. Further, there was deep disappointment with the response of the United States and U.S.-led international financial institutions, such as the International Monetary Fund. The United States continued to promote neoliberal reforms in the wake of the crisis, despite the longstanding resistance to these reforms from East Asian governments, many of whom believed that such reforms had been a cause of the crisis. Japan's proposal for an Asian Monetary Fund that would help maintain regional stability in the future was opposed by the United States, a move widely viewed in East Asia as a U.S. attempt to maintain its influence in the region, despite the cost to stability. Since 1997, the focus has shifted away from integration at the Southeast Asian or Pacific-wide level to wider integration across East Asia.

Process of Regional Integration in Europe

Limitations of space preclude a comprehensive review of regional integration theories, let alone of the wealth of regional experiences around the world. This section reviews functionalism and neofunctionalism (collapsing most distinctions) and liberal intergovernmentalism as the two dominant approaches. The section concludes with some comments on new departures in regional integration theory concerning the EU, departures that signal a break with the questions posed by existing theoretical frameworks.

Functionalism

The causal factors emphasized by functionalism fit into three categories: (1) the fertile postwar environment, (2) the initial integrative successes, and (3) the interconnected nature of modern capitalist societies, which in turn leads to the expansion of these initial successes. The fertile postwar environment was characterized by late capitalism (industrial and postindustrial), specialized and partly autonomous interest groups, and democratic forms of governance. In telling the story of European integration, it is easy to downplay Europe's early postwar history, when major political problems (how to incorporate Germany, how to provide for European security) were addressed and resolved, and focus only on the economic side of the picture. The economic recovery of Germany, aided by a multilateral structure set up by the Marshall Plan, and the subsequent integration of Germany into the North Atlantic Treaty Organization (NATO) in 1955 provided the necessary preconditions for further integration. Analysts attempting to compare Europe with other areas of the world should keep these salient facts in mind.

The second explanatory factor offered by functionalism has to do with the hoped-for initial successes of the integration project. One could argue that the initial successes were contingent rather than a predicted outcome of functionalist theory. However, the success of the initial attempts to integrate was endogenous in the sense that the practitioners and analysts believed that by focusing on the less controversial sectors, they would stand a better chance of succeeding. In good measure, they were right about this prediction. The free trade area, the customs union, and much of the common agricultural policy were in place by 1968. There is little doubt that these successes paved the way for further integration, even though there was little movement on the policy front between 1968 and 1985.

Third, functionalists argue that the modern capitalist society is interconnected and these interconnections all but ensured that the initial success implied further integration. Several kinds of linkages are theorized. There are linkages among sectors (e.g., trade and monetary), linkages from the economic to political spheres (e.g., market participation generates citizenship rights), and purely tactical linkages. This last category offers negotiators the possibility of linking sectors that are not inherently connected; for example, market expansion may be linked to regional aid for the purpose of making the former more attractive to suspicious participants. These linkages are mechanisms that perhaps will lead to further integration, once the initial foundations are in place. In functionalism jargon, the secondary integrative processes set in motion by these mechanisms are spillover processes.

The preceding discussion can be thought of as dealing with the demand side of integration. But the demand for integration does not automatically lead to integration. Political market failures may occur. Inadequate institutional structures or weak leadership may thwart the process. For integration to occur, even when key social actors want it to occur, collective-action problems have to be overcome. For this reason, functionalists assigned a central role to supranational institutions, from the High Authority of the European Coal and Steel Community (ECSC) to the Commission and European Court of Justice of the EU.

In the able hands of first-generation scholars such as Ernst Haas, Philippe Schmitter, and Leon Lindberg, the basic analytics of regional integration theory were put into place. A second generation of neo-functionalist scholars (e.g., Alec Stone Sweet, Wayne Sandholtz, Paul Pierson) extended the basic research program to account for deeper processes of integration, including the completion of the single market, economic and monetary union, and subsequent treaty revisions (Amsterdam, Nice, Lisbon). In a 1998 work, Stone Sweet and Sandholtz increased our institutional understanding of the EU. Their work on the European Court of Justice takes pains to link active interest groups with the structure of litigation and legislation. The Commission, Council of Ministers, and European Parliament are all integrated into one comprehensive picture of triadic dispute resolution.

At the same time that Stone Sweet was building his model of triadic dispute resolution, Sandholtz was questioning the assumption of exogenous preferences. Sandholtz argued that preference formation was partly endogenous to membership within the EU itself. In his 1996 work "Membership Matters," Sandholtz reasoned that attitudes were not formed in an insulated domestic context and then transported to Brussels, where officials acted on them. Instead, the experience of member states working together in the EU, solving problems collectively through EU institutions, was expected to contribute to the formation of preferences, along with the forces emanating from the domestic and international political economy. Sandholtz's contributions should be seen as part of a longer line of research on socialization and the formation of preferences.

Finally, with regard to the extension of neo-functionalism, the theory gets a more rigorous dynamic dimension by reframing some old questions within a principal–agent framework. Of what importance are unintended consequences? Under what conditions do they occur? What accounts for the discrepancies between the incentives and information available to principals (national executives) and agents (their appointees in Brussels)? Pierson was able to provide a sounder theoretical foundation to neo-functionalism, giving some previously theoretically unanchored propositions a home.

Liberal Intergovernmentalism

The major rival of neo-functionalism is liberal intergovernmentalism (LIG). With a series of articles published during the early 1990s, culminating in his 1998 book *The Choice for Europe*, Andrew Moravcsik set out the foundations of a state-centric theory of the integration process, one that relies on the preferences of the member states, formed by processes external to member (socialization) pressures. Moravcsik theorizes that the formation of preferences of state actors is due mostly to the pressures emanating from the domestic and global political economy.

In Moravcsik's "Preferences and Power in the European Community: A Liberal Intergovernmental Approach" (1993), he identifies a two-stage theory of integration in which the first stage is preference formation by state leaders and the second stage is intergovernmental bargaining. A third stage is added in *The Choice for Europe* (1998), in which bargained outcomes are institutionalized in an attempt to prevent them from being overturned. At the core of the model lie the social and economic interests of key producer and commercial groups.

After the preferences of state actors are formed, governments engage in international bargaining. Here, state power (oddly absent from much integration theory) plays a role. The relative costs of nonagreement, in particular the ability to revert easily to the status quo, are the main source of power. Countries that can do without an agreement, for example, Germany in the case of the Economic and Monetary Union (EMU), can hold out for favorable bargaining outcomes.

LIG has come in for its share of criticism. It limits itself to grand bargains, those momentous occasions when states confront each other over high-stakes outcomes. This focus misses the way in which small things may accumulate and create pressure leading to an important international negotiation. Indeed, this is a central functionalist point, namely, that relatively mundane and nonsalient events can become transforming if viewed in the long run. LIG and functionalism are seen as two separate theories, but they may actually be linked through a tissue of events tying together grand bargains.

A second criticism is that pressure for renewed change need not come from exogenous or endogenous change in the domestic or global economy. It may come from a disequilibrium present from the moment a grand bargain is struck. If state actors can bring about a bargain, and if they vote by consensus (which they do), then by definition they are satisfied with the bargain. But this may not be the case for institutional actors, for example, the Commission, the Council of Ministers, the European Court of Justice, or the European Parliament. Each has its own institutional interests, which are different from the interests of national executives. These actors may agitate for change the moment the grand bargain is struck.

New Departures, Europeanization, and Approaches Based on the Social Purpose of Integration

While functionalism and LIG occupy most of the debate regarding regional integration theory, some new approaches have appeared that ask different questions and introduce novel directions in our research. Significant new directions are provided by the Europeanization and Gramscian approaches. Space constraints allow only a brief word about each.

The Europeanization approach already claims a substantial following. In some sense, the Europeanization framework was a logical outgrowth of the success of European integration itself. When regional institutions were weak and policy was decided at the national level (in the early stage), the natural question was "How do we account for delegation of authority to the regional level?" When regional institutions became much more developed, the problematic shifted to how these institutions functioned to make policies (hence "Europe as a polity"). And when Europe was sufficiently established as a polity, it became natural to ask, "How do its institutions and policies feed back onto the very political systems that compose it?" In a sense, the Europeanization approach closes the conceptual circle.

A final approach—labeled Gramscian—is singled out because of the novelty of the questions asked. The main departure from the other approaches is that it asks a question that is astonishingly absent from the functionalism/LIG debate. This debate centers mostly on the questions of how much authority is delegated to the supranational level (and under what conditions) and which actors are influential in the process. The Gramscian approach asks about the social and political content of integration. What goals are served, and what groups or class fractions are dominant? These questions are approached not as a pluralist battle among all organized interest groups but as a rivalry among the various "fractions" of productive and financial capital. A key advocate of this line of analysis is Bastian van Apeldoorn (2002), whose work on the role of classes and business groups charts out new directions in integration theory. Others, such as Fritz Scharpf (1999) and James Caporaso and Sidney Tarrow (2009), adopt a slightly broader emphasis. All of these researchers ask about the content of the integration project rather than the level, scope, or depth of regional integration.

The future of regional integration is likely to be increasingly involved with attempts at liberalization of international trade, especially in non-European settings. Efforts to find the "right" membership to pursue regional goals will be salient, especially in the Asian setting, where ASEAN, APEC, and ASEAN + 3 all compete for regional leadership. In Europe, the functionalist/intergovernmental debate will continue, though in muted form, but it will share the stage with newer theories based on Europe as a polity, Europeanization theories, and theories emphasizing the social purpose of European regional integration, including the relationship among integration, the welfare state, and democracy.

As shown, regional integration processes are vibrant across the globe. It is hoped that the gap between academic theories of integration in Europe and in other parts of the world will be bridged by the continuing research on comparative regional integration.

REGIONALISM

Regionalism refers to the political and cognitive idea of forming regions. It is usually associated with a formal program, and since the mid-1980s, there has been an explosion of such regional programs on a global scale. The broadening and deepening of the European Union (EU) is perhaps the most obvious example, but regionalism is also evident in the revitalization or expansion of many other regional projects around the world, such as the African Union (AU), the Association of Southeast Asian Nations (ASEAN), the Economic Community of West African States (ECOWAS), the North American Free Trade Agreement (NAFTA), the Southern African Development Community (SADC), the Southern Common Market (Mercado Común del Sur, MERCOSUR), and, more recently, the Union of South American Nations (Unión de Naciones Suramericanas, UNASUR).

Today's regionalism is closely linked with the shifting nature of global politics and the intensification of globalization. Regionalism is characterized by the involvement of almost all governments in the world, but it also involves a wide variety of nonstate actors. This results in a multitude of formal and informal regional types of governance and regional networks in most fields of politics. This pluralism and multidimensionality of contemporary regionalism gives rise to a number of new puzzles and challenges in today's politics.

This entry first defines the terms *region*, *regionalism*, and *regionalization*. Second, it provides an overview of the continuities and discontinuities between the early and the more recent debates on regionalism. Finally, it presents a brief discussion of regionalism and world order.

Regions, Regionalism, and Regionalization

The concept of a region evolved historically to mean the space between the national and the local within a particular state. This meaning may be captured by the term *microregion*, or subnational region. The concept may also be used to refer to *macroregions* (the so-called world or international regions), which are larger territorial units, as opposed to nonterritorial units or subsystems. They exist between the state level and the global system level. The macroregion has been the most common object of analysis in international relations, while microregions have more commonly been considered in the study of domestic politics.

A conventional definition of a macroregion, originally suggested by Joseph Nye, is a limited number of states linked together by a geographical relationship and by a degree of mutual interdependence. Historically, a plethora of opinions have been advanced regarding which mutual interdependencies matter the most: economic, political, and social interrelationships or historical, cultural, and ethnic bonds. It has been argued that the definitions of what constitutes a region may vary according to the particular issue under investigation. This may lead to the identification of overlapping types of regions, such as economic regions, security regions, environmental regions, and cultural regions.

The overwhelming majority of studies in the field of political science and international relations have focused on predefined regions in the form of state-led and interstate regional organizations and frameworks. The AU, ASEAN, EU, SADC, and ECOWAS are examples. The argument that the composition of regions should not be limited to regional intergovernmental organizations has been stressed in recent constructivist and poststructuralist scholarship. From this perspective, all regions are deemed to be socially constructed and hence politically contested. Emphasis is placed on how political actors perceive and interpret the idea of a region and notions of "regionness." According to this school of thought, there are no "natural" regions; all regions are (at least potentially) heterogeneous, with unclear territorial margins. The focus is often on the processes of region building and regionalization, which implies that the distinction between regionalism and regionalization is emphasized.

Regionalism means the body of ideas, values, and objectives that contribute to the creation, maintenance, or modification of a particular region or type of world order. It is usually associated with a formal policy and project and often leads to institution building. Further, regionalism ties agents to a specific project that is limited spatially or socially but not in time.

Regionalization refers to the process of region formation. It implies a focus on the process by which regions come into existence and are consolidated, their "becoming" so to speak. In its most basic sense, the term may imply no more than the concentration of goods, services, investment, peoples, and ideas at the regional level. This interaction may lead to the emergence of regional actors, networks, and organizations. When they are active at the regional level, regional actors bring about regionalization, so-called region building. Regionalization may be caused by regionalism, but it may also emerge in the absence of a regionalist project and ideology. Hence, regionalism may not always have much practical significance for the reality of regionalization.

Early and Recent Debates on Regionalism

Experts on the subject often distinguish between the "old" and the "new" regionalism, or what is more appropriately labeled the early and the more recent debate on regionalism. The early debate covers research undertaken between the 1950s and the 1970s, and the key term was *regional integration*. These studies generally viewed regional integration as an endogenous process, that is, a development that arose from conditions internal to and specific to each region in question. With some exceptions, particularly studies conducted in Latin America and Africa, most early research dealt with European integration, as there were few other regional experiments to theorize about at that time. The dominant approach was neo-functionalism, which mainly considered the "spillover" from the economic integration of Western Europe to its political unification. Among the leading authors who wrote on such early regionalism were Ernst Haas and Karl Deutsch.

The 1970s was a period of "Eurosclerosis" within the European Community, but the 1985 white paper on the internal market and the Single European Act resulted in a new, dynamic process of European integration. This was also the start of what has often been referred to as the "new regionalism" on a global scale. To some observers, regionalism was "new" mainly in the sense that it represented a revival of protectionism or neomercantilism. However, most observers highlighted the fact that the closure of regions was not on the agenda. Indeed, one of the characteristic features of the more recent debate on regionalism, especially within the field of international relations, is its focus on the conditions related to globalization. The recent debate is to a large extent generated by the transformation of the Westphalian nation-state, the erosion of national borders, and the urgent question of how to find an alternative post-Westphalian order in the context of globalization. Perhaps the richest literature in this regard is on the role of regionalism in the context of multilateral trade and security.

One prominent scholar of the recent debate, Björn Hettne, stresses that regionalism needs to be understood from both an exogenous perspective (outside in) and an endogenous perspective (inside out). The former perspective refers to the fact that regionalization and globalization are intertwined articulations of global transformation, whereas the latter implies that regionalization is shaped from within a region by a large number of different actors. The exogenous perspective has developed primarily in the course of the recent debate, whereas the endogenous perspective finds continuity with functionalist and neo-functionalist theorizing about integration (of Europe), the role of agency, and the long-term transformation of territorial identities. In contrast to Haas, Deutsch, and the early regional integration scholars, today's scholars identify many regionalisms, which provides a very different base for comparative studies of regionalism. It is apparent that neither the object of study (ontology) nor the way of studying it (epistemology) has remained static. One indication of this is the emergence of a variety of theoretical frameworks for the study of regionalism, such as constructivism, liberal institutionalism, regional security complex theory, governance approaches, the new regionalism approach (NRA), and the region-building and regional network approaches. Indeed, current regionalization may be seen as a new political landscape in the making, characterized by an expanding cast of actors (state and nonstate) operating in the regional arena and across several interrelated dimensions: security, development, trade, environment, identity, and so on.

Historically, the study of regionalism and regional integration has emphasized states as actors and focused on sovereignty transfer or political unification within interstate regional organizations. Since the late 1990s, research has placed greater emphasis on "soft," *de facto* or informal regionalization, acknowledging the fact that a range of nonstate actors has begun to operate at the regional level, within as well as beyond state-led institutional frameworks. For instance, not only are business interests and multinationals operative in the global sphere, but they also tend to create regionalized patterns of economic activity. Oft-cited examples include the regional production systems in East and Southeast Asia and South African business expansion in Southern Africa. Similarly, the role of civil society is often neglected in the study of regionalism, despite the fact that its impact is increasing, as is evident in the transnational activist networks and processes of civil society interaction emerging at the regional level around the world.

The causal relationship between regionalism and regionalization (or formal and informal regionalism as it is sometimes called) has attracted considerable attention in the recent debate. Key issues are whether or not formal regionalism precedes informal regionalization and the ways in which state, market, and civil society actors relate and come together in different formal and informal coalitions, networks and modes of regional and global governance. Consequently, the study of regionalism is inseparable from the study of globalization and world order.

Regionalism and the World Order

Many regionalists contend that regions have become critical to contemporary word politics. As Peter Katzenstein (2005) points out, "This view is in stark contrast to those who focus on the purportedly stubborn persistence of the nation-state or the inevitable march of globalization" (p. 306). It is generally agreed that globalization challenges the Westphalian nation-state. However, political intervention, or at least some form of governance, is still needed. One way in which "the political" may return is as a reformed neo-Westphalian order (i.e., building on the nation-state system), governed either by a reconstituted state-driven multilateral system or by a more loosely organized global "concert" of the regional hegemons of the world, such as Germany, Japan, Brazil, and South Africa.

Regionalism may also be part of a post-Westphalian governance model (i.e., transcending the nation-state system) of coexisting regional communities. By comparison with economic and market-led globalization, regionalism is more anchored to territorial domains. By comparison with multilateralism, it is a more exclusive relationship based on conscious political strategies, potentially guided by world order values such as multiculturalism and interregional dialogue and cooperation.

REGIONALIZATION

Regionalization is the program or process of forming regions. This implies the reorganization of a territory according to various criteria or dimensions and with different aims. Considering a state or any political entity with a unitary essence, regionalization can be viewed as the process of rearranging or subdividing its territory into smaller administrative and/or political units. These would acquire powers and competences previously held by the superior unit. Hence, regionalization is a decentralized reorganization of territorial interests and political positions. Normally, both subnational entities (in the case of unitary states) and substate entities (in the case of federal states) are called regions; however, the same reasoning could be applied at lower levels of decentralization, although in this case the term used to refer to these entities might be a different one. Nonetheless, under this common thread and with a wide range of terminology, many different realities, dynamics, and political or cultural traditions can be found: France's Départements, Spain's Comunidades Autónomas, Italy's Regioni, and many other denominations that are rooted in the local traditions. This entry points out the key dimensions of the phenomenon, the various approaches to territorial politics, and the varieties of regionalization. The last section clarifies the ways in which different state policies unfold into different types of regionalization processes.

Dimensions of the Regional Phenomenon

The regional phenomenon took a leading role in politics, economy, and spatial planning—especially in the case of the more developed unitarian states—during the second half of the 20th century. Many states, mainly in Europe, underwent regional and decentralizing reforms, which are among the most important political and institutional innovations of the past decades. In these regional facts, at least three meaningful dimensions can be identified: First, there is the sociopolitical and/or economic dynamics underlying these regionalizing reforms, which change even the structure of the relationship between the state and the local entities. Second is the impact that globalization and other dynamics that promote suprastate integration—especially the European one—can have on this regionalization progress. Finally, there are cultural aspects that surround or impel regionalization, either rediscovering or reasserting territorial or regional identities, mainly in those arenas where regionalist and/or nationalist forces play an important role.

From another point of view, there are three other elements not to be ignored. First, the political and administrative decentralization created by regionalization affects the institutions and their relationships at the territorial level. Next, there is the socioeconomic ingredient of spatial planning, with an impact on uneven development and on interterritorial balance and cohesion. Last, there is a cultural or identifying element, which can be more or less challenging and self-assertive and which may in varying degrees constitute a mobilization in defense of territorial claims.

Approaches to Territorial Politics

All things considered, if territory is seen as an essential part of the state and the authority or political sovereignty the latter has over it, the way such territorial authority is managed and organized becomes territorial politics, and regionalization develops within this frame. Regionalization as territory management is, above all, a way to retain and renovate the state's sovereignty, mainly in those contexts where there are identity conflicts or peripheral nationalistic demands. In these cases, regionalization can even go as far as secession, with a territory demanding a redrawing of territorial boundaries and instituting a different form of territorial authority.

The issue has been approached from different perspectives within political science, which reflect various theories about the formation and consolidation of states. Salient among these is the *diffusionist* approach, which dominated the paradigm for decades with its "center–periphery" model. (Modernization and integration theories consider the irreversibility of the homogenization process more plausible.) The key concept of this paradigm is the formation of societies and states around a dominant center that radiates its hegemony to the periphery, absorbing it and thus forming a common social, economic, and political system—we are referring here to *state-building* and *nation-building* paradigms. This hegemony builds on the values of the elites within the different public spheres, hence legitimizing the distribution of power in all domains—political, economic, social, cultural, educative, and so on. Obviously, this approach is not limited to a narrow geographic conception of the core–periphery relationship but is linked with an enlightened vision of economic and social development as well as social modernization. A strong socioeconomic determinism underlies many of the different versions of this diffusionist approach. This determinism maintains that the politics of the state are shaped by economic and social forces. The orthodox Marxist version of this conception does not question this core idea but instead corrects it from the point of view of historical materialism, in which the class struggle is the power behind social and political transformation. Therefore, its state-centrism point of view dominates to the detriment of any territorial differences or identities, which are relegated to a second-tier status. Nonetheless, the center–periphery model has been revised mainly in its deterministic component. The processes that states undergo during territorial unification can be very different, and the same applies to the modernization of societies. As a consequence, we find asymmetric territorial development, territorial conflicts, and, in all, territorial differentiation, which can be more or less chronic or more or less acute within national states. Therefore, the territorial politics or matrix leading to regionalization is the result of the combination of the different factors that participate in the process of state unification.

However, some authors question the center–periphery paradigm due to its state centrism: There are states with more than one center, such as the United States and Canada; others may not have any clear center or periphery, such as the Federal Republic of Germany and the Swiss Republic; further, there are states where the peripheries relate to more than one center, such as Northern Ireland and its relation with London and Dublin, or the Basque Country, with Madrid and Paris. From this new point of view, and considering the existence of strong territorial identities that have been politicized and activated by nationalist and/or regionalist movements, a new paradigm can be found based on societal fragmentation, territorial asymmetry, and centrifugal politics.

Varieties of Regionalization in Territorial Politics

Regionalization processes vary depending on the characteristics of territorial matrixes and the integration processes of national states, as well as whether there are nationalist or regionalist peripheral demands, which can be more or less powerful. States undergoing regionalization take into account territorial differences, even if these are, on the one hand, objective or material ones or, on the other hand, subjective or sociocultural ones.

The former, socioeconomic dissimilarities, are the result of uneven development and the dependence dynamics stemming from the processes of modernization and industrialization of societies. They can generate interregional geopolitical discordances, as well as other disparities among the central and peripheral elites—political, economic, social, and cultural.

The latter, subjective or sociocultural dissimilarities, are normally due to the contradictory perceptions that national and territorial elites have of the process of integration and homogenization at the nation-state level. These differences can generate tensions and conflicts of identity, especially when there are regionalist or nationalist movements in the periphery that claim their own signs of identity—their own history, ethnic or religious differences, linguistic struggles, and so on—and are responding to the centralization and homogenization process at the nation-state level. Therefore, the regional differentiation underlying the regionalization process can be due to political, economic, or sociocultural reasons, or even a combination of all these, and always seek to better the governance of the nation-state territory.

On the basis of this varied matrix, the different forms and strategies of the regionalizing politics that state-nations (territories that have undergone regionalization at the state level) apply under this new governance are the result of the characteristics that define and homogenize their regions, whether real or potential. These policies always aim at developing and improving the process of national integration and cohesion. They also seek to ensure the maintenance of territorial sovereignty of the state, which is endangered either by an excess of centralized homogenization or by the inefficiencies and limitations distinctive of economic and societal modernization processes. Hence, depending on those state policies, different types of regionalization processes can be found.

First, there is the sheer arrangement or management of the territory—applying economic and administrative criteria—by means of the creation of homogeneous regions. These regions assume the decentralized administrative management of the state's responsibilities, in the interest of a better interterritorial balance. The unitary character of the state is not questioned at any point, nor is the symmetry of the new regional division, which is limited to the amount of state decentralization achieved.

The second type of process goes a step further in decentralizing institutions of a national character within the region, as well as government functions that are recognized as properly subject to local sovereignty. This type answers the political claims of regional elites and politicians, following a type of federalizing dynamic—either symmetrical or not—that does not question the unitary nature of the state. The British and Spanish examples are a good illustration of this second type of regionalization.

Finally, we find federal or confederal structures, either symmetrical or not, with shared sovereignty. Here, Belgium is the most recent example. The extreme case is always territorial secession, when coexistence under the roof of the same nation-state becomes untenable for all elites, even after other forms of advanced regionalization have proved to be impossible. The former USSR, Yugoslavia, and Czechoslovakia are good examples of this impossibility.

REGRESSION

Regression analysis is, by far, the most commonly used statistical technique in political science. While regression analysis can be defined in many different ways, it is a tool for describing the relationships among variables. Regression is generally used for two complementary purposes. First, it measures the effects of one or more independent variables on a single dependent variable. Second, it can be used to predict the values of a dependent variable that can be expected to occur at specified levels of the independent variables. In the former capacity, regression is a useful tool for theory testing. In the latter capacity, regression is a forecasting tool that is useful for decision making. These two uses are closely connected. Theories are evaluated by their ability to predict as yet unobserved phenomena, and forecasting is carried out most effectively when predictions are based on a substantive theory. In the following, the major features and applications of regression analysis are discussed.

If there is one independent variable, the analysis is commonly called a *simple* or *bivariate regression*. If there is more than one independent variable, it is called *multiple regression analysis*. In traditional nomenclature, the dependent variable is generically represented as Y and the independent variable is designated as X. If there are multiple independent variables, the Xs are given subscripts, say $X_1, X_2, \ldots, X_j, \ldots, X_k$ for k variables (note that the specific order of the X_js generally does not matter). For the moment, we will assume that all variables are relatively continuous and measured at the interval level.

The immediate objective of a regression analysis is to show how the conditional distribution of Y varies across the values of X (or across the values of the X_js in a multiple regression). Attention is usually focused on the conditional mean of Y rather than the entire conditional distribution. If the conditional Y distributions (and, specifically, the conditional Y means) do, in fact, differ systematically across the X values, then Y is said to be related to X. If the conditional Y distributions do not vary across the X values, then X and Y are unrelated to, or independent of, each other.

Bivariate Regression

There are several ways in which a regression analysis can be carried out. For example, a graphical approach would simply plot Y against X and superimpose a curve that traces out the conditional Y means across the range of X. While this strategy is often useful for exploring bivariate data, it becomes much more difficult in the multiple regression case. And there are some practical limitations in using a graph as the final output of the analysis in any context. Further, the sample estimates of the conditional Y means are likely to be somewhat unreliable and unstable since there are usually only a small number of observations at each distinct value of X.

An alternative approach would be to specify a function that describes the hypothesized relationship between Y and the X_js. The empirical analysis then estimates the parameters of this function and determines how well the function actually represents the data at hand. Probably the simplest function for relating the variables is linear in form. In the bivariate case, a linear function would be shown as follows:

$$Y_i = a + bX_i.$$

The subscript, i, that appears with Y and X in the preceding equation is an index for the observations; it ranges from 1 to n (the total number of observations) and is used here to indicate that the values of the two variables are different from one observation to the next. The other two terms, a and b, are the coefficients; they do not have subscripts, indicating that their numerical values are constant across the n observations in the data. Notice how this function provides a simple rule for starting with any observation's value on the X variable and producing the observation's Y value. If this function actually did provide an accurate description of a bivariate data set, then a scatterplot of Y versus X would produce n points arrayed along a straight line.

The b coefficient is often called the *slope* of the line. The absolute value of the number associated with b gives the *steepness* of the line. The sign of the number (plus or minus) indicates whether the line runs from lower left to upper right (a positive relationship) or from upper left to lower right (a negative relationship). The slope shows the difference in the values of Y that is associated with a single-unit increase in X. This is generally interpreted as Y's *responsiveness* to the X variable. The a coefficient is often called the *intercept* of the line. It gives the value of the Y variable that occurs when $X = 0$. The intercept determines the vertical position of the line within the scatterplot of Y versus X. But the intercept usually does not have a substantive interpretation.

The simple linear function depicted above is not very useful by itself because empirical data seldom (if ever) conform to such a clear-cut pattern. But a scatterplot of Y against X may show an approximately linear orientation that might be usefully summarized by a linear function. In that case, the previous equation would be modified as follows:

$$Y_i = \hat{Y}_i + e_i,$$

where $\hat{Y}_i = a + bX_i$.

Hence, the full regression equation is

$$Y_i = a + bX_i + e_i.$$

In the preceding equations, $\hat{Y}$ is a new, "imaginary" variable, created as part of the analysis. Unlike Y itself, $\hat{Y}$ is perfectly linearly related to X. The other new term on the right side of the equals sign, e_i, is a residual, indicating that the value of Y_i generally does not fall exactly on the line. If the value of the residual for observation i is a positive number, then the point representing i in the scatterplot falls above the line relating $\hat{Y}$ to X. If the residual is negative, then the point falls below the line. If the residual is zero, then $\hat{Y} = Y_i$, and the point falls exactly on the line.

The immediate analytical objective in the regression analysis is to define $\hat{Y}$ (i.e., select numeric values for the coefficients, a and b) such that the line relating $\hat{Y}$ to X passes through the middle of the point cloud in the scatterplot, coming as close as possible to as many of the points as possible. Here, "closeness" is defined as the vertical distance from each data point to the line; hence, it corresponds to the residual for each observation. But residuals can be either positive or negative in value, so they are typically squared to provide positive quantities for each observation. Then, the line is fitted such that it produces the smallest possible sum of squared residuals across the n observations in the data set. This is called the *least squares criterion* for fitting the regression line, and the mathematical procedure that is typically used to find the line is called *ordinary least squares* (OLS).

If the point cloud in the scatterplot really does conform to a linear pattern, then the line produced by the OLS method can be used as a model, or abstract representation, of the data. It provides a succinct summary of any systematic linear structure that exists within the observations. But it is important to develop a measure of how well the OLS line summarizes the observed data. To do so, we begin with the fact that $\hat{Y}$and the residual term will be uncorrelated with each other (this is a consequence of the OLS procedure and our requirement that the fitted line runs through the middle of the point cloud in the scatterplot). Therefore, the variance of Y can be broken down neatly into the sum of the variance of $\hat{Y}$ and the variance of the residual, e. A goodness-of-fit measure, called R^2 (this term is used because R^2 is equal to the square of the correlation r_{xy} between X and Y), is defined as the ratio of the variance of $\hat{Y}$ to the variance of Y. R^2 is often interpreted as the proportion of variance in Y that is "explained" by X, since it represents the part of Y's variance that is linked to X through $\hat{Y}$. Since R^2 is a proportion, it varies between zero and one. The value of R^2 indicates the degree to which the data conform to a linear pattern. If $R^2 = 0$, then there is no linear relationship at all between the variables; an R^2 of 1.0 occurs only when all of the observations fall perfectly along a single line within the scatterplot of the bivariate data.

Multiple Regression

The idea of fitting a linear function to data can be generalized very easily to situations with more than one independent variable, producing a *multiple* regression equation. Once again, we begin with

$$Y_i = \hat{Y}_i + e_i.$$

But now, $\hat{Y}$is defined a bit differently than in the bivariate case:

$$\hat{Y}_i = a + b_1X_{i1} + b_2X_{i2} + \cdots + b_jX_{ij} + \cdots + b_kX_{ik}.$$

Here, the $\hat{Y}$ variable is a linear combination of k distinct independent variables. The precise value of k is determined by the number of variables the researcher believes to be influencing the dependent variable, Y. The coefficient associated with each independent variable (i.e., b_j for X_j) shows the difference in $\hat{Y}$ that occurs when X_j is increased by one unit. The coefficient a is once again an intercept; it represents the value of $\hat{Y}$ that occurs when all of the independent variables are equal to zero. The full multiple regression equation is formed by combining the preceding two equations:

$$\hat{Y}_i = a + b_1X_{i1} + b_2X_{i2} + \cdots + b_jX_{ij} + \cdots + b_kX_{ik} + e_i.$$

As in the bivariate case, e_i is a residual, indicating that Y is not a perfect linear function of the X_js.

Once again, the least squares criterion is used to estimate the coefficients in the multiple regression equation. The value of k must be smaller than the number of observations; otherwise, there will not be enough information to calculate numeric values for the coefficients. But if that is the case, the OLS methodology can be generalized in a straightforward manner to produce the set of coefficients, a, b_1, $b_2, \ldots,$ b_k, that minimize the sum of the squared residuals across the set of n observations. Analogous to the regression *line* in the bivariate case, OLS for multiple regression produces a flat *surface* in the multidimensional scatterplot with axes formed by the k independent variables and the dependent variable. Once again, the OLS coefficients position this surface so that it comes as close as possible to the data points. Closeness is still defined in terms of the squared vertical distances from the regression surface to the data points. The overall fit of the multiple regression equation to the data is still measured with the R^2 statistic. The latter is defined as before: the ratio of the variance in $\hat{Y}$ to the variance in Y itself. This gives the proportion of Y's variance that is related to (or explained by) the independent variables through the regression equation. R^2 is equal to the square of the correlation between Y and $\hat{Y}$; therefore, it is sometimes called the *squared multiple correlation coefficient*. The interpretation of specific R^2 values remains the same as in the bivariate case.

In the multiple regression equation, the b_js are often called *multiple regression coefficients* or *partial slope coefficients*. They are generally interpreted as measures of each independent variable's unique linear effect on the dependent variable, after the linear effects of the remaining $k - 1$ independent variables have been statistically "removed." The OLS procedure estimates all $k + 1$ coefficients (i.e., the k partial slopes and the intercept) simultaneously; therefore, the value of each coefficient typically is affected by the values of the remaining coefficients. The only exception occurs when the independent variables are perfectly uncorrelated with each other—a situation that seldom (if ever) exists with nonexperimental data.

Political scientists typically use a regression equation as a model of the structural relationships among theoretically relevant variables. Substantive theories usually specify multiple causal agents for any given dependent variable. And there are often mediating factors that affect the relationships between variables. Such phenomena need to be incorporated into the empirical analyses that test theoretical propositions. For this reason, multiple regression is employed more frequently than bivariate regression in substantive applications. In addition, theories are broad statements. Therefore, researchers are often concerned with statistical inference. Rather than using the regression equation as a tool to describe the structure within a given data set, the objective usually is to generalize from the observed data to the larger, but unobserved, population of interest.

Statistical Inference

Statistical inference begins with a set of assumptions about the processes that generated the observed data. First, it is assumed that the regression equation accurately mirrors the structural relationships that exist within the population. So for a context in which Y is affected by k independent variables, the population structure is assumed to be

$$Y_i = \alpha + \beta_1 X_{i1} + \beta_2 X_{i2} + \cdots + \beta_j X_{ij} + \cdots + \beta_k X_{ik} + \varepsilon_i.$$

The variables in the preceding equation are identical to those in the regression equation presented earlier (although they now encompass all objects in the population, not just a limited sample of n observations). The coefficients (α and the β_js) are interpreted as before; but now, they are fixed population parameters rather than statistics whose values vary from one sample to the next.

The last term on the right-hand side of the equation, ε_i, is the *error* or *disturbance* term. This can be interpreted as the sum total of all influences on Y that are not explicitly included in the equation (i.e., apart from $X_1, X_2, \ldots, X_k$). The disturbance term is usually assumed to consist of random "noise." That is, its distribution is assumed to have a mean of zero and a variance that is fixed across all possible combinations of X_j values. The disturbance is also assumed to be uncorrelated with all the variables (including itself). The X_js are assumed to be independent of each other and measured without error. For convenience, they are also usually assumed to comprise fixed values for the n observations, meaning that they do not vary across repeated samples drawn from the same population.

When all of the preceding assumptions hold, the OLS coefficient estimates possess some useful statistical properties. First, the multiple regression coefficients are *unbiased* estimates of the corresponding population parameters; that is, b_j will not systematically over- or underestimate the corresponding β_j. Second, the OLS estimates are *consistent* in that sampling variance decreases as sample size increases; in other words, larger samples generate more precise estimates of the population parameters, and with large enough samples, this precision becomes almost perfect. And third, the OLS estimates are *efficient* in that their sampling variances usually are smaller than those of alternative estimators of the β_j values. A result called the Gauss-Markov theorem proves that the OLS coefficients are the most efficient of all linear unbiased estimators (i.e., unbiased estimators that are a linear combination of the data).

The OLS coefficients are linear combinations of the sample Y_i values. Therefore, a generalization of the central limit theorem implies that the coefficients are normally distributed. Student's t distribution can be used with the estimated standard errors to construct confidence intervals for and test hypotheses about the population values of the respective regression coefficients. One can also test the null hypothesis that the variance of $\hat{Y}$ equals zero; this is often interpreted as a test of the statistical significance of the overall regression equation. In other words, it is the functional equivalent of testing the null hypothesis that $R^2 = 0$ in the population and that any observed nonzero regression coefficients are due to the effects of sampling error alone.

Statistical tests of the joint effects of several independent variables can be carried out in several ways. For example, a t test can be performed on a linear combination of regression coefficients. Or an F test can be used to determine whether adding additional variables to an equation significantly improves the fit to the data. And, more generally, the F test can be used to test hypotheses about sets of linear combinations of regression coefficients. This flexibility in the strategies used for statistical inference is one of the most attractive features of OLS estimates in regression analysis.

Applications

Another reason for the popularity of the linear regression model is its adaptability to different research situations. For example, categorical independent variables (in which observations are distributed across m discrete categories) can be incorporated into an equation by creating $m - 1$ dummy variables representing all of the respective categories except one (which is designated the "reference" category). And curvilinear relationships can often be modeled by applying transformations to the independent or dependent variables or by incorporating polynomial terms. Similarly, multiplicative terms between two (or more) independent variables can be used to represent conditional effects, wherein the impact of one independent variable on the dependent variable is itself affected by the value of another independent variable.

Since regression analysis is used primarily as a theory-testing tool, there is often great attention paid to the question of exactly which independent variables are included in the regression equation. While there are stepwise procedures that select regressors for inclusion from a pool of potential independent variables, they are not typically employed in political science because of their data-driven, "atheoretical" nature. Instead, substantive theory is usually regarded as the appropriate guide for the specification of regression models. This is a critical issue. If theoretically relevant variables are excluded from the equation, then the coefficients of the included independent variables are likely to be biased estimates of their associated population parameters. This occurs because the included variables "pick up" some of the effects on the dependent variable that properly should be attributed to the omitted independent variables. Alternatively, including extraneous variables in the regression equation (i.e., X_js that have no real effect on Y) will decrease the precision of the coefficient estimates since they introduce error into the estimation process.

In addition to theory testing, there are situations in which regression analysis is used as a forecasting tool, to predict the value of the dependent variable under specified conditions. When the various assumptions about the model and the disturbance term hold, the predicted value for a given observation, $\hat{Y}_i$, can be interpreted as an estimate of the conditional mean of Y. So the analyst can make predictions about the average level of the dependent variable that will occur when the independent variables are held at specified values. Further, a standard error for the conditional mean can be calculated very easily. So the precision of the prediction can also be estimated, using a confidence interval or a hypothesis test. This makes regression analysis a useful tool to provide formal guidance for decision making in a wide variety of substantive contexts.

As mentioned earlier, regression analysis typically is used with nonexperimental data. Therefore, nonzero correlations will almost always exist among the independent variables. This situation is called *multicollinearity*. Multicollinearity makes it impossible to identify the specific effects of each independent variable because to the extent that any two independent variables are correlated, they will exert a nonseparable, shared impact on the dependent variable. In practical terms, multicollinearity makes the coefficient estimates less precise and increases the standard errors. Multicollinearity is a condition that exists in the data; it is not a feature of the statistical model. There are diagnostic tests that can indicate the degree to which multicollinearity exists in a regression equation. But there is no way to "fix" or eliminate its effects. Fortunately, multicollinearity really does not cause serious problems in most research contexts. The regression coefficients remain unbiased, and the inflation in the standard errors is usually not large enough to compromise the process of statistical inference.

Valid interpretation of the results from a regression analysis is only possible if the assumptions about the model and the disturbances reflect the actual conditions that exist in the data. Therefore, it is critical to employ tools called *regression diagnostics* to check the veracity of the assumptions. This often involves examining a graph of the residuals against the corresponding $\hat{Y}_i$ values. This scatterplot shows the spread of the observations around the fitted regression surface. If the regression assumptions hold, then the residuals are similar to the disturbances, and they should appear to be random noise with no systematic structure. To the extent that the researcher can perceive patterns or shapes in the residual plots, it indicates that the regression model is "missing" some type of structure that exists within the data. It is also important to identify outliers, or observations with particularly large residuals; in certain situations, such observations can be highly influential in determining the values of the regression coefficients. When such problems are diagnosed, there are usually corrective actions that can be taken to alleviate their effects on the model's parameter estimates; this is yet another strong feature of regression analysis.

REGULATION

Regulation is a key component of the systems that make up our political, social, and economic lives. It is also one of the least visible and transparent components that shape our governance systems. To regulate is to legislate in public and private organizational arenas, that is, under indirect and often ex post judicial and parliamentary controls. In democratic and pluralist societies, all aim to regulate all, and thus, all contribute to "regulatory creep." The amalgamation of these regulations defines our liberties, privileges, opportunities, and life plans in ways that challenge our conventions about politics and about the locus of democratic controls and accountabilities. In addition to defining the concept and the phenomenon, this entry discusses regulation as a key activity of administrative agencies, regulation beyond the state, the governance of regulation, and the phenomena of both the regulatory state and regulatory capitalism.

Meaning and Empirical Content

Like many other political concepts, regulation is hard to define, not the least because it means different things to different people. The term is employed for myriad discursive, theoretical, and analytical purposes that cry out for clarification. It is also a highly contested term. For the Far Right, regulation is a dirty word representing the heavy hand of authoritarian governments and the creeping body of rules that constrain human or national liberties. For the Old Left, it is part of the superstructure that serves the interests of the dominant class and frames power relations in seemingly civilized forms. For progressive democrats, it is a public good, a tool to control profit-hungry capitalists and to manage social and ecological risks. For some, regulation is something that is done exclusively by government, a matter for the state and law enforcement, while for others, regulation is mostly the work of social actors who monitor other actors, including governments. State-centered conceptions of regulation define it with reference to state-made laws, while society-centered analysts and scholars of globalization tend to point to the proliferation of various forms of civil and business-to-business regulation.

For legal scholars, regulation is often a legal instrument, while for sociologists and criminologists, it is yet another form of social control. For some, it is the amalgamation of all types of laws—primary, secondary, and tertiary legislation—while for others it is confined to secondary legislation. For economists of the Chicago school, regulation is usually a strategic tool used by private and special interests to exploit the majority. For institutional economists, regulation is less a strategic tool and more a constitutive element of the market; for them, it is often understood as the mechanism that constitutes property rights or even as a source of national competitiveness. The French Regulation School seems to have developed a similar institutional perspective but with a more critical tone and without the functionalist orientation of some English-speaking economists (Robert Boyer, 1990). Whereas scholars of public administration seem to perceive it with direct and in-depth reference to the scope of state authority and formal regulatory organizations, scholars of global governance tend to focus on standards and soft (nonbinding) norms. While some seem to think of the rise of regulation as yet another indication of the advance of neoliberalism and the retreat of the welfare state, others tend to see it at as a neo-mercantilist instrument for market expansion, high modernism, and social engineering. In European parlance, for most of the 20th century, regulation was synonymous with government intervention and, indeed, with all the efforts of the state, by whatever means, to control and guide the economy and society. This rather broad meaning of the term seems to have faded, and scholars now make an effort to distinguish rule making from other tools of governance and, indeed, from other types of policy instruments, such as taxation, subsidies, redistribution, and public ownership.

Regulation not only is a distinct type of policy but also entails identifiable forms and patterns of political conflict that differ from the patterns that are regularly associated with redistribution and distribution. In addition, while other types of policy such as distribution and redistribution are about relatively visible transfers and direct allocation of resources, regulation only indirectly shapes the distribution of costs in society. Government budgets include (relatively) visible and clear estimations of the overall costs of distribution and redistribution but hardly any of the cost of regulation (with the exception of the administrative costs of fact finding, monitoring, and implementation). The most significant costs of regulation are compliance costs, which are borne not by the government budget but mostly by the regulated parties. The wide distribution of these costs and their embeddedness in the regulatees' budgets make their impact, effects, and net benefits less visible and therefore less transparent to the attentive public.

For some, regulation is a risky business that is prone to failure, but for others, the business of regulation is the business of risk minimization. Some contend that regulation comprises mostly rule making, while others extend it to include rule monitoring and rule enforcement. For some, regulations are about the rules and functions of the administrative agency after the act of delegation; for others, as already observed, regulation includes every kind of rule, including primary legislation and even social and professional norms. The extensive literature on regulation in the United States and the extensive attention paid to regulation could have resulted in a consensual definition of regulation. Yet this is not the case. The American Administrative Procedure Act defines the term *rule* but not the term *regulation*, and what it defines as rule is confined to the scope of the act itself.

Regulation and Administrative Agencies

One important aspect of any discussion of the different connotations and characteristics of regulation is the relation between regulation and the existence of an administrative agency. Rule making and rule-making agencies are closely connected. An emphasis on the workings, characteristics, failures, and merits of regulation by administrative agencies is prevalent in the literature on regulation. Indeed, these aspects are expressed in one of the most widely cited definitions of regulation, namely, as "sustained and focused control exercised by a public agency over activities that are valued by the community" (Selznick, 1985, p. 363). Not only does this definition include an explicit reference to public agencies, but it also stresses the sustained and focused nature of regulation, which requires a continuous action of monitoring, assessment, and refinement of rules rather than an ad hoc operation. Implicit in this definition is also the expectation that *ex ante* rules will be the dominant form of regulatory control. The definition is apt also in the sense that it recognizes that many, perhaps the most important, regulations are exercised not by "regulatory agencies" but by a wide variety of executive organs. This definition is less successful, however, in other respects. It recognizes regulation only as a public activity by a public agency and thus excludes business-to-business regulation as well as civil regulation. It also does not clarify which kinds of focused control the public agency applies (is it rule making only or also other forms of control such as arbitrary commands?); and the definition unnecessarily limits regulation to those actions that are valued by the community.

Regulation Beyond the State

The focus on administrative aspects in the study of regulation might be less useful for scholars who emphasize the limits of "hard law" and who are aware of the importance of social norms and other forms of "soft law" in the governance of societies and economies. A wider definition of regulation that captures regulation as soft law would suggest that regulation encompasses all the mechanisms of social control, including unintentional and nonstate processes. Indeed, it extends to "mechanisms which are not the products of state activity, nor part of any institutional arrangement, such as the development of social norms and the effects of markets in modifying behavior" (Robert Baldwin, Colin Scott, & Christopher Hood, 1998, p. 4). Thus, the notion of intentionality in the development of norms has been dropped from this definition of regulation, and anything producing effects on behavior may be considered regulatory. In addition, a wide range of activities that may involve legal or quasi-legal norms, but without the mechanisms for monitoring and enforcement, might also come within the definition. This definition connects widely with the research agenda on governance, "the new governance" and the "new regulatory state," where elements of steering and plural forms of regulation are emphasized in an effort to capture the plurality of interests and sources of control around issues, problems, and institutions. This rather wide definition of regulation also allows us to "de-center" regulation from the state and even from well-recognized forms of self-regulation. De-centered approaches to regulation emphasize complexity, fragmentation, interdependencies, and government failures and suggest the limits of the distinctions between the public and the private and between the global and the national.

Scholars of regulatory systems often point to the growth in the number of civil and business actors that invest in regulation and accordingly also to the growth of civil and business-to-business regulatory institutions and instruments. At the same time, there are indications of the transformation of the politics of interest groups and nongovernmental organizations. Civil actors are often associated with advocacy (e.g., lobbying) and service provision (e.g., replacing the state in the provision of welfare), but in our areas of study they also produce, monitor, and enforce regulation. The concept of *civil regulation* aims to capture this evolving feature of civil politics. The term, as noted by David Vogel (2005), refers to the institutionalization of voluntary global and national forms of regulation through the creation of private (nonstate) forms of regulation intended to govern markets and firms. Civil regulations attempt to embed international markets and firms in a normative order that prescribes responsible business conduct. They include old and traditional forms of self-regulation but go beyond them to include regulatory techniques such as third-party accreditation and certification, gatekeeping strategies, metaregulation, enforced self-regulation, self-regulation, and league tables. Business-to-business regulation is another form of a nonstate source of regulation. Here, the growth of regulation is driven by the ability of some businesses (most often big business) to set standards for other businesses (most often smaller ones). One relevant example is the ability of big supermarket chains to set standards for food manufacturing, processing, and marketing all over the world.

The Governance of Regulation

Much of the academic and public discussion of regulation nowadays deals with the governance of regulation itself (or regulating regulation) rather than governance via regulation. The expansion of regulation represents two major challenges: of effectiveness and of democratic control.

Effectiveness

The first challenge focuses on the alleged weakness of command-and-control systems with prescriptive rules that tell regulated entities what to do and how to do it. These prescriptive rules tend to be highly particular in specifying the required actions and standards and are usually backed up by state sanctions. Peter J. May (2007, p. 9) observes that when compared with the alternatives, principles and norms, regulations are characterized by clear-cut lines of responsibility and, thus, accountability. Yet clarity, the ability to sanction, and direct lines of accountability all come at a price. Six shortcomings of regulation are important to note:

1. expensive and ineffective regulatory strategies;
2. inflexible regulatory strategies that encourage adversarial enforcement;
3. legal constraints on the subjects, procedures, and scope of regulatory discretion;
4. regulatees' resentment, which leads to noncompliance or "creative compliance";
5. strict regulation, which often presents an obstacle to innovation; and
6. regulation that often serves to set a lowest common denominator for regulatees to follow rather than supplying incentives for improving standards.

According to Neil Gunningham and Peter Grabosky (1998), and Steven P. Croley (2008), there are five major strategies of response to these weaknesses. The first and the most controversial is to deregulate existing regulation and to constrain new rule making. These "ossification" strategies might result in a race to the bottom, or degradation of economic and environmental performances, unmitigated risk, and immoral economies and societies. The second is to turn to "lite" and management-based regulation and to harness economic incentives as much as possible toward politically determined public goods. The third is to promote responsive forms of regulation. The fourth is to improve the regulatory arsenal (e.g., by employing auctions and using benchmarking) as well as the quality and training of the regulators and the quality of the regulatory design. The fifth is to institutionalize regulatory impact analysis and cost–benefit techniques. These control measures are becoming increasingly popular, and some countries have even established regulatory agencies to regulate regulation itself (e.g., the British Better Regulation Executive, and the Office of Information and Regulatory Affairs in the United States).

Democratic Control

The second governance challenge that regulation represents is derived from the democratic qualities (or, more accurately, weaknesses) of regulation. The belief that the legislator should legislate, the judiciary should adjudicate, and the executive should govern via the bureaucracy takes regulation to be, at best, a "necessary evil." Yet this necessary evil is expanding and diversifying to an extent that raises important challenges for democratic theory and practice. First, regulators are not elected and are accountable to the people only indirectly, hence the arguments about the democratic deficit of regulatory systems. Second, while it is a fundamental idea of law that people should be subject to fixed, known, and certain rules, the sheer numbers of rules and the frequency and the process with which they are changed create a situation where it is beyond the capacity of most, if not all, individuals to act without legal advice. The sheer volume of regulations represents a challenge for democratic, judicial, parliamentary, and administrative systems of control. Third, the growth of international administrative law makes supposedly sovereign polities into rule takers rather than rule makers. Regionalization, internationalization, and globalization of regulation all raise issues of legitimacy and may lead to new and innovative forms of democratic control over regulatory systems. Fourth is the emergence of "private regulatory regimes" and "private governments," which may weaken democratic legitimacy and may change the balance of power between corporations and states. To deal with these democratic challenges, it is necessary to develop and strengthen three systems of control over bureaucratic legislation: parliamentary, judicial, and participatory.

The Regulatory Agency and the Regulatory State

One of the most important indicators of the growth in the scope and depth of regulatory activities in modern society is the proliferation of regulatory agencies as the administrative and intellectual core of national and global systems of regulatory governance. Regulatory agencies are not a new feature of modern systems of governance, but they have become a highly popular form of regulatory governance since the 1990s. A regulatory agency is a nondepartmental public organization mainly involved with rule making, but it may also be responsible for fact finding, monitoring, adjudication, and enforcement. It is autonomous in the sense that it can shape its own preferences; of course, the extent of the autonomy varies with its administrative capacities, its ability to shape preferences independently, and its ability to enforce its rules. The autonomy of an agency is also constituted by its establishment as a separate organization and by the allocation to this agency of a policy space where it is expected to operate by way of exercising its functions and responsibilities. Note that while rule-making, fact-finding, monitoring, adjudication, and enforcement capacities are the defining characteristics of regulatory agencies, other organizations, both within and outside the state, can also acquire and successfully deploy these characteristics.

The expansion in the number of regulatory agencies, and arguably also in the scope of regulation and in the policy capacities of these agencies, has been manifest since the 1990s in the popularity of the notion of the regulatory state. In its most straightforward form, the term *regulatory state* "suggests [that] modern states are placing more emphasis on the use of authority, rules and standard-setting, partially displacing an earlier emphasis on public ownership, public subsidies, and directly provided services" (Hood et al., 1999, p. 3).

As noted by David Levi-Faur and Sharon Gilad (2004), three elements are especially useful in characterizing the regulatory state. First, the bureaucratic functions of regulation are being separated from service delivery. Second, the regulatory functions of government are being separated from policy-making functions, and thus, the regulators are being placed at arm's length from their political masters. In this way, regulatory agencies became the citadels that fortify the autonomous and influential role of the regulocrats in the policy process. We are witnessing the strengthening of the regulators at the expense of politicians on the one hand and of the managerial elite on the other. Third, and as a result of the first two elements, regulation and rule making emerge as a distinct stage in the policy-making process. Accordingly, regulation is emerging as a distinct profession and administrative entity. Professional affiliation to global networks of experts is becoming a major source of innovations, worldviews, accountability, and legitimacy.

From the Regulatory State to Regulatory Capitalism

The term *regulatory capitalism* denotes the growth in the scope, importance, and impact of regulation at the national and global levels and the growing investments of political actors in regulation in general and regulatory strategies in particular. It suggests that regulation and rule making are the major instruments in the expansion of global governance. The notion of regulatory capitalism takes regulation theory analysis beyond national boundaries (hence beyond the notion of the regulatory state) and beyond formal, state-centered rule making (therefore toward civil regulation and de-centered analysis of regulatory systems). It also denotes a world where regulation is increasingly a hybrid of different systems of control: Statist regulation coevolves with civil regulation; national regulation expands with international and global regulation; private regulation coevolves and expands with public regulation; voluntary regulations expand with coercive ones; and the market itself is used or mobilized as a regulatory mechanism.

RELIGION

Any investigation into the interdependencies between religion and politics first of all calls for a definition of the subject matter and hence for a definition of religion. However, such a definition faces considerable difficulties because religion historically is a universal phenomenon and encompasses today an enormous variety of experiences, convictions, and practices the religious character of which is far from being unequivocal. The distinction between religious phenomena and other social phenomena is found in religious sociology and anthropology, mostly with regard to specific contents or functions. As to content, the experience of or interaction with superhuman, preternatural, or transcendental creatures, powers, forces, or orders often is defined as a universal characteristic of religion. Functionalist approaches use functions such as the individual coping with contingency or a collective foundation of identity. Content criteria, however, often prove to be too exclusive and functionalist definitions, too inclusive. The attempt to determine criteria for the identification of religion as a unique area of activity clearly to be differentiated from other societal or cultural spheres of action is also highly selective from an intercultural point of view, because it refers to a large extent to Western Christianity, with its characteristic notion of a differentiation between the worldly and spiritual spheres. Nevertheless, the category "religion" has established itself as a global concept of reference even for non-Western religious traditions, and it has admittedly been rephrased and revised in the course of its global reception. Because of this global, pluralistic, and contextualized debate about the term *religion*, James A. Beckford recommends a constructivist approach to its definition. Constructivist approaches assume that the concept of religion, like other concepts, is the result of conflictual definition processes and advocate following this everyday practice when defining social science terms. This entry sketches the role of contemporary religion in politics and discusses some issues of current research and their different perspectives.

Religious traditions and religious actors have been highly relevant in politics and hence also in political science. After all, religious traditions have at their disposal specific notions about the constitution of the self and the world as well as about proper conduct in one's individual and collective life. These concepts and moral guidelines have also left their mark on the political orientations of individual and collective religious actors. However, not only do religious politics exercise an influence on the constitution of the political community, but religious actors and traditions, symbols, and practices in nearly all historical and contemporary societies have also been instruments and objects of political action and control. Often, the specific dynamics of the religious–political complex result from the interaction of religious politics and the politics of religion. The interactions between religion and politics are currently of particular interest because since the end of the 1970s, a (re)vitalization of religious traditions and the politicization of religious actors can be observed in many parts of the world.

The current practice of researching the interactive relationship between politics and religion is also due to its rediscovery by political science. At least since the 1960s, religion was regarded in large parts of the discipline as a social complex whose historical destiny had been settled. The reason for this was the underlying conviction of secularization theory that, in the course of processes of modernization and functional differentiation, religious traditions had lost many of their former societal and political functions as well as their attractiveness and persuasiveness. They would, therefore, be relinquished to the private sphere if not disappear altogether. Even the normative issues about the relationship between politics and religion seemed to be settled. Many traditions of political theory, such as liberalism and republicanism, agreed on the basic tenet that religion had to be limited to the private sphere because neither was it suitable for forming a universally acceptable normative basis for democratic political communities nor was it able to supply arguments or justifications for political decisions that could be universally agreed on. Moreover, large parts of the social sciences were shaped by a "methodological atheism," according to which experiences with or interactions with supernatural powers are illusionary. This methodological atheism led to reductionist patterns of explanation that regarded and reconstructed religion as a mere epiphenomenon of social or political processes. Based on these underlying convictions, religion was found interesting at best in the sense of a relic of religious influence on politics, which could be found in political cleavages, voting behavior, party systems, or types of welfare states.

The relative neglect of research into the interaction of religion and politics started to change with the globally observable (re)vitalization of religious traditions and the mobilization and politicization of religious actors since the late 1970s.

(Re)Vitalization, Mobilization, and Politicization

Phenomena of (re)vitalization have become discernible in nearly all religious traditions. The number of followers of Islam as well as of Catholicism and Protestantism outside the Western Hemisphere has increased considerably. Even the Orthodox Church in Eastern Europe has seen an unexpected renaissance following the breakdown of the communist regimes. Moreover, new religious movements are forming in many parts of the world, especially in Asia. Phenomena of politicization also can be found in nearly all religious traditions. First and foremost among them is the formation and political mobilization of fundamentalist or conservative religious movements. Since the attacks of September 11, 2001, the phenomenon of religiously motivated terrorism has increasingly entered the public consciousness. Also, since the 1990s, the number of religiously motivated or influenced violent conflicts and civil wars has increased.

Particularly in the Western world, with its increasing religious pluralism, the traditional institutional arrangements for the relationship between state and church, politics and religion, have become the cause for and object of political debate and the mobilization of religious actors. But religious actors, organizations, and movements have also played an important, even decisive, role in the processes of democratic transition. All over the world, an increasing political activity of Christian churches and organizations can be registered. This increasing presence of religious actors in the public sphere is also an effect of the transformation of politics itself. In the course of the comprehensive politicization of current societies, almost no societal situation is exempt from becoming the object of political decisions and regulatory actions. Due to this fading distinction between the public and the private sphere, the formerly guaranteed areas of a self-determined religious way of life are further reduced. Another case in point is that due to cultural pluralization and technological progress, more and more value-oriented conflictual issues, such as the relationship between the sexes, sexual identity, and biomedicine, have been put on the political agenda. These are questions touching the religious beliefs of many citizens. Finally, globalization leads not only to the internationalization and transnationalization of religious actors but also to an accelerated diffusion of political activity patterns and problem perceptions.

Issues of Current Research

The first reaction by political science to the (re)vitalization and politicization of religion consisted in the research of religious fundamentalism. Similarly, in political theory, a new debate began about the principles of determining the relationship between religion and politics. Now as in former times, the classic liberal and republican positions of a strict separation between religion and politics and the referral of religion to the private sphere are being defended. Alternative approaches do uphold a minimum necessary mutual autonomy of politics and religion, but with regard to religious and cultural pluralism, they no longer consider the exclusion of religious points of view from politics as mandatory. At the same time, they grant politics considerable leeway in determining the relationship between religion and politics. This debate has also led to an increase in comparative empirical research into the genesis, mechanisms, and effects of different models for representing the relationship between religion and politics.

Another important focus of political science research into the interrelationship of religion and politics concerns the compatibility of democracy with specific religious traditions, especially Islam. The starting point of this debate is the finding that the majority of current democracies have a predominantly Christian population, whereas the majority of Islamic countries have nondemocratic constitutions. One explanation of this finding is that only in Latin Christendom has there been the concept of the fundamental distinction between the worldly and the divine. Critics of this argument refer to the variety and changeability of religious traditions, citing among others the example of the Catholic Church, which only after the Second Vatican Council changed into an important promoter of democracy. The nondemocratic constitution of many Islamic countries is ascribed instead to specific historical, regional, or cultural factors. However, there are still considerable deficits of research, for example, regarding the instruments and strategies, and also the opportunities and limitations, of religious actors exerting a political influence at the national and international levels. This concerns, for example, research into the religious conditioning of welfare states or on the effects of religious influences on public policies.

Perspectives for Future Research

Research into the interaction of politics and religion is a current trend. The dynamics of the religious–political complex will—together with the competitively organized national and international research in political science—open up new issues and debates. It can be expected that existing gaps in this research will soon be filled. But what will also be necessary is a stronger reflection on the term and the phenomenon of religion as well as on the discipline's underlying convictions about religion and its interrelationship with politics. The debate about the concept of religion is irrefutable for two reasons. On the one hand, the discipline is also conducting research into phenomena such as civil religion and political religion, which share a number of characteristics with religions without being religions in the classic sense of the word. On the other hand, the religious field is changing due to the formation of new individual and syncretistic forms of religiosity and spiritualism. Reflecting on the underlying convictions is necessary because the latter predetermine not only the selection of issues but also the interpretation of findings. That is especially true for assumptions about the capability of the religious field for transformation, change, and adaptation; for the concept of religion as a (latent) threat to the peaceful integration of societies; and also for methodological atheism and the reductionist strategies of explanation usually associated with it.

RELIGIOSITY

Religiosity refers to the strength and scope of religious activity among faith-based communities. Although "religion" and "religiosity" are often used synonymously, there is a considerable difference between these two terms. Whereas religion sociologically denotes beliefs and practices in relation to the sacred, religiosity encompasses a variety of representations that symbolize religious involvement. Within the religions of the Abrahamic traditions, for example, there exist monotheistic belief systems involving a multitude of practices that adhere to the teachings of literary texts. However, the religiosity of these traditions would be found within any number of activities including patterns of religious involvement, forms of religious expression, manifestations of religious structures, and the like. This entry discusses some historical and contemporary political implications of the different manifestations of religiosity.

In the international political climate of the 21st century, for example, religiosity has become a crucial feature in discourses concerning global security. In a controversial assessment of religiosity's role in global politics, Samuel P. Huntington's (1996) book *The Clash of Civilizations and the Remaking of World Order* attributed the potential for post–Cold War conflict to religious and cultural clashes between nations and differing civilizations. Despite Huntington's classification of some eight civilizations based on cultural lines, these civilizations are largely bound by the demarcations of religiosity. Given this type of reasoning and categorization, religiosity represents a critical position in transnational conflicts.

Notwithstanding some other factors, the conflicts of the early 21st century generated by religious groups suggest that Huntington's thesis is supported by a considerable amount of evidence. Demonstrated through the violent incidents of September 11, 2001, the 19 hijackers can be said to have been defending their religiosity through a type of aggression that they felt would stem the spread of Western values and ideologies. Western encroachment in this way on what Huntington called "Islamic civilization" may, perhaps, engender the greatest amount of conflict.

When one's religiosity becomes systematically threatened, contentions appear to be elevated to another level. Mark Juergensmeyer, in his 2000 book *Terror in the Mind of God*, coined the term *cosmic war* to describe a situation where battles between perceptions of good and evil emerge. In this case, a person's or group's religiosity becomes the basis for at least one side of such a cosmic conflict. For example, the indifference that the West often displays toward the contradictory interplay between modern customs and traditional sacred beliefs and practices creates an atmosphere where religious expression marks a quasi-ideological status. In this way, dealing with religiosity in a culturally insensitive manner is detrimental to the resolution of conflicts of this magnitude.

Given the importance of religiosity in global affairs, measuring its attributes is particularly useful. Religiosity is often measured in terms of practices that indicate the religiousness of a population, including prayers, worship, service attendance, adherence to established principles of faith, commitment to belief, and any number of other activities that suggest an interaction with religious institutions. Basic examples of the results of such measurements may yield quantitative data such as correlations between the frequency of church attendance and physical well-being or qualitative data that suggest, for example, that the social mobility and economic success of an individual is linked to his or her commitment to a particular set of religious beliefs. One of the most well-known examples of studies pertaining to religiosity is Max Weber's ([1904/1905] 1998) book *The Protestant Ethic and the Spirit of Capitalism*. Weber focused on an insightful finding about the relationship between religiosity among the Calvinist branch of Protestantism and the emergence of modern capitalism. As Weber noted, the religious doctrine of predestination led to an ethic of hard work combined with an innerworldly asceticism that indirectly resulted in an early accumulation of capital.

In one of the most widely cited pieces of literature on the topic of religiosity, a group of Utah-based researchers created a model for measuring religiosity among members of the Church of Jesus Christ of Latter-day Saints. M. Cornwall, S. L. Albrecht, P. H. Cunningham, and B. L. Pitcher (1986) used the components of religious belief, religious commitment, and religious behavior, combined with two modes of personal and institutional types of religious practice, to construct a cross-classification for measuring religiosity. This schema generated six dimensions of religiosity: (1) traditional orthodoxy, (2) particularistic orthodoxy, (3) spiritual commitment, (4) church commitment, (5) religious behavior, and (6) religious participation. Through the analysis of these six dimensions, the categories of cognition, affect, and behavior were established as components used in measuring religiosity.

Such a multidimensional approach to classifying religiosity suggests similar multidimensional approaches to the more general study of religiosity. Rather than creating standardized models for all religious activities, much of the literature suggests a movement toward case-by-case assessments of what constitutes religiosity in different cultures, including its significance and meaning.

RELIGIOUS MOVEMENTS

A religious movement is an organized effort that intends to bring about religious reforms. Many religious movements also have political goals because the kinds of reforms they want appear possible only by altering, sometimes fundamentally, political and/or social contexts and arrangements in which they operate. This entry discusses some major manifestations of such movements in contemporary politics.

In recent years, social scientists have consistently noted that religion can influence politics. Three decades ago, the Iranian revolution showed that an Islamic religious movement could overthrow a regime once seen as a key example of the modernizing effects of secularization in the Middle East. More recently, the rise of the Christian Right (CR) in the United States demonstrated how religious movements can evolve as a result of changing political circumstances. Further, the emergence and consolidation of the Bharatiya Janata Party (BJP) in India was made possible because of the party's foundations in Hindu religious movements. Similarly, Jewish fundamentalist movements have emerged in Israel with plenty to say about the Israel–Palestinian issue.

All these examples point to the inadequacies of modernization and secularization theories, which predicted that the importance of religion in politics would decline. Although secularization has clearly occurred in many countries, especially in Western Europe, this has taken place at the same time that religion has exhibited sustained presence—some would call it a resurgence—in many parts of the world. Overall, the impact of religion on politics has not declined but instead changed in complex ways, including the political involvement of some religious movements.

Until recently, such issues were judged to be remote from central political questions. The explanation for this neglect lies in a key assumption embedded in the social sciences. One presupposition, especially evident in theories of modernization and political development, was that the future of the integrated nation-state lay in secular participatory politics. The assumption was that nation building would be ill served by perceived "obscurantist" beliefs—such as religion. Nearly everywhere, it seemed, secular political leaders dominated, displacing once powerful traditional and religious figures from prominence. The implication was that, to successfully build nation-states, political leaders would have to remain as neutral as possible from the entanglements of particularistic claims, especially those derived from religion. It is hoped that this would avoid dogmatism and encourage citizens' tolerance, a crucial prelude to building viable nation-states and democracies. Decades of apparently unstoppable movement toward increasingly secular societies in many parts of the world reinforced the assumption that religion and piety would inevitably become private matters everywhere. Consequently, in political analysis, religion was often regarded as an increasingly minor problem of little or no significance in the search for national unity and political stability.

Such a view is, however, problematic. If it were correct, how could we explain and account for many religious movements' current political significance? Consider again the examples mentioned above:

- In officially secular India, the Hindu nationalist BJP came to power in the mid-1990s after staging a 10,000-kilometer march that sought to destroy an ancient mosque at Ayodhya, alleged to have been built on the remains of a temple dedicated to Lord Rama.
- In the United States, where the principle of separation of church and state is incorporated in the nation's constitution, the organized CR—a religious movement with social and political goals—has become very influential.
- The continuing conflict between Israel and Arab neighbors encouraged the emergence of Jewish fundamentalist movements and settlers in occupied territories after the 1967 war.
- The Muslim Brotherhood (MB) is a religious movement that emerged in Egypt in the 1920s, becoming politically and socially prominent from the 1970s, with the aim of establishing an Islamic state.

These cases obviously differ greatly, and this entry does not offer a comprehensive theory of politics and religious movements. Instead, it briefly examines religious movements in four countries (India, the United States, Israel, and Egypt) from four religious traditions: Hinduism, Christianity, Judaism, and Islam. We will see that in each case, religious movements from different religious traditions engage significantly and consistently with politics, seeking to achieve various goals that relate to the nature of the state and the moral and ethical universe that informs it.

Hindu Religious Movements in India

At independence in 1947, the victorious Congress party reluctantly accepted partition (between India and East and West Pakistan) but decisively rejected the ideology of Hindu nationalism (known as *Hindutva*). From the 1980s, India saw tensions increase between Muslims and Hindus, leading to the political rise of the BJP.

In officially secular India, an explosion of militant Hinduism focused on, but not confined to, the incident in which the Babri Masjid mosque at Ayodhya was demolished by a Hindu mob in 1992, served to transform India's political landscape. Hindu nationalists, concentrated in the BJP, achieved significant political gains in the 1990s and early 2000s. They were reacting against the secular visions of the country's nationalist founders, Mahatma Gandhi and Jawaharlal Nehru. They used various strategies to bring about change in political structures and processes. What was especially striking was how consistently they aimed at political targets not only to solve religious problems but also to try to bring about the consolidation of religious identities and values.

The rise of the politics of religious identity in India underlines a central problem: How can religiously plural India survive the creation of a powerful sense of identity based on religion? Of the population of 1 billion Indians, 82% are Hindus, while about 11% are Muslims, 2.5% are Christians, and around 1.6% are Sikhs. There are also small numbers of Buddhists, Parsis, Jains, and followers of tribal religions. This religious diversity encouraged Indian nationalists to pursue a development path firmly located within a secular sociopolitical and cultural milieu.

Over time, the issue of Hindu–Muslim relations became a key political topic, a concern emphasized by the rise of the political ideology of *Hindutva* (Hinduness). Hindutva is a Hindi word, a neologism first used by Vinayak Damodar Savarkar, a politician and independence movement activist, in his 1923 pamphlet *Hindutva: Who Is a Hindu?* The term now generally refers to Hindu movements that advocate Hindu nationalism in India. The leading Hindu nationalist political party, the BJP, which dominated Indian politics for a decade from the mid-1990s, is Hindutva's political focal point. Its foundations are in a number of Hindu movements, collectively promoting Hindutva, known as the Sangh Parivar (meaning "family of associations"). Leading organizations within the movement include the Rashtriya Swayamsevak Sangh, the Bajrang Dal, and the Vishwa Hindu Parishad.

The overall aim of the Sangh Parivar is to increase the predominance of Hinduism in India, in relation to its societal, political, and cultural presence. It seeks to pursue this goal through various means, including violence and terror. The Hindutva agenda includes attempts to suppress or drive out Muslims and Christians. This is because, for the Sangh Parivar, they were alien faiths, historically introduced to India by external conquerors. Islam was patronized by the Muslim Moghuls in the 16th century and Christianity by the British, mainly from the 19th century onward.

The Christian Right in the United States

The CR is an influential religious movement with social and political goals, which emerged at the time of the presidency of Jimmy Carter (1977–1981). The CR shared many of the ideals and goals of Carter's successor, Ronald Reagan (1981–1989), facilitating its development into a significant and influential entity. The election of George W. Bush in 2001 saw a resurgence of the CR. Conservative Christian leaders were able to arrange sessions with senior White House aides. This was widely understood to reflect an ideological empathy between leaders of the CR and prominent government insiders, including the President himself.

The CR has key concerns, including what form of Christianity should take precedence in America, reshaping American society according to their understanding of Christian values, the importance of "family values," and the relationship between these values, public education, and public policy generally. After George W. Bush's first term (2001–2005), CR leaders were emboldened by their role in reelecting him and galvanized by their success in campaigning for constitutional amendments to ban same-sex marriage, eventually passed in 18 states. The aim was to organize and build on these early successes, to solidify their agenda-setting role, and to help elect sympathetic public officials.

It used to be said that every 4 years at the time of the U.S. presidential elections American and foreign journalists rediscover religion. This was the periodic occasion when the media scented the electoral possibilities of the influence of the CR, a significant domestic political lobby group, on electoral outcomes. Initially, the CR comprised mainly Protestant conservative evangelicals. Over time, however, its makeup became more eclectic, referring to a broad community of mostly Christian religious conservatives. Prior to the 1970s, the CR had been a subculture, largely keeping its distance from electoral politics. But with a new focus on social conservatism, around the time of the presidency of Ronald Reagan, Republican Party strategists—together with neoconservatives and other right-wing ideologues—encouraged the politicization of CR members as part of a "New Right" fusionism that saw Ronald Reagan elected as president in 1981 and reelected 4 years later.

Despite ideological and political differences among the different organizations that make up the CR, many members share a belief that secularism poses a serious threat to liberty, democracy, and pluralism. The CR is "radical" in that it advocates dramatic changes in society and "religious" in that its members and leaders tend to base their ideologies on religious doctrines drawn from the Bible. In the mid-2000s, it was estimated that those claiming identification with the ideas of the CR comprised around 20% (some 60 million people) of the adult population of the United States. Today, the CR seeks to uphold and perpetuate "Christian values," regarding as anathema manifestations of "excessive liberalism," including legal abortion, absence or downgrading of prayers in public schools, and science teaching that adopts a rationalist, rather than a "creationist," perspective.

Jewish Religious Movements in Israel

Since Israel's founding in 1948, state policy has traditionally favored the political middle ground. This implies that neither religious nor secular political ideas have on their own been able to dominate the political agenda. Over time, religious Jews organized themselves through a number of religious movements and became an increasingly significant political voice. They were especially vocal in opposition to the policy of conceding parts of Biblical Israel to the Palestinians, especially the West Bank of the River Jordan. The topic is a subject of intense controversy that divides the country. It has dominated the political agenda since the early 1990s, focused in the divisive Oslo peace accords of 1993, Prime Minister Yitzhak Rabin's assassination in 1995, and, following pressure from the government of the United States, handing over control of the Gaza Strip to the Palestinians in 2005.

In addition to various religious political parties, including Shas and United Torah Judaism, Israel's political landscape also includes a number of influential Jewish movements, including Edah Haredit (God Fearful Community), Neturei Karta (Guardians of the City), and Gush Emunim (Bloc of the Faithful). One of the most influential is Gush Emunim, founded in 1974 in the West Bank settlement of Kfar Etzion. Gush's main aim is to achieve conquest and settlement of what it regards as the Biblical land of Israel (*Eretz Yisrael*). During the 1980s, the movement grew rapidly, especially after the 1978 Camp David agreement between Israel and Egypt that led to the return of the latter to the Sinai desert—grabbed by Israel in the 1967 Six-Day War. Along with Gush, other extremist religious movements, such as the late Rabbi Meir Kahane's organization, Kach (meaning "Thus") and Kahane Chai ("Kahane Lives"; founded after Kahane was assassinated in 1990), argue on religious grounds against giving back territory not only to Egypt but also to the Palestinians or any other non-Jewish entities. This is because they regard such a policy as a contradiction of God's will expressed in the Torah.

Organized in movements such as Kach and Kahane Chai, Jewish religious zealots seek to be the voice of the mostly religious Jewish settlers, who try to influence Israeli policy in relation to both Egypt and the Palestinians so as not to hand land back to non-Jews. Following the 1993 Oslo peace accords with the Palestinians, involving the latter receiving autonomy in the Gaza Strip from August 2005 and an area around the West Bank city of Jericho, religious opposition to the accord with the Palestinians was manifested in mass murder. A Jewish religious zealot, Baruch Goldstein, linked to both Kach and Kahane Chai, murdered 29 people and injured approximately 100 more in a dawn attack on a mosque in the West Bank town of Hebron in February 1994. Following the massacre, the Israeli government, as a sign of its commitment to crush Jewish extremist groups that systematically used violence to try to achieve their objectives, banned both Kach and Kahane Chai.

The political significance of religious parties and movements on policy making in Israel is unlikely to fade soon for several reasons. First, the basis of both nationality and the creation of the state of Israel remains a sense of religious identity, making the issue consistently vulnerable to the influence of religious Jews, some of whom are also political extremists. Second, there has been strong growth in the numbers of religious Jews since the early 1970s, including recent immigrants. Now, it is claimed that up to half of Israeli Jews "respect the religious commands," while 1 in 10 belongs to the *haredi* (ultra-orthodox) community. Around 60% of the *haredi* population is younger than 25 years of age—and the proportion of the ultra-orthodox will grow because many have large numbers of children. Many such people form the core support and activist base of the—sometimes extremist—religious movements and parties. Third, the latter will continue to have major political influence because of the nature of the country's political system, which is based on proportional representation and a very low minimal threshold of 1.5% of the vote to be represented in the Knesset (Israeli parliament). As a result, such parties have the ability to acquire political rewards in return for supporting the main secular political parties, including Kadima, Likud, and Labour, in the context of the formation of coalition governments. Finally, in recent years, there has been a dovetailing of secular security concerns (concerned with Israel's regional national interests and power) and religious interests (an aversion to handing over land to the non-Jewish Palestinians, as it is believed to be against God's will). Overall, the Jewish movements are a powerful coalition of interests, often able to apply significant pressure on Israel's government via both the ballot box and civil society.

The Muslim Brotherhood in Egypt

Hassan al-Banna (1906–1949) established the MB in Egypt in 1928 as an organization providing welfare services, aiming to encourage and defend morality. The aim was to Islamize society "from below." Initially, the MB was just one of a number of small Islamic associations engaged in charity work among the poor of the country's fast-growing cities. MB built mosques, schools, and clinics, providing an Islamic welfare framework by which Muslims could live without reference to the Western and secular influences around them. However, the MB was soon drawn into politics. It developed explicit political goals, involving a radicalization of its philosophy and tactics and the creation of an armed wing. Nonetheless, the MB's main focus remained education from below and the infiltration of Egypt's political and social institutions. The combination of its welfare services, its religious credentials, and the government's increasing authoritarianism combined to make the MB Egypt's largest religious movement, with tens of thousands of followers, which also pursued explicitly political goals.

It is important to understand that the brotherhood, despite its own rhetoric, is not a manifestation of "traditional Islamism." Instead, the MB is a key example of a *modern* social movement: mass based, populist, supported mainly by the urban middle and lower classes, using a cell-based structure, and embracing religious reformism. In addition, the MB focuses explicitly and primarily on Egypt's domestic situation: It wishes to reform the country, not the universal Islamic community as, for example, the transnationalist group Al Qaeda aims to do. Like Egypt's secular nationalists, the MB struggles primarily for Egyptian independence, with a rallying cry that reflects this aim: "Egypt for the Egyptians."

After al-Banna's assassination in 1949, the MB became close to the revolutionary government of Gamal Abdul Nasser, following its accession to power in 1952. By the mid-1950s, however, relations had soured following an unsuccessful attempt on Nasser's life. As a result, the MB was proscribed, thousands of members were imprisoned, and its leader, Sayyid Qutb, arrested. He was executed in 1966. During his captivity, Qutb produced a comprehensive commentary on Islamic history, arguing that Egypt was not an Islamic country, as it was in a state of *jahilya* (religious ignorance). Muslims could not live a proper religious life in such circumstances. It was therefore necessary to overthrow the existing political order by any means.

Qutb's ideology was deeply influenced by the revolutionary radicalism of a contemporaneous Indian Islamist, Sayyid Abu'l-A'la Mawdudi (1903–1979). Qutb's ideological development fell into two distinct periods: before 1954 and from 1954 until his execution. During his second, radical phase, Qutb declared "Western civilization" the enemy of Islam, denounced leaders of Muslim nations for not following Islam closely enough, and sought to spread the belief among Sunni Muslims that it was their duty to undertake jihad to defend and purify Islam.

Following President Anwar Sadat's accession to power in 1970, the brotherhood enjoyed improved relations with the government—because it was anxious to cultivate the MB's support in the state's fight against secular leftists. Taking advantage of Sadat's overtures, the brotherhood built mosques, schools, and clinics. Its financial position improved following the founding of a range of profitable companies and financial institutions. Such entrepreneurial flair was not, however, appreciated by all brotherhood members, and the movement split into two sections: the "radicals" and the "moderates." The latter believed in a gradualist approach, to Islamize society slowly by increasing the brotherhood's influence as a popular movement, while the former wanted a speedier, more radical action. Later, after Sadat's assassination in 1981 at the hands of Islamists, moderate MB members entered electoral politics. Since then it has consistently won seats in parliament, in line with President Mubarak's goal of "limited democracy" in Egypt.

The radicals were too impatient for change, too opposed to what they perceived as a sham democracy to join in such a program. Breaking away from the moderates, several new Islamist movements—including Takfir wal-Hijra and al-Jihad—were founded. Together they were the core of a shifting set of religious-political movements under the general title of al-Gama'at al-Islamiyya (The Islamic Groups). Stimulated by the writings of Qutb, they were characterized not only by a denial of conventional electoral politics but also by the use of terrorist tactics to achieve an Islamic state. Members of Takfir wal-Hijra were responsible for a number of political assassinations, while the al-Jihad group not only killed President Sadat but also tried to kill two government ministers and the parliamentary speaker at the same time. The state then decided to crack down on the radicals. More than 300 members of al-Jihad were arrested and some executed, specifically for their alleged involvement in the murder of members of the state security forces in the town of Asyut in the early 1980s.

The divisions between the secular nationalists and the MB in Egypt developed in the 1980s into a conflict between two different conceptions of society and two different ideas of what are desirable social and political changes. The conflict spilled over from the religious sphere into the fields of politics, economics, and social affairs. The goal of the MB—to build an Islamic state—was an attempt to transform the language of politics, to build as broad as possible a coalition of opposition forces, and to deliver welfare benefits, especially to the underprivileged urban poor. More generally, the Islamists of the MB wanted to reverse what they saw as a cataclysmic slide into godless modernity, exemplified by a secular society.

Conclusion

As this discussion of the relationship between selected religious movements and politics has shown, religious movements have specific aims and objectives that differ according to their specific contexts, backgrounds, and history; however, they share an overt disavowal of the desirability of secularization and associated modernization that highlight state attempts to restrict religion to the private sphere. Religious movements work at the level of civil society. Their aim is not usually to enter conventional electoral politics and try to achieve the changes they want to see by involvement in political society. Instead, their focus is on the community or grassroots level, where they seek to build mass support, whether working alone or in coalition with other like-minded groups. The intention is to change both the status quo and the prevailing power equation, so as to build a society with more involvement of religion in everyday matters that affect the well-being, norms, and values of the mass of the people.

REORGANIZATION

This entry discusses the meaning of the term *reorganization* in the public sector, the targets, the argument, and the models for reorganization and concludes by assessing the consequences of these changes.

The Meaning of Reorganization

In political science and public administration, reorganization usually refers to government reorganization. But one can talk about legislative reorganization and judicial reorganization as well. Reorganization refers to the imposition of a new way of organizing, or "to organize differently," which often involves an extensive alteration of the structure of government.

Any such reorganization or "shake-up" introduced must by definition produce extensive and drastic changes to government; minor changes in government are not considered to be an act of reorganization. In addition, there may be a wide range of goals in reorganization, but the assumption is that these goals—efficiency, effectiveness, and changes in policy—are all being addressed through structural changes in the public sector.

The expression "government reorganization" has a neutral connotation. It does not directly praise or condemn the Old System as being good or bad. The emphasis is on the introduction of a different way of organizing government. On the other hand, the word *reform* is value laden. Reform refers to a change for the better as a result of correcting abuses, as in the common statement, "Corruption in government is rampant, so there is an urgent need to reform government." So the words *government reorganization* and *government reform* are different, although at times they tend to be used interchangeably.

Recent developments in the field of political science and public administration have emphasized "reform" over "reorganization." The new buzzwords are, for example, "administrative reform," "government reform," "governance reform," "NPM reform," "reinventing government," and "revitalizing government." One reason why the phrase word *government reorganization* is being replaced by these new words has to do with the beliefs among practitioners and scholars that the old government machines are in an urgent need of being changed drastically. This has been true in both the developed and the less developed countries. The phrases *administrative reform* and *government reform* are very broad and do not specify the intended nature of reform. In fact, *administrative reform* is a broader term than government reform because the latter focuses on the reform of government, while the first covers broader areas such as the public sector and civil society. Meanwhile, the terms *governance reform, new public management (NPM) reform*, and *reinventing government* are driven by specific doctrines or principles of reform. We will return to this topic later in the entry.

The Targets of Government Reorganization

There are many ways to implement programs for government reorganization. The most common kind of government reorganization is structural. For example, government reorganization may involve the creation of new ministries and departments, the merging of several lower level units into a higher one, and the structural expansion of a government agency. The assumption is that the manipulation of structural variables is the key to improving how the system operates. Other targets of reorganization are more focused on procedures. For example, one of the common targets for reorganization has been budget processes. Other targets have included personnel policy in government, policy making, ethics, and strategic management.

Changing the structure of government organization involves, for example, choices between pyramid or flat organizations, centralization or decentralization, strong or weak leadership, small or big government, the variety of forms of public organizations in government, the size of the public sector in relation to the private sector, the role of the civil society and citizens in public affairs, and the configurations of multilevel governance. One of the most common structural reforms during the past several decades has been the creation of executive agencies that have responsibility for a limited number of functions and enjoy a good deal of autonomy from direct controls by the rest of government. The contrary pattern of reorganization has been to create very large cabinet-level departments that are designed to coordinate a wide range of public functions and provide more coherent packages of services to the public.

The systemic choices for reorganizing public budgeting are, for example, line item budgeting, performance budgeting, program budgeting, or zero-based budgeting; nonintegrated or integrated budget; and annual or multiyear budget. In personnel reorganization, the system choices have been, for example, spoils or merit system; for recruitment; position classification system or contract system; and performance appraisal or seniority for internal promotions. An example of the reorganization of the policy process may involve the extent to which government mechanisms facilitate citizen participation in the policy decision-making process and implementation. Attempts to change the nature of personal morality, professional ethics, organizational ethics, and social ethics can also be seen as a reorganization of the agency's normative system that is used to control the behavior of individuals within government. Reorganization in strategic management may involve the implementation of strategic tools such as best practices, benchmarking, and balanced scorecards. Again, these represent attempts to control the behavior of individuals within the public sector.

The Arguments for Government Reorganization

The most common reason given for carrying out government reorganization is to improve the efficiency of the government machine. Government officials responsible for reform will usually justify a major bureaucratic reform by claiming that such institutional change will bring in better services to the people and savings to government. Efficiency is defined as the ratio between input and output: More output is obtained from the same amount of input. There are, however, hidden agendas in every reorganization effort.

Scholars have pointed out that there are vested interests involved in any attempt to reorganize government. Reform, as a matter of fact, *is* politics. After government reorganization, there are always those who gain and those who lose in the reform process. For example, the splitting off of a new ministry from an old one opens up new opportunities for senior government officials to fill in new higher positions, and there may be a better "target" for interest groups attempting to influence policy. As a separate entity, the new ministry can also demand more allocation of budget. New laws, rules, and regulations are issued to provide legitimacy and authoritative power to the officials in the new ministry. Another example is that reform proposals put forward by central agencies such as the Civil Service Commission, the Budget Bureau, the Ministry of Finance, and the Government Reform Commission have tendencies to consolidate power and tighten control over the entire bureaucracy. Such organizations will claim that central executive control was necessary to promote bureaucratic responsiveness, especially from line agencies. Proposals by a single department such as the national police or a regulatory organization usually contain clauses to increase their autonomy and authoritative power. In short, more positions are requested, new suborganizations are proposed, new legal power is justified, and bigger budgets are requested.

Further, most proposals for government reorganization designed by government officials involve suggestions for bureaucratic structural expansion and power aggrandizement. Scholars (such as Anthony Downs, 1967) have pointed out that, in fact, all organizations have inherent tendencies to expand. C. Northcote Parkinson's famous law states that "work expands so as to fill the time available for its completion" (quoted in Downs, 1967, p. 16). Downs summarized the reasons why bureaucracy inherently seeks to expand as follows: (a) an organization that is rapidly expanding can attract more capable personnel and more easily retain its most capable existing personnel than one that is expanding slowly, stagnating, or shrinking; (b) the expansion of any organization normally provides its leaders with increased power, income, and prestige; (c) growth tends to reduce internal conflicts in an organization by allowing its members to increase their personal status without lowering that of others; and (d) increasing the size of an organization may also improve the quality of its performance (per unit of output) and its chances for survival (p. 17). Subsequent analysts have pointed out that increasing the size of an organization may create more managerial problems than it creates benefits, but many bureaucratic organizations persist in seeking expansion.

Launching a major government reorganization plan also can be good publicity for the government. It creates the impression that the problem lies in the government machine, not the political executive and that the elected government is seriously addressing the problem of inefficiency and corruption in the bureaucracy. This kind of bureaucratic bashing pleases the public voters, who are bored with and frustrated by their bitter experiences with government bureaucrats. Indeed, when governments have few opportunities to address a policy problem directly, they often reorganize government in order to appear to be doing something.

The experiences of countries at reorganization indicate that despite all the publicity on government reorganization, at the end, the bureaucrats are often able to outsmart the political executive. In many cases, not much has been achieved from government reorganization. Instead, the reform commissions have produced mountainous piles of reports and studies on the ideas and reform plans that never got implemented. Not much bureaucratic reform was actually undertaken, and the "ugly old bureaucracy" remains as inefficient and venal as ever. Again, reorganization and reform are as often as not symbolic policies rather than effective means of solving public problems.

Another reason why government reorganization is needed is the argument of the turbulent environment. Government reorganization is needed because of the volatile, unpredictable, and rapidly changing environment. For example, the Minnowbrook Conferences, held by Syracuse University in 1968 and 1988 for scholars in public administration, were organized to bring in new ideas about government reorganization and improvement. In the age of rapid globalization, there is an urgent need to reorganize government in line with this new international system. Another factor in support of government reorganization is the revolution in information technology that is drastically changing the way governments work. Most recently, the economic crisis of the early 21st century is forcing substantial rethinking of the role of government and of the means of organizing the public sector.

Reorganization in the public sector can also be used to alter the policies adopted and implemented by government. While efficiency may be difficult to attain, given the numerous barriers that exist within the public sector, reorganization may be more effective in altering policy, simply because of the different priorities that may be involved when an organization is independent or when it is contained within a different department or ministry. For example, the U.S. Coast Guard moved from the Department of Transportation to Homeland Security after the terrorist attacks of September 11, 2001. After that move, the agency shifted its priorities toward security and away from safety on waterways.

The Models of Government Reorganization

Thinking about how to implement government reorganization leads us to making choices about centralization and decentralization, big or small government, strong or weak leader, pyramid or flat structures, the extent of citizen participation, the power relations between superiors and subordinates, the appropriate values and culture, and the nature of environment one is facing. All these variables are important for defining how government will function and the type of choices that the organizations have on which to base their decisions.

B. Guy Peters (1992) proposes a theoretical analysis of "government reorganization." According to him, reform and reorganization is one of the most common activities in government. He pointed out three sets of approaches to reform: purposive model of reform, environmental dependency, and institutional models of organization change. First, purposive-action approaches assume that one or more actors in the reorganization process have a particular end state in mind for the public sector when they propose the reform or reorganization. The need to reorganize government may come from perceived inadequacies of existing arrangements, a sense of "overload" and "ungovernability" in public organizations, and the desire of the rational individual bureaucrat to maximize his or her personal utility. Second, the environmental-determinism approach assumes that changes occur as a function of the relationship of the administrative structures to their environment. The need to reorganize comes from the reaction of government to innovations in their environment that provide them with the opportunity to exploit the new situation. Another explanation is from contingency theories, which argued that "the internal structuring of organizations will, over time, come to reflect the characteristics of the task environment" (Peters, 1992, p. 206). The population ecology models assume that the best way to understand government reorganization is to look at the evolution of entire populations of organizations. Third, institutionalism approaches assume that reform requires to some extent altering the internal values of the organization, which includes the modification of the operative values of organizational members. Institutional models in political science "stress the durability of organizational values, or cultures, and therefore the extreme difficulty that may be encountered in attempting to produce any rapid or significant changes in performance through reorganization" (Peters, 1992, p. 211).

The traditional model of government organization, and perhaps reorganization, often follows the classic ideal-type bureaucracy of Max Weber. The characteristics of bureaucracy are as follows:

1. There is the principle of fixed and official jurisdictional areas, which are generally ordered by rules—that is, by laws or administrative regulations.
2. The principles of office hierarchy and of levels of graded authority mean a firmly ordered system of super- and subordination in which there is a supervision of the lower offices by the higher ones.
3. The management of the modern office is based on written documents (the files), which are preserved in their original or draft form.
4. Office management, at least all specialized office management—and such management is

distinctly modern—usually presupposes thorough and expert training.

5. When the office is fully developed, official activity demands the full working capacity of the official, irrespective of the fact that his obligatory time in the bureau may be firmly delimited.
6. The management of the office follows general rules, which are more or less stable, more or less exhaustive and which can be learned.

The literature in public administration is marked by efforts to find a more suitable way to reorganize government than Weberian bureaucracy. Peters (1996) proposes four alternative models: the market model, the participatory state, the flexible government, and the deregulated government. Michael Barzelay and Barbak Armajani (1992) observed the shifting from the bureaucratic paradigm to the postbureaucratic paradigm as a movement away (a) from the public interest to the benefits for individual citizens, (b) from efficiency to quality and value, (c) from control to winning adherence to norms, (d) from enforcing responsibility to building accountability, and (e) from justifying costs to delivering value.

In many parts of Europe and the Antipodes, the reform movements are loosely called the NPM. Christopher Hood (1991) summarized the doctrines of NPM as consisting of (a) hands-on professional management in the public sector, (b) explicit standards and measures of performance, (c) greater emphasis on output controls, (d) shift to disaggregation of units in the public sector, (e) shift to greater competition in public sector, (f) stress on private sector styles of management practices, and (g) stress on greater discipline and parsimony in resource use.

The NPM model was not, however, widely adopted in Southern Europe because of the emphasis on administrative law as the means of controlling within the public sector.

In the United States, the use of private sector styles of management came to be known as the reinventing government movement. David Osborne and Ted Gaebler (1992) attacked the "sluggish centralized bureaucracies" as unfit for the rapidly changing, information-rich, knowledge-intensive society and economy of the 1990s. They proposed, instead, "the entrepreneurial government," consisting of 10 principles:

1. catalytic government (steering rather than rowing),
2. community-owned government (empowering rather than serving),
3. competitive government (injecting competition into service delivery),
4. mission-driven government (transforming rule-driven organizations),
5. result-oriented government (funding outcomes not inputs),
6. customer-driven government (meeting the needs of the customer, not the bureaucracy),
7. enterprising government (earning rather than spending),
8. anticipatory government (prevention rather than cure),
9. decentralized government (from hierarchy to participation and teamwork), and
10. market-oriented government (leveraging change through the market).

This style of reform was more compatible with governing in the United States because of the long-standing emphasis on management within the public sector.

Another emerging framework for reorganizing government is "governance." At the abstract level, as noted by Bidhya Bowornwatana (1996), governance in public administration refers to a reform model that advocates the following principles: a smaller government that does less, a flexible and global-vision government, an accountable government, and a government that is fair. From the government's experience in the United Kingdom, R. A. W. Rhodes (1996) concludes that governance is about managing networks that are self-organizing and autonomous. The governance approach has involved the use of social actors through networks as a means of providing public services, as well as a means of shaping public policy. These social actors have tended not to be market actors but more often represent a variety of civil society organizations and interests.

For some, mostly practitioners, government reorganization meant the introduction to government of management tools such as the balanced scorecard, strategic planning, the learning organization, reengineering. Many scholars have criticized such practices as being part of management fads and fashions that do not really improve government performance and that the management tools applied will soon go out of fashion.

The Consequences of Government Reorganization

The study of government reorganization cannot be complete without considering the impact of government reorganization. What are the intended and unintended consequences of government reorganization? Who gains? Who loses? Have the power relationships in a ministry or department been changed? Have public services delivery been improved? What are the positive and negative unintended consequences? Several observations can be made about the results of reorganization. First, important consequences of government reorganizations take a long time to materialize. The time span of such an impact bypasses the time in office of the policymakers. Second, the question of who is responsible for any negative consequences of reform can get very complicated, as during the course of time (e.g., 10 years) several actors may have been involved with the reorganization policy. New policies may be introduced one after another, with the effect that it is almost impossible to trace accountability.

Third, the immediate gainers and losers of government reorganizations are the political executives and subordinate bureaucrats. Some actors are promoted to newly established positions. Some others are reshuffled to less important positions. The political executive in the short run gets political points from their publicity of the reform plans. Fourth, the success of reorganization efforts to change the values and cultures of government programs, and of the system more generally, cannot be easily proven. They are not easily visible, and change takes a long time. As Frederick Mosher (1967) pointed out, a reorganization effort is not a one-time thing but a step in progressive history. Fifth, the majority of reorganization efforts tend to fail in meeting their proclaimed goals. Although new positions have been created and more money spent, efficiency has not improved.

REPRESENTATION

Political representation is a basic institution of Western modernity. Put simply, it exists so that those governed can govern indirectly. It thus creates a minimum level (considered to be the only realistic one) of self-government. Under the systems of modern representation, the governed choose those who will govern through elections and authorize them to do so in their name, thus granting representatives a mandate to look after the interests of the governed.

In its original Latin form, the word *representation* covered a vast semantic field, and this has been further widened over time. To represent means to portray, describe, narrate, and duplicate—to *make present* something that is not and cannot be so. Hence, the problems begin with the very word, and circumscribing its significance by talking about "political" representation does little to resolve this.

Even if, officially, they do not bear this name, forms of representation—or, at least, institutionalized communication between the governed and the governing—can be seen even within those political regimes not commonly classified as representative. Further, theoretically, no collective body can exist without some form of (even symbolic) representation. A people, nation, political party, class, interest, or religious belief needs to be represented—and have its own spokespeople—so that it can be recognized by both its own members and everyone else. However, if representation is a constituting element of a collective body, this raises the key question of how the wishes of that body can be transmitted to its representatives.

Belying modernist rhetoric regarding the individual, a collective body in the real world of politics is effectively the aggregation of preexisting collective bodies. A plurality of collective bodies—territorial communities, associations, organized interests, political movements and parties, and so on—decides to constitute a unitary political body with representatives who lead them and act as their spokespeople. It is thus represented to the external world through these spokespeople, and a plurality of wills is thereby transformed into a collective will. We might ask, however, how can representatives perform this task? If the collective body consists of heterogeneous parts, willing or induced to cohabit, but possessing different and often conflicting desires, what will these representatives effectively represent?

Of course, no form of representation is ever a perfect replication of the original concept. To represent means to interpret, and interpretations are inevitably arbitrary and distorting. To represent something—and political representation is no different from literary, pictorial, photographic, cartographic, or any other form of representation—can also signify improving and embellishing it. However, this can never be a perfect replication, especially so in the case of a collective body. Here, to represent implies generalizing, abstracting, and, basically, manipulating, especially when the mandate is reduced to such a simplified and stylized act as voting—in other words, a mark on a ballot paper. Allegiance is therefore a constant, theoretical, and political obsession for political representation. What defines it and to what degree this mirrors the original is another fundamental issue of the debate.

Some theorists even deny the idea of a mandate conferred on representatives and/or of representation itself. Two illustrious authors—Hans Kelsen and Joseph A. Schumpeter—crudely define representation as being nothing more than a "fiction," which, according to Kelsen, is useful for its legitimizing role since it convinces those governed that they are governing, while, in Schumpeter's view, this fiction is inevitably damaging because electoral mechanisms force those governing to be opportunistic rather than to pursue the collective good. Therefore, what is conventionally called a representative government is merely a device legitimizing the division of work between the governed and the governing, transforming electoral consensus—which is often fictitious given the workings of electoral systems—given by voters to a political party, a coalition, or a leader, into the will of the collective body. Rather than hereditary or other principles, representation is the mechanism that modern societies have adopted to validate their governors. This is not without its complications, beginning with the fact that representative regimes not only authorize the representatives of the majority party obtaining electoral success to govern but also give a voice, again through representatives, to the defeated minorities, thus enabling and encouraging them to interact with the representatives of the majority. It is then expected that everyday politics will establish in what way and to what degree this takes place.

However, even if what we call "representation" is not really representative, it still offers a series of extremely valuable advantages: Mandates (at least in the West) are limited over time, there is the opportunity to replace governments, and the electoral procedure allows citizens to voice—individually or collectively, peacefully or otherwise—their opinions and interests. Above all, representation creates for both the governed and the governing the not inconsiderable opportunity of communicating fairly regularly with each other. The process is anything but linear, and the equality of citizens is a myth; however, representation establishes an incentive structure that enables the governing to govern and to minimize conflict with those governed. Of course, these incentives do not always work because the governed are a heterogeneous body with variegated interests, and satisfying the wishes of all is thus inconceivable. However, to date, representation has generally worked, albeit with some notable accidents along the way.

Experience tells us that representation also considerably reduces the costs of cultural, political, and social conflicts. These do not disappear, but the electoral and parliamentary procedures of representation increase the chances of their being managed peacefully. A represented interest is an acknowledged interest and, once it has accepted representation (and is allowed to be represented), its explosive potential is attenuated. It may not happen: Some interests transcend the boundaries of representation and maintain a position of rejecting it and refuting the rules. While there are many such examples, these only serve to confirm the fact that representation and representative government are inevitably somewhat imperfect.

Given the number of controversial issues and questions surrounding the topic of "representation," it is no surprise to discover that, for the past 3 centuries, theoretical work has attempted to give form to the necessarily provisional device of representation. The great challenge facing representation at the outset is what could be defined as the challenge of pluralism. This is a challenge, which, to date, aside from momentary defeats, representation has generally won. However, it is a challenge that is not yet over. It has been (and continues to be) very demanding, and it is interesting to observe how theory has approached the issue.

What can be defined as the "pure" theory rejects pluralism outside the political arena, based on the logic that there is a fundamental unity of the collective body and its representatives and that representation essentially aims to legitimatize the representatives' authority. Representation denotes the population as a whole, and any mandate dictated by the represented to its representatives—who are, therefore, "trustees"—is to be discouraged because it would prejudice the independence and ability of representatives to transcend specific interests when in pursuit of what the theory solemnly defines as the common good.

Alongside this pure theory, however, there is an "impure" or pragmatic theory, which over time has undermined the former. This enjoys a more relaxed relationship with pluralism since it acknowledges the composite nature of the collective body and comes to different conclusions. From this perspective, there is nothing wrong with seeing the representative as a delegate or a spokesperson for particular interests, but it is to be hoped that such representatives will be capable of rising above these interests to have a more farsighted view. The synthesis effect is achieved through the interaction, whether through negotiation or conflict, between different interests within the representative body. The outcome is not necessarily more modest than what was promised but is effectively something not quite achieved by the pure theory.

Obviously, under these conditions, no government is sufficiently representative (not least because the objectives are very unclear), and this insufficiency has been a recurrent issue within public debate. There is always someone ready to denounce the lack of representation and to look for reparation. There is always some political force that claims to be more representative than its competitors. This is still happening at the dawn of a new millennium when representation is clearly encountering considerable difficulties.

In recent decades, the decisions taken by authorities not based on any electoral mandate, or that have minimal representative links to those affected by their decisions, have multiplied. As an example, it is sufficient to consider the deterritorializing processes of political authorities provoked by globalization. Moreover, in large part, thanks to the media, the sophisticated manipulative methods with which electoral competitions are now held shape (and distort) communications between the governed and the governing. Democratic regimes have recently tended to enhance the role of the executive power to the detriment of the elected assemblies. The executive is always a representative body, as is its leader, because it is chosen by the electorate. But what is the level of representation of an individual and the limited committee working with them in relation to the complexities of contemporary democracies? If representation implies interpretation, will what contemporary democracies propose be all too simplistic and dismissive? Finally, according to current theories, there are also those who want to remove representation from the political vocabulary, acknowledging the possibility both of forms of representation not supported by a popular mandate and of forms of democracy not founded on representation.

Put simply, it is possible to divide representation as occurring in three main periods:

1. individual representation, in which the representatives were chosen from a minority of notables, a limited group based on wealth and culture; social prestige was thus the decisive element in electoral competition;
2. collective representation, organized through political parties; and
3. post–political party collective representation—that is, the current era, which is fairly uncertain and complicated.

The outlines of these three epochs will be described below as we disentangle the key (pure and impure) theories relevant to the definition and social construction of representation.

Pure Representation Theory

Modern political representation was invented in Great Britain in the 17th century by reusing and renewing long-standing institutions. Needing to replace a monarch who ruled by divine right and was, therefore, the representative of God on earth, parliament had the idea to designate itself as the representative of the people. The problem was that while God is abstract and remote, the people are rather closer and more concrete. Although it is not entirely clear who and what “the people” were, representation had a precedent in that of the ancien régime.

From the time that large territorial, political entities began to organize themselves around a central power, the problem arose for sovereigns of persuading civic and religious potentates, collective bodies, and lower level territorial units to acknowledge their authority and cooperate with them. The solution adopted was that of consultation through agreements and reciprocal recognition of powers, privileges, and rights. This practice also had the advantage of assembling in a single place, and at the same time, the entire collective body, whose unity was thereby “represented” while at the same time “representing” (since it was frequently impossible for the existing potentates to be directly present).

However, both the transition to modernity (which eroded the old centers of power and established new ones) and the growing monarchical ambitions of unifying and governing the territory required a change in representation methods. The dispersion of power over a multiplicity of potentates, which had been confirmed by ancien régime representation, had become intolerable for large territorial states. There were two main alternatives available to such states. The first was that the monarchy should limit the competing powers without formally annulling them, as would be the case in the French model: The States General ceased being convened in 1614. The second was that of unifying the competing powers in a single body representing the whole of collective society, as was the case in England.

The extraordinary theoretical move devised by Hobbes was that of representing the entire collective through an artificial figure and imagining it to be constituted no longer by preestablished powers but by a crowd of autonomous individuals who renounce their powers through a social contract. However, history ignored his preference for an individual as the representative of the multitude and the owner of sovereignty, and in the 1640s, following the conflict with the King (although the Malmesbury philosopher had not excluded this second possibility), England opted for a parliament, which, according to Hobbes, is nonetheless also a single artificial figure constituting the unity of the people rather than the dispersion of the crowd.

Once it had liberated itself of power by divine delegation, the elite sitting in parliament pursued the following logic: It was prepared to represent the people but was little inclined to hand over the power conquered in the people’s name. On the contrary, it wanted to concentrate this power, monopolistically, among its members. However, if "the people" is an invention of parliament and if it exists only in so much as it is represented, the constraints of representation are, obviously, different from those of the ancien régime. Not only are the people unified by a single mandate but the mandate holder also receives a mandate that is no longer bound by the instructions of a preexisting power. Modern representation thus requires that the representative is not a delegate but a trustee who looks after the interests of the collective as a whole.

As frequently occurs, practice struggles to correspond to the ideal prescriptions of theory. If "the people" is an invention, there nonetheless exists a scattered population of aggregated interests that want to have a voice. Further, as representation is materially based on a formal act such as elections through which the mandate is manifested, it is sufficient that elections are minimally competitive so that, on the one hand, the electorate (even when carefully selected through requirements of property and wealth) may advance requests in exchange for their vote and, on the other, those aspiring to the mandate may encourage such requests. This raises the question, however, given the stiff competition for a parliamentary seat, of how candidates can be expected to merely display their personal merits and capacities and appeal to generic superior values and interests, thus renouncing the attempt to attract voters through the offer of some specific advantage.

The debate surrounding the nature of the mandate thus immediately became entangled. Among those who attempted to unravel the knots, the name of Edmund Burke leaps to mind. He stressed the idea that, over and above what he considered the legitimate pluralism of particular interests, the role of parliamentarians is not to satisfy the desires of this or that representative but to pursue, with full independence of judgment, what they consider to be the interests of the nation. The electorate is mandated by the nation, which is a much more vast and noble entity than those holding the vote. Burke's parliament, in his famous 1774 *Speech to the Electors of Bristol*, was not a convention of ambassadors representing opposing interests but a representative assembly of a single nation sharing the same interests in a common good. As a consequence, representatives should not receive any binding mandate but should simply and solely obey their own judgments and conscience.

Given that they had a number of illustrious precedents, Burke's pronouncements were not intended to formulate a new theory of representation. Rather, he wanted to persuade voters that elected representatives would, first, provide the best possible service without receiving their instructions or having generalized aims and, second, would subsequently account for their actions. Since political circumstances are always the stimulants of theory, Burke was very familiar with the Whig ideas that opposed those of the Tories, according to whom it was the monarch who represented the nation—while parliament should content itself with transmitting local demands and partial interests.

In practice, the impact of Burke's ideas was limited. An indication of this was possibly the fact that his speech was followed by a resounding electoral defeat. However, his arguments had been established as part of the theory of representation, reappearing on the other side of the Channel where revolutionary political theory, and, above all, Emmanuel Sieyès, laid down a fairly similar but much more linear and decisive path. The French situation in 1789, however, was different possibly because history did not allow it to update and adapt preexisting institutions but required it to found and construct new ones and possibly also because there were different challenges against which theory and practice were measured.

Rejecting Jean-Jacques Rousseau's praise for democracy and condemnation of representation as incompatible with modern society, Sieyès not only argued that society should request that the principles of the division of labor be applied to politics and representative government, but, with revolutionary resolution, he also called for the autonomy of representatives. However, recalling Hobbes's lessons, his solution, despite initially being similar to Burke's, was rather more drastic. Sieyès's concept of society was a compact, homogeneous, and unified space without any of the asymmetries of ancien régime society against which the Third Estate had arisen. Indeed, given that such a society did not exist in reality, rather than being discouraged, Sieyès invented his own. He promoted the nation to the role of a third, virtual actor, standing between the people and its representatives, hence averting the possibility that one would assume a superior role in relation to the other since the nation could only be constituted through the legislative body. The nation was, therefore, a unitary and indivisible body but, equally, so too was the assembly as its exclusive spokesperson.

According to Burke, society and its articulations were not without political relevance. Worried by memories of the ancien régime and concerned with liberating at all costs the actions of the elective body and, therefore, the state, from claims by partial interests, Sieyés indicated the nation as the only alternative to the state. As for the citizens, they would express themselves only at the moment of voting. Pluralism was dissolved in the representative body, the single mind and voice of the nation, together with any inequality or diversity between individuals. According to Sieyés, it was not even important whether the assembly was divided into majorities and minorities: The singleness of the nation's intents allowed the will of the majority always to coincide with the common interest.

Among all the inventions, and all the hypocrisies, of modern political theory, the latter appears to be one of the most prized and persistent. It is assumed that the individual choices made by majority choice are based on a "unanimous will of the associates," equipped with the means—such as a majority principle—to allow the collective body to function and pursue its own ends. Underlying the majority principle—Sieyés was not lacking in common sense—there was also an indication of method: There should first be a division into majorities and minorities. The elected had the honor of debating issues together and, therefore, according to an expression that has recently come back into fashion, to "deliberate"—to discuss, negotiate, persuade, change opinion, and make compromises in order to arrive at a common will. Further, Sieyés perfected these arguments by formulating a plan of social and cultural engineering (which the French revolutionaries and their successors earnestly cultivated) and establishing a related model destined to be successful. We refer, of course, to the nation, which, according to Sieyés, in addition to its role as a virtual political actor, should also be established as a collective identity in which the material articulations of society could truly be transformed.

Impure Theory and the Revival of the Pure Theory

Burke and Sieyès transformed representation. Members of a class of notables, selected by census suffrage (a system in which votes are not equal but are weighted according to the social rank of the voter), wanted to entrust government to an assembly of notables, isolating it from its environment and thereby reducing eventual conflicts to differences of opinion. However, there was also an alternative model. The fathers of democracy in the United States had previously come up with a more pragmatic solution in relation to social and political pluralism, possibly because the constituting process took place under different conditions. First of all, they had no ancien régime to exorcize. Second, only a handful of colonies sought self-government and these contractually decided to unite, giving themselves a constitution along with common bodies of representation and government.

The authors of *The Federalist Papers*, and James Madison in particular, were well aware of the threat of factions. Nonetheless, since their existence was seen as inevitable, they also believed that any attempt to eliminate them would be a threat to liberty. Undoubtedly, as proposed by Burke, filtering them through an assembly that brought together a wise, enlightened, and patriotic minority ready to sacrifice its particular interests for the good of the nation would help reduce any potential threat (*Federalist Paper* No. 10, 1787). However, it seemed better to focus on the possibility of applying a representative government to a state with broad dimensions, which contained a numerous and diverse population among whom interests would be not only multiplied but also dispersed and balanced against one another in representative institutions.

In other words, representation was a risk, but it would have been senseless to pretend to ignore it like Sieyès by creating a virtual people. Given the presence of an established and peaceful tradition of self-government, of citizen and village assemblies, it was considered preferable to focus on the confrontation of opposing interests and on the capacity of a representative government to create equilibrium. The U.S. doctrine, more realistic than that in Europe, was thus not scandalized by the idea of sectoral interests and constituency service (harshly stigmatized in Europe as clientelism) since it was felt that solutions would always be found for large collective issues.

The United States was still a distant province, unable to influence significantly representation in Europe where, for a further century, representative theory would continue along the path traced by Sieyès, convinced of the need to exclude any particular interest from the sphere of *stateness*. Moreover, circumstances were such that, just as the requirements of wealth and ability that limited access to the vote were beginning to weaken, a new and more rigorous version of the pure theory was created by those who were not political but were, instead, a new category of public law scholars formed under the shadow of the state. These scholars claimed that only the state has an autonomous life since nothing precedes it and nothing can oppose it—neither society nor the people, even less so the forces of social or political pluralism.

This area of reflection was inaugurated by a German doctrine, of which an emblematic exponent was Paul Laband. He disputed the concept of representation, resolutely rejecting the notion that the Reichstag's members were representatives of the people or even that they represented anyone at all. According to Laband, the electorate did not confer any mandate nor did it govern through its representatives. Once voting had ended, public participation definitively ceased.

Laband's sentiments were soon echoed in other European countries. In France, Raymond Carré de Malberg similarly reduced representation to a mere technical device for the recruitment of the ruling political class. According to Malberg, the representative represented the nation—considered as a unitary body, distinct from its individual and collective parts and even from the state itself. The members of parliament are hence the organ of the state, while voters only exercise nominal power and do not confer any mandate.

In reality, what this generation of jurists was pursuing was another goal that was much more important than the independence of those elected. In Germany, the aim was to reduce any possibility of competition between elected bodies, the monarch, and the executive's power. In France and Italy, the purpose was to rescale the parliamentary regime within the state—that is, the parliament, the political parties, and representation itself, in addition to the pronouncements of the electorate. Nonetheless, a radical criticism of the representative regime was needed to address the enigma of representation based on electoral mechanisms. This was the task taken on by Gaetano Mosca, who, finding in this a confirmation of his theory of the political class, contrasted the normative structure of the pure theory with empirical observation: Not only were candidates and the elected subject to even the most modest private interests, but, to gain consensus, they flattered the electorate and actively encouraged particular interests. Voters, according to Mosca, prefer representatives who look after the interests of the voters. However, it is not just the voters who elect the representatives but the representatives who persuade the voters to elect them, by raising expectations and making commitments regarding their future work.

Further, Mosca believed that the impending intervention of political parties was destined to increase such disadvantages. His key idea, however—in truth, previously advanced by *The Federalist Papers*—was, above all, that political representation would be unable to comply with the prohibition of an imperative mandate. Theoretical work had denied this at length but should have been aware of this. Indeed, according to Mosca, it was perhaps precisely because theory had in reality always known this that it continued to deny it with such vehemence. Hence, it was an illusion to deny the existence of a pluralism of interests outside the state, essentially because political-electoral competition multiplies the number of candidates, making them spokespeople and, at the same time, transforming politics from a mission reserved for an elite identified with the state into a set of opportunities facilitating the social ascent of individuals and groups seeking to obtain favorable political measures.

In discussing representation, Mosca thus outlined an entrepreneurial concept of politics that was destined to last. Max Weber further developed this by identifying the existence of the "party enterprise," which competes to obtain votes and public roles. This idea was then perfected, in the early 1940s, by Joseph A. Schumpeter, who definitively dismantled the myth of representation (and democracy) and reread politics as a marketplace. Schumpeter's ideas, inspired by U.S. democracy, saw the problem as lying in how democratic politics was constructed. He considered there to be a vast range of latent interests that the political representative brings to light, puts into a form, and exploits to his or her own advantage. The political entrepreneur thus transforms latent questions into significant political interests to be used in mobilizing the electorate to his or her own advantage. The risk that follows from this is that government actions may become a mere subproduct of electoral competition. In other words, if the transformation by candidates of the latent preferences of voters into political demands is a key strategy within the competition for power, it therefore constitutes not only a resource but also a handicap for political representation, which is thereby more inclined to favor particular interests to the detriment of general interests.

Representation and Political Parties

The great novelty of the 20th century, as Mosca had perfectly understood, consisted in the advent of mass political parties whose success was strictly linked to the introduction of universal suffrage (which they enthusiastically promoted). Mass political parties were imposing machines with millions of members and solidly organized apparatuses. Never before, within national boundaries, had there been such a dangerous challenger to the authority of the state. This produced apocalyptic pronouncements by theorists, of which Mosca's was only the precursor. The reaction of one of the most sophisticated exponents of antiparliamentarianism between the two World Wars, Carl Schmitt, was exemplary as regards its catastrophic overtones: He imputed no less than the destruction of representation and liberal parliamentarianism to the intrusiveness of political parties and organized economic interests. According to Schmitt, once the elected had become party delegates, parliaments could do little other than ratify decisions made elsewhere.

It is difficult to deny the fact that, with the advent of mass political parties, a demanding intermediary imposed itself between the electorate and the elected. Compared with the parliaments of notables in which the elected were linked to each other only by fragile bonds of association, the introduction of party discipline hardened both parliamentary confrontation and political lines of division. However, Schmitt's depiction of a situation whereby the intervention of political parties deprives democratic parliaments of the possibility of rational discussion while unrestrained centrifugal dynamics lacerate society and irreversibly prejudice the primacy of the state and its capacity to pursue the general interest was dictated, above all, by his own authoritarian leanings. In fact, if anything, political parties constituted a formidable reducing and reordering element as regards the pluralism of ideas and interests.

This was the view expressed by Max Weber in 1918, following World War I. Political parties, seen as large mass associations, served to discipline the conflict and, due to their preferred method of establishing leadership, were a precious antidote to the "iron cage" of instrumental rationality. It was not even true that the advent of political parties destroyed the possibilities for discussion and deliberation but merely moved their location to within the parties themselves. Schmitt's catastrophist ideas were challenged, again during the tempestuous Weimar years, by another illustrious jurist, Hans Kelsen, who, far from reprocessing liberal principles, attempted to reconcile representation with pluralism in order to recreate a credible form of political synthesis in place of that originally offered by the liberal state.

According to the Kelsenian critique, the use of the expression "representation" can even be considered abusive as it serves only to foment the illusion that the people really govern. However, when linked by party political mediation to universal suffrage, what is commonly called representation could be invigorated and given new meaning. Kelsen's thesis was that the combination of representative institutions and universal suffrage creates a renewed structure of political opportunities that in turn encourages old and new political entrepreneurs—previously concerned only with cultivating a limited electorate or securing entry into the political marketplace—to mobilize large numbers through political parties. Thus, not only can individual citizens, in association with others, overcome the conditions of marginality to which they would otherwise be condemned, but even the weakest interest groups are offered the opportunity to join together, demonstrate, and influence political decisions. According to Kelsen—an intellectual with social-democratic leanings—representation may well be a fiction, but, thanks to political parties, it at least allows the governed to communicate with the governing, in addition to balancing society's inequalities. Refuting the idea that mass political parties prejudice every political synthesis, Kelsen argued that it would ultimately be elected bodies and the interactions between parties that would recalibrate the pluralism that the latter have previously reordered.

Kelsen's view was revived after World War II when political parties obtained official recognition, in some cases in the newly established Western European constitutions. Whether based on an illusion or not, political parties renewed and revitalized representation, receiving an exemplary recognition—but obviously not the only one—from another German jurist, Gerhard Leibholz, who had originally shared Schmitt's position. At the end of World War II, Leibholz pleaded the case for the official recognition of political parties and also raised a question that would soon backfire on them. If political parties are, he asked, rightfully incorporated into the constitutional structure, why not fully ratify this inclusion with all its consequences? In other words, he raised the extremely delicate subject of the internal party democracy.

While this, of course, has long been a thorny issue, political parties can effectively represent it, among other things, by adopting a "descriptive" method of representation—the driving force behind "substantive" representation. While promoting the social classes they represent to elected office and broadening the recruitment pool for political leadership, the premise is that, by sharing the same life experiences of the represented, representatives will become more sensitive to the former's needs. This understanding of political parties was, above all, symbolic. However, the argument on which descriptive representation is founded is not to be underestimated. So much so that it has recently been revived through propositions (albeit often unsuccessful) for the introduction of quotas benefiting segments of the population considered to be underrepresented.

However, the fundamental novelty that political parties embodied in the European experience was something different. They undertook the responsibility for a large part of the representative relationship. They received a mandate from citizens to represent them and became the repositories of their collective hopes (and therefore their trustees), while representatives in elected assemblies were party delegates. As ever, of course, reality is more complex and often belies the image both of parliament as the exclusive place for negotiations between parties and of parties as an irremovable obstacle between the elected and the electorate. Mass political parties were more complex, and less disciplined, machines than those described in abstract models. They were the site of bitter internal conflicts and interacted in very different ways with the various segments of the electorate: For example, the middle classes were treated differently than the working classes, and confessional parties were represented in a different way from socialist parties. Even the most disciplined parties allowed space for direct contact between the elected and their electors—clientelism was frequently practiced—and party discipline was also considerably softened at times in elected assemblies. Thus, while in theory political parties (especially ideologically based parties) were trustees, in reality they were much more adaptive.

The equilibrium achieved by representation, thanks to political parties, was called into question by their transformation due to exogenous reasons: social change, political competition, and the intrusion of the media. Within a generation, the social transformations created by the great postwar developments, the erosion of class cleavages, the demise of ideologies, and the downsizing of political competition, on the one hand, made parties less attractive as large collective associations and, on the other, encouraged them to dilute their policy offer, to differentiate between electorates, and to concentrate mainly on their leadership. Already by the mid-1960s, Otto Kirchheimer had indicated the new political technology of the catch-all party and, 15 years later, when public financing of political parties was introduced, the concept of the cartel party (a party that uses the resources of the state to maintain its position within the political system) served to highlight the restrictions imposed on party competition. As a result of these changes, party machines have increasingly specialized in election campaigns and the selection of political personnel while simultaneously ceding a consistent part of their representative functions to interest groups.

Previously, traditional mass political parties had nurtured the grand ambition of covering the needs of society as a whole. At the height of its development, sectors within society would disperse in all directions in the search for new methods of representation and new instruments to make themselves heard by public authorities. The political scene would be rapidly crowded with actors and organizations offering representation in competition with the parties: entrepreneurial associations, trade unions, and territorial communities. At the same time, a multiplicity of forms would emerge that, technically, must be considered representative but that would claim legitimacy on the basis that they offered possibilities for direct citizen participation: We refer, of course, to the associations and collective movements making up the galaxy of organizations that has become known as civil society. In various ways, therefore, the pluralism of interests and opinions has spilled out over the sides of the "political party as container," running down new paths. As a result, the geometries and landscapes of representation known to date have been overturned.

Representation After Political Parties

Overcoming liberal prejudices toward them, political parties adapted representation to mass democracy. However, toward the end of the 20th century, ancient anti–political party prejudices reappeared, presenting themselves as the defense not only of representation but also of democracy. The criticism was paradoxical. Political parties were simultaneously accused of being both an excessively permissive and an overly rigid filter of society, of representing too much and representing too little. They were accused of allowing themselves to be led by electoral opportunism and of being too amenable to partial interests (with highly damaging consequences for government performance). They were also charged with being intrusive bureaucracies concerned with the interests not of those they were supposed to represent but of their executives and managers. Parties sought, it was said, merely to optimize vote shares and public positions, to the detriment of technical competencies, the public purse, and the spontaneous generosity of civil society. None of these of course is an unfounded criticism.

As we know, political parties are anything but defunct. Nonetheless, they have been profoundly changed: From large collective associations, they have become mainly political enterprises. The cartel party (as described by Robert S. Katz and Peter Mair) is a very different machine from the traditional mass political party, having ceded a large part of its representative capacity to other institutions. Parties are also hotly pursued by the media, which, through its extensive and obsessive use of surveys, claims to represent public opinion. Thus, the great concern that stimulated the pure theory of representation has resurfaced, as we can see in the work of the U.S. academic Hannah Pitkin, who effectively illustrated in *The Concept of Representation* the atmosphere of uncertainty surrounding representation and elaborated an essentially normative, but empirically based, response that recalled the lessons of *The Federalist Papers*.

When Pitkin's book came out in 1967, the demise of conventional mass political parties in Western Europe had only just begun. However, in the United States this had taken place some time earlier. As a consequence, Pitkin returned to the argument (dear to those in the United States) of the representative as delegate, along with that regarding the systemic effects of representative government. The representative, according to Pitkin, must demonstrate the qualities of a delegate *and* a trustee (and, even better, of a leader). That said, a delegate's role is far from easy. What is he or she a delegate of? Of the constituency from which he or she was elected? Of a group? Of a particular interest? Or of the party that has facilitated and sponsored his or her election? Appearing at the dawn of the era of collective movements (and the rediscovery of civil society), Pitkin's book constituted a detailed and updated inventory of the classic dilemmas of representation. It primarily confirmed that the vote is an approximate tool for identifying the electors' preferences, as well as directing the electorate's choices. Among the issues reproposed, or raised, by Pitkin, in addition to those concerning *delegates* and *trustees*, the most striking are those about *standing for* and *acting for* and "descriptive" and "substantive" representation. However vital political representation may still be, Pitkin argues, it is a problematic tangle from which it would be an error to expect too much. What counts, above all, is the overall performance of representative government. Representation requires the presence of the people in government activities, even if it does not permit them to act directly and/or individually. To this end, representatives must know how to act, when required, based on what they believe in good faith to be the interests of the represented. The latter, in turn, will need to monitor the actions of their representatives—with both sides seeking to avoid conflict between the preferences of the represented and the decisions of the representatives. Representation, therefore, must be not only responsive but also accountable.

This formula does not preclude representatives from making decisions independently of preferences expressed by the citizenry; however, this can happen only in those cases where representatives provide public, credible justifications that allow the public to assess and sanction the choices made in their names. Government ceases to be representative, Pitkin concludes, when the contrast between the work of the representatives, general interest, and public opinion becomes systematic. The plurality of the representatives and the possibility of them not only deliberating together but also reciprocally controlling one another combine to reduce the risks.

An heir to the "impure" theory of political representation, Pitkin seeks to reconcile democracy and representation. She acknowledges the intrinsic difficulty of their cohabitation, admitting that the balance between the two will always be somewhat precarious. However, as she recently emphasized, it is not necessarily a foregone conclusion that the marriage between democracy and representation is a thing of the past. Rather, it could yet be saved by strengthening the role of citizens and injecting representative institutions with a more substantial dose of self-government and participation. Indeed, the latter consideration is one of the most frequently raised issues in the theoretical and political debates of the past decade.

The Last Metamorphosis?

The transformation and repositioning of political parties have had enormous effects on representation. Being unable to herald a return to the liberal model of representation, typical of a society of notables, it has led instead to the rediscovery of a double circuit of representation. The official circuit, in the main, connects the electorate, parties, parliament, and the executive, where, due to the much discussed "presidentialization" of politics, the mandate conferred by voters has been significantly strengthened, making the head of government its direct consignee. Thus, a "lengthening" of the representation relationship—hinged on the personalization of government action—has occurred. Moreover, this relationship is often tinged with strong plebiscitary tones.

While political parties appear to have specialized in the selection of leadership candidates as well as electoral marketing, this does not exclude them from every representative activity. They remain as gatherers of interests, and great conflicts of interest still take place within them. However, the "presidentialization" of democratic regimes has created a more rigid filter than was the case in the past. The position and status of the representative institution par excellence—that is, parliament—is decidedly less certain, however. It would be wrong to say that parliaments have become marginal institutions, given that they still provide for the preparation of legislative norms and their members generally maintain constant contact with the electorate. However, they are now usually far more subordinate to the executive's power than was previously the case.

Rejected by political parties, interests have managed to establish a second unofficial and nonelectoral path that stands in competition with the official one. This phenomenon had already assumed importance thanks to neocorporate negotiations (involving collaboration between unions and the government), but it has become even more crucial thanks to the social changes brought about by post-Fordism and globalization. Representation of interests, as a result, has been separated from electoral representation: For example, in Europe, the phenomenon of lobbies, well-known in U.S. politics, has taken root and appears to be flourishing. So much so that it has been fully recognized and validated by the European Union (EU). Further, the unofficial path has been widened to embrace advocacy groups, nongovernmental organizations, and social movements.

What conclusions can we draw about these innovations? Not that official representation has become optional for democratic regimes. This is confirmed both by the debate about quotas for both elected and nonelected positions—to help disadvantaged social groups—and the debate on political rights for immigrants. Representation is thus still a decisive condition of existence and recognition. It still implies that the people (despite the problems surrounding that term) must be taken into consideration. Nonetheless, we can see a swinging back of the pendulum toward the pure theory, thanks to the prominence given to representatives, whether official or unofficial.

Ultimately, it is no coincidence that theory has sought to replace the rhetoric of representation as responsiveness with that of retrospective judgment. Accountability is the new parameter against which the quality and legitimacy of democratic regimes are measured. The concept of accountability is discussed elsewhere in this encyclopedia; but, in general terms, we can say that accountability is the link created between the performance of representatives and the expectations placed on them. Their degree of receptiveness with regard to the preferences of the governed is left to the judgment of the governing. It is up to representatives to establish whether it is opportune or not to accept the suggestions of voters—evaluated alongside indications from opinion polls, the media, and pressure from organized interests and civil society. In return, the right of citizens to assess political performances is legitimized and bolstered. Further, a horizontal, less asymmetric accountability of government activity also takes place, thanks to both the separation of powers and private power. It goes without saying that what is thus offered at the end is a rather different interpretation of representation than that which previously prevailed.

Above and beyond the rhetoric surrounding it, representation implied an impulse from below (the represented) to above (the representatives). The rhetoric of accountability casts those governing as trustees, who, from their lofty position, decide which policies should be adopted, interpreting the needs of the governed and, above all, leaving to the latter the possibility of sanctions afterwards. The motives that necessitate such a change are the dissolving of the large collective bodies of reference (class and religious affiliations, etc.), the very evident growth of cultural pluralism, the difficulties that political parties have encountered in reconstructing themselves, the tendency of the media to dramatize issues while also influencing the political agenda, and the preeminence assumed by rather sui generis institutions such as those governing the EU.

The rules established by theory for accountability are neither hurried nor superficial. It remains to be established, obviously, if and to what degree they are effective, and there are solid reasons for supposing that if representation is a fiction, then so too is accountability. Since representation, despite being a fiction, has produced effects that continue to be appreciated, the same reasoning could hold true for accountability.

However, the difficulties of representation encourage other innovations. Alongside the unofficial circuit of interests, a third one has been created, which, to varying degrees, reproposes direct democracy—not as an alternative to the representative form but as a complement—to foster and promote greater citizen engagement in decision making. An established product of similar attempts is that denoted by the term *governance*. Located at the crossroads of interest representation and citizen participation, governance claims that policies are the product of partnership negotiations conducted by stakeholders and public institutions, with the latter no longer viewed as a consistent and hierarchical system pursuing the general interest, but as a varied constellation of agencies (and other kinds of interests) performing particular services.

Combining the representation of interests and participation, governance appears to be very insubstantial (particularly as a form of direct democracy). It is no surprise therefore that attempts are continuing, both in theory and in practice, to graft forms of direct democracy onto the trunk of representative government. Through neighborhood democracy, citizen juries, participative budgets, and associative and deliberative democracy, representative democracy continues to call on ordinary citizens to assist it, while the features of elected assemblies—discussion, confrontation between different points of view, and reciprocal persuasion—appear to be enjoying a second youth beyond the confines of such assemblies among the citizenry.

The effectiveness of these forms of course is also questionable. It is not a given that, as promised, they can indeed serve to transcend particular interests and bring ordinary citizens closer to politics. One could argue that deliberation appears limited to the periphery of the system and that citizens are only periodically given a voice, with grassroots representatives, probably carefully selected by public authorities, taking the floor. However, as often is the case with innovations, the process is open-ended. By way of conclusion, we might finish with another question: Thanks to this double movement of political representation—on top toward personalized leadership and below toward direct democracy—is it the case that, after almost 4 centuries of resurrections, the phoenix of representative government is rising from the ashes, or are these innovations simply diversions accompanying the definitive burial of representation?

REPRESENTATIVE BUREAUCRACY

The central tenet of the theory of representative bureaucracy is that passive representation, or the extent to which a bureaucracy reflects or mirrors the demographic characteristics of the population, leads to active representation, or the pursuit of policies reflecting the interests and desires of represented groups. The theory is premised on the belief that such attributes or characteristics lead to certain early socialization experiences that in turn give rise to attitudes, values, and beliefs that ultimately help shape the behavior and decisions of individual bureaucrats. The theory of representative bureaucracy is based on the idea that the demographic composition of bureaucracy should reflect the demographic composition of society. Supporters believe that a bureaucracy that reflects the diversity of the general population implies a symbolic commitment to equal access to power and that shared personal characteristics of distinctive group members will offer a shared voice in the policy process. When members of identifiable groups, such as a specific racial or ethnic group, become public officials, they become legitimate actors in the political process with the ability to shape public policy and implementation. A representative bureaucracy provides a means of fostering equity or at least the perception of equity in the policy process. If the bureaucracy reflects the demographic origins of society, the theory implies that government will be more responsive to the public interest by better ensuring that all politically significant interests and values are represented in the formulation and implementation of public policies and programs. This entry continues with a discussion of the existing three main research streams on such a theory (passive representation, active representation, and linkage between passive and active representation) and concludes with remarks on possible future developments.

Research on Representative Bureaucracy

For more than 50 years, scholars have been interested in both the normative and empirical study of representative bureaucracy. Three important streams of research have emerged. First, researchers have focused on passive representation or the extent to which public bureaucracies reflect the demographic composition of society. Second, scholars have explored whether passive representation affects active representation. Third, scholars have explored factors that moderate the linkage between passive and active representation.

Passive Representation

Studies dating back to the 1960s examine passive representation or the extent to which women and racial and ethnic minorities are employed in the public sector. Researchers in the United States first focused primarily on race and ethnicity as the demographic characteristics of interest, but similar approaches were later applied to examine the representation of women in public organizations. Because of the marked social, cultural, and economic differences among different minority groups, research on representation in the United States moved from combining minorities into one category to splitting minorities into four groups—African Americans, Hispanics, Native Americans, and Asian Americans. Researchers have examined a number of other demographic factors, such as age and disabilities and the interaction between race/ethnicity and gender. In the U.S. context, race, ethnicity, and gender are considered the most salient characteristics because numerous politically relevant attitudes and values are defined along these two dimensions.

In early works, scholars examined aggregate public employment trends to ascertain the extent to which women and minorities were broadly represented, but to understand the phenomenon better, subsequent studies segmented the employment figures by organizational level and occupational category. While women and some minorities appear to be reasonably well represented in terms of presence in public organizations (penetration), they tend to be overrepresented in the lower echelons of bureaucracies and underrepresented in the managerial and executive ranks (stratification). *Penetration* refers to how well minorities and females are represented in total numbers, while *stratification* is concerned with how well these groups are represented throughout the career ladder, particularly in senior executive positions. Thus, penetration examines the quantity of employment, and stratification provides information about the quality of the employment.

Mary Guy's work shows that while American women have found great success entering public service, they lag behind men in their ability to advance to the highest ranks and tend to be disproportionately located in certain agency types. Similarly, African Americans and Hispanics have had difficulty advancing to the highest levels of public service. While women and minorities have gained greater access to positions in government in the past several decades, a key challenge facing public organizations is advancing women and minorities into positions of greater responsibility and power.

Active Representation

Students of representative bureaucracy also suggest that bureaucracies broadly representative of the general public should produce policy outputs that meet the needs of all citizens. Here, scholars have examined the relationship between employment of minorities and women and agency outputs and outcomes affecting these groups. Specifically, research has examined the relationship between demographic representation and disciplinary actions and ability groupings in school systems, charges or complaints of discrimination filed by a regulatory agency, child support collection, housing loan eligibility determinations made by a federal agency, federal procurement decisions, and student educational achievement.

The evidence is largely supportive of the linkage between passive and active representation for minority groups. In the first study, linking demographic representation and policy outcomes, Kenneth J. Meier and Joseph Stewart found that the increased presence of African American street-level bureaucrats (e.g., schoolteachers) had a significant effect on policy outcomes favoring African American students. In a similar approach, John Hindera found that as the employment of African Americans in the U.S. Equal Employment Opportunity Commission increased, discrimination charges filed on behalf of that group also increased. Sally Coleman Selden's research demonstrated that as the employment of African Americans, Hispanics, and Asians Americans increased in the Farmers Home Administration, the percentage of rural housing loan eligibility determinations favoring each group increased. Craig Smith and Sergio Fernandez found that increasing minority representation at the senior executive levels resulted in increased contracting with small minority-owned businesses.

The evidence for women is mixed. Early studies did not find that increased representation of women results in policy outcomes favoring women. However, Lael Keiser and her colleagues outlined several conditions that moderate the linkage between passive and active representation for women. Specifically, they note that the following three conditions facilitate the linkage between passive representation and representation of women: (1) the policy decision needs to directly benefit women, (2) the issue needs to be defined as gendered or salient for women, and (3) the gender of the administrator making the decision fundamentally changes the relationship or interaction between the administrator and client. Kenneth J. Meier and Jill Nicholson-Crotty found that women file more sexual assault reports when there are more women officers in police departments.

Factors That Moderate the Linkage Between Passive and Active Representation

As noted above, implicit in the linkage between passive and active representation is the expectation that civil servants will hold similar attitudes to citizens with similar backgrounds and experience and that attitudes, in turn, will influence policy decisions. This expectation is founded on the following logic: Civil servants from a particular demographic group experience similar socialization patterns and therefore hold similar values and beliefs with members of that particular demographic group. Scholars have taken several approaches to examine whether conditions and attitude moderate the link between passive and active representation. Research has demonstrated that active representation is more likely to occur when administrators have considerable discretion, or at least the perception of discretion, in decision making and when policy decisions are meaningful or salient to a particular group. Bureaucrats need to have enough discretion to translate their value preferences into actions that will improve policy or program outcomes benefiting represented groups.

Some scholars have examined attitude congruence between minority and women bureaucrats and citizens. Recently, Mark Bradbury and J. Edward Kellough found that African American administrators hold attitudes very similar to those of African American citizens. Moreover, they found that White administrators exhibit very different attitudes from African American citizens. There are a few studies that demonstrate that attitudes shape role perceptions, which subsequently affect behaviors or produce policy outputs favorable, at least for minorities. Selden found that minority status is largely mediated by the adoption of a minority representative role. That is, active representation is driven by the degree to which minority bureaucrats perceive of themselves as minority representatives. Bradbury and Kellough's study showed that African American bureaucrats are more likely to adopt a minority representative role than White bureaucrats. Because the research examining attitudes is less clear regarding women, Julie Dolan proposes that scholars measure and examine the linkage between gender consciousness and active representation of women in the population.

Another factor that moderates the linkage between passive and active representation is organizational socialization. Depending on the nature of how an organization socializes its members, it may either hinder or promote active representation. In one of the few studies that examine this factor directly, Vicky Wilkins and Brian Williams find that an organization's structure and processes can hinder representation. African American police officers revealed that they felt pressure to conform to the norms of their departments, which affected both their attitudes and their actions.

Future Development

Scholars interested in representative bureaucracy have much opportunity. In the United States, most of the existing research focuses on African Americans or minorities, generally. Future studies need to focus on the observed patterns of representation of Hispanics, Asian Americans, Native Americans, and women. Internationally, scholars need to examine further factors that affect the ability of administrators to translate their values into actions and factors that influence the adoption of a representative role.

REPUBLIC

The word *republic* is derived from the Latin *res publica*, meaning "the common thing" or "the public good." Cicero, among other Latin writers, translated the Greek *politeia* into res publica, and, in 55 BCE, he wrote his famous political treatise *De Re Publica*. Although the term *republic* has been used in a variety of ways and historical contexts, we can distinguish two main meanings, "substantive" and "formal." In the substantive sense, "republic" refers to a government in which the supreme power resides not in a monarch or a king but in a body of citizens entitled to vote. Thus, in a republic, power is exercised by elected officers and representatives governing according to law and accountable to the people. In this sense, Cicero refers to res publica as *res populi*, a thing or good that belongs to the people, or the public. Referring in turn to the Greek city-states, the Roman republic, the American republic, the French one, or the Dutch one, various authors from Cicero to Niccolò Machiavelli, Jean-Jacques Rousseau, James Madison, and Hannah Arendt have understood "republic" as a political model (formal). This model is based on the absence of the oppressive rule of a monarch and the establishment of rule of law and mixed government, as well as a concern for the public good and virtue. The different versions of the republican model of public virtue and collective liberty have been opposed to liberalism, as being one-sidedly focused on individual liberty and private interest. In addition, the term has referred, in recent times, to a government having a chief of state who is not a monarch but, as a general rule, a president. In this minimal sense, it has been applied at a global scale. Sovereign political units such as Romania, Bulgaria, or Iran (as an Islamic republic) have embraced this form of government. A republic can also be a constituent political and territorial unit, as seen in regimes such as the Union of Soviet Socialist Republics or Yugoslavia.

The Roman republican model, with its respect for rule of law and results of elections, complemented by the alliance between the rulers and the ruled and sealed in victorious military combats, has been revered from the Renaissance until the present day. This entry traces the different meanings and realities of the republic through medieval times and the beginnings of modernity, the American and French revolutions, and into the contemporary period when it has continued to capture the political imagination.

The Middle Ages and the Beginning of Modernity

During the Middle Ages, res publica generally designated the political community in opposition to the church. It was composed of a body politic whose head was the prince or the king. In the late Middle Ages, new republics (e.g., the Swiss confederation) appeared in Europe when a number of small states or city-states embraced republican principles of government. Generally, these were small states or city-states in which the merchant class had risen to prominence. In Italy, given the absence of a powerful central government, prominent towns gained considerable independence and adopted communal forms of government (e.g., the Republic of Venice and that of Genoa). In Florence, the memory of the Greek city-state, the Roman republic as well as of the successful restoration of the republic between 1494 and 1512 inspired an exceptional generation of Florentine republicans. Machiavelli, its most outstanding representative, served as second secretary in the Chancellory of the restored Florentine republic between 1498 and 1512. Machiavelli's reinterpretation of the political legacy of antiquity was based on the notion of *virtu*—common liberty and love of the country—and inspired antiroyalist, republican literature in 17th-century England (e.g., James Harrington's republican tract *Oceania*). The republican revolts in Britain and the Netherlands were linked to the formation of a large merchant class who prospered from the trade. The Dutch Revolt, beginning in 1566, saw the Dutch republic reject the rule of Hapsburg Spain in a long conflict that would last until 1648. The Dutch republic resisted the greatest military power of the day and was the wonder of 17th-century Europe. In contrast to the Roman republican model centered on military virtue, the Dutch republic was centered more on mild commercial virtues. The Dutch commercial republic brought together the values of republicanism with those of democracy and tolerance. However, in a world of emerging large absolutist monarchies, the defense of the liberty of small republican governments was short lived. It was the modern revolutions in America and France that would leave a definitive scar on the "system" of absolutist monarchies. The actions of both nations marked the beginning of the Democratic Age and brought about a historical reversal of balance in favor of the republican *and* the modern democratic model of government.

American and French Revolutions and Their Aftermath

The American and French Revolutions did not start as antimonarchical movements, but they both led to the establishment of influential republican regimes. The American Founders drew inspiration from the history of the republics. Whereas the term *republic* does not come up in the Declaration of Independence, it appears, for instance, in Article IV of the Constitution, which "guarantee[s] to every State in this Union a Republican form of Government." The American Constitution established a federative republic, whose justification is to be found in *The Federalist Papers*. Using Publius as their common pen name, the authors of *The Federalist Papers* gave a novel meaning to the term *republic*. In contrast to a long-standing tradition of thinking epitomized by Rousseau, they argued that a republican regime is also possible in a large territory and population. In addition, in the influential *Federalist Paper* No. 10, James Madison opposes "republic" to direct democracy, but in the name of the democratic-universalistic principles of liberty and equality. The term referred to a government indirectly controlled by the people—in other words, what we call representative democracy. The United States developed into a federative republic through a system of indirect representation and the dispersal of powers in the republic out of the concern, famously voiced by Madison, to avoid centralized despotism.

In contrast to the American case, the French Revolution resulted in a state of permanent instability and the gradual creation of a centralized republic. The model of the French republic, while centralized, was based on the democratic-universalistic principles of *liberté, egalité, et fraternité* (liberty, equality, and fraternity). Surely, Enlightenment thinkers such as Voltaire were initially more interested in the notion of constitutional monarchy than that of republic, arguing that republics tended to fall into anarchy or tyranny. Such thinkers quoted Montesquieu who had claimed that a city-state should ideally be a republic and had maintained that a limited monarchy would be better suited to a large nation. In fact, the 1789 *Déclaration des droits de l'homme et du citoyen* (Declaration of the Rights of Man and of the Citizen) and the new constitution promulgated in 1791 were not antimonarchical in principle, as the Revolution looked initially for a redefinition of the terms of monarchy—for instance, the 1791 constitution acknowledges the king to be the representative of God and of the nation, the instrument "from which all powers emanate." The French Revolution turned "republican" only after Louis XVI's "flight to Varennes," which resulted in his condemnation as a traitor. The subsequent radicalization of the political climate led to the King's eventual decapitation, the declaration of France as a republic, and the infamous Reign of Terror. Radicalization led France to a state of war both at home and abroad. Between 1792 and 1815, there was a permanent war between France and the European monarchies. The success of France in the Revolution pitted republican France against the European monarchies and saw republics spread by force of arms across much of Europe as a series of client republics were set up across the continent. The rise of Napoleon marked the end of the First French Republic, and his eventual defeat allowed the victorious monarchies to put an end to many of the oldest republics on the continent, including Venice, Genoa, and the Netherlands. Napoleon aimed to build a French continental Europe but stumbled especially in front of the British monarchy. The consequence was the strengthening of the grip of the European monarchies that crushed the Revolution of 1848 and the awakening of nationalist feelings. Outside Europe, the Napoleonic Wars allowed some of the states of Latin America to gain their independence (e.g., Venezuela under the leadership of Simón Bolívar). These movements, despite their ambiguities, carried on the echo of emancipation and universal message of the democratic revolutions, gradually leading to the association between the concept of "republic" and the modern democratic principles of equality and liberty.

The 20th Century and Beyond

At the beginning of the 20th century, republics in Europe were but a few. This situation would radically change with the two World Wars. In both wars, political mobilization was, by and large, not driven by the monarchical principle. The aftermath of World War I was marked by the dismantling of empires: The Austro-Hungarian Empire, the German Empire, the Russian Empire, and the Ottoman Empire were turned one by one into republics. The most violent conversion occurred during the Russian Revolution of 1917, in which the czar and his family were brutally executed. In Eastern Europe, Asia, and Cuba, the communist regimes brought to power—often by means of force—meant the abolition of the existing monarchies. The resulting communist republics (e.g., China, Romania, and Albania) proved in practice to be authoritarian or totalitarian regimes.

The formation of new republics was also linked to the process of decolonization. The years after World War II saw most of the remaining European colonies gain their independence, and many of them became republics. France, for example, encouraged the establishment of republics in its former colonies. However, in the Middle East, Britain installed local monarchies in several colonies and mandates, including in Iraq, Jordan, Kuwait, Oman, Yemen, and Libya. In the following decades, revolutions and coups overthrew a number of monarchs and installed republics. For instance, in Iran, the Iranian Revolution overthrew the monarchy and created an Islamic republic. Several monarchies remain, and the Middle East is the only part of the world where several large states are ruled by monarchs (e.g., Saudi Arabia, Jordan, and Morocco).

The fall of the Berlin Wall did not mean a return to the monarchical form of government. Today, *republic* is one of the most widespread terms designating existing states. But the popularity of the term came at the cost of its losing its explicative power. It has been applied to different and even opposing regimes, from liberal democracies to authoritarian and even totalitarian governments. Overall, the opposition between republic and monarchy has become less salient. Especially in the West, the monarchy has mainly a symbolic value (e.g., in Great Britain, Spain, and Norway). Some formal republics (Syria, North Korea) act like absolutist monarchies, totalitarian regimes, or a combination of both. In general, the tension that existed between the republicans and monarchists has lost its impact in many places in the West, as well as in Latin America or Asia, even if it remains a divisive issue in some Islamic countries. The decreased relevance of the opposition between monarchical and republican regimes is, however, only a part of the story. In the past decade, there has been a revival of the interest in the substantial meaning of *republic*, in relation to the Roman, Dutch, American, or French historical experiences. The republican emphasis on common good, rule of law, and public virtue has become even more relevant in a time of consumer individualism and disaffected democracies.

REPUBLICANISM

In the realm of political concepts, republicanism appears as the doctrine favoring the prevalence of the republican regime, whether this prevalence is the outcome of some activism (eager to see the achievement of the republic considered as the best regime) or of intellectual considerations (the republic encapsulates valuable political ideas and ideals). A more anecdotic subset of acceptations is linked with the existence (as is the case in the United States) of "republican" parties: Republicanism is no more than the fact of belonging to them. *Republicanism* is anything but a recent lexical creation: According to English dictionaries, the word made its grand debut in the language in the wake of civil troubles in 17th-century England. Its conceptual and semantic roots go back even further than its 3-centuries-old existence. Coined from the word *republic* (and the adjective derived from it, *republican*), the idea of "republicanism" encapsulates one of those long intellectual histories that are the privilege of only a handful of modern political concepts. It refers to a concept inherited from antiquity: the Roman *res publica* (which resulted in the modern *republic*). As such, it has this rare supplementary specificity among political concepts of having an authentic Roman origin: Classical Greece, which has influenced in so many ways the political history of the West, has only indirect equivalents for the Latin *res publica*. The success of the concept is all the more remarkable because, and is sufficiently measured by the fact that, in the 2 millennia of its history, the word has hardly changed in many European languages. The Latin *res publica* is still easy to retrieve from the French *république* (from which the English *republic* was imported), the German *republik*, or the Italian *repubblica*.

The meaning of the word has probably known more significant changes than its phonetics. *Res publica* means literally in Latin "the public thing." *Public* in its turn (*publicus* in Latin) derives from *populus*, which means "people," and thus, as Marcus Tullius Cicero (106–43 BCE) puts it in his *De Republica*, "The public thing is the thing of the people": "res publica, res populi." This is why the traditional translations of *res publica* as "commonwealth" or even "state" (when it is not just "republic") are not totally satisfactory as they do not spell out what was evident for the Romans when they talked about the republic: the dimension of the collectivity, the dimension of the people.

This meaning is equally lost in contemporary acceptations of the word *republic*. It has eventually specialized in characterizing a type of political regime, where, basically, the head of the state is not a monarch. Roman conceptions do include this aspect: The end of the monarchy and the instauration of republican institutions by Marcus Junius Brutus after the destitution of Tarquin the Proud is an important part of the political mythology of Rome. But it is a secondary aspect compared with the role of the people, which receives the real emphasis in the Latin expression. Being a notion defined by what it is not, the modern conception of the republic is even vaguer. It is not surprising that it applies to a large variety of situations, from the proudly secular French one (with a history of no fewer than five different "republics" in the span of nearly 230 years) to the "Islamic Republic of Iran," created in 1979, where there is no separation between religion and the state.

"Republicanism," as the derivative of the already protean notion of the republic, reflects its many understandings. In English as well as in many other European languages, the suffix *ism* develops the root of the word to mean a doctrine or a norm, and most modern English dictionaries follow these lines in their definition of *republicanism*. The two first (and main) acceptations screened by the *Oxford English Dictionary* are "the spirit characteristic of a republic or republican ideas; support for or adherence to republican principles; republican government or institutions" and "the principles and policies of the Republican Party. Also: support for or membership of this party." However, as a concept of political theory or thought, "republicanism" has retained many of the original traits of the Latin *res publica*. It refers to the crucial importance of the part of social life that is appropriated by the form of collectivity called a "people." This sector is not to be understood as a material one (the republic is not principally the public real estate, so to say) but as something more immaterial: It is the common interest of the people in participating in the decisions that affect their lives. Republicanism, as the sets of values involved in this conception, largely draws on a conception of the people as citizens and of liberty as the supreme political value.

History

In its most neutral conception, *republicanism* refers to the doctrine of those who, in established monarchies, want to suppress the monarchic system. It is the case of the "republicans" in England or Luxembourg, for instance: They want to put to an end to the monarchy in the United Kingdom or the Grand Duchy and have them replaced with republics. By this token, republicanism would not really exist in republics, where the goal that "republicanism" ascribes to politics has already been reached. But other acceptations prove to be richer, when they qualify something specifically ideological: the idea that the republic is not a fact but an ideal of governance that has to be deepened or protected even in existing republics. In this conception, republicanism is less a doctrine than a doctrinal agenda for pursuing the attainment of political goods considered as crucial in a political collectivity defined by the preeminence of the people. It ultimately defines the shaping of a specific *political togetherness* far beyond the mere question of the republican form of the regime.

Such a conception of the republic can be called normative as it entails the consideration of norms (i.e., representations of the world from the standpoint of ideal, regulating behaviors). It can trace its origin back to classical Rome. It is true that the Romans did not know the word *republicanism* (or rather did not have any equivalent to it). But they linked their idea of the republic with specific values and virtues; they were convinced that politics was about the norms and collective ideals that republican forms of collective life reflected and helped achieve. To them, the republic did not correspond solely to a form of governance (such as democracy, aristocracy, or monarchy) but to the hope for better governance. They thought of the republic as a specific regime, an inherently superior one, a desirable one; in this sense, the Romans could not separate the republic from what we now call "republicanism." This conception obviously lost its preeminence with the rise of the Empire, which followed the fall of the Republic. The expression *res publica* gained the more neutral meaning of a political collectivity without precise reference to the values attached to it. It is the acceptation retained in medieval Latin, and the evolution of Roman languages, that even led to legitimate talk of a monarchy as a "republic."

It was only at the dawn of modernity, mostly at the beginning of the 16th century, that the concept of the republic regained some of it original specificity. Since then, authors have considered more and more often that even if the term means something broader that what the Romans had in mind, it could not refer to all types of governance. For them, despotism is mostly the kind of governance that cannot be considered as a republican one. We see it ruled out by Étienne de La Boétie (1530–1563), the French author, in his *Discourse About Voluntary Servitude* (1549): He insists that one could hardly call an absolute and tyrannical political organization a "republic." Two centuries later, Jean-Jacques Rousseau is still undecided in his *Social Contract* (1762/1997). When in the second book he notes that "any legitimate government is a republican one" (II 6), he seems to consider that republics include monarchies that comply with his standards of legitimacy. But in the third book, he places the "monarchic government" "under the republican one" (III 6), thus indicating that, in his opinion, a monarchy should eventually not be considered as a republic. In 1788, when James Madison writes in the 39th release of *The Federalist Papers* about the "Republican Principles" of the American Revolution, it is done with hesitation. That diverse regimes have been called a *republic* is only an "impropriety" and only shows "the extreme inaccuracy with which the term has been used in political disquisitions."

The reticence in completely identifying the word *republic* with any kind of political collectivity, and the subsequent specialization of the word at the end of the 18th century in different languages, illustrates the progressive rediscovery of classical republican ideals and the rebirth of republicanism. Since Hans Baron's *The Crisis of the Early Italian Renaissance: Civic Humanism and Republican Liberty in an Age of Classicism and Tyranny* (1966), it is often considered that the Italian Renaissance was the time and place of the rediscovery of these republican ideals. The "humanist" movement of the time would have seen a growing interest in civic action and participation in public life. Baron and his followers, such as John G. A. Pocock, in his *Machiavellian Moment* (1975/2003), insist on the reestablishment of the republican tradition inherited from antiquity under the form of a "civic humanism." In this intellectual tradition of the Renaissance, the value of the individual, his (political notions were still strongly gendered) enlightened opinion, and his culture, nourished by the reading of the great ancients, are reflected in a civic engagement based on the commitment to defend one's collectivity and its rights and liberties. This is the basis for what Pocock calls the "Atlantic republican tradition," which drags on at least until the 18th century in America. His work, focusing on the English-speaking world after the Italian Renaissance, neglects in quite a spectacular fashion the prominent French republicanism of the 18th and 19th centuries as well as the continental republican ideologies of the 19th and 20th centuries. But it provides a historiography that, though contended, has the merit to indicate how—and when—the influence of classical Rome found its way back into modern politics.

The People

The reengagement with the model of republican Rome during the Renaissance period is crucial for modern republicanism. Even if the details of the "Machiavellian moment" in Western history might be challenged, and the role of the Florentine ideology of the Renaissance is nuanced, it is difficult to deny that with the Renaissance, and the role played in it by Italy, a shift in the conception of the relation between humanity and the world is perceptible. This change influences the conception of legitimate politics, laying the ground for modern conceptions of republicanism.

As Baron, and then Pocock, underline it, the Renaissance was characterized by a new conviction that it is necessary to be involved in the life of the city. According to these authors, this contrasts sharply with the tendency in the Middle Ages to emphasize among clerical elites the superiority of contemplation. The substance of what Baron calls "civic humanism," which has become an iconic expression for studies on republicanism, is precisely the alliance between a new vision of humanity promoted by intellectual elites and the sense that the natural outcome of this vision is involvement in state affairs. Such an involvement is obviously at odds with traditional monarchic ideologies, where political decision making and actions are concentrated at the level of the reigning monarch. The Renaissance transformed this core conviction of the Middle Ages. In a way, it reinforced it strongly with the rise of absolutism and the progressive debasement of traditional aristocracy, which gave the figure of the monarch an increasingly central role. But at the very same time, the dawning of capitalism, a new critical culture influenced by the reading of the ancients and the taste for new ideas, challenged the authoritarian grounds of absolutism. Modern republicanism is an inherent part of these changes.

The pivotal concept in this reinvention of republicanism is the rediscovery of the "people" considered as a "public." Indeed, the "people" played its role in medieval conceptions of politics, as the monarch was supposed to govern for the common good. However, this role was mostly the passive one of a recipient of good politics consenting to the action of the leader. On the contrary, in the republican tradition inherited from classical Rome, the "people" is an active subject of politics, and the role of the leader (the prince) is significantly transformed. If, as republican ideologies claim, politics is "public," then it is not a "private" thing, owned by private tenants such as kings, who would "have" the collectivity as one of their belongings. The contrast was already familiar to Roman thinkers. Tacitus, for instance, opens his *Annals*, which retrace the beginning of the empire after the fall of the republic, with a remembrance of the early Roman kings, evoking this period when "Rome was ruled by kings," as the English translation stands. In fact, Tacitus's Latin is more precise. He writes literally that "kings had the City of Rome." What he has in mind is the contrast between the king, who "has" the power, and the republican magistrate, who "exerts" power—exerts it in the name of the Roman people. This distinction between the public exercise of power, which should include the popular will, and monarchy as a form of privatization of politics is one of the strongest elements of differentiation in the Roman experience of politics. In the late history of Rome, the most powerful emperors carefully avoided taking the title of king, only using the title of prince for this reason.

Modern republicanism did not have, in its early stages, a notion of the people as thoroughly formed as was the case in classical Rome (after all, Machiavelli, one of the heroes of Pocock's "republican tradition" wrote a book about the prince and not about the people). But it still proved to be averse to absolute monarchy: The English republic in the 17th century—when the word *republicanism* entered the English vocabulary—was the first illustration of the fact, with the execution of Charles I. In the 18th century, the "people" gained a still stronger presence in political affairs and started to play a role as a prime actor of political life in an evolution that finds its ultimate formulation in the American and French revolutions. The American constitution, which grants in its Article IV, Section 4, a "Republican Form of Government," opens with the legendary formula: "We the people. . . ." The first French Republic (1792), in its turn, states in its 1793 constitution that "there can be no constitution but [that] accepted by the people."

The sense that the republic is public in that it involves the people is one of the most stable features of republicanism. This is how Madison (1788)—18 centuries after Cicero—still defines the republic:

> We may define a republic to be, or at least may bestow that name on, a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behavior. (*The Federalist Papers*, No. 39)

This definition undoubtedly adds to the classical idea a democratic sentiment that was not always present in ancient conceptions. Rome, for instance, was not a democracy, no more than the "Florentine" republics were, which serve as an early model for modern republicanism. Politicians and theoreticians were very aware of this fact, and in Rome, they even took pride in not being democrats. Cicero, in the *De Republica*, insists on a conception of the republic that illustrates Aristotle's theory of the "mixed" government: According to Cicero, the republic combines a regal element, an aristocratic one, and a democratic one, seeing in them the qualities of "affection," "talent," and "liberty."

The difference between a republic and a democracy is probably one of the oldest debated issues as regards republican matters, and to a certain extent, it has remained the same: In a democracy, the people that rule are in fact a majority, whereas in a republic, it is considered as a whole. This could be the basic difference between a *public* instance of politics and a *popular* one. In the public conception, decisions are not necessarily unanimous. But there is the idea that they should be made in the interest of the people as a global entity. This conception of the republic is akin to the concept of "general will" that Rousseau designs to explain how a public decision (about law) integrates all the differences expressed by individuals. In such a model, each individual has a voice, but everybody should recognize his (and later in the history of republics, her) best interest in the final decision even if it is not the one initially favored by the individual. In this case, Rousseau adds, it is just that the individual was wrong about what he thought was best for himself.

Rousseau's outlook cannot be considered as encompassing all sorts of republicanism. Moreover, his thought is not solely dedicated to spelling out republican ideologies but also tries to embrace the source of political legitimacy. However, both undertakings are eventually the same in his mind, as "a legitimate government is a republican one" (*Contract*, II 6), and this is how Rousseau's paradigm can serve as a general model for the republican conception of the people. It allows understanding of what is at stake in the republican idea: the attempt to articulate individual wills and rights in a collectivity that would not be dependent on individual behaviors but would aggregate them.

This model is a powerful one when it comes to understanding how the republican and democratic conceptions of the people might diverge. This is not always the case, however. Many prominent figures of modern republicanism of all periods have not differentiated between the two. The politician-thinker Thomas Jefferson (1743–1826) in the United States, where he was recognized informally as the leader of a "democrat-republican party," and the republican intellectual Alain (Émile-Auguste Chartier, 1868–1951) in France do not really imagine that republican ideals can limit the role of the people in politics. However, other authors lean toward qualifying republicanism as a specific way to consider democracy or even, like Auguste Comte (1798–1857), as a way to avoid democracy. This conception of the republic as separate from a democracy promotes a vision of the *demos* ("the people" in Greek) as standing united by showing a superior capacity to silence its internal divisions. This tendency is often critical of "liberal" conceptions of democracy, for which the division of interests is legitimate. It is even sometimes dangerously at odds with a proper liberal state: the first French republic (1792–1804) slid into "the Terror" precisely when its leaders, following Maximilien Robespierre (1758–1794), considered that any kind of opposition was the seed of a division that had to be suppressed. Because republican ideals emphasize the "agreement about justice" that Cicero talked about, they can end up, in radical practices of the republic, legitimizing the elimination of dissenters within.

The Citizen

The radicalization of terror is neither an accident in the history of republicanism nor its fate. It is not an accident in the sense that the promotion of the unity of the people in republican ideologies has often been linked with the necessity of defending the preeminence of the country. This is why nationalism, or at least a jealous affirmation of one's sovereignty, is a frequent trait of republicanism in its modern versions. It might favor a strong communitarian and possibly violent reaction against dissent. One can see it in the history of the Roman republic, which has constantly suffered from coups, exiles, and brutal evictions. The Renaissance republicanism, which serves as a paradigm for Baron and his successors, also corresponds to the dark history of the Italian republics, and Machiavelli's indifference to political violence is a symptom of this rather rough republican history.

The privilege given to the collectivity also encourages bellicose behavior toward outsiders for the sake of defending the integrity of "the people." Since classical Rome, war is often considered as a sign of the strength of true republics. The rationale for such an attitude is easily understandable. If the unity of the people is the supreme reference for republican politics, whatever threatens this unity is regarded as the most lethal menace, whether the threat comes from the inside or from the outside.

At the same time, it would be wrong to assume that republicanism is limited to an authoritarian affirmation of the people without tolerance for diversity. On the contrary, if republicanism has been rediscovered in the early stages of modernity, it is because it makes room for another value of political modernity: the individual.

The question was already raised by Cicero, who noted that a people is not "any junction of men united in any fashion" but "the junction of a multitude, which associates on the grounds of an agreement about justice and a commonality of what is useful" (I 25). The collectivity is not a collection of persons, and the people is not a multitude but its "junction" due to shared principles and interests. Hence, a way of considering the people as a *public* consists in paying attention to its composition. If the people is a collective entity, the public is also made of *individuals* who belong to the common sphere of deliberation—what Cicero calls the "agreement about justice." For this reason, republicanism cannot be unilaterally associated with a communitarian approach of politics. Cicero, and with him more largely the Roman conception of the republic, was keen on differentiating between the people in the sense of the republic and the people in the sense of a mass that would dissolve individualities. The distinction between what is public and what is "popular" parallels the distinction between a collectivity of individuals reasoning about their common interest and an indistinct crowd often suspected to be prey to momentary passions, leading to anarchy and disorder. It also parallels the opposition between politics as the outcome of rational decisions made by individuals and politics as influenced by the spread of passions through the mob. This value of republicanism has been particularly important for the reflection on French republicanism. Authors such as Jules Barni (1818–1878), Edgar Quinet (1803–1875), and Alain insist on the value of individual reasoning to achieve a more efficient republic. The people is worth what each part of it is.

This individual that republicanism celebrates as the vivid part of the people is not the one lost in his (and later, her) special interests; it is the individual who is able to understand the common good and reflect on it. This individual is the citizen. For this reason, the republican prominence of the individual does not solely reflect the rise of modern individualism, though it is obviously compatible with it. Rome also promoted the individual citizen as an important aspect of its "republicanism." But in modern times, the figure of the citizen is a practical solution that republicanism offers to solve the delicate equation of contemporary politics, for which the necessity to govern, the voice of the governed in public matters, and the place of the individual in a social life that is by necessity a collective one are as imperative as they are contradictory.

The major device in this configuration is the role of the law. The republican tradition considers that law is the product of the collective reasoning of the citizens, the citizen being defined since Aristotle (384–322 BCE) as the one who has the right to participate in the life of the city. Hence, law is a testimony to the appropriation of politics by the people, who can recognize themselves in the ruling of their country, and hence ensures that the republic is truly public—that is, a product of the people's will. This is why the citizen, as we have seen with Rousseau, does not decide from a personal point of view. He makes his decision in view of what he thinks best for his country. This kind of abnegation is both integrative and exclusive: By deciding the rules that are applied to the whole political body (or, in a representative government, by choosing those who make or apply the law), the citizen extends his real sphere of influence to the coalescence of his vote with those of his peers in a ballot. This is a particularly strong way of integrating each individual into a collectivity that he can grasp. At the same time, this very integration has been the reason why republicanism has often supported the exclusion of those who were considered unable to participate in the elevated sense of the public sphere because they were too tied to private interests—slaves in antiquity and, until the 20th century, women, whom many republics, such as the French or the Helvetic republics, have adamantly excluded (until 1944 in France and until 1971, even until 1990 at the local level, in Switzerland).

This elevated sense of the public good is often linked, in the republican literature, with the theme of a specific virtue on which republicanism depends. The virtue of the citizen is not solely moral. It is also an important political device, as this virtue consists in being able to see beyond one's immediate benefit and to favor the collectivity over oneself. This attitude regularly leans toward a sacrificial rhetoric, in which the individual must be ready to forgo his personal interests for the sake of the public good. The Romans had a particularly rich mythology of citizens sacrificing their life or their well-being for Rome. This bold conception of virtuous devotion resurfaced in the Italian Renaissance and continued to feed republicanism during the American and French revolutions in the 18th century. During World War I, the theme of the sacrifice of the soldier for the homeland is constant in the French republican propaganda, for instance.

There is another important aspect of the republican conception of the law: the equality of citizens before the law. This allows differentiating between the individual engaged as an equal to any other individual in the public sphere and the same individual in the private sphere, where inequalities dominate and where the individual is limited to local interests and constraints. The law is thus placed between the citizen and the wider public collectivity in which he still recognizes himself. Republicanism thus promotes a universal conception of politics, in the sense that everybody is supposed to be integrated in this equal sense of the common good that translates into laws.

Liberty

From a republican standpoint, the rule of law is thus not only a way to govern the people. It is also a way to preserve and reinforce a central political value: liberty.

While liberty is not solely a republican concept, it is not possible to imagine, whichever period we consider, a republican ideology that would not favor liberty as the most important aspect of its public values. This, once again, is linked with the centrality of the people in the conception of politics that republicanism develops. Maintaining the integrity of the people means that it must not be subject to any foreign law. To that extent, liberty concentrates all the functions of politics from a republican standpoint.

Freedom is first linked with the absence of tyranny. This aspect explains how suspicious monarchical regimes look in a republican conception; there is the deep fear that the personal sovereign might turn into a despot. But republican freedom is more than just protection from the evils of personal subjection; it is also perceived as a function of the law. As the French republican Jules Barni (1872) underlines it in his *Manuel républicain*, law in a republic has as

> its object to regulate the reciprocal relations of citizens, in order to insure both the respect of their individual rights and the well being of society as a whole. . . . Instead of hindering individual freedom, laws must . . . protect its legitimate usage. (II 6, 36)

Barni's analysis is a significant illustration of republican principles; he sums up many of the values of late-modern republicanism, for which law is a means to protect freedom and not to "hinder" it. If the people is the foundation of the republic, the law made by this people is its own expression of freedom, and the republican tradition as a whole could illustrate the proud aphorism of Rousseau (1762/1997): "Obedience to a law which we prescribe to ourselves is liberty" (*Social Contract*, I 8).

However, this conception of the law is at odds with a more pessimistic outlook that states that any form of law is a limitation of somebody's liberty. This analysis, developed by Isaiah Berlin (1909–1997) in his famous article "Two Concepts of Liberty," leads to the idea of "negative freedom," which is based on noninterference: One is free inasmuch as nobody interferes with one. This conception of liberty is often labeled as the "liberal" one. Berlin opposes this conception and puts forth a "positive" understanding of liberty, which claims that freedom is the participation of the people in the making of the law, as one cannot be self-oppressed. These categories, originally crafted after Constant's remarks (1767–1830) in his 1819 lecture "On the Liberty of the Ancients Compared With That of the Moderns," provide an easy contrast between a liberal conception of freedom based on noninterference and a republican conception that takes its roots in collective participation in the public sphere. Contemporary republicanism contends that the former allows the retreat of citizens from the public sphere to enjoy private freedom and insists on the necessity for citizens to engage in the public sphere in order to preserve their liberty.

The two positions are not incompatible. Constant, and then Berlin, emphasize that political freedom is a combination of private enjoyment and political mobilization to promote and defend freedom. This does not entirely satisfy the requisites of republicanism, and the contemporary republican thinker Philip Pettit insists that the aim is less a "combination" of positive and negative liberties than "a third alternative." This alternative would be "the conception of freedom as non-domination." This, Philip Pettit (1997) writes, "requires that no one is able to interfere on an arbitrary basis—at their pleasure—in the choices of the free person. This is the conception espoused in the long republican tradition" (chap. 1). Such a conception is for him the path to a renovated republicanism that can accommodate both the republican tradition of an engaged people developing a strong sense of the autonomy of its community and a modern sense of freedom that makes room for differences in lifestyles and values the private sphere, without forgetting that the pursuit of happiness is thoroughly hampered in a world devoid of true political freedom.

Conclusion

Republicanism, beyond its venerable antique origins, has undoubtedly proven to be a dynamic way of addressing the questions of political modernity. By providing political theory with an integrative conception of the law and by highlighting a conception of freedom that respects individual rights and the necessity to build a strong collectivity, republicanism is able to frame a particularly efficient conception of modern democracy. Its ambition is also to avoid the less favorable outcomes of the latter while retaining its most valuable inspiration. The balance is neither always easy to maintain nor always favorable to republican conceptions. Republicanism also contains, not solely as a theory but also as a political reality, the seeds of authoritarian behavior and the temptation of conservatism and of elitism. Liberal democracy might be criticized, and efficiently so from a republican standpoint, for its propensity to comply with the rule of a changing, superficial majority. But republicanism might not give a fully satisfying response to these evils when it pretends that majorities rule legitimately not on the grounds of their numerical superiority but because they are or should be the voice of the people as a whole. If, as republicanism contends, liberalism is never completely immune from the temptation of relativism and indifference, republicanism is also never fully above the suspicion of desiring, as Rousseau put it, to force people to be free.

RESPONSIBILITY

Responsibility is one of those big political words that are commonly used but whose precise meaning is often left obscure. Responsibility is a concept that implies a value judgment, but the values it embodies can differ according to the context, the discourse, and the views of the speaker. Responsibility is a state of affairs—more precisely, as the Oxford and Webster's dictionaries define it: the state, quality, or fact of being responsible. However, one can be responsible in a variety of ways, which signify various usages of the concept of responsibility.

Usages of the Concept of Responsibility

Responsibility as Agency, Cause, or Capacity

The concept of responsibility can be used to indicate that someone or something has had the power to cause a particular event to happen. In a mere descriptive sense, responsibility, in this sense of agency, coincides with *causality*. "Responsible for" can be replaced by "caused," or any other expression that suggests a causal connection. Not only human agents but also things, situations, or circumstances, can be said to be responsible—for example, "a virus was responsible for the outbreak of the epidemic." In a moral sense, however, responsibility can be ascribed only to human agents, who moreover must have the *capacity* to act responsibly. This implies that they must have had the possibility to act otherwise—that is, they must not have been compelled by external forces and they must have possessed sufficient mental capacities to have realized the consequences of their actions and to direct their will. This is a major issue in criminal law and moral philosophy and has sparked legal and philosophical debates about mens rea and about determinism versus free will.

Responsibility as Task, Duty, or Obligation

The concept of responsibility can also be used to indicate the tasks, duties, and obligations that flow from a social role, position, or office. For example, "The president is responsible for appointing the heads of federal agencies," or "It was his responsibility to coordinate the crisis response." Often the plural "responsibilities" is used, as in "She has many responsibilities." Responsibility in this sense is often followed by the preposition "for." This meaning of responsibility is often at stake in administrative law and is relevant in determining the width and extent of political accountability.

Responsibility as Accountability, Answerability, and Liability

Very often "being responsible" is used to indicate moral, political, or legal *accountability* for a sorry state of affairs. In the first instance, this may amount to simply having to provide an account to a forum, such as parliament, a congressional committee, or a legal court, and to provide information about one's conduct. Second, this can involve *answerability*. The forum may ask questions and the actor will be asked to provide justifications or excuses. Finally, this can involve *liabilities*. The forum may pass judgment on the conduct of the actor—it may approve of an annual account, denounce a policy, or publicly condemn the behavior of an official or an agency. Judgment also implies the imposition of formal or informal sanctions on the actor in case of malperformance or, for that matter, of rewards in case of adequate performance. Responsibility as accountability is often followed by the preposition "to." This sense is highly relevant in politics, for example, with regard to the doctrine of ministerial responsibility in parliamentary systems.

Responsibility as Virtue

"Being responsible" can also be used to indicate a positive moral attitude, a desirable character trait, or praiseworthy conduct. We can say of someone that she or he is a "responsible administrator," "behaves responsibly," in short, that she or he is a person with a "sense of responsibility." What these various usages have in common is that they see responsibility as a desirable quality in officials and organizations. Responsibility is used as a normative concept, as a set of standards for the behavior of actors, or as a desirable state of affairs. Often, in this type of discourse, the adjective "responsible" or the adverb "responsibly" are used, as in "responsible government," "the responsible administrator," or “we want public officials to behave responsibly.” In these usages of the concept, responsibility is seen as a *virtue*, as a positive feature of institutions or officials. It is used to positively qualify a state of affairs or the performance of an actor. It comes close to “responsiveness,” considerateness, and a willingness to act in a transparent, fair, and equitable way. This sense is often used in discussions about political morality and administrative ethics.

Historical Roots

The noun *responsibility* is relatively modern. According to the *Oxford English Dictionary*, the first references date back to the end of the 19th century. It appears, for example, in *The Federalist Papers* and in the work of Edmund Burke, where it refers to both capacity and obligation. The adjective “responsible” is found much earlier, for example, in the work of both Thomas Hobbes and John Locke, as being liable and virtuous, respectively. Responsibility used in the sense of virtue can be found in modern Christian ethics from the 19th century onward. Both the English “responsibility” and the French *responsabilité* can presumably be traced to the word *responsabilis*. This term, meaning having to answer, does not occur in the classic Latin vocabularies and probably dates from the legal jargon of the late Middle Ages.

Active and Passive Responsibility

In the realm of politics, with its multiple and often evocative uses of the word *responsibility*, it can be helpful to distinguish between active and passive responsibility. This distinction more or less amounts to the distinction between responsibility as a virtue on the one hand and as accountability or a liability on the other.

When responsibility as a virtue is at stake, the focus is on action in the present, on the prevention of undesirable situations and events. Active responsibility is about taking responsibility *ex ante*, about *behaving* responsibly. The central question is “What should be done?” An example of such a proactive use of the concept of responsibility in the realm of politics is Max Weber’s famous distinction between an ethics of principle and an ethics of responsibility. According to Weber, a strictly deontological approach to politics, in which all that matters is adherence to political principles, is highly irresponsible. The truly responsible politician takes the foreseeable consequences of his own decisions into account when deciding on a course of action.

In the case of passive responsibility, the focus is on determining accountabilities and liabilities after the fact. Passive responsibility is retrospective in nature, it is about responsibility *ex post*, about *holding* someone accountable for a given state of affairs. The central question is “Who is to blame?” Passive responsibility has both a practical dimension—who is to be held accountable?—and a normative dimension—who is to bear the blame and suffer the consequences? In the realm of politics, a major issue in this regard is the *problem of many hands*, which was first coined by Dennis Thompson. Because many different officials contribute in many ways to decisions and policies of government, it is difficult, both practically and in principle, to identify who is responsible for political outcomes.

Political Responsibility

In most Western democracies, the problem of many hands has led to introducing a kind of vicarious liability for ministers, heads of departments, and other political officials. They are, at least in principle, accountable to parliament or congress for anything that goes wrong under their guidance, whether or not they were actually in a position to do anything about it. In political practice, however, political leaders often accept complete responsibility only *in retoricis*, without accepting further consequences. Political responsibility is often limited to giving an account and to answering questions from journalists or political representatives and does not extend to resignation.

In Westminster parliamentary systems, this vicarious liability is known as the *doctrine of ministerial responsibility*. Ministers are accountable to parliament not just for their own conduct but also for any acts or omissions of their civil servants. The traditional view of ministerial responsibility holds that in the case of serious mistakes of civil servants a minister should not only give an account to parliament but should also take the blame and resign, regardless of whether he himself or she herself was personally to blame. This is also known as the Carrington doctrine—after Lord Carrington, the British minister of Foreign Affairs, who resigned because his intelligence service had presumably not foreseen the Argentinean invasion of the Falkland Islands. However, the practice of ministerial responsibility does not extend nearly as far as this broadly conceived doctrine. If ministers resign at all, they usually do so only because they have failed in personally supervising their civil servants or in their conduct toward parliament. (Even the resignation of Lord Carrington came to be seen by many as less noble than it seemed, because years later it turned out that he himself had decided not to pass on the information about the pending invasion of the Falklands.)

An important advantage of this rather narrow view of ministerial responsibility is that cabinets will not lose very capable ministers as a result of unfortunate incidents. A major disadvantage is that this weakens the political control of the civil service, as there is no direct political accountability of civil servants in most Westminster systems. This is different in the United States, where senior public officials can be asked to give an account before congressional committees.

RESPONSIVENESS

The most general connotation of the notion of *responsiveness* pertains—as a noun—to reactivity or sensitivity. Descriptively, it denotes the quality of being responsive to stimulation: as a dynamic process of reacting quickly. The adjective *responsive* refers to "answering, replying, and responding" as well as being "susceptible to the feelings of others." In technology, the term is used to describe how quickly the system responds to user input. This entry analyzes in greater depth the meaning of the notion, points out the components of responsiveness and its foci, and discusses what its "causal links" are.

Meaning

The political meaning of *responsiveness* is rather faithful to all the foregoing meanings. Responsiveness in political science is closely related to concepts such as "representation," "accountability," "delegation," and "representative government." Many scholars consider the stable responsiveness of a government to the preferences of its citizens to be a fundamental feature of a representative democracy.

Before disentangling the concept of *responsiveness*, let us concentrate on the other aforementioned notions and phenomena. *Accountability*—reads one of the political science dictionaries—has two major meanings, which partly overlap. First, the more common and standard one is that those who hold power are, in a broad sense, stewards and must be able to manifest the fact that they exercise power and fulfill their duties properly. (It is precisely the issue of fulfilling their duties that is at the crux of the concept of responsiveness.) Second, accountability refers to arrangements that secure conformity between the values of a delegating body and the person to whom the powers and responsibilities are delegated. In contemporary democracies, governments are accountable to the people through the process of election. This means that political accountability confines the use of power and, if need be, sanctions its abuse. Institutionalizing accountability means de facto binding the use of political power to specific, clearly defined, and publicly accepted standards.

The hidden dimension of these relationships pertains to the phenomenon (and concept) of *delegation*. Governing and political decision making in large entities, such as contemporary democratic states, entails the delegation of authority. The right to make decisions is designated—in agency relationships—to an *agent* by a *principal*. However, this task is conditional; it continues only if the principal is satisfied with the deeds of the agent and the former is satisfied when the agent performs in accordance with the principal's wishes and interests. It may be withdrawn, however, if the principal's evaluation is poor. This very conditionality, coupled with the possibility of withdrawal, is the essence of accountability mechanisms. This threat of withdrawal need not materialize; as a confidence procedure, accountability works even when the principal is not trying to replace the agent with an alternative. Yet she or he has the potential and means to do so. Consequently, "governments are *accountable*"—as the classic volume on the topic puts it—"if voters can discern whether governments are acting in their interests and sanction them appropriately, so that incumbents who act in the best interests of citizens win reelection and those who do not lose them" (Adam Przeworski, Susan C. Stokes, & Bernard Manin, 1999, p. 40). The single macromechanism behind this, approximating the phenomenon of responsiveness, is the one that forces the incumbents to choose policies that enhance their chances of reelection. In the same volume, one finds yet another proposal of a linkage between accountability and responsiveness: "Accountability is . . . a property of institutional structures, whereas responsiveness is a consequence of interaction within such structures. . . . Responsiveness is a measure of how much accountability an institutional infrastructure permits" (Przeworski et al., 1999, p. 131).

The notions introduced here might be better understood if approached from a policy process perspective. A simplified model of policy process assumes that it starts with the commonsense premise that what drives politics are people's interests and values, which are translated into preferences; these preferences are then aggregated and signaled (via elections, demonstrations, and opinion polls) to respective politicians. In contemporary representative democracies, "mandates" are the essential form of such "signals" sent out at elections, constituting, in fact, a choice between the different political programs offered by competing parties. Once elected, politicians implement policies, which result in certain political outcomes. It is these outcomes that are evaluated—one criterion of which is their congruency with voters' preferences; if the evaluation is positive, it is very likely that the incumbent will remain in office; if it is negative, the likelihood of replacing one camp of politicians with another is high. In short, representation is a relation between interests and outcomes; the essence of responsiveness is in the relationship between "signals" and "policies" as well as between "mandates" and "policies."

A responsive government is one that takes into account the preferences of the citizens and acts according to these preferences. The key purpose of the mechanism of accountability is guaranteeing that agents do not depart from the expressed or tacit, though objective, interests of their principals. In a way, accountability is a means to a political end, which is responsiveness. Put differently, one may state that accountability is the property of an institutionalized relationship in which the exercise of power by one actor or set of actors is constrained and subject to some requirement of responsiveness to those over whom the power is exercised.

Defined in such a way, accountability can be further divided into two functional dimensions: Transparency in the exercise of power and enforceability of the principle of responsiveness via the establishment of some means by which sanctions can be imposed on representatives in case they misrepresent constituents or violate commonly accepted standards.

Unfortunately, citizens at large cannot participate in all decisions that affect them; however, accountability mechanisms assume that representative responsiveness requires a certain level of citizen competence and participation in controlling representatives. Obviously, political systems differ; one of the fundamental domains of empirical research concerns exactly this—what kind of political institutions provide incentives for representatives to be responsive. The main distinction in this respect lies either between presidential versus parliamentary systems or between two visions of democracy, one coined the "majority control vision" and the other the "proportionate influence vision." The major difference between the latter two is whether the government ought to be responsive to the majority of people, as the first Westminster majoritarian design assumes, or to as many people as possible, which is the underlying political logic of proportional, consensus-type democracies. Many empirical studies confirm theoretical expectations and indicate that different visions of democracy, manifested by the relevant institutional infrastructures, have an impact on the type and quality of responsiveness in an anticipated direction. At the same time, the intricacies within responsiveness are sensitive to representational role orientations (i.e., party role, pressure group role, and constituency-representational role).

General politics is divided into issue packages or policy areas. Responsiveness is not an unmitigated virtue. In some areas, we expect politicians to be responsive; in others, more complex and specialized, we believe that politicians and their advisers should decide on our behalf without great attention to our preferences (e.g., monetary policy, defense spending). As a result, how much accountability there should be is a difficult issue to resolve and can be decided only in view of to what extent popular responsiveness is desired.

Components of Responsiveness

Responsiveness ought to be viewed as a complex, multidimensional phenomenon composed of a variety of targets in the relationship between the representatives and the represented. Most commonly, responsiveness pertains to policy congruence. However, there are at least three other components, which result in service responsiveness, allocation responsiveness, and symbolic responsiveness. It is only when all four components are taken into account simultaneously that one can truly cover the representation phenomenon.

Policy responsiveness refers to the relationship between a district's or electorate's stance on a policy issue, determined by some measure of central tendency, and the policy orientation of the representative and, consequently, to his or her decisions concerning its implementation. This concerns the congruence or fit between the two sides of the representational bond; one expects a meaningful link between the policy preferences of the electorate and the deeds of their representatives, be they attitudinal or behavioral. To claim that policy responsiveness exists, one must ensure that both the representative and his or her constituents agree on a particular policy. Many problems arise: (a) some scholars point to the alleged incompetence of the constituents, (b) others indicate that in many policy areas they usually prove incompetent, (c) another problem derives from responsiveness to the long-term interests of the constituents versus their immediate wishes, and (d) still another problematic issue concerns biased information that the representative has about either the wishes or the interests of the constituents.

Service responsiveness covers a wide range of activities performed by the representative, often dubbed "pork barrel politics" or "case work." This concerns the benefits a representative can secure for the constituents outside his or her legislative work. At the individual level, this ranges from responding to letters and inquiries to interventions on behalf of citizens in state or local institutions. On a more collective, macrolevel, the representative might embark on the role of an advocate or lobbyist for local interests.

Allocation responsiveness is relatively similar to the "service" type, except that in this case the initiative is rather on the side of the representative and the scope of activity is broader. Allocation often concerns what is usually called "public goods" and is related to the development of the welfare state and expansion of the state's role in society and the economy. Usually, such allocations benefit entire regions as a whole and, in reality, this very much depends on the representative's future orientation and his or her ability to anticipate the prospective needs and developments of a given area. Seen from another angle, this means she or he invigorates local entrepreneurship, animates local communities, and stimulates people's needs.

Symbolic responsiveness is less behavioral and more psychological. It is also more vague and diffused in its manifestations. Symbolic responsiveness pertains more to diffused trust and support caused by how the representative's role is performed and is less related to the particular, instrumental satisfaction derived from acquiring some material goods or profit. It more often concerns fundamental values, confidence in political procedures, and the way a politician behaves; it concerns his or her integrity. What matters most in symbolic responsiveness is that voters feel represented, which is at the crux of the legitimacy of the general political system.

Consequently, because of the relative independence of these four forms of responsiveness, there is no reason to assume that good, effective responsiveness in one domain ought to be accompanied by equally effective and sound responsiveness in another domain. Particular voters and social groups might be unsatisfied with the performance of their representative in some policy area, but at the same time, they may be relatively satisfied by the way he or she delivers services.

There are, however, certain patterned relationships regarding the frequency of the occurrence of particular forms of responsiveness. If politicians—for whatever reason—are oriented toward local interest, what follows is the high priority given to "service" and "allocation" responsiveness. If, however, they are focused on the party role, they are more likely to give precedence to "policy" or "symbolic" responsiveness.

A frequently debated issue within the political representation domain is the extent to which, on the one hand, the "will to represent" and, on the other, the problem of the district's or electorate's heterogeneity are important for the quality of representation. The former—the will to represent—is at the crux of the responsiveness phenomenon, although in the classical formulation of the "standing for" descriptive representation, the will is not necessary. The representative might simply look responsive because he or she is from the constituents' geographical district. Moreover, even if the representative has a distaste for representing the will of the people, he or she might nevertheless deliver high-quality representation—that is, look responsive—because his or her values, attitudes, and preferences are similar to the constituents', notwithstanding a knowledge or willingness to follow their expectation of principals. In a nutshell, it is important to know where such unintentional and accidental responsiveness occurs and what are its long-term effects—for instance, for the reelection of the representative. It is worth noting that the mainstream classical approach to political representation and responsiveness assumes the will to represent as an important point of departure for deciding to whom exactly, what precisely, and by what means the representative is intentionally attempting to be responsive.

The latter—the issue of the district's or electorate's heterogeneity—is even more acute for the quality of responsiveness. In an ideal world, which is rarely the case, the existence of a perfectly homogeneous constituency would allow the representative to—at least potentially—become an ideal representative, achieving perfect responsiveness vis-à-vis a constituent's preferences. In fact, the extent to which his or her representational merits approximate perfection depends completely on him or her, assuming that the representative has access to reliable information about the district's sentiments and the will to familiarize himself or herself with them. The world is, nevertheless, much more complicated, and the usual state comprises complex heterogeneous constituencies coupled with a limited ability of the latter to effectively communicate its preferences. In such an instance, what a "willing to be responsive" representative can do is offer issue stances and enact policies that minimize the unsolvable problem of representing conflicting interests. The best the representative can do is to follow the majority, more precisely; learn about some central tendency in his or her constituency; and follow the preferences of such a majority. If, however, there is no clear majority, or—worse—the district preferences are highly polarized, the representative can either decide to be responsive to one end of the spectrum or offer some "central" policies that will rarely represent the sentiments of anybody but will at least minimize the discrepancy between the representative and the constituency at large. One should note, however, that such a far-from-unique situation regarding significant district heterogeneity is a sound excuse for the representative to follow his or her own considered judgments or conscience when having to make ultimate legislative decisions, which are often supported by details of competent deliberation among peers.

Focus of Responsiveness

Another method of depicting the multidimensionality of responsiveness is through the foci of the representation relationship. Briefly stated, the foci can be organized into three baskets. The first is a geographical focus; both representatives and constituents may think that the crucial representative bond is between the representative and the constituency defined in terms of region, state, city, or district. Second, the representation focus can be viewed by means of a classical functional approach, conceiving what is to be represented in terms of class, professional group, ethnic or religious group, or ideological camp. Third, the focus of responsiveness can be individuals, be they socially important and influential local celebrities, or rank-and-file citizens, or unknown clients in need of assistance.

The Causal Link

Some scholars mistakenly assume that responsiveness by its very nature is always a dependent variable. The representation relationship is far more complex: Transactions between the represented and representative are dynamic, top down and bottom up, and their very essence depends to a large degree on both the exact component and the focus of responsiveness. *Responsiveness* and *response* are not the same. In fact a "purely reactive" representative is a far cry from the ideal role model assumed in contemporary democracies.

This is a relevant place to check the classics. Hanna Pitkin, in her now classic 1967 work on representation, does not define the concept of responsiveness. The responsiveness phenomenon features, however, in the chapter on the mandate–independence controversy. Following Burke's famous opposition, Pitkin also asks many detailed questions related to the issue of whether a representative ought to do what the constituents want, and be bound by mandates or direct instructions from them, or be free to act as he or she chooses based on his or her skills, knowledge, and competence to guarantee their welfare. To precisely grasp and conceptualize the responsiveness phenomenon, it is extremely important to decide at which point we lie between the two poles of the ideal model of the mandate–independence controversy. On the one hand, one may assume that "good representation" occurs only when the representative acts on direct and explicit instructions from his constituents, and any deviation from them is considered unacceptable. At the other end of the scale, good representation means complete independence and full discretion; consequently, constituents have no right even to assess the fulfillment of campaign promises; in this stance, once the representative is elected, he or she must be completely free to use his or her own judgment and competence. Of course, there are solutions that fall in between: One might expect a "good representative" to act as he or she thinks the constituents would want, unless he or she receives instructions from them, which then must be obeyed. Whatever the precise understanding of good representation is assumed to be, it has direct consequences on the way we conceive the notion of responsiveness.

An additional requirement for clarifying this paradox is that it is expected that the represented must reveal the ability to be active. Pitkin highlights throughout the book that "the represented must be both present and not present" to talk logically of the very sense of representation. The representative must, of course, act and be independent; however, the represented must be in some sense acting through him or her. Moreover, the relationship between the two becomes meaningful only if the represented is capable of action, and has and is ready to present a will, judgment, or a preference on his or her own. If this capability and readiness to act is missing, the whole idea of representation as substantive activity is questionable. Acting on behalf of someone who is completely helpless, has no idea of what his or her preferences are, or is totally incompetent is not representing. As a consequence, the process of representing consists of supporting and achieving the interests of the represented, assuming that the represented is capable of judgment and action, but at the same time, it does not act and does not object to what is done on his or her behalf by the representative.

> *What* [italics added] the representative does must be in his principal's interest, but *the way* [italics added] he does it must be responsive to the principal's wishes. . . . Responsiveness seems to have a kind of negative criterion: conflict must be possible and yet nevertheless not occur. (Pitkin, 1967/1985, p. 155)

The reasons for either following the will of the people or promoting their interest is crucial from yet another perspective—the cognitive ability and mobilization of the citizenry at large. Numerous methodologically sound empirical endeavors show that a very small proportion of the public can actually articulate their interests; moreover, even fewer people can manifest coherent belief systems that allow their values and preferences to be translated into comprehensive rational policies. In such a situation, the dilemma of the representative, whether and to what exactly he has to be responsive, is extremely complicated. If no conflict between citizens' wishes and their interests is visible, the role of the representative is relatively simple, but on rare occasions, this does occur. Obviously, the representative need not follow the wishes of the represented, but he or she must consider them, especially when they are in conflict with what he sees as the constituent's interests, because the reason for this discrepancy must be found and clarified. This stipulation is at least true for democracies. In other words, if a representative behaves and acts contrary to the publicly known wishes of his electorate, some explicit rationale is required. Such behavior calls for explanation and justification. It is precisely at this point that the issue of responsiveness comes into play. The representative has to explain why he or she is *unresponsive;* and not any explanation will do, and only certain clarifications will be legitimized by the people. On the other hand, accepted justifications boost the chances of the representative's reelection.

Throughout this classic volume, one finds a convincing picture of political representation that is impersonal and institutional. Whenever we refer to a system or government as "representative" we are in fact describing an institutional arrangement and its mechanisms. The representation, and its quality, emerges not from an individual will to represent, but from the logic of the structure and functions of the system. Political representation comes about when the system is effectively looking "after the public interest and is responsive to public opinion except insofar as nonresponsiveness can be justified in terms of public interest" (Pitkin, 1967/1985, p. 224). These traits of representation—its "public" and "institutional" character—contrary to many assumptions about the individualistic, dyadic nature of responsiveness, can emerge independently from any deliberate interactions between voters and representatives. It is because of the very mechanisms of free media, separation of powers, regular fair elections, and other inventions of liberal democracies that responsiveness is likely to emerge even from a political system in which particular individuals, voters, and representatives are pursuing quite other goals.

This problem—to what extent responsiveness is a systemic property and to what extent it should be treated as emerging from individual deliberate interactions—remains a question open to empirical inquiry.

RESPONSIVENESS OF BUREAUCRACY

Responsiveness is one member of a family of related and positively valued concepts such as responsibility and answerability that have to do with the accountability of bureaucrats. There is, at first glance, generally, little controversy about the proposition that bureaucrats should be responsive to the (elected) politicians or their appointees at the top levels of governments. This seems obvious, or it would be impossible to hold politicians accountable for the actions of the governments they lead. However, beneath these simple statements lurks a minefield of complications.

Responsive to Whom or to What?

How responsive do we want bureaucrats to be to those at the top levels of government? Might we also want them to answer to those they serve, their "customers," in the language favored by recent reformers? Or to the norms and traditions of the organizations they serve? Or to external expectations that come from their professions—to the standards and norms of their roles as scientists, engineers, social workers, or related professionals? Or to some moral standards that are widely shared in the society? Or to the desires of those in the legislative branch of government, especially if they work in a separation-of-powers system, such as that of the United States?

When there is a clash between the demands of the many forces that affect bureaucrats and the orders of those at the top of governments, the situation becomes complex. The most extreme and, in a sense, the most straightforward to deal with is when government leaders demand actions that clash with common morality—mass killing, torture, depriving people of basic rights, and the like. There bureaucrats are looked on, at least after the fact, as heroes when they are not responsive.

Most situations are not so clear, even in retrospect. Bureaucrats in agencies responsible for protecting the environment may be pressured by scientific evidence on the one side that suggests the need for strict regulation of pesticides or of factory emissions and on the other by political leaders who oppose such regulation and interpret the laws in these areas in a way that preclude strict regulation. Customers or constituents of organizations may have preferences that differ from those at the top of governments, and they may be in a position to make life very uncomfortable, now or in the future, for those who do not respond to them. Bureaucrats who have been trained as scientists, engineers, or social workers may face demands from political leaders who would rather please an important constituency than follow a course recommended by scientific findings or the standards of a given profession. Legislators, especially in systems with strong legislative committees, may have different perspectives than executive leaders on what should be done, and these legislators may be quite influential because of longevity in office or the related possibility that they will be there long after executive leaders have departed.

Responsiveness Problems

Bureaucrats, especially those at or near the top levels of their organizations, have numerous resources that they bring to the relationship with politicians. They have the expertise gained through long service in a given area, supplemented often by specialized training prior to entering the civil service and training on the job and in programs designed to increase their knowledge. Max Weber, perhaps the most famous theorist of bureaucracy, put a great deal of emphasis on the power this expertise brought, and though those who study bureaucracy may debate the level of bureaucratic influence under various circumstances, few would deny it. Senior career civil servants have a great deal of knowledge about the history of their programs, the proposals that have been made in the past to change their programs, the constellation of forces that stand in support or in opposition to their programs, and what has worked or failed to work in the past. This is useful information to politicians, and they ignore it at their peril, but it also permits bureaucrats to help shape the agenda and to exert control over what is or is not done. In a real sense, bureaucrats responding to requests for information may make their nominal masters responsive to them rather than the other way around. This is a consistent dilemma for executive politicians seeking change.

A related problem is that leaders may be reluctant to give clear signals to their subordinates about policy changes because too much clarity can be a source of political opposition or embarrassment after proposals have been compromised to secure adoption. This ambiguity gives civil servants opportunities to shape their responses in ways that insert their own preferences or those of supporters of their programs into the mix without seeming to act in an unresponsive manner.

Civil servants can also act in a passive-aggressive manner, withholding information that would be very useful to their superiors. Political leaders should want to avoid this, but if they distrust or ignore civil servants, they may inadvertently encourage such behavior.

On the other side of this problem is the dilemma bureaucrats may face when they deliver advice or analyses to politicians based on what they believe in good conscience are the facts or are reasonable conclusions based on experience. Politicians, motivated by their ideologies—and research shows that they are generally more motivated by ideologies than bureaucrats—may react harshly to such information if it does not fit their predilections and may blame the messenger for what they are told. The easy way out for bureaucrats is to avoid providing such information or advice, or even to distort what is communicated to fit the predilections of political superiors, though one can make a strong argument that such a course is not the responsible way for a professional to be responsive.

Finally, as mentioned above, in real political systems, especially in separation of powers systems, there are multiple authorities with some say over what civil servants do. How to deal with conflicting demands from these authorities can be a big problem for those who see it as their role to be responsive and an opportunity for those with their own agendas.

Exit, Voice, or Loyalty?

The most famous book relevant to this general subject is *Exit, Voice, and Loyalty*, by Albert Hirschman. Hirschman argues that an organization's customers or employees have three basic things they can do when they are dissatisfied with the policies or actions of those who head the organization. One option is exit. Civil servants, the focus of this essay, can resign in protest. This may be a futile gesture, but it may also—if handled astutely—result in much negative publicity for the organization or policy that is the target of the resignation. A problem for a career civil servant is that he or she may not have the resources to cope effectively with the aftermath of exit. In addition, the gesture may be futile. The organization may be able to simply shrug off the resignation and continue doing what it did before with relatively little problem. On the other hand, a dramatic resignation may cause the organization a good bit of trouble; indeed, even the threat of resignation may be adequate from the standpoint of the civil servant. Whatever the ultimate outcome, exit is a way to avoid responsiveness.

A second option is voice. Here, the civil servant stays in the organization and gives voice to his or her concerns. At one level, this is an expression of loyalty because the civil servant stays and expresses what he or she believes should be done (or what the available evidence suggests should be done), but it may be greeted with hostility by those at the top of the organization. The civil servant who gives voice may be relegated to an unimportant job, not receive promotions, or be the target of other acts of recrimination. Evidence indicates that there is a cultural dimension to voice—that is, how appropriate people think it is as a means to express dissent. For example, in a comparative study done in the mid-1980s, 82% of West German civil servants felt that they should support their government's policies even if they personally disagreed and found them "very undesirable or ill considered," whereas only 42% of U.S. civil servants felt the same way.

A more aggressive form of voice, especially attractive if exiting is not a readily available choice, is sabotage. Here the civil servant remains in the organization but gives voice by passing information to those in a position to use it against the organization. Ironically, those who feel extremely attached to the organization may find this the best course of action. So-called whistle-blowing has become more and more institutionalized in U.S. organizations, with formal protections in place to protect the whistle-blower, but the simple leaking of information that can compromise the direction of an organization by the current leadership is a time-honored practice in bureaucracies. Research findings in the United States indicate that civil servants would prefer to give voice within the confines of the government, resigning if persuasion does not work and the disagreement is severe. Leaking, then, may be thought of as something between voice and exit.

The final option is loyalty. Here the civil servant sticks with the organization and follows its directives no matter what he or she might think of what is asked. This is responsiveness that may be attractive to organizational leadership because what it wants will be implemented no matter what the people in the organization's bureaucracy might think or prefer. But there is a cost, and the cost can be significant if the leadership's goals are unattainable, extremely costly, extremely unwise, or some combination of the above. Bureaucratic voice, at a minimum, is often in the interest of the leadership; abject submissiveness may be much regretted after the fact.

Conclusion

Bureaucratic responsiveness is important in a governing system where top decision makers are ultimately held accountable for the policies and actions of the governments they lead. We would not want politicians to say credibly that while the law permitted alternate actions, the career bureaucracy was unresponsive and there was no way because of that to change programs or policies. On the other hand, we also should be wary of a totally submissive bureaucracy. Bureaucrats carry with them the expertise and experience to help make policy decisions viable and policy implementation effective. They know a great deal about what has worked in the past, what has failed for technical or political reasons, and what course might be best for accomplishing what political leaders would like, though this may require changes and compromises that political leaders would prefer to avoid. Ideally, bureaucrats also adhere to a code of personal and professional conduct that makes them valuable servants of the nation, leading them to resist the worst impulses that might seize national leaders. An "unresponsive" civil servant who refused to send victims to concentration camps or to help organize torture sessions would deserve the thanks of his or her nation. It is hoped that cases where this is necessary will be extraordinarily rare. In between that extreme and abject obedience is found a complicated world where bureaucratic responsiveness is much sought after but, for the most part, not fully attainable or even fully desirable.

REVISIONISM

As a term of art, *revisionism* surfaced in the late 1800s and has since steadily gained in scope. Its meaning may be either critical or assertive, but its purpose is always to probe the intellectual validity and the political legitimacy of a dominant orthodoxy. The notion typically implies an ongoing attempt to revise, revisit, or reconsider an official, mainstream, well-established, or at least widely accepted tenet, brought forth by the history of political thought and events that claims ethical authenticity and prescribes normative conduct in public affairs. For regular criticism to qualify as revisionism, it should challenge canons of interpretation of facts, processes, and/or ideas that are conducive to the configuration (or are the intended outcome) of a system of power relations in the international arena, national politics, or academia. Revisionism deserves its name to the extent that it remains a failed orthodoxy and its proponents are singled out as deviationists not only from a prevailing construal of truth but also from the social administration of it. Hence, revisionism and revisionists are often subject to coercive interventions from the incumbent orthodoxy: sanctions in international relations, purges and trials in nondemocratic national settings, and marginalization and exclusion in the academic sphere. Revisionism itself, especially when manifested—as is frequently the case—in the realm of arts and letters, is sometimes inclined to prize such an imposed peripheral position in the production of values emphasizing negation and evasion as creative hermeneutical forces. At any rate, *revisionism* could be the name of a contentious politics of practical knowledge. This entry is especially focused on the variety of revisionisms and the ambiguities of the concept.

Variety of Revisionisms

Three authoritative interpretations of intellectual and political history, and the political arrangements that accompany them, have engendered the main versions of revisionism. They are related to Marxism, the Great War, and the Holocaust. As a strong and recurrent political label, revisionism was used aggressively in 1908 by Vladimir Lenin with the explicit intention of defining a canonical brand of Marxism against what he deemed to be the nonrevolutionary reformist trend gaining sway over German and Austrian social democracy. The evolution of Marxism as the official ideology of state socialism could be read from then on as a narrative of orthodoxy enforcing its speculative outlook and political command by permanently exposing and overcoming present or suspected revisionisms. In the history of international relations, revisionism is a descriptor of the foreign policies of the former Central Powers that stood in defiance of the status quo established in 1919 by the Treaty of Versailles. The classic example would be Hungary, a polity traumatized by severe territorial losses and insulated in a culture of denial of its new identity as a diminished European actor. The normative elusiveness of the international order presided over by the Society of Nations allowed Japan, albeit a victor of the Great War, to adopt a revisionist language, critical of Western supremacy, and to embark on revisionist operations in East Asia and the Pacific; in the process, the democratic-oriented Japanese governments of the 1920s were replaced by a military-driven direction of national politics in the 1930s. German revisionism was rooted in the 19th-century *völkisch* (ethnic) movement and related to previous forms of national revanchism (a term used since the 1870s to describe a political manifestation of the will to reverse territorial losses incurred by a country, often following a war) and irredentism (any position advocating annexation of territories administered by another state on the grounds of common ethnicity or prior historical possession, actual or alleged). The initially progressive, then turned “Old Right” American scholar Harry Elmer Barnes (1889–1968), perhaps the most prominent and prolific revisionist historian, echoed the German style in his work. In his book *The Genesis of the World War* (1929), Barnes argued against what he described as “court historians,” that the Great War (World War I) was by no proper historical account a just one, and that all the powers concerned share responsibility for its causes and course of events. He extended his argument after World War II, theorizing against the “blackout” of mainstream historiography, which he denounced as a myth factory working for political purposes and under political command. Expanding his prior analyses, Barnes maintained that Nazi German war crimes and the extermination of the European Jews were to be considered at best unproved facts, anyway matched by the treatment imposed by the Allies to the vanquished Germans.

The legacy of Barnes is twofold. On the one hand, he remains a source of inspiration for many libertarians connected to the Mises Institute, among whom Murray N. Rothbard (1926–1995) stands out. According to them, revisionism should be construed as a teacher of freedom of speech and thought, of truth and rationality in a world subdued by propaganda, and of indoctrination and spectacular mythologies taking advantage of the gullibility of a misinformed general public. On the other hand, Barnes’s work is used as a cornerstone by the massive body of literature displaying a diverse array of conspiracy theories, efforts of revision of national canonized histories, the explicit or implicit denial of the Holocaust, and other varieties of negationism. This last form of revisionism aims not only at questioning and raising doubts as to the veracity and the scale of the Hitlerian genocide but also, and most important, at leveling the guilt of all parties, civilians included, involved in the two conflagrations of the 20th century and their respective aftermaths. Had abjection been evenly distributed, there would ultimately be no irrational aggressor and no defender of just causes, no victim to be remembered, and no executioner to be held responsible. In the negationist view, the politics of retribution and memory are but tools of control of the public mind employed by conspiring minorities ruling over markets, the media, and some governments. This literature, networking across Western cultures and the Middle East, manifests itself as an alternative type of historical writing and habitually addresses marginal but committed audiences associated with extreme Right and fundamentalist political persuasions. Fostered by the language of history and doctrine, revisionism is always pleading, if only by implication, for a transfiguration of a domestic political regime or the international order.

Ambiguities of the Concept

However miscellaneous its major historical shape, *revisionism* emerged in normative terms as a word of no certain meaning. Its first uses point to this built-in ambiguity. The earliest revisionists appear to have been, rather technically, the advocates of the judicial review of the notorious Dreyfus affair that stirred political passions in 1894–1895 France. After the exculpation of Alfred Dreyfus, the notion itself was inverted by conservative voices denouncing not a mere reversal of justice but a *revision of history*. The case may provide a pattern for understanding the very fabric of revisionism: It is almost never an intellectual controversy about how reason could restore facts to their pristine historical state but rather a political contention on how a society should form its beliefs about what facts ought to stand for and who is entitled to expound their position. This indistinct word turned into a concept at about the same time in Marxist German thought. Eduard Bernstein (1850–1932) authored between 1896 and 1898 a series of articles devoted to *The Problems of Socialism*, instantly arousing a long-lasting controversy as to how Marx's entwined theories on capitalism and proletarian revolution, coined in the mid-1800s, should be empirically tested for the political use of the working-class movement. Bernstein's critique of the inaccuracy of the Marxian predictions about the inevitable collapse of capitalist economy, the accelerated impoverishment of the working class, the evaporation of the middle class, as well as his reshuffling of the labor theory of value and the dismissal of class struggle as the privileged venue of social change were initially rejected by his fellow socialists (Karl Kautsky, August Bebel, and Rosa Luxemburg) only to lay a few years later the foundations of the enduring orthodoxy guiding the policies of the Western and Central European Socialist and Social Democratic parties. What emerged as orthodoxy in Germany, France, and later Britain was dubbed revisionist by the Bolsheviks even before they seized power in Russia. Lenin wrote it clearly: To amend Marx is blatant proof of hostility toward Marxism (even if a Fabian anecdote has it that the elderly Marx did not consider himself a Marxist). Hence, revisionism grows to be the elaborate but standard crime of betrayal of the communist project. After October 1917, Lenin's triumphant party imposed itself as nothing less than revolutionary (i.e., genuine) Marxism incarnated in one country and organized globally in the Communist International. By way of consequence, to tell apart orthodoxy from reformism was no longer the task of a "professorial science" of Marxism (to quote Lenin) but the public policy of a political regime that raised "scientific socialism" to the dignity of a practical philosophy able to have recourse not only to means of persuasion but also to instruments of coercion. Plain intellectual criticism (expressed, suspected, or attributed) deserved to be qualified as revisionism as soon as a sociological dimension was tactically attached to it: Prone by definition to *embourgeoisement*, revisionists were "objectively" doomed to the condition of "social fascists," promoters of state capitalism, elitists, and agents of imperialism. Henceforth a matter of bureaucratic decision and penal sanction, revisionism multiplied its facets and materializations as the Soviet leadership moved to provide a Marxist/Leninist-certified interpretation of international and domestic political events and social processes. As long as he was in command, Stalin's thinking and actions embodied orthodoxy for all seasons: Yesterday's orthodox might have easily been unmasked as today's revisionist, as in the case of Trotsky and many others. Or else, an orthodox at home could look from abroad like a revisionist. For instance, in 1957, the Polish leader Władislaw Gomułka, while formally charging Leszek Kołakowski with revisionism (alongside other Marxist philosophers who were experiencing the Khrushchev report as an intellectual liberation), was himself accused of revisionism by his Romanian communist counterparts. In the early 1960s, Nikita Khrushchev was in turn denounced as a "modern revisionist" by Mao Zedong. Two decades later, Mao himself was labeled as one by the Albanian communists, proud to proclaim themselves antirevisionists. The term was briefly revived in 1989 by the Romanian hardliners as a causal explanation for the roundtable talks through which Hungarian or Polish ruling parties were contemplating free and fair elections and eventually a transition to political pluralism and unplanned economy. After the demise of communism, revisionism (self-styled, imaginary, or indisputable) still lends itself to a variety of uses in international and domestic politics or in academia but seems to have exhausted its career as a concept. As a moral and political language, it still can map the hermeneutical and ethical encounters of politics and history.

REVOLUTION

Social scientists have provided two alternative definitions of revolution. Some theorists articulate a political definition of revolution characterized by the forcible transfer of state power. Charles Tilly defines revolution as forcible transfer of power in the course of a struggle involving at least two distinct blocs of contenders that make incompatible claims to control the state with some significant segments of the population supporting the claims of the rival contenders. Others developed criteria that incorporated significant social outcomes. Theda Skocpol is interested in social revolutions—that is, alterations in both the political and economic structures of society. Skocpol's definition requires a rapid, basic transformation of the state and class structures that are carried out in part through class-based revolts from below. Social revolutions, though rare phenomena, have produced the most fundamental changes in the modern world and social life. For this reason, this entry will focus on the causes, processes, and outcome of social revolutions and will review alternative theories, namely, class analysis theories, state-centered theories, political-conflicts theories, and theories that stress the role of ideological transformation in accounting for revolutions.

Revolutions have played a significant role in the rise of the modern world and, over the past few centuries, have transformed the political and economic systems of social life and at least partially altered the nature of social relations. In the West, modern revolutions have been produced by conflicts over the distribution of material resources, the allocation and extent of political power, and the essence of social relations. These revolutions, in turn, eventually gave rise to modern capitalism, democracy, and various social movements, including the abolition of slavery, socialist and labor movements, civil rights, women's equality, and gay and lesbian rights. In the developing world, national liberation movements and revolutions have produced independence, nationalist regimes, and, in a few cases, socialist transformations.

Revolutionary movements and transformations have also stimulated scholarly debates about the causes, processes, and outcome of revolutions and large-scale social conflicts. Indeed, 18th- and 19th-century European revolutions and revolutionary movements influenced Karl Marx's analysis of capitalism, class conflict, and revolution, which in turn influenced generations of 20th-century social scientists.

Causes of Revolutions

Modernization and Political Instability

Modernization theorists claim that rapid economic development and social change in developing countries can be destabilizing as large-scale social transformations such as commercialization, industrialization, and urbanization dislocate and uproot large segments of the population. These changes, in turn, may generate some measure of confusion and anomie, leading to antisocial activities and destructive violent behavior. In the absence of integrative forces within the existing order, the uprooted may join revolutionary movements to integrate into the new social system. Other versions of the theory emphasize the political dimension of rapid modernization, which may extend political consciousness, expand political mobilization, and instigate demands for political participation. These developments, in turn, may undermine traditional political authority and complicate the creation of new political institutions, which may result in disorder and political instability.

Class Conflict and Revolutions

Class analysts of revolution claim that the key to understanding revolutions lies in the conflict over the distribution of material resources. These theorists often point to economic polarization, concentration of wealth and income, and rising disparities in promoting conflicts and revolutions. Under highly polarized economic conditions, the dominant and lower classes may not find common ground for compromise and peaceful coexistence but instead may adopt extremist political positions leading to conflict and revolution.

Marx was a leading proponent of the class conflict model. He viewed the contradiction between the forces and relations of production within a single mode of production to be pivotal in generating class conflict and revolutions. He claimed that class exploitation and domination within the economic sphere would generate shared interests within the working class, which would lead to class solidarity, consciousness, and organizations. Market competition and endemic economic crises under capitalism continuously undermine the position of the petty bourgeoisie and force them into the ranks of the proletariat, the industrial working class. According to Marx, these transformations would expand the proportion of the working class in advanced industrial societies and convert them into a giant force capable of disrupting the social structure. Marx expected that class conflict would inevitably find expression in the political sphere. In times of economic crisis, when the capitalist system is most vulnerable, industrial workers armed with revolutionary ideology would target the state whose policies generally support the interests of their class enemy, the capitalist class. Given the ever-expanding size of the working class and recurrent capitalist crises, the working class would ultimately be able to overthrow capitalism and establish a socialist system.

Although Marx's predictions on revolutions in advanced capitalist countries never materialized, his class analysis inspired a number of scholars to undertake studies of revolutions and large-scale social conflicts in a wide variety of countries. In a seminal work, Barrington Moore, Jr. demonstrated the ways in which alternative coalitions of urban and agrarian classes produced a constellation of 20th-century revolutions that determined the nature of the modern political systems of capitalist democracy, fascism, and communism. Moore also employed class analysis to explain conditions that produced peasant uprisings and revolutions. Other scholars, such as Jeffery Paige and Eric Wolf, also used class analysis in different ways to explain 20th-century peasant revolts and agrarian revolutions in developing countries.

State-Centered and Structural Theories of Revolution

State-centered theories of revolution shift the focus of analysis away from class conflict and toward the power structure, notably the state, which is regarded as relatively autonomous. State-centered theorists locate the state within the international political system and examine the political and military pressures that may render it vulnerable. According to Skocpol, a leading proponent of this model, military pressures and defeat in wars may undermine the state's coercive apparatus and lead to revolution. In agrarian bureaucracies, external pressures combined with state efforts to promote industrial development may generate schisms between the state and the dominant class, with each sector competing to extract greater resources from the peasantry. In such conflicting situations, dominant classes may be able to block state policies and frustrate government attempts at economic transformation. Such conflicts between the state and the dominant class may result in state breakdown, paving the way for revolutionary upheavals. Peasants may be able to revolt and bring about a revolution if they have communal solidarity and strength.

In another view of state-centered revolution in developing countries, Misagh Parsa points out that state autonomy does not prevent states in the developing world from serving the interests of the privileged. Interested in promoting development, state policies often serve the economic interests of large capital, often adversely affecting the interests of the rest of the population and providing favorable conditions for coalition formation.

In particular, highly centralized, exclusive, and hyperactive states may be vulnerable to attack in times of crisis. Such states contract the scope of the polity, use repression to block access to the state, and thus undermine support for the regime, increasing the likelihood of polarization and revolution. In Parsa's analysis, the relationship between the state and the economy has significant implications for the nature of social conflicts. The level of state intervention in capital accumulation can affect the nature and outcome of social conflicts. In regulative states such as market economies, the low level of state intervention in capital accumulation reduces the probability that the state will become the direct target of collective action and thus diminishes the likelihood of revolutionary conflicts. Capital allocation and accumulation are determined by an abstract, decentralized, depoliticized, and "self-regulating" market system, which tends to defuse and privatize conflicts, confining them to the civil society. Because markets are abstract, decentralized, and depoliticized, they cannot be attacked or overthrown. As a result, the regulative state is unlikely to attract direct attacks or challenges because class conflict remains confined within the economic sphere and the civil society. Should such conflicts escalate, aggrieved groups may clamor for the regulative state to intervene on their behalf rather than attacking it, increasing the likelihood of a reformist, nonrevolutionary outcome. Where state intervention is low, the regulative state may be perceived as an autonomous entity that serves general, societal interests. In such cases, the regulative state may actually become an integrative rather than a divisive force. Alternatively, low state intervention in capital accumulation may increase the likelihood and intensity of class conflict, which can remove the regulative state as the principal target of attack and thereby reduce the likelihood of revolution.

Hyperactive states, in contrast, intervene greatly in the economy and, as a consequence, can become vulnerable to challenge. Hyperactive states tend to be major economic actors, control abundant economic resources, and intervene extensively in capital allocation and accumulation. High levels of intervention entail significant political consequences for these states. As they become direct producers and financiers, the abstract, decentralized, and depoliticized market mechanism is replaced by a visible, concrete social entity, which can be attacked during conflict or crisis. High state intervention expands the extent of political conflicts in times of economic crisis, as economic and political conflicts converge in the political arena, when the hyperactive state rather than market forces are held accountable for failure and mismanagement. Finally, hyperactive states that employ sizable segments of the workforce tend to become the target of workers' economic conflicts. Workers' attacks against the state may reduce the intensity of class conflict and, in turn, increase the likelihood of coalition formation. Broad coalitions and disruption of the social order are very important in Parsa's theory of revolution. In the absence of broad coalitions, revolutionary challengers might be repressed and rendered ineffective.

Jeff Goodwin articulates another version of state-centered revolutionary theory in contemporary developing countries. Although class interests and economic grievances are important, Goodwin argues that the roots of revolutionary movements are to be found in the political context in which class relationships and economic institutions are embedded. Revolutionary movements in the periphery have been inadvertently facilitated and encouraged by the formation of violent, exclusionary, authoritarian governments that are also organizationally incoherent. Despotic regimes provide a visible focus of opposition for groups and classes that may have different grievances but come together in a broad coalition. Exclusionary, repressive states render political moderates and reformists relatively impotent and inconsequential. Thus, revolutions often take place in countries that reject peaceful attempts to redress social and political grievances through elections and organizing and instead resort to blatant fraud and violent repression. Revolutionary movements may attract broad popular support where states sponsor or promote unpopular economic or social arrangements, repress or exclude mobilized social groups, and alienate the elite through corruption and arbitrary personalistic rule. Even moderate and predominantly middle-class political parties and voluntary associations can join in broad alliances that effectively support radical movements waging armed revolutionary struggles.

Tilly argues that a natural history of revolutions that could specify necessary and sufficient conditions for revolutions is not possible because as regimes vary and change historically, they also alter conditions for the violent seizure of state power. Nevertheless, Tilly does provide a state-centered explanation of revolution, analyzing a state's vulnerability to revolution as determined by its capacity to control resources and the activities of its population and the extent to which the public enjoys equal rights and is able to influence governmental affairs and policies. He reasons that high-capacity democratic regimes are not vulnerable to revolutions because they are popular, and high-capacity nondemocratic states are unlikely targets for revolution because their rulers are able to impose strict controls on the people. Low-capacity nondemocratic regimes likewise do not produce revolutionary outcomes because once the revolutionaries seize power, the state apparatus tends to fragment and create difficulties for forming a new state. Thus, in Tilly's model, medium-capacity nondemocratic regimes are the most likely to foster revolutionary outcomes.

Ideology and Revolutions

Some theorists attribute independent power and dynamics to ideology in the analysis of revolutions. Maintaining that ideology has a central, even independent role in any existing social structure and in its transformations, they argue that class, economic, and political conflicts by themselves could not lead to revolutions and that only revolutionary ideologies can convert social discontent into revolutionary crisis. Using the example of the Iranian revolution, some theorists emphasize the role of the Shi'a culture of martyrdom that inspired devout Iranians to oppose the Shah in the face of repression and death. Proponents of this perspective maintain that without a revolutionary ideology and culture of resistance, revolutions are highly unlikely.

Theorists who stress the role of ideology in revolutions are correct in one important sense: Ideologically driven challengers have been in the forefront of revolutionary struggles in developing countries. In the 20th century, intellectuals and students adopted revolutionary ideologies and struggled to transform their societies. Ideological shifts among students and intellectuals not only fostered solidarity and cohesion among these vanguards of revolutionary struggles but also provided an analysis of the causes of the conflicts and provided a formula out of those conditions. Although these revolutionaries fought for their ideology, they were also aware of the need to form broad coalitions to bring down the ruling powers. To minimize ideological conflicts, revolutionary challengers often adopted alternative public approaches to ensure coalition formation. To attract those who did not share their ideologies, revolutionary leaders were sometimes circumspect about their ideologies. In Iran, for example, Ayatollah Khomeini never told the Iranian people about his theocratic goals, but instead, he borrowed significant aspects of the nationalist ideology of the 1950s and attacked the Shah's regime for failing those aspirations. In the case of Nicaragua, the Sandinistas compromised and modified their program to ensure a broad coalition that was able to overthrow the government in 1979.

Revolutionary Processes and Outcome

Modern revolutionary conflicts often begin with the rise of a revolutionary challenger or coalition of challengers that attempt to gain exclusive control over state power. These challengers are often ideologically driven intellectuals and students inspired in part by the success of revolutionaries elsewhere and antagonized by domestic economic structures and political systems. Revolutionary challengers may emerge in many societies, but most fail due to government repression and/or lack of popular backing. Those revolutionary challengers that do survive are successful in gaining the support of dissident intellectuals and students who contribute resources and new recruits. Revolutionary challengers become serious contenders for power when they acquire adherents among major classes or collectivities such as workers, peasants, or segments of the middle class.

Revolutionary situations emerge when popular backing for revolutionary challengers becomes substantial and rulers are incapable or unwilling to suppress the challengers. It is important to note that revolutionary situations often arise as a result of certain societal characteristics and major economic and political crises, not because of the actions of revolutionary challengers, who often constitute a very small segment of the population. Specific characteristics render certain societies more vulnerable to revolutionary situations. Countries marked by high levels of inequality in the distribution of wealth and income are vulnerable to economic and political crises. Further, countries that are highly dependent economically on other countries tend to be more susceptible to economic crises. Vulnerability is especially acute for developing countries that rely heavily on exports of one or a few raw materials and primary commodities. Fluctuations in the world market and falling prices for their goods, combined with an economic downturn, can be devastating. The impact may threaten broad segments of the population, contributing to a decline in support for the government and a rise in popular backing for revolutionaries. In revolutionary situations, states lose popular support, and rulers may become isolated and be abandoned even by the dominant classes who are not generally given to supporting revolution or radical social change.

Revolutionary outcomes result when members of the polity defect from the regime or when challengers successfully neutralize or defeat the armed forces and seize control of the state apparatus. Where the core of a regime refuses to relinquish power in a revolutionary situation, challengers may have to resort to large-scale disruptive tactics and armed struggle to overthrow the government. Certain states are especially vulnerable to revolutionary outcomes. States that are highly exclusive, repressive, and corrupt often have a narrow base of support and may be quickly abandoned by members of the polity, facilitating a revolutionary outcome. States that depend on external support are also vulnerable to a revolutionary outcome. Such dependent states may lose their external support for various reasons, including an interest in preventing deteriorating conditions and further radicalization of politics. These shifts in international alignment and the withdrawal of external support may expedite the overthrow of the government, producing a revolutionary outcome.

Complex processes affect the immediate political outcome of revolutions. In most revolutionary situations, alternative contenders such as radical and moderate challengers compete against each other for state power. Generally, in economically polarized situations of the developing world, where income inequalities are high and growing, liberal and moderate political organizations do not gain a great deal of strength and popular support. But the political ideology and organizational strength of challengers do not always affect their likelihood of seizing power. In fact, the immediate political outcome of revolutions is not easily predictable at the outset of revolutionary struggles. The mobilization options that are available are central in determining which challengers will be victorious. For example, in Nicaragua, state policies under the ruling Somoza family marginalized the moderate opposition for decades. When the government refused to hold free elections in 1978, any chance for peaceful change was blocked, and the opposition became radicalized, thereby narrowing the mobilization options. This improved the position of the Sandinista National Liberation Front, a small, militant guerrilla organization who had already launched an armed struggle to overthrow the regime and was eventually able to seize power. In Iran, the majority of the opposition fought for independence, freedom, and social and economic justice, but the Shah's policies had severely repressed the secular political organizations and closed all mobilization options. As a result, mosques remained the only public spaces that enjoyed some measure of autonomy from the state and provided relatively safe places for the people to gather and mobilize. Mobilization through the mosque enabled Khomeini and a small segment of his clerical supporters to lead the struggles in the final stages of the conflicts and seize power. In the Philippines, radical leftist revolutionaries, the most powerful political organization in the 1980s, failed to seize power in part because their radical ideology threatened the privileged classes and prevented the formation of a broad coalition. When the radicals boycotted the fateful election in 1986, moderates were able to take the lead in the struggles against Marcos, and in the end, the reformist elite was able to take power. Thus, it is reasonable to say that the revolutionary process itself exerts a great deal of influence on the eventual outcome of the revolutionary struggle.

Once the state is overthrown, revolutionary coalitions generally break down. Although revolutionary challengers need broad coalitions to seize state power, these coalitions become superfluous once the revolutionaries control the instruments of coercion. The new revolutionary regime is often more centralized and sometimes more repressive than the old one and may not fulfill all its prerevolutionary promises. The long-term structural outcomes of revolutions are often determined by complex factors and not easily predictable. The interest and ideology of the revolutionary regime only partly determine the structural changes pursued by the new government. Other internal forces, from both within and outside the polity, can mobilize to realize their interests, thus affecting the structural outcome of revolutions. The overthrow of the state's repressive apparatus often leads to reduced repression and provides an opportunity for various classes and collectivities to mobilize and demand change. Additionally, international political and ideological conditions may also influence the internal development of postrevolutionary societies, particularly where the country's economy depends on external sources and the state requires outside support.

Future analyses of social revolutions would benefit from perspectives that synthesize and analyze large-scale social transformations, class analysis, states, ideologies, and role of global forces. It is important to understand the large-scale social changes that often precede social revolutions. They can affect major interests and the capabilities of various actors and set the stage for social conflicts. Changes in the class structure are also critical in understanding social revolutions. While class conflict may prevent and delay revolutions, class coalitions seem to have played a very important role in revolutions in developing countries by disrupting the social structure and facilitating the overthrow of the government. State-centered theories of revolution can contribute much by specifying state vulnerabilities and conditions that may result in the isolation of the state and its abandonment by broad segments of the population. Finally, analyses of ideology can contribute immensely to explanations of social revolutions by analyzing the causes of the rise of revolutionary challengers and explaining why large segments of the population shift their support to such challengers.

RIGHTS

Modern political theory locates the notion of "rights" at the center of its debates. The liberal state and constitutional theory have emphasized rights as fundamental building blocks of the social order. In political thought, after a long lull, rights are once again a renewed focus of interest. Political theorists now commonly opt to articulate social demands in terms of rights rather than (for instance) as a general utility or integrity of the body politic. In this vein, several theorists—above all, those with liberal roots—have adopted the Lockean vision of the just political order whose primary obligation is to respect the moral rights of its citizens.

However, there is a broad spectrum of definition for the concept of rights. In its older, objective usage, a right means "what is just" or "what is fair." Aristotle, for instance, used *dikaion* to indicate that a society is rightly ordered. However, this "objective" sense of right is not equivalent to our modern, subjective notion of rights, which originates, according to historians, in the thought of John Locke in the 18th century—or perhaps even further back, in late-medieval European thinking. In this subjective sense, rights are sometimes defined as "normative attributes" that pertain to persons. Other approaches see rights as entitlements to choose, entitlements (not) to perform certain actions, or entitlements to expect that others will (not) perform certain actions.

This entry defines a right as a legal or moral recognition of choices or interests to which a particular weight is attached. It proceeds in three steps. The first section elucidates the different types of rights and the second section the forms and functions of rights. The final section delivers a brief overview of the major theories of rights.

Types of Rights

Any study of rights should begin with an elucidation of the multiple categories of rights. In the realm of politics, one can distinguish between legal and moral rights, between rights as such and "human rights," and between civil, political, social, and cultural rights.

Legal and Moral Rights

Legal rights describe a type of institutional arrangement in which interests are guaranteed legal protection, choices are guaranteed legal effect or goods, and opportunities are provided to individuals on a guaranteed basis. Assertions that *X* has a legal right to *Y* are tested according to whether the law does in fact recognize and implement *X*'s right to *Y*.

Moral rights express the justified demand that such institutional arrangements should be implemented, maintained in the name of a fundamental principle that accords importance to certain basic individual values such as autonomy or moral agency. The assertion that *X* has a moral right in the absence of any legal recognition of this right may take the form of a demand for the law to be changed.

Natural rights can be considered as a subclass of moral rights. These are fundamental rights, derived from nature or divine authority, and enjoyed by all men and women regardless of their beliefs and position in society. They pertain to human beings in the state of nature, prior to the institution of society. Natural rights are thus considered to precede civic rights held in the political order. They are therefore universal, inalienable, and indefeasible: They cannot be contested by political authority, and indeed, it is the responsibility of those who govern to protect them. Consequently, the concept was used to justify the revolutions of the 18th century on the grounds that the existing law infringed on individuals' natural rights. In the United States, for instance, the Declaration of Independence (1776) against the British colonial state was based on an appeal to the natural rights of all Americans. The *Déclaration des droits de l'homme et du citoyen* (Declaration of the Rights of Man and of the Citizen, 1789) also refers to certain "natural rights" of mankind.

Rights and Human Rights

This distinction between moral or natural rights and legal rights leads to another difference: the difference between rights and human rights. One agrees with Michael Freeden (1991) that human rights are the most basic prerogatives pertaining to what is essentially human, while other categories of rights are more specific, limited, and normally derivative. Freeden defines human rights as a "conceptual device, expressed in linguistic form, that assigns priority to certain human or social attributes regarded as essential to the adequate functioning of all human beings" (p. 7).

The promulgation of the French Declaration in 1789 gave an impetus to the debate about the rights of man. In his *Reflections on the Revolution in France* (1790), Edmund Burke attacked the abstract, metaphysical, and simplistic character of human rights, which he contrasted with the "real rights"—related to their particular history and circumstances—of "Englishmen." In reaction, Thomas Paine published *Rights of Man* (1791) in which he argued that having been created rational and equal, man had natural rights including those to liberty, property, and security, as well as the right of resistance to oppression. Two other major critics of human rights were Jeremy Bentham and Karl Marx. For the former, the term *right* should be confined to its legal sense, since the demand for a right is no more a right in itself than a hungry man's plea for bread. Marx claimed in *On the Jewish Question* (1843) that there was an inherent contradiction in the French Declaration. Whereas in the "political community" man regards himself as a "communal being," in "civil society" he acts as a private individual who regards other men as a means. Marx therefore concluded that "not one of the so-called rights of man goes beyond egoistic man, man as a member of civil society, namely, an individual withdrawn into himself, his private interest, and his private desire and separated from the community."

Civil, Political, Social, and Cultural Rights

In a seminal essay published in 1950, Thomas Marshall divided the development of citizenship in England into three parts: civil, political, and social. The civil element is composed of the rights necessary for individual freedom/liberty of the person: freedom of speech, thought, and faith; the right to own property and to conclude valid contracts; and the right to justice. These so-called first-generation rights were most prominently proclaimed during the revolutions of the 18th century, particularly in the French Declaration of 1789 and the 1791 Bill of Rights in the United States. The institutions most directly associated with civil rights are courts of justice. In theory, civil rights exist independently of state action, protecting the freedom of the individual against potential encroachments by state power. They are often called "liberty rights" since they are based on a "negative" conception of freedom.

The political element means the right to participate in the exercise of political power, as a member of a body invested with political authority or as an elector of the members of such a body. These so-called second-generation rights developed principally over the course of the 19th century, and their corresponding institutions are parliaments and local government councils.

The social element ranges from the right to a modicum of social welfare and security, to the right to share fully in the social heritage, and to live the life of a civilized human being according to the standard prevailing in society. These rights, which represent a continuation of several claims made by 19th-century socialist movements, came to fruition in the 20th century in the framework of the welfare state. The institutions most closely associated with social rights are the educational system and social services. These rights are also known as "claim rights" on the grounds that they represent "positive" freedoms—that is, concrete rights that individuals and groups can expect to enjoy a decent standard of living. They rely on state intervention to guarantee societal solidarity and equality. Codified in the Universal Declaration of Human Rights (1948), social rights have also been formalized in the International Covenant on Economic, Social, and Cultural Rights (United Nations, 1966).

The International Covenant of 1966 also recognizes "cultural rights," which can be defined as the body of rights guaranteeing respect, protection, and promotion of cultural references and expression—that is, the ensemble of values, convictions, beliefs, language, and knowledge—through which individuals identify themselves, communicate with each other, forge a shared sense of belonging, and consider themselves to be recognized with dignity. Sometimes known as "fourth-generation," cultural rights were recognized in the second half of the 20th century, particularly in North America. "Multiculturalist" authors interpret cultural rights as being clearly individual and not collective since their ultimate purpose is the protection of the individual. Indeed, cultural rights such as the freedom to speak one's native language are intimately linked to other individual rights such as dignity or freedom of expression.

Forms and Functions of Rights

An analysis of rights can be divided into two parts: a description of the internal structure of rights and a description of what rights do for those who hold them.

Forms of Rights

The most famous legal analysis of the form of a right is that of Wesley Hohfeld (1879–1918). Hohfeld argued that the proposition "*X* has a right to do *R*" could mean four things:

1. First, it could mean that *X* has a *privilege* to do *R*. In this case, *Y* (or anyone else) has "no rights" toward *X*, and *X* has no duty to perform that action. Singing in your bath or painting your bedroom blue would be examples.
2. *X* has a *claim* (or a right) against *Y*. Consequently, *Y* has a duty toward *X* to do *R*. For instance, an employer has the duty to pay wages to employees or a parent has a duty to provide food to his or her child.
3. *X* has a *power* to do *R*, which alters the legal rights and duty of *Y*. For instance, a police officer has the power to ask to see the license of a speeding driver.
4. *X* has an *immunity* with regard to *R*. In this case, *Y* (or anyone else) lacks the power to bring about a certain consequence for *X*. For instance, witnesses in court have a right not to be obliged to incriminate themselves.

However, Hohfeld's categorization makes no attempt to clarify what the function of a right is. There are two broad accounts of the special relation between duties and right bearers that have been proposed: the choice theory of right and the interest (or benefit) theory of rights.

Functions of Rights

The "choice theory" (or will theory) singles out the rights bearer. It holds that when I have a right to do something, what is effectively protected is my choice of whether or not to do it. It accentuates my freedom and my self-fulfillment. In a famous article, Herbert L. Hart argued that if there was one natural right, it was the equal right of all men to be free. In addition to this right of freedom, Alan Gerwith establishes a right to well-being. John Rawls, too, assumes in his theory of justice that rights pertain to primary goods that rational and moral individuals would regard as necessary to the functioning of a just constitutional framework. In all cases, the end is to ensure the conditions without which autonomy is impossible and without which human agency cannot be realized.

The "benefit theory" maintains that the function of a right is to further the interests of the individual who enjoys it. An owner has a right not because owners have choices but because ownership makes the owner better off. To have a right is, then, to be the intended beneficiary of someone else's duty. In other words, rights and duties are correlative. A less strict version (the "interest theory") maintains that individuals have rights whenever an interest that they hold is regarded as sufficiently important in itself to justify obliging others to promote that interest in some way. In this interpretation, rights thus generate duties.

Theories of Rights

Richard Tuck has correctly pointed out that the meaning of a term such as *right* is "theory dependent." In other words, the elucidation of a complex notion such as rights requires an account of the possible theories about politics that employ the concept.

The Natural Rights Paradigm

According to Freeden, the theory of natural rights includes four elements. First, it argues simply that human beings are born with such rights, that they are part of our initial equipment in the same ways as our bodies are. A common core of human nature is thus defined by encircling it with a succinct list of natural rights. They are innate, inalienable, and indefeasible. Second, natural rights are presocial. They are not the product of any social artifice; rather, political societies are created for the very purpose of ensuring the recognition and implementation of natural rights. Third, natural rights are absolute; they prevail over any other consideration that might deny their validity, applicability, or range. Fourth, such rights are universal; all human beings, irrespective of time and space, enjoy them. Historically, appeal was made to natural law or the law of God. The primary exposition of natural law is to be found in the writings of the Dominican St. Thomas Aquinas (1225–1274) who defined natural law as the participation of divine law—discoverable by reason—in God's rational creatures. For John Locke (1632–1704), since we are all creatures of God, we have inalienable rights. The modern age, however, is more skeptical about revelation as a basis for political morality. Recent theories have attempted instead to identify the deep moral values and principles that underlie the idea of rights. John Finnis (1940–), for example, has revived some of the central tenets of natural law: If the overriding rationale of natural law is to establish what is truly good for human individuals, it follows that one needs some conception of human good—of individual fulfillment in a form (or in a range of forms) of communal life that fosters rather than hinders such fulfillment. This might include, among other things, the right not to be tortured, not to be deprived of one's capacity to procreate, the right not to be lied to, and so on. Finnis insists that the first principles of natural law are not deductively inferred from any speculative principles or metaphysical propositions about human nature. To discover what is naturally right is to ask not what is in accordance with human nature but what is in accordance with reason.

Legal Positivism

This central claim of natural law is rejected by legal positivists who deny that the legal validity of a norm depends on its substantive moral quality. Bentham (1748–1832) attacked natural rights in his *Anarchical Fallacies* as "rhetorical nonsense—nonsense upon stilts," calling rights in general "fictions," before distinguishing between the "bad" fiction of natural rights and the "good" fiction of legal rights. He analyzed rights as a rational human contrivance necessary for political and social life. Rights could exist only within this framework and were not anterior to law: "From real laws come real rights, but from imaginary laws, from laws of nature . . . come imaginary rights" (*Principles of Legislation*, Chapter XIII). Together with his disciple John Austin (1790–1859), Bentham laid the foundations of legal positivism, which rejects the conception that rights exist independent from human enactment. The validity of any right can always be traced to an objectively identifiable source—be it the command of a sovereign for Bentham and Austin, the rule of recognition for Hart, or a basic norm that validates the constitution for Hans Kelsen. Consequently, legal positivism establishes a clear distinction between "ought" (what is morally desirable) and "is" (what actually exists). It does not follow, however, that they subscribe to the proposition that an unjust law must be obeyed. Both Austin and Bentham, for instance, acknowledged that disregard for unjust laws is justified if it promotes change for the good. According to Hart, rights are distinguished from other moral considerations by the fact that they protect and promote the specifically human interest in freedom.

Rights as Trumps

In the 1970s, the foundations of legal philosophy were shaken by the vision of law advanced by American jurist Ronald Dworkin (1931–). Dworkin's attack on legal positivism and utilitarianism is founded on his concern that the law ought to "take rights seriously." Rights are best understood as "trumps" over some background justification for political decisions that state a goal for the community as a whole. For instance, if someone has a right to publish pornography, this means that it is wrong to act in violation of that right even if there are some reasons to believe that the community would be better off without pornography. Dworkin's thesis is grounded in the conviction that no government may impose any constraint on a person that this person could not accept without abandoning her or his sense of equal worth. Utilitarianism—which identifies the notion of average or collective welfare as the goal of human action—should be replaced by a rights-based theory centering on individual independence. However, this liberal conception of rights differs from a libertarian conception such as that advocated by Robert Nozick. While the latter is concerned with preserving individual choice (limited only by the rights of others to the same good), the former insists on an equal treatment of all members of society. Dworkin's conception of political morality includes three elements: (1) justice, which incorporates both individual rights and collective goals for treating citizens with equal concern and respect; (2) fairness, which designates the procedures that give all citizens equal influence in decisions that affect them; and (3) procedural due process, which relates to the correct procedures for determining whether a citizen has violated the law.

This metaphor of rights as "trumps" raises the question of whether there is any absolute right. According to Gerwith, a right is absolute when it cannot be overridden by any circumstances, can thus never be justifiably infringed, and must be fulfilled without any exceptions. Gerwith asserts that there is at least one such absolute right: All innocent persons have an absolute right not to be the intended victims of a homicidal project.

RISK AND PUBLIC POLICY

The relationship between risk and public policy goes back to the 17th-century Prussian origins of scientific enquiry into policy and state science, as part of cameralist *Policeywissenschaft* (German for "public policy"). The systematic study of policy was to ensure the well-being of the local state and its subjects. There has been little change to that understanding since. Risks include not only threats to health through environmental, economic, or social processes but also risks to actors arising from political processes themselves. In terms of definition, the literature usually follows the economist Frank Knight in suggesting that risks are associated with events whose probabilities are known. Consequently, three sets of linkages between risk and public policy can be distinguished: (1) related to the substantive analysis of risks, (2) the context of policy making related to risk, and (3) the policy instruments employed in addressing risk.

Substantive Analysis of Risks

The relationship between risk and public policy can be defined in a *substantive* sense. Accordingly, the interest here is how public policies deal with particular types of risk. Within this discussion of substantive risks, three separate but overlapping concerns can be identified.

Risks to Individual and Collective Health

One key consideration over the past 3 decades has been the interest in risk as a result of environmental and technological developments, namely, the risks to individual and collective health that public policies are supposed to protect against. The field of science and technology studies has considered how organizations deal with uncertainties (potential events to which probabilities cannot be assigned) and risks (potential events to which probabilities can be assigned). Significant attention has been paid to the socially constructed nature of expert decision making, such as regarding the specifications of nuclear reactors or civilian aircraft. Further, there has been significant interest in organizational processes, whether relating to the "normalization of deviance" as part of (interorganizational) processes; the inevitability, as discussed by Charles Perrow (1999), of things going wrong; or the avoidance of such errors in so-called high-reliability organizations. This interest has moved into the field of environmental and civil contingency-related risks, especially given the concern over the impact of climate change (e.g., flooding) and security. A related category of interest has concerned itself with how changing values among the population have led to a growing distrust of large technical systems, especially those associated with risks of catastrophic consequence, for example, nuclear reactors. But attention has not merely been paid to high-tech or catastrophic large-scale risks. In a comparative study of nine risks (e.g., air pollution, dangerous dogs, and pesticides), Christopher Hood, Henry Rothstein, and Robert Baldwin (2001) found significant differences in risk regulation regimes that could not be explained by a purely functional "risk profile" explanation. Related to this, Christopher Hood and Martin Lodge (2005) found institutional similarities in regulatory responses to one particular risk, namely, dog bites in public, across significantly different national institutional contexts. Regardless of the political system, regulatory responses to media pressure in the wake of fatal dog-bite attacks was remarkably similar.

Risk and the Political Process

A second key consideration relates to how actors deal with risk affecting them as part of the political process. Such substantive issues of risk to actors are at the heart of the public policy literature on regulation, in particular regarding the regulation of infrastructures. Here, the key interest is in understanding the institutional conditions that accentuate so-called political risks. In contexts in which developmental outcomes (such as investment in infrastructure modernization and expansion) depend on private investors, as governments lack budgetary resources, private investors will adjust the levels of their investment according to the risk of their being expropriated through administrative-regulatory means. The risk of such expropriation is particularly high following the initial investment in fixed assets (such as infrastructure). As a result, private investors seek regulatory devices that reduce political and regulatory discretion. Therefore, policies need to be devised that reduce administrative discretion in the context of specific political institutional constellations. At the same time, the literature has also been interested in reducing the risk of "capture" and "drift"—that is, the risk that private parties will not fulfill their mandate or rather redirect the goals of regulation away from oversight toward advocacy of their own interests. Following a period in which the literature assumed a near inevitability that "agents" would escape oversight, more recent literature in institutional analysis has pointed to devices to hardwire regulatory regimes in order to reduce problems of political and "private" risks.

Risk and Responsibility When Things Go Wrong

The third area of concern is the risk of being blamed when things go wrong. This literature links to the long-established interests in explaining why politicians delegate certain tasks to agencies rather than maintain decision-making authority (the "blame-shift" hypothesis that has not received much empirical support) as well as other strategies by which politicians seek to avert or divert the risks of being blamed, such as strategies of presentation (relying on spin and other communication devices) or on policy strategies. The latter can be either explicit by abandoning particular public activities or less explicit in the sense of frontline abandonment. For example, street-level bureaucrats, such as police forces, withdraw from particular activities that have caused public backlash. It has been suggested that an increasingly adversarial and legalistic environment has accentuated the trend toward frontline abandonment.

The Context of Policy Making

Looking at the contextual setting of risk and public policy indicates the ways in which either the *context of policy making* has shifted or the specific conditions under which policies associated with particular risks arise. Again, three literatures can be distinguished.

In the first understanding of a changing context, the key environmental change is associated with Ulrich Beck's "risk society." According to Beck, societies are not just organized by risk but are also confronted with risks that are generated through processes of modernization itself. Whereas in the past, risks were associated with exogenous (or external) events (rain, asteroids), contemporary society is faced by endogenous (or manufactured) risks, such as industrial and automotive emissions. Importantly, the nature of these endogenous risks leads to a redistribution of positions within society in which wealth no longer directly insures against risk exposure. Instead, position is defined by knowledge and access to information, as risks are largely "invisible."

Further, the risk society is also characterized by increased skepticism, if not hostility, toward traditional sources of authority and expertise. Moreover, as noted by Mary Douglas and Aaron Wildavsky (1982), accounts informed by grid group cultural theory highlight value conflicts and shifts within society and therefore stress the importance of risk perceptions, thus challenging the supposedly neutral technologies of risk assessment.

A further literature considers how risks provoke "moral panics." Heightened public attention translates into pressure (transmitted by the media) for something to be done to which politicians seek to respond. Their knee-jerk reactions are regarded as suboptional, not just because decision making under pressure is said to reduce information flows but also because uncertainty regarding cause and effect is prevalent. Consequently, inappropriately designed responses emerge that are made even more problematic by agencies seeking to regulate for the "last 10%," thereby incurring substantial costs.

Risk and Policy Instruments

A third type of linkage between risk and public policy is particularly interested in *instruments*. Indicating a fundamental divide between normative assumptions, the literature is divided into two key areas. One focuses in particular on the importance of deliberative and proceduralized solutions to questions of risk, pointing in particular to the societal context, as described by Beck. In light of inherent value conflicts within society, it is argued that deliberative processes are likely to narrow rather than widen differences and that therefore procedural devices need to be established to allow such deliberation to take place. A key example of this literature has been the rise of the *precautionary principle*, a policy approach that has gained considerable attention, with accusations that it invites "capture" and "populism" as it suggests (depending on exact definition) that the burden of proof can be reversed if considerable doubts regarding safety exist. Particular activities or products are no longer innocent until proven guilty; instead, they are assumed to be guilty unless proven otherwise.

In contrast to the deliberation-oriented literature, a separate strain argues the case for improved "risk analysis" instruments—that is, attempts at rationalizing decision making by enhancing the quality of information used. Such instruments and technologies have garnered substantial interest, especially since the 1970s and the rise of the "cost–benefit state" in the United States. Subsequently, such instruments have gained increased currency in other jurisdictions, for example, in the form of regulatory impact assessments or the advocacy of diverse "risk management" tools. These tools supposedly improve decision making and reduce "irrationality" among politicians and civil servants alike. Whereas the attraction of these instruments is partly to reassert authority in decision making and prevent "hasty" decision making (and thus "overregulation"), it is less evident that these instruments have actually reduced the impact of interest groups and heightened public attention on public policy. In contrast, they appear to have themselves become part of contested policy making, given that their performance in terms of controlling risks has proven to be less than satisfactory. Indeed, Michael Power has suggested that such attempts at rationalizing risk in policy making is likely to accentuate rather than reduce risks. Not unrelated to contributions that seek to "rationalize" decision making regarding risk, there have been debates about instruments to insure against actualized risks and their potentially redistributive consequences. This relates, for example, to debates regarding flood or crop insurance schemes, their funding, their private or public status, and the degree to which such systems are mandatory or not.

The Field of Risk and Public Policy

Risk and public policy is a field populated by contributions from across the social sciences. The transdisciplinary nature of these contributions has only increased in recent years as the rise of interest in civil contingencies, both before and after crises (as noted by Arjen Boin, Allan McConnell, & Paul t'Hart, 2008), as well as the growing importance of climate and demographic change demand such cross-disciplinary approaches. While the focus on substantive risks remains critical, other research agendas are developing that focus particularly on the failure of instruments to identify risks and the need to understand and explain variations between jurisdictions and domains, especially in terms of variations in enthusiastic endorsement of risk policy instruments or perceptions of risk across different contexts.

RITUALS

Rituals are a challenge for political science. They can be found in a great variety of forms and are multifunctional to such an extent that science has been unable to find an unambiguous definition up to now. Already the term *ritual* was used in antiquity in a double sense—with a primarily religious meaning (religious cult) or modally (the type and manner of carrying out the ceremonies of the cult). In Roman religion, *ritual* denotes an ordered ceremonial activity. Theology and religious studies adhere to this day to the concept of *ritual* as a collective term for religious ceremonies as well as for individual sequences therein. It includes the cults and worshipping customs of Jews and Christians as well as those of various peoples in different times and places, from the Egyptian Isis cult or the Roman priestly authority of the Vestal Virgins to the religious forms of contemporary Confucianism, Buddhism, Taoism, and Islam. Early on, Confucian philosophers investigated the legitimate role of ritual (in Chinese, *li*) in the guidance of a society. This entry will discuss the impact of such traditions on recent developments in the social sciences and the renewed importance of the study of rituals.

From the perspective of religious studies, ritual is a matter of cultic actions that follow fixed rules for the purpose of worshipping God, the gods, or figures considered to be holy. Religious rites express explicit wishes for propitiation, solace, recognition, and order. They refer to a transcendental power. Their rules, texts, and notes are gathered in Christian churches into official liturgical books. For instance, in the Roman Catholic Church they are described in the Rituale Romanum dating from 1614 (Pope Paul V), which in 1918 became obligatory for all dioceses. Anthropology, ethnology, anthropological religious research, sociology, and psychology attach great significance to the conceptual-theoretical recording, collection, and classification of religious and profane ceremonies.

The founder of anthropological religious research, Edward Bernett Tylor (1873), distinguished religious rites as an expressive-symbological gestural language of theology from those that serve for communicating with and influencing spirits. With his investigation of the religion of the Semites, William Robertson Smith created an initial foundation for the systematic investigation of rituals. He developed the thesis that religions essentially consist of beliefs and rites, with rites and practical customs being dominant. Arnold van Gennep's *Les Rites de Passage* recognizes the rhythm-creating function of rituals as a reflection of natural rhythms. A phase pattern serves for classifying rites or individual sequences. Transitional rites are intended to allow individuals and groups to transcend spatial, temporal, and social borders. For Gennep, rites are "compelling actions." Thus, the acceptance of a gift has an obligatory effect on the recipient. Gennep's conceptualization gained lasting recognition for the anthropological investigation of initiatory rites.

The social sciences speak of rituals as a collective designation with which, however, individual scientists relate different categories and theories. *Ritual* and *rite* are frequently used as synonymous terms. Émile Durkheim and his students Henri Hubert and Marcel Mauss developed, with regard to the sociology of religion, a theory later taken up by social anthropology and French structuralism. Durkheim defined religion as a system of beliefs and practices that are united in a single moral community. For the Durkheim school, rituals bring about social integration; they are mechanisms that produce social conformity and solidarity. Whenever people come together, there is, according to Durkheim, a natural tendency to coordinate, standardize, and repeat their actions. Durkheim designated the feeling of participating through group activity in something transcendent as "the sacred," which is represented in symbols.

With Max Weber, too, rituals can have the function of creating identity, based on common interests and the "ritual qualification" of membership, as he demonstrated with early religions or the cultic communities of the polis. Subsequently, in Chinese Confucianism and Taoism, those well versed in writing and literature (ritually trained scholar-politicians) occupied high political offices. According to Weber, rituals can mark the social differentiation of a society. Thus, caste societies are based on the ritual separation of occupations and professions. Social scientists at the turn of the 20th century focused mainly on the rituals of traditional, preindustrial societies. They linked them closely to religion and magic and excluded other (profane) manners of behavior. Social rationalization, however, caused religions and rituals to diverge more strongly. The tendencies of Western societies toward rationalization, which were analyzed by Weber, are capable, through a "disenchantment" of the world, of relegating religious rituals to the margins of public and private life, or of situating them in the political and social domains.

Political Rituals

Terminologically, the concept of ritual cannot be limited to religious and magical rituals, for the conceptual core consists of ritual acts. These are omnipresent in modern and postmodern societies, additionally and especially in political life: from ceremonies in parliaments, inaugurations of presidents, jurisprudence, diplomatic protocol, and electoral campaigns all the way to debates in the mass media. Political leaders endeavor by means of rituals to shape a political reality for their followers. Revolutionaries seek new paths for the legitimation of a political regime. Through their participation in rituals, citizens identify themselves with political parties and social movements that are comprehensible only in symbolic form. The political elite live amid rituals that regulate the interaction among its members and with the public at large.

Edward Shils found that ritual still had a bad reputation among utilitarian-thinking intellectuals in the 1960s; the advance of rationalization and secularization had caused it to be considered as no more than a relic. There are, however, good reasons to treat it as a contemporary phenomenon sui generis. Political rituals have been noted, but their empirical investigation is only now getting under way. Impulses for research came from three directions: (1) from the debate concerning symbolic policy and politics of symbols (as discussed by Murray Edelman, 1971), (2) from analyses of fascist and communist dictatorships (such as that of Charles Lane, 1981), and (3) from political culture research such as that of Gabriel A. Almond and Sidney Verba. Attention shifted from religious to symbolic rituals. Inasmuch as symbols imbue actions with meaning, rituals allow persons and groups to develop their own worldviews. Politics is then the art of understanding and further developing (in accordance with one's self-interest) the predominant symbols of an era.

Symbolic politics are capable of simply feigning political activity before a mass audience and of providing benefits for an elite. But as a rule, they are structured so as to include the audience in political activities. They refer to the symbolic and cultural capital of individuals (as noted by Pierre Bourdieu), which determines social prestige through the use of language, education, and culture. Symbolic politics are engaged in an unswerving struggle over the designations, concepts, and interpretations of the agenda of public life. When successfully used, they become a communicative power for the purpose of promoting interests. In repressive regimes, rituals can be used to stifle contradiction and to destroy regime opponents, as, for example, in the Moscow purges of the 1930s.

In addition to the interest in the ritual activity of integrated groups in the tradition of Smith and Durkheim, questions arise as to the function of rituals in conflicts within and between groups and societies or with regard to the establishment of social and political borders. Civil wars, ritualistic terrorism, and failed states demonstrate the political relevance of ritual. They help represent political power openly inasmuch as, for example, constructed traditions and myths are ritualized. In the heterogeneous global society, nationally or culturally based rituals may appear to be dangerous—for instance, in the Western world, the rituals of honor and disgrace. But rituals can also have a pacifying effect, such as the ritual of recurring world conferences, or they can symbolize the concept of peace, as in the sit-ins and human chains of the peace movement during the 1960s and 1970s. Consideration is also given to the biological bases of social behavior that influence the fundamental forms of politics: hierarchy, peer groups, authority, fear, and competition. The ethologist Julian Huxley introduced the term *ritualization* for the stylized, repetitive gestures and postures of animals. Proceeding from this perspective, ethnological sociology understands this term as a mechanism for regulating social behavior, with which intimacy, formality, territoriality, hierarchy, or difference in age can be expressed, and which simultaneously fosters self-identification. Rituals thus are multifunctional, open processes. The anthropological and literary-critical mainstream regards ritual phenomena as symbolic, expressive activity. Anthropologists such as Victor Turner (1969) applied the concept of ritual to industrial societies, and political scientists such as David I. Kertzer (1988) argued for an application to modern politics. It is basically a matter of inquiring into how symbolic processes enter into politics and why they are important.

For a long time, political scientists tended, through their belief in ongoing secularization, to overlook the phenomena of ritual and concomitantly of the body as carriers of communication. Later, in the 1980s, in the United States, a cross-disciplinary investigative approach was established around the *Journal of Ritual Studies*. Sociologists, political scientists, jurists, media and communications scholars, art theoreticians, dramaturgists as well as literary and cultural scholars united in the investigation of ritual aspects in the subsystems of postmodern societies. The political, social, cultural, and religious dynamic since the end of the East–West conflict has sharpened the awareness of ritual forms in the political sphere. In parallel, religion has been rediscovered as a crucial social-political factor. Samuel P. Huntington's 1996 study *The Clash of Civilizations and the Remaking of World Order* became an important point of reference. Initial analytical steps brought to the fore, out of existing microstudies and theoretical outlines, a series of attributes or attributive dimensions. Jan Platvoet (1955) suggests distinguishing between 13 characteristics or functions with which rituals may be identified. He argues that rituals are interactive, collective, a habit, a traditionalizing innovation, expressive, communicative, symbolic, multimedial, a performance, performative, aesthetic, strategic, and integrative. Proceeding from the experiences of participants in various ritual acts, Ronald L. Grimes (1995) formulated a typology that endeavors, under the generic term of ritual, to classify the entire area into six types: ritualization, rules of propriety, ceremony, magic, liturgy, and celebration.

Communication, Performance, Political Performance

The three key concepts of communication, performance, and political performance are characteristic of various social-scientific approaches toward explaining ritual processes. The widespread conception of rituals as communicative activities is related, on the one hand, to the theory of action that goes back to Max Weber and Talcott Parsons and, on the other hand, to the shift toward language as activity accomplished in the 20th century by philosophy and by the theory of science. According to the philosopher Ludwig Wittgenstein, speech is an activity guided by rules. The ritual as text, as script, determines sequences of actions and those engaged therein. Its symbols refer to certain systems of belief or knowledge. Rituals are thus a special genre of communication within the communicative repertoire of a social unit.

Alongside stands an application of philological methods to the study of human activities that is derived from structuralism (e.g., the work of Leonard Bloomfield, Claude Lévi-Strauss, etc.). The speech acts of a ritual or of other forms of activity are segmented into repetitive parts whose distribution is classified with the goal of comprehending the synchronous coaction as a structured semiotic system. The analysis is text related and without contextualizations, for example, of a social-historical, geographical, or economic type. The primary object of investigation consists of the frequently unconscious ritualizations of everyday speaking (performance). There are significant investigations into rituals of transition (e.g., by van Gennep) or rituals of accessibility (e.g., by Erving Goffman) on entrance into a new situation, a new office, an assembly, or a segment of life and into the changes in status and roles that are contained therein. The accent of these investigations is on social borders.

The terminology of performance that has spread from the artistic program of "action art" to the analysis of ritual should draw attention to the fact that activities embody and construct meaning. Clifford Geertz and others have included this realization in the term *cultural performance*; Turner speaks of social drama. The analysis thus reacts to social upheavals during the 1970s that were triggered by new social and political movements, by a sensitization to spiritual ideas and foreign traditions (New Age), and by the liturgical renewal (Second Vatican Council) of the Roman Catholic Church. Inasmuch as the processes and transformative power of theatrical dramaturgy and ritual prove to be interrelated, it is expected that rituals will be able to help channel social crises into the reconstruction and renewal of societies.

Above all, the mass media have taken over the role of staging reality for a worldwide audience through the ritual formats of the news broadcast, talk shows, and political events such as inaugurations, parliamentary hearings, conferences, and wartime reports. The holders of political office have at all times made use of a broad repertoire of symbols to create solidarity among people and to impart to them—in Durkheim's sense—a group or community identity: flags; hymns; insignia of power such as coats of arms, the throne, the crown, ceremonial clothes, and reserved colors; political symbols of above and below, good and evil, or left and right; and certain animals (e.g., lions, eagles), key words, sounds, and images, as well as buildings.

ROBUST STATISTICS

Traditional methods for estimating regression models can be unduly influenced by a small subset of the data. For example, using ordinary least squares (OLS) regression to model economic growth in 15 industrialized democracies, Peter Lange and Geoffrey Garrett find that the interaction between Left governments and organized labor is positively and significantly correlated with economic performance. In his analysis of the data, however, Bruce Western illustrates that these findings are largely determined by the Norwegian case. Using robust estimation techniques to account for this observation reveals much greater uncertainty about the influence of the interaction effect on economic performance. OLS estimation minimizes large residuals at the expense of degrading the fit of the remaining observations. The coefficient estimates it generates can thus be strongly influenced by even a single large residual, as was the case in the model estimated by Lange and Garret. Like OLS estimation, unusual points may also influence traditional maximum likelihood methods. The likelihood often depends on means and variances, whose estimated values can be largely determined by points lying outside the majority of the data. Thus, when implementing any regression method based on the mean and variance, the analyst must be wary of unusual observations. In this entry, various ways of dealing with this problem are discussed.

Observations can be unusual in two important ways: First, an observation may be an outlier if the value of the explanatory variable is typical of the sample but the value of the outcome variable is atypically large or small; alternatively, an observation may be a leverage point if the value of the explanatory variable(s) is demonstrably different from the rest of the data. An influential observation refers to either an outlier or leverage point whose inclusion in the analysis substantially alters the estimates of the statistics of interest, including parameter estimates and predictions, the estimated variance of these values, and the goodness-of-fit statistics. These influential observations can result from "bad" data (such as data that have been recorded incorrectly), improper modeling of an outcome variable with a heavy-tailed distribution, or models that fail to describe the data well for certain values of the predictor.

Even if only a small fraction of the data—or even a single observation—is influential, estimation strategies that assume all data are modeled correctly may produce erroneous results. To avoid producing incorrect estimates, regression analyses must account for influential observations. A popular strategy for dealing with these observations is the diagnosis and removal of these points before the estimation of a regression model to the remaining "good" data. This technique is acceptable if the observation has been recorded incorrectly and the true value cannot be recovered, if the observation arises from a different population than the other data, or if there is a theoretical justification for excluding the observation from the analysis. It is problematic, in contrast, if the influential point emerges because of heavy-tailed distributions or inadequate models. In these cases, an observation cannot be discarded simply because it fails to fit the model, as removing this data point provides unwarranted support to the incorrect model. Instead, robust regression provides a compromise between deleting influential observations and allowing them to violate the assumptions of traditional regression estimators. When data conform to conventional assumptions, robust and nonrobust methods provide similar estimates of statistics of interest. Robust estimators, however, are resistant to the effects of influential observations and retain their efficiency when data are nonnormal.

Diagnosing Influential Points

To determine if a robust regression approach is necessary, the analyst must establish whether there are influential points in the data set. Before fitting a regression model, the investigator often conducts exploratory data analysis such as visualizing the variables in scatterplots and box plots. While a visual examination of the data can sometimes be used to detect outliers and leverage points, it cannot determine whether these points are influential, nor does it capture all potential influence points. Another popular strategy for detecting outliers is a post hoc examination of the residuals from the regression analysis. Though a large residual indicates that an observation is an outlier, this outlier may not be an influential point. Moreover, leverage points can exhibit small residuals while altering the estimates of the statistics of interest. Given the limitations of these techniques, it is necessary to examine influence statistics before assuming that there are no influential observations in the data set.

The three most popular measures of influence rely on regression deletion diagnostics that examine the effect of removing a given observation on the estimated quantities of interest. The most commonly used diagnostic for influential cases is Cook's Distance (Cook's D), which measures the impact of an unusual observation on the slope coefficients. Unless the observation is an influential point, the coefficient estimates calculated when observation *i* is removed from the analysis should be similar to the estimated values when this case is included. The Cook's D is usually assessed by comparing its value with an *F* distribution, and while there is no universally acknowledged cutoff, a percentile value greater than 50% demonstrates that the *i*th observation has a significant effect on the estimated slope coefficients.

While Cook's *D* measures the influence of the *i*th observation on all slope coefficients, the *DFFIT* provides the actual changes in the prediction estimates caused by the deletion of each case through a measure of the influence of the *i*th observation on the fitted value for y_i. The resulting statistic represents the number of estimated standard deviations that the fitted value increases or decreases with the inclusion of the *i*th observation in the model. Any observation with $|DFFIT| > 2\sqrt{(p+1)/n}$, where p is the number of linear predictors and n is the number of observations, should be investigated.

Finally, the *DFBETA* is an analogous statistic for examining an observation's influence on a particular coefficient. It is obtained by calculating the difference between the coefficient estimated with and without the *i*th observation. The resulting statistic measures the change in the number of standard deviations for these two estimates of the coefficient. A large *DFBETA* value may indicate that the *i*th observation has a large influence on this regression coefficient. The cutoff value for *DFBETA* statistics is $2/\sqrt{n}$.

These three deletion diagnostics are used to uncover individual observations that are influential. It can be possible, however, for a case that is not individually influential to become highly influential when grouped with other observations. This is known as the *masking effect*, because the influence of the observation is masked by the presence of a neighboring case. Single-case deletion diagnostics can be extended to assess the changes caused by the deletion of more than one observation at a time. Although this strategy may be effective for small subsets of the data, if all possible subsets of cases are considered multiple-case deletions, diagnostics become computationally burdensome. Thus, measures of influence employing cluster analysis may have to be implemented in order to detect subsets of influence points.

Robust Regression

After diagnosing the presence of influential points in the data, an appropriate regression method must be selected to mitigate the effect of these points. In selecting a modeling strategy, an important factor to consider is the breakdown point of the method. The breakdown point is the proportion of incorrect observations that an estimator can support before giving an arbitrarily erroneous result. A breakdown point cannot exceed 50%, because if more than half of the observations are problematic, it is impossible to differentiate the underlying distribution from the contaminating distribution. In the context of estimating the center of a distribution, the mean has a breakdown point of 0, as it can be made arbitrarily large by changing a single observation. The median, in contrast, exhibits the maximum breakdown point.

Resistant statistics are those with breakdown points near 50%. There are three main robust regression techniques that generate resistant statistics: *M*-estimators, least median estimators, and likelihood modifications. Each of these strategies approaches robust regression differently. *M*-estimators can be used to weight observations to reduce the effect of influential points. Least median estimators, in contrast, are naturally resilient to influential points due to a high breakdown point of the median. Finally, likelihood modifications allow the investigator to model the distribution of the influential points. While all three techniques are superior to regression models that do not account for influential observations, each method has theoretical and computational strengths and weaknesses that must be considered when choosing a modeling strategy.

M-*Estimators*

Most fitting criteria find parameter estimates that minimize (or maximize) an objective function of the observed data and the parameters. Minimizing the sum of squared residuals is an example of a broader class of estimators, known as *M*-estimators, which provide statistics that minimize an objective function of the form $\sum_i w_i \rho(r_i)$, where r_i is the residual of the ith observation. The function ρ represents the type of error that the investigator wishes to minimize, such as the squared error, the absolute value of the error, and so on. Many robust regression methods are based on iteratively reweighted *M*-estimators, where weights (w_i) are used to diminish the effect of influential points. Because these weighted *M*-estimators have a higher breakdown point than traditional regression estimators, they are more resistant to influential observations.

The estimates of the parameters $(\hat{\beta})$ are easy to calculate (though the standard errors can be obtained only through the use of bootstrap methods). Iteratively reweighted *M*-estimators are estimated using the following algorithm:

Step 0: Assign weight 1 to each data point.

Step 1: Find the value of $\hat{\beta}$ that minimizes y_i.

Step 2: Compute the new residuals (r_i).

Step 3: Redefine the weights w_i using the residuals r_i by the prescribed weighting scheme.

Step 4: Return to Step 1, substituting the new residuals and weights into the objective function.

Step 5: Repeat the iterations until the values of $\hat{\beta}$ have converged.

When using *M*-estimators, the most important consideration is prescribing a weighting scheme that down-weights influential points in a reasonable way. Since the weights depend on the values of the residuals, plotting w_i as a function of r_i shows how large residuals are treated by the weighting scheme. Deletion methods have a weighting function that is 1 on an interval until the residual exceeds the cutoff point determined by the method, and the weighting function immediately drops to 0. A continuous weighting function, in contrast, gradually decreases the weights as the residuals increase.

A popular continuous weighting scheme is Tukey's biweight method. This iteratively reweighted least squares *M*-estimator assigns weights between 0 and 1 to all observations, decreasing from 1 to 0 as the residual becomes larger. This method results in the removal of observations whose residuals are too large, but in contrast to deletion methods, a residual that is close to the cutoff point receives a weight that is close to 0, rather than a weight of 1. Like other down-weighting *M*-estimators, Tukey's bi-weight method adequately accounts for influential outliers. Under certain circumstances, however, both Tukey's method and the broader class of *M*-estimators can be susceptible to high-leverage observations.

Least Median Estimators

In contrast to the reweighting methods, it is also possible to define objective functions that are already robust in some sense. In place of $\sum_i \rho(r_i)$, functions of the form $median_i \rho(r_i)$ give rise to least median regression. The intuition behind this method is straightforward. Since the median is a statistic that is naturally robust to extreme values, minimizing the objective function allows one (or several) influential points to take a large value of $\rho(r)$ while the remaining observations have a value of $\rho(r)$ that is small. The few large values have little or no effect on the estimate of the median, and the values of $\hat{\beta}$ that are obtained best fit the majority of the data.

One theoretically appealing choice is least median squares (LMS) regression, which arises from choosing $\rho(r) = r^2$. The breakdown point of LMS regression for $p > 1$ is

$$\frac{n - 2p + 4}{2n},$$

which is 50% in large data sets. Although both this method and *M*-estimation techniques handle outliers in a satisfactory manner, LMS regression is more robust to leverage points. For this reason, it is preferable to other robust regression techniques. However, an exact solution to a least median squares estimation problem necessitates searching over a space of size $\binom{n}{p+1}$ and inverting a $(p + 1) \times (p + 1)$ matrix at each step, which is infeasible for large n and moderate p. Random subsampling must therefore be used to achieve a good estimator with high probability.

Likelihood Adjustments

In contrast to minimization techniques, the effect of influential points can be reduced using likelihood methods. OLS regression is equivalent to maximum likelihood estimation when the errors are assumed to be independently and identically distributed from the same mean 0 Gaussian distribution. To account for influential points, the sampling distribution of the data can be changed from a Gaussian to a heavy-tailed distribution. This allows for more large residuals to be observed without greatly modifying the estimated mean structure of the regression. A natural choice of heavy-tailed distributions is the Student's t family. These distributions have polynomial decay, which is slower than the exponential decay of the Gaussian, and as $\nu \rightarrow \infty$, the Student's t with ν degrees of freedom converges to a normal distribution. In contrast to the other techniques, the confidence bounds on parameter estimates, and predictions can be easily obtained from the likelihood function. However, while this likelihood method accounts for influential outliers, like the *M*-estimator, it remains susceptible to leverage points. To account for leverage points in the likelihood framework, it may be necessary to fit a mixture model. This approach acknowledges that the observations may arise from multiple data generating processes, each of which must be modeled.

ROUSSEAU, JEAN-JACQUES (1712–1778)

Jean-Jacques Rousseau is a unique figure in the history of political thought whose legacy spans literature and political philosophy with equally outstanding creativity. As a political thinker, Rousseau helped formulate with the greatest rigor the normative standards of modern Western politics. Many ideas and convictions now considered fundamental to modern democracy originated with Rousseau or were revisited by him—sovereignty of the people, the role of the individual, the requisites of fair governance based on respect for the voice of the collective, and the revolutionary dimension of these aspirations. All are to be found in Rousseau's works. Although not literally a democrat himself (he notes in his most important treatise of political philosophy, *On the Social Contract*, that only a "people of gods" could govern itself under such a regime), Rousseau sketched many of the concepts on which modern democracy rests. In the 18th century, when philosophy contributed new ideas to radically reshape the norms of what is acceptable and desirable in politics and when new classes came to power, Rousseau was seen by many as the soul of his era and a major inspiration for the future. This entry reviews first his life, then his career as a philosopher, and finally his works.

Rousseau's prominence as a political philosopher should not eclipse his eminent position as a writer. A gifted stylist, Rousseau rightly ranks as one of the most revered authors in the French literary tradition. His literary influence has been of no less importance than his political heritage. Rousseau's daring *Confessions* (published after his death in 1782) made him the inventor of the major modern autobiographical genre. In the *Confessions*, as well as in other personal narratives, Rousseau does not gloss over the minutiae of his character or its flaws, thus reflecting a new interest in the depiction of the self without any self-aggrandizing descriptions of one's virtue. In texts such as his *Reveries of the Solitary Walker*, Rousseau also set the tone for the early French romanticism—something like half a century ahead of its time—where admiration for nature, recognition of the power of feelings and emotions on moral behavior, and the taste for solitude and the sentiment of isolation predominate.

Early Life

Born in 1712 in Geneva, Switzerland, to a modest watchmaker who had married the daughter of a pastor, Rousseau belonged neither to the traditional aristocracy nor to the rising bourgeoisie, from which many of the intellectual elite arose. Nothing in his early years or his family background seems to have predestined him to produce the most influential works in political philosophy.

Rousseau's childhood is like that of many others of his time, a story of multiple separations and loose family links: His mother died soon after his birth, he hardly knew his only brother, and his father had to flee Geneva when Jean-Jacques was 10. Rousseau was left in the custody of a pastor, who oversaw his formal education. Despite these separations, Rousseau considered that he had a happy childhood until age 13, when he became an engraver's apprentice, suffering the violence of a particularly brutal master. Three years later, this caused him, for fear of being beaten once more, to leave Geneva, after he had found the doors of the city closed because of a curfew. Rousseau began a vagabond lifestyle, traveling to France and Italy, returning at some point to Switzerland, all mostly by foot. For all his life, Rousseau loved walking, eventually giving his last (unfinished) book the title *Reveries of a Solitary Walker*.

In a few years, Rousseau had travelled across many countries, eventually settling down in France. He became a Catholic (converting back to Protestantism in 1754). He discovered the minor provincial nobility with his first patroness, Mme de Warens, who oversaw his conversion to Catholicism. Until his mid-30s, he was employed in a series of positions of domestic service, from lackey to embassy secretary in Italy and from steward (as well as lover) to Mme de Warens to singer and music master or private tutor. All his life, Rousseau resented his dependence on powerful protectors and made sure that he could make an independent living with a modest employment as music copyist. In 1744, he met Thérèse Levasseur, a seamstress and chambermaid, with whom he had at least three children, whom he would abandon. He married her secretly late in his life.

Literary Career

Rousseau's literary career started in the 1740s, when he met Denis Diderot and the team of the *Encyclopedia* through one of his patronesses, Mme d'Epinay. The *Encyclopedia* was a collective endeavor to present systematically the sum of knowledge of the time. Rousseau contributed several articles on music and also an important text on political economy. He was acquainted with some of the brightest minds of the time, the philosopher Etienne de Condillac and the mathematician and philosopher Jean le Rond d'Alembert, and was in communication with Voltaire. Fame came to him following the publication in 1750 of his *Discourse on the Arts and Sciences*, which he had submitted to the Academy of Dijon in competition for a prize. His work received the award despite an audacious central claim that the development of sciences and arts (in the parlance of the time, *technique*) contributed not to the development of man but to his regression. His well-crafted paradox satisfied not only the religious conservatives, who were critical of the idea of progress founded on the development of reason and science, but also the modernists, who could see in his text a critique of the building of prejudices through misguided reasoning and a praise of natural reason. It also attracted enough polemics to draw flattering attention to itself.

The *First Discourse*, although certainly not Rousseau's strongest work, nevertheless inaugurated his systematic reflections on politics. The second discourse—*What Is the Origin of Inequality Among Men, and Is It Authorized by Natural Law?*—written in 1754, clarifies his position. A radical manifesto in favor of equality among men (and, to a certain extent, women), the *Second Discourse* purports to show that inequality is not a social fact but the sign of corruption in society. Rousseau's position is situated, in the wake of the contractarian theories that had dominated political thought for over a century, in time with Samuel von Pufendorf, Thomas Hobbes, and John Locke: Social bonds are not natural but constructed, and any rational explanation of politics has to justify precisely why it has been built. But Rousseau added one consideration that radically changed the meaning of the social contract: Why should human beings accept a contract that is obviously to the detriment of those being oppressed?

To answer this mystery, Rousseau sketches a new anthropology of the individual, insisting on the rupture between the state of nature and civil society. Rousseau notes the inconsistency of the contractarian theories before him, which suppose that society starts with individuals but assume, like Locke, that they are tied by the rules of natural law. He is equally critical of Hobbes, who reduces the natural links between men to the "battle of all against all": Conflict is still a social relation. Only people who can relate to one another can fear each other. The informal cooperation imagined by Locke, just like the perpetual strife pictured by Hobbes, already presupposes society and so cannot provide a true outlook on the natural state of man and, thus, any explanation of the beginnings of society.

Maturity and Isolation

The *Second Discourse* opens up many major themes for modern political thought. The first is the economic dimension of social links: Only the invention of property—which for Rousseau is not natural—and the necessity to protect it make crucial the guarantees that society offers. Second, the book is characterized by a fundamental pessimism about the origins of society, which could be described as a *soft-power coup* of the wealthy against the poor: Society was established when the wealthiest convinced the poorest that they both had a similar interest in becoming engaged in the bonds of society, thus making the strongest stronger with the help of the weaker. But this pessimism is balanced with a sort of optimism about the very nature of society. Since men engaged themselves in the bonds of society freely and equally to seek protection, any legitimate social organization should respect this equality and this freedom. Equality and liberty are not solely natural rights; with Rousseau, they have also become legitimate political claims.

With the publication of two major works in 1762, *On Social Contract* and *Emile*, Rousseau develops his thought, insisting that people's sovereignty derives from the necessity to grant freedom and equality and thus denying any rule by divine law. In the *Second Discourse*, he directly opposes the notion of original sin, or rather the idea that it was a justification for inequalities. In *On Social Contract*, he refuses the justification of domination in the name of religion. Hence, his praise of religious tolerance and, in a famous section of *Emile*, the idea of a *natural religion* that would be the heart's call for faith versus the artificiality of established religions.

With such claims, Rousseau would confront again the religious conservatives (be they Protestants or Catholics). But he also opposed the "philosophers" who, in a liberal tradition, considered after Montesquieu that the people could not be the direct source of law. For Rousseau, on the contrary, law was solely the translation of the will of the people—the "general will." There was to be a direct link between the existence of a people and its actual organization as a political body expressing itself in laws. Otherwise, it was all too clear to Rousseau that the Age of Enlightenment was not a grand solution if it meant continuing dispossession of the people from their rights.

Within a few years, Rousseau came to be isolated (his illicit relationship with Levasseur was publicly condemned, and he was accused of abandoning his children), while his support in the intellectual community grew thin as former friends like Diderot turned into enemies—the most venomous being the powerful Voltaire—and hostility turned to persecution (Rousseau's views on religion led to his condemnation by both Catholics and Calvinists). Rousseau was threatened with imprisonment and had to flee to England. Although he returned to France during his last years, he was a deeply unsettled man whose mood was darkened by what he considered to be plots against him.

Conclusion

The richness of Rousseau's thought makes its interpretation difficult. Countless disputes have arisen about meaning. For the longest time, Rousseau appeared as a radical individualist, belonging to a certain tradition of liberalism in the context of contractarianism. But he also has been reproached for his insistence on the collective power of the people, to the point of being portrayed as a "proto-socialist."

His influence on the French Revolution also has been discussed heatedly. Rousseau, perhaps more than any other thinker, encapsulated in many aspects of his work the contradictory meanings of political modernity. For this reason, he is probably best understood as a political philosopher at the crossroad of ideologies that would diverge only after him, for they hardly existed before.

RULE OF LAW

The phrase *rule of law* is commonly understood to mean the method of government of a sociopolitical system featuring the following properties:

1. Conflicts among actors—individual and collective—are governed by means of rules that are impartial and equal for everyone.
2. Rules are enacted by means of a "limited government" that wields its own functions within the confines of the same rules (supremacy of rules over the rule of men).
3. Compliance with such rules is rooted in a legal and political culture (*nomos* as a sociolegal order).

This entry first explores the meaning of the concept and how it has evolved historically, as a basis for a comprehensive definition of the concept. It then considers the relationship between the rule of law, sovereignty, and democracy and distinguishes between the formal and substantive/normative aspects of the rule of law. The various dimensions of the rule of law as it is realized in particular cultural contexts are then discussed. The entry then examines empirical research on the rule of law in relation to political action and the implementation of the rule of law, and it also describes recent research agendas, touching on the way the rule of law contributes to the quality of democratic processes. The entry concludes with a look at directions for future research, including the way the rule of law is transformed by the transnationalization of law and politics.

Historical Roots of the Concept

Prima facie, the institutional ideal of the rule of law pivots on the meaning of impartial and abstract rules, on the foundations of the *nomos* (order). The origin of the concept of rule of law dates back to classical Greece. By emphasizing the importance of relations among equals, Plato's *Laws* and Aristotle's *Politics, Book III* elaborate a vision of *nomos* whose rules transcend the subjective will and men's protean proclivities. A *nomos* is the rule of laws, which is in contrast with the rule of men. The relevance of cogent laws for the entire political community became one of the pillars of Roman civilization, within which the law (*ius*) split into *ius gentium* (the Roman law that is in force for other populations) and *ius civilis* (the ensemble of laws deriving from legal experts, assemblies, and emperors' rule-making activities). Part of the *ius civilis* was constituted by laws in the strict sense of the word or, more precisely, by those laws adopted by assemblies (*lex*). As Charles McIlwain (1940) stressed, the difference between the concepts of *ius* and *lex* can be summarized against this background in classicism, from which the term *rule of law* inherited a semantic ambiguity, being understood as both rule by *ius* and rule by *lex*.

The Middle Ages grafted on this first form of ambiguity (law vs. enacted law) the seed of a second element of criticality. In the Middle Ages, the political order was legitimate to the extent that it reflected the rationale (*ratio)* of a transcendent order, the divine one. From this viewpoint, formal legitimacy and substantive legitimacy could only converge. As noted by James Blythe (1992), a political order, such as the Holy Roman Empire, that emanated from divine investiture (and from obeying the behavioral precepts mandated by the religious tradition) had to derive from that investiture the pledge of its own "fairness." The appearance of modernity on the institutional scene, and with it the separation of the moral system from the political and legal system, created an irreparable split between the formal and the normative understandings of the rule of law.

How could the convergence between formal legitimacy and substantive legitimacy be guaranteed within the political order? A possible response comes from the Age of Enlightenment, which accepted that the rules of the political order were legitimized by their relationship with the natural order (natural law). Nevertheless, since the link between natural laws and government rules is created by human activity, either by jurisprudential law or by statutory law, the passage from the first to the second is influenced by a human motivational and value-laden predisposition. As noted by Herbert Hart (1961), the rule of men, with their different moral and value-laden positions, seems to go back therefore to the rule of rules.
