If these questions seem to be imbued with exquisitely philosophical considerations, no one can deny their bearing on empirical research. What do we measure when we use the concept of rule of law? The form of government? The content of governing rules? To what level of reality does the unit of analysis belong? To what extent do recent institutional changes affecting both law and politics exert an influence on the semantics of the concept of rule of law? The remainder of this entry presents a critical overview of the knots that were left hanging by the secular debate around the concept of rule of law and offers an overview of the main findings from empirical research conducted in political science. Historical and analytical arguments are presented to delimit the meaning of the concept of rule of law. Finally, a multidimensional conception of the rule of law is analyzed in relation to two main approaches adopted by political scientists: the first focusing on rule of law as a *precondition* for unfolding political processes and the second on rule of law as the *outcome* of unfolding political processes.

Given its polysemy, the definition of the concept of rule of law needs to be based on its historical foundation and on both the consideration of organizational forms exemplifying the rule of law in the history of Western political institutions and the philosophical meanings that this concept has acquired in Western legal and political thought.

The first meaning of *rule of law* has its historical roots in the Anglo-Saxon experience of common law: the ensemble of legal rules created through the jurisprudential elaboration of ordinary courts within the territory of the Kingdom of England (Albert Dicey, 1915). With regard to the original nucleus, which remains bound up with the legal tradition of common law, as suggested by Gianfranco Poggi (1978), European institutional experiences have induced a modification and extension of the meaning of the concept in light of the emergence of the modern state during the 16th and 17th centuries.

With the emergence of the state as a center of power, the concept of rule of law deviated from the initial conception, which had been grounded in common law. The first deviation arose out of the new vision of the *Rechtsstaat*—the state as a rational organization of society originating from the foundational act of a sovereign entity, to which the legal system should conform. The second deviation draws attention to the correspondence between legal rules and the orientation of the popular will as expressed by the legislative body—the parliament—first pointed out by Emmanuel Sieyès in 1789. The postrevolutionary French experience advanced the idea of *état de droit* (rule of law) and the belief that "popular sovereignty" is the source of the legitimization of the rule of rules.

Only vaguely does this look like the United States' formulation of constitutionalism. Across the Atlantic, the creation of a republican form of government centered on political and institutional liberal-constitutional principles, introducing the idea of a "rule of rules" based on the supremacy of "constitutional rule," as pointed out by John Ely (1980). This is conceived in contraposition to the rule of men, as stated in *The Federalist Papers*, where "Publius" (the public) justifies the need for limited government by referring to the intrinsic fallibility of human nature:

> If men were angels, no government would be necessary. If angels were to govern men, neither external nor internal controls on government would be necessary. In framing a government which is to be administered by men over men, the great difficulty lies in this: you must first enable the government to control the governed; and in the next place oblige it to control itself. A dependence on the people is, no doubt, the primary control on the government; but experience has taught mankind the necessity of auxiliary precautions. (Hamilton, Jay, & Madison, 1787–1788, No. 51)

If in postrevolutionary France the supremacy of the rule of rules is to be understood as supremacy of the legislative rule (of the law), American constitutionalism pivots on the supremacy of the constitutional rule and the Bill of Rights. Alexis de Tocqueville saw this difference as rooted in the fact that the two constitutional orders have different historical origins. Only the French constitution was born out of a breaking point with the ancien régime, which implies the search for a foundational act—namely, a constitutive moment of the state. This is the fundamental distinction for understanding the difference between the ways in which the French and American democracies work.

During the 20th century, the historical experiences of European totalitarian regimes highlight a critical aspect of the continental version of the rule of rules. When by "rule of rules" one means rule of laws—that is, of legislative rules—one can run into the following perverse effect. Laws can comply with all formal criteria of legality and procedural correctness and yet can undermine individual rights on the substantive plane. In extreme cases, they can (as it happened in totalitarian systems) transform themselves into instruments of domination and violence. The debate on Gustav Radbruch's dilemma of unfair law is the apogee of a cultural and legal process that puts emphasis on the substantive aspects of the rule of rules, especially if they exemplify themselves as the *état de droit* and the *Rechtsstaat*.

As Ronald Dworkin (1978) points out, this is the start of the constitutionalism of rights, of the constitutional charters and catalogs of fundamental rights built into constitutions. The constitution, and to a larger degree the activity of constitutional courts in charge of interpreting the constitution and controlling the constitutionality of laws, become instruments used to anchor democratic political regimes and ensure the legitimacy of legislative norms (valued not only in terms of procedural correctness but also for substantive coherence with a superior normative order, that of fundamental rights). The introduction of the requirement of a qualified majority or referendum to modify the constitution formally ratifies the assurance or the persistence of such an anchorage.

Studies conducted on the different forms that the democratization process has taken in areas of Latin America and Central and Eastern Europe emphasize the role of the rule of law as capable of granting stability for democratic transition. Juan J. Linz and Alfred Stepan (1996) maintain that the rule of law is a necessary condition for the good functioning of those dimensions or "arenas" whose development is required to construct a democratic regime. In particular, noncompliance with the rule of law forecloses any possibility of developing an independent civil society and a pluralist and competitive political system.

Since the 1990s, the contribution of political scientists has been enriched by experiences and reflections drawn from policies intended to promote the rule of law. As Daniela Piana (2010) has noted, it is precisely because of their orientation toward crafting interventions for countries in the democratization stage that such policies have contributed to identifying the institutions and capacities necessary for the emergence and maintenance of the rule of law. In many cases, the same meaning of the concept has been operationalized to comprise the ensemble of institutions to which the promotional politics of the rule of law point.

In general, these contributions draw attention to the political-institutional dimension of the rule of law. In a different way, Russell Hardin (1999) interprets the rule of law as a rule of rules that spontaneously emerges to solve problems of social coordination where conditions of pluralism of values and preferences exist. According to Hardin, the concept of rule of law denotes those systems of collective action where power asymmetry exists. He thus puts emphasis on the importance of the social fabric that underlies institutions, on a par with what political science studies on social capital have pointed out.

History teaches us that the institutional configurations adopted to implement the principle of the rule of rules can vary according to the cultural context, although they all tend to vouch for the legality and legitimacy of political power. For this reason, it is possible to identify a common thread among the different exemplifications of the concept of rule of law, referring to the way in which the form of government ensures that rules (laws) do not become a mere instrument of domination. It is in this vein that, as noted by Gianluigi Palombella (2010), the history of liberal constitutionalism gives flesh to an institutional ideal, the rule of law, whose meaning is determined in relation to the nature (source, form, and content) of government rules. The organizational form of power—the form of government that substantiates an architecture where powers are separate or are mutually accountable—cannot but operate by virtue of the institutional ideal of the rule of law, never being the rule of law itself.

Rule of Law, the Sovereign State, and Democracy

As the concept of the rule of law has evolved, it has become a polysemic one, with multiple meanings that allow its application in a variety of contexts. However, this polysemy also makes it challenging to conduct empirical research on the rule of law. Despite the internal variability of the concept, it is useful in such empirical research to maintain a distinction between the rule of law and other aspects of modern liberal political systems, such as state and democracy. Although there is a strict relation between these two concepts and the rule of law, the relation cannot be reduced to a relation of either causal necessity or synonymy.

Rule of Law and the Sovereign State

With the concept of the sovereign state, the rule of law entertains a relation of semantic inclusivity. In other words, the rule of rules, under specific historical and cultural conditions, has become, as Joseph Raz (1996) notes, the rule of statutory laws and regulations, both expressions of the modern state. Conceived as the state of law, the rule of law prompts empirical research focused on the formal correctness with which the law is applied. The state of law contributes to legitimize the use of power because it ensures the following:

- *Formal legitimacy:* Actions are predicated on formalized rules that are clear, ratified, and neutral in terms of their values.
- *Consistency over time:* The actions of centralized decision-making bodies conform to such rules, making possible the orderly operation of the state.

In this respect, the presence of the state of law, understood as a form of government pivoting on the logic of synoptic rationality, based on written law, and codified in a systematic and coherent fashion is a condition of democracy as we conceive it today. However, this does not exhaust the meanings of the concept of rule of law. If the rule of law were to be defined as the rule of rules, not of men, then the presence of the state conceived as a modern state—much less as a nation-state—is not a necessary dimension of the rule of rules. It becomes, though, a necessary part of it if the concept of "rules" is intended to refer to "statutory laws."

This point is important for understanding the process of adoption and implementation of the principles of the rule of law in cultural contexts where the formation of the state has not taken place. As noted by Leonardo Morlino (2009), hybrid regimes exist in which some embryonic forms of rule of law mingle with a territorial administration that lacks some fundamental features of the state of law, the proceduralization of the application of the law. In this regard, it is appropriate that the two concepts of rule of law and of the state are kept separate, since it is possible that there is a state without rule of law, and in some case even vice versa, or that the second appears as a mechanism capable of applying laws in a formally correct way without, however, ensuring that such laws comply with citizens' fundamental rights.

To conduct empirical research, one needs to observe how the machinery of the state embodies legality in its legislative and regulative law-making processes. As stressed by Poggi (1978), since the state is a bureaucratic legal order, founded on laws that define and ratify—in a constitutive fashion—the spheres of action of all the areas of the public machine, from the individual (public sector employees) to the collective (the branches and departments of the public administration), it is in addition appropriate to study how far the obedience of legality is not only an objective property of rules (laws) but also a cognitive feature of public sector actors (how far the obedience of legality is a guiding principle of public action).

Rule of Law and Democracy

The rule of law does not necessarily imply a democratic form of government. This theoretical premise has influenced a large part of the Western literature on the rule of law and on democracy. As noted earlier, the meaning of the rule of law does not emerge historically in relation to the construction of a democratic regime. To be sure, the rule of law requires merely that government functioning obey some fundamental constraints, represented by rules that, even in a monarchy, first the sovereign and next the executive must follow. The introduction of democracy in sociopolitical systems where the rule of law is in force happens in the second instance, after the consolidation of the modern state and the party function of political representation.

The union between the rule of law and democracy brings with it an intrinsic tension. If, as a matter of fact, the rule of law provides for rules that constrain political power, democracy makes it possible that through lawmaking one can wield political power, the latter made legitimate thanks to its stemming from democratic consensus. Therefore, between the two forces, one that limits government via rules and the other empowering a democratic government by means of rules, it is necessary to find a point of equilibrium. The balancing of the democratic principle and the constitutional principle takes on different forms according to which countries one takes into account. Broadly speaking, Robert Dahl's (1971) position should apply. Starting from a minimum concept of democracy, Dahl speaks of obedience to the rule of law, provided that polyarchies are characterized by conditions of equal access to public offices, respect for individual freedom, and valid rules *erga omnes* (for all). Yet this condition is necessary but not sufficient to ensure a fair union between the rule of law and democracy. Indeed, Dahl is concerned with the rule of law in its formal meaning. The existence of formal legality, as Dahl describes it, does not guarantee the implementation of the rule of law. Formal legality leaves open the relationship between the value system of legislative majorities and the value system of a normative order regardless of the majority's will. The rule of law in a system that is formally a democracy does not determine whether such a system recognizes and protects the fundamental rights of citizens; thus, we need to distinguish between the broad and narrow senses of the rule of law—the substantive versus the formal or procedural.

Adam Przeworski (1991), who does not dismiss a purely formal vision, claims that the rule of law clears up two sets of problems: the "Madisonian" dilemma, which is the need to set limits to the potential capacity of the state to overwhelm citizens' rights, and the "Hobbesian" dilemma, namely, the need to protect individual rights from the potentially predatory actions of other private actors. He identifies two dimensions of the rule of law: One pertaining to freedom, which has to do with the capacity of the state to protect citizens' rights, and the other pertaining to safety, which has to do with the capacity of the state to protect citizens from other citizens. While to perform the first function one needs mechanisms that constrain the public hand, the execution of the second requires mechanisms that make the public hand sufficiently powerful and effective to maintain social control. Such conditions define the minimum requirements to say that a democracy is subject to the rule of law.

If, however, one wants to broaden these conditions and integrate the substantive dimensions of the rule of law, the systems of democratic governance should give rise to an implementation of rules so that the fundamental rights can be fulfilled in a comprehensive and enduring fashion. In this regard, rule of law and democratic principles—that is, the legitimacy of rules that constrain the power and legitimacy of the objectives pursued through the power of the majority—must therefore be made compatible through a vision of the constitution that is not an *ex ante* given (guaranteeing the formal conditions of the democratic game) but that stems from the same democratic game *ex post*. Concretely, each Western liberal democracy has configured itself along an axis where the different forms with which history has changed the principle of rule of law and the democratic principle have been located. Yet since the beginning of the 20th century, the majority of contemporary democracies have included such principles in their constitutional charters. Together with the rules that define the democratic institutional system, these constitutions ratify even lists of fundamental rights unavailable to political majorities. Such constitutional principles entail that parliamentary will, even when pursuing collective objectives legitimized by majority consensus, cannot compromise the fundamental rights of citizens. The constitution defines at the start of political processes those areas where ordinary politics can be legitimately practiced according to democratic practices and in compliance with fundamental rights. These are established and arranged once and for all in the constitutive rules of political order. In this regard, a constitutional democracy sets forth the form the government must take, the rights guaranteed to citizens, and the procedures by which such rights are implemented.

In addition, written constitutions provide for institutional devices with which it is possible to protect the constitution from both attacks by parliamentary majorities and possible drifts of executive power. Among these, the most common, as noted by Mauro Cappelletti (1989), is the inspection of constitutionality that constitutional courts can perform against primary and secondary legislation and against the norms of international law. The growth of politics aimed at safeguarding one's rights is an additional feature of the Western democracies that emerged in the second part of the 20th century as a reaction to the totalitarian and authoritarian drifts that prevailed over the democratic majorities at the beginning of the century. The history of the 20th century revealed that the constitution is not only an initial given of the political process. Rather, it should be conceived as the aggregate effect of the interaction between the demand for and the supply of justice, such interaction taking place not only through the dialogue between the judiciary and the legislative but also through the dialogue between jurisdictions and individuals or social groups.

Dimensions, Units, and Levels of the Rule of Law

Beyond the different forms of instantiation of the rule of law, the concept of rule of law can also refer—at a more abstract level—to a system where the rule of rules is in force, intended as an institutional ideal available in different organizational forms (administrative-legal structure and government standard procedures) according to the source, form, and content that rules gain (jurisprudential, legislative, and administrative-regulative). Concept formation should then follow the path of all multidimensional concepts, whose advantage stems from being able to incorporate into their semantics different aspects related by juxtaposition—conjunction—rather than by disjunction. The rule of law is many things together, all of them combined into a real instantiation in different patterns.

The extension of the rule of law is, thus, composed of a combination of five dimensions:

1. *Civil order:* a focus on the right to life, freedom from fear and torture, personal security, and right to own property, guaranteed and protected throughout the country; low rates of crime and social conflict; a persistent and durable culture of legality
2. *Independent judiciary and a modern justice system:* a focus on mechanisms establishing an independent, professional, and efficient judiciary system that allows equal access to justice, free of undue pressures and with enforcement of decisions
3. *Capacity of the sociopolitical to formulate, implement, and enforce the law:* a focus on a governance system (legislative and executive branches) capable of ensuring the production of high-quality legislation and its implementation throughout the country; a transparent policy-making process allowing for the participation of the civil society; and the presence of a professional, neutral, accountable, and efficient state bureaucracy
4. *Low if not nonexistent rate of corruption, illegality, and abuse of power by state agencies:* a focus on the internalization of the law by public officials and social actors; the existence of self-constraint mechanisms of public ethics

and, in case these mechanisms are ineffective, effective policies for fighting corruption and abuses of power

5. *Security forces that are respectful of citizens' rights and are under civilian control:* a focus on the mechanisms of civilian control over security forces as well as on efficient, uncorrupted, and disciplined police forces respectful of human and political rights

This strategy enables research to encompass different ideal types or forms of government, provided that the nature of rules whose supremacy is suggested by the phrase *rule of law* is specified. The concept of rule of law here takes on a precise meaning and can be operationalized once the origin of jurisprudential, legal, and administrative-regulative rules has been determined. The term *rules* is meant in a broad sense, not restricted to positive law. Rules consist of jurisprudence, doctrine, and the interpretative principles that judges of different rank and jurisdiction refer to, as well as the social rules that stem from institutional tradition and are implicit in the very fabric of political community. This is a fundamental point. It emerges as a "thick" formulation of the rule of law that redefines what has been stated by scholars of democracy and in particular by authors such as Guillermo O'Donnell (2004), who have highlighted that the legality and formal correctness of rules (the "thin" vision) are not sufficient to ensure that a country is subjected to the rule of rules.

If one narrows the field of observation to democracies, the rule of law is not only a *necessary condition* for achieving a high degree of quality of democratic governance but also the *effect* of the interaction among different factors, including both social and political aspects. This distinction does not entirely cover the previously mentioned dichotomy between formal and substantial rule of law—which belongs more properly to the realm of normative theories—nor can it be considered as a way to reword the relationship between rule of law as an end and rule of law as a means to an end. Both these second distinctions belong as a matter of fact to a normative, prescriptive discourse, whereas the distinction between rule of law as a precondition and rule of law as an outcome is phrased in terms of the empirical analysis of a democracy.

This double vision finds its own reference even within the contemporary debate developed by the supporters of the rule of law, namely, law or administrative science experts, who together with policymakers, diplomats, and bureaucrats are committed to the diffusion of the principles of the rule of law in developing countries or those countries in transition toward democracy. According to Rachel Belton (2005), all these options fall within two broad concepts, which are not necessarily in opposition to each other: the first focused on the rule of law as an *end* of the political order and the second on the rule of law as an *instrument* of the political order. The rule of law as an end in itself means limited government and a guarantee of fundamental rights. This is the definition of constitutionalism. According to Morlino (2009), the rule of law as an instrument means an independent legal system, a transparent and efficient public administration, and an ensemble of police forces and law enforcement agencies subject to civil control. However, the distinction between rule of law as a means and rule of law as an end does not provide any profitable way to conduct empirical research. Indeed, it presupposes by *petitio principii* that actors who comply with the rules that underlie the very basis of the institutions to which the five dimensions listed above refer—civil rights, the judicial system, the administrative system, military force, and the police—are pursuing an end or are using their compliance as a means to a different end. One may argue instead against such a teleological view of the rule of law. Rule of law has been unveiled by empirical research as a complex process imbued within political institutions, whose direction and whose main rationale cannot be grasped simply on the basis of the means–end dichotomy. Rather, it may be of some interest to distinguish between strategies of research and empirical analysis, being fully aware that reality is ontologically unified and this distinction serves only human cognitive goals.

Empirical Research on the Rule of Law

Rule of Law as a Source of Opportunities for Political Action

This scholarship is framed in a neo-institutionalist approach and ultimately restored to the social sciences the primacy of agency as the source of social processes. Law as a condition of action basically entails that research should focus on the way actors interact under the conditions set down by the law and on the way actors take advantage of the existence of laws and institutions believed to instantiate the principle of the rule of law—as, for instance, the judicial branch. Two types of actors have been taken into account: (1) institutional actors, in particular with regard to the use of the constitutional courts as clearinghouses for institutional conflicts, and (2) social actors, in particular with regard to legal mobilization.

When law is thought of as an opportunity to apply pressure, the organizational and cognitive resources handled by social and political actors become of utmost importance in transforming an opportunity for political pressure into an effective instrument for the exercise of power. Nongovernmental organizations and citizens associations that can take cases before the courts and make their actions visible by any means may bring about a major change in the legal and the constitutional system of a country, achieved through pressure from below.

A large body of scholarship has been developed over the past decade in the field of European studies by devoting energies to cast light on the use of European Community law to make policies or to enact new ways of enforcing traditional rights. The so-called supranational rule of law that has been identified in European legal norms and judicial institutions—for instance, the European court of justice and the European court of human rights—has been thought to be a promising arena that actors endowed with resources and capacities can enter to push forward their own interests and values. European scholars are vigorously debating the type of rule of law used by the European Union (EU) (in the context of the constitutional debate developed over the past years). As a matter of fact, the EU seems to be more intelligible as a rule of law in process—rule of law as an outcome—than as a rule of law as a precondition for democratic processes. To phrase it differently, European constitutionalism, thought of as a complex and multilayered system of rights enforcement, is not given *ex ante* but instead is made up as a political, social, and cultural construction.

Rule of Law as Outcome of Political Processes

The rule of law may be thought as a social system in which interactions, both social and political, are ruled and shaped according to fundamental, impartial, stable, and predictable rules, some of them of *longue durée* (long term). Rule of law as outcome is highlighted by nonformalist and nonpositivist scholars such as Hardin (1999) and Morlino (2009), who have devoted time and energy to restore to the field of research the study of how rules are implemented.

Some research has been developed to bring political processes to light, both at the macrolevel and at the mesolevel. A major point related to the study of the rule of law as an outcome impinges on the capacity of a society for settling disputes on the basis of the law. An extensive scholarship has revealed the importance of cultural and cognitive conditions, which exist alongside, and sometimes even in opposition to, structural conditions.

These studies have observed that the legitimacy of legal rules and political institutions is key to maintaining, in the long run, the rule of law. Civic engagement and a civic culture have been pointed out by scholars working on political culture and related matters as a cornerstone of a well-functioning democracy and ipso facto of a system based on the rule of law. The argument put forth about the positive correlation that should exist between civic culture and the rule of law is as follows: Civic culture helps maintain a low level of social conflict, and as a consequence, it reduces indirectly the need to use rules to foster social behaviors based on common principles of peaceful social life.

Empirical research has recently pointed out the role played by factors that stand outside the political system, for instance, the existence of the supranational networks in which standards of rule of law are set down, promoted, and disseminated internationally. In a way, this fairly new phenomenon is associated with the increasing importance of the interplay of domestic and supranational factors in making the rule of law a multilayered configuration of rules and principles rather than the epiphenomenon of a hierarchical system of rules enacted exclusively by domestic actors. International scholars and comparative political scholars have joined in exploring the mechanisms that work in the interstices of the two-level games played by domestic and supranational institutions nowadays. The result has been a spectacular growth of normative production, pursuing the implementation of the rule of law that transcends the usual traditional, domestic, judicial, and legislative arenas.

Empirical Research on Democratic Quality

Complexity and polysemy can be handled effectively if the rule of law is meant to be a multidimensional, conceptual tool covering different aspects of sociopolitical systems. This approach appears promising when framed in a broader context, as the empirical analysis of the quality of democracy. Democratic-quality assessment appears today to be the contemporary way of phrasing an old and perennial question cutting across all Western political experiences, namely, the search for good government. Democratic assets address the issue of expanding the spectrum of political participation, injecting the principle of political competition under conditions of formal equality and given the primacy of the law. However, although formal designs may perfectly satisfy abstract criteria, in practice democratic institutions work differently in different countries and may deliver different types of services and goods, resulting in differing levels of citizen satisfaction despite being designed similarly. In brief, what matters in reality is how democracy works and what puts into motion the formal institutional designs. This point is fully accepted by the comprehensive and empirically oriented approach to democratic quality that has recently been developed by Morlino (2004). Following this approach, one refers to the *qualities of a democracy*. These qualities are grouped into three types:

1. qualities associated with the procedures of the political system,
2. qualities associated with the content of the policies, and
3. qualities associated with the products of the political processes.

The first comprises rule of law, interinstitutional accountability, electoral accountability, competition, and participation. The second relates to the responsiveness of the democratic processes. The third concerns the equality and solidarity that are in reality offered to citizens.

Accordingly, the rule of law is not only a procedural dimension of the democratic regime—one of the qualities it is expected to feature. It is also one of the crucial dimensions on which many other aspects—or qualities—of democratic governance depend. As a matter of fact, the rule of law enters into patterns of regular interaction with other procedural dimensions. First among these is interinstitutional accountability. In those cases in which legislative oversight of the policies enacted by government proves to be weak and ineffective, judicial institutions—for instance, the constitutional courts—can perform a subsidiary function and put into motion an alternative mechanism of checks and balances. In a different setting, the rule of law may specifically interact with the participants and thereby contribute to the enforcement of the rules that govern a society. One way for this to happen is through legal mobilization. Civil society organizations and rights advocacy coalitions may help enforce or deepen the fundamental freedoms of citizens, thereby bringing about a change in the political system. Judicial arenas may become in this view an opportunity to act, of which social actors may take full advantage if they have the resources to mobilize and bring a case before the courts.

A further point that deserves to be emphasized is that the empirical approach to democratic-quality assessment illustrates and reveals the several different ways by which the law enters into a combination and intertwines with the extralegal norms of a society. In a way, the wide range of policies and programs put into motion to promote the rule of law in nascent democracies has provided scholars with a formidable experiment of institution building, something that in old and consolidated democracies would have never been possible. Such an experiment creates quasi-optimal conditions to detect and disentangle the relative weight of prelegal dimensions incorporated into the daily life of social communities and to assess the role such dimensions play in transforming formal legal rules into effective social practices. Drawing lessons from these experiences of social and legal engineering, a comprehensive democratic-quality assessment exercise considers the interaction between the procedural aspect of the rule of law and the degree to which legal norms and jurisprudence match the diffuse legal culture (an aspect referred to by the notion of responsiveness). By focusing on the prelegal dimension of the rule of law, a scholar may be accused of naive optimism. If on the one hand rule of law proves to be a fairly vague concept, on the other hand prelegal aspects show resistance to empirical investigation. Indeed, for social scientists, this exploration is forced to deal with a never-ending puzzle, namely, the intangible nature of unobservable forces, whose effects we can measure and whose intrinsic ontology we can only guess. However, by denying the importance of the prelegal aspects of rule of law, one does not get very far either in understanding the way society functions or in providing policymakers with sound frameworks to set their agenda for legal and judicial reforms. According to Leonardo Morlino and Wojciech Sadurski (2010), a way out would be to refer to the democratic rule of law in order to incorporate those aspects that refer directly to the prelegal dimensions of social enterprise. In this way, as Palombella (2010) has observed, rule of law would mean simply the primacy of rules, whereas the determinacy of what these rules are, where they come from, and where they are going remains an open question, to be addressed empirically. As a matter of fact, rules used in a society to deal with an inescapable part of social life—disagreement—might have different sources and different formats. By endorsing this view, scholars are able to appreciate the delicate intertwinement that exists among democratic qualities and, more specifically, between the rule of law and the different components that characterize a democratic society.

A valuable aspect of the way the democratic-quality assessment addresses the rule of law comes from its pluralist theoretical stance. As mentioned before, the rule of law is a “thick” concept, in which traditionally normative and descriptive aspects are mingled in a complex interlacing of mutual influences. Democratic-quality assessment accepts this plurality of views and interprets them as a variety of configurations in which the rule of law as an institutional principle can be instantiated into a democratic regime. In countries in which the rule of law is grounded in a vibrant civil society and the extension of the public sector is limited because of historical reasons, democratic-quality assessment does not endorse an evaluative position; that is, it does not assess this specific configuration as a better or a worse one than others equally represented by Western institutional experiences. It simply recognizes that each configuration of a democracy is characterized by the specific way in which each quality participates to determine the whole of democratic governance.

Beyond the Rule of Law?

A further development witnessed by contemporary scholarship concerns the way legal and political reality challenges traditional definitions and conceptions of rule of law. Despite its being a concept with a long history, the rule of law does not cease to be subjected to a steady and permanent confrontation with reality and, thereby, to restlessly readapt its meaning and its normative value. In fact, this complex and polysemic concept mirrors the multiplicity of the institutional and cultural experiences that are observed by the numerous and different models of organization of power—both in the Western tradition and nowadays outside it—and by the many different models through which individuals have managed to accommodate selfishly oriented behavior in a collective setting of predictable and stable rules of interaction. In a way, this is a sign of the state of good health of the concept, because it bespeaks its capacity to accommodate different instances of the same general principle, namely, the idea of constraining power through rules, legal and extralegal.

However, in recent decades, new institutional phenomena and new ways of thinking and practicing law making and law enforcement have come to light. The diffusion of democratic institutions and the emergence of regimes that combine nondemocratic features with elements of the rule of law have added richness and complexity to an already large spectrum of empirical cases to which the concept of rule of law have been applied both in the presence and in the absence of the democratic conditions in which politics takes place.

One can mention at least three new developments undergone by political institutions that call for a rethinking and a reconsideration of the meaning of the rule of law and, consequently, the way the concept is operationalized in empirical research design.

1. *The unpredicted growth of the production of legal norms, which is currently being experienced in many advanced democracies.* The idea of constraining power through rules that are “law” seems to encounter some difficulties, due to overproduction of legal norms. In this respect, too much regulation shadows the magic glamour of the rule of law as a limit to the rule of men. When the legal norms are persistently changed, the

intervention of the will of men becomes dominant and even overrules the "rule of rules."

2. *The uncontrollable process of transnationalization of the rule of law.* This is related to the multiplication and fragmentation of the sources of law. Laws, quasi laws, and so-called soft laws are produced at the subnational, national, and supranational levels. In practice, they mix together. In reality, they offer to social and political actors the possibility of moving between different normative systems, in a way that owes much more to a contingent and strategic logic than to a stable, predictable, and valid *erga omnes* logic.

3. *The increasing hybridization of legal, judicial, and institutional practices and procedures.* Social and political systems have deployed extensive processes of mutual imitation, which have transferred practices and procedures from other systems where they had once been adopted or invented. This occurs at all levels of the organization of the state, in new and advanced democracies as well as in nondemocratic and hybrid regimes.

These comprehensive changes entail a number of important consequences for the political science research agenda. When the rule of law is studied as an outcome—as rule implementation—it should be considered a radial concept, composed of semantic building blocks radiating outward from a center. Not all the blocks have empirical meaning in all instantiations of the rule of law. They can even have different relative weights in different empirical contexts. This may allow researchers to accommodate the large variety of different forms of rule of law, without stretching the concept to the point of emptying it of value.

It is of paramount importance that typological studies are used. When the rule of law is studied as a precondition, it is extremely useful in analytical terms to start from ideal types, which feature a specific way of combining law, politics, and society. The rules that constrain power are produced not only by making laws but also, over the long run, by social processes. History has provided us with experiences that took different paths through law, politics, and society. Once developed as an abstract typology, the research then can go in depth and see to what extent each real case instantiates the features presented in the ideal types.

Generally the rule of law seems to carry an intrinsic dilemma, which is mirrored in the way it has been used as a concept in empirical research projects. Basically and substantially, it has been thought of as a way to steer and control social processes on the basis of general, abstract rules that are able to remove the unavoidable discretionary power from the process of resolving social and political conflicts. However, these general rules must be implemented by the actions of individuals, and thus, the rule of law does not eliminate the inherent tension between the rules and those who make them.

It is important that dialogue continue to develop between those whose chief concern is concept building and observation of reality and those concerned with broadening the theoretical base of the rule of law, thereby accounting more fully for the different aspects of democracy with which the rule of law interacts. For these reasons, empirical research in all the social sciences—and particularly empirical research using a comparative methodological approach—deserves more than ever to be elaborated on and intensified by future generations of social scientists.

S

SAMPLING, RANDOM AND NONRANDOM

In its most general form, a sample is simply a subset of a larger population or group. In scientific applications, the purpose of sampling is to be able to draw conclusions about a larger population. There are many reasons to sample rather than attempt to collect data on the full population. They include the following:

- *Cost:* It is often cost prohibitive to collect data on the entire population.
- *Speed:* To collect data on the entire population would take an excessive amount of time.
- *Feasibility:* Often the complete set of population elements is unknown. Most populations do not have centralized lists of their members. Even when such lists exist, it is usually impossible to collect data on every single member.

This entry discusses the major types and problems of sampling procedures.

The sampling procedure can be described using the following terminology.

Population Unit. The population unit is the unit at which the data are collected. In survey research, population units are typically people, although they can also be at other levels, such as households. Other types of research designs may look at larger units of analysis, such as nations, cities, organizations, or institutions.

Target Population. The target population is the group of elements that the sampling procedure aims to represent. For example, a public opinion survey may attempt to represent all adult Americans or may limit the population to individuals with certain qualifying characteristics, such as parents of school-age children, voters, people with heart disease, or residents of South Carolina.

Sampled Population. In contrast to the target population, the sampled population refers to the portion of the population from which the sample is actually drawn. In an ideal world, the sampled population and the target population are nearly the same thing, but for a number of reasons drawing a sample from the target population is usually not feasible. For example, survey data collected using random digit dialing is unable to include respondents who do not possess telephones. Low-incidence target populations exacerbate these issues. For instance, if a researcher wants to do a representative study of people who run for local office, using a random digit dialing technique would be enormously expensive, as many contacts would need to be made to get a single eligible respondent. For this reason, studies of low-incidence populations are often conducted on prescreened individuals (e.g., those from membership lists or clinics). In all cases, it is important to consider any systematic differences between the target population and the sampled population.

Sampling Unit and Sampling Frame. To select the sample from the population, the population must first be divided into sampling units, or elements that are subject to being selected. The collection of the list of sampling units is referred to as the sampling frame. In a simple random sample design, the sampling frame may consist of a list of individuals who belong to an organization, with the sampling units being each individual. Cluster designs may have a more complex relationship between the sampling frame and the sampling unit, as described in the next section.

Types of Sampling

Sample selection can be broadly defined as being random or nonrandom—that is, as either probability or nonprobability sampling. The primary difference between these two approaches is that nonprobability samples require some judgment on the part of the researcher as to which cases should be included, while probability samples are selected such that any member of the population may be included (although not necessarily with equal probability). Additionally, self-selected samples have no sampling frame in the traditional sense.

There are numerous approaches to random and nonrandom sampling. The next section describes some of the most commonly used designs.

Random Sampling

- *Simple random sample (SRS):* In a simple random sample of size n in a population of size N, every possible subset of size n has an equal probability of selection, and the probability that an individual unit is selected into the sample is n/N.
- *Systematic sampling:* In a systematic sample of size n of a given population of size N, the first step is to pick a random starting point R between 1 and k, where k is the next integer after N/n. Next, R and every kth element after R in the population are selected into the sample. One risk of using systematic sampling is that if there is any periodicity in the list, the sample variance may be large.
- *Stratified sampling:* The stratified sampling procedure first divides the population into subgroups, called *strata,* and then selects an SRS from each stratum. One potential downside of using an SRS design is that simply due to chance, certain groups in the population may be underrepresented, especially when smaller sample sizes are used. One way to guard against this is to use stratified sampling on measures of interest. For instance, when conducting a survey of political attitudes in a U.S. state, one might want to ensure that urban, suburban, and rural areas are adequately represented. To achieve this, the researcher can stratify the state into levels of urbanicity and then sample within each urbanicity level. Stratified sampling improves efficiency if within-strata units are relatively homogeneous and most of the variance in the survey measurements is between strata.
- *Cluster sampling:* Often, SRS designs are not feasible because the total list of elements is not known. For example, if one wanted to conduct a study of restaurant workers in a city, there is no centralized list of these employees. However, it would be relatively straightforward to find a list of restaurants in a city. In a cluster sampling design, the first step would be to take an SRS of the restaurants in the city and then take a subsample of the employees in each restaurant. In this design, restaurants are the *primary sampling units*, and employees are the *secondary sampling units*. Cluster samples are more efficient if there is little variation between clusters and more variation within clusters.
- *Multistage cluster sampling:* A variation on the previous design is multistage cluster sampling, which effectively is a series of nested clusters. Taking the previous example, suppose the same researcher wants to interview a representative sample of restaurant workers at the state level. While one could sample from the list of restaurants in the state, to do so may be an inefficient use of limited resources and time. For that reason, it makes sense to first take a random sample of the regions in the state (e.g., counties), with the probability of selection proportional to the population in the region; then a random sample of cities within the selected counties; followed by a sample of several restaurants in each city; and finally of employees in the selected restaurants.

Nonrandom Sampling

Nonrandom sampling comprises a broad category of approaches that are similar primarily in that subjective criteria are used in case selection rather than randomization. While nonrandom samples lack the statistical properties that random samples have, there are often compelling reasons to use them, ranging from feasibility to convenience to specific criteria tailored to the research design. Some examples of nonrandom sampling are as follows:

- *Quota sampling:* Quota sampling resembles stratified sampling in that strata are created with target numbers for each group. Where quota sampling differs from stratified sampling is that the elements within each strata are not chosen at random. Quotas can be based on marginal distributions of individual variables or by the joint distribution of a number of variables. The main risk in using quota sampling is that the selected elements are subject to bias, including the following:

  Judgment: The respondents are selected by the interviewer, which introduces the interviewer's preferences as to whom to interview within the quota groups.

  Self-selection: The respondents opt into the study. While these respondents may fill the quota groups, they may be qualitatively different from members of the group who do not opt in.

  Nonignorable bias: The factors defining the quota groups are insufficient to explain the differences between the respondents in the quota groups and the population in those groups.

- *Convenience sampling:* A convenience sample contains a group of participants who select themselves into a study. Clinical trials for medical treatments frequently use this type of design. Because it is impossible to sample patients at random, these studies rely on the willingness of patients to volunteer for a clinical trial. Once in the clinical trial, patients are assigned at random to receive the drug being tested or a placebo.

- *Purposeful sampling:* Other types of nonrandom sampling rely on case selection by the researcher. In these situations, cases are selected based on a cluster of characteristics that allow the researcher to test a theory. Generally, these designs are used when a relatively small number of cases are to be examined in depth. There are many types of purposeful sampling. Some examples are as follows:

  Typical cases: Cases are selected by virtue of not being unusual or exceptional with respect to the larger population.

  Most similar/most different: Cases are selected based on having very similar or very different characteristics. For example, two nations with a similar set of policies but very different outcomes may be examined.

  Critical cases: In critical case sampling, cases are selected that are considered to be particularly important to understanding the logic behind a causal phenomenon. Critical cases are often used to make the argument that if an outcome is true for that case, then it is likely true for all cases.

- *Snowball sampling:* Snowball sampling builds a sample in stages by starting with a (generally small) group of subjects who are considered to be good sources of information, who then recruit additional subjects from their own social networks. The new recruits then find more recruits, and so on, until a "snowball" of recruits is built up. While the resultant sample may not be representative of the population at large, snowball sampling is especially useful for collecting data on populations that are hard to reach (e.g., people engaging in illegal activities).

Sampling and Nonsampling Errors

Samples are often used to obtain estimates of population parameters of interest. A population estimate obtained by a sample estimator may contain errors that can arise from many sources. The total error can be decomposed into two pieces: sampling error and nonsampling error.

Evaluating Sampling Measurements and Errors

Sampling error is the random error that arises as a result of selecting a sample of a population. In a random sample with no bias present, an individual sample may differ from the true population parameter, but many repeated estimates from a sample will on average cover the true population parameter. The degree of uncertainty that is introduced by sampling error is quantified by the standard error of the estimate or the margin of error of a sampling procedure. This section discusses the characteristics of sample estimators in general and the characteristics of estimators derived from simple random sampling in particular.

Sample Measurements

Given a sample of $i = 1, \ldots, n$ units from a population of N units, measured with respect to characteristic χ, the *sample mean* of an attribute is given by the sum of the values of χ over all the units in the sample, divided by the sample size:

$$\bar{y} = \frac{1}{n}\sum_{n} y_i.$$

The sample mean is considered to be an estimate for the population mean.

The precision of this estimate can be described using the *sampling distribution.* The *sample variance* is a measure of the spread for a given attribute χ, calculated as the average squared deviation from the sample mean:

$$s_y^2 = \frac{1}{n-1}\sum_{n}(y_i - \bar{y})^2.$$

The *sample standard deviation* is the square root of the sample variance:

$$s_y = \sqrt{\frac{1}{n-1}\sum_{n}(y_i - \bar{y})^2}.$$

The statistic that is typically reported to quantify the amount of sampling error is the *standard error* (*SE*), or the standard deviation of the sampling distribution:

$$SE_{\bar{y}} = \sqrt{\left(1 - \frac{n}{N}\right)\frac{s_y^2}{n}}.$$

The standard error can be used to generate the *confidence interval* of the sample mean. Because the distribution of all possible sample means is approximately normal, the 95% confidence interval of the sample mean is

$$\bar{y} \pm 1.96 \times SE_{\bar{y}}.$$

Nonsampling Errors

Nonsampling error refers to any error introduced into the sample estimate that is not attributable to sampling variation. If these errors are systematic, then they introduce bias into the sample estimate. In probability sampling where the selection probabilities are known, unbiased estimates of the population parameters and their standard errors can be calculated. For nonprobability samples, or probability samples where the selection probabilities are not known, this is not always the case, and at a minimum, a model of sample inclusion is necessary. For both random and nonrandom sampling designs, however, nonsampling errors are often present.

Nonsampling errors can systematically bias parameter estimates to a greater extent than the deviation caused by random sampling errors. These errors can be due to *selection bias,* where some set of the target population is systematically not included in the sample. For instance, *coverage error* results when units in the target population are not included in the sampling frame (undercoverage) or when some units in the sample do not originate from the target population (overcoverage).

Additionally, errors in the survey instrument can lead to bias from *measurement error.* Measurement error can be introduced into a survey instrument in several ways. Not all are preventable, but a carefully constructed survey design can minimize these errors.

- Question wording, order, and context can introduce bias into the survey instrument. The respondent may be "primed" to provide a particular response, or a question may not be neutrally worded.
- An imprecise measurement device may prevent respondents from expressing their actual opinions.
- Respondents may provide inaccurate answers to survey questions unintentionally, because of poor questionnaire design or simple mistakes.
- With sensitive material and when sampling human subjects, the researcher also has to consider the possibility that respondents are deliberately misrepresenting information in the survey responses. For example, respondents may lie when asked about their yearly income or when asked whether they voted in the previous

general election. Respondents may also forget details when answering questions about activities in the past and may provide guesses in response.
- Human errors can also be introduced into the survey when coding the responses for analysis.

Nonresponse error can create significant bias in samples. Often, the characteristics of non-responders are systematically different from the characteristis of those who do respond. This problem is especially significant if the measurement of interest is affected by nonresponse. For example, in a study of political participation, if people who participate are more likely to respond than people who do not, then estimates of participation rates will almost certainly be affected. In cases such as these, nonresponse is *nonignorable.* There are two basic types of nonresponse.

- *Unit nonresponse* occurs when an entire sampling unit is missing from the sample. A respondent who refuses to answer any of the questions in a survey is an example.
- *Item nonresponse* occurs when a single or multiple survey items are missing, but not all of them, for a single unit. For example, a respondent who skips a question about income level but responds to the rest of the survey exhibits item nonresponse.

In cases where the probability of response is affected only by observed variables rather than survey measurements, the data are considered *missing at random,* and the effects of nonresponse can be considered ignorable, as a model can adjust for any effects of nonresponse. Using a different participation example, suppose women were more likely to respond to the survey than men were. If the participation rate among the women surveyed is the same as it is for the population of women and, similarly, the participation rate among the men surveyed is the same as it is for the population of men, then survey weights can correct for the effects of unit nonresponse.

SANCTIONS

Originally conceived by Woodrow Wilson as a key component of the post–World War I order within the League of Nations, the effective application of economic and other sanctions did not develop unilaterally until after World War II and developed multilaterally only after the post–Cold War era. Despite some examples of punitive sanctions taking an economic toll when imposed unilaterally, such as the United States against Cuba and Iran and the former Soviet Union against Armenia, multilateral sanctions have become the norm as they have both the greatest legitimacy and chance of success. Thus, they constitute the main focus of this entry.

Since 1990, the United Nations Security Council (UNSC) has imposed sanctions against 19 nations and entities, while regional organizations, most notably the European Union and the British Commonwealth, have increasingly resorted to sanctions as well. The legal authority for United Nations (UN) sanctions appears in Chapter VII, Article 41, of the UN Charter, which provides that the Security Council may call on states to impose nonmilitary measures, such as interruptions of economic and diplomatic relations, to protect international peace and security. In its first 45 years of operation, the Council imposed sanctions measures in just two cases: in Southern Rhodesia in 1966 (S/RES/232) and in South Africa in 1977 (S/RES/418). The end of the Cold War removed the political roadblocks preventing collective action, while the dynamics of economic globalization convinced nations that they derived little benefit from cheating on the enforcement of sanctions. Instead, nongovernmental actors and criminal networks have tended to be the major sanctions busters.

UN multilateral economic sanctions have been imposed for a diverse set of reasons: to promote democracy and human rights, to enforce international law and resolutions of the UNSC, to prevent military aggression and armed conflict, to encourage military demobilization and postconflict reconstruction, to counter terrorism, and to prevent the proliferation of nuclear weapons. The list of the sanctions imposed by the UNSC from 1990 to 2009 reveals a substantial set of cases where sanctions are not imposed against a government but rather against nonstate actors or militia forces operating within a particular country. Examples of this trend include the cases of UN sanctions against actors in Somalia, Angola, Rwanda, Sierra Leone, Democratic Republic of Congo, Sudan, and Côte d'Ivoire. In the cases of Afghanistan and Iraq, sanctions initially were imposed against governments, but after the U.S.-led overthrow of these governments, the Security Council measures were redirected against individuals and entities associated with the former regime and/or insurgent/terrorist groups. Sanctions imposed in Iraq, Somalia, Liberia, and Afghanistan have changed significantly over the years, in line with changing political conditions within the targeted regime.

Of all UNSC sanctions, only those imposed against Southern Rhodesia (1966), South Africa (1977), Iraq (1990), Yugoslavia (1991), and Haiti (1993) included comprehensive trade sanctions as part of a larger set of coercive techniques. Controversies regarding the devastating humanitarian impact of such sanctions in Iraq led to a reevaluation of general trade embargoes and prompted the adoption after 1994 of more selective and targeted measures—the so-called smart sanctions. Smart sanctions are aimed exclusively against wrongdoers rather than entire economies. These include individuals holding specific government positions, economic elites, and entities who provide significant support to—or benefit from—the sanctioned government or who have violated international law or Security Council resolutions on their own accord. Smart sanctions seek to control, capture, or restrict the movement and use of financial assets, specific products—such as luxury goods, arms, or particular commodities—that often are critically necessary for the supply and financing of armed conflict or that are being moved illegally to aid an illegal action or actor. Smart sanctions include

- financial sanctions, which freeze the assets (including property) of and block financial transactions with designated individuals and entities, including restrictions on dealing with specific banks;
- arms embargoes, which ban the supply of weapons, military-related technology, and other forms of military assistance;
- travel sanctions, which deny visas and ban the travel of designated individuals or prohibit travel on designated airlines or to the airspace of targeted regimes;
- commodity sanctions, which prohibit imports or exports of specific materials or goods, such as diamonds, oil, timber, and selected stones and metals; and
- diplomatic sanctions, which deny national participation in international events or organizations or withdraw the diplomatic privileges of designated individuals or regimes.

To implement these focused, targeted financial measures, the UN has relied on state implementation and enforcement through banks and major financial institutions. Most international hard-currency transactions are screened through name detection software, which provides an effective means of interdicting illicit transfers. Many nations also have financial intelligence units that assist law enforcement officials in detecting and thwarting financial crime and sanctions violations.

The Security Council has also created sanctions committees and authorized them to establish lists of designated individuals and entities whose assets are to be frozen. In most cases, those listed are also subject to travel and visa restrictions as well. The Al Qaeda and Taliban Sanctions Committee (UNSCR [UNSC Resolution] 1267) has the largest and most contested list, with approximately 500 names. Designation lists also exist for the sanctions in Liberia, Côte d'Ivoire, Democratic Republic of Congo, and Sudan and for the sanctions against insurgents and supporters of the former regime in Iraq. As of 2009, the total number of individuals and entities on UN sanctions committees lists was more than 900. The procedures for designating and removing names from these lists have proven to be highly controversial, especially for the Security Council's consolidated list of alleged supporters of Al Qaeda and the Taliban.

Arms embargoes are the most frequently employed forms of sanctions, but in many ways, they are the least successful. The enforcement of arms embargoes requires a high degree of international cooperation. Arms smuggling networks are highly sophisticated and pervasive and are often able to circumvent interdiction that is poorly enforced in some borders. Only in the sanctions against Iraq has international cooperation been sufficiently strong to make Security Council restrictions on the supply of arms and the advanced weapons technologies relatively effective.

Commodity sanctions are a means of preventing militia and criminal actors from exploiting natural resources to finance and sustain armed conflict. Commodity sanctions have also helped facilitate more effective governance by newly emerging postconflict regimes in the wake of the UN-approved peace settlements. The Security Council imposed oil embargoes as part of the sanctions against Iraq, former Yugoslavia, and the other countries in the 1990s. An embargo on the export of logs was imposed in Liberia in 2003. The most significant and successful commodity sanctions came against the so-called blood diamonds. Beginning in 1998 with the case of Angola, and continuing with the sanctions in Sierra Leone and Liberia, the Security Council prohibited the import of diamonds from territory controlled by rebel groups. This effort spurred the creation of the Kimberley certification system that, in turn, has helped shrink the financial base used by criminal groups and militias in armed conflict.

UN smart sanctions have also been used as a means of controlling nuclear proliferation. The end of these efforts will depend on the intelligent integration of incentives, sanctions, and security assurances as part of a diplomatic bargaining process. Sanctions can be imposed and implemented by the UNSC, but security assurances and inducements are the purview of individual nations, particularly the United States and other major powers, acting on their own or in concert beyond the UN framework.

Scholars have engaged in contentious debate regarding how to evaluate the effectiveness of sanctions generally and UN sanctions in particular. The most authoritative empirical study is that by Gary Hufbauer and colleagues, which examines 204 cases from 1914 to 2006. Their data set includes a large number of cases of unilateral sanctions, mostly imposed by the United States. Their conclusion is that sanctions contributed to policy change in 70 of the cases studied, for an overall success rate of 34%. Other scholars have found that sanctions are most effective when economic costs are high for the target but low for the sender, when the gross domestic product of the sender is much larger than that of the target, and when the target and the sender have extensive trade relations. To these results, Daniel Drezner has added the "sanctions paradox," noting that sanctions are most likely to be effective when the sender and the target are interdependent economically and have cooperative political relations, yet coercive measures are rarely necessary under such conditions and in fact are often imposed when political relations and interdependence are low. David Cortright and George Lopez found the 1 in 3 success rate noted by the Hufbauer study replicated for the UN sanctions as well, especially when the Council maximized the use of expert panels, monitoring groups, and aggressive sanctions committees.

Many analysts would consider the current state of sanctions a mixed success. On the one hand, the diversity of global economic relations has made it possible for the UNSC to institute many refinements in the design and implementation of targeted economic sanctions that have some success in curtailing violent conflict and enforcing international norms of counterterrorism and counterproliferation. The record of success for multilateral sanctions is mixed but no less so than for the use of military force.

On the other hand, concerns about the lack of due process rights in the listing and delisting procedures for smart, targeted sanctions have created a political backlash against UN sanctions. A number of European states, longtime supporters of sanctions, have both criticized the Security Council procedures and redrawn some of the boundaries of sanctions imposition as a result of court rulings and administrative decisions.

SCALING

Scaling methods used in the social sciences typically are statistical procedures that take observed data and extract latent (i.e., abstract) dimensions on which the objects or subjects are ordered. In political science, the primary focus has been on issue/public policy and/or ideological scales using individuals' judgments or observed voting behavior. One important example is the estimation of ideological dimensions for all of congressional history by Keith Poole and Howard Rosenthal. Below, the development of these techniques and their applications in political science are discussed.

Scaling methods used in political science for the most part have their origins in psychology. The original work on scaling in psychology done at the turn of the 20th century was aimed at measuring general ability or intelligence. The pioneers were Karl Pearson and Charles Spearman. Spearman in 1904 used factor analysis to analyze a correlation matrix between test scores of 22 English high school boys for Classics, French, English, Math, Pitch, and Music. Spearman computed a form of rank-order correlation between each pair of skills across the 22 school boys and then extracted a common or general factor (g factor) from the matrix. His method of computing pairwise correlations and calculating the g factor was quickly supplanted by later work.

In particular, Pearson invented the product–moment correlation coefficient that is universally denoted as r, and he should also be credited with the invention of principal components analysis (what we now would think of as straightforward eigenvalue/eigenvector decomposition). Pearson in 1901 called it "the method of principal axes" and stated the problem quite succinctly: "In many physical, statistical, and biological investigations it is desirable to represent a system of points in plane, three, or higher dimensioned space by the 'best-fitting' straight line or plane" (p. 559). Remarkably, this also describes the essence of the famous Eckart-Young theorem (1936), which is the foundation of general least squares problems.

Lewis Leon Thurstone thought that Spearman's one-factor theory of intelligence was wrong, and he succeeded in developing a method for extracting multiple factors from a correlation matrix. Thurstone's theory of intelligence postulated seven rather than one primary mental ability, and he constructed tests specific to the seven abilities: verbal comprehension, word fluency, number facility, spatial visualization, associative memory, perceptual speed, and reasoning. Thurstone also developed the law of comparative judgment. Thurstone's law is more accurately described as a measurement model for a unidimensional subjective continuum. Subjects are asked to make a series of $n(n-1)/2$ pairwise comparisons of n stimuli. It is assumed that a subject's response reflects the momentary subjective value associated with the stimulus and that the probability distribution of these momentary values is normally distributed. It is then possible to recover the underlying continuum or scale by essentially averaging across a group of subjects. If the variances of the stimuli (the *discriminal* dispersions) on the underlying scale are the same (Case 5 of the model), the requirement of the parallel-item characteristic curves in the Rasch model is satisfied. Case 5 of Thurstone's method should yield essentially the same results as the Rasch model for dichotomous data.

In the decade after World War II, Thurstone's scaling work inspired the development of what became known as Guttman scaling and multidimensional scaling (MDS). These methods represent measurements of similarity between pairs of stimuli as distances between points in a low-dimensional (usually Euclidean) space. The methods locate the points in such a way that points corresponding to very similar stimuli are located close together, while those corresponding to very dissimilar stimuli are located farther apart. Warren Torgerson showed a simple method of MDS based on the Eckart-Young theorem. However, Torgerson's method assumed that the similarities were measured on a ratio scale, which is very unlikely in most cases.

Roger Shepard argued that the relationship between the true distance between a pair of stimuli and the observed distance was exponential. This led him to develop nonmetric multidimensional scaling in which distances are estimated that reproduce a weak monotone transformation (or rank ordering) of the observed dissimilarities. Shepard's program worked, but the key breakthrough was Joseph Kruskal's idea of monotone regression that led to the development of a powerful and practical nonmetric MDS program. By the early 1970s, this was known by the acronym KYST (Kruskal, Young, Shepard, and Torgeson) and is still in use today.

MDS methods can be seen as evolving from factor analysis and Thurstone's unidimensional scaling method with the key difference being that MDS methods are applied to *relational* data—that is, data such as similarities and preferential choice data that can be regarded as *distances*. At the same time that MDS methods were evolving, Louis Guttman developed scalogram analysis or what is more commonly known as Guttman scaling. A Guttman scale is the basis of all modern skills-based tests. It is a set of items (questions, problems, etc.) that are ranked in order of difficulty so that those who answer correctly (agree) on a more difficult (or extreme) item will also answer correctly (agree) all the less difficult (extreme) items that preceded it. Rasch analysis (more broadly, item response theory [IRT]) is essentially a sophisticated form of Guttman scalogram analysis. These are techniques for examining whether a set of items is consistent in the sense that they all measure increasing/decreasing levels of some unidimensional attribute (e.g., mathematical ability, racial prejudice).

At the same time when Torgerson was developing classical scaling and Guttman was developing scalogram analysis, Clyde Coombs developed unfolding analysis. Coombs came up with the idea of an ideal point and a single-peaked preference function to account for the observed rank orderings. The idea was to arrange the individuals' ideal points and points representing the stimuli along a scale so that the distances between the ideal points and the stimuli points reproduced the observed rank orderings. Coombs called this an unfolding analysis because the researcher must take the individuals' rank orderings and "unfold" them.

Unfolding analysis deals with relational data and is therefore an MDS method. Both unfolding analysis and scalogram analysis deal with individuals' responses to a set of stimuli. But Guttman's model is very different from the unfolding model. In terms of utility theory, unfolding analysis assumes a single-peaked (usually symmetric) utility function. That is, utility (the degree of preference) declines with distance from the individual's ideal point. In contrast, Guttman scaling is based on a utility function that is always monotonically increasing or decreasing over the relevant dimension or space. Above some threshold, the individual always responds with a Yes/Correct, and below the threshold, the individual always responds with a No/Incorrect. The counterpart to an ideal point is the position on the scale where the individual's responses switch from Yes/Correct to No/Incorrect.

Interestingly, these two very different models are observationally equivalent in the context of parliamentary voting. In the unfolding model, there are two outcomes for every parliamentary motion—one corresponding to "Yea" and one corresponding to "Nay." Legislators vote for the option closest to their ideal points. In one dimension, this forms a perfect scalogram. Hence, Guttman scaling methods and their IRT parametric descendants can be used to analyze parliamentary (binary choice) data.

In the 1970s and 1980s, political scientists began to combine techniques from econometrics and statistics with approaches developed by psychometricians. John Aldrich and Richard McKelvey in 1977 developed a unidimensional scaling method for 7-point scales. This method uses the respondents' perceived locations of the political stimuli to recover an underlying latent configuration. It also will recover the respondents' self-placements on the same latent scale. Henry Brady made contributions to the statistical foundations of nonmetric MDS as well as methods for and problems with the analysis of preferences. Poole and Rosenthal combined the random utility model developed by economists, the spatial model of voting, and alternating estimation methods developed in psychometrics to develop NOMINATE, an unfolding method for parliamentary roll call data.

In the 1990s and the early 2000s, the availability of inexpensive and fast computers made simulation methods for the estimation of complex multivariate models practical for the first time, and these methods were fused with long-standing psychometric methods by political scientists. Specifically, Markov chain Monte Carlo (MCMC) simulation within a Bayesian framework coupled with the IRT model can be used to perform an unfolding analysis of parliamentary roll call data. Political scientists have successfully blended methods from statistics and econometrics with psychometrics to produce unique scaling applications. The coming decades should see even greater advances due to the availability of ever-faster parallel computing methods and the increasing sophistication of political science methodological training.

SCALING METHODS: A TAXONOMY

Scaling methods germinated in the pioneering work of Karl Pearson and Charles Spearman, who in the first decade of the 20th century developed methods to describe relationships between variables. Pearson created the correlation coefficient for metric data, while Spearman introduced the rank order correlation and an algorithm designed to document the existence of a general factor in intelligence research. Since then, these ideas have been extended to permit an (in theory) unlimited number of factors obtained from data ranging from crude categorical to refined metric and permitting the imposition of a variety of constraints on the variables. What all scaling methods have in common, however, is that they can be used to transform a set of observed variables to a smaller number of latent variables or factors (dimensions).

Scaling methods differ with respect to the type of input data for which they are most appropriate. Principal component analysis (PCA) and factor analysis (FA) make the assumption that the data are metrically scaled. If the data are ordered categories, such as Likert-type responses, categorical (or nonlinear) principal component analysis (CATPCA) is probably the best choice. Multiple correspondence analysis (MCA) is particularly suited for the analysis of unordered categorical (or nominal) data. For paired-comparison data, the proper choice would be multidimensional scaling. Rasch scaling or the unfolding model are proper choices when the response options are dichotomous (Yes/No) with an implicit item difficulty order, which usually means that they have a one-dimensional solution. The following documents the similarities and differences of the most popular scaling methods in the political and social sciences, namely, PCA, CATPCA, and MCA.

To demonstrate these methods, we chose seven variables on national pride from the U.S. portion of the International Social Survey Program (ISSP) 2003. To avoid a lengthy discussion on missing data, possible imputation techniques, and their impact on the solution, we use listwise deletion, which reduces the sample from 1,216 cases to 1,148 cases. The seven variables (identified with the abbreviations that will be used in subsequent figures) are as follows:

A. I would rather be a citizen of [Country] than of any other country in the world.

B. There are some things about [Country] today that make me feel ashamed of [Country].

C. The world would be a better place if people from other countries were more like the [Country Nationality].

D. Generally speaking, [Country] is a better country than most other countries.

E. People should support their country even if the country is wrong.

F. When my country does well in international sports, it makes me proud to be [Country Nationality].

G. I am often less proud of [Country] than I would like to be.

Five response options ranging from *agree strongly* (1), to *neither agree nor disagree* (3), to *disagree strongly* (5) were made available for all items. Five of the seven variables have a positive formulation, such that *agree strongly* implies a favorable attitude toward the country. The remaining two items (2 and 7) have a negative formulation, requiring respondents to (strongly) disagree to express a favorable attitude.

Principal Component Analysis

Assume that there are m observed variables with n respondents each. In PCA, these m observed variables are reexpressed without any loss of information by m latent variables; that is, when the number of factors equals the number of variables, the original observed scores can be recaptured. However, the usual aim is to reduce the dimensionality of the data by using a substantially smaller number of m^* factors. Specifically, each observed variable ($\mathbf{z}_j$) can be expressed through its association (α_{jk}) with each latent factor ($\mathbf{f}_k$), resulting in

$$\mathbf{z}_j = \mathbf{f}_1\alpha_{j1} + \mathbf{f}_2\alpha_{j2} + \cdots + \mathbf{f}_{m^*}\alpha_{jm^*} + \cdots + \mathbf{f}_m\alpha_{jm}.$$

Here, $\mathbf{z}_j$ is a vector that contains the z-transformed categories of the jth variable for all n respondents, $\mathbf{f}_k$ contains the categories from the kth latent variable of all n respondents, and α_{jk} is the correlation between the jth observed and the kth latent variable.

In matrix notation and for the full solution (i.e., where the number of observed variables is equal to the number of factors), $\mathbf{Z} = \mathbf{F}\mathbf{A}^{\mathrm{T}}$, with $1/n\mathbf{F}^{\mathrm{T}}\mathbf{F} = \mathbf{I}$. $\mathbf{I}$ is an identity matrix, which by definition has ones in the main diagonal and zeros in the off-diagonal elements; in other words, the factors are orthogonal (uncorrelated) with each other. Because $z_{1i} = (x_i - \bar{x})/s_x$ and $z_{2i} = (y_i - \bar{y})/s_y$, it follows that $r_{12} = (1/n)\mathbf{z}_1^{\mathrm{T}}\mathbf{z}_2$, and in matrix notation, $\mathbf{R} = (1/n)\mathbf{Z}^{\mathrm{T}}\mathbf{Z} = (1/n)\mathbf{A}\mathbf{F}^{\mathrm{T}}\mathbf{F}\mathbf{A}^{\mathrm{T}} = \mathbf{A}\mathbf{A}^{\mathrm{T}}$, which is known as the fundamental theorem in FA. Since the idea is to reduce the set of m observed variables to m^* factors, with $m^* < m$, it follows that $\mathbf{Z} \approx \mathbf{F}_{m^*}\mathbf{A}^{\mathrm{T}}$ and $\mathbf{R} \approx \mathbf{A}_{m^*}\mathbf{A}_{m^*}^{\mathrm{T}}$.

Applying canonical decomposition produces $\mathbf{R} = \mathbf{B}\Delta\mathbf{B}^{\mathrm{T}}$, where $\mathbf{B}$ is the matrix of the eigenvectors and Δ is the diagonal matrix of the eigenvalues, with $\lambda_1 \geq \lambda_2 \geq \cdots \geq \lambda_{m^*} \geq \cdots \geq \lambda_m$. From

$\mathbf{R} = \mathbf{AA}^{\mathrm{T}}$, it follows that the correlations between any two variables (j, l) can be recomputed from the corresponding factor loadings: $\sum_{k=1}^{m} \alpha_{jk}\alpha_{kl} = r_{jl}$. The factor loadings ($\alpha_{jk}$), ranging between -1 and $+1$, can be interpreted as correlations between the latent and observed variables. The communality $\left(h_j^2\right)$ describes the proportion of the variance in variable j explained by those m^* factors that were used to construct the reduced space.

Several possibilities exist for deciding on the number of dimensions to be included in an interpretation. The eigenvalue (or Kaiser) criterion, which is the default in many statistical packages, is most often applied in the social and political sciences. The rationale for this criterion is that a latent variable should explain more of the variation in the data than an observed variable. Since each observed variable has an explained variance of 1.0 (the correlation of a variable with itself), the eigenvalues of the factors to be considered in the solution have to be greater than one—that is, $\lambda_{m^*} > 1$. This is an arbitrary criterion that nevertheless is sometimes useful. An alternative criterion is the so-called scree test: The eigenvalues are plotted in successive order; the factor that forms an elbow (i.e., a substantial change in magnitude in the increasing/decreasing list of eigenvalues) will be the first one that is not considered in the solution. Finally, it is sometimes preferable to consider just those factors for which one can provide a substantive interpretation.

After choosing the number of factors to be retained in a solution, scholars often rotate the solution to obtain a better interpretation; varimax rotation is most commonly applied. In an iterative procedure, the coordinates of variables and cases in the m^*-dimensional latent space are changed in a way that maximizes the sum of the variances of the squared loadings on each factor. Using this technique, median loadings become either smaller or larger and are therefore more clearly associated with a single factor. While varimax rotation keeps the orthogonality of the factors (i.e., the factors remain uncorrelated), other rotation methods such as oblimin allow the factors to be correlated after rotation.

The literature sometimes confuses PCA and FA. The difference between these methods is that PCA does not incorporate any error term, since $\mathbf{Z} = \mathbf{FA}^{\mathrm{T}}$ and $\mathbf{R} = \mathbf{AA}^{\mathrm{T}}$. In contrast, in FA, it is assumed that each variable has an item-specific error term ($\mathbf{v}_j$); from this, it follows that $\mathbf{Z} = \mathbf{FA}^{\mathrm{T}} + \mathbf{V}$ and $\mathbf{R} = \mathbf{AA}^{\mathrm{T}} - \mathbf{V}^{\mathrm{T}}\mathrm{V}$. If the errors are uncorrelated, only the main diagonal elements of the correlation matrix $\mathbf{R}$ (which are by definition one) have to be reduced iteratively to correct for the item-specific error. The manner of estimating these error terms differentiates the various methods of FA. The aim of structural equation modeling (SEM) is to allow for correlations between the error terms and for correlations between the latent factors themselves and to classify observed and latent variables as dependent and independent ones. While PCA is used to explore the structure of the data, SEM is used to test whether the data are consistent with the models developed on the basis of the literature.

Input for PCA and FA is usually the matrix of product–moment correlation coefficients, which assume metric data. Hence, the PCA of categorical variables such as the 5-point Likert items in our example is problematic. Nevertheless, such variables have often been treated as if they were metric. In the following, we apply PCA to the ISSP data described above to show the solution that one would typically find in the literature. Using the seven variables on national pride as input data, Table 1 shows that the first and second eigenvalues are 2.631 and 1.086, respectively; together, they explain 53.1% of the variation. After varimax rotation, the two eigenvalues are 2.227 and 1.490 (Table 1).

According to the eigenvalue criterion, the solution is two-dimensional since only the first two eigenvalues are greater than one. However, the difference between the first and the second eigenvalue is large, while there is only a small difference between the second and the third eigenvalues. By the scree test criterion, the solution would be one-dimensional. With respect to the factor loadings (Table 2), all variables are associated with Dimension 1: Positive loadings are found for the positively formulated items and negative loadings for those of reversed polarity. Substantively, this factor appears to reflect the extent to which respondents report feeling national pride. On the second dimension, all variables have positive loadings, regardless of the content or polarity of the item. This latent variable might be interpretable as a methodological artifact known as acquiescence (the tendency to

agree with statements regardless of their content). By the scree test criterion, as well as that of substantive meaning, the solution is one-dimensional. However, since most scholars use the eigenvalue criterion, we tentatively follow this procedure, keeping the two-dimensional solution and performing a varimax rotation.

After varimax rotation, the loadings of the positively formulated items remain almost unchanged on the first dimension, while the loadings of the negatively formulated items move to the second dimension to define their own factor. Therefore, the rotated solution suggests a two-dimensional structure mirroring just the polarity of the items: Positive-polarity items form Dimension 1, and negative-polarity items define Dimension 2. Findings such as these have sparked a lively debate about whether the underlying structure consists of two unipolar concepts or one bipolar concept. Regardless of which position is taken, it is insufficient to base it just on the rotated solution and the eigenvalue criterion.

A more appropriate technique for analyzing ordered categorical variables is CATPCA, in which the categories are replaced by optimal scores. The optimal scoring process allows order constraints to be imposed so that ordered categorical variables get increasing, or at least nondecreasing, scores as the category levels become increasingly severe. Responses inconsistent with the implied ordering manifest themselves in tied optimal scores for two or more successive categories. In contrast to PCA, the number of dimensions m^* to be used for the fit must be specified in advance, and the solutions for m^* and $m^* + 1$ dimensions are not nested. Once the optimal scores have been calculated, they replace the category codes, and the remainder of the analysis can be regarded as (classical) PCA. In short, CATPCA is an appropriate technique to display relationships between cases associated with a set of ordered categorical variables. Like PCA, the method produces eigenvalues and explained variances, factor loadings, and factor scores with mean zero and unit standard deviation. Essentially, CATPCA can be regarded as PCA applied to ordered categorical data. An additional advantage of CATPCA is that the solutions can be visualized with the help of biplots. It is possible to impose linearity on the optimal scores, in which case the biplots can be expressed as vectors. John Gower and David Hand (1996) simplified this approach by showing that biplot axes can be interpreted just like other coordinate axes—that is, by projection and by reading a value off a scale. The closer two biplot axes are to each other, the stronger the association of the corresponding variables in the m^*-dimensional space.

Running CATPCA on the ISSP data described above and restricting the solution to two dimensions, the first factor explains 38.2% of the variation and the second an additional 15.6%. Comparing the CATPCA with the PCA solution

Note: CATPCA = categorical principal component analysis; PCA = principal component analysis.

shows a small increase in the explained variation. An increase in explained variation is always the case since CATPCA does not restrict the items to have constant distances between successive categories as does PCA. The differences in the explained variances can be interpreted as one indication of the quality of the data: The smaller the difference between the solutions, the better the data. Comparing the factor loadings of the unrotated PCA with the CATPCA solution (Table 2) reveals only trivial differences. Dimension 1 reflects the difference between positive and negative formulations, while all items have positive loadings on Dimension 2.

Figure 1 shows the biplot axes of the seven variables, with tick marks to symbolize the category-level points and with labels affixed to the *agree strongly* end point. The factorial axes are excluded since they are not useful in the biplot presentation. Two sets of items are distinguished, corresponding to the positive and negative formulations. As numerically shown for PCA via varimax rotation, the two sets of items could be described as separate factors. Inspecting the distances between all successive categories on each item shows that there are no ties—that is, there are no two single categories measuring the same level of agreement/disagreement to a certain item. However, the distances between the categories are quite unequal. Take Item A as an example: The first category (*agree strongly*) is relatively far from the second category (*agree*); in fact, the first category is located in the negative parts of Dimensions 1 and 2, while the second category is already located in the positive parts of those dimensions (i.e., on the other side of the mean, which is the point where the lines for all items cross). In other words, the midpoint of the latent concept behind Item A is not "3"; rather, it is a point between "1" and "2." Furthermore, the categories *neither agree nor disagree* and *disagree* are relatively close to each other, indicating that these two responses are rather similar for the average respondent.

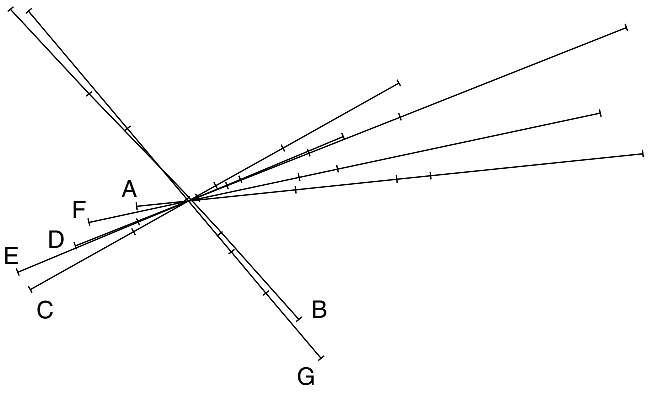

Figure 1 Biplot Presentation of National Identity Data

Source: Data from International Social Survey Programme (ISSP), National Identity II (2003). Distributor: GESIS Cologne Germany, ZA No. 3910.

In the final step, we perform MCA on the same data. While PCA restricts the data to be metric (i.e., all distances between two successive categories are equal), and while CATPCA keeps the ordinality of the successive categories, MCA makes no assumptions about the measurement level of the variables. In sum, MCA can be regarded as PCA with (unordered) categorical variables. In contrast to PCA and CATPCA, the visualization of the data is usually of primary interest in MCA.

Figure 2 presents the visualization of the seven variables with its total of 35 categories. In this figure, the successive categories of the individual variables are connected by trajectories. Projecting the categories from all variables onto the first dimension shows that all items retain the ordinality of their categories. Dimension 1 reflects the substantive meaning, which is the level of national pride, with the negatively formulated items running in a direction opposite to the positive ones. The second dimension shows the horseshoe (or the Guttman effect), with extreme values in the negative part and moderate values in the positive part. This effect is methodologically induced; for the given example, it has already been suggested that these are due mainly to acquiescence. It is precisely to exclude methodologically induced variations of such kinds in ordinal data that Jan de Leeuw (2006) proposed the use of CATPCA.

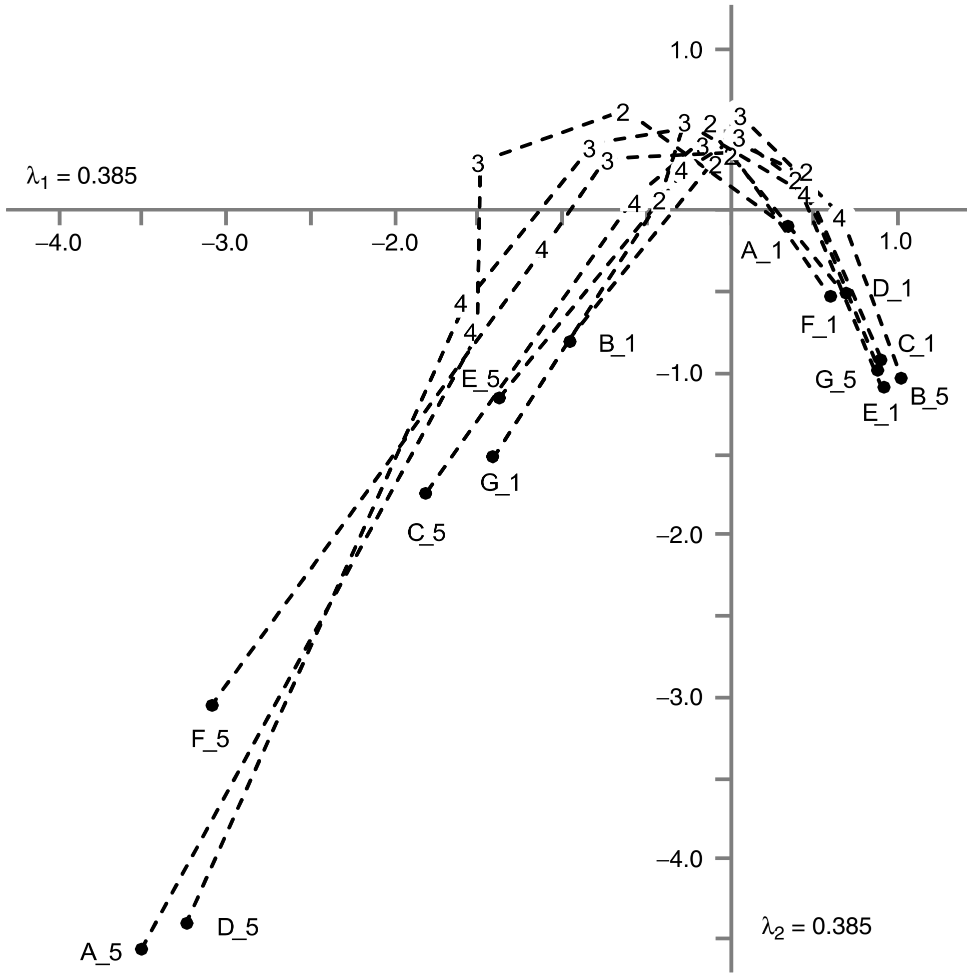

Figure 2 Multiple Correspondence Analysis (MCA) Presentation of National Identity Data

Source: Data from International Social Survey Programme (ISSP), National Identity II (2003). Distributor: GESIS Cologne Germany, ZA No. 3910.

It should be noted that CATPCA also allows a combination of metric and categorical (ordered and unordered) data within a single analysis. In such situations, the metric variables are restricted to a metric scale with equal distances and the ordered categorical variables to their implicit successive order of categories, while no order is imposed on the categories of the unordered categorical variables.

SCHEMA

A schema (plural *schemata*) in the field of social science represents a person's mental structure used to organize current knowledge about the world and to guide cognitive processes and behavior. In this way, we use schemata to categorize objects and events, based on their elements and characteristics, to interpret and predict the world. While evaluating the world, new information is being processed according to how it fits into the mental structures, or rules. In the field of social science, and particularly in cognitive science, we retrieve knowledge from various areas, such as artificial intelligence, with the main goal of developing simplified mental structures about our knowledge to draw conclusions about missing or nonevidential information, such as during decision making or political evaluation. Examples of schemata include rubrics, social roles, stereotypes, and worldviews. This entry discusses meanings and the use of schemata, as well as their application to social science.

The Concept and Its Application

Schema as a concept was first introduced into psychology by the British psychologist Frederic Bartlett (1886–1969) through his learning theory. Bartlett perceived organized knowledge as an elaborate network of abstract mental structures that represent our understanding of the world. Bartlett's main studies concentrate on the impact of our cultural background in rephrasing and memorizing certain events. For example, in one of his most well-known studies, Bartlett examined whether subjects could recall events that strongly deviate from their own environmental background, and he showed that the more culturally deviated one's own background was from that of the presented story, the less likely it was that participants could remember the story. Bartlett concluded that the participants distort the presented story in favor of their own cultural stereotypes, and details that were difficult to interpret were omitted because they did not fit in with the participants' own schemata.

In general, the learner in schema theory actively builds schemata and revises them in light of new information. Here, it is important to mention that each schema is unique and depends on an individual's experiences and cognitive processes.

David Ausubel (1968), in his meaningful learning theory, argues that there exists a hierarchical organization of knowledge where new information will be added to the already existing hierarchy. In contrast, Jean Piaget shows that there is more than one body of knowledge available to learners. Piaget claims that there exists a network of context-specific bodies of knowledge and according to specific situations we apply a specific body of knowledge. Piaget's definition of schema is useful for interpreting information in which situation-specific schemata are useful in distinguishing between two types of categories of interpretation of knowledge: the expert and the novice. Experts are more complex and developed schemata that function better in any given domain, and the novice has no schema or inadequate schema to help interpret new information. Since schemata are perceived as context specific, they depend on the individual's experience with the subject.

Beside interpreting information, the literature also suggests that schemata are crucial for decoding how that information is presented to oneself. One possibility is reflection in text structure. This means that readers use their systematic representation of text to help them interpret the text. Also, as Robert Kaplan (1966) points out, it is important to note that an essay style is culturally determined.

Moreover, schemata have two types of hierarchies that concentrate on the relationship between the part and the whole. It shows that on the basis of partial information structures, we are able to perceive the whole picture of an event. This reference is possible because each schema has a main category, a so-called slot that connects different semantic networks and provides us with a whole picture of an event or object. For example, in the main slot "house," we store the information "wall," "roof," and "floor," among others. Within the context of part–whole relationships, we can therefore infer that a house has a wall, a roof, and a floor. Moreover, each schema is developed in a way that helps us simplify drawing conclusions of a represented concept. For example, if we know that an object is a door, then according to the definition of a schema "door," we can assume that it has a lock, a handle, and hinges, which shows that we apply all the attributes of a door.

Moreover, William Brewer and James Treyens (1981) studied the effects of schemata in human memory. They conducted a study in which 30 subjects were brought into the office of the principal investigator and were told to wait there. After 35 seconds, the subjects were asked to leave the room and to list everything that they could recall being in the room. Brewer and Treyens showed that the subjects could recall all those objects that fit into their schema of "office room," and they had a much more deviated memory of those items that were not a part of their schema. For example, 29 of the 30 subjects recalled that the office had a chair, a desk, and walls; however, only 8 could recall the anatomic skull or a writing pad. Interestingly, 9 subjects mentioned that they had seen books, when, in fact, there were no books in the office. Being able to recall books when books were not among those objects present shows that our memory of the characteristics of certain locations depends on schemata that we associate with those types of locations.

Schemata can also contain so-called event concepts, which can be defined as a conceptual structure. Roger Schank and Robert Abelson (1977) developed one version of an event concept that they defined as "scripts." If we define an event, for example, as a "restaurant visit," then we are able to determine stereotypical sequences of action that define a restaurant visit. A study shows that different subjects recalled different sequences from the same event. Among the total number of 32 subjects in their study, there was no consistent recall of the sequences of actions. In fact, in an overlap of 73% of all subjects, Schank and Abelson found that only a stereotypical sequence of "taking a seat," "ordering food," "eating," and "paying" was the same.

Applying Schema Theory

Applying a schema to social science represents our common understanding about an event or a concept. Hence, each individual has his or her own understanding of this event, which depends on the characteristics that he or she associates with the object, content, or location, which, in turn, depends on his or her cultural and political background. Several misrepresentations of an actual event described in social science arise from our own particular cultural-political background. Many areas in political science apply schemata when decision making occurs—for example, during peace negotiations or United Nations summit meetings, where a vast variety of cultural-political backgrounds are represented. It can be inferred, therefore, that the more detailed the description of an event, the more likely are larger proportions of members to reach agreement.

The literature on schemata concentrates primarily on strategies that focus on how different representatives with a defined set of schemata communicate and interpret the events. Here, abstract theories and exemplary theories apply to how schemata are actually used by distinct learners. Abstract theory works through the usage of a prototype that represents a certain category, and exemplary theories work through the individual comparison with the prototype. In the exemplary theory, we do not store concepts in our schema but individual examples, and the schema functions through comparisons rather than representation, as in abstract theory.

Certain strategies of simplifying schemata include stereotypes and archetypes that drive our decision-making process. Here, the literature suggests that numerous strategies follow from schema theory. Sharon Widmayer (2007) acknowledges the role of prior knowledge in cognitive processing and shows that already existing schemata related to the new information need to be activated. This is described in the literature as "stimulating recall of prior knowledge." Teachers, for example, activate student's prior knowledge through reading the heading and the title before starting a new subject related to it. Another teaching strategy is using analogies and comparisons to activate the learner's existing schema in particular to help learners draw connections among already existing schemata. Here, it is crucial that teachers use the most realistic familiar scenarios instead of conventional abstract methods. With regard to the familiarity of already existing schemata, the literature points out that with highly familiar scenarios, the learner will activate the already existing schemata more successfully, and the strongest connections among schemata will thus be achieved. To support this conclusion, Edward Price and Marcy Driscoll showed in their 1997 study that around 11% of the subjects could solve a particular problem in an unfamiliar context, while around 58% of those participating in the study could answer a very similar problem in a familiar context.

In conclusion, schemata help us represent our knowledge of how characteristics of certain events are recalled. However, there remain limitations such as the applicability of schemata across knowledge domains that are relevant. Here, one's self-knowledge as well as one's cultural-political background are crucial determinants.

SCRIPT

The notion of cognitive scripts, closely related to schema theory, became especially important in the 1970s, when cognitive psychologists (e.g., Robert Abelson, 1981; Roger Schank & Robert Abelson, 1977)—and, later, scholars of international relations—began to explore the role of cognitive shortcuts in information processing and decision making. According to Abelson, one of the leading advocates of this approach, scripts are "conceptual representations of stereotyped event sequences." Put more simply, a script may be thought of as a particular kind of schema or "mental box" that provides the typical default values for an event of some kind or an act that we are accustomed to performing, such as watching a movie or eating out at a restaurant. We usually experience little difficulty dining at a restaurant we have never visited before, for instance, since we simply rely on the default values stored in our memory to guide our behavior; we wait to be seated by the host or hostess, a server presents us with menus, we pick what we want to eat, we eat it when it arrives, and so on. By the same token, if a friend informs you that she went to see a movie last night, you can easily use the default values you keep in your head for typical visits to the cinema to guess how her evening probably went. Scripts can help decision makers assess the nature of a situation quickly but can sometimes be a source of cognitive error, a fact that has not been lost on students of foreign policy decision making. The notion of scripts has been broadly accepted within international relations, but it has also been subjected to various criticisms (as discussed below).

The concept of a script clearly draws itself on the cognitive image of a movie or theatrical script in which events are played out one after the other, and it can also be compared to a cartoon strip. This idea is consistent with the more general notion that human beings are "cognitive misers," and the approach may be viewed as part of the bounded rationality tradition within political science, which stresses the ways in which individuals depart from "pure" or comprehensive rationality. Rather than considering everything we experience sui generis, according to this view, we are usually far more economical in our information processing. We commonly fit new sensory data into established mental categories, both because this requires little effort and because it allows us to make sense of the outside world quickly and expeditiously. This is particularly the case under conditions of high uncertainty and ambiguity, when the individual is being bombarded with too much information, or when he or she possesses too little. As well as helping us make sense of what has happened in the past or is happening now, scripts often play a strong predictive role in decision making, allowing us to ascertain in advance with a reasonable degree of confidence what is likely to occur in the future (or at least what we *think* is likely to occur).

Scripts can also be a major source of cognitive error, however. Because they contain information about things that are only *typically* true, at least in that individual's experience, there is always the potential for oversimplification of a novel stimulus. We may make assumptions based on the typical or prototypical behaviors that may be entirely misleading or false. Scripts can also compete with one another in our minds in situations where it is unclear what is actually happening. Two or more scripts may seem relevant to the case in hand, and the decision maker may grapple with uncertainty as to which best suits the issue in question.

Scholars of foreign policy decision making such as Deborah Larson (1985) and Michael Shapiro and G. Matthew Bonham (1973) were quick to pick up on the political relevance of scripts in international relations. "Balkanization" and "the Trojan Horse," for instance, are two scripts often used in international relations, and as noted by Yaacov Vertzberger (1990), scripts appear to play an especially prominent role in the analysis of strategic threats. In American foreign policy, the "Munich script" and the "Vietnam script" have frequently influenced the deliberations of decision makers, both during the Cold War and since. This provides a useful political example of the ways in which rival scripts can compete for a decision maker's attention and of the manner in which scripts are used to predict future events. The generation of policymakers who had experienced World War II were particularly attuned to the memory of British Prime Minister Neville Chamberlain after the Munich conference of 1938, where he famously waved a piece of paper on which Adolf Hitler had agreed not to invade Poland and Western Europe in exchange for part of what was then Czechoslovakia. Chamberlain famously emerged from the conference promising "peace in our time." When this attempt at accommodation failed and was followed by World War II, many policymakers (especially in the United States) drew the wider lesson that any effort to "appease" a dictator was bound to lead to disaster. The widespread use of the domino theory by

U.S. decision makers during the Cold War, for instance, was clearly based on the cognitive appeal of this script. From this perspective, attempts to appease an adversary inevitably lead to well-intentioned but empty negotiations; verbal or written promises are followed by betrayal, causing a nation to fight a war against an enemy it should have confronted much earlier using its military might.

During the Cuban missile crisis, John F. Kennedy appears to have had the World War I script in mind, urging his advisers to read Barbara Tuchman's book *The Guns of August*; he was determined not to allow events to spiral out of control in 1962, as they had in 1914 prior to the onset of World War I. The Munich script was evoked on far more numerous occasions during the Cold War, however, and it was perhaps most famously used by President George H. W. Bush after Saddam Hussein's troops invaded Kuwait in 1990. Bush argued that if Hussein's aggression was not confronted early on—if the Iraqi leader was appeased, in other words—events similar to those of the 1930s would play out, albeit in the Middle East rather than Europe and with Hussein as the antagonist rather than Hitler. This cognitive image remains highly potent in American political discourse today, despite the passage of (to date) more than 70 years; during the 2008 presidential election in the United States, for instance, the then candidate Barack Obama was accused by Republicans of appeasement for advocating direct talks with Iran over the issues of nuclear weapons and terrorism. The Vietnam script—which remains equally potent—stresses, on the other hand, the dangers of confrontation rather than accommodation. Recalling the military and political errors that cost the United States so much blood and treasure, one popular interpretation of Vietnam suggests that a nation should exercise extreme caution when contemplating the use of military force. Images of "body bags," "getting bogged down" in enemy terrain, and mass protests are all evoked by the Vietnam script, as well as the considerable human and political costs of a military intervention that effectively destroyed Lyndon Johnson's presidency.

The prominence of the Munich and Vietnam scripts in the United States illustrates the perils of "overlearning" the lessons of a single event. The former illustrates the dangers of overgeneralizing one set of historical events into a script that purports to predict what will usually happen when a ruthless or expansionist leader is appeased (or, taken to its extreme, when any form of diplomacy is used). Equally, one can argue that the Vietnam script has often led American leaders to be overly cautious in responding to genuine threats, creating a sometimes inappropriate reluctance to use military power. As a young antiwar activist, Bill Clinton had been strongly influenced by the costs of Lyndon Johnson's decision to escalate American involvement in the Vietnam War. As president, he was consequently often slow to use military force, most notably when the former Yugoslavia began to break up in the early 1990s. Eventually, U.S. firepower was used against the Serbs in 1995, helping to bring the parties together at a peace conference in Dayton, Ohio, but not before hundreds of thousands had perished in the conflict. Similarly, Clinton may also have been reluctant to intervene in Rwanda when major acts of genocide erupted there in 1994, because he was relying on what might be termed the Somalia or "Black Hawk Down" script; the latter suggested that military interventions and/or attempts to "nation build" in Africa are fraught with danger, drawing on the cognitive image of the disastrous 1993 attempt by U.S. forces to capture the Somali warlord Mohammed Farah Aidid during which 18 American soldiers died and 73 were wounded (the death toll among Somalis was much higher). Although the similarities between the Somali and Rwandan cases were arguably superficial, Clinton administration officials later admitted that the dangers of committing troops to intervene in the slaughter of Tutsis by Hutus in Rwanda dominated their thoughts as a result of what had happened the previous year in Somalia.

While the notion that leaders use cognitive scripts has been generally (if perhaps grudgingly) accepted by most scholars within international relations, a number of potential problems within this area should also be highlighted. The first is simply that there has been relatively little development of the script idea within international relations or political science since the 1980s. For good or bad, the rational choice or game-theoretical tradition—which makes the "as if" assumption that decision makers possess pure rationality—has in general proven more attractive to many political scientists for modeling purposes than the admittedly messy notion that policymakers employ a variety of cognitive shortcuts (not the least because the latter assumption renders decision makers somewhat idiosyncratic). Indeed, one of the scholars who originally helped popularize the idea of scripts and schemas within political science—Robert Axelrod—joined the rational-choice tradition some years ago. Second, many scholars of foreign policy decision making have preferred to use the competing but obviously related notion of analogical reasoning in their work, a now well-established tradition that covers the same ground as early work on scripts but has generally proven itself to be somewhat more popular among scholars of foreign policy analysis. Third—and in a related vein—there has been a general failure in the literature to disentangle the notion of scripts from strongly related concepts such as schemas and analogies. If scripts are simply "event schemas," do we really need the former label? Are scripts merely the same thing as historical analogies, or are they something analytically distinct? Last, there has also been an overemphasis, perhaps, on the "cold" information–processing tradition from which the focus on scripts derived, and some political psychologists are themselves turning away from the computational analogy on which much of the original literature of schemas and scripts was based.

Nevertheless, whatever terminology we use, scripts will remain highly relevant to the study of politics because both elite decision makers and ordinary voters must often make decisions with only incomplete information about the situation at hand. Political actors can and do make incorrect inferences by fitting individuals or events into the wrong categories or scripts, based on their observable but all too frequently superficial similarities.

SECESSION

Secession is the formal withdrawal from an established, internationally recognized state by a constituent unit to create a new sovereign state. This entry analyzes the meaning of the notion, its empirical dynamics, and its justification and finally addresses the key question on the reasons why there are not a higher number of secessions in the world.

The decision to secede represents an instance of political disintegration, when the citizens of a subsystem withdraw their political activities from the central government to focus on their own center. To the observer, secession may appear irrational as it often entails the sacrifice of economic opportunities and the endurance of social upheaval. Because of the state's opposition and monopoly of coercive force, secessionist struggles frequently become violent and protracted. Thus, secession is disintegrative in the most fundamental sense: It involves not the overthrow of the existing government but rather its territorial dismemberment.

The breakup of the Soviet Union and Ethiopia and the fragmentation of Yugoslavia and Czechoslovakia have created some 20 new states through secession, which has grudgingly received international recognition and legitimation. Indeed, from 1776 onward, secession has been one of the most frequent ways of creating new states. With the collapse of the Austro-Hungarian, Ottoman, and Russian empires after World War I, numerous new states were created through secession. Given the countless unresolved cultural and territorial disputes and the many unsatisfied aspirations of nations in Africa, Asia, and even in the West—for example, Quebec, Catalonia, the Basques, Flanders, Scotland, and Wales—secession continues to be a force to be reckoned with in international politics.

Dynamics

The dynamics of secession rest on four preconditions: nation, territory, leaders, and discontent. Secession demands must be presented by an identifiable community that is smaller than the state and that threatens to withdraw if not satisfied. Questions of identity underpin this community of people, or nation, who perceive the characteristics that distinguish their members from other groups, who feel a commitment to each other, and who then undertake the challenge of changing their circumstances. This community must be associated with the territory on which it would establish its newly independent state. Without effective leadership to translate community needs into demands, threats to the nation might merely degenerate into social unrest as pent-up frustrations are vented. Discontent with the current circumstances motivates the community's demands for change. Often a nation is bound together, and perhaps even defined, by common claims of discrimination, neglect, exploitation, or repression in economic, political, cultural, linguistic, or religious terms. The U.S. Declaration of Independence points to the "unbearable tyranny of the state" as both the reason, in the sense of providing the motivating force, and the moral justification for secession.

Embedded in any secession lies the perceived justice of the community's cause. The debate surrounding the "right of secession" and its close relative, "the right of national self-determination," revolves around (a) the argument that secession may be justifiable either in circumstances where state rule over a nation is particularly oppressive and tyrannical or when a majority of a territorially concentrated community desires secession and (b) the argument that secession may be desirable due to the benefits it provides for nations to organize themselves according to their own values.

Justification

Those seeking to justify secession extend the argument that if a society may overthrow an unbearable government, then a segment of the population may also remove itself from a particularly objectionable government. John Stuart Mill acknowledged that freedom and liberty may not be possible when the state is an artificial amalgamation of two or more distinct nations with one dominating the government and, thus, conceded that secession may be a necessary alternative to promote liberty. One need only think of the experiences of the Armenians, Jews, Kurds, and people from many other nations facing government-sponsored slaughter to understand how nations would believe that they could guarantee their safety and even survival through possessing their own state. For revolution or secession, thus, the underlying principle of protest is the same.

President Woodrow Wilson extended the argument from when secession may be justifiable to when it may be desirable. Above all else, Wilson sought peace based on justice. He believed that the subjugation of one nation by another was unjust and would lead inevitably to a threat to peace. Implicit in Wilson's approach lies the belief that secession was a desirable way to create states coterminous with nations. Every historic nation should possess the same right to organize its communal affairs according to its own values, not simply those who through foresight, geography, or luck gained their own independent states. Some have even argued that a more peaceful world may not be possible without the completion of the international system of states through continued secession based on national aspirations.

Low Incidence of Secession

Given these arguments, one might reasonably question why there have not been a larger number of successful secessions. According to one account, the world possesses approximately 8,000 different languages and cultures but fewer than 200 independent states. The forces arrayed against secession—both domestic and international—go far beyond simply the philosophical difficulties surrounding the "right of secession."

Secession, by its very nature, presents the international territorial system with instability and chaos. The potential conclusion for the logic of secession would be the infinite division of existing political entities. More often than not, given their legitimate monopoly of force within a territory, most states have effectively opposed secession attempts. And even if the secessionist community were to win on the battlefield, it stands to lose the diplomatic contest. The principles of state sovereignty and territorial integrity function as fundamental norms of post-1945 international relations, thereby effectively limiting secession as a means of altering existing borders. Article 2(4) of the *United Nations Charter* states,

> The Organization and its Members . . . shall act in accordance with the following Principles: . . . (4) all Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state.

As a consequence, the international community has consistently withheld diplomatic recognition from secessionist entities.

The comparative study of secessions and separatist movements from Western liberal democracies, former communist states, and developing countries reveals that a nation's decision to secede can be thought of as a function of its appraisal of its circumstances. Whether or not to attempt secession depends on the costs and benefits associated with the nation's political alternatives: continued membership within the existing state or secession. This appraisal is dynamic and continuous and can be affected both by policies of the central government and by developments in the international system. Indeed, although the road to independence is frequently a long one, the actual decision to secede only arises when government action or international developments change the community's view of the balance among these costs and benefits. A nation's decision to seek independence can change with circumstances; in some instances, sensitive government policy can convince a secessionist community to accept greater autonomy within the existing state, while in other cases, evolution in the prevailing international climate can outweigh domestic factors in the dynamic of secession.

SECRET SERVICES

From an academic point of view, there is no canonical definition of secret services. The word *secret* qualifies the most apparent characteristic, even if hidden, of these services' modus operandi. Obviously, unlike other administrations, the secret services are discreet and their activities are hidden, but the term *secret* gives no indication of their exact role. The secret services' function is first to gather information. The two main areas in which they specialize are intelligence and counterespionage. They are also responsible for a third mission, referred to as "covert actions." In most countries, these three activities are implemented by several intelligence agencies. However, this kind of definition only insists on a functional dimension.

Nature and Function of Secret Services

In 1966, the U.S. Central Intelligence Agency analyst and academic historian Sherman Kent wrote a short, seminal book in which he defined the three dimensions of intelligence services: (1) these services are *organizations*, (2) they undertake *activities*, and (3) they produce *knowledge*. This approach is very helpful for scholars insofar as it shows that intelligence agencies are not merely the tools of executive authorities. The very nature of secret services means that they try to escape from all kinds of external scrutiny and especially from academic analysis. As a result, current literature concerning the secret services is influenced, on the one hand, by journalistic bias (the need for scoops and permanent suspicion toward what is hidden) and, on the other, by conspiracy theories. Today, this lack of academic literature is problematic especially since the assessment of "global" threats and the so-called war against terror have increased the role played by intelligence organizations. During the Cold War, most countries, apart from the former USSR and the United States, had only limited means. In recent years, most intelligence services have seen their size, budget, and means increase considerably. They are no longer an insignificant part of the state, a weak side of public policies. That is one of the reasons why governments in liberal democracies have tried to improve accountability and oversight.

Most intelligence agencies now publish some of their reports and documents and edit their own official histories (usually written by academics), and the parliamentary committees in charge of overseeing their activities edit the annual reports on the agencies. It is surprising, then, to note the paucity of academic literature considering the ever-increasing available material (the current published official documents and declassified archives). For a long time, intelligence has been described as the "missing dimension" in the study of international relations, but the same could also be said of domestic policy studies. Despite the criticism of intelligence activities by its detractors, the first academic works were published in the 1970s by "practitioner-scholars" like Sherman Kent. Academic scholars began to work on the topic in the 1980s. Today, intelligence studies is an authentic scientific research field with its own research centers, departments in college and universities, and journals and series. Different stakeholders meet regularly at conferences and contribute to journals. The majority of academic literature comes from English-speaking political scientists specializing in international relations and from historians. This would indicate that intelligence is not yet entirely recognized as a bona fide subject by all social sciences: The same can be said of sociologists and scholars working on politics while not taking intelligence into account. The situation is worse in continental Europe, where the first works only appeared at the very beginning of the 21st century.

Despite this doubtful state of affairs, it is possible to pinpoint some truths in the field. The specialization of a part of the state in the gathering of information illustrates the existence of a specific function in the contemporary state. Secrets function like a veil: They hide the fact that intelligence services are organizations—that is, one part of the bureaucracies in our liberal democracies. Indeed, these secret bureaus have to cope with special rules—essentially concerning information and law—yet they are nevertheless a growing part of states. The activities of the secret services, whose aim is to provide governments with intelligence, sometimes of a strategic nature, make them powerful. Despite the progress of civil liberties and transparency, this core of the state remains hidden for the most part. In this secret area, the state finds more autonomy and, theoretically, more power. Intelligence agencies are an important part of what could be called the *secret state*. In fact, the study of secret services leads us away from the view that the state has become more transparent and has less influence on citizens in the long term. Nowadays, the existence of secret states in liberal democracies could restimulate studies on the current nature of states.

The Political Dimension

One can also consider the existence of intelligence agencies in the state from a political perspective. Despite the theory of the law-abiding state, whereby the entire state has to comply with the law and implement neutral policies, the existence of the secret services linked to the political authority would indicate that some part of the administration is not a neutral tool for high-ranking officials but, conversely, that its nature is profoundly political. Politics in intelligence operates at three different levels.

1. The secret services are located within the state but are very close to political authorities. The sensitive dimension of intelligence often transforms the agencies into advisors or think tanks. This means that the agencies can be used to elaborate political agendas or they can themselves influence them.

2. Then, intelligence is, of course, a tool for political authority when it implements policies at home and abroad. Many public policies are not neutral. Here, scholars face a problem. The fact that the most important parts of these policies are

not publicized diminishes the capacity to assess them, and at the same time, it automatically suggests that they are more efficient and powerful than they perhaps really are. It is impossible to go beyond this limit, except for scholars working on archives or historical material.

3. Politics in intelligence is not only linked to the position of the agencies within the state; being civil servants or contractors, their members are sometimes in a situation where they can express their political opinion through their professional occupations. The politicization of agencies is a common case.

Finally, intelligence activity is one part of public policies and one part of politics. This implies that the very essence of the state remains close to politics. It means that the Weberian illusion of a neutral state preoccupied only with efficiency must be left aside when studying the secret state.

Recent Developments and Future Directions

Most agencies first appeared in the 20th century. At this time, their staff was composed of civil servants and military officers. The fact that the agencies served the state was indubitable. However, the nature of the intelligence services has considerably evolved in recent decades because of a significant transformation in the conception of their work and their management. Now, more and more agencies have recourse to contractors or to people coming from the private sector for short missions. Furthermore, retired officials from agencies often work for private intelligence firms that become contractors for the agencies. The classical borders between private sector and public administration are vanishing slowly. This has an effect on the way we define the secret state, which remains secret in its process but has become less public. Finally, the transparency/secrecy tandem seems to be more prevalent than the private/public one.

If a sociological study of the state could help demarcate the nature of the secret state and outline its real borders, empirical works would be necessary to delineate the limits of the notion of intelligence community that is often used by scholars and also by officials. The fact that people working in or for the agencies are subjected to clearance processes and use sensitive information isolates them from other professionals. This does not mean that intelligence careers avoid the traditional features of other professions. The notion of an intelligence community produces a false feeling of cohesiveness that is reinforced by the secret dimension of its activity. A sociological study of the different stakeholders and professions inside the agencies could enable us to study them from a more impartial point of view in order to understand the relationship between the different agencies and within each agency in each country.

If this could be helpful to understand what intelligence is today, its study is also useful to approach the features of secrecy in contemporary democracies. Indeed, the secrecy of agencies is not only something that is not submitted to publicity; throughout the 20th century, the state enacted special regulations to protect what it judged to be most sensitive. These regulations became the borders of the emerging contemporary secret state, and the first written judicial rules were in fact the first rules to hamper the agencies in their being a part of the secret state. The creation of official secrecy through regulations and classification processes was a major step in the secret state–building process, but it also refers to its features in the shadows of liberal democracy. This shows that democracy accepts and adjusts to a special area where transparency and liberalism are ineffective. The fact that a Freedom of Information Act (FOIA) was passed in the United States and in the United Kingdom (UK) is a landmark in this evolution. Today, the FOIA is a lawful weapon against public secrecy, even if not all-powerful.

Finally, it is important to understand that the comprehension of intelligence needs both comparison and a historical approach. There is no single model of a secret state or of an intelligence agency. The building of the agencies is the result of a long process that began in the 19th century. Wars and international crises have played a major role in this evolution. However, despite these common features and the current expansion of agencies after the end of the Cold War, the essence of intelligence agencies is very different depending on the country. If we can talk of a U.S.–U.K. model in so far as most agencies aspire to have the same position in the state as in these countries, the reality is very different. The means accorded to the agencies, the role of the law, the kind of states into which the agencies fit, and their influence on public policies are not the same. This emphasizes once again the need for more social science studies to understand what intelligence really is.

SECULARISM

The term *secularism* has different senses. It is used to refer to secular humanism and atheism; the social process of secularization; and political, state-driven projects. This entry is concerned solely with the third sense, which is most frequently used in political science.

What Is Political Secularism?

Broadly speaking, secularism, anywhere in the world, means the advocacy of a separation of organized religion from organized political power (the state) that is inspired by a specific set of values. In this general sense, secularism is a normative doctrine that pretends to be universal, although it is applied in different cultures that are more or less compatible with it. Secularism can be understood in its strict meaning of separateness between political power and religion or, more broadly, as bearing several values such as toleration, equal religious liberty, and freedom of religion. Sometimes these two definitions may be in contradiction, as illustrated in France over the issue of Muslim women wearing the veil. However, its constitutive elements can be differently interpreted, giving rise to multiple forms of secularism.

Secular states are disconnected from religion at three distinct levels: (1) ends, (2) institutions and personnel, and (3) law and public policy. This distinguishes them from theocracies and states that establish single or multiple religions. In a theocracy, a deep connection between state and religion exists at all three levels. A priestly order directly administers the state by reference to what it believes are ends inscribed in divine laws (e.g., the Islamic Republic of Iran as Ayatollah Khomeini aspired to run it). In states with established religions, in which one religion is accepted as the official one, a priestly order does not govern directly, and a large measure of institutional and personnel differentiation exists. This disconnection, at Level 2, also referred to in some contexts as church–state separation, goes hand in hand with an overall ideological connection. Religion and state share common ends. The state is subordinate to religious ends even though it has its own function, power structure, and internal norms. Thus, in states with an established religion, because of this primary connection at Level 1, there is an automatic connection at Level 3. For example, the revenue collected by the state is available for religious purposes.

A secular state is nontheocratic and has no established religion. Disconnection from religion at this level distinguishes secular states from both theocracies and states with established religion. A secular state has its own secular ends. The second-order disconnection, church–state separation, demarcates it only from a theocracy.

Given that ethical reasoning is best when it is contextual and comparative, what are the positive and negative aspects of secular and nonsecular states? Historically, nonsecular states have recognized a particular version of the religion enunciated by the dominant church as the official religion, compelled individuals to participate in only one church, punished them for failing to profess a particular set of religious beliefs, and levied taxes in support of one particular church. Nonsecular states embody a regime of inequality between religions (e.g., between Christians and Jews) and also among the churches of the same religion. Societies with such states were either wracked by inter-/intrareligious wars or have persecuted minority religious groups. States with substantive establishments have not changed with time: such as Saudi Arabia, Pakistan, and Israel. Opponents of theocratic states and of those with an established religion argue that such states perpetuate inter- and intrareligious domination and are incompatible with the values of freedom and equality.

Secular States and Religion-Centered States

Are all secular states better than religion-centered states? This does not follow. As mentioned above, a secular state must have secular ends. However, these ends themselves may be of two kinds. The first are amoral. Amoral secular states are so called when their entire purpose is to maximize power, wealth, or both. But just as without separation there is no true secularism, a value-less separation does not add up to secularism. A state may separate itself from the ethics and morality of religions for wealth and power, as we can observe in plutocracies (government based on wealth) or in totalitarian regimes that are based on material ideologies. Such a state is secular but does not instantiate the normative perspective of secularism and in fact is incompatible with it.

Value-based secular states are distinct from amoral states. Several values are constitutive of secularism: prevention of cruelty, toleration, equal religious liberty, the freedom to exit from religion and to profess no religion, and equality of both passive and active citizenship rights (equal distribution of benefits such as protection of life, availability of health care, emergency services, welfare benefits, and education and nondiscrimination in the distribution of the right to vote, to stand for public office, and to deliberate on the public good). Furthermore, some of these values can be interpreted both individualistically and nonindividualistically (the right to worship or education can be given to both individuals and communities—that is, to maintain their religious practices or to set up their own schools).

These values-based secular states differ from one another in the selection and combination of values and the weight assigned to each, but most important in how they unpack the metaphor of separation at a third level, concerning laws and public policy. One type of secular state conceives of disconnection at the third level in a wholly one-sided manner. To disconnect is then to exclude religion from its affairs but without setting any limits on its own interventionist powers in the affairs of religion. Such states (e.g., the former communist states, Kemalist Turkey, and to some extent France) exclude religion to regulate, control, or sometimes destroy it in the name of a single value such as equality. This may help states deal with aspects of intrareligious domination (e.g., anticlericalism in France) but not to address interreligious domination—that is, when members of one religious community discriminate against, marginalize, or even oppress members of another religious community.

The explanation of this contradiction is to be found in history: Issues of radical individual freedom and citizenship equality arose in European societies *after* religious homogenization. The birth of confessional states was accompanied by the massive expulsion of subject-communities whose faith differed from the religion of the ruler. Such states found a place for some toleration in their moral landscape, but this was consistent with the deep inequalities and the virtually invisible, marginalized existence of members of religious minorities. The liberal democratization and the consequent secularization of many European states have helped citizens with non-Christian faiths acquire most formal rights. But critics of secularization and advocates of pluralism and consociative order may argue that such a scheme of rights neither embodies a regime of interreligious equality nor effectively prevents religion-based discrimination and exclusion. Indeed, it masks majoritarian, ethno-religious biases. This is evident in the different kinds of difficulties faced by Muslims. For example, in Britain, a third of all primary school children are educated by religious communities. Yet applications for state funding by Muslims have been frequently turned down. This is also manifest in demands by the Muslims that they be allowed to build mosques (as in Germany, Italy, and Switzerland) or have proper Muslim burial grounds of their own (as in Denmark). Another ongoing area of controversy, especially in Western European states such as France, concerns policies that restrict the wearing of the hijab (headscarf), niqab (face veil), or burka.

A second type of values-based secular state conceives of this third-level disconnection as mutual exclusion. Such a state maintains a policy of strict or absolute separation in which religion is excluded from the affairs of the state but the state too is excluded from the affairs of religion. The state has neither a positive relationship with religion—for example, there is no policy of granting aid to religious institutions—nor a negative relationship with it; it is not within the scope of state activity to interfere in religious matters, even when the values professed by the state are violated. This noninterference is justified on the ground that religion is a private matter, and if something is amiss within the private domain, it can be mended only by those who have a right to do so within that sphere. This, according to proponents of this view, is what religious freedom means. When a state is disconnected from religion at all three levels in this particular way, then we may say that a wall of separation has been erected between the two. American political secularism could exemplify some aspects of this model.

It is now increasingly clear that both forms of Western secularism have persistent difficulties coping with community-oriented religions such as Roman Catholicism, Islam, and Sikhism, which demand a greater public presence and even official recognition for themselves—particularly when they live in the same society. Moreover, they were not designed for societies with deep religious diversity. Both of these versions developed in the context of a single-religion society and to solve the problems of one religion, namely, Christianity. Both understand separation as exclusion and make individualistically conceived values—individual liberty or equality between individuals or both—as the ground for separation.

India provides another model of secularism, with multiple religions being a part of its foundation. Indian secularism is inextricably tied to deep religious diversity. It has a commitment to multiple values—liberty and/or equality—not conceived of narrowly as pertaining to individuals but interpreted broadly to cover the relative autonomy of religious communities. While there are boundaries between the state and religion, these boundaries are porous. Thus, the state may intervene to inhibit some practices, just as it respects and lends support to other practices, of a religious community. India's commitment to multiple values and principled distance means that the state tries to balance different, ambiguous, but equally important, values. Thus, its secular ideal resembles a contextual, ethically sensitive, politically negotiated arrangement that evolved to deal with tensions generated continuously by deep religious diversity.

SECURITY AND DEFENSE POLICY

The term *security policy* denotes the aims and means that are needed to protect a state from both external and internal threats. *Defense policy* has a narrower extension, usually confined to the aims and means against external military threats.

Security and defense policies have always been at the center of international politics, but their nature has changed due to the advent of nuclear weapons and their proliferation, economic interdependence, the end of the Cold War, environmental problems, technological advancements and vulnerabilities, as well as other material and cultural developments typically linked to globalization. These phenomena have also brought about conceptual changes and competing terminological usages.

Traditional and Contemporary Views

It is widely assumed that every state must have a security and defense policy if it wants to survive in the anarchical international system. Security is seen as the key national interest of states, and that is why defense is needed. Security and defense policy is thus seen as belonging to high politics, which implies that it occupies a superior hierarchical position among state activities and ranks higher in importance than other fields of foreign policy.

These traditional views of security and defense policy are, however, in many ways challenged in today's world politics. Both terms, *security* and *defense*, have been widened and are broadly applied in various ways. Also, the assumption that security and defense must be given priority (a normative claim) or are given priority (an empirical claim) among various policy issues is seen as questionable. Alternative views of security have been put forward by critical security theorists, environmentalists, and proponents of "human security."

Security is a difficult concept, because it can refer both to the objective absence of threats and to a subjective feeling of security. It is also debatable whether security means an absolute absence of threats or whether security refers to a state of affairs where the likelihood or "risk" of major threats is low.

The traditional view links defense and security to military affairs. It starts from the assumption that there is a security dilemma in world politics because of the anarchical nature of the international system. Because there is no central authority, states need to be prepared for defending themselves. International security has been associated with balance of power and stability.

Against this background of traditional security thinking, it can be suggested that "defense" and "security" are actually euphemisms for war and military. States used to have ministries for war; after World War II, they were renamed ministries for defense. Military officers are "security professionals," and "private security companies" conduct war operations. "Security studies" is often another name for strategic or war studies. If security and defense policy are understood in this way, the term denotes all military activities regardless of whether they have to do with security as a goal and whether they are defensive or offensive. This definition, however, reflects quite a common usage that emerged after World War II.

Security policy is often seen as a combination of foreign and defense policy. The administrative utility of adopting the concept of security was in tightening the link between defense and foreign offices, for example, in the United States through the establishment of a National Security Council. In some countries, the concept of security policy implies that foreign policy goes (or should go) ahead of defense policy. According to this view, defense policy is a subset of security policy, whereas parts of foreign policy, such as development cooperation, can, but do not necessarily, fall outside the realm of security policy.

There is no agreed definition of security policy partly because there is no agreement on the notion of security. The narrow notion of security emphasizes military threats, but a broader notion of security, *comprehensive security*, includes all kinds of "new" threats, such as financial instability, climate change, environmental risks, natural catastrophes, energy shortage, organized crime, piracy, drugs, technological hazards, international migration, and epidemic diseases. Moreover, a security policy can also address internal threats, such as political opposition, social unrest, famine, aging, or street violence. These days, one of the meanings most often used for "security policy" deals with the security of information systems.

The problem with the wider understanding of security is that the concept lacks focus. For example, one important border to uphold is the difference between intentional and unintentional threats. Moreover, although a wider concept of security has become widely accepted also by many state authorities, this has not necessarily led to notable changes in practices. The role of the military in understanding security and defense has not disappeared; it has just been framed within a larger view of security.

In particular, after the terrorist attacks of 2001 in the United States, the internal aspects of security policy have become more salient. Administratively, therefore, ministries of interior and other agencies such as ministries of justice have become much more active agents of security policy than before. At the same time, technical methods of producing security through control and surveillance have dominated the discussion about how to manage various security problems.

The concept of defense policy can also be related to actions other than military. Like "security," "defense," too, has a larger broader definition that includes all measures that are taken to defend a country or an organization against all sorts of threats. It can thus denote the economic, civil, and psychological aspects of defense in addition to the military aspect and covers activities during both war and peace. Such a concept of "total defense" has been adopted in particular in small countries such as Austria, Finland, Sweden, Switzerland, and Singapore. Peace movements have also proposed other alternative understandings of defense, laying emphasis on civilian resistance and nonviolent means.

Among the alternative paradigms to the traditional notion of security, proponents of human security suggest that human needs should be at the center of security concerns and that this would put emphasis on development as well as on health issues and the economic, social, and political rights of individuals. Advocates of critical security studies are generally dissatisfied with the traditional, realist view of security. They also want to broaden the understanding of security and emphasize the potential of overcoming security problems through emancipation. Postmodern approaches to security regard security discourses as essential in creating state identities in the first place.

The theory of securitization developed by the so-called Copenhagen school of security also subscribes to a broader view of security consisting of various sectors, such as military, political, economic, societal, and environmental sectors. It also stresses that labeling something as a security threat is a speech act, which means that there are no security threats before they are made into such in the political discourse. Because securitization means lifting security issues above normal politics, often justifying emergency measures and exceptions, it could hamper open political debate and have negative effects on the policy-making process.

Characteristics and Implementation of Security and Defense Policies

States are usually seen as principal actors that adopt and implement security and defense policies, partly because they are seen as legitimate holders of means of violence. However, in particular, if the military aspect of security and defense is downplayed also, international organizations, regional actors, international companies, and other human groupings can have a security or defense policy.

The object of security or defense can also vary. It can be the state, its government, critical infrastructure or territory, society, population or individuals, or principally anything that is seen as worth securing and defending. It is also possible to talk about global, common, or international security and to defend the existing world order or the ecosystem.

Many countries and institutions have their own specific definitions for the terms *security* and *defense*. After the terrorist attacks of 2001, the United States adopted the concept of "homeland security" to deal with military, terrorist, and other threats inside the territory of the country. For example, when launching the Common Foreign and Security Policy (CFSP) and the European Security and Defense Policy (ESDP), the European Union adopted its own conceptual scheme, according to which security and defense policy deals with crisis management and not with common defense.

Security and defense policies have traditionally been surrounded by a realm of secrecy, information gathering through intelligence, and a lack of democratic control by parliaments. Many states, however, lay out their doctrine on security and defense in the form of a "white book" or a public statement on security or defense. Such governmental documents create transparency, promote public discussion and legitimacy, and enable long-term strategic planning.

A nation's defense can take various forms even when restricted to the traditional military meaning of the term. One basic choice, for example, deals with offensive and defensive defense strategies. Another choice is whether to acquire nuclear or other nonconventional weapons. A state relying on conventional forces has to find the right balance between air, naval, and land forces. States can also choose whether to emphasize territorial defense or intervention forces. Furthermore, states can choose between conscription and a professional army or a mixed system and can decide whether to use private security companies. Finally, defense policy also covers various other political and social issues such as civil–military relations and democratic control of the military, defense economics, and gender and sexual equality within the military.

States also face security policy choices and can develop different security strategies. Besides choosing between a narrow and broader concept of security for the basis of their security policy, states can choose whether or not to securitize certain threats. Furthermore, states can try to seek security within an alliance, in a multilateral framework of collective security, or alone, for example, on the basis of a policy of neutrality. The classic security strategies in world politics are balancing, bandwagoning, and buck-passing. Balancing means gathering strength against the opponent either by domestic mobilization or with external alliances; bandwagoning leads one to accommodate and join the opponent; and buck-passing refers to shifting the responsibility for resisting the opponent to other actors.

SECURITY APPARATUS

The concept of security apparatus builds on distinct yet functional elements with dynamic and structural value. This entry examines security as the state of being—or at least feeling—secure and considers, in particular, the meaning of security defined as the safety of a state or an organization against criminal activities such as terrorism or espionage and other potential dangers. The security apparatus is considered as a complex structure, usually a segment of a larger organization, as well as the equipment required for a particular purpose. The structures responsible for providing security to a society and its population reflect the contemporary values held by a country or any other human organization. As such, the security apparatus also provides the state of affairs of the underlying cultural, social, and political elements and, in addition to its primary function, allows a "health check" of a society that can help assess its status and predict its future. This entry first considers various ways in which security and security threats have been defined and then describes various types of threats to security at the national, regional, and global levels. A centralized national approach to security (e.g., the U.S. Office of Homeland Security) is contrasted with the decentralized European approach, in which responsibility is distributed among various agencies. Descriptions of the security apparatus in Italy and France illustrate two ways in which nations may implement security policy. Last, the role of international security organizations is considered.

Evolving Definitions of Security

The geopolitical, social, and economic developments that have occurred since the last decade of the 20th century have made the distinction between internal and external security increasingly blurred, thereby influencing both the concept and the structure of security apparatuses throughout the world. The rise in independent states and in worldwide travel and exchange, for example, and a more open communication society have greatly influenced the strategic thinking underpinning national and international security affairs.

Whether geared toward facing risks, threats, or actual dangers, the security apparatus will require several basic elements to meet its challenges, as it would normally be triggered by an asymmetric scenario where the attacker would have at its disposal a range of targets to strike through different tactics. Hence, a security strategy will represent the basic framework of any security apparatus, one encompassing all the elements that may need protection as well as the tools and measures available to provide such protection. The key to any strategy is accurate information and skilled users who are able to receive it and take appropriate action. Therefore, information gathering and processing also need to be assessed in view of their value and meaning for a security apparatus.

A list of what must be protected and the corresponding security measures may be only tentative due to the dynamic character of the security environment; nonetheless, the broad categories of internal and external security may generally be broken down into elements such as resources, infrastructures, and civil protection; natural and man-made disasters; policing, intelligence, military, and diplomatic sectors; nongovernmental and intergovernmental cooperation; and low-intensity conflict and state of war. An open-ended list may be further developed through an examination of issues of concern to national security, including “megaprotection” in conventional, strategic, and nuclear deterrence; serious and organized crime, including illicit arms and drugs trafficking, and terrorism; commercial, industrial, financial, and economic competitiveness; environmental decay; and cultural and ethical values.

The range of security concerns that may come to the forefront of public concern is matched by the depth of the apparatus called on to ensure the security, safety, and well-being of individual societies. The traditional divide between external and internal security has normally reflected the distinction between conventional and emerging threats, which largely fell within the mandate of the military and the civil infrastructures, respectively. The evolution toward a multipolar and multidimensional environment contributes to giving a new shape to the security concept and relevant apparatus, particularly as it concerns domestic security.

Threats to Security

The structure of the security apparatus is influenced by the threats affecting security, whether at the domestic, regional, or global level. Since World War II, the Western Hemisphere, particularly the Western European countries, has known an unprecedented period of peace and stability mostly due to their cooperation through common institutions such as the Council of Europe, the European Communities, and the North Atlantic Treaty Organization (NATO). Still, Europe, just like other major international actors, including the United States, Russia, China, India, or Japan, faces security threats and challenges that originate both within and beyond the regional borders. As a matter of fact, the 2003 European Security Strategy was premised on the consideration that, while large-scale aggression against any member of the European Union was unlikely, Europe faced new threats of a more diverse, less visible, and less predictable fashion.

Terrorism and its complex social, cultural, religious, and developmental causes constituted the first security threat on the European agenda, because of the then still fresh memory of the September 11, 2001, attacks on the United States; the bombings in Madrid, Spain, on March 11, 2004; and the bombings in London, United Kingdom, on July 7, 2005. European countries have been and continue to be both a target and a base for terrorism, whether politically motivated or linked to religious extremism. This continuing threat raises questions about the integration of foreign communities; it also draws attention to the stark contrast between modernization and secularism, on the one hand, and strict observance and religious zeal, on the other.

Proliferation of weapons of mass destruction was assessed as potentially the greatest threat to European security given the risks implied in an arms race in bordering regions, especially in the

Middle East, and the increased potency of weapons facilitated by advances in the biological sciences, which could be supported by the spread of missile technology. The deadly scenario of a terrorist group armed with weapons of mass destruction and able to inflict damages previously available only to state actors demonstrates the equation produced by the combination of convention and emerging threats, which requires a uniform reaction.

Regional conflicts were also listed as top security concerns for they threaten stability, destroy human lives and social and physical infrastructures, and challenge fundamental freedoms and human rights. Furthermore, regional conflicts may lead to extremism, which facilitates and provides opportunities for two other strategic security issues: state failure and organized crime.

The collapse of the state not only entails domestic threats such as bad governance, corruption, weak institutions, and a lack of accountability but also has international resonance. Failed states also risk providing a home for terrorist and organized criminal groups, thereby undermining regional stability and global governance.

Finally, organized crime represents an internal security threat with an important external dimension through its activities, particularly cross-border illicit trafficking and its possible links with terrorist activities.

Most recently, the international economic and financial crisis affecting all national systems has added to the list of security threats in view of its implication for, among other things, the growth of extremist and antisystem movements that can destabilize weak societies and the increased geopolitical tensions between countries that are struggling to defend critical national assets such as the banking or the industrial sector. The economic crisis may affect peace and stability in countries and entire regions that have emerged from or are still struggling with conflict and tension, thereby affecting their own security as well as the security of their neighbors with increasing risks for the national financial systems, including the security of sovereign financial viability. Security risks may become opportunities for political movements or criminal organizations seeking to exploit weak or unstable governments through social unrest, predatory financial practices, or common criminal activities.

The security apparatus builds on prevention and law enforcement and intelligence efforts to ensure domestic security, combating terrorism and protecting the public, infrastructure, and historical and cultural sites. Recent terrorist attacks have led to suggestions for strengthening legislation and other measures dealing with border control, illegal immigration, and related criminal activities such as trafficking in human beings, transport security, and terrorism financing; however, countries with a multiagency approach normally assign complementary tasks to the different agencies. The Italian and the German security apparatuses are examined as they typify the European system for security protection, while each represents a specific subsystem, namely, the central approach and the federal approach, respectively.

Organization of the Security Apparatus: Contrasting Approaches

Two clear approaches emerge among those countries that have been confronted with serious natural and man-made disasters over the past decade. On the one hand, the United States, following deadly terrorist attacks on its soil, attacks against its interests abroad, and natural disasters, underwent a thorough reorganization of its national security and security apparatus, which led to the establishment of the Department of Homeland Security. At the other end of the spectrum, countries such as France, Germany, Italy, Spain, and the United Kingdom have elected to preserve the existing organization of their security apparatuses where responsibilities are allocated through different public agencies and levels. The different philosophies behind the choice between a unified, central department and a system of central and local agencies reflect historical, cultural, and political considerations, chiefly the debate over the protection of civil liberties and the need to ensure protection against deadly dangers, which involves a proper balance between increased security and the adequate safeguarding of personal freedoms.

While the U.S. Department of Homeland Security builds on a concept of security that includes border protection, transport security, emergency preparedness, and the protection of critical infrastructures, European countries have mainly invested in law enforcement efforts and have sought to integrate counterterrorism and preparedness programs into emergency management efforts with a view to greater flexibility in responding to security challenges with often limited personnel and resources. Regardless of the security apparatus elected to ensure the safety and well-being of the nation, a consistent pattern has recently emerged whereby increased investments are made in intelligence and law enforcement initiatives, and often a combination thereof, to fight against organized crime and terrorism.

At a time when the traditional distinction between foreign and domestic threats is blurring, the ability to plan and carry out devastating attacks—particularly through cyber warfare or chemical, bacteriological, radiological, and nuclear agents—enables relatively small groups of terrorists or criminals to challenge state actors and their defenses. Even those countries with experience in terrorist attacks and counterterrorism policies need to improve their security apparatus in a way that allows for ready information exchange among disparate government agencies that, by their very nature, professional culture, or legal requirements, have been used to create organizational barriers, with the consequent segregation of duties and knowledge.

The vexing question concerning the exchange of information among law enforcement and intelligence agencies brings with it, as related issues, the balance between strategic and tactical intelligence; data collection, its exploitation, and dissemination in view of the intrinsic need to maintain secrets, methods, and sources; a review of the classification methods that would allow sharing information with other agencies nationally and abroad; the exploitation of intelligence data in the framework of law enforcement operations intended to investigate crimes for prosecution and adjudication; and the need to improve security while respecting civil liberties.

Two European Models

Italy

In Italy, the government (Council of Ministers), comprising the head of the government and the ministers, is the collective decision-making body, and it coordinates the efforts made by governmental ministries and agencies to protect domestic security.

The Ministry of Interior is the lead government ministry on public order and security, immigration and border controls, and civil protection. The Public Security Department manages the national police force and is responsible for implementing the public order and security policy; the Civil Liberty and Immigration Department sets immigration and asylum policies; and the Fire Brigade, Public Aid, and Civil Defense Department leads efforts in emergency preparedness and response policies.

The activities carried out by the Ministry of Interior are normally supported by several other government ministries with responsibility over particular aspects of national security, including the Defense Ministry, the Health Ministry, and the Infrastructure and Transport Ministry. Customs and financial policies are under the responsibility of the Economy and Finance Ministry.

To coordinate the various efforts, interministerial bodies are usually set up to bring together department ministers and officials. The Public Order and Security Committee examines issues related to the protection of public order and security and to the organization of the police forces. The committee is chaired by the interior minister and comprises the chief of police/director general of public security and the undersecretary entrusted by the prime minister with special responsibility for the intelligence services. The heads of the other police forces also take part in the committee, and additional ministers may be involved depending on the issue at hand. The Interministerial Committee for Intelligence and Security, which provides advice and makes proposals on the general direction and fundamental objectives for intelligence and security policy, is chaired by the prime minister and comprises the ministers for the Interior, Defense, Foreign Affairs, Justice, and Economy and Finance departments, while the heads of the intelligence services and other government officials may also be invited to participate. Finally, the security apparatus includes the Politico-Military Unit and the Department of Civil Protection of the Prime Minister's Office, which have, each in its own respect, responsibilities for drawing up and implementing emergency plans to deal with any chemical, biological, radiological, and nuclear incidents; transport safety and bioterrorism; and civil and military preemptive measures against major incidents or attacks. The

Department of Civil Protection coordinates and works with a tight network of central, regional, provincial, and local administrations as well as other public agencies and voluntary organizations, thereby forming a "national service" operating on the basis of the principle of subsidiarity.

The Interior Ministry has responsibility over the State Police (*Polizia di Stato*) through the Public Security Department, which coordinates police tasks and activities at the central level and hosts the Anti-Terrorism Strategic Analysis Committee (*Comitato per l'analisi strategica del terrorismo*, CASA). At the provincial level, the top public security authorities are the prefect, who is appointed by and answerable to the central government, and the *questore*, the State Police's senior provincial officer with operational control and jurisdiction in the field of public order, security, and criminal and intelligence matters. The State Police includes different specialist units that may play a role in protecting various aspects of domestic security: The antiterrorism police have primary responsibility for investigations aimed at preventing and fighting terrorism, including information collection and analysis; the traffic police patrol roads and highways; the railway police ensure the security of travelers and their belongings, the security of railway stations, and the control of dangerous goods transported by rail; the immigration and border police are responsible for the entry and stay of foreign nationals and immigrants in Italy, as well as the prevention and control of illegal immigrants; and the postal and communications police seek to prevent and tackle the illegal use of communication technologies. Other specialist units may be deployed to perform high-risk interventions, for example, in the case of a hostage incident, or to provide rescue services in areas affected by natural disasters.

The Italian security apparatus also has a military corps (*Carabinieri*) that carries out police duties among the civilian population, not unlike units in other European countries, such as the French *Gendarmerie* or the Spanish *Guardia Civil*. The Carabinieri, which are empowered to gather intelligence, investigate terrorist and organized crime organizations, and respond to high-risk situations, are institutionally accountable to the Ministry of Defense and the Ministry of Interior. A third police force with responsibilities over financial, tax, and customs issues is the *Guardia di Finanza*, directly attached to the Minister of Economy and Finance, with a structure resembling the Carabinieri, although its specialized tasks make it a prime actor in the prevention, investigation, and disruption of money laundering, fraud, tax evasion, and illicit financing.

In addition to the law enforcement agencies, the Italian security apparatus also includes intelligence and security services with distinct responsibilities for the defense of the state's independence and integrity against any danger on the military front with counterespionage and counterintelligence duties (*Agenzia informazioni e sicurezza esterna*, AISE) and for the defense of the democratic state and its institutions against all forms of subversion (*Agenzia informazioni e sicurezza interna*, AISI). The AISE and AISI work under the authority of the prime minister, or an undersecretary with due delegation of authority, who exercises the relevant functions through the Department of Information for Security.

Germany

Germany, like Italy, has no department or ministry for "homeland security." Its long-established organization for protecting security and responding to emergencies within the national borders is defined by the 1949 Basic Law (*Grundgesetz*, i.e., the Constitution), which involves ministries and agencies at the federal, state (16 *Länder*), and local levels. The German approach to dealing with incidents, whether natural disasters or terrorist acts, is bottom-up, beginning at the local level, involving state authorities if necessary, and relying on federal agencies if needed.

Since September 11, 2001, the German government has assessed terrorism as the most immediate threat to national security, although Germany's experience with terrorism dates back to the 1970s, when both domestic and international terrorism were a cause of serious concern. At the federal level, security functions are the responsibility of several ministries, including the Interior, Justice, Defense, Foreign Affairs, and Finance departments, as well as other departments and agencies. The German security apparatus relies on intelligence, law enforcement, and judicial prosecution to prevent terrorist acts and to identify and neutralize potential terrorists.

The most important intelligence authorities are the Federal Intelligence Service (*Bundesnachrichtendienst*, BND), which is responsible for gathering intelligence abroad under the Federal Chancellery; the Federal Bureau for the Protection of the Constitution (*Bundesamt für Verfassungsschutz*, BfV), which gathers domestic intelligence and is placed under the Ministry of the Interior; and the Military Counterintelligence Service (*Militärischer Abschirmdienst*, MAD), which is under the Ministry of Defense. The federal law enforcement agencies include the Federal Bureau of Criminal Investigations (*Bundeskriminalamt*, BKA); the Federal Police (*Bundespolizei* [BPOL], formerly *Bundesgrenzschutz*), which has responsibility over border protection and aviation security and carries out the screening of border traffic (BKA and BPOL are placed under the Ministry of the Interior); and the Federal Public Prosecutor General (*Generalbundesanwalt*, GBA).

Following the September 11, 2001, attacks, the BKA has been given authority to lead its own investigations without a formal request from the BfV, as had been previously required. Furthermore, since 2004, the federal and state ministers of the Interior have introduced measures to improve coordination, which include a central database regarding religious fundamentalists suspected of terrorism and a coordination center under the Ministry of Interior comprising BKA, BND, BfV, and MAD, as well as state and local agencies. These coordination initiatives prompted the debate over the need for greater centralization of security activities, which, however, faces opposition from the state and local authorities and finds obstacles in the constitutional laws and arrangements. The German structure for civil protection and emergency response is also a joint responsibility of both the *Länder* and the federal republic and their local jurisdictions and the Federal Office for Civil Protection and Disaster Response (*Bundesamt für Bevölkerungsschutz und Katastrophenhilfe*, BBK), which was established in 2004 under the Ministry of the Interior, is called to support state and local authorities in the event of significant disaster and damage situations.

Germany's history, geographical location, and its industrial and economic prominence have greatly affected the shape of its security apparatus. On the one hand, strong emphasis has been placed on the protection of the civil rights and liberties of all those residing in Germany, including noncitizens; on the other hand, its position in the heart of Europe and its economic strength have made Germany attractive to millions of immigrants, thereby calling for the need to protect its borders and introduce robust security controls.

International Security Organizations

The external dimension of security issues has triggered the establishment and development of institutions forming an embryonic international security apparatus supporting domestic activities. Two organizations deserve a closer scrutiny as they facilitate cross-border police cooperation and support national services and authorities whose missions is to prevent and combat crime.

The International Criminal Police Organization (INTERPOL), established in 1923, is the world's largest international police organization and currently has 188 member countries. INTERPOL operates through its General Secretariat (Lyon, France) and a network of National Central Bureaus located in each member country. Its core functions cover secure global police communication services through a system (I-24/7) that enables national police services to request, submit, and access police data instantly and the management of operational data services and databases with information on known criminals, wanted persons, fingerprints, DNA profiles, stolen or lost travel documents, stolen motor vehicles, child sex abuse images, and stolen works of art. Support to police services is provided in six priority crime areas: corruption, drugs and organized crime, financial and high-tech crime, fugitives, public safety and terrorism, and trafficking in human beings. While mostly devoted to operational police assistance and support, INTERPOL's mandate may also extend to civil protection activities such as disaster victim identification in case of a terrorist attack or a natural disaster; following the tsunami that hit Thailand and Sri Lanka in December 2004, INTERPOL took an active role in the international effort to identify the victims of the disaster.

A notable example of what may be considered a regional security apparatus is the European Police Office (EUROPOL), established by the member states of the European Union with the mandate to handle criminal intelligence and improve cooperation in preventing and combating serious international organized crime and terrorism. EUROPOL supports the member states' competent authorities by facilitating the exchange of information with and among Europol liaison officers, seconded as the representatives of the national competent services to the headquarters (at The Hague, the Netherlands), and by providing expertise, technical support, and criminal intelligence analysis in support of operations. EUROPOL also produces strategic reports, notably the yearly Organized Crime Threat Assessment and the Terrorism Situation and Trend Report, as well as crime analysis on the basis of information and intelligence provided by the member states and third parties and assessed through different information, index, and analysis systems.

Conclusion

The structures responsible for providing security to a society and its population reflect the contemporary values held by a country or other human organizations. As such, the security apparatus also provides the state of affairs of the underlying cultural, social, and political elements and, in addition to its primary function, allows a "health check" of a society that can help assess its status and predict its future.

SECURITY COOPERATION

This entry deals with security cooperation in a classical sense: It focuses on state security and cooperation. This does not imply that other actors are not subjects of security or do not participate in related cooperation; it pays just tribute to the fact that states are still the main actors in both domestic and external security activities, including cooperation. It is worth noting that international and nongovernmental organizations, substate actors, companies, and others are involved in these activities as well.

International security cooperation is counterintuitive to the notion of "international anarchy." To entrust a part of the responsibility for state survival to other actors thus sounds far-fetched; neorealism has expressed this skepticism distinctly. Yet in everyday international life, security cooperation is found in ever more varied forms: It is an ubiquitous pattern in world and in regional politics.

Cooperative strategies in security policy accept the notion of *anarchy* but view it in a more relaxed way than neorealists do. These strategies see states as security seekers. Security interests have become interdependent owing to the penetrability of national borders and the impossibility of perfect defense, and national interests in general have become interdependent through globalization. Competing interests are mitigated by common interests. States can signal effectively benign intentions. "Predators" and sincere partners can be distinguished. Common security institutions supply reliable information about present and future capabilities and intentions, and common norms channel the goals, interests, and actions of states in a mutually agreeable direction.

This entry provides a typology of security cooperation in today's world. It distinguishes between *exclusive* security cooperation, where entry rights are limited and controlled and which coordinates policies toward the nonmembership, and *inclusive* security cooperation, which is open and which regulates the policies of the members toward each other. Exclusive institutions contain a strong element of realism, though they are by no means exclusively rooted in realist theory. Inclusive institutions have stronger relations to liberal-institutionalist, constructivist, and normative-idealist theories. The following sections describe the basic structure, advantages and disadvantages, and theoretical underpinnings of each type.

Exclusive Security Cooperation

Coalitions of the Willing

Today's "coalition of the willing"—a short-term association of states that ally for a single strategic purpose at a certain point in time and space—was the standard type of alliance in the classical Westphalian world. In this type of coalition, the alliance does not define the mission, but the mission defines the alliance. Coalition partners are selected for their particular capabilities to achieve the specific purpose, not by more intrinsic attributes and considerations.

Coalitions of the willing contain no legal obligations, develop no institutional structure, have no common staff, entertain no common ideology or culture, elaborate no grand strategy, and refrain from integrating military forces. Their members have only a short-term time horizon. Since the strongest member or a few core members select the partners, they are exclusive.

Because of its short time horizon, the coalition of the willing cannot mitigate the security dilemma: No long shadow of the future reduces the remaining distrust among its members; no expectations are created over how relations might evolve after the short-term objective has been achieved. As an example, the "coalition against terror" includes even long-term enemies (e.g., India and Pakistan). However, with regard to nonmembers, high uncertainties emerge over whether such coalitions might turn against other states in the future. Being exclusive and unilateralist, coalitions of the willing might stimulate "coalitions of the unwilling," or even "counter-coalitions of the threatened."

For the leading great powers, several advantages emerge. In the absence of institutional structures, customary, political, or legal rules exist; symmetries translate directly into influence; and the command of the strongest is unchallenged. Burdensome consultation procedures are absent (e.g., Kosovo 1999 vs. Afghanistan or Iraq 2003). Because the coalitions are shaped for a single purpose, unity of political will is granted—no opposition force within the coalition must be expected. Also, transaction costs are very low, no future obligations ensue, and freedom of action remains unconstrained. For smaller states, coalitions of the willing are a cheap way of bandwagoning, enhancing their security, and sharing the eventual spoils without the burden of enduring dependence.

On the downside, smaller coalition members have little influence on the coalition's politics, which are dominated by their powerful partners. They bear the consequences of actions decided and conducted unilaterally by others. These, in turn, are helpless against any moves of the smaller allies to desert the coalition. Coalition performance is thus uncertain because of the lack of predictability within the coalition.

Hence, coalitions of the willing appear fit to achieve short-term, straightforward objectives. If circumstances are complex and problems enduring, these advantages fade in comparison with more stable and reliable structures.

Alliances

Today, the notion of "alliance" has been shaped by the model of NATO (North Atlantic Treaty Organization), even though its longevity and institutional complexity constitute a historical singularity.

Alliances are a corollary of international anarchy. Each ally's security is enhanced against potential enemies by the pooling of resources. To rely on the promises of somebody else goes beyond a common sense notion of "self-help." Within the realm of neorealist theory, the puzzle is all the larger as the problem of "relative gains" affects allies as well. Because of this problem, distrust is not uncommon in alliances, and a lot of symbolic politics is deployed to deal with this destructive factor.

Realists dispute which variable triggers an alliance. According to the classical view, states ally against the biggest power in their environment. Another perspective has gained increasing support in the past 2 decades: States ally against the biggest perceived threat in their environment. This amendment modifies basic neorealist assumptions. “Threat” resides in the behavior of the threatening actor and is a unit-level attribute. Assessment of threat depends on subjective (or collective-cultural) factors. Finally, according to neoclassical realism, in a system without “predators,” alliances will evaporate, as predators are the only threats that can emerge and without them, allying would be a waste of resources.

Alliances, once formed, face several dilemmas. Allies do not necessarily hold identical security interests. As a consequence, they must expect two opposite types of behavior from each other. First, one ally’s security guarantee for the other ally may embolden that ally to engage in brinkmanship, provoking an armed conflict one does not want (entrapment risk). Otherwise that ally might switch sides and desert to the erstwhile enemy (risk of abandonment). By reassuring one’s ally of one’s own loyalty, one is reducing the danger of abandonment, but only to enhance the risk of entrapment as the ally will take one’s loyalty for granted no matter what. If one keeps a distance from one’s ally, the ally might be less emboldened to practice brinkmanship, but disappointment might drive that ally toward the enemy.

An alliance between a great power (as protector) and a couple of smaller powers (as protected) contains a specific dilemma. The protector worries about the risk of the guarantee it is giving to the small allies. Individually, they may not amount to much, but together, they may be geopolitically important. But is the value of each single one worth marching into a war with another great power? For the smaller allies, the reliability of the alliance guarantee can also be a reason to be nervous: Will the protector risk a war against the threat I am facing?

Vast distances exacerbate the alliance dilemma: Geopolitics is not the same for all allies; vital interests differ. Politically, the allies are at pains to agree on the threat and on the trigger that triggers the “alliance case.” Physically, the allies struggle hard to devise a strategy, a posture, and logistics that make the alliance’s promise credible. The enhanced risks of the nuclear age have exacerbated this dilemma.

Asymmetric alliances quarrel about burden sharing. The biggest member makes the decisive contribution. Assets of the smallest allies add virtually nothing at the margin. Smaller allies have thus an incentive to contribute less than their “arithmetic” share—they are up for a free ride, while the larger member produces most of the public good alliance security.

Many alliances in history were weakly institutionalized. With the growing speed of, and the stakes involved in, modern warfare, alliances try to achieve greater effectiveness and to mitigate the defection problem by higher institutionalization. NATO has been the first fully institutionalized alliance with a headquarters, a bureaucracy, a general staff, a council, an agreed strategy, and a far-reaching military integration. Institutionalization enhances alliance efficiency, trust, and stability. “Sunk investment costs” motivate members to keep the alliance under changed circumstances: Enduring collaboration creates social bonds. As a consequence, NATO has survived the loss of its enemy.

Clubs

International club governance is on the rise. Clubs are less institutionalized than alliances but more so than coalitions of the willing. They are distinct in that they are not necessarily confined to rendering security services to their members alone but deliver “security products” to a broader community, including nonmembers.

“Clubs” in the security field are, for example, the export control regimes (e.g., Nuclear Suppliers Group [NSG]), the Proliferation Security Initiative, and the G8 [Group of Eight]). They do not rest on treaties and have an exclusive membership that is enhanced by consensual co-optation. They are meant to be permanent. All have a flat institutional structure: some agreed rules and norms, even in written form (e.g., the export guidelines of the NSG). And they all have established decision-making structures (usually consensus rule).

The form of “club” permits members to escape from the constraints of legally regulated cooperation. It allows for an opaque style of proceeding that might be helpful to achieve consensus on politically difficult issues (e.g., export control) while creating mutual confidence that the partners are sincere. This might be a condition to establish cooperation in controlling the export of weapons of mass destruction (WMD) between potential political rivals. It might also facilitate substantial coordination in areas of high-security salience, such as G8 antiterrorism collaboration. And it allows for greater flexibility than formal treaties. The guidelines for clubs are easy to change and amend, namely, by simple agreement of the executives and without the often cumbersome ratification procedures. The downside is a lack of accountability.

Concerts

Concert is a mechanism to coordinate great power policies. The historical model, the Concert of Europe, was established at the end of the Napoleonic wars, and it kept the peace between the European great powers from the Vienna Congress (1815) up to the Crimean War (1853), contained the ensuing wars of Italian and German unification, and provided an arena for conflict management afterward until the breakdown in 1914. It was a tool to provide security for its members against each other, to prevent third parties from disturbing stability, to offer the public good of broad conflict management, and to mitigate the consequences of inevitable political change.

The classical concert relied on a combination of behavioral and procedural norms. Great powers guaranteed each other's existence and territorial integrity and recognized each other's vital interests. They committed not to change the status quo by force. They accepted restraint on their right to intervene unilaterally in other states' internal affairs. Crisis management was to be conducted jointly (with the option to opt out when vital interests were not at stake). A rough balance of forces was maintained. The overarching norm was to avoid a devastating major war in Europe. The concert maintained an elaborated system of conferences, meetings of ambassadors, and occasional encounters between monarchs. Consultations were intensified when an international crisis arose.

The strength of the concert was based on the common experience of large-scale, enduring war after the French Revolution and on a similar social basis of largely aristocratic or great bourgeois leaderships and diplomatic corps. These commonalities permitted collaboration despite value differences between the more liberal Britain and France, on the one hand, and the much more conservative Russia, Prussia, and Austria, on the other. When the memory of the wars faded, extended suffrage in Britain and France brought new social forces to the seats of power, and nationalism led to higher political mobilization everywhere, it became harder to achieve a consensus. The concert suffered also from the shortcomings that a Russian attempt failed to place arms control on its agenda and that extra-European issues remained largely outside its concerns, but it influenced the balance of power and mutual perceptions of the members. Interests of small states or national movements were not generally ignored—the concert helped with the independence of Belgium, Greece, and Romania and managed the transfer of the province of Neuenburg from Prussian possession to Swiss sovereignty—but smaller states had a voice only if the concert granted it occasionally.

The concert realized security cooperation among major powers of different ideological orientation in a phase of great change, and it worked for an impressively long period of time. It combined realist (balance of power), normative, and institutionalist features; this might be a hint that successful real-world security cooperation has to rely on paradigmatic synthesis rather than purism.

Inclusive Security Cooperation

Collective Security

The concept of collective security has never been realized in pure form and with resounding success. It aims to establish a system of generalized deterrence and reassurance, which relaxes the need for self-help efforts. An operating system of collective security would reduce the security dilemma for everybody tremendously.

The basic principle of collective security is "all for one, one for all": Members commit to assist an attacked partner. Collective security is an inclusive provisional alliance without a predefined enemy. The aggressor is supposed to be one of the partners who, by attacking, defines himself as the enemy of the rest. The basic feature is thus the marshaling of overwhelming defense in the moment of aggression (which assumes that no member has more power than the rest together).

The difficulties start with the question of who the aggressor is. Escalatory processes leading to war can be interactive and incremental, making it difficult to identify an aggressor unambiguously, as at the outset of World War I. Countries may feel compelled to engage in preemptive defense, as Israel claimed in 1967, in which case the one who fires the first shot does so for defensive purposes. Those who are assessing an aggression claim may suffer from biases as they feel friendlier to one party than to the other. The next hurdle is an assessment of which measures are to be taken and which forces should intervene on the basis of what strategy and under whose command. Once a war for collective security is under way, when and on what conditions it should be terminated and what the postwar settlement should look like are divisive issues. Collective security can fail on each of these choices.

A public good problem arises because the utility of collective security is enjoyed by all, while the burdens in the hour of truth are more likely to fall only on a part of the membership. Geostrategic interests differ, as do military resources. Few countries can project and maintain power over long distances. The more powerful an aggressor is, the riskier a collective military counteroperation will be. A further complicating factor is the enormous risk of escalation into gross destruction should the aggressor be a nuclear weapons state.

For these reasons, realists have shrugged off collective security as inferior to self-help security systems. Nevertheless, the disruptions emerging from unfettered self-help in an increasingly interdependent world have led analysts repeatedly to reconsider collective security. It is at least possible to define some conditions that would enhance the chances that it might work: (a) if the great powers are not in existential conflict and share an interest in stability, (b) if nuclear weapons are not in the hands of would-be aggressors (or could be reasonably defended against), and (c) if efficient joint assessment capabilities and procedures are available to steer parties through the difficult choices to be made. In other words, collective security assumes the existence of concert-like features as its basic condition.

Security Regimes

Security regimes offer a more modest form of cooperation. They aim at regulating policy subfields rather than security at large. Regimes exist, for example, in subfields of arms control and nonproliferation, in curbing terrorist financing, or in the United Nations (UN) routine for peacekeeping operations. As other international regimes, they consist of four different levels: (1) *principles* state what the objective of the regime is and how cause-and-effect relations in the specific field are seen by regime members; (2) *norms* contain general guidelines for the behavior of members; (3) *rules* consist of specific prescriptions and proscriptions, specifying selectively the meaning of the norms; and (4) *procedures* establish how decisions are taken.

Regimes might be treaty based or informal. They might be supported organizations that administer the regime and perform services for members, such as verification or technical assistance (e.g., the Organization for the Prohibition of Chemical Weapons [OPCW] in the chemical weapons regime).

Regimes perform valuable functions in the security sector. Specific rules for behavior create precise expectations for the future, reducing the uncertainty that is at the root of the security dilemma. Transparency, verification, and procedures for the clarification of ambiguous information give insight into the faithfulness of regime members. Moreover, arms control regimes that curb seriously the opportunities for surprise attacks and comprehensive offensives suggest the benevolent intentions of all partners, in addition to providing information about their capabilities. A dense network of such regimes might help transform relations of mutual distrust into mutual confidence and help overcome the security dilemma: In the end phase of the Cold War, progress in arms control and political change reinforced each other.

This effect, however, is not determined. The overall interstate relationships and the opportunities for progress in arms control are connected. If a conflict is harsh and mutual distrust high, field-specific regimes might be too piecemeal to help. Either party in the conflict might request such fundamental changes in the position of the other side as a precondition for negotiations that the whole cooperation process falters. The failure of arms control and regional security talks between Israel and its Arab neighbors during the 1990s is a telling example. Likewise, arms control is vulnerable to domino effects if something else in the relationship goes wrong; For example, U.S. concern about a Soviet army brigade on Cuba sealed the fate of the Strategic Arms Limitation Talks (SALT II) ratification in the Senate in 1979, even though the two issues were not substantially related.

Regional Organizations

Regional organizations are increasingly important in security cooperation. Only a few regions are lacking in related structures (the Middle East and South Asia). A great number of war-driving factors are most likely to occur in regional settings: territorial conflict, enduring rivalry, contiguity, and overlapping transborder ethnicities. Neighbors are most prone to face the risk of war, while, on the other hand, they might be more similar in terms of historical experience or cultural traits than countries far away and may also harbor a considerable potential for mutually beneficial cooperation. Thus, while the security problem is particularly virulent, remedies are also more easily available.

International organizations, regional ones in particular, have potential effects that make them fit for conflict management and security production. They create permanent contact among officials, leading to greater familiarity and, eventually, more mutual confidence. They provide information and enhance transparency, reducing the uncertainty problem behind the security dilemma. They create the expectation of further cooperation, lengthening the "shadow of the future." In these functions, they are similar to international regimes. But they can address interstate conflicts among their members more comprehensively. They offer communication channels that facilitate talks about conflict solutions. And embedding rivals in the same organization offers other actors opportunities for mediation.

Some regional organizations have been created with an ostensible focus on nonsecurity issues but perform important roles for regional security or have evolved their agenda to include security explicitly (e.g., the European Union [EU], Association of Southeast Asian Nations, or the Economic Community of West African States). Others have been created for security collaboration, such as the Organization for Security and Cooperation in Europe (OSCE) or the Shanghai Cooperation Organisation. It might also be that a setting is created ad hoc with the specific mission to manage a particular project but evolves into a broader multilateral institution. This might be the future of the six-party talks in East Asia, which came into being to contain the regional risks emerging from North Korea's nuclear activities.

The success of these organizations appears to depend more on specific regional conditions and on leadership and practice and less on prefixed structural conditions. It requires fundamental political willingness and truly shared objectives. Where these conditions are absent, regional cooperation does not take off at all (e.g., in the Middle East) or with limited success (e.g., the OSCE).

Security Communities

In security communities, cooperation reaches such a level that the security dilemma evaporates altogether: The specter of military conflict is replaced by the expectation of peaceful change. While security communities may start from utility motivations for working together, in their mature state, they are transformed. The key change is the development of a shared identity. This identity makes the idea of warring "against one's own kin" out of the question. Military contingency plans against each other and related preparations do not exist. The EU is the most outstanding example.

Mature security communities contain a tight interrelationship between material (utilitarian) and ideational factors. Close relations provide collateral utilities: enlarged freedom of movement for citizens, economic benefits, scientific collaboration, and so on. Common values and the observation of established behavioral norms, instantiated in everyday practices, keep the community tightly linked. Close-knit elites serve as "community entrepreneurs"; they may compensate for a less determined popular commitment. Communities tend to develop more elaborate organizations and communication channels. Military collaboration might grow into partial integration. This evolutionary perspective on security communities should not be confused with a eufunctional bias: If environmental circumstances change drastically or if domestic upheaval produces new attitudes, communities may decay.

While the main thrust of security communities is the pacification of intracommunity relationships, they may also create outside effects. They might erect a joint defense against a common threat, like an alliance, and offer security services for third parties (e.g., capacity building for export controls, the transfer of counterterrorism-relevant information, and providing troops for peacekeeping). While the "alliance" function can have destabilizing effects for excluded parties, security services might transfer the pacifying effects.

Security communities are ambiguous as to inclusiveness/exclusiveness: Inclusiveness applies only to countries that share criteria of membership; the procedure for entry is co-optation. On the other hand, security communities bind themselves to welcome everybody fulfilling these criteria; in that sense, they are inclusive. Uncertainties about EU boundaries illustrate this ambiguity.

SECURITY DILEMMA

A security dilemma is a situation in which the actions taken by a state to increase its own security cause reactions from other states, which leads to a decrease rather than an increase in the state's security. Some scholars of international relations find that the security dilemma is the most important source of conflict in international relations. They argue that in the international realm, there is no legitimate monopoly of violence—that is, there is no world government—and as a consequence, each state must take care of its own security and survival. For this reason, the primary goal of states is to maximize their own security. Even if states focus solely on this goal and have no intention of harming others, many of the actions taken by states to increase their own security—such as weapons procurement and the development of new military technologies—will decrease the security of others. Decreasing the security of others does not automatically place the state in a dilemma, but because of the anarchic structure, other states will follow suit if one state arms. They cannot know whether the arming state will use its increased military capabilities for attack in the future. For this reason, they will either choose to increase their own military capabilities in order to reestablish the balance of power or they will launch a preemptive attack to prevent the arming state from upsetting the balance in the first place. If they choose the first option, the result may be a security spiral. A security spiral is an action–reaction process, where two states are tied in an armaments race with each state responding to increases in weapons procurement and defense expenditure by the other state, leading them both to arm themselves more and more heavily. This may lead to war in the long run. If they choose the last option, military conflict will be imminent.

The logic of the *security dilemma* was first described by Herbert Butterfield in 1949. The term itself was coined by John Herz in 1950. Although the logic seems to fit particularly well with the security competition between the United States and the Soviet Union during the Cold War, proponents of the term do not see it as tied to a specific historic era. Rather, it reflects the fundamentally tragic nature of international life: State actors strive for peace and stability but end up in military conflict. Thus, even if all states are status quo powers wishing only peace and security, war may occur because of the fear and insecurity following from the anarchic structure of the international system. This focus on the effect of international anarchy on the behavior of states is typical of so-called structural realism—sometimes termed *neorealism*—which posits that the international system is a self-help system, where states must focus on their own interests to maximize their chance of security and survival. In particular, the security dilemma logic is central to so-called defensive realism. Proponents of defensive realism argue that states seek to maximize their chance of security and survival by maintaining their position in the international system, not by expansion. Still, scholars working within alternative theoretical traditions have discussed how the security dilemma logic looks from their perspective and have used their own theoretical insights to suggest how we might move beyond the security dilemma logic and create a more peaceful world.

A large number of international relations scholars have applied and developed the logic of the security dilemma. Some of the most prominent security dilemma scholars are Robert Jervis, Barry Posen, and Charles Glaser. From a more critical stance, the security dilemma logic has been explored by, among others, Ken Booth and Nicholas Wheeler. Recent research on the security dilemma has applied the logic to most regions of the world, and it has resulted in a proliferation of more fine-grained distinctions between different types of security dilemmas.

Some scholars of international relations argue that all states face a security dilemma all the time, but most of them agree that the intensity of security dilemmas tends to vary over time and space. The literature on international relations points to different sources of variation in the security dilemma. Security scholars such as Stephen Van Evera argue that the intensity of the security dilemma depends on the ease of conquest. If conquest is easy, states will typically face an intense security dilemma, because the risk of military defeat is raised every time a competing state adds to its military capabilities. Conversely, if conquest is difficult, the security dilemma is ameliorated, because other states may add to their military capabilities without posing a direct offensive threat. If we are able to tell the difference between offensive and defensive weapons, states may even signal their benign intentions by deploying defensive weapons. Other states will know that they have acquired weapons not to attack but to defend. Offense and defense dominance vary over time and space depending on a number of factors, including geography, military technology, and military doctrine.

Also, regime type may affect the intensity of the security dilemma. Although democracies often go to war, they rarely go to war against other democracies. When two autocracies face each other or when a democracy and an autocracy face each other, security spirals sometimes spin out of control, because each side interprets the move by the other side as potentially threatening. But this is rarely the case when two democracies face each other. Two characteristics of modern, stable democracies explain why. First, the policy processes in liberal democracies is fairly transparent, even when viewed from outside the country. Parliamentary debates are usually open to the public—sometimes even televised—and political parties outside government, mass media, and interest groups ensure that few government decisions of any importance are taken without scrutiny and public debate. Second, democracies usually have rules and regulations preventing them from rushing into war. Some policies are made extraordinarily difficult, thereby binding the policymakers and signaling to the outside world that decisions cannot be taken without prior warning. Both of these characteristics of modern, liberal democracies reduce uncertainty and thereby ameliorate the security dilemma. As summed up by Charles Lipson (2003), “Because democracies have more accurate perceptions of each other, they are better able to cooperate, build trust and avoid war” (p. 72).

Other scholars argue that the security dilemma is largely irrelevant, because international conflict is not the result of status quo powers seeking to maximize security but of revisionist powers seeking to maximize power. If all states are status quo powers, these critics argue, then military conflict would be extremely rare, because the world would consist of status quo powers eager to signal their benign intentions. But this is not the case: States wishing to expand their power at the expense of others are the most important source of military conflict in international relations, not the uncertainty and insecurity of status quo powers.

Today, military conflict between states is less frequent than throughout most of the world's history. At the same time, conflict related to weak and failed states is now a major source of instability in many parts of the world. Some scholars argue that even though this development seems to fit uneasily with the idea of unitary state actors stuck in a security dilemma in an anarchic international system, the basic logic of the security dilemma may still be applied. For instance, Barry Posen, analyzing ethnic violence between ethnic groups in a collapsing Yugoslavia in the early 1990s, found that the Serbs and Croats experienced a security dilemma in an emerging anarchy where each group had to take care of its own security. Brian Job extends the applicability of the security dilemma even further by discussing how a similar logic applies to weak Third World states unable to provide security for their own citizens and sometimes even constituting a threat to parts of their own population.

SELECTION BIAS

Selection bias refers to the inaccurate estimates that can occur when a sample of data is nonrandomly selected for study. Samples may be purposefully nonrandomly selected by researchers. More often, however, nonrandom (also called "selective") samples result from choices made by the actors being studied or by others whose choices affect them. This entry discusses the importance of such biases and the ways to avoid them.

The samples available for studying political processes often are selective. For example, to learn about the escalation or resolution of international disputes, one must study a sample of states involved in disputes. These countries have made or been the recipients of demands or threats. To learn what leads citizens to vote for particular parties or candidates, one must study a sample of persons who have registered to vote and decided to go to the polls. To learn what makes economic sanctions or peace-building missions effective, one must study a sample of cases in which sanctions have been applied or civil wars have ended, respectively. To learn about public opinion, one must study persons who have consented to respond to surveys and to do so informatively. In each of these cases, the sample available for study is not a random sample from the population of interest; instead, it is a sample that has been nonrandomly selected or self-selected.

The economist James Heckman was awarded the Nobel Prize in economics in 2000 for his work on methods for analyzing selective samples without bias. Heckman popularized these methods and applied them extensively to the study of labor economics. Christopher Achen was the first political scientist to develop methods for analyzing selective samples. Achen explained how nonrandom selection often affects analysts' attempts to evaluate public policy. For example, an analyst might wish to evaluate a pretrial release system: Are appropriate criteria used to decide which defendants will and will not be released? One criterion that judges use in determining whether or not to release a defendant is the seriousness of the accusation; those accused of serious crimes are less likely to be released. The analyst might therefore wish to know whether those accused of serious crimes are more likely to flee or commit additional crimes if released; if not, perhaps judges would want to release more defendants accused of serious crimes. This question is difficult to answer, because the sample of released defendants is selective. When judges do release those accused of serious crimes, it is because they have some additional information (e.g., exemplary courtroom behavior) indicating that these defendants are unlikely to be rearrested. Thus, in the sample of released defendants, everyone is unlikely to commit additional crimes—in some cases because those accused of more minor crimes are unlikely to do so and in some because those who are released after being accused of serious crimes are exceptional. For this reason, a study of released prisoners will show little or no relationship between the seriousness of the accusation and the chance of rearrest, even if such a relationship truly exists. However, methods that correct for selection bias show that those accused of serious crimes are more likely to flee or be rearrested if they are released without regard to courtroom behavior. Failure to correct for selection bias might lead judges to release more defendants accused of serious crimes and to regret this decision when those defendants go on to have a higher rearrest rate.

In statistical terms, selection bias can lead to biased or inconsistent estimates, depending on the model. Stated more formally, selection bias refers to the biased and/or inconsistent estimates that may occur as a result of nonrandom selection. To see the problem, consider a researcher's attempt to test the hypothesis that pairs of states are more likely to go to war when their military strength is nearly equal (they have power parity); one rationale behind this hypothesis is that leaders are less likely to know which side would win a war when states are more evenly matched, and so the ultimate loser is willing to fight. Assume, for example, that whether or not two countries are roughly equal in power determines their likelihood of being in a military dispute (selecting into the sample) as well as their likelihood of escalating a dispute to war (the outcome of interest). Assume further that an unobserved variable, the interests at stake in the dispute, also affects both initiation and escalation. Pairs of countries enter the sample of militarized disputes in one of three ways. Some pairs are involved in disputes because they are roughly equal in power, some because one or both of the states has strong interests at stake, and some for both reasons. Informally, the problem is that in the sample of disputing dyads, pairs of countries that do not have equal power contain at least one country with particularly strong interests at stake, while pairs with equal power may or may not contain a country with strong interests at stake. For this reason, dyads in the sample with equal power are likely to go to war, and dyads with unequal power also are likely to go to war. When we use the countries involved in disputes to estimate the effect of power parity on whether or not states go to war, parity appears to have little effect—even though it has a strong one. In other words, the estimate of the effect is inaccurate.

This problem can be represented formally. In the equations that follow, the importance of the issues is one component of the error term in the selection equation (u_{1i} in Equation 1) and also one component of the error term in the outcome equation (u_{2i} in Equation 2), so that the two error terms are correlated:

$$U_{\text{select}_i} = \alpha_1 = \gamma_1 \text{parity}_i + \gamma_2 X_{2i} + u_{1i}, \tag{1}$$

$$U_{\text{war}_i} = \alpha_1 = \beta_1 \text{parity}_i + u_{2i}. \tag{2}$$

In this example, the observed dependent variables are dichotomous; the country has some unobserved utility of being in a dispute, and we observe that $Y_{1i} = 1$ (the observation is in the sample) if $U_{\text{select}_i} > 0$ and $Y_{1i} = 0$ (the observation is not in the sample) otherwise; similarly, the country has some unobserved utility of going to war, and we observe that $Y_{2i} = 1$ (the case goes to war) if $U_{\text{war}_i} > 0$ and $Y_{2i} = 0$ otherwise. The variable X_2 is another variable that influences selection but not the outcome of interest; it is called an *exclusion restriction* (see below). Since by assumption power parity has a positive effect on selection and on escalation to war in the example, γ_1 and β_1 are positive. If the states have roughly equal power (parity has a value of 1), the observation is more likely to have a high value of U_{select_i} and select into the sample, even if the error term, u_{1i}, is small or negative; but if the states have unequal power (parity has a value of zero), the observation will only select into the sample if the other independent variable (X_2) leads it to do so or if the pair has a large value of the error term in the selection equation, u_{1i}. Thus, observations with parity that get involved in disputes can have any value of u_{1i}, and observations without parity that get involved in disputes more often have large values of u_{1i}.

The selection process and the correlated error terms in Equations 1 and 2 lead power parity, the independent variable of interest in the outcome equation, to be correlated with the error term in that equation. Because of the correlation between u_{1i} and u_{2i}, the sample of dyads available to estimate the impact of power parity on whether countries escalate their disputes to war includes (a) pairs of countries with equal power ($X_{1i} = 1$) that may have large or small error terms in the outcome equation (values of u_{2i}) and (b) states with unequal power ($X_{1i} = 0$) that have large error terms in the outcome equation (values of u_{2i}). Thus, power parity is negatively correlated with the error term in the equation of interest, and the researcher's estimate of its effect (β_1) using standard techniques (probit or logit) is inconsistent.

The problem of selection bias often is given short shrift by researchers, who ignore selection because they believe that the estimates are accurate for the sample in which they are interested. However, without modeling the selection process, the researcher cannot obtain an accurate estimate of the causal effect of the independent variables of interest on the dependent variable in the equation of interest, even for the sample under consideration. The reason is that the independent variables of interest are correlated with the error term in the selected sample whether or not they were correlated with the error term in the selection equation; the selection process creates the correlation. In the power parity example, power parity is not associated with a greater probability of war in the sample of disputes. However, power parity does have a causal effect on war for states involved in disputes; this causal effect is hidden by the fact that among disputing dyads, those with uneven power are more likely to have serious disputes due to the selection process.

Fortunately, the problem of selection bias can be surmounted, given appropriate data. Heckman showed that when the dependent variable in the selection equation is continuous, the problem described here leads to what is known as *omitted-variable bias* in the outcome equation. He further devised an easy, two-step estimation technique that avoids the bias. Other researchers have developed techniques for avoiding selection bias with different types of data. Techniques to avoid selection bias almost always require a valid exclusion restriction (X_{2i} in Equation 1 on previous page), which is a measured variable that influences whether or not the observation is selected into the sample but does not affect the outcome of interest. Critics of selection methods have argued that appropriate exclusion restrictions often are difficult to obtain; without a valid exclusion restriction, evidence from computer simulations suggests that selection methods may be more misleading than estimates obtained with standard techniques.

SELF-DETERMINATION

Self-determination is a highly contentious concept that encompasses a variety of meanings and political claims. Each of these claims is based on the theory that particular population groups possess an inherent right to control their own political institutions. The term has been used in at least three different ways. First, *self-determination* can refer to the collective right of a defined ethnic, linguistic, cultural, or religious community to create and administer their own state. This is often the foundation for an argument in favor of secession or irredentism, the doctrine that populations should live under the sovereignty of the country to which they are ethnically or culturally related regardless of existing juridical borders. Second, it can refer to the right of a population to decide how they will be governed and who will represent them in government, the bedrock of democratic theory. Finally, the concept of self-determination also represents the claim that all states and societies have the right to determine their own political, economic, and social institutions. In this sense, it is synonymous with the principle of sovereignty and nonintervention, reflecting one of the most important concepts in diplomatic practice and international law. More specifically, the principle of self-determination has been advanced by populations challenging the role of foreign powers in influencing their governments and its political structures. This claim has long been associated with anticolonial resistance movements and, following decolonization, with efforts by popular movements to challenge intervention by foreign powers in their internal affairs.

Although all of these approaches are viewed as paths to liberation, in practice they are often competing doctrines. Because there are often competing claims over who the "self" is in self-determination, the concept has been the source of both civil and international conflict. This occurs on a number of levels.

First, the liberal principle of popular sovereignty de-emphasizes social distinctions within the population as the political foundation of the state. Since all citizens are juridically equal, the principle of democratic decision making gives priority to the will of the majority. On the other hand, national sovereignty is based on the will of the nation and gives priority to the needs of the national community. It has been common over the past century to have competing claims of self-determination based on these differences. Whereas a national community may claim the right to secede or amalgamate to create a new state out of at least some of the territory of existing states, the principle of popular sovereignty holds that the entire population should decide whether to break up the country. Thus, although a plebiscite or referendum would reflect the popular will and likely result in a vote against creating a new sovereignty, the principle of national autonomy would demand that each community be given the right to decide for itself with whom it wishes to associate. Moreover, the principle of territorial integrity as the foundation of the modern nation-state system is inconsistent with secession except in the most extreme circumstances.

Second, what constitutes the national community that can legitimately evoke the principle of self-determination? There is no objective definition of nationality that can be applied in all circumstances. Nationalists have alternatively defined themselves in terms of culture, ethnicity, language, religion, and political association. Thus, since nations are usually self-defined, their composition is subject to contestation and even redefinition. It is therefore not always clear who gets to define what constitutes the community. In the face of competing claims, at least one group's assertion of self-determination will inevitably be denied. Moreover, there is not even agreement around the foundation of nationhood. Some, such as the German romanticists and their followers, argue that nationality is primordial—that is, it reflects the long-standing natural divisions inherent in human societies. Individuals are born into their national communities, and therefore, one's national identity is not a matter of personal choice. Constructivists like Benedict Anderson, on the other hand, argue that nations are imagined communities that reflect mental images of an affinity that its members create rather than any natural grouping based on actual historical or physical properties. This construction of nationality, Ernest Gellner adds, is primarily a product of industrialism and the alienation from the community that it produces.

Third, the liberal notion of popular sovereignty is built on the assumption of a common citizenry, and therefore, ethnicity and religion had little to do with the definition of either the state or the nation. John Stuart Mill, for example, argued that democratic institutions are next to impossible in a country made up of different nationalities. Without a fellow feeling, a unified public opinion, which he argues is necessary for the working of a representative government, cannot exist. If this is the case, then the only way to resolve the issues raised above is through a policy of ethnic cleansing. Thus, as Eric Hobsbawm holds, the ideal of the national state advocated by U.S. President Woodrow Wilson in 1919 is one that could only be attained by barbarians.

Self-Determination in Practice

The revolt of the American colonies against British rule in the late 18th century was the first successful assertion of the right to self-determination against an external ruler, although the frequent but unsuccessful Irish revolts against English rule predated the American Revolution. However, though the American War of Independence was waged against a colonial ruler, the cry for independence by the colonists was not based on claims of nationalism, nor did the revolutionaries specifically challenge colonialism per se. Rather, the Declaration of Independence was based on the democratic principle that the consent of the governed was the only legitimate foundation for government. The challenge to British taxation, which provided the initial spark for the revolution, centered on the arguments that the colonists were not represented in the British Parliament and, moreover, that British rule itself did not reflect the will of the colonial population. For revolutionary leaders like Thomas Jefferson, self-determination meant self-government and popular sovereignty. In this sense, the right to self-determination was held individually by each citizen. This idea of popular sovereignty was also the foundation of the 1789 French Revolution and its radical conception of citizenship.

During the 19th century, the concept of self-determination shifted to collectivist claims advanced by European nationalist movements seeking to create national states out of the large multiethnic empires that ruled Central and Eastern Europe. Such movements argued that all national groups were entitled to a state of their own and that national self-determination was the only legitimate criteria for statehood. This philosophy provided the foundation for the creation of Italy and Germany, as well as for the claims advanced by dozens of ethnic groups living within the Hapsburg and Ottoman empires. This conception of self-determination saw the right as one that was held collectively by a self-defined national, ethnic, linguistic, or religious community. Sovereignty, then, was held not by the people per se but by the nation as a whole. Self-government, defined as one that reflected the individual wills of the population, was not a requirement for the fulfillment of this ideal.

These movements reached their peak around the time of World War I. Both U.S. President Woodrow Wilson and the Bolshevik leader Leon Trotsky voiced strong support for the concept of self-determination as the foundation for a just peace. Wilson original concept of self-determination was synonymous with self-government. However, he later adopted the nationalist perspective, advocating a reorganization of the Hapsburg, German, and Ottoman territories along national lines after the collapse of the three empires during the war. He was particularly influenced by the political pressures created by the publication of the Bolsheviks' peace program and by the agitation for national independence that swept the Czech, Hungarian, Polish, and South Slav territories. The core of the Bolshevik platform for the settlement of the war was the realization of national self-determination for peoples throughout Europe, a proposal that drew particular favor with the nationalist movements challenging the Hapsburg monarchy. The allies knew that they needed to develop a program of their own if they hoped to compete for the hearts and minds of the public and forestall the spread of Bolshevism among the disaffected populations of Eastern and Central Europe.

Wilson responded to these events by reframing the war as one for national self-determination. There could be neither justice nor order, Wilson argued, so long as national (i.e., ethnic) communities were denied the right to choose their own political affiliation. His solution would be a readjustment of borders and a redistribution of territory based on the ethnic composition of the population. He articulated this political vision for the new European order in a series of speeches known as the Fourteen Points Address, the Four Principles, the Four Ends, and the Five Particulars.

At the same time, although the reorganization of Central and Eastern Europe provided for the creation of a dozen new states, the postwar settlement did not abolish the practice of colonialism, nor did it provide for political independence for those living under the former Ottoman Empire. It was not until the aftermath of World War II that millions of people living in Africa, Southeast Asia, and the Middle East were granted the right to form their own states. Following World War II, the institution of colonialism quickly collapsed. In some cases, the colonial powers determined that colonialism was no longer either feasible or sustainable and granted independence to their colonies. This was the case in much of Africa. In other cases, however, colonial powers such as France and Portugal refused to do so, sparking anticolonial rebellions and wars of national self-determination. These challenges were particularly acute in Vietnam, Algeria, Angola, and Rhodesia (now Zimbabwe).

Yet even voluntary decolonization produced problems of its own with regard to the ideal of self-determination. First, the European powers did not facilitate decolonization in Africa and the Middle East by creating national states based on the composition of the ethnic, religious, linguistic, or tribal populations living there. Rather, they built new states from the existing colonial boundaries that had been established almost a century earlier at the Congress of Berlin. The self-determination principle would be based on political independence, not on national or cultural autonomy. While this was probably the most practical method for transferring sovereignty to the native populations, it violated the principle of national self-determination by creating states that failed to coincide with the distribution of the traditional political communities on the continent. This not only forced the populations to reconceptualize their identities from tribal or clan-based affinities to “citizens” of a new abstract state that was alien to their cultures and histories, it also created significant internal conflicts among groups over who would dominate the new states. Thus, conflicts over self-determination erupted between various communities within many of the new states, sparked by resentment from those peoples who felt that they were being oppressed by a dominant tribal or ethnic group.

In addition, both the former colonial powers and the emerging U.S. superpower began to exercise a significant amount of influence in the economic and political development of the new states. As newly formed weak states, the new formations were highly susceptible to external pressure, and the great powers emerged as dominant forces within these states. The governments of such states tended to be authoritarian and often worked closely with these great powers in defiance of the popular will. This led to new types of movements for self-determination, popularly known as “anti-imperialist,” often escalating into decades-old civil wars. The resolution of these conflicts is still partial at best.

The revolutions in Eastern Europe in the early 1990s did not only bring down communist governments allied with the Soviet Union. They also reopened questions of national identity that had been settled for almost half a century. Lacking the secular identity that the communist governments had provided to the population, the emerging authorities viewed liberation as synonymous with ethnic nationalization. As such, they asserted that their states would reflect the will of their dominant nations, often in the face of large, newly oppressed national minorities. Using the popular sovereignty principle of majority rule, many imposed the dominant nationality on the entire population, often resulting in ethnic conflict and civil war. This was most pronounced in the breakup of Yugoslavia, a political entity that had been formed after World War I on the principle of Pan-Slavism. Following the fall of the Berlin Wall, however, parochial nationalism emerged as the dominant political principle, encouraging the Serbian, Bosnian, and Croatian authorities to assert their autonomy and reject a common Slavic culture. This resulted in the worst political violence and gross human rights violations since the 1930s.

SELF-REGULATION

Self-regulation describes the way a specific group controls and supervises any or all aspects of its own activities in terms of public interest. It is an extraordinarily fluid concept. The term bleeds into neighboring ideas, such as voluntary regulation, self-policing, self-governance, corporate social responsibility or coregulation. Self-regulation applies to institutions ranging from local sports clubs, to professions, to global industrial networks, leaving out little of what lies in between. Self-regulation covers myriad activities and comes in various organizational guises. Consequently, the idea is the subject of some controversy. This entry defines the notion, shows the past traditions, discusses professional self-regulation with its issues and criticisms, and finally presents its recent evolution.

Definition and Background

The term *self-regulation* implies two dimensions, as emphasized by Anthony Ogus (1999). First, regulatory regimes differ in the amount of control they have over the supervision they give the group, that is, the extent of *self*-regulation. Some forms of self-regulation are handled entirely by the group in question, such as self-regulation of the medical profession. In other instances, notably industry technical standards, self-regulation may rely on third-party oversight, such as the International Organization for Standardization (ISO). Second, regulatory approaches may differ in the capacity to enforce regulation, that is, the ability to self-*regulate*. Some self-regulatory regimes have legal or quasi-legal status, for example, for law or accountancy. Others are little more than a set of normative aspirations, such as the nonbinding industry codes of conduct in, for example, the tobacco industry.

Historical antecedents of self-regulation go as far back as ancient Rome. In medieval and Renaissance Europe, largely self-governing guilds regulated trades and crafts. According to Philippe Dollinger (1998), the Hanseatic League, a politically autonomous alliance of trading cities and their guilds, was probably the culmination of trades-based self-governance in premodern Europe. In Asia, there are records of associations of craftsmen and trades, called *shreni* in India or *hanghui* in China. In general, premodern forms of self-regulation contributed to the broader goal of self-governance. With the rise of the modern state and its monopoly on political power, self-regulation evolved into an alternative to direct state oversight, albeit an alternative that was to complement rather than replace the general regulatory legitimacy of the state. Particularly in the English-speaking world, self-regulation of this kind is most commonly associated with the oversight of professions, most prominently of medicine and law. In Europe and the United States, as noted by Donald Irvine, much of the legal basis for professional self-regulation was established in the 19th and 20th centuries. Symbolizing the status of an independent profession, professional self-regulation has become the gold standard for aspiring vocations.

Professional Self-Regulation

Proponents of professional self-regulation contend that it solves the problem of information asymmetry between the state and the professions. Professions, not only medicine and law but also accountancy, have traditionally argued that effective regulation requires a level of expert knowledge found only within the profession itself. Regulation by peers, so the argument goes, creates the trust and reciprocity crucial to supervising a highly complex, knowledge-intensive, and dynamic field of activity. Since expertise, trust, and collegiality lead to fewer regulatory errors, proponents point out, the costs of self-regulation to the taxpayer are lower than in the case of external regulation. For this reason, professional regulation typically is independent and equipped with considerable enforcement capacities, for example, the barring and disbarring of legal practitioners.

In the past, social scientists have viewed professional self-regulation with suspicion. For schools of thought committed to methodological individualism, such as Public Choice, self-regulation puts the lunatics in charge of the asylum. This distorts market mechanisms in a number of ways. First, by issuing licenses to practice, professionals tend to keep the supply low to inflate prices—a claim that resonates well with the fact that, for example, U.S. health care costs have consistently made up about 14% of the gross domestic product. Second, professional trust and collegiality—articulated in jargon and reproduced through impenetrable hierarchies—blur the lines of accountability between individuals within professions and between the professions and society. In this way, professional self-regulation becomes a system of private law (or, literally, *privilege*) that, in the view of critics, eludes democratic accountability and legitimates the violation of consumer rights (Ogus, 1999). Third, self-regulating institutions, such as the American Automobile Association (AAA) in the United States or the Law Society in the United Kingdom, occupy a privileged position in the policy process. Equipped with requisite independence and legal clout, thinkers have argued, institutions of self-regulation invariably bring about self-serving policy. In sum, economists have concluded, the practice of professional self-regulation ensures that whenever professional self-interest is incongruent with the public interest, the interests of the professions prevail. Suspending market competition, so the argument goes, creates opportunities for rent seeking that no rational individual could, or indeed should, let pass. Typically, economists such as Milton Friedman have suggested that the market be allowed to allocate professional resources and services. Market competition would then regulate all else.

In the past 3 decades or so, self-regulation has departed from its traditional home within the professional services. Partly in response to shifting beliefs about the role of the state in regulation and partly in response to emergent global trends, productive and extractive industries the world over have experimented with self-regulation. Here, the justification has been cast in terms of efficiency by pointing out, as Richard Andrews (1998) has done, that so-called command-and-control regulation has proven unwieldy, ineffective, and expensive. What is more, particularly for environmental regulation, as Andrews notes, new, more diffuse forms of environmental degradation—climate change or stratospheric ozone depletion—elude conventional end-of-pipe regulation. Self-regulation of this kind is believed to work with the grain of the market by allowing competition to determine and diffuse best industrial practices. Unlike traditional professional self-regulation, industry self-regulation takes place in widely varying degrees of independence. Significantly, as both Richard Andrews and Virginia Haufler (2001) have observed, very few self-regulatory regimes for industry can demonstrate the enforcement capacities of the traditional professions

This too has been the object of criticism. For these commentators, including Denis Smith and Steve Tombs (1995) as well as Andrews (1998), industry self-regulation, however dressed up, is almost synonymous with no regulation and is unable to protect the public interest. First, critics argue that effective market-based self-regulation often requires rather specific industry or sociopolitical conditions. For example, best practice models are important in industries that rely on reputation. In markets driven predominantly by price, such as the garment industry, best practice usually equates to cost minimization. Similarly, political and socioinstitutional cultures based on consensus and cooperation, such as the Nordic countries, favor effective industry self-regulation more than countries where industrial relations are characterized by animosity and competition. In industries where these conditions do not hold, classical collective-action problems, such as free riding, undermine self-regulatory regimes. Second, even under ideal conditions, so the argument goes, self-regulation by itself is unlikely to address the social, environmental, or health-related external costs of industry activities. Yet it is precisely these costs to the environment, society, and human health that legitimate regulation in the first place (Haufler, 2001). Third, state regulation has in the past been a reaction to the lack of enthusiasm on part of industry to voluntarily rein in harmful activities (Andrews, 1998; Smith & Tombs, 1995). Critical observers argue that empirical evidence offers no reason to believe that this has changed. Similarly, proponents claim, evidence suggests that lack of institutional distance between regulator and industry often leads to agency capture and, as a consequence, rent-seeking behavior. The upshot of the argument is that industry self-regulation amounts to a carte blanche for industry to pursue profits with little or no regard to social, environmental, and health-related costs. The pressures of highly competitive global markets, so the argument goes, ensure that even well-intentioned firms are forced into the "race to the bottom." The solution here is to install external, preferably public, instances of oversight.

Despite coming to opposite conclusions, both critiques consider self-regulation primarily as a strategy for pursuing individual self-interest through public institutions. Recently, however, researchers have started thinking about self-regulation as a process of institutional evolution. Ongoing social, political, and environmental changes around the globe, so the argument goes, have profoundly transformed the environment for regulation in ways that are not always straightforward. On the one hand, globalization blurs organizational and ideological boundaries, say, between nation-states or the political Left and Right. On the other hand, it (re-)creates powerful new divisions at global level, for example, between the rich and the poor or between the advocates and skeptics of climate change policy. New opportunities, argue these thinkers, go hand in hand with new problems. For example, firms today can operate in "governance voids" where regulation is light and costs are low. On the other hand, these very same firms face highly discerning consumer citizens who demand ethically, environmentally, and socially sound business practices, all this at a time when fragmentation of national polities into highly specialized policy subsystems—often spilling over national boundaries—erodes public sector regulatory capacities.

The Future of Self-Regulation

For institutionalists, the variety of self-regulatory practices suggests an open-ended process of institutional evolution. Thus, they argue, it would be a mistake to dismiss out of hand either the potential or the risks of self-regulation. Instead, self-regulatory regimes need to be assessed as social systems that define norms, create organizational structures, and generate patterns of (recursive) practices. The complexity and uncertainty of contemporary regulatory challenges rule out a priori assessments of regulatory effectiveness. Today, effective self-regulation has become "responsive regulation" that evolves according to the requirements of the specific policy subsystems. Consequently, institutionalists argue that setting up regulatory choices in terms of polar opposites—market versus state versus civil society—is likely to yield no benefit. Instead, regulation requires the tailor-made interplay of skills and knowledge found throughout society. Effective self-regulation, then, is about a finding a robust public/private/civil society mix. The precise ingredients of this mix—the relative roles and functions of contending policy actors—will depend on the institutional circumstances in which regulation takes place.

Therefore, institutionalists contend, self-regulation requires openness: of institutions, of networks, and, not the least, of minds. While traditional self-regulation was about closing off professions to external scrutiny, "responsive" regulation entails encouraging experimentation and debate. On this view, self-regulation is an integral part of a larger process of "coregulation" in which all social sectors, including the state, play a vital, if constantly changing, role.

SEMIPRESIDENTIALISM

Semipresidentialism is a constitutional type that combines a popularly elected head of state with a head of government who is responsible to a popularly elected legislature. Semipresidentialism is therefore a mixed regime form that combines features of parliamentarism, which prescribes a fusion of powers and mutual dependence between executive and legislative powers, and presidentialism, which is, in contrast, characterized by a separation of powers and mutual independence of executive and legislative powers. Semipresidential systems thus maintain a dual power structure in which the head of state shares executive power with a prime minister and his or her cabinet.

Semipresidentialism as a Mixed Regime

The concept of *semipresidential* government was coined during the 1970s by the French political scientist Maurice Duverger in an attempt to investigate and appraise the constitutional uniqueness of the French Fifth Republic. In 1980, in what is by now a classic article, Duverger introduced his model to the greater international public and defined semipresidentialism as a combination of three elements: (1) the president is elected by universal suffrage, (2) the president possesses considerable powers, and (3) the president has opposite him or her a prime minister and ministers who possess executive and governmental power and can stay in office only if the parliament is not in opposition to them. Applying this definition, Duverger identified seven semipresidential regimes, in Austria, Finland, France, Iceland, Ireland, Portugal, and the Weimar Republic in Germany (1919–1933). More recent identifications come up with much larger numbers, and a 2008 survey by Robert Elgie lists no less than 54 semipresidential regimes in existence. To mention just a handful of cases in addition to those identified by Duverger, the list includes countries such as Angola, Bulgaria, Cameroon, Egypt, Guinea-Bissau, Mongolia, Sao Tomé and Príncipe, Senegal, Tajikistan, and Timor-Leste. Several of these more than 50 countries have nondemocratic regimes being run under the cloak of semipresidentialism, but a good 30 or so are partial or full democracies.

The remarkable increase in the number of such regimes reflects two partly intertwined circumstances. First, this type of regime has gained much ground in recent years. For instance, the dualistic logic of semipresidentialism having much in common with the previous communist system of government, varieties of semipresidentialism have frequently been adopted in constitutional developments following the collapse of communism in Central and Eastern Europe and the former USSR. Second, the increase also reflects deviations by authors and analysts from the criteria laid down by Duverger, which are, admittedly, contestable and anything but transparent. For example, the criterion that the president is elected by universal suffrage is interpreted by some to mean a direct election and by others to mean election by a popular vote, either direct or indirect. While the first interpretation excludes elections in an electoral college, the second does not. To give another example, when and if the criterion is that the president must possess considerable powers, authors may differ in their view of what set of powers is to be regarded sufficient to satisfy this criterion. Also, how the powers are divided between president and prime minister vary greatly between countries, and this variation carries problems of classification and interpretation in its wake.

Furthermore, while some classifications rely on institutional criteria only, others employ in addition criteria that relate to actual or political power. Clearly, this adds to the confusion, as constitutions that are relatively similar may still be applied differently. Duverger was certainly very much aware of this, as he maintained that the constitutions of Austria, Ireland, and Iceland are semipresidential, while political practice in these countries is parliamentary. In fact, according to Duverger, the very purpose of the concept of semipresidential government was to explain how it was the case that a similarity of rules may still result in a diversity of games. The differing views and interpretations of semipresidentialism have even come to concern the very status of the concept. According to one school of thought, the alternation between presidential and parliamentary power that is inherent in this form of regime implies that semipresidentialism is a hybrid form or a synthesis between parliamentarism proper and presidentialism proper. Others maintain, however, that semipresidentialism is rather a specific and separate regime form. Having like presidentialism two sources of popular legitimacy, namely, presidential elections on the one hand and legislative elections on the other, semipresidentialism, the argument goes, is a regime form closer to presidentialism than to parliamentarism.

Given that the concept of semipresidentialism has been and still is a source of confusion, it is only natural that most listings of semipresidential regimes tend to come up with divergent findings, at times including cases that may only with hesitation be referred to as semipresidentialism. For instance, the small African island state São Tomé and Principe often figures in lists of semipresidential regimes; in this country, however, the directly elected president is charged with dismissing the prime minister. In fact, according to the constitution, the government is politically responsible before the president as well as the assembly. Clearly, this constitutional order is some distance away from the basic idea of semipresidentialism. Finland, to mention another example, was earlier regarded by many as a model case of semipresidentialism. However, presidential powers were much reduced in the new Form of Government Act from the year 2000, and they now boil down to a statement in the Finnish Constitution that foreign policy is led by the president in cooperation with the cabinet. Given that trends toward internationalization and globalization have much blurred the distinction between foreign and domestic policy, the correct interpretation of this vague constitutional statement has become a source of much political dispute in the country. The point to be made here, however, is that Finland nowadays represents a much weaker variant of semipresidentialism than before. Indeed, future inclusion of Finland in the semipresidential camp may even be seriously questioned.

Empirical Findings on Semipresidentialism

From the difficulties of definition it follows that the empirical findings concerning the politics and impact of semipresidentialism are in like manner indistinct and even contradictory. In practice, however, semipresidential systems tend to oscillate between two forms. On the one hand, the president gains in power if the legislative majority is of the same party as the president. On the other hand, if the legislative majority is of divergent parties, it will strengthen the position of the prime minister. This second form is named cohabitation and may result in a formally or informally agreed-on division of labor between the two heads of government. For instance, in France during the cohabitation period of 1986 to 1988, President François Mitterrand retained responsibility for foreign affairs, while Jacques Chirac as prime minister was responsible for domestic affairs. Such inoffensive solutions are not always obtainable, and findings suggest that cohabitation creates political tension in times of crisis and may in some cases even be responsible for the collapse of democracy. Of course, if authority is fragmented in the legislature, with no party or coalition enjoying a substantive majority, the outcome may be that the president resorts to executive decrees and emergency rule. Further findings from the study of the new democracies that have resorted to semipresidentialism are that the dual executive is in general likely to generate conflict; however, systems that accentuate the position of the prime minister are likely to maintain better democratic performance than systems that emphasize the position of the president. If both the president and the prime minister have significant powers, the situation becomes complex and perhaps even risky to newly democratizing regimes.

The main lesson to be learned from the confusion of definitions and from the less than consistent research findings concerning semipresidential politics is that there is not one kind of semipresidentialism but many. In consequence, as the manifoldness brings forward operationalizations that are muddled and easily contested, the concept of semipresidentialism should not really be used as such as an independent or dependent variable in attempts to chart the consequences or the determinants of regime choice. True, the fact that semipresidential regimes operate in different ways may be accounted for by reference to historical and contextual factors and to factors that relate to the operating of electoral and party systems, but the differences also follow from the simple fact that the regimes in question are not all alike. Reformulations of the term are therefore called for, and in recognition of the analytical difficulties, attempts have been made to establish more finely differentiated categories. A volume from the early 1990s by Matthew Shugart and John Carey (1992) has emerged as a landmark publication in this respect, as it replaces the semipresidential category with a distinction between premier-presidential systems and president-parliamentary systems. The former type comprises cases in which the prime minister exerts greater executive power; the latter is about cases in which the president wields greater authority. Attempts have also been made at a further division of premier-presidential systems; these attempts build on the significance of the nonlegislative powers vested in the presidency.

Future Directions

Efforts at promoting the future use of the semipresidential category should probably advance further along these lines. Semipresidentialism has often been conceptualized as a sort of umbrella model, intended to cover somehow the terrain between parliamentarism and presidentialism. When strictly and narrowly defined and applied, the concept of semipresidentialism no doubt brings analytical rigor and capacity to the study of political regimes; at the same time, however, precisely because it is strictly and narrowly defined, the concept fails to cover all the varieties and the diversified arrangements of checks and balances that have been introduced in many contemporary constitutional frameworks. As these varieties have been incorporated into the semipresidential frame, the frame has become fuzzy and difficult to fit into the practices of research. Obviously, future efforts need to depart from the ambition to preserve conceptual clarity while advancing the capacity of the concept to cover and manage an expanded field of empirical observations. In these efforts, one is well advised to consider that as there are subtypes of semipresidentialism, there are subtypes of parliamentarism and subtypes of presidentialism as well. At some point these latter subtypes merge with the subtypes of semipresidentialism. Recognizing this, constitutional political science needs to work out and adopt in future research a full-fledged typology that describes by including also semipresidential subtypes the relative levels of parliamentarism and presidentialism in political regimes.

SEPARATION OF POWERS

Governmental powers are separated for several reasons. This entry analyzes the notion and its rationale, discusses the concept of mixed government, assesses the influence of Montesquieu, reviews the American experience, and shows how the separation of powers is actually implemented.

Nations may decide that it is necessary to separate functions that are considered unique and exclusive in nature, such as the legislative, executive, and judicial powers. Another motivation is to divide the functions of government to ensure that no one body can accumulate sufficient power to violate the individual rights and liberties of citizens. The first reason is analytical and based largely on experience and practicality. The second is more theoretical and value laden, especially because it involves making judgments about the human tendency to abuse power. To check that inclination, powers are kept separate. The U.S. system of separation of powers draws from both sources.

The Notion in the Classic Literature

The concept of separation of powers is found in the works of political analysts from the time of the Greek philosophers Plato and Aristotle. Misinterpretations and misconceptions about separation of powers are perennial problems. If there is no separation of powers, one branch of government might acquire too much influence and threaten other branches and the people. With too much separation, government does not function properly, creating conditions that invite a dictator to appear in order to restore order and efficiency.

The constitutions of 1791 and 1848 in France represented concerted efforts to establish a pure separation of powers. The first experiment resulted in the Committee of Public Safety, the Directory, and the reign of Napoleon Bonaparte. The second led to Louis Napoleon, reaction, and the Second Empire. Professor M. J. C. Vile (1967) observed that "this last flirtation with the pure doctrine ended in the same way as others had ended in France—in absolutism" (p. 207). The framers of the American Constitution attempted to avoid those violent swings. Justice Joseph Story (1905) said that the framers accepted a separation of powers but "endeavored to prove that a rigid adherence to it in all cases would be subversive of the efficiency of the government, and result in the destruction of the public liberties" (p. 396).

The Concept of Mixed Government

The framers of the American Constitution were familiar with efforts over the centuries to combine different political interests to provide for balanced government. The principle of mixed government, as a method of stabilizing a political order, can be traced back to Greek philosophy. In Book III of his *Laws*, Plato combined monarchy and democracy to form a well-governed city. Aristotle, in Book IV of his *Politics*, mixed different types of oligarchies and democracies to create a stable state. He also divided government into separate departments: the deliberative, executive, and judicial.

In an effort to ensure balance and stability in a political order, Polybius, a Roman historian of the 2nd century BCE, studied different types of constitutions to prevent ideal forms from degenerating into perverted ones. In Book VI of his *Histories*, he settled on a mix of kingship, aristocracy, and democracy: The force of each being neutralized by that of the others, neither of them should prevail and outbalance another, but the constitution should remain for long in a state of equilibrium like a well-trimmed boat. Niccolò Machiavelli, in his *Discourses*, adopted a similar method of avoiding the risks of a pure form of government. It was better to pull out portions from each form, so that there is combined under the same constitution a prince, a nobility, and the power of the people—then these three powers will watch and keep each other reciprocally in check.

John Locke studied the bloody civil wars in 17th-century England, which pitted the monarchy against Parliament and brought ruin to the people. What system of government could check against those misfortunes? He concluded that what was needed was not a balance among political classes but rather a division among political institutions: legislative, executive, and federative, with the latter representing external affairs. As he explained in Book II of his *Two Treatises of Civil Government* (1690), men discovered methods of restraining any exorbitances of those to whom they had given authority over them and of balancing the power of government by placing several parts of it in different hands. It was a mistake to entrust government functions to a single department: It may be too great a temptation to grasp at power, for the same persons who have the power of making laws to have also in their hands the power to execute them.

In dividing the departments of government, Locke did not attempt a pure separation. The legislative branch could punish the executive for maladministration of the laws, and the executive was empowered to assemble and dismiss the legislature. Locke did not provide for an independent judiciary. Under his system, the judicial function was placed largely under the executive. In 1701, a decade after the appearance of his political treatise, the Act of Settlement in England helped secure judicial independence by guaranteeing tenure to judges as a reward for their good behavior.

From these studies, one can appreciate how the doctrine of separated power evolved. For early writers on the mixed state, stability came from dividing the sovereign power among three social classes: (1) the king, (2) the nobility, and (3) the common people. In later developments of political thought, authority is allocated by assigning power to three different governmental bodies and expecting them to check one another.

Montesquieu's Influence

There have been frequent claims that the French political theorist Baron de Montesquieu had a profound impact on the American framers and their reliance on separation of powers. Woodrow Wilson (1908) wrote that the framers of the Constitution "followed the scheme as they found it expounded in Montesquieu, followed it with genuine scientific enthusiasm" (p. 56). James Bryce concluded that the U.S. Constitution was created "*de novo*, on the most slender basis of pre-existing national institutions," relying in large part on Montesquieu's seminal work, *The Spirit of the Laws* (1748). According to Bryce (1891), "no general principle of politics laid such hold on the constitution-makers and statesmen of America as the dogma that the separation of these three functions is essential to freedom" (pp. 20, 26).

The American framers did indeed refer to Montesquieu favorably and with great respect. In *Federalist No. 47*, James Madison spoke of "the celebrated Montesquieu" as the "oracle" who was also cited on the separation doctrine (Alexander Hamilton, James Madison, & John Jay, 2002, p. 337). There are similarities between Montesquieu's theory and the U.S. Constitution, but the evidence is persuasive that the American framers relied on their practical experiences in the colonies and state government after their break with England. Also, Montesquieu anticipated a far greater separation between the branches than exists in the U.S. Constitution, and he misperceived the British form of government at the time of his study.

In providing for the legislative, executive, and judicial branches, Montesquieu selected the British Constitution as his model and visited London from 1729 to 1731 to study its distribution of powers. As one of several critiques, Frederick Maitland wrote that it was "curious that some political theorists should have seen their favourite ideal, a complete separation of administration from judicative, realised in England; in England of all places in the world, where the two have for ages been inextricably blended" (Kenneth Davis, 1951, p. 28). To Walter Bagehot (1895), the English system represented the "close union, the nearly complete fusion, of the executive and legislative powers" (p. 78). Montesquieu's model was highly theoretical and failed to pick up political developments in England. Power began to rest in the hands of the Cabinet and leading ministers such as Robert Walpole from 1721 to 1742.

The concept of an independent judiciary, coequal with other branches, owes little to Montesquieu. He did not view the judiciary as a permanent branch. It was to be drawn from the body of the people at different points of the year, as had been the custom in Athens during the time of Socrates. Compared with the legislative and executive branches, Montesquieu called the judiciary to some extent "next to nothing." This framework for the judiciary had little application to the U.S. Constitution, which creates a Supreme Court with permanent jurisdiction and grants its members life tenure.

Montesquieu captured well the tension and checks among the three branches. To form a moderate government, it was necessary to combine the several powers; to regulate, temper, and set them in motion; to give, as it were, ballast to one, in order to enable it to counterpoise the other. Again he stressed how the experience shows us that every person invested with power is apt to abuse it and to carry his or her authority as far as it will go.

The American Experience

Much of what the American framers discovered about the structure of government came from what they learned during the colonial period, their break with England, and efforts under the Continental Congress to develop a form of government that would be both effective administratively and protective of individual rights. Even during the colonial period, with political power theoretically centered in London, Americans created legislative bodies and assemblies that exercised the rudiments of representative control. When London decided on a stamp tax in 1765 to help pay for the costs of the French and Indian wars, colonial opposition was so intense and bitter that the British government decided to repeal the statute within a year. America had its first taste of political independence and democratic rule.

After declaring their independence from England in 1776, many of the American states wrote into their constitutions explicit provisions for a separation between the branches of government. New Hampshire, the last of the 13 states to form a constitution, recognized that separation could not be so extreme to prevent effective government. The three departments were to be kept

> as separate from the independence of each other, as the nature of a free government will admit or as is consistent with that chain of connection that binds the whole fabric of the constitution in one indissoluble bond of union and amity. (Francis Thorpe, 1909, p. 2457)

After the break with England, America operated under a single branch of government at the national level: the Continental Congress. Delegates gathered to pass laws, sat in committees to handle administrative duties, and sat on other committees to settle adjudicatory disputes, especially those involving questions of admiralty. By 1781, the burdens were so great that the Congress decided to create a single executive to carry out administrative matters and set up a court of admiralty. Those bodies were not independent. They were creatures of the Congress and subject to legislative control. But more from practicality than theory, the Congress had evolved separate bodies to carry out the functions of government (Louis Fisher, 1972).

By the time of the constitutional convention in Philadelphia in 1787, there was broad agreement among the arriving delegates that the new charter of government must have three branches of government. The structure and operation of the Continental Congress had been thoroughly discredited. It was well said by the historian Francis Wharton (1889) that the Constitution "did not make this distribution of power. It would be more proper to say that this distribution of power made the Constitution of the United States" (p. 663).

After the convention had drafted the Constitution and adjourned, James Madison confided to Thomas Jefferson that the boundaries between the three powers "consist in many instances of mere shades of difference." In *Federalist No. 47*, Madison upheld the maxim that tyranny resulted whenever three branches were concentrated in the same hands. However, he charged that the principle had been "totally misconceived and misapplied" (Hamilton et al., 2002, pp. 336–337). Neither in Montesquieu nor the British government were the three powers separated in any pure sense. In turning to the state constitutions, the same pattern of overlapping powers emerged. The intent of Montesquieu, Madison said, could be no more than that in cases where the *whole* power of one department is exercised by the same hands that possess the *whole* power of another department, the fundamental principles of a free constitution are subverted.

When the draft constitution was released for public discussion and ratification by the states, critics condemned the intermixture of the branches. By 1788, however, the doctrine of separated powers in any pure sense had lost ground to the concept of checks and balances. One contemporary pamphleteer called the separation theory a "hackneyed principle" and a "trite maxim" (Vile, 1967, p. 153). Madison and Hamilton had to contend with those who objected that the branches of government were not separate but blended. The impeachment process, for example, was attacked for combining legislative and judicial powers in the same department. In *Federalist No. 66*, Hamilton argued that the true meaning of the separation maxim was "entirely compatible with a partial intermixture" and that overlapping was "not only proper but necessary to the mutual defence of the several members of the government against each other" (Hamilton et al., 2002, p. 431). For those who objected that the treaty process mixed the executive with the Senate, Hamilton responded wearily in *Federalist No. 75* to "the trite topic of the intermixture of powers" (Hamilton et al., 2002, p. 475).

During the ratification debates, three states (North Carolina, Pennsylvania, and Virginia) insisted that a separation clause be added to the national bill of rights. Different proposals were advanced to keep the branches separate and distinct. Among the other items to be included in a bill of rights, the House and the Senate debated the merits of a separation clause. It was finally omitted. Had it been adopted, it would not have affected the blending of departments and powers already sanctioned by the Constitution (Fisher, 1972).

Separation in Practice

The framers of the U.S. Constitution offered general guidance to the structure and operation of government. Much of their efforts could not have anticipated how the three branches would exercise their powers or how the national government would grow in size and dominance. An early dispute concerned the president's power to remove executive officials. In 1789, when the first three executive departments were being created, Madison argued successfully that the president possessed an implied removal power over department heads who prevented him from fulfilling his constitutional duty to see that the laws were faithfully exercised. At the same time, also in 1789, Madison insisted that certain officials who carried out what he considered duties of a "judiciary" nature should not serve at the pleasure of the president, especially when those officials were responsible for determining that federal funds were being spent in accordance with law.

Another restriction on presidential control over the executive branch concerned the distinction between two duties. Some executive officials owed allegiance to the president. Those were political duties. Other responsibilities were to the statutory direction from Congress. Those were legal duties, referred to as "ministerial acts." Over time, courts understood that they could not order officials to fulfill political duties but could compel the discharge of legal duties. Through this development, both legislative and judicial branches became involved in directing the administration of law within the executive branch.

The Constitution does not expressly provide for the power of judicial review, allowing courts to strike down as invalid the actions of the states, Congress, and the president. Judicial review evolved as another implied power, invoked in the 1803 case of *Marbury v. Madison.* A sentence in that decision later came to be interpreted as "judicial supremacy," meaning that a U.S. Supreme Court ruling had finality and could not be challenged or overridden by the other branches. Yet nothing in the sentence implies any level of finality: "It is emphatically the province and duty of the judicial department to say what the law is." This means that courts decide cases, not that what they say is the "last word."

In studying other governments and constitutions, the framers concluded that single executives had involved their countries in wars not for the national interest but for reasons of personal fame and ambition. In *Federalist No. 4*, John Jay warned,

> It is too true, however disgraceful it may be to human nature, that nations in general will make war whenever they have a prospect of getting any thing by it; nay, absolute monarchs will often make war when their nations are to get nothing by it, but for purposes and objects merely personal, such as a thirst for military glory.

Those motivations led a ruler "to engage in wars not sanctified by justice or the voice and interests of his people" (Hamilton et al., 2002, p. 101).

The framers understood that British theorists such as John Locke and William Blackstone vested the responsibility for foreign affairs and war with the executive. The U.S. Constitution assigns none of those powers to the president (foreign commerce, making treaties, appointing ambassadors, declaring war, or issuing letters of marque and reprisal). They are either assigned exclusively to Congress or shared between the president and the Senate (treaties and appointments). From 1789 to 1950, all major wars were either declared or authorized by Congress. The president had no independent authority to take the country from a state of peace to a state of war. However, President Harry Truman in 1950 ordered U.S. troops to Korea without ever coming to Congress for statutory authority. Since that time, other presidents have also claimed the right to engage the country in war without legislative authority, seeking "authority" instead from the United Nations Security Council or from countries of the North Atlantic Treaty Organization (NATO).

Truman was also the first president to use not only express, implied, and emergency power but what has been called "inherent" authority—powers that somehow inhere in the nature of an office and supposedly are not subject to checks and balances from other branches. In claiming that power in 1952 when seizing steel mills to prosecute the war in Korea, Truman was rebuffed by the federal judiciary. Other presidents, including Richard Nixon and George W. Bush, cited inherent authority to justify their actions but typically encountered defeat in both the courts and Congress.

Over the past 6 decades, Congress has often failed to defend its constitutional powers over war and spending. It has repeatedly deferred to presidential initiatives. In this manner and others, the three branches have not had what the framers assumed they would: the incentive to fight off encroachments and protect their institutional powers. When checks and balances are weak, political institutions gain powers that exceed constitutional limits and threaten individual rights and liberties. To the framers, individual freedoms depended mainly not on courts acting as guardians or the president acting in the "national interest" but on the structural checks supplied by the separation of powers.

SIMULTANEOUS EQUATION MODELING

Ordinary least squares (OLS), along with its cousins such as probit, is the workhorse method of empirical political science. Starting with, as usual, the linear model,

$$y = a + \beta x + \theta z + \varepsilon, \tag{1}$$

OLS is a fine way of estimating β and θ as long as x and z are exogenous. An explanatory variable is exogenous if whatever statistical process determines it does not depend on the statistical process that determines either the dependent variable or the error term. If an explanatory variable is not exogenous (and so is said to be endogenous), then OLS has severe problems. These problems are typically worse than for other forms of misspecification and do not disappear as the sample size grows. Endogeneity issues cannot be fixed by the usual tweaks to OLS (generalized least squares); different estimation methods are required.

Predetermined socioeconomic characteristics are, by definition, exogenous. Beyond a few simple variables (physical characteristics of people or countries), the argument that a variable is exogenous must be made theoretically and must be made relative to the dependent variable of interest. Thus, for example, if we believe that democracy is exogenous to economic development, a regression of economic development on democracy yields meaningful results; but we need some theory to know that democracy is exogenous—that is, that it is not the case that increased wealth leads to more democracy. Empirical results are conditional on this assumption; the assumption of exogeneity *cannot* be tested empirically.

Suppose, for example, that we are interested in explaining attitudes toward political candidates. Let y be a measure of how much one likes a political candidate and x be a measure of how close the candidate is to the voter on various issues. It may be the case that voters who like a candidate more are more likely to perceive the candidate as being close to them on issues, so x may not be exogenous. If x is endogenous to y, it is well known that OLS can be badly biased, and these problems persist even with huge sample sizes (i.e., OLS is not even consistent). The solution, worked out in the 1940s by various Nobel Prize-winning econometricians associated with the Cowles Foundation, is to estimate a series of simultaneous equations for both x and y.

Thus, for two equations, if x determines y but y also determines x, we can write

$$y = \beta x + \theta z + \varepsilon \tag{2}$$

$$x = \gamma y + \kappa w + \zeta, \tag{3}$$

where z and w are exogenous and ε and ζ are error terms that may well be correlated with each other (but separately satisfy the usual Gauss-Markov conditions). One issue is what method is best for estimating the various model parameters; but a more fundamental issue is whether it is even possible to estimate these parameters. The latter is called the identification problem.

Identification

The identification issue is critical, and dealing with it comes before any estimation issue. The basic question is whether more than one set of parameter estimates is *equally* consistent with the data; almost always, if more than one set of estimates is consistent with the data, an infinite number of estimates are consistent with the data. In such cases, the model is not identified. In this situation, even if we were sure we had ideal estimates of the parameters, someone else could have equally ideal but different parameter estimates. This problem does not arise with models typically estimated via OLS (but only because we assume away the problem by assuming that all explanatory variables are exogenous) but is always a potential issue with simultaneous equation models. A simple example shows the problem.

Suppose we have an infinite amount of data, so there is no statistical uncertainty. Consider the model where x determines y and vice versa but nothing else. We run our favorite computer program and obtain, say,

$$y = 2x + 3 + \varepsilon \tag{4}$$

$$x = -y + 2 + \zeta. \tag{5}$$

Nothing can prevent us from adding the two equations together, giving, after simplification,

$$y = \frac{x}{2} + \frac{5}{2} + [\varepsilon + \zeta]. \tag{6}$$

Since the compound error in brackets looks like a perfectly good error term (remember that the errors in the equations may be correlated), if we are sure that $\beta = 2$, we are just as sure that $\beta = 1/2$, and similarly for the second equation. This is the unidentified situation, and no amount of fancy estimation will help.

If both equations contain the same additional exogenous variables, there is nothing to prevent adding of the two equations together to mimic the original equation but with different coefficients. But suppose that theory tells us that there is some *exogenous* z that belongs in the first equation but not in the second equation, and the opposite for a different exogenous w. Then, we cannot add the equations together without making either y depend on w or x depend on z. These conditions must be given by theory, since if they are not correct, the system is not identified and so estimation cannot proceed.

For our example, we might have liking for a candidate depend on whether one shares one's ethnicity with that candidate (but where theory tells us that ethnicity does not affect how close the candidate is to the voter on the issues, a very strong assumption) and closeness on the issues affected by the voter's occupation (which would not be expected to directly affect how much the voter likes a candidate but might affect issue positions). These are strong assumptions, but without these or similar assumptions the system is not identified and empirical research cannot proceed. Sometimes the correct conclusion is that theory is inadequate for identification; other times theory allows further empirical work. (Resorting to OLS does not solve the problem, since this would imply, incorrectly, that x is exogenous.)

We can check to see if a system is identified by counting the number of exogenous and endogenous variables in each equation. An exogenous variable is excluded from an equation if it is used in the system but does not appear in that equation. An equation is identified if it has at least as many excluded exogenous variables as it has included endogenous variables. If this condition is met exactly, the system is said to be exactly identified; if there are more excluded exogenous variables than included endogenous variables, the system is said to be overidentified. It is possible that some equations are identified, some overidentified, and others not identified. Obviously, we can say nothing about the parameter estimates of the unidentified equations. For the others, we can proceed to estimation.

It is possible to test where the restrictions that overidentify a system are valid, but the restrictions to test where a system is just identified must be justified purely theoretically. It is possible for a system to be weakly identified, where the excluded exogenous variables in an equation have only a weak effect in equations where they are theoretically included. This leads to problems similar to those of underidentification. Weak theory is inadequate for identification purposes.

Two-Stage Least Squares

There are many good ways to estimate a system of simultaneous equations, but by and far the most common is two-stage least squares (2SLS). 2SLS works because we can always solve the system of equations to get each endogenous variable to be a linear function of all (included and excluded) exogenous variables. This is called the reduced form of the system. Each of the equations of the reduced form can be well estimated by OLS, since all the explanatory variables in each equation of the reduced form are exogenous.

The first stage of 2SLS estimates the reduced form. Each of these OLS estimations (one for each endogenous variables) is used to predict the values of the endogenous variables as a function of the exogenous variables in the usual way. These predicted values then replace the endogenous variables in a second OLS regression (equation by equation). This provides good estimates of the coefficients of the system of equations. If we just do two OLS regressions, the estimated standard errors will be wrong, but any computer package will automate the process and provide the correct standard errors. There are other ways of estimating simultaneous equation models, but none are great improvements over 2SLS.

Simultaneous Equations Today

After the initial burst of enthusiasm, the estimation of systems of simultaneous equations in political science (and in social science, in general) is today rarely done. While there are a number of reasons for this (including the rise of other research methodologies for assessing complex causal situations), probably the main one is that it is hard to find strong theory to allow for the identification of the entire system.

Over the past decade or so, there has been a huge increase in the use of instrumental variables. This focuses attention on a single equation of interest where one or more explanatory variables of interest are endogenous. Researchers then look for instruments that are simply exogenous variables that explain the endogenous explanatory variables but do not explain the dependent variable directly. This method is identical to 2SLS, except for the focus on only one outcome variable. Often it is easier to find variables that we believe explain one or more endogenous explanatory variables but do not explain the prime dependent variable of interest. Thus, 2SLS has again become a critical tool but one that lives on under another name. Note that instrumental variables have exactly the same identification issues as do simultaneous equations (except that we are interested in only one equation, not the whole system), and the estimation method is exactly the same as 2SLS. The various issues discussed above thus continue to be critical.

SOCIAL CAPITAL

The central premise of social capital is that social ties have value. The term *social capital* refers to the collective value of all social networks and the inclinations that arise from these networks to do things for each other. In other words, social capital refers to the people we know and the norms of reciprocity that exist between us. The notion of social capital, therefore, emphasizes a wide variety of specific benefits that flow from the trust, reciprocity, information, and cooperation associated with social networks. In this way, value is created for people who are connected and, at least sometimes, for bystanders as well. This entry reviews the concept of social capital by unpacking its perspectives and components as well as assessing its implications in social, economic, and political arenas.

This simple definition of social capital serves a number of purposes. First, rather than focusing on the consequences of social capital, it concentrates on the sources thereof and recognizes that the features of social capital, namely, trust and reciprocity, are developed in an iterative process. Second, this definition includes the different dimensions of social capital and acknowledges that communities can have varied access to each dimension. Third, it identifies community as the primary unit of analysis, while conceding that individuals and households can appropriate social capital. As a result, the notion of social capital has become an influential theoretical concept in the analysis of contemporary social and economic development, and change and cohesion in various societies, communities, and groups. In addition, social capital is related to the description and explanation of social action. While it features in much academic and interdisciplinary discourse, including political science, economics, sociology, and social anthropology, it also has parallels with political agendas, social and economic development and, more recently, social policy development. This has to a large extent become visible in the influence of international bodies such as the World Bank and International Monetary Fund in defining research areas as well as structuring the debate surrounding social issues related to the analysis of social capital.

Social Capital: Different Types and Perspectives

The wide variation of interest in the concept of social capital is partly evident in early works by Pierre Bourdieu and James Coleman and was popularized by the most widely recognized proponent of social capital, Robert Putnam. The focus of social capital for each of these authors lies on networks and relationships as a resource; however, they have done so in different ways. This conceptualization of the role of social relationships in development marks a significant departure from earlier theoretical approaches and as such has direct implications for contemporary development research and policy. It is, therefore, necessary to distinguish between the four perspectives on social capital, which identify the types of social capital in different ways.

The Communitarian View

The communitarian perspective equates social capital with mostly informal and local horizontal associations, such as clubs and civic groups. The focus of this perspective lies in the number and density of these local organizations and associations within a community. The basic premise for communitarians is that social capital is essentially good and the more social capital that is present in a given community, the more positive its effect on that community's welfare. Critics of this view, however, have pointed to *perverse* social capital, which exists in communities that are isolated or parochial. Furthermore, this perspective implicitly assumes that communities are homogeneous and strive to achieve the society's collective interest; however, racial and ethnic exclusion, inequality, and gender discrimination are only a few examples that suggest otherwise. This downside of social capital has the potential to hinder development.

The Networks View

The networks view is a more nuanced perspective on social capital as it stresses the importance of vertical and hierarchical as well as horizontal associations between people and also attempts to account for relations within and among organizational entities such as community groups and firms. This view also distinguishes between two types of social capital, namely, *bonding* and *bridging* social capital. The former refers to strong intracommunity ties that provide families and communities with a common purpose and a sense of identity, while the latter refers to weak intercommunity ties, namely, those that cross social and cultural ties such as gender, class, race, ethnicity, religion, and socioeconomic status, which can form the basis for sectarian interests.

The networks view has two key propositions. The first proposition is that, although social capital can provide a range of services for the members of a community, there are potential negative economic consequences resulting from the costs that these ties can place on the noneconomic claims of a member's commitment. The second proposition is that a distinction needs to be made between the sources of social capital and the consequences derived from them. Thus, to make claims with regard to the efficacy of social capital, the network view acknowledges the necessity of both strong intercommunity ties and weak extracommunity networks and that the range of outcomes associated with social capital are attributable to the different combinations of these two dimensions. The strength of this view lies in its ability to engage in policy discussion based on empirical evidence and assessments of contending explanations. A clear challenge, however, lies in retaining the integrity of the many positive aspects of bonding social capital while trying to ensure increased access to formal institutions and facilitating a diverse stock of bridging social capital.

The Institutional View

The third perspective on social capital builds from the first two perspectives, adding formalized national structures to the mix. The basic premise of this view is that the legal, institutional, and political environment facilitates the strength of civil society and community networks and that social capital is regarded as a dependent variable—in contrast to the communitarian and network views, where social capital is regarded as an independent variable. The institutional approach stresses two points: first, that social groups' capacity to act in accordance with collective interests depends on the quality of their formal institutions and, second, that the performance and effectiveness of the state and firms are dependent on their internal credibility and competence as well as their external accountability to civil society.

There are two primary approaches to research from this view. The first approach employs case studies that are based on comparative history and postulates that civil society is only able to thrive to the extent to which the state encourages it. The second approach adopts quantitative cross-national techniques to measure the impact of social divisions and government performance on economic performance. The ability of this view to address macroeconomic policy concerns is its greatest strength as well as its weakness in that it fails at a microeconomic level.

The Synergy View

The forth and most recent perspective on social capital, the synergy view, encompasses an integration of the work from the networks and institutional views and focuses primarily on conditions that may foster developmental synergies. This approach identifies *complementarity*—mutually supportive relations between various private and public actors that are embodied in legal frameworks—and *embeddedness*—the nature of and the extent to which ties connect citizens and public officials—as the basis for synergy between government and citizen action. In other words, this approach can only work when the actions of public officials are embodied by performance-oriented organizational environments that are credible and competent.

The synergy view can be used for three fundamental functions: (1) to identify the nature of a community's social relationships and formal institutions as well as the extent of the interaction between them; (2) to develop institutional strategies on the basis of these social relations, with particular reference to the two types of social capital—namely, bonding and bridging social capital; and (3) to determine the ways in which the positive manifestations of social capital can counteract isolationism, sectarianism, and corruption.

The four perspectives on social capital thus differ in terms of the unit of analysis that each focuses on; their treatment of social capital as a dependent, independent, or mediating variable; and the extent to which they integrate state theory. However, the four perspectives on social capital also have a number of common features: They all link the social, economic, and political spheres; they all recognize that social relationships can improve development outcomes and that these outcomes are dependent on the horizontal versus hierarchical relationships and broader political and legal context; they all recognize how the formal and informal organization of the relationships between economic agents can improve economic activities; and all infer that desirable social relationships and formal institutions have positive externalities.

Components of Social Capital: Networks, Norms, and Trust

Definitions of social capital vary considerably, and this becomes problematic when trying to establish a set of indicators for measuring social capital or in reaching a consensus on the best ways of measuring the concept. To date, census data of groups and associational memberships in a given society and survey data measuring levels of trust and civic engagement have been the two broadest approaches taken. Producing anything similar to that of a census of a society's stock of social capital could be described as practically and logistically impossible because it would rely on the multiplication of numbers that are nonexistent or subjectively estimated. Surveys on trust and civic engagement are the other source of data that has been widely used as a proxy for social capital.

Social capital exists in two methodological dimensions: one qualitative and one quantitative. The quantitative dimension is simply the number of social contacts that people within a society have. The more the social networks to which people have access, and the more extensive those social networks are, the more social capital a society has. Extensive and varied networks are an asset in almost all situations, and such social contacts need not be strong or deep on the personal level. As noted previously, there is also strength in organizations and societies distinguished by extensive weak ties. However, this quantitative dimension alone is inadequate for the analysis of social capital and its components. In addition to the sheer number of social contacts, we need to add the quality of those contacts. The reason for this is obvious: It cannot be an asset to know a lot of people whom you cannot trust or tolerate. Networks alone thus do not have value. Instead, the value of contacts and networks depends on the quality of relations—trust and tolerance—within these networks. The concept of social capital can be measured by a wide range of indicators. Most empirical researchers have made contributions with regard to three of the core elements or components of social capital, namely, the number of voluntary organizations (networks) that individuals are actively engaged in, tolerance, and trust.

Networks

Two approaches have been used to measure social networks, the most common of which has been a structural analysis whereby the focus rests on formal associational membership as opposed to informal social ties. Most empirical research has relied on data from longitudinal surveys tracking the trends in associational membership; however, these are often limited to a small number of sectors, such as religious organizations (church, etc.) and labor unions. Subsequently, the official records of membership in voluntary organizations such as sports and social clubs and humanitarian societies have been the focus of most historical institutional studies.

The importance of associational membership, for some authors, rests with its capacity to act as a proxy indicator for both the structural features and the cultural norms of social capital—that is, social networks as well as trust and cooperation. Macrolevel trends, or trends at the societal level, are often investigated among a number of voluntary organizations such as sports or recreation clubs, arts and cultural societies, and professional associations; however, the challenge has been to measure the extent to which associational membership in these organizations is able to generate and facilitate tolerance, reciprocal cooperation, and social trust, which are the components of social capital.

Although earlier works regarded formal associational membership as proxy indicators of social networks, the significance and value of informal social ties as a means to generate and facilitate the norms of reciprocity, mutual trust, and tolerance, as opposed to card-carrying membership, are widely recognized and gaining momentum. In other words, although formal associational membership is regarded as a strong indicator of societal networking, it is only one such indicator and not necessarily the most important.

Tolerance

Tolerance is consistently related to perceptions of threat and one's willingness to put up with others who are perceived as the least liked. To tolerate is to allow something from which one recoils, which one considers unacceptable and would prefer not to identify with, and is a disposition directed at an object of aversion or dislike. Tolerance entails the forbearance to admit, to accommodate, to put up with, and to overcome the hostility generated by dislike. Intolerance emerges when revulsion finds expression in prejudice and hostility.

In a democracy, tolerance requires one to accept that one's political opponents, even one's enemies, have the right to participate in a contest for power under the principled assumption that they might win the contest and assume power, albeit limited and constrained by the rule of law. Within a multicultural context, it is to accept as fellow and equal citizens those people who hold cultural beliefs and practices rooted in values that may be unfamiliar, and even incompatible with, and offensive to one's own cultural beliefs. Such allowance may take the form of *negative* tolerance, which amounts to forbearance by way of ignoring, avoiding, and disengaging with the object of tolerance. In this case, tolerance entails having to grit your teeth and to "grin and bear it." *Positive* tolerance, by contrast, is based on the principled assumption of being able "to agree to disagree," which allows opponents to engage with rather than shun one another.

Tolerance is considered an essential requisite for democracy as it is required for the effective functioning of the competitive processes of representative democracy, as well as the effective maintenance and deepening of a doctrine and practice of human rights. Representation is achieved through elections by organized political parties, who compete for the popular vote. Competition occurs as parties present different campaign promises to the voters and vie for the voters' preference by showing their policy positions to be superior to those of others. This is a process of comparative evaluation that can be stressful, as personalities and the personal virtues and weaknesses of candidates become easily enmeshed with ostensibly dispassionate policy differences.

Policy differences themselves can also become matters of intense contestation when high interest-based stakes are involved in the election outcomes. Tolerance is needed in such intense contests, as the liberal model of democracy prescribes that all such actions be conducted within the boundaries of law and the rule of law. Opponents are to be defeated at the ballot box, not eliminated from the political arena. Winners must bear with losers, and both need to be prepared to face up to one another again and again in subsequent contests. And the arena of contestation itself, with its constraining laws, has to be maintained.

The functioning of human rights doctrines also requires tolerance from citizens. Rights, as special claims against the state or other civic bodies or other citizens, function alongside one another, and unless a clear hierarchy of rights is established, such rights hold equal claims against one another. The advancement of any right by a citizen then becomes contingent on its not being infringed on by the claims advanced by other rights holders. Constant litigation becomes one way of dealing with rival claims, but for the effective functioning of society on a regular basis, tolerance becomes essential as an operating norm.

Trust

Trust in any person emerges from a prior conviction that that particular person holds no malevolent intentions toward one and is not intent on willful exploitation of or doing harm or damage to oneself. Trust is a disposition toward others that follows from their reputation for reliability, honesty, and integrity. A person is trusted by others to the extent that these others have confidence in the commitments made by the said person—that is, when predicted, expected, and promised outcomes do in fact materialize accordingly. Such trust can be directed or dispersed. If dispersed, it is referred to as generalized trust and is indicative of an individual's overall worldview of other people. If directed, trust is a disposition that addresses clearly demarcated categories of people.

Democracy requires both political trust and interpersonal trust. Political trust is directed at institutions of power. In a liberal democracy these are, in the first instance, the institutions of political representation, which elected representatives occupy after having contested free and fair elections. In electoral contests, promises are made thick and fast, and trusting voters cast their ballots on the expectation that such promises will be kept and duly executed by the newly elected rulers. But liberalism limits the kinds of promises politicians can offer to the electorate. For example, human rights doctrines proscribe promises to exterminate one's opponents after the election or even to limit their human rights. On the contrary, an inbuilt, implicit promise of each and every politician has to be that the rule of law, the doctrine and practice of liberal rights, and the procedural as well as substantive commitments entailed therein are going to be upheld. Without a certain threshold level of trust in politicians that such system maintenance will take place, the legitimacy of the entire liberal democratic regime is open to question.

Interpersonal trust is also of vital importance to the maintenance of democratic regimes. As is the case with political trust, interpersonal trust entails the confidence that certain expectations about the behavior of others will actually materialize. In interpersonal relations such a reputation for reliability is usually vested in the knowledge that people have of one another and of the personal traits that are attributed to others on the basis of such knowledge or are explicitly or implicitly derived from it. It is, therefore, not a generalized but a directed form of trust. People who know one another personally and meet on a daily basis have the best opportunity to gain the knowledge necessary for establishing trustworthiness.

Family, friends, and community relations form this inner core of interpersonal relations, from which reputations for reliability can be established and from which so-called thick trust can be established. Slightly less intimate relations in the form of shared values and cultural practices (such as religion) as well as presumed kinship relations that together form the basis of ethnic identities provide another source of knowledge for thick trust. *Thin* trust, by contrast, is established between strangers and may even be typified by the very absence of overt socially shared denominators such as language, religion, or heritage. Such trust is established on the basis of ongoing joint engagement in projects and/or more formally shared identities, such as corporate membership or, at the national level, citizenship. Both these kinds of trust are required for the maintenance of a liberal society. Thick trust cements families and households, the core social units from which overall social cohesion is constructed and the primary units of general and political socialization. Thin trust is needed to bridge larger social divisions in society and is required for very large projects of collaborative endeavor such as socioeconomic development, which typify modernizing societies.

Both kinds of interpersonal trust, as well as political trust, are ultimately established under conditions of imperfect information, albeit at varying levels, and require an element of risk taking. The trusting person is always vulnerable to exploitation. The classic liberal conviction argues that such risk taking is warranted because of the presumed reasonableness of people and of their ability to sense that they can pursue their own interests in collaboration with others rather than in perpetual opposition to them. And liberals assume reciprocity—that is, that other citizens will calculate likewise. One way of minimizing such risk in emergent liberal societies, and the attendant vulnerability of trusting citizens, has been to establish an extensive set of explicit rules within which to construct the liberal "open society." The fundamental rules are those found in human rights charters, usually embodied in a rigid formal constitution and backed up by an independent judiciary within a constitutional state to oversee its maintenance and implementation.

Conclusion

In essence, social capital is a multidisciplinary concept that has a growing influence over ideas in health science, urban studies, regional studies, social policy, criminology, business studies, and social and economic geography and history. It is a concept that has captured the imagination of policymakers and professionals in many fields and has influenced research and theory right across the social sciences.

SOCIAL CHOICE THEORY

The theory of social choice aims to explain collective outcomes as derived from individual decisions and institutional rules. The founding contributions in the 1950s and 1960s eroded a previously unquestioned confidence in the capability of certain common aggregative procedures, including majority rule, to guarantee consistent social choices satisfying individuals' preferences. According to several "impossibility" theorems, no decision procedure can guarantee social choices fulfilling some apparently simple requirements of fairness, but all of them are vulnerable to strategic manipulation and may produce arbitrary or unstable results. This entry discusses the history, problems, and current applications of social choice theory.

The problem of aggregation of individual preferences into a social welfare function or a collective decision by voting led to revisions of certain traditional utilitarian assumptions in welfare economics and democratic theory. The study of institutions, decisions, and voting rules became of paramount interest to explain inefficiencies and undesirable collective results. In more recent developments, social choice theorists have also contributed to distributive justice theory by approaching classical topics such as auctions, negotiations, fair division, and other resource allocation procedures. The explanation of unsatisfactory social choices provides room for normative concerns of better institutional and mechanism design.

In a foundational theorem, Kenneth Arrow proposes a set of normative conditions to make a social choice acceptable. They include, for individual preferences, (a) transitivity or internal consistency (if somebody prefers A to B and B to C, he must prefer A to C) and (b) universal domain, or admission of all preferences without previous restrictions. For social choices, his conditions are (a) monotonicity, or the requirement of a consistent relation between individuals' preferences and the social choice (which contains the Pareto criterion favoring unanimous decisions); (b) independence of the social choice from individual preferences regarding irrelevant alternatives that cannot win; and (c) "no dictatorship," or the nonexistence of an automatically decisive actor. According to Arrow's theorem, no decision rule can fulfill all these conditions all the time.

A typical example of inconsistency and instability is the so-called Condorcet cycle. Assume that three voters, A, B, and C, have different preferences over three alternatives, X, Y, and Z, as shown in these profiles:

A: X > Y > Z

B: Y > Z > X

C: Z > X > Y,

where ">" means "is preferred to."

If we apply majority rule to comparisons of the three alternatives by pairs, we find that X is socially preferred by majority to Y (because a majority formed by A and C prefers X to Y), Y is preferred to Z (because A and B prefer Y to Z), and Z is preferred to X (because B and C prefer Z to X). Thus, we have a cycle of successive social choices: X > Y > Z > X. Even if the individual preferences are complete and transitive, the social choice by majority rule is not transitive but is unpredictable—in practice, any choice would be arbitrary and potentially unstable.

However, this and other paradoxes do not mean that all social choices made by majority or any other rule are never fair or always arbitrary and, thus, vulnerable to instability. They mean that no decision rule can guarantee that, under any distribution of individuals' preferences, the social choice will always fulfill a set of normative conditions. In particular, the distribution of preferences in the above example is prone to haphazard results because it implies that the alternatives are located on two "dimensions" (since some of the preferences are and some are not consistent with the alphabetical order). Generally, it is not the case that social choices are always unstable but that they can be unstable. In further developments, certain conditions regarding individuals' preferences have been identified that guarantee consistent and stable social choices. Many exercises to test instability have used simulations in which an "impartial culture" or "random society" involving an equal probability of each conceivable individual order of preferences is assumed. This assumption, however, maximizes the probability of inconsistent and unstable social choices.

An alternative is to relax the founding theorems' prescription that no restrictions should be imposed on individuals' preferences (or "universal domain"). Specifically, a sufficient (although not necessary) condition for social choice stability is the single-peakedness of individual preference curves, which is formally equivalent to the condition that all individuals' preferences can be ordered along a single linear dimension (e.g., the left–right axis). More in tune, it has been found that arbitrary and potentially unstable social choices are more likely the higher the dispersion of individuals' preferences (the proportion of multipeaked individual curves or the number of issue dimensions) and the dispersion of alternatives (the number of alternatives and the distance between them).

These contributions suggest the advantages of relatively harmonious societies in producing consistent and stable social choices, even with potentially manipulable procedures. Yet the restriction of relevant preferences may also result from the decision process itself, ultimately depending on the institutional rules of the game.

Institutional Rules

A subsequent line of research promoted by social choice theory attempts to evaluate the relative performance of different institutional and decision rules in satisfying individuals' preferences and producing acceptable social choices. The impossibility theorems tell us that it is impossible to guarantee fair and stable social choices with any rule. But certain rules tend to produce inconsistent choices more frequently than others. In a world of uncertainty, the likelihood of consistency and stability may be a useful guide to institutional evaluation and design.

With these lenses, some decision procedures based on the majority principle can be reviewed. The spatial theory of voting shows that if there are only two alternatives along a single issue or value dimension (e.g., the left–right axis), majority rule tends to make the alternative closer to the median voter's preference the social choice. By definition, the median voter—that is, the voter whose preference is located in an intermediate position with less than half of the voters on each of the two sides—is always necessary to form a consistent majority on a single dimension. Since the median position has the property of minimizing the sum of the distances from all other positions, the winner by majority rule in a two-alternative contest can not only be stable but also minimizes aggregate distance from all individual preferences and thus maximizes social utility.

However, this model relies on two strong assumptions: only two alternatives and a single-dimensional issue space. If the set of alternatives submitted to majority decision is not bound, interested actors can manipulate the social choice by the introduction of new alternatives—such as a party or candidate's platform that includes a "package" of proposals on several issues—or new issue or value dimensions. If there are more than two alternatives, even in a single-dimensional space, no alternative may obtain more than half the votes, thus making majority rule indecisive and unable to produce a social choice. In a multidimensional space, even with only two alternatives, the majority winner can be unpredictable, depending on which issue or value takes higher salience in voter choice; in the long term, there can be a series of successive winners relying on different salient issues and values, with no foreseeable "trajectory."

Several procedures loosely related to the majority principle can then be adopted. With plurality or relative majority rule, the winner is the alternative that obtains a higher number of votes than any other alternative while not requiring a particular proportion of votes. It guarantees a winner (except for a tie), but it may imply minority support. For example, the winner by simple plurality rule among three alternatives may be the one most rejected by an absolute majority of voters having split their votes among the other two alternatives. From a social choice perspective, simple plurality is usually considered the least desirable decision rule.

The procedure of majority runoff requires an absolute majority of votes in the first round of voting, while in a second round the choice can be reduced to the two alternatives receiving the highest number of votes in the first round, so as to secure majority support for the winner. Majority-preferential or instant-runoff voting also requires an absolute majority of voters' first preferences, while successive counts of further preferences are made to find an alternative with majority support. In contrast to what can happen with plurality rule, these procedures prevent the most rejected alternative from winning, since if it has not been eliminated at the first round, it will be defeated at the second round.

However, with both plurality and majority-runoff rules, the median voter's preference can be defeated or eliminated in the first or successive rounds. This implies that the nonmedian winner by any of these procedures might be defeated by another alternative by absolute majority if the choice between the two were available. These procedures are, thus, dependent on irrelevant alternatives; they encourage strategies aimed at altering the number of alternatives, such as "divide and win" and "merge and win," as well as nonsincere or strategic votes in favor of a less preferred but more likely to win alternative.

Additional voting procedures based on the majority principle were invented by several Christian philosophers and enlightened academics. The 13th-century Catalan philosopher Ramon Llull and the 18th-century French Marquis de Condorcet almost concurred in proposing variants of pairwise comparisons. By these procedures, an election requires multiple rounds of voting between all possible pairs of alternatives. In Llull's version, the winner is the alternative having won the greatest number of pairwise comparisons, while in Condorcet's version, an alternative is required to win all pairwise comparisons—that is, the majority winner is the alternative able to win by majority against every other alternative. When the alternatives are perceived by the voters as ordered along a single linear dimension, the winner by Condorcet procedure is always the one preferred by the median voter. The Condorcet winner can be considered highly satisfactory for the electorate and can be used as a positive reference for comparison with the results obtained with other procedures. However, in multidimensional spaces, such an alternative may not exist, as shown with the example at the beginning of this entry.

Another sophisticated procedure, known as rank order count, was devised independently by both the 15th-century German Cardinal Nicholas of Cusa and the 18th-century French academic Jean-Charles de Borda. This procedure requires that the voter order all the alternatives and award them 1, 2, 3, and more points, ranking them from the least to the most preferred. The winner is the alternative that has collected the highest sum of points. The "Borda winner" can also be considered highly satisfactory for the electorate and can be used as a normative reference. Yet this voting procedure can be manipulated because some voters can award lower points to rival alternatives than would actually correspond to their sincere preferences in order to prevent their victory. For this reason, Cusanus warned that electors should "act according to conscience," and Borda remarked that his procedure was conceived "only for honest men." Nevertheless, the likelihood of making a sincere loser a strategic winner is lower the higher the differences in votes and ranks between the two alternatives, as had already been shown by the Spanish mathematician Joseph Isidoro Morales in Seville in the late 18th century.

Approval voting has also remote origins in medieval times. It allows the voters to vote for those alternatives that they consider acceptable, from a minimum of one to a maximum of all minus one, and the alternative with a plurality of votes becomes the winner. Approval voting tends to produce broadly consensual social choices. Yet it is still vulnerable to strategic manipulation since voters with information regarding others' preferences and whose preferred alternatives have wide support can concentrate their votes on one or a few alternatives and present their intermediate preferences as unacceptable.

Finally, according to classical utilitarian assumptions about cardinal utilities, as presented by the English philosopher Jeremy Bentham in the early 19th century, range voting gives voters the opportunity to give different numbers of votes (or scores) to alternatives. As voters have both the incentive and the opportunity to provide detailed information about their preferences, this procedure may produce the most satisfactory outcome for the greatest number of voters. All in all, the aforementioned procedures tend to produce results that are more consistent with individuals' preferences than plurality rule.

Certain formal findings in voting theory can also enlighten performances of institutional formulas implying different degrees of fusion or division of powers. According to spatial theory, the "single-package" social choice in a policy "space" formed by multiple issues and dimensions can be highly unpredictable, as mentioned. This may correspond to single-party parliamentary regimes, as well as presidential regimes with a president's party majority in the assembly, where a single election may become decisive for all the multiple policy issues that may enter the government's agenda. These institutional frameworks tend to produce relatively changing and unstable policies.

By contrast, in multiparty elections producing coalition cabinets, different issues, roughly corresponding to different portfolios, can be dealt with separately on single-issue spaces. Also, in regimes of separation of powers, each separate election for a different office can focus on one or a few issues and favor the consistency and stability of social choices. In these institutional frameworks, each issue can be the subject of a broad multiparty or interinstitutional agreement around the median voter's position, which can preclude drastic changes and induce policy stability in the mid- or long term.

A Model of Social Choice

A simple geometrical model can illustrate the relevance of social choice models for the analysis of institutions and their performance. Let us use the simplest case of an electorate composed of three voters with different preferences (or three voters' groups with the same preferences and a similar number of members). If the voters' preferences can be located on a single-issue dimension, such as A, B, and C on the horizontal axis in Figure 1, the median voters' preference, B, may win any election by majority rule against each of the other alternatives.

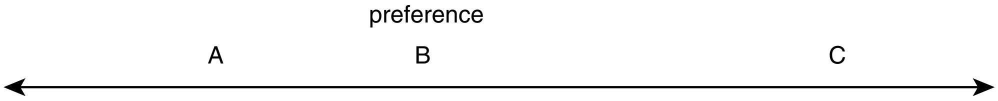

Figure 1 A Single-Dimensional Electorate

If, alternatively, there are two issue dimensions, the three voters, A, B, and C, can hold different preferences on Issue 1 (a_1, b_1, and c_1) and on Issue 2 (a_2, b_2, and c_2), as presented in Figure 2. Then different institutional formulas involving separate and joint elections can produce different social choices. Let us assume, first, that there are two separate elections for different offices, such as congress and presidency or two chambers in parliament, dealing with different sets of issues or issue dimensions. On each separate election, the intermediate alternative close to the median voter is advantaged and may win. In Figure 2, b_1 wins in the election on Issue 1, and a_2 wins in the election on Issue 2. The social choice is represented by the intersection point of the winning positions on each issue, b_1-a_2. As can be seen, the social choice of separate elections on different issues under the above assumptions is a somewhat centrist point located inside the minimal set containing all voters' preferences, or the Pareto set (the triangle ABC in the figure).

Now, let us assume, alternatively, that the social choice on all the issues is made in a single election, as would correspond to a simple institutional framework, such as a unicameral parliamentary regime by plurality rule. The institutional setting forces the voters to choose, not between alternatives on separate issues but between packages of alternatives on all the issues at the same time. The set of possible winners, or win set, in such a joint election depends on the status quo. Let us adopt the hypothesis that the status quo is the social choice previously produced by two separate elections, the point b_1-a_2 in Figure 2. The set of possible winners in a single, two-dimensional election from this point is represented by the multipetal shaded area in the figure. This is formed by circular indifference curves around the voters' preferences and crossing the status quo. It is assumed that every voter prefers the alternatives that are closer to the voter's preference and in particular prefers those inside the indifference curve to those outside. Accordingly, the set of possible majority winners in a joint election is formed by all the points at which a majority of voters (any majority of two voters out of three in the example) is more satisfied than they would be in the status quo; that is, the win set is formed by the intersections of pairs of indifference curves.

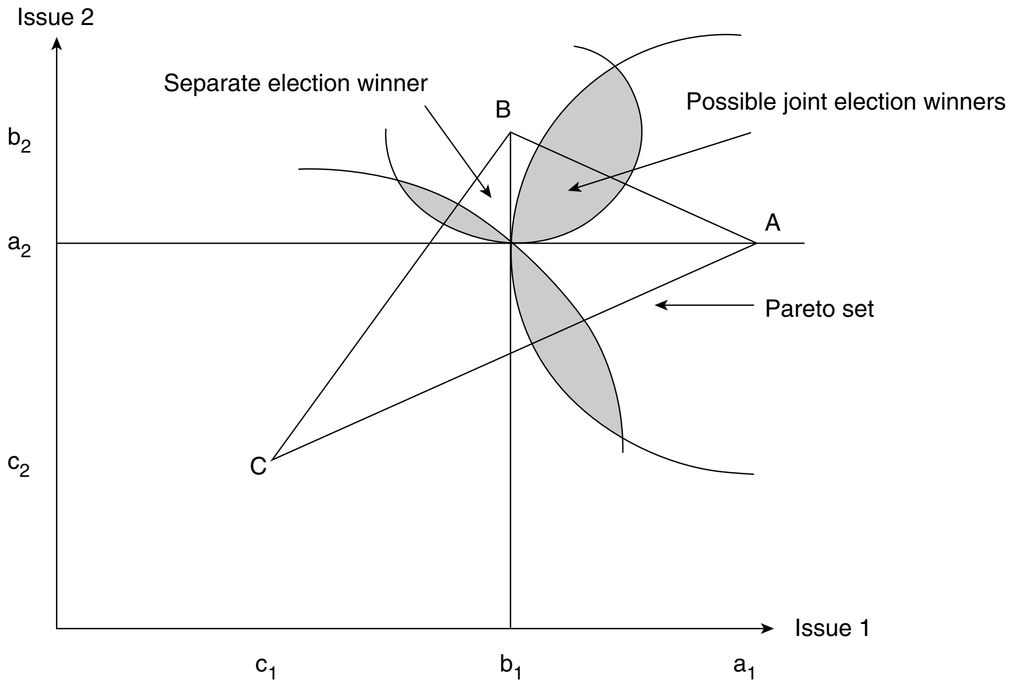

Figure 2 Joint and Separate Elections

As can be seen, the set of possible winners in a joint election is relatively large, which makes the prediction of results difficult. A number of possible social choices are located outside the Pareto set and even beyond the rank of voters' preferences (e.g., the set includes some points located beyond the extreme preference, b_2, on Issue 2). The possibility that many different alternatives can win may generate instability in a series of successive social choices, since any winning point can be further beaten by some other point in the corresponding win set. This analysis allows us to state that a joint election on a multidimensional set of issues, as a model for the typical single election in a simple regime, can be more uncertain and unstable over time than separate elections on different issues, such as elections for different offices in regimes with division of powers.

How to Choose

The analysis of the relative successes and pitfalls of different institutional rules has moved social choice theorists to study how institutions are chosen and how they ought to be chosen in order to favor fair and stable developments—or the problem of choosing how to choose. Game theoretical models have also been used for the analysis of strategic behavior in such a field. In consistency with the assumptions regarding human behavior within institutional constraints, it can be assumed that people may prefer, choose, and support those institutional formulas producing satisfactory results for themselves and reject those making them permanently excluded and defeated. As a consequence, institutions producing widely distributed satisfactory social choices should be better able to develop endogenous support and endure. In general, widely representative social choices should feed support for the corresponding institutions, while exclusionary, biased, or arbitrary outcomes might foster rejection of the institutions producing such results. These findings have led to the establishment of a positive relation between institutional pluralism, social efficiency, and democratic stability.

SOCIAL COHESION

In the work of the founders of sociology, society was conceived of as an organism that needed to respond to the main challenge posed by modernity: How do societies marked by social differentiation and distinct social groups create mechanisms to live together? The concept of social cohesion features prominently in the work of its originator, Émile Durkheim (1858–1917), for example, and was later revisited, though not always under the same name, in the functionalist tradition. However, Durkheim, in his major work on the subject (1893), used the notion of solidarity to describe ways in which social integration is achieved. Solidarity is a "force" that binds the different parts of a whole, creating bonds and relations of reciprocity between individuals.

Progressively, and more so in recent times, and far removed from the initial analytical use that Durkheim gave to the concept of solidarity, social cohesion has become increasingly intermingled with normative and policy-making purposes. Therefore, the current literature reflects two different visions of social cohesion. The first perspective is policy oriented and part of the political discourse; it strives to put in place a battery of objective indicators for assessing the *degree* of social cohesion observable in a society. The second, by contrast, a sociological perspective, interrogates the *nature* of social cohesion, focusing on social dynamics and the cultural and political mechanisms that bind society. The following presentation focuses on both visions.

The Policy-Making Concept of Social Cohesion

The concept of social cohesion adopted by the European Union (EU) is an excellent example of the first strategy. It is essentially a normative reference associated with operational criteria revolving around indicators (e.g., employment, health) that are selected by public debate, politicians, and technocrats. This predominant concept of social cohesion in the current international debate was developed in the 1990s by the EU as part of a political discourse imbued with an essentially normative-evocative meaning that seeks to define a desirable horizon for society. The concept of social cohesion is defined as

> the capacity of a society to ensure the welfare of all its members, minimising disparities and avoiding polarisation. A cohesive society is a mutually supportive community of free individuals pursuing these common goals by democratic means. (European Committee for Social Cohesion, 2004, p. 3)

The notion of social cohesion is believed to represent the central values of solidarity and equality that are the original features of the "European model." It is contrasted sharply with the so-called Anglo-Saxon (English-speaking countries) model, which is regarded as steeped in more individualistic values and less concerned with distributive aspects or the state's role as guarantor of the common good (European Commission, 2007).

According to Gøsta Esping-Andersen, Duncan Gallie, Anton Hemerijk, and John Myers (2002), explicitly underlying the EU's concerns with social cohesion are the changes in its economy and demography in recent decades, particularly its inclusion in the globalization process and the subsequent impact on job creation/unemployment and distribution of wealth, and the resultant challenges to its welfare state. These changes provoke social tensions, which, in turn, jeopardize social cohesion. The EU concept of social cohesion has to do with an effort to maintain the (idealized) standard of the immediate past that it would like to preserve.

As the concept of social cohesion became increasingly central to the EU's discourse, criteria and indicators were developed to measure it. Known as the Laeken indicators, they deal mainly with distributive variables (employment, income, access to public services). In this way, the notion of social cohesion, a normative framework, became operational and, therefore, a target for public policies intended to influence the indicators. In sum, the concept of social cohesion is associated with a specific political context that evokes what is regarded as a desirable state of affairs relative to the status quo ante.

This use of the concept of social cohesion has tended to be disseminated in recent years among international agencies. To do so, they have separated the concept from the concrete European context in which it originated, producing an abstract and ahistorical concept of social cohesion. For example, according to the Economic Commission for Latin America and the Caribbean (ECLAC), social cohesion is "the dialectic [relationship] between instituted social inclusion and exclusion mechanisms and the responses, perceptions and attitudes of citizens towards the way these mechanisms operate" (2007, p. 18) and implies a previous theory and an empirical analysis of what is meant by "citizens" and "inclusion/exclusion mechanisms" in the Latin American context.

The included–excluded dichotomy produces a preconceived vision of society that fails to take into account the different and complex processes differentiating society that are far broader than a single cleavage. Of course, limited access to social services, income, and opportunities in the labor market is frequently the cornerstone in the construction of a sense of social exclusion. But concrete situations are mostly in the gray areas, and most citizens feel simultaneously included and excluded.

Analysis of social cohesion can neither be dissociated from the category of relative deprivation (e.g., the expectations and feelings of inclusion or exclusion of a recent migrant originally from a rural setting are not the same as those of a generation born and raised in the city), nor can it overlook the fact that feelings of exclusion, frustration, and social anomie may be even stronger among sectors with a better state of social well-being. In general, analyses of social cohesion guided by the included–excluded dichotomy tend to consider economic mechanisms (usually employment and social policy) as the main, or even the only, factor of integration, against which individual leanings are juxtaposed. This vision does not consider other social processes of solidarity formation that are extremely important to preserve social cohesion, such as religion or the mass media.

Societies whose cohesion revolves around egalitarian values can intensify feelings of exclusion among individuals and groups that would be considered acceptable in other contexts. In certain cases, greater economic inclusion can increase feelings of symbolic and political exclusion, and conversely, greater symbolic inclusion can intensify feelings of economic exclusion. In sum, the objective and subjective dimensions of inclusion/exclusion are complex and require theoretical and empirical analyses sensitive to the historical formation of values systems in each society.

The Analytical Concept of Social Cohesion

As social theory teaches us, all societies generate some form of cohesion. Otherwise, they would not exist. But the mechanisms for maintaining social cohesion vary according to the historical formation of each society. In complex societies, this is reflected in the existence of universes of beliefs and values shared, to varying degrees, by all members of society and by systems of authority rooted in consensual norms and coercive systems that ensure the functioning of the established order. Mechanisms of social disintegration are also many and varied. They may be the product of exclusion, anomic violence, or authoritarian ideologies. Social cohesion in modern times cannot be dissociated from social change and from social conflict. Modern societies are in constant mutation, which means that some forms of sociability are always disintegrating and giving way to new mechanisms for integration in which citizen participation and demands play a critical role.

If every society has, by definition, some form of social cohesion, then what is at stake from an analytical standpoint is the understanding of the mechanisms by which social cohesion is produced and absorbs the processes of change and social conflict, as well as the mechanisms through which these are expressed and resolved. This means expanding the horizon of analytical and normative social cohesion beyond (but inclusive of) public policy to encompass the functioning of political and cultural systems. Social cohesion has not only to do with the most adequate or effective public policies, but it also requires us to ask ourselves about the mechanisms for the symbolic and political mobilization of citizens, which are a prerequisite for the possibility (or impossibility) of public policies and state reforms.

In this view, the concept of social cohesion requires more sensitivity to, and the effective inclusion of, social, political, and cultural issues, an interdisciplinary dialogue that incorporates the required contributions of the various disciplines in the social sciences. This means bringing together economists, sociologists, political scientists, anthropologists, and historians in an effort to discover the many nuances evoked by the concept of social cohesion (societies that value democracy and equity and transmit a sense of belonging and dignity to their citizens). Broadly speaking, cohesion is not so much a matter of developing a theory of social cohesion as of placing this concept at the service of a multidisciplinary examination of the social processes under way in contemporary societies.

The challenge, in particular, is to make sure that sociocultural dynamics are not overlooked in the reports of governmental and international agencies.

One of the reasons for this absence is that when handled in an intellectually responsible manner, sociocultural dynamics require a sensitivity to, and acknowledgment of, the diversity of national values and histories in which values acquire specific symbolic meanings that are hard to quantify and generalize. This ultimately conspires against the analyses developed by international organizations whose vocation is to come up with generalizable and quantifiable solutions, sometimes at the expense of the complex webs and the particularities of national histories. This also means accepting social conflict as a legitimate and critical component of the construction/transformation of mechanisms for social cohesion in democratic societies.

SOCIAL DEMOCRACY

Social democracy (sometimes used synonymously with *democratic socialism*) refers to a political tendency resting on three fundamental features: (1) democracy (e.g., equal rights to vote and form parties), (2) an economy partly regulated by the state (e.g., through Keynesianism), and (3) a welfare state offering social support to those in need (e.g., equal rights to education, health service, employment, and pensions). Very often, socialist democratic parties are members of the "Socialist International," an organization of social-democratic, socialist, and labor parties that pursues mutual cooperation. This entry discusses social democracy's roots and its fundamental characteristics and modern development.

Origins

Inspired by the 19th-century German economist and sociologist Karl Marx (1818–1883), social democrats traditionally deemed total equality the final goal of efforts to remedy the plight of the working class. They regarded the capitalist economic system as the cause behind society's ills. With close ties to the then budding labor movement, social-democratic political parties began, toward the end of the 19th century, to form and organize themselves. A key demand was public ownership of the means of production as a way to transform society into a socialist economic system, thus ending the exploitation of the working class by the bourgeoisie and creating true democracy. Very soon, different groups began to debate the means by which to reach the end. Could and should what was regarded as capitalism's inner contradictions be passively allowed to develop, or should the final collapse be speeded up by resorting to violent revolution? Others instead suggested "revisionist," peaceful, and gradual reforms of the system launched through liberal democracy via political parties in parliament, including cooperation between social classes. Soon, the nature of the end itself became a bone of contention. Could and should the entire capitalist economic system really be thrown overboard? Or rather, were reforms of the economic system preferable, so as to sustain its ability to create wealth? Were not welfare state measures sufficient to alleviate the system's perceived unfair wealth distribution effects? Led by the German socialist Eduard Bernstein (1850–1932), the revisionist camp evolved into the social-democratic movement. The other camp opted for more revolutionary, far-reaching solutions including "dictatorship by the proletariat," culminating in the Russian Revolution of 1917 and the first communist state. Subsequently, most social-democratic parties began reorienting themselves from being solely the political branch of the working class to becoming "catchall" parties.

The issues of how extensive the transformation of society should be and by what means it should be achieved did not end with the social democrats' break with the Communists. Applying the commonly used "left–right" ideological continuum to two analytical aspects, "public ownership" and "social policy," many researchers would certainly place social democracy slightly left of center regarding public ownership and perhaps a little further to the left on social policy. However, consensus is less solid when "left" and "right" are to be defined. Normally, left would signify more public enterprises and more dirigiste state involvement in the economy, but the actual mix of socialist and capitalist policies differs considerably between parties and between different time periods. Actual ownership of the means of production has seldom formed a vital part of policies. As to the social policy dimension, the left would stand for a more extensive welfare state in terms of covering more people with more generous support at higher cost and with fewer if any market-emulating characteristics.

Postwar Developments and the "Third Way"

Social democracy evolved after World War II into a political ideology that focused on working inside the overall framework of a mixed-market economy while trying to protect and make life decent for all those who were economically the most vulnerable. Although often critical of aspects of the market economy, social democracy accepted its fundamentals. The exact policies were always a balancing act between "planning," "steering," and "control" on the one hand and "efficiency," "profit," and "competitiveness" on the other. Rather than putting the economy in the hands of politicians, most parties chose the welfare state as the primary step to "decommodifying" society, although few would argue for complete decommodification. The status of equality is a moot point. Originally, most social democrats defined equality as a situation in which most people enjoyed roughly the same standard of living. To attain this condition, redistribution from the haves to the have-nots would be necessary. Later, the meaning underwent a shift to signify equality of opportunity rather than of outcome, thus lessening the emphasis on redistribution through transferring resources from one group to another. Although the focus was no longer specifically on retribution, measures were advocated to ensure that no one fell below a decent or minimally acceptable standard of living.

Once there, the welfare state had to be protected. Generating fresh resources for the welfare state became imperative. The parties increasingly came to rely on the efficiency of the market economy to create those resources. Gradually, the idea of abolishing the market economy was pushed into the background. Indeed the mixed-market economy became core social-democratic ideology—with public policies, for example, through so-called Keynesian countercyclical policies and through active labor market policies and sometimes through corporatist solutions, to help the economy function even better than if left on its own.

However, occasionally, parts of social democracy have contemplated further steps toward a more socialist society. Yet any concrete plans about real planning institutions have only rarely emerged. A peak of ideological revival occurred from around 1970 to 1983, when some groups in some parties began questioning whether the welfare state alone would suffice to create the desired society. The ownership issue reemerged with force as an internal issue in many parties. Some—for example, certain groups in the British Labour

Party—advocated the return to older policies in which state nationalizations of major, if not all, businesses would take center stage. Others—for example, in the German and the Swedish Social Democratic Parties—suggested extended union influence over business decision making as the way forward. Perhaps the most innovative and controversial of the new policies were plans for "economic democracy" through so-called wage earner funds put forward by sections of the Swedish social democracy. In their original, blue-collar union draft proposals, the funds were designed to tax major parts of businesses in order to create funds that would soon be able to take economic control of private companies. However, the social-democratic leadership was far less enthusiastic about any takeover plans and considerably watered down the final version that was adopted in 1983. A number of nationwide funds were set up much like pension funds. A special business tax funneled off resources to the funds for buying shares on the regular—private—stock market with an overall ownership cap set at about 10%. When a nonsocialist government was formed in 1991, the funds were abolished and have not since reappeared in social-democratic policy making.

No doubt social democracy has been a very successful ideology. Some would even stress that after World War II many Western societies became more or less permeated by social-democratic ideas. Although support varies, social democracy has enjoyed remarkably stable parliamentary strength over the decades. This is a movement optimistic about the possibilities of modernizing society through technological advances and prepared to use an array of policies with which to improve people's lives by correcting the market economy's inequitable effects. However, in practice, several other political tendencies, such as Christian democracy and social liberalism, also propose far-reaching public sector measures including welfare states and other regulations designed to correct the adverse effects of an unregulated market economy. These parties strive to establish socially beneficial societies too. Still, even though similarities with Christian democracy and social liberalism are strong, many researchers would agree that social democracy is more ambitious in its quest to eradicate unfairness rather than just alleviating the effects of social injustices, although the differences may not always be easy to pinpoint.

Toward the turn of the millennium, many social-democratic parties began to feel concern about some perceived tendencies, all of which basically had to do with the financial burden of the welfare state. It was always evident that the expansion and even maintenance of welfare states would be expensive. Therefore, public incomes were of the essence. Taxes were essential not only as a means to narrowing down real-income gaps between the different strata in society but also as a means to create budget incomes. A growing tax base was deemed equally important to support public sector budgets. As the welfare states grew, further expansions would entail not only higher taxes but also heavier reliance on ever-growing economies. Even though many voters have accepted high taxes in countries where welfare state measures have been universally enjoyed, some resentment toward high marginal taxes was beginning to be felt during the 1980s and 1990s. Many parties began debating whether taxes had perhaps reached their ceiling. If so, welfare state programs would have to rely even more on a growing tax base and, thus, on an ever more efficient market economy. Whether real or not, the perceived effects of economic globalization and the ensuing constant structural changes at the same time caused many parties to reconsider how far the market economy could in fact be regulated without negative efficiency consequences. Simultaneously, mounting criticism of welfare state bureaucracy, planning inertia, and lack of citizenship choice led many parties to try new policies, including lower taxes, deregulation of financial markets, and various public–private combinations including elements of competition inside the public sector.

Soon, social democracy was criticized for being "neoliberal," unacceptably diluting true social-democratic ideals, and finally closing the door to more genuine reforms of capitalism. Others fervently defended new policies as a "Third Way" between socialism and capitalism. It has been suggested that "equality" was replaced by "fairness," "collective rights" by "individual rights," "redistribution" by "individual chances," and "the state as a provider" by "the state as enabler." How drastic the changes have actually been is a recurring academic theme. No doubt a change of rhetoric has taken place, but there is a case to be made for substantial policy continuity with the past. Aiding the market and enabling citizens to overcome changes were vital parts of the golden age (roughly 1945–1980) of social democracy. Socialism "today" was never on the agenda. Efficiency, full employment, and an element of equality took center stage. Sometimes policies such as these were described as corresponding to a "planned" society. However, they closely conformed to a mixed-market economy but—and this is the key to social democracy—where the economy is regarded as the means to a higher end, a decent society.

SOCIAL DOMINANCE ORIENTATION

Social dominance orientation (SDO) is a concept developed in social dominance theory (SDT) to describe an individual-level value structure that prefers inequality and stratified categorization among social groups. Individuals with high SDO desire a society marked by stratification and are thus inclined to accept such social structures as warranted. They differentiate between groups on the basis of superiority and subordination, which, in political practice, often leads to attitudes and behavior that entail discrimination and segregation.

Insight into the existence of SDO emerged from growing interest in the group-based aspects of human life. SDT, of which orientation forms an integral and crucial part, was first developed by Felicia Pratto and Jim Sidanius in the early 1990s and since then has been frequently used in psychology and social psychology research, mostly in journals focusing on personality or experimental psychology. As issues of multiculturalism, integration, and assimilation due to increasing migration and societal diversity have risen on the political science agenda, the SDO concept has began to make its way into parts of the discipline. This entry defines SDO in greater detail, including how it is measured and what is known of its distributional pattern. The important matter of how SDO relates to authoritarianism will also be touched on. Finally, some political and practical implications of SDO are introduced.

SDO is defined as a personality trait that predicts certain attitudes, a basic structure that in turn translates into several more concrete perceptions. In research into values and culture, "orientation" refers to basic cognitive structures and beliefs, of which we as individuals possess relatively few. Orientations tend to be stable, formed in a process of early-childhood, adolescent, and young-adulthood socialization and experience. Attitudes, in contrast, are more numerous and malleable and emanate from orientations. Individuals with SDO are characterized by strong perceptions of their own ingroups as hierarchically and justifiably superior to other groups, most prominently so in relation to immigrants, people of other ethnicities, and the opposite sex. SDO has a number of attitudinal consequences, all of them favoring hierarchy over equality. Concrete expressions of SDO include ethnic prejudice, nationalism, cultural elitism, sexism, and a belief in meritocracy (i.e., people with superior competence or skill should occupy favored positions in society). SDO has been claimed to be a personality variable on par with what are known in personality psychology as the "Big Five" traits: extraversion, agreeableness, openness, neuroticism, and conscientiousness.

The SDO concept has developed in the interface between personality and social psychology, and experimental studies have demonstrated that it can successfully predict prejudice. Through measuring SDO, one can differentiate individuals based on their level of SDO inclination. The South African nationalists, who introduced apartheid and openly defended it with arguments of hierarchy and superiority, exemplify SDO. Anti-Black racism in the United States is yet another well-known example of the orientation, as is India's caste system, as it is a social order based on human hierarchy.

Authoritarianism has been related to socializing experiences in childhood—for example, dominating parents—which in adulthood are translated into an individual desire to dominate others. SDO is not believed to originate from formative experiences but from a combination of socialization and personal temperament.

SDO is measured using a scale developed by Felicia Pratto, Jim Sidanius, Lisa Stallworth, and Bertram Malle (1994). The various items constituting the scale all concern perceptions of hierarchy (e.g., "Some people are just more worthy than others" or "It is not a problem if some people have more of a chance in life than others") as opposed to equality (e.g., "If people were treated more equally, we would have fewer problems in this country"). The original seven-step scale runs from "very negative" to "very positive."

SDO and Right-Wing Authoritarianism (RWA)

SDO is often studied and analyzed in relation to another neighboring, yet different, individual value structure, right-wing authoritarianism (RWA). Both SDO and RWA predict prejudiced action that is discriminatory and could be perceived as intolerant, for example, supporting the persecution of immigrants and other "outgroups." However, the RWA scale, which grew out of the research of Theodor Adorno, Else Frenkel-Brunswik, Daniel Levinson, and Nevitt Sanford (1950) into the authoritarian personality (measured using a scale originally developed by Robert Altemeyer), is driven by conformity bias (as opposed to autonomy), submissiveness to authority figures, ethnocentricity, and aggressiveness toward outgroups. SDO, in contrast, is motivated by concern for social hierarchy between groups (as opposed to egalitarianism). RWA has been demonstrated to be preoccupied with relationships between the individual and the group (i.e., intragroup relationships), whereas SDO is concerned mostly with relationships between groups (i.e., intergroup relationships). Individuals guided by RWA support assimilationist practices for immigrants and marginal groups, which lessens these outgroups' potential to introduce change. For people with high SDO, assimilationist practices are instead viewed as threatening, because they conflict with and even blur social boundaries. There is a distinct difference between the more individual-oriented RWA and SDO, which focuses on the collective, group level. SDO and RWA are thus complementary but only partly overlapping in predicting prejudice. RWA is related to uncertainty reduction in various respects: High-RWA people tend to be religious and to desire order, structure, security, and tradition—desires that generally do not characterize those with high SDO. It has been argued that SDO represents a more modern kind of prejudice than the conformist and traditionalist RWA. Differentiating between SDO and RWA, as done, for example, by Sam McFarland and Robert Altemeyer, has advanced and fine-tuned our understanding of individual preference and value structures. Because of their similarity at an aggregate behavioral level, as evident, for example, in anti-immigration rhetoric and prejudiced perceptions of groups such as Jews, homosexuals, African Americans, and women, it is easy to miss their different bases of such sentiments and policy preferences.

Gender and SDO

SDO is claimed to have evolutionary roots. Most research has found systematic variation between the sexes in the level of SDO and that men, almost regardless of cultural context, have higher SDO than women. A few studies of homosexual men have concluded that they have lower SDO than heterosexual men or women. Although absolute levels of SDO vary among cultural settings, due to differences in distributional policy and economic system between, for example, the United States, India, Sweden, or Ukraine, men always have relatively higher SDO than do women. In SDT, this is called the "invariance" hypothesis, explained by the different reproductive patterns of the sexes, which leads women to be more selective in choosing mating partners to ensure reproductive success (defined as raising a sexually mature second generation). Consequently, females choose higher status men, making men competitively involved in a status struggle for the more selective women, a struggle, a desire, and even a need to dominate other men and groups of men that could threaten their access to fertile women. As a behavioral consequence of their higher SDO, in professional contexts, men are more often found in hierarchical social milieus, such as the military, and politically are more inclined to support intolerant political parties. The cross-cultural similarities in SDO distribution between the sexes have thus been explained by biological predispositions in mating selection. This gender bias in SDO allows an analysis in which worldwide male dominance in society as well as in politics and economics could have some evolutionary explanations.

A second major hypothesis in SDT is called the "interaction" hypothesis, predicting that among "arbitrary set" groups (e.g., class and ethnicity), SDO levels will vary between the groups depending on the hierarchical structure of a society. In low-hierarchy cultures, the level of SDO will be more similar throughout a range of groups, while the differences will be much greater in highly hierarchical societies. Evidence has been found to support both the interaction and the invariance hypotheses.

Implications

Research has identified important behavioral implications of SDO. These concern the roles of both the private person, who may be highly prejudiced and aggressive toward outgroups, and the citizen, who may vote for anti-immigration, xenophobic, and intolerant parties. Individuals with high SDO are inclined to move into jobs and institutions that maintain or increase social hierarchy, and they prefer policies that support social separation rather than integration or assimilation.

Are there ways to modify SDO at the aggregate or individual level? Knowing that societies with more equal relationships display more similar levels of SDO between high- and low-status groups, we could single out redistributive welfare policies as one such way. Since SDO is focused on group relationships, relaxing group rhetoric and sentiment and instead emphasizing individual aspects has been proven in experimental research to have some beneficial effects. Similarly, empathizing with members of the outgroup could reduce high levels of SDO too.

SOCIAL EXCLUSION

Distinct from, and typically broader than, the traditional concept of poverty, social exclusion is a contested, broad concept that can take very different meanings from one policy setting to another. A central aspect of most definitions of social exclusion available in the literature is the lack of adequate work opportunities, which can lead to unemployment or underemployment. But reducing social exclusion to employment-related issues would be a mistake, as the concept refers to issues ranging from gender and ethnic discrimination to housing problems and limited access to health and social care, among other things. Another central aspect of social exclusion is its complexity. According to Hilary Silver and S. M. Miller (2003), for example, social exclusion appears as

> (1) *multi-dimensional* [italics added] (. . .); (2) *dynamic,* [italics added] denoting a process, movement or trajectory from full integration to a condition of multiple exclusions; (3) *relational,* [italics added] in that exclusion entails social distance or isolation, rejection, humiliation, lack of social support networks and denial of participation; (4) *active,* [italics added] in that people and processes do the excluding; and (5) *relative* [italics added] to context. (p. 8)

Although analytical remarks such as this have done much to clarify the meaning of this concept, social exclusion remains contested, and some social policy scholars reject it altogether, claiming that it is overly vague or, even worse, misleading. Consequently, there is no consensus in the social science literature about the analytical usefulness of this concept. This entry elaborates the history and meaning of this concept and examines its role as a central idea in contemporary social policy.

History and Meaning of the Concept

The French writer Jean Klanfer published a book (*L'Exclusion Sociale: Étude de la Marginalité dans les Sociétés Occidentales* [Social Exclusion: The Study of Marginality in Western Societies]) in 1965 that defined social exclusion in terms of irresponsible behavior and economic marginalization. In the mid-1970s, another French writer, René Lenoir, helped popularize the concept of social exclusion in his country. According to him, social exclusion was the product of factors such as poverty and disability, which prevented some citizens from fully participating in the French economy and society. However, in France, it is only during the 1980s and early 1990s that social exclusion became a major policy idea. A number of issues contributed to this situation. First, long-term unemployment became a permanent feature of the French economic landscape. Second, the debate on immigration and the status of ethnic minorities increased interest in the concept of social exclusion, which can refer to the negative effects of racism and discrimination. From a political standpoint, however, *social exclusion* became a major term in French public discourse partly because centrist politicians referred to it to reinforce their reputation as compassionate actors who care about the fate of the nation's less privileged citizens. In general, fighting social exclusion is a source of legitimacy for the state and for political actors who seek to fight what is widely perceived as a social evil.

Beyond France, the concept of social exclusion has become a key policy idea, even if the emergence of this concept at the forefront of international policy debates is relatively recent, as it was only during the 1990s and 2000s that it became a permanent feature of international debates about social inequality and the future of the welfare state.

Since the 1990s, the concept of social exclusion has become increasingly popular across Europe. For instance, in the United Kingdom (UK), after taking office in 1997, New Labour Prime Minister Tony Blair depicted himself as a crusader against social exclusion. A major symbol of this emphasis on social exclusion was the creation of a state unit devoted to this issue in late 1997. As in France, although a powerful rhetoric surrounded social exclusion, critics noted that the resources allocated to fight this set of social ills remained quite modest in scope. From a political standpoint, the rhetoric about social exclusion helped the Blair government reinforce its social policy credentials at the same time as it was pursuing a broad liberal economic agenda. Importantly, however, significant resources have been allocated to the struggle against social exclusion, which has become a legitimate public policy concept, both in government and in academia. In comparative terms, the political discourse around social exclusion in the UK was based more on moral and behavioral issues than in France; however, in both cases, social exclusion has become an enduring aspect of policy debates in a way that makes it difficult to reduce it to a short-term political fad.

Beyond France and the UK, social exclusion has become increasingly influential in many other European countries, largely through the platforms and initiatives of the European Union (EU), which has explicitly embraced this concept as part of an attempt to increase its policy legitimacy. Although the EU discourse about social exclusion can be traced back to the late 1980s and 1990s, the concept only emerged as a central EU policy concept in 2000, as the main legacy of the European Council conference held in Lisbon. At that meeting, member states agreed to transform the fight against poverty and social exclusion into a core aspect of the EU's employment and social policy strategy. Articulated around the idea of a "European social model," the EU approach to social exclusion is based on the "open method of coordination," which is based on the interaction between EU-defined goals and national policy initiatives. Substantively, the EU stressed the central role of employment policy in the struggle against social exclusion. From this perspective, social exclusion is closely related to the quest for activation and the European Employment Strategy. As stated in a European Commission document titled *Fight Against Poverty and Social Exclusion* (2000), "Employment is the best safeguard against social exclusion. In order to promote quality employment it is necessary to develop employability, in particular through policies that promote the acquisition of skills and life-long learning" (p. 3). Additionally, income maintenance programs such as social assistance schemes and pension programs are depicted as major tools in the fight against social exclusion.

A Central Idea in Contemporary Social Policy in Europe and Beyond

Since 2000, social exclusion has remained a prominent aspect of EU policy debates. According to Even Nilssen, the popularity of this concept within the EU is related to fact that it has been defined mainly in economic rather than in moral terms. By focusing mainly on employment and economic issues, the EU has largely reduced social policy to labor market regulation. From this perspective, the EU push to transform social exclusion into a major policy issue reinforces its economic focus while creating the sense that the "social question" has become a political priority, which may not effectively be the case. Overall, although social exclusion has become a major component of EU discourse and policy guidelines since 2000, there is no consensus about the true impact and the long-term policy consequences of the various EU initiatives launched in the name of the struggle against social exclusion.

Outside Europe, since the 1990s, the concept of social exclusion has been increasingly debated in other parts of the advanced industrial world. This is the case in countries such as Australia and Canada, for instance. Although social exclusion is perhaps not as central a policy concept in these two countries as it has become in Europe, it is now part of mainstream international policy debates. Considering this remark, one country within the advanced industrial world where social exclusion remains a relatively marginal policy idea is the United States. As critics have pointed out, this is puzzling considering the comparatively high levels of poverty and social inequality in U.S. society. Clearly, the phenomena that are described as social exclusion in Europe and other parts of the world are widespread in the United States; however, terms such as *inequality* and *poverty* remain largely used due to the fact that social exclusion and ways to deal with it are explicitly associated with social policy and redistribution in some sense. Thus, in the United States, the concept of social exclusion is best known among students of comparative social policy and largely remains a terminology for academic discourse. A more likely explanation for the absence of a widespread social exclusion discourse in the United States is the fact that, in contrast to the situation prevailing in the EU and in other parts of the world, prominent U.S. political actors have rarely embraced this concept as part of a broader electoral and/or policy strategy. Only time will tell if this concept has a political future in the United States.

Finally, the concept of social exclusion as formulated in Europe and other parts of the advanced industrial world is known and debated in developing societies. Yet, as Ruhi Saith notes, the concept of social exclusion cannot be transposed from the wealthiest to the poorest regions of the planet without substantial analytical adjustments being made. For instance, because the concept was first adopted in a European society characterized by a formal labor market and large welfare state programs, it takes a different meaning when used in the context of much poorer countries, where the informal sector can be larger than the formal one and where public social programs do not adequately cover very large segments of the population. This situation has led scholars, policy experts, and nongovernmental organizations (NGOs) to adapt this concept to the realities of the developing world. Thus, in the developing world, concerns over social exclusion have taken the form of poverty reduction programs sponsored mainly by international financial institutions and designed to address the negative social impacts of previous macroeconomic adjustments as well as to provide some basic protection for the most vulnerable members of society.

SOCIAL MOVEMENTS

In a comprehensive sense, the concept of social movement refers to (a) mostly informal networks of interaction, based on (b) shared beliefs and solidarity, mobilized around (c) contentious themes, through (d) the frequent use of various forms of protest. This entry begins with a discussion of the elements of this definition. Next, specific forms of (nonconventional) participation, mobilization, and organization of social movements are identified. Their impact in recent decades on political systems, democratization, public policies, and even the international sphere is then highlighted. Finally, the consequences for normative political theory and deliberative or direct forms of democracy are discussed.

Social movements are constituted by *networks of informal relations* between a plurality of individuals and groups, which are more or less structured from an organizational point of view. While political parties and pressure groups have relatively well-defined organizational boundaries, such as card-carrying members of specific organizations, social movements are composed of scattered and weakly connected networks of individuals who feel they are part of a collective effort. While organizations that refer to movements exist, movements are not organizations but rather networks of relations between diverse actors that often also include organizations with formal structures.

These networks of relations are considered as constituting a social movement when their members share a system of beliefs that nourish solidarity and collective awareness. In fact, one characteristic of movements is the elaboration of alternative world visions and value systems that differ from those dominating at that time. For this reason, movements have been considered as protagonists of social change.

These emerging values form the basis of the definition of *conflicts* around which actors mobilize. In particular, from the 1970s onward, new social movements were defined as actors in new conflicts. While Marxist analyses traditionally posited the centrality of capital–labor conflicts, the transformations that followed World War II stressed the relevance of social criteria—such as gender or generation—that were not based on class position. Scholars of the new movements, such as the French sociologist Alain Touraine, agree in highlighting the declining relevance of the conflict between capital and labor. As Alberto Melucci has observed, in complex societies, which require increasing integration and extend their control even over the motivations for action, new social movements (e.g., ecological, feminist) try to oppose the penetration of the state and the market into social life, reclaiming individual identity and the right to shield one's private and romantic life from the omniscient manipulation of the system.

Finally, social movements are characterized by their adoption of "unusual" forms of political behavior. Many scholars pinpoint the fundamental distinction between movements and other political actors in the use by the former of protest as a form of exerting political pressure. *Protest* is defined as a nonconventional form of action that interrupts daily routine. Protestors generally address their actions to public opinion over elected representatives or public bureaucracies. In fact, movements are characterized by their fundamental critique of representative democracy, and they challenge institutional assumptions about conventional ways of doing politics in the name of participative democracy.

Over the past few years, the analysis of social movements has been approached through the concept of contentious politics, defined as episodic, public, collective interaction among claims makers and their targets (when at least one government is a claimant, an object of claims, or a party to the claim and the claims would, if realized, affect the interests of at least one of the claimants). Doug McAdam, Sidney Tarrow, and Charles Tilly developed a broad research project that addressed the similar mechanisms at play in social movements, revolutions, democratization processes, and ethnic conflicts. Advocating a dynamic use of concepts, the scholars involved in this project have tried to single out general mechanisms of contention. Although social movement studies first developed in the field of sociology, they have also contributed, as will be discussed below, to the main disciplinary subfields of political science.

Nonconventional Participation

The first pieces of research on social movements in the field of political science were carried out within the solid research tradition on political participation. While this field of research was initially focused on conventional forms of participation, underlining the unequal participation of various social groups, from the 1970s onward, scholars began to observe a rapid growth of new, *nonconventional* forms of political participation, such as petitions, sit-ins, boycotts, the occupation of buildings, and the blocking of traffic. This led them to investigate the different *styles of participation* of different social groups, generations, or nations and the conditions that would provoke the development of new forms of participation.

In an important piece of comparative research carried out in the 1970s on different Western democracies, Samuel Barnes and Max Kaase observed that, with respect to laws and decisions seen as unjust or illegitimate, ever-wider groups of citizens are ready to resort to forms of action characterized by their nonconventionality. Yet we cannot speak of a real split between those who use "orthodox" participatory tactics and those who use so-called direct-action tactics. In fact, conventional participation is often accompanied by nonconventional participation, indicating that those interested in politics and competent in the field tend to use a range of the various available instruments for exerting pressure on governments. If there are individuals who prefer one or the other type of strategy, there are nonetheless many who combine the two types. The conclusion is that the increase in nonconventional participation is not an indicator of the decline of the legitimacy of liberal democracies, where, on the contrary, a growth in political competence has been observed, in particular among young people. It is instead an expression of a lasting enlargement of the strategies available to citizens.

Later pieces of comparative research (among them work by Russell Dalton and Pippa Norris) have revealed that while levels of traditional types of political participation have remained stable or (in some forms) declined in the 1990s and the new millennium, levels of noninstitutional participation have increased enormously. This growth concerned all of the countries analyzed, and inside the single countries the differences in levels of participation linked to gender, age, and educational level had lessened, leading some to speak of a "participatory revolution."

Research on social movements has made a particularly rich contribution to the analysis of political participation in work on repertoires of protest. Charles Tilly has defined a *modern repertoire of collective action* as formed by the set of means a group has at its disposal for making collective claims. Tilly has, in particular, identified the differences in the types of contentious action in particular historical periods. Protest was certainly not unheard of prior to the formation of the nation-state: Peasants burned down mills in protest against increases in the price of bread; subjects dressed up to mock their superiors; and funerals could be turned into occasions for denouncing injustices. The tactics adopted by protestors varied from the use of irreverent symbols and music (as in the custom of charivari or shivaree) to field invasions and grain seizures. However, they all were parochial in scope, addressing local actors or the local representatives of national actors; moreover, they relied on patronage, appealing to local power holders to convey grievances or settle disputes. In the 19th century, however, forms of collective action began to change, as the old parochial and patronage-dependent repertoire was replaced by one that was national and autonomous, involving actions such as strikes, electoral rallies, public meetings, petitions, marches, insurrections, and the invasion of legislative bodies. This transformation in the form of protest was the result of the creation of the nation-state, the development of capitalism, and the emergence of modern means of communication. The new repertoire, therefore, responded to a new situation in which politics was increasingly national in character, the role of communities diminished, and organized associations spread, particularly among the working class.

Resource Mobilization and Organizational Approaches

Another significant contribution from scholars of social movements is found in organizational theory, from research on organizational populations to the most recent neo-institutionalist approaches. In particular, placing itself within the open-system approach (which maintained the relevance of interactions between organizations and their environments), research on social movement organizations, carried out by scholars such as Mayer Zald and John McCarthy, has underlined the role of organizational entrepreneurs in the mobilization of resources in the organizational fields of single groups.

Until the 1960s, studies on social movements were dominated by a functionalist approach that interpreted them as reactions to systemic malfunctions, thereby reducing them to purely reactionary, pathological phenomena. Criticizing this representation, throughout the 1970s, the resource mobilization approach considered social movements as a normal part of the political process, focusing analyses on the mobilization of those resources necessary to collective action. According to the resource mobilization approach, social movements act in a rational, prognostic, and organized manner. Protest actions derive from a calculation of costs and benefits, influenced by the presence not only of conflicts but also of the resources that are required to be mobilized around those conflicts. In a historical situation in which unease, contrasts, conflicts of interests, and ideological clashes appear ever present, the rise of collective action cannot be explained on the basis of these elements alone, begging the study of the conditions that permit the transformation of discontent into action. The type and extent of available resources explain the tactical choices of movements and the consequences of collective action for the social and political system.

In this sense, the mobilization capacities of groups vary enormously, and this reinforces the inequalities present in society. As far as the so-called weak interests—of those poor in resources—are concerned, their organization often depends on the mobilization of influential patrons and/or strong organizational structures. Organization, aided by solidarity links, can therefore compensate for the absence of material resources.

Unlike the "mass society" theories, which had presented some forms of political aggregation as effects of the uprooting of individuals from primary groups and of the social disaggregation stemming from modernization, the resource mobilization approach instead explains mobilization through both the moral gratification intrinsic to the pursuit of a collective good and the existence of horizontal (i.e., internal to the collective) and vertical (i.e., between different collectives) solidarity links. The density of relations between people who share some cultural characteristics tends to facilitate the construction of solidarity. Social movement activists are in fact well integrated within various types of social networks, both formal and informal. It is above all due to these links that the potential activist develops a particular vision of the world and acquires the information and skills necessary for collective action. Given that social environments (and groups) are differentiated on the basis of the density of the networks that characterize them, this gives rise to different capacities for participation. Charles Tilly has argued that the mobilization of groups is influenced by their level of *catnet-ness*, a synthesis of characteristics linked to social *cat*egories and the density of social *net*works. Indeed, the passage from a category (an aggregation of individuals who share determined characteristics) to a social group (a community capable of collective action) is facilitated by the simultaneous presence of specific categorical traits and networks of relations that link the subjects shared among those traits.

That opportunities for participation grow for those social groups characterized by similar structures and intense social relations is indicated by numerous studies on the labor movement. This was linked in particular to the presence of large masses of workers who carried out similar tasks and tended to spend not only their working hours but also their leisure time together, living in socially homogeneous areas found close to the factories. The presence of socially homogeneous networks characterized by intense social relations favored the choice to cooperate. Collective action then reinforced the awareness of holding common interests—causing the growth of what Karl Marx called class consciousness. Socialist ideology would then politicize many social struggles, proposing a wider vision of the world.

Modernization has on the whole increased organizational capacities. Above all, technological developments have increased the quantity of resources available in the environment. In an imposing piece of research spanning the past 4 centuries, Charles Tilly has uncovered an evolution from decentralized and informally coordinated movements to centralized and formal movements—that is, from solidarity or community groups to proactive and prolonged actions, organized on a grand scale by associations constituted with the aim of gaining specific ends. This development was rendered possible by the expansion of means of communication (today, in particular, of communication via computer). Economic progress too had a generally positive effect on the associative capacities of individuals, increasing the quantity of resources available for collective action. In particular, the diffusion of education and the proportional upward shift in socioeconomic class heightened propensities to associate, since more people are able to subscribe and give money. In addition, together with education, faith in one's own ability to influence the outside world tends to increase, and with it the motivation for collective action.

Identities and History

Research on social movements has also contributed to the debate, an increasingly relevant one in political science, on the development of collective identity. According to Alessandro Pizzorno, a characteristic of politics is its reference to solidarity systems that form the basis of the definition of interests. Those who are mobilized defend certain interests, which are recognizable only with reference to a certain value system. Interest in one's own material welfare is not, for example, absolute or innate but linked to a certain conception of the world. Value options lead us to identify with larger groups, to which we feel a sense of belonging and in the interests of which we are disposed to act. The process of participation thus requires the construction of sympathetic collectives inside which individuals consider one another as equals.

Identity as the awareness of belonging to a collective "we," or to a class, thus facilitates political participation. If the construction of an identity is a precondition for collective action, it is at the same time a product of it. In fact, participation transforms the identity of individuals, reinforcing the feeling of belonging to some groups and weakening identification with other roles. In the evolution of collective action, identity is produced and multiplies. The barricades of the revolutionary movement, the strikes of the labor movement, and the occupations of the student movement are all forms of action oriented toward influencing public decisions. But they also have an internal effect, creating solidarity between participants, making them feel part of a collective effort. It is the same action—participation—that then reinforces the sense of belonging in a sort of virtuous circle.

For collective action to occur, it is necessary that those who act elaborate a definition of themselves, of other social actors, and of the content of the relations that connect them. They must identify not only a "we" with whom to sympathize but also a "they" to attribute blame to for the conditions they wish to change. The construction of identity requires not only a positive definition of who is part of a certain group but also necessarily a negative definition of who is excluded. For interaction to occur it is necessary, on the one hand, that the identities of diverse actors be recognized by external actors, so that a part of the mobilization is oriented toward this search for recognition, inseparable from identity itself. On the other hand, collective action itself contributes to building and consolidating identity through the definition of boundaries between actors involved in a conflict.

Political Opportunities and Comparative Political Systems

The analysis of social movements has been particularly lively in the field of comparative politics. Although concentrating mostly on liberal democracies, studies of social movements have systematized their observations on the relations between institutional political actors and protest. As challengers to a given political order, social movements interact with the actors that enjoy a consolidated position in that order. The characteristics of these interactions affect both the form that collective action takes and its probabilities of success. In the study of social movements, the most widely used concept for defining the characteristics of the external environment relevant to the development of social movements is the *political opportunity structure*, developed in particular by the American political scientist Sidney Tarrow. Integrating various empirical observations into a theoretical framework for his study of protest cycles in Italy, Tarrow considered the degree of openness or closure of formal political access, the degree of stability or instability of political alignments, the availability and strategic postures of potential allies, and the political conflicts between and within elites as the main categories of political opportunities for social movements.

With the increase in interest in social movements by political scientists, European scholars, including Hanspeter Kriesi, Dieter Rucht, and Donatella della Porta, started to use the concept of political opportunities in cross-country research projects. Alexis de Tocqueville's famous contrast between a "weak" American government and a "strong" French one is usually the implicit or explicit starting point for analyses linking institutional factors with social movement development. Some criticism notwithstanding, the idea that a state's strength or weakness influences social movement strategies remains central to the literature on collective action in general and on revolutions in particular. In Europe especially, this approach resonated with a focus on the cross-national comparison of different types of European democracies, based on different institutional assets and cultural traditions. In general, an institutional system has been considered more open (and less repressive) the more political decisions are dispersed (through functional differentiation of power, territorial decentralization, and direct democracy). The prevalent belief is that the greater the number of actors who share political power (the greater the checks and balances), the greater the chance that social movements will gain access to the system. However, while a weak executive may ease access to the decision-making process, it will have little hope of implementing policies to meet the demands of social movements. Formal institutions do, however, interact with informal strategies to deal with opponents, with either inclusive or exclusive historical traditions that tend to reproduce themselves.

Beyond the comparison of different institutions, the political process approach also stressed the role of institutional allies for social movements. A more dynamic set of variables—susceptible to change in the short term and the object of pressure from social movements—included aspects such as electoral instability and elite divisions. Attention to allies such as trade unions and political parties also resonated with the relevance assigned to these actors.

One of the reasons for the spread of the political opportunity approach in Europe may have been the interest, well developed in European political science and sociology, in cross-European comparisons. In the 1990s, in particular, this interest produced large comparative research projects, singling out and exploiting different dimensions of comparison among European countries, such as citizens' regimes in research on mobilization, migrant rights, welfare regimes, or issues of unemployment. Historical comparisons, looking at long-term evolution, singled out a trend toward an increasing diffusion of protest repertoires and social movements.

The Effects of Social Movements on Public Policies

Another area to which research on social movements contributed is the analysis of public policies. A growing number of studies have addressed the effects of protest on the policy process. In one of the first and most influential studies on social movement effects, William Gamson identified the factors contributing to success as a minimalist strategy ("thinking small"), the adoption of direct action and a centralized and bureaucratic organization. Other scholars of collective action have, however, challenged this vision. In particular, it has been noted not only that violence can sometimes appear as a winning strategy but also that when organizations, including social movements, become bureaucratized, the desire for organizational survival comes to prevail over declared collective objectives. According to Francis Fox Piven and Richard Cloward, the effort to build organizations could be not only futile but also damaging. The search for material resources to ensure organizational survival leads inexorably toward cooptation and the taming of protest. However, it has been remarked that no particular strategic element can be evaluated in isolation without taking into account the conditions within which social movements must operate as well as the presence of alliances or opponents in power. Most important, movements are never the sole actors to intervene on an issue; rather, they are part of alliances including political parties and sometimes even public agencies.

The attribution of credit for obtaining substantive successes is in fact complex. The presence of a plurality of actors makes it difficult to attribute success or failure to any one particular strategy, and whether the results of protest should be judged in the short or the long term represents a further problem. While social movements demand long-term changes, protest cycles instead tend to stimulate immediate "incremental" reforms. Policy development is characterized by steps forward and backward, moments in which public policy approaches the demands made by social movements and others in which the situation deteriorates. Factors peculiar to social movements, such as their distance from the levers of power, the heterogeneous definition of their objectives, and their organizational instability, further complicate matters.

These difficulties notwithstanding, social movements have had relevant effects on different stages of public decision-making processes. Generally, social movements are formed to express dissatisfaction with an existing policy in a given area. Although it is usual to make a distinction between political and cultural movements, the first following a more instrumental logic, the second more symbolic, all movements tend to make demands on the political system: Environmentalist groups have demanded interventions to protect the environment; pacifists have opposed the culture of war; students have criticized selection and authoritarianism in education; the feminist movement has fought discrimination against women; and the world social forums have criticized neoliberal globalization.

The definition of specific policy claims is often relevant for the very self-definition of a social movement. Frequently, a particular demand becomes *nonnegotiable*, being the basis for a movement's identity. In many countries, for example, the feminist movement has been constructed around the nonnegotiable right of women to "choose" concerning childbirth; the halting of the installation of nuclear missiles in the countries of the North Atlantic Treaty Organization (NATO) fulfilled a similar role for the peace movement. In the first case, mobilization was proactive, seeking to gain something new, the right to free abortion; in the second, it was reactive, seeking to block a decision (to install Cruise missiles) that had already been taken. One of the founding organizations of the World Social Forum in Porto Alegre, the Association for the Taxation of Financial Transactions and for Civic Action (Association pour la Taxation des Transactions financières et pour l'Action Citoyenne, ATTAC), emerged around demands for a tax on transnational transactions; also present in Porto Alegre, the debt relief campaign asked for the cancellation of foreign debt for poor countries. Demands whose symbolic value is very high, such as the Equal Rights Amendment in the case of the American feminist movement, remain central for a movement even when their potential effectiveness is questionable. The importance of such nonnegotiable objectives is confirmed by the fact that, although activists may be willing to negotiate on other demands, even partial victories on these issues, such as a woman's right to voluntarily interrupt pregnancy, are considered as defeats. While nonnegotiable demands are particularly important in the construction of collective identities, social movements rarely limit themselves to these. In fact, they tend to articulate specific requests for reforms.

The changes brought about by social movements may be evaluated by looking at the various phases of the decision-making process: the emergence of new issues, the writing and applying of new legislation, and the analysis of the effects of public policies in alleviating the conditions of those mobilized by collective action. Various levels of responsiveness to collective demands within the political system can be distinguished: from the availability of the authorities to listen to the protestors, to their willingness to put an issue on the agenda, and, then, to adopt and implement specific policies. Research on social movements initially concentrated on the production of legislation, with quantitative and qualitative analyses of the responses of parliaments and governments.

More and more, however, research has developed also on the implementation of decisions demanded by social movements as well as the cultural transformations they produce. Although movements tend to request legislative change, it is also true that this is neither their only nor perhaps even their primary objective, as movements are in fact carriers of *symbolic messages* by influencing bystanders and spreading their own conception of the world and alternative values. Typically, new ideas emerge within critical communities and are then spread via social movements. While the capacity of social movements for reaching their general aims has been considered low, their capacity for *thematization*, the introduction of new issues into public debate, and their long-term cultural influence have been considered high.

Local Protest and Urban Policies

From the 1990s onward, research on social movements and public policies has also focused on protest campaigns against large-scale public works in urban and semirural contexts. If the presence of territorial conflicts is certainly not a new phenomenon, the 1990s saw a growing analytical focus on new forms of protest, which have been portrayed as limited and localized. It has been observed that those seeking to defend the quality of life in a limited territory tend to oppose public works that are seen as compromising either the ecological equilibrium (e.g., refuse incinerators) or public security (e.g., the insertion of unwanted social groups in their territory). The presence of localized conflicts has met with great concern, given the multiplication in both these types of protest against locally unwanted land uses (LULUs) in recent years.

Local conflicts are usually seen in the social science literature (and more generally) as being motivated by a "not in my backyard" (NIMBY) syndrome, associated with conservative behavior and an egotistical resistance to social change. In public policy analysis, local opposition is often associated with "free riderism"—that is, the refusal to pay the necessary costs to attain public goods. This interpretation of the NIMBY syndrome has, however, been disputed. In fact, empirical research on local oppositions has indicated a complex reality, with committees characterized by a diverse capacity or will to present their particular claims within a more comprehensive framework.

In contrast to a NIMBY reading of the situation, sociological research has often interpreted LULU conflicts as an expression of different types of social movements. In the discourse of those who protest, the defense of local natural resources is often accompanied by a more general defense of natural resources. From this point of view, local conflicts can be interpreted as an evolution in the ecological movement, characterized not only by the growth (in numbers, resources, and legitimacy) of environmental organizations but also by the diffusion of environmental awareness into public opinion as well as an extension of collective action beyond traditional organizational networks or environmental discourses. In contrast to the 1970s and 1980s, the main role in the mobilization of the protest is now played by citizens' committees—that is, organized but weakly structured groups of citizens that unite on a territorial basis and use forms of protest to oppose interventions that they claim to be damaging for the quality of life in their territory. Additionally, although previously framed mainly as a "postmaterialist" concern, shared by a "new bourgeoisie" with high levels of education, environmental conflicts now tend to involve more and more underprivileged groups, above all in degraded areas, where projects with high environmental impacts (e.g., incinerators) are often executed. In these conflicts environmental associations are usually present, but they often cooperate and conflict with other organizations based in the territory.

Local conflicts are also discussed in the light of earlier research on urban "growth machines," defined by formal and informal networks between public and private actors oriented toward increasing investment for economic growth. Against these networks, social movements, groups, and associations opposed to the reduction of welfare resources destined for marginal social groups, as well as residents' associations who see themselves as damaged by projects for urban transformation, propose a different model of development.

To overcome the NIMBY label, social movements mobilized in these local conflicts tend to bridge the opposition to specific land use with frames of social justice. Faced with those who accuse them of protesting on behalf of the individual interest (rather than the common good), they develop a "not on planet Earth" (NOPE) discourse. Moreover, they often define their protest through a procedural rhetoric that defends their action as opposition to the abuse of power and lack of transparency in public decision making, as well as the collusive alliance between government and entrepreneurial interests.

Social Movements and Democratization

Reflections on social movements are also relevant for the analysis of democratization processes. The role of social movements for democracy has been discussed with very different expectations. Initially, social movements were considered either as marginal (vis-à-vis political parties) to democratic development or as dangerous for democracy, promoting excessive levels of societal mobilization. Later on, however, these assumptions have been contested, and more and more attention has been paid to the development of civil society organizations.

It is true that some movements have refused democracy altogether (e.g., fascist and neo-fascist movements), while others have the unintended effect of producing a backlash against democratic rights. Additionally, identity politics, often seen in ethnic conflicts, have sometimes ended in religious war and racial violence. However, since the 1970s in particular, the assessment not only that social movements flourish in democracies but also that most, albeit not all, social movements support democracy has become widespread. Pushing for wider suffrage or the recognition of associational rights, social movements contributed to the first waves of democratization and the development of democratic public spheres. Later on, the labor movement has contributed to the enlargement of citizens' rights, and social movements have played a fundamental role in the struggles for democratization as well as in democratic consolidation.

The social science literature on regime transformation has stressed that social movements contribute to democratization under certain conditions. In particular, only those movements that explicitly demand increased equality and protection for minorities actually promote democratic development. In fact, looking at the process of democratization, it may be observed that collective mobilization has frequently created the conditions for the destabilization of authoritarian regimes and can also lead to the intensification of repression or the collapse of weak democratic regimes, particularly where social movements do not stick to democratic conceptions. While labor, student, and ethnic movements brought about a crisis in the Franco regime in Spain in the 1960s and 1970s, the worker and peasant movements and the fascist countermovements contributed to the failure of the process of democratization in Italy in the 1920s and 1930s. Moreover, social movements have often formed transnational alliances to overthrow an authoritarian regime. In Latin America, as well as in Eastern Europe, social movements have asked for (different forms of) democratization, producing a final breakdown of neo-fascist as well as real-socialist authoritarian governments.

Research on various transition processes has stressed that the first steps toward democratization include a demobilization of civil society and the development of more institutionalized political actors following the opening of institutional opportunities, or the "pacted" strategy of the elites' settlement, as in Spain after Franco and toward the end of the Pinochet regime in Chile. In recent democratization processes, the availability of public and private funds in the Third Sector contributed to an early institutionalization of movement organizations. This does not, however, necessarily seem to be the fate of social movements in phases of democratic consolidation: The presence of a tradition of mobilization, as well as movements that are independent from political parties, can facilitate the maintenance of high levels of protest during transition and consolidation—as the shantytown dwellers' movement in Chile, the urban movement in Brazil, or the environmental movements in Eastern Europe illustrate.

In turn, consolidation fuels the development of social movements. Resources for collective action tend in fact to increase over time, as movements become institutionalized, construct subcultural networks, create channels of access to policymakers, and form alliances. This organizational continuity means that the experiences of "early-riser" movements represent both resources and constraints for those that follow. Processes of imitation and differentiation, and enforced repetition and learning take place simultaneously. Movement activists inherit structures and models from their predecessors. The social movement sector grows with the diffusion, during each wave of mobilization, of the capacities required for collective action. In fact, mobilization is facilitated by the presence of networks of activists willing to mobilize around new issues, where these are seen as compatible with their original identities. Moreover, the substantive gains made by one movement can have beneficial consequences for the demands of other movements, and their success can encourage further mobilizations. It can be concluded, therefore, that the importance of social movements tends to grow insofar as there is an ever-increasing amount of resources (both technical and structural) available for collective action.

International Relations and Transnational Movements

Social movement studies, like other areas of the social sciences, have been late to address the phenomena of transnationalization and are still in search of adequate methods, concepts, and theories to explain them. There are several reasons for this. First, most scholarship has time and again confirmed the relevant role that national political opportunities play in influencing social movement mobilization, its dimensions, duration, and forms. The modern repertoire of protest emerged with the creation of the nation-state, and social movements have played an important role in the development of (national) citizenship rights. So it is at the national level that they fought for access, suffered state repression, and found allies. Second, social movement studies focused on Western (and Northern) democracies. Furthermore, research in international relations has long considered the states as the only relevant actors.

In the field of social movements as in others, phenomena of transnationalization were first, and not by chance, addressed within the fields of international relations and international sociology. Bringing "transnational relations back in," Thomas Risse, Kathryn Sikkink, and others have pointed out the role of transnational environmental and human rights campaigns in developing international normative regimes. In doing this, they took into account the role of nonstate actors, as well as emphasizing cooperation over competition. Research on human rights regimes or peace and war also stressed the emergence of international norms that challenged the vision of international politics as an anarchic system of states.

At the same time, research emerged on the development of international governmental organizations

(IGOs) and, in parallel and related to these, on a population of international nongovernmental organizations (INGOs), often taking the form of transnational social movement organizations. Over the past 2 decades, these nongovernmental actors have grown enormously in terms of numbers, membership, material resources, public resonance, and institutional access. This research also recognizes the interplay of actors at different geographical levels, going beyond disciplinary borders between internal and international politics. In human rights campaigns, national actors, suffering repression in authoritarian regimes, found allies abroad in epistemic communities, involving IGOs, national governments, experts, and INGOs.

Focusing on the interactions between social movements and IGOs, in the first studies from a social movement perspective, Hanspeter Kriesi, Dieter Rucht, Sidney Tarrow, and Donatella della Porta emphasized the capacity of transnational social movements to adapt to IGOs' rules of the game, with a diplomatic search for agreement over democratic accountability, discretion over transparency, and persuasion over mobilization in the street. In this, they found some resonance in the more normatively oriented literature on civil society seen as the beginning of a *global* civil society.

Research on transnational processes and social movements first developed around reflections on multilevel opportunity structures. In this sense, two main paths of transnationalization were singled out: (1) social movements with domestic political concerns (especially in authoritarian regimes) searching for external, international allies and (2) social movements addressing their own governments to influence international political decisions.

Attention was also paid to the resource exchanges between transnational social movement organizations and IGOs. Exchanges of knowledge as well as a potential reciprocal legitimization were singled out along with the capacity of transnational social movements to sensitize public opinion to global problems. At the same time, the difficulties in protesting beyond national borders were stressed by looking at different data on protest events, which generally seemed to remain anchored at the national level. Some studies also pointed out the cognitive effects of globalization, for example, in the intensification of relations beyond borders in terms of the cross-national diffusion of movement frames and strategies for maintenance of public order. Here as well, attention is paid not only to the potential for increasing exchanges but also to their limits.

With the development of campaigns addressing various and diverse IGOs, more reflections were developed concerning the different opportunities that different international assets offered to different social movements. Opportunities such as a consensual culture and a reciprocal search for recognition were available, for example, for the United Nations (UN) but not for (the much more closed and hostile) international financial institutions such as the World Trade Organization (WTO), the International Monetary Fund (IMF), and the World Bank, which became the targets of lively protests. In fact, more recent research has indicated that there are as many types of institutions at the transnational level as there are national ones. The social movements that target them, therefore, have to find specific leverage, for example, in the unanimity rules of the WTO, which make alliances with some states particularly relevant, while international experts and formal channels of consultation are exploited in interactions with the ILO. Additionally, in recent research, IGOs have emerged as complex and fragmented institutions, made of different bodies that provide external actors with differentiated opportunities. Looking at the European Union, the European Council, Commission, Parliament, and courts are all targeted by social movements, but protest strategies vary with the different characteristics of these specific bodies. Furthermore, different movements can have a more difficult or an easier life in terms of gaining access to specific (sympathetic) Directorates General in the European Commission or opposing powerful ones.

Different opportunities require different strategies. If previous research had stressed the moderation of social movement tactics when addressing IGOs, with a move from the street to the lobbies, recent studies have rediscovered protest. In fact, going beyond the specific experiences of the parallel summits organized by the UN on environmental or women's issues, many interactions between social movements and IGOs have involved protest. With time, the frustration over the results of more moderate forms of interaction brought about the development of broader coalitions, including religious groups, unions, and social movements, which combined pressure with petitions, marches, and even direct action. Since the 1999 protests during the WTO meeting in Seattle, the 2000s have seen an escalation of interactions between protestors and the police during the contestation of international summits. Even though transnational protests remain a rare occurrence, the few transnational protests that have taken place (whether in the form of global days of action, countersummits, or social forums) emerge as particularly "eventful" in their capacity to produce relational, cognitive, and affective effects on social movement activists and social movement organizations themselves.

Finally, at the cultural level, a global language developed together with intense interactions during the transnational events mentioned and indeed a growing acknowledgment of the roles and responsibilities of IGOs. Social movement activists started to present their actions as part of a global justice movement, calling for global justice and global democracy. Although still deep-rooted in national political systems and movement families, cosmopolitan activists tend to bridge the local with the global and vice versa. In doing this, they are contributing to the development of a transnational political system, as well as transnational identities.

Social Movements, Democracy, and Normative Theory

Although mainly addressed within the empirical subfields of political science, social movement studies have recently begun to interact with political theory, more specifically the branch reflecting on participatory and deliberative conceptions of democracy.

Social movements often do not limit their interventions to single policies but challenge the ways in which political institutions work. Movements demand, and often obtain, the decentralization of political power, the consultation of interested citizens on particular decisions, or appeals procedures against decisions by the public administration. They also interact increasingly with public administrations: They ask to be allowed to testify before representative institutions and the judiciary, to be listened to as counterexperts, and to receive legal recognition and material incentives. In fact, social movements increase the possibilities for access to the political system, both through ad hoc channels relating to specific issues and through institutions that are open to all noninstitutional actors. In the late 20th and early 21st centuries, social movements have indeed been able to introduce changes that move toward greater grassroots control. They have produced a change in political culture, in the whole set of norms and reference schemes that define the issues and means of action that are politically legitimate. Repertoires of collective action, which were once condemned and dealt with simply as public order problems, have slowly become acceptable, and new policy arenas have been created on issues of major concern for social movement activists (see, e.g., environmental or gender rights agencies). Not only were some public bureaucracies established under the pressure of movement mobilizations and movement activists regarded as potential allies, but also movement activists have been co-opted into specific public bodies as members of their staff. The public administrators working in these institutions mediate particular social movement demands through both formal and informal channels and frequently ally themselves with movement representatives to increase the amount of public resources available in the policy areas over which they have authority. They tend to have frequent contacts with representatives of the social movements involved in their areas, with the movements taking on a consultancy role in many instances. In addition, they sometimes develop common interests.

Social movement activists also maintain direct contacts with decision makers—participating in epistemic communities, made up of representatives of governments, parties, and interest groups of various types and persuasion. Nongovernmental organizations critical of neoliberalist globalization have, in particular, resorted to bringing pressure to bear at both the national and the international levels, cultivating specific expertise. From human rights groups to environmentalists, advocacy networks—composed of activists, bureaucrats belonging to international organizations, and politicians from many countries—have won significant gains in a number of areas, such as the protection of the environment or human rights violations. Some social movement organizations have, indeed, been highlighted as having not only increased in number but also strengthened their influence on the various stages of international policy making.

Most important, so-called participatory and deliberative institutional experiments have developed over the past 2 decades, especially at the local level. They are based on the principle of participation by "normal citizens" in public arenas of debate, empowered by information and rules for high-quality communication. Actors associated with social movements have intervened in the development of some of these experiments, sometimes as critical participants, sometimes as external opponents.

More generally, social movements have developed a fundamental critique of conventional politics, affirming the legitimacy (if not the primacy) of alternatives to parliamentary, liberal democracy. Especially since the 1960s, many social movements have supported the direct participation of citizens in public decision making, criticizing the delegation of decision making to representatives who can be controlled only at the moment of elections. Moreover, they seek to switch decision making to more transparent and controllable sites. In the social movement conception of democracy, the people themselves (who are naturally interested in politics) must assume direct responsibility for intervening in the political decision-making process. More recently, the normative debate on deliberative democracy has found resonance in some social movement organizations that have developed norms and practices of consensual decision making, stressing the need to improve the quality of communication. Some attention on the part of political theorists has also been focused on the role of social movements in the creation of alternative public spheres, free from state intervention.

In the global justice movement, in particular, several organizations have experimented with participatory, discursive models of democracy both in their internal decision making and in their interactions with political institutions. Internally, social movements have—with a greater or lesser degree of success—attempted to develop an organizational structure based on participation (rather than delegation), consensus building (rather than majority votes), and horizontal networks (rather than centralized hierarchies).

As far as the social movement critique of existing democracy is concerned, their search for an alternative cannot be considered as over. Not all students of social movement organizations agree that they have overcome the risk of producing oligarchies and personalistic leadership, the very problems at the center of their critique of traditional politics. Although it maximizes responsiveness, the direct democracy model has weaknesses as far as representation and efficiency are concerned. Problems of efficiency affect the success of movement organizations themselves; problems of representation concern the legitimization of new forms of democracy. The refusal by social movements to accept the principles of representative democracy can undermine their image as democratic actors, particularly when they begin to take on official and semiofficial functions within representative institutions, assuming the form of parties or public interest groups. Social forums, by bringing together heterogeneous actors, pay great attention to the quality of internal communication but with unequal results. These limitations notwithstanding, social movements have helped open new channels of access to the political system, contributing to the identification, if not the solution, of a number of democratic problems.

SOCIAL STRATIFICATION

Social stratification refers to the positions held by individuals and groups in the structures of inequality existing in a society. Specifically, it denotes the classification of individuals and groups into different categories on the basis of the amount of one or more privileges enjoyed by the members of each category and/or the intensity of power that they are able to exert over other people. In contemporary advanced societies, based on democratic political regimes and market economies, these categories are usually referred to as strata or classes, depending on the criteria chosen to identify them. Strata and classes are groups based on factual inequalities—that is, disparities produced by the workings of societies with legal systems stipulating the equality of all citizens before the law. Hence, strata and classes are open groups that individuals can enter or leave according to the acquisition or the loss, during their lives, of the characteristics defining membership of a specific class or stratum. By contrast, in most traditional societies, social inequalities were based on legal and/or religious rules that led to the formation of closed groups—such as castes, orders, or estates—to which people belonged from birth and for their entire lifetimes, with no chance of escaping from their initial condition. In this entry, the major factors determining social positions and various ways to group them into broader categories of strata and classes are discussed.

Social Stratification Systems of Advanced Societies

From an analytical point of view, the advanced societies comprise a plurality of institutional orders characterized by distinct systems of social stratification. For instance, within the political sphere, heads of states, prime ministers, and ministers of central governments perform more crucial roles and hold superior positions compared with those performed and held by members of parliaments, mayors, members of city councils, and the like. The latter, in their turn, are politically more influential than simple citizens. Indeed, even mayors and members of city councils can (a) take decisions regarding the needs and interests of different people and the whole community and (b) frame these decisions in legal rules. No simple citizen has this authority. However, some simple citizens can hold commanding positions in the economic sphere, such as chief executive officers of big corporations or proprietors of medium- and small-sized firms. Chief executive officers and entrepreneurs can determine the goals of their companies and firms, their organizational features, and the tasks undertaken by their managers and professionals. In their turn, managers and professionals are responsible for organizing the work of routine nonmanual employees, foremen, and skilled and unskilled manual workers. Obviously no white- or blue-collar worker can take any decision regarding the firm's economic strategies and organizational arrangements. As a consequence, they are placed at the bottom of the stratification system of the economic realm. Yet even national politicians have no direct role to perform in this sphere, and in no sense can they be considered as holding top positions in the relevant stratification system. Similar situations can be observed in the cultural and educational sphere, in the religious realm, and so on.

Though largely independent, the main institutional orders of contemporary advanced societies are not reciprocally disconnected. On the contrary, they are functionally interdependent. Educational systems and universities are required to produce not only intellectuals but also skilled workers for the economy. Moreover, a high level of schooling can be a useful asset in the political and economic arenas. In their turn, the workings of the economy, besides being dependent on the availability of suitably skilled labor, depend closely on infrastructural interventions, trade and tax policies, labor market regulations, and welfare and educational measures decided by central and local governments. Politics can take even more incisive action in the economic realm by determining specific financial support in favor of individual sectors or firms to prevent unemployment episodes or to guarantee the survival of economic activities considered as crucial national or local assets. In parallel, the economy, through taxation, supplies politics with the financial resources needed to develop public policies and to pay the costs of political assemblies, related bureaucratic bodies and administrative staffs, the army, and so on. Furthermore, companies, firms, and actors with higher positions in the economic sphere can influence the workings of the political realm by selectively funding parties and politicians.

Owing to the functional interdependence among institutional orders, those who perform superior roles and hold higher positions in one such order can influence both their counterparts in other orders and, even more so, those occupying subordinate roles in them. As a consequence, the incumbents of higher positions in the political system, for instance, are usually able to secure advantages for themselves, civil servants, and related social groups. In a similar way, people in higher positions within the cultural sphere are frequently able to obtain sizeable material and symbolic privileges. Moreover, they are quite often able to use these advantages and their cultural capital to achieve desirable standings in the political or economic sphere. Obviously, the same holds for the incumbents of higher roles in the economic or other institutional realms. These people may also use their power and privileges to obtain social acknowledgments and honors and to pursue political careers. By contrast, people occupying lower positions within an institutional order can only with difficulty compensate for their disadvantages by exerting some kind of influence in other social realms. It is decidedly more likely that they will play subordinate roles in the latter as well.

It is precisely because advantages and power linked to one specific structure of inequality can be transformed into advantages and power linked to other forms of social disparity that most social scientists maintain that there exists a general system of stratification in contemporary advanced societies. This general system is thought to be much more important than those existing within each individual institutional order: first, because it involves all members of a society, and second, because it concerns the overall living conditions of persons and groups. The roles underlying the positions held in specific systems of stratification are usually made up of occupations. This is all the more so in the case of a general stratification system. Obviously, occupation is not the sole feature conditioning the allocation of persons and groups in specific and general systems of stratification. Gender, generation, race, ethnicity, educational credentials, level of technical skills, type of social competencies, and so on can operate as factors generating several specific forms of inequality and hence influence the positions of individuals in the relevant stratification systems. Yet the vast majority of social scientists maintain that, in advanced societies, several inequalities—and hence the overall social positions of persons—mainly depend on the occupation that they (or the members of their household) perform. Indeed, crucial aspects of the disparities observed in people's living conditions—such as income, consumption, prestige, health, psychological well-being—are deeply affected by occupations. As a consequence, all the schemes developed by social scientists during the past 50 years to represent the main features of general stratification systems have used occupations as their observation units.

Despite this basic similarity, the stratification schemes and measures developed by social scientists differ substantially. A fundamental distinction can be made depending on which aspect of social inequality—distributional or relational—is the main concern. Distributional disparities refer to the amount of a privilege, or a set of privileges, enjoyed by different groups of people. Relational inequalities concern power disparities occurring between these groups and their capacity both to condition the conduct of other groups and to successfully fulfill their interests and choices. These two aspects of inequality are connected. Power is a means to achieve social advantages, while advantages can be used to achieve power. However, precisely because they are conceptually distinguished, the distributional and relational aspects of social inequalities can be studied separately.

Social Strata and Occupational Stratification Scales

Some scholars focus on the distributional aspect, arguing that it is more directly linked to the disparities among the living conditions of individuals and groups. As a consequence, they maintain that general stratification systems are made up of strata. Indeed, a social stratum can be defined as a set of individuals and families who share similar living conditions because they enjoy similar amounts of one or more advantages. Strata form a linear hierarchy in which each of them (except the highest and the lowest) is adjacent to two other strata: one standing above and one standing below. The reason why strata form a completely ordered hierarchy is that privileges are gradational properties. For instance, it may happen that the poorest family in a country does not possess anything. But it is not true that the wealthiest family possesses the entire national wealth. It possesses only a part of it. Moreover, between the poorest and the wealthiest families lie numerous other families who own intermediate amounts of wealth. In principle, one may say that each individual person or family possesses a different amount of wealth and hence that the number of strata identifiable on the basis of the distribution of this characteristic is virtually infinite. Yet social scientists tend to identify a discrete and reasonably small number of positions by grouping together persons and families with similar amounts of privilege(s) and hence rather similar living standards.

Usually, individuals and families are grouped in each social stratum by means of statistical procedures that lead to the specification of stratification scales, where each stratum is given a specific score (and hence a rank). In their turn, the scores are intended to measure the entire range of inequality underlying the distribution of one or more privileges, to define the distances (in terms of strength of inequality) between the various strata, and to express the specific position occupied by a given stratum in a stratification system. Social scientists have developed stratification scales of various kinds. A first distinction differentiates between analytic and synthetic scales. The former refer to just one privilege, whereas the latter pay attention to (more or less formally specified) combinations of several privileges. Analytic scales mainly regard income and prestige. Income scales are intended to identify the economic disparities among socio-occupational strata, while those based on prestige (in the strict meaning of the term) are intended to identify status groups and the amount of honor, deference, respect, and social consideration they receive. Synthetic scales intend to measure the overall social standing of socio-occupational strata by combining two or more privileges—for instance, income level, amount of social prestige, intensity of psychological gratification, degree of autonomy in performing job tasks—typically associated with the occupations belonging to a stratum.

Besides their synthetic or analytic character, socio-occupational scales can be distinguished on the basis of the information used in their construction. Objective scales rely on data sets recording factual properties of occupations (e.g., the amount of salary or wages, the intensity of unemployment risks) or their incumbents (e.g., education level, technical skills, the occupations of friends and spouses). Subjective or reputational scales are based on surveys that collect popular evaluations of the overall social standing of occupations. It is to be noted that, despite their subjective foundations and the considerable changes that the occupational structures of advanced societies have undergone, these scales prove to be rather stable over time and across countries. This indicates that the mechanisms underlying the generation of socio-occupational strata are similar in most countries with a market economy and a democratic political regime and that the new occupations produced by technological progress do not alter the basic features of individual strata and the related stratification system.

Social Classes and Class Schemes

Class schemes furnish representations of social stratification alternative to those based on socio-occupational strata and scales. A class can be defined as a social category made up of individuals and families who possess the same power assets and hence hold the same positions in the overall system of social relations of domination and subordination existing in a society. The reason why some scholars prefer to represent social stratification in terms of class schemes is quite simple. They argue that distributive inequalities ultimately depend on relational disparities.

Most class schemes envisage stratification structures based on a rather small number (5–15) of different positions—in other words, different classes. This is so because power resources (or effective combinations of some of them) are rather scarce and the control exerted over each of them by individual classes is either (almost) complete or (almost) nonexistent. Indeed, if a power resource were gradually distributed between classes, no class could dominate another. As classes are rooted in relational inequalities, they do not necessarily form a linear hierarchical order. It may happen that two or more classes, controlling different power resources, stand in a position of reciprocal equilibrium. Nonetheless, classes give rise to a partially ordered social hierarchy in which higher classes dominate the remaining ones and in which middle classes are dominated by higher ones but in their turn dominate lower classes.

Because the amount of the power assets controlled by members of a given class can vary, as well as their ability and opportunities to exploit it, classes are internally stratified. However, according to scholars who adopt a class perspective, the inequalities in living standards that may occur within classes are markedly smaller than those observed between classes. Despite the unavoidable internal heterogeneity of classes, the boundaries among them are far less conventional than those drawn among strata. Indeed, it is the control, or the lack of control, over power resources, rather than the decisions of scholars, that automatically define the class positions and the class memberships of individuals and groups.

Most class analysts maintain that, in advanced societies, the process of class formation is mainly influenced by power relations in the economic sphere. In their turn, these power relations depend on the power assets controlled by the members of individual classes. Four types of power assets are usually identified:

1. means of production,
2. educational qualifications and technical skills,
3. labor power, and
4. control over organizations exerted by top and middle managers and civil servants.

Power resources, however, are not equally effective. Control over the means of production and organizations furnishes greater power than that afforded by the possession of educational credentials or technical expertise, and all of these guarantee greater influence than that furnished by simple labor power. It is essentially this inequality of effectiveness that engenders the specific relations between classes. Power assets can be combined, and the social position of some classes is defined precisely by their combinations. This is typically the case of self-employed workers owning very small firms and frequently labeled the *petty bourgeoisie* (shopkeepers, plumbers, electricians, mechanics, stockbreeders, vinedressers, etc.). Indeed, they possess their own means of production, have specific technical expertise, and directly contribute with their own labor to the operation of their small firms. A similar case can be made for self-employed professionals (lawyers, financial consultants, architects, and medical doctors). Their class position is based on the possession of both high educational credentials and means of production. Obviously, numerous people are equipped with high educational credentials or technical skills, and everybody is endowed with his or her own labor. But in many cases, these assets are intangible and can be ignored. The class positions of entrepreneurs and chief executives entirely depend on their control of means of production. Indeed, an entrepreneur remains an entrepreneur even though she or he may be in poor health and does not possess any educational qualification.

As in the case of socio-occupational stratification scales, social scientists have developed several definitions of classes and numerous class schemes. However, those linked to the Marxist and Weberian traditions are still the most influential. Neo-Marxist scholars maintain that classes are rooted in the social relations of production and the related processes of exploitation. However, they acknowledge that the social stratification of advanced societies is much more complex than envisaged by Marx in the mid-19th century. They state that, besides the bourgeoisie and the proletariat, there are classes whose members are simultaneously exploited by the owners of means of production and are exploiters of the working class. These middle classes are distinguished according to the amount of educational and professional credentials possessed by their members and the control that they can exert over the organizational arrangements of firms and public bureaucracies. Moreover, neo-Marxist authors maintain that the owners of means of production do not form an entirely homogeneous class, and they split them among the bourgeoisie (i.e., entrepreneurs and chief executive officers of large- and medium-sized firms), small entrepreneurs (owners of firms with a small number of employees), and the petty bourgeoisie (i.e., the self-employed with at most one or two employees).

Authors who adopt the neo-Weberian perspective draw up their class schemes by considering both the work and the market situation of individuals and groups. In their opinion, the process of class formation does not revolve solely around the social division of labor; it also revolves around the economic life chances of individuals and groups. In their more recent developments, neo-Weberian representations of class structure first separate employers from the self-employed and employees and then group employers into three classes: large employers, small employers not in agriculture, and small employers in agriculture. The same sectoral distinction is performed for the self-employed. Finally, employees are allocated to different classes mainly according to the employment relations between them and their employers. Two main dimensions underlie the forms of employment contracts usually available in the labor markets of advanced societies: the (high or low) specificity of the human assets possessed by employees—that is, their level and kind of technical and social abilities—and the (high or low) difficulty of monitoring their work by employers. The combination of these two dimensions produces three basic types of contract: (1) service relationship, (2) labor contract, and (3) mixed forms of service relation and labor contract. These contractual categories are then internally subdivided according to the usual organizational roles of the relevant employees and/or the economic sector (industry and services vs. agriculture) in which they work.

Recent Developments

In recent years, the two standard approaches to the study of social stratification have progressively converged, and currently, several lines of empirical inquiry on social inequalities are carried out using class schemes or socio-occupational scales indifferently. This convergence has been produced by the increasingly detailed information about interviewees' occupations collected by socioeconomic surveys, the progress achieved in the statistical techniques used for the relevant analyses, and the conviction that both ways to express social positions of individuals and groups can be useful in clarifying the effects of these positions on specific inequalities and the mechanisms underlying them.

The convergence of the class and stratum perspectives has not increased their popularity among social scientists, however. On the contrary, both have been challenged by authors who maintain that strata and classes are disappearing, or have already disappeared, from contemporary advanced societies. In the opinion of such authors, social inequalities are becoming increasingly fragmented on an individual basis. Two main arguments are put forward to support this thesis. First, advanced societies have undergone a long process of institutionalization of individualism: that is, a process that places personal rights and personal independence at the center of cultural, political, economic, and juridical arrangements. As a consequence, collective entities, such as professional associations, local communities, classes, strata, churches, and even families, are increasingly less able to shape the life trajectories and destinations of individuals. Second, the globalization of the economy exposes everybody, no matter how privileged in their current social positions, to increasing risks of suddenly lapsing into unemployment, financial hardship, poverty, multiple deprivation, and similar distressful situations.

Social stratification scholars react to the thesis of the individualization of social inequalities by maintaining that it has not yet received convincing empirical support. These scholars admit that advanced societies are experiencing a secular trend toward emancipation of individuals from the strict social control exerted in the past by different communities. But they also point out that a large body of empirical analysis has shown that several different expressions of crucial inequalities—such as those regarding educational opportunities, intergenerational mobility and career chances, risks of unemployment, level of income and wealth, and health conditions—and even the mating selection process are still linked to the class and stratum of origin and current belonging. Authors supporting the thesis of the crystallization of inequalities around classes and strata recognize that the latter are less socially visible than they were at the beginning of the industrialization process. Moreover, they acknowledge that contemporary advanced societies are becoming somewhat more socially fluid and open. But they stress that this movement toward greater social fairness is feeble and slow, so that most of these societies still exhibit highly effective processes of social closure structured around strata and classes.

Indeed, as shown by the experience of the Nordic countries, only systematic and long-lasting policies aimed at increasing levels of social equality can guarantee a stable reduction of social disparities. In the past 10 years, however, these policies have been weakened everywhere by both the increasing popularity of market-oriented economic thought and the more recent negative effects of economic recession.

SOCIALISM

By the final third of the 19th century, socialism had emerged in Europe, both as a critique of liberalism and as the only comprehensive alternative to it. In this sense, socialism was an intellectual reckoning with the world created by the British industrial revolution and the French Revolution of 1789, and it was initially confined to dissident groups within these two countries. But like its main ideological rival, socialism came in many competing, dynamic varieties. Uniquely, socialism in all of these varieties was concerned with understanding the world both as it is and as it might be or would become. As such, it represented an alternative socioeconomic system to capitalism based on principles of egalitarianism and collectivism. The main currents of socialism also became champions of democracy.

Origins and Early Development

Socialists and liberals drew on a common stock of Enlightenment assumptions. In this view, humankind had struggled successfully to control nature by the application of reason. History was an ascent, though one in which irrationalist forces had obstructed the march of progress and were yet to be swept away completely. Reason applied to human affairs could in principle produce the same advances as science had already made possible in the effort to understand and subdue nature. The social world was the work of humanity, and human beings could understand its evolution and promote their self-improvement in the process.

Radical and dissident opinion within the Enlightenment pointed beyond mainstream liberalism and inspired future socialists. Thomas Paine, for example, had shown the imagination and audacity to advocate old age pensions, land nationalization, more liberal marriage and divorce laws, family allowances, free education, and a host of other reforms that became part of the social-democratic program in the 20th century. Jean-Jacques Rousseau contradicted his Enlightenment peers in the mid-18th century by identifying civil society (and the division of labor) as the source of inequality, which the political superstructure merely legitimated and protected. He also stressed the iniquities of private property, the multiplicity of artificial wants and the dependencies they generated, and the growth of invidious distinction, base rivalry, and competition that emanated from the same quarter. Where mainstream liberalism saw only progress, Rousseau saw also "an assembly of artificial men and factitious passions."

Rousseau blamed these discontents on the whole course of civilization, whereas the socialists accepted that industrialism, its most recent phase, was here to stay. It was capitalism that would have to be reformed or overthrown. For large sections of the population, the first industrialization (in Britain) was experienced as a social and economic catastrophe—the destroyer of community, family, environment, and the quality of life in general. The motivating force behind this "great transformation" was individual profit. The socialists did not deny that wealth and technological advances were associated with this change, but they were also concerned with understanding and overcoming its destructive and divisive features. A new language was developed. It gave us terms such as *working class*, *industrialism*, *capitalism*, and *middle class*. In November 1827, the word *socialism* appeared in print for the first time in the *Co-operative Magazine* in Britain. The argument was now set forth that the problems of the new society were not attributable to industry as such but to capitalism in particular.

Robert Owen, himself a factory owner, had for 10 years previously argued that the source of problems such as poverty lay in unrestrained competition. The answer lay in the principle of cooperation. Owen was a firm believer in social engineering; human beings would improve as their environments were altered to induce desired changes in behavior, health, morals, educational attainment, and so on. He thus believed that the suffering created by capitalism was avoidable. He changed his factory regime at New Lanark in Scotland to demonstrate in practice that pauperism, squalid housing, chronic ill health, and unemployment were unnecessary evils. In 1813, he published an account of these changes in *A New View of Society*. At first, Owen argued that profits would improve rather than be damaged by such enlightened reforms. Later, as his ideas developed, he denounced property, religion, and the family—forfeiting his respectability in elite circles in the process. He turned to funding egalitarian and communitarian experiments in the United States, such as the one at New Harmony in Indiana, begun in 1826. After the Great Reform Act of 1832 failed to enfranchise the working class in Britain, Owen, who had returned to London, associated himself with both the cooperative movement and the creation of the Grand National Consolidated Trade Union. His followers in Britain strengthened their critique of capitalist exploitation by developing the argument that labor was the source of all wealth—a doctrine inspired by the labor theory of value expounded by David Ricardo in *Principles of Political Economy and Taxation* (1817).

Meanwhile, in France, the radical reconstruction of society was an ambition promoted and legitimated by the revolution of 1789. The principles of this revolution—expressed in the name of "the people"—included the "rights of man" and "liberty, equality, and fraternity." These ideas had international resonance and were opposed internationally by the counterrevolution of the aristocracy and monarchy. France was involved in a virtually continuous war between 1792 and 1815. In 1793, the most radical wing of the revolutionary leadership, the Jacobins, seized power in Paris in circumstances of French military reversals. The Jacobin dictatorship itself was overthrown a year later, and a process was begun that promoted the army and the person of Napoleon Bonaparte. The most extreme radicals in the Jacobin milieu began to conclude that the revolutionary dynamic had been stopped at the point where it benefited only the bourgeoisie. They now formulated demands of economic as well as political equality. This Society of Equals, a Parisian political club led by Gracchus Babeuf, was suppressed by Bonaparte himself. But before Babeuf and the leaders were executed in May 1797, the Society of Equals had laid the foundations of a communist political current stressing abolition of private property in land, the need for social planning, the provision of state-supplied basic necessities to ensure a national minimum standard of life, communal living arrangements, the universal obligation to work, and the abolition of divisions of rich and poor.

After Napoleon's final defeat, the principal object of the victors at the Congress of Vienna in 1815 was to suppress "the Revolution." But the Jacobin and Babouvist traditions were kept alive in France by men such as Filippo Buonarroti (1761–1837), Etienne Cabet (1788–1856), and Louis-Auguste Blanqui (1805–1881), who stressed the need for a revolutionary dictatorship to complete the unfinished business of 1789 in the creation of a new social order based on a radical egalitarianism. These doctrines commanded support within the urban working class, as the insurrections of 1830 to 1848 in cities such as Lyons and Paris showed. The secret societies of the French communist tradition, though they envisaged a world without class distinctions, were less successful in elaborating theoretical alternatives to bourgeois society. This was better accomplished by socialist reformers such as Charles Fourier (1772–1837) and the Comte de Saint-Simon (1760–1825), who separately elaborated detailed schemes—many of them frankly fantastic—and seminal ideas that others (including Karl Marx and Auguste Comte) would take forward in different ways.

Saint-Simon and his followers believed that they were developing a science of society that disclosed the centrality of production and consumption. They argued that scientists and producers must be at the top of any rational hierarchy of merit and should play a major role in the government of the future, committed as it would be to the scientifically planned improvement of humanity. Saint-Simon's vision of progress imagined such elites—including the propertied elite—exercising an enlightened self-interest by solving conflicts of interest with the improvement of the poor in mind. This was the way to avoid violence and increase the security and prosperity of the propertied, as well as to promote the good of society as a whole. In elaborating his doctrines, Saint-Simon parted company with liberal individualism, embraced feminism and pacifism, and imagined pan-European structures of cooperation. He also inaugurated forms of Christian socialism (in his *Nouveau Christianism*). His ideas spread across Europe in the years up to 1848, thanks to the work of followers such as Barthelemy Enfantin, Amand Bazard, and Pierre Leroux, who systematized the chaotic original.

Charles Fourier's (1772–1837) thoughts were even more detailed and confused than Saint-Simon's but no less original and provocative. Fourier championed feminism and cooperation as keys to, and measures of, social progress. He proposed and set up model communities, which he called *phalanstery*, based on assigning individuals to jobs for which they were suited. In describing these communities, Fourier ignored no detail of social organization. But his big ideas centered on the relationship between environment, education, and character. From a competitive, selfish, exploitative system could come only greedy, dishonest people. The influence of Rousseau is evident, as indeed it is in Saint-Simon's thinking. Fourier's best known follower, Victor Considerant (1808–1893), also championed the "right to work" and was prominent in the 1848 revolution in Paris as well as the First International Working Men's Association, established in 1864.

Saint-Simon, Fourier, and Owen were known to later socialists by the collective name given to them by Marx (1818–1883) and Friedrich Engels—the Utopian Socialists—largely because their schemes depended on methods of persuasion, education, and example, which the founders of "scientific socialism" deemed impractical. Marx and Engels were nevertheless converted to socialism through the work of these pioneers and their German followers (e.g., Wilhelm Weitling and Moses Hess). In 1842, an observer such as Lorenz von Stein could associate socialism in France with peaceful reform and detailed thinking about the nature of reform, whereas *communism* signified, according to the same author, a revolutionary rejection of existing society, with proletarian roots, stressing the need for practical actions to overthrow the status quo. The French Revolution had bequeathed both the Jacobin model of the dictatorial, insurrectionist vanguard—kept alive by the secret societies—and the ideal of a republican democracy. Louis Blanc (1811–1882) became the best known exponent of the latter, arguing that any social change to socialism had to be democratic. But the insurrectionary tradition survived not the least because the urban working class was everywhere a small minority except in Britain, and it was far from clear that a "democratic revolution," as suggested by Blanc and the German émigré Moses Hess, was possible. Even in Britain, the remarkable campaign of the Chartists (1837–1848) for male suffrage came to nothing, and socialism itself disappeared from view in that country until its revival in the 1880s. From the perspective of Europe in the 1840s—a continent still consisting predominantly of peasants and autocracy—socialism as a reforming movement of the working class was a nonstarter. Yet the work of Marx and Engels made this very connection.

Marx and His Legacy

Marx came to socialism via German philosophy, especially the work of G. W. F. Hegel (1770–1831) and the critiques of Hegel associated with Ludwig Feuerbach and the Left Hegelians. He shared Hegel's idealization of the Greek *polis* and the conviction that the modern world was scarred by fragmentation and alienation. He also adopted Hegel's dialectical method while giving it a materialist foundation not found in Hegel's own philosophy. In Paris from 1843, Marx encountered the proletariat for the first time and studied the works of the mutualist socialist Pierre-Joseph Proudhon as well as those of the Utopians. He learned more about the working class through Engels's *The Condition of the Working Class in England in 1844*, the product of the author's investigations in Manchester since 1842 and his knowledge of Owenite, Chartist, and trade union circles. Together, Marx and Engels were active in German communist émigré circles in Brussels between 1845 and 1848, and it was here that they were commissioned to write a manifesto for the clandestine Communist League. Their involvement in the revolutions that swept across Europe from Paris in 1848 led Marx to permanent exile in London a year later. He devoted his studies from this time to the critique of capitalist political economy, culminating in the publication of the first volume of *Das Kapital* in 1867.

Marx's intellectual revolution effected the single most important development of socialist thought. He argued that the economic basis of society—its mode of production—determined its social and political structures. On this foundation, social classes arise, and it is conflict between classes that generates historical change. In capitalist society, the basic classes in conflict were those of the bourgeoisie—the owners of capital—and the proletariat. Marx regarded his greatest insight as the theory of surplus value, which showed the way in which capitalists exploited their workers. Such exploitation was an integral structural feature of capitalism and would persist for as long as capitalism existed. But the development of capitalism would lead to class polarization, periodic crises of overproduction, and opportunities for the emergence of proletarian class consciousness. Eventually, when objective conditions and subjective class consciousness were aligned, the proletariat—the vast majority in a mature capitalist economy—would overthrow the system of exploitation and the political institutions that served to legitimate and defend it. This is how socialism would emerge as the successor to capitalism in the march of human progress.

Most of what Marx and Engels wrote remained unpublished or unread outside the small groups of British and German socialists with which they had contact in the 1840s, 1850s, and 1860s. During this period, their thinking moved emphatically against the mentality of the secret societies in favor of revolutionary change as the product of open, mass struggles arising from conditions generated by capitalism itself. When the First International was formed in 1864, with Marx as a foundation member, it brought British trade unionists, French Proudhonists, German Communists, and anarchist followers of Michael Bakunin together. Marx failed to convert the trade unionists to his vision but succeeded in marginalizing the anarchists, Blanquists, and Proudhonists, even at the cost of relocating the International to New York City in

1872 and thereby effectively terminating it. But there were other, more important indications that Europe was moving in the direction Marx expected, such as the spread of industrial capitalism, the growth of trade unionism and class conflict, and the creation of nation-states in Italy and Germany, which Marx believed would pave the way to the formation of united workers' movements. The German Workers' Association had already been set up by Ferdinand Lassalle in 1863 to press for universal suffrage and socialism through the existing state machinery. Marx's own followers were involved with those of Lassalle in creating the Social Democratic Party (SPD) in 1875. Throughout this period and up to Engels's death in 1895, the "Marxists" in Germany were guided by the doctrine's founders, such that the SPD as a whole could be called a Marxist party by the 1880s. After Marx's death in 1883, Engels did what he could to systematize and codify the doctrine for the widest dissemination, establishing contacts throughout Europe as he did so, watching as the SPD moved from strength to strength and new Marxist parties were created across the continent, coming together in a new federation of national parties in 1889 as the Second International.

Socialism nevertheless lost none of its capacity for disputation and dissent. In part, this was because it continued to display a dual temporal existence, being both an account of the world as it was as well as an account of the world as it might be. On both counts, there was enormous scope for disagreement. There was the question of how the transition would come. Would it be revolutionary or by incremental reform, would the transition be peaceful or violent, and would it be dependent on skilled leadership or the result of blind economic forces or some combination of the two? One important variable in providing answers to these questions was national. The Marxist parties themselves were noticeably more committed to an insurrectionist reading of Marx the more one travelled east across Europe and into the zones of autocracy, censorship, and political intolerance. In Russia, Marxists argued among themselves about the need for a prior bourgeois-democratic revolution and their role in relation to it. But there was no argument that they had to organize clandestinely and that any political work that they did was necessarily illegal. By contrast, socialism in England, when it came back to life in the 1880s, developed in circumstances of emerging parliamentary democracy and a strong liberal tradition that accommodated currents sympathetic to state-sponsored social reform. In Germany, the most successful socialist party of them all, the SPD, was practically divided and ideologically challenged from within by "revisionism" as the century came to an end. Meanwhile, in the United States of America, it was noticed in the first decade of the 20th century that the most powerful industrial nation on earth had failed to produce a socialist movement of corresponding size and significance. Thus began enquiries into "American exceptionalism," but even in the heartland of socialism, there were well-developed doubts about the Marxist analysis of capitalism and its inevitable demise.

In theoretical terms, it was Eduard Bernstein, a protégé of Engels himself, who questioned whether the evidence supported Marx's vision of class polarization, working class immiseration, capitalist breakdown, and the necessity of a revolutionary rupture. Instead, he pointed to the persistence, even growth, of multiple class strata, the need for class allies, the evidence of improvements in living standards, and the prospect of further gradual change via the ballot box. In practice, sections of the SPD—notably the Reichstag *Fraktion* and the trade unions—were already home to strong reformist currents. Though the "revisionism" debate (1898–1903) was concluded with apparent victory to the revolutionaries, events soon showed how misleading this was. In August 1914, the major powers of Europe went to war, and the SPD initially supported Germany's war effort with as much enthusiasm as the avowedly reformist Labour Party supported Britain's. The immense strains engendered by the war in all the belligerent countries eventually brought revolutionary Marxists to power in Russia in November 1917. Lenin's Bolsheviks moved quickly to establish a rival Third (or Communist) International in 1919, and by 1921, communist parties had been formed in most European countries.

The Russian Revolution and Its Aftermath

Ideologically, the consequences of World War I and the Bolshevik seizure of power in Russia were immense. Lenin was able to argue persuasively that the war signaled the beginning of "an epoch of wars, civil wars and revolutions" in which bourgeois democracy would wither and the prospects for meaningful reforms recede. The empirical evidence of the interwar years—economic dislocation, the world crisis sparked by the Wall Street Crash, and the rise of fascism—did not contradict this reasoning. Nor did growing conflict in the colonial world, for which the Bolsheviks claimed a special relationship as the first revolutionaries to embrace anti-imperialism as a foundation value and permanent project. In these circumstances, Communists were persuaded to model themselves on Lenin's Bolsheviks. A party once justified as a necessary adaptation to Tsarist persecution was now the model for all Communists, whether in England or China. The Jacobin tradition was restored, not the least in the dictatorial way in which the Bolsheviks purported to represent the workers and peasants of the old Tsarist Empire.

World interest in the Union of Soviet Socialist Republics (USSR), as it was known from 1922, massively increased after 1930 when the global capitalist economic crisis coincided with the apparently successful inauguration of Soviet Five-Year Plans. Socialism became increasingly associated with the idea of state-centered planning. Soviet prestige was also enhanced by its role—real and imagined—in the struggle against fascism and Nazism, culminating in the expansion of the Soviet sphere as far west as central Europe in 1945. Thereafter, the Soviet Union was perceived as a model of how conscious economic planning could transform a backward, peasant society into a modern, industrialized, technologically advanced state, free of foreign domination. Throughout the Third World, socialism and the Soviet Union exercised this appeal almost until the final dissolution of the USSR in 1991. Socialism was equated with modernization, social progress, and various forms of unity in the first decades after World War II, giving rise to claims for specific forms of African, Arab, Islamic, and Third World socialism. In postcolonial Africa, in countries marked by "poverty, ignorance, disease and illiteracy," as Kwame Nkrumah itemized the legacy of imperialism, leaders arose such as Julius Nyerere of Tanzania, who pointed to precolonial forms of collectivism and egalitarianism on which an indigenous socialism could be built. There was no disguising, however, that socialism appealed because the high road to prosperity and real independence was thought to lie with industrialization and rapid modernization under the direction of the Plan.

In the advanced capitalist countries of Western Europe, the reformist parties that regrouped as the Labour and Socialist International in 1923 were led by men who emphatically denied the socialist credentials of the Bolsheviks precisely because of Lenin's violent and undemocratic methods. The dictatorship of Lenin's successor Stalin provided gruesome support for their insight. But it was not until the long period of full employment and prosperity following World War II that they could boast a coherent alternative to Soviet socialism. This "Keynesian" alternative depended on the belief that democratically elected governments could steer economies to ensure annual economic growth. By this means, the goals of socialism could be obtained: full employment; an egalitarian distribution of income, wealth, and opportunity; the elimination of poverty; and the end of economic crises and their destructive consequences. Social-democratic Sweden was the shining model of this approach as late as the 1970s, though the left wing of the social-democratic parties continued to insist on the need to further reduce private economic power.

The Crisis of Socialism

In the years 1970 to 2000, socialism in all its varieties entered a profound crisis. Economic stagnation and authoritarianism in the communist world led eventually to the collapse of these regimes in Eastern Europe in 1989 and finally the Soviet Union itself as the communist leaders failed in their attempts to reform the system from within. Socialism as an alternative system lost its powers of attraction because of this failure, coming as it did on top of the moral calamity of communism, with its death toll of millions, which some socialists had forecast shortly after the Bolshevik seizure of power but which others had ignored for as long as they could. Meanwhile, social democracy entered a period of ideological retreat as the Keynesian approach broke down in the 1970s, and the future of the welfare state was called into question by long-term changes in the structure of societies and markets. The term *globalization* was often invoked as a shorthand for these subversions of the old social-democratic paradigm. Though radical ideas of left-wing provenance continued to develop after 1970, socialism had ceased for the foreseeable future to provide them with a coherent vision of an alternative social system.

SOCIALIST PARTIES

Socialist and social-democratic parties are the main and the most electorally successful party family of the Left. The first socialist parties appeared in Europe during the last quarter of the 19th century as a result of the politicization of the class conflicts generated by the Industrial Revolution. The formation of socialist parties was one of the outcomes of the cleavage between capital and labor and of the political mobilization of the working class. This entry discusses the origins, programs, and political role of these parties.

Prior to World War I, there were socialist or social-democratic parties or candidates in almost every European country and in some states in other regions of the world (Australia, New Zealand, the United States, and some Latin American countries). In some cases, they were part of a subculture milieu in which a socialist mass-party organization was linked to a trade union and to a network of ancillary groups. In its early years, the European socialist or social-democratic parties emphasized some core ideas concerning the transformation of capitalist societies into more egalitarian ones built on solidarity, cooperation, and social justice. These parties, many of them Marxist, postulated the end of human exploitation, class divisions, and economic inequalities. The 1940s witnessed the expansion of socialist parties to places distant from their European origins, as some anticolonial organizations adopted socialism as their ideology in Asia and Africa. However, this phenomenon resulted in the formation of parties that—from the ideological point of view—could only partially be considered socialist given their combination of a socialist ideology with anticolonial and nationalist ideas.

The socialist movement experienced, almost since its birth, divisions over its program and policies for the transformation of capitalism (e.g., concerning the role of the state in the management of the economy) and over the best strategies to achieve it (e.g., divisions between reformists and revolutionaries). These debates among parties and leaders were already present in the First (1864) and Second (1889) International Working Men's Associations. In his analysis of electoral socialism, Adam Przeworski argues that the early socialists confronted three choices: (1) whether to achieve socialist goals from within or from outside the political institutions of capitalism, (2) whether to trust exclusively in the working class as the agent of socialist change or whether to appeal to other social classes as well, and (3) whether to transform society through partial reforms or to devote all efforts to the final abolition of capitalism. The responses to these three choices caused internal strife, shaped the evolution of the socialist parties, and contributed to differentiate them from other left-wing organizations.

The socialists decided to participate in elections. In doing so, socialist parties tried to take advantage of the political rights that capitalist societies accorded to the workers as a means to achieve improvements in their life conditions. This option clearly differentiated socialist parties from "abstentionist" streams of the workers' movement, such as the anarchists. Despite the acceptance of the electoral process to win political power, within the socialist parties, there was a certain ambivalence about the need to eventually use revolutionary means to conquer political power or to defend it once attained by peaceful means. However, democracy eventually became not just the main path to socialism but the parties' very goal. In a certain sense, the ideal defended by socialist parties consisted in the extension of democratic political principles to the economic and social domains. The abandonment of revolutionary roads to gain power differentiated socialist and social-democratic parties from other groups of socialist and Marxist origin, such as the Communists.

Socialist parties originally opted for the electoral route to obtaining improvements in the living conditions of their electorate and to extend its influence among working class voters, but they were also convinced that this path would give them political power relatively easily. They believed that they would win elections in the short to medium term, given the unstoppable growth of the working class inherent in capitalism. However, the working class did not grow to become the social majority in most capitalist societies, and in any case, it never voted as a single cohesive electoral bloc as socialist leaders and intellectuals had hoped for. Under these circumstances, the socialist parties were confronted with the decision either to appeal to other social groups, if they wanted to maximize their votes and their possibilities to form governments in Western countries, or to remain a minority party appealing to an exclusively working class constituency. They decided to build a multiclass electoral coalition that reflected the evolution and differentiation of the social structure of capitalist societies. This wider electoral coalition—at least in class terms—blurred many socialist goals. In any case, the socialist project, regardless of the class orientation of its appeals, hardly attracted the support of a clear majority of the electorate in many countries during the first decades of its development. Hence, socialist parties rarely had the opportunity to implement their program without incorporating other political allies.

The socialist program was characterized by its reformist nature. This feature also differentiated socialist parties from other revolutionary and radical groups. In its original implementation, these reformist policies were understood as steps in the path toward the complete and future transformation of capitalist society, following the socialist ideal. Therefore, socialist parties originally believed that the accumulation of economic and social reforms would eventually produce a radical transformation of the social order in a socialist way. But what was far from clear was what these reformist economic socialist policies should exactly be. The socialist parties were formally favorable to the nationalization or socialization of the means of production. However, once the socialist parties were in government during the end of the 19th and first third of the 20th centuries, hardly any overarching policy of nationalization took place in Western Europe. Despite their electoral successes, socialist parties did not gain enough political and electoral support to promote their own programs. Furthermore, they did not want to risk their political prestige in a policy they were unsure how to implement and that could find strong resistance. In the absence of a well-defined and differentiated socialist economic policy, socialist parties promoted public policies directed toward the expansion of social welfare through different plans on housing, health, salaries, unemployment, and so on.

In the 1930s and 1940s, some West European socialist parties began to defend and to implement Keynesian policies to regulate the economic crisis and to reduce unemployment. The socialist parties defended an active role of the state in the economy, anticyclical policies, public investment, and public debt, aiming to maintain jobs and to reinvigorate the economy. After World War II, socialist parties generally adopted Keynesian policies to regulate the economy; the projects of nationalization or socialization were almost forgotten, nationalizations were rarely implemented (although some took place during postwar economic reconstruction), and the parties assumed a non-Marxist program for the increase of equality and social justice within the limits of capitalism. Consequently, the possibilities of an advancement of equality were linked to the expansion, inclusiveness, and redistributive efforts of state intervention and of social welfare programs. However, in the view of the socialist parties, the state should limit itself to the provision of public goods, compensating through these policies the inequalities generated by the market. Given that this program should be developed within a capitalist economy, social welfare policies were very dependent on the evolution of the free market economy, of its efficient management, and of its growth rate. The socialist economic and social policies, welfare state programs, state investment, and state fiscal revenues through direct taxation that would make possible all these policies were subject to sustaining a growing and full employment economy that ensures private sector returns.

This bundle of socialist policies encountered a benign economic environment for its implementation from the end of World War II until the 1970s. This period has been sometimes described as the golden age of West European social-democratic parties and policies. In any case, in spite of the influence of non–social-democratic parties and governments in the creation of West European welfare states, some elements of the social-democratic program became a crucial component of the West European policy status quo after the postwar period.

However, what could be termed as the social-democratic *settlement* faltered in the 1970s, when the economic context worsened notably. The Keynesian and economic redistribution policies did not seem to be feasible under the new economic circumstances. The principles that guided the policies of the socialist parties were challenged: The role of the state in the management of the national economies, its role in the regulation of the market dynamics, and the welfare state policies suffered from economic and financial crises, decreasing growth rates, rising unemployment, and growing internationalization of the economy. Later on, the social-democratic orthodoxy—that rising social expenditure, together with state intervention and regulation, ensured better functioning of the market—was severely challenged by economic globalization.

In the 1980s and 1990s, not only did socialist parties confront important challenges coming from social, cultural, economic, and institutional changes that made their platforms less appealing than the neoliberal or neoconservative ones, but they also confronted new competition from New Left parties. In this context, the socialist parties began a yet unfinished search for a new program that could provide them with a new identity adapted to the changes in the socioeconomic environment and in the patterns of electoral competition. During this period, social democracy underwent a substantial programmatic change that in many cases has meant an abandonment of the previously traditional social-democratic concerns, moving toward more centrist and promarket policy positions, sometimes called the *third way*.

In the long term, socialist parties have successively abandoned their original anticapitalist and Marxist positions of the late 19th century, have adopted Keynesian policies compatible with the efficacy of macroeconomic management in the context of a capitalist society, and finally have moderated their reformist impulses to match the strongly market-oriented political environment that has existed since the 1980s. Although they still have more favorable policy positions than other party families toward social justice, income redistribution, and state social expenditure, a policy convergence between socialist parties and right-of-center party families has taken place in Western Europe.

SOCIALIST SYSTEMS

Socialist systems are those regimes based on the economic and political theory of socialism, which advocates public ownership and cooperative management of the means of production and allocation of resources. These include states described as socialist, communist, or Marxist, all of which claim to be based on efforts to achieve social justice and equality. The best term for these regimes may be *state socialism*, which has gained wide currency in the political science literature. In response to the crisis and collapse of state socialism at the end of the 1980s, many analysts have emphasized that the universalistic goals of socialism were not thereby invalidated, since many other currents of socialism, for instance, social democracy, have been vigorously developing around the world.

According to the classical Marxist approach, socialism is only the first stage of the postcapitalist society, followed by communism as a second stage in which people receive "according to their needs." Marxist theory was elaborated for, and based on, the most developed countries of the world. Although the state socialist project originated from Marxist theory, it was, however, a deviation from the original theory of Karl Marx. The application of this theory in backward countries, starting with Lenin's Russia, can be considered as turning it to the other extreme—that is, to a revolutionary theory for the poorest countries of the world. This trend reached its peak under Joseph Stalin and Mao Zedong and, later, was embraced by Fidel Castro of Cuba and by other local leaders in the developing countries. What is more, there have been two basically different paths to state socialism. Along the above-mentioned lines was a series of internal revolutions and subsequent transformations, as in Russia, China, and Cuba, leading to state socialist regimes on different continents. In the second case, there were also some repressive impositions of communist rule on some countries by conquest, as for instance in Poland and Hungary. This second path to state socialism has usually been distinguished from the first, since these state socialist regimes were to a great extent alien in terms of the historical course of the countries concerned.

The following sections briefly describe the history and main features of state socialist systems, the political science models that account for their emergence, and their historical trajectories from their origins, through phases of industrialization and social transformation to their abrupt collapse in response to the global economic and political crises of the 1970s and 1980s.

Characteristics of Socialist Systems

The main features of state socialist systems are the following:

One-Party System. Political rule is based on the unified power of partocracy or on the concentration of power in the Communist Party as a superstate. In state socialism, there is no division of power because the party represents the dictatorship of the proletariat and builds a bureaucratic system of political control. Democratic centralism, first in the party and then in all political institutions, became the general organizational principle for state socialism. In the constitutions of the countries concerned, the leading role of the party in state and society is stipulated.

Command Economy. This is an economic system with central planning (Five-Year Plans) in the state-administered economy. There can be no private ownership of the means of production, since these are nationalized and state owned. Directive planning as instructions from above is the method of economic management in an economy based on state property, in which the State Planning Agency (*Gosplan* in Russia) acts as a superministry. But planning was a bargaining process between/among various actors and organizations, with centrally determined prices, heavily subsidized products, and huge subsidies for the heavy industries. Command economy is accompanied by the coercive collectivization of agriculture, which produced a general scarcity and low quality of agricultural goods.

Personality Cult of the Leader. A cultural system based on the ideological monopoly of "Marxism–Leninism" and on the "charisma" of the number one leader was followed. This ideological monopoly means that the official ideology penetrated all spheres of cultural life, demanding ideological conformity and uniformity. State socialist systems had a future-oriented legitimacy; that is, they tried to legitimate themselves in these backward countries as the means for catching up with the most developed Western states. However, this legitimating device was more and more eroded in the 1980s in the European "socialist" countries by the slowing down of economic growth and by the growing attractiveness of the Western world with its abundance of goods and services.

The chief actor in state socialist countries was the *nomenklatura*. It meant that the Communist Party was involved in the appointment of people to all senior posts in society. The *nomenklatura* principle was the main instrument for the exercise of democratic centralism. It was applied not merely within the party itself but also in the state administration, the police, the military, the judiciary, education, the economy, and social organizations such as the trade unions and the people's fronts—in short, it involved total control over appointments in all major organizations. The party structure was highly hierarchical; the real power was in the hands of a larger central committee and a smaller politburo controlled by the almighty leader. The party congress and/or the party conference were only legitimizing devices for democratic centralism and the official communication platforms for the economic and political decisions of the party leadership. The Communist Party was also a mobilizing instrument since there was a rather large party membership—between 6% and 10% of the adult population—as a "transmission belt" to the population as a whole to implement party decisions.

The emergence of state socialist systems was one of the most important historical developments of the 20th century. In the 1980s, at its peak, 40% of the world's population lived in the socialist world (i.e., in countries run by communist parties), and one third of the global industrial output was produced by the various state socialist systems. The core state socialist countries were military allies and economic partners of the Soviet Union in two major organizations: the Council for Mutual Economic Assistance (CMEA, or Comecon, 1949–1991) and the Warsaw Treaty Organization (1955–1991). These organizations were instruments of the great power efforts of the Soviet Union for global dominance. The Warsaw Pact and Comecon were the two pillars of Soviet global power as the basic military alliance and economic organization in the bipolar world on the side of the Soviet-dominated state socialist countries. Comecon was organized in January 1949 as a reaction to the Marshall Plan (1947), and it was extended beyond Europe with the entry of Mongolia (1962), Cuba (1972), and Vietnam (1978). The Warsaw Pact as a reaction to the North Atlantic Treaty Organization (NATO) was also an instrument of the coercive control of the Soviet Union over its allies. The major principle of the Warsaw Pact was formulated in the Brezhnev doctrine of limited sovereignty (December 1968) after the Soviet Union's crushing of Czechoslovakian reform efforts in the "Prague Spring." The state socialist countries in general had a network of multilateral treaties, but there were also a series of bilateral treaties between the core state socialist countries modeled after their contacts with the Soviet Union.

Varieties of State Socialism

The socialist world system embraced four continents with many countries for shorter or longer periods, reaching its largest territorial extension in the mid-1980s. However, these countries claiming to be "socialist" were not homogeneous at all, nor did they form a real "world system," since they were split by serious tensions and deep cleavages, first of all by the adversarial competition for dominance between the Soviet and Chinese models. The state socialist countries were usually allies of one of these two big powers that tried to extend their respective spheres of influence, even against each other. Given their diverging and conflicting approaches to the one-party state, command economy, and personality cult of the leader, the state socialist countries were sometimes fierce enemies of each other in different historical periods. First, after World War II, a conflict emerged between the Soviet Union with its allies and Yugoslavia and, parallel with it, between Yugoslavia and Albania; then in the 1960s between the Soviet Union and China (and their allies); and finally between China and Vietnam. China and Vietnam fought a real war in 1979, but the Soviet Union and China also had a series of border clashes. As state socialism spread in the world, so the controversies became deeper between its leading powers; therefore, in fact, no unified socialist world system ever existed.

One can distinguish the following territorial groupings of state socialist countries in the 1980s:

European group: Albania, Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, Poland, Romania, Soviet Union, and Yugoslavia

Asian group: Afghanistan, Burma, Cambodia, China, Laos, Mongolia, North Korea, and Vietnam

Latin American group: Cuba, Guyana, Nicaragua, and Surinam

Arab socialist group: Algeria, Iraq, Libya, Syria, and Yemen

Black African group (usually called socialist orientation): Angola, Benin, Burkina Faso, Ethiopia, Ghana, Guinea, Guinea Bissau, Congo, Madagascar, Mozambique, Somalia, Tanzania, and Zimbabwe (These countries were fragile, nondurable systems, and it was very difficult to define their "socialist" character beyond official declarations.)

Three models have been offered in political science for the explanation of the emergence and transitory survival of state socialist countries:

1. *Totalitarianism:* This involved the state penetration of society for its total control. This theory was very fashionable after World War II and also after the collapse of the Soviet-dominated socialist world system. Totalitarianism is an ideological label for modern tyranny. It is simplistic but is still very popular as a journalistic term. However, this theory fails to answer two basic questions: first, how totalitarian control over the society can work at all, and if it is so, then second, how political change can be explained according to this static and rigid model. No doubt, this theory makes some contributions to the partial understanding of the worst and most repressive period of Stalinism, between 1949 and 1953, or the current history of North Korea, for instance. But it is unable to explain the state socialist project as a whole in its historical dynamism from the October Revolution in 1917 to the collapse of the Soviet Union in 1991, with its internal fights, oppositions and counterelites, and increasing social resistance. The totalitarian form of state socialism is a unique phenomenon in world history as a worst-case scenario of historical blind alleys.

2. *Radical revolution:* This is the "Bolshevik"-type seizure of power by the working class or the poor peasantry through a long internal war or "permanent revolution." These transitory societies have been in between, or have combined elements of, capitalism and socialism. The internal revolutionary potential of these poor countries has played a dominant role in the fight against dependency on world capitalism and for national independence, so "socialism" and "nationalism" have also been combined. According to this model, the fate of these revolutions supposedly remains open. They may develop toward a "real" socialism, toward communism, or toward the capture of power by the state bourgeoisie as *nomenklatura*, leading to the bureaucratic deformation of state socialism. For the theory of radical revolution, state socialism is a historical hybrid, a combination of "genuine" socialism or anticapitalism and dependent capitalism in the guise of revolutionary nationalism, that has survived nowadays mostly or exclusively in the Third World.

3. *Modernization:* This refers to the catching-up exercise of a modernizing elite organized in the form of a communist party to establish an industrial society belatedly. The repressive state apparatus is in fact acting as an instrument of state capitalism to carry out the process of capital accumulation through the forcible extraction of surplus from the working class and the peasantry. In the last analysis, this modernization exercise leads to the convergence with world historical development, if the catching-up effort proves to be successful. Thus, in the final analysis, state socialism is just one of the more peculiar ways of reaching the stage of modern capitalist society. For modernization theory, state socialism is not an aberration or "hell on the earth" but only one of several transitory and controversial routes that early industrial societies take to converge finally with mainstream global development.

Historical Trajectory of State Socialism

The usual descriptions follow only the historical trajectory of communist ideologies from the theoretical foundations by Marx and Engels through Lenin and Stalin to Mao Zedong and Castro. Lenin indeed elaborated the revolutionary theory for a backward Russia with the basic principles of the Bolshevik party as its democratic centralism. He emphasized the revolutionary potential of Russia as the weakest part of the imperialist world system. After the victory of the October Revolution and the failure of the "world revolution," Stalin introduced the principle of "socialism in one country." To consolidate the state socialist system, Stalin exercised a high level of political repression to overcome social resistance and to complete the state-building process in the early stage of industrialization. He completed the building of the repressive one-party state and a command economy with the personality cult, reducing the Russian populace to infantile dependence on the state. The vigorous development of industrial society led to the growth of Russia as a great power after the victory in World War II. Mao Zedong and later Castro extended the state socialist ideology more and more to the peasantry as the main revolutionary force. These ideological forms have been in fact a combination of the class struggle theory with the rise of nationalism in the (post)colonial world, where large peasant masses were dislocated.

Behind these ideologies, the "existing socialism" had to cope with real, not only ideological, obstacles and controversies. State socialism emerged after World War I as an alternative to world capitalism, and it vanished in the early 1990s as a meaningful alternative. It came to an end as an important social formation, even if some of its hybrid forms have survived in China and Vietnam; in some other archaic forms with traditional authoritarianism, as in North Korea; and with some vague postcolonial variants elsewhere. There were some basic internal and external built-in obstacles that were responsible for the vanishing of state socialism or the "really existing" socialism as a major type of development by the end of the 20th century. The previously noted catching-up exercise from inside as well as underdevelopment and external dependence were the domestic and international reasons that emerged, but a combination of internal and external built-in obstacles caused its abrupt demise at the end of the 20th century. If, and when, state socialism generated development, it also produced some economic factors and sociopolitical forces that turned against it. As extensive industrialization came to an end, the problems of economic management were aggravated, and the command economy proved to be unable to achieve economic integration and steer the structures created by intensive industrialization. Therefore, the economic crisis cycles were integral parts of this system of recurring imbalances. The historical trajectory presented different models from war communism to market socialism, but the policy of perestroika failed, and the reforms instituted by Premier Mikhail Gorbachev were the last attempt at a revival. At the same time, the external obstacle of world capitalism proved more and more that the economies of state socialist countries were not competitive in the world market. They were suitable only for the first and most drastic phase of industrialization, followed in the 1980s by economic decline in the core state socialist countries during their second phase of industrialization, although at the same time, state socialism had spread to the world's poorest countries, where early industrialization was still taking place. State socialism lost the economic competition with the West in the 1980s, when the Soviet Union had become the world's largest industrial society of the late-19th-century type, with an obsolete socioeconomic structure and a high level of militarization and also with an economy of shortage that would lead ultimately to mass discontent and full delegitimation of the socioeconomic system.

Although all state socialist countries had a legacy of authoritarianism from their previous history, the new type of repressive state soon became itself an internal obstacle to their socioeconomic development. Political reforms were always high on the agenda because it was clear that the political system could not work properly, since it continually created new obstacles to its own working—the new industrial and educated classes that had arisen as a result of socioeconomic development could not fit into the political system. When the urbanized strata, including the new working class, began to demand more human rights and freedoms, they were confronted with the implacable tenets of state socialism as a one-party state. Thus, they turned against the ideological monopoly of the party and demanded an open society.

In the core state socialist countries, a series of grave political crises in 1956 (Hungary), 1968 (Czechoslovakia), and 1988 (Poland) finally culminated in a deep crisis of political legitimacy at the end of the 1980s. Two factors—economic and political—produced a combined internal pressure at the end of the 1980s, when the democratic erosion was strengthened by the external pressure of globalization. As global telecommunication penetrated to these countries, the advantages of the Western economic order and world market were displayed in much more detail than before and resulted in the spread of democratic ideas through the new types of media. All in all, the year 1975 may be considered as a turning point for both internal models and external competition:

1. Until the mid-1970s, the core state socialist countries developed much more quickly than the Western states; thus, the future-oriented legitimacy of the catching-up model seemed to work. But the global crisis in the 1970s caused the economies of the state socialist countries to slow down, and owing to this deceleration of socioeconomic development, state socialism in the most developed core countries lost its legitimacy step by step. The development model of state socialist countries was shifted to the poorest countries, so as a result of this qualitative failure, state socialism was significantly weakened in the core countries, but paradoxically, it became attractive in the poorest countries, and it began its largest quantitative territorial extension in the Third World.

2. During their industrialization process, the state socialist countries looked externally competitive for a long time; therefore, even the Western modernization models suggested that they were successful industrial societies. But they could not adapt to the structural changes in the world economy during the 1970s; their obsolete structures remained and, increasingly, were lagging behind in the global competition. At the peak of détente in 1975, the Conference on Security and Cooperation in Europe (CSCE, later the Organization of Security and Co-operation in Europe; OSCE)—with the participation of the United States and Canada—became instrumental in the erosion of state socialism through the permanent campaign for human rights (Helsinki Watchdog groups for human rights in Central and Eastern Europe).

3. There was also an imperial overstretching of Russia's resources, both externally and internally. To sustain such an empire and its full apparatus of oppression demanded vast energy and expenditure, creating an internal obstacle for Russian society from the combined effects of full militarization, the economic burden of producing military hardware, and the social-ideological burden of suppressing human freedom. In the end, the Soviet Union was too weak economically to maintain such a world empire, which was very costly and diverted resources from Russia's own socioeconomic development (around one third of its gross domestic product). Consequently, the system's eventual collapse was not only a political failure but also an economic necessity.

SOFT LAW

Although law is often thought of as binding on those to whom it applies, and sanctions are associated with breaking the law, some legal rules are voluntary and not coercive. Particularly in international law, legal rules are not legally binding, and legal sanctions cannot be used in cases of noncompliance. *Soft law* refers to those legal rules that are not legally binding and for which legal sanctions cannot be used in cases of noncompliance. These rules can be guidelines, codes of conducts, standards, and other voluntary rules. In contrast to hard law, soft law can be decided by a variety of actors, public and private. Making hard law is the prerogative of legislative assemblies, national parliaments, and the European parliament, with a few exceptions. Soft law can be created by governments, international organizations, nongovernmental organizations, and the business community. It should be noted that the distinction between hard and soft law is hard to make in practice. Legally binding law often contains references to standards and other non–legally binding rules, and soft-law rules often contain references to legally binding legislative rules. The two types of rules are therefore ideal types that cannot easily be found in their pure form empirically. This entry defines soft law, contrasts it with other forms of public sector intervention, and discusses its applications in the European Union (EU) and elsewhere.

Definition

Ulrika Mörth defines soft law as legitimate rules that may have political and legal effects, although the rules are not legally binding. This means that not every voluntary rule can be regarded as soft law. In cases of noncompliance, the sanctions are social and political rather than legal. A good example of how these social sanctions might look is the peer pressure mechanism in the international body the Organisation for Economic Co-operation and Development (OECD). OECD lacks competence to issue legally binding laws. However, it is often argued that the organization has had important influence on the policies of member states, as these concern, for instance, reforms in the public sector, often labeled as the new public management reform. Social and political pressures are put on the member states by "naming and shaming" countries that do not follow the OECD recommendations. The soft law–making processes in the OECD are also characterized as social processes in which there is confidence building, exchanges of experiences, identity building, and socialization among the national officials; this can explain why the member states implement the OECD recommendations.

A classic and often used definition of soft law is that by Francis Snyder, in which he states that they are rules that have no binding force but that they may in any case "have practical effects" (Snyder, 1993, p. 198). A more thorough definition is presented by Karel Wellens and Gustaaf Borchardt (1989). Soft law is

> the rules of conduct that find themselves on the legally non-binding level (in the sense of enforceable and sanctionable through international responsibility) but which according to the intention of its authors indeed do possess legal scope, which has to be further defined in each case. Such rules do not have in common a uniform standard of intensity as far as their legal scope is concerned, but they do have in common that they are directed at (intention of the authors) and do have as effect (through international law), that the conduct of States, international organizations and individuals is influenced by these rules, however without containing international legal rights and obligations. (p. 274)

The essence of these three definitions is that soft law is defined in a procedural way, that it consists of non–legally binding rules, and that it comes in many varieties. What Mörth's definition adds to the traditional ones is thus the aspect of legitimacy.

Forms of Public Sector Intervention

The phenomenon of soft law has for a long time been used in global organizations, in the EU, and in nation-states, but it was not until the 1970s that the very concept of soft law was established. One explanation for why the concept started to be used by scholars and others was the fundamental changes in international politics. The oil crises in the 1970s changed how students of international politics defined international power. They changed their power perspective from a state-centric one to a more pluralist view on power in a globalized world. The increased awareness in the 1970s of globalization has since given rise to a vivid literature on the need for global rules in a globalized world. Studies of international regimes, as a way of analyzing the new international landscape, have argued that international cooperation consists of private and public actors and that non–legally binding rules are sometimes the only ones possible. Indeed, many international organizations use soft law because they have no other alternative. The absence of a world government that can decide on supranational and legally binding rules makes voluntary rules the only viable alternative. Even coercive rules, which can be decided by the United Nations Security Council, are sometimes viewed as soft because of the lack of credible legal sanctions in cases of noncompliance. There is an illusory expectation that legally binding rules are more efficient when it comes to compliance in a globalized world, which lacks the authority of and democratic system found within nation-states.

Applications in the European Union

The use of soft law has increased in the EU, which seems to contradict the explanation mentioned above that soft law is often the only alternative for international organizations. Indeed, the EU has the legal competence to decide on hard law. One explanation of why soft law is used more is the increased need for flexibility when there is a concern about the possibility of noncompliance. Soft law is preferable when you are dealing with problems that are complex and diverse and characterized by uncertainty. Thus, rule making concerning highly controversial issues is politically the only way of moving forward in the European integration process because the member states want to retain national sovereignty in these areas. These controversial questions often go beyond the issues on the domestic market and other issues, such as economic policy, taxes, pensions, and other welfare topics, that are decided within the EU member states. The alternative to soft law is in practice never hard law. This is so because of the unwillingness of EU member states to delegate supranational decision-making powers to the EU with respect to politically controversial welfare state issues. By deciding on soft law, the national governments can argue to their EU-skeptical citizens that as these rules are voluntary, they have not delegated national sovereignty to the EU.

Nonstate Actors

So far, we have only discussed the use of soft law by international organizations. Legitimate rule making is not only a prerogative of intergovernmental organizations or of states. Private actors, both for-profit and nonprofit actors (nongovernmental organizations), are sometimes also seen as legitimate rule makers. Soft law is often linked to nonstate actors and to their participation in national, European, and global rule making. The private actors are not formally part of the hard-law legislative process that one finds in nation-states or in the EU. If they want to set up rules that regulate their activities, they have to use soft law. Voluntary rules are often the preferred alternative for the business community, which wants to preempt any state interference. One telling example is the emergence of corporate social responsibility, which consists of various codes of conduct that regulate how a socially responsible firm should behave. Whether these soft rules are complied with or not is often monitored by various nongovernmental organizations and not by states or other public actors. What is interesting with the emergence of corporate social responsibility is that it seems to support the idea that we are living in a time when soft law is the most readily available regulatory mode not only for private actors but also for states. States are less prone to use their hierarchical authority and so become advisory rather than directing. This change from hierarchical authority to a more horizontal steering is sometimes characterized as a move from *government* to *governance*. The steering mode of governance has empowered private actors and given them an authority that traditionally belonged to the state and the public sector. The spread of codes of conduct, standardization, and other voluntary rules indicates that a range of actors other than public ones strive to establish regulation through innovative mechanisms. The recent trends in making private firms more socially responsible suggest that we are dealing with a cross-sectional phenomenon. It is a reflection of transformed boundaries and relations across societal sectors—business, state, and civil society. These transformed boundaries can partly be explained by new demands on the three sectors and spheres. Modern society places many demands on private companies and on public actors. States are placing more emphasis on regulation instead of on public ownership and directly provided services. The state has a regulatory role and a contracting role in agreeing on rules between the public and the private spheres. These rules are increasingly soft or a complex combination of hard and soft law in which one may also find legally binding rules that are decided not by legislators but by the contracting partners. This mixture of actors and rules seems to blur the border between private and public actors. A new public domain emerges in which there are actors and rules from the state, from business, and from civil society. This public domain is transnational rather than national or international. Soft law makes boundaries less relevant and important. From a democratic point of view, this state of no borders between the public/private and the national/international could be a problem. Democracy is often practiced in terms of representative democracy, which means that elected politicians are the hard law legislators. They are accountable for the laws and for the decisions that they make. The use of soft law broadens the possibilities for who the legitimate rule makers may be and extends rule making to actors other than elected politicians. This means that the realm of the rule-making sphere expands but the democratic realm only concerns some of the actors. This, in turn, could lead to a situation in which those who have power are not democratically accountable for the decisions they make and that those who can be democratically accountable have no power.

SOLIDARITY

Solidarity is a feeling of being connected to and responsible for others. This experience of connection and obligation is a key aspect of the life of any collectivity and its members. Solidarity has therefore received much attention in political thought concerning both premodern and modern politics. In the context of democratic culture, it has been one of the celebrated ideas and ideals, although perhaps not as much as liberty and equality, among others. This has to do with the central, yet difficult, nature and role of solidarity. Hence, the two questions that this entry strives to answer are "What are the general characteristics of solidarity?" and "What are the challenges it entails?"

Characteristics of Solidarity

Solidarity refers to the type of relation in which people feel that they have an obligation to help others, for instance, because they experience a connection and "we-ness" with them based on a community of interest and values—to help others so that they are empowered and can stand on their own feet. Obviously, the modalities of this feeling of solidarity and of obligation, including its level of intensity, vary with the configuration of the environment in which it takes place. In this perspective, solidarity can be organized and analyzed according to three categories. Although these categories can overlap in reality, we present them separately for the sake of clarity. They concern the structural character of solidarity, its scope, and its subjective dimension. From this, we can infer that solidarity has a strong connection with responsibility and justice.

Structural Solidarity

Solidarity, understood and defined as structural, alludes to the social role that it plays in a collective entity, whatever this collectivity is (group, community or society, public or private, etc.). This role suggests that a collectivity cannot progress and develop if its members are not working together to achieve the common goal(s) with which it identifies or if they do not feel and act on a sense of solidarity toward one another and the collectivity. This structural aspect of solidarity is why solidarity tends to be seen as the expression, instrument, and result of a commitment to the group, its members, and their well-being. Even the emergence and sustainability of cooperation, so essential socially because it epitomizes mutually beneficial interactions and the collective good, would be quite impossible if people did not think that they can count on the help of others—on their sense of solidarity—when needed.

Because solidarity as a structural phenomenon is about the possibility of collective life, it implies that each individual existence is social; that is, it relies in crucial ways on the sense of solidarity with others. This comes down to the fact that people cannot be and do much on their own. To a large extent, all people—no matter how capable—depend on the care of others to grow and flourish. Hence, at most junctures of their life, mundane or fundamental, individuals are the recipients of multiple actions of solidarity. The final stage, when the end has come, is no exception. It is a deep sense of human and spiritual solidarity that allows us to be buried with dignity and remembered after we are gone.

The structural character of solidarity and the modalities of the social dimension of each individual existence are not fixed forever. They differ according to the type of social group in which they unfold. Regardless of whether his analysis and classification of solidarity is correct, Émile Durkheim had this in mind when he distinguished mechanical solidarity from organic solidarity. For him, mechanical solidarity was characteristic of the relatively undifferentiated social structures of premodern societies, where, in his view, members are bound together by shared values, beliefs, and customs and are generally engaged in the same activities. In contrast, he saw organic solidarity as more typical of modern, industrial societies, where people are bound together by a high degree of functional interdependence based on a complex division of labor.

The Scope of Solidarity

A second way of analyzing solidarity is related to its scope: In other words, to whom does it apply, and how deeply does it apply? Or to what extent is the realm of solidarity and of those who are in it wide or narrow, closed or open, and to what extent are the benefits it brings about thick or thin? To illustrate this point, it is helpful to recall the distinctions that have often been drawn between traditional and modern solidarity.

In traditional forms of social organizations, solidarity connotes a tight bond among people, frequently based on kinship. The sense of solidarity runs deep and permeates the collectivity's internal relations. The flipside of this "thick" inward solidarity tends to be its exclusive character. The translation of the "us" versus "them" divide into the "in" versus "out" difference has a heavy bearing on who is a recipient of solidarity and who is not. In comparison, modern solidarity in its various forms, springing from democratic values, tends to be wider than the ties of family. The norms of universality and equality at their core introduce and call for a connectedness among people. This connectedness goes much beyond the boundaries of the immediate communities in which individuals live. As a result, these norms have historically worked in favor of a widening and deepening of solidarity at the national and, subsequently, international levels.

This is not to say that the disparities between traditional and modern solidarity necessarily amount to absolute differences of scope. For example, although premodern solidarity has the tendency to be exclusive, it contains significant cosmopolitan orientations fueled by philosophical (e.g., the Stoics) and religious (as represented by Saint Paul and Christian universalism) beliefs. Not surprisingly, modern humanism and democratic culture built on these to develop their own brand(s) of solidarity. As for modern solidarity, although it was meant to be wide, it is also inclined to be thin. As universality and equality expand the circle of human solidarity, relating to people and offering real solidarity becomes abstract, fragile, and attenuated. Moreover, democratic considerations do not eliminate the existence of priority and hierarchy in any social setting and its selective and limiting impact on the projection of solidarity. How could it be otherwise considering that priorities and hierarchies are a part and parcel of human life, because without them, there are no particular guidelines to allocate the always limited resources at hand? Furthermore, when solidarity takes place within the framework of nationalism, a product and expression of modern democratic culture, it can conceive of and implement inclusiveness in an exclusive manner. This may happen both among countries where nationalist solidarity may be pursued without regard for the welfare of other states and within countries where dominant groups may deny the legitimacy of minorities and their right to observe their own traditions.

Subjective Solidarity

The third characteristic of solidarity, subjective solidarity, refers to the requirement that individuals carry out actions that create the structure needed for solidarity. They depend on the collaboration of people to function and, therefore, need to be activated by people. The negative effects accompanying actors' disengagement best illustrate this. Once people feel that there is no point in upholding a sense of solidarity, particularly due to a lack of expected reciprocation, structural solidarity is in danger of disappearing. Exit strategies develop, each of them amounting to a "desolidarization" from others and from the collectivity with which the individual had previously identified.

But subjective solidarity is not limited to its contribution to structural solidarity. It can be at work in the absence of structural solidarity or against it. For instance, cosmopolitanism and the sense of solidarity it extends to all individuals certainly exceed the realms that solidarity has socially shaped, be it within the primary communities (e.g., the family) or at the national level. This is where solidarity is more—or less, depending on how we see it—than organized social reality and can become a product of individual initiative and, as such, dependent on subjective morality and solidarity. The individual decides that solidarity is owed to someone regardless of the existing collectivities of allegiance and the discriminations of solidarity they entail. In his own way, Emmanuel Levinas defends a radical version of this form of solidarity when he argues that our fundamental moral situation as people is not one of autonomy but of heteronomy, or obedience to the voice of the other.

Solidarity, Responsibility, and Justice

From these elements of solidarity, we can infer that it is closely connected to the notions of responsibility and justice. Concerning solidarity and responsibility, one of the highlights is that to experience solidarity is also to experience responsibility. In addition, since responsibility calls for action, if not leadership, solidarity as responsibility is neither simply theoretical nor an end in itself. It is geared toward action, toward helping others in a concrete manner and, if the gravity of the situation demands, with the commitment of an activist. Short of this, professing solidarity and doing next to nothing is destined to be no more than hypocrisy.

Such a letdown is all the more damaging since, ultimately, solidarity is a requisite of justice, in four principal ways. First, solidarity serves as a trigger mechanism vis-à-vis the concerns of justice. If there is no identification and connection and, consequently, no solidarity with others, experiencing and calling for justice is not likely to happen. Second, the fact that solidarity toward others presupposes that they have rights and that these have to be fulfilled is another illustration of the strong link between justice and solidarity. Third, as solidarity stresses the social conditions of possibility of a collectivity and the social nature of each individual's existence within it, it necessarily asks for the interests of each to be taken into account and looked after. Hence, the distributive characteristic at the core of justice is at the center of solidarity as well. Fourth, while solidarity underlines what is owed to others in general, similar to justice, it pays special attention to the less fortunate and to the one who has been victimized.

Challenges of Solidarity

The challenges that solidarity has to confront are not to be ignored. Its importance makes them all the more daunting. Among them is the pressure that solidarity can put on human agency. There is also the difficulty of handling the conflicts among solidarity traditions. Finally, there is the problematic future of solidarity.

Solidarity and the Question of Agency

Although solidarity is essentially viewed as a positive phenomenon, what makes it an asset for the collectivity and its members can make it a liability. This Janus-faced nature applies to premodern and modern solidarity.

As noted earlier, solidarity tends to be about both inclusion and exclusion. Another problem is related to this perhaps unavoidable ambiguity and limitation of solidarity—the fact that solidarity has had difficulty finding a balance between too much and not enough and, in the process, endangering the sense of human agency—a somewhat paradoxical turn of events, since solidarity's goal is empowerment.

Regarding the existence of too much solidarity and not enough agency, the constraining aspects of primitive forms of solidarity have at times led anthropology, sociology, and political science, for example, to stress that in these primitive forms, people have no room for a life of their own. To a lesser degree, a similar assessment has been put forward concerning how long-established traditions fix collective and individual existences in more or less unquestioned and difficult-to-change patterns. From the 18th century onward, criticisms of the social role of religion have frequently taken place in this context.

A classic charge against modernity has been that it leads to a very thin and perhaps inadequate solidarity, with debilitating effects on human agency. Two kinds of shortcomings have been underlined in particular. Connected and standing at the intersection of democracy and capitalism, they point to the fact that modern culture strengthens individual and collective agency in some ways but weakens it as well.

The first alleged shortcoming of modernity arises from the individualism of modern democratic solidarity. Although its values originate from a commitment to universality and equality, which engineers empowerment, at the same time, it encourages individual and anomic tendencies. From this perspective, many have argued that the liberal branch of democratic culture, especially in its celebration of individual liberty, is more prone to this than the republican one, which stresses the dynamics of rights and duties among individuals. In any case, in the worst circumstances, individuals can end up being loyal to and in solidarity with no one. As such, they can be deprived of the social anchoring with, and belonging to, the world and others that is so important to feeling and being at home in one's life.

A second shortcoming arises when those in charge politically and economically are eager to minimize the sense of obligation associated with democratic values. What is interesting is that the principle of responsibility and its individual and social virtues are often put forward both as a justification for a decreased sense of responsibility and as an alternative to redress the ills that this may produce. An example of this shortcoming of modernity can be seen at the national level in the United States. There, a cultural tendency toward self-reliance is at times instrumentalized by self-serving economic forces to discredit the idea that institutions have a duty to make possible and underwrite social solidarity. The debates on health care, in 2009 and later, provide a case in point. But the reduction of solidarity to a bare minimum is taking place internationally as well, as the state of international human rights indicates. To be sure, conventions calling for their defense in their various dimensions create a framework of international solidarity. However, this sense of solidarity is not imperative. Despite the costs incurred by people beyond their borders, countries never fail to give preference to their national interests and those of their citizens. Their reluctance to act decisively to address the humanitarian crisis of the 1990s and the insufficient policy efforts at the global level to overcome widespread poverty, to say the least, are part of this story. The absence of international mechanisms of accountability to tackle these limitations only expresses and reinforces the lack of commitment.

Conflicts Among Traditions of Solidarity

The difficulty of accommodating and reconciling the variety of solidarity traditions is another major challenge. Conflicts between these competing traditions concern access to and distribution of resources, on the one hand, and redefinition of identities, collective and individual, on the other.

The different forms of solidarity of the past and the present and those constituting the diverse layers of social life show that solidarity comes in many shapes and sizes. In addition, as each of them orients people and collectivities in set ways, it is not easy to find a constructive middle ground between status quo and change.

Already in the West, it has been difficult. Most of the economic, political, social, and cultural battles related to the evolution of Western countries have taken place in connection with tensions among visions of solidarity. The conflicts surrounding the various welfare state models of the European continent and even more so between them and the American model are the latest illustration of this situation. That being said, no matter how formidable these struggles and the pain of accommodation have been, they appear relatively benign compared with the ones generated by the clash of Western and non-Western traditions of solidarity since the West started its worldwide expansion at the end of the 15th century. Over time, to formulate and advocate their claims of individual and collective rights in support of their emancipation, non-Western countries have borrowed extensively from the values and structures of modern democratic solidarity. Therefore, not all is bad. Still, the non-West has paid a heavy price for the hegemonic domination of the West.

National alliances with the West have often led to the elimination of local forms of solidarity, with no replacement by other forms. Furthermore, although countries may have gained nominal independence, in fact, the majority of citizens have often been relegated to second-class status. In the worst case scenario, with the local elite playing the double game of being Westernized and yet fixated on preserving their ancestral privileges and regular people left with no place to go, the types of solidarity that had glued people together can disintegrate. In the process, it can open the gates of radicalization and violence within and across national boundaries. While gradually, non-Western communities have had, nolens volens, to forge hybrid and workable new identities, the trauma and resentment generated by cultural dislocation and alienation have been deep, with subsequent success in development, when it took place, easing but not erasing these.

The West has been equally effective in imposing its vision of solidarity internationally. At this level, too, non-Western countries have made the best of the Western culture of solidarity expressed in the norms of human rights, self-determination, and sovereign equality of states, in particular to liberate themselves from the shackles of colonialism. Nevertheless, beyond this, it has been an uphill battle. Although Western powers have been to some extent willing to bring on board non-Western traditions and concerns of solidarity in the negotiation, conceptualization, and implementation of international norms of regulation, their worldview and interests have prevailed and continue to prevail. This dominance could be seen in the drafting of the Universal Declaration of Human Rights when the United Nations was created. Today, the battles concerning development and climate change indicate how developed countries, essentially the West, continue to concede very little to the developing countries—by and large, the non-West.

The consequence of this somewhat one-sided story of solidarity is not simply that it undermines or even expels non-Western traditions of solidarity but that the message of solidarity, and of the democratic solidarity projected by the West, also becomes a contradictory one. It is made of and oscillates between predatory and humanistic orientations. This is not new, since this has been the trademark of Western relations with the rest of the world during more or less the past 5 centuries. Critics of Western solidarity call attention to several issues. First, they ask, what kind of solidarity, especially one that claims to be democratic, offers the spectacle of people being consistently inclined to overlook the interests and rights of others? Second, if the solidarity is geared toward monopoly and exclusiveness, the risk is high that this will result in a world without options and reflexivity. If only for this, it is at odds with the commitment to pluralism at the core of modern democratic solidarity. Finally, these critics argue that at a time when societies are increasingly not self-sustainable because they are increasingly not self-contained, these are counterproductive ways to conceive and implement solidarity. It engenders more disintegration than integration.

The Future of Solidarity

Part of the solution for this problem, and the future of solidarity, lies in establishing relations and systems of dependencies among individuals and collective actors that are more positive and inclusive than negative and exclusive, as is presently the case. This will not eliminate all the dilemmas of solidarity, particularly when these have to be addressed in the context of the democratic demands of pluralism, universality, equality, and liberty now serving as benchmarks of legitimacy, nationally and internationally. But at least it shows a path for winning not at the expense of others but with and through taking account of others. From this perspective, inequalities should never be so profound and entrenched that they deny countries and individuals who suffer from them the possibility of overturning them and achieving at some point a threshold of decent empowerment.

Solidarity, one of the oldest notions of social life and political thought, far from being a thing of the past, is at the center of the future of individuals and collectivities. Its relevance endures.

SOVEREIGNTY

In practice, sovereignty is one of the most contested concepts in political science, although it is conventionally used to connote supreme authority within a given polity. The meanings of sovereignty vary widely depending on the context, as well as on its inferential connections to other concepts. Although long crucial to modern political science and international relations, the concept of sovereignty is notoriously ambiguous and thus hard to define with any precision. During the past decades, it has been argued that the concept of sovereignty has lost some of its analytical purchase due to the intensified exchange and increased interdependence between political communities. This entry examines issues related to the definition of sovereignty, traces its historical evolution since the Middle Ages, and considers its relevance to political science today.

Issues of Definition

The proper *source*, *locus*, and *scope* of political authority have been subjected to constant debate in the history of political thought. From where does such authority derive its legitimacy? With whom should it reside? What are the proper limits of its exercise? While these are some of the questions that any account of political authority must confront, most modern definitions of sovereignty imply that such authority—quite irrespective of the sources of its legitimacy and its exact locus—must be both *indivisible* and *absolute* to qualify as properly sovereign and nothing else. While being indivisible implies that it must—at least in theory—reside with a single agent in a given polity, being absolute entails that this agent either is sovereign or not but nothing in between. These formal characteristics distinguish sovereignty from related concepts such as autonomy and independence, both of which are thought to be matters of degree. Insofar as sovereignty is defined in terms of authority, it is also thereby distinguished from mere power, since the latter concept does not normally carry the same connotations of acceptance, obligation, or obedience as does authority. Taken together, these defining characteristics have raised the question whether sovereignty is best understood as a *rule* or as an empirical *fact*. In analogy with grammatical rules, we could say that the concept of sovereignty contains both descriptive and prescriptive elements. Sovereignty thus not only refers to a state of affairs but also implies that this state of affairs constitutes a norm to which political life ought to conform in order to be intelligible. Finally, there is a *performative* dimension to the concept of sovereignty, insofar as it is frequently used by various agents to claim supreme authority in different contexts.

Modern theories of sovereignty frequently distinguish between the *internal* and *external* aspects of sovereignty. Internal sovereignty is attributed to the governmental institutions of a state by virtue of fulfilling some or all of the above criteria, while external sovereignty is attributed to the state as a whole by virtue of being recognized as such by other states. Since the terms of recognition are dependent on the internal attributes of sovereignty, the requirements of external sovereignty have varied considerably over time. Recognition has been granted on different grounds, ranging from principles of dynastic succession, via national self-determination and territorial integrity, to the more recent requirement that states should be governed according to democratic principles to merit international recognition.

Historical Evolution

Although quintessentially a modern concept, the history of sovereignty can be traced back at least to the political theology and feudal practices of the late Middle Ages. At this point in time, supreme authority was vested in the person of the prince, who derived his authority both from theological sources and from his relative ability to protect his subjects from internal and external enemies. The subsequent articulation of modern conceptions of sovereignty followed a series of cumulative steps.

The first step toward the articulation of a recognizably modern conception of sovereignty was taken when claims to supreme authority were *territorialized*. This took place in sharp contrast to prevailing views of imperial authority, which emphasized its universal and boundless character. While the idea of imperial authority implied no restriction on the scope of temporal power, rulers who contested such imperial claims during the 13th century did so by asserting that individual kings ought to enjoy the same political and legal status within their domains as does the emperor within the empire. A decisive break with the imperial order occurred when the rulers of the medieval kingdoms of France and Naples refused to recognize the authority of the emperor Henry VII over matters considered internal. In support of their claims, they could draw on the doctrines of jurists such as Andreas de Isernia and Bartolus of Sassoferrato, who argued that temporal authority ought to be territorially delimited.

A second, and largely simultaneous, step toward a modern conception of sovereignty was taken with the gradual *depersonalization* of political authority. During the Middle Ages, authority had often been conferred on the physical person of the prince through anointment and other acts of liturgy that established his divine right to rule. Depersonalization meant that supreme authority was relocated to the fictitious person of the crown and then transferred to the royal domain or to the body politic as a whole. This transition culminated in the creation of an abstract state concept during the 17th century, to which sovereignty could be attributed independently of the physical person of the prince.

The third step toward a modern conception of sovereignty was taken during the 16th and 17th centuries, when sovereignty was defined in terms of *indivisibility* and *absoluteness*. Legal theorists such as Jean Bodin, Hugo Grotius, and Thomas Hobbes argued that sovereign authority could not be divided within one and the same polity and that it is either attributable to a given agent or not. The consequence of these conceptual mutations was that the modern concept of sovereignty came to connote supreme, indivisible, and absolute authority within a given territory, while the questions of its proper locus and scope within each state was left to succeeding generations to handle. This shift implied that the very identity of the early-modern state, along with the emergent international society of states in Europe, became dependent on the existence of sovereign authority and its recognition by others.

The fourth and final step toward a fully modern conception of sovereignty was taken when sovereignty was *popularized* by being relocated from kings to the people. From Rousseau onward, the will of the people was regarded as the source of sovereignty. Yet the rise of popular sovereignty did little to challenge the underlying requirements of territoriality and indivisibility, which left modern political theory with the problem of accounting how the sovereignty of the people could be justified in democratic terms. The final outcome of this transition was the modern nation-state, governed according to the principles of popular sovereignty. Toward the end of the 19th century, this entity became the main object of inquiry for modern historiography and political science.

During the 20th century, the concept of sovereignty became increasingly controversial within political science. Whereas many *pluralists* argued that the concept of sovereignty was redundant to understand how modern democratic societies are governed, *Marxists* argued that sovereignty was but a fiction designed to conceal the uneven distribution of power and wealth between classes in capitalist societies. Still others argued that the concept of sovereignty should be banished from the vocabulary of political science because of its opacity and ambiguity.

The Contemporary Debate

More recently, the usefulness of the concept of sovereignty has been contested on other grounds, however. At the heart of this debate, we find the question whether sovereignty is a permanent condition of political order or whether it is likely to be replaced by other forms of political authority in the near future.

Many political scientists today dispute whether it is meaningful to speak of political authority as being absolute and indivisible since the processes of European integration and globalization have brought relocations of political authority to levels below as well as above that of the state. Today, political authority appears to be both relative and divisible in character. Consequently, many political scientists argue that the concept of sovereignty has to be either redefined to fit present conditions better or, more radically, abandoned altogether in favor of other concepts such as autonomy. Other critics have contested the usefulness of the concept of sovereignty on more philosophical grounds, questioning the ontological status of this concept and its ideological functions in justifying abuses of power and international warfare. Many of these critics have argued that sovereignty has been reified by modern political science and international relations theory. Rather than simply referring to a legal norm or an empirical fact, *constructivists* and *poststructuralists* have argued that the concept of sovereignty has been constitutive of the modern political order through its usage in political discourse. By implication, sovereignty is believed to be historically contingent and hence mutable, rather than a necessary condition of political order.

Such a diagnosis of course begs the question of available alternatives. Like many earlier attempts to contest the concept of sovereignty, the recent critique of sovereignty presupposes what it sets out to criticize, namely, that there is, or at least has been, something like indivisible and absolute political authority. The concept of sovereignty, along with all its traditional connotations of supremacy, territoriality, indivisibility, and absoluteness, nevertheless continues to exercise a powerful influence on the contemporary political imagination, to the point that alternatives either seem out of reach or carry features similar to that of the good old sovereign state.

This should be evident from contemporary attempts to justify a relocation of sovereignty to the global level, which despite their aspirations often remain premised on the notion that political authority needs to be both bounded and centralized for a political community to be viable. Hence, symptomatically, the present contestation of sovereignty seems to be what keeps this alive within political science and international relations theory. By focusing on sovereignty and the question of its endurance, recent critics have left some more basic questions of political authority—questions that the concept of sovereignty once was invented to address—unanswered. To answer these questions without presupposing that political authority needs to be indivisible, or that political communities have to be bounded, remains one of the main challenges to political science and academic international relations today.

SPATIAL MODELS OF POLITICS

Spatial models are widely used by political scientists to analyze decision making in a wide range of settings, from elections and legislatures, to government formation, to international organizations, to the U.S. Supreme Court, and many other things. Spatial models provide what has proved to be a fruitful way to think rigorously about politics, grounded in a simple intuition with a reach far beyond the narrow confines of professional political science. At least since the days of the French Revolution, indeed, references to "left" and "right" and to changing policy "positions" have been a part of day-to-day political discourse. The general public generally understands what it means to talk about politics using "spatial" language, as such language is not just a conceit of political scientists. In this entry, mathematical and empirical approaches to spatial modeling and their applications to various forms of political decision making are discussed.

The words *left* and *right* refer in this context to directions along a "dimension" of political preference. But one dimension is rarely enough for a good description of how real people think in a given setting. It is easy to imagine two people who are both on the economic right, with similar views about government intervention in the economy, who nonetheless have very different views about government intervention in matters of personal morality. One can think of views on matters such as abortion and same-sex marriage, for example, in terms of a liberal–conservative dimension that is quite independent from—in spatial language orthogonal to—the left–right dimension. If economic and social issues are all that concern political scientists, then they can consider political preferences to be well described using a two-dimensional space, spanned by a left–right economic policy dimension and a liberal–conservative social policy dimension. Building systematically on this spatial metaphor for describing political preferences, a metaphor that does seem to be deeply rooted in real politics, political scientists tend to take one of two distinct but related approaches when they analyze political decision making. These approaches can be thought of as mathematical and empirical.

Mathematical and Empirical Approaches

One can, as a mathematical construct, think of an abstract space of possible outcomes. An integral part of the formal definition of individual rationality is having preferences that rank such outcomes in a transitive way: Preferring outcome A to B and preferring B to C implies preferring A to C. Many cost–benefit calculations involve specifying "how much" A is preferred to B, relative to how much B is preferred to C. Information or assumptions about such matters can be expressed as perceived "distances" between A, B, and C in an assumed "metric" space comprising a set of possible outcomes and a measure of the distance between these.

One key distinction between mathematical and empirical approaches to spatial modeling arises as soon as the metric used to measure distances between outcomes is considered. A typical approach by mathematical modelers is to assume a distance measure that is analytically tractable. By far, the most common assumption is the Euclidean metric, familiar to all who know elementary geometry. The Euclidean metric uses Pythagoras's theorem to measure the distance between two points in a multidimensional space as the square root of the sum of the squares of interpoint distances on each dimension. If individual *i*, with ideal point x_{id} on dimension *d*, evaluates outcome *j*, perceived as having a position x_{jd} on dimension *d*, then *i*'s perceived Euclidean distance from *j*, D^E_{ij}, is

$$D^E_{ij} = \sqrt{\sum_d (x_{id} - x_{jd})^2}.$$

While Euclidean distances are often implicitly treated as being "natural," they make a key empirical assumption about how real people trade off distance from their ideal points on one dimension against distance on other dimensions. For example, if important issues to be decided concern abortion and public spending and if some voter is evaluating two policy packages, the Euclidean assumption is that this evaluation is not the aggregate distance between packages on abortion and public spending but rather the square root of the sum of the squares of these distances. This is an empirical assumption about how real people think. There is, furthermore, consistent psychological evidence that if two dimensions are separable—that is, if a person's evaluations of outcomes on one dimension can be described without knowing his or her evaluations on the other dimension—then decision making by real humans is more realistically modeled using the city block metric. This assumes that the perceived distance between two outcomes is the simple sum of their distances on each dimension:

$$D^{CB}_{ij} = \sum_d |x_{id} - x_{jd}|$$

Notwithstanding the evidence that a city block metric may generate a more realistic empirical representation of the preferences of real humans, it is far less tractable analytically. Thus, most published formal analyses of spatial models in a multidimensional setting assume a Euclidean metric or some generalization of this that is convenient for manipulation using calculus. This is an aspect of a more general distinction between mathematical and empirical approaches to spatial modeling.

The empirical approach uses a space as a way to describe the real preferences of real people in real settings, not as a formal scheme for characterizing the possible preferences of possible agents in possible settings. In the empirical approach, in stark contrast to the mathematical approach, dimensions of difference in the outcome space have substantive meaning. As opposed to a horizontal or *x* dimension, left and right may be described, for example, in terms of economic policies; similarly, a second dimension may be described in terms of specific social or moral issues. Much more important than the words used to describe dimensions, however, the structure of the space is defined in terms of structures of preferences in real populations. For example, political scientists may be able to predict attitudes on same-sex marriage in a given population from attitudes on abortion, gun control, and capital punishment; indeed, they may be able to predict attitudes on any one issue in this bundle from attitudes on the other issues. In this event, they can think of attitudes on same-sex marriage, abortion, gun control, and capital punishment as if, in this population, all correlate with an unobservable "latent" dimension. And they can give this latent dimension a name, such as liberalism versus conservatism. This is an empirical description of how real people think in this population—not an abstract mathematical characterization of how possible people might possibly think. Thus, while it is theoretically possible to envisage vegetarians who favor capital punishment for humans, if, indeed, most real vegetarians oppose capital punishment, then we think of vegetarianism and capital punishment as if they are both predicted by a single underlying dimension. The same set of issue areas may thus generate different empirical spaces for different human populations if attitudes correlate in different ways.

This focuses attention on the dimensionality of policy spaces, which are fixed by assumption in mathematical spatial models but are the primary focus of interest for empirical models. Empirical policy spaces are estimated from data on real attitudes (or assumed from assumed data on these). One way or another, this estimation involves data reduction; information on a large number of specific matters on which real people do, or might, have preferences is summarized in terms of their positions on a much smaller number of latent dimensions with substantive interpretations.

There are many ways to do this. One way is to analyze manifest behavior, such as voting in legislatures. A political scientist might think, for example, that legislators' voting records reflect their real preferences and that people who typically vote on the same side of a set of motions in a legislature have more similar preferences than people who typically vote on different sides of these motions. Observed behavior on legislative voting can be used to derive a matrix of interlegislator differences; the political scientist can then seek a low-dimensional space that represents these differences reasonably well. Alternatively, he or she can use surveys to ask politicians directly about their preferences on a range of issues. Expert surveys can use country specialists as surrogates, in essence asking them how politicians would answer a set of questions on the issues if they were asked and if they were to answer honestly. Speeches and texts generated by real politicians can be analyzed for content about the authors' preferences by human interpretative coders or by automated computational algorithms. There are many potential sources of raw data on the preferences of real political actors.

Having collected raw data on preferences, a high-dimensional data space can be reduced using some scaling technique to a low-dimensional summary space that is taken as the most efficient description of preferences of many different people on many different matters. The most detailed possible description of preferences is always high-dimensional—everyone is different from everyone else in some way. For a given substantive problem, therefore, there is always a trade-off. Analysts ultimately seek a spatial description of preferences that is a parsimonious (low-dimensional) summary of relevant similarities and differences between people yet does not miss something that is both substantively important and critical to theoretical conclusions. This means that there is no such thing as the abstract dimensionality of the structure of preferences in a given setting. In this sense, there is no "one true space" to be discovered if only political scientists could find it. For any substantive problem, there are high-dimensional background data that can be collected on "raw" attitudes in the real population under investigation. There are also "metadata," which cannot be collected, on potential attitudes on matters that have yet to arise and cannot yet be conceived. Given the data on attitudes, there is a best estimate, *d*, of the dimensionality of the relevant policy space (with *d* lying somewhere between zero and infinity) that is the most useful low-dimensional summary of preferences for the problem at hand. Once the problem is specified, scaling techniques that reduce high-dimensional data spaces to low-dimensional summaries typically have measures of "fit" that show how much variation in the raw data is captured by a given low-dimensional description. Such measures help the analyst make substantive judgments, for example, that the best spatial representation in a given setting is two-dimensional—in the sense that a two-dimensional representation fits the data much better than a one-dimensional representation but adding a third dimension does not yield much improvement in fit in relation to a given problem. Notwithstanding this, the ultimate decision on the dimensionality of an empirical space is a judgment call for the analyst, who in a sense is always an activist in imposing some low-dimensional representation on high-dimensional data about preferences.

Implications

The dimensionality of a given policy space, a fundamentally empirical matter, has profound implications for abstract mathematical models. This is because logical inferences derived from formal spatial models of political decision making, and especially of voting, depend critically on the dimensionality of the assumed outcome space as well as on other detailed assumptions about the preferences of real humans. One well-known reason for this arises from the possibility of voting cycles over outcomes in multidimensional spaces, whereby A beats B, B beats C, and C beats A in majority votes. While the famous formal proofs of this are known as the *chaos results*, the substantive implication in such settings is not "chaos" but that "something else," over and above unconstrained majority voting, is needed before models can make unambiguous predictions about outcomes. Mathematical models of voting in multidimensional outcome spaces, therefore, tend to be very sensitive to precise substantive assumptions about the local institutional setting under investigation—assumptions that may drastically narrow both their formal generality and their empirical applicability—and hence their susceptibility to scientific testing.

Spatial representations of preferences over outcomes, whether assumed arbitrarily or estimated empirically, are not of course models in themselves; they are key inputs to such models. Thus, there is no such thing as "the" spatial model of voting, of legislative behavior, or of government formation. There are many different spatial models of these important political phenomena, each model building on some spatial characterization of preferences by making precise behavioral assumptions about decision-making agents and the institutional setting in which their decisions are manifested. What makes all these very different models spatial is that the utility functions of key agents, which may of course include many different things, all include terms that compare expected utilities deriving from different points in the outcome space. Relative utilities of pairs of outcomes are described in terms of perceived distances between these points and an additional assumption about how the agent feels about "policy loss." Let U_{ij} be the utility derived by agent i from outcome j and A_{ij} be some vector of other sources of agent utility, perhaps the charisma of some political candidate or a bribe paid, that have nothing to do with policy preferences. It is conventional to assume that agent utilities decline as a function of increasing policy distance between an ideal point and the outcome being evaluated. This function is often assumed to be linear ($U_{ij} = A_{ij} - D_{ij}$) or quadratic ($U_{ij} = A_{ij} - D_{ij}^2$). As with the choice of metrics, the choice of loss functions is often made on the basis of analytical convenience rather than empirical evidence about how real people actually think. The assumption of quadratic loss is the more common and is occasionally justified as an empirical assumption that real humans are risk-averse, though hard evidence about risk aversion in the real word typically concerns economic decision making, and there is very little evidence one way or the other concerning whether real people tend to be risk-averse when making political decisions. It seems equally plausible to argue that voters, for example, are more sensitive to policy differences between two parties whose policies are close to their own ideal points than they are to the differences between two parties whose policy positions are very remote, yet this runs counter to the assumption of quadratic loss. For this reason, a number of spatial models of political decision making assume linear rather than quadratic policy loss in the agent utility functions that they specify, although justifications for this, when explicit, tend to be casual.

Model Types

Within the general spatial modeling framework set out above, there is huge variation in the type of model one encounters. One famous application, associated with the name of Anthony Downs, though predating his work, concerns voting in elections. A spatial model of voting in elections might assume an exogenously fixed institutional setting of an election to one single-seat district with a simple plurality formula for mapping votes cast into seats won. It might assume two species of agents—politicians and voters—with an exogenously given set of politicians assumed to prefer winning the support of as many voters as possible and with voters assumed to prefer voting for the politician who promotes the policy package that seems to them to be closest to their own ideal policy. These assumptions define premises for one of many possible spatial models of electoral competition—in this case, one possible model of presidential elections under plurality rule. If voters' preferences on all relevant issues can be represented using a single latent dimension and if politicians have good information about these preferences, then such a model generates the well-known implication that, in the absence of some other assumption, the policy positions of both candidates will tend to converge on the ideal point of the median voter, who in this sense will be pivotal in deciding the election result. The reader will have noticed a lot of *ifs* in this informal statement of the model, however, hinting at the many possible spatial models of this one single political process.

Quite different spatial models may be generated by different institutional settings. Such models might allow the strategic "entry" of new candidates into the competition. They might assume a diverse set of single-seat districts, in which candidates from the same party must all set the same policy position. Given some assumed structure of political communication, they might assume that politicians can set different policy positions in different districts. They might also assume the following: a diverse set of multiseat districts, with exogenous or maybe endogenous boundaries, and various, maybe endogenous, electoral formulae used to translate votes cast into seats won. Different models may make different behavioral assumptions about politicians—for example, that politicians are motivated to enact policies rather than maximize votes or have some specified trade-off between these objectives. Also, it may be assumed that voters are motivated to have an impact on the composition of the eventual government rather than supporting their closest party, or some trade-off may be assumed between these objectives. There is thus no limit to the number of possible spatial models of voting in elections. A particular model is identified by its explicit (and often implicit) assumptions about agent behavior and the institutions structuring this.

Moving beyond voting in elections, characterized by elite–mass interactions between a small set of candidates and a large set of voters, spatial models have also been applied to elite–elite interactions such as voting in committees and legislatures and in the U.S. Supreme Court as well as bargaining between party leaders over government formation in parliamentary democracies. Such high-stakes settings with interactions between small numbers of sophisticated agents may well imply different empirical assumptions about the following: how much each agent knows about the preferences of all others, whether all agents perform the same type of complex strategic calculation about matters that may or may not be important to them, and how much agents focus on optimizing decisions on the problem under investigation, such as voting on some issue, when they must in reality make many decisions on many different matters. Voting in elections may be important, but not that important, for voters, whereas bargaining between seasoned politicians over who becomes the prime minister is likely the most important deal they ever do.

In each of these cases, there remains a sharp analytical distinction between spatial models that make the assumption that real-world preferences on all important matters can be well represented by a single latent dimension and those that assume that more than one dimension is needed for a realistic representation of preferences. One-dimensional spatial models tend to be analytically tractable, even if they can sometimes be difficult to resolve. They are thus appealing to formal theorists, who would be the first to acknowledge that the assumption of a one-dimensional preference structure is substantively unrealistic. Many published spatial models are, for this reason, one-dimensional, and the claim is typically that, even when patently unrealistic, they are in some sense aids to intuition. Multidimensional models, while of their essence offering greater potential realism with regard to descriptions of how real people think, tend to be analytically intractable. One response to this is to constrain the model with further strong institutional assumptions that make it tractable while at the same time reducing its generality. The other solution is to investigate the model using carefully designed suites of computer simulations.

Conclusion

Spatial modeling is a general approach to analyzing political decision making. The more abstract and formal the approach, the more the resulting models are about decision making in general. The more empirical the approach, the more they are about decision making by human beings in settings where data could possibly be collected. Within this general approach, there is no single spatial model of decision making, by either abstract agents or real humans, in any specified setting. The considerable intellectual attraction of the spatial modeling approach is that it offers a conceptual language that allows different modeling assumptions to be compared in relatively explicit ways. The spatial modeling approach thus provides a set of building blocks for different models of important political processes but leaves all important substantive assumptions firmly in the hands of the modeler.

STABILITY

Political stability is an elusive concept, one that is difficult to define and operationalize. In simplest terms (and, as will be seen, the concept *simplest terms* can itself be misleading), stable political systems are those in which governance and the transfer of power occur in regular, predictable ways. When we think of stable political systems, therefore, we think of those that hold regular elections and incumbents who vacate offices and allow opponents to take over those offices. We also envision systems in which protests are not widespread, especially violent, or challenging to the basic system of governance. As is evident from this definition, however, stable systems that are not democratic would seem to be excluded from it. Yet dictatorships can last for decades and, thus, in this sense, are stable. Consequently, we must acknowledge that the proposed definition is problematic, and so we need to think more deeply about the topic. This entry is consequently focused on the three questions that should be addressed when dealing with this topic: how to define, how to achieve, and how to measure stability.

Defining Stability

Two primary difficulties confront us when we think more deeply about the meaning of political stability. First, while most journalistic and some academic accounts treat stability as a dichotomous variable, meaning that a given political system is either "stable" or "unstable," on-the-ground reality is quite different. Only at the most basic level is such a dichotomy justifiable. For analytical purposes, however, there is widespread recognition among experts that political stability in the real world covers a very broad continuum. There are some political systems that are chronically unstable, with elections occurring irregularly (if at all), and in which the outcome of elections is often contested and likely to lead to mass protests, elite subversion, or both. On the other hand, there are systems in which regular, predictable political processes are almost always the norm. Finally, there is a wide range between these two extremes and cases of nations that fluctuate between stable, unstable, and everything in between.

Political science has recognized the continuous nature of political stability and as a result has accepted the wide variation in degrees of stability as an important variable to be studied in comparative politics and international relations. Indeed, there often exist regions within a given country that exhibit more stability than others. Far less consensus emerges on the normative benefits of stability, which leads to the second and more vexing challenge in coming to grips with the term *stability*.

Is stability a good thing, and if so, is more of it always better? Consider the argument in favor of a state of continual instability. This position was perhaps most strongly and dramatically argued by China's Mao Zedong. From Mao's perspective, China (and indeed all Marxist regimes) benefited from a state of constant revolution; in the absence of such revolution, bourgeois forces could threaten to reinstate capitalism. As a result, Mao plunged China into the Cultural Revolution in 1966, producing social unrest, violence, and purges. From Mao's point of view, however, and from that of the intellectual leadership of the Red Guards who held sway during this period, instability was to be institutionalized as the new "normal" in order to prevent the communist revolution from being extinguished. Only with the death of Mao and the arrest of the so-called Gang of Four in 1976 did this protracted, nonstop "revolution" come to an end.

Whereas for Maoists political instability was a cherished ideal, for other regimes, whether on the right or the left, instability of any kind has been seen as an existential threat. Cases on the left include Cuba under Fidel Castro, a country ruled for nearly 50 years by one man until his health failed, and the case of North Korea under the rule of Kim II-sung, who ran his country from 1948 until 1994. At the opposite extreme, are the cases of Alfredo Stroessner, who ruled Paraguay from 1954 until 1989, and the Somoza family dynasty, which controlled Nicaragua from the 1930s until their fall in the Sandinista Revolution in 1979. These and similar regimes see any form of instability as threatening and have routinely imprisoned and/or killed anyone who has challenged them. In these cases, then, extreme stability is clearly not a positive state from most normative perspectives.

Even when we move away from such cases of extreme stability or extreme instability, it is unclear how much stability is normatively ideal. From an instrumental point of view, however, it does seem clear that the extremes are highly dysfunctional in a variety of ways. At the most basic level, human life is often threatened when instability is high. The great famine that affected China from 1958 to 1961, in which at least 15 million people are said to have died, is an illustration of the negative impact of such instability. Beyond death from famine, instability also affects health more generally, as well as education, since schools and universities are often shuttered in conditions of permanent revolution. On the economic side, financial investment is almost certainly attenuated in countries that exhibit high levels of instability, as the risk premium is too great for all but the most risk-tolerant investors. In addition, political careers are hard to shape and plan for when instability is high, since the rules of the game are constantly in question and subject to change. Young people who aspire to a political career can find themselves with their political parties banned or the political office to which they aspire eliminated.

Extreme political stability, on the other hand, produces other costs. Dictatorships discourage investors because, although the regime itself may be stable, its decisions are often unpredictable, since they depend on the whim of a single individual or clique of noncompetitively selected rulers. Investors can find themselves with their factories, farms, or banks expropriated virtually overnight. Recourse to the courts is futile, as the rule of law is no more than what the dictator declares it to be. Innovation is stifled in such regimes, since there are few incentives for individuals to be creative. Indeed, dictatorships inculcate fear in those who wish to accomplish any sort of change, since such change will be seen as a challenge to the status quo. Political careers are often truncated by purges, as parties or families fall out of favor.

In sum, it would appear that as one moves to the extremes of stability or instability, the costs grow exponentially, suggesting that the gains for stability may conform to a quadratic form with the highest returns of all kinds (human, economic, and political) lying at the top of an inverted U curve. In effect, it would appear that the ancient Greek philosophers had got it right—Aristotle criticized Sparta in the *Politics* for its exclusive focus on making war and its lack of attention to making peace.

Achieving Stability

The key question in the literature of contemporary political science is how to achieve stability. Much of that literature has focused one way or the other on the link between political legitimacy and political stability. Most modern theorizing goes back to Max Weber in his classic work *Politics as a Vocation*. Weber saw three types of legitimacy: charismatic, traditional, and rational-legal, only the last being a stable form. In *Political Man*, Seymour Lipset drew on Weber and hypothesized that stable democracies are achieved when political systems are seen by their citizens as being effective at delivering public services and are held accountable for their actions. Lipset as well as David Easton realized that regimes that achieved these goals would produce citizens uninterested in violent or radical change. Moreover, such systems would be better equipped than others to weather the storm of periods of especially poor performance. Hence, legitimate systems can overcome sharp economic downturns because they have built up a reservoir of political support, and citizens are prepared to grant them significant degrees of freedom to "fix up the mess."

Beyond legitimacy, stability also seems to depend on reasonable equality in the distribution of wealth. Considerable literature, beginning with Aristotle and continuing into modern political science, has linked instability to inequality. Academic disputes have emerged, however, as to how to measure inequality and whether scholarly attention should be focused on income inequality, wealth inequality, or land inequality (see, e.g., the works of Manus Midlarsky, and Edward Muller and Mitchell Seligson listed in the Further Readings).

Measuring Stability

Stability has been measured extensively by databases in political science that have counted the number of coups, revolutions, insurrections, violent protests, and so on. Debates center on the significance and weighting of each of these events: Do 10 violent protests add up to the equivalent of one attempt at insurrection, and how can one measure these events? The empirical work on factors related to legitimacy, which in turn would lead to stability, has been extensive, but much of it has suffered from a narrow empirical perspective. Here, as Arthur Miller notes, the "trust in government" paradigm has held sway, in which a small number of items in surveys measure the extent to which citizens trust their government "to do the right thing."

More recently, the conceptualization of legitimacy has been broadened considerably. One approach, as noted by Bruce Gilley, includes measures based on public opinion (from the World Values survey) as well as objective indicators, such as tallies of protests. Another approach argues that legitimacy is fundamentally an attitudinal construct and looks at it as the extent to which citizens express various degrees of their support for their political systems. Surveys are ideal for measuring this notion of legitimacy. A six-dimensional system developed and tested by John Booth and Mitchell Seligson (2009) in a number of countries was found to powerfully predict political stability. This approach, rather than making stability part of the legitimacy phenomenon itself, makes legitimacy a predictor of it.

Important research frontiers lie ahead. We do not know if there are important worldwide trends in stability. The widespread movement toward democracy with the end of the Cold War has produced some stable regimes, but it has also been associated with expanding conflicts in others. It remains to be seen if the world as a whole is moving toward more stable or less stable polities.

STAGES MODEL OF POLICY MAKING

A common method of examining the operation of a policy process is to break it down into several stages and substages. Each of these can then be analyzed separately, and commonalities across stages can also be identified. Over the course of the history of the policy sciences, several distinct models of the policy process were put forward before the current five-stage model of agenda setting, policy formulation, decision making, policy implementation, and policy evaluation was settled on. The evolution of these models and their advantages and disadvantages as analytical and empirical constructs are set out below.

One of the most popular means for simplifying public policy making has been to disaggregate the process into a series of discrete stages and substages. The resulting sequence of stages is referred to as the *policy cycle* or *stages model of policy.* This simplification has its origins in the earliest works on public policy analysis but has received somewhat different treatment in the hands of different authors.

The idea of simplifying the complexity of public policy making by breaking the policy-making process down into a number of discrete stages was first broached in the early work of Harold Lasswell, one of the founders of the policy sciences. Lasswell divided the policy process into seven stages: (1) intelligence, (2) promotion, (3) prescription, (4) invocation, (5) application, (6) termination, and (7) appraisal. In Lasswell's view, the seven stages described not only how public policies were actually made but also how they should be made. The policy process began with intelligence gathering—that is, the collection, processing, and dissemination of information for those who participate in the decision process. It then moved to the promotion of particular options by those involved in making the decision. In the third stage, the decision makers actually prescribed a course of action. In the fourth stage, the prescribed course of action was invoked; a set of sanctions was developed to penalize those who failed to comply with the prescriptions of the decision makers. The policy was then applied by the courts and the bureaucracy and ran its course until it was terminated or cancelled. Finally, the results of the policy were appraised or evaluated against the aims and goals of the original decision makers.

Lasswell's analysis of the policy-making process focused on the decision-making process within government and had little to say about external or environmental influences on government behavior. It simply assumed that decision making was limited or restricted to a presumably small number of participants staffing official positions in government. Another shortcoming of this model was its lack of internal logic, especially with reference to placing appraisal or evaluation after termination, since policies are usually evaluated prior to being wound down rather than afterward. Nevertheless, this model was highly influential in the development of a policy science. Although not entirely accurate, it did reduce the complexity of studying public policy by allowing each stage to be isolated and examined before putting the whole picture of the process back together.

Lasswell's formulation formed the basis for a model developed by Gary Brewer in the early 1970s. According to Brewer, the policy process was composed of six stages: (1) invention/initiation, (2) estimation, (3) selection, (4) implementation, (5) evaluation, and (6) termination. In Brewer's view, invention or initiation referred to the earliest stage in the sequence when a problem would be initially sensed. This stage, he argued, would be characterized by an ill-conceived definition of the problem and suggested solutions to it. The second stage of estimation concerned calculation of the risks, costs, and benefits associated with each of the various solutions raised in the earlier stage. This would involve both technical evaluation and normative choices. The objective of this stage is to narrow the range of plausible choices by excluding the unfeasible ones and to somehow range the remaining options in terms of desirability. The third stage consists of adopting one, none, or some combination of the solutions remaining at the end of the estimation stage. The remaining three stages consist of implementing the selected option, evaluating the results of the entire process, and terminating the policy according to the conclusions reached by its evaluation.

Brewer's version of the policy process improved on Lasswell's pioneering work. It expanded the policy process beyond the confines of government in discussing the process of problem recognition and clarified the terminology in use to describe the various stages of the process. Moreover, it introduced the notion of the policy process as an ongoing cycle. It recognized that most policies did not have a definite life cycle—moving from birth to death—but rather seemed to recur, in slightly different guises, as one policy succeeded another with only minor or major modifications. Brewer's insights inspired several other versions of the policy cycle to be developed in the 1970s and 1980s, the most well-known of which were set out in popular textbooks by Charles Jones and James Anderson.

To avoid a plethora of models of policy stages and their variants, it is necessary to clarify the logic behind the cycle model. In the works of Brewer, Jones, and others, the operative principle behind the notion is the logic of applied problem solving, The stages in applied problem solving and its corresponding stages in the policy process are depicted in Table 1.

In this model, *agenda setting* refers to the process by which problems come to the attention of

Table 1 Five Stages of the Policy Cycle and Their Relationship to Applied Problem Solving

Phases of Applied Problem Solving	*Stages in Policy Cycle*
Problem recognition	Agenda setting
Proposal of solution	Policy formulation
Choice of solution	Decision making
Putting solution into effect	Policy implementation
Monitoring results	Policy evaluation

governments; *policy formulation* refers to the process by which policy options are formulated within government; *decision making* refers to the process by which governments adopt a particular course of action or nonaction; *policy implementation* refers to the process by which governments put policies into effect; *policy evaluation* refers to the processes by which the results of policies are monitored by both state and societal actors, the result of which may be reconceptualization of policy problems and solutions.

The most important advantage of the policy cycle model as set out above is that it facilitates the understanding of public policy making by breaking the complexity of the process into any number of stages and substages, each of which can be investigated alone or in terms of its relationship to any or all the other stages of the cycle. This aids theory building by allowing numerous case studies and comparative studies of different stages to be undertaken. Another advantage of the model is that its breadth permits examination of the role of all actors and institutions dealing with a policy, not just those governmental agencies formally charged with the task.

The principal disadvantage of the stages model is that it can be misinterpreted as suggesting that policymakers go about solving public problems in a very systematic and more or less linear fashion. This is not the case in reality, as the identification of problems and the development and implementation of solutions are often an ad hoc and idiosyncratic process. Decision makers often simply react to circumstances and do so in terms of their interests and preset ideological dispositions. Another problem with the model is that while the logic of the policy cycle may be fine in the abstract, in practice, the stages are often compressed or skipped, or they are followed in an order unlike that specified by the logic of applied problem solving. Thus, the cycle may not be a single iterative loop but rather a series of smaller loops in which, for example, the results of past implementation decisions have a major impact on future policy formulation, regardless of the specifics of the agenda-setting process in the case concerned. In short, there is often no linear progression of a policy as conceived by the model. Third, and perhaps most important, the model lacks any notion of causation. It offers no pointers as to what or who drives a policy from one stage to another, a matter of crucial interest to scholars working on the subject.

STALINISM

The term *Stalinism* in its proper sense denotes the essence of a specific social system that emerged in the Soviet Union in the late 1920s under the leadership of Premier Joseph Stalin. The term is also used to refer to (a) a specific way of behavior and thinking dominant in Soviet politics from the late 1920s to the mid-1950s or influenced by and similar to it, (b) a corresponding ideology or class of ideologies justifying Stalin's policies, or (c) constitutional arrangements and institutional designs typical of or similar to those developed under Stalin's leadership.

One of the first, if not the first, documented usage of the word *Stalinism* appeared in an article by Karl Radek published in December 1934 in *Pravda*, where he introduced the expression *Marxism–Leninism–Stalinism*. This initiative was short-lived. Neither Stalin himself nor party ideologists used the word, preferring *Marxism–Leninism* as the title of their ideology and *socialism* as a typical description for the social order developed in the Soviet Union. Since the mid-1950s, *Stalinism* essentially has become a derogatory term. Even its champions—with very few exceptions (see Sergeev's 1999 apology for "mystical Stalinism")—avoid using the word. Furthermore, a word *Stalischina* emerged in Russian with essentially the same meaning as *Stalinism* but with much more offensive connotations.

Traditionally, interpretations of Stalinism vary between a limited focus on highly specific characteristics of Soviet politics, often attributed to Stalin's weird personal impact, and a shallow explanation of related phenomena as mere instances of totalitarianism. A more balanced view requires a combination of a still broader perspective with adequate reference to precise historical particulars and conditions of political developments.

Origins and Characteristics

By the beginning of the 20th century, the spontaneous development of European countries and their overseas colonies extended over great expanses and held sway over civilizations and cultures hardly ready to adjust to the modes and models of modern behavior. The world became integrated into a single interstate system of territorial rule that was internally divided by imperialist rivalry and structural disproportions. Political leaders had no institutional and intellectual resources to manage such development even on national levels, to say nothing of an international one. The worldwide expansion of modernization coupled with the imperialist enclosure of the entire surface of the globe into a single interstate system made the issue of control of development critical. The inability to adequately respond to that great challenge provoked World War I.

Postwar reconstruction implied a grand project to meet the challenge. The Entente winners relied on national self-determination and the creation of a universal quasi polity in the form of the League of Nations. This project proved too simplistic and straightforward, however, to be adequate. It immediately provoked an alternative one. During World War I, radical Marxists had called for transforming an imperialist war into a world revolution through a series of civil wars. The October Revolution and the civil war that followed seemed to prove the underlying logic. Thus, Soviet power and the Comintern emerged as an alternative grand project. This was the historical context for the first wave of democratization and the Soviet experiment that evolved into Stalinism, as well as for a number of national alternative projects that produced a variety of totalitarian and authoritarian regimes.

Soviet power was highly ambivalent. On the one hand, it relied on mass participation and thus had a clear democratic calling coupled with an institutional form of direct democracy of Soviets—Councils of Workers and Peasants Deputies. On the other hand, the emergent system could only be run by a highly integrated and disciplined new-type vanguard party. Lenin, in his seminal book of 1920, *"Left-Wing" Communism: An Infantile Disorder*, clearly fixed a hierarchy of power: leaders → party → working class → masses.

Further development reshaped the initial combination of democratic conceptual and institutional insights with authoritarian and repressive trends into a highly contradictory pattern of rule known as Stalinism. Its core was the "totalitarian democracy" (Jacob Talmon, 1952) that prevailed during the civil war (1918–1920) and successive postwar periods (1920–1922, 1924–1927). This nascent system was gradually made more and more effective by institutional and ideological innovations. Some of those innovations could be attributed to Stalin personally, but many were developed by his counterparts and would-be political rivals. The first decade after the October Revolution saw a successive accumulation of traits that could be considered attributes of Stalinism, particularly through an increasing authoritarianism. Correspondingly, the years and decades after Stalin's death may be seen as a gradual de-Stalinization or a series of structural and substantive changes that had a very profound effect despite the claims of radical anti-Soviet critics that "the system is untransformable."

The dating of Stalinism and its specific periods is problematic. Widespread attribution of Stalinism to the period between the respective deaths of Lenin (1924) and Stalin (1953) seems to be inaccurate, greatly exaggerating agency factors at the expense of structural ones. Rather, it is the congresses of the new-type party that should be considered critical junctures. Thus, all the years of profound internal political struggle within the party up to the 15th Congress in December 1927 could best be seen as a period of *nascent Stalinism.*

The age of Stalinism proper could be divided into a number of periods. They include emergent Stalinism, up to the 16th Congress of July 1930; early or initial Stalinism, up to the 17th Congress of January to February 1934 and the subsequent death of Sergey Kirov in December 1934; the complete or full-fledged Stalinism of 1934 to 1941; the Word War II interlude; the advanced Stalinism of 1945 to 1952, the year of the 19th Congress; and the late Stalinism of 1952 to 1956, concluding with the 20th Congress.

Some essential characteristics of Stalinism, however, had started to be elaborated much earlier.

The core of the new political system was a new type of party. Initially, it was a highly disciplined and motivated clandestine vanguard party organized and molded by Lenin on the basis of the principle of democratic centralism. After the October Revolution, in a number of realignments, Communists managed to keep dominant positions and after the Civil War emerged as the only commanding power. At the 10th Party Congress of March 1921, internal party factions were banned, but policy options could be discussed on the basis of alternative platforms. Soon after, in the first purge (*чистка*, meaning "cleansing"), about a third of the membership was expelled from the party. Launching campaigns against oppositions of various kinds and using purges, Stalin managed to consolidate the party by its 15th Congress. Only then was it possible to start its transformation from a party proper into the core of a party–state totalitarian system.

The conception of building socialism in a single country was another cornerstone of the Soviet experiment. Already in his 1915 article "On the Slogan for a United States of Europe," Lenin had declared that uneven economic and political development made the victory of socialism possible, first in a few countries or even in a single country alone. Lenin's criticism of left Communists in 1920 and his subsequent playing down of the idea of permanent revolution, as advanced by Leon Trotsky, marked a significant departure from the orthodox Marxist vision of world revolution. By the end of 1924, Stalin recognized that "the proletariat can and must build a socialist society in one country" in the second edition of his book *Foundations of Leninism*—the statement was missing in the first edition earlier in the same year. Soon after, Nikolai Bukharin elaborated on the issue. He argued that the existing economic base of the Soviet Union was sufficient for socialist construction in case its security could be militarily provided. By the time of the 15th Congress, the idea was a fully accepted cornerstone of official policy.

After coming to power, the Communist Party made consistent attempts to control appointments to most important posts. Stalin himself did a lot to establish special departments in regional party committees that would oversee the most important appointments. As Secretary-General, beginning in 1922, he personally handled similar control in the center. That practice foreshadowed the future system of *nomenklatura* (described below in the discussion on complete Stalinism).

Historical Development

Emergent Stalinism (1927–1930) was primarily linked with the beginning of industrialization and collectivization as well as the launching of the so-called 5-year plans. With all the economic importance of those policies, their social aspects were far more crucial. A highly heterogeneous economy and society were radically transformed. The economy became state controlled and planned. Society was first atomized and then reshaped with imposed homogenization. All those steps seemed highly modern, but in fact, such radical and one-sided modernization would turn out to be dysfunctional.

The second general party purge of 1929 to 1930 was a major event of the period. About 100,000 Communists, or some 10% of the membership, were purged. At the same time, a significant number of new members—industrial workers—joined the Party.

Early or initial Stalinism (1930–1934) was marked by further consolidation of party control. During that period, a theory of aggravation of the class struggle in the process of building socialism was advanced. In his speech on the results of the first 5-year plan in January 1933, Stalin (1951) began as follows:

> Eradication of classes is accomplished not by cooling down the class struggle but by its heating up. Withering of the state would be achieved not by weakening of state authority but by its maximal strengthening, necessary to crush the remnants of the dying classes and to organize a defense against capitalist encirclement, which is not yet destroyed and would not be destroyed soon. (p. 211)

This argument supplied a theoretical basis for the claim that ongoing repression of political opponents is necessary.

The third general party purge was performed during 1933. This time, during the period of the purge, new memberships were temporarily suspended. About 400,000 Communists, or some 18% of the membership, were purged.

Complete Stalinism (1934–1941) was marked by the growth of the personality cult of Stalin and the fastening down of a full-fledged *nomenklatura* system. The term *nomenklatura* (from the Latin *nomenclatura*, or “list of names”) denotes a practice of advance nomination of candidates to various important positions by respective party committees. For example, important positions at the union level were staffed by the Central Committee of the Party, at the republican level by each republic’s Central Committee, at the regional level by regional committees, at the local level by local committees, and so on. Nomination implied that a person’s name appeared in the list of names, or *nomenklatura*. The person was controlled, replaced, promoted, or disgraced within that system. One could have access to significant positions only by virtue of joining the *nomenklatura*.

Nomenklatura is often interpreted as a new class (e.g., by Milovan Djilas and Michael Voslenski). Strictly speaking, it was not so. *Nomenklatura* itself was highly stratified. It was more a system of control and rationalization of government by and through the party than a social grouping, much less a class. In fact, it was nothing but a central link between the party as a core of the Soviet totalitarian system and administrative infrastructure integrated into the system. In fact, its development was coupled with the reduction of the state to an administrative arrangement.

From 1936 onward, purge campaigns were replaced by the “struggle with traitors of the people.” This struggle culminated in what came to be known as *Yezhovshchina*. The worst of the repressions occurred while the People’s Ministry of Internal Affairs (*Narodnyy komissariat vnutrennich del*, NKVD) was headed by Nikolai Yezhov from September 1936 to August 1938. Stalin made him responsible for the repressions. Yezhov was subsequently arrested and executed. The very term *Yezhovshchina* was coined to integrate the campaign of criticism.

The World War II period created a new reconfiguration of world politics that influenced many aspects of Stalinism. The idea of building socialism in a single country was reinterpreted, putting the Soviet Union at the center of capitalist states, ranging from its most reactionary fascist foes all the way to its allies. Intensification of the class struggle was linked to this picture. While the totalitarian party–state formation proved effective and instrumental, it was supplemented by the traditional great-power apparatus of the Russian imperial autocracy; thus, Stalin’s personality cult was greatly boosted and became more deeply entrenched.

Advanced Stalinism (1945–1952) saw a further transformation of the theory of building socialism in a single country. People’s democracies in the countries that fell into the sphere of Soviet geopolitical control formed the so-called socialist camp. Consolidation of the new system gave impetus to the idea of intensification of the class struggle. Stalinism made claims to global domination. Its conceptual basis of Marxist scientific teaching was extended to integrate all science. The natural sciences were supposed to elaborate dialectical materialism, while social scholarship was to be informed by historical materialism. Several public campaigns on specific sciences were launched, with Stalin himself publishing a book on linguistics.

All in all, the system of advanced totalitarianism became too complex and complicated to be run by simple principles of total control. The system was bound to change.

Late Stalinism (1952–1956) saw a series of reforms begun by Stalin himself, finishing with the thaw initiated during the premiership of his successor Nikita Khrushchev. The 19th Congress, organized after a 13-year interval, signaled the beginning of the process. It was Georgy Malenkov, not

Stalin, who made the main speech (report on party activities). The speech highlighted the need for criticism and self-criticism. The theme was developed by Stalin himself and most of the speakers. Many historians interpret this as preparation for a new wave of purges. This was probably true, but it also signaled the coming reforms. They followed, coupled with a power struggle after Stalin's death in March 1953. Several projects of de-Stalinization emerged, ranging from strengthening state structures and emancipating them from the party (Lavrentii Beria, Minister of the Interior) to revivalism of Leninist principles, including totalitarian democracy (Khrushchev).

STATE

The three sections of this entry examine the very complex and controversial political phenomenon commonly referred to as *the state*. The first section presents a conceptual statement that takes as its point of departure the ideal-typical treatment of the state presented at the beginning of the 20th century by the German scholar Max Weber (1864–1920). This choice reflects the significant influence that treatment exercised, over the remainder of that century, within the disciplines of law, political science, and sociology. (Note that Weber's arguments, while markedly original in parts, echoed and elaborated theoretical views widely shared within the juridical and social science literature of his time, both in Germany itself and elsewhere. However, neither at the time nor later were they universally accepted as valid.). Included here are comments that support, qualify, and modify Weber's own treatment. The next section of the entry summarizes the major historical developments that in the course of Western modernization imparted to the political institutions of certain European countries the distinctive features emphasized in Weber's state concept. They turned the state itself into the model arrangement for the generation and management of large-scale political power, first in other European countries and then in other parts of the world. The third section of the entry considers very briefly the major events that, since Weber wrote, have markedly affected the institutional physiognomy of the state itself and its position within the larger society and highlights some aspects of the contemporary discussion about "the state of the state."

A Conceptual Portrait of the State

Weber's understanding of the state is most often recalled in a definition he proposed in various texts: "The state is a human community that (successfully) claims the *monopoly of the legitimate use of physical violence* [italics added] within a given territory" (Gerth & Mills, 1946, p. 78). But a more elaborate definition may provide a better start to our own discussion:

> The primary formal characteristics of the modern state are as follows: It possesses an administrative and legal order subject to change by legislation, to which the organized activities of the administrative staff, which are also controlled by regulations, are oriented. This system of order claims binding authority, not only over the members of the state, the citizens, most of whom have gained membership by birth, but also to a very large extent over all action taking place in the area of its jurisdiction. It is thus a compulsory organization with a territorial basis. Furthermore, today, the use of force is regarded as legitimate only insofar as it is either permitted by the state or prescribed by it. (Weber, 1978, p. 56)

Although Weber here as elsewhere uses the expression "the modern state," in his own view, the qualifier *modern* is largely superfluous. While his best known work, *The Protestant Ethic and the Spirit of Capitalism* (1905/2002), investigates (famously and controversially) a religious aspect of the economic component of Western modernization, Weber views state formation as the most significant political component of that same, broad-ranging, universally significant historical phenomenon. By the same token, the state constitutes a distinctive, relatively recent moment within the historical career of a universal but highly varied phenomenon—that of *Herrschaft* (an expression often translated as "authority" or "domination," which below we generally refer to as "rule").

Conceptually speaking, rule itself is a variant of an even broader phenomenon—that of political power. In the Weberian construction of it, political power exists in a situation where given two parties (individual or collective) pursuing incompatible interests, one can overcome the resistance of the other to its own pursuits by engaging or threatening to engage in violent action and thus putting at stake the other's physical vulnerability. The resulting inequality between the two parties can be more or less marked, more or less durable, and wide-ranging. It can become sharper and more stable, involve greater numbers, and affect a broader spectrum of social affairs when the superior party no longer needs to exercise or threaten violence in order to get its way but establishes and manages a relation where its own command routinely engenders the other party's obedience. To the extent that this happens, we can say that political power has become institutionalized into rule.

Weber's greatest contribution to the study of the institutionalization of political power lies in his emphasis on its legitimation; indeed, he views rule as legitimate political power. This is the case to the extent that the inferior party is not subjectively induced to obey by its sheer, unquestioning habituation to its own position or by a calculation of the material costs and rewards it can expect respectively from granting or denying obedience. Rather, its obedience expresses the belief it entertains in the superior party's entitlement to issue-binding commands and in its own corresponding moral duty to obey them. This is of course an ancient insight, but Weber develops it most creatively. First, he argues that the beliefs in question, for all the historical variety in their content and in the situations that engender them and that they sustain, can all be subsumed under three basic, ideal types of legitimacy: traditional, charismatic, legal-rational. Then, he shows that this tripartition is correlated with other significant distinctions concerning diverse aspects of systems of rule.

Building to an extent on this and other contributions of Weber's, the contemporary German sociologist Heinrich Popitz (1925–2002) developed a broader theory of the institutionalization of political power and of its development into rule. There are three components to this process:

> First, power relations become de-personalized. Power is no longer undistinguishable from the particular individual who at a given time is in a markedly advantageous position, but increasingly appears to be connected with functions and positions which transcend the individual. Furthermore, a formalization of power takes place, in that its exercise is more and more oriented to rules, procedures, and ritual practices. (This does not exclude its arbitrary use; but one can talk about this, or about undue favor, only when arbitrary or favourable acts are contrasted with what happens in most situations.) The third aspect of the institutionalization of power is the growing integration of power relations within a broader order. Power gears itself into the pre-existent situation. It becomes part of and is encompassed within the social edifice, which it supports and by which it is in turn supported. (Popitz, 1992, pp. 38–39)

The French social theorist Jean-Yves Calvez suggests that we characterize the state as a polity where institutionalization is particularly thorough and advanced. This proposal is significant but considers expressly only the extent to which institutionalization is realized in state building and disregards the question of how it is institutionalized. In some systems of rule—for instance, in the classical Chinese empire—a very extensive and penetrating institutionalization process was carried out largely by means of what Popitz calls ritual practices, both those of an expressly religious nature (the emperor was supposed to have a mandate from Heaven) and others that we might call *ceremonial* and *etiquette*. Here, political and administrative practices were standardized primarily by reference to values and norms perceived as sacred, stylized in ways chosen for their symbolic appropriateness, conveying and instilling a respect for tradition and a commitment to its protection.

Although in the West ritual and similar practices have also been used in constructing and managing political power, already in ancient Greece and Rome, it was institutionalized and managed by means of rather different practices, both originally unique to the West. On the one hand, significant political and administrative decisions came to depend, more or less, on express, legitimate, public deliberation over alternative views of what policies to adopt. On the other, those polities structured themselves by means of law—that is, of general commands that articulated the polity itself into organs and offices with distinctive faculties and responsibilities.

Furthermore, the formation of policy itself and (as far as possible) its subsequent implementation were also regulated by law, which the Greeks and Romans increasingly understood as a body of principles and rules of secular nature, capable of being taught, learned, and rationally interpreted and applied. Its bearing on a huge variety of contentious matters could be determined by means of a distinctive form of legal discourse—highly literate, sophisticated, intellectually prestigious (especially in Rome)—which, in principle, could produce choices demanding rational assent between alternative solutions to a given practical problem.

Thus understood, law is much better than ritual at confronting open-ended situations and at handling and generating contingency. Now, contingency itself—the understanding that much (perhaps all) that is the case in the world is not so of necessity but merely because it *is* the case, often (not always) as a result of human agency—is a central aspect of modernity. On this account (among others), one may understand why law played a large role in the building of the typical polity of Western modernity and in the formation and implementation of its policies. For while legal decisions are occasioned by the possibility of alternative choices, they settle for one or the other via a work of interpretation intrinsically open to contestation and reconsideration. This is all the more so when they draw on principles and modalities of argument not perceived as divine or supernatural in nature and, thus, not endowed with absolute and utterly unchallengeable validity.

Later Western polities, particularly during the Middle Ages, maintained a close relationship between law and rule. But here, law itself was seen chiefly as the product of long-lasting, spontaneous social and cultural processes, mainly embodied in locally evolved customs; these expressed widely shared moral convictions, often interpreted and inculcated by priests as constituting religious commandments. Rulers related to the law, so understood, chiefly as its (more or less effective and reliable) custodians and enforcers.

A rather drastic change in the relation between rule and law associated with (indeed, constitutive of) the advance of modernity (though oddly enough, it finds a significant precedent in the Gregorian reform of the Church in the 11th century) was associated with the emergence and development of so-called positive law. Here, lawmaking comes to be seen as a distinctive and exclusive prerogative of rule, turning law from a framework of policy into an instrument for it. It has become possible to make law(s) in order to confront the situation and change it by selecting and mandating new policies.

This "positivization" of law, by making it depend on express, deliberate, time and place–bound human decisions (rather than on its presumed agreement with the supreme religious and moral dictates of the divinity or of nature itself, or with the folk's jural traditions), makes it relevant to a distinctive feature of the ideal-typical, Weberian state—its rationality. The system of rule can treat law as one instrument for optimizing the relation between the costs and benefits of its own activities. This, in principle, is not possible where the system's prevalent mode of institutionalization relies on ritual, where the connection between activities and intended results is chiefly symbolic, not intrinsic.

But turning law into a political instrument raises a threatening problem: how to secure the third aspect of the institutionalization of political power, its integration into the larger society—a balance between what a society is induced (or indeed compelled) to do for the state and, vice versa, what the latter does for the former. States generally deal with this problem by establishing a hierarchical distinction between different sources of law—between a state's constitution and its statutes or between these and the authoritative acts applying them (judicial sentences, ministerial decrees). Legal commands at lower levels are valid only if, while in principle their content is open-ended, they can be discursively shown to be consistent with higher level commands. These come to represent, so to speak, a more deep and abiding commitment of the polity to the protection and fostering of some societal interests. But the formation and execution of commands at each level can be expected to reflect, once more, a preoccupation with rationality, a sustained effort to attain optimal results in the face of changing circumstances while minimizing costs and risks. Thus understood, legal commands can both confront and generate a great deal of contingency.

When it is thus "positivized"—that is, rendered contingent on express, deliberate, and time and place–bound human decisions—the making and application of law empowers the state. Instead of closely monitoring multiple, diverse, and changing circumstances to issue commands that activate specific responses from specific individuals, the state can address abstractly formulated, general commands to an open-ended plurality of individuals, both those actively involved in its own operations and those at the receiving end of them; it can program and make predictable their response to those commands. It can evoke in them not just ad hoc responses but lasting and broad-ranging dispositions to act, frame their activities within an environment of sanctioned expectations, and structure both their private relations to one another and those they entertain with the state itself. And it can do this not only by ordering, authorizing, or forbidding specific activities of individuals but also by enabling them to produce valid, actionable legal effects in their own open-ended, selective pursuit of their interests.

Insofar as it does this, the state recognizes as differentiated from, complementary to, and autonomous of itself (though to some extent controlled and empowered by its own activities) a whole realm of social and cultural processes that we can label *civil society*. This exists insofar as individuals and collectivities subject to the state's law also hold under it rights of their own, that is legally recognized and protected claims—private rights, which they exercise in their dealings with one another, and public ones, the exercise of which concerns their relations to the state itself and asserts some entitlements vis-à-vis it. The complementarity between the state and civil society is the state's characteristic mode of integration—the third aspect of the institutionalization of rule mentioned by Popitz.

All this presupposes the peculiar and historically rare juridical development whereby the center of political power to some extent, in some fashion, binds itself to the observance of rules of its own making. To quote Popitz (1992) again,

> Only rarely, in the history of society, has one found it possible even just to pose systematically and consequentially the question, how to lay boundaries on institutionalized violence. Essentially, one has accomplished this only in the Greek polis, in republican Rome, in a few other city-states, and in the history of the modern constitutional state. The answers to that question have remained strikingly similar: the postulate of the supremacy of the law and of the equality of all before it (isonomia), the idea of delimiting in principle all legislation (basic rights), procedural norms (decisions taken by organs, publicity, appeals to higher authorities), norms on the attribution of offices (turn taking, selection), and norms of the public sphere (freedom of thought and of assembly). (p. 65)

Nothing less than that is at stake in the state–law relation—but also, nothing more. An excessive emphasis on that relation may obscure the sheer factuality of other aspects of the state's operations—not just its ultimate grounding on violence but also the question of whether it does or does not at a given moment possess the material resources required for those operations, be these once more of a violent kind or of a peaceable kind. (The saying *C'est l'argent qui fait la guerre*—it is money that makes war—suggests that the two kinds are closely connected.) Much of Weber's political theorizing has to do with the arrangements whereby under different kinds of rule those resources are gathered, managed, and committed, thus, with administration. The administrative arrangements typical of the state are bureaucratic; this means (in Weber's own famous ideal type of bureaucracy) that administration is carried out on the basis of various forms of knowledge—juridical, military, fiscal, managerial, statistical, geographical, all of which are perceived as different from (and superior to) purely factual information and practical know-how. When deployed in the course of express deliberation, they are expected to yield decisions that command assent and that activate and orient the conduct on the ground of merely executive activities. The state's capacity to apply such forms of knowledge via its bureaucratic apparatus further qualifies it as a distinctively rational kind of political enterprise, purposefully seeking both effectiveness (the maximal achievement of its own ends) and efficiency (the optimal relation between means and ends). It can use its bureaucratic staff to monitor changing circumstances; identify and forecast dangers and opportunities; maintain, suspend, or modify existing arrangements; and make appropriate dispositions to confront (and to generate) contingent situations.

The diversity in the contents of the knowledge that the state can mobilize is paralleled by the diversity in other resources at its disposal—guns and gallows, sophisticated financial instruments, buildings, various means of communication, specific juridical faculties, moneys. Both diversities (and the consequent one in the vocational identities within the staff) reflect themselves in the varied nature of the tasks the state can take on itself in managing a society's political affairs. In turn, the diversity in the *savoirs*, the materials, and the personnel available to the state finds visible expression in the organizational design of the state itself. It is in the first instance articulated functionally, that is, into units that are each normally engaged in different activities, reflecting the varied nature of the tasks those activities must accomplish and of the relative bodies of knowledge and of relevant material resources. Again, in matching as far as possible its structures to its functions, the state expresses its rationality. (The familiar image of the state as a machine best conveys this principle.)

The second mode of articulation is instead hierarchical. The performance of the various state activities by diverse personnel on the ground—soldiers, teachers, diplomats, policemen, judges, tax collectors, and social workers—is controlled by personnel higher up, who activate the personnel under them and instruct them on how to operate, monitor, and if necessary sanction those operations. Here, the telling image is that of the pyramid, where the base is provided by the personnel on the ground and the apex by the controlling bureaucratic elite. In this way, the state secures its unity and the uniformity or, at any rate, the consistency in the way its activities are carried out over time and in various locales. Furthermore, the higher levels not only can mandate and thus constrain the local, time-bound exercise of the same activities at lower levels, but they can also merge and coordinate diverse activities and effect the convergence of different bodies of knowledge and of personnel.

Both in their functional and in their hierarchical arrangements, bureaucratic systems embody the first two dimensions of institutionalization according to Popitz:

1. *Depersonalization:* The basic components of bureaucratic units are offices, ensembles of resources, entitlements, and responsibilities to which the physical individuals appointed to each office are expected to orient their activities. To guarantee this expectation, officials do not own the facilities they use, and in using them, the officials are expected to serve the interests of the office, not those private to the occupants themselves.
2. *Formalization:* The activities of the occupants are imputed to the offices themselves and rendered valid only insofar as they implement certain rules, both of a technical and of a legal nature, both substantive and procedural.

The state can produce such rules directly, by means of positive law that at successive levels—a statute turned into bylaws, a bylaw into concrete ordinances—can activate the discretionary capacity of the administrative personnel. It can also produce such rules indirectly, by authorizing activities that mobilize the bodies of nonlegal, professional knowledge, which have qualified individuals for entering that profession. In both ways, it can program the conduct of the officeholders, on the one hand, making it predictable and, on the other, making it respond to the particularities and contingencies of the hic et nunc that the officials confront.

A system of administration that mobilizes very diverse resources and articulates itself into a variety of units permits the state to exercise rule in a continuous and intensive manner. It can thus match the demands and opportunities presented by the increasingly complex and changing societies of modernity and acknowledge their growing preference for a rational and secular orientation to action, individual and collective, and the particular significance they attach to economic affairs.

This conceptual portrait of the state has expressly considered only the ways in which rule is structured and carried out within it. But the modern political universe is constituted by a plurality of states and characterized also by the relations that typically exist among them, for the monopoly of legitimate violence constitutive of each state refers to a specific portion of the globe, at the boundaries of which it encounters the monopoly vested in other states. Together, they make up the states' system, the critical feature of which is that the units making it up are not empowered and controlled by an overarching power center. They are equal to one another in some respects: Each is territorial, being bounded by the portion of the globe over which it exercises the monopoly of legitimate violence; each is sovereign, in the sense of constituting the overriding fount of all legitimate political authority; and each is expected and entitled autonomously to define its own interests and to pursue them by committing its own resources at its own risk.

This elementary view of international affairs, and the decisive role unavoidably played in them by sheer relations of might between the participating states, is grounded on the principles laid down in the Treaties of Westphalia (1648). The extent to which these still hold is a key issue within the discipline of international relations, given the number and magnitude of events that have occurred since that time in the relations between states. Weber himself seems to have held a Westphalian view of these matters, perhaps because many of the aforementioned events (such as the development of certain kinds of international organizations or the advent of nuclear weapons) occurred after his death. In fact, his theoretical writings are largely silent on these matters, but some of his political ones, especially from the times of World War I and immediately afterward, throw some light on them.

There is thus a marked contrast between the import of state building within the state itself and its import between the states. At the first level, state building is typically associated with pacification, since the state monopolizes legitimate violence and commits it to sanction the activities of an extensive, differentiated but at the same time unitary system of law and administration. All this, it might be said, has an ordering effect, reducing the contingency in the relation between the parts. At the second level, contingency is instead increased, since the states take their own initiatives vis-à-vis one another (including the recourse to violence) in light of their own autonomous definition of their own interests. For each, chief among these is its own security, but a state of affairs that secures one state may desecure another. Under these conditions, for each, the pursuit of security must take the form of increasing as far as possible its own might.

Major Phases in State Development

An overview of "the state's story" is possible only by means of considerable oversimplification. This discussion reduces it to three phases, each comprising institutional developments that varied considerably from one context to another in their timing and in their concrete manifestations.

Consolidation of Rule

The first phase can be labeled *consolidation of rule*; it took place in Europe between the 12th and the 17th centuries. During this phase, a number of locally based rulers sought to extend the territorial reach of their political control. Naturally, this engenders between them a competitive process whose outcome favors a few rulers and compels a considerably larger number of others to remain in the business of rule (if at all) only in a subordinate position, their own territories being subsumed under the larger ones now controlled by the successful competitors. As a result, the political map of the continent becomes simpler and simpler, comprising fewer distinct areas, now mostly geographically more continuous and historically more stable ones—unless, of course, they become themselves objects of further processes of consolidation.

Sometimes, these are peaceful. For instance, the scions of two dynasties ruling over different parts of Europe marry, and the territorial holdings of one spouse become soldered with those of the other. Or a political center temporarily hands over to another a part of its own territory as security for a loan but then defaults and surrenders that security. But mostly, consolidation is the more or less direct outcome of open conflicts between two centers of rule over which one will control which territory. Such conflicts are mostly settled by war, which leads to conquest and forcible annexation of all or a part of the loser's territory to the advantage of the winner. "States make war," as Tilly (1992) has memorably put it, "and wars make states" (p. 42).

Thus, a decisive role in the consolidation of rule is played by military resources. But these in turn require the "sinews of war," that is, the financial capacity to muster those resources—troops, officers, and material—and deploy them against opponents with the intent of prevailing over them in the clash of arms. Very often, military innovation confers an advantage to armies and fleets that are larger, for these can wage war on more than one front and become internally differentiated into "services," which can effectively perform distinct, complementary tasks in warfare. But only rulers who marshal larger resources can afford such armies and fleets, and to this end, they need to raise troops from larger populations, tapping the wealth produced by larger territories. This premium on bigness is a strong inducement to what we call consolidation.

When weapons are silent, however temporarily, resources of a different nature also come into play. Often, political centers intent on consolidating rule do this in response to an appeal to peace that recurs most frequently in European history, being often voiced by religious leaders. Each center seeks to prove that by establishing its control over a larger territory, it can put an end to tensions between rivalrous lesser powers, which would otherwise occasion war or other violent disorder. This does not always involve prevailing over those powers in battle. Diplomatic action, the game of alliances and coalitions, the ability to isolate opponents or to make them accept a degree of subordination, and sometimes the recourse to arbitration by the empire or the papacy also play a role.

In addition, military activity itself requires and produces rules of its own, the very core of an emerging body of law seeking, more or less effectively, to regulate aspects of the relations between states. Another significant part of such law makes conflict over territory less likely by laying down clear principles for succession into vacant seats of power, mostly by making legitimate descent the exclusive entitlement to rule. Other developments contribute to the same "pacification" effect. For instance, thanks to the remarkable advances in geography, in the measurement of terrain, and in cartography, the physical reach of each center of rule comes to be clearly delimited by geographical borders, in turn often determined by features of the terrain. It remains true, as Thomas Hobbes puts it, that states adopt toward one another, even when they are not fighting, "a posture of warre [*sic*]." But they partition the continent of Europe, and later other continents, in a clear and potentially stable manner. (There are also rules concerning the seas.)

Rationalization of Rule

Consolidation of rule produced larger, more visible and stable territorial containers for the next phase in the "state's story," which can be labeled rationalization of rule. Postmedieval Western modernization entailed a thorough-going institutional differentiation between diverse spheres of social existence and cultural practice. This allowed the rationalization of each sphere, for it allowed the efficiency and effectiveness of the workings of each to be verified with reference to distinctive criteria of success and failure. This also happened, in highly varied ways, as concerns the relation between the political and the other societal spheres. Rulers increasingly sought to place themselves in charge of *all* political concerns of society and *only* those. One expression of this was the successful (though contested) enthronement of the idea of *state reason* as the distinctive, imperious standard and polestar of their action. Much more significant was the secularization of the state—the protracted, controversial process whereby, so to speak, the state got out of the business of sending souls to heaven, in which previously it had been much involved.

Less visible, but in the long run at least as significant, was a process that found early expression in a formula adopted by absolutist rulers. They claimed for themselves all the *imperium*—that is, all faculties and facilities related to the political management of society—but left to the "particulars" (which at the time meant chiefly the landowning estates and various city-based corporate bodies) the *dominium*, that is, the property of most economic resources. In due course, this led to an increasing institutional autonomy of the economic sphere. The progressive marketization of the production and distribution of wealth would progressively limit some of the economic policies pursued by the absolutist rulers themselves and replace them as far as possible with legal frameworks within which the private initiatives of individual market actors could display their peculiar, powerful dynamics.

This process of differentiation and mutual autonomization of parts (which can be characterized as the progressive matching of structures to distinct societal functions) was carried out also within the political sphere itself through what came to be called the separation of powers (legislative, jurisdictional, and executive) and, as noted above, through the increasingly complex structure of the state's administrative apparatus. Here, the rationalization of rule finds further expression in the emergence of a professional body of administrators. These, in the name of their competences (assumed to be proved by the possession of degrees and by success in open competitions for public appointment), displace and replace (without depriving them of their economic advantages and status privileges) the members of traditional elites who had previously exercised various political, administrative, judicial, and military functions as a matter of right. Increasingly, those functions come to be exercised instead as a matter of duty by expressly selected, appointed, and promoted individuals. The consequent rationality gain is obvious, for instance, in the ease with which their activities can be programmed, coordinated, monitored, and sanctioned from the political center.

Expansion of Rule

Having strengthened and rationalized their administrative apparatus, states can embark on a third phase of their development, which can be called the expansion of rule. This phenomenon has that apparatus as its protagonist (and, in some interpretations, its main beneficiary). But it has roots also in other institutional processes, including some pertaining to the relation between state and society itself.

The latter increasingly constitutes a complex and changing environment, set in motion by modernizing processes such as increasing literacy, the first printed media, incipient processes of urbanization and industrialization, and the formation of new social groupings and new elites.

In certain political contexts, the rationalized administration seeks to take charge of those processes on behalf of the ruler. Consider a statement on *Polizey* from 18th-century Prussia, a state with a marked tendency to authoritarian rule and a particularly advanced administrative system:

> Police, in the broad understanding of the term, refers to all those measures in the internal affairs of a nation through which the wealth of the state may be more permanently established and maintained. . . . Police, in the narrow sense of the term, refers to all that which is required for the proper condition of civil life, and in particular for the maintenance of good order and discipline among subjects. (Charles Maier, 1997, p. 110)

In other contexts, however, the developments mentioned above generate new forms of social, cultural, and economic power in the hands of groups that resist and sometimes openly oppose the political practices of the ancien régime, such as the privileged roles it reserved for members of the aristocracy; the *arcana imperii*, which excluded the processes of policy formation from the observations and the inputs of an increasingly informed and sophisticated public; or extensive censorship of printed materials. Where such groups are successful, the result is the emergence of the liberal public sphere. Here, private individuals and spontaneously formed groupings can address each other regarding matters of common interest, formulate claims and critiques concerning their handling by the authorities, generate bodies of opinion, and eventually form expressly political alignments, which compete for electoral success within increasingly broad and active constituencies and thus for the formation of governments.

By establishing a liberal public sphere, a state can project itself as to some extent mandated and empowered by its population, committed to serving its needs. The involvement in the public sphere of broader and broader strata of the population and the fact that normally the outcomes of public decisions are accepted also by those whose proposals are not successful increasingly legitimize and strengthen the state.

However, since a liberal public sphere operates as a hinge between civil society and the state and transmits to the latter impulses from the former, it unavoidably also reveals the divided nature of the society itself, the cleavages (political, socioeconomic, cultural, and regional) that traverse it, and the contrast between the interests activating its different components. The mechanisms of political representation increasingly map these antagonisms onto the legislative organs, all the more so as the suffrage is broadened. Policy formation becomes largely adversarial; the policy proposals and critiques of government and opposition advocate contrasting demands; and the elites guiding the parties commit themselves, if put in control of government, to preserve or modify the current distribution of economic advantage within the population.

Adversarial policy formation confirms and emphasizes a characteristic of the state we have already mentioned: the contingent, open-ended nature of political initiatives. By the same token, however, it threatens the state's abiding commitment to its own unity, its claim to represent and pursue the general interest and to override those of a sectional nature that divide civil society and, within the public sphere, articulate intrinsically controversial issues.

There are two basic responses to this threat, both of which in different ways promote the expansion of rule. The first is the promotion of citizenship. Here, only the most antagonistic and subversive claims conveyed in the public sphere are (more or less openly) suppressed, while others are allowed expression and a measure of realization, thus institutionalizing the related conflicts and making them less divisive. In this way, contrasting proposals can be moderated and made the object of compromise. Policies of this nature are generally associated with progressive parties but were sometimes undertaken by conservative governments—for instance, Bismarck initiated in Germany some of the early provisions characteristic of what would later be called the "welfare state."

The other response confronts in a different fashion the threat to state unity generated by some aspects of political modernization. Oriented to the promotion and the fostering of nationhood, it consists in evoking within the population an emotionally compelling sense that it shares politically significant commonalities, expressing a single political identity and a single political destiny. These commonalities supposedly transcend and relativize all existent cultural and socioeconomic divisions within the society and are focused on the state itself, investing its unity and its might with value in everybody's mind. The promotion of nationhood, in a sense, attributes to the early-modern notion of reason of state—originally conceived as the exclusive concern of a very narrow political elite, the object of deliberations and machinations covered by the *arcana imperii*—a broader and deeper resonance and makes it attain significance in the hearts and minds of the masses.

At any rate, in the prevailing political rhetoric, the notion of *national interest* becomes the lodestar of the most important forms of policy making. The state itself acquires a new justification as the political instrument of the nation itself, conceived as a social entity grounded on prepolitical commonalities, which generate in its components a shared belonging. Among other things, nationhood entails that the population has a close, abiding, intensely meaningful relation with the state's territory and construes it as the very body of the nation. When this relation cannot be attained or maintained, their frustration feeds nationalist complaints and aspirations.

There are significant differences between these two positions, revealed among other things by the style and content of the respective flows of political communication. *Citizenship*, as indicated, aims to moderate and, to an extent, reconcile differences revealed by the public sphere; *nationhood* aims to transcend them. The latter does so by focusing on the fact that, as already emphasized, each state exists next to others and together they constitute an unstable and threatening environment, whereas the promotion of citizenship addresses in the first place a state's internal conditions. The politics of nationhood are *high* politics, focused on the pursuit of collective destiny chiefly through might; the politics of citizenship are sometimes labeled *low* politics, for typically, they address humdrum issues of distribution of the domestic product by increasing or abridging the rightful claims of different sections of the population. What we may call the discourse of citizenship tends to be conducted in a relatively factual, cognitively oriented manner, largely to establish what contribution various groups make to the economy and whether they are properly rewarded for it. The discourse of nationhood is largely intended to evoke and celebrate shared sentiments; its content is highly symbolic and is often the product at least as much of creative intellectuals and literati (musicians, poets, and novelists) as of experts and specialists. (Characteristically, the book that in late-19th- and early-20th-century Italy did the most to generate nationalist feelings among schoolchildren bore the title *Cuore* [Heart].)

For all this, the two responses do not differ radically, and there are affinities between them. For instance, the expansion of suffrage has been historically associated with the increasing rate of military participation required by the modernization of warfare; other rights of citizenship have sometimes expanded to reward subaltern groups of the population for efforts made and sacrifices borne in times of war on behalf of national interests. Policies to remedy some extremes of socioeconomic inequality within the population, particularly those associated with regional differences, have often been considered necessary for the promotion of nationhood. More generally, both citizenship and nationhood project, in somewhat different ways, the same view of the population as the constituency of the state, and both may be considered as different but overlapping aspects, on the one hand, of progressive democratization of the state and, on the other, of the expansion of rule.

Vicissitudes of the 20th-Century State

Both the previous sections have had as their focus (the first in conceptual terms, the second via a schematic narrative) the "state story" as it developed up to Weber's times. Only some of the most significant later developments can be treated here, and that too only briefly, with an emphasis on the more problematical ones.

First, the late 19th and 20th century witnessed what could be called the state's success as *the* universally recognized institutional arrangement for constructing and managing large-scale polities with a territorial base. By the end of the 20th century, almost every part of the world had fallen under the jurisdiction of one state or the other. (The major exception, not discussed here, is that of extraterritorial waters.) This drastic extension of a model that originally had a regional basis in Western Europe took place over a few centuries but was accelerated by phenomena such as nationalism (which in a sense challenged and inverted the sequence proposed earlier "first state, then nation"), decolonization, the position of unique visibility and legitimacy gained after World War II by the United Nations and a few other international organizations (mostly with states as their constituents), and the breakdown of empire-like polities such as the former USSR and Yugoslavia and the establishment of numerous new states on parts of their territory. However, the state model can be interpreted and implemented in various ways, some of which hardly qualify as states in the meaning of the expression we derived from Weber. There are in any case strong states and weak states, and the current expressions *failed states* and *rogue states* point to further dimensions of variability.

Furthermore, arguably, no contemporary state entirely possesses a key characteristic of the classical state: territorial sovereignty. The territorial component has been weakened by some aspects of economic and cultural globalization; by ecological phenomena that ignore territorial boundaries; by massive, uncontainable migration flows; and by forms of warfare the protagonists of which have no distinctive territorial bases. The sovereignty of many states has been compromised by their more or less open surrender of various jurisdictional faculties and resources to international organizations of various kinds. The development of nuclear weapons has called into question a basic component of "Westphalian" territorial sovereignty—the right of states to assert interests they deem critical by waging war—because the "ascent to the extremes" characteristic of warfare has acquired the potential to visit utter and final doom on both parties and, possibly, the rest of humankind as well.

The domestic dimension of the state's institutional mission—its relationship to civil society—also has seen massive developments in the 20th century. The most significant of these can be seen in the development of totalitarianism. This happens in some states when unbounded political power has not just modified that relationship to the state's advantage but in a sense abolished it by denying any autonomy to the institutions and processes that structure civil society itself: the family, organized religion, the market, public opinion, education and science, and social and cultural movements. If some complementarity with civil society is conceptually essential to the state itself, totalitarianism can be seen, paradoxically, as abolishing the state itself. In fact, it has been suggested that in totalitarian systems, ultimate political power lies not with state institutions proper but with a single party and its supreme leadership—sometimes a single individual. Only these can activate and direct the powers vested in state institutions.

Even in states committed to liberal democracy, the expansion of rule has continued powerfully into the 20th century, generally shifting the boundaries between state and society by allowing the former greater leverage over the latter. This is an "overdetermined" phenomenon, produced by a number of diverse and often not otherwise related causal influences. Schematically, these can be seen to arise either from the state or from the society side of the boundaries.

On the state side, expansion has been produced in the first place by the states pursuing those distinctively political interests related to each state's position in the international order. This holds particularly for the great increase in state involvement in societal management occasioned by the two world wars. More sustained and equally significant in the long run is the impulse that involvement received as a result of the fact that, under liberal democratic rules, adversary politics is the main matrix of policy. However, it is not the only matrix, for a further impulse has come from the state administrative apparatus's own interest in gaining a greater and greater capacity for authoritative oversight and regulation of social affairs, with the result that there has been an increase in its own size and complexity, the entity of the resources it extracts and manages, and the related degree of discretion.

A look at society's side, however, suggests that the often evoked imagery of an increasingly invasive, interfering, and greedy state has serious limitations. In the first place, societies may witness structural developments (e.g., new forms of communication or financial innovations) or cultural developments (e.g., those inspiring "identity politics") that displace existing forms of legal and administrative regulations. Often, the resultant vacuum can only be filled by the state modifying previous regulations and adding new ones; if this does not occur, large-scale social and economic disaster may take place. Furthermore, state-ruled societies are all characterized by persistent and significant divisions, some of which can only be tempered or accommodated by the state's distributive policies and the related forms of administrative intervention. The social demand for this is generally expressed through adversarial politics and/or by alignment with the state's administrative apparatus to establish new units and acquire new faculties and resources.

The most visible product of this phenomenon is the great 20th-century expansion of the welfare state. But seeing this as the product chiefly of "the politics of envy" is facile and ignores multiple demands for state intervention and spending that originate instead from powerfully entrenched economic groups, seeking public support for their financial needs, their technological innovations, and their search for secure markets at home and abroad. In other terms, there is a welfare state also for the rich, not just the poor.

The continuing and intensified expansion of state rule in the 20th century engenders, as we have suggested, the tendency of the administrative apparatus to grow in size and complexity. In turn, this makes it more and more difficult for the state's political summit to coordinate the activities of that apparatus across its multiple, diverse, and oftentimes competing units to ensure the effectiveness and efficiency of their operations.

The widely used notion of state overload explains these problems but should be complemented by other considerations. To some extent, the bureaucratic mode of organization of the state itself, as Weber presented it by way of the ideal-typical method, is rendered problematical by the increasingly diverse, changing, dynamic, open social and cultural environments characteristic of contemporary advanced societies. One senses that, in such a context, that model can no longer deliver on its promise of continuing rationalization of existence. Although the state is by no means the only sphere in which the bureaucratic model asserted itself in the course of modernization, that model appears to have been successfully revised, improved, or to an extent supplanted in other spheres, especially the economy. In the political sphere, it seems to suffer from an additional degree of rigidity, of a denial of its own difficulties as it were, although here too there are attempts at transcending those limitations: Consider the late-20th-century slogan "reinventing government." But by and large, it is not unfair to call attention to the contradiction between, on the one hand, the state's increasing attempts at intervention and regulation of societal affairs and, on the other, the intrinsic clumsiness and costliness of its modus operandi.

But this critique should not be taken entirely at face value. In most of its formulations, it is an ideological aspect of a phenomenon that warrants some suspicion—the deliberate, self-interested offensive against the state of large accumulations of economic power characteristic of the end of the 20th century and the beginning of the 21st. Essentially, the dominant units of the contemporary economy have been seeking to take over more and more aspects of general societal management; and while doing so in the pursuit of their own interests, they have appealed to what they claim to be the undeniable, intrinsic, across-the-board superiority of "the market" over "politics/the state."

The most visible aspect of this offensive is constituted by so-called economic globalization. But this, in the words of Vincenzo Roppo (2001), an Italian legal scholar, is in essence "a gigantic process whereby state functions are transferred to markets" (p. 531). The arguments for the legitimacy and necessity of the process are the core of neoliberal ideology, and their *pars destruens* consists largely in denouncing the intrinsic, unavoidable weakness and wastefulness of rule itself as the only alternative mode of societal management.

The vast resonance imparted to such arguments by media of all kinds (including academic literature) has put the state (and politics) on the defensive, under charge, especially, of inefficiency. There are serious grounds for the charge, but the arguments present them as uniquely valid, whereas the criterion of efficiency itself should be recognized as not being unmistakably and universally valid and paramount but as constituting an arguable value preference and thus, unavoidably, as itself entailing a political choice.

STATE, VIRTUAL

A virtual state is a country unit that, like a virtual corporation, has largely transferred its production overseas. This occurs for two reasons. First, the industrialization process itself stresses manufacturing production but ultimately locates greater value in the output of high-level services. Thus, every industrial economy goes through this shift from an emphasis on the products of land, to manufacturing, and then to services. Second, even if manufacturing output is still critical for the corporation, it can best be produced in countries with low-wage but technically competent labor supplies. The virtual corporation, in this way, abets the development of the virtual state. This entry reviews small states, large states, and the impact of "virtuality" on peace.

Small and Large States

Initially, small-island or littoral countries such as Hong Kong, Taiwan, Singapore, and Holland produce goods at home. Then, they discover that these goods may be produced more economically on the Chinese mainland, Indonesia, Malaysia, Vietnam, or Bangladesh. Shares of gross domestic product (GDP) in the various virtual states shift increasingly toward services, with Hong Kong ultimately having little or no home production at all. Foreign direct investment rises as a consequence, and production takes place in areas that the home country does not control. Guaranteed economic access to that region then becomes the necessary substitute for imperial governance.

The process is not confined, however, to small or island nations. Even major and large states experience "virtuality" as they shift away from home manufacturing to technical services such as research and development. Japan still retains 30% of its GDP in manufacturing, but in the United States, the figure is less than 20%. European countries are moving in the same direction, and India, a developing country, has grown particularly because of the value of its service industries. It follows, of course, that some nations must do the manufacturing that is outsourced to them from overseas. Brazil, China, Mexico, Poland, Hungary, and the East European states have benefited from this shift. In this sense, there is a distinction between "head nations"—countries that decide what shall be produced and do the design, financing, and marketing—and "body nations," which perform the manufacturing tasks. This is not a hard-and-fast distinction; however, many erstwhile body nations such as South Korea and China are now in the process of becoming head nations. Nor do head nations fail to do manufacturing for others. Taiwan has devolved many manufacturing functions on China, but it also acts as a "foundry" to produce goods to order for client head countries. In this way, even the United States has acted as a body nation for Japanese, German, French, and even Chinese production located within its borders. Countries that produce abroad may seek to have their production sold in those markets, and they thereby escape the tariff walls between them and their market. As Robert Mundell has shown, the movement of factors of production abroad can compensate for limits on export trade. In the 1930s, however, this process did not occur, and nations seeking raw materials and markets believed that they had to conquer territory to retain access to both. The military conflict that followed was in part the result of economic restrictions.

In theory, the virtual state, a model to which many states are tending, carries with it a new system of international politics. In the past, when military conflict and the irrepressible desire for territory determined relations among states, the main flow between countries consisted of armies. If the virtual model holds, future flows will be largely economic as capital, technology, labor power, and information move rapidly among states. In the long term, national access to mobile factors of production (capital, technology, and labor) can replace the need to control or own additional land.

Transferring the bulk of their home production overseas and shifting most of their economy to high-level services, virtual states reshape both productive and international relationships. They inaugurate a world based on mastery of flows of production and purchasing power rather than on stocks of goods. They emancipate labor from routine mechanical tasks and offer new employment in technical or creative services. They usher in a world based on education and human capital rather than on machines and physical capital. They offer nations the opportunity to forge international links of production that are difficult if not impossible to break. (Some believe that the relation between the United States and China in both political and economic terms is reaching an important level of "unbreakability.") Like the headquarters of a virtual corporation, the virtual state determines overall strategy and invests in its people rather than amassing expensive production capability. It contracts out other functions to states that specialize in or need them. Imperial Great Britain may have been the model for 19th-century practice, but Singapore may be the model for the 21st century. The state no longer commands resources as it did in mercantilist yesteryear; rather, it negotiates with foreign and domestic capital and labor to lure them into its economic sphere and to stimulate its growth.

The virtual state, however, is not equal to the small state. Even large states undergo the economic transition from land, to manufacturing, to services. Like larger states, small states can shift their production overseas only if they are protected in doing so. They therefore depend on guarantees of freedom of the seas and open trade routes to carry on their business. Some larger power or powers have to provide these protections, and it is not surprising, therefore, that, to continue to exist, small virtual states need to have either alliances with, or de facto support from, much larger and stronger powers. The small virtual state depends on a single Great Power protector or on a balance of power internationally. In addition, if tariffs rise or even if they fail to fall, virtual states are in jeopardy. This is because capital moves much more quickly than goods. An indebted country cannot quickly send new cascades of exports abroad and hope to finance a looming deficit. The first moves slowly: the second instantaneously.

In recent years, small virtual states such as Indonesia, Malaysia, Thailand, and South Korea have needed "spare tires." They have required access to "spare finance" to tide them over periods of economic crisis. In 1997–1998, Thailand could not meet payments on its international obligations, and speculators withdrew their money. The Thai currency—the baht—had been overvalued for some time. It began to lose parity with the dollar and the yen. Since Thai borrowings were in foreign currency, Bangkok needed more local currency to compensate for it. When this was printed, it inevitably caused inflation. When Thailand devalued, it did not have enough foreign currency to cover its obligations. It needed money from the International Monetary Fund (IMF) or other lenders to cover its losses, but these sources would only help if Thailand put on high interest rates and threw its economy into recession, cutting imports. After Thailand devalued, speculators attacked the currencies of Indonesia, Malaysia, and Korea, all of which were (in relation) overvalued. All three were thrown into recession to meet the demands of international investors. Small virtual states, thus, needed access to much larger stores of capital. They were too small financially to stand on their own feet. At the same time, Japan and China, much bigger economies—with greater hoards of foreign capital—breezed through the 1998 crisis without a tremor. Economic size began to tell the tale.

As larger states become virtual, they establish production chains that save on labor costs and that link them to distant markets. Few links in this chain remain within the home country. The Hong Kong firm Li & Fung, experts in fashion textiles, illustrates this point:

> Li and Fung work with 10,000 suppliers in 48 countries to source materials and makers for clients. So a fabric from India that gets dyed in China will go to Thailand to be embroidered (with sequins made in Korea and rhinestones from Brazil) and then return to China to be cut into garments. The firm adheres to a "30/30" principle; it guarantees that it will purchase at least 30% of the business from each supplier, but it will not exceed 70%. . . . And it requires that suppliers have to go outside the network to survive—and thus be in a position to bring in new ideas from the outside. The results are impressive. In terms of asset productivity, Li & Fung earns 30–50% return on equity. Regarding personnel productivity, it earned $1 million per employee per year. And it scales elegantly. The firm took in $11 billion in 2004. (Kenneth Cukier, 2007, pp. 22–23)

The Impact of "Virtuality" on Peace

The United States, Germany, France, and Japan became almost equally dependent on overseas production chains, units of which, however, did not work for one corporation or even one country. They were available for many headquarters firms in different parts of the world.

Production chains make warfare among participating units difficult, expensive, and perhaps ultimately self-defeating. No such chains existed in

1914 or 1939. Aggressive states will have to choose, geographically, between trying to capture the headquarters of the virtual state or its production links with other countries and firms. In an era of capital and labor mobility, the first suggests a loss of capital and headquarter talent overseas. Whether the in-house experts will work with foreign occupiers is doubtful, and international sanctions will in any event likely occur. If an aggressor seeks to capture one or more links in an overseas production chain, it may also be disappointed. Will car chassis separated from engines, transmissions, wheels, tires, and shocks serve much of an instrumental or even financial purpose? Units can, of course, be sold off but at diminishing prices, because the links with headquarters and research and development have been severed. To guard against nationalization, recent research shows that multinational corporations investing in developing countries have tried to avoid placing full assembly or component manufacture in one place. The effect is equally marked in deterring foreign seizure. The effect is redoubled for corporations in states that enjoy economies of scale in production.

Software, finance, autos, long-haul civil aircraft, insurance, microprocessors, and pharmaceuticals are monopolized in a small number of states. Aggression that strives to engross such industries will fail unless Europe, Japan, and the United States are captured simultaneously, a very difficult task. And even then, in all three cases, the economies are gained by major production chains overseas that would not be seized coincidentally with headquarters nations.

The greatest long-term advantage of virtual states is not just economic; it is also pacific. By linking with countries and economic capabilities overseas, such states achieve their competence and power through a form of hard interdependence with others. These essential ties did not exist in 1914 or 1939, but they are becoming characteristic in recent years. Not only that: As “virtuality” comes to attach itself to large states and Great Powers—such as China, the United States, Japan, and Europe—it provides an insurance against major war that did not exist before in human history.

STATE COLLAPSE

State collapse represents a rare and an extreme level on a continuum of state decay, when a weak state becomes unable and/or unwilling to fulfill its task as the provider of public goods. Although there is no consensus on a precise definition of the term, still there are several traits that collapsed states share. The first is the disappearance of state authority as grantor of security and welfare of its citizens. The second is the appearance of subnational leaders, mainly in the form of strong warlords, who control several hundred armed militias that rob, rape, and pillage to finance their war efforts. Third, the national identity is replaced with subnational identities, including those of ethnic group, religion, and race. Finally, the territorial integrity of the collapsed state becomes compromised when all other state and nonstate actors, especially neighboring states, intervene. This entry analyzes the causes and consequences of state collapse and the possible remedies for avoiding it.

The phenomenon of state collapse is a recent addition to the political science parlance that came with the end of the Cold War in the 1990s. In this period, the number of internal wars around the globe began to rise, with deadly consequences in places like Rwanda and Bosnia. Many of these conflicts have been described as "ethnic conflicts"; nonetheless, ethnicity is only one aspect of political violence. While violent conflicts must be considered as a failure of the state to perform some of its fundamental tasks, one must also pay attention to the formation of the state, especially in most of the developing world such as Africa. The foundation of these states is colonialism, which made use of clan-based divide-and-conquer tactics in addition to their military superiority. Furthermore, state formation in places such as Africa did not begin on a contractual basis; rather, predatory powers conquered the land, created state institutions, and imposed taxes and forced labor intended only to facilitate the extraction of wealth, mainly in the form of raw materials, in these territories.

The postcolonial state in areas like Africa began with divided societies and economies that rely heavily on rent from the sale of commodities. Since the 1960s, however, many economies in the region have witnessed a decline in their livelihood as a result of unstable political regimes and diminished commodity prices that shattered the ability to adequately provide public services. Many of these states went through an initial phase of ethnic group federation as a substitute for the lack of essential services to all their citizens. Often, a just system of redistribution within and among groups is the key to creating solidarity among citizens, and its breakdown often triggers deadly political violence. Thus, in most of the conflict-ridden countries, nepotism and favoritism were practiced rather than a fair and just redistribution system.

With the end of the Cold War, two reforms, heavily promoted by the West, further undermined the already weak states in many parts of the developing world. The first one involved structural adjustment programs grounded in neoclassical economics, which promoted privatization, discouraged subsidies, and devalued currencies and which were complemented by the reduction of the amount of aid; together, these measures led to heightened inflation and reduced many government services. The second is the imposition of political reform based on the idealization of representative democracy, which had been promoted as the only ingredient for stability and development. However, as has been proven, a sudden democratic transition in the midst of economic devastation facilitated the widespread internal wars and cases of subsequent state failure and collapse of the 1990s. During this period, state after state in Eastern Europe and Africa experienced deadly internal wars that claimed (and still claim in places like Somalia and the Democratic Republic of Congo) many lives, created thousands of refugees and internally displaced populations, and eventually redrew the map of Eastern Europe. Moreover, with the absence of superpower involvement, states began to intervene in neighboring conflicts, which led to the widespread availability of arms and mercenaries, especially child soldiers.

Nevertheless, since the beginning of the 21st century, the overwhelming majority of collapsed states are in the continent of Africa. According to Fund for Peace, 7 out of the top 10 failed states are in the African continent. The remainder of this entry examines the factors behind the collapse and what actions, if any, can be taken to reverse their status.

The Process of Collapse

A strong state can be described as a state in control of its territory and able to deliver a full range of political goods to its citizens. Conversely, weak states are incapable of controlling their territories and unable to adequately provide public goods. Such states become weak either as a result of inherent factors, including geographical, physical, and fundamental economic constraints, or because of internal antagonisms, greed, or despotism. Weak states typically harbor ethnic, religious, linguistic, or other tensions, which may be transformed into all-out conflict between contending groups. Their ability to provide adequate political goods becomes diminished. Gross domestic product (GDP) per capita and similar indicators fall, corruption becomes widespread, and the rule of law is hardly practiced.

In some instances, weak states turn into failed states as they are no longer able to provide essential political goods. They progressively forfeit their role as the preferred national suppliers of political goods, which in turn impels warlords and other nonstate actors to fill the vacuum. Its institutions are flawed where both legislature and judiciary, if they exist at all, ratify the decisions of a strong executive rather than being independent. The bureaucracy loses its sense of professional responsibility. Failed states exhibit deteriorating infrastructures where telephones fail, water supplies dry up, and power falters. Educational and medical facilities crumble, resulting in increased illiteracy, infant mortality, poverty, food shortages, and hunger. Failed states are insecure and cannot project power much beyond the capital city. However, failed states offer unparalleled economic opportunity for a privileged few, mainly those within the ruling class. These faltering state failures become obvious even before, or as, rebel groups and other contenders arm themselves, threaten the residents of central cities, and overwhelm demoralized government contingents, as in the cases of Liberia, Nepal, Somalia, Rwanda, Sierra Leone, Democratic Republic of Congo, and Côte d'Ivoire.

Nevertheless, many states recover as they open the political space to other concerned parties and move toward inclusive and stable polity. Unfortunately, some states progress toward more decay and eventually collapse. As argued, collapsed states are rare and extreme versions of a failed state. They exhibit a vacuum of authority and mere geographical existence, where the forces of entropy have overwhelmed the state and its ability to provide some semblance of order. Political goods are obtained through private means. Security becomes the rule of the strong, where warlords take over. However, parts of the collapsed state may exist and function, albeit unrecognized and in a disorderly manner.

The collapse of states is a combination of two processes of decay that simultaneously work from inside and outside the country, weakening and eventually destroying the state. The primary force of the inside–out process is the prevalence of bad leadership. These leaders over the years weaken their states through kleptocracy, neopatrimonialism, corruption, and politicization of elements such as ethnicity, religion, and race. Often, state property becomes the private property of the ruler, thus making the control of the state zero sum. The collapsed state is not only unable to develop a stable political system but lacks the administrative capacity to govern the territory effectively and ignite sustainable economic development. The weakness of the state is most apparent in the periphery, while all services and facilities are concentrated in urban areas. Thus, while the core of the state weakens through mismanagement, pressure from the periphery becomes emboldened. Finally, competition for the control of state functions ensues between different forces in the country, and in the end all of them lose.

Nonetheless, the decay that leads to state collapse also simultaneously occurs from outside in. As noted, it is in Africa that, with devastating impact, the largest concentration of collapsed states is found. The external influence began with slavery, which caused millions of casualties, dehumanization, and massive depopulation, followed by colonialism, which resulted in artificial borders and economies that currently depend on rent from commodity and foreign aid. Finally, the conflicts in many collapsed states are fueled by the latest weaponry, and the warlords receive support and legitimization, which further delays any hope for ending the political violence.

Possible Remedies for State Collapse

The revival of a collapsed state is like putting together a broken pot. Unfortunately, systematic analyses and comparative studies in the field of peaceful conflict settlement are largely underresearched. Nevertheless, the reconstruction of a collapsed state initially requires reliable conflict mediation and facilitation. The term *mediation* entails activities requiring a dynamic influence by reputable individuals and groups as go-betweens. *Facilitation* involves activities such as inviting the warring parties to talk to each other and providing conditions for talks. The focus of facilitation and mediation should be on long-term prevention of violent conflict rather than on producing short-term, "bandage" solutions. Therefore, it is imperative that efforts be made to enhance the capacity of the middle and local levels rather than concentrate on the warlords. Additionally, the warlords must at the same time be disarmed, isolated, and eventually punished for their crimes against humanity.

In addition to the facilitation and mediation efforts, there is also a need for genuine efforts to rebuild state institutions. While there has been success in the rebuilding of many collapsed states, mainly in Eastern Europe, others remain in a collapsed condition, especially in Africa. Many states in Africa continue to face great challenges in the reconstruction of their state institutions and establishment of rule of law in their territories. Collapsed states, as argued, require strong support to rebuild legitimate institutions, which in turn will bring law and order, create trust among the combating groups, and revive the destroyed economic infrastructure.

In the past few years, international efforts have been mainly focused on achieving cessation of hostilities and signing of peace agreements while neglecting other, more pressing factors, especially creating favorable political and economic conditions. As a result, the conflicts, especially in sub-Saharan Africa, tend to be longer and deadlier, mainly due to lack of international finance and capital to curb humanitarian disasters and, more important, help in reconstruction after peace settlements. The donor countries continue their abandonment, and the critical help needed to reconstruct the political and economic institutions is usually not provided. Finally, collapsed states can only backtrack along the path from collapsed to failed to weak status, which is only possible if sufficient security is restored to rebuild the institutions and strengthen the legitimacy of the revived state. This backtracking can only be realized through a strong and genuine intervention force, as in the case of Lebanon with Syrian security and Sierra Leone with British intervention. Finally, the citizens of collapsed states must be educated and empowered to demand their rights and become active in rebuilding their broken state.

STATE FAILURE

State failure is composed of two elements: the failure and the state. This entry first examines the diverse notions of failure, including their definition, their components and processes, some examples, and rehabilitation. It then addresses divergent conceptions of the state, with particular attention to ideas about the non-Western state that impinge on an understanding of failure and associated processes. State failure is the basis of a large array of concepts, starting with a rare and narrow concern, already containing certain ambiguities of definition, measurement, and remedy, and expanding into nearly the entire field of comparative politics, democracy, development, and interstate policy.

Failure

Failure refers to several overlapping concepts, unfortunately often confused with each other: collapse, failed, failing, fragile, and weak.

The most narrowly defined category is that of collapsed states. Collapse, the most extreme form of damage, occurs when states can no longer perform their basic functions, defined as enforcing internal and external security, extracting and allocating resources, and providing social services, for some time or where the structure, authority (legitimacy), law, and political order have fallen apart. There are few unambiguous modern cases of the disappearance of a state (Ghana, 1979–1981; Chad, 1979–1985; Lebanon, 1983–1987; Haiti, 1986–1991; Sierra Leone in the mid-1990s; Afghanistan, 1992–2002; and Liberia, 1989–1997—although none have done so as lengthily and conclusively as Somalia since 1990). State collapse can occur because of but also without civil war, although the collapse of law, order, and legitimate authority does create a security vacuum that opens society to lawlessness. I. William Zartman (1995) has identified some signs of the process of collapse: conflict at the political center, decision failure, a narrow central clique, defensive policies, and privatization of state agents. But there is no notion of any sequence, of necessary and sufficient components, or of the nature of the process. These conceptual weaknesses are present in all other types of state failure analysis.

Equally uncertain is the process of rehabilitation after collapse. Unsolved issues include the need to rehabilitate *the* state versus *a* state, the priorities of the process, the relation between security and institutionalization, the role of welfare, the role of the international community, the relation between state building and nation building (see below, under "States"), and the need for a Man on a White Horse or a strongman. Again, these conundrums will appear with regard to other types of state failure, although, there, they are more specifically addressed.

Failed states constitute the next larger circle. The immediate problem with the concept is that it is not clear whether it refers to states that have failed as states—hence being closer to the collapsed category—or to states that have failed in one or more of their functions while still holding onto their state status. In the latter case, how many functions must have failed before the state itself can be termed a failure? Furthermore, some cases of state failure often cited, such as Yugoslavia or old Pakistan, refer to constituted units (states) discarding an overarching federal framework (state) to take over geographic pieces of the formerly larger unit and are scarcely cases where some institutional framework was ever completely absent. Another problem with the concept of failure is its geographic reference: Frequently, states continue to be effective, often strongly effective, in a given part of their territory, leaving the rest beyond their control to a more or less effective opposition; thus, they fail in their duties as rulers of their assigned territory but succeed in ruling a part of it while leaving the rest as a proto- or counterstate. Examples include Colombia and the FARC (Revolutionary Armed Forces of Colombia), Sudan and the SPLA/M (Sudan Peoples Liberation Army/Movement), and Sri Lanka and the LTTE (Liberation Tigers of Tamil Eelam).

These problems do not invalidate the concept but rather indicate its complexity and the difficulty of applying it to a multifaceted reality. In most works on failed states, it is the components of failure that drive the analysis, so that analysis can pinpoint at what the state has failed, if not at "everything." These functions can be classified in many ways, but according to Stuart Eizenstat and colleagues (2004), an effective categorization is in terms of security, capacity, and legitimacy. The striking fact is that there is little overlap between the three types of failure: conflicted states, neglecting states, and illegitimate states. One measure gave two overlaps on all three (Congo-Brazzaville and Afghanistan), with 25% appearing on two columns; another gave none, with 10% on the listings appearing in two columns. Listings vary substantially over a span of several years. Immunization rates were used as indicators (proxies) for capacity, battle deaths for security, and a composite measure of "political freedom" for legitimacy, but other measures can give very different results.

When analysis turns to individual cases, not only the component concepts and indicators but also the paths to failure can be seen to vary enormously, indicating that the causes of failure only coincide at a high level of abstraction that is often circular. Rapacious concentration of power, and hence resources, in a small, often ethnically and/or geographically concentrated clique, to the neglect of the general population—the "privatization" of states—is a frequent characteristic. Thus, for example, behind the capacity gap lies a political rather than a resource failure; states do not fail because they are poor but are poor because they fail, although poverty admittedly makes good governance more difficult.

Failing states is the next largest circle, both broader and softer. It refers to states that show signs of doing badly in some crucial sector or function but that have not necessarily reached an end point of failure in that function. Again, definition and measurement problems arise: It is not clear how failing a state has to be on how many sectors to qualify for the general category, particularly since most states can be said to show weakness in many policy areas. Most treatments have handled this problem by avoiding it with a sliding scale and a complex set of indicators, taking the analysis closer to bumpy reality and further from implications of clear-cut categorization. An understanding of the paths of sectoral failures and then their relation to each other both causally and in creating a whole picture of "failing-ness" is still underdeveloped, although some work, such as that of Robert Rotberg (2003), has been undertaken to disregard the causational problem and address sectorally the rehabilitation problem.

The name of the condition measured also varied. One index, that of the Fund for Peace, measures instability using 12 indicators: demographic pressures, refugees and internally displaced persons, group grievance, population flight, income inequality, economy, legitimacy, welfare/services, human rights, security apparatus, elite factions, and foreign interventions. Another index, by Susan Rice and Stewart Patrick (2008), seeks indications of weakness with a more complex set (only partially overlapping with the previous set) of measures, divided into four baskets (as opposed to the previously mentioned three gaps), with five subindicators in each: (1) economic (per capita gross national income, GDP growth, income inequality, inflation, and regulatory quality), (2) political (state effectiveness, rule of law, accountability, corruption, and freedom), (3) security related (conflict, human rights, conflict territory, coups, stability, and absence of violence), and (4) welfare related (child mortality, water and sanitation, undernourishment, primary schooling, and life expectancy). Only 15 of the top 20 states were on both lists, in very different rankings. The instability study puts a causal emphasis on poverty, particularly in the more failing states, although Paul Collier et al. (2003) found structural weakness to correlate only distantly and indirectly to cause political instability. The study also indicates that remedies vary according to levels of instability: Failed states need greater attention to security first, whereas states of middle-range failures need to give targeted attention to specific sectoral weaknesses.

It is not clear how much significance lies in the difference between instability and weakness. However, another study (for the Central Intelligence Agency), which started out as a task force on state failure and used rigorous statistical analysis, was led by its data and correlations to focus instead on political instability. The report found failure and collapse to be new labels for a kind of severe political crisis and reduced their cause to three basic variables: child mortality, trade restrictions, and lack of democracy—variables so distant from the effect as to suggest a complex causal chain.

Other concepts such as *fragile*, *vulnerable*, and *weak*, even broader than failing, constitute the focus of the broadest research, appearing in the end as a variable characteristic of all 140 to 160 developing or non-Western countries. Studies focus on the economic functions of the state, with more than 100 indicators; on weakness in authority, capacity, and legitimacy, using 74 indicators; on fragility, measured through effectiveness and legitimacy in the economic, social, political, and security spheres, using 33 indicators, as does the USAID Fragile States Strategy of 2006; or, as in Paul Collier and colleagues' 2003 study, simply on conflict proneness, among others. Different indicators of different dimensions lead to strongly different diagnoses. However, even though the terrain is uneven and slippery, they do permit a debate over causes, relations among causes, and remedies, which is useful both for understanding state failure and for policy making. On the other hand, the analysis has moved away from a single identifiable concept that can be explained and also away from consensual understandings of even a broad condition that can form the basis of comparative analysis.

As a result, rehabilitation—measures to overcome or, in a preventive manner, to avoid the subject condition, that is, state failure—has also been the subject, or at least the end purpose, of some attention. Most work on state failure, in all its forms, ends with prescriptions for rehabilitation and specifically for third-state—usually Western—interventions. The compass, which once headed toward institutionalization, now seems to be turning to antipoverty measures, reviving an old leitmotif of the World Bank and also a constant interest of the Organisation for Economic Co-operation and Development, the United States Agency for International Development, and the UK Department for International Development. A third compass point, which continually reappears, is security, often seen as the precondition of poverty reduction and institutionalization. In the end, these three foci correspond, of course, to the three disciplinary baskets of economy, polity, and security, totally interdependent but fighting for precedence. When states fail, everything must be corrected at once, and waiting for one sector to be completed before starting another means that failure will not be overcome. That said, aid missions and state builders will agree that security comes first, even though it may well end last.

States

Beyond this analytical and remedial disagreement lies uncertainty about the nature of the state. The state, as we know, is "a human community that (successfully) claims the *monopoly of the legitimate use of physical force* within a given territory," in Max Weber's restrictive terms. A similar definition with force only subsumed terms a state "the authoritative political institution that is sovereign over a recognized territory" (Zartman, 1995, p. 5). Weber's name is also associated with the idea of a Weberian state, distinguished by the bureaucratic, institutional nature of its routinized, performance-based legitimacy. By this definitional complex, therefore, the state's functions include internal and external security, internal and international legitimacy, territorial control, institutionalization, and by some extension services, possibly welfare-oriented programs. To some, a state is a state, so defined; the definition is highly abstract and can be used to judge performance or other characteristics such as failure or collapse. It is not a phenomenon of all times and places; although the state as defined took some centuries to emerge in Europe and then was transferred to the Western Hemisphere, it has been slower to take root across other parts of the world, despite earlier isolated instances. Probably the most widespread alternative to the state, as defined, is the nonterritorial polity, which has exercised many of the functions of the territorial state while also extending sovereignty over a people, wherever they may be at the moment. Notions such as the Muslim *umma* ([mother] community), expressed in the diverse ideas of Muammar al-Qadhafi of Libya and Osama bin Laden of Al Qaeda, are contemporary examples, constrained in practice by the existence of territorial states.

To some, however, it is inappropriate to talk of a state in some parts of the contemporary world, notably in Africa. There, states are not in a condition of shortfall with regard to a claimed or aspired condition (statehood) but are simply not there because they are not native to the land and its people. Hence, attempts to analyze the causes of a shortfall would be pointless, although it is also sometimes suggested that new entities should be established (by someone) that would be more natural to the terrain. To these arguments, the notion of state failure or failings provides a useful alternative, indicating how states are doing on various measures and functions on the ladder to effective statehood.

This evaluation is based on the working assumption that a broad category such as *state* is applicable, even if not fully attained, around the contemporary world. While historical, geographical, and cultural peculiarities affect the ability of the polity to climb the ladder, it is considered a ladder that applies to functions that are universally required and desired.

One element not explicitly covered in either of the definitions of *state* (although perhaps implicit in Weber's reference to a community) is the notion of a *nation*, the identity community contained within the state. Since the end of the 19th century, customarily associated with the French Revolution, state and nation have been assumed to be coincident, although not synonymous, as the nation-state. The term *state* has two meanings, both relevant to state failure. One is that sovereignty lies in the identifying population, rather than in an elevated figure such as a monarch (or a deity). The other is that the population of the state coheres in a shared identity. However, again there are ambiguities in reality. The first meaning is assumed to be symbolically true, but in practice, the ruler can often take decisions on his or her own without any reference to popular will. The matter is usually covered in accountability measures in many failing-state indices. This element edges state failure or nonfailure toward considerations of democracy, a concept that is not directly associated with most aspects of failure but that slips in measures of legitimacy. Confounding the two notions opens up a great debate. The second meaning also carries a significant assumption: Many developing states and even some developed states can be far from failure, even though there is no effective sense of national identity coherence. Even before the notions of failure became current, new states looked to the needs of national coherence and sought to create a nation to fit the state, or state-nation. The imposition of a new identity drew critical reactions from traditional or ethnic nations and in turn contributed to state failure. "Nation-ness" is not covered in most evaluations of failure, although it is a critical underlying variable in matters such as the measurement of internal conflict.

Whatever the evaluation of a particular state's position on the ladder, *state building* becomes the prescription for improvement. The term is not to be confused with *nation building*, which is often mistakenly used as a synonym; nation building refers to the policy of building the identity unit and can only be conducted indigenously within the state, whereas state building can be contributed to by external assistance, at least to a limited extent. In a specific sense, state building refers to *institutionalization* and *good governance*, terms particularly important to international financial institutions and their policies toward low-income countries under stress or fragile and conflict-affected countries. In policy terms, whether state building is an internal or external exercise is an important aspect of the debate, basic to decisions on specific policies and measures. The answer that it is both does not solve the kernel of the debate over proportions. Too much international attention removes the element of ownership and responsibility from the failing state, an element that is at the core of the failure question: A state must overcome failure itself; by definition, it cannot be "unfailed" from the outside. However, states in failure, like those in conflict, need help; their very condition removes elements that are needed for its correction. State building is a topic of particular focus specific to the post–World War II era but especially to the post–Cold War world. During both periods, the dominant focus was on the limitation of overpowering, totalitarian states, whereas the contemporary focus is on building state capacity; inclusion of the notion of good governance, which contains a notion of restricted effectiveness, is a corrective to the danger of overwhelming state power.

Finally, one of the most important questions with regard to state failure, which is still unresolved, is the relation between state failure and *civil society failure*. While it has been suggested that state collapse is made possible by the concomitant collapse of civil society, which is unable to promote candidates to fill the gap, other work indicates that civil society expands to fill the functional gap. Like other questions with regard to the topic, the relationship is fraught with conceptual ambiguities. A useful definition, but by no means the only one, considers civil society to cover civil organizations independent of government. The functions civil society can fill the range between none and all, either extreme constituting a contribution to state failure. The more functions civil society can perform, the less the state has to perform, beyond some (undetermined) degree of regulation of civil society performance. Yet some functions, such as security (policing and military defense) and national adjudication, are uniquely state functions and relegation to civil society (as to external contractors) weakens the state rather than strengthening its functional performance.

The Challenge of State Failure

In sum, state failure is a serious problem in contemporary politics. The topic of state failure faces a double challenge. On the one hand, as a problem, it calls for correction of conditions of state weakness to varying degrees. On the other, the topic itself and its component concepts are all ambiguous and open-ended. The first runs up against the limited capabilities of external support to help deal with the situation and to do so without the further weakening of effective foreign involvement. The second calls for more detailed conceptual measurements and indicators, involving further concepts related to more specific aspects and unrealistic precision. Yet both challenges are inherent in the paths to greater effectiveness and understanding.

STATE FORMATION

State formation refers to the processes leading to the centralization of political power within a well-defined territory. These processes are not historically and geographically uniform, and there is no single explanation for them. There have been a variety of paths to statehood. This entry deals with the most general question of state formation concerning the historical origin of states as such as well as with more specific questions connected to the development of the modern states system and to state formation in the contemporary world. State formation in early agrarian societies, in the early capitalist West, and in the era of decolonization and imperial dissolution display different processes and institutional features and will also be analyzed.

There are at least three major theoretical perspectives on the state and state formation. The *pluralist* view describes the state as a set of various interest groups, an arena for contending actors. The state developed, accordingly, through bargaining processes between interest groups. The *Marxist* view is instrumentalist, with the state as a committee for managing the common interests of the ruling class. Here, the state was established as an instrument of domination. The *statist* perspective implies that states have emerged as distinctive structures with institutions and modes of operation that cannot be derived from interest group maneuvering or class structure. The latter perspective is particularly associated with Max Weber and even with neo-Marxist critiques of orthodox Marxism. In empirical accounts of state formation, the major theories are rarely employed one-sidedly or spelled out explicitly, but they are often combined into a more compound analysis.

The Origin of the State

State formation requires cooperation and rule within a unit far greater than a kinship group or a community based on face-to-face recognition. A possible explanation for cooperation on a grand scale is population pressure and scarce resources, particularly the shortage of soil. Increasing population density and scarce resources stimulate more intensive food production. Thereby, social complexity increases because agriculture requires division of labor and specialization. Early state formation emerged after the establishment of agricultural societies.

The basic idea here is that societies organized as states will be more efficient externally and internally. Externally, they are stronger, better organized, and more competitive in relation to less well-organized societies. Internally, big units with intensive production may serve the population with services and conditions of life that are unavailable for small groups or individually. Conflict and common defense abroad may also support social integration at home. The inhabitants of a state are in the same boat, sharing threats from the outside.

State formation has not been a linear historical process. States and empires have disintegrated, collapsed, and disappeared, while others have thrived and enlarged over long periods. If the authorities are unable to supply the population with a minimum of services and security, legitimacy and support will erode. This has happened in failed states as well as in many former empires and colonial territories.

States and empires may also disintegrate due to a principal–agent problem. The central authority delegates power and responsibility to the local and regional representatives. The representatives in the periphery may then exploit the derived resources in a quest for autonomy. Imperial erosion and state failure have various elements of these mechanisms.

Population pressure as a state-building factor is accompanied by division of labor and social inequality. Agriculture and other modes of intensified food production allow for the emergence of a rent-collecting upper class. In a state, there is a vertical division of labor into social classes with differentiated access to land and other productive assets. In contrast to the roaming gangs and bandits in an anarchy, the stationary rulers in a territorial state will benefit from more limited surplus extraction whereby the productive capacity of the people—and thereby the tax basis—is upheld in the long run. Here is a source of support from below, whether or not government is representative.

From another perspective, the increased productivity in agricultural societies could hardly be handled by relatively egalitarian tribal communities. With increasing productivity, the available surplus was distributed on the basis of power. State organization was an organization of command whereby inequality and legitimacy could be combined in new ways.

More specific accounts of the processes of state formation have introduced religious, technical, and geographical factors. Religion is a mode for the legitimation of social stratification and command, conducive to state formation at the early stages. The evolution of script made possible the centralization of information and the spread of precise, long-distance messages. Variation in geography, soil, and climate, certainly, had crucial consequences for the ways and means of state formation. Island states and states surrounded by high mountains were relatively easy to defend, compared with states with borders in open, continental areas.

One specific hypothesis of early state formation is the *irrigation hypothesis*, which states that the organization of states on a large scale started with big hydraulic constructions in the drylands of the Middle East, Asia, and Meso-America. The theory of a *hydraulic society*, made famous by Karl Wittfogel, has been opposed by references to numerous early state formations prior to large-scale irrigation, to societies where irrigation was organized locally, and to state formation in areas of the world where complex hydraulic systems were out of the question.

Numerous states have been born by conquest. When agricultural communities are conquered by nomadic tribes or nomadic tribes establish control over large territories, state organization is the stabilization of command. The productive capacity of an agrarian society is fused with the political interests of nomadic conquerors. Generally, however, the expansive Eurasian nomadism is younger than the first high cultures with organized state power. States have been established and enlarged by conquest, but this is not the prime mover in historical state formation. Morton Fried differentiated between the endogenous factors that were prevalent in *primary* state formation in the Middle East, Meso-America, and the Far East and the exogenous factors—such as conquest and pressure from the outside—in *secondary* state formation.

Externally, war supported the internal mechanisms in early state formation. In the rivalry between states, the more efficient and powerful polities survived either by their own mobilization of force or by protection in powerful alliances.

The Modern States System

The modern states system arose in Europe with the development of international law. The turning point in legal terms was the Treaty of Westphalia in 1648, after 30 years of unruly war between principalities and religious authorities. Roman Catholic emperors fought against Protestant kings and Roman Catholic kings against Protestant princes. The treaty stated that the individual principalities could choose their religion freely, independent from imperial or papal control—*cuius regio eius religio*. This was a long step toward the idea of autonomous territorial states, sovereign and formally equal. The idea implied that the system of governance, public religion, and economic principles could be shaped without external interference. This idea of state sovereignty was elaborated in the theory of international law by 18th-century writers like Christian Wolf and Emmerich de Vattel; it has been confirmed in a series of international treaties right up to the still valid United Nations (UN) convention of 1945. The long-term effect of the Treaty of Westphalia was the contemporary delineation of the globe into constitutionally sovereign states.

The legal formalities of European state formation was substantiated by technological and socioeconomic transformations. The building and centralization of the states was served by technological innovation. The development of firearms and cannons in the early-modern epoch made local fortifications inefficient. Political centralization was a prerequisite for the economic extraction necessary for the finance of standing armies.

The modern state has been characterized by Max Weber as a monopoly of legitimate force and by Joseph Schumpeter as a monopoly of taxation. Modern state building may thereby be described as increasing territorial control by force—army, police, and bureaucracy—on the one hand and effective taxation on the other. New resources are then controlled by the central authority. A specialized state bureaucracy is a prerequisite for this kind of control, and it is in turn reinforced by it.

Weber's idea of the modern state combines the monopoly of physical violence with legitimacy and territoriality. Without these characteristics, anarchy would ensue. The fundamental ambition of the state authority is to legitimate the structure of domination. In this context, Weber developed the categories of *traditional, charismatic*, and *legal* types of legitimation. In specific instances of state formation and state power, there is a variable mix of these pure types.

Warfare was revolutionized with the development of standing armies, field weaponry, and heavy artillery. The central state power was strengthened, while the earlier feudal warrior aristocracy lost their military advantages. Armored cavalry became obsolete, local fortifications were no longer defensible, and hired troops and enlisted armies were beyond the financial means of the local nobility. The war technology undermined the position of the feudal aristocracy to the advantage of monarchic centralization.

Financial resources are the nerves of government, as Jean Bodin noted toward the end of the 16th century. Taxation upheld the preindustrial states, but public financial means were chronically in short supply with increasing expenditures. Low productivity, inefficient markets, and arbitrary tax burdens resulted in tax riots and political setbacks as the fiscal pressure increased. On the other hand, the crises of legitimacy brought about by increasing taxation led to administrative buildup and reform to cope with tax resistance.

The monarchy acquired a tax monopoly and a control with central banking. Schumpeter argued that the concentration of state power was linked to the development of early capitalism. The market economy led to increased economic growth, while the central authorities acquired an increasing part of the economic surplus through taxation and state enterprise. Capitalist growth could not proceed without a rational bureaucracy for public administration and a rational system of law for stable transaction rules and predictable frameworks for entrepreneurship. In Max Weber's view, these bureaucratic and legal conditions were unique to the European trajectory, in contrast to the charismatic, patrimonial, or traditional modes of rule elsewhere.

With political centralization and economic expansion, the capacity for warfare increased accordingly. The perspectives of Weber and Schumpeter are echoed in Charles Tilly's famous dictum that *war made the state, and the state made war*.

An absence of government would have been disastrous for economic growth. Anarchic conditions would breed disorder, localism, and infrastructural defects. The development of communications, certified knowledge and expertise, legal frameworks for market transactions, justice, and order would all suffer. State formation was favorable for the development of trade and industry.

On the other hand, an overdeveloped state—a self-serving power structure alienated from civil society—would also be hostile to economic development. The state bureaucracy as a new ruling class could easily degenerate to kleptocratic and corrupt practices. Predatory governments are systematically exploiting society rather than being responsive to it. Arbitrary and predatory rule drain the surplus away from long-term investment and undermine the stable conditions of law and predictability. This is the liberal account of state power.

The liberal perspective on early-modern state formation has been tied up with the advantages of political fragmentation in the early-modern epoch. Whereas the empires of antiquity were characterized by administered trade and a coalescence of economic system and territorial control, capitalist expansion and industrial growth thrived with an economic market system beyond the borders of state polities. The economic division of labor gained vitality from a more open space than a single political unit. The economic system was wider than any single state before the emergence of the modern states system. The plurality of states stimulated economic growth and provided their inhabitants with an escape system that served as a barrier to arbitrary government. The importance of the multipolarity in Europe was considered already during the Enlightenment and developed at length by Edward Gibbon in his monumental study of the decline and fall of the Roman Empire.

At closer range, there is a variety of reasons for the specifics of modern state formation in different parts of Europe. While Britain emerged as a centralized polity in the early-medieval epoch, Italian and German lands were not unified until the second half of the 19th century. Above the specifics of individual states, Perry Anderson has drawn a major line of division between the East and West in Europe. The absolutist state in the West emerged on endogenous lines of development, through antiquity and feudalism, while the Eastern variety of statehood was a response to external challenges. Western absolutism was erected above an emerging urban network and a relatively free peasantry, while Eastern absolutism built on small, subordinate urban societies and rural serfdom. Thus, the socioeconomic forms of the West were dynamic and adapted to a modernized state, while the Eastern institutions remained economically stagnant with the state as a response to exogenous military pressure.

Historically, state formation in Africa, Asia, and the Americas has taken a variety of forms. Precolonial chiefdoms in Africa were centralized polities with large territories and often with hundreds of thousands of inhabitants, some of them intact right up to the onslaught of European colonization. The Asian empires evolved in a continuous rivalry between nomadic and sedentary societies; even the long history of Chinese dynasties was highly dependent on the border fortifications and challenges from the outside. The indigenous realms in Meso-America and South America were unified in defense against hostile tribes until the technologies and diseases of European conquerors brought them down.

These instances of early state formation did not lead continuously into the contemporary world. The political trajectories were broken by revolution, as in China, or by colonial occupation and control, as in Africa and—earlier—in the Americas. Postcolonial state formation is a complex mix of endogenous and exogenous change, with new international conditions as a crucial factor.

Recent and Contemporary State Formation

Modern statehood has expanded throughout the globe in four major waves during the past 200 years: first the formation of independent republics in the Americas from the late 18th century, then the dissolution of the Ottoman and Habsburg empires during World War I, followed by the process of decolonization—with the dissolution of the European empires overseas—from about 1960, and finally the emergence of new states in the wake of the collapse of the communist regimes and the dissolution of the Soviet Union from 1991.

These waves of state formation were orchestrated by the victory of rebellious movements, the collapse from above, and the withdrawal of external control. The key to state formation here was different from the processes in the neolithic revolution or the emergence of postfeudal absolutism in the West. Still, the European postfeudal and post-Renaissance state provided a formal model toward which recently acquired states gravitated.

In terms of international law, as a formalization and codification of the modern states system, there were approximately two dozen entities within this system at the end of the 19th century; they included the European states, the former American colonies, the Ottoman empire, and other entities recognized by treaty with European powers—Persia, Siam, China, and Japan. In the 19th century, however, it was unclear what state formation and statehood really were. There have been shifting criteria for the definition of a sovereign state. International power relations have been crucial in modern state formation, as illustrated by the attempt by the Western powers to establish Kurdistan and Armenia as independent states in 1920, withdrawn 3 years later under Turkish pressure.

The states system of the 19th century was based on a constitutive theory of state formation. The status as an independent state was derived from diplomatic practice—through treaties and the exchange of ambassadors—without explicit criteria or formal registration. The states system had no clear borders, and the exact number of states was uncertain.

This lack of formal criteria became increasingly awkward with international conferences and treaties, including the League of Nations after World War I. Which political entities were qualified for admission? General recognition required standardized and universally accepted criteria for statehood. The League of Nations Treaty circumvented the problem by stating that any fully self-governed state, dominion, or colony could be voted in as a member, but this left the field open for diplomatic maneuvering and power politics.

The problem was addressed at an inter-American conference in Montevideo, Uruguay, in December 1933. The final treaty defined a state according to objective criteria in a way that is still the current view according to international law. To be a state, a political entity has to have a permanent population, well-defined borders, a government, and a capacity to honor international obligations. This was called a *declaratory theory* of statehood, whereby an effective government was a prerequisite for international status and recognition. As statehood no longer hinged on recognition as such, it was not abolished by the withdrawal of recognition. The fact of statehood was moved from recognition to the empirical prerequisites for recognition.

Furthermore, the League of Nations soon codified the prevalence of the territorial integrity of established states above the right of secession, whatever the composition of the population or the public opinion in the contested areas was. How was it possible to adapt post–World War II decolonization to the idea of territorial integrity? There were 51 original members of the UN in 1945, increasing to 127 member states in 1970, 157 in 1981, and 191 in 2004. This is a fast and radical process of *state formation*, within an international states system where the established polities were eager to protect their territorial integrity and avoid secessional dismemberment.

The eventual solution was pragmatic and finite, with a doctrine of decolonization that limited the new states to colonies overseas and prohibited further secession from these new sovereign states. According to the doctrine, decolonization should proceed in one step across salt water, without further legitimate challenges to the integrity of old and new states. This principle was accepted by governments throughout the Third World, in defense of the new state order. When the former USSR and the federation of Yugoslavia dissolved after the Cold War, sovereign states were established within the borders of the former republics, without further secessions or border revisions. The contested independence of Kosovo in 2008 is the only exception here.

The postcolonial states and their borders are the result of exogenous processes. State formation is based, first, on arbitrary colonial delineations and, second, on diplomatic principles. Due to the combination of a colonial past and a postcolonial lack of national integration and legitimacy, many postcolonial states have been bureaucratically overdeveloped, predatory, and inefficient. Robert Jackson has called them *quasi states*, lacking the institutional qualities of the Weberian state. The modern state proper, after a long historical evolution, developed institutions by sailing between the Scylla of anarchy and the Charybdis of predatory rule. The quasi state, on the other hand, was fully recognized abroad, but it was predatory or partially anarchic internally.

In Max Weber's terms, many postcolonial states are neopatrimonial in the sense that the public bureaucracy is mixed up with clientelism, kinship relations, and personal dependency. In the neopatrimonial state, political support is either for sale or based on kinship obligations. Moreover, neopatrimonial features are a matter of degree, on a scale from the Weberian ideal type of formal rationality to the failed state.

War may have been a prime mover in early-modern European state formation, but this explanation is not generally valid in the non-European world. War and waves of conquest contributed to state formation in some parts of Asia, such as Vietnam, but were hardly relevant in the African context. In many cases, formal independence was followed by territorial disintegration, ethnic strife, and civil war.

Postcolonial state formation has been a process against heavy odds. Early-modern war in Europe unified the states against external threats, while modern wars in the non-European world have been mostly domestic. External powers may continue to exploit the economic weaknesses of postcolonial states, in contrast to the centralization of surplus extraction in the early-modern epoch. Weak institutions and deficient leadership contribute to the failure of state formation in many postcolonial areas.

State Formation as a Nonuniform Process

State formation takes place in a historical context. There is only a superficial similarity between the origin of the state in neolithic times, the evolution of the early-modern state in Europe, and the variety of geopolitical and socioeconomic conditions behind state formation in the modern era. It is the outcome of a certain class of phenomena—the centralized political structures within relatively large territories—that bind these processes together. *State formation* is a generic term. The state and the mechanisms behind it cover a wide range of political forms and experiences.

No single explanation can explain state formation in general—during the neolithic, the early-modern, and the contemporary epochs. Nor can a single explanation adequately deal with modern state making in, for instance, Britain, France, Germany, or the United States. We have to combine the more general preconditions with those mechanisms that are specific to the emergence of the individual state.

STATISM

The English word *statism* and its equivalents in other languages denote an idea of the supremacy of the state and the corresponding principles, ideologies, policies, institutions, and even specific instances of state intervention in personal, social, or economic matters.

Origins

As a vague and contested term, *l'étatisme* emerged in France and then spread throughout Europe in the late 19th or early 20th century, either as a transliteration (German *Etatismus*, Polish *etatyzm*, and Swedish *etatism*) or in the form of a calque (Italian *statalismo*, Spanish *estatismo*, Portuguese *estadismo*, Turkish *Devletçilik*, and Finnish *Valtiojohtoisuu*), or as both transliteration and calque (Russian этатизм, государственничество; English etatism, statism; and Dutch *etatisme*, *statisme*). Later, there emerged transliterations of the English term (e.g., Lithuanian *statizmas*).

The idea of the supremacy of state emerged much earlier then the term *l'étatisme*. Soon after Niccolò Machiavelli and Francesco Guicciardini coined the word *stato* in early 16th century, signoral or kingly supremacy over a territorial polity was gradually depersonalized and conceptualized as a core notion of political order. In the mid-17th century, Thomas Hobbes identified the state as "*Mortal God*, to which wee owe under the *Immortal God*, our peace and defence" (*Leviathan*, chap. 17) or as the ultimate and supreme authority. He claimed that there was no power on earth to be compared with the *Leviathan*—"*Non est potestas Super Terram quae Comparetur ei*" (There is no power on earth that can be compared with him). Accordingly, the state was to be a departure point for all political thinking and practice.

Historical Evolution

Further development of statism in the 17th and 18th centuries was challenged both by its repersonalization by absolute monarchs (as in Louis XIV of France's declaration "L'Etat c'est moi") and by attempts to usurp state prerogatives by political factions of all kinds. At the same time, the viability of the idea of state supremacy was confirmed by "public policy science" (*Polizeiwissenschaft*) and constitutionalism. They highlighted the transition from "state of estates" (*Ständestaat*) to "good-policy state" (*Polizeistaat*), and then to various forms of limited monarchy, and finally to constitutional ones.

A major problem was posed by a lack of clarity about the source or sources of state authority. A conflict of alternative viewpoints ranging from divine to popular mandate made the idea of state supremacy highly contestable. It was Georg Wilhelm Friedrich Hegel who tried to develop a decidedly abstract perspective that would justify philosophically the supremacy of the state. In his *Elements of the Philosophy of Right* (*Grundlinien der Philosophie des Rechts*), he further developed the Hobbesian idea of the state as Mortal God:

> The state is the march of God through the world. Its foundation is the power of reason that implements itself as will. To pursue the idea of state one has to consider not specific states but the idea for itself or the actual God. (sec. 258 addendum)

In other words, the idea of the state could not be reduced to specific instances but should be enhanced to the higher abstraction of transhistorical development. The state was made a part of the divine strategy, not a mere product of human endeavor. To this day, Hegel's claim remains the purest expression of the philosophical justification of statism.

In the postrevolutionary era of the 19th century, statism was challenged by its many rivals. It was opposed by individualism, anarchism, socialism, communism, and radical brands of liberalism, to mention only the most important ones. Marxism advanced a "scientific" theory of universal development according to which the state was supposed to wither away. It was the most radical and clear expression of antistatism at that time.

It was in the 19th century that the word *statism* acquired its pejorative or derogatory sense, which is still widespread in ideologically motivated discourses. But it was also the moderate liberalism and particularly the constitutionalism of the 19th century that helped clarify many aspects of the idea of the supremacy of state as the crucial framework for international and national political order.

The Second Empire periods in France (1852–1870) and in Germany (1871–1919) were the main vehicles of statism. The term *welfare state* (*État providence*) was originally coined by Émile Ollivier, a deputy in the National Assembly, in 1864. He used it to identify a new system of social solidarity (*système de solidarité national*).

In Germany, statism was not only related to strengthening the traditional aspects of state power (military might, administrative capabilities, etc.) but also marked by the intrusion of the new imperial state into areas that previously were the domains of nonstate agencies. The policy of culture struggle (*Kulturkampf*) allowed the German state to promote effective secularization and to play down the authority of the Catholic Church. As a result, the state gained control over certain functions that hitherto had belonged exclusively to the church, such as education, marriage ceremonies, and so on. The church was forbidden from participating directly in political affairs. The state assumed responsibility for the training and appointment of clergy. Under Chancellor Otto von Bismarck's May Laws of 1873 and 1874, the state assumed responsibility for the training and appointment of clergy. (In 1886, however, this policy was relaxed, returning education of clergy to the seminaries.)

Bismarck's policy of social insurance (*soziale Fürsorge*) meant a more direct and decisive intrusion of the state into the private sphere. It helped introduce health insurance, accident insurance, disability insurance, and old-age retirement pension in the 1880s. The policy helped further develop the German tradition of the welfare state (*Wohlfahrtsstaat*) that dated back to the "good-policy state" (*Polizeistaat*) of the 18th century and paved the way for the "social state" (*Sozialstaat*) of the 20th century. In fact, Bismarck himself identified his policy first openly as practical Christianity and then informally as "state socialism" (*Staatssozialismus*). Both identifications were correct since the traditional church domain of caretaking for the poor and needy was taken over by the state to forestall socialist claims on the issues of well-being of working people.

At the turn of the 20th century, statism was provided with sound intellectual justification by a prominent Swedish political scientist, Johan Rudolf Kjellén. He advocated that only states as main political units made domestic and foreign politics possible. States collectively provided the arena of international politics; each individual state comprised a framework for national politics. He identified states as a "life-form" (*lifvsform*), stressing their organic unity with the life stories of respective peoples in their natural environment. Thus, Kjellén secularized the Hobbesian "Mortal Gods" into "life-forms" subject to scientific investigation.

World War I led to a major breakthrough of statism. All the belligerents were forced to develop state-controlled wartime economies. Both political thinking and institution building were greatly influenced by this development. At the same time, this also provoked a reaction, boosting antistatism of various sorts, ranging from serene pacifism to revolutionary communism. The clash of statist and antistatist pressures further complicated the political developments. In the setting of postwar reconstruction, state agencies, corporations, trade unions, cooperatives, and social movements were making overlapping efforts.

The October Revolution posed a major challenge to statism, launching an alternative form of direct "workers' and peasants' democracy of Soviets." A supposedly antistatist drive soon led to the adoption of the Stalinist policy of a "socialist state in a single country" and the creation of a totalitarian "party-state" (*партия-государство*).

Policies of self-determination swept many countries in the wake of the World War I. To a great extent, this trend depended on state efforts and promoted various kinds of statism. For example, in Turkey, statism, or *Devletçilik*, became one of the six "arrows" or principles of Kemalism (the political philosophy of Mustafa Kemal, founder of the modern Turkish Republic). According to that principle and policy, the state was to direct the country's economic development. It was also to engage in areas where private enterprise had proven to be inadequate, or where national interest required direct state involvement. In promoting *Devletçilik*, the Turkish state emerged as the owner of the major industries of the country.

Statism was also one of the cornerstones of Italian fascism. At a meeting in October 1925, Benito Mussolini formulated the guiding motto of his regime: "Everything in the State, nothing outside the State, nothing against the State" (*Tutto nello Stato, niente al di fuori dello Stato, nullo contro lo Stato*; Karl Bracher, 1973). Such verbiage incited resentment. Soon the fascist brand of statism was labeled *statolatry* (*statolatria*). In his encyclical *Non Abbiamo Bisogno* of June 29, 1931, Pope Pius IX denounced fascist attempts to monopolize completely the young, from their most tender years up to manhood and womanhood, for the exclusive advantage of a party and of a regime based on an ideology that clearly resolves itself into a true and genuine pagan worship of the state ("*in una vera e propria statolatria pagana*")—statolatry. Later, the term *statolatry* was widely used by a staunch critic of statism, Ludwig von Mises.

Such claims to total control were beyond the capabilities of fascist Italy to sustain. Instead, it developed a state structure known as the corporate state with the ruling party acting as a mediator between "corporations" making up the body of the nation. Similar designs were quite popular elsewhere in the 1930s. The most prominent examples were *Estado Novo* in Portugal (1932–1968) and Brazil (1937–1945), the Austrian *Ständestaat* (1933–1938), and authoritarian experiments in Estonia, Romania, and some other countries of East and East-Central Europe.

Much more consistent attempts to develop totalitarian versions of statism were undertaken in the German Third Reich and the former USSR. Still, the "success" was fairly ambiguous and self-defeating since the emergent models actually integrated state structures into a more inclusive system of total control, in the form of the Hitlerite "movement-state" (*Bewegungsstaat*) and the Stalinist "party-state" (*партия-государство*). Thus, the *state* in the proper sense of the term was actually eradicated.

Liberal versions of corporate statism of the 1930s developed into welfare states. The most notable examples are the United States, Netherlands, Australia, New Zealand, Uruguay, Sweden, and other Nordic countries.

The advancement of the American welfare state was highlighted by the New Deal, a series of economic programs President Franklin D. Roosevelt's administration initiated between 1933 and 1936. The First New Deal, of 1933, was aimed at short-term recovery programs to combat the effects of the Great Depression. The Second New Deal (1935–1936) included labor union support, the Social Security Act, and programs to aid farmers and migrant workers.

In Sweden, a policy of taking over the system of parish welfare by the state and the development of additional state-controlled social services was introduced in early 1930s. It is known as *people's home* (*Folkhemmet*), a very telling term introduced already in 1928 by the Social Democratic Party leader Per Albin Hansson, with inspiration presumably coming from Kjellén.

Recent Developments

In the later part of the 20th century, the welfare state and statism had their ups and down. Emergence of new states, economic crises, social unrest, and revolutions were typically accompanied by an upsurge of statist policies and thinking. Periods of relatively steady development tended to incite withdrawal of the state from economic and social spheres. The most prominent examples are Thatcherism and Reagonomics.

Statism's influences on political science are mainly found in the traditions of normative and legal studies of states. Far more outspoken are antistatism traditions related to liberal and Marxist sources of inspiration. In a more general context, both the behavioral approach and structural functionalism helped play down elements of statism from the 1950s to the 1970s, introducing concepts of political systems and political culture. Reaction followed and "brought the state back in" (see Theda Skocpol, Peter Evans, & Dietrich Rueschemeyer, 1985). The globalization debate reintroduced expectations of the state "withering away." Currently, a more balanced approach seems to prevail. It is generally recognized that the system of states is indispensable as a kind of reference grid for world politics and the respective territorial units are vital institutional frameworks for internal policies.

STATISTICAL INFERENCE

See Statistical Inference, Classical and Bayesian

STATISTICAL INFERENCE, CLASSICAL AND BAYESIAN

Statistical inference is a form of induction and can be broadly defined as "learning from data." The two dominant forms of statistical inference are "classical" (or "frequentist") inference and Bayesian inference.

Briefly, classical inference assesses the plausibility of a hypothesis by asking *how frequently* we would see results like the one actually obtained in repeated applications of the data generation mechanism, assuming the hypothesis to be true. If a statistic $\hat{\theta}$ computed with the observed data is judged to be sufficiently unusual relative to its expected value under the hypothesis, then the hypothesis is considered falsified. The assumed hypothesis is often a "null" or "no effects" hypothesis; if this hypothesis is rejected (in the sense given above), then we usually say that we have a "statistically significant" finding. The assumptions here are that statistics vary randomly across repeated applications of the data generation mechanism (e.g., random sampling, say in the case of the analysis of survey data), while the objects of interest—population parameters θ—are constants. Repeated applications of the sampling process, if undertaken, would yield different y and different $\hat{\theta}$. The distribution of values of $\hat{\theta}$ that would result from repeated applications of the sampling process is called the *sampling distribution* of $\hat{\theta}$; the standard deviation of this distribution is the *standard error* of $\hat{\theta}$. For many statistics, asymptotic theory gives the form of the statistic's large-sample sampling distribution (e.g., normal, χ^2). The sampling variance of a statistic is often also easy to estimate; for instance, if $\hat{\theta}$ is the maximum likelihood estimate, then $V(\hat{\theta})$ is often estimated with the inverse of the information matrix (minus the second derivatives of the log of the likelihood function with respect to θ, usually evaluated either at $\hat{\theta}$ or at a hypothesized value θ^*). This approach is by and far the most frequently taught and frequently deployed framework for statistical inference in the social sciences.

By contrast, Bayesian inference uses Bayes rule (we will drop the apostrophe in "Bayes' rule") to compute the conditional probability of hypotheses given the data at hand, without any explicit reference to what might happen over repeated applications of the data generation mechanism. Bayes rule states that if A and B are events then

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}, \tag{1}$$

where $P(A|B)$ is the conditional or posterior probability of A given that event B has occurred, $P(A)$ is the prior probability of A, and $P(B)$ is the marginal probability of B. This proposition—an uncontroversial result given the conventional definition of conditional probability—can be restated more provocatively as

$$P(H|E) = \frac{P(E|H)P(H)}{P(E)}, \tag{2}$$

where $P(H)$ is the prior probability of a hypothesis and $P(E|H)$ is the likelihood of "evidence" (or data) E under hypothesis H. This form of Bayes rule underscores its relevance as a tool for statistical inference. In the case of a finite set of competing hypotheses $H = \{H_1, \ldots, H_J\}$, the law of total probability implies that $P(E) = \sum_{j \in H} P(E|H_j) P(H_j)$. Note that the resulting posterior probabilities constitute a proper probability mass function over the set H; that is, $\sum_{j \in H} P(H_j|E) = 1$. For the case of a continuous parameter $\theta \in \Theta \subseteq \mathbb{R}$ and data $y \sim p(y|\theta)$, Bayes rule becomes

$$p(\theta|y) = \frac{p(y|\theta)p(\theta)}{\int_\theta p(y|\theta)p(\theta)d\theta} \propto p(y|\theta)p(\theta), \tag{3}$$

or (in words) the posterior density for θ is proportional to the prior density for θ, $p(\theta)$, times the likelihood for the data given θ, $p(y|\theta)$. The integral in the denominator in Equation 3 ensures that the posterior density integrates to one and thus is a proper probability density.

Note that Bayesian inferences do not rely on how $\hat{\theta}$ might vary over repeated applications of random sampling. Instead, Bayesian procedures are geared toward answering a simple question: What should I believe about θ in light of the data available for analysis, y? The quantity $\hat{\theta}(y)$ has no special, intrinsic status in the Bayesian approach, although a statistic such as a least squares or maximum likelihood estimate $\hat{\theta}$ is a feature of the data that may be helpful in computing the posterior distribution for θ. In the Bayesian approach, the roles of θ and $\hat{\theta}$ are reversed relative to their roles in classical, frequentist inference: θ is random, in the sense that the researcher is uncertain about its value, while $\hat{\theta}$ is fixed, a feature of the data at hand. An example will help make the distinction clear.

Example: Attitudes Toward Abortion. In the 1994 General Social Survey (GSS), 1,934 respondents were asked, "Please tell me whether or not you think it should be possible for a pregnant woman to obtain a legal abortion if the woman wants it for any reason."

Of the respondents, 895 reported "yes," and 1,039 said "no." Let θ be the unknown population proportion of respondents who agreed with the proposition in the survey item—that a pregnant woman should be able to obtain an abortion if the woman wants it for any reason. The question of interest is whether a majority of the population supports the proposition in the survey item.

Under the assumption that the survey responses are independent (not an unreasonable assumption for a survey such as the GSS), the binary survey responses can be modeled as binomial process; that is, the likelihood has the binomial form

$$p(y|\theta) = \binom{1,934}{895} \theta^{895}(1-\theta)^{1,934-895}. \qquad (4)$$

Frequentist Approach. The maximum likelihood estimate of θ is $\hat{\theta} = 895/1934 \approx .46$, the approximation coming via rounding to two significant digits. With this large sample, the normal is an excellent approximation to the sampling distribution of $\hat{\theta}$. Interest focuses on whether the unknown population proportion, θ, is equal to .5. A typical classical approach to this question is to test the null hypothesis $H_0 : \theta = .5$ against all other alternatives $H_A : \theta \neq .5$ or, say, a one-sided alternative $H_B : \theta > .5$. We would then ask how often we would see the value of $\hat{\theta}$ actually obtained, or an even more extreme value if H_0 were true, by centering the sampling distribution of $\hat{\theta}$ at the hypothesized value. The variance of $\hat{\theta}$ under H_0 is given in the usual way, computed as minus the inverse of the second derivatives of the log-likelihood function evaluated at the hypothesized value of θ. In turn, the standard deviation of the normal sampling distribution (the standard error of $\hat{\theta}$) under H_0 is

$$\begin{aligned}\mathrm{se}(\hat{\theta}|H_0) &= \sqrt{\frac{\theta_{H_0}(1-\theta_{H_0})}{n}} \\ &= \sqrt{\frac{.50 \times (1-.50)}{1934}} \approx .011.\end{aligned}$$

The realized value of $\hat{\theta}$ is $(.5 - .46)/.011 \approx 3.64$ standard errors away from the hypothesized value. Under a normal distribution, this is an extremely rare event. Over repeated applications of random sampling, only a small proportion of estimates of θ will lie 3.64 or more standard errors away from the hypothesized mean of the sampling distribution. This proportion is

$$2 \times \int_{3.64}^{\infty} \phi(z)dz = 2 \times [1 - \Phi(3.64)] \approx .00028,$$

where $\phi(\cdot)$ and $\Phi(\cdot)$ are the normal PDFs and CDFs, respectively. Given this result, most (frequentist) analysts would reject the null hypothesis in favor of either alternative hypothesis, reporting the p values for H_0 against H_A as .00028 and for H_0 against H_B as .00014.

Bayesian Approach. The unknown parameter is $\theta \in \Theta = [0, 1]$. Suppose that we bring little or no prior information to the analysis, assigning θ a uniform prior over Θ. Applying Bayes rule, we seek the posterior density $p(\theta|y) \propto p(\theta)p(y|\theta)$. The uniform prior is constant with respect to θ and is absorbed into the constant of proportionality. With a binomial likelihood and a uniform prior on Θ, the posterior density of θ is a Beta density, which is well approximated by a normal density for samples of even moderate size. That is, our working approximation to the posterior density for θ is a normal density centered on the maximum likelihood estimate of .46 with standard deviation .011; that is, $p(\theta|y) \approx N(.46, .011^2)$. Note that most of the posterior probability mass lies below

.5, suggesting that the hypothesis $\theta > .5$ is not well supported by the data. In fact, the posterior probability of this hypothesis is

$$\begin{aligned}\Pr(\theta > .5|y) &= \int_{.5}^{\infty} p(\theta|y)d\theta \\ &= \int_{.5}^{\infty} \phi\left(\frac{\theta - .46}{.011}\right)d\theta = .00014.\end{aligned}$$

Note an apparent symmetry between the frequentist and Bayesian answers. In both instances, the "answer" involved computing the same tail area probability of a normal distribution, with the probability of H_0 under the Bayesian posterior distribution corresponding with the p value in the frequentisi test of H_0 against the one-sided alternative H_B (see Figure 1). But this similarity really is only superficial. The Bayesian probability is a statement about the researcher's beliefs about θ obtained via application of Bayes rule, and is Pr $(H_0|y)$, obtained by computing the appropriate integral of the posterior distribution $p(\theta|y)$. The frequentist p value is obtained via a slightly more complex route and has a quite different interpretation from the Bayesian posterior probability since it conditions on the null hypothesis; that is, the sampling distribution is $f(\hat{\theta}|H_0)$, and the p value for H_0 against the one-sided alternative is the proportion of $\hat{\theta}$ less than .46 we would see under repeated sampling with the sampling distribution assumed under the null hypothesis.

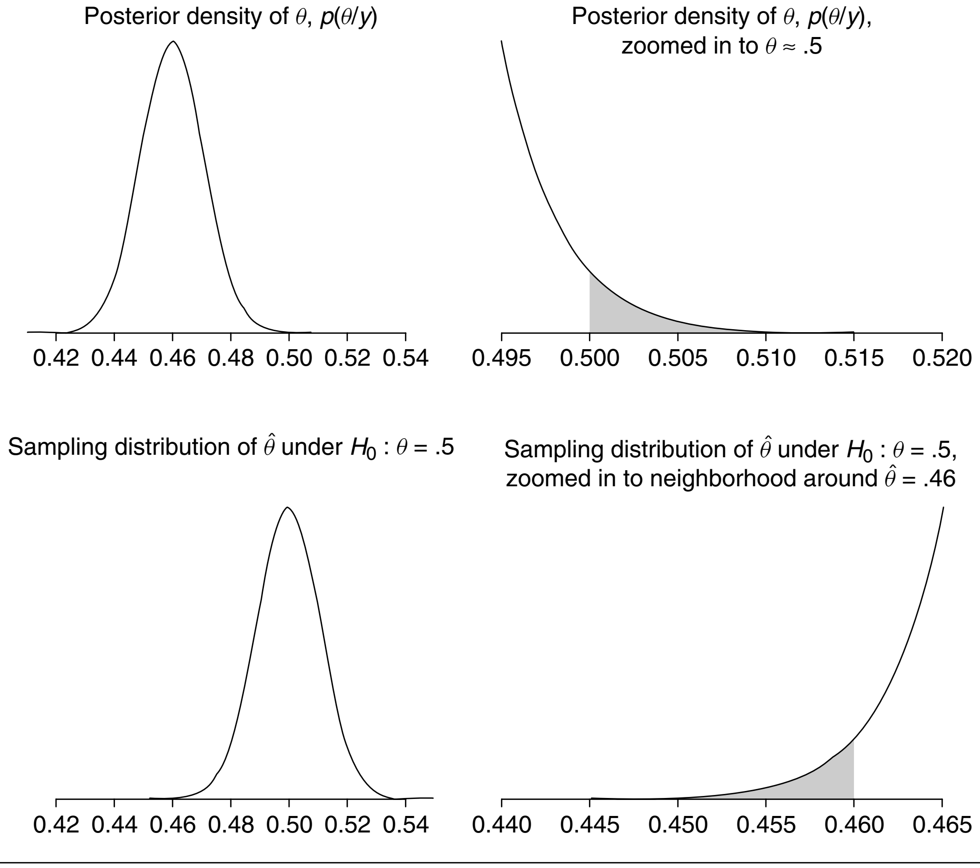

Figure 1 Attitudes Toward Abortion: Posterior Density of θ Contrasted With Sampling Distribution of $\hat{\theta}$ Under H_0: $\theta = .5$

Source: Jackman, S. (2009). *Bayesian analysis for the social sciences* (Figure 1.10, p. 35). Hoboken, NJ: Wiley.

Note: The top right panel shows the posterior density in the neighborhood of u 5 .5, with the shaded region corresponding to the posterior probability $p(\theta > .5|y) = \int_{.5}^{\infty} p(\theta|y)d\theta = .00014$. The lower right panel shows the sampling distribution in the neighborhood of $\hat{\theta} = .46$, with the shaded region corresponding to the proportion of times one would observe $\hat{\theta}$# .46 if H_0 : u 5 .5 were *true,* corresponding to .00014 of the area under the sampling distribution.

Relevance of the Classical/Bayesian Distinction to Social Science

The distinction between the classical/frequentist and Bayesian approaches to statistical inference is important in at least three ways: (1) although the frequentist approach is ubiquitous in social science training and practice, it is unclear whether its premises apply in many social science contexts; (2) many social scientists often give Bayesian interpretations to the outcome of classical procedures and (3) since parameters are considered random variables in the Bayesian approach, extensions such as multilevel or hierarchical modeling are straightforward, as is inference for latent variables, missing data, and so on.

Inference Without Random Sampling

Consider the analysis of cross-national data in economics, political science, or sociology, say using national accounts data from the OECD (Organisation for Economic Co-operation and Development). Alternatively, consider researchers in American politics analyzing all trade votes in the U.S. Senate in a given period or an analysis of the determinants of civil war, using an authoritative, comprehensive listing of all civil wars in the world since World War II.

In what sense do data such as these comprise a sample from a population? Repeating the data collection exercise would not yield a new sample from the population, but rather, save for coding error or errors in transmission or transcription of the data, "repeated sampling" would yield exactly the same data set and statistics, $\hat{\theta}$. In cases such as these, *there is no uncertainty due to variation in repeated sampling from a population.* Nonetheless, one can feed data of this sort to a computer program and have standard errors and significance tests reported for various statistics (e.g., means, correlations, regression coefficients) as usual. But what do those standard errors *mean* in this context? What do we mean when we say a result is "statistically significant" in this setting?

Several possibilities come to mind. Coding error might see the numbers changing over repetitions of the data collection process, say, if the data were being manually transcribed from archival sources into a database. But this form of measurement error may have quite different operational characteristics from classical sampling error: For example, what is the population of possible data sets that might be generated via transcription error, and how do we (randomly) sample from that population? Are those transcription errors distributed randomly and, if so, via what distribution? In short, does a central limit theorem apply to the resulting estimator and standard errors? Almost surely not: As $n \longrightarrow \infty$, frequentist sampling error vanishes (and, for independent data, at a rate of $\sqrt{n}$), but this hardly seems likely for coding errors.

Nor is it satisfying or particularly helpful to say, "The data are just one of many possible data sets that could have been generated if history were to be replayed many times over." What is the sampling mechanism that selected the history we happened to observe? No one knows, or can know. Adhering to a frequentist conception of probability in the face of nonrepeatable data seems dubious.

Moreover, it is not clear how to attach frequentist probabilities to past or nonrepeatable events about which one may be uncertain (e.g., the probability that an asteroid impact caused the K-T mass extinction) or to future events (e.g., the probability that Democrats will hold a majority of seats in the U.S. House of Representatives after the next election). That is, there is a large class of events of interest to social scientists for which the frequentist notion of probability is inappropriate. In these situations—quite common in the social sciences—the Bayesian approach provides a coherent basis for inference.

What Is a Confidence Interval?

The stark contrast between classical and Bayesian inference is also particularly evident when we consider a staple of statistical practice, the confidence interval. To illustrate this, consider the abortion attitudes example again. Using a large-sample, normal approximation, a 95% confidence interval for θ is $\hat{\theta} \pm 2 \times \text{se}(\hat{\theta}) = .46 \pm 2 \times .011 = [.438, .482]$. But what exactly is the interpretation of this confidence interval? Many social scientists in this situation would say, "There is a .95 probability that θ lies between .438 and .482."

But this is not the correct classical interpretation. In the classical approach, parameters are fixed characteristics of populations, so either θ lies in the interval, or it doesn't. The correct interpretation of a classical or frequentist confidence interval depends on the repeated sampling characteristics of a sample statistic. In the case of a 95% confidence interval, the correct frequentist interpretation is that 95% of the 95% confidence intervals one would draw in repeated samples will include θ. This leads us to wonder if the 95% confidence interval that one constructs from the data set at hand is one of the lucky 95% that actually contain θ. No one knows.

This example highlights how the repeated sampling, frequentist notion of probability is simply not about how many researchers use and understand the term *probability*. From the frequentist perspective, the statement "There is a .95 probability that θ lies between .438 and .482" is valid, since for frequentists "probability" is, at least tacitly, understood to mean "relative frequency in repeated sampling." But this is not how most practioners understand confidence intervals. Rather, subjective statements of the sort "I am 95% sure that $\theta \in [.438, .482]$" are quite typical. The correct frequentist interpretation is the less helpful statement about the performance of the 95% confidence interval in repeated sampling. On the other hand, the statement "Having looked at the data, I am 95% sure that $\theta \in [.438, .482]$" is produced by a Bayesian analysis, a characterization of the researcher's *beliefs* about a parameter in formal, probabilistic terms rather than a statement about the repeated sampling properties of a statistical *procedure*.

Hierarchical Modeling

The prior density $p(\theta)$ plays a key role in Bayesian inference. Some critics of Bayesian inference point to the arbitrary, subjective nature of the prior density as a weakness of the Bayesian approach. But the prior density also provides a way for model expansion when working with data pooled over multiple units and/or time periods. Data of this sort abound in the social sciences. Individuals live in different locations, with factors that are constant for anyone within that location but that vary across locations; students attend different schools; voters live in different constituencies; firms operate in different types of markets; politicians compete under different sets of electoral rules, and so on. Understanding the relative weight of microlevel variables and macrolevel or "contextual" variables—and critically, the interaction between them—is central to many research programs in the social sciences. A key question in research of this type is how the causal structure that operates at one level of analysis (e.g., individuals) varies across a "higher" level of analysis (e.g., localities or time periods).

The Bayesian approach to statistical inference is extremely well suited to answering this question. Recall that in the Bayesian approach parameters are random variables. Thus, it is not difficult to replace the prior $p(\theta)$ with a richer model to allow for the way the parameters θ might vary across groups $j = 1, \ldots J$, perhaps as a function of the characteristics of the groups: For example, $\theta_j \sim f(z_j, \gamma)$, where γ is a set of unknown *hyperparameters*. That is, the model is now composed of a nested *hierarchy* of stochastic relations: The data from unit j, y_j, are modeled as a function of covariates and parameters θ_j, while cross-unit heterogeneity in the θ_j is modeled as a function of unit-specific covariates z_j and hyperparameters γ.

Models of this sort are known to Bayesians as *hierarchical* models but go by many different names in different areas of the social sciences depending on the specific form of the model and the estimation strategy being used (e.g., models with "random" or "varying" coefficients models, "multilevel" or "mixed" models). It is no exaggeration to say that hierarchical modeling is one of the great successes of the Bayesian revival of the past 20 years. Simple models of causal heterogeneity—in which parameters are assumed to vary in a nondeterministic way across units—are substantively attractive and yet nontrivial enough to estimate in a classical setting. A suite of models known as Markov Chain Monte Carlo (MCMC) made Bayesian computation for these models rather simple.

Feasibility of Bayesian Inference via MCMC

As recently as the 1980s, applications of Bayesian inference were limited to a relatively small set of problems in which the posterior density for θ can be expressed in closed form; even a problem as simple as logistic or probit regression models for binary data was mathematically intractable, and so Bayesian inference was more a philosophical position than a practical strategy for data analysis. But throughout the 1990s, there was something of an explosion of interest in Bayesian approaches, almost entirely driven by the fact that cheap computing power made it feasible to do simulation-based, Bayesian statistical data analysis. The MCMC made the Bayesian approach not just a theoretical curiosity but a practical reality for applied researchers. Briefly, MCMC works by using Monte Carlo methods to generate simulation-based characterizations of posterior densities; the results from Markov Chain theory show that the stochastic explorations of posterior densities typically generated by MCMC algorithms nonetheless yield "simulation-consistent" summaries of the posterior density.

MCMC algorithms have proven themselves amazingly powerful and flexible and have brought wide classes of models and data sets out of the "too hard" basket. We have already mentioned hierarchical models. But other examples include data sets with a lot of missing data, models with many parameters, models with many latent variables, mixture models, and flexible semi- and nonparametric models. Thus, whatever one's view of the intellectual or philosophical virtues of Bayesian inference, by adopting a Bayesian approach to inference, researchers can avail themselves of MCMC algorithms, an extraordinarily powerful set of techniques for estimation and inference.

A Historical Note

The result that we now refer to as Bayes theorem appeared in an essay attributed to the Reverend Thomas Bayes and communicated to the Royal Society after Bayes's death in 1761. This famous essay has been republished many times. Several authors have noted that there is some doubt whether Bayes actually discovered the theorem that was named after him. Nor is it clear that Bayes himself was a "Bayesian" in the sense that we use the term today.

Apparently unaware of Bayes's work, Pierre-Simon Laplace stated Bayes theorem in a more general form. Perhaps because of Laplace's work on the subject, Bayes's essay went unnoticed until after 1780 and played no important role in scientific debate until the 20th century. This said, Bayesian inference was the dominant mode of statistical inference until the early 20th century, although it was known at that time as the "method of inverse probability."

The adjective *Bayesian* did not enter the statistical vernacular until the 20th century. The first use of *Bayesian* as an adjective was by Ronald Fisher, in his introduction to a paper originally written in 1921. Not surprisingly, Fisher's use of the term was not flattering, since he was at pains to contrast his approach to statistical inference from the subjectivism he disliked in the Bayesian approach.

STATISTICAL SIGNIFICANCE

Political scientists use the concept of statistical significance to validate theoretical assertions about statistical relationships. In the most basic sense, statistical significance means that the hypothesized statistical relationship is probably true. That is, the hypothesized relationship is not due to random chance. When a result is highly significant, it is very unlikely to be due to chance. But this does not mean that the hypothesized relationship is strong. Statistical significance is not to be confused with substantive importance. A research finding may be strongly validated but not very important. Moreover, significance tests in political science, and social science in general, do not directly test the significance of the researcher's belief about the statistical relationship between the variables of interest. Instead, statistical significance relates to how likely the findings are, given the assumption that there are no differences in the subgroupings of the population. This entry is presented in four parts: (1) it discusses the relationship between the significance test and the research hypothesis, (2) it presents the elements of the significance test, (3) it explains the relationship between statistical significance and the power of the significance test, and (4) it briefly discusses the relationship between statistical significance and sample size.

The Significance Test and Hypotheses

A hypothesis is a statement about an underlying population that may be true or false. Relationships in political science are generally probabilistic rather than deterministic, and this fact has major implications in the design of attempts to prove the existence of hypothesized relationships between variables. In political analysis, researchers are often interested in establishing a causal relationship between variables. Establishing this causal relationship involves meeting three conditions: (1) establishing association between variables, (2) establishing an appropriate time order between variables, and (3) eliminating alternative explanations. Statistical significance is most related to establishing association between variables and is only tangentially related to the other two conditions.

Establishing statistical significance involves testing a hypothesized statistical relationship. Ronald A. Fisher is credited most with the development of the statistical significance concept. Fisher proposed a procedure that produces significance levels from the data about a single hypothesis with a known distribution and a specified test statistic (such as z, t, F, and χ^2). Meanwhile, Jerzy Neyman and Egon Pearson proposed a procedure that tests the probability of a null or restricted hypothesis against a research (alternative) hypothesis. As political science has matured as a discipline, political scientists rely more and more on quantitative data and statistical methods to test hypothesized relationships. Over time, the fusion of Fisher's significance test procedure and Neyman-Pearson's hypothesis test procedure produced the null hypothesis statistical test, which is now the dominant procedure for determining statistical significance in political science and in social science in general.

An important aspect of significance tests is determining whether to use a one-tailed or two-tailed test of significance, and this decision is related directly to the form of the paired hypotheses. The null hypothesis (H_0) is the hypothesis to be tested and is usually a statement of a parameter value, say θ, that corresponds to a parameter value of no effect, say θ^*. In turn, the null hypothesis takes the form H_0: $\theta = \theta^*$. In many political and social research applications θ^* is zero. Meanwhile, the form of the alternative hypothesis determines whether the significance test is one-tailed or two-tailed. The two-tailed test takes the form H_a: $\theta \neq \theta^*$. This means the alternative hypothesis includes values falling below and above the value of θ^* listed in H_0. Conversely, one-tailed alternative hypotheses have the directional forms of H_a: $\theta < \theta^*$ or H_a: $\theta > \theta^*$. The alternative hypothesis H_a: $\theta < \theta^*$ refers to detecting whether θ is smaller than the particular number θ^*. The alternative hypothesis H_a: $\theta > \theta^*$ refers to detecting whether θ is larger than θ^*. In short, the researcher predicts deviation in H_0 in a particular direction. It is generally safest to use a two-tailed test, but there are some situations in which the one-tailed test is more appropriate.

Elements of Significance Tests

All significance tests have five elements: assumptions, hypotheses, test statistic, *p* value, and conclusion. The concept of significance relates most directly to the *p* value, which contains information concerning the probability of observing a result like the researcher observes if there is no difference in the corresponding groups in the population from which the sample is drawn. A significance test involves comparing a test value that the researcher has calculated with some critical value for the statistic.

Assumptions

Significance tests require certain assumptions for test validity. These include the type and scale of the data, the form of the population distribution, the method of sampling, and the sample size. Data may take quantitative or qualitative forms. Additionally, data may be collected from different research sources: attitude surveys, governmental documents, historical records, newspaper files, voting statistics, or other stored data. These types of data collected from various sources suggest different distributional forms. Typical parametric distributional forms include the normal, Student's t, gamma, binomial, and chi-square. Additionally, some data may preclude the use of parametric testing procedures (e.g., count or rank data). Assumptions must also be made concerning the type of sampling that is required for the conclusions drawn from the sample to be applicable to the specified population. Many significance tests require a minimum sample size, and the validity of most tests improves as the sample size increases. Sample size is an important factor in statistical significance, which is discussed in greater detail as follows.

Hypotheses

Significance tests generally examine two hypotheses about the value of a parameter: the null hypothesis and the alternative or research hypothesis. The investigator designs the research to determine the amount of evidence that exists to support the research hypothesis. That is, evidence against the null hypothesis is evidence in support of the research hypothesis.

Test Statistic

Test statistics generally follow the normal, Student's t, F, or chi-square distributions. The formation of the test statistic usually involves a point estimate of the parameter to which the hypotheses refer. Commonly used test statistics include the *z score* for large sample means ($\bar{y}$) and proportions ($\bar{\pi}$), the *t statistic* for small-sample means and proportions and individual coefficients in linear regression models, the *F statistic* to test the significance of multiple linear regression models, the *chi-square statistic* (χ^2) to test independence of variables and goodness of fit for generalized linear models (GLMs), the *likelihood ratio test statistic* (-2 LOG L) to test nested GLM models, and the *Wald statistic* (z^2) to test the significance of parameters in GLM models.

p Value

The p value provides a means to interpret the evidence provided by the test statistic on a probability scale. The p value is the probability of obtaining a test statistic value as large as the one obtained, conditioned on the null hypothesis being true. The smaller the p value, the more strongly the data contradict the null hypothesis. Conversely, a moderate to large p value indicates that the data are consistent with the null hypothesis. The p value is the summary of the evidence in the data about the null hypothesis.

Conclusion

Significance tests are designed to minimize Type I error, which is the error of rejecting the null hypothesis when the null hypothesis is true. To establish the minimization of Type I error, the investigator sets the predetermined and small α level at which H_0 is rejected. The α level of .05 has become the conventional level of statistical significance in social research. The .05 level provides that only 5 times out of 100 the null hypothesis will be rejected when the null is true. The researcher is interested in the range of values of the test statistic for which the null hypothesis will be rejected. If the statistic produces a p value that is smaller than the critical alpha level, the researcher has fairly strong evidence against the null hypothesis (H_0). In the case of a two-tailed test, α is divided by 2 so that half of the .05 probability is in the left tail of the distribution and half of the probability is in the right tail of the distribution.

Significance and Power of the Test

The Neyman-Pearson hypothesis test approach yields the idea of the power of the test. Type I error can only be made when the null hypothesis is true. Conversely, Type II error can only be made when the null hypothesis is false and is defined as the probability of failing to reject the null hypothesis when the null hypothesis is false. Type II error is usually referred to as beta (β). Power ($1 - \beta$) is related to statistical significance in that it is the probability of rejecting the null hypothesis conditioned on the fact that the null hypothesis is false. In other words, power is the probability of detecting an association (effect) given that there is indeed an association (effect). Under the power rubric, the researcher seeks to develop and employ the test that has the highest power for a given predetermined α level through sample size, desired significance level, and the research hypothesis.

Statistical Significance and Sample Size

There are two misunderstandings related to the relationship between statistical significance and sample size: (1) statistical significance in large samples translates into substantive importance and (2) *p* values associated with larger samples are more reliable than identical *p* values in smaller samples. In the first misunderstanding, as sample size increases, the researcher is increasingly likely to detect a significant effect. Additionally, as sample size increases, it is more likely that the investigator will detect smaller population effect sizes progressively. This means that large sample sizes are more likely to reveal statistical significant relationships, but these statistically significant effects may relate to small substantive effects. In the second misunderstanding, a *p* value derived from a larger sample is *not* more reliable than an identical *p* value produced by a smaller sample. Two studies that reject the null hypothesis with the same *p* value are equally likely to make Type I errors. This statement holds true even if the sample sizes are dramatically different.

STATISTICS: OVERVIEW

Empirical work is about estimating the relationships among variables and then, based on the values of and confidence in those estimates, discussing their substantive implications. These relationships are expressed as a model relating some outcome or set of outcomes, the endogenous variable or variables, denoted by *Y*, to a set of explanatory variables, conventionally denoted by *X* and referred to as the exogenous or causal variables. The models may be explicitly referred to as causal models, but the term *causal* is frequently treated as implicit.

The current commonly used definition of causation, referred to as the Neyman-Holland-Rubin (NHR) model, is based on how one might expect *Y* to be different if there were a different value for *X* in an otherwise identical world. A second view is that causation is a process of interactions that connect values of *X* to values of *Y* and that this process depends on the context being studied. For example, being female might be the "cause" of women's wages being lower than wages for men with the same education and experience because of the chain of actions that occur in the labor market, not because an additional *X* chromosome affects wages. An important research objective is elaborating and examining empirically the components of this chain in their sequential order. All views of causation imply a temporal sequence, where a change in *X* must occur, or have a very strong likelihood of occurring, prior to the change in *Y* even if the time lag is smaller than the intervals at which one observes *X* and *Y*. An important requirement for models and empirical work is that they improve our understanding of this causal process.

Causal models and thinking are a central part of our personal and professional lives. If you hit your thumb with a hammer, it will hurt and you will at a minimum get a bad bruise. More abstractly, social scientists talk regularly in causal terms: Will mailings increase voter turnout? Will reducing class size improve student learning? Will more on-the-job training raise wages? Will economic sanctions bring a nation to the bargaining table? These examples involve a chain of reasoning underlying the causal statement connecting the change in one variable to the change in the other. The hammer hitting a thumb does not directly cause the bruise, pain, and swelling. Post cards, smaller classes, job training, and sanctions per se do not cause voters to turn out, students to get higher test scores, wages to increase, or countries to bargain, but we proceed as if we believe they do.

Causal statements vary in the confidence one has in the causal logic or in the chain of events linking Y to X and therefore in the prediction of how Y is likely to be different if X is different. For example, one can confidently predict that your thumb will hurt, swell, and turn purple if you hit it with a hammer. There is less confidence in the prediction that turnout will increase if all potential voters receive a mailing or a phone call before election day. And there is far, far less confidence in the prediction that economic sanctions will lead a rogue state to negotiate. This entry provides a brief introduction to the types of data and statistical methods used in the social sciences to try to reduce this uncertainty about causal arguments and to estimate the magnitude of the relationship between Y and the X.

The entry begins with a very brief discussion of the common models representing causal statements. This is followed by a discussion of the different strategies for designing empirical studies, of the types of data that are frequently available in these studies, and of some of the common statistical methods used to evaluate and estimate the causal model. The entry concludes with some cautions about the types of conclusions that can be reached in these different circumstances and with a plea for modesty in any empirical study.

Models, Empirical Analysis, and Causal Inferences

Models facilitate predictions of how an outcome is likely to differ if some other variable is changed, represented as $\Delta Y = F(\Delta X)$. Since the social sciences discuss outcomes probabilistically, the expression should refer to the expected change in Y, or if Y is a discrete variable, the change in the probability that Y changes its state—that is, $E(\Delta Y) = F(\Delta X)$ or $E[Pr(\Delta Y)] = F(\Delta X)$. For the purposes of this discussion, the origin of the model, be it mathematical deduction, previous empirical results, or conventional wisdom, is not important. What is important is that there be a set of logical and consistent statements about how or why changes in X cause changes in Y.

In some instances the model may be extremely simple. Consider Harold Gosnell's pioneering field study of whether pre-election mailings increase voter turnout. Here the outcome variable Vindicates is the probability that a subject votes. The variable X indicates whether the person received the mailing and is a binary variable—the person did or did not receive the mailing. The model is

$$Y = B_0 + B_1 X_1, \qquad (1)$$

where B_0 is the probability of voting among those who did not receive the mailing, $X_1 = 0$, and B_1 is the increase in that probability among those who received the mailing, $X_1 = 1$. In the NHR model, B_1 is the magnitude of the counterfactual of what would have been the outcome if a person who did not receive the mailing had received it.

The purpose of the study was to estimate the magnitude of B_1. It was not just enough to know that the mailing increased turnout, it was also important to estimate by how much, as that would determine whether it was worth the costs in money and time to use mailings in future elections. Although Gosnell does not refer to this as an explicit model, there very definitely is a causal model in his study. Other models often relate continuous variables in the same manner. Studies of educational achievement use Equation 1 to relate the expected performance on standardized test scores, Y, to class size, X_1, both of which are continuous variables. Here, B_1 indicates how test scores are expected to change with each reduction in class size, with the expectation that B_1 is negative. Again, the magnitude of B_1 is important as it is central to any benefit-cost analysis for hiring more teachers. Though models rapidly became more complex, this simple model is the basis for much empirical work.

Models often include multiple causal variables because of what is being modeled and because of the model's purpose. Most outcomes of interest to social scientists are not the result of single causal factors, so it is important to understand and to compare the influence of the various factors. Voter turnout, for example, can be stimulated by personal contacts, X_2; phone calls, X_3; media promotions, X_4; and same-day registration, X_5, as well as mailings, X_1. Decisions are often based on the relative influence, cost, and side effects of these factors: Are personal contacts more cost-effective at stimulating turnout than mailings, than phone calls, than same-day registration? These interests lead to multivariate models—for example,

$$Y = B_0 + B_1X_1 + B_2X_2 + B_3X_3 + B_4X_4 + B_5X_5. \qquad (2)$$

One may conduct an empirical study where only one X is varied to isolate the effect of changes in that X on Y, but ultimately the analyst will want to know the magnitude of all the coefficients.

Increasingly, models are featuring nonlinear specifications, which add to their richness as well as to their complexity. The simplest nonlinearities are introduced with algebraic transformations, such as logs, powers, roots, and trig functions, of continuous variables. Such transformations make the relationships between Y and the Xs nonlinear and nonseparable. Many studies of educational achievement, for example, model the log of test scores as a function of the logs of the various explanatory variables. This specification allows for increasing or decreasing as well as constant returns to each input and indicates that the marginal effect of any one input depends on the levels of the other inputs. This property contrasts with that of the linear and separable model, where the marginal effect is constant and independent of the values of the other variables.

Models may also be nonlinear in the values of the parameters, which may vary randomly or systematically with time or as functions of other explanatory variables. This general form is

$$Y_i = F(X_i, B). \qquad (3)$$

Note that Equation 2, which is linear in the coefficients, is a special case of Equation 3. The nonlinearities add greatly to the ability of the models to represent complex phenomena, including the possibility that some coefficients may vary systematically among potential observational units. In the linear model in Equation 2 this could mean that the B coefficients are denoted with an i subscript, indicating that they vary across cases. While being more general in form, the nonlinear models present estimation challenges.

Models may also encompass multiple outcomes, which are both the consequence and the cause of other variables. An early form of such a model is Peter Blau and Otis Dudley Duncan's hierarchical model of U.S. occupational status attainment. An individual's occupation at time t is modeled as a direct function of his or her father's occupation, the person's education level, and the first job; while the latter two variables are themselves related, both are related to father's occupation. In this model, status attainment entails the interrelationship among several endogenous variables. A more complex example is Patrick Brandt and John Freeman's model of the U.S. macropolitical economy, which uses nine interacting variables, each with its own equation. As discussed in the section on multi-equation models, models with multiple endogenous, or outcome, variables present challenging data and estimation problems. These are a consequence of the model and the phenomena being represented, and a single endogenous variable and equation would be inadequate.

The discussion of models and their uses is an important introduction to empirical estimation. The empiricist's task is twofold. One objective is to provide evidence about the model's credibility—how consistent the model is with empirical evidence, in how broad a set of contexts, and when compared with other possible explanations. Arthur Stinchcombe, in 1968, made the still relevant point that most empirical studies do not refute theoretical propositions but demonstrate their consistency with observable data. The more frequent and broader the contexts in which this consistency is observed, the more credible the model. This increased credibility then raises one's confidence in the model's predictions about what change in Y to expect from a specified change in X. The second empirical task is to estimate the magnitude of the model's parameters. This enables one to say what change in Y is expected from a change in X, or in different Xs, and something about the uncertainty in this expectation.

A second reason for this brief summary of models is that empirical researchers must have a clear understanding of the model prior to any study. A model's content and structure determine the most appropriate empirical strategy, including the design of the study, the types of data, and the statistical methodology. The linear model in Equation 1 or 2 can be estimated with a range of methods and data that would be inappropriate or unavailable for models with nonlinear coefficients or extensive interactions among the explanatory variables. Models that emphasize dynamic adjustments may require time-series data with stringent stability and equilibrium properties. Many important phenomena are not amenable to explicit manipulation as is done in experimental studies, so the models must be examined with observational data. And the list goes on. It is critical for a credible empirical study that the design, data, and methods match the properties of the model, a requirement that must be met before any data are collected and any numbers crunched.

The Experimental Method

The textbook lab or field experiment is often cited as the gold standard for empirical work. The model in this case is Equation 1. In a well-designed and conducted experiment, the values of X are determined by the researcher and randomly assigned to subjects, and neither the subject nor the individuals measuring the outcomes know the values of X for each subject. We refer to these conditions as exogeneity, randomization, and double-blindedness, respectively. If these conditions are met, a simple linear regression will give unbiased estimates for B_1 with both binary and continuous variables. And as the number of subjects becomes larger, the balance between the control and treatment groups with respect to unobserved variables becomes better, meaning that estimated results become more accurate estimates of the true causal relationship. An experiment may also be conducted under very controlled conditions so that other factors that might influence Y are constant. It is worth examining these conditions and their contribution to accurate estimates as these conditions become important in developing other methods.

The fact that the researcher determines the values for X precludes the possibility that these variations are the result of changes in Y or of some aspect of the data collection process, both of which will prevent accurate estimates of B_1. This can be a major problem with observational data. Consider the positive correlation between media attention and turnout. Does hearing more political information lead one to vote, or does an intention to vote cause one to pay more attention to media coverage of the campaign? If the researcher determines each person's media exposure within the experiment, it rules out the latter explanation.

Randomization is critical in any experiment. Subjects will not be identical on all factors other than the variable of interest. Gosnell's mailing would reach people of different ages, education levels, genders, political interests, and so on. All these, and many more, factors will be associated with differences in turnout. These excluded factors are represented in the model by adding a stochastic term denoted by U to Equation 1:

$$Y = B_0 + B_1X_1 + U, \qquad (4)$$

where U represents all these factors and how they affect the observed value of Y. Now suppose that the mailings happened to be sent to, or read by, those more disposed to vote. Then comparisons of turnout between those receiving and those not receiving the mailing would badly bias the estimate of the effect of the mailing. Formally, the values of U, which include the effects of predispositions, would be correlated with X_1

Randomization, if done properly and if the sample is large enough, ensures that the composition of the group receiving the mailing is identical to, or balanced with, the composition of the group that did not receive the mailing. Turnout will be higher among those predisposed to vote, but because each group has an equal proportion of such people, differences in turnout between the two groups would not be the result of one group having more committed voters than the other. More formally, X and U are uncorrelated. Randomization, when done properly, makes the reliability of experiments far greater than that of observational studies and greatly simplifies the statistical analysis, as one only needs to estimate the coefficients in Equation 4, which can be done with ordinary regression or comparisons of means if X is binary.

Any factor that does not vary in the sample can be ruled out as an alternative explanation for the observed variations in Y, lending greater credibility to the variations in X as the cause. If Gosnell had sent mailings only to people under 25 who had not voted before and compared their turnout with that of 25-year-old nonvoters who did not get the mailing, then age and past voting behavior would not explain any differences in turnout between the two groups, increasing one's confidence in the conclusion that turnout differences are related to receiving the mailing. In some research, it is possible to design or select observations such that possible confounding factors are constant within the sample, greatly reducing the possibility of bias.

If Equation 1 accurately models the substantive question and an experiment is feasible, then a well-designed and executed experiment will provide very credible estimates of the effects of X on Y. Much of political methodology, however, addresses situations where the model of interest does not conform to Equation 1 or where an experiment was not or could not be conducted according to the requisite standards, though there has been a dramatic increase in the development of creative experimental designs in the social sciences. The remainder of the entry discusses the procedures analysts use to deal with these shortcomings. The detailed discussion of the experimental method is important in understanding these procedures as many of them are designed to reproduce what can be accomplished with a proper experiment. It is also important to see the experimental approach as being consistent with one, but not all, models.

Observational Studies

Many substantive areas of interest in political science are not amenable to experiments, despite recent expansions in the use of experiments. In some instances, the manipulations required by the model are technically possible but are prohibited on ethical grounds. More often, X cannot be controlled and varied by the researcher. Astronomers cannot create black holes or alter galaxies, medical researchers cannot force people to engage in risky behaviors, and political scientists cannot create economic depressions, randomly assign representatives to districts, start or stop wars, and so on. All rely on observational studies, meaning data that are generated by the world outside researchers' control. Observational studies question the randomization and exogeneity conditions. Considerable attention is devoted to addressing these questions. The types of data generated by observational studies also increase the uncertainty of the causal interpretations one can draw from the analysis of these data.

Nonrandomization

The classical response to the lack of randomization in observational studies is the multivariate regression shown in Equation 2. The problem with estimating the model in Equation 4 is that the stochastic term, U, contains factors other than X_1 that are related to Y and that are correlated with X_1. (Random assignment in an experiment, when achieved, means that they should be uncorrelated.) If one can specify and construct variables for these factors, they can be included in the multivariate regression shown in Equation 2, expanded to include the stochastic term and as many explanatory variables as necessary:

$$Y = B_0 + B_1X_1 + B_2X_2 + B_3X_3 + \cdots + B_KX_K + U. \tag{5}$$

The additional variables are included not to assess their relative influence on Y, though this may be an important result, but to include potentially confounding factors in the analysis. The interpretation of Equation 5 is that B_1 indicates the change in Y expected for a unit change in X_1; holding X_2 through X_K constant. If one has been successful in including all those factors that are causally related to Y, meaning their true coefficient is different from zero, and that are correlated with X_1 in the sample, then U is uncorrelated with X_1 and the estimate for B_1 obtained with an ordinary least squares (OLS) regression is unbiased, as it was in the experimental setting.

In some applications, OLS is not the most appropriate estimator because of the limited nature of the outcome variable. Examples are when outcomes are observed as dichotomies, such as turnout; discrete categories, such as votes in a multiparty election; event counts, such as the numbers of conflicts in given time periods; or durations, such as the likely length of governments formed under different conditions. The latter example is also directly related to hazard models, which estimate the probability of failure at some time t, given survival up to that time, and event history models, which examine the length of time between events. These outcome measures, which are not continuous, unbounded, interval variables, violate the conditions assumed in OLS regressions. The form of the relationship between the observed variables is unlikely to be linear, and it is even unlikely to be linear in the coefficients, precluding the conventional transformations that might create such a linear model. Furthermore, the form and distribution of the stochastic term, U, in Equaiton 5 will not meet the requirements of the OLS estimator. Taken together, these difficulties are likely to lead to biased estimates of the coefficients if OLS is used with the observed data.

These problems have stimulated the development of a vast array of estimation methods tailored to the specific distributional properties of the resulting stochastic term. These have the popular names of probit and logit, with their various modifiers; Poisson and negative binomial; Weibull and Cox hazard models, and so on. They have a common approach, which is to specify a distribution for the stochastic term and to use this distribution to derive an expression for the likelihood of observing the data. This description of the data is referred to as the data-generating process, and the expression is referred to as the likelihood function, which measures the likelihood of the data for specific values of the parameters. (The value of the likelihood function is directly proportional to the probability of observing the data given the model and parameters.) Estimation proceeds by finding the values for these parameters that maximize this likelihood function—or, in most instances, the log of the likelihood function—hence the name maximum likelihood estimation (MLE). If, for example, the stochastic term in Equation 5 is normally distributed, the maximum likelihood estimator is OLS. If the data-generating process is described properly, the MLE-derived estimates will have desirable statistical properties if the sample size is large, and in most applications, they are easily computed. These methods' statistical properties only hold in large samples and usually require stricter distributional assumptions about the Us than the more straightforward unncorrelatedness of X and U required in OLS estimation.

Unfortunately, what is straightforward in theory is quite difficult in practice. There are no statistical tests to determine if U is uncorrelated with each X or if one has the correct data-generating process. The Us are not observed and for individual observations are not well approximated by the residuals in the regression. Furthermore, by construction the correlation between these residuals and each X is zero, so that result cannot be used to argue that U and the Xs are uncorrelated. One must use the available theories and detailed knowledge of the context in which the data were collected to argue that the uncorrelatedness condition is met. Simply adding more variables in the hope that U will eventually become uncorrelated with the Xs is not a remedy as this process introduces its own problems and errors. Such "kitchen sink" regressions may not reduce bias and certainly run the risk of increasing the coefficients' standard errors and thereby increasing the coefficients' mean squared errors.

Mimicking Experimental Methods With Observational Data

Deep skepticism about the ability to meet the conditions for unbiasedness using linear regression models has led to an extensive, growing, and sophisticated literature on alternatives for situations where only observational data are available. This section briefly reviews three of these alternatives. Readers wanting more detail are referred to other survey articles.

Natural Experiments. Though this would seem to be an oxymoron, there are instances where "nature" randomly assigns treatments to one set of observations and not others, creating balanced treatment and control groups. If these assignments are truly random, then analysis of the resulting data using comparisons of means and simple linear models can proceed as if the data were generated by an experiment. An example of research based on a natural experiment are studies assessing the effect of additional income on a range of behaviors, such as political attitudes or consumption, by studying lottery winners. The assumption is that lotteries are random events, so that the amount of money won is equivalent to random assignment and thus is uncorrelated with other factors that are related to the behavior being studied.

Natural experiments are also useful in creating continuous variables that are correlated with outcomes of interest but uncorrelated with other measures of behavior because of nature's randomness. The value of such variables is discussed in a subsequent section on endogeneity and instrumental variables (IVs). Studies of the ability of U.S. federal disaster relief aid to buy support for incumbent administrations and of the effects of past vote patterns on its distribution rely on the randomness of hurricane paths in Florida. The destruction caused by a hurricane can eventually cover a wide area, but its exact path over local areas is random. This randomness means that the local variations in a hurricane's severity are unlikely to be correlated with the community's characteristics, such as income or support for the current government in previous elections. A variable measuring this severity can then be used to predict what aid levels would be independent of economic and political considerations.

Regression Discontinuity. This strategy, which is a more elaborate version of the natural experiment, takes advantage of the natural random assignment of observations to treatment and control groups. The term *discontinuity* arises because these natural experiments occur around some exogenously given threshold. The outcomes for the two groups can then be compared to assess the effects of the natural treatment. For example, a study of the electoral advantage of incumbency uses this method to compare the vote share of incumbents who won their previous election with less than 52.5% with that of the freshman representatives who replaced incumbents who lost with more than 47.5% of the two-party vote. The proposition is that election outcomes are sufficiently random within this band (around 50%) so that incumbency is effectively a random treatment. This randomization is used to justify the comparison of the vote shares of these two groups as a measure of the incumbency advantage. Regression discontinuity designs have a relatively long history, coming into and out of favor in different disciplines. They are currently generating considerable interest in economics and, more recently, in political science.

Matching. This method stems from the work of Donald Rubin and Paul Rosenbaum, separately and jointly with others. It does not try to create random assignment but compares observations in the treatment group with observations selected from the control group that have similar characteristics. A logical difficulty with the NHR causal model is that it is impossible to answer the counterfactual of what an untreated subject would have done if she or he had been treated because both states cannot be observed for the same individual. The ideal next step is to have identical cases of those receiving treatment and those who do not. The statistical exercise called matching finds those appropriate matches, meaning the most similar untreated and treated observations, among the observed data. This process gets complicated when one has to match on a multidimensional set of variables, some of which may be continuous, such as age. There are a number of procedures for measuring similarity and for deciding which observations to compare.

If certain conditions are met, then matching methods have very desirable statistical properties, including reduced bias and smaller mean squared errors relative to other multivariate methods. Comparisons of results from experiments with randomization with results from analysis of non-randomly assigned groups using matching report comparable results with both methods. This gives further credence to the efficacy of the matching strategy, when done properly.

The design in these methods is to re-create statistically the advantages of a true experiment by either controlling potential confounding variables through the matching process or randomizing them through the natural setting or the discontinuity. The causal model in each instance is still the one represented in Equation 1, in which the effect of the treatment is separable from and additive to any other factors.

Observational Data and Causal Interpretations

Observational data limit in a number of ways one's confidence in the causal interpretations given the model and the empirical results. Causal arguments have an implied time frame, with changes in X preceding changes in Y. In an experimental setting, this condition is met as the researcher controls for each case the change in X prior to observing whether Y changes. Often with observational data, the information on X and Y is not observed within the necessary time frame, making it hard to determine if a change in X preceded a change in Y and by how much Y changed as a result.

Observational data come in several forms. Some data may be from a cross section of the population, meaning the cases are observed only once; from a panel, meaning the same units are observed multiple times; from a time series, where units are observed at regular intervals; and from pooled time series and cross sections, where multiple units are observed at regular intervals. The distinction between panel data and a time series is the number and frequency of the temporal observations. Event history data, which are commonly used in some subfields in sociology and political science, are a form of time series that provides data for an individual's, an organization's, or a country's history.

Causal inferences with cross-sectional data and the model in Equation 5 require several conditions. Assume that the adjustment process for any cross-sectional observation i from $Y_0 = X_{i0}B + U_{i0}$ to Y_1 for a new value of $X_{i1} = X_i^*$ is

$$\begin{aligned} Y_{i1} &= \rho Y_{i0} + (1 - \rho)X_i^*B + U_{i1} \\ &= X_i^*B - \rho(X_i^* - X_{i0})B + \rho U_{i0} + U_{i1}. \end{aligned}$$

If X_i^* is stable for at least t periods, the equation for Y_{it} is

$$\begin{aligned} Y_{it} &= \rho Y_{i,t-1} + (1-\rho)X_i^* B + U_{it} \\ &= X_i^* B - \rho^t (X_i^* - X_{i0})B + \sum_{s=0}^{t} \rho^s U_{i,t-s}. \quad (6) \end{aligned}$$

If each U_{it} is independent of X_i^* for all units, the randomization condition, and if t is large and/or ρ is small so that the term in Equation 6 involving ρ^t becomes ignorable, the regression estimates for B will become unbiased. The estimates will also be unbiased if the change in X is uncorrelated with X_i^*, but this is a more sample specific and stricter condition. Accurate estimation of Equation 6 also requires that the values of B for each observation be constant over the period encompassed by t. Subsequent sections discuss appropriate methods to use if the values of B vary among the cross-seetional units and conditions for accurate estimation if the observed units are not independent.

Panel data offer substantial advantages over cross-sectional data in that one can observe ΔY and ΔX_k for the same unit for the interval between waves, permitting a more direct estimate of B_k. Results from the analysis of panel data increase confidence in the original model, but limitations remain. Consider Equation 6 with Y_{it} denoting the observations of Y at the second wave, with t indicating the number of time periods between the second wave of interviews and when X first equaled X_t. Subtracting $Y_{i0} = X_{i0}B + U_{i0}$ from both sides of this equation gives

$$\begin{aligned} \Delta Y_i = \Delta X_i B(1-\rho^t) + (U_{it} - U_{i0}) \\ + \sum_{s=1}^{t} \rho^s U_{i,t-s}. \quad (7) \end{aligned}$$

Unless ρ is small and/or enough time has elapsed between when X changed and the second wave, as measured by t, regressions of ΔY on ΔX will underestimate B. Again the relationship between Y_i and X_i, the estimate B, must be constant over the interval of the panel. Panel data have a distinct advantage if there are fixed individual effects, as part of the stochastic term, the first difference in the Us, will eliminate most of their effects. Multiple-wave panels provide even greater advantages in estimating these relationships and in assessing their stability.

The informationally richest data that enable the most reliable estimate of the time sequences relating changes in Y to changes in X are those with a long time series, including event history data, and particularly pooled time-series and cross-sectional data. As discussed in subsequent sections, time-series data permit more extensive modeling of whether and how Y reaches a new equilibrium following changes in X. This modeling can also include heterogeneity in equilibrium and in how fast units might reach that equilibrium. If one's substantive interests and the model developed to represent those interests include temporal dynamics and heterogeneity, then time-series data are required to estimate and evaluate the model.

A Model-Based Approach to Empirical Analysis

A limitation of the work described so far lies not just in whether the data and/or analysis constitutes or mimics a well-designed experiment by meeting the randomization condition. The limitation is in the structure of the model being estimated. This model will be an appropriate representation for the phenomena being analyzed in some circumstances, particularly those that resemble medical trials, where these techniques have been used extensively. In many instances, however, the separable and additive expression in Equation 4, or even its multivariate form in Equation 5, will be an inadequate representation of the causal structure. This brings us back to some form of Equation 3. Some examples of such models and possible estimation strategies will be described in the following sections.

Models With Variable Relationships

The simplest form for Equation 3 are models where the relationship between Y and X is conditional on the value of the other variables. These propositions are increasingly common in political science, where many theories are about the magnitude of the effect of an X on Y. These propositions lead to models with interaction terms of various forms and various degrees of complexity.

Interaction Terms. The simplest model with varying relationships is a straightforward interaction term, the product of two variables. Consider Ted Brader's experimental study of the effects of TV ads. A major proposition is that ads that cue enthusiasm reinforce prior decisions while ads that cue fear reduce this relationship and increase the reliance on current evaluations. A simple but accurate expression of Brader's model is $\text{Choice}_t = b_0 + \alpha\text{Choice}_{t-1} + \text{Eval}_t\beta + U_t$, where $t - 1$ and t refer to the pre- and post-treatment periods, respectively: Choice_t is a participant's candidate choice at t; and Eval_t is a set of issue and candidate trait evaluations. Brader's propositions about the effects of different TV ads are that they alter the values of α and β, not that they have an additive effect on Choice:

$$\begin{aligned}\text{Choice}_t &= b_0 + (\alpha_1 + \alpha_2 * T_e - \alpha_3 * T_f) * \text{Choice}_{t-1} \\ &\quad + \text{Eval}_t * (\beta_1 - \beta_2 * T_e + \beta_3 * T_f) + U_t \\ &= b_0 + \alpha_1\text{Choice}_{t-1} + \alpha_2(T_e * \text{Choice}_{t-1}) \\ &\quad - \alpha_3(T_f * \text{Choice}_{t-1}) + \text{Eval}_t\beta_1 + (T_e * \text{Eval}_t)\beta_2 \\ &\quad - (T_f * \text{Eval}_t)\beta_3 + U_t, \end{aligned} \tag{8}$$

where T_e and T_f indicate the type of treatment, that is, an ad that cues enthusiasm or fear, respectively. Brader uses a well-designed and executed experiment to collect the information to estimate this model. The estimation is done with a probit version of the MLE estimator because of the dichotomous nature of the Choice variable. The important point here is not one of experimental or observational data. It is the need to be clear about the model, about what evidence can be used to evaluate or enhance the credibility of the model, and about the most appropriate statistical procedure given the model and the evidence.

Equation 8 is a straightforward example of the broader group of models that feature propositions about systematic variations in the relationships between Y and X, which are represented by the interaction terms. Many central propositions in political science relate to systematic variations in the influence that one or more variables have on some outcome of interest. For example, central bank autonomy affects the influence central governments have on inflation. The bank's autonomy does not contribute directly to inflation but alters the ability of incumbent governments to manage the macroeconomy in accord with its preferences. William R. Clark suggests that most studies of the effects of institutions, of cultural differences, and of applications of game-theoretic models require models with interaction terms. The need to model systematic variations in coefficients is evident in sociology as well. Parameters describing important aspects of the intergenerational transmission of occupational status are expected to vary nationally and temporally.

Estimation of the simplest models with interaction terms have been the subject of considerable and long-standing discussion in political science. In models such as Brader's, the interaction terms constitute another explanatory variable, and the model remains linear in the parameters, which justifies the use of a linear model such as OLS or probit in Brader's study. Statistical inference about the marginal effects on Y of changes in an X require more complicated calculations than in models without interaction terms because these marginal effects change with the values of the exogenous variables.

An important variation in this structure with temporal models occurs when the coefficients vary with time. There are a number of different propositions one might make about the pattern of these variations. One can depict such models as $Y_t = X_tB(t) + U_t$, where $B(t)$ represents some function of time. The simplest variation is when there is a sharp break in the value at a critical point but the coefficients are constant on either side of that break. In this structure, $B_t = (B_1 + B_2D_t)$, where D_t equals zero for intervals before the critical period and one for the periods following. This creates interaction variables that consist of the explanatory variable of interest multiplied by D_t. This shifts the relationship between Y_t and X_t up or down for the second period but leaves the relationship constant within these periods. More complicated variations in the relationship between Y_t and X_t can be modeled through a variety of functions, such as polynomials: for example, $B(t) = a_0 + a_1t + a_2t^2 + \cdots + a_mt^m$. The more complex models necessitate more sophisticated estimation procedures than the linear models shown so far, but the main point is that these models, which are required for studying dynamic processes, as with studies of the federal open market committee and monetary policy, have a far more complex structure than Equation 4 or 5.

Random Coefficients. Models with randomly varying coefficients are used in a variety of contexts. Here, the relationships between Y and the Xs are not identical for all observations, as in Equation 5, nor do they vary in some systematic way with time or with other variables but are themselves random variables. The model with random coefficients can be represented by $Y_i = X_i B_i + U_i = X_i(B + \varepsilon_i) + U_i$, where ε_i denotes the variations in the relationship between Y and X among observations. If $E(\varepsilon_i) = 0$ for all observations, meaning that B_i is uncorrelated with X_i then B denotes the mean effect of X on Y.

The random coefficients model has been used to critique the use of regression adjustments to experimental data. Some statisticians consider the outcome for individual i to be fixed or random for that individual conditional on whether the person is in the treatment or control group, respectively. These constant individual effects then vary among individuals, so that $Y_i = X_i T_i + (1 - X_i)C_i$, where X_i equals one if the subject is in the treatment group and T_i and C_i are the outcome for person i if she or he is in the treatment or control group, respectively. The average treatment effect is $\bar{T} - \bar{C} = (1/n)\sum_n T_i + (1/n)\sum_n C_i$, which corresponds to the mean of the coefficients on X_i and $(1 - X_i)$, for the treatment and control groups, respectively.

Estimation of the model with random coefficients requires one important condition and some specialized methods. The condition is that $\sum_{i=1}^{n}(X_{ik} - \bar{X}_k)\varepsilon_i = 0$ for all K explanatory variables, meaning that the coefficient variations are independent of each explanatory variable. If the condition is met, then OLS estimates are consistent but inefficient. More elaborate estimators are required for efficiency and to get the standard errors correct as the stochastic term created by inclusion of the coefficient variations does not meet the homoskedastic conditions for OLS estimation. If this independence condition is not met, the result is biased estimates for B. The correction if X and B_i are correlated involves modeling the systematic variations in B_i as a function of some exogenous variables, for example, $B_{ik} = Z_i A_k + \varepsilon_{ik}$, so that ε_{ik} is now uncorrelated with the explanatory variables. Including this expression for B_{ik} in Equation 5 gives the model with interaction terms between X_k and Z.

Hierarchical Models. Often the context for studying outcomes of interest consists of multiple levels. Individuals in voting studies reside within a layer of election districts. In the United States, this hierarchy consists of municipalities, counties, congressional districts, and states. In the European Union, individuals are nested within districts, provinces, and countries. It is likely that the factors affecting individual behavior vary among these different higher level units but are constant for all individuals within a unit. Party organizations, resources, strategies, and competitiveness, which affect individuals' turnout and vote decisions, vary substantially among local areas and states. In democratic countries, there is substantial institutional variation, which affects individual decisions. Models that adequately represent these hierarchical relationships are more complex than Equation 5 and are an application of the previous models with interaction terms and random coefficients.

Models with these multiple levels, frequently referred to as hierarchical or mixed models, combine explicit interaction terms and random coefficients to represent these multilevel effects. Consider the following two-level model, where Y_{ij} refers to the outcome for person i residing in Level 2 of unit j, such as a state or a country; X_j refers to if individual-level explanatory variables; and Z_j refers to M variables describing state or country characteristics for unit j. The full model is

$$Y_{ij} = B_{oj} + \sum_{k=1}^{K} X_{ijk} B_{kj} + U_{ij},$$

$$B_{oj} = A_{00} + \sum_{m=1}^{M} Z_{jm} A_{0m} + \varepsilon_{oj},$$

$$B_{kj} = A_{ok} \sum_{m=1}^{M} Z_{jm} A_{km} + \varepsilon_{kj}.$$

Combining these equations gives

$$\begin{aligned} Y_{ij} = A_{00} &+ \sum_{m=1}^{M} Z_{jm} A_{0m} + \sum_{k=1}^{K} X_{ijk} A_{0k} \\ &+ \sum_{k=1}^{K} \sum_{m=1}^{M} X_{ijk} Z_{jm} A_{km} + U_{ij} \\ &+ \varepsilon_{oj} + \sum_{k=1}^{K} X_{ijk} \varepsilon_{kj}. \end{aligned} \tag{9}$$

The A_{0m} terms estimate the Level 2 (e.g., state or country) effects on Level 1 (e.g., individual) behavior by shifting the intercept for all individuals in the same Level 2 unit. The coefficients A_{0k} estimate the effects of individual-level variables on individual behavior. These are the terms in the conventional individual model possibly represented by Equation 5. Finally, the coefficients A_{km} indicate how the Level 2 factors, Z_j, alter the relationship between the individual variables and the individual outcome. For example, if the competitiveness of the two U.S. parties within a state affects both voter turnout in a state and the relationship between education and turnout, then the model needs to include an interaction term that is the respondent's education, X_{ijk}, times the two parties' competitiveness within state j, Z_{jm}. The ε_{0j} and ε_{kj} terms represent heterogeneity in the higher unit's intercepts and coefficients, respectively, and are terms in the random coefficients model just discussed.

Summary. There is a major distinction between the models described in this section and the one represented by Equation 4 or 5. Both structures are linear and separable in the parameters, meaning that the basic model is described by the expression $Y_i = \sum_{k=1}^{K} X_{ik}B + U_i$, but the models in this section are not linear and separable in the relations between Y and X. In Equations 4 and 5, $\partial Y/\partial X_k = B_k$ regardless of the value of X_k or of any other X. Transformations of Y and X such that $Y^* = f(Y)$ and $X^* = f(X)$ still leave the expression $\partial Y^*/\partial X_k^* = B_k$. In the models with interaction terms, the expected marginal change in Y for a marginal change in X_k is not the constant B_k. Consider the simple model with one interaction term:

$$Y_i = B_1 + B_2X_i + B_3Z_i + B_4X_iZ_i + U_i. \tag{10}$$

This produces the marginal relationship $\partial Y_i/\partial X_i = B_2 + B_4Z_i$. This changes the marginal relationship between Y and X, even to the point that for certain values of Z there may be no change in Y for a change in X, depending on the values of B_2 and B_4. Any effort to use or mimic experimental methods to estimate $\partial Y/\partial X$ must take the context, meaning the value of Z, into account. More important, if the interest is in estimating how the relationship between Y and X varies with the value of Z, as it is in many studies, one must have observations in which both X and Z vary. Estimation of both B_2 and B_4 may not require observational data, as Brader demonstrates, but it requires an estimation method that matches the structure of the model in Equation 10 and data with systematic variations in both X and Z.

Models With Interactions Among Observations

Some substantively important topics require models with explicit interactions among the observations, whether temporal or spatial. Such models are necessary to examine the temporal dynamics of social processes and their possible equilibrium properties. The extensive work on the interaction of macroeconomic and political conditions exemplifies such models. In these studies, the effects of conditions in one time period on conditions in later periods are an explicit part of the model, the data, and the estimation procedures. There is increasing interest in models that include explicit interactions among individuals or geographically defined units. Communication of political attitudes and information among individuals and the diffusion of policy innovations among states are examples of these substantive interests. The substantive questions focus, at least in part, on the interdependence of observational units, and this interaction is more than a statistical nuisance. Models that treat the interdependence of either temporal or cross-sectional units as an integral part of the structure are more complex than those in Equations 4 and 5 and require sophisticated statistical methods to estimate these interactions.

Interdependencies among observations imply a different model and their estimation requires different statistical methods from those derived from the experimental paradigm. A central necessary condition of the experimental method and of the techniques developed to mimic it is that each observation is observed and is behaving independently of all the other units observed. This is referred to as the SUTVA (stable unit treatment value assumption) condition. In the context of Gosnell's and other voter turnout field experiments, it means that there is no interaction between someone receiving the "treatment," for example, a mailing or a phone call, and an individual not receiving the treatment. For subjects living in the same neighborhood and possibly attending meetings of the same local organizations, such as a church or PTA, this condition might be problematic. The basic premise for SUTVA is obviously violated for studies of how units interact, be they time periods, individuals, or political units.

Temporal Interdependence. For studies of dynamic processes, the interactions among observational units are a primary focus. Even when an examination of the temporal interactions is not the primary interest but one must use observational time-series data, the possible interdependence cannot be ignored but must be included in the model. At one point, these interactions were treated as nuisance terms that had to be diagnosed and then dealt with statistically in order to obtain efficient estimators and accurately estimated standard errors. The extensive use of the Durbin-Watson statistic and of models with first-order autocorrelated error terms exemplifies this thinking.

Increasingly, this autocorrelation is interpreted as being substantively interesting, and efforts being are made to incorporate temporal interdependencies into the model. Consider the commonly used error correction model (ECM), which is an elaborated version of Equation 6:

$$\Delta Y_t = \Delta X_t B_1 + (1 - \rho)(Y^*_{t-1} - Y_{t-1}) + U_t, \quad (11)$$

where $Y^*_{t-1} = (1 - \rho)^{-1}(B_0 + X_{t-1}B^*_2)$ is the long-run equilibrium value of Y at time $t - 1$ given X_{t-1} and $\rho < 1$. Changes in Y from $t - 1$ to t depend on its responsiveness to exogenous shocks, defined by $\Delta X_t B_1$; and how quickly Y responds to being out of equilibrium, given by $(1 - \rho)(Y^*_{t-1} - Y_{t-1})$. With appropriate manipulation of terms, this model is estimated as

$$\begin{aligned} Y_t &= B_0 + X_t B_1 + X_{t-1}(B^*_2 - B_1) + \rho Y_{t-1} + U_t \\ &= B_0 + X_t B_1 + X_{t-1}B_2 + \rho Y_{t-1} + U_t. \quad (12) \end{aligned}$$

In time-series models of the macropartisanship of the U.S. electorate, for example, the interest is in whether the electorate's partisanship responds to short-term economic shocks, ΔX_t, and how quickly it returns to equilibrium after these shocks. The ECM also predicts a new equilibrium, given by $Y^* = (1 - \rho)^{-1}[B_0 + X^*(B_1 + B_2)]$, if there is a permanent shift in the exogenous variables from X_{t-1} to X^* and estimates how long it takes to approximate that equilibrium. In this framework, macropartisanship might shift to a new equilibrium if the electorate permanently shifts its preferences on a major issue, if the parties adopt new platforms, and/or if the electorate sees a permanent shift in the parties' ability to manage economic or foreign policy issues.

Spatial and Individual Interdependence. The treatment of cross-sectional interdependence is experiencing a comparable and extensive transformation. One approach treats the stochastic terms as spatially interdependent and develops tests and methods for incorporating this interdependence. There is no causal interdependence, whereby the actions of one unit influence the actions or outcomes in the other units. An example of this stochastic interdependence would be a model of voter turnout in election districts where bad weather reduces turnout and weather patterns are not confined to individual districts but spill across boundaries, reducing turnout in the adjacent districts. More substantively interesting models incorporate interdependence whereby the actions or outcomes in one unit directly influence the actions of the other units. This type of interdependence has a long history in political science research. Propositions about how political attitudes are communicated among individuals and about the diffusion of policy innovations among states within the United States are examples.

Here is the formal distinction between the two types of interdependence:

Stochastic interdependence:

$$Y_i = \sum_{k=1}^{K} X_{ik}B_k + \varepsilon_i,$$

$$\varepsilon_i = \lambda \sum_{j=1}^{N} w_{ij}\varepsilon_j + U_i$$

gives

$$Y_i = \sum_{k=1}^{K} X_{ik}B_k + \lambda \sum_{j=1}^{N} w_{ij}\varepsilon_j + U_i. \quad (13)$$

Structural interdependence:

$$Y_i = \rho \sum_{j=1}^{N} w_{ij}Y_j + \sum_{k=1}^{K} X_{ik}B_k + \varepsilon_i. \quad (14)$$

The terms w_{ij} indicate the pattern of interdependence among observations, so that $w_{ij} = 0$ if units i and j are independent and $w_{ij} \neq 0$ otherwise. There are various ways to measure w_{ij} for the nonindependent case, depending on how dense one expects the interactions to be and whether one standardizes each unit's values for w based on the number of connections. The terms λ and ρ indicate the magnitude of the stochastic and structural interdependence, respectively.

In Equation 13, the expected effect on Y_i of a change in X_{ik} remains fixed and is given by B_k. Random shocks in one observation are shared among the other observations as their effects are propagated through the other stochastic terms. This indicates that the stochastic terms in the equation to be estimated are no longer independent, which means that the OLS estimates are unbiased but inefficient and the computed standard errors are incorrect. In Equation 14, by contrast, any change in X_{ik} leads to direct and indirect changes in Y_i as its effects are propagated through the other observations. The total magnitude of these direct and indirect effects depends on the structure of interdependence, the w_{ij}s, and the magnitude of the interdependence, ρ. [These effects are shown better in matrix notation as $Y = (I - \rho W)^{-1}(XB + \varepsilon)$, where W is an $N \times N$ matrix showing the full pattern of interdependencies.] This latter model is by far the more *substantively* interesting as it proposes some form of strategic or learning behavior among the units. This would be the appropriate model for discussing the diffusion of innovations among states or the communication of political information. Common programs such as Stata describe and include various tests and estimation procedures for each type of interdependence.

Summary. The substantive questions that motivate Equations 11 and 14 are different from the ones embodied in Equation 4 or 5. The parameter ρ, which measures the interdependence among units, does not have an analog in Equation 5. So it is not surprising that the structure of the models is different, even to the point that Equation 14 is not even linear in the coefficients. Estimation of ρ, and therefore of the whole model, requires different types of data and methods. Furthermore, the observational interdependence embodied in ρ is not a nuisance parameter or a property of the data to be excised, if possible. It represents a substantive part of the model.

Nonlinear Models

The most general version of the model in Equation 3 is nonlinear in the coefficients. This form is useful for modeling a large set of complex processes. The model in Equation 14 is an example of a model that is nonlinear in its coefficients. Some models with interaction terms can become nonlinear in the parameters. For example, a model of central bank and governmental control of monetary and inflation policy posits interaction terms that are functions of unobserved variables, which are modeled as functions of observables. When the functions for the latent variables are introduced as interaction terms, it produces a model that is nonlinear in the coefficients because of the constrained multiplicative terms.

Nonlinear dynamic systems are likely to include nonlinear functions of parameters. Processes that might be path dependent, for example, have received considerable attention in some areas of political science. Path dependence in a temporal process requires a time-varying transition parameter. Incorporating this requirement in a dynamic model similar to Equation 6 requires a ρ_t that is a function of time-varying variables in the system, denoted by Z_t, giving $\rho_t = \rho(Z_t)$. This variation in and extension to the temporal models discussed above gives

$$\begin{aligned} Y_t &= \rho_t Y_{t-1} + (1 - \rho_t)X_t B + U_t \\ &= \rho(Z_t)Y_{t-1} + [1 - \rho(Z_t)]X_t B + U_t. \end{aligned} \qquad (15)$$

There is an important difference between this model and the ECM model in Equation 11, although Y has the same long-run equilibrium in both if $\rho_t < 1$ for all t. In the ECM model ρ is constant, while here ρ varies with time as a function of the values of Z_t. The constraints on a dynamic system are that $0 \leq \rho_t \leq 1$, which implies that it is a nonlinear function of Z_t. An example of such a function is $\rho = a_1 e^{-a_2 Z_t^2}$, which ensures that $0 \leq \rho_t \leq a_1$. The resulting model has important dynamic properties that are vastly different from those of the linear model in Equation 5, and possibly even Equations 6 and 11. For example, if $a_1 = 1$, meaning that $\rho_t < 1$ when $Z_t^2 \neq 0$ and $\rho_t = 1$ when $Z_t^2 = 0$, if the variance of U_t goes to zero as Z_t goes to zero, it produces a path-dependent sequence for Y_t, whose equilibrium value depends both on the values for X_t, as in Equations 6 and 11, and on the sequence of values for X_t and for U_t prior to the point where $Z_t = 0$. If the variance of U_t does not go to zero when $\rho_t = 1$, the process becomes what is called a random walk after $Z_t = 0$.

If the stochastic term is separable and additive, as it is in Equation 15, a method called nonlinear least squares can be used to estimate the model's coefficients. Derivation of the nonlinear least squares estimator is straightforward. As in Equation 3 let $Y_t = F(X_t, B)$ and $\hat{Y}_t = F(X_t, b)$, and let there be K coefficients B_k to be estimated. As with OLS, the nonlinear method chooses the values for each b_k that minimize the expression $\sum_{t=1}^{T} e_t^2 = \sum_{t=1}^{T} (Y_t - \hat{Y}_t)^2 = \sum_{t=1}^{T} [Y_t - F(X_t, b)]^2$. The central term in this minimization is the matrix of the partial derivative of each $F(X_t, b)$ with respect to each coefficient b_k, $f(X_t, b_k) = \partial F(X_t, b_k)/\partial b_k$. There are K such derivatives for each observation, which when done for all T observations gives a $T \times K$ matrix. The non-linear least squares estimator is the solution to the set of K nonlinear simultaneous equations:

$$\begin{aligned}\sum_{t=1}^{T} f(X_t, b_k) e_t &= \sum_{t=1}^{T} f(X_t, b_k)\,(Y_t - \hat{Y}_t) \\ &= \sum_{t=1}^{T} f(X_t, b_k) Y_t \\ &\quad - \sum_{t=1}^{T} f(X_t, b_k)[F(X_t, b)] = 0. \quad (16)\end{aligned}$$

With the linear model, $\hat{Y}_t = \sum_{k=1}^{K} X_{tk} b_k$, and the partial derivative of $\hat{Y}_t$ with respect to b_k is simply X_{tk}, so the *jth* equation in Equation 16 then becomes

$$\sum_{t=1}^{T} X_{tj} e_t = \sum_{t=1}^{T} X_{tj}\left(Y_t - \sum_{k=1}^{K} X_{tk} b_k\right) = \sum_{t=1}^{T} X_{tj} Y_t - \sum_{k=1}^{k} b_k \sum_{t=1}^{T} X_{tj} X_{tk} = 0,$$

which is the familiar expression for the OLS estimator. (In matrix form, this expression is $X'Y - (X'X)b = 0$, which may be more familiar.) Finding the solution to the equations in Equation 16 is much more complicated than for the OLS estimator, but with the power of current computers and numerical methods, most estimations can be accomplished relatively easily. The resulting estimates are consistent and asymptotically normally distributed.

As in many models of nonlinear dynamic systems and other applications of nonlinear least squares, the substantive process is best, or possibly only, modeled by a structure that is nonlinear in the coefficients. Also, in many of these applications, accurate parameter estimates are very important as the models may have vastly different equilibrium and dynamic properties for different coefficient values, as is the case with the model of path dependence above. The properties of these models render the linear model inappropriate, giving rise to the need for a nonlinear estimator. Fortunately, as various simulation studies illustrate, the nonlinear least squares estimator performs quite well, even for potentially difficult parameter values.

Multi-Equation Models

Some important processes can only be represented by multiple equations, as there are several interacting endogenous variables, and these interactions are the central concern. The Blau and Duncan model of occupational status attainment features two predetermined but not necessarily exogenous variables, father's occupation and education, and three outcome measures for the respondent, education, first job, and current job status. These five variables are organized in a hierarchical system in which the variables expressed earlier in the system are not functions of the variables included later. By then treating all the stochastic terms in the separate equations as uncorrelated (a strong assumption), the system is recursive and can be estimated with the same methods used to estimate Equation 5. This early multi-equation model stimulated an extensive amount of work on models with multiple outcomes. This subsequent work and earlier but related work in economics removed both the hierarchical structure and the condition of uncorrelated stochastic terms, leaving a fully endogenous system.

A much more complex example is Brandt's and Freeman's recent model of the U.S. macropolitical economy. This model uses nine equations to model the contemporaneous interaction of nine economic and political variables, emphasizing the dynamic interactions within the political economy. Each of these variables is the left-hand-side variable in one equation and a right-hand-side variable in the others. Multi-equation systems with joint endogenous variables, whether hierarchical or not, present difficult estimation problems as the endogeneity of the variables included in each equation violates the basic principle of independence between the explanatory variables and the stochastic term, referred to earlier as the exogeneity condition.

As with some of the previous models, the early treatment of multi-equation models considered the presence of endogenous variables in an equation to be a necessary nuisance resulting from the observational nature of the data. There is an extensive literature in econometrics related to dealing with these nuisances, usually under headings such as endogenous regressor, instrumental variables, two-stage least squares, or simultaneous equations. These concerns are real, and endogeneity poses serious estimation problems, even in the best of conditions.

The thumbnail description of the IV estimator is as follows. The equation being estimated is

$$y_t = \sum_{k=1}^{K} X_{tk}B_k + \sum_{m=1}^{M} Y_{tm}C_m + U_t, \qquad (17)$$

where the X_ks are exogenous variables and the Y_ms are endogenous variables. The Y_ms are considered endogenous because they are correlated with U. IV estimation requires one or more exogenous variables, denoted by Z_l, that are correlated with Y_m but uncorrelated with U. There must be at least as many instruments as there are included endogenous variables, that is, $L \geq M$. Formally, these requirements are that $E\left(\sum_{t=1}^{T} Z_{tl}Y_{tm}\right) = \sigma_{lm} \neq 0$ and that $E\left(\sum_{t=1}^{T} Z_{tl}U_t\right) = \sigma_{lu} = 0$. (These conditions are usually stated as probability limits, but the covariance form is easier to picture.) Informally, this means that y is related to each instrument variable Z_l, but only because of Z_l's association with Y_m; that is, Z_l has no direct association with y.

The natural experiments discussed earlier can be a good source of instruments. If the consequences of some natural event, such as the local severity of a hurricane's winds, are a random event, then measures of this event can be good instruments. The research estimating the ability of federal aid to build support for an incumbent administration had to treat the amount of aid distributed to communities as endogenous as it was also proposed that aid distribution was influenced by votes for the incumbent in previous elections. The hurricane's intensity should be related to the amount of aid, but because of the randomness of hurricane paths, wind intensity should be uncorrelated with previous vote patterns over the larger area covered by the hurricane.

The selection of instruments is often aided by the model itself. Many applications contain equations modeling each of the endogenous variables in the system, which means that there are separate equations for each Y_m in addition to the equation for y. This set of equations is referred to as a structural model, and each equation will usually contain both exogenous and endogenous explanatory variables. In estimating the equation for y, the exogenous variables not included in this equation but that are included in the equations for the other endogenous variables become the natural instruments. Denote by X^* the K^* exogenous variables that are included in the equations for Y_m but are not included in the equation for y. The variables in X^* become the instruments, that is, the Zs. The propositions that argue for their inclusion in the other equations imply that they are correlated with Y_m. The logic for excluding them from the equation for y is that they are uncorrelated with U. Together these define the properties of an instrument.

A necessary condition for estimating the equation for y is that the number of included endogenous variables be less than or equal to the number of excluded exogenous variables, $M \leq K^*$. This, however, is only a necessary condition. The sufficient conditions, referred to as identification, require a more detailed knowledge of which variables in X^* are related to which included endogenous variables. If there is only one included endogenous variable—for example, the structural model contains only two equations—the necessary condition is also the sufficient condition. Determining if the equation for y is identified and can be estimated if it contains more than one endogenous variable is a more exacting process, for which there are no simple, uniform rules. A more detailed discussion of identification and how to determine if an equation is identified can be found in any econometrics textbook.

IV estimation is a general estimation strategy for equations with endogenous variables. Its application to multi-equation systems is a special case. Regardless of the application, the requirements for IV estimation are the reason why one should approach IV estimation with caution, because they may be difficult to meet. The requirement that the Z_ls, or the X^*s, and Y_m be correlated can be tested as these variables are observed. The tests for this correlation require more than a simple correlation. First, what is important is the partial correlation between Y_m and the Z_ls, controlling for the included exogenous variables, the X_ks. Second, if there is more than one included endogenous variable, each Y_m must be correlated with a different instrument or set of instruments. This is another statement of the identification condition, but it means that it must hold for the data at hand, not just as a theoretical statement.

The condition that the Z_ls and U are uncorrelated is not testable, as U is not observed. In cases where there are more instruments than endogenous variables, that is, $K^* = L > M$, referred to as the over identified case, there are some weak tests for the adequacy of the instruments. These tests are based on the fit between the residuals from the estimated equation for y and the instruments. The better this fit is, the less likely the instruments are to be independent of U. But these are relatively low-power tests, meaning that they are not highly reliable for deciding whether to accept the null hypothesis of independence.

There are other, and very different, estimation strategies for accommodating endogeneity as illustrated by the model of the U.S. macropolitical economy mentioned earlier. But they are beyond the scope of this entry. These estimation methods rely on different constraints and assumptions from those in the IV estimator. They also nicely illustrate the development, specification, and use of multi-equation models to provide important insights into the intricate interactions among the components of complex social phenomena. Substantive use of these models extends far beyond models of political economy. The challenge in these models is to continue to develop estimation methods that are tailored to the models and to the types of data available to estimate these models. The estimation task posed by these models is not simply the reliance on observational data due to the difficulty, maybe impossibility, of performing experiments that carefully and exogenously manipulate one variable at a time. The central feature of these models is how to represent and then to estimate the complex contemporaneous and lagged interactions among a set of variables, which are endogenous because of these interactions.

Concluding Comments

The focus of this entry is on models that represent causal statements about social processes and on some of the data and estimation methods that are consistent with these models. The models discussed here (from Equations 4 through 17, regardless of whether the data are derived from experiments or observations, share one common feature. The stochastic component is separable and additive to the systematic part. This condition simplifies the estimation process and facilitates derivation of the estimator's statistical properties. There are methods beyond the scope of this discussion that rely on other specifications, assumptions, and conditions that need to be considered in any empirical study.

There are a variety of strategies one might use to estimate and evaluate the various models. There is no single "best" method for all studies. The choice of estimation method should follow from the substantive question, from the model used to study that question, and from the available data. The limitations of OLS regression in accurately estimating Equation 5 with observational data are well documented, if not always acknowledged in practice. Lab experiments are often considered the "gold standard," and they have very desirable properties in many contexts. They also need to be considered carefully. The experimental setting, stimulii, and subjects must closely approximate the actual setting, stimulii, and individuals on which the results will be applied. Artificial experimental settings may generate artificial findings. Field experiments will overcome the validity concerns but may raise other problems. Randomization and double-blindedness may be difficult to achieve when working with real organizations with their own agendas and procedures.

Natural experiments and regression discontinuity designs and matching methods all use observational data. This gives them the advantage of analyzing "real" data from "real" subjects in their natural setting and in ways that can overcome some of the problems associated with regression analysis of observational data. One must be sure, however, that there are no subtle selection processes that prevent true randomization. For example, in the studies based on lottery winnings, can one be sure that those with large winnings were not playing different games from those with small earnings and thus might have different personal characteristics that could be correlated with how the money was spent or with political attitudes? In the regression discontinuity study of incumbency mentioned earlier, the electoral margins were taken as 50% ± 2.5%. Is assignment to incumbency or nonincumbency still random within that range? And what about a margin of ±1% or ±5%? With matching methods, one must be sure there are no unobservables omitted from the propensity score that might be correlated with the treatment. Matching procedures can also be compromised by subtle biases in the selection processes and the failure of those in the treatment group to actually receive the treatment. Subjects reachable by phone may have different characteristics from those who are not, and receiving a mailing is not the same thing as receiving and reading a mailing.

There is an important aspect to the decision about what method to employ that is not captured in the debates about the limitations of observational data, regressions, experiments, and the methods that mimic them. This is the match, or mismatch, between the proper causal model, the available data, and the empirical method. For models with additive and separable variables, such as Equations 4 and 5, experiments, when possible, and the methods that mimic them with observational data are indeed powerful tools that should be and are used regularly. But, as discussed here, there are many models of important substantive phenomena in the social sciences and many types of data for which these methods are inadequate. As always in the social sciences, and maybe other sciences as well, this situation leads to some less than desirable choices. One can choose to study phenomena that are suited to particular methods because of their desirable properties, for example, sticking with phenomena that can be studied experimentally or with matching techniques. But this means choosing substantive topics that are well modeled by the additive and separable equations and the SUTVA condition. One can choose to use methods that are powerful in one setting to examine phenomena that are better represented by more complex models, in the hope that the power of the method trumps the cost of having an inadequate model. Or one can examine substantive questions of interest with the appropriate models and the best available methods and data, recognizing the limitations of each. Good science requires a combination of the three, with a conscious and modest admission of their limitations. It is also the case that important methodological advances have come from efforts to advance the third strategy.

Particularly in the case of the third strategy, where the substantive questions require complex models, where the available and observed data may be far from perfect, and where the "best" methods are weak, the process of building confidence in causal statements and applications will be slow and highly contested. Scientists would do well to follow the description of this process offered by Arthur Stinchcombe quite a while ago, which every empirical researcher should read. He is very emphatic that not only can empirical research not prove theories, it seldom rejects theories. What it does do is lend credibility to theories. This credibility is enhanced with a cumulation of studies in multiple settings and with multiple types of data and methods. For some questions and evidence, this credibility may quite high. But for many others, because of the complexity of the causal process that connects *X* to *Y* of the available data, or because of the limitations of even the most appropriate best methods, this credibility may remain low and contestable. In this context, proposals for another study, for a new design, or for the use of a new method are a critical part of normal science. As is some honest modesty about what is and can be learned from each study and with each method.

STRATEGIC (SECURITY) STUDIES

Within the discipline of political science, the study of security was, until the 1990s, dominated by strategic studies. The end of the Cold War dealt a significant blow to the legitimacy of strategic studies as the centerpiece of the study of security, resulting in the transformation of the field into what we now know as security studies. This entry traces the history of that transformation, beginning with the evolution of strategic studies, its challengers, and the emergence of security studies as the new moniker for the field. It begins with the so-called golden age of strategic studies, in which the central concepts of Cold War security and defense were elaborated, and in particular, intellectual work was performed to integrate nuclear weapons into the discussion on national defense. It then considers the other two periods of Cold War strategic studies: the first characterized by the operationalization of arms control in the period of détente and the second coincident with the period known as the Second Cold War. As the Second Cold War swiftly gave way to the rapid transformation of Europe and the Cold War's end, the criticisms of strategic studies that had been voiced throughout its history gained greater purchase within the discipline. The entry traces first the emergence of security studies in the 1990s as a reformed study of security after the Cold War's end and then the changes wrought to the field by the events of September 11, 2001. The final section in the entry considers the state of the field today.

The close connection of the periodization of strategic and security studies with the major events of the postwar world is no accident. Security studies is a policy science and was intimately connected to the creation of the national security state in the United States following World War II. The close connection of academic disciplines and the security state is by no means unique to strategic studies and has been particularly noted in the creation of area studies within political science, but the ties were particularly overt in the case of strategic studies. While strategic studies developed as a recognized academic discipline within the universities, it was always closely tied to military institutions, as in the case of the RAND Corporation, formed to conduct research for the U.S. Air Force. As a policy science with a military focus, strategic studies was underpinned theoretically by the political realism that emerged in the 1950s as the dominant approach to the study of international relations (IR) in the English-speaking world. Even as the marginal variant of realism, liberal institutionalism, grew in importance in the 1970s and 1980s, strategic studies remained largely immune, and was, indeed, at the heart of the reassertion of a parsimonious "neorealism" in the period. With the development of security studies, theoretical pluralism has developed in the field, with the various theoretical traditions of IR reflected in security studies. This pluralism has included the development of what has become termed *critical security studies*, drawing the traditions of critical social theory into the study of security—which has, in turn, led to the suggestion that security itself be abandoned.

Strategic Studies

In the aftermath of World War II, the United States undertook one of the largest reorganizations of its state institutions in its history—a reorganization exceeded only by that following the events of September 11, 2001. The centerpiece of this reorganization was the National Security Act of 1947, but that was only the most prominent piece of legislation among a range of legislative and executive actions that collectively created the U.S. national security state. Explaining the nature and meaning of this transformation of the U.S. state depends on the theoretical position taken to look at it. The overt explanation, accepted by most in the mainstream of IR and reflected in strategic studies, is that the United States was responding to the emergence of a global threat posed by its erstwhile ally, the Soviet Union. Based on this reading, the National Security Act (1947) and its attendant reorganization of the U.S. state were strategic responses to the security threat of the former USSR, designed to achieve "national security" for the United States. One problem with this explanation is that the very idea of "national security" was a product of the same processes that gave rise to the national security state in this period. Scholars informed by critical theories have therefore argued that the national security state and the threat to which it purports to respond were both a creation of the same practices, designed to maintain an increasingly globalized American liberal capitalism.

On either account of the creation of the national security state, the development of strategic studies paralleled the state's transformation and supported the goals of U.S. national security. The nature of the enterprise, however, is seen rather differently in each account. The mainstream view is that strategic studies developed as a policy-relevant science in response to the same problem that gave rise to the transformation of the U.S. state: the growing animosity between the United States and the former USSR and the addition of nuclear weapons to the traditional great power conflict. The goal of strategic studies, based on this view, was to build on previous work on great power relations and the nature of warfare in order to understand the dynamics of the emergent Cold War and to develop concepts for understanding the application of force and the provision of defense in the nuclear era. Critically informed scholars reject this reactive view of the strategic studies field and see rather that the conceptual development performed by strategic studies was part of the production of a particular kind of United States, a particular kind of Soviet Union as its enemy, and of the specific form the nuclear-armed Cold War took. This entry will provide an account largely consonant with the critical view of the place of strategic studies, both because it is more compelling and because the mainstream account is easily read through the critical one.

Strategic Studies' Golden Age

The "golden age" of strategic studies was dominated by the question of nuclear weapons. Indeed, nuclear weapons provided the raison d'être for strategic studies as a separate, civilian, academic enterprise in the context of the early Cold War and the production of the national security state. The problem strategic studies set out to solve was how to normalize nuclear weapons—that is, how to take a technology whose destructive power was orders of magnitude greater than any that had preceded it and make of it a usable military and political instrument. The scale of the problem was magnified soon after the field's founding when the United States successfully tested a thermonuclear device in 1954, making the explosive potential of nuclear arms all but unlimited. The explosives that destroyed Hiroshima and Nagasaki were roughly the equivalent of 25,000 tons of high explosive; the thermonuclear devices that were developed after that initial test in 1954 are measured in the millions of tons of equivalent trinitrotoluene (TNT). Plotting how to make something this destructive appear meaningfully as a "weapon" was truly, in Herman Kahn's evocative phrase, "thinking about the unthinkable."

Deterrence

The primary solution that was developed by strategic studies to the problem of nuclear weapons and national security was the theory of deterrence. The basic concept of deterrence is quite simple, as it involves issuing a threat of some kind in an attempt to prevent another from doing something that they would otherwise do. Even as a military concept, deterrence much predates the nuclear age, as the issuing of threats is a common military tactic. Nuclear deterrence is different in two ways, however. First of all, strategic studies reformulated deterrence as a strategy rather than a tactic, and second, it developed deterrence to be mutual.

The elevation of deterrence from tactic to strategy solved the central problem of nuclear weapons for the national security state. A strategy of deterrence placed nuclear devices at the heart of the military (and political) organization but structured the system of management in such a way that the devices did not need to be detonated to be useful. Deterrence produced nuclear devices as "weapons" in name only, as they were intended only to be used as a threat; the actual use of nuclear weapons would mark the failure of deterrence. Deterrence is therefore an elegant solution to the problem of vast destructive capability being framed as "weapons," because it produces a strategy that never actually calls on the explosive potential of the devices to be realized.

As elegant as the deterrence solution is to the nuclear problem, it raises a number of problems of its own, not the least of which is that it frees nuclear weapons from any rational constraints. A "normal" explosive weapon, the purpose of which is to be detonated in the course of a military campaign to achieve certain ends, is limited by its tactical uses and the ends to be sought. Those uses and ends will largely dictate both the size of the explosive needed and the number of explosives in a usable arsenal. Together with some assumptions about the likely scale and duration of any conflict, military planners will have a fair sense of the necessary development of any given weapon. By contrast, deterrence produces nuclear weapons simply as the materialization of threat, rather than as explosives to be deployed, and so more and bigger are likely to be better as they are even more threatening than smaller and fewer.

Strategic studies provided one solution to the problem of constraint in developing nuclear deterrence as mutual. Without nuclear weapons, deterrence is generally a unilateral tactic: The relatively larger, stronger, more capable potential combatant can threaten the smaller and weaker to shape the latter's actions, but the smaller, weaker combatant is unlikely to be able to threaten the stronger sufficiently to deter. Nuclear weapons were seen to change this simple equation, because if both sides in a conflict had them, they would be able to inflict tremendous damage on each other without one having first to "win" on the battlefield. This observation led to one of the most memorable products of golden age strategic studies: mutually assured destruction, or MAD. MAD was not considered a strategy but rather a condition. With enough weapons and delivery systems, both the United States and the Soviet Union would be able to inflict untold damage on each other, at the same time, regardless of anything either tried to do to defend itself.

Most of the work of golden age strategic studies was devoted to operationalizing a strategy of deterrence in conditions of MAD. Central to this effort was the concept of "strategic balance," which provided an answer to the problem of limits. Deterrence, strategic studies argued, would be workable in conditions of MAD if the two sides were roughly equivalent. It is worth noting that this conclusion does not derive from the logic of nuclear deterrence under MAD, where all that is necessary is to retain the capacity to devastate an opponent under any conditions, and so the relative size of the arsenals is irrelevant. However, a strategic imbalance in which the former USSR held more weapons than the United States was politically unacceptable and so was never seriously countenanced in strategic studies, an indication of the mutually constitutive relationship between the study of strategy and the production and maintenance of the national security state.

While strategic stability provided a relative solution to the problem of limits, it provided no guidance in absolute terms. As long as there was rough parity and the two arsenals were configured in such a way that MAD obtained (i.e., each retained a so-called survivable second-strike capability), the absolute numbers of arms could continue to climb. The solution to the arms race problem was the second major output of strategic studies' golden age: the theory of arms control.

Arms Control

While deterrence theory provided no upper limit on the level at which strategic stability could be achieved, it did have consequences for lower limits. The most important of these was that zero was not an option: Eliminating nuclear weapons does not allow for strategic stability in the terms developed by strategic studies. Before the emergence of strategic studies, attempts to limit arms were generally conceived in terms of disarmament—the United States had even attempted to entice the former USSR into mutual nuclear disarmament under the United Nations (UN) control with the Baruch Plan of 1946. With the elaboration of nuclear deterrence theory and the demonstrated ability of the former USSR to develop and build nuclear weapons, seemingly at the same pace as the United States, strategic studies took up the problem of devising limits to their development.

Through the latter half of the 1950s, following the test explosion of a Soviet thermonuclear device in 1955, strategic studies turned its collective attention to the question of controlling the development of nuclear weapons. This effort culminated in the special issue of the journal *Daedalus* in 1960, which was described by the issue's editor as a "handbook on the problems of arms control and national policy."

The two outputs of the golden age of strategic studies were intimately interconnected, as arms control was developed as a means of achieving the balance required of "strategic stability," which was in turn the necessary condition for the successful functioning of deterrence. The handbook that strategic studies devised was then put into operation by the U.S. state throughout the 1960s, producing a series of bilateral and multilateral arms control agreements, culminating with the Nuclear Non-Proliferation Treaty (NPT, 1968) on the multilateral side and the Strategic Arms Limitation Treaty (SALT, 1972) on the bilateral one.

While both the theory of deterrence and that of arms control were seen to be scholarly answers to objective problems, they were rather more political programs that required the mutual consent of those operating them to function. What this meant in particular was that the managers of Soviet military and foreign policies needed to accept the basic tenets of deterrence for both it and arms control to function, and initially they did not. Deterrence theory is more formally termed *rational-deterrence theory*, and the modifier "rational" is important. To develop its impressive edifice of theory, strategic studies assumed that decisions were taken by strategically rational men—that is, by applying a simple cost–benefit analysis to the situation in which the decision makers find themselves—and it further assumed that the costs and benefits associated with nuclear war were fairly clear. Those responsible for Soviet policy, however, had been trained in a tradition quite different from that of liberal economics, which gave rise to the parsimonious assumptions of strategic rationality and to the game theories that were derived from these assumptions, which, in turn, informed the strategy of deterrence.

For deterrence to function, therefore, the United States needed not only to build weapons and issue the appropriate threats but also to educate the Soviet Union in the intricacies of strategic rationality and the theory of deterrence that flowed from it. The arms control negotiations that followed strategic studies' development of an arms control theory in the 1950s therefore served two purposes in facilitating the functioning of deterrence. The first, overt function was to reach agreements on limits to the size and structure of the two sides' nuclear arsenals, creating the much sought strategic stability. However, at least as important, if not more so, was the educative function of the negotiations, as the U.S. delegations socialized their Soviet counterparts into the nature and functioning of deterrence theory. This was, perhaps, strategic studies' greatest contribution to the successful functioning of the U.S. national security state—that is, the development of a body of concepts that could be successfully communicated to the Soviet Union to construct it as the particular enemy called for in the security doctrines of the United States. It was truly a singular achievement.

Détente and a New Cold War

The successful SALT negotiations ushered in a period of détente between the Soviet Union and United States and seemingly reduced the urgency of the problems that defined strategic studies as a field of inquiry. In the broader discipline of IR, this period was marked by the growth of liberal institutionalism as a challenge to political realism and a reorientation of the discipline toward issues of political economy and international cooperation rather than those of security and conflict. Interest in strategic studies waned through the 1970s, although the institutional basis in both universities and think tanks was not seriously eroded, and with the return of the Cold War following the election of Ronald Reagan to the U.S. presidency in 1980, strategic studies experienced what Stephen Walt has termed *a renaissance*.

As with the golden age, the renaissance in strategic studies was driven by the complicity of the academic field with the security policies of the United States. The Reagan administration ushered in what is generally termed the *Second Cold War*, a period of heightened rhetorical tension between the United States and the former USSR and of staggering growth in U.S. defense spending. In particular, two elements of the Reagan foreign policy required the intellectual talents of strategic studies: (1) dissatisfaction with a deterrence theory that pronounced any actual use of nuclear weapons as a failure and (2) a closely related desire to escape from nuclear vulnerability by technical means.

There are a number of terms used to denote the first of these changes in U.S. state attitude. The most official is the term *countervailing strategy*, but its opponents attempted to offset the poor public relations of MAD by terming it the *Nuclear Utilization Targeting Strategy*, or *NUTS*. Whatever term is used, it denotes a change in U.S. military thinking about the way in which nuclear weapons would be used in times of war. The golden age answer to this question had been that nuclear weapons should be held as a threat and should only be used in the case of deterrence failure to punish the Soviet Union for not heeding those threats. The countervailing strategy, or NUTS, sought to develop a tactical doctrine for nuclear weapons, giving them a real military mission, with the ultimate goal not just of deterring the Soviet Union but of doing so by planning to win a nuclear war.

The shift to a countervailing strategy, which triggered the renaissance in strategic studies, is associated with the bellicose Reagan administration, but in fact, it was put into motion during the Carter administration. It represents, therefore, not a partisan shift in policy as much as a reinvigoration of the national security state, and, as with the foundation of that state in the 1940s and 1950s, strategic studies undertook much of the necessary intellectual work. Strategic studies through the 1980s was dominated by literature working through the problems posed by the countervailing strategy, testing them through the rigors of academic contestation by those still committed to deterrence strategies that were not so overtly war-fighting strategies.

The second prompt to the renaissance of strategic studies was rather more partisan in its origins, though it reflected the flip side of the move to a war-fighting strategy for nuclear deterrence: Reagan's Strategic Defense Initiative (SDI). In the often-quoted words of the presidential speech that launched SDI in March 1983, the initiative was designed to render nuclear weapons "impotent and obsolete" by providing a defensive shield against incoming Soviet nuclear missiles. The strategic implications of a defense of this kind would have been extraordinary, though nothing compared with the technical achievements required to make it happen. The twin challenges of technology and strategy drove a second constituent of the strategic studies renaissance of the 1980s, as analysts grappled with how to realize Reagan's dream and also questioned whether or not it was a dream that should ultimately be pursued.

The renaissance of strategic studies also marks the apogee of the field as the heart of the study of security. Critics of strategic studies in the 1980s had increasing grist for their mills, as the patently absurd "winnable nuclear war" was taken up as a serious issue for scholarly debate, and similarly, the science fiction dream of an impenetrable missile shield was actively pursued. While these two intellectual pursuits undermined the legitimacy of strategic studies, the ground on which it had been built was unceremoniously removed from underneath the field by the end of the Cold War.

The Critics of Strategic Studies

Given the close connection of strategic studies to the national security system in the United States, it is not surprising that much of the criticism of the field came from outside the United States. There were certainly criticisms of strategic studies raised within the United States in the 1980s, particularly from outside the discipline, but many of those with the deepest resonance came from scholars based in the United Kingdom (UK) and continental Europe.

One of the most extensive critiques of strategic studies was developed institutionally around peace studies. Peace studies, or peace research, as an alternative discipline to strategic studies was largely concentrated in Scandinavia (notably at the Stockholm Peace Research Institute and the Peace Research Institute of Oslo) and in the UK. Peace studies grew alongside strategic studies in the postwar period, and where strategic studies were largely the product of political science, peace studies attracted substantial involvement from natural scientists, particularly nuclear scientists, who were concerned with the destructive potential their work had produced. It stressed pacifism in its approach to foreign policy and rejected the rational and instrumental approach to nuclear weapons adopted by strategic studies. In particular, peace studies argued that the potential devastation of nuclear conflict—including the potential extinction of the human species, what Jonathan Schell in an influential text called "second death"—meant that rational cost–benefit analysis was inappropriate and, particularly, that nuclear explosives had to be conceived as something other than military weapons. The peace studies' critique did not gain much purchase within political science until the 1980s, when the MAD versus NUTS debate made the peace studies' position considerably more generally comprehensible.

A second important line of critical argument was advanced by Ken Booth in the UK in an important book, *Strategy and Ethnocentrism*. Booth also took aim at the instrumental rationality of strategic studies, arguing that it represented a construct of a particular Western philosophical tradition. Decision makers outside that tradition, he argued, would not necessarily accept the arguments underpinning rational deterrence theory, nor, therefore, would they act in the ways predicted by strategic studies. The need to socialize the Soviet Union into the logic of deterrence is a clear example of the sort of problem Booth's work raised.

A third line of criticism that has informed much of what followed in security studies after the end of the Cold War took issue with the narrowly military focus of strategic studies. The most prominent exponent of this criticism was Barry Buzan in his noted work *People, States & Fear*. Buzan argued that while military defense was, of course, important to the security of states, there were a number of other "sectors" in which states faced threats from which they needed to be secured. These sectors—political, economic, societal, and environmental, in addition to the military—call for security strategies that are not necessarily (indeed, not usually) military and thus for a study of security that is potentially quite different from that found in strategic studies.

Taken together, these and related criticisms of strategic studies informed a significant transformation in the study of security within political science following the end of the Cold War. Strategic studies was a creature of the Cold War in a number of quite fundamental ways. The national security state that it serviced was built for the Cold War, and the principal research focus of strategic studies was the Cold War nuclear contest between the East and the West. Even more significant than this, however, was the evident failure of political realism to anticipate or even explain the end of the Cold War. Realism was the theoretical foundation of strategic studies, and as the end of the Cold War undermined realism's claims, so too did it undermine the legitimacy and supremacy of strategic studies as an approach to security.

Security Studies

The end of the Cold War appeared to transform the global security environment fundamentally. The contest between the Soviet Union and the United States had defined the international security environment since the end of World War II. Its passage seemed to herald an era in which cooperation rather than conflict might define global security, in which direct military threats to the future of the state might recede in importance, and in which security was divisible—that is, not every security issue worldwide was connected to a central great power rivalry. Furthermore, the apparent changes to a more peaceful global order led many in both the West and the East to seek a "peace dividend," an opportunity to redirect resources away from military security and toward other social goals.

Although the end of the Cold War was clearly a tremendous opportunity, it also posed a difficult problem for the management of international security. The Cold War had guided policy practitioners in the practice of security policy—they knew what the risks were, and they knew how to "go on" in conditions of Cold War. Indeed, providing the stock body of answers to the nature of the risks and the best means of response was precisely what strategic studies provided to the national security state through the latter half of the 20th century. Without the Cold War context, neither the risks nor the strategies were accepted as understood, and what is more, the discipline that had been providing the answers was undermined by its own failure to comprehend this extraordinarily significant change in its own object of study.

In this context of global political change, policy uncertainly, and intellectual fluidity, there grew a series of movements to redefine security, to understand it in some new way, and to provide a reconfigured study of security for the new era. These movements have given rise to what is now called, in political science, security studies, which is a much broader, theoretically plural, and interdisciplinary activity compared with strategic studies, which both preceded it and continues within it. The fragmentation and flowering of security studies began with a simple question: What is security?

What Is Security?

Booth (1991) characterized the study of security during the Cold War as "looking at world politics through a missile-tube and gun-sight" and said that in such a study "weapons provided most of the questions, and they provided most of the answers—whatever the weapon, whatever the context, and whatever the cost" (pp. 315–316). Booth's caustic comment points to the assumptions of strategic studies in the Cold War: that security, first and foremost, meant the defense of the state against external threats, specifically those that threaten the continued existence of the state itself. Such existential threats against the state are military threats, particularly nuclear threats, and the defense against them is primarily a military matter. In Walt's (1991) terms, security concerned the "threat, use and control of military force" (p. 212).

Once the Cold War's end undermined the military conception of both security and the study of security that followed from it, scholars took to asking the deceptively simple question "What is security?" The debates that followed from this question rapidly identified two axes along which answers could be organized. These axes followed from challenges to the two key elements of the traditional answer to the question of security by strategic studies: that it was the protection of *states* from *military threats*. The first axis emerged from considering the question of what security is by asking, "What if there are security threats to the state other than military threats?" This refinement on the question led to a discussion of the *broadening* of security. The second axis developed from challenging the first element of the traditional answer—the focus on states. This second line of argument began by asking what happens if we are concerned with securing objects other than the state, leading to a debate on *deepening* security. Post–Cold War security studies is, therefore, born from a debate characterized by the broadening and/or deepening of security.

Broadening Security: Multiple Threats/Multiple Responses

The arguments suggesting the broadening of security followed from, or largely reproduced, Buzan's critique of strategic studies from *People, States & Fear*. Buzan had argued that the state was threatened in a range of ways, which could be organized into five sectors, of which the military was only one. The broadening argument looked at the other sectors Buzan outlined—the political, economic, societal, and environmental—to suggest that a post–Cold War security needed to be concerned with the threats faced in these areas, at least as much as those in the military realm.

There is an important consequence of any move to broaden the security agenda by considering nonmilitary threats to the security of the state: The military will not necessarily be the most useful tool in responding to those threats. Consider, for example, the threat supposedly posed to Western Europe by "communism" during the early Cold War. This is an evident example of a threat in the "political" sector, according to Buzan's schema: a threat aimed at the organizational stability of the (in this case, liberal-capitalist) state. While there may have been a connection between the European Communists and the Soviet Union, the military could not provide any meaningful protection against that external influence, and it was entirely irrelevant to the ideological threat posed by the appeal of communist parties internally. The same is true of societal, economic, and, particularly, environmental threats.

The final of Buzan's sectors—the environmental—attracted considerable attention in the debate over the broadening of security in the early 1990s. A variety of issues that later became gathered under the label of "climate change"—global warming, rising sea levels, desertification, and environmental pollution such as "acid rain"—were gathering significant political attention. Several of these were seen to pose important risks to the state, and a literature on "environmental security" developed as part of the argument for broadening security studies. Not only was the environmental security debate important in its own right, but it also raised a number of the issues that have defined much of the rest of security studies since the early 1990s.

The first question of the environmental security debate was what sort of security issue was posed to the state by environmental change. One line of argument was that environmental change posed a direct threat to the state, in much the same way as external armies did. Under extreme conditions, climatic change could threaten the very existence of the state. However, the conditions under which this was possible seemed extremely rare in most instances: The most common example raised was that of Pacific Island nations that could be inundated by rising sea levels. For the Western states generally serviced by security studies, however, it was difficult to imagine such a direct threat to their continued existence. A second line of argument suggested that the environmental threat was not direct but rather that climatic change could produce effects that were generally recognized to be issues of security, most commonly the mass movement of people and conflict over increasingly scarce resources.

The second line of environmental security argument, that climatic change would produce conflict, did not fundamentally challenge the traditional notion of security as a military affair but rather argued that military threats could emerge from nontraditional locations. This rather conservative consequence bred a third argument within the environmental security debate, which focused on the contradiction between military means and environmental security. Essentially, the argument was that the military, in both preparation for and prosecution of wars, was tremendously destructive to the environment. Environmental security, this argument suggested, was therefore best seen as protecting the environment from the military! By making such an argument, however, its proponents posed a fundamental challenge to traditional security studies, as it was no longer the state that was to be secured but rather, in this case, the environment itself. Such a conclusion tied the "broadening" security arguments to the second stream of the security studies debate in the early post–Cold War period, that of considering "deepening" security.

Deepening Security: Protecting Other Referents

The "deepening" security discussion began from the question of whether what should be secured (i.e., the *referent object* of security) should be something other than the state. The environmental security debate led to the suggestion that it was the environment itself that needed protection from, among other things, the very practices that are generally considered to provide security. However, a number of other answers to this question were advanced in the context of the discussion of what security meant. Some argued that the state was a representative of a community—usually termed *the nation*—and that what should be secured was not the state as such but rather the nation. Others rejected the narrowness of even thinking of states as "nations" and suggested that security studies should be concerned with the security of communities, regardless of the terms under which they were constituted. Any of these forms of communal argument were particularly useful in drawing attention to those circumstances in which the state, rather than *providing* security to its population, was an active threat to at least some part of that population.

The most influential argument for broadening security was drawn into security studies from international development, specifically the United Nations Development Programme's (UNDP) 1994 annual report, *New Dimensions of Human Security*. The basic notion of human security was that individuals, rather than states, should be the referent object of security. As the UNDP formulated it, human security was a very broad notion, encompassing all threats to the lives and livelihoods of people. In many ways, the UNDP's conception of human security was an attempt to reformulate the notion of development, particularly human development, in terms of "security," driven in part by a desire to capture some of the expected peace dividends from the end of the Cold War for the global development agenda.

Coming as it did, just as states, and the security studies that serviced them, were searching for a way to think about security in a post–Cold War world, human security has had a significant impact on both policy and scholarship. It has been picked up particularly by midranked states in the international system, who have seen in it a means of forging for themselves a significant role in the global security agenda, often otherwise dominated by the larger states. As the states and security studies have turned to human security, the breadth of the original UNDP conception has been lost. Indeed, two competing conceptions of human security have emerged from this debate, with Canada championing a conception of human security as "freedom from fear" and Japan championing one of "freedom from want," both of which are contained within the UNDP's formulation. Canada's formulation has had, perhaps, the most obvious policy impact, as it led to actions to ban antipersonnel land mines, a global plan of action on small arms and light weapons, and some consideration of action on child soldiers.

Securitization

The attempt by the UNDP to recast human development in terms of human security can be usefully described using one of the most important concepts to be developed in post–Cold War security studies: that of "securitization." In these terms, it would be said that the UNDP attempted to "securitize" the development agenda, or at least some significant part of it, though it would then be a question of whether or not that "securitizing move" was successful. The term *securitization* was introduced into security studies by Ole Wæver, who then later teamed with Buzan to marry the latter's sectoral approach to securitization in order to form what has been termed the *Copenhagen School of security studies*. There are some deep tensions between securitization and Buzan's security sectors, and so in addition to the Copenhagen School, the idea of securitization has spawned a wide range of scholarship, often simply called "securitization studies."

The idea of "securitization" is at once simple and radical. Wæver counsels that we treat security as a "speech act," by which he means an utterance that produces something in the world by virtue of its being said. Promising is one of the more common examples of a speech act: A promise only exists by virtue of someone saying, "I promise." Wæver suggests that security only exists by virtue of someone authoritatively saying "such and such is an issue of security" and (importantly) having that utterance broadly accepted by its target audience. The effect of a successful securitization, he argues, is to remove an issue from the realm of normal politics and so make it possible for extraordinary means (often, but not necessarily, military means) to be applied in response.

The radical implications of securitization are also quite easily seen. Securitization fundamentally undermines the claims of political realists, and the forms of security study that follow them, that the world *is* a dangerous place, and security involves identifying the threats "out there" and responding appropriately. By contrast, securitization argues that there are no objective security threats; rather, an issue becomes a matter of security if and only if it is successfully securitized. Security is socially produced—socially constructed to use language common in the field—and securitization provides a broad conception of the means of that construction. Securitization also, therefore, makes security intensely political. While successful securitization removes an issue from normal politics (it is worth thinking here of the range of extraordinary measures taken in response to "terrorism" as a security threat following 9/11), the act of securitization itself is a potential site of political contestation. For strategic studies, by contrast, security is "too important" for politics. What securitization illustrates is that this assertion by the academic study of security is part of the securitizing apparatus of the state, designed to insulate the most extreme forms of violent state action from political opposition.

Critical Security Studies

The treatment of security as a social construct and, therefore as a site of politics, is a feature of a number of approaches to security that have grown up in the period following the end of the Cold War, in addition to securitization studies. These approaches are loosely termed *critical security studies*, after a 1997 volume of the same name. The volume, and the conference from which it came, drew a range of scholars dissatisfied with strategic studies as the heart of the study of security and sought theoretical pluralism among the disaffected. Theoretical pluralism, however, does not sit well with the professional practices of academics, and so the inclusive home for opponents to the mainstream has divided into rather more exclusive and exclusionary literatures, largely along theoretical lines.

The first theoretical tradition that gathered under the critical security studies name was *social constructivism*, which had emerged in the United States in the late 1980s. Constructivism was concerned with the role of ideas in international politics, particularly the ways identities and interests were constructed in social interaction. Borrowing from Anthony Giddens's ideas of structuration, IR constructivism sought to overcome the debate between agency and structure in IR through the reflexive production of identities and social institutions in world politics. The constructivist position, however, did not accept a complete break with the epistemological realism of mainstream IR, which closely allied it to the Copenhagen School and, particularly, securitization studies. The same is not true of the other two broad streams of critical security studies, which drew on continental European critical social theory for theoretical guidance: The first laid claim to the critical security studies label by virtue of its drawing its primary theoretical inspiration from the critical theory of the Frankfurt School and the related post-Marxist German social theory; the second is a looser gathering of scholars informed by poststructural French social theory.

Critical Theory, with capitals, is a product of the Frankfurt School, which is both an institution and an intellectual tradition, and is associated with a series of important social theorists, including Max Horkheimer, Theodor Adorno, Herbert Marcuse, and Walter Benjamin. The most prominent contemporary social thinker associated with the Frankfurt School is Jürgen Habermas. The ideas of these thinkers have been drawn into the study of security, largely by Booth and his colleagues at the University of Wales, Aberystwyth, and so have spawned what is sometimes termed the *Welsh School of critical security studies*. The Welsh approach to security sees emancipatory politics at the heart of security studies—that is, security studies that in reality works for those presently oppressed by the global capitalist security system, rather than being an academic exercise undertaken by the national security state, which is the principal institution of that oppression.

Progressive political change is also a hallmark of the French tradition of social critique. French social theory is not so clearly organized into a school as is its German counterpart, but it is generally associated with the work of a number of influential French thinkers—Jacques Derrida, Michel Foucault, and Jean Baudrillard, among the most commonly cited in security studies—as well as a number of others with similar philosophical starting points: Slavoj Žižek, Judith Butler, Gilles Deleuze, Felix Guattari, and Giorgio Agamben. What marks out the poststructural contribution to security studies is an acceptance of a radical epistemological break with the modern tradition, an epistemological break that is resisted by mainstream security studies, constructivism, and even the Welsh School. This break, often termed *antifoundationalism*, leads, for example, to an acceptance of contingency and contextuality in understanding social formations, including security institutions and practices. In relation to security, the contributions of a poststructural approach can be found most prominently in the work of David Campbell, Simon Dalby, and James Der Derian, among others. Poststructural security studies has also flourished in response to the dramatic reexpansion of the national security state following the 9/11 attacks.

Feminism and Security

Most accounts of security studies, even critical security studies, exclude feminist scholarship, and yet feminist work on security has flourished in the same period, and much of it draws on a similar range of mostly critical social theory, as do other parts of the field. The range of feminist scholarship is particularly important, because there is not one single feminist approach to security but rather feminist analysis begins from the full range of social theory—including liberal, post-Marxist, poststructural, and postcolonial—and in no way seeks to distill these theoretical traditions into a single "feminist" theory. What does unite feminist scholarship is a concern with gender in social life and, for those interested in security, the relationship of gender to security. *Gender* refers to the constitution of sex-related social differences, of masculinities and femininities, and so feminists are concerned with the ways in which these social categories are (re)produced and with its effects.

Feminist security scholarship has explored the ways in which masculinities and femininities have been produced in and through security institutions and practices, as well as the ways in which those institutions differentially affect the lives of men and women. The military is perhaps the quintessential such security institution, and much feminist scholarship has explored the ways in which the military produces and relies on a particular kind of masculinity (often termed *hypermasculinity*), which is also (re)produced in wider society. Feminist scholars have also demonstrated the ways in which, unsurprisingly, the hypermasculine and necessarily violent military has particular, and highly gendered, effects when it acts. These effects are seen most obviously in rape as a tactic of war and in the persistent use of prostitution to service soldiers in the field, both of which have been shown to be long-standing features of militaries. Indeed, Sandra Whitworth has turned the feminist gaze on UN Peacekeepers, and she found that donning a blue beret does not alter these violent, hypermasculine practices.

More broadly, much feminist scholarship can be said to show the way in which the national security state as a whole is a product and producer of patriarchy. In other words, the state and the form of "national security" it produces and practices, (re)produce a broad social structure that differentially benefits men at the expense of women. For an account of security studies, this finding is particularly important, because of the role that security studies has played in providing intellectual service to the national security state. The inescapable corollary of the feminist critique of that state is that security studies is not only an enabler of the national security state but is a product and producer of gender inequality too. Security studies, in other words, is in itself a highly gendered practice.

The End of Security?

The post–Cold War era has seen a burgeoning of security. The peace dividend anticipated from the end of the superpower confrontation was never realized as the decade following the transformation of Europe saw the national security state reassert itself in novel ways. In its search for continued relevance, the national security state and its academic support, security studies, looked to the world outside the Central European front and found it dangerously unstable. The national security state and security studies, therefore, retooled to bring security to the violent hinterland—particularly when that hinterland bordered on the core, as it did in the wars of the former Yugoslavia. Security studies provided the intellectual resources for this retooling, providing a wealth of literature exploring the dynamics of what, most notably, Mary Kaldor has termed the *New Wars*. The fact that these new wars tend to be fought in some of the least advantaged parts of the world—Afghanistan, Somalia, the Democratic Republic of Congo, and Sierra Leone, for example—has led to a growing merger between security and development, although ironically not in the fashion the UNDP would have hoped in launching its notion of human security. Rather than capturing the power and resources of "security" for the hard work of human development, the merger of security and development has harnessed the global development institutions to the national security state's violent export of its liberal-democratic self.

Having survived the 1990s, security received its largest single boost since the end of World War II with the terrorist attacks on the United States in 2001. Suddenly, the homeland appeared once more to be under threat, and this time, unlike during the Cold War, even the United States had been successfully attacked. Security spread like a virus throughout Western societies in response: Antiterrorism legislation was passed, amended, updated, and passed again; borders became sites of ever-greater scrutiny and potential violence; state surveillance spread rapidly; and a wide range of legal protections in Western societies, which had been won through centuries of struggle, were summarily cast off. The prison at Guantánamo Bay, Cuba, stood as the symbol of this renewed security, but security was far from contained in an island limbo. The United States undertook the largest reorganization of its state structure since the National Security Act of 1947 with the creation of the Department of Homeland Security, which in turn has served as the model for the reinvigoration of the national security state among the allies of the United States. Against this backdrop, it is not surprising that security studies has likewise flourished, since the transformed national security state has just as much need for intellectual support work as it did at its postwar founding.

Much of the work in security studies as it emerged from strategic studies, however, leads to troubling questions about the future practice of security studies itself. The original securitization work, for example, argued that the best security politics was "desecuritization," an attempt to remove as much of it as possible from the ambit of security and into the realm of normal politics. The feminist work on the gendered character of the national security state similarly suggests that there is something deeply troubling about the services provided to that state by security scholars. Mark Neocleous gave a strong and clear voice to these questions in his 2008 book, *Critique of Security*, in which he suggested that security was the central logic of the liberal state, and so speaking in terms of security, even to oppose the extravagant security practices of the state, is to reproduce the national security state and insulate it from the possibility of political transformation. Just as security studies is maturing in its new, poststrategic studies guise, therefore, we are led to ask whether we have now reached the end of security.

STRUCTURAL EQUATION MODELING

Structural equation modeling (SEM) is a very general statistical approach for modeling and estimating data. It is seen as a combination of factor analysis and regression or path analysis. These procedures are regarded as special cases of SEM. It contains, in addition, classical multivariate techniques such as analysis of variance, analysis of covariance, dummy regression, and canonical correlation as special cases. A structural equation model contains latent variables that should correspond to theoretical constructs from substantive theory and their reflective indicators or items that form the measurement model. The relationships between the latent variables (constructs and factors) and their indicators (observed variables) are quantified by the corresponding factor loadings. The regression coefficients between the latent variables (structural relations) take random and nonrandom measurement error into account and are, therefore, not biased. This part of the model is called "structural model" and represents the underlying theory. This entry presents some of the basic features of SEM using an example from the European Social Survey (ESS).

SEM models can be visualized by a graphical path diagram, which represents the relationships between the latent variables (structural model) and the relationships between latent and observed variables (measurement model). The latent variables are symbolized by circles, the observed variables by rectangles, and the postulated direction of influences by directed arrows (see Figure 1). The path diagram can be translated into a set of linear or matrix equations. Figure 1 displays a diagram that graphically represents a structural equation model with the measurement and the structural part. It contains one exogenous (independent) construct and one endogenous (dependent) construct. Each construct in Figure 1 is measured by three indicators to control for all forms of random and nonrandom measurement errors.

In Figure 1, ξ_1 is an exogenous latent construct, measured by three indicators x_1, x_2, and x_3. Their measurement errors are designated as δ_1, δ_2, and δ_3. η_1 is an endogenous latent construct, measured by three indicators y_1, y_2, and y_3. Their measurement errors are designated as ε_1, ε_2, and ε_3. λ is the symbol for the unstandardized factor loading. The residual of the latent endogenous variable is ζ_1. It represents the unexplained variance of the latent endogenous variable. The regression coefficient between the exogenous and the endogenous latent variable is γ_{11}. The first subscript refers to the dependent variable, the second to the independent variable.

The corresponding equation system for the model in Figure 1 is as follows:

Structural model:

$$\eta_1 = \gamma_{11}\,\xi_1 + \zeta_1 \tag{1.1}$$

Measurement model:

$$x_1 = \lambda_1^x \xi_1 + \delta_1 \tag{2.1}$$

$$x_2 = \lambda_2^x \xi_1 + \delta_2 \tag{2.2}$$

$$x_3 = \lambda_3^x \xi_1 + \delta_3 \tag{2.3}$$

$$y_1 = \lambda_1^y \eta_1 + \varepsilon_1 \tag{2.4}$$

$$y_2 = \lambda_2^y \eta_1 + \varepsilon_2 \tag{2.5}$$

$$y_3 = \lambda_3^y \eta_1 + \varepsilon_3 \tag{2.6}$$

The intercepts of the structural and the measurement model have been omitted.

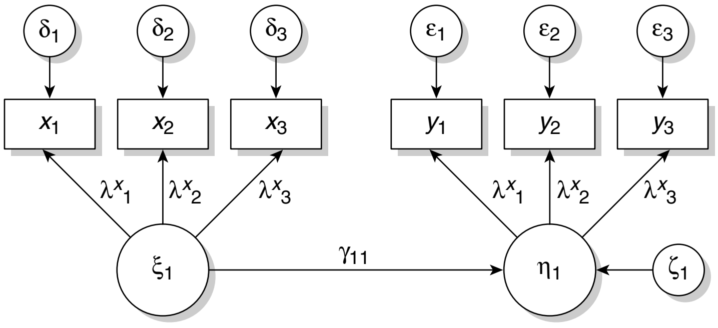

Figure 1 The General Model for Two Latent Variables

The items are conceptualized as reflective indicators, as in confirmatory factor analysis, which means that the researcher postulates a direction of influence from the latent to the observed variable. Both the measurement model and the structural model can be generalized to take into account *n* indicators and *m* constructs. One can now differentiate between three types of parameters: (1) free parameters to be estimated from the data, such as in classical multivariate analysis; (2) fixed parameters that are set a priori to a certain value such as 0 or 1; and (3) constrained parameters that are set equal to another parameter. For estimating the coefficients, several estimation methods are available. The standard method is maximum likelihood estimation. By using this method, all the free parameters are estimated simultaneously taking into account both the fixed and the constrained parameters in the minimization of the fitting function. Other estimation methods take nonnormal distributions into account such as robustified maximum likelihood, asymptotic distribution free estimator (ADF), and weighted least squares (WLS). In addition, Bayesian estimation is possible, which allows the testing of a broader class of hypotheses and which may be more robust in smaller samples. The model testing is mostly done in at least two steps, because otherwise the necessary model modifications are too complex.

The measurement model is first tested via confirmatory factor analysis. After one has found a well-fitting measurement model, in the second step, the full structural equation model, which includes the fitted measurement model, is tested. There are three approaches for testing SEM models: (1) strictly confirmatory, (2) the use of alternative models, and (3) model generating.

1. In a strictly confirmatory situation the researcher has formulated one single model and has obtained empirical data to test it. The model should be either accepted or rejected.
2. The researcher has specified several alternative models (or competing models), and on the basis of an analysis of a single set of empirical data, one of the models should be selected.
3. In the model-generating approach, the researcher has specified a tentative initial model. If the initial model does not fit the given data, the model should be modified and tested again using the same data. The respecification of each model may be theory driven or data driven. (cf. Jöreskog, 1993)

As with classical multivariate analyses, the estimation procedure (in the standard case this is maximum likelihood estimation) provides unstandardized and standardized coefficients and standard errors and *z* values for the unstandardized coefficients from the estimation procedure. In addition, global- and detailed-fit measures for the specified model are provided. The global-fit measures are all some function of the chi-square, the degrees of freedom, and, in some cases, the sample size. There are descriptive measures such as the comparative fit index (CFI), probability-based ones such as the chi-square test and the root mean square error of approximation (RMSEA), and those based on information theory (e.g., Akaike's information criterion [AIC]). Cutoff values for these measures have been proposed, although there is an ongoing discussion about which ones should be used in which way.

Generally, the process of model building in SEM can be described in the steps visualized in Figure 2. It is important to understand that most specified models are in the first step falsified, and one has to modify the model according to detailed fit measures such as the modification index and the expected parameter change that together with substantive theoretical knowledge should guide the respecification of model modifications. This process corresponds to model generating (the third

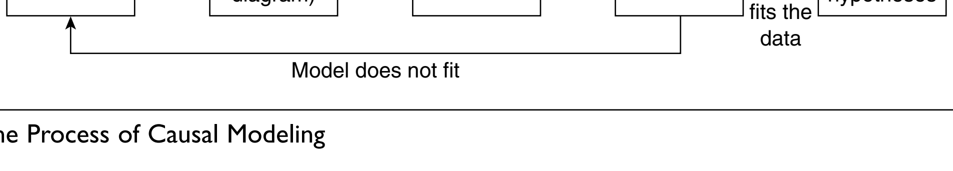

Figure 2 The Process of Causal Modeling

approach) rather than model testing (the first or second approach).

The following example uses data from the British sample of the ESS, Round 1 (2002). Results of a model to explain attitude toward immigration by the two latent variables "education" and "tradition/conformity" value are reported. These relations represent the structural model. This model is specified as a partial mediation model, as education influences both values and attitude toward immigration, and the effect of education is only partially mediated by value. As a consequence, the structural model is composed of two equations for explaining the two latent endogenous variables value and immigration. "Immigration" is measured by three reflective indicators, "tradition/conformity" by four observed variables, and "education" by two. The question wordings and the unstandardized factor loadings and their standard errors are reported in Table 1; the standardized solution is reported in Figure 3. All factor loadings are significant ($p <$ .001). The fit of the model is very good according to the standard criteria ($\chi^2 = 32.82$ with 24 degrees of freedom; CFI = .999; RMSEA = .013).

Figure 3 shows that the loadings of the three items to measure attitude toward immigration are all very high, indicating a high formal validity. The same is the case for the two indicators of "education." The standardized factor loadings of the value construct "tradition/conformity" are generally lower than those of the other constructs, and they range from 0.44 to 0.72. The regression coefficient between "education" (EDU) and "tradition/conformity" (TRCO) is significant, but weak (0.24);

Table 1 Question Wordings and Unstandardized Factor Loadings

		Education (EDU)	*Tradition/ Conformity (TR/CO)*	*Immigration (IMM)*
edu$_1$: Highest level of education	λ	0.47	0	0
	SE	0.02	0	0
edu$_2$: Years of full-time education	λ	1.00	0	0
	SE	[a]	0	0
tr/co$_1$: Important to follow traditions and customs	λ	0	0.75	0
	SE	0	0.05	0
tr/co$_2$: Important to do what is told and follow rules	λ	0	1.05	0
	SE	0	0.06	0
tr/co$_3$: Important to behave properly	λ	0	1.00	0
	SE	0	[a]	0
tr/co$_4$: Important to be humble and modest	λ	0	0.63	0
	SE	0	0.04	0
imm$_1$: Allow many/few immigrants of different race/ ethnic group from majority	λ	0	0	1.31
	SE	0	0	0.03
imm$_2$: Allow many/few immigrants of same race/ ethnic group from majority	λ	0	0	1.00
	SE	0	0	[a]
imm$_3$: Allow many/few immigrants from poorer countries	λ	0	0	1.18
	SE	0	0	0.03

more education is associated with less agreement on the TRCO scale. The effect of education on "immigration" (IMM) (−0.34) is higher than that "TRCO" on "immigration" (−0.15). The regression coefficients on "immigrants" are partialized coefficients. Substantively, more education and more disagreement on the TRCO scale are associated with less negative attitudes toward immigration. One can see in the path diagram that "education" has not only a direct effect on "immigration" but also an indirect effect mediated by "TRCO." Direct (−0.34) and indirect effects (0.24 multiplied by −0.15) are added as total effects (−0.38) of one variable (education) on another (immigrants). The asymptotic standard errors and bootstrapped standard errors for indirect effects and total effects and their significance levels are additionally calculated in most SEM software.

In Figure 3, one can see for the latent variables that the explained variance is 0.06 for "TRCO" and 0.17 for "immigrants." These low numbers indicate that especially for the explanation of "TRCO," but also for the attitude toward immigration, the relevant explanatory variables are missing.

The model can be extended as a generalized latent variable model to multiple groups or models, estimating latent means and intercepts; autoregressive, cross-lagged, latent growth curves; latent curve models; and stochastic differential equations for longitudinal/panel data, testing mediation and moderation, nonlinear models, multilevel models, and mixture models. Furthermore, it can be extended to ordinal and categorical data, where other estimation techniques are used. The latent variable approach can be embedded easily in a Bayesian framework.

SUBJECT CULTURE

Among scholars of political culture, the term *subject culture* signifies a specific subtype whose members are not actively participating in the central political system. The members of all political systems at all times exhibit significant differences in their orientations, attitudes, and beliefs about politics. Many of the differences depend on the inequalities in access to the political opportunities existing in these political systems. Especially, gender differences, with women disadvantaged vis-à-vis men, are clearly the product of solidly structured biases against women's participation in politics. Many differences are also the consequence of some aspects of the processes of socialization. Finally, some of the differences simply derive from the preferences of the individuals, from their willingness to devote more or less of their time and energy to learning about politics and to taking part in political activities. Some political cultures encourage and reward political knowledge, involvement, and participation; others do not. However, differences among individuals appear in all political systems. These have been the object of quite a number of studies, mainly carried out by political anthropologists, but in the 1960s, the study of political culture became an important component of the field of political science and, more precisely, in the work of scholars attempting to explain modernization and political development.

The first major contribution to the field of political culture was made by the survey of citizens' attitudes in five democracies performed by Gabriel Almond and Sidney Verba. In their seminal book *The Civic Culture*, they explored the dense web of relationships between political attitudes and the survival/stability of Germany, Italy, Mexico, the United Kingdom (UK), and the United States. The underlying hypothesis was, understandably, that there should exist significant differences in the political cultures of citizens to explain the differences in the various political systems, two of them (the United States and the UK) stable and effective democracies, two of them (Italy and Germany) democracies that had previously failed, and one (Mexico) a single-party hegemonic regime. To capture the nature and quality of the respective civic cultures, the authors identified three different orientations: cognitive, affective, and evaluational. *Cognitive* orientations refer to the knowledge of and the beliefs about the political system, its roles and the incumbents of these roles, its inputs and its outputs. *Affective* orientations are the feelings about the political system and its roles, personnel, and performance. *Evaluational* orientations concern the judgments and opinions about political objects that typically involve the combination of value standards and criteria with information and feelings. Combining these orientations with aspects of the political system and its inputs, outputs, and the role of the individual in the system, Almond and Verba suggested the existence of three types of political cultures. More precisely, in a *parochial* political culture, individuals have no knowledge concerning the political system—that is, neither its inputs nor its outputs. By contrast, in a *participant* political culture, individuals know about the political system and its inputs and outputs and are also aware that they can play an active role. *Subjects* have come to know about the political system and its actions, the outputs, but they are not familiar with how they themselves can affect the inputs and how to play a role in the political system.

All political systems contain varying combinations of individuals with parochial, subject, or participant orientations. It makes a great difference for any political system, of course, whether any one of these three types of political culture is or has become dominant. Almond and Verba argue that there must exist and develop some congruence between political cultures and political structures. They suggest that a parochial culture is most congruent with a traditional political structure, a subject culture with a centralized authoritarian structure, and a participant culture with a democratic political structure. One could also remark that, for instance, a centralized authoritarian structure may devote some resources to the transformation of parochials into subjects, but it will certainly also pursue the goal of preventing the subjects from becoming participants. Unfortunately, the analysis by Almond and Verba did not aim at providing sharp profiles of the types of political cultures prevailing in the five political systems they had taken into consideration. Instead, they shifted their attention to the relationship between cognition, affect, and evaluation and three additional dimensions of political culture: *allegiance*, *apathy*, and *alienation*. However, they did not even explore whether the parochials, the subjects, and the participants were more likely to become allegiant, apathetic, or alienated. Nor did they give enough attention to the presumably differentiated impact of diverse combinations of parochials, subjects, and participants in the political culture of a democracy. Moreover, as Verba has recognized in *The Civic Culture Revisited* (Almond & Verba 1980), a dynamic view and a careful interpretation of how these processes and situations were bound to be affected by time were sorely lacking. Finally, practically none of the studies that followed their pathbreaking empirical research (Lucian Pye & Sidney Verba, 1965), not even the book reappraising their original contribution, has devoted specific attention to the category of *subject* political culture.

According to Almond and Verba, two variables have a significant impact on all types of political culture: the amount of information and the level of education. In slightly different ways, of course, both the parochials and the subjects have a rather low level of education and are exposed to a limited amount of political information. Therefore, they are easily manipulated by the rulers. In a way, one can say that both information and education, increasing their political knowledge, will encourage their eventual transformation into participants. Indeed, this was the most important message conveyed by Daniel Lerner in his 1958 book, *The Passing of Traditional Society*: The revolution in communications will produce significant consequences for the political cultures of traditional societies. The most important among these consequences were thought to be the almost complete disappearance of the parochials because, inevitably, all individuals living in the same territory, under the same rulers, and affected by similar processes would become increasingly cognizant of the political system and its inputs and outputs and would probably also come to realize that they might have a role, though subordinate, to play. Even more so for the subjects, their growing knowledge of the political system and its outputs might motivate them to learn more about the way to produce inputs (demands and support) and to become personally active in politics.

Scholars studying political development have often been accused of having a teleological and ethnocentric bias in their approach—that is, of being oriented to foresee and predict for developing countries the political future already reached by Western democracies. Curiously, though, when it came to the likelihood of the transformation of political cultures, most of the same scholars were significantly more cautious. There was no explicit prediction of any possibility of a swift appearance of a widespread participant culture. On the contrary, most scholars believed that for some indefinite period of time, the majority of developing countries would suffer exactly because of the difficulty of transforming parochials and subjects into participants. In any case, in the 1960s and early 1970s, the scholarly and policy-making emphasis was placed on the need to build states and to strengthen their structures (the bureaucracy and the armed forces and, to a minor extent, representative assemblies) more than on the creation of nations, an idea not easy to export into developing countries. The analysis of the agencies and processes of socialization—families and schools—so important for the transformation of political cultures, remained of limited interest and was rarely carried out with specific commitment. That social and political movements, for instance, those active in the national liberation struggles, could exert some influence in accelerating cultural changes, especially among those "subjects" who might become involved in their activities, was not a common theme worthy of in-depth studies.

The concept of a subject culture disappeared rather quickly from the language of scholars interested in modernization and political development. It had never made significant inroads among scholars studying political participation. The attention shifted to more precise and better manageable and researchable directions. The following three elements, interest, information, and efficacy, have been explored extensively by subsequent scholars who were specializing in the study of political participation. Nevertheless, one can still stretch the concept of subject culture to indicate the type of political culture shown by those individuals who have some interest in politics, not much information, and a very low sense of political efficacy. Their interest in the working of the political system may be stimulated only by their awareness that it affects their lives. They collect the amount of political information that seems sufficient to cope with the outputs of the political system. They are more or less painfully conscious of their inability to play a successful role in the working of the political system. With reference to the wealth of existing data on the quantity and quality of political participation in contemporary political systems, it is possible to state that, contrary to the views formulated by Almond and Verba in the 1960s, there remain significant numbers of individuals, not only in centralized authoritarian regimes but in all contemporary democratic regimes as well, whose political culture shows the features of a subject culture.

SUPERPOWER

International relations as a field of study has traditionally been defined as a science whose primary purpose has been to explain the behavior of states operating in an anarchic world where power—usually measured in terms of economic resources, military strength, and moral influence—has always been unevenly spread among its various units. How to measure power, the uses to which power is put, how states acquire and lose it, and what impact its unequally distributed character has on relations between states in the wider international system have been central issues discussed by scholars of international relations ever since Thucydides wrote his classic *History of the Peloponnesian War* in the 4th century BCE.

Measuring the power of states has, of necessity, created its own taxonomy. Thus, different states may be defined as great, weak, imperial, regional, global, or even—more recently—failed, largely in terms of three attributes: (1) their own set of unique capabilities, (2) the distribution of capabilities in the wider international system, and (3) their capacity to exercise control over both their own affairs and those of others. Inevitably, most attention has been paid to the actions of great powers insofar as they have exercised most influence on the international system. Thus, when the Napoleonic wars ended with France's defeat in 1814, it was naturally assumed that the future of Europe would be shaped by at least five "great" powers: Great Britain, the Austrian Empire, Russia, Prussia, and France. A century later, it was taken for granted that the outcome of World War I would, in the end, be determined—once again—by the policies and capabilities of the various great powers.

World Wars I and II

The term *superpower* only emerged in the period following the "Great War" (World War I) of 1914 to 1918. Hitherto, writers had hardly used the term, preferring instead to speak of certain states possessing vast powers that extended well beyond their own territory as empires. The term *superpower* was thus very much a modern creation and was first used in the early 1920s with special reference to the greatest of all modern empires—the British Empire, with one in four people around the world living under its flag. It then became more commonly employed during World War II. Indeed, the idea that the war would conclude with an enormous concentration of power in the hands of only three states—the British Empire, the United States, and the former USSR—was initially mooted by the Dutch American geostrategist Nicholas J. Spykman, first in his 1942 study *America's Strategy in World Politics* and then 2 years later in his short, but highly influential, book *The Geography of the Peace*. Spykman was a power theorist par excellence. But he made a clear distinction between different kinds of power and concluded (against the then influential arguments advanced by the British geographer Halford Mackinder) that the dominant global actor after the war would not be the Soviet Union, which now controlled the Eurasian land mass—what Mackinder termed the *heartland*—but rather the United States, with its unmatched maritime global supremacy.

The belief that the defeat of the Axis powers would lead to the creation of a new kind of world order dominated by "super" powers was also advanced by William T. R. Fox, a Chicago-trained academic who after forming part of the international staff at the United Nations conference in San Francisco went on to influence many up-and-coming international relations scholars in the United States. In his justly famous 1944 book, *The Super-Powers: The United States, Britain and the Soviet Union—Their Responsibility for Peace*, Fox effectively helped popularize the term *superpower*. Interestingly, like Spykman, he identified three (not two) states that could lay claim to this particular status as the war came to an end. Two of these—the United States and the Soviet Union—had acquired their position in the process of waging war against Germany and Japan; the third (the United Kingdom [UK]) had for some time been the most extensive empire in world history. Fox, however, drew different conclusions from those of Spykman. Spykman never believed that the three would easily work together to ensure the peace after the war. In his opinion, they were doomed to compete. Fox, on the other hand, was more optimistic and initially hoped that the three powers could work in concert to secure a more stable world. Indeed, as the subtitle of his book suggested, they had a responsibility to do so.

The Cold War Period

The period between 1944 and 1950 saw a significant change in the application, if not the meaning, of the term *superpower*. This led to the deletion of the British Empire from the original trio. Weakened by war and increasingly dependent on the United States in a new world order that was fast decolonizing (India declared independence in 1947), it became more and more difficult to think of the UK as a superpower. This of course left only two superpowers in play—the United States and the Soviet Union. They in turn were said to be "super" for a variety of different reasons: their sheer geographical size, their respective hard power capabilities, their global reach, their pursuit of defined missions worldwide, and their ability to shape the policies and choices of other increasingly dependent small- and medium-sized powers.

The idea that there were now only two superpowers also gave rise to another connected idea: bipolarity. This notion was popularized by the most widely read international relations scholar of the immediate postwar years: the German-born American scholar Hans J. Morgenthau, who in 1948 spoke of a radically new world organized around two dominant "poles" of power and attraction. This system could quite easily conclude in war, he feared. But as time passed, Morgenthau began to wonder whether this bipolar international system might even contain within itself the basis of a more stable international order. Later, another international relations scholar, Kenneth Waltz, developed this argument even further. Like

Morgenthau, Waltz noted the apparent stability of the postwar order and the success of the superpowers in defying earlier predictions that the Cold War would sooner or later turn hot. This, he argued, happened in part because of nuclear weapons. But it was also a function of the bipolar distribution of power. This, he insisted, was less war prone than a system where there were many power sources (a multipolar order). He believed that error was more common in the latter system because of the difficulty of estimating accurately the power and cohesion of shifting and often unstable coalitions. In a bipolar world, on the other hand, where the two superpowers relied on their own vastly superior power for their security, coalitions were less important and so stability more likely.

As a simplifying device, the idea of a bipolar world composed of two superpowers to describe the international system after 1947 was useful enough. But it was not without its limits. Four at least deserve mention here.

One was that it could not really explain the Cold War itself. To do this, one required to look at more than just the uneven distribution and concentration of power in the world. This only provided one kind of measure. It did not necessarily explain the deeper reasons for, and unique character of, the conflict. To do this, it was necessary to examine the very different socioeconomic foundations of the two states, their opposing worldviews, and their quite different histories.

Second, the idea of a “superpower” implied a rough-and-ready equality between the two states. But as we know, from the outset—and for the duration of the Cold War—the United States was always in a superior position. This was partly for the geographical reasons originally suggested by Spykman. But it was also because its economy was larger and more productive and its allies richer and generally more willing to follow its lead than say Poland, Czechoslovakia, and Hungary were ever prepared to follow that provided by the former USSR.

Third, the notion of there being just two superpowers having the capacity to project power anywhere in the world does not explain significant alterations in the balance of power in the world after 1947. In 1950, for example, there were only two nuclear weapons states: the United States and the former USSR. By the late 1960s, however, there were five, including China, the UK, and France. In 1947, the United States was “super” in nearly every conceivable way. Twenty-five years later, it faced quite a different set of circumstances brought about by the emergence of new economic players such as Europe and Japan. Nor could the United States and the former USSR control events quite so easily as the notion of a superpower might have implied. Thus, both lost significant allies in the 1960s when China broke from the former USSR and France left the military command structure of the North Atlantic Treaty Organization (NATO). Then, in the 1970s, the United States was unceremoniously ejected from two key countries—Vietnam and Iran—while the former USSR was thrown out of Egypt. And during the next decade, the Soviet Union fought a long and unsuccessful war on its southern border in Afghanistan.

Finally, the notion of superpower really had no predictive capacity. Indeed, precisely because many scholars viewed the former USSR as a superpower, it may well have misled them into assuming it was far stronger than it turned out to be. Certainly, one of the more important reasons why so many students of international relations failed to anticipate the sudden and unexpected end to the Cold War in 1989, followed 2 years later by the collapse of the former USSR itself, was because of an attachment to a concept that ultimately proved to be more an obstacle than an asset in understanding how the Soviet Union actually worked.

1991 and After

If a superpower is a state traditionally considered to be one step higher than a great power, it remains an open question as to how we should characterize the distribution of power following the collapse of the former USSR in 1991. Clearly the world was no longer bipolar. But what kind of world was it? For a while, some predicted the rise of a new multipolar world order consisting of Japan, the newly empowered European Union, and the United States. It soon became clear, however, that this was not to be. Japan failed financially. Europe proved to be weak in its efforts to end the civil war in (former) Yugoslavia. Meanwhile, the United States experienced one success after another from military victory in Iraq in 1991 through to Kosovo just a few years later. At the same time, the U.S. economy boomed, the Russian economy declined, and the capabilities gap between the United States and the rest of the world grew and grew.

In a world without rival (or indeed without balance) in which American values seemed to be driving all before them, it was hardly surprising that scholars and policymakers alike were drawn to the distinctly radical conclusion that we were now living in an entirely, almost unique, world order whose single most obvious characteristic was that there was only one single pole in it. This in turn raised the intriguing question of how one should then characterize the United States itself: "Superpower" seemed too weak and anyway was too much associated with a period now long since passed—namely, the Cold War. Analysts thus began to look around for new ways of defining the United States. Some, like the French Foreign Minister, Hubert Vedrine, preferred the idea of a "hyperpower," suggesting that the United States now had unprecedented power and capacity. Others were attracted to the notion of hegemony, implying that the United States had not only enormous power but also a capacity to lead and inspire others. A few writers, however, began to define the United States as a new form of liberal Empire—a new Rome on the Potomac, as one observer put it—which, even if it did not seek to acquire other people's territory, did what all empires have done in the past: It shaped the choices of others and defined the rules of the game while punishing those who did not play by them.

By the beginning of the 21st century, therefore, the term *superpower* was no longer much used. Indeed, according to many thinkers, the very term had little value in trying to explain international politics in an increasingly interdependent world composed of several actors often facing challenges that did not necessarily arise from the possession of vast concentrations of power. Some even suggested that the distribution of power had changed so much in the first 10 years of the new millennium that it would be quite meaningless to think of the world in terms of any kind of superpower determination. That age, it was agued, was now past.

Yet the idea did not die away entirely. On the contrary, as America's fortunes began to fade and those of China started to rise, many began to view the emerging international order in increasingly superpower, possibly even bipolar, terms. China may have been no Soviet Union. Still, its potential was huge and its ambitions global. Nor was it the only potential superpower on the scene seeking to compete with the United States. Europe, and perhaps India in time, could also lay some claim to being, or over time becoming, superpowers of a sort. Policymakers certainly seemed to think so and, while talking the cooperative language of globalization and global governance, continued to act in ways that would have been easily recognizable to policymakers from a bygone age. The Cold War with all its ideological baggage might have been over. The market may have also triumphed. But very powerful states, or groupings of states, with serious capabilities, international ambitions, and a desire to mould the future, still sought to determine the way the world looked. Even if one kind of superpower rivalry had concluded by the beginning of the 1990s, nearly 20 years later, it very much looked as if another was just starting to take shape.

SUPPORT, POLITICAL

The concept of *political support* was initially devised by David Easton in the context of his theory of political systems. According to Easton (1965), political systems have inputs and outputs, with inputs taking the form of demands and support. Political support occurs when "A acts on behalf of B or when he orients himself favorably toward B" (p. 159). A more precise definition was provided by this author in a later work where he defines *political support* as the "way in which a person evaluative orients himself to some object through either his attitudes or his behaviour" (1975, p. 436). Easton develops a multidimensional conceptualization of political support in which he distinguishes both between the objects of support and the types of support. Within the first, he differentiates from each other support for three distinct objects: the political community, the regime, and the authorities. Within types, he distinguishes between two: specific and diffuse.

As important as it has been for the study of political attitudes, Easton's conceptualization of political support has been seen by some as unclear and has led to much research that has been criticized as ambiguous, confusing, and noncumulative. Different understandings of Easton's original arguments have led to a variety of schemes, approaches, and indicators that have aimed to capture the different dimensions of political support. There is no consensus on how exactly Easton's ideas should be empirically assessed. Long-standing debates among scholars have concentrated not only on which are the best ways to measure the different dimensions empirically but also on what the evidence gathered thus far has meant.

Objects of Political Support

An initial distinction put forward by Easton deals with the classification of the different objects toward which political support might be extended. According to him, support is fed into the political system in relation to three basic objects, which he orders in a scale of abstractness. At one extreme lies the most intangible or "abstract" object: the political community, or nation. At the other extreme lies the most immediate, concrete object: the political authorities. Between the poles lies a third object of support: the regime, or the "rules of the game," that allow a political system to be maintained. Easton warns that the fact that support for a political system can be broken down into three elements does not mean that support for each one of these objects is independent of the others. Many times the three kinds of support are closely interrelated, so that the presence of one is a function of the presence of one or both of the other kinds.

Authors such as Pippa Norris and Russell Dalton have followed Easton's line in differentiating certain objects of support that are more generalized from others that are more concrete. Both authors offer refined versions of Easton's classification of objects of political support, in which they argue about the need to differentiate between three different components of the political regime: regime principles, performance, and institutions. Along these lines, they suggest and empirically confirm a five-dimensional structure that includes as objects the political community, regime principles, regime performance, regime institutions, and political authorities. John Booth and Mitchell Seligson have confirmed through factor analysis that a similar structure is operating in several Latin American democracies, with the addition of a sixth dimension that reflects attitudes toward local government.

Diffuse and Specific Political Support

Besides classifying the objects of political support, Easton (1975) distinguishes between two kinds of support, specific and diffuse, which are of different natures and have different implications for the political system. On the one hand, specific support is described as the type related to the "satisfactions that members of a system feel they obtain from the perceived outputs and performance of the political authorities" (p. 437). On the other hand, diffuse support refers to "evaluations of what an object is or represents—to the general meaning it has for a person—not of what it does" (p. 444). Thus, specific support is the temporary and relatively ephemeral acceptance or approval that citizens express for a political object as a result of its satisfaction of their specific demand; whereas diffuse support is conceived of as a deeper, more enduring, and more generalized political loyalty resulting from early-life political socialization and, therefore, is more immune to short-term inducements, rewards, or performance evaluations.

This distinction is an important contribution. Specific support can be object specific in two ways: In the first place, people are assumed to be capable of being aware of the political authorities working on behalf of the system; in the second place, it takes into account the perceived decisions, policies, actions, utterances, and style of the authorities. In this sense, members of a political system can perform a rational calculation of whether the authorities' actions address their needs and demands. Under such conditions, specific support, which can only exist in societies whose institutions allow authorities to be held accountable for their actions and the resulting consequences, will fluctuate according to people's perceived benefits and satisfactions. Diffuse support instead hinges on the general meaning given to political objects and is defined as a "reservoir of favorable attitudes" that members of a given political system possess, which allow them to overlook outputs that do not benefit their wants. It is more durable than specific support and more resistant to or even independent of sudden epiphenomena such as policy outputs and performance. This support also remains, despite the ups and down in outputs and beneficial performances. While diffuse support may change, it is difficult to weaken when strong and to strengthen when weak. Rooted in early socialization and experience, diffuse support might be generated and fostered independent of the fulfillment of particular needs and demands by the authorities.

The Problem of the Multidimensionality of Political Support

Most research has interpreted Easton's conceptualization as a unidimensional axis that ranges from specific to diffuse support, along which the different political objects are arrayed (Figure 1) (Norris, 1999). In this conception, support for each political object is given a level of specificity/diffuseness, implying that specific and diffuse support do not represent distinct kinds that could be extended toward every political object. This approach has been criticized by other readers of Easton such as Mariano Torcal and José R. Montero (2006) for its simplicity, which has given birth to an excessively

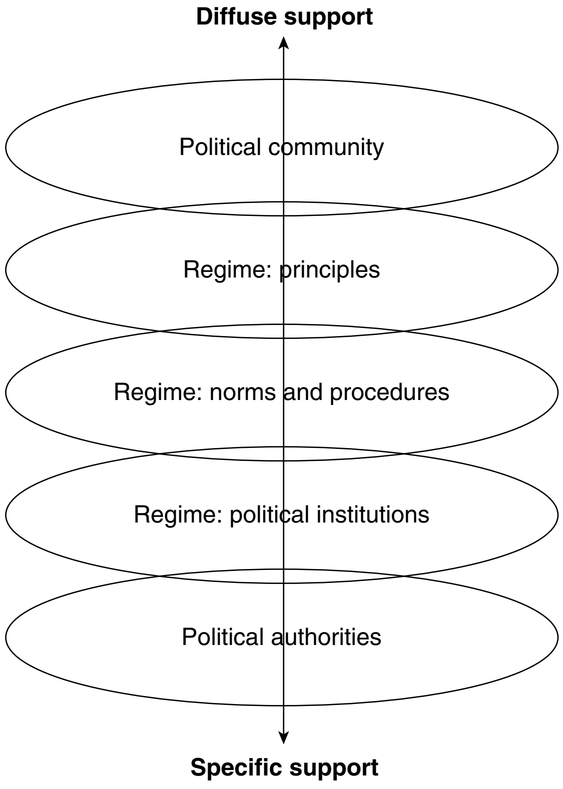

Figure 1 Unidimensional Conception of Political Support

broad concept of support, which "empirically works as a sort of umbrella under which different dimensions are not differentiated" (p. 10).

The latest refinements to the multidimensional understanding of political support have been developed by Dalton (2004) and by Torcal and Montero (2006). These authors have argued that the correct interpretation of Easton's theory implies that every political object is subject to both specific and diffuse support. Thus, a multidimensional structure of political support is devised, where objects may be subject to both diffuse and specific support at the same time (Figure 2). This view does not imply that support for a political object, in every context, will be a combination of both specific and diffuse support. What it means is that each political object should be "addressed alternately or jointly by both diffuse and specific support" (Torcal & Montero, 2006, p. 9).

Measurement and Hypothesis Testing Problems

The disagreements over the multidimensional nature of *political support* have been extended to debates regarding the appropriate ways of measuring it. No consensus has been reached among scholars on which are the best indicators for capturing the different components of political support. Furthermore, discussions regarding what the indicators aiming to measure specific and diffuse support have meant date back to the 1970s, when scholars debated whether the increasing levels of discontent shown in surveys reflected attitudes toward the incumbents or toward the regime. Almost 40 years later, the debate is still open. Indicators that have been used to measure political support have been criticized severely and recurrently for their problems of validity. For instance, it is still common to measure regime support (both specific and diffuse) with satisfaction with democratic functioning, an indicator highly contaminated by incumbent support, which in a way is reproducing the 1970s debate between Jack Citrin and Arthur Miller, reaching again the same inconclusive results.

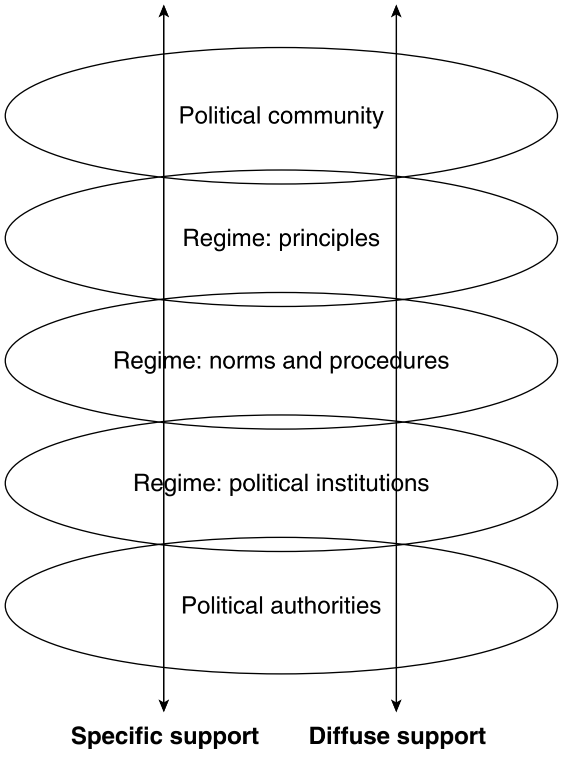

Figure 2 Multidimensional Conception of Political Support

Dalton (2004) has warned about the difficulties on drawing fine theoretical distinctions when aiming to measure the different components of political support. In fact, there are doubts about the efficiency of empirical research when trying to isolate the different types of support, as public sentiments can blend adjacent orientations and indicators of public support frequently overlap between levels. Despite the obstacles in measuring the different components of political support, Dalton argues that it is important to depart from a multidimensional framework, as "public orientations towards different objects of support carry different political implications" (p. 7). Therefore, he proposes different indicators to measure specific and diffuse support for each different political object, leaving aside the frequent assumption, discussed before, that each political object contains by definition a level of specificness/diffuseness. However, this approach, although not too critical of Easton's theoretical proposal, does contain a problematic assumption: It assigns an a priori meaning of specificity or diffuseness to different survey indicators for each political object. Some critics or researchers argue, instead, that the level of conditional (specific) and unconditional support (diffuse) can only be estimated by assessing empirically the role of different variables in explaining political support for each political object. Support is specific, and therefore conditional, when it can be explained by variables such as ideological preferences, party preferences, underlying values, or satisfaction with the economic or social performance. Support becomes diffuse, and therefore unconditional, when neither of these factors influences the level of individual support in a significant way.

SURVEY RESEARCH

Survey research is a method of measurement based on the systematic collection of information from a sample of members of a population. This sample is only a fraction of the population of interest. It represents the whole population by the way it is selected. Conclusions about the total population are reached through a process of statistical inference. Samples can be drawn of anything whose properties can be defined and, therefore, can be made of many types of populations, such as persons, products, institutions, organizations, or events. The most familiar surveys are those taken from persons about their opinions using a structured questionnaire. This entry is mostly about survey research of human populations. In the United States and other English-speaking countries, surveys are also called polls. There is no precise distinction between these terms and there are no significant methodological differences between polls and surveys. The term *survey* is frequently used when speaking of polls done by academic institutions, and *polls* are surveys reported in the media. The first part of this entry describes the general scientific bases of survey research and offers an overview of the principal aspects involved in the design of surveys. The second part gives an account of the key moments in the evolution of survey research. The third part describes the principal contributions of survey research to the social sciences along with some criticisms.

Scientific Bases of Survey Research

Survey research is based on sampling techniques founded on probability theory. People attribute different meanings to the concept of probability. Most often it is interpreted as the relative frequency of events, such as the number of red or black cards in a deck. Its precise meaning is centered on the concept of a "normal distribution." The most important characteristic of the normal distribution is that even when the actual values of a variable do not have a normal distribution, the mean of that variable estimated from a large sample can be regarded as having come from a normal distribution of sample means. This is what the central limit theorem states. If researchers draw a large number of independent random samples of any variable, the mean value of the means obtained in each of the random samples will be close to the actual mean of the population. Moreover, they will be able to calculate the standard error of the mean. Hence, researchers can draw samples of populations and infer that the mean of the variables observed will be close to the mean of the population with a known margin of error.

Good, reliable surveys follow basic scientifically founded rules to select the sample of the population to be studied. First, the researcher has to precisely define the population he or she wants to study. The sample of individuals to be interviewed is selected in such a way that every member of the total population has a not necessarily equal, but a known, chance of selection. If all members of the total population have the same chance to be selected, every individual in the sample represents the same number of persons in the population. These are self-weighted samples. If the selected individuals have different chances of being selected, weights are used to estimate the number of persons in the population they represent.

Any bias in the selection of the sample would produce distorted measurements. Errors of selection come from many sources, but selection errors are frequently produced when the researcher has some preconceived ideas about the individuals he or she wants to select—for instance, when the researcher looks for *typical or relevant individuals* of a population, when the poll depends on volunteer or easy-to-contact subjects, or when interviewers are asked to look in the field for some specific type of subjects. A random selection of a sample, such as choosing a specific number of persons from a list using random numbers or selecting every *n*th number of persons from the list, minimizes selection biases. The designer of a survey can improve the accessibility of the sample-selecting groups of individuals that can be found in the same location or area, in clusters of individuals, such as electoral precincts, counties, or neighborhoods. This technique is known as *area probability sampling*. The survey designer can also subdivide the population into more homogeneous subparts, known as strata, to improve the quality and accessibility of the samples. This technique is known as *stratification*. For instance, in an electoral study, the researcher can select in the first stage a sample of precincts from a total list of polling areas, a list that was previously divided according to turnout and voting behavior. In the second stage, the researcher selects households within each of the precincts selected following a systematic method, such as every other household starting where the voting site is installed. In the third stage, the interviewer selects the persons to be interviewed following some almost random method of selection, such as asking for the person with the most recent birthday.

When a sample is selected following these basic rules—that is, if it is truly probabilistic—it will be unbiased and will therefore reproduce the characteristics of the total population within a known margin of error. In the electoral example, the aggregate vote of the sampled precincts should be very close to the actual vote in previous elections, and the sociodemographic characteristics of the population interviewed would be very similar to the total population. In other words, once aggregated, the statistics obtained from the sample will reproduce the actual parameters of the population with a known margin of error.

The adequate size of a sample does not depend on the extent of the total population. The decision on the size of a survey is always a delicate balance between the value of the additional information and the cost to obtain it, but ultimately, the designer of the study has to determine the lowest number of cases on which he or she is willing to generalize from the sample to the total population and the size of the error he or she is willing to accept. In any case, as the size of the sample is increased, its quality improves, but at some point, any increase in size produces very limited gains in quality. Common sample sizes for national or regional studies usually vary between 1,200 and 2,500 cases, but if the designer of the study wants to generalize about something of very low occurrence, say some rare illness, he or she would get very few cases with these sizes. For instance, imagine that only 3% of the population has been infected by the H1N1 virus at some moment. In a well-designed survey of 1,000 cases, the researcher would generalize about the infected population based on only 30 cases, a very small number.

Surveys are interviews with the individuals of the sampled population using a structured questionnaire. The interview with the sampled individuals can be done by an interviewer or can be self-administered. Individuals can be interviewed in person or by telephone. Wherever the extent of telephone lines is not significantly biased toward the upper-level economic strata, the telephone is the preferred way to interview. The new information technologies offer new forms of interviews. Self-administered interviews are questionnaires to be filled out that were given to the sampled population directly or sent via e-mail or the Internet. In some cases, surveys can be done using more than one mode of interview, but the sample has to be very carefully designed, and the researcher should be aware that the mode of interview can have some effects on the results that the researcher must take into account.

The design of the questionnaire is another fundamental aspect. Questions should produce good, unbiased, and objective information. The questions in a survey should answer what the designer of the study wants to know and should be equally accessible to all respondents. For some topics, the researcher knows in advance that the questions asked could produce something called *social desirability biases*, simply because they are embarrassing, or because the respondent might be afraid to reveal what he or she assumes to be "bad" behavior. Some questions might be simply deliberately biased because they include approval of means and of results, what is known as *double-barreled questions*. The order of the questions in a questionnaire should be also carefully designed, because some questions might lead to the answers of the following questions.

The biggest challenge to survey research is the problem of nonresponse. Even if the sample and the questionnaire are carefully designed, and the field execution of the actual process of data collection is done by well-trained professional interviewers and close supervision, people can refuse to participate or not answer the questions asked in the survey. In some environments, the intense use of polls by the media has resulted in an increasing number of refusals to participate. Survey research is based on the information provided by those who participated in the survey. Based on the random selection of the sample, in survey research, it is assumed that those who refused to participate or did not answer some of the questions are not substantially different from those who participated, except for their unwillingness to participate. This may be a sound assumption, but ultimately there is no way to be sure about it, since the researcher does not have actual information from the nonrespondents. Consistent trends in public opinion data or the rationality of actual changes in these trends and other indicators show that the assumption about nonresponse is sound, but surveys with very large numbers of nonresponse should be read with some degree of skepticism.

Information Obtained in Surveys

Surveys can produce factual or perceptual information. The objective information can be actual facts of different matters such as how many individuals in the sampled population are employed or unemployed, the extent of the audience of a TV program, the number of years a person attended school, or the types of goods the family owns or uses. They can also measure past or present behavioral experiences, such as cigarette consumption, crime victimization, or use of public transportation. Likely future behavior can also be measured, but there is a general consensus that polls are not a very good instrument to do this. The typical electoral forecasts are based on questions about the vote preference of the respondent at the moment of the interview, and a typical error in predicting the election results usually comes from late changes in preferences that surveys might fail to register.

Perceptual information can measure attitudes or opinions, such as the evaluation of the job performance of different authorities, the state of the economy, or opinions about some general topics or issues. Attitudes are positive or negative orientations toward objects, persons, governments, institutions, public policies, or party programs. Surveys can measure not only the prevalence of the attitudes explored but also their intensity. Preferences based on comparisons of attitudes are also measured in surveys. Comparisons of candidates, parties, specific public policies, or general orientations toward them are frequently obtained from the public in surveys of all kinds. People have opinions or perceptions about the objective state of the world. For the researcher who measures these beliefs, it is not relevant if the belief is true or not, the relevant finding is that a population thinks that the state of affairs at a given moment is as they describe it. Many times, perceptions about the state of the economy or crime are not in correspondence with actual reality. As in the case of attitudes, surveys can measure how important these beliefs are for the public.

A survey taken at some particular moment produces a cross-sectional measure of the value of variables at the moment of the interview. Many variables are constantly measured, resulting in extremely useful longitudinal studies that show changes and continuities. If these continuous measurements are obtained from differently sampled individuals, they can show changes over time in the mean values of the variables studied, but conclusions about the behavior of the individuals would be unfounded. The researcher would have to interview the same individuals over time to come to sound conclusions about the individual's changes of behavior. These are panel studies with specific methodologies.

Development of Survey Research

Survey research evolved gradually from various social needs. A survey is any comprehensive view or appraisal of any population. In this broad sense, surveys have probably been done since the first tax collectors valued the extent and resources of their desired contributors. Actually, the first evidences of written language are records of commercial transactions and of tax or tribute payers. In the Middle Ages, poll began to mean "head" and acquired the contemporary meaning of taxing. In the 16th century, every Spanish conquistador was always accompanied by an accountant in charge of the survey of the conquered territories. These tax collectors produced hundreds of invaluable surveys of the "New World," first recovering the tax records of the Indian authorities where available and later carrying out their own appraisals. The Industrial Revolution created a complex set of new social problems and the need to understand them. There are records of some surveys that were done on different matters such as poverty, education, and health in many of the countries that are now called industrialized or developed. In the newly independent national states, the need to create new tax rolls kept tax collectors busy.

These were enterprises of data collection that attempted to survey the entire population of interest. The evolution of surveys based on fractions of the populations took longer to become the common practice of today. The desire to predict the results of upcoming elections has been a constant incentive in the development of survey research. Besides the value that the news media attribute to these forecasts, particularly in presidential systems, electoral predictions based on surveys offer the rare if not unique opportunity to evaluate *ex post* the accuracy of the polls on which they are based. The first of these surveys were the so-called straw polls that some newspapers in the United States conducted to predict the winner of upcoming elections. It is generally agreed that the first such poll was taken in the summer of 1824 by the *Harrisburg Pennsylvanian* in the election between Andrew Jackson and John Quincy Adams. Other straw polls were done in the 19th century, and at least nine newspapers and magazines published the results of straw polls for different state and presidential elections in the first quarter of the 20th century. The newspapers obtained the information to do their prediction by various methods. In some cases, the newspaper printed a ballot for some period of time and asked its readers to cut it and mail it back to the journal. Others polled citizens attending political meetings or in selected areas.

From 1916 through 1932, the magazine *Literary Digest* predicted the outcomes of the U.S. presidential elections correctly but missed in 1936 with data obtained with its well-known straw poll. At every presidential election, the *Literary Digest* mailed millions of ballots some time before the elections to a mail list taken from the telephone directories of state car registrations. In 1936, the magazine announced that the Republican candidate Allan Landon was expected to obtain 57% of the national vote. He obtained 38.5%. This fiasco marked the demise of the straw polls. Regardless of the occasional accuracy of some of the predictions estimated with the data obtained with this form of data collection, the ballots were tabulated ignoring the implicit biases involved in the way the respondents were selected. The mail list used by the *Literary Digest* magazine was clearly biased to upper-income households, and the magazine received information only from those who were willing to respond to the poll. They assumed in aggregating the results that car owners willing to respond represented the entire population. In other words, the researcher assumed that the participants in the poll had the same chance of selection as those who did not participate in the survey, either because they were not contacted or because they refused to answer. These nonresponse biases favored the most committed Republicans, resulting in the mistaken estimate. These were typically what we call now nonprobabilistic samples.

By the 1930s, vast changes in the production and in the marketing of goods and services started to develop. New information about the markets and the demands of consumers was needed, and market research appeared to satisfy it. A long tradition of social statistics supplied in Western Europe the needs of this new market research, while in the United States, data collection based on surveys became a common practice, and survey research received a substantial impulse that has pervaded until today. By the end of World War I, many large manufacturers and advertisement media had market research groups, and new firms began to offer market and consumer information to their clients; among them were those founded by Elmo Roper and George Gallup. They adopted the methods of market research to measure public attitudes and, in fact, created today's public opinion polls. In July 1935, *Fortune* magazine published the first Fortune poll produced by Roper, and in October, Gallup published the first Gallup poll as a syndicated service to 35 newspapers and magazines.

The methodologies used by this new industry were closer to the scientific standards of the methods in use today but insufficient to produce unbiased results. Usually, respondents were contacted and interviewed either in clusters of neighborhoods or in places of great attendance of visitors such as commercial plazas. To try to prevent biases in the data collected, researchers selected very diverse points of interview, and interviewers were asked to complete predefined sociodemographic quotas in such a way that the aggregate would resemble the strata defined in the population census.

Another big fiasco marked again the change in methodologies and the real incorporation of the probability principles to the selection of the sampled population. Polls had predicted with great accuracy the U.S. presidential elections of 1940 and 1944, but in 1948, the three major producers of electoral forecasts, George Gallup, Elmo Roper, and Archibald Crossley predicted a substantial victory for Thomas E. Dewey over Harry S. Truman who was the actual winner by a comfortable margin of more than four points. Hearings were called by the House of Representatives to discuss the big mistake, and the Social Science Research Council produced a study of the major polls. The study pinpointed various reasons for the error, but the most important in terms of the adoption of better sampling methods pointed to the persistence of selection biases associated with the quota sampling in use. Instead of following loose quota samples, the industry began to assign interviewers to specific areas previously selected through a random process. As the installation of telephone lines dramatically expanded, interviewing respondents over the phone became the most common form of contact and interview. Respondents were selected through a process known as random digital dialing where the researchers do not need lists or directories since the lines are selected automatically following random processes. Survey research expanded all over through market research and government production of social studies and economic data. As large producers or marketing companies entered new territories, local market research began to be demanded, and local industries emerged. Gallup opened local offices in many places, and by the outbreak of World War II, public opinion polling was a common practice in most democratic societies.

Perspectives of Survey Research

Public acceptance of surveys varies constantly. Big flaws, such as those that still occur in electoral forecasts, produce widespread criticism and disappointment. During political campaigns, when polls tend to be more present in the media, criticism increases, and the idea that polls influence voters is frequently expressed. The use of polls as a source of information for politicians to craft their messages has become a constant source of criticism of survey research. The media, particularly broadcast media, play an increasingly important role in politics today. Image and constructed messages prevail in the public arena. A new breed of political consultants has emerged to polish the image of politicians and to construct their messages. These consultants struggle to tune their designs to public opinion based on polls and surveys. Critics claim that this use of survey research leads to the trivialization of democracy and that it manipulates the desires and choices of the public.

These are serious criticisms, but survey research has produced many positive things as well. The electronic and printed media routinely report public sentiments on a wide variety of issues and closely follow electoral campaigns. This common practice in established democracies set in later in younger democracies, but in the long run, the use of survey research to monitor governments and elections developed together with the consolidation of democratic practices. This intensive use of public opinion polling to produce political data such as election forecasts or presidential approval is the most visible evidence of survey research in the daily life of citizens.

Survey research has also been widely used for a long time to produce a broad range of data about markets and various economically relevant variables. Surveys are routinely taken to estimate market opportunities for old or new products or to follow public sentiment toward brands and products. Many of the most familiar economic data, such as employment, income, and expenditure patterns among households or consumer sentiments, are obtained using surveys. Policymakers use survey research to assess social needs or to evaluate the impact on the public of the policies implemented.

But the most significant effect of survey research has been in the production of knowledge over a vast number of disciplines. The impact of survey research in pure and applied social research has been of great consequence. Studying scientifically selected samples, researchers can soundly infer conclusions of total populations without the almost impossible task of studying every individual. The repeated measurement of many and very diverse variables has allowed the understanding of change. Information obtained through direct interviews to actual persons, and scientifically based statistical inferences to the entire population, opened the door to the study of individual motivations. Before, individual motivations could be studied only through experimentation with very small samples or improperly inferred from the study of aggregate data. Survey research has produced abundant findings in many areas of economics, sociology, social and political psychology, and political science among others.

In many countries, huge collections of surveys have been collected, and various international projects are booming, opening the doors to a new comparative understanding of many aspects of societies and politics.

SURVEY RESEARCH MODES

Systematic surveys of the opinions, attitudes, and behavior of human populations are one of the major inventions of 20th-century social science research. Although survey research has its origins in the pre–World War II era, in the late 1940s, social scientists began to conduct high-quality survey research on a regular basis. Since that time, surveys have become a staple of social science research, and data generated by such studies are used by thousands of scholars around the world. These data are gathered in a variety of ways, which methodologists call survey *modes*. In the early 21st century, major survey modes are in-person interviews, telephone interviews, self-completion questionnaires, and Internet questionnaires. Below, these modes and their respective advantages and disadvantages are discussed in greater detail.

In-Person Interviews

The in-person or face-to-face interview occupies a preeminent position in scientific survey research. Such interviews typically are carried out in respondents' homes, although, historically, survey firms ("houses") have used other venues as well. In-person interviews have been a major data collection device since the inception of survey research and—when used in conjunction with probability samples of populations of interest—still are considered by many scholars to be the gold standard for valid and reliable measurement. The claim is that experienced, well-trained interviewers doing in-person surveys can gather higher quality data than would be possible using any other data-gathering mode. Working in the face-to-face mode, interviewers can build rapport and trust with respondents, thereby minimizing social desirability biases that threaten data quality. Also, although in-person surveys have a long history, they are not technically primitive. Using computer-assisted personal interview techniques, sophisticated experiments can be conducted without recourse to a researcher's lab. Data can be e-mailed back immediately from the field to project headquarters, ensuring the close and continuous monitoring of a survey's progress.

Despite its virtues, the face-to-face mode has significant drawbacks that have prompted some researchers to consider alternative data collection modes. One very serious problem is the high cost. National surveys with large probability samples have become extremely expensive, and their cost is escalating rapidly. Another problem is declining response rates. Although some major in-person surveys continue to have very high response rates, others have experienced a sizable erosion in the percentage of people willing to participate.

Telephone Interviews

Starting in the 1980s, social scientists and commercial pollsters reacted to these emerging problems by employing computer-assisted telephone interview methods, with probability samples chosen by random digit dialing procedures. In addition to their relatively low cost, these surveys can be conducted quickly, with fieldwork completed in a fraction of the time needed for a face-to-face study. This is a very important consideration for researchers interested in monitoring the dynamics of public opinion. Using telephone interviewing techniques, researchers can conduct daily interviews with random subsets (replicates) of larger samples to produce fine-grained portraits of the evolving public mood during national election campaigns. Yet another desirable feature is that telephone interviewing facilitates survey experiments.

These pluses notwithstanding, the attractiveness of the telephone mode has faded in recent years. Response rates have fallen substantially, with implications that are not yet well understood. Although some studies suggest that the impact of low response rates on data quality is not particularly pernicious, deleterious effects may vary by subject matter. Coverage problems are also increasing as people abandon landline telephones for cell phones that are not reached using traditional techniques. And there is emerging evidence of an enhanced social desirability bias relative to other modes.

Self-Completion Questionnaires

Another survey mode is the self-completion, mail back questionnaire. A cover letter, a printed questionnaire, and a self-addressed return envelope are mailed to a list of potential respondents. If the names and addresses of a population of interest are available, a researcher can draw a probability sample and deploy the standard machinery of statistical inference. The self-completion mail back questionnaire also can be used in conjunction with an in-person survey, with the questionnaire being given to respondents after they have completed a face-to-face interview. The interviewer can wait while the respondent fills out the questionnaire or request that it be returned later.

Self-completion questionnaires have enormous cost advantages relative to in-person and telephone interviews. In Australia and New Zealand, national election studies have been conducted quite effectively using mail back questionnaires. The British Election Study and the British Social Attitudes surveys cut costs and expanded their data collections by having interviewers deliver supplementary self-completion questionnaires to respondents when face-to-face surveys were conducted. The response rates for these surveys have been very good. However, the overall report card for self-completion surveys is not stellar. Researchers using this mode typically find that response rates are mediocre to dismal unless careful attention is paid to the incentives needed to secure participation by members of particular study populations.

Internet Surveys

Over the past 2 decades, a new mode, the Internet survey, has become increasingly popular. Internet surveys have several attractive features. Total cost is typically at least an order of magnitude less than that for a comparable in-person survey, and the marginal cost of increasing the sample size is extremely low. These cost advantages make it possible to do extremely large-*N* surveys and to employ multiple waves of data collection to track individual-level dynamics. Low costs also mean that multiple surveys on the same topic can be fielded simultaneously or in rapid succession, thereby making replication a realistic possibility. There is more. Speed is spectacular, and the reach is global; Internet surveys have the ability to enter and exit from the field in countries around the world in a matter of hours. In addition, with the spread of high-speed broadband connections, sophisticated experiments involving a variety of audio and visual stimuli are realistic options.

These exciting features notwithstanding, Internet surveys are controversial. A major sticking point is the failure of the vast majority of Internet surveys to employ probability samples. The reason is a lack of Internet sampling frames for populations of interest. In pioneering work in the 1980s, the Dutch social scientist Willem Saris addressed this problem by recruiting a panel of Internet respondents via initial telephone contact. The Internet coverage problem—that is, that some potential respondents lacked a computer—was handled by giving them one. Saris's methodology was subsequently adopted by the American firm Knowledge Networks. Although the Saris methodology initially seemed to be a sound method for obtaining a probability sample of Internet respondents, it was only as good as the obtained telephone sample. With telephone surveys suffering from declining response rates and increasing coverage problems, the quality of an Internet panel recruited by telephone cannot be assumed. A related problem may be long-term panel retention.

Other Internet survey researchers do not attempt to recruit a traditional probability sample. For example, the British survey house YouGov draws stratified random samples from a huge list of people that it has recruited to its master Internet panel by a variety of non–probability-based methods. Poststratification weights based on demographic characteristics, media consumption patterns, and political partisanship are used to improve sample representativeness. YouGov's U.S. partner, Polimetrix, employs an innovative respondent selection technique in which people chosen at random from large-scale surveys using high-quality probability samples are matched with participants in its enormous PollingPoint panel on several demographic and political characteristics. The panelist with the closest match to the person from the probability sample is then sent an Internet survey. Polimetrix argues that its matched sample estimates outperform poststratification weighting procedures and have a sampling distribution similar to that used for simple random samples. Yet another innovative approach has been developed by George Terhanian of Harris International, who uses a propensity score matching technique to select respondents for Harris's Internet surveys.

Some analyses of the quality of the data produced by these non–probability-based Internet surveys indicate that they can produce results comparable with high-quality probability surveys. For example, the marginal distributions for key variables in the Internet component of the 2005 British Election Study are very similar to those produced by the traditional in-person survey. Perhaps, more important, the vast majority of parameters for models of electoral choice estimated using the two data sets are statistically indistinguishable. YouGov has experienced great success in predicting vote shares in recent British elections; there are similarly encouraging results for U.S. survey data gathered as part of the 2006 Cooperative Congressional Election Study. However, other studies conducted using U.S. data, particularly those by Jon Krosnick and his colleagues, report significant differences between results of analyses of Internet data gathered using panels of respondents recruited by nonprobability means and data gathered using either in-person interviews or Internet questionnaires administered to national probability samples.

These discrepant findings are part of the larger, very lively debate concerning the advantages and disadvantages of various modes of survey research. As this debate unfolds, considerations of cost-effectiveness, representativeness, sample size, speed of data collection, and possibilities for sophisticated experimentation and replication will be key factors that analysts weigh when deciding which survey mode is best able to accomplish their particular research goals.

SUSTAINABLE DEVELOPMENT

Sustainable development was famously defined in the 1987 *Report of the World Commission on Environment and Development* (The Brundtland Report) as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Long accepted as a guiding notion aimed at reconciling developmental and environmental concerns, the concept has been criticized as being based on the anthropocentric notion of nature as a resource requiring expert human management. Others point out that this is too closely linked with notions of capital-intensive economic development to be of any use in the formulation of an alternative environmental vision that can restore the balance in human interaction with the ecosphere. Proponents and detractors of the concept agree that it is a vague notion that can be interpreted in divergent ways, depending on whether the emphasis is placed on development or on resource sustainability, on economic development only, or on broader notions of *human* development. Despite the appropriateness of these and other criticisms, there is no evidence that the concept is soon to lose its privileged position in the national and international politics of development and the environment.

Development refers to the process of increasing people's welfare. The welfare of a group ultimately depends on the extent and quality of stock of all natural and human assets in their economy—commonly referred to as *wealth*. The notion of sustainable development reminds us that current changes in wealth must have consequences for welfare in the future of both the current generation and generations to come. Attempts to increase people's welfare must therefore be accompanied by *genuine savings* in wealth: the offsetting of resource depletion and environmental degradation, limiting exhaustible resource exports, protecting critical natural capital, and maintaining and increasing investment in human resources.

Intergenerational and Global Inequality

Sustainable development's biggest contribution is to broaden the scope of ethical thinking to include future generations among those to whom we owe obligations. It also holds important consequences for the practices of national accounting and for issues of global governance. Appreciation of the importance of genuine savings implies that we have to look anew at national accounts and indicators of development. Analysts have long agreed that national production and income figures provide little evidence of the fundamentals of development, as they indicate only how successfully the current generation is exploiting resources. With its measure of *human development* the United Nations (UN) Development Programme and its annual *Human Development Reports* have attempted to introduce a broader and intergenerational measure of development by combining data about education and health with national production/income figures. However, the literature on sustainable development prescribes that we also consider how countries manage their natural and human resources with an eye to the future. Income ratios between the rich and poor have converged in recent decades (according to some measures and in some parts of the world) and infant mortality is declining across the majority of countries. There is also a perceptible narrowing of average human development index scores over time in the cross-sectional data. Some analysts take this as indicative of a narrowing of inequality between countries (which is only one but a very important dimension of the phenomenon of global inequality). However, when we measure in what shape the production processes and social policies of the industrial era have left the human and natural resource base of many parts of the world, it is clear that a devastating global divide is widening between those parts of the world where genuine savings have kept pace with population growth and those where fertility increasingly outstrips genuine savings. The evolution of this *genuine savings divide* is a tale of the misuse of power and the generation of privilege and of marginalization, and it places humankind before one of its most daunting policy and moral challenges: how to reduce global poverty and inequality *now* without exacerbating both in the *future*. Unfortunately, the international politics of sustainable development makes it unlikely that we will be able to meet that challenge anytime soon.

Sustainable Development and International Politics

From its inception, the term *sustainable development* has had a bearing on international politics. In the late 1960s and early 1970s, the newly independent industrializing countries of the South started to use UN resources to frame their needs for economic modernization in terms of the structural inequities of the global economy. The emerging green political revolution in the industrialized states, precipitated by reports of imminent resource scarcity, compelled leaders of the rich North to focus on possible causal links between economic modernity and environmental degradation. In contrast, John Vogler argues, the leaders of the South coalition in global affairs saw their own rapid economic modernization, supported by generous official development assistance from the industrialized North, as the solution for the interrelated problems of poverty and environmental degradation.

These diverging conceptions of the relationship between development and protection of the environment were carried into the 1972 UN Conference on the Human Environment held in Stockholm but were largely left unresolved. Nevertheless, Stockholm led to the mainstreaming of environmental concerns both internationally and nationally and precipitated, among others, the formation of the UN Environment Programme and the creation of departments of environmental affairs in many countries. It was only with the publication of the Brundtland Report in 1987 and the UN Conference on the Environment and Development (Rio "Earth Summit") of 1992 that it became possible diplomatically to strike a tenuous balance between the interests of the North and the South. The concept of "sustainable development"—first popularized in the Brundtland Report and then institutionalized at Rio with the creation of the Commission for Sustainable Development—persuaded the leaders of the South that after the end of the Cold War development issues were to be placed at the center of world attention. When the Rio Declaration and the UN Framework Convention on Climate Change (UNFCCC)—two of the major outcomes of Rio—formulated the principle of "common but differentiated responsibilities," the long-standing resource concerns of the South also seemed to be alleviated. On the other hand, the term *sustainable development* and its operationalization at Rio also came as a bonus for the leaders of the North, as it allowed them to satisfy the demands of their increasingly environmentally conscious electorates to mainstream environmental issues; to build up domestic modi vivendi between agriculture, business, and environmental activists; and to attempt to add environmental standards as a new weapon in their protectionist armor.

Problems and Future Prospects

While the normative framework of sustainable development continues to be the focal point on which global environmental and developmental regimes converge, it appears as if the underlying bargain that was struck at Rio is eroding. Bitterly disappointed by the failure of the North to live up to its resource-sharing promises, and after the indecisiveness of the Johannesburg World Summit on Sustainable Development in 2002, emerging centers of power in the South are falling back on a distributive bargaining strategy in global negotiations on development, the environment, and international economic interaction. This is evident in their vocal resistance to the inclusion of environmental issues in trade negotiations and in their resistance to accept any climate change mitigation deal that will undermine their economic modernization. Having been conned before by *sustainable* development, the major countries of the South are adamant not to let their "right to develop" be compromised by a deal on the mitigation of greenhouse gas emissions, no matter how persuasive the case for mitigation is. With growing concerns about fuel and food shortages becoming more common in the first decade of the new millennium, the emphasis for the leaders of the South again falls on how to make *development* sustainable.

Both conceptually and politically, the notion of sustainable development thus seems less sustainable than it was in 1992. However, there is no conceptual or normative challenger in sight, and it remains embedded in numerous dimensions of global and national governance. Successive secretaries general of the UN have elevated the notion of sustainable development to an overarching norm in multilateral attempts to secure global public goods. These efforts no longer include only government leaders, but they also include transnational nongovernmental organizations and private corporations. The very definition of a global public good favored in the UN system is based on the idea that a public good can claim to be global only if it allows for nonexcludability and nonrivalry across generations.

Its institutionalization at the highest governance levels has allowed the notion to contribute a range of principles and managerial tools to the governance of the environment, both nationally and internationally. Among the lasting principles that it has contributed are the so-called precautionary principle that is now deeply ingrained in multilateral negotiation practice, the notion of common but differentiated responsibilities, the importance of taking an ecosystem approach in dealing with challenges, the "polluter pays" principle, and the principle of environment policy integration. In recent years, emphasis has also shifted to the political conditions of sustainability: subsidiarity (i.e., that decisions should be taken at the appropriate level of governance), participation by and responsiveness to the people directly affected by decisions, and gender equity.

The concept of sustainable development has also presided over the emergence of international environmental law dealing with the protection of the ozone layer, the protection of biological diversity, biosafety, the protection of natural forests, the combating of desertification, and the stabilization of climate change. It has also had a profound effect on corporate governance, where it joins profitability and social responsibility as one of the three "bottom lines."

Political scientists have good reasons to be interested in sustainable development. First, the concept prompts a broader, more inclusive basis for ethical deliberation by introducing intertemporal considerations (i.e., an analysis that takes into account a large span of time). Second, sustainable development has become an integral part of the contemporary state's managerial apparatus. Third, it progressively has become the normative focus around which the global governance of the environment converges. Fourth, it adds a significant new dimension to distributive battles between the industrialized North and the industrializing South and to analytical attempts to measure inequality between states. Finally, the concept itself continues to be politically highly contested.

SYMBOLS, POLITICAL

Political symbols are signs (images, flags, slogans, etc.) that represent political reality. Political symbols constitute the foundation for the cognitive, emotional, and psychomotor processes with which individuals evaluate the political sphere. Political symbols can be used strategically in a quest for political power; they may, however, also have unintended consequences. This happens because the interpretation of political symbols is not only informed by predefined notions but is the social, political, and cultural context that adds another dimension of meaning to a given set of political symbols.

Political symbols reduce the complexity of politics by making references and increasing the amount of information in the communication process. While the term *political symbol* describes the objects of political communication, the term *symbolic politics* subsumes the occurrence of a specific process of political communication. In habitual language, symbolic politics means a publicly displayed deception or surrogate action that is used to detract from actual political reality. In this sense, symbolic politics is considered to be a surrogate for politics. Symbolic politics differs from substantial policy. As a policy of signs (terms and slogans, badges, banners and pictures, gestures, ritual acts, and political staging), symbolic politics evolves in a semantic field. Substantial policy, by contrast, consists of a revisable succession of political decisions (e.g., legislation, contracts, and taxes). Symbolic politics and substantial policy can be related to each other. On the one hand, symbolic politics can have an impact on substantial policy. On the other hand, substantial policy can be communicated, implemented, or averted by symbolic politics. In the following sections, the relationships between political symbols and symbolic politics and their various functions are discussed.

The Use of Signs and the Nature of Symbolic Politics

Political symbols/symbolic politics constitute a specific dimension of how we construct, represent, and perceive political reality. As is always the case, when we deal with the reality of social phenomena, this happens against a backdrop of questions concerning the difference between substance and appearance. The negative connotation of symbolic politics, which is often expressed in public opinion polls, does not correspond to the more sophisticated view of symbolic politics in cultural studies and the social sciences, for symbolic politics in a broader sense also means the strategic use of signs to meet society's requirements of political orientation. Attention may be attracted; willingness to engage in political action, to express loyalty, or to demonstrate protest may be shown by symbolic politics. In doing so, the symbolic value of signs is converted into political power.

This process is not a common cultural, philosophical, or epistemological phenomenon of nomination or interpretation. The use of symbols in politics is the expression of a struggle for a certain view of life. Thus, questions of dominance or subordination are involved, resulting in the tendency to unilaterally implement or achieve by mutual agreement what should be generally binding. The strategic use of symbolic instruments in politics does not simply aim at achieving interaction. Political symbols are neither mere decorative attachments nor ideological ballast, in contrast to "real" politics. Symbolic politics was, and is, still an integral part of political communications in the media society and thereby of politics in general. Thus, symbolic politics is not restricted to acts of state with ostentation, national commemoration ceremonies, or mass rallies. Precisely because there is no pure form of politics—it is more or less always a dual reality of occurrence and interpretation—there is a need for the use of symbolic means.

Symbols have a constitutive meaning for social reality in an all-embracing cultural and philosophical sense. They are neither simply an image of reality nor an exponent of its objects but, as the philosopher Ernst Cassirer (1985) points out, are a medium for the perception of reality and thus part of the aesthetic construction of the world. They create a transcendental precondition for the construction of human reality. From a sociological point of view, social reality is not perceived by firsthand experience but by a symbolic world of meaning. This symbolic world can overlap or assimilate antithetical parts of everyday life.

An important impulse for the international debate about symbolic politics was provided by Murray Edelman in his works *The Symbolic Uses of Politics* (1964) and *Politics as Symbolic Actions: Mass Arousal and Quiescence* (1971). He argues in favor of an analysis of political power based on substantiated social theory. Edelman ties in with the basic assumptions of the symbolic interactionist and the interpretative school of sociology, as exemplified in the work of George Herbert Mead (1863–1931), which propagates the extension of normative and institutional political concepts by affective and evaluative aspects of politics. He understands political action as playing a certain role, which finds its expression in dramatic or symbolized form. Edelman connects subjective and intersubjective forms of analysis—microphenomena—with the production of general binding decisions—macrophenomena. Referring to Walter Lippmann's (1922/1997) classic study of public opinion, he draws the conclusion that politics is too complex to be accessible to the public. Instead of improving real conditions, a dramatic symbolic scene of abstractions appears. A panoptic view is built by images, staging, and symbols. This surrogate world may refer to objective reality ("referential symbols"). But then there are also "condensation symbols," which deceive about reality. Permanently installed democratic rituals encourage belief in political participation and rational acts of state, even though they are instruments of political "quiescence." Publicly communicated policy is becoming ritual, a political sport for spectators. According to Edelman, political symbols and symbolic politics are becoming instruments of manipulation for political elites.

To a large extent, there has been no result in the critical debate initiated by Edelman to correlate the assumed real politics and their legitimation by symbolic politics. Furthermore, symbolic politics has to deal with collective actors and institutions that are symbolic regimes themselves, being central elements in forming, stabilizing, and transforming social relationships. Political symbols/symbolic politics are successful when they make room for interpretations that are compatible with the way a culture endows its politics with meaning. As Pierre Bourdieu (2000) observed, symbolic politics is successful if it refreshes a specific repertoire of interpretation that can be affiliated to the culture of political interpretation or "symbolic space."

So symbolic politics, in the sense of pseudopolitics, is just a negative special case of a fundamental aspect of political acting that always has instrumental and expressive parts. Four fundamental functions of symbolic politics can be defined:

- Political symbols as well as symbolic politics have a signal function: They attract attention, breach routines for providing or placing information, organize the perception of politics, and contribute to the reliability of behavior.
- By decreasing complexity, they provide a regulator to cope with the mass of information.
- The use of political symbols not only aims to denominate political circumstances but is also a part of the political fight for the disposal of denomination.
- By perceiving symbols in a mode of suggestive immediacy, symbolic politics not only addresses rationality but also activates emotions.

Conclusion

Symbolic politics is policy and as such neither principally good nor bad. It is an essential component of political communications. Symbolic politics is not an invention of a media society. However, the permanent presence of politics in the media and a high-level display of modern media systems bring about responses concerning mediation and the impact of "symbolic power" (as portrayed by Bourdieu) to an extent that has never occurred in history before. The mere existence of symbolic politics is not itself a political problem. A striking question concerns its quality. An analytical, differentiated evaluation may result from varying stress ratios: between retrogressive or reflexive, withdrawn to privacy or active citizenship, relating to persons or relating to factual issues, entertaining or informative, causing emotions or solving problems, concerning actors or concerning affected persons, being hermetic or proceeding from an idea to logically following an idea, and so on. By using such an analytical concept, an incorrect dualistic understanding can be avoided, one that regards symbolic politics as being a phenomenon of political acting on stage, while "real" politics are seen as taking place backstage. Politics, including symbolic politics, are played on many different stages at the same time. In this action, politicians can only succeed if they know how to play different roles and are able to use symbolic politics.

Research concerning symbolic politics shows serious gaps. In cultural studies, the dominant interpretive of symbolic politics should be reinforced with an analysis of social sciences, especially with the results of evaluation research. Researching symbolic politics should not be restricted to a view on the interior logic of systems of symbols. It should contain the structure of material and pragmatic problems, as is the case in various cultural-historical evaluations. An analysis of symbolic politics has to evaluate the relationship of symbolic and pragmatic means in structures of political interpretation and construction. By detecting coherences and antitheses between the logic of fact and the logic of presentation, such an analysis can contribute toward understanding the logic of the function of the political dimension as well as the rating of political communications according to the quality of democracy.

SYSTEMS THEORY

Systems theory is a science that has the comparative study of systems as its object. There are different types of systems: organisms (animals, humans, and particularly cognitive mechanisms in organisms), machines (particularly computers), physicochemical systems, psychic systems, and social systems. Such a comparative research program for heterogeneous types of systems presupposes a highly general concept of systems, for which numerous features have been proposed: the interdependency of the parts of a system, the reference of any structure and process in a system to the environments of the system, equilibrium and adaptedness and continuous readaptations to environmental demands as core elements of the understanding of a system, self-organization of a system as the principal way it responds to external intervention, and complexity as a trigger mechanism for system formation and as the form that describes the internal network structures of connectedness among system elements. After examining the historical roots of general system theory, this entry focuses on the main two theories that have been elaborated in social sciences from this perspective.

General System Theory, Information Theory, and Cybernetics

Systems theory is an understanding related to those definitions developed in the years after 1940 on the basis of suggestions from biology (the "general system theory" of Ludwig von Bertalanffy), physiology (Walter B. Cannon, Walter Pitts, and Warren McCulloch), and information theory and cybernetics (Claude Shannon, Norbert Wiener, and William Ross Ashby). Particularly, the idea by Shannon and Wiener of defining information as a selection among alternative possibilities turned out to be a generalization transcending heterogeneous systems and pointing to systems theory as a kind of general selection theory. This was connected to the strictly binary way of operation Pitts and McCulloch postulated in a paper on nerve cells published in 1943. This idea that at any branching of nerve cells there are only two alternative states available proved to be the simplest suggestion of how to make use of a network of cells for long chains of numerical operations. From this came the computer and, at the same time, came more general ideas regarding the operational realities of any observing system whatsoever.

Since its beginnings, the social sciences were an important part of the establishment of systems theory. Jürgen Ruesch and Gregory Bateson were in 1951 the first who tried to base a social science discipline on an information and communication theory coming from cybernetics (*Communication: The Social Matrix of Psychiatry*). But the two most influential suggestions were the comprehensive sociological versions of systems theory that were proposed by Talcott Parsons and Niklas Luhmann beginning in the 1950s and the 1970s, respectively.

Talcott Parsons

Parsons (1902–1979) had been influenced by equilibrium ideas from physiology (Cannon), the system–environment thinking of the Harvard physiologist Lawrence Henderson, and the duality of information and energy that Wiener had proposed. From these materials, he developed a sociological systems theory. Social systems are related either to the internal environment of other social systems or to external nonsocial environments (psychic, biological, and cultural environments). Furthermore, they differ in the way they refer to time: They are either oriented toward realizations in the future or to satisfactions of needs in the present (*instrumental* or *consummatory*). From these two distinctions, internal/external and instrumental/consummatory, Parsons derived four possibilities for the formation of systems: first, there are *adaptive* systems (combining external reference and future orientation, e.g., the economy); second, systems that are specialized on *goal attainment* (internal reference and future orientation, e.g., the polity); third, systems focused on *integration* of system elements (internal reference and present orientation, e.g., the society conceived as a community); and fourth, systems that are responsible for the *maintenance* of long-term *patterns* (external reference and present orientation, e.g., cultural institutions in society).

There is one further aspect that Parsons adds to this elementary distinction of the four types of systems. Among these four system types, he distinguishes those in which a primacy of the *transfer of information* obtains all cultural institutions and systems from those that are focused on transfers of energy (e.g., the adaptive economic system). Information-rich systems *control* energetical systems. These, on the other hand, are thought of as *conditioning* factors that limit the scope of information-rich systems. This argument was taken from Wiener, and Parsons derived from it a bidirectional hierarchy of conditions and control that interrelated all types of systems.

On the basis of these elementary distinctions, Parsons worked for a further 3 decades on a social theory that identified in any concrete social system these four universal functional aspects (adaptation, goal attainment, integration, and pattern maintenance), which often constitute autonomous subsystems of the respective system. In an analogy to economics, he then added input–output analysis. Systems and subsystems are interrelated via the input and output of resources that are either the result or the precondition of ongoing system processes. Among these resources are the cognitive and motivational resources of participants and the rights and values that are attributed to them. These different types of resources are transferred in exchange processes between systems. For analyzing these exchange processes going on between systems, without which systems would never be able to procure the resources they need for their functioning, Parsons created a theory about *media of exchange*.

Parsons started again with an analogy to economics in theorizing about media of exchange. He postulated that there is first of all *money* in its economic function as a medium of exchange, well-known to economists. Then, he added *power* and argued that it is best understood when analyzed as analogous to money, as an exchange medium that mediates the transfer of resources (decisions, support, responsibility, etc.) important in political processes. And after having written theories for power and money, Parsons added further media of exchange for input–output processes between systems, among which *influence* and *value commitments* play an especially prominent role on the level of societal exchanges.

In continuing his decades-long work on media of exchange between systems, Parsons affirmed once more the cognitive starting point of systems theory in the 1940s: Systems theory as an interdisciplinary endeavor making use of intellectual resources, from the sciences as well as from the humanities, always focused on strategies for comparing heterogeneous systems and diverse system processes.

Niklas Luhmann

Luhmann's (1927–1998) writings always presupposed what Parsons had done. But it is also true that he started systems theory anew. For him, the system–environment distinction as inspired by Ludwig von Bertalanffy's theory of open systems was a much more important starting point than it was for Parsons. Whereas for Parsons the environment of a social system always consists of other systems, for Luhmann, a phenomenological understanding of *environment* is far more prominent—one that looks at the *difference* between system and environment, environments being structured in a completely different way than is the case in systems. *Order from noise*, the formula of Henri Atlan, which Luhmann later on cited very often, gives a good idea of concepts of environment that look for contrasts and for differences and not for a simple plurality of other systems.

From the start, *complexity* was another central term in Luhmann's writings. Systems process complexity; they arise by establishing and stabilizing the difference in complexity with respect to their environments. As is the case in the work of Wiener and Bateson, systems for Luhmann are those originating in communications, and as such they are based on a way of processing information that Luhmann calls *meaning*. Meaning is formally similar to information as it is based on something being a selection among plural alternatives. But what is characteristic of meaning and thereby constitutive for social and psychic systems, as the two types of systems making use of meaning, is that the alternatives not chosen are still remembered. One can come back to them, one can criticize selections by pointing to the alternatives that were available, and one can write history on the basis of this dual structure of meaning.

For Luhmann, too, systems have a functional orientation. They specialize in certain problem solutions characteristic and constitutive of them. But he completely refrains from making a finite catalog of the basic functions that have to be dealt with everywhere. Instead, every system is conceived to be singular in fulfilling the functional need that somehow was the catalyst around which the process of system formation came about as a historical and a contingent process. Sports, for example, is a global function system in present-day world society. But the formation of this system is contingent on the improbable synthesis of very heterogeneous traditions (the hunting and riding traditions of the European nobility, boxing and wrestling as popular amusements in early-modern Europe, ball games in English public schools, the gymnastics of Northern Europe, etc.). On the basis of such examples, one can understand that for Luhmann, modern society consists of huge and global function systems for economic relations, science, religion, law, and intimate relations—and for a number of other functional problems in communication. Functional differentiation is the guiding principle of differentiation in contemporary society.

Further elaboration of the theory then was done by work on three theories that were added to the theory of social systems. There is a theory of sociocultural evolution, conceived as a neo-Darwinist theory, which analyzes how structure formation is possible on the basis of chance events. Second, Luhmann reformulates the Parsonian theory of media of exchange that mediate input–output processes between systems as a theory of communication media, which are conceived as being internal to functional systems. These communication media are effect mechanisms. They are based on symbols that are thought to be effective in communication—such as symbols of money, power, truth, or love—and as such effective symbols, motivate other social actors to do something they would not otherwise have done. In this version of the theory there is no exchange implied, as communication is not understood as an exchange process. Third, Luhmann works out a differentiation theory that embeds the empirical core diagnosis of functional differentiation into a more general theory of forms of system differentiation, including segmentation and stratification. The guiding idea is once more to have an instrument for doing comparative research on social systems. Different historical formations can be compared by looking at the forms of system differentiation that are dominant in them.

A further shift in the foundations of systems theory arose in the late 1970s as the result of a new interdisciplinary import. Luhmann adopted the theory of *autopoiesis* proposed by Humberto Maturana and Francisco Varela, which differs from the Bertalanffy tradition of open systems in looking at systems (e.g., cells) as being completely closed on the basis of their own production processes. Whatever they consist of—elements, structures, processes, or boundaries—systems are conceived to produce all their elementary constituents by their own production processes. Luhmann connected this hypothesis to communication theory. He then described social systems as autopoietic communication systems, which always produce and reproduce a specific type of communication (e.g., payments in the economy or published truth claims in the social system of science) and which do this only on the basis of processes internal to the system. At the same time, he held on to the primacy of the system–environment distinction. Regarding autopoietic systems, this means that for them, too, it is true that they only can continue their processes of production and reproduction of their components if they incessantly observe their relevant environments and generate information instructive for their production processes on the basis of these observations.

Systems Theory Today

Systems theory today continues in its two variant forms: first, as general systems theory, primarily influential among some biologists, chemists, physicists, and mathematicians and holding an important institutional place in the Santa Fe Institute and, second, as a paradigm of sociological theorizing and research, linked to the writings of Parsons and Luhmann. As a sociological paradigm, it is attractive because of its universalism, conceiving a multifaceted approach to the analysis of social systems that, in the plurality of theoretical approaches it brought about, promises to be applicable to a whole range of problems relevant for sociology. In political science, this tradition was deepened by David Easton (1953), who opened the way to a more empirical use of the concept of "political system" that was clearly compatible with the behavioralist approach to politics and challenged the classical use of the concept of the state. Strongly present during the 1960s, this tradition faded by the end of the 1970s.

Tax Policy

Taxes are monetary charges imposed by governments on natural or legal persons. They are compulsory and unrequited: Taxpayers are legally obliged to pay taxes and cannot expect to receive any specific benefit in return, such as a piece of public property or a particular health care treatment in a public hospital. Taxes are not fees. While taxes are ostensibly collected for the sake of the public good, the liability of the individual taxpayer is independent of the personal utility he or she derives from that good. Taxes are levied in virtually all countries of the world. They constitute the major source of revenue of the modern state.

This entry deals with tax policy generally. It considers the major types and purposes of taxation, reviews common trends and national variations in the tax policy of advanced Organisation for Economic Co-operation and Development (OECD) countries, reflects on the causes and constraints of tax policy making, discusses the effects of taxation on growth and inequality, and highlights specific features of taxation in developing countries.

Types of Taxes

It is conventional to distinguish between direct and indirect taxes. A direct tax is paid directly to the government by the (natural or legal) person on whom it is imposed. Direct taxes are usually based on the taxpayer's ability to pay. The most important direct tax is the individual income tax levied on the labor, capital, or other income of a person or household. Other important direct taxes include the corporate income tax on business profits, the property tax on real estate holdings, the wealth tax on net worth, the inheritance tax on bequests, and social security contributions. An indirect tax is paid to the government by a person different from the person on whom it is imposed. The most important examples are general consumption taxes, such as the value-added tax (VAT) or the sales tax, and specific consumption taxes, such as excises on fuel, tobacco, or alcohol. These taxes are indirect in the sense that they are imposed on the consumers of goods and services but paid to the government by the seller of the goods or services. In contrast to direct taxes, indirect taxes cannot take into account taxpayers' ability to pay. While poor people usually pay less income tax, absolutely and relatively, than rich people, they always pay the same rate of VAT or excise.

Another typology sorts taxes according to their presumed distributive effect. The individual income tax is usually considered a progressive tax because it typically combines a progressive statutory rate schedule with a personal exemption for a minimum level of income. Both features ensure that income earners pay progressively more of their income in tax the higher their earnings. Corporate income, property, and wealth taxes are also often considered to be progressive. Social security contributions, by contrast, can be considered proportional to the extent that they are charged at flat rates and with little or no personal exemption. Often they are charged only up to a maximum level of income. This tends to make their distributive effect regressive because taxpayers with incomes above the income cap owe an ever smaller share of their income to social security contributions the more they earn above the income cap than taxpayers with income below the cap. General consumption taxes and excises are commonly considered to be regressive because the share of income spent on consumption tends to decrease as the level of personal income increases. The theoretical basis for distinguishing taxes according to their distributive impact is shaky, however. The link between corporate income taxation and tax progressivity, for example, is by no means clear and crucially depends on assumptions about incidence. There is also empirical evidence to suggest that common intuitions about the distributive effects of taxes are often inaccurate. For example, income and property taxes are not invariably progressive in end effect and may sometimes even be regressive.

Purposes of Taxation

According to the American economist Richard Musgrave (1959), taxation serves three broad purposes, which are discussed below.

Resource Allocation. Taxes allocate resources to the public sector. This is the obvious fiscal function of taxation. During the 19th and 20th centuries, alternative sources of revenue—ownership of productive resources, sales of public office or monopoly power, coercive confiscation of domestic or foreign wealth, monetary debasement—decreased in significance. For the modern state, taxation is the single most important source of government revenue. Taxes can also improve resource allocation in the private sector, for example, by forcing actors to internalize externalities, as in environmental taxation or tobacco and alcohol taxation. Hence, taxation may also serve a regulatory function for private resource allocation.

Redistribution. Taxation is one major instrument to reduce inequalities in the distribution of income and wealth either directly through tax progressivity or indirectly through funding redistributive expenditure programs.

Stabilization. Taxation, together with public expenditure, monetary policy, and public debt, can help stabilize the business cycle and ensure high levels of employment and growth.

Common Trends and National Variations

Tax policy in advanced OECD countries has followed broadly similar trends over the past 50 years in terms of tax level, tax mix, and tax design, but significant national variations remain.

The level of total taxation has risen in all advanced OECD countries. Taxation as a share of GDP grew from roughly 25% on average in 1955 to 38% on average in 2005. The level of taxation is highest in Nordic countries, such as Sweden (49% of GDP in 2005) and Denmark (51%). It tends to be below average in Anglo-Saxon countries, such as Australia (31%). IT is also below average in the United States (28%). Tax levels in continental Europe and in Mediterranean states lie between these extremes.

The tax mix has grown more uniform. All advanced OECD countries derive the bulk of their tax revenues from just three taxes: individual income tax, social security contributions, and a general consumption tax, usually a VAT. While these taxes accounted for only about 45% of total tax revenues on average in 1955 and for as little as 21% and 23% of total revenues in Ireland and Portugal, respectively, by 2005, they accounted for an average of 71% of total tax revenues. Other taxes, the most important of which are excises on specific goods and services, have lost in fiscal importance. Significant national variations still remain in the relative reliance on the three major taxes though. Anglo-Saxon countries tend to rely more heavily on the individual income tax (and also the corporate income tax) than other OECD countries but less on general consumption taxation and social security contributions. Australia and New Zealand collect no revenue from social security contributions at all. Continental European and Mediterranean countries, such as Belgium, the Netherlands, Germany, France, Portugal, and Spain, tend to rely disproportionately on social security contributions, while the revenue raised through individual income taxes is often below average. Finally, Nordic countries rely heavily on income tax (but not corporate income tax) and

VAT but less on social security contributions. Denmark is the extreme case, raising almost 50% of total tax revenue through income tax and 20% through VAT but hardly anything through social security contributions in 2005.

In terms of tax design, the most prominent recent development in income taxation has been the flattening of the statutory rate schedule. The top individual income tax rate fell from an average of almost 70% in advanced OECD countries and more than 90% in the United Kingdom and Japan in 1975 to an average of slightly below 48% by 2005. In some states, rate cuts were accompanied by a move away from a global income tax, under which income from whatever source is aggregated and subjected to a single rate of tax, toward a so-called schedular income tax, under which income from different sources is taxed at different rates. Thus, interest income is increasingly subjected to a separate final withholding tax outside the individual income tax in OECD countries. The so-called dual income tax, introduced in Norway, Sweden, and Finland in the 1990s, separates the taxation of capital and labor income completely, subjecting only the latter but not the former to taxation at high progressive rates. Corporate income taxation has been characterized by a general move toward lower statutory tax rates and broad tax bases since the 1980s. The dominant trend in consumption taxation has been the spread of VAT since the 1970s. In 2010, all OECD countries except the United States had a VAT. At the same time, the number of excises has generally fallen, and some new environmental taxes have been introduced.

Determinants of Tax Policy

Various factors shape the choice of tax level, tax mix, and tax design, including public spending, administrative capacity, domestic politics, and international influences.

Public spending has increased even faster than total taxation over the past 50 years. It went up from 27% of GDP on average in 1950 to 45% on average in 2005. The main driver behind the growth in spending was social expenditure. As the welfare state expanded, the outlays for social purposes went up. Social expenditure now accounts for more than 50%, on average, of public spending in advanced OECD countries and explains virtually all the variance in national tax levels. The major difference between high-tax and low-tax countries is simply that the former have a large welfare state while the latter do not. While the close association between public spending and taxation is obvious, the direction of causation is more contested. Some, such as Junko Kato (2003), argue that the establishment of high-performance tax systems preceded and enabled the growth of large welfare states, while others, such as Peter Lindert (2004), maintain that high taxation is a consequence of high levels of social expenditure.

According to B. Guy Peters (1991), administrative capacity has a major influence on the level and shape of taxation. Early taxes, such as tolls, tariffs, excises, and property taxes, targeted the easy-to-monitor bottlenecks of economic activity. This helped economize on scarce administrative resources but was economically distorting and fiscally ineffective. As administrative capacities grew during the 20th century, these bottlenecks were relieved, and the tax burden was spread more widely and efficiently. Tolls, customs duties, and excises were replaced by general sales taxes and, since the 1960s, by the technically superior but administratively complex VAT. In direct taxation, property and wealth taxes were supplanted by income tax. The spread of the withholding method of income tax collection since the 1940s, whereby the tax due is retained ("withheld") by the income's paying agent (the employer or bank) rather than the income earners themselves, facilitated the conversion of an income tax originally restricted to the upper class into a mass tax and increased the timeliness and buoyancy of tax collections. Problems of assessment, monitoring, and enforcement also explain why, for example, capital (net wealth, capital gains, owner-occupied housing) or fringe benefits are usually taxed more leniently than labor income or why financial services are often exempt from VAT even though they constitute an important part of economic activity.

Taxation is a major issue in domestic politics. It is commonly assumed that left parties favor high and progressive taxation because their core constituency comes primarily from the lower half of the income distribution, while right parties prefer moderate levels of proportional or regressive taxation because they represent the upper half of income earners All else being equal, high levels of inequality should move tax policy to the left, low levels to the right. However, various contextual factors modify or even reverse this simple logic. First, electoral competition is usually multidimensional, and this tends to moderate the parties' policy positions on any one dimension, including taxation. Second, left-party governments may be deterred from high, progressive taxation by the possibility of negative macroeconomic consequences. Actually, left governments in Sweden and elsewhere have often opted for regressive consumption taxes and social security contributions rather than progressive income taxes, to fund social spending. Finally, institutional factors shape the translation of party preferences into government policies. Consensus democracies, characterized by multiparty systems, proportional representation electoral institutions, broad coalition governments, interest group corporatism, and strong judicial review, decrease the responsiveness of tax policy making to the policy preferences of the median voter, while majoritarian systems with two-party systems, majority elections, single-party governments, and interest group pluralism tend to increase it. Some argue that this difference explains why majoritarian Anglo-Saxon democracies rely more heavily on progressive income taxes and corporate taxation than the more consensus-oriented continental and Nordic European countries: In these countries, as noted by Jude Hays (2009), the majoritarian impulse to impose heavy taxes on the rich has been kept in check by multiple veto players, while in majoritarian Anglo-Saxon democracies, it dominates tax policy making during periods of leftist government.

Various international influences shape national tax policy making. One is the diffusion of tax policy examples and ideas across national borders. It has been argued, for example, that the highly visible "market-conforming" 1986 U.S. Tax Reform Act triggered a wave of reform in other OECD countries, which emulated the U.S. example and established a new, "neoliberal" tax policy orthodoxy. This may account for the general trend toward low statutory tax rates and broad tax bases in corporate and individual income taxation. International organizations can also influence national tax policy. The European Union (EU) severely constrains the freedom of its member states in matters of tax design and administration by detailed tax harmonization in indirect taxation and through the case law of the European Court of Justice in direct taxation. The influence of other international organizations is more selective and less obvious. The World Trade Organization stipulates international norms for the tax treatment of international trade. The so-called OECD Model Tax Convention, which serves as an almost universally accepted blueprint for bilateral double-tax-avoidance treaties, exerts some soft harmonizing pressure on national income taxation by defining basic tax concepts that have become established features of national taxation, such as the distinction between active and passive income or between subsidiaries and permanent establishments. Also, OECD revenue statistics, by defining a common classificatory frame for the comparison of national taxes, exerts subtle pressure to design national taxes such that they can be fitted into this frame. Finally, national tax policy is constrained by international tax competition. Tax competition has been a major driver behind the general fall in corporate tax rates since the 1980s. Corporate tax revenues remained largely unaffected partly because of the offsetting effects of broadening the tax base. But the corporate tax burden shifted from high-profit firms, which benefit most from low rates, to low-profit firms, which suffer most from base broadening. Arguably, individual income tax also suffered because low corporate tax rates increase the incentives for rich individuals to shift income into the corporate sector in order to protect it from taxation at the top individual income tax rate. Generally, tax competition is more constraining for small states than for large states: They suffer more in terms of tax base flight if they try to maintain high corporate tax rates. However, they also potentially benefit more from undercutting foreign tax rates. Ireland has set aggressive corporate tax rates to speed up national economic development, and many new EU member states in Eastern Europe have tried to emulate Ireland's apparent success.

Taxation and Economic Growth

Perhaps surprisingly, there is little evidence for a negative correlation of economic growth and taxation. High-tax states do not systematically grow more slowly than low-tax ones in the OECD area.

Most observers agree that a crucial key to explaining what Lindert (2004) called the "free-lunch puzzle" is that high-tax, high-spending welfare states in Scandinavia and continental Europe have a more growth-friendly tax mix than the relatively low-tax Anglo-Saxon states. Some highlight the fact that the former group of states relies more heavily on regressive taxes on labor and consumption (social security contributions, VAT, and excises on alcohol, tobacco, and fuel) and less on progressive income taxes than the latter. As Lindert notes, a more regressive tax mix is said to promote growth by reducing the disincentive effects of taxation. Progressive taxes purportedly discourage extra effort by subjecting extra income to a higher tax burden; regressive taxes encourage effort by rewarding extra income with lower effective tax rates. Others note that progressive taxes may also stimulate growth. A progressive tax system is praised for putting money into the hands of those most likely to spend it—namely, the poor. According to Achim Kemmerling (2009), a progressive tax system invigorates the labor market by facilitating the take-up of low-wage work and by discouraging wage drift, and it smoothes disposable income over the business cycle and, thus, helps stabilize the macroeconomy. From this perspective, continental European and Scandinavian tax mixes appear more growth friendly than the Anglo-Saxon tax mix, not because they are more regressive but because they burden capital less. Steffen Ganghof (2006) suggested that focusing taxation on labor and consumption stimulates savings and investment and, therefore, innovation and employment.

Taxation and Inequality

Taxation can reduce income inequality either directly, by a progressive rate schedule that imposes a higher tax burden—relatively and absolutely—on the rich than on the poor, or indirectly, by funding redistributive social expenditure. According to Lane Kenworthy (2008), while advanced OECD countries rely on both strategies, they generally achieve more inequality reduction by social expenditure than by progressive taxation. The redistributive effects of both strategies are not completely equivalent though. While poverty alleviation calls for social expenditure because the poor have little or no taxable income to begin with, the reduction of high-end income inequality calls for progressive taxation because the rich do not depend on social transfers and public services. The combination of progressive taxation and redistributive expenditure is made difficult by economic and political trade-offs. Redistribution by progressive taxation requires a high tax burden on the rich and also a high tax burden on capital because the rich are likely to derive a large share of their income from capital. This tends to increase the efficiency costs of taxation in terms of reduced savings, investment, and work effort, and to alienate the rich and parts of the middle class from the welfare state. This may explain why countries relying strongly on redistribution by progressive taxation, such as the United States, usually allocate less funds to social expenditure. It may also explain why countries with high levels of social expenditure, such as Sweden and Germany, rely strongly on regressive consumption taxes and/or social security contributions and have a low income tax burden on capital. Harold Wilensky (2002) suggested that these features reduce the efficiency costs of taxation and keep the well-off committed to the welfare state thus allowing for higher levels of taxation and spending.

Taxation in Less Developed Countries

Developing countries rely less on taxation and more on nontax sources of revenue—debt, seigniorage (the "inflation tax"), and foreign transfers—than advanced OECD countries. This is reflected in a significantly lower level of total taxation. According to some estimates, the tax take of an average developing country has stagnated at less than 20% since the late 1960s. The tax mix of developing countries is typically geared toward indirect taxation, especially excises and taxes on international trade, while direct taxes on income, property, wealth, corporate profits, or capital gains typically contribute little to total revenues. Various potential explanatory factors have been discussed for the specific tax features of developing countries. Low levels of legitimacy and trust in state institutions are said to increase tax resistance, constraining revenue-raising potential. High levels of corruption purportedly have a similar effect. There is empirical evidence of a substitution effect as people do not like to pay for public services twice, first via taxes and then again via bribes. The economic structure can also have a constraining effect. High levels of agricultural employment and a large informal sector tend to be negatively associated with tax revenue, whereas industrialization and a concentration of economic activity in resource extraction tend to increase tax revenue. Also, developing countries are more vulnerable to the pressures of tax competition and have purportedly suffered revenue losses because of it. Finally, administrative problems help explain the strong focus on easy-to-monitor tax handles, such as specific transactions (excises and trade taxes) or large corporations (the corporate income tax).

TERRITORY

Several dimensions of politics come together in the word *territory:* land, a functional factor such as communication infrastructure, and a symbolic factor such as national identity. Typically associated with a polity, particularly a nation-state, the term can also be applied to any portion of space referred to otherwise as a region, locality, or place. Sometimes, a territory is an area awaiting formal incorporation into an adjacent state, as in the case of Alaska before it became one of the U.S. states. In general, however, territory is particularly, if not exclusively, associated with the spatial organization of the modern state with its claim to absolute control or sovereignty over a population within carefully defined external borders. Indeed, until Robert D. Sack extended the understanding of human territoriality as a strategy to individuals and organizations in general, use of the term *territory* was largely confined to the spatial organization of states. In the social sciences, such as sociology and political science, this is still the case, such that the challenge posed to territory by networked forms of organization (typically associated with globalization) is invariably characterized in totalistic terms as "the end of geography." This signifies the extent to which territory has become the dominant geographical term (and imagination) in the social sciences. It is then closely allied to state sovereignty. As John Agnew (1994) pointed out, because sovereignty is seen to "erode" or "unbundle," territory is also assumed to behave likewise. From this viewpoint, territory takes on an epistemological centrality, in that it is understood as absolutely fundamental to modernity.

The territorial nation-state is a highly specific historical entity. It first arose in Europe in the 16th and 17th centuries. Since that time, political power has often been seen as inherently territorial. Politics take place only within "the institutions and the spatial envelope of the state as the exclusive governor of a definite territory. We also identify political territory with social space, perceiving countries as 'state-societies'" (Paul Hirst, 2005, p. 27). Much interstate conflict is about competing territorial claims. The process of state formation has always had two crucial attributes. One is exclusivity. All the political entities (the Roman Catholic Church, city-states, etc.) that could not achieve a reasonable semblance of sovereignty over a contiguous territory have been steadily delegitimized as major political actors. The second is mutual recognition. The power of states has rested to a considerable extent on the recognition each state receives from the others in the form of noninterference in its "internal" affairs. Together, these attributes have created a world in which there can be no territory without a state. In this way, territory has come to underpin both nationalism and representative democracy, both of which depend critically on restricting political membership by homeland and address, respectively.

In political theory, control over a relatively modest territory has long been seen as the primary solution to the security dilemma: to offer protection to populations from the threats of anarchy (disorder), on the one hand, and hierarchy (distant rule and subordination), on the other. The problem has been to define what is meant by "modest" size. To Baron de Montesquieu (1949), the Enlightenment philosopher, different size territories inevitably have different political forms: "It is, therefore, the natural property of small states to be governed as a republic, of middling ones to be subject to a monarch, and of large empires to be swayed by a despotic prince" (p. 122). Early modern Europe offered propitious circumstances for the emergence of a fragmented political system, primarily because of its topographical divisions. Montesquieu further notes, however, that popular representation allows for the territorial extension of republican government. The founders of the United States added to this by trying to balance between centralizing certain security functions, on the one hand, and retaining local controls over many other functions, on the other. The recent history of the European Union can be thought of in similar terms.

Human activities in the world, however, have never conformed entirely to spaces defined by proximity as provided by territory. Indeed, and increasingly, as physical distance proves less of a barrier to movement, spatial interaction between separated nodes across networks is an important mechanism of geographical sorting and differentiation. Sometimes posed today in terms of a world of flows versus a world of territories, this is better thought of in terms of territories and/or networks of flows rather than as one versus the other. Territories and networks exist relationally rather than mutually exclusively. If territorial regulation is all about tying flows to places, territories have never been zero-sum entities in which the sharing of power or the existence of external linkages totally undermines their capacity to regulate. If at one time territorial states did severely limit the local powers of transterritorial and local agencies, the fact that this is no longer the case does not signify that the states have lost all of their powers:

> Territory still matters. States remain the most effective governors of populations. . . . The powers to exclude, to tax, and to define political rights are those over which states acquired a monopoly in the seventeenth century. They remain the essentials of state power and explain why state sovereignty survives today and why it is indispensable to the international order. (Hirst, 2005, p. 45)

Territoriality is the strategic use of territory in either the organization and exercise of power, legitimate or otherwise, over blocs of space or the organization of people and things into discrete areas through the use of boundaries. In studies of animal behavior, spatial division into territories is seen as an evolutionary principle, a way of fostering competition so that those best matched to their territory will have more surviving offspring. With human territoriality, however, spatial division is more typically thought of as a strategy used by organizations and groups to organize social, economic, and political activities. From this viewpoint, space is partitioned into territorial cells or units that can be relatively autonomous (as with the division of global space into territorial nation-states) or arranged hierarchically from basic units in which work, administration, or surveillance is carried out through intermediate levels at which managerial or supervisory functions are located to the topmost level at which central control is concentrated. Alternative spatial organizations of political and economic institutions, particularly hierarchical networks (as in the world-city network) or reticular networks (as with the Internet), can challenge or supplement the use of territoriality.

Theoretically, territory can be seen as having a number of different socioeconomic origins. As Sack notes, these include the following:

1. as a result of explicit territorial strategizing or territoriality to devolve administrative functions but maintain central control,
2. as a secondary result of resolving the dilemmas facing social groups in delivering public goods (as in Michael Mann's 1984 sociology of territory),
3. as an expedient facilitating coordination between capitalists who are otherwise in competition with one another (as in Marxist theories of the state),
4. as the focus of one strategy among several of governmentality (as in Michel Foucault's writings), and
5. as a result of defining boundaries between social groups to identify and maintain group cohesion (as in the writings of Georg Simmel and Fredrik Barth and in more recent sociological theories of political identity such as that of John Agnew).

Whatever its origins, territoriality is put into practice in a number of different, if often complementary, ways: by popular acceptance of classifications of space (e.g., "ours" vs. "yours"), through communication of a sense of place (where territorial markers and boundaries evoke meanings), and by enforcing control over space (by surveillance, policing, and legitimation). When combined, these practices constitute a political hegemony exercised territorially.

In a distinctive formulation, that of Gilles Deleuze and Felix Guattari, the term *deterritorialization* has been used to refer to the breakdown of territorial organization. Epistemologically juxtaposing "state philosophy" with "nomad thought," Deleuze and Guattari associate territorialization with the former and deterritorialization with the latter. Ontologically, however, there could be quite different territorial systems at play over time as, for example, with pre- and postcolonial contact between colonizers and natives leading to the breakdown of one system followed by a period of deterritorialization before the imposition of a new territorial organization. Crucial to the concept of deterritorialization of Deleuze and Guattari is the claim that "processes are becomings, and aren't to be judged by some final result but by the way they proceed and their power to continue, as with animal becomings, or nonsubjective individuations" (Deleuze, 1995, p. 146).

More typically, however, two other approaches tend to dominate most thinking about the contemporary erosion of territorial organization. In the first case, territory is posed as a physical base for economic activities, and deterritorialization is viewed as either the lessening importance of local constraints or the weakening of the impact of physical distance on economic transactions. Such ideas are part and parcel of much discussion of economic globalization. In the second case, territory is perceived as a declining spatial assemblage of power relations and identity strategies. From this perspective, ideas such as the "end of territory" and the rise of network space are linked to the recent onset of a worldwide deterritorialization. This camp tends to see deterritorialization in terms of the overall weakening of territorial identities in the face of globalization and the proliferation of "nonplaces" such as airports and fast-food joints.

In summary, there have been important historical dimensions to and philosophical disputes about territory. It takes various forms, and they have waxed and waned in relative significance. Overall, churches and polities (states, empires, federations, etc.) have been the most important users of territory. Some churches (such as the Roman Catholic Church) and some states (such as the United States) have more complex and formally hierarchical territories than do others. Today, transnational and global businesses often erect territorial hierarchies that cut across existing state-based ones. So even as some uses of territory fade away, others emerge. State-based territory may undergo a renaissance in the face of recent challenges to the sustainability of financial globalization. Therefore, though varying in precise form and complexity, territory seems still to be very much with us in one form or another.

TERRORISM, INTERNATIONAL

“International terrorism” is a contested term. In popular usage, it is typically taken to refer to groups that use “terrorist” tactics, such as targeting civilians, across national borders. A contemporary example of “international terrorism” is the transnational Al Qaeda network. But the term has been used to describe phenomena as diverse as the 19th-century anarchist movement, the Palestine Liberation Organization in the 1970s and 1980s, and the various Marxist groups operating in Europe and elsewhere during the 1970s, such as the Italian Red Brigades.

Both parts of the term are contested. The term “terrorism” continues to elicit passionate debate, both in terms of how it should be defined (and whether it constitutes a separate category of violence) and how it is used. Definitions range from those encompassing most forms of political violence (rendering it indistinguishable from other forms of warfare) to those encompassing most oppositional activism (rendering it indistinguishable from nonviolent activism). A more precise set of definitions defines it with reference to the type of target selected (usually noncombatants) and to the way in which violence is used to inculcate fear in a wider audience than those actually targeted, to achieve political change. Disagreements persist, though, over who can be considered a “noncombatant” and whether one can generalize such a definition, given that the very notion of “noncombatant” is intertwined with the development of the modern state and warfare in Europe, while boundaries between combatants and civilians are blurred by practices such as conscription and aerial and asymmetric warfare.

Similarly, controversy continues to rage over how the term is applied. Acts of violence against military personnel, for instance, are regularly labeled “terrorist,” while state actors engaging in “terrorist” tactics (as defined above) are typically not labeled thus—unless they are considered “rogue” states. Definitions are routinely used beyond their analytical reach to describe any acts by actors who have been labeled “terrorist” by state elites. What or who is considered “terrorist” is thus profoundly shaped by political context. Before terrorism became a widely accepted term, acts of violence in 1970s Italy, for instance, were described as bombings or kidnappings. Only in retrospect, when the term had gained international credence in the context of the Cold War, were these acts labeled “terrorist.” The term is, moreover, used by governments and nonstate actors alike to delegitimize opponents and justify extraordinary measures against them. This has led some, particularly critical terrorism scholars, to argue that the term is a political–normative tool, rather than a useful analytical concept.

The “international” part of the term is also contested. Some reserve the term “international terrorism” for the acts of those whose goals, membership, and operations cross national boundaries. Others apply it to the acts of any group operating in more than one state, even if goals and membership are limited to one state. Yet others use the term interchangeably with "terrorism," particularly in the context of the global war on terror where "terrorism" has become synonymous with opposition to the international order, regardless of one's aims. The U.S. State Department, for instance, refers to all organizations it has labeled "terrorist" as indulging in "global terrorism." Intriguingly, few use "international terrorism" to describe acts of state terrorism across borders, even though within the discipline of international politics, the term "international" is usually reserved for relationships between states (as opposed to "transnational," which refers to nonstate actors across borders). Those who recognize this distinction tend to use the term "transnational terrorism" to refer to nonstate terrorism across boundaries.

The "new terrorism" debate has added further fuel to these definitional controversies. According to a number of scholars, a "new terrorism" has emerged since the 1990s, which is transnational, religiously inspired, organizationally decentralized, and more lethal, radical, and uncompromising. Al Qaeda is the primary example, but other groups, mostly Islamist, are also cited. Critics of this trend have pointed out that many aspects of this so-called new terrorism can be found in examples of "old terrorism" and that by calling this type of violence "new," insights from the "old terrorism" literature and from past conflicts are ignored. Moreover, by linking the "new" to the ostensibly "religious" motivations of these groups, the "new terrorism" literature overemphasizes the religious aspect of these groups while downplaying political and socioeconomic dynamics. It also downplays the vast differences between groups that draw their inspiration from religion. Hamas, for instance, draws its inspiration from Palestinian nationalism as well as religion and has shown more willingness to compromise and practice restraint than Al Qaeda.

Because there is little agreement over what constitutes "terrorism," let alone "international terrorism," debates over what drives this type of violence are problematic. Most "terrorism databases," for instance, exclude nonstate violence in sub-Saharan Africa because this is usually classified as "civil war"—with significant implications for analyses of the relationship between "terrorism" and "poverty" or the availability of mineral resources. Similarly, few databases include acts of state terror, and most do not distinguish between violence against noncombatants and violence against combatants, if the perpetrators are classified as "terrorist."

Contributing Factors

With this caveat, numerous factors have been cited as facilitating "terrorism." Political exclusion and repression have been found to play a role in many instances (e.g., Algeria, Egypt, Colombia), but so has (rapid) political liberalization and an increase in political opportunities (e.g., Indonesia, Colombia, Spain). Ethnic and religious cleavages can contribute to violence, especially when overlapping with socioeconomic cleavages or with interethnic occupation or repression. Modernization—and in particular urbanization, the expansion of education, the weakening of traditional power structures, and unequal development—has been a factor, but so has lack of development and recession (especially following economic growth). Recession played a part in the slide of Algeria into civil war in the 1990s and in the outbreak of the Palestinian Intifada in the late 1980s (both of which conflicts included "terrorist" acts as defined above). The weakening of traditional power structures and expansion of the university sector, coupled to unequal development, facilitated the development of, among others, the Provisional Irish Republican Army (IRA) in Northern Ireland, Hizbollah (also known as Hezbollah) in Lebanon, and the Tamil Tigers in Sri Lanka. But without state violence and discriminatory policies these socioeconomic factors would not have been sufficient to trigger a violent response.

Transnational safe havens and support from third-party states have played a part in a number of conflicts, as have—facilitated by the processes of globalization—the presence of transnational diasporas or criminal networks (such as those linked to the blood diamond trade). The Tamil Tigers, for instance, were strengthened by support from elements in the Tamil diaspora. The Basque nationalist ETA benefited from safe havens across the Spanish border in France, while Lebanon's Hizbollah has been profoundly shaped by Iran's support. Al Qaeda's transnational character is similarly in part a product of the transnational networks of volunteers arriving in Afghanistan during the 1980s, just as it is a product of globalization and its effect on resources, a sense of self, culture, and territory. But it is important not to overstate the significance of transnational factors because this can obscure the, often, very local reasons for political violence. The Tamil Tigers' struggle was rooted in deeply felt grievances over the marginalization of Tamils by the Sri Lankan government, just as Hizbollah's emergence was a response to Israel's 1982 Lebanon invasion and local Shi'i grievances against the Lebanese state. Even Al Qaeda has roots in local struggles across the Middle East and Asia between secular state elites, reformist Islamists, and militant Islamists.

Macrofactors alone cannot explain "terrorism." Modernization, political exclusion, and inequality have not everywhere given rise to political violence. Political liberalization in Morocco did not usher in the level of violence seen in neighboring Algeria. This underlines the importance of complementing macro with micro- and mesolevel explanations. What type of organization emerges, how many competing groups materialize within a particular social movement sector, what resources are available, how macro and micro events are interpreted—all these factors influence whether or not violence ensues.

Research on what factors facilitate "international state terrorism" or state sponsorship of nonstate "terrorism" (beyond that carried out by so-called rogue states) is still in its infancy even though the scale of violence emanating from states far outstrips that of its nonstate equivalent. There is a nascent literature on the role of Western states in supporting state repression or nonstate "terrorism in the Global South." But there is nothing (yet) resembling the amount of research that has been done on nonstate "transnational terrorism."

International Coordination of Responses

Until the attacks on New York's World Trade Center and the Pentagon on September 11, 2001, most responses to "transnational terrorism" remained within the national sphere, limited cooperation notwithstanding. Since 2001 and the declaration of a Global War on Terror, responses have become more coordinated internationally, facilitated by the broader processes of globalization. The establishment of the international Financial Action Task Force, which has coordinated the freezing of financial assets of internationally designated "terrorist" groups and individuals, is a case in point, as is the involvement of an international alliance in the fight against Al Qaeda and the Taliban in Afghanistan. Cooperation between states has increased on practices such as extradition, the sharing of intelligence data, rendition (transporting suspects to states that allow torture), and replicating deradicalization models, such as the rehabilitation programs for prisoners accused of "terrorism."

The notion of "international terrorism" and the term's malleability has arguably helped state elites to forge a united response to a plethora of different threats, both local and international. Critics have argued that such an approach risks downplaying local differences, encouraging a homogeneous counterterrorism model that advances a hegemonic globalization (seen as part of the problem) against all dissenters, and privileging military over nonmilitary measures, such as the controversial invasion of Iraq. The notion of an all-threatening "international terrorism" has, according to its critics, served to increase state power while weakening mechanisms of accountability, facilitating the birth of a surveillance society, particularly affecting those believed to be "at risk" from radicalization (so-called suspect communities). Against this, protagonists point to the success in foiling "terrorist" plots through increased international cooperation, including cooperation with previously uncooperative states, and to the development of nonmilitary responses, such as rehabilitation programs, economic development, and the strengthening of "at risk" communities.

TERRORIST GROUPS

Defining a terrorist group is as difficult as defining terrorism, which is a highly contested concept politically. There is no universally accepted, legally binding definition of the term, and national legislations or international organizations attach different meanings to the concept. As a consequence, the United Nations, for example—in 13 conventions and protocols adopted since 1963—confined itself to defining and proscribing specific acts of terrorism (such as skyjacking, hostage taking, and nuclear terrorism). A review of the literature by Alex Schmid produced more than 100 different definitions some of which diverge strongly. However, there are commonly cited criteria, such as the use of violent means, the political motivation of the perpetrators, and the intention to create panic and fear among segments of the population or the population as a whole. In the following, the major characteristics, forms of action, and types of such groups are discussed in light of a number of current explanatory approaches.

Against this background, terrorist groups or organizations can be described as actors who use primarily terrorist tactics and means to pursue their political goals. This does not exclude the use of other violent or nonviolent means. Most groups labeled terrorists are, therefore, multifaceted: For example, they may also conduct guerrilla-style operations; they may act as political movements or parties by instigating a political wing; they may work as business actors through the establishment of companies and fund-raising organizations; and they may serve as social welfare organizations by delivering services to particular segments of the population. Thus, terrorist groups are usually not only interested in pursuing terrorist activities but in a whole range of different issues. Nevertheless, the frequent or occasional use of terrorism remains a key characteristic of these groups, which has severe implications for the recruitment and training of activists; internal organization; operational planning and logistics; methods of internal and external communication; transfer and channeling of money, weapons, and people; and leadership and their opportunities to act and maneuver. Most of this is simply because terrorism is a tactic that attacks people and institutions from underground. "Going underground" and acting from the hidden, however, has material and political costs, which affect the entire organization, their followers, and supporters.

Distinguishing Terrorist Groups From Other Phenomena of Violence

Terrorist groups—or more precisely terrorist cells, squads, and commands—should analytically be distinguished from other phenomena of violence. First, terrorist groups are *groups* in the sense that they comprise a number of members who are bound together by some kind of organizational structure, which exists over a certain period of time. According to some national legislations (e.g., that in Germany), a minimum of three persons is required in an organization to speak about it as a "terrorist organization." This implies that violent acts by single individuals (gunmen, killers, snipers, homicide, etc.) do not fall into that category. Second, because of their political ambitions, however defined, terrorist groups differ from primarily criminally or economically motivated organizations—such as criminal gangs, mafia structures, syndicates, warlords, or mercenaries. This distinction does not exclude the fact that individual members of terrorist organizations may be economically motivated; indeed, sometimes, terrorist groups may exploit the socioeconomic needs of particular persons or segments of the society for their own ends. Moreover, terrorist groups often undertake criminal activities (e.g., drug trafficking)—or cooperate with criminals (e.g., to get weapons and explosives)—to finance and launch terrorist operations. Therefore, a terrorist–criminal nexus usually exists. But the key question still remains as to whether the economic and criminal activities are ends in themselves or whether they are instruments to further a political and ideological agenda. Third, terrorist groups should be distinguished from other politically motivated actors, in particular from rebel or guerrilla groups, militias, and paramilitary organizations. Rebel movements in general aim at the conquest of and—if possible—permanent control over territory. Terrorist groups, on the other hand, might have territorial ambitions; however, they simply lack the capabilities to conquer and control larger territories. In addition, while rebels usually employ physical violence in the context of unconventional warfare (insurgencies) to diminish their opponent's military clout, to defeat the enemy, or force it to surrender, terrorist groups are mainly interested in the psychological effects of violent acts. In the real world, it may still be difficult to uphold these ideal-type distinctions as some groups may transform from one type of actor to another in the course of a conflict, while others have to be seen as hybrid organizations, which incorporate features of both rebel or militia and terrorist groups (e.g., the Tamil Tigers in Sri Lanka and Hizbollah [also known as Hezbollah] in Lebanon).

Fourth, terrorist groups are nonstate actors and should not be equated with state institutions responsible for acts of state terror. Phenomena of state terror have variously been subsumed under the specific terms of *war crimes*, *crimes against humanity*, *torture*, *extralegal killings*, *human rights abuses*, and *genocide*—labels that are much more adequate than the concept of terrorism. State terror (tyranny, at worst) and terrorist groups differ fundamentally in that the former is oriented toward keeping and consolidating the political status quo, while nonstate actors use terrorist tactics to change the situation and, finally, to overthrow a political regime. Moreover, state actors or those acting on behalf of a government do not typically operate covertly but seek visibility to intimidate either the population at large or particular groups (such as opposition groups or minorities). Furthermore, terrorist attacks can be the work of a few armed individuals, while state terror requires a relatively powerful security and intelligence apparatus. There is, however, a gray area of state-sponsored terrorism, which implies state toleration of, support for, or direction of terrorist groups. Thereby, state actors strategically sponsor terrorist groups in pursuit of their own agenda. In a few cases, they may even actively promote the founding of terrorist organizations or may be directly involved in terrorist operations, thus blurring the line between state and nonstate actors.

Rationale and Characteristics of Terrorist Groups

Despite the fact that terrorist groups differ largely in size, organizational structure, ideology, political goals, and support, their rationale has remained basically unaltered since the beginning of modern terrorism during the 19th century, even though terrorist methods have changed over time. First of all, terrorist groups—even the largest ones—are relatively "weak" actors compared with regular armies or security forces. Terrorist tactics, such as car or truck bombs, suicide bombings, targeted assassinations, kidnapping, and hostage taking, are therefore used because of lack of alternatives. Terrorist groups use this kind of violence—frequently against targets of high symbolic value—not only to shock and intimidate particular segments or the society at large but also to mobilize sympathizers and supporters as well as to contribute to the radicalization of political movements. They see themselves as the vanguard acting on behalf of "oppressed," "humiliated," and "marginalized" groups, thus, adopting a sense of moral superiority, which serves to justify their immoral and illegal acts in their eyes and that of others. In this sense, terrorism is a "communication strategy" conveying political messages to friends and foes alike.

In addition to the operational level, terrorist groups also rely on the spread of propaganda in the form of claims of responsibility after attacks, the launch of warnings, and political declarations, which nowadays are usually disseminated on the Internet or on videotapes. For this purpose, some larger groups even have their own media departments and ways of transmitting their messages. Propaganda aims not only at conveying signals but also at purposeful deception and disinformation; it provides terrorist groups with a platform that makes them appear "bigger" and "more powerful"—an effect that an isolated terrorist attack can hardly produce. Terrorism would simply not work without publicity. Yet terrorist attacks and terrorist propaganda in and of themselves do not necessarily produce the desired mobilization of supporters. Rather, mobilization is achieved through the reaction that an attack provokes among those against whom it is directed. Attacks are aimed at prompting the opponent to adopt brutal and disproportionate measures, which will—as terrorist groups frame it—“delegitimize” and “unmask” him. For terrorist groups, the objective is to convey the impression that the target of their attacks (e.g., a government) is the actual aggressor, while the attack itself is justified as a means of legitimate self-defense and self-assertion.

Terrorist groups employ an action–reaction spiral, which allows them to swap roles and portray themselves as the actual victims. As many observers note, there is an asymmetrical relation between terrorist groups and the state’s security apparatus: On the one hand, terrorists are typically inferior to the state’s police and military potential—logistically but also in terms of manpower. On the other hand, they operate underground and, thus, have the element of surprise on their side. It is enough for them to succeed every now and then to demonstrate that even comprehensive and cost-intensive security measures by the state cannot offer complete security for the population. Moreover, many terrorist groups have a time horizon that is different from that of their counterparts; they see themselves as being on a historical mission and, therefore, think long term; they do not aim at quick victories but believe that “history” or “destiny” will be on their side and that in the long run, they will prevail.

These strategic advantages do not come without costs, however. Terrorist groups are forced to be innovative—on the one hand, because they are usually constantly on the run and, on the other hand, because they have to do the unexpected to remain successful. They have to be unpredictable; they must avoid adopting behavioral patterns and must therefore change their methods from time to time. By the same token, this increases the risk of failure. Not every terrorist organization is able to be innovative in the long run due to the lack of resources, adequate leadership, or a favorable environment. Terrorist groups face a structural dilemma: On the one hand, they have to implement considerable precautionary measures to avoid being discovered—measures that, however, limit their freedom of movement and their operational capacity. On the other hand, their political visibility and influence crucially depend on their ability to launch successful and surprising attacks. But each plot, in turn, inevitably provides investigators with information about the group, their logistics, and their operational patterns. A further difficulty for terrorist groups lies in securing their financial and logistical base for a longer period of time. To some extent, actors are preoccupied with sustaining themselves and organizing their survival. Doing this from the underground and with discreet support from outside does have a number of implications for the internal organization and the cooperation with others. In many instances, for example, terrorists need to cooperate with organized crime groups in acquiring weapons, laundering money, or trafficking illegal goods. In other cases, terrorist groups undertake legal or shadowy business activities; they are involved in fund-raising or in collecting a “revolution tax.” A critical juncture is when the means become an end in themselves, and the self-sustaining aspect of a group becomes more important than the actual political ambitions. Then, terrorist groups or, at least, certain segments of that group, simply degenerate into criminal or money-making organizations—such as the Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia, FARC) and the IRA—which no longer care about mobilizing larger parts of the population for political ends.

Over time, the conspiratorial character of terrorist groups often leads to psychological defects—mainly due to group-think as well as to strict black-and-white thinking. The groups tend to create their own reality, perceiving and interpreting every event and all information according to their own worldviews. From their perspective, each setback or “failure” is merely an “insignificant episode” on the long-term path to “victory.” Terrorist leaders generally disregard contradictory developments and the possibility of pursuing alternative strategies. This development culminates in terrorists feeling reassured in their behavior, irrespective of what is happening around them. Progressive loss of reality frequently goes hand in hand with increasing radicalization and brutalization in the use of violence. The latter may also be directed against group members or supporters. Doubts, dissent, or even compromise with the opponents is usually not tolerated because they jeopardize the group's internal coherence.

Numbers and Types

Since the labeling of militant groups as *terrorists* is loaded with political considerations and terminological problems, there can be no authoritative list of terrorist groups. The most comprehensive set of data is provided by the Global Terrorism Database (National Consortium for the Study of Terrorism and Reponses to Terrorism [START] at the University of Maryland). The database contains information about more than 80,000 terrorist attacks beginning in 1970 and conducted by more than 2,000 squads, commands, or groups with distinct names, ranging from very small fringe groups to large, full-fledged insurgencies. These data, however, just indicate how many groups may use inter alia terrorist tactics, but it does not say anything about a consistent pattern of behavior, which would justify the term *terrorist group* and which would enable analysts to distinguish them from other armed nonstate actors. The same problem applies to the comprehensive list of groups in a 2008 study by Seth Jones and Martin Libicki, which refers to 648 "terrorist organizations" that existed between 1968 and 2006—244 are still active and 241 have been active for 10 or more years, which underscores how persistent militant groups can be once they have been established. This set of data also points to the fact that most terrorist groups are very small and count in the 10s rather than the 100s. But the list also includes a number of larger groups, which are better understood as rebel or guerrilla movements (such as FRELIMO in Mozambique, the Maoists in Nepal, or the Sandinistas of Nicaragua) or simply as organized crime groups. Not least because of these difficulties, governments' official lists of terrorist groups are much smaller. For example, the U.S. State Department has listed 45 groups as "foreign terrorist organizations" (July 2009); the Canadian Security Intelligence Service, 40 (November 2008); and the Council of the European Union, 47 (January 2009); a large number of them are characterized by an Islamist ideology.

Beyond the issue of numbers, the literature on terrorism mainly deals with the question of typologies since terrorist groups differ greatly according to various aspects. The most common typology focuses on the ideological orientation and worldviews of terrorist groups. Depending on the author, they are categorized as follows:

- social revolutionary, Marxist, or left-wing groups (e.g., the German Red Army Faction);
- ethnonational, separatist groups (e.g., the IRA or the Basque Homeland and Liberty [Euskadi ta Askatasuna, ETA]);
- right-wing, neo-fascist, or racist groups (e.g., the Ku Klux Klan in the United States);
- religious groups (e.g., Al Qaeda and other Jihadist groups); and
- apocalyptic groups (the Aum Shinrikyō sect in Japan may be a case in point).

The assumption is that the form of ideology does explain other aspects of terrorist groups, such as the political agendas, the links with particular communities and milieus, the level of public support, the duration of the group, or their destructive potential.

An alternative typology distinguishes terrorist groups on the basis of their geographical reach, that is, based on whether their actions and goals are limited to a local area or whether they pursue an overarching, global agenda.

First, *national* or *domestic terrorist group* refers to a terrorist group that operates mainly in its home country to challenge the domestic political status quo, either by regime change or by territorial separation; perpetrators and victims are both residents of the same state. Despite their contacts with like-minded groups elsewhere, the Basque ETA, the IRA, the Kurdish Workers' Party (Partiya Karker Kurdistan, PKK), the Sri Lankan Tamil Liberation Tigers of Tamil Eelam (LTTE), and the European left-wing groups of the 1970s and 1980s (e.g., Brigate Rosse in Italy, Action Directe in France, and Red Army Faction in Germany) do by and large fit into that category.

Second, the label *international terrorism*—or internationally operating terrorists—applies to groups that aim at internationalizing a local conflict to attract the attention of a wider public and to put their issues on the international agenda. They deliberately choose and attack targets abroad; typically, assassins and victims are not residents of the same state. Examples for this kind of terrorism have been Palestinian groups, such as the Palestine Front for the Liberation of Palestine (PFLP), the PFLP–General Command (PFLP-GC), and the Abu Nidal Group, which in the late 1960s consciously decided to undertake spectacular operations abroad to make the world aware of the Palestinian cause.

Third, *transnational terrorism*—sometimes also called *new* terrorism—involves groups and networks of groups that aim at changing the global or, at least, the regional political order. Their acts are directed against the actual or assumed dominance or hegemony of certain states, ideologies, and ways of life (e.g., the Western culture). These groups may be engaged in local conflicts also, but they see these struggles in a broader context of a global or regional fight. Transnational terrorist groups share a number of features, including a transnational ideology, multinational membership, and transnational network structures designed to bypass states and regions. The paradigm case is the Al Qaeda network of Osama bin Laden. Since 1996 at the latest, bin Laden's Islamist movement has been directly targeting U.S. and Western influence, or "imperialism," in the Islamic world, which in its view has to be defeated first in order to "liberate" Muslim populations from their "corrupt" rulers and install a "true" Islamic order under the rule of the Caliphate. In its ideology, Al Qaeda has linked local conflicts with Muslim involvement (e.g., Bosnia, Chechnya, Mindanao, and Indonesia), with the mission of a global jihad against the "Jewish–Christian crusaders." Moreover, in contrast to most conventional terrorist groups, Al Qaeda works as a multinational enterprise, which—despite its Arab origin—comprises persons of different ethnic, national, and linguistic backgrounds bound together by a common transnational Islamist ideology. Other groups—associated with Al Qaeda to a greater or lesser extent—such as Jemaah Islamyyiah in Southeast Asia, the Al Qaeda of the Maghreb region, and some Central Asian as well as some Pakistani jihadi groups—have adopted a similar worldview.

Understanding and Explaining Terrorist Groups

There is no single theory that could explain the emergence, persistence, transformation, and decline of terrorist groups in general—the universe of groups is simply too diverse for that. However, it has been widely established that most terrorist groups are the radical outgrowth of domestic or international conflicts. Thus, terrorist groups typically emerge in three different situations: The first is a latent conflict that terrorists aim at escalating by their acts to mobilize parts of the population in order to trigger a mass movement (e.g., left-wing terrorism in Western Europe in the 1970s). Here, terrorist groups view themselves as "catalysts" of a subversive or separatist movement. The second case of terrorist groups emerges in the context of an armed struggle, which has already escalated to a greater extent. The militarily weaker actor—feeling backed into a corner—then frequently resorts to terrorist methods. Depending on the circumstances, terrorist acts may replace previous strategies altogether, which leads to the actor's transformation and the consolidation of terrorist structures. In the third scenario, a ceasefire or peace agreement would have been concluded between the warring factions, which will then be undermined and sabotaged by radical fringe groups that may have frequently split from existing militant factions. These groups continue the "fight" by launching terrorist attacks to reignite the conflict (e.g., Real IRA in Northern Ireland after the 1998 agreement).

Despite this common terrorism–conflict nexus, there are a number of factors that determine the circumstances under which terrorist groups emerge and exist. These factors can be analyzed on three levels and using various social science theories. First, the microlevel refers to individual motivations and circumstances to establish or join a terrorist group. Here, biographical analysis, theories about deviant behavior, identity theories, psychological and sociopsychological theories, and rational choice theories are often used for isolating explanatory variables, such as, inter alia, traumatic events, past or current experience with violence, personal revenge, altruism, narcissistic personality, paranoia, peer pressure, frustration and aggression because of "relative deprivation," and cost–benefit calculations, which may influence the behavior of individuals. Second, the mesolevel considers the group as a collective actor together with its decisions and activities. In this regard, theories on collective action (e.g., resource mobilization theory); social learning and group behavior (e.g., ingroup–outgroup thinking); organizational and network studies; perceptions, belief systems, and mind sets; political economy; concepts and theoretical assumptions about the role of ideology; and myths and symbols as well as theories about the role of leadership (e.g., charismatic leadership) are usually applied in order to analyze the establishment, the internal coherence and structure, and the prospects for persistence of a group. Third, the macrolevel addresses the general political, cultural, and socioeconomic environment in which a terrorist group operates. This level refers to modernization theories; center–periphery models and theories about structural imbalances; issues of historical injustice; approaches of conflict and peace studies; theories on globalization, transnationalization, and space; sociological questions about the political system; and the behavior of ruling elites as well as concepts of statehood. Based on these, a number of explanatory factors are mentioned in the literature, such as poverty, relative deprivation, political frustration and marginalization, fragile or failed statehood, lack of democratic governance, geographical aspects, and the effects of shadow economies and global markets. In any case, the three levels have to be studied in combination because they are deeply intertwined: For example, factors at the meso- or macrolevels may influence individual motivations and the demands, needs, and identity of individuals, which, in turn, have to be reflected at the mesolevel to keep a group together.

THEOCRACY

The term *theocracy* was coined by Flavius Josephus in the 1st century CE to label a political system in which political rule is exercised by the clergy or other religious officials deemed as representatives of God on earth. This entry discusses the meaning of the term *theocracy* and its presence in various religions, historically and in the present. Theocracies have existed throughout the world at various points in history, not only in the Catholic and Islamic worlds but also in contexts as varied as that of the early Mormons in the United States, under Joseph Smith and Brigham Young, and in Tibet from the 13th until the mid-20th centuries. After describing the concept of theocracy in various religions, this entry further explores the meaning of theocracy through the example of the role of the Russian Orthodox Church. It concludes with questions about whether political society in general presupposes some broadly theocratic foundation.

The Concept of Theocracy in Various Religious Contexts

In the strict sense of the term, theocracy is not parallel to the categories of democracy, aristocracy, and monarchy. One would indeed be at a loss if one wanted to situate God, who certainly is not of this world, in a concrete political function of any kind.

The word *theocracy* has, however, a real history, related to the justifications given by both ecclesiastical and secular authorities for the imposition of their views in the political sphere or in some aspects of it. There is a theocratic aspect to a given viewpoint if it is presented as indisputable because it is derived from a scripture deemed religious, or sacred, such as the Bible or the Koran, or from an assertion coming from a religious authority not recognized as competent in the political sphere. The latter is the case with fatwas, the decrees proclaimed by one form or other of Islamic authority, an ulema or a college of ulemas, even if it is on the other hand affirmed that in Islam there is no authority of any kind above the individual believer's reading of the Koran.

During the Middle Ages, the removal of a king or an emperor by a pope could also be termed an act with a theocratical basis, since papal sovereignty gave the pope indirect power over the political sphere. Another example is the pope's authority to intervene in the case of sin (*ratione peccati*) when there is a question of morality.

On the other hand, some princes and some kings, especially those who were the objects of quasi-sacramental coronations, seemed to be invested with a divine right proper; there was something theocratic about them, their power, and their commands. One may wonder whether this form of pretension still exists today anywhere. It may have been the case, probably, with the Japanese emperor until after World War II. The present Iranian regime, in which the final authority lies with an ayatollah (presently Seyed Ali Khamenei), can in some real sense be termed theocratic, and the same applies, with the differences specific to the Sunni world, to the Wahhabi monarchy of Saudi Arabia. Today's jihadist movement advocates the restoration of the caliphate system, abolished almost a century ago by Atatürk at the fall of the Ottoman Empire.

John Calvin is known, for his part, to have ruled Geneva, the city of his reformation, in a theocratic way and with a theocratic justification. Luther, contrarywise, reinforced the profane power of the temporal sovereigns, freeing them from any pretense of jurisdiction of the Catholic authority. Thus, in his theory of two kingdoms, he made them dependent on God alone (*Zwei Reiche*).

In the Catholic world of the 17th century, Jacques-Bénigne Bossuet (1627–1704) was convinced of the divine character of the absolutist power of his king. More generally, he thought that there is something divine in the proper sense of the term invested by God himself in the princes as such. One had consequently to show "religion" proper toward them, though it was to be the religion of "second majesty," or second degree, in comparison with the religion of first majesty, which we owe to God (*La politique tirée des propres paroles de l'Ecriture sainte*, III 2, 3). All this again sounded theocratical, at least in the broad sense of the term. Perhaps one can ask whether there is any branch of religion that has not known something of this in the past. But even today, in Tibetan Buddhism, the power of the Dalai Lama, at the same time temporal and spiritual, is invested with a similar dual character.

The Russian Orthodox Church

On the other hand, the close association of a state with a religion—even if it is short of a state religion—produces, similarly, some kind of a theocratical effect. In contemporary Russia, where, in spite of the constitutional separation of church and state, there exists a special recognition of the Orthodox Church (Moscow patrarchate) in some documents of the state, one can sense a special religious aura of favor to the advantage of the Church in many actions of the government. In the perception of many citizens, the government is not quite purely profane. Conversely, this has to do with the special relationship to the "nation" that appears in the statements of the Orthodox Church. In the *Sotsialnaia kontseptsia* (*Bases of the Social Concept of the Russian Orthodox Church*), approved by the Holy Synod in the year 2000, one reads,

> The Church does not distribute men according to nationality or social origin. . . . The universal character of the Church does however not mean that the Christians do not enjoy a national specificity, a national expression. [There exists] a Christian national culture. . . . Among the saints whom the Russian Orthodox Church venerates many have made themselves famous by their love and fidelity to their fatherland.

While it is true that no mention is made here of the 1941 case when the Patriarch was called by Joseph Stalin to the rescue of the nation, the insistence is, however, significant. Following Germany's attack on the Soviet Union in 1941, Stalin relaxed his formerly vigorous antireligious and anticlerical policy and adopted a more tolerant stance toward the Russian Orthodox Church. According to some historians, this shift occurred in part to satisfy U.S. President Franklin Roosevelt's conditions for increased American support in the war against Adolf Hitler and also because, particularly with clerical approval, many who might resist an appeal to go to battle for communism could be relied on to do so for the Holy Russia of Orthodox Christianity. The Russian Church has many times given its blessing to the people for their participation in the Liberation wars.

Today other Christian denominations in Russia complain about the special treatment of the Orthodox Church. Some Muslims too are critical of this situation of privilege enjoyed by the Russian Orthodox Church.

Of course, the Russian Orthodox Church, however, is far from theocratic in Ayatollah Khomeini's sense of running a state as of a few years ago in Iran, or even in Khameini's sense of running a state today. It is Islam that most frequently looms on the horizon whenever one speaks of theocracy today, even if it be in a vague sense in countries that do not kowtow to politicoreligious authorities as such.

The Possibility of Political Authority Without Theocracy

The word *theocracy* may also come up in discussions on the question of whether any political authority can exist without an aura of religious transcendence, such an aura signifying conversely that the political authority bows to conscience and stops from acting whenever conscience or conscientious objection is at stake—the latter being, of course, of utmost importance. There is indeed such a majesty in political power that some authors do not hesitate to see an element of theocracy in the democratic governments themselves. In March 2007, the Paris *Revue d'éthique et de théologie* (*Journal of Ethics and Moral Theology*) published an article of strongly paradoxical intent by the prominent French scholar Rémi Brague under the title "Un régime autre que la théocratie est-il possible?" ("Is a Regime Other Than Theocracy Possible?"). Brague, an expert on medieval Arabic, Jewish, and Latin philosophy and cultural history, notes that democracy particularly is some kind of theocracy:

> Whether the fundamental idea in democracy is the law or conscience does not make much of a difference: the two of these ideas have theological foundations. This is why our democratical ideals of the supreme power of the law (Law state) or of an interior tribunal of ethics as the last authority in the each person's soul, are theologically grounded. (p. 110)

In Western political regimes, Brague says, law is considered to be "anchored in the people's will," but

> the people consists of free human beings, apt to recognize what they should do through listening to the voice of their conscience. In this case too, law is grounded in the last instance in the idea of the human conscience. *Vox populi, vox Dei* is the origin of "one man, one vote." (p. 111)

Brague then discusses in the same vein the nature of divine law and Islam and notes also that with respect to Western democracy, "we Westerners live, or have lived, in a certain sense, in a theocracy of conscience" (p. 117). Although today Westerners want to conceive of their regime as a democracy, Brague asks whether, in fact, that is the kind of society we really want. He argues that, instead, we want a regime of free citizens. That freedom means "that we have to obey no other instance but our conscience, the presence of which in us expresses God's care for his creature" (p. 118). With Rousseau, Fichte, and Kant, there has been a secularization of conscience. But, says Brague,

> The secularized state of our democracies is [itself] a problem. One can indeed ask whether a human community can live in the long run otherwise than a "laos" (people under a conscience) or without some kind of a theological basis. . . . Is a non theocratical regime possible in the long run? (p. 120)

If we take *theocratical* in a broad sense of the term, the answer is indeed clearly no. No one is self-engendered. The social contract, so praised as the foundation of political society, does not produce *those* who themselves make the contract. So, at the least, it seems that political life presupposes some sense of moral authority as a condition for the social contract, though this may not be considered a theocractic concept in the strict sense, especially today, when the term is used primarily in reference to Islam.

Authorities in the Religious Sphere Itself

Can the religious authority exercised *in the religious sphere proper*—that is, the authority of the Christian bishops, and of the Catholic pope in particular—be termed *theocratic*? It is not so, at least in the official documents of the Catholic Church. Any such reference is normally avoided because, among other things, it is obvious that such authorities are under the authority of the Scriptures themselves. The Vatican II Council has of late repeatedly stressed that there is a term of reference beyond any episcopal or pontifical authority itself.

Such authority is religious when it is derived from the faith of the believers, but this does not mean the same as theocratic, because here there can be no pretension to enjoying God's very authority, or some part of it. There is the pretension only of some participation in the authority of Jesus Christ as the founder of this body, the Church, in which he is in some sense continued. Vatican II in its document *Lumen gentium* (1964) says, "The social whole which constitutes the Church is at the service of the Spirit of Christ who gives it life, for the growth of that body" (No. 8).

Aftermath of "Political Theology"

In the realm of political philosophy, one should finally also mention here the Christian legal scholar and philosopher Carl Schmitt (1888–1985), whose views on the national socialism of Nazi Germany probably were drawn from his adherence, in his early writing *Politische Theologie* (1922), to the idea of some form of perpetuation of the Holy Empire. In a context of "neutralization" and "depolitization," dominated by a technicist way of thinking—the Weimar Republic—he defended a view of politics as not innocent but instead characterized by the dialectics of friend and foe and the presence of power (*Macht*), as well as a certain transcendence. This colored in some way the very positive attitude he showed, at least for a time, toward national socialism. (For this reason, it would of course be dangerous to associate all ideas of transcendence in political philosophy with such an extreme vision of the political realm).

THICK DESCRIPTION

Thick description is a research method enabling us to discern meanings within the contexts in which social actions take place. It originated as a tool for ethnographers engaged in participant observation and was later adopted by a wider range of qualitative researchers, including some sociologists and political scientists. In his famous 1973 essay titled "Thick Description: Toward an Interpretive Theory of Culture," the anthropologist Clifford

Geertz explained the contrast between "thick" and "thin" description. Drawing from the Oxford philosopher Gilbert Ryle's reflections on thinking as entailing an account of the settings, circumstances, and intentions that give actions their meanings, he showed how important it is to go beyond mere facts and appearances when it comes to interpreting behavior. The most well-known illustration provided is that of the contraction of one eyelid, which may be taken as either an involuntary twitch or as a wink (imparting a particular message, related to a socially established code), as a parody of wink, or even the rehearsal of this parody. Geertz goes on with other examples taken from his own field experiences. The core of the argument is that performing empirical research involves accurately describing social actions and exploring underlying meanings. In other words, thick description leads to thick interpretation. This entry discusses the basic assumptions underlying this method and its relevance for political science.

Methodological Critique and Epistemological Debate

From a methodological point of view, such an approach marks an important departure from traditional assumptions. What is explicitly criticized is the empirical "thinness" of some research traditions—such as behavioralism—which largely overlook what makes sense to the social actors studied. A typical reproach from the advocates of thick description is that in many sectors of the social sciences, there is too much abstract theorization and not enough serious field research. Interpretivists are notably skeptical about "armchair scholars" who delegate the collection of data to polling organizations or junior assistants and concentrate on the more noble tasks of calculation and theory building. To some extent, this opposition coincides with the endless debates between researchers who use quantitative indicators that are deemed reliable insofar as they are replicable and those who resort instead to direct observation or long interviews because they believe that only intense immersion into particular settings will yield the information required. Within the first (positivist) tradition, the norm is to handle "objective" data or at least evidence that is not excessively dependent on what might be seen as the researcher's subjective reading; moreover, all sorts of highly sophisticated analytical instruments (correlation coefficients, causal modeling based on econometric techniques, etc.) are seen to guarantee "true science." On the other (interpretivist) side, serious doubts are harbored about the reliability of the procedures and the outcomes these procedures, which are often influenced by the questions asked.

At the epistemological level, it is claimed that thick description leads, for better or worse, to contextualism. Rich information is a leading hallmark of thick descriptive qualitative research—not in the sense of pooling superficial comparable data from many places but in amassing many contextually relevant details. This richness may be seen as commendable in the context of monographs; however, it is somewhat problematic when theoretical ambitions or even comparisons are involved. Once again, here, we are at the core of hotly debated axiomatic beliefs. Many social scientists share the view that it is incumbent on them to emulate the natural sciences and provide universal laws. Any "excessive empiricism" is consequently viewed as a posture making it difficult to develop necessary generalizations. On the contrary, in the other camp, it is held that the chief merit of in-depth field studies lies precisely in making us understand that efforts to explain the social world with grand theories held to be ubiquitously valid amount to denying important sources of difference and complexity. In political science, contextual analysis—referring to historical, cultural, psychological, and demographic dimensions and others—is sometimes taken quite seriously (see Robert Goodin & Charles Tilly, 2008). However, the question arises as to what extent context matters and whether the main goal of the discipline should, or should not, remain the defense of abstract and homogenizing models, even at the price of glossing over important contextual dimensions.

We are touching here on several key themes, such as context dependency possibly leading to relativism, the sensitive question of causality and, more generally, that of whether or not the social sciences should seek to ape the methods used in the "hard" sciences. To return to Geertz, who clearly defined himself as an "anti anti-relativist," the world is incorrigibly diverse because human development has led to infinite sociocultural arborescence, with ever multiplying branches. This enabled the existence of myriad cultural expressions and an unlimited number of potentialities and motivations, each of which should be understood in its particular context. This clearly draws attention to the importance of culture and, more specifically, to what concerns us here—its place within the analysis of political life. In what is probably his most often quoted phrase, Geertz (1973) explains,

> Believing with Max Weber, that man is an animal suspended in webs of significance he himself has spun, I take culture to be those webs, and the analysis of it to be therefore not an experimental science in search of law but an interpretative one in search of meaning. (p. 5)

It is important to note that he adds that culture must be understood as a "deep" context and not merely as "reflecting," "expressing," "corresponding to," "emerging from," or "conditioned by" interest-based social cleavages. This perspective obviously defies the assumptions of several classical schools of thought (e.g., Marxist visions in terms of ideology or constructivist theories of social reality), and it was to have a considerable influence on several disciplines, leading notably to what is now known as the new cultural history or cultural sociology.

Universalism Versus Relativism in Political Science

As far as political science is concerned, and more specifically if we look at the subfield of comparative politics, it might be argued that two rival metatheoretical frameworks for research are used: the universalist and the relativist. Within each one of them, obviously, there are distinct standpoints. For example, both structuralist and rational choice perspectives are universalist. Similarly, there is a variety of cultural approaches. In the following, an attempt will be made to clarify the positioning of interpretive perspectives based on thick description vis-à-vis other established traditions in this discipline. Within the universalist paradigm, there is, first of all, the political philosophy tradition. Geertz insists that cultural categories emerging from the past hold us in thrall. Therefore, one should wonder whether ways of thinking formulated in one particular context—say that of Athens during the 4th century BCE—are relevant when it comes to interpreting politics in settings far removed from those from which those views derive. Likewise, having systematic recourse to the concepts of political economy, a discipline elaborated to account for the dynamics of the rise of capitalism in Europe, might not always be relevant to non-Western polities. There, it may be more appropriate to reason in terms of "moral economy" or "economy of affection," concepts that have been applied, respectively, to Southeast Asia and sub-Saharan Africa as a result of the empirical observation of actual political practices. In a Geertzian perspective, one should think twice before using any apparatus with universalistic ambitions because they are usually ethnocentric and normative. This inevitably raises the tricky issue of the dominance of a terminology drawn from the experience of Europe and North America, which is assumed to apply to the entire world. However, if each "terrain" generates its own operational notions, how can political scientists communicate with each other, and how can we make comparisons possible? We shall return to this crucial point and suggest how the conundrum can be resolved at the end of this entry.

As was already mentioned, the Geertzian approach holds that culture is not merely to be defined as a by-product of more fundamental factors. This does not necessarily mean that we should argue in terms of primacy of culture but only that we should beware of approaches that systematically resort to the same structural determinants (economic ones, for instance). Structuralists frequently accuse those they classify as "culturalists" of having an overly impressionistic and "essentialist" viewpoint. Seeking to identify universal features transcending cultural diversity, they are eager to reduce the range of observable cases to a limited number of given types, looking for functional equivalents if need be. Pivotal to the dispute between the two schools of thought is the question of meaning. In sharp disagreement with the idea that local meanings would merely be a negligible surface phenomenon, interpretivists hold that it is imperative to unravel what makes sense (or not) to the actors concerned. Hence, there is a dialogue of the deaf between adherents of structuralist approaches, who argue that it is necessary to avoid being blinded by the apparent diversity of concrete situations, and advocates of thick descriptions, who are constantly wary of reductionist approaches prone to fitting realities into preconceived molds.

Another influential perspective, within the universalist paradigm, is rational choice. We can all agree that human beings are possessed of reason. However, the motivations and interests that motivate groups or individuals in one milieu are often incomprehensible to those in another. For interpretivists, the aim is not to deny the possible use of the concepts of interest and rationality. It is merely to place them in context. Even if we take it for granted that human beings always carefully weigh the consequences of their actions, we need to accept that the realm of possible choices is constrained by the prevalent universe of meaning within which they live. This is where thick description is viewed as fundamental. We would all like to believe that it is easy to transcend the limitations of our own culture and to understand those of others. In reality, this is an exercise that requires lengthy training and is never fully completed. To take just one example, Scandinavian diplomats may deplore the fact that in international summits "the poorer the country, the more ostentatious its representatives," but reciprocally, the conspicuously modest behavior of the members of some Nordic nongovernmental organizations appears to be incomprehensible in the eyes of some sub-Saharan elites. The role of the interpretivist is to go beyond such ethnocentric views and to make sense of the respective attitudes and cross-perceptions.

The developmentalist schools of thought may be placed at the intersection of the universalist and the relativist paradigms. The singularity of these approaches is that their adherents are usually rather conscious of important disparities between societies or polities, but they also share the assumption that it is quite possible to move toward a desirable direction. Their frameworks are affected by the fact that they take their own model of reference as the end point toward which all others should be converging. The teleological goals might be different, and indeed radically divergent (suffice it to think of the Cold War era and the two systems in competition), and largely biased by ideological convictions. However, evolution toward the supposedly best system would only be a matter of time, willpower, and application of the right recipes. Even if some macromodels of deep sociopolitical mutations deserve to be admired for their sophistication, the question is whether they are generally applicable. Adherents of cultural approaches are often accused of promoting a fairly static and immutable vision of societies. It is true that they are particularly attuned to the *longue durée* and thus to the resilience of cultural traits or some logics of adoption/adaptation. However, they think it useful to reason not only in an evolutionist way (when appropriate) but also in terms of involutions—that is, to pay full attention to the possible specific dynamics of some societies. This heuristic concept, widely used by Geertz in his studies of Indonesia, makes it possible to account for cultural patterns that are no longer traditional but not evolving into a recognizable modernity either.

Relativism, Postmodernism, Interpretivism

Let us now consider the relativist paradigm. As is well-known, some confusion is engendered by the fact that there are so many conceptions of what is exactly meant by culture. Space limitations preclude the full enumeration and discussion of all the schools of thought that take cultural dimensions seriously, but it is important to explain, at least, in which ways an interpretivist approach diverges from perspectives in terms of values and from postmodernist views. In political science, a large number of scholars equate culture with systems of beliefs and customs. At the heart of all these definitions lies the notion of *values*, which refers to that "conception of the desirable" commonly shared within a given social grouping. If it is arguable that such an approach is useful as concerns small, traditional communities, it is less likely that it can offer insights regarding modern polities, characterized by a high degree of social differentiation, and even less regarding postmodern societies in which normative conventions have been shattered. As Bertrand Badie has noted, the great advantage of an approach in terms of meaning is that once we accept that culture is not a concatenation of normative standpoints but the language that makes understanding possible, it becomes easier to explain why individuals who live within the same cultural setting can hold antagonistic convictions based on different values and still belong to the same culture. For similar reasons, interpretivists distance themselves from conceptions in terms of political culture. If they accept that the notion of culture refers to a wide semiotic framework, the idea of a political culture autonomous from the rest of a society's cultural codes presupposes the existence of a political sphere strongly differentiated from other spheres (religious, economic, etc.)—which is far from being generally the case, even in the contemporary world. Beyond the antagonistic visions of the ideal society held by political parties, what is of interest to an interpretivist approach is that they all operate within shared systems of meaning.

It is sometimes assumed that Geertzian antipositivist writings have paved the way for postmodernist skepticism (see, e.g., Goodin & Tilly, 2008, p. 8). Admittedly, some postmodernists praise interpretivists for having recontextualized "Western knowledge" and also for having emphasized the need to study other systems of meaning in their own terms. Nevertheless, they typically criticize interpretivists for not following them all the way when it comes to challenging dominant cultures and glorifying those of the so-called oppressed minorities. There is obviously a huge gap between militant postures eager to propagate multiculturalism and a scientific one merely aiming to underline the magnitude of cultural cleavages. An interpretivist approach does not exalt differences; it just seeks to analyze them seriously. Likewise, if interpretivists are fairly critical of much of the apparatus of the natural sciences, including hypothesis testing or the formulation of dependent and independent variables, it does not mean that they readily adhere to deconstructivist perspectives considering that reality is pure illusion and that everything is intertextual. The intention certainly is to challenge the premises on which earlier approaches have been constructed but with the aim of providing a new form of science generating rigorous theorizing driven by data collected through serious fieldwork.

This has several important consequences. First, thick description implies thinking semiotically. It should be underlined that the semiotic approach espoused here does not refer to semiology and assorted structuralist theories of signs derived from linguistics but entails being particularly attentive to the worlds of meaning of others. A key aspect that should be noted is that, whereas thin descriptions use experience-distant concepts, thick descriptions resort more willingly to experience-near concepts. In other words, this tradition of studies is not very comfortable with ubiquitous abstract concepts that confer an illusion of analytical familiarity to all places and situations. As already alluded to, a major problem is our need to operate at a certain level of generalization and to find ways of translating the unfamiliar logics of other cultures into an idiom that all political scientists can understand without falling prey to excessive universalism. This is not necessarily an impossible mission. Following Bertrand Badie and Guy Hermet (1990), one possible approach to resolving this dilemma is to make a distinction between concepts that are transcultural and those that are monocultural. For instance, according to these two authors, the concept of *norm* falls into the first category but that of *state* would fall into the second—insofar as, thanks to the insight provided by historical sociology, we understand that the state is not the natural framework of political activity but merely one specific mode of political organization, which unpremeditatedly emerged in some European countries at the end of the Middle Ages. Moreover, we know that its transplantation to other contexts has often proved problematic, largely because of cultural factors. What is required is not the evaluation of states according to an ideal-type model or according to a gradualist approach that would put Scandinavian countries at one extreme of a continuum and Somalia at the other. It is rather to study all sorts of polities without necessarily placing the concept of the state at the heart of our research and, instead, to pay full attention to the thick description of the nature and working of social and political relations. Consequently, comparative studies should question the explanatory value of concepts and analytical models across cases.

Second, a thick description perspective involves thinking inductively rather than deductively. This means beginning with an examination of empirically observed realities and only at a later stage mobilizing the most appropriate instruments. The chief merit of in-depth field studies is precisely in avoiding the temptation of a priori generalization on the basis of grand theories held to be universally valid. Although many apparatuses are worthy of note, it is often relatively simple to supply empirical findings that do not readily fit with their respective predictions. The existence of such discrepancies necessitates not a further elaboration of alternative theories with global explanatory ambitions but limited ones succeeding in making sense of nonnegligible variations across time or space. The scientific reasoning suggested here is not one that attains the highest level of abstract generalization but one that takes into account various logics of meaning. Placing the issue of meaning center stage leads us to rethink the merits and demerits of the classical approaches and challenges the supposed universality of some mechanisms (see the many illustrations in Patrick Chabal & Jean-Pascal Daloz, 2006). Such an interpretivist standpoint leads to theoretical eclecticism. Needless to say, its intention is not to juxtapose largely incompatible theories but rather to move toward an awareness of the limited validity of exclusivist conceptual frameworks. The result is certainly not sterile empiricism or subjectivism but a nondogmatic perspective seeking to illuminate a great diversity of scenarios. At the paradigmatic level, in contrast, ecumenism (see, e.g., Mark Lichbach & Alan Zuckerman, 1997, which attempts to marry rationalist, cultural, and structuralist approaches in the field of comparative politics) can only be considered with skepticism. There is obviously little possibility of analytical dialogue or theoretical convergence between the proponents of universalist and relativist paradigms.

THINK TANKS

The term *think tank* has been used to describe both private and public organizations that provide advice to governments. A generally accepted definition would describe think tanks as organizations that are distinct from government and whose objective is to provide advice on a diverse range of policy issues through the use of specialized knowledge and the activation of networks. What follows in this entry is, first, a discussion of the historical and geographical development of the concept; second, a typology of think tanks; third, a discussion of characteristics and myths related to think tanks; and finally, some thoughts about the impact of globalization on think tanks.

Origins

The term *think tank* was first used in military jargon during World War II to describe a safe place where plans and strategies could be discussed, but its meaning started changing during the 1960s when it was used in the United States to describe private, nonprofit policy research organizations. It has been proposed that in reality the first example of a think tank was the Fabian Society, which was aiming to influence public policy in Britain at the end of the 19th century. For many years, the majority of scholars studying think tanks considered them as a uniquely American phenomenon that boomed in the United States because of the exceptionality of its political system and its rich tradition of private funding available for think tanks. From a global perspective, however, the argument that think tanks are a uniquely American phenomenon is not convincing. Think tanks have also flourished in other industrial Anglo-American countries, such as Canada, the United Kingdom (UK), and Australia, where normally, they are more modest than in the United States. European think tanks vary considerably. In Germany, for example, large, influential think tanks are encountered, but they are often state funded and associated with political parties or universities. In France, what could be described as think tanks are organizations gathered around the government in Paris that operate in a conflictual but subordinate relationship with political parties. In southern Europe, think tanks are a more recent phenomenon as they began to appear in the 1970s after the establishment of democratic governments. Research on think tanks outside the Western world shows that it is likely that an even greater variety of organizations exists globally.

Typology

The diversity of organizations that fall under the term *think tank* has led to the creation of typologies. At least four types of think tanks can be observed. The first is the ideological tank, which refers to organizations that have a clearly specified political or, more broadly, ideological philosophy and are clearly related to the category of advocacy tanks. Examples include the New Right think tanks in the UK and the think tanks that are affiliated to political parties in Germany. This type is the closest to the stereotypical idea of what a think tank is. The next type is the specialist tank, which includes institutes that have a thematic focus. The most common subjects are foreign and public policy, but think tanks also specialize in other issues, such as the environment. The third category includes institutes that do not work at the national level. They could either work at the regional level, such as the American state tanks, or at the supranational level, such as the think tanks that are based in Brussels and are aiming at the European Union (EU). The final category is the think-and-do tanks that relate to organizations that apart from their traditional research activities, are starting to be active at a more practical level, such as in the funding of charity projects. This type of think tank is closer to nongovernmental organizations (NGOs).

Following the above typology, it can be observed that think tanks are similar, but they can be distinguished from other organizations that are involved in the political arena. A think tank is different from a university unit that offers courses but also conducts research. It is different from philanthropic organizations that have as one of their lower priorities the funding of research and prefer the funding of actions directed to society in a more straightforward way. They are different from government advisory organizations because they play a distinctive and unique role by providing more independent intellectual support to, or new alternatives for, public policy. Nevertheless, there have been government research institutes, for example, in France, that are often described as think tanks. Finally, think tanks are also different from pressure groups and interest groups. This division has become less obvious because pressure groups increasingly develop in-house, well-researched critiques of existing policy. One of the most important differences is that pressure groups have a membership of individuals as one of their central characteristics. When they do get involved in research, they do it to support their campaigns, and it does not constitute their preliminary interest.

Common Characteristics of Think Tanks

If these are the types of think tanks, what are the common characteristics of these organizations? First, it is their policy focus, which means that their objective is to bring knowledge and policy making together by informing and, if possible, influencing the policy process. Think tanks conduct and recycle research that aims to solve policy problems and not solely to advance the theoretical debate. The second characteristic is public purpose, which refers to the reason for the existence of think tanks. Most of the think tanks claim that they conduct research to inform the public and the government on how to improve public policy. Their rhetoric often claims that their work is for the common good and to educate the public. Third, the expertise and professionalism of their research staff is the key intellectual resource of think tanks and a way of legitimizing their findings. Finally, the key activities of think tanks are usually research analysis and advice, which come in the form of publications, conferences, seminars, and workshops.

Myths Concerning Think Tanks

It has been argued that think tanks do not always possess the characteristics described above and that some of these features are better described as myths. The first myth concerns the policy focus of think tanks and their role as bridges between knowledge and government policies. As has already been discussed, no one type of think tanks exists. Furthermore, the borders between think tanks and organizations such as interest groups, professional associations, consultants, and university institutes are blurred. The result is that it is not always easy to identify an organization as a think tank and that bridging knowledge and policies can happen in a variety of ways, if indeed it is a priority of the organization. Another obstacle for think tanks that wish to play the role of a bridge between knowledge and government is that in many countries, the directors and experts of think tanks are closely related to politicians and bureaucrats. In reality, they belong to the same elite; they have similar worldviews, and they often move between governmental organizations and NGOs. Thus, think tanks cannot fulfill their role as bridges.

The second myth is that think tanks serve the public purpose. Although the public purpose is always in their rhetoric, think tanks are themselves organizations that have private interests, and they are dependent on their sources of funding. Often, their concern about their image and reputation limits the spectrum of their policy proposals. It is even doubtful to what extent think tanks can determine their own research agendas because this is often dependent on contracts and funding opportunities. This myth is closely related to the alleged independence of think tanks, which as has been shown is only partial given their needs for funding and publicity. The third myth concerns the knowledge resources of think tanks. Although think tanks do normally recruit experts and provide policy analysis, they often recycle rather than produce academic knowledge. Their aim is to make academic findings more palatable for busy politicians and policymakers. This means that think tanks play an important role in setting the research and policy agenda and in prioritizing some subjects over others.

International Think Tanks

Globalization has affected think tanks, especially by increasing their appetite and capacity for international networking. International think tanks and global networks have emerged since the 1990s. International think tanks, although they are based in one country, claim not to have any specific national links. An example is the European Policy Centre in Belgium, which claims that it is interested in the EU and not in a particular member state. Additionally, there is a tendency for transnational communication between think tanks to occur through the creation of regional and international fora, such as the Global Development Network. International organizations, such as the World Bank, are encouraging this kind of activity through the organization of a number of regional and international conferences for the promotion of think tanks and their work. On the other hand, think tanks are increasingly offering their services to international organizations, such as the World Bank and the EU. All this international activity has translated into a proliferation of the number of such organizations globally.

Future Challenges

The challenges, but also the opportunities, that think tanks are facing are many. First, the nature of funding has changed, and at times of economic recession, obtaining it has become difficult. Second, the proliferation of think tanks and other NGOs has meant increased competition but also increased possibilities for synergies, better productivity, and broader audiences. Third, the rise of the Internet has multiplied their communication possibilities, but it has also signified the spread of information that is not always accurate. Fourth, the emergence of specialist think tanks in new areas, such as biotechnology and genetics has facilitated the provision of more focused analysis. Finally, globalization has meant an increased demand for policy advice and a new role for think tanks that are forced to study policy alternatives from around the globe and then adapt them to their local context.

TIME-SERIES ANALYSIS

Time-series analysis is a type of statistical analysis of observational data that vary over regular units of time. In political science, the data used are typically aggregate descriptors, such as unemployment rates, levels of presidential approval, the incidence of terrorist attacks, or the percentages of Democratic and Republican Party identifiers in the electorate. The time intervals over which these data are gathered are usually years, quarters, or months, but data gathered over much shorter periods also may be employed. For example, political economists studying variations in currency exchange rates or volatility in stock markets may use data gathered every day, every minute, or even every second. Although there are exceptions, time-series analysts normally do not generate their data de novo but rather rely on data gathered by government statistical agencies or private entities, such as public opinion polling agencies. In the following, the basic features and recent advances in this field are presented.

Historically, time-series analysis was closely integrated with other aspects of econometrics. Researchers typically began by specifying a model where the dependent (Y_t) and independent (X_{kt}) variables as well as the stochastic error term (ε_t), were subscripted with t to denote variation over time. Equation 1 is an example with a single predictor variable (X_t). The coefficients β_0 and β_1 in this equation were assumed to be time invariant and were estimated using ordinary least squares (OLS) regression:

$$Y_t = \beta_0 + \beta_1 X_t + \varepsilon_t. \tag{1}$$

A standard set of postestimation diagnostics was performed, with a Durbin-Watson test used to detect the presence of first-order autocorrelation in the residuals. Autocorrelated residuals prompted analysts to infer the existence of autocorrelation in the error process, that is, $\varepsilon_t = \rho\varepsilon_{t-1} + v_t$, where v_t is a well-behaved Gaussian error term that is $\sim N(0, \sigma^2)$ by assumption. In turn, autocorrelated errors were treated as a nuisance, rather than as an indicator of model misspecification. This nuisance could be eliminated by a variant of generalized least squares (the Cochrane-Orcutt transformation), with the parameter ρ being estimated from the data.

The resulting model (Equation 2) involves first-order partial differences of all left- and right-hand-side variables, including the error process:

$$\begin{aligned} Y_t - \rho Y_{t-1} = \beta_0 - \rho\beta_0 + \beta_1 X_t \\ - \beta_1 \rho X_{t-1} + \varepsilon_t - \rho\varepsilon_{t-1}. \end{aligned} \tag{2}$$

The model thus contains a common factor restriction $(1 - \rho L)$, where L is a backshift operator. Political scientists using this technique often appeared to be unaware that the model had dynamic properties with effects of all predictor variables being distributed over time by the presence of a lagged endogenous variable Y_{t-1}, with the rate of decay of these effects being governed by the parameter ρ.

Starting in the 1970s, analysts became increasingly aware of the restrictive nature of the Cochrane-Orcutt transformation, and many began to address the "nuisance" of autocorrelated errors by inserting a lagged endogenous variable on the right-hand side of their model (Equation 3).

$$Y_t = \beta_0 + \lambda Y_{t-1} + \beta_1 X_t + \varepsilon_t. \tag{3}$$

This specification avoided the common factor restriction associated with the Cochrane-Orcutt transformation, but it still imposed a possibly theoretically unattractive uniform dynamic on the effects of all predictor variables, with the rate of decay of those effects being governed by the parameter λ associated with the lagged endogenous variable. In addition, the lagged endogenous variable heightened the possibility that parameter estimates would be biased and inconsistent. Analysts recognizing this possibility typically tested model residuals for first-order correlation using statistics such as Durbin's H (the Durbin-Watson test being inapplicable for models with lagged endogenous variables).

Another important development in the 1970s involved threats to inference posed by trending (nonstationary) data. The stationarity condition requires that variables have constant means, constant variances, and constant autocovariances for any lag *k* regardless of the value of *t*. Well before World War II, prominent statisticians and economists (e.g., George Udny Yule and John Maynard Keynes) worried about the fact that relationships between variables as suggested by statistically significant coefficients estimated in time-series regressions might be artifacts of nonstationarity. The reality of this spurious regression threat was documented by Clive Granger and Paul Newbold in 1974. Using simulated nonstationary variables that were independent by construction, Granger and Newbold found that they falsely rejected the null hypothesis for regression coefficients at alarmingly high rates. Type I errors (rejecting a true hypothesis) were a serious problem when data were nonstationary.

Traditionally, researchers concerned about this threat had "detrended" their data by regressing them on a time counter corresponding to the units of temporal aggregation of their data. However, many analysts believe that such deterministic trends are rare in the data-generating processes for variables of interest to social scientists. In this regard, Granger and Newbold had assumed that nonstationarity was a product of a local-level process, such as a random walk (see Equation 4).

$$Y_t = 1.0 * Y_{t-1} + \varepsilon_t. \tag{4}$$

As Equation 4 shows, a random walk "remembers everything": that is, its value at time *t* equals its value at $t - 1$ plus a contemporaneous random shock, ε_t. Since shocks are not discounted over time, the value of a random walk at any time *t* is the sum of all shocks to that point in time, plus the initial value of the series. The variance of such a process increases without bound as *t* goes to infinity. If the random walk model also includes a constant on the right-hand side, the resulting model—a random walk with drift—generates a deterministic trend. Random walks, with and without drift, are clearly nonstationary.

Given the seriousness of the spurious regressions threat, it is important to diagnose the presence of nonstationarity in time-series variables. Historically, the simplest of these diagnostics has been an ocular inspection of the graph of successive values of a time-series variable. If the variable appears to move predominantly upward or downward over the period for which data are available, the analyst concludes that the process "trends," that is, it is nonstationary. A second diagnostic was suggested by George Box and Gwilym Jenkins, who demonstrated that "stochastic trending" variables, such as random walks, have characteristic autocorrelation functions. An autocorrelation function is the correlation of a time-series variable with itself at successively longer lags. The autocorrelation function for a random walk will have very large values at low lags, and the value of those correlations will decay only very slowly as the lag length increases. The autocorrelation functions of stationary variables are very different, either decaying at geometric rates in the case of an autoregressive process or having one or more significant "spikes" (correlations) in the case of a moving average process.

Inspection of graphs and autocorrelation functions involves judgment calls rather than formal statistical tests. However, over the past three decades, econometricians have developed a large battery of formal tests for nonstationarity. The most widely used of these unit-root tests was proposed by David Dickey and Richard Fuller (DF):

$$(1 - L)Y_t = \beta_0 + \beta_1 T + \lambda Y_{t-1} + \varepsilon_t, \tag{5}$$

where *T* represents time.

The DF test involves regressing the first difference of a variable on its lag in levels plus possibly a constant and a deterministic trend (as in Equation 5), depending on hypotheses about the data-generating process. The key parameter is λ, with a significance test (*t* test) for λ determining whether the variable is nonstationary. For the DF and many other (but not all) of these tests, the null hypothesis is nonstationarity. The *t* distribution for the DF test is nonstandard, and special tables of critical values must be used for significance tests. If one is concerned that test results may be biased because the error process of the DF regression is not "white noise," lags of the dependent variable may be added to the right-hand side. The result is an augmented Dickey-Fuller test, and again, special *t* distributions must be used. Like other unit-root tests, the DF has been criticized for having low power, thus, raising the possibility of incorrectly failing to reject the null hypothesis of nonstationarity (a Type II error).

Since the 1980s, it has become standard practice for analysts who conclude that variables of interest are nonstationary to first-difference these variables prior to doing regression analyses, that is, to compute $Z_t = Y_t - Y_{t-1}$. If subsequent diagnostics suggest that the differenced series remains nonstationary, a second difference is taken, that is, $W_t = Z_t - Z_{t-1}$. If we assume that the data-generating process is characterized by a stochastic trend, such differencing will engender stationarity.

Analyses of models using differenced variables will not be subject to the spurious regressions threat. However, by virtue of being specified with differenced variables, these models address only the short-term effects of various predictor variables. Any long-run relationships will be ignored. Since such relationships can be of considerable theoretical interest, a methodology for incorporating them in the analysis of nonstationary data is very useful. Such a methodology was provided in 1987 by Robert Engle and Clive Granger, who developed the concept of co-integration and demonstrated its relationship with error correction models in the context of applied time-series analysis. (Engle and Granger were awarded the Nobel Prize in Economics for this work in 2003.) They showed that it is possible for a linear combination of two nonstationary variables to be stationary. If this is the case, then, the variables are said to be co-integrated. Engle and Granger's proposed test for co-integration is simple—regress Y_t on X_t in their original-level form, and then, test the residuals for nonstationarity. (Again the requisite *t* distribution for a DF test on these residuals is nonstandard.) If the residuals are stationary, one concludes that the two series are co-integrated. If *Y* and *X* are co-integrated, Engle and Granger show that it is possible to model both the short- and long-run effects of *X* on *Y* via an error correction specification. This error correction model (an autoregressive distributed lag model with restrictions) is

$$\begin{aligned}(1 - L)Y_t = \beta_0 + \beta_1(1 - L)X_t \\ + \alpha(Y - C_1X)_{t-1} + \varepsilon_t, \quad (6)\end{aligned}$$

where C_1 is the correction term.

In Equation 6, the short-run effect of *X* operating at time *t* on Y_t is captured by the β_1 coefficient. The long-run effect is captured by α, with $(Y - C_1X)$ operating with a one-period lag constituting the error correction mechanism. If such a mechanism is operating, the expectation is that α will have an absolute value less than 1.0 and carry a negative sign. For example, an estimated α of −.5 implies that, ceteris paribus, any shock to the system that disturbs the long-run dynamic equilibrium between *Y* and *X* will be eroded at a rate of 50% in all subsequent time periods. Engle and Granger suggested that $(Y - C_1X)$ could be measured as the residuals from the co-integrating regression of *Y* on *X*. Then, Equation 6 could be estimated using OLS. However, this two-step approach to estimation is not necessary, and equations such as Equation 6 can be estimated in one step using nonlinear least squares or maximum likelihood procedures. If one is not interested in a standard error for C_1, OLS can be used.

In contrast to the methods described above, Box and Jenkins in 1976 offered a class of ARIMA (autoregressive, integrated, moving average) models designed to simplify and improve forecasting. Reacting to the perceived theoretical inadequacies and empirical failures of the traditional Cowles Commission approach to forecasting, which involved the specification and estimation of large multi-equation models, Box and Jenkins proposed that the future values of a time series could be forecast using only its own history. As illustrated in Equation 7, the resulting ARIMA models had autoregressive and moving-average components, with the variable of interest (Y_t) being differenced one or more times if necessary to achieve stationarity. A variable that becomes stationary with one difference is said to be integrated of order 1 (i.e., $I(1)$). Using Box and Jenkins's (*p*, *d*, *q*) notation, the model in Equation 7 is a (1, 1, 1) model; it has one difference to produce stationarity, one autoregressive term $[(1 - \varphi L)Y_{t-1}]$, and one moving-average term $(\theta\varepsilon_{t-1})$. The parameters φ and θ are estimated from the data:

$$\begin{aligned}(1 - L)Y_t = \varphi(1 - L)Y_{t-1} \\ + \varepsilon_t + \theta\varepsilon_{t-1}. \quad (7)\end{aligned}$$

Since univariate ARIMA models are theoretical forecasting tools, the data are used as a guide to model identification (specification). In this regard, Box and Jenkins showed analytically that autoregressive and moving-average models have characteristic patterns in their autocorrelation and partial autocorrelation functions that could be used as specification guides. In addition, they suggested diagnostic procedures for assessing the quality of ARIMA models. These include significance tests for model parameters, parameter values consistent with the assumption that the (differenced) series is stationary, and the presence of white-noise residuals from a series filtered with an estimated ARIMA model; the latter condition was typically assessed via Ljung-Box or Box-Pierce portmanteau tests. *Ex post* forecasting performance using a portion of currently available data is another important diagnostic.

ARIMA models may be extended to include explanatory variables. These may be a mixture of continuous variables (Xs; e.g., inflation and unemployment rates) and interventions (Is; e.g., a national election, a terrorist attack), with the latter typically being measured using dummy variables 0 and 1 (see Equation 8). Depending on how these dummy variables are coded, interventions may be specified as having permanent or temporary effects. The impact of any explanatory variable may begin contemporaneously or with a delay of 1 through k periods. Also, unlike garden-variety time-series regression models with lagged endogenous variables, multivariate ARIMA models may specify different dynamics for the effects of different predictors. For example, in Equation 8, the immediate (time t) impact of I is captured by ω_1, and the lagged effects (growth or decay) are captured by δ_1. Lagged effects of X are estimated with δ_2, which need not have the same value as δ_1. Depending on the available degrees of freedom, several δs may be specified in a single multivariate ARIMA model:

$$\begin{aligned}(1 - L)Y_t = \varphi(1 - L)Y_{t-1} &+ \omega_1/(1 - \delta_1 L)(1 - L) \\ I_{t-k} &+ \omega_2/(1 - \delta_2 L)(1 - L)X_{t-k} \\ &+ \varepsilon_t + \theta\varepsilon_{t-1.}\end{aligned} \quad (8)$$

Recent research on long-memoried processes has produced a class of autoregressive, fractionally integrated, moving average (ARFIMA) models that generalize the integration concept in traditional ARIMA models. As Janet Box-Steffensmeier and Renée Smith argue, time-series variables are not simply stationary or nonstationary in a knife-edged sense; rather, they can be thought of as having degrees of integration. Thus, the d term in the Box-Jenkins p, d, q models is no longer an integer with values 0 if a variable is stationary or 1 if it needs to be differenced once to make it stationary. In ARFIMA models, the values of d lie along a continuum from -0.5 to 1.0, with values equal to or greater than 0.5 and less than 1.0, indicating that the variable is nonstationary but ultimately mean reverting.

The d parameter and its associated standard error, together with any specified autoregressive and moving-average parameters, can be estimated from the data using maximum likelihood or other procedures. An example of such an ARFIMA model is Equation 9. Lacking any autoregressive or moving-average terms, this model is called "pure fractional noise." As with conventional ARIMA models, explanatory variables can be included in ARFIMA specifications. A recent extension of these models involves the development of the concepts of fractional co-integration and fractional error correction:

$$(1 - L)^d Y_t = \varepsilon_t. \quad (9)$$

The desire for simple, easily estimated, accurate forecasting models did not abate with the development of ARIMA models. In 1980, the econometrician Christopher Sims offered a penetrating critique of conventional multi-equation forecasting models and suggested a radical alternative. Sims argued that many of the parameter restrictions required to achieve identification in multi-equation models (with endogenous regressors) were simply "incredible." Researchers imposed these restrictions not because they were justified by theory or evidence but rather because they were necessary to avoid simultaneity biases. Given this ad hoc nature, the poor forecasting performance of such models was hardly surprising.

Sims did not claim that econometricians were radically ignorant of their subject matter. Rather, he asserted that researchers could use theory and experience to assemble sets of variables that were dynamically interrelated in possibly highly complex ways. Researchers wishing to forecast could "round up the usual suspects," even if that complexity kept them from developing credible identifying restrictions needed for the estimation of structural parameters. But all was not lost. Sims proposed that forecasters use these sets of variables to develop simple multi-equation autoregressive models comprising unrestricted reduced forms. Each variable of interest was a function of one or more lagged values of itself and one or more lagged values of all other variables in the system. Additional variables capturing important exogenous shocks could be added if desired. The resulting set of equations is called a vector autoregression or VAR. In Sims's original formulation, parameters in VARs could be estimated simply—via OLS or SUR techniques. Equations 10a and 10b are an example of a simple two-variable VAR with a single lag on both variables in the system:

$$Y_t = A_0 + A_1 Y_{t-1} + B_1 X_{t-1} + \varepsilon_t, \qquad (10a)$$

$$X_t = C_0 + C_1 X_{t-1} + D_1 Y_{t-1} + u_t. \qquad (10b)$$

Although the simplicity of these VARs was attractive, researchers soon attempted to improve their forecasting performance by imposing restrictions on various parameters in a system. Later, analysts attracted by the ideas of co-integration and error correction developed vector error correction models that incorporated hypothesized long-run relationships explicitly into a VAR setup. Others, wishing to extract explanatory power from VARs, respecified them as moving-average representations of a system of interest. By so doing, they could trace the dynamic effects of shocks to a variable on other variables in that system. These analyses are not entirely theory-free; rather, general hypotheses about the flow of causality are required to order the variables in a system and, hence, how shocks are transmitted through it. Still others have leveraged recent developments in applied Bayesian statistics to specify and estimate VARs.

Another important methodological advance enables researchers to study the evolution of the variance of a time-series variable. These autoregressive conditional heteroskedasticity (ARCH) models were pioneered by Engle in 1982, with a subsequent generalization by producing the generalized ARCH (GARCH) model that closely resembles traditional ARIMA models. Equations 11a and 11b are an example. Here, the error process (ε_t) for Y_t in Equation 11a has a hetereoskedastic variance that evolves according to Equation 11b. The scaling parameter for this conditional variance, h_t, is driven by its own past value as well as the size of the variance at $t - 1$, that is, ε^2_{t-1}:

$$Y_t = \beta_0 + \lambda Y_{t-1} + \beta_1 X_t + \varepsilon_t, \qquad (11a)$$

$$h_t = \lambda_0 + \lambda_1 h_{t-1} + \lambda_2 \varepsilon^2_{t-1}. \qquad (11b)$$

Econometricians have extended GARCH models to incorporate ideas such as asymmetry, nonlinearity, integration, and fractional integration. GARCH models also may be specified such that the conditional variance influences the evolution of the mean of a process, and explanatory variables may be included in the equation for h_t to help account for how it evolves.

To date, the vast majority of applications of GARCH models have been in the field of finance, where investigators are keenly interested in measuring risks associated with holding an asset at any time t. Conditional heteroskedasticity, tapping overtime variation in the size of shocks to a system and, hence, volatility, is a natural way of calibrating such risks in empirical analysis. Other applications are possible. For example, in 2009, Harold Clarke, David Sanders, Marianne Stewart, and Paul Whiteley used GARCH models to study the development of consensus in public opinion regarding the performance of British Prime Minister Tony Blair. A key explanatory variable in the model of the GARCH process for the conditional variance of Blair's performance evaluations is a measure of civilian casualties in the Iraq War. This application of GARCH modeling illustrates how advanced time-series methods can be used in empirical analyses of phenomena of long-standing interest to political scientists.

TIME-SERIES CROSS-SECTION DATA AND METHODS

The use of pooled time-series cross-section (PTSCS) data in quantitative political analysis has increased immensely over the last two decades. Pooled data analysis has become the standard especially in subdisciplines such as international relations, comparative politics, and comparative political economy. However, fields that use microdata, such as political behavior or American politics, also increasingly use PTSCS data due to the greater availability of survey data over time. Panel data pool cross-sectional information (number of units N) with information over time (number of time points T), for example, data on individuals or firms at different points in time, information on countries and regions over time, and so on. Thus, panel data consist of repeated observations on a number of units. We can distinguish between cross-sectional dominant data (cross-section time-series, CSTS), time-series dominant data (time-series cross section, TSCS), and pooled data with a fixed number of units and time points. The data structure has implications for the model choice since asymptotic properties of estimators for pooled data are either derived for $N \to \infty$ or $T \to \infty$. In addition, violations of full ideal conditions and specification issues have more or less severe effects for bias and efficiency depending on whether the number of units exceeds the number of observations over time or vice versa. In what follows, we discuss the respective strengths and weaknesses of this method and various ways by which we can cope with some of the inherent problems.

Some have argued that TSCS and CSTS data consist of observations at different points in time for fixed units of theoretical interest, such as countries or dyads, whereas in panel data, the units, mostly individuals in surveys, are of no specific interest and are randomly sampled from an underlying population with all inferences dedicated to uncovering the relationships in the population. Textbooks and articles, however, use these terms quite loosely. This entry follows this trend and discusses general estimation procedures and specification issues with respect to different kinds of data pooling cross-sectional and time-series information.

Advantages and Disadvantages of PTSCS Data Analysis

Panel data pool observations for units (i) and time periods (t). The typical data-generating process can be characterized as

$$y_{it} = \alpha + \sum_{k=1}^{K} \beta_k x_{kit} + \varepsilon_{it}, \quad i = 1, \ldots, N; \quad t = 1, \ldots, T, \quad (1)$$

with k independent variables x, which have observations for N units (i) and T periods (t). The dependent variable y is continuous (though in principle, it can be limited dependent, which requires nonlinear estimation procedures) and also observed for i and t. ε_{it} describes the error term for observations i and t and we can assume an $NT \times NT$ variance–covariance matrix Ω of the error term with the typical element $E(\varepsilon_{it}, \varepsilon_{js})$. In case all Gauss-Markov assumptions are met (the error term is *iid*), this model can be straightforwardly estimated by ordinary least squares (OLS). Because PTSCS data combine time-series and cross-section information, this is rarely the case. However, the analysis of PTSCS data offers significant advantages over the analysis of pure time-series or pure cross-sectional data. First, using pooled data increases the number of observations and, therefore, the degrees of freedom, which allow us to test more complex arguments by employing more complex estimation procedures. More important, most theories in the social sciences generate predictions over space and time, and it seems, therefore, indispensable to test these hypotheses by using data providing repeated information for theoretically interesting units. PTSCS data analysis allows the modeling of dynamics, which is impossible when pure cross sections are examined, which may lead to spurious regression results. Finally, analyzing pooled data allows controlling for unit heterogeneity beyond the inclusion of additional right-hand-side (RHS) variables. Accordingly, pooled data can be used to get rid of some kinds of omitted-variable bias, make the best of the available information, test theories that predict changes, and test theories that predict parameter heterogeneity.

The most prominent disadvantage of panel data analysis lies in the fact that an econometrically sound model specification is typically hard to find since the data structure not only combines all the problems of cross-sectional and time-series data, but also these problems typically arise simultaneously. Specification problems in pooled data analysis can be summarized as follows:

- The residuals are typically serially correlated and not independent of each other.
- The residuals have different variances for different units (panel heteroskedasticity).
- The residuals of different units are contemporaneously correlated.
- The residual of unit *i* covaries with residuals of unit *j* for different points in time.
- The expected mean of the error term deviates from zero for different units.

While each single violation of the underlying model assumptions is often straightforwardly accounted for by existing econometric measures, combinations of problems might not be solved simultaneously in a satisfying manner. Econometric solutions are often incompatible with theories. Sometimes, it is hard to find models that at the very same time are econometrically sound (unbiased, efficient) and provide an appropriate test of the theory. Weighing the advantages and disadvantages of pooled data analysis, the positive aspects certainly prevail, especially because the analysis of pooled data allows the testing of complex arguments over space and time, which are characteristic for the social sciences. From this perspective, the steep increase in the popularity of panel data analysis does not seem to be surprising.

Heteroskedasticity and Contemporaneous Error Correlation in Panel Data

Heteroskedasticity in pooled data presents a more complex problem than in pure cross sections since (a) the error term can have unit-specific variances (panel heteroskedasticity), (b) the error term can be contemporaneously correlated, that is, the error term of unit *i* is correlated to that of unit *j* in the same year, and (c) the error term of one unit *i* can be correlated with the error term of unit *j* at different points in time. In addition, the error term can have time-dependent error variances (autoregressive conditional heteroskedasticity). Panel heteroskedasticity mainly occurs if the model specification fits different units differently well. Correlations of the errors across units are determined by unobserved features of one unit that are linked to another unit. Both features violate Gauss-Markov assumptions: While they leave the simple estimators consistent, such estimators are now inefficient, and standard errors may be incorrect. More important, both heteroskedasticity and error correlation often signal omitted-variable bias since in both cases something that should have been included into the structural part of the equation was left out.

This problem can be solved in a substantive way by identifying the causes of the omitted-variable bias and including these variables into the RHS of the models. Often, this approach is not feasible since the sources for heteroskedasticity are unknown, or excluded factors cannot be measured. In this case, several econometric solutions have been proposed.

A first approach brought forward by R. W. Parks and Jan Kmenta is a feasible generalized least squares (FGLS) estimation, which is characterized by an $NT \times NT$ block diagonal matrix with an $N \times N$ matrix Σ that contains contemporaneous covariances along the block diagonal. Parks and Kmenta also suggest an Ω matrix with a panel-specific first-order autoregressive, AR(1), error structure and contemporaneously correlated errors, but in principle, FGLS can handle different correlation structures.

Because the true structure of $\sum$ and Ω are unknown, this procedure requires the estimation of a very large number of parameters to obtain the error covariances, which in turn leads to very inefficient and therefore unreliable results. Nathaniel Beck and Jonathan Katz show that the Parks method highly underestimates standard errors and therefore induces overconfidence in estimation results. As a result, this estimation procedure is very rarely used in recent work using pooled data. Beck and Katz suggest a different way of dealing with panel heteroskedasticity. They argue that coefficient estimates of OLS are consistent but inefficient in pooled data and that the degree of inefficiency depends on the data and the exact error process. They suggest using OLS and correcting the estimated standard errors by taking the specific panel structure of the data into account:

$$\mathrm{Var}[\beta] = (X'X)^{-1}X'\Omega X(X'X)^{-1}, \tag{2}$$

with

$$\Omega = (E'E/T) \otimes I_T. \tag{3}$$

This is called the panel-corrected standard errors method. Other violations of Gauss-Markov assumptions, such as serial correlation of the error term, have to be treated beforehand. Since this approach manipulates only the standard errors of an OLS model, the coefficients are biased whenever OLS is biased.

Dynamics and Serial Correlation

As pooled data combine information across units and over time, another problem arises if the error term is serially correlated. The error term in t is dependent on the error term in $t - 1$:

$$\varepsilon_{it} = \rho_i \varepsilon_{it-1} + \xi_{it}. \tag{4}$$

Again, violating the independence assumption econometrically only influences the efficiency of the estimation. Yet since the residual of a regression model picks up the influences of those variables that have not been included, persistence in excluded variables is the most frequent cause of serial correlation. Several remedies for serial correlation are available, all of which have different consequences for the model specification and interpretation of the estimation results.

A substantive solution to the problem of serial correlation is the inclusion of a lagged dependent variable (LDV) y_{it-1} to the RHS of the regression equation. In many cases, this is enough to eliminate serially correlated error terms. However, there are also many perils of adding an LDV to the list of regressors. One of the main problems arises because the inclusion of an LDV makes it difficult to interpret effects of the substantial RHS variables directly and correctly since the conditional effect of x on y is dynamic and aggregated over all periods. It can be described by the following polynomial:

$$y(x)_{t_1 \to t_p} = \beta_1 x_{it} + \sum_{p=1}^{t_p} \left(\beta_0^{t-p} \beta_1 x_{it}\right). \tag{5}$$

Unfortunately, the standard errors of the function in Equation 5 cannot be easily calculated.

Since including an LDV resembles a shortened distributed lag model, we implicitly assume that all variables exert an equally strong one-period lagged impact on the dependent variable. Therefore, finding a nonsignificant coefficient of a theoretically interesting explanatory variable in an LDV model does not necessarily mean that this variable has no effect; it only tells us that this variable does not affect the dependent variable contemporaneously—it might still have a lagged effect. From this, it follows that the coefficient of the LDV estimates at best the average dynamic effect of all substantive RHS variables rather than the actual dynamic effect of each explanatory variable.

Another (lesser) problem occurs when combining an LDV with the estimation of unit-specific effects by a fixed-effects (FE) specification or a least squares dummy variable (LSDV) model (see the next section for a more detailed description). This leads to biased estimates since the LDV covaries with the time-invariant part of the error term. This problem is called Nickell bias. The best known suggestions tackling the problem of Nickell bias are the instrumental variable approach by Theodore Anderson and Cheng Hsiao (AH), the differenced GMM (generalized methods of moments) model by Manuel Arellano and Stephen Bond (AB), and the Kiviet correction (by Jan Kiviet), which proposes a corrected within estimator that subtracts a consistent estimate of the bias from the original FE estimator. The first two approaches solve the bias problem by first differencing both sides of the regression equation and instrumentation of the LDV with higher order lags of the LDV. Thereby, AH only uses the two-period lagged LDV as an instrument while AB allows the use of all possible lags of the LDV and all exogenous variables in the model. Both approaches generate asymptotically consistent estimation results, whereby AB produces more efficient estimates due to the exploitation of all moment conditions. In finite samples, however, both estimators are problematic with regard to efficiency as Monte Carlo experiments examining the finite sample properties reveal. Higher lags of the LDV provide good instruments only in the case when y is highly persistent over time. Unfortunately, in such a case, the probability that the instruments also covary with the error term remains high. From this perspective, both estimators cannot solve the problem of Nickell bias if y is highly persistent, or they solve the problem very inefficiently in the case of low persistence.

A Prais-Winsten (PW) transformation of the model offers another solution to serial correlation. The advantage of the PW approach consists in the transformation of both the LHS and the RHS of the equation, which allows a direct interpretation of the regression coefficients. PW is estimated by GLS and is derived from the AR(1) model for the error term. First, a standard linear regression is estimated:

$$y_{it} = x_{it}\beta + \varepsilon_{it}. \tag{6}$$

An estimate of the correlation in the residuals is then obtained by the following auxiliary regression:

$$\varepsilon_{it} = \rho\varepsilon_{it-1} + \xi_{it}. \tag{7}$$

A Cochrane-Orcutt transformation is applied for observations $t = 2, \ldots, n$:

$$y_{it} - \rho y_{it-1} = \beta(x_{it} - \rho x_{it-1}) + \varsigma_{it}. \tag{8}$$

And the transformation for $t = 1$ is as follows:

$$\sqrt{1-\rho^2}\,y_1 = \beta\left(\sqrt{1-\rho^2}\,x_1\right) + \sqrt{1-\rho^2}\,\varsigma_1. \tag{9}$$

Equation 9 shows that another advantage of the PW transformation is the preservation of the first period. The differences between a PW and an LDV model might be substantial depending on ρ and the serial correlation in both y and x.

Heterogeneity

One of the advantages of analyzing pooled data is the possibility of controlling for heterogeneity across units. When examining cross-sectional data, it is impossible to tell whether the estimated effects are contingent on unobserved effects that are specific to each unit and, therefore, biased. PTSCS data analysis rests on the assumption that units are similar enough to be pooled together. If that were not the case, we could still find appropriate specifications that allow accounting for differences across units that might influence the estimation results. Textbooks discuss this problem usually under the header "unit-heterogeneity" and offer remedies such as FE or random-effects (RE) models. However, these models only deal with time-invariant unit-specific effects, but units can also be heterogeneous with respect to slope parameters, dynamics, or lag structures. The next sections discuss different versions of unit heterogeneity.

Unit Heterogeneity

When units have specific characteristics that cannot be measured and are time invariant, they offer different initial conditions that might influence the regression model. Especially, if these time-invariant unit-specific effects are correlated with any of the RHS variables, coefficient estimates are distorted by omitted-variable bias. If that is the case and we do not control for unit-specific effects, the Gauss-Markov assumption of x being deterministic is violated:

$$y_{it} = \alpha + \sum_{k=1}^{K}\beta_k x_{kit} + \sum_{m=1}^{M}\gamma_m z_{mi} + u_i + \varepsilon_{it}, \tag{10}$$

where u_i denotes the unit-specific effects and z the other explanatory variables that are time invariant but can be measured and are of theoretical interest. If u_i is excluded from the estimation, it becomes part of the overall error term and will make the model less efficient in the case when it does not covary with any of the x or z but will induce bias if it is correlated with any of the regressors. Econometrically, we can solve for correlated unit-specific effects by including a dummy variable for each unit into the RHS of the model, which generates unit-specific intercepts. This estimation procedure is called the LSDV model:

$$y_{it} = \alpha + \beta_k \sum_{k=1}^{K} x_{kit} + \gamma_{n-1} D_i + \varepsilon_{it}. \tag{11}$$

The unit-specific dummy variables (D_i) are multicollinear to any time-invariant variable z; the coefficients for z are therefore not identified. We can also employ a so-called FE specification, which is econometrically equivalent to an LSDV model. The FE model first de-means all variables in the model and then estimates the transformed equation by OLS:

$$\begin{aligned} y_{it} - \bar{y}_i &= \beta_k \sum_{k=1}^{K} (x_{kit} - \bar{x}_{ki}) + \varepsilon_{it} - \bar{\varepsilon}_i + u_i - \bar{u}_i \\ \equiv \ddot{y}_{it} &= \beta_k \sum_{k=1}^{K} \ddot{x}_{kit} + \ddot{\varepsilon}_{it}. \end{aligned} \tag{12}$$

The FE transformation eliminates not only the unit-specific effects but also the time-invariant variables that might be of theoretical interest. FE can become highly inefficient because it only uses the within information of all variables. Yet not controlling for unit-specific effects leads to biased estimates if unit effects exist and are correlated with any of the regressors.

If unit-specific effects do exist but do not covary with any of the RHS variables, not controlling for unit effects does not bias the estimates but increases the sampling variation of the OLS estimator and therefore generates less efficient results. A straightforward remedy is an RE specification, which treats the u_i as a random unit specific part of the error term. The RE model only quasi-de-means the variables: Rather than removing the time average from the explanatory and dependent variables at each t, RE removes a fraction of the time average. The RE estimator generates more efficient results than the FE estimator, but the RE model produces biased estimates if the RHS variables covary with the unobserved unit-specific effects. RE resembles a feasible GLS estimator where the Ω matrix (VC [variance–covariance of the errors]) matrix of the error term) has a specific RE structure that only depends on two parameters: σ_u^2 and σ_ε^2. RE and FE estimates tend to be close if T gets large or the variance of the estimated unit effects increases as compared to the error variance.

Since the RE estimator is more efficient than its FE counterpart in the case when the unit effects are uncorrelated with the regressors, it is useful to determine which of the two specifications should be used. Textbooks typically suggest employing the Hausman test. The Hausman test is based on the following logic: Since the RE estimator is biased if unit-specific effects are correlated, differences between FE and RE estimates are interpreted as evidence against the RE assumption of zero covariance between x and u_i. Econometricians confirm that the Hausman test has good asymptotic properties. Nevertheless, in finite samples, the test results are influenced by the trade-off between bias and efficiency. The Hausman test is only powerful in the limit: Since FE is consistent, the difference between RE and FE estimates can only be caused by biased RE estimates. In finite samples, however, the differences can result from two sources: biased RE estimates and unreliable FE point estimates due to inefficient estimation of variables with low within variation. The Hausman test actually mirrors this trade-off since it divides the difference of RE and FE estimates by the difference in the asymptotic variances of the RE and FE estimates. From this, it follows that the test results are especially unreliable if the estimation equation contains regressors that are both correlated with the unit-specific effects and rarely change over time.

Highly problematic in a FE specification is the estimation of time-invariant or nearly time-invariant variables. While the problem of including completely time-invariant variables is apparent, the estimation of rarely changing variables does not seem as problematic since FE specifications generate an estimate. However, this estimate might be very inefficient since FE specifications eliminate all cross-sectional variation, and only the variance over time is used to compute the coefficient. If this within-unit variation is very small, the sampling variation of FE estimates increases drastically, which leads not only to large standard errors but also to very unreliable point estimates. In the case of time-invariant variables, applied researchers often resort to a simple pooled OLS or an RE model, which allow the estimation of coefficients for time-invariant variables that are biased in case the unit-specific effects covary with the regressors. Hausman and Taylor suggest an estimator that uses the uncorrelated RHS variables as instruments for the correlated regressors. If the instruments are poor, the Hausman-Taylor estimator produces highly inefficient parameter estimates. Plümper and Troeger developed an estimation procedure combining the favorable characteristics of FE with the possibility of efficiently estimating time-invariant and nearly time-invariant variables. This procedure is called a fixed-effects vector decomposition (FEVD). FEVD is a three-stage estimation procedure that decomposes the unit fixed effects into a part that can be explained by the time-invariant and rarely changing variables and an unexplained part. FEVD generates estimates with smaller root-mean-squared errors than competing estimators (Hausman-Taylor, FE, RE, pooled OLS) under a wide range of conditions.

Parameter Heterogeneity

As compared with unobserved time-invariant unit heterogeneity, we observe parameter heterogeneity if the coefficient of an explanatory variable differs significantly across units or over time. If parameters change across time or units, we are likely to deal with unobserved and therefore excluded interaction effects, or it could be that we have assumed the wrong functional form for the statistical relationship. If the source of parameter heterogeneity is known or our theoretical model even predicts differences in parameters across units or time periods, we can straightforwardly specify the correct model by including interaction terms between time periods or groups of units and the specific RHS variables.

In cases where the source of parameter heterogeneity is unknown, seemingly unrelated regressions (SURs) or random-coefficients models (RCMs) offer an econometric solution to the problem. SUR models estimate a single regression for every unit but exploiting the panel structure of the data by assuming a joint error process for all units. This increases the efficiency of estimation by "borrowing strength." SUR models only generate acceptable parameter estimates for long time series, that is, when T is much larger than N. SUR models employ a GLS-type estimator for the VC matrix, which weights the standard errors by the cross section–specific mean-squared errors.

The random-coefficients estimator (e.g., Beck and Katz) provides a compromise between estimating the fully pooled model and a fully unpooled estimate (separate OLS for each unit). Pooled OLS depends on the stark assumption of unit homogeneity, whereas separate OLS estimation for each unit produces inefficient results. The RCM borrows strength by shrinking each of the individual unit OLS estimates back to the overall (pooled) estimate. It is, therefore, also a good test for "poolability" of the data. The RCM generalizes the RE estimator from the intercept to all parameters of interest

$$\begin{aligned} y_{it} &= \alpha + \beta_{ki} \sum_{k=1}^{K} x_{kit} + \delta_m \sum_{m=1}^{M} w_{mit} + \varepsilon_{it}, \\ \beta_i &\sim N\left(\beta, \sigma_\beta^2\right). \end{aligned} \tag{13}$$

The RCM can be made more useful by allowing the β_i to be functions of other unit-specific variables.

Heterogeneity of Dynamics and Lag Structures

In pooled data, not only do coefficient estimates vary across units but also dynamic effects. In addition, different RHS variables might exert a differently lagged impact on the dependent variable, and the lag length can differ across units. Different dynamics can be straightforwardly incorporated into an RCM or SUR models by including an LDV with unit-specific coefficients. PW specifications also allow for unit-specific autoregressive processes in the error term.

Since statistical tests for heterogeneous dynamics or lag structures are not readily available, defining specific dynamics should be based on theoretical grounds. Unit-specific dynamics can then be more directly modeled by making the relevant regressors or the LDV interact with dummies for specific groups of units. Since different explanatory variables can have differently lagged effects across units as well, it is not plausible to just vary the estimates of the LDV because the marginal effect of an RHS variable at time $t > 1$ partially depends on the estimate for the LDV.

In summary, different kinds of unit heterogeneity do not prevent pooling of information over time and across units. Theoretically, unit heterogeneity leads to interesting research questions that can be empirically analyzed with the appropriate model specification. The possibility of controlling for unit heterogeneity renders pooled data analysis more attractive than pure cross-section or time-series analysis.

Conclusion

This entry provides a short overview of basic estimation procedures and specification issues in PTSCS data. Due to space constraints, other important topics, such as spatial effects in pooled data, nonstationarity, and the usefulness of error correction models as well as estimation procedures and specification issues in limited dependent-variable models for pooled data, could not be discussed. While estimators and statistical tests are discussed in most econometric textbooks, a thorough discussion of specification problems in pooled and panel data remains important. This also holds true for the question of how asymptotic properties of estimators translate to finite-sample analysis.

TOCQUEVILLE, ALEXIS DE (1805–1859)

French political thinker, author, historian, and political philosopher Alexis de Tocqueville, known primarily for his *Democracy in America* (two volumes, 1835–1840), has constantly gained readership after a hiatus from 1880 to 1945. The development of liberal democracies, demands for pluralism, and the demise of the communist model seem to explain this worldwide renewal of interest. It is important not to succumb to the allure of a visionary who saw it all coming, however. Instead, let us gauge the work's originality with respect to its era and the tradition of political philosophy. Three points in particular come to the fore: the relationship between freedom and equality, the concept of democracy, and the vision of despotism.

Freedom and Equality

Compared with a predecessor, such as Benjamin Constant, or a contemporary, such as François Guizot, Tocqueville pondered the consequences of the principle of equality promoted by the French Revolution in 1789 in far greater depth. He believed that the aspiration to equality is the driving force in history that would inevitably transform not only class relations, law, customs, and language but also all of modern humanity's self-representations. The "gradual and progressive development of equality," as the introduction to *Democracy in America* states, upsets hierarchies and shapes minds in such a way that Tocqueville wondered if they are compatible with freedom—the other great modern value. It was because he was of the liberal school but also of aristocratic stock (old nobility by his father, *noblesse de robe* by his mother) that Tocqueville pursued this inquiry. He viewed the aristocracy, due to intermediate bodies and the decentralization of power under the feudal system, as the very source of the spirit of liberty in Europe, together with the Christian idea of human freedom.

For Tocqueville, the conflict between freedom and equality largely corresponds to the opposition between aristocratic society and democratic society. This gives rise to the second originality, less with respect to his era than our own: modern democracy does not necessarily promote a society of freedom, contrary to what today has become a widespread idea. Guizot shared this opinion. He preferred the representative system, in which payment of the poll tax determined eligibility to vote, over democracy, which he believed, like Sieyès, was a primitive and oppressive form of societies in their infancy. Guizot considered that the model for free societies was found in the English parliamentary system and not in the young republic of the United States of America. For Tocqueville, France had certainly experienced a period of despotic democracy in the form of the Napoleonic Empire and even a bloody democracy during the Terror practiced by the revolutionary government of 1793. But America offered food for thought as it had found the means to curb the dangers of popular sovereignty by dispersing the locus of power and allowing civil society to organize, thereby, diminishing the threats that the spirit of equality posed to freedom via associations, freedom of the press, systematic recourse to justice, religious freedom, the separation of church and state, local community life, and more generally speaking, federalism.

Traveling to investigate President Jackson's America at the age of 26 (1831), Tocqueville thus reproduced Baron de Montesquieu's accomplishment as regards the English Constitution: to draw overarching principles from a particular case. The liberal tradition had taken the British monarchy as a model. Tocqueville took this same comparative stance, in line with Montesquieu's aspiration, that is, aristocratic liberalism, but this time, he aimed to draw lessons from the American republic. This young writer, with his aristocratic background, did not seek to salvage the values of his milieu by taking the supposedly right model or right version of society: England, with its aristocracy, a service class, and open to merit, which was a stark contrast to the social sterility of the French nobility steeped in its privileges of birth. He instead aimed to reform, elevate, and spiritualize a lifestyle that he had little sympathy for: a society of commerce and jealous competition among equals, calculated self-interest, utilitarianism, and the lack of any official hierarchy. The typical example is America, but it was bound to gain favor in Europe. He hoped nevertheless to breathe certain aristocratic values, such as the spirit of freedom, public service, and protection of the weak, into this social form that was making advances in history with the expansion of the bourgeoisie.

Democracy

Actually, Tocqueville's new concept of democracy consisted of two very different components: the political system on one hand (elections, constitution, political debate as a public scene) and the social state (*état social*) on the other—that is, civil society, but including in it customs, beliefs and public opinion, forms of self-representation, and relations between individuals.

What is there in common between these two constitutive spheres of democracy? Majority rule triumphs in both civil society and government, but—it is remarkable to note—political despotism in government can very well gain acceptance by democracy as a social state. Tocqueville himself witnessed with sorrow and helplessness the rise to power and the coup d'état of Napoleon III and then his lasting triumph. The Second Empire regime illustrated, unfortunately, what he had described in *Democracy in America* some 20 years earlier. In the foreword to the *Ancien Régime and the Revolution* (1856), he alluded to a few pages of the introduction to *Democracy in America* (1835) pertaining to the immoderate thirst for wealth, lack of interest in politics, cynicism in social relations, respect for brute force as being the very passions aroused by democracy that can lead to despotism. "Democratic societies that are not free can be wealthy, refined, even splendid." It is in that sense that a democratic society can be not free, despite the opinions we hold today.

Despotism

From this derives the treatment of despotism as a theoretical problem to which Tocqueville, building on the analyses of Locke, Montesquieu, and Rousseau, takes an entirely new approach. The originality is to consider that despotism can arise out of the very logics of democracy (considered as civil society), as we have already seen. But actually, two possibilities exist, which are sometimes combined and sometimes separate.

Apathetic, depoliticized citizens devoted to the constant search for "material gratifications" (to use Tocqueville's expression) will in the long run unburden themselves of the task of governing themselves if a power (and a leader) offers its services, promising to satisfy their thirst for wealth and take charge of all aspects of their everyday life. In this sense, despotism, "soft and tutelary" (as Tocqueville calls it), occurs when a centralized and bureaucratic state extends its intervention, replacing citizen freedom with egalitarian paternalism, even if it means harshly repressing unruliness. The picture of this new brand of despotism is found in the now famous pages at the end of Volume 2 of *Democracy in America*.

Further, given both the numerical and moral weaknesses of an individual faced with the mass of his equals and fellow men, despotism is realized in the form of this *conformism* that always plagues democracies. The "tyranny of the majority" that is given free rein in a parliamentary regime if minority rights are not preserved by appropriate institutions finds its counterpart in civil society as well. The democratic paradox is thus as follows: Proud of his individual freedom of judgment, the individual feels intimidated before the majority judgment every time he is told that public opinion has spoken. Can one be right alone against thousands of people when one makes the equality of minds the cornerstone of the regime and life in society? In a democracy, it may seem that enlightenment, wisdom, and truth lie in numbers, which make up the public or public opinion: Tocqueville believed that he had observed in America the paradoxical union of freedom of thought, proclaimed as a founding axiom, with the stifling of this selfsame freedom—in certain periods—under the Empire of the Public: "In the United States, the majority takes it upon itself to provide individuals with a range of ready-made opinions and thus relieves them of the obligation to form their own." (p. 491).

Modern democracy would thus be a confirmation of the fact that democracy embodies just as much the potential for freedom as it does a new brand of despotism and that it is in general profoundly ambivalent as is its chief principle, the principle of equality. Equality even embodies a new religion that democracy eagerly builds on:

> Regardless of what political laws men are subject to in ages of equality, we may anticipate that faith in common opinion will become a sort of religion, with the majority as its prophet. (p. 492)

The Public is democracy's new god; it worships itself through the practice of consulting public opinion. No one more than Tocqueville has arrived at such a richness of expression on this question, however much it was debated during the 18th century: What is the new power of public opinion? What is government by opinion?

We will note that Montesquieu, after Plato, had described the disadvantages of total equality (*The Spirit of the Laws*, VIII 3, "Of the Spirit of Extreme Equality"). Tocqueville makes use of this analysis but enriches it as well with his readings of the French moralists and especially the Jansenists, such as François de la Rochefoucauld, Blaise Pascal, and Pierre Nicole: He analyzes the endless pursuit of material gratifications as an equivalent to what Pascal had called "distractions" (in which man hides his own mortality from himself by the pursuit of satisfactions that occupy him entirely); he even says explicitly that perfect and definitive equality flees on an "eternal flight," according to an expression Pascal had used and that Tocqueville cites. As regards the situation of the French after the 1789 revolution, he adopts a tone that is both patrician and one of a Jansenist-influenced author, so to speak: "Having destroyed the obstructing privileges enjoyed by some of their fellow men, they run up against universal competition" (p. 627). Such is "democracy" according to Tocqueville—at once a set of political institutions, mentalities, and social behaviors. It is a system that can be improved on, with which one must learn to live, he explains to his family and his friends in the legitimist party: local freedoms, the power of public opinion, the search for material well-being are all fields of action offered to democracy and that should draw the attention of reformers, theoreticians, and political professionals alike.

Influence on U.S. Political Science

Tocqueville has inspired many works of political science, especially in America. We might mention Louis Hartz, for whom liberalism in America developed in the absence of a feudal past to be fought against (*The Liberal Tradition in America*, 1955); Robert Bellah expounds on a typically Tocquevillian theme in *Habits of the Heart: Individualism and Commitment in American Life* (1985), as does Robert D. Putnam in his theory of "social capital" more recently (*Bowling Alone*, 2000): the communitarian stream takes Tocqueville as one of its reference points.

TOLERANCE

Tolerance is derived from the word *tolerate*, which is broadly defined as permitting or enduring what is objectionable. This entry discusses the historical and philosophical background of tolerance with an emphasis on liberal doctrines and examines its connection to human rights as well as the limits of tolerance.

Social tolerance involves a permissive attitude toward those whose race, religion, ethnicity, nationality, sexual orientation, opinion, or habits differ from one's own. In politics, tolerance can be a quality of an individual, group, corporate entity, or state. Although the meaning of the concept has changed over time, tolerance for different opinions and, thus, allowing for freedom of expression and association is considered the hallmark of a liberal democratic state. Although it started as an exclusive political system, some commitment to religious pluralism and the gradual expansion of political rights have contributed to its identification with social tolerance as well.

Historical and Philosophical Background

Eurocentric historiographies of tolerance attribute its origin to the Protestant movement or the age of Enlightenment, which respectively, invited religious pluralism and humanism. Arguments raised by natural law and social contract theorists, such as John Locke (1632–1704) and Jean-Jacques

Rousseau (1712–1778), against the "divine rights of kings" or aristocratic privileges of the ancien régime and in favor of religious freedom or secularism constitute the core of liberal theories of tolerance. John Stuart Mill's (1806–1873) emphasis on liberty and utilitarian endorsement of nonconformity, deemed necessary for the creative mind to flourish and help advance the society, have been very influential as well.

However, the philosophy and practice of tolerance existed in both European and non-European societies since ancient times, and the latter ones were usually more advanced and informed the former. The Edicts of Ashoka, issued by the 3rd century BCE ruler of the Maurya Empire with the purpose of spreading his recently adopted religion of Buddhism, also included provisions of ethnic and religious tolerance. Islamic empires, in general, were known for respecting other major religions and protecting their followers. These protected people (the *dhimmi*) originally included "the people of the book" (the Abrahamic texts: the Old and New Testaments and the Koran), but the definition was expanded to include Hindus and Buddhists when the Mughal Empire expanded Islamic rule into the territories of some older Asian civilizations.

Andalusian Spain, ruled by the Moorish Muslims between the early eighth and late fifteenth centuries, was a hotbed of multiculturalism and collaboration of intellectuals of all creeds and cultures. Muslim philosopher Ibn Rushd (Averroes, 1126–1198) and Rabbi Moses Maimonides (1135–1204) argued not only for tolerance but also promoted the Stoic notions that there was an eternal and universal natural law that governed the entire universe, that all human beings were born with the ability to reason, and that human conduct therefore needed to be harmonized with this universal law. For Christian Europeans, Andalusia served as a door to new ideas; in addition to the Moorish philosophers' writings, their ancient Greek sources entered the European worldview, especially after the completion of the Christian conquest of Spain in 1492. However, this exposure had no immediate impact on discriminatory practices. In fact, the Inquisition and other mechanisms were employed more vehemently than before, and the persecuted "heretic" Christians and Jews sought refuge in the multicultural Islamic Empire of the Ottomans.

The recognition of the legitimacy of diversity and allowing different cultural groups to maintain their customs and identity, however, did not make these empires immune to discrimination. In fact, the noninterference form of tolerance, advanced or practiced in highly authoritarian or hierarchal empires, involved considerable discrimination. For example, the Ottoman state, often praised for allowing all nationalities to freely practice their customs, language, and religion, also imposed heavier taxes on its non-Muslim subjects.

In the West, the natural rights philosophers usually fell short of upholding the universalism of the Stoic teachings and denied equality to certain segments of humanity. John Locke, for example, claiming that the inalienable rights of life, liberty, and estate were held by land-owning men, trusted only that small group of people with governance and political rights, disenfranchised other men and all women, and justified slavery. Though more egalitarian, John Stuart Mill denied equal treatment and rights to "those backward states of society in which the race itself may be considered as in its nonage" (Chapter 1, *On Liberty*). The blatant sexism of St. Thomas Aquinas (1225–1274), who wondered why God would even create woman, a "misbegotten male," in the first production of things, has been expanded on by others who questioned if women had souls (if they were fully human). In the early modern era, Western imperialist expansion instigated similar queries about whether aboriginals had souls. Colonialism, often justified as an enlightening and civilizing mission, involved repression, assimilation, and the ultimate devaluation of the colonized and their cultures.

Liberal Doctrines

The democratization of liberal philosophies and states drew them closer to universalism. However, while the contemporary liberal democratic stance against discrimination constitutes an improvement over the discriminatory tolerance displayed in ancient and medieval empires, it maintains a similar negative conceptualization of tolerance. Both the liberal democratic and imperial models of tolerance allow different people or peoples "to exist" by employing a "let them be" approach, which is considered a major flaw by their contemporary critics.

Feminists, postcolonial theorists, and postmodernist detractors have scrutinized the egalitarian claims of the liberal tradition and democratic systems. They find that the liberal model's demand of and reliance on noninterference translates to a lack of full recognition, thus, permitting the continuation of inequalities and discriminatory practices. In fact, they consider the act of toleration as hierarchal and patronizing, because by tolerating the "objectionable," the person (or the dominant group in a society) passes a judgment and creates an "other" that is considered less valuable, yet harmless enough to be allowed existence. Thus, instead of promoting tolerance, which would involve a vertical recognition, they call for horizontal recognition, which would mean recognizing that other individuals and cultures are equal in value.

In Western societies, these debates on the accommodation of differences have included questions about the limitation of legal equality and freedoms. Arguments about the repressive impact of nonrecognition of the achievements and contributions of minority cultures and the notion that indifference to one's identity or culture can in fact harm the person ushered in the advocacy of multiculturalism, which is also referred to as identity politics or politics of recognition. (The main and overt battleground of multiculturalism has been educational systems, where the debates ranged from the means and merits of preserving minority languages, e.g., French in Québec, to revising the curricula to include the historical, literary, and other contributions of non-White, non-Western populations, e.g., Africans and African Americans in the United States.) While the movement has promoted equality in dignity and recognition, the means of evaluation of cultures and parameters of recognition continue to be contentious issues.

Connection to Human Rights

Arguments in favor of tolerance have been always closely related to arguments on human rights, which are rights claimed against the state and society for the sole reason of being a human. While human rights can be traced back to ancient times, a leap toward a common definition of human rights and their universal recognition was made with the establishment of the United Nations (UN), the Charter (1945) of which included the promotion of human rights as one among the goals of the organization. The Universal Declaration of Human Rights (UDHR), adopted by the UN General Assembly in 1948, provided a list of human rights, and the subsequent conventions and treaties issued by the organization created a body of international human rights law.

The principles of antidiscrimination and equality in dignity lie at the core of the normative framework of the international human rights law. First, the UDHR spells out that human rights are put under protection because "human beings are born free and equal in dignity and rights" (Article 1). In addition to the UN Charter, which specifies that human rights apply to all without distinction as to race, sex, language, or religion, Article 2 of the UDHR expands the list to include "race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status" and objects to discrimination based on "political, jurisdictional or international status of the country or territory to which a person belongs." The same extensive nondiscrimination list is repeated in various articles of the subsequent human rights treaties but without taking a position on the value of the specified categories of differences—they do not call for their elimination or protection. The International Covenant of Civil and Political Rights (ICCPR, which was adopted in 1966 and came into force in 1976), however, brings ethnicity, religion, and language under protection as minority rights (Article 27).

In addition to nondiscrimination, the international human rights law promotes respect for differences. For example, the International Covenant on Economic, Social and Cultural Rights (adopted and entered into force in 1966 and 1976, respectively) not only recognizes everyone's right to education but also stipulates that "education shall be directed to the full development of the human personality and sense of dignity" and "enable all persons to participate in a free society, promote understanding, tolerance and friendship among all nations and all racial, ethnic or religious groups" (Article 13).

The emphasis placed on equality in dignity and respect for differences provide for a "nonnegative" conceptualization of tolerance in the international human rights law. It promotes positive and horizontal tolerance by requiring the acceptance and full recognition of differences, and the unique identity of individuals or groups without discrimination. This approach has been displayed in other UN documents and activities on tolerance, including the Declaration on the Elimination of All Forms of Intolerance and of Discrimination Based on Religion or Belief (1981), the designation of 1995 as the "Year for Tolerance," and holding a World Conference against Racism, Racial Discrimination, Xenophobia, and Related Intolerance (2001).

The Limits of Tolerance

A question that applies both to the liberal notion of "negative" tolerance and to the broader conceptualization of it as recognition is whether tolerance warrants tolerating the intolerant. In other words, what are the limits of tolerance? While the liberal philosopher Karl Raimund Popper (1902–1994) considered the intolerant (especially the advocates of totalitarian ideologies) as the enemies of open society and thus objected to the idea of tolerating them, another liberal philosopher, John Rawls, argued that tolerance for all was necessary to maintain a just (tolerant) society, but that could be allowed only if the intolerant ones do not endanger the tolerant essence of the society. In a similar vein, stating that "any advocacy of national, racial or religious hatred that constitutes incitement to discrimination, hostility or violence shall be prohibited by law," the ICCPR sets boundaries of tolerance in the international human rights law (Article 20). Although paradoxical, these propositions address some concerns about hate speech, violence stemming from bigotry, or authoritarian takeover of democratic systems. However, calls for cultural preservation and recognition, prevalent in the discourse of politics of recognition and multiculturalism, make women and others, whose subordination is dictated or enforced by cultural norms and values, uneasy. It is not only gender equality and other emancipatory aspects of the international human rights law that can be jeopardized in the name of religious freedom or celebration of multiculturalism, cultural relativism, but also the right to self-determination in primarily undemocratic contexts, where members are not allowed to interpret the cultural sources and determine their own lives, may help sustain discrimination and serve the privileged.

TOTALITARIAN REGIMES

The most common definition of totalitarian regimes, categorized generally under the concept of "totalitarianism," refers to modern antiliberal and antidemocratic regimes based on the monopolization of power by a revolutionary single party led by a charismatic leader and dominating over the state and society by means of terror and propaganda. Totalitarian regimes carry out their policy using a variety of institutions controlled by the single party: a highly centralized bureaucracy, an official and secret police, a party militia, the manipulation of culture and public opinion through the monopoly of mass media, and a network of organizations set up all over the country under the control of the single party, whose tasks are to regiment, indoctrinate, and mobilize permanently the individual and the masses.

More specifically, some scholars consider mass extermination as a necessary feature whose presence makes a regime truly totalitarian; other scholars argue that there can be totalitarianism without terror, or they emphasize the role of the charismatic leader or the mobilization of the masses as an essential characteristic of totalitarian regimes. However, all scholars, whatever their definitions of totalitarian regimes, agree that these are new types of antidemocratic political systems that differ substantially from traditional dictatorships and civil or military modern authoritarian states, whose concentration of power is based mainly on repression but does not require a revolutionary single party, an all-encompassing ideology, or a network of collective organizations for the mobilization of the masses.

The definition of totalitarian regimes has been a matter of endless debate, with highly ideological and political implications. Hence, any definition of totalitarian regimes necessarily implies a survey of the origins and development of the concept of totalitarianism. This will be done in the following sections of the entry, complemented by an analysis of this type of regime in the Cold War. Next, the entry examines the eclipse of the concept of totalitarianism in political science from the middle of the 20th century through the 1970s. The entry concludes by examining the renewed interest in this concept that began in the 1980s and has led to new interpretations of it.

The Name and the Thing

Contrary to widespread opinion, the terms *totalitarian* and *totalitarianism* were not invented by Mussolini, even if the Fascist regime was the only one to label itself as totalitarian. Both words were originally coined by Italian antifascists a few months after Mussolini was appointed by the King as Prime Minister in October 29, 1922. In November 1923, the liberal antifascist Giovanni Amendola, probably the inventor of the word *totalitarian*, described fascism as imbued with a *totalitarian spirit*, using violence to impose its ideology as a form of faith obligatory for all Italians. In the same period, Catholic antifascists used this new adjective to define fascism as a *political religion* sacralizing the nation and the state, thus being anti-Christian in essence. Since June 1924, when the socialist deputy Giacomo Matteotti was assassinated by a Fascist gang, the word *totalitarian* was also applied to the Fascist extremists pushing Mussolini hard to establish a dictatorship. In December 1924, the Marxist antifascist Lelio Basso used the substantive *totalitarianism* for the first time to describe the new Fascist state in the making by transforming traditional institutions such as the monarchy, the parliament, and the magistracy, as well as the armed forces, into the instruments of a single party.

We must bear in mind that *totalitarian* and *totalitarianism* were coined by anti-Fascists before the establishment of the single-party regime in Italy. Therefore, they did not refer to Fascist ideology or to Fascist rhetoric but to the reality of the Fascist party's practice of ruling over the country using an armed militia to terrorize, persecute, and kill political opponents. It was the first time that an armed militia party, identifying itself with the nation and attacking all political opponents as internal enemies of the state, took power in a Western parliamentarian democracy to destroy it. The novelty of the phenomenon required a new concept to define it.

The concept of totalitarianism was first developed by the Italian priest Luigi Sturzo, the founder of the Popular Party, who was forced into exile by the Fascists in 1924. In his book *Italy and Fascism*, published in English in 1926, Sturzo compared the reality of the two regimes fascism and bolshevism and defined both as totalitarian because of their points of resemblance, in spite of their differences in historical background, social support, ideologies, and method of achieving power. The points of resemblance were the rejection of the principles and method of democracy, the monopoly of power and politics by a single party, the violent suppression of all opponents, and the regimentation of society under party control. Sturzo's book was soon translated into German, French, and Spanish, thus spreading the concept of totalitarianism in Europe and America from the late 1920s.

The Totalitarian State

After Adolf Hitler's seizure of power in 1933 and the establishment of a single-party regime in Germany, the expression *totalitarian state* was being commonly used by intellectuals and politicians to define the new antidemocratic regimes in Russia, Italy, and Germany in order to distinguish them from ancient despotism and the modern dictatorships mushrooming all over Europe during the interwar period. Most of these antidemocratic regimes believed in the concentration of power in the hands of a king, an army official, or a "strong man" representing the old establishment. During the 1930s, an increasing number of scholars in Europe and the United States, such as Raymond Aron, Franz Borkenau, Alfred Cobban, Michael Florinsky, Hans Kohn, Fritz Morestein Marx, Elie Halevy, Carlton J. H. Heyes, Emil Lederer, and José Ortega y Gasset, put forward various interpretations of the totalitarian regimes, emphasizing their novelty.

According to these scholars, the basic feature of totalitarianism was a single-party regime created by an antidemocratic mass movement that used paramilitary violence and terror combined with electoral consensus, as in the case of fascism and Nazism, to conquer and maintain power, rendering permanent its own dictatorship as a police state based on the supremacy of a charismatic leader and the oligarchy of the single party, which comprised an elite group of "new men" emerging from anonymity. Other peculiar features of a totalitarian state were the cult of the supreme leader of the party, who was exalted and revered like a demigod by the followers and by the masses; absolute state centralization in the administrative and political fields; state control of the economy; the militarization of society through the permanent and capillary rule of the single party, whose main goal was to remold and transform the individual and the masses in the image of its ideology; the fanaticism and missionary spirit of the single-party regime; a rigorous monopoly of education militarizing the youth; the use of methods of technological and organizational modernization for the mobilization of the masses; and the development of an intense and constant activity of collective indoctrination through mass organizations, festivals, parades, pageants, plebiscites, and sports.

Here again, we have to bear in mind that it was the reality of these regimes, their structure and functioning, and their concrete policy toward the masses, and not their ideologies, intentions, or goals, that were at the origins of the definition of totalitarianism.

Interpretations of Totalitarianism

Theories of the totalitarian regime were also developed by the intellectuals mentioned above to explain its origins, workings, and foreseeable evolution. The theories focused mainly on modern phenomena and events that contributed to the emergence of totalitarian regimes in different countries such as Russia, Italy, and Germany. Since all these regimes were established after World War I and were strictly connected to the war, although in different ways, the war was considered as the seedbed for totalitarianism. Conditions for the emergence of totalitarian regimes were the radicalization of politics and class struggles; the incapacity of the parliamentary system to provide an effective solution to social and economic conflicts; the impoverishment and disorientation of social classes hit by fierce economic crises, moving toward a revolution or a counterrevolution to survive; and the rebellion of the masses, looking for simple and reassuring solutions by subordinating themselves to the command of a "strong man," who promised to resolve the crisis with brutal yet efficient methods. From the war experience, the revolutionary movements that built up a totalitarian regime derived the militarization of politics, the use of violence, total state control over society, and brainwashing propaganda as basic methods to maintain the monopoly of power. A feeble or short-lived democratic tradition, widespread political fragmentation, and a sequence of weak governments were also reckoned as conditions for the emergence of totalitarian regimes.

In a broader historical perspective, the roots of the totalitarian state were linked to the mounting tendency toward centralization of the modern state, expanding its control over public and private life. Some scholars pointed to the advent of the mass society, the atomization of individuals, the political mobilization of amorphous masses, and the use of modern techniques of propaganda by ruthless and cynical demagogues as the main factors for the making of a totalitarian regime. The totalitarian state was also seen as a perverted experience of mass democracy in the age of industrialization. The Jacobin dictatorship during the French Revolution as well as the regimes of Napoleon I and Napoleon III were numbered among the harbingers of totalitarianism.

More specifically, scholars of religious orientation, such as Adolf Keller, Waldemar Gurian, Jacques Maritain, and Eric Voegelin, attributed the origins of the totalitarian state to the process of secularization: They defined totalitarianism as a political religion deifying the state, race, or class and enforcing state control over the body and mind of the people to mold them into obedient believers and servants. Hence, totalitarianism was anti-Christian in essence, even if fascism and Nazism did not preach atheism as bolshevism did but pretended to be respectful of the churches.

Theories of totalitarianism had their heyday in 1939, when many writings on totalitarian regimes were published. The nonaggression treaty between Nazi Germany and Soviet Union in August 1939 was regarded as a confirmation of the affinity between the two totalitarian regimes. In his book *The Totalitarian Enemy*, published in 1940, discussing the conflict between the democratic and totalitarian types of regime, its origins, and its results, Franz Borkenau called Nazism "Brown bolshevism" and affirmed that Russian communism was inherently the most expanding and aggressive form of totalitarianism.

After 1941, however, when the Soviet Union was attacked by Nazi Germany and hence joined the Allied forces in World War II, the tendency prevailed among anti-Fascists not to talk about Joseph Stalin's regime as totalitarian, one exception being Sigmund Neumann's book *Permanent Revolution: Totalitarianism in the Ages of International Civil War*, published in 1942. Neumann put forward the most systematic and in-depth comparative analysis of the totalitarian regimes of the time. Taking into account earlier interpretations of the roots, features, and structure of totalitarianism—the legacy of the Great War, mass democracy, single-party rule, the new elite, the cult of the leader, state control of the economy, the militarization of society, the mobilization of the masses, political religion—Neumann systematized them into a new comprehensive theoretical framework, adding new concepts to define totalitarianism: the revolutionary dictatorial party, the permanent revolution, and the international civil war. The revolutionary dictatorial party was antidemocratic in essence, imbued with a quasi-religious missionary spirit and claiming an exclusive identification with a collectivity, the nation, the proletariat, or the race. It was driven by its own ideological dynamism to acquire monopoly of power, to build a one-party state, and to organize, regiment, and mobilize the masses in order to regenerate them and create "a new man," aiming also at extending its revolution through territorial and ideological expansionism, therefore promoting an international civil war to achieve its goals. While emphasizing significant structural similarities, Neumann also stressed that communism, fascism, and Nazism must be differentiated through their historical background, ideological orientation, social mobilization, and ultimate goals. Hence, he concluded, a full definition of the totalitarian regime must include this diversity, avoiding therefore any sweeping formula.

Totalitarianism in the Cold War

Following the fall of fascism and Nazism in 1945, the only surviving totalitarian regime was the Soviet Union, which never accepted being labeled as such. After the breakdown of the international antifascist alliance and the start of the Cold War, there was a new wave of interest in totalitarianism, this time with a strong anticommunist orientation. This time, because of the Holocaust and the mass killings under Stalin's regime, terror and mass extermination were added as necessary features in the development of the concept of totalitarianism. At the beginning of the Cold War, the concept was widely used in anticommunist propaganda to identify Stalin's regime as a political "evil" similar to Hitler's regime. Two major works in the 1950s triggered off new debates on totalitarianism: Hannah Arendt's *The Origins of Totalitarianism*, published in 1951, and Carl J. Friedrich and Zbigniew K. Brzezinski's *Totalitarian Dictatorship and Autocracy*, published in 1956, after a conference on totalitarianism held in March 1953 by the American Academy of Arts and Sciences, whose proceedings were published 1 year later.

In her interpretation of totalitarianism, Arendt echoed many concepts developed by earlier scholars—the atomization of society, the amorphous masses, the ruthless elite, and the permanent revolution—while stressing the role of an all-encompassing ideology and the subordination of the state to the single party as key features of the totalitarian regime. Arendt also theorized that the totalitarian regime was the result of a totalitarian movement, but she argued that actually only the Nazi party was a totalitarian movement, while denying this characterization to the Bolshevik party. She considered only Germany under the Nazis and the Soviet Union under Stalin's rule as examples of "true totalitarianism," asserting that Lenin's Bolshevik party and the Soviet Union were not totalitarian until Stalin's rule. Even Mussolini's regime, according to Arendt, was not totalitarian until 1938. Nevertheless, she also asserted that only if Nazi Germany had won World War II would Hitler have been able to establish a fully developed totalitarian regime. Arendt considered that the essence of totalitarianism was mass terror and mass extermination, as the Holocaust under the Nazis and the purges under Stalin's regime. Therefore, she defined totalitarianism in its final stages as an absolute evil. Arendt's approach to the question of totalitarianism was more philosophical than theoretical. Notwithstanding serious criticism of her interpretation of totalitarianism based on what were claimed to be its many shortcomings and contradictions, Arendt's work had a major impact on the debate on totalitarianism in the following decades.

More theoretically oriented, Friedrich and Brzezinski analyzed the structure of the totalitarian regimes in Russia, Italy, and Germany, classifying their similarities in a syndrome of six basic features:

1. an official ideology that covers all vital aspects of man's existence and is projected toward a perfect final state of mankind;
2. a single party led by one man, unquestionably dedicated to its ideology, hierarchically and oligarchically organized, and either superior to or completely intertwined with the bureaucratic government organization;
3. a system of terroristic police control;
4. technologically conditioned, near-complete monopoly control by the party of all means of mass communication;
5. similar technologically conditioned, near-complete monopoly and control of all means of effective armed combat; and
6. central control and direction of the entire economy through bureaucratic coordination of its formerly independent entities.

Modernization and industrialization were also emphasized by Friedrich and Brzezinski as necessary conditions for the establishment of the totalitarian regime.

Friedrich and Brzezinski were criticized because their *totalitarian syndrome* was considered a descriptive concept instead of an explanatory theory, while historians who were skeptical about the validity of the concept of totalitarianism put into question the applicability of their static model of similarities to the complex reality of the so-called totalitarian regimes, obscuring their substantial differences and their contradictory reality.

The Eclipse of the Concept of Totalitarianism

Debates on totalitarianism flourished during the Cold War. Among the totalitarian regimes then included were the communist states established in Eastern Europe, China, and North Korea after the end of World War II, as well as Castro's regime in Cuba after 1959. However, after Stalin's death and the condemnation of Stalin's cult of personality and his crimes by Soviet Premier Nikita Khrushchev in 1956, there was mounting criticism of the concept of totalitarianism. It was rejected by communist and left-wing scholars as a mere propaganda slogan to denigrate the Soviet Union and the communist regimes by comparing them to the Nazi regime.

The use of the concept of totalitarianism came under fierce attacks through the 1960s. It is significant to note that in the 1967 edition of her book on totalitarianism, Arendt mentioned the spread of totalitarian governments in Eastern Europe after World War II because of the imposition of bolshevism by Stalin, but she also asserted that Stalin's death was followed by a process of *detotalitarization*. She recognized also that the Chinese Communist Party's totalitarian traits have been manifest from the beginning and that Mao Zedong's regime was characterized by mass terror and extermination, but she denied that Communist China was totalitarian because she felt that Mao's was not a criminal mind like Stalin and Hitler.

Attacks on the concept of totalitarianism went so far as to propose that the name itself should be banned from encyclopedia entries and political science itself, because there has never been such a thing as a totalitarian regime. In the wake of

Arendt's interpretation, some historians asserted that fascism was not totalitarian; other historians made similar claims about the Nazi regime and the Soviet Union, denying any validity to the concept of totalitarianism. The more traditional and generic term *authoritarianism* was preferred to describe all types of modern dictatorships and one-party states.

In the following decade, there was actually a sort of "eclipse of totalitarianism." One scholar proposed seriously in 1976 that we should cease to speak of totalitarianism. Ten years later, another scholar asked ironically if there has ever been such a thing as totalitarianism. The rejection of the concept meant actually the rejection of the thing, thus producing a sort of conceptual void in the analysis of the variety of single-party regimes in the 20th century, though new experiences of domination, such as the Khmer Rouge regime established in Cambodia in 1976 to 1979, did replicate the fundamental traits of the totalitarian regime in its most extreme form—mass extermination—to transform human beings and create a "new man." Many features of totalitarianism were also present in many secular nationalist one-party states in the Islamic world and the Third World: the cult of the leader, an armed militia, mass mobilization, a political religion, and the myth of regeneration.

Going Back to Reality: New Interpretations

However, since the late 1980s, mainly due to the fall of the Soviet Union, there has been a revival of interest in totalitarianism, resulting in new approaches to the question of totalitarianism and new interpretations of it. Pioneers in the revival of the concept, even during its eclipse, were scholars such as Hans Buchheim, Karl D. Bracher, and above all Juan J. Linz. They dealt with the definition of totalitarianism going back to the historical reality and revising previous theories according to the result of new research. They argued that the nature of the totalitarian regime is not static but dynamic and that such regimes are monistic but not monolithic. Hence, a more nuanced interpretation of the relationship between the leader and the party and between the party and the state arose from their revision of the concept of totalitarianism. While stressing the prominence of police control and repression, they denied that terror was the essence of totalitarianism and argued that it was not sufficient to define it. Finally, they did not underestimate the role of ideology, mass mobilization, and even popular enthusiasm in totalitarian politics but recognized also that the totalitarian claim to total control over society had never been achieved.

Linz's definition of what characterizes a regime as totalitarian has been fundamental in the revision of the concept of totalitarian regimes and its revival. In an essay published first in 1974 and then in 2000 with an up-to-date introduction, Linz defines a regime as totalitarian when the following characteristics apply and only when they occur together: an exclusive ideology, a single mass party and other mobilization organizations, and power concentrated in an individual and his or her collaborators that is not accountable to any large constituency and cannot be removed by legal, peaceful means. When one or more of these characteristics are missing, the regime could be defined as pretotalitarian or posttotalitarian.

Since the early 1990s, there has been worldwide a flourishing of new discussion about totalitarianism. New historical works, mainly those on Italian fascism, have also contributed to renewing substantially the interpretation of totalitarianism. The result of this new research and interpretation can be summarized as follows.

The totalitarian regime is a modern experiment in political domination undertaken by a revolutionary movement, with an integralist conception of politics, that first secures total power monopoly, whether by legal or illegal means, and then destroys or transforms the previous regime and constructs a new state. This new state is based on a single-party regime under the rule of a charismatic leader and has as its chief objective the conquest of society—that is, the subordination, integration, and homogenization of the ruled by means of the integral politicization of existence, whether collective or individual. The new reality is interpreted according to the categories, myths, and values of an exclusive and all-encompassing ideology, institutionalized in the form of a political religion, that aims to shape the individual and the masses through an anthropological revolution, thus regenerating the human being and creating the new man, dedicated in body and soul to the realization of the revolutionary and imperialistic policies of the totalitarian party. The ultimate goal of this regime is to create a new civilization along expansionist and supranational lines.

Defining the totalitarian regime as an *experiment* is intended to emphasize that totalitarianism is a *continual process* or a *permanent revolution*; it is a *method of rule* to achieve a goal, not a goal in itself.

TOTALITARIANISM

All political concepts are essentially contested, but some are more contested than others. This is certainly the case for totalitarianism. It is almost impossible to reach a consensus based on an operational definition of this term. Many of its users apply it to any dictatorship, autocracy, or fanatical belief or behavior. Many of its critics see it as an invention of Cold War propaganda, aiming to identify Nazism and communism in order to delegitimize the latter or excuse the former. While the scientific character and the present relevance of the concept of totalitarianism can be challenged legitimately, the discussion must first get rid of the two temptations mentioned above. If the use of the term *totalitarianism* is to be justified, it makes sense only if it is applied to a regime, a movement, a mentality, and an aspiration that goes beyond the limits of politics to encompass the whole of society, culture, and human life by negating the autonomy of domains such as science, religion, or art. Also, whatever the propagandistic instrumentalization during the Cold War, it is simply historically wrong to see in it the origins of the concept. In this entry, its origins, different uses, and contemporary relevance are discussed.

Origins and Definitions

The first known use of the term *totalitarianism* occurred in 1922 in Italy. It is due to liberal opponents of Mussolini, like Piero Gobetti and Giovanni Amendola, who were accusing him of wanting to dominate not only government but the whole of social and institutional life—an accusation that Mussolini proudly accepted by proclaiming his "ferocious totalitarian will." While Italian fascism was in fact less totalitarian than German Nazism, it made abundant use of the term *the total state*, while the German Marshal Ludendorff was promoting the idea of *total war*. As for totalitarianism as such, it was mainly used by left-wing German émigrés like Emil Lederer in his "State of the Masses" or Sigmund Neumann, trying to pinpoint the novelty of Nazism. They converged with Catholic authors like Waldemar Gurian and Eric Voegelin who were putting forth the notion of "political religion" to indicate the ambition of both fascism and communism to bring salvation on earth and their appeal to total faith and total commitment, similar to that demanded from the members of a sect.

The "totalitarian syndrome" continued to take shape in the 1930s, centered on fascism but, more and more, involving an implicit or explicit comparison with communism. It included the three elements of an ideology, a movement or a party, and a regime. The ideology characteristically combined an interpretation of the world and of history, claiming to be based on science (a racist biology in one case, scientific materialism in the other) and a quasi-religious appeal. The movement or party was a totally devoted elite. The regime was based on a complete monopoly of power and a claim of total unity, typically incarnated in one leader, and total war against the enemies of the faith and against the groups (racial in one case, social in the other) who were supposed to be the sources of all evil and who had to be eliminated in order to bring about the triumph of justice.

For some authors, like the French philosopher Claude Lefort, the essence of totalitarianism is the effort to bring back societies based on modern individualism and differentiation to a premodern unit with a total primacy of the community, albeit through modern means. Others emphasize the other side of the coin: the attempt at totally eliminating an enemy—the inversion of the Clausewitzian formula, "War is the continuation of politics by other means" into "Politics is the continuation of war by other means." The perfect formulation would be that of Carl Schmitt, which he, ironically, applied to the enemies of Nazism rather than to Nazism itself: "Total enemy, total war, total state," the total enemy being the key.

Two works provide the central formulation of this classical notion of totalitarianism: that of George Orwell (*Animal Farm* and *1984*) and Hannah Arendt (*The Origins of Totalitarianism*). Orwell's lasting contribution is above all the notion of total surveillance ("Big Brother is watching you"), the manipulation of feelings (with the conclusion of *1984*: "He loved Big Brother"), and even more, the "newspeak," the creation of a new language where *love* can mean *hatred* and *peace* means *war*. Hannah Arendt's emphasis is on the dynamics of ideology and terror (the latter literally eliminating the groups condemned to historical extinction by the former), which become an irrepressible process and a force by themselves, beyond their original content and target. Here, too, a "supersense" is created, a kind of "mad logic" through which Hitler diverts precious vehicles from the war effort to the extermination of the Jews and Stalin purges the Soviet elite, including the Red Army leadership, on the eve of the German invasion.

A third, less illustrious but more academic work has nevertheless become a classic of totalitarianism studies. It is Carl Friedrich and Zbigniew Brzezinski's *Totalitarian Dictatorship and Autocracy*. It provides a number of criteria that distinguish a totalitarian regime from an ordinary tyranny. These refer to the existence of a single party; a monopoly on ideological, political, cultural, and economic affairs; and the use of modern technology for a degree and pervasiveness of control and indoctrination that were not at the disposal of earlier autocracies. Raymond Aron provides an analogous list of criteria, but he also makes a point that is more important—that the totalitarian dynamic, powerful and fearsome as it is, is not the only one at work even in societies in which it rules. Other dynamics, like that of economic development, the arms race, or of external contacts, which cannot be entirely suppressed, may compete with it or deviate from it.

Earlier, the great social historian Barrington Moore had distinguished three forces in Soviet evolution: power (leading to totalitarianism), rationality (leading to bureaucracy or to democracy, or to both), and tradition (leading to the reassertion of old Russian cultural and imperial patterns). Similarly, Alex Inkeles proposed in 1966 that the logic of totalitarianism be combined with that of development and that of industrial society. This more complex and, in a way, more modest approach, is in any case more able to respond to the barrage of criticism aimed at the key notion of totalitarianism, particularly toward the end of the Cold War, by a number of historians and social scientists.

The attacks revolve mostly around two themes. First, the notion of totalitarianism is supposed to gloss over the fundamental difference between Nazism (or fascism) and Stalinism (or communism). It seems to rely on an essentialist and fixed view of politics, negating the changes that have affected, in particular, Soviet communism over the years. Clearly, communism and fascism come from two different traditions. As the Polish philosopher Leszek Kolakowski put it, one is the monstrous child of the enlightenment, the other the monstrous child of romanticism. While both react against bourgeois democracy, the one does it in the name of a radical equality, the other in the name of the superiority of an esthetic, aristocratic, or heroic elite. Both were propelled by World War I, but one by a pacifist reaction and the other by a cult or nostalgia for war. Above all, one was bound to alienate the entire world since it proclaimed the national and racial supremacy of one people, while the other stood for universalism as well as for equality. But this can be seen as one more argument in favor of the problem raised by totalitarianism: How can a universalistic, egalitarian, and libertarian doctrine, whose official song proclaimed the refusal of any supreme savior, be it God or Caesar, end by adopting the divinization of one man, the absolute power of the rulers, and a permanent war against supposed enemies, all practices that seem to go much more naturally with Nazism?

It is precisely this strange convergence that is the strong point of Hannah Arendt, whose analysis is essentially based on a parallel between the two extreme periods of the two regimes—1936 to 1939 for one and 1941 to 1945 for the other. Even there, however, there are enormous differences. Nazi totalitarianism was more directly murderous and targeted a number of categories (Jews, Roma, homosexuals, communists), which had to be destroyed, whereas normal apolitical Germans were left in peace. In Russia, totalitarianism was extended to every sphere of life and literally any citizen could be its victim.

Of course, the end was very dissimilar: violent overthrow from outside through lost war in one case and the decay of ideology and terror and the considerable reduction of its role over time in the other. This leads us to the other group of objections: about the possibility of change. Of course, nobody knows whether de-Hitlerization or de-Polpotization would have occurred in Germany or in Cambodia after the death of their respective leaders. The loss of self-confidence in their power and legitimacy, which obviously occurred in the European communist elite, or the attempt to combine their power with an adoption of the most extreme form of capitalism, as in the Chinese case, are not a unique evolution, yet who can say that they were inevitable in each case? Two pure cases of totalitarianism, the Maoist and the Cambodian ones, appeared or were flourishing at a time when a process of de-Stalinization was already well under way in the Soviet Union. And an almost pure totalitarian fossil-like North Korea survives to this day.

At any rate, the end of the Soviet Union surprised the critics of the totalitarian model as much as its advocates. Most of the former believed that the Soviet Union would reform and evolve toward a kind of social democracy. Most of the latter thought that totalitarianism could never change. In fact, it did. But due precisely to the nature of totalitarianism, the attempt to reform it led to its collapse.

Contemporary Relevance

Where, then, are we now? Is totalitarianism dead, or alive and well? The most likely answer is that it has taken a postmodern turn; in other words, its various components are dispersed and carry on independently or in various new combinations. It does not seem likely that the combination of a general doctrine and a revolutionary practice claiming to be scientific but appealing to religious feelings and commitment can rule a country or an empire in the 21st century as in the 20th. Theocratic fundamentalism seems to be on the rise rather than "secular religions," and while less exposed to verification and disappointment than the latter, it seems even less able to adapt to modern society. Totalitarian regimes in their pure form—like North Korea—do survive for the time being but ever more precariously. Genocidal regimes like that of the Khmer Rouge, collective genocides like in Rwanda, mad dictators, or oppressive military regimes are likely to appear and disappear with catastrophic results, but they are more likely to be based on nationalism, ethnicity, religion, or old-fashioned personal tyranny than to be or remain specifically totalitarian, unless the progress of biology enables a government to fulfill one old totalitarian dream: that of changing human nature and creating a posthuman society that would be totally controlled. But for the time being, this possibility still belongs to science fiction rather than political analysis.

The same cannot be said, with the same probability, of totalitarian movements. The combination of fanaticism and technology, to use George W. Bush's formulation, in movements that attempt to use science and technology to destroy the existing order, or even the planet itself in a grand apocalypse, is certainly a possibility. The Aum Shinrikyō sect in Japan, with a membership that includes scientists and engineers, trying to destroy Tokyo in order to hasten or forestall the end of the world, may be a harbinger of things to come. But should one call it totalitarian?

More broadly, should one call global terrorism or a movement like Al Qaeda totalitarian? Or should we reserve the term for the historical phenomenon born in the 20th century and assuming a specifically modern character? Both choices are legitimate, and depend on whether one adopts a narrow and precise or a broad and approximate definition of totalitarianism. What seems certain, however, is the permanence or the periodic resurgence of a third element—totalitarian aspirations and passions. The wish to be God; the wish to eliminate one's enemies; the wish for absolute security or for "escaping from freedom"; passions such as compassion or indignation, which can lead to hatred and revenge; and, above all, the search for sacrifice and for identifying with a great cause or conversely the search for stability and for definitive answers in an ever-changing and complex world—all these are permanent possibilities of human nature. But they are particularly likely reactions to a regime like liberal democracy and an era like that of globalization, both of which generate anxiety because they deprive us of the old certainties about the fate of the individual and of the world.

TRADE LIBERALIZATION

Trade liberalization refers to the opening up of markets to foreign imports and entails the abolishment or reduction by governments of tariff and nontariff barriers (quotas, standards, etc.) that limit trade in goods or services across countries. Governments can liberalize trade unilaterally or on a reciprocal basis in negotiations with other countries and can apply any cuts in a preferential or a nonpreferential manner. Preferential liberalization removes barriers to imports only from selected countries and can lead to the establishment of free trade areas and customs unions, whereas nonpreferential liberalization applies to all countries that are covered by a most favored nation clause. The modern international trading system built around the World Trade Organization is based on the nonpreferential liberalization of trade and thus limits member countries' discretion to liberalize trade preferentially. A country that abolishes all its trade barriers engages in free trade. This entry first presents a brief history of major moves toward international free trade and then discusses the possible causes and consequences of trade liberalization.

Most major European countries engaged in trade liberalization from the mid-19th century until the start of World War I, producing the rapid growth in international trade that was a key feature of the first phase of globalization. By contrast, nearly all countries increased barriers to trade in the interwar years, leading to a collapse of international trade. The process of trade liberalization was restarted by the United States in 1934, when Congress passed the Reciprocal Trade Agreements Act that conferred authority on the president to agree on reciprocal tariff cuts with other countries, which entered into force without requiring further congressional approval. After the end of World

War II, other developed countries joined the process of trade liberalization and agreed to repeated negotiations in the framework of the General Agreement on Tariffs and Trade (1947–1994).

While initially these trade rounds yielded only minor tariff cuts, the Kennedy Round (1964–1967), which was launched as a response to the creation of the European Economic Community (1958), led to a reduction of average tariffs by about one third. Overall, the multilateral negotiations caused a drop in the average tariffs on industrial goods applied by developed countries from more than 40% at the end of World War II to less than 4% after the implementation of the cuts agreed on in the Uruguay Round (1986–1994). For some time, these tariff reductions were partly offset by the imposition of nontariff barriers to trade and the use of administrative trade instruments, such as antidumping duties. Since the 1960s, however, a series of international agreements have also imposed limits on the use of these instruments for protectionist purposes.

Throughout most of the postwar period, developing countries hardly participated in the process of trade liberalization, not least because they received one-sided preferences from developed countries, which gave them little incentive to reduce their own barriers. In the 1980s and 1990s, however, many of them undertook partly substantial unilateral tariff cuts when moving away from import-substituting industrialization policies. Developing countries have also become eager participants in the proliferation of preferential trade agreements that characterize the current international trading system. There has been little progress in multilateral trade liberalization since the mid-1990s, and therefore, it seems safe to conclude that international trade is currently as free as it has ever been, which also explains the rapid growth in international trade over the last few decades. Variation in trade barriers across countries and sectors obviously still persists: on average, developed countries have lower trade barriers than developing countries, and industrial goods and services face lower trade barriers than agricultural goods.

Causes of Trade Liberalization

While the economic case for free trade is very strong, trade liberalization is puzzling from a political science perspective given that politicians have short-term incentives to impose barriers to trade. These incentives derive from the fact that although overall a country is expected to gain from freer trade, trade liberalization imposes costs on some sectors of the society—generally, the scarce factor of production and producers of goods and providers of services that face competition from imports. A political economy model of trade policy making expects these losers to defend their interests—namely, averting trade liberalization—in the policy-making process, for example, by lobbying and voting for parties or politicians that promise protectionist policies. By contrast, consumers, who benefit from the lower prices on imported goods and services resulting from trade liberalization, are unlikely to become politically active to defend their interests because of the diffuse nature of these benefits.

The puzzle of trade liberalization in the face of short-term political incentives to provide protection has motivated a large political science literature that stresses factors such as hegemony and geopolitics, societal demands, political institutions, and ideas and learning. One of the earliest explanations provided for trade liberalization emphasized the existence of a hegemonic power in the international system that may either have an interest in an open trading system or provide openness as a public good. A hegemonic power's interest in free trade may stem from its ability to reap the traditional gains resulting from trade while at the same time avoiding the associated costs because the large internal market cushions the distributional effects of trade. A hegemonic power, moreover, may open its market in pursuit of geopolitical objectives, such as strengthening allies, creating relations of asymmetric dependence, and fostering security alliances. A prominent explanation for the liberalization of trade after World War II, consequently, highlights the hegemonic position of the United States at that time and its geopolitical rivalry with the Soviet Union.

Another school of thought looks for a change in the balance of societal demands when trying to explain trade liberalization. Following this reasoning, the rise of multinational companies, which benefit from low trade barriers when shipping inputs across borders and selling finished goods abroad, may have given impetus to the liberalization of trade after World War II. Moreover, an increase in the number of firms that can take advantage of economies of scale should foster trade liberalization since these firms are likely to be competitive on world markets. As the United States is the home country to both many multinational companies and firms that benefit from economies of scale, these arguments may explain why that country was at the forefront of trade liberalization after World War II. At the same time, these arguments have relatively little to say about trade liberalization in the second half of the 19th century, when neither multinationals nor economies of scale played a major role. Equally based on societal demands is the argument that trade liberalization may be a reaction to the trade policies chosen by other countries. If the trade policies of a country reduce foreign exporters' market access, these exporters are likely to react and lobby their government to engage in negotiations with the foreign country with the aim of eliminating the obstacles they face. These negotiations, in turn, may lead to a liberalization of trade. Finally, an initial step toward trade liberalization may have feedback effects that strengthen free trade forces. By bolstering exporters and weakening import competitors, it should change the balance of societal demands in a way that favors further liberalization.

Trade liberalization may also be a result of changes in political institutions. At the domestic level, an increase in the size of electoral districts, for example, should undermine the influence of protectionist forces by exacerbating their collective action problems and thus pave the way for freer trade policies. Moreover, democratization may lead to more liberal trade policies in countries in which labor is abundant. The reasoning behind this argument is that in labor-abundant countries, workers are expected to benefit from more trade; therefore, inclusion of their preferences in the political process should make that country's trade policy more liberal. At the international level, the existence of an international regime that facilitates trade cooperation among countries by reducing the transaction costs associated with trade negotiations and providing a commitment device may also lead to trade liberalization. The international trading regime after World War II may not only have resolved intergovernmental bargaining problems but also reduced domestic opposition to trade liberalization by enabling the coexistence of relatively free trade and domestic compensation—a system that has become known as *embedded liberalism*.

Ideas and learning provide for final potential causes of trade liberalization. In the second half of the 19th century, the spread of the idea that free trade is beneficial for all countries may have motivated the abolition of trade barriers, first in the United Kingdom and later in the rest of Europe. In the second half of the 20th century, decision makers may have been influenced by their perception that the protectionist policies in the interwar years had contributed to, and had made worse the consequences of, the Great Depression. Most recently, developing countries may have reacted to the perceived failure of import substitution industrialization policies when enacting relatively liberal trade policies from the 1980s onward. In this last case, economic ideas may also have become causally relevant because they were carried by international organizations, such as the International Monetary Fund, which applied them when arranging for conditionality agreements with debtor countries.

Consequences of Trade Liberalization

Whatever the causes of trade liberalization, a step toward free trade is likely to have consequences for the distribution of wealth in a country and the political organization of that country. With respect to the distribution of wealth, trade liberalization produces winners and losers in a society. Unless a government redistributes income, this will lead to greater inequality—an effect that is confirmed by a series of empirical studies. What is more, some authors have suggested that free trade will undermine a country's capacity to redistribute income, since an open trading system makes it easier for companies to relocate to countries with lower taxes and less welfare spending. The evidence concerning this expectation, however, is at best mixed.

Trade liberalization may also have an impact on the political organization of countries, especially if an initial move toward freer trade makes them dependent on continued openness. A country that becomes dependent on relatively free trade may require changes in the political structure that lock in liberal policies. This may be achieved, for example, by adopting corporatist practices, with strong domestic compensation mechanisms. Alternatively, countries may insulate decision makers from protectionist pressures by increasing the size of electoral districts and moving toward proportional representation. Trade liberalization may even foster political disintegration. By allowing small countries to benefit from a large market, an increasingly open international trading system removes one of the incentives for their continued stay within a larger federation. This reasoning may provide a rationale for the recent increase in the number of sovereign countries in the world.

TRADITIONAL RULE

As indicated by F. Nyamnjoh (2003) in the 1950s and 1960s, modernization theorists predicted that traditional rule would soon become outdated and would be replaced by "modern" bureaucratic offices and institutions. Nyamnjoh further contends that even underdevelopment and dependency theorists did not seem to give chiefs and chieftaincy much of a chance; they saw chieftaincy as lacking in mobilizational ability for social and political change. However, political scientists, sociologists, historians, and educated traditional leaders in Africa acknowledge the resilience of chieftaincy institutions (cf. Nyamnjoh, 2003, pp. 233–250; Chief Linchwe II, 1989, pp. 99–102). Today, new scholarship in Southern Africa such as that by Lungisile Ntsebeza (2005) is paying attention to chieftaincy, intrigued by the manner in which the institution remains part of the cultural and political landscape constantly negotiating and renegotiating its position within the modern institutions of countries such as Botswana. This entry examines the place of traditional rule in Africa, using Botswana as an example.

Botswana enjoys a good reputation for its record of good government and democracy. Over decades, Botswana has demonstrated to the world an immense socioeconomic strength driven by a combination of modern and conservative traditional leadership despite diversification of socioeconomic bases. The country's leadership has been able to face and overcome challenges of great magnitude, such as the scourge of HIV/AIDS. Several scholars have attributed the country's pillars of modern democracy and ability to withstand 21st-century socioeconomic challenges to its traditional government system (cf. G. Somolekae & M. H. Lekorwe, 1998). In Botswana, there are intangible but identifiable group sensibilities toward democratic discourse, a discourse that is situated within culture, leadership, and development. In this entry, traditional rule in Botswana and its contemporary methods for avoiding and resolving conflicts in the past and the present are examined. The role of chieftaincy (*bogosi*) and the *kgotla* system is emphasized. *Bogosi* and the *kgotla* institution are deeply ingrained in Botswana society, and the chiefs (*dikgosi*) are a critical component of chieftaincy. In fact, one cannot conceive of chieftaincy without a chief who is placed at society's helm. A few relevant examples will be cited as illustration for Botswana's historic and contemporary tools for dialogue, consultation, and mediation. However, the entry does recognize limitations that still exist within the *bogosi* institution.

On several occasions, the *kgotla* institution has been cited in contemporary studies as an institution that encourages mutual knowledge, appreciation, respect, and tolerance (cf. Somolekae & Lekorwe, 1998).

Bogosi and the *Kgotla*: Agents of Sustainable Democracy and Development

One important feature of the precolonial Tswana traditional rule was the use of tribal assemblies or *kgotlas* and the conduct of public affairs, including the tradition of peacemaking, that took place through the *kgotla*. Tswana institutions of governance, such as *bogosi* (chieftainship) and the *kgotla* system, have continued to be relevant to the lives of Batswana.

Earlier studies suggested that the *kgotla* had been a central element in the traditional machinery of Tswana government. Kofi Darkwah (1996) argues that before 1966, the *kgotla* may be said to have been not just a public meeting place but also the seat of the government or administration of the community. As Isaac Schapera (1994) notes, the central *kgotla* of the *kgosi* was the public assembly where he not only delivered judgments and laws but also listened to the people when matters of public interest were discussed. Chiefs (*dikgosi*) presided in large *kgotla* meetings (*pitso* or *phuthego*), where after lengthy discussion in which "all" could participate, the *Kgosi* had the right to make final decisions on all matters. The chief exercised authority over a large area (a district today) through a hierarchy of relatives and officials, including close advisers and ward headmen (P. M. Mgadla & A. Campbell, 1989, p. 49). During the 19th century, BaNgwato in what is today the central district and BaTawana of Ngamiland (northwest district) extended their political control over other groups considered of lower status than the Tswana dominant groups. The so-called minority groups included San/Basarwa, BaYei, Bambukushu, BaKalanga, BaBirwa, and BaTswapong. BaNgwato and BaTawana were among those who considered themselves superior to others because of their strong political and administrative system, which included monarchy, as well as courts of laws and an economy based on large-scale animal husbandry. In both the Ngwato and Tawana hierarchical system of government, the whole area under their thraldom was divided into "counties" with senior Tswana each in charge as chief's representatives (*baemedi ba kgosi*). The chief's representatives would supervise their areas and ensure that the paramount chief's (*kgosi e kgolo*'s) property, such as cattle, ivory, and furs, was properly guarded. Representatives of the constituent wards expressed their opinions at the main *kgotla* on behalf of their charges. The constituent ward far from the administrative center of the traditional rule also had its own small *kgotla*, which gave certain semiautonomy from the paramount chief and invested the group with the authority to regulate some of its affairs and to address the chief.

Although the subordinate *kgotla* did not have the power to legislate, they formed part of the traditional government machinery in the sense that they were part of the administrative and judicial system of the community. Early accounts of the Tswana chief portray him as relying a great deal on consultation with leading men, both agnates and commoners, hence the Tswana aphorism "*Kgosi ke Kgosi ka batho*" [The chief is the chief by the grace of the people]. Omulf Gulbrandsen (1995, pp. 415–444) points out that on the one hand, the Tswana strongly felt the need for an effective ruler, while on the other hand, they were strongly aware of the need for a check on the powers entrusted to him as expressed in the above proverb. Pauline Peters (1994, p. 34) argues that the *kgotla* embodied the consultative aspect of ruling authority; thus, it played the role of counterweight to central power. The great *kgotla* was the arena where the chief promulgated laws, which had been discussed in detail at prior meetings, and where the many not included in the select circle around the chief were able to express their opinions on the proposal. In theory, all men who attended the *kgotla* had the right to air their views without fear of reprimand. The dictum, "*mmualebe o bua la gagwe*" or "*mahoko a kgotla a mantle otlhe*" meant that no one could be debarred from voicing his or her opinion, no matter how unpopular.

In defining the contemporary *kgotla*, during an interview, Isaac Tudor (August 23, 2001) of Kgosing ward in Maun (Ngamiland district) describes it as a

> democratic institution, you are free to say anything from your mind, it's your freedom of

> speech, and nobody will send you to court for talking nonsense. Everyone deserves to be heard. You are bound to have endless *Kgotla* meetings, depending on the seriousness of the subject discussed.

It is common that each male speaker randomly stands up to speak. In what is considered Tswana custom and tradition, respectable adult men wore hats (which they had to remove at the *kgotla*); by contrast, female adults had to cover their heads with scarves when attending the *kgotla*.

The result was a government with a certain openness, and the whole idea of debate was recognized as an important part of policy making. While all major decisions and pronouncements appear to have been subjected to public appraisal, it also seems clear that once a decision was made, it was expected to be observed by all. Peters (1994, p. 35) has described the *kgotla*, therefore, as an open forum where consensus politics decided the outcomes of debate. Although the powers of the *kgotla* were advisory only, the chief and his officials could use that forum to generate a consensus before taking action and to sense opposition to particular proposals.

There were exceptions to this openness. L. D. Ngcongco (1989, pp. 46, 58–74) has cited the example of exclusions in Kweneng where BaKgalagadi were not as a rule expected to speak at a *kgotla*, even though they were free to attend. In the case of Ngamiland, likewise, subordinate groups such as the BaSarwa (San) felt intimidated and thus found it difficult to stand up and speak at the Maun *Kgotla*. Tswana societies, like other African societies, did not consider public affairs a domain for women (Somolekae & Lekorwe, 1998, p. 187). Like other subordinates, women were treated as children. Thus, as a rule, they did not participate in *kgotla* debates unless they were invited to give evidence during the settlement of disputes. The aggregate functions of the *kgotla* rendered it a space that was historically a male domain. Only during the colonial period were Western-educated women, such as Pulane Moremi of BaTawana (1947–1964) and Gaogangwe Gaseitsiwe Ntebogang Ratshosa of BaNgwaketse (1924–1928), made regents. Gradually, after World War II, nonroyal women found their place in the *kgotla* and could speak in meetings.

Chieftaincy has presented the strongest challenge to women's struggles against their minor status than any other factor. Arguments have been advanced against chieftaincy in Africa with the assumption that this is a predominantly male institution. Gender and human rights activists have called for reform within the traditional rule structure, which is often viewed as an institution of an undemocratic nature. Although chieftaincy has been dominated by men in the past, the approval of the appointment of female paramount chiefs by the Botswana Minister of Local Government in the past few years is an indication that traditional rule has reformed and that the institution accommodates women as capable leaders. The ascension of Kgosi Mosadi Seboko to head a *kgotla* in 2002 is a good example of the few women who have broken new ground. Her official installation as a chief, draped in a leopard skin like other male traditional leaders, marked her authority among her tribal group, the Balete, 30 km south of the capital, Gaborone. Seboko became the first woman to serve in the Ntlo Ya Dikgosi mandated to advise both the government and parliament on issues relating to custom and tradition, including tribal property. The transformation of *bogosi* was noted by several speakers during this historic moment in Botswana. During Kgosi Mosadi Seboko's inauguration, Athaliah Molokomme, the first Botswana female Attorney General remarked,

> The institution of chieftainship and the installation of Botswana's first woman paramount chief cannot be seen in isolation from the tremendous socioeconomic changes that have taken place in our country and the world. (*Mmegi*, 2003)

On her side, Seboko thanked her people for support. "You were able to transcend the gender imbalance that many are still grappling with, and installed me not because I am a woman, but rather on the basis of birthright equity" (*Mmegi*, 2003). Since her installation as paramount chief, her major concern has been the increase in the number of disintegrating families, crime, domestic abuse and violence, unemployment, and HIV/AIDS. Nyamnjoh (2003) observes that these new developments in Botswana point to an institution that is adaptable and negotiating with changing political and social realities in the country. Since

Seboko's installation, several women, such as Keleatile Moremi of Batawana, are now claiming full citizenry as provided for in Botswana's constitution. The Bill of Rights in the Constitution suggests that actually women have equal rights as men. On August 26, 2009, Mosadi Seboko was recognized at Riverwalk cinema in Gaborone, with a few other women, through a Botswana home-produced film documentary not only contributing to the socioeconomic and political development of Botswana but also for serving as a mentor to the younger generation.

Another visible transformation within traditional rule in the country is the installation of young and educated chiefs to strengthen the voice in the Ntlo ya Dikgosi, negotiating their way into the democratic discourse. In the past, educated chiefs, such as Kgosi Seepapitso IV of BaNgwaketse and Kgosi Linchwe of BaKgatla II, not only served as traditional authorities within the confines of the then House of Chiefs (an advisory body to Parliament and government on matters pertaining to Botswana tradition and culture) but were at some point assigned by the government to serve as diplomats in countries such as the United States and China. The number of young, educated, and elite paramount chiefs has been increasing since the installation of a number of Tawana II of BaTawana in the late 1990s. Among these young cadre of chiefs are Lotlamoreng II of BaRolong (2002); Kgari Sechele II of BaKwena (2002), who was enthroned chief of Puso Gaborone of BaTlokwa (2006); the new chairman of Ntlo ya Dikgosi; and more recently Kgafela II of BaKgatla (2008).

In 2009, Kgosi Tawana II, who had resigned from chieftainship to stand for public office, was elected to Parliament. As men such as Tawana move from traditional authority into modern politics, they remain royalty and carry the prestige of being *Kgosi* into Botswana's modern politics. Like the first president of Botswana, Seretse Khama, and his son and current president, Seretse Ian Khama, their relative Tawana is likely to enjoy a legitimacy drawn from his position as former chief of the dominant BaTawana tribe. Ian Taylor has observed that the electorate of Botswana is still inclined toward a traditionalist culture of respect for authority, and this may explain why Kgosi Bathoen II of BaNgwaketse in 1969 played a dominant role in local politics and won support for the opposition Botswana National Front Kanye South constituency. The well-educated but non-royal Quett Ketumile Masire, a Botswana Democratic Party candidate, lost the constituency to Bathoen II. The Kanye South constituency was in the hands of the opposition for a very long time. In his recent biography, Masire (2006, p. 103) contends that in the mid-1950s, tradition or authority was often used to undermine the emerging non-royal elites. However, it is worth noting that when the Chieftainship Act was introduced in 1965, it meant that power was granted to the president to recognize or not recognize a traditional ruler, making all chiefs subordinate to central government. Ntlo ya Dikgosi has no legislative powers, and the positions of chiefs are dependent on recognition by the state.

Transformation in chieftaincy in Botswana should also be understood in the context of ethnic minority representation in the Ntlo ya Dikgosi. In 2006, the President of Botswana Festus Mogae toured the country to address and consult Batswana on issues of *bogosi* and the reconstitution of the House of Chiefs to become *Ntlo ya Dikgosi*. The president's tour was a follow-up to the Balopi Commission, which had been assigned earlier to undertake a national consultation exercise to come up with proposals for change that would have a profound impact on national unity (Republic of Botswana, 2000, pp. 93–110). After independence (1966), some sections of Botswana society repeatedly voiced concern at the inadequacy of the constitution in addressing the aspirations of some sections of the nation. According to President Mogae, "The House of Chiefs, as it was then known, was singled out as a classic symbol of inequality as it was perceived to be an exclusive club of some tribes" (Piet, 2007). He observed that this did not go well with some citizens of Botswana and viewed this as a threat to national unity and lack of political will for democratization and political development. The inequality that existed then had to be addressed by amending sections 77, 78, and 79 of the Constitution of Botswana in order to render them tribally neutral. On February 1, 2007, Botswana's historic opening of the first meeting of the *Ntlo ya Dikgosi* was held at which 20 new members, including a few women, were welcomed to the house. The forum of communication for these presidential deliberations was the *kgotla*.

Conclusion

Bogosi and the *kgotla* have gradually evolved as institutional agents of democratization and development. Since independence, chiefs have become active agents of government. However, traditional rule has displayed remarkable dynamism and adaptiveness to new socioeconomic and political developments in the country. Traditional instituitional functionaries have over time learned to adapt themselves in accessing and using resources such as political power and education in building sustainable change in governance. It is worth emphasizing that to promote interaction leadership and a culture of peace and to support actions that foster understanding, tolerance, and solidarity in Botswana, traditional rule still requires further transformation to address gender equality and minority representation in the Ntlo ya Dikgosi. Leadership skills, such as strategic planning, communication and presentation, team building, creative problem solving, consultation, and conflict resolution, are very relevant to *bogosi* and the *kgotla* for fostering democratic participation.

TRAGEDY OF THE COMMONS

The tragedy of the commons is a concept that denotes a specific type of social dilemma in which interdependent individuals face incentives to choose independent actions that maximize their individual benefit but generate a suboptimal aggregate outcome. Garrett Hardin is credited with first introducing the concept to describe the potential conflict between individual rationality and collective efficiency inherent in the management of a common-pool resource (CPR). A CPR is a natural or man-made resource characterized by a low degree of excludability and a high degree of subtractability. Excludability refers to the feasibility and hence costliness of excluding potential users from using a resource; subtractability, on the other hand, concerns whether a user's appropriation of units from the resource would reduce the amount of the units available to others. The two physical attributes generate what are known as *provision problems* facing individuals managing a CPR. Once a CPR is provided, it is difficult to exclude potential users from using the resource, regardless of whether or not they have contributed to the resource's provision. A rational individual who considers the costs and benefits of alternative courses of action would find no incentive to contribute and instead would wait for others to provide the resource. Collective inaction is often the outcome.

In his famous 1968 article in *Science*, Hardin depicted a hypothetical world of a pasture open to all. Every herder faced the incentive that by bringing in an additional animal to graze in the pasture, he would reap all the benefit generated by the additional animal but bear only a small fraction of the cost of overgrazing. A rational herder facing such a cost–benefit calculus would likely choose to bring in as many animals to the pasture as possible to maximize his short-term personal gain. When every herder adopted the same calculus and acted on it, however, the collective outcome would be a complete depletion of the pasture—an outcome that would harm every herder. As Hardin pointed out, what makes the situation a tragedy is not the unhappy ending per se but the remorselessness involved. Although every herder would see the predicament coming, they would find themselves trapped in a dilemma from which they could not escape.

The tragedy of the commons is in fact one type of social dilemma in which interdependent individuals face the incentive to make independent choices that, while maximizing short-term individual benefit, collectively generate an inefficient aggregate outcome. The outcome is inefficient because there is at least one alternative that can generate a higher level of collective gain benefiting all the individuals involved. While the individuals are fully cognizant of their contributing to the suboptimal situation by failing to exercise temperance and restraint, they find themselves left with no choice but to continue to pursue short-term interest so as to avoid falling prey to others. In a social dilemma, aggregate inefficiency is not necessarily a result of evil acts by some malicious culprits who means to harm others. Even for a group of benign and innocent individuals, as long as they have to choose independent actions in an interdependent situation and are unable to read others' minds, the possibility of a social dilemma always exists.

The "tragedy of the commons" provides policy analysts with a powerful metaphor for describing and deciphering public problems that are rooted in human interdependence. Moving from the more traditional forms of CPRs, such as irrigation, fishery, forestry, groundwater, transport systems, and budgets, studies of the commons have extended to cover nontraditional sectors, including the intellectual domain and the Internet. Recent studies of the new commons—forms of shared resources formerly not recognized as CPRs—have been a result of changing understanding of resource management and organization in new policy areas or sometimes an improved appreciation for the formerly unrealized extent and complexity of long-existing problems. Starting with high-seas fisheries and other more traditional forms of cross-border commons, the field of "global commons" now includes abstract common properties—biodiversity, genetic commons, atmosphere, social diversity and interconnectedness, equality, and knowledge.

Governing the Commons as a Search for Policy Panaceas

Hardin's grim prediction about the tragedy of the commons prompted generations of social scientists and policy analysts to engage in a search for effective ways to govern the commons. Hardin himself sees a change in human values and ideas of morality as the only way to escape from the tragedy; the crux of the problem lies with the question of how the morality of temperance can be put in place. Hardin is pessimistic about the possibility that a morality of temperance could emerge out of conscience; the perverse incentives embedded in a commons are simply too strong for the development of credible mutual commitment, which is the very foundation for conscience. To Hardin, the second best alternative is to create mutual coercion that is mutually agreed on. Although Hardin is well aware that coercion can be generated by various mechanisms, such as shame, he argues that for the commons, which are on a large scale and involve a large number of individuals, restrictive laws passed by a government are the more feasible way to generate mutual coercion.

A caveat is warranted here. Hardin did not naively argue that coercion by government is a foolproof and straightforward solution. In particular, he cautioned that the morality of temperance is highly context sensitive, and hence, it is almost impossible to stipulate a law that could take all conditions into account. Hardin also recognized that a major challenge of legislating temperance is to make sure that those who make and monitor the rules are themselves properly monitored and controlled.

For many policy analysts who favor simple and clear-cut policy advice, however, the tragedy of the commons metaphor provides not only a diagnosis of the problem of the commons but, more important, also a neat policy panacea. Given that the users of a commons are trapped in a social dilemma and are presumably unable to get out of it by themselves, direct government intervention seems to be the logical solution to help them out. In irrigation management in the 1970s and 1980s, for example, many international donors and governments in much of the developing world considered direct government intervention a policy panacea. When put into practice, the panacea took the form of outright nationalization of the existing irrigation systems, large-scale infrastructure investment, and the establishment of a strong, centralized irrigation bureaucracy. As policy analysts embraced the policy panacea, Hardin's caution about the context specificity of the morality of temperance and the need to monitor the monitors fell largely on deaf ears and was often considered a trivial matter involving implementation details.

At the time when direct government intervention was hailed as a policy panacea for coping with the problems of the commons, policy analysts trained in economics, in particular property rights economics, advocated the imposition of private property rights as an alternative policy panacea. The logic of their argument is straightforward: By putting in place private property rights and hence some sort of (pseudo)market exchange, individual owners of a CPR would be able and willing to internalize all the costs and benefits of their actions in relation to the provision and use of the resource. Without externalities, the maximizing behavior of the individuals will aggregate into collective efficiency.

Although the privatization panacea seems to offer a neat analytic solution to the problems of the commons, attempts to apply the panacea in the real world have been subject to the thorny questions of whether it is practically possible and, if so, how to divide up a commons and how to keep the transaction costs involved in the exchange at a reasonably low level. In irrigation management, for example, ample evidence has shown that an effective water market is possible only if there exists both a strong physical infrastructure that allows for efficient transfers of resource units and a solid social infrastructure that enables the users to engage in exchange activities in an orderly manner. Unfortunately, in the real world, both types of infrastructure are often in short supply; this is particularly the case in many developing countries where the livelihood of the poor often directly hinges on the effective management of various CPRs, such as irrigation systems and other rural infrastructure.

Empirical Research on the Commons

In the early 1980s, as direct government intervention in CPR management, particularly in the developing world, had produced rather mixed outcomes, scholars and policy analysts began to question the viability of the panacea of centralized control and regulation. Instead of taking Hardin's pessimistic prediction for granted, researchers started to seriously take stock of existing ethnographic evidence of the governance of the commons and conduct systematic empirical research. If there were major lessons that the decades of empirical research on the commons had to offer, three would stand out.

First, a commons is not destined to be a tragedy. While there are instances of failure, there are many cases of success in various policy domains ranging from irrigation, fishery, groundwater, and forestry, to grazing lands. In most of these successful cases, resource users and managers are able to develop an appropriate governance structure to manage and regulate the use of the resources so as to maintain a certain level of sustainability.

Second, the users of a CPR are not doomed to be helpless individuals awaiting help from an external authority. Empirical evidence has shown that around the world many communities of resource users are able to organize effective collective action to govern the commons. In fact, self-governance is not only a possibility but a commonplace. Moreover, contrary to what conventional theories have suggested, successful self-governance is not confined to CPRs of a small scale. In irrigation management, for example, there are cases in which local communities have successfully governed and managed irrigation systems that serve a service area of thousands of hectares over long periods of time. What is intriguing is that self-organized community-based irrigation systems have often significantly outperformed government-managed irrigation systems, which are often characterized by sophisticated physical infrastructure and management by professional engineers.

Third, contrary to what Hardin presumed, a CPR is not necessarily an open-access resource that is available to all at any time. In a majority of the successful cases, the users of the commons are able to define membership in relation to their resource through a diversity of institutional arrangements. The existence of considerable diversity in the design of CPR institutions raises a fundamental question as to whether the tripartite choice of the state, markets, and open access can fully capture the empirical diversity and provide an adequate analytical framework for the study of the commons.

Governing the Commons as a Search for Effective Design of Institutions

Hardin's analysis of the commons and the conventional CPR theories are anchored on two assumptions. The first assumption is that those involved in the commons dilemma resemble the neoclassical rational man, who is portrayed as having clear and definite preferences and excellent information-processing capabilities. While the neoclassical rational man may not make the right choice every time, he commands good knowledge of the probability distribution of what might happen for alternative courses of action. Theoretical and policy analyses, then, focus on examining the logic of action of the neoclassical rational man in a social dilemma and explicating possible ways to circumvent the perverse incentives embedded in the dilemma.

The problem of the neoclassical assumption of rationality is not so much that it oversimplifies but that it has been overgeneralized, as if it were the only viable assumption of rationality. Recent research has shown that the neoclassical model works relatively well only in stable situations where the information required for decision making is more or less complete, such as in a perfectly competitive market. For the analysis of individual choice making in a commons where a high level of uncertainty is involved, and hence learning is essential, the more complex model of bounded rationality, which takes into account human beings' cognitive limitations as well as their ability to learn and engage with one another, would be more appropriate. An implication of the model is that fallible individuals, while capable of making mistakes, can learn from the mistakes, improve their understanding of action situations, and design new institutional arrangements and strategies to cope with the social dilemma. The model points to the need to understand problem solving as a process of trial and error in a search for both means and ends (common understanding) and to the relevance of choices at multiple levels.

The second assumption underlying the conventional analysis of the commons is that individuals make choices in an institutional vacuum. The conventional theories not only fail to acknowledge the process of socialization as central to the creation of the individual but also decontextualize the analysis of actors' behavior. As argued by many researchers, individuals in a commons are in fact making situated choices; their decisions are shaped and conditioned by the greater contexts of culture and social rules.

As a result of a better appreciation of human fallibility and the importance of institutions, beginning in the 1980s, the focus of CPR research has shifted toward examining how the boundedly rational individuals struggle to cope with social dilemmas by crafting institutions and identifying design principles for institutions that can bring about effective outcome. Among the contending definitions of institutions in CPR research, the one developed by Elinor Ostrom and her colleagues in a tradition of institutional analysis and development (IAD) is a particularly useful analytical construct. In the IAD framework, institutions are defined as "rules-in-use" adopted by a community of individuals to regulate their repetitive interactions pertaining to the physical–biological world. The rules-in-use are linguistic prescriptions that require, prohibit, or permit a range of action for individuals under particular situations. When individuals ponder their actions and strategies in relation to one another, they take the rules into their calculus.

Based on careful theoretical analysis and meta-analysis of a large number of empirical case studies, Ostrom and her colleagues have identified eight principles of institutional design for robust governance of CPRs. These now well-known principles are

1. clearly defined boundaries,
2. congruence between rules and physical conditions,
3. collective-choice arrangements,
4. monitoring,
5. graduated sanctions,
6. conflict resolution mechanisms,
7. minimal recognition of rights to organize, and
8. nested enterprises.

Unlike conventional theories that focus on how users choose strategies of action in response to a given incentive structure, the IAD framework looks at the governance of the commons as an ongoing process that requires continual contribution from the users and recognizes the possibility of the users developing and modifying institutions to govern the resource. Empirical evidence has shown that institutions that are characterized by some or all of these design principles are better able to provide incentives for users of a commons to engage in collective action and, more important, to craft and continuously recraft institutions (rules-in-use) to govern the commons.

First, individuals in a CPR situation would be more likely to participate in the provision and management of the resource if they perceived a possibility that they would enjoy the benefits generated by their collective effort. Rules that stipulate clearly how consequences of collective endeavors would impact on whom are of major significance in providing incentive for individuals to engage in collective action. The existence of well-defined boundary rules and user rights is a particularly important factor accounting for system performance.

Second, individuals in an interdependent situation are not always able to see their interdependence and its implications for aggregate efficiency. Only when the users of a CPR are aware of and understand how their interests relate to those of one another, how much potential benefits could be generated by working with one another, and how fragile one could be when acting alone in an interdependent situation can they begin to see the potential of and need for arriving at a broader conception of preference in which self-interest is conditioned by recognizing the need to take the interests of others into consideration. When institutions provide opportunities and incentives for the users to communicate, reason, and share information with one another about not only the physical conditions of the commons but also their concerns, the users are more ready to work with others in managing the resource.

Third, research has found that the users of a CPR are better able and willing to cooperate with one another if they have a better understanding of the physical conditions of the resource and are able to monitor and keep track of the change in the physical environment. Institutions can serve an information-inducing function if they embody useful information, encourage the gathering and use of local information at various settings, and allow the users to use time-specific and place-specific information in their daily exigencies. Moreover, by ruling in certain actions and ruling out some others, institutions also provide information not only about the structure of the action situation faced by individuals but also about the choices of others. Such information allows them to form expectations, which in turn enable the individuals to make choices by taking the possible choices of others into consideration.

Fourth, strategies available to resource users that are ruled in by institutions are usually the ones that maximize collective outcomes but not individual payoffs. Hence, a collectively optimal outcome usually hinges on quasi-voluntary compliance, where the compliance of a user is contingent on the compliance of others. Quasi compliance can be sustained only if the users expect long-term gains from complying with the rules and perceive some prospect of being sanctioned if any one user among them breaks the rules. For monitoring and sanctioning to be effective, they have to be designed in such a way that the activities of monitoring and sanctioning involve only low costs, are diffused in scope, and are perceived by users in the community as fair and reasonable.

TRANSACTION COSTS

Transaction costs figure prominently in formal political decision making as well as in informal processes of political negotiation. Transaction cost considerations are highly relevant in a number of domains, such as social choice theory, public sector reforms aiming at contracting in or out, and the design of global governance.

Costs linked with transacting among humans arise when there is cooperation in one form or another. Cooperation resulting in agreements requires a number of measures for it to be effective, such as negotiation of the terms of agreement, specifying a contract or writing down the agreement, and implementation of the agreement, possibly through court action.

As these costs before and after an agreement tend to be measured chiefly in time, effort, and frustration rather than in money, they are distinguished from ordinary production costs in economics. Although transaction costs were first theorized about in economic theory, they have figured prominently in politics, less often as the costs of contracting and more often as so-called decision costs. One may here recall the much debated institutions of *liberum veto* and the filibuster, both of which tend to maximize transactions costs. Today transaction costs are a major consideration in public sector reform, especially in new public management, where government seeks to replace long-term contracting (bureaucracy) with short-term contracting (tendering/bidding).

Foundations of Transaction Cost Economics

Transaction cost economics started with the 1937 article by Ronald Coase on the firm and continued with his 1960 article on social costs. Economic life is replete with different forms of contracts, whose shape transaction cost theory helps explain. Thus, in the Coasean tradition, internal firm organization with long-term contracts presents a mechanism to reduce transaction costs when relying on massive short-term contracting in the market. This 1937 insight received a much needed elaboration by Oliver E. Williamson, underlining the implications of transaction costs for both hierarchies and markets. In the Williamson tradition, minimizing transaction costs is of paramount importance in economic life where strong forces like opportunism and asymmetric information with economic agents, especially when possessing asset-specific knowledge, are conducive to economic inefficiency, such as monopoly. The 1960 Coase article broadened transaction cost economics to the domain of public policy and externalities, arguing that with zero transaction costs, external effects and market failures could be handled by means of bargaining and compensation. This claim about the ability of market forces to allocate responsibility for external costs is known as the Coase theorem. It anticipated recent debates about extending the "polluter pays" idea to a global ecology policy to reduce carbon emissions. In general, institutional economics (new or neo-institutional) combine the insights from both Coase and Williamson, emphasizing that economic evolution aims at minimizing transaction costs (Oliver Williamson & Scott Masten, 1997). No similar teleology concerning a fundamental drive to develop institutions that minimize transactions is to be found in politics, however.

Transaction Costs in the Political Sphere

In politics, transaction cost arguments are primarily found in the theory of voting and the public choice school. Transaction costs arise in any political group taking decisions by some mechanism of voting, whether the group be a domestic one like the national assembly or an international organization like the World Bank, the United Nations, or the International Monetary Fund. In a group of choice participants—political parties, legislators, state representatives, faculty members, and club members—any decision or collective action will result from the summation of the preferences of the participants according to some mechanism of aggregation. Alternative social choice mechanisms—majoritarian techniques, proportional methods, utilitarian scoring, positional techniques—result in varying transaction costs for the group as a whole.

Given the assumption that no participant in the choice group should be given a separate status, the decision method that appears to be the just one is the Wicksell unanimity principle. It epitomizes the idea of deliberative democracy—namely, that a group decision must take into account the views of all participants. By deliberating the relevant issues, the "correct" group decision will emerge. In 1896, Swedish economist Knut Wicksell had already identified this kind of efficiency justice with the veto principle, meaning that all choice participants have not only a *say* but in effect a *no* capacity. By favoring the consensus method, Wicksell wanted to avoid the situation of a minority getting pushed over, having to bear alone the heavy costs from a collective decision. Thus, unanimity would secure Pareto optimality in politics. However, Wicksell did not recognize the full scale of the transaction costs that attend the unanimity principle when employed in practice. Consensus is the most transaction cost–burdensome decision rule for a choice group. Thus, alternatives must be employed, at least in domestic politics, to avoid decision inertia. As noted by James Buchanan and Gordon Tullock (1962), Wicksell's insights into decision costs—for the loser (external costs) and for the group as a whole (transaction costs)—form the backbone of the public choice school.

It is interesting to note that in politics, minimizing transaction costs is not an overall manifest objective or latent function, as it were. One may distinguish between domestic politics and international relations. Only for the first domain can one speak of a search for institutions that minimize transaction costs, such as the simple majority decision procedure and majoritarian election techniques. In contrast, choice participants in international institutions—the governments of member states—are reluctant to give up the Wicksell unanimity principle. The principle of state sovereignty entails that governments can protect their vital interests in international organizations with a firm veto. Similarly, in regional organizations, with the exception of the EU, the veto rule is upheld, although it maximizes transaction costs.

Transaction costs surface in decision making in political groups whether domestic, regional, or international. They are inversely related to the decisiveness of the group, which is the ratio of the number of winning coalitions to the total number of coalitions among the choice participants. When decisiveness is low, then, a stalemate is probable because of the ensuing strategies of delaying and holding out. Voting under a simple majority or qualified majority increases decisiveness and reduces transaction costs. The existence of a dictator in the group minimizes transaction costs but also increases the majority's risk of losing out on its preferred positions. A simple majority minimizes transactions costs in social choice while at the same time letting the majority prevail.

The fact that regional and international organizations seldom employ simple majority entails that minimizing transaction costs is not the sole preoccupation of these choice participants. They may favor unanimity or qualified majority because these regimes increase the choice participants' power to block, which may be a more important concern than the decisiveness of the group. Thus, transaction costs in politics may be supported because they follow necessarily from the highly valued blocking power of each participant.

These insights into the inverse relationship between blocking power and group decisiveness stemming from the logic of transaction costs in political decision making have been elaborated on in constitutional economics and *N*-person game theory. Recognizing the positive effect of increasing transaction costs, many constitutions provide for a qualified majority on sensitive matters, increasing the individual power to block and decreasing group decisiveness. Constitutional decision making is especially surrounded by inertia that leads to more substantial transaction costs. Realizing that transaction costs may become staggering as a result of delays and holding out, international organizations have deviated from unanimity and introduced qualified majorities of one or another kind. Yet procedural matters, being less sensitive, are often decided by simple majority.

Measuring and Managing Transaction Costs

In economics, several attempts have been made to measure transactions, but they are far less identifiable than standard production costs like labor and capital. More specifically, the costs of establishing a patent in various countries have been measured in the form of the length of time it takes from the launching of an application. Some scholars estimate that transaction costs may amount to a staggering one third of the GDP, including both financial operations and enforcement costs. Yet it must be pointed out that these measures of transaction costs in the economic literature are somewhat imprecise. It has even been argued by Eirik Furubotn and Rudolf Richter that transaction costs include the costs of maintaining or changing the political institutions that legislate about or administer contracts. More convincing are the attempts, such as that by Yoram Barzel, to estimate the reduction in transaction costs involved in introducing more efficient institutions like the *Aktiengesellschaft*, private property to land and partnership schemes.

In political science, transaction costs can be identified as being related to the inverse of the decisiveness of an assembly or a decision-making board. In domestic affairs, one tends to opt for a transaction costs minimizing mechanism like simple majority, whereas in regional and international coordination, unanimity or a qualified majority is favored, resulting in sometimes heavy transaction costs. Transaction costs in political assemblies are minimized when the individual blocking power is not substantial. *N*-person game theory, especially the power index approach, offers a convenient method for estimating the decisiveness of a choice group under alternative institutional arrangement, as, for instance, in the European parliament, the European Council, and various international bodies.

In public administration or public management, the seminal move toward contracting out or externalization has raised a concern over rising transaction costs. Relying on a multitude of delivery agents—public, private, and third sector—governments have become more anxious about getting the contracts correct as disputes under the new public management will be settled in court. It is an open question as to whether the reduction in production costs that come with short-term contracting is enough to compensate for the sharp rise in transaction costs with tendering/bidding schemes, especially litigation costs. When giving up long-term contracting in standard employment relations, the government also loses its general authority to direct the work effort and to train its employees continuously—sometimes described as the hollowing out of the state.

Transaction Costs in Global Governance

Today, transaction costs surface strongly in global governance as the governments of the countries of the world confront a number of issues arising from growing interdependences. Groups like the G8 or G20 are basically unanimity groups and are, therefore, associated with decision inertia and delays. Since the decisions of international coordination bodies are not only time-consuming in the making but can also be reneged on *ex post*, transaction costs loom large in several domains of global governance. To reduce these transaction costs, international organizations need to reconsider their structure, avoiding unanimity but allowing for quantitative voting in order to recognize the immense differences in scale between various countries. They also need to examine the enforcement problem in global governance as few of them have explicit dispute settlement mechanisms, at least not those that operate speedily.

Transaction costs have also been taken into account in global policy making in the form of the carbon emissions scheme—the Kyoto agreement. If a price on carbon abatement could be set and emission rights be allocated to all countries globally, then, a global emissions policy imitating the market would be conducive to an efficient reduction in carbon emissions, following the Coase theorem. However, arriving at such a comprehensive global emissions policy has not yet been successful due to transaction costs both in negotiating the emission rights (*ex ante*) and in enforcing the agreement against reneging (*ex post*).

TRANSATLANTIC RELATIONS

Like many of the most widely used concepts in the political science subfield of international relations, the term *transatlantic relations* defies precise definition and has been used to refer to a variety of historical, political, cultural, social, and economic interactions between polities, societies, institutions, groups, and individuals in Europe and North America. As such, the phenomenon, if not the term itself, stretches from the period of European exploration and colonization of the Americas, especially in the 16th and 17th centuries, through the ensuing political upheavals of the late 18th century—in particular those associated with the United States War of Independence—the consolidation and extension of U.S. power and influence across the New World in the 19th century—primarily at the expense of Spain and France—to the projection of U.S. power and influence into Europe itself. The latter process was most clearly reflected in the United States' crucial contribution to the outcomes of the two world wars of the last century and the establishment of a permanent military presence in Europe, which, although it outlived its origins in the Cold War, continues today. Because of their origins in the efforts of European powers to colonize the New World, however, transatlantic relations have never been limited to merely political or security affairs. They have always been influenced by economic and cultural interactions, with trade and immigration constituting the most important components of transatlantic relations in the 18th and 19th centuries.

The rich history of transatlantic relations and the membership of Canada in important transatlantic institutions, such as North Atlantic Treaty Organization (NATO) and Organization for Security and Co-operation in Europe notwithstanding, the term today is most often used with reference to post–World War II relations between the United States and Europe. In security affairs, it primarily comprises relations between the United States and its European NATO partners. In economic affairs, the frame of reference is the United States and the members of the European Union (EU), although relations between the EU and the North American Free Trade Area are sometimes covered by the term. Generally excluded from the concept are relations between Europe and Latin America as well as relations between the United States and European states that are not members of either the EU or NATO.

Following a brief summary of the major contours of transatlantic relations in the post–World War II period, this entry addresses the development of transatlantic relations after the demise of the Soviet Union and the Warsaw Pact. The discussion then turns to a survey of the major theoretical approaches to the analysis and explanation of the history and future development of transatlantic relations.

Transatlantic Relations in the Postwar Period

Although there were some efforts to systematically analyze transatlantic relations in the interwar period, they first emerged as a central topic of concern in international relations theory and practice in the period following World War II. In particular, the breakdown of the wartime alliance between the Western powers and the Soviet Union, the extension and consolidation of Soviet control over the states of Eastern and Southeastern Europe, and the perceived threat posed by the Soviet Union to the war-ravaged states of Western Europe implied the need for close economic and military cooperation between the states of Western Europe and the United States and led to the Marshall Plan, the development of NATO, and the strategy of containment. For the first three decades of the Cold War, transatlantic relations were characterized by a high degree of asymmetry. In economic and military affairs, the United States was the provider and Europe the consumer. In both fields, the United States was a global superpower. Europe, by contrast, was at most a regional junior partner.

Both sides of the Atlantic drew large benefits from this asymmetrical relationship; however, transatlantic relations experienced frequent and serious controversies. Whereas the states of Europe were quite happy to accept American economic assistance and security guarantees on the continent, the former colonial powers found it difficult to cede to the United States those prerogatives that had accompanied their previous status as great powers. A general American aversion to Europe's continued colonial pretensions resulted in strained relations throughout the 1950s and erupted into a serious crisis when the United States demanded the withdrawal of British and French forces from Egypt, which together with Israel they had attacked in October 1956 in response to President Nasser's decision to nationalize the Suez Canal. For their part, Europeans often resented the fact and exercise of American power. In the wake of Suez, French president Charles de Gaulle set out to enhance France's military and political independence by developing nuclear weapons, successfully testing an atomic bomb in 1960. In early 1966, he announced that France would alter the terms of her participation in the Atlantic Alliance. As a result, France withdrew its ground and air forces as well as headquarters personnel from NATO commands, demanded the removal of U.S. and Canadian forces from French territory, and forced the relocation of NATO headquarters and installations to neighboring countries.

The 1970s and 1980s were similarly marked by periodic strains in transatlantic relations, in particular over nuclear strategy and arms control, as well as relations with the Soviet Union and its East European satellites, but the debates were generally conducted within a larger consensus over basic interests, goals, and values. It is perhaps a paradox of transatlantic relations that their very success has tended to engender subsequent tensions between Europe and North America. Hence, the American decision to condition receipt of Marshall Plan assistance on the development of a common European economic policy contributed to the development of the European Communities and eventually the EU. Premised on transatlantic cooperation, Europe's economic recovery nonetheless led to conflict with the United States over questions of economic policy especially in the fields of trade and investment.

By the beginning of the 21st century, the economic asymmetry between the United States and its European trading partners was all but eliminated. Ongoing efforts to widen and deepen European integration in the fields of foreign and security policy by means of a European Constitution hold the prospect of eliminating the political asymmetries between the United States and Europe, although Europe's capacity for power projection lags far behind that of its American ally.

Transatlantic Relations After the Cold War

The rapid and unexpected end of the Cold War and the subsequent collapse of the Soviet Union and communist governments across Eastern Europe in 1989 to 1990 dramatically changed the context within which transatlantic relations had developed for almost a half century, leading many to question their future course. If transatlantic relations had been premised on meeting the threat posed by the Soviet Union in a global anticommunist struggle and the reinforcing imperative of economic recovery and if the early asymmetry in capabilities between the two sides of the Atlantic was disappearing, could a basic consensus on both sides of the Atlantic over fundamental interests, goals, and values in international and domestic affairs suffice to sustain the history of close cooperation? Since 1990, the question has preoccupied policymakers and scholars alike.

Scholars of international security and defense policymakers wondered whether NATO could survive without an identifiable enemy. Prominent political scientists maintained that NATO was indeed disappearing, while influential politicians argued that NATO would have to go out of area if it were to retain relevance. Meanwhile, many observers of transatlantic economic relations argued that with the opening of the economies of Eastern Europe augmenting ongoing economic liberalization in China, the end of the Cold War would accelerate the ongoing processes of globalization. As a result, Europe and the United States were expected to engage in fierce competition for mobile capital and a declining number of high-paying jobs. Moreover, as the relative importance of other regions of the world for both Europe and the United States increased, some reduction in the level of importance that was accorded to transatlantic relations seemed unavoidable.

After an American-led coalition defeated Iraq and restored the Kuwaiti Emir to power in 1991, the transatlantic agenda of the 1990s was largely dominated by two broad strategic issues. The first involved the expansion of NATO and the EU to the newly independent states of Eastern Europe; the second issue was how to respond to the campaign of mass murder and ethnic cleansing that emerged after the breakup of Yugoslavia and resulted in the 1992–1995 war in Bosnia. With respect to the latter issue, NATO proved unwilling or unable to develop and execute a coherent strategy for the first three and a half years of the conflict. In light of that failure, the logic of NATO expansion was less than entirely persuasive. Meanwhile, the EU pursued a strategy of sanctions, United Nations resolutions, and threats of diplomatic isolation in an effort to coerce Serbia and the Bosnian Serbs to stop the ethnic cleansing but to no avail. Following a series of transatlantic recriminations and a change of government in both the United States and France, NATO eventually intervened militarily and forced the parties to negotiate a resolution to the crisis. The lessons of the Bosnian War still fresh in their minds, United States and European leaders responded in a swift and effective manner to the 1999 crisis over Kosovo.

The question of the future course of transatlantic relations again became acute in the aftermath of the September 11, 2001, terrorist attacks on New York and Washington, D.C., and the ensuing transatlantic debate over the course and scope of the global war on terror and how to deal with the perceived threat posed by weapons of mass destruction (WMD) in the hands of so-called rogue states. The debate was focused primarily on Iraq, which the U.S. and European intelligence agencies believed possessed WMD and which was invaded by U.S. and British forces in March 2003. The ensuing dispute pointed to divergent perceptions of core interests between the United States and important European allies—France and Germany in particular—and led to a breakdown of allied cooperation in the United Nations and a wave of anti-American sentiment across Europe. Many regard the crisis over Iraq to have been the most serious of the post–World War II era.

Transatlantic relations appeared to reach a nadir during the two administrations of U.S. President George W. Bush (2001–2009). For example, in Germany, Chancellor Gerhard Schroeder not only opposed the United States on a fundamental question of security but premised his 2002 reelection campaign on opposition to American foreign policy. But the transatlantic divide was not limited to debates over single issues or the rhetoric of individual politicians. A series of differences over issues as diverse as the role of religion in politics, the establishment of an International Criminal Court, climate change, and the death penalty, many of which predated the Bush presidency, led substantial numbers of citizens on both sides of the Atlantic to conclude that the postwar consensus over fundamental interests, goals, and values had dissipated.

Theoretical Approaches to the Study of Transatlantic Relations

Given that the field of international relations is characterized by a number of competing paradigms, theoretical traditions, or schools of thought, the absence of a scholarly consensus over the basic causes and consequences of transatlantic relations should come as no surprise. Owing to the interdependence of facts and theory, disputes begin at the level of description—that is, over the question of what precisely needs to be explained. Thus, many state-centric approaches find it difficult to describe, let alone explain, what constructivist or culturally oriented approaches regard to be a major development in transatlantic relations over the course of the second half of the 20th century: the emergence of a pluralistic security community in the North Atlantic area. Although the relevant literature is vast and includes Marxist and other critical perspectives, mainstream scholarship has come to cluster around three broad approaches.

Realism

Although no longer as dominant as it was during the Cold War, realism as an approach to the study of international relations remains influential, particularly in the subfield of international security. Realism does not offer a single theory of international relations, but realist theories tend to share a set of common assumptions about the fundamental causes of international outcomes. These include the following: that international relations are characterized by the absence of legitimate authority above the sovereign state, which is to say that the ordering principle is anarchy; that sovereign states are the primary actors in the international system; and that states at a minimum seek to survive but may strive to dominate the system by maximizing their power relative to other states. Because of anarchy and the possibility that some states may try to dominate others, the use of force is always possible and hence states are fundamentally insecure. Realism assumes that the insecurity produced by anarchy leads states to jealously guard their relative position in the international system. When considering opportunities for economic cooperation, states will worry that the eventual distribution of benefits might leave others better off. Moreover, they will fear that economic gains might be converted to military capability. Hence, realist theory expects relatively little cooperation in international politics.

Among realist theories, the balance-of-power theory is the most developed and relevant for the analysis of transatlantic relations. Because realism in general is skeptical regarding the prospects for durable cooperation in international politics, the long history of cooperative transatlantic relations appears puzzling. At first glance, balance-of-power theory appears to offer an explanation. When confronting a potential threat to their security, states are expected to try to balance it through the acquisition of arms or allies. Hence, the history of postwar transatlantic cooperation is explained as a response to the commonly perceived Soviet threat. Although rivalry between the United States and its European allies was never completely absent, the need to maintain a united front against the Soviet bloc kept conflict within manageable bounds.

From the perspective of balance-of-power theory, however, because the collapse of the Soviet Union and the breakup of the Warsaw Pact eliminated the overriding common interest that sustained close transatlantic relations, it should have led to a significant weakening of transatlantic cooperation and the collapse of common institutions, including NATO. Indeed, balance-of-power theory would appear unable to explain not only NATO's persistence but also its expansion to Eastern Europe in the 1990s and the early years of the 21st century as well as the decision of French President Nicolas Sarkozy in 2009 to reverse President de Gaulle's decision of 1966 and to reenter the alliance's integrated military command. With regard to economic relations, even the largest economic crisis since the Great Depression during 2008–2009 did not lead to a repeat of the "beggar thy neighbor" policies that plagued transatlantic economic relations during the 1930s. Rather, transatlantic relations were characterized by intense efforts to coordinate American and European macroeconomic policies in an effort to stimulate the global economy, an outcome clearly at odds with the predictions of realist-inspired analyses.

Liberalism
