Not surprisingly, all of the major critiques are tied in important ways to the features that define practitioner inquiry, particularly to notions of knowledge generation and use, validity and generalizability, and appropriate roles of researchers and sites of research. The critiques are tied as well as to fundamental ideas about what counts in the first place as research, data, knowledge, evidence, and effectiveness, and who in the final analysis can legitimately be regarded as a knower about issues related to teaching, learning, and teacher education. In the section that follows, we discuss five critiques of practitioner inquiry that have been notable in the last quarter century or so since the early 1980s. We refer to these as: the knowledge critique, the methods critique, the science critique, the political critique, and the personal/professional development critique.

The Knowledge Critique

One of the most visible critiques of practitioner inquiry rests on philosophical, and more explicitly, epistemological grounds. The knowledge critique centers on the issue of what kind of knowledge – if any – is generated when practitioners do research about their own schools, classrooms, courses, programs, and other contexts of practice (Fenstermacher, 1994a; Richardson, 1996). The knowledge critique is based on the premise that there is a formal, theoretical, or scientific form of knowledge for and about teaching and learning that is distinguishable from some other kind of knowledge variously referred to as practical knowledge, craft knowledge, lore, received wisdom, the wisdom of practice, accrued wisdom, or knowledge that is experiential, personal-practical, situated, relational, embodied, popular, and/or tacit. Fenstermacher, for example, makes a major distinction

between *practical* knowledge, which is bounded by context and is about how and when to do things or see events in a particular situation, and *formal* knowledge, which is knowledge about relationships between actions and consequences that are generalizable across contexts.

At the heart of the knowledge critique of practitioner inquiry is criticism of the use of the word knowledge itself and the suggestion that practitioners can generate needed knowledge about teaching and teacher education based on their perspectives inside professional contexts. Fenstermacher argues that it is essential to make very careful distinctions whenever the concept of knowledge is used to describe teachers' "mental states". He differentiates three possible meanings for the term, "knowledge," only the first of which (formal or practical knowledge in the traditional philosophical sense) has valid epistemic merit. Fenstermacher argues that if a discussion about teacher knowledge is to be useful, interesting, or important, then it must use the term knowledge in this first sense and concentrate on establishment of the warrant or justification for epistemic claims. However, Fenstermacher warns those who would couple "teacher research" with "knowledge," suggesting that outsiders to the field of philosophy have not adequately attended to the conventions of the discipline, particularly the "exquisite complexities of knowledge claiming and justifying" (p. 41). Fundamentally, Fenstermacher's critique of the teacher research movement challenges the argument that research by teachers and other practitioners can generate knowledge about teaching and learning unless it is born of a science, "analogous to the science that yields formal knowledge" (p. 48). What this means is that teacher research, even if it is intended to contribute to what Schön (1995) once called a "new epistemology of practice," should be governed by the same epistemological traditions as research intended to generate formal knowledge.

The Methods Critique

Closely related to the knowledge critique is what we refer to as the methods critique. This is one of the oldest critiques of practitioner inquiry, challenging on methodological grounds the very notion that practitioners have the skill, the distance, or the analytic capabilities to conduct research about their own work and in the context of their own professional contexts. Zeichner and Noffke (2001) point out that rather than recognizing practitioner research as an emergent form of inquiry, critiques of method have usually assumed that practitioner research was simply a "lesser" form of academic research, but conducted by ill-prepared amateurs.

Along these lines, well-known qualitative methodologist, Michael Huberman (1996), questions whether teacher research is research at all, challenging the claim that it may be thought of as a new genre or that teacher research may have the potential to generate a "qualitatively distinctive body of understandings, skills, and dispositions" (p. 124). If teacher research is research at all, Huberman contends, it is located within the "fairly classic genre" of interpretive research. Huberman points out that understanding events when one is a participant in them is excruciatingly difficult if not impossible, thus challenging the possibility

of the teacher functioning as a researcher in his or her own school or classroom setting. If the teacher does try to function as researcher, Huberman suggests that the "classic criteria" of qualitative research apply – that teacher research is bound by rules for the, "provision of evidence, consistency, freedom from obvious bias, and perceptions of the people involved" (p. 128) and that he or she must transcend the self in order to transform an emic perspective into a "more widely shared etic idiom" (p. 126).

Huberman argues that the fact that teachers may have intimate insider information about teaching does not negate the need for research methods that are "minimally reliable" in order to safeguard against "delusion and distortion" (p. 132). Huberman's critique of the teacher research movement concludes with the claim that teacher researchers need to develop an alternative and codified discourse that connects to propositional (or formal) knowledge via more "coherent" language, "leaner" vocabulary, "robust yet tailored" methods, and a "less woolly" body of evidence. Echoing Fenstermacher (1994a), Huberman argues that teacher researchers' work cannot escape the application of criteria for assessing "truth" like those that are applied "in a more deliberate universe like the academy" (p. 38).

The Science Critique

The science critique is actually a combination or a subset of the knowledge critique and the methods critique. We mention it separately here because of its relevance at the turn of the 21st century when many segments of the U.S. educational community are preoccupied with research-based evidence as the grounding and the authority for educational policies of many kinds (Shavelson & Towne, 2002). [See the special theme issue of *Educational Researcher* for discussion of many of the issues and debates involved: (Jacob & White, 2002)]. The U.S. federal government's claim to be willing to fund and implement only those educational policies legitimated through scientific research is reflected in the language and emphasis of the No Child Left Behind Act of 2001 (HR1), which reauthorized the U.S. Elementary and Secondary Education Act that provides billions of dollars in federal assistance for education programs; the language used in discussions of the reauthorization of the U.S. Office of Educational Research and Improvement, which funded educational research projects throughout the country; and, the U.S. Secretary of Education's annual report to Congress on teaching quality (U.S. Department of Education, 2002), which analyzes the yearly progress of the 50 states in meeting the challenge of providing highly qualified teachers for all U.S. schoolchildren. Each of these documents makes dozens of references to "scientifically based research" (SBR), which, as Feuer, Towne, and Shavelson (2002) point out, now has "acronym status" in Washington, D.C. and will have especially broad-reaching effects since all recipients of federal dollars will be constrained from funding any programs or initiatives that do not have a track record based on SBR.

The clearest indication to date of how the science critique may play out in evaluating practitioner inquiry may be found in the recent synthesis of research

on teacher preparation completed by Suzanne Wilson, Bob Floden, and Joan Ferrini-Mundy for the Office of Educational Research and Improvement of the U.S. Government (Wilson, Floden, & Ferrini-Mundy, 2001). The report by Wilson and colleagues is intended to summarize the existing empirical research on teacher preparation since 1980 that has been conducted, "with rigor and critically reviewed by other researchers" (p. 1) in order to provide for the policy and research communities a sense of what we currently do and do not know about how best to prepare highly qualified teachers for the nation's schoolchildren.

Although they began with more than 300 references, only 57 were included in the final synthesis. Studies were excluded if they were irrelevant to the questions stipulated by OERI, were insufficiently rigorous, were based on opinions or principles without empirical evidence, or were based on a single course in a particular teacher education program. The studies in this last category were excluded "because it was difficult to synthesize studies that were idiosyncratic" (p. 3). The report notes that many more studies were found "that examined teacher learning within a particular course, but, given both the limited time frame for this report and the difficulties in comparing specific courses cross institutions, [the report] did not include those course-specific studies" (p. 14). These footnotes in the report reveal some of the basic assumptions underlying the science critique of practitioner inquiry – studies conducted in single courses or about single programs are idiosyncratic; synthesizing findings across courses and institutions is paramount; and, rigor depends primarily on cross-site comparisons, large sample sizes, and uniform procedures and measures.

Included in the recommendations section of the Wilson–Floden–Ferrini–Mundy report are calls for research that facilitates comparisons among alternatives, cross-site analyses, controlling and testing for the impact of particular variables, and a focus on the outcomes of teacher preparation. The gist of these recommendations is consistent with what Floden (2001) elsewhere has called the "effectiveness paradigm" of research wherein the point is to identify consistent factors that increase the effectiveness of teaching, primarily as measured in pupil's gains on standardized tests of learning. Much of the practitioner inquiry in the area of teacher education has been completed by teacher educators engaged in research or self-studies of their students' and their own learning and experiences by focusing on their own courses, programs, and institutions. While practitioner inquiry in teacher education certainly draws on empirical evidence broadly construed, much of this is likely to be discounted by the meteoric rise in prominence of a narrow brand of science. In fact, as St. Pierre (2002) points out in her recent critique, the danger with the National Research Council discussion of scientific research in education (Shavelson & Towne, 2002), which rejects postmodernism, is to dismiss a kind of research that studies, "the possibilities, limits, usefulness, and dangers of any theoretical position – including their own – in the production of knowledge and lives" (p. 26).

The Political Critique

A fourth critique of practitioner inquiry, which we refer to as the political critique, concentrates on its purposes and ends as well as on its political or ideological bases. Like some of the other critiques, this one is double-edged. One edge of the political critique, usually made by those who advocate forms of action research, assumes that the bottom-line purpose of practitioner research is social change and social action. Based on the assumption that all research is political, this critique eschews versions of inquiry that have goals that are more or less instrumental and/or that lack clear connections to larger social and political agendas (Anderson *et al*., 1994; Kincheloe, 1991; Noffke & Brennan, 1997). Many of those who have offered this political critique of practitioner inquiry work out of disciplines influenced by European critical social and economic theory, feminist theory and research, and/or the notion of pedagogy as praxis, that is, the dialectical relationship between critical theorizing and action (Freire, 1970). This political critique is generally based on the assumption that although action research and other forms of critical teacher inquiry have the potential to alter fundamentally the nature of practice and the role of teachers and teacher educators, their power is severely diminished if their "democratic edge is blunted" (Kincheloe, 1991), if they are separated from "the political sphere" (Noffke, 1997), or they are used to "further solidify and justify practices that are harmful to students" (Zeichner, 1994).

This political critique of practitioner inquiry revolves primarily around questions connected to agency and ownership. What this critique points to is that there are more and less "benign" constructions of practitioner inquiry – some that are more readily integrated into the existing social and institutional arrangements of schools and universities than others. For example, to the extent that teacher research fits comfortably with a university or school district's institutional agenda for reflective practice, increased professionalism, and/or teacher accountability, it can be regarded as compatible with ongoing efforts toward professional development. To the extent that action research is consistent with a district's stated commitment to teacher leadership, site-based management, or curricular revision, it can be regarded as at least compatible with, if not central to, ongoing efforts to improve schools. To the extent that self-study or the scholarship of teaching is consistent with traditional research methods for data collection and analysis, they can be regarded as supporting the commitment of many universities to improve the practice of their faculty members. Many of those who have critiqued practitioner inquiry on the basis of its political perspectives, however, suggest that benign versions of practitioner inquiry, especially action research, misunderstand their historical roots and dilute their necessarily political edge (Kincheloe, 1991; Noffke, 1997).

Some of those who have advocated teacher research for K-12 teachers and program-based educators have also emphasized the ways in which inquiry can help to challenge the taken-for-granted aspects of schooling. Cochran-Smith (1991), for example, has advocated the notion of teacher research as part of

learning to teach "against the grain," and Lytle (1993) has characterized teacher research as engaging in "risky business." Notions like these are consistent with the idea of practitioner inquiry as something decidedly different from the quest for certainty in teaching and teacher education or for a new canon of "best practice" certified by systematic classroom documentation. From these perspectives, practitioner inquiry is associated more with uncertainty than certainty, more with posing problems and dilemmas than with solving them, and with the fundamental recognition that inquiry both stems from and generates questions.

The other side of the political critique sword is exactly the opposite. That is, many of the more critical versions of practitioner inquiry are often critiqued precisely because they have a political agenda and are directed toward social change and social justice. The assumption behind this critique is that research can be (and ought to be) a-political neutral, non-ideological, and value-free (Gee, 1996). Instead the assumption underlying this critique is that research (and the knowledge that it generates) ought to be based solely on the empirical and certified facts of educational matters and not related to any political agenda. The political critique of inquiry that openly emanates from an ideological perspective – particularly an ideology intended to challenge the status quo and bring about a more socially just educational system and society (Noffke, 1997; Noffke & Brennan, 1997) – is ultimately dismissive. Notwithstanding the fact that many of those who conceptualize practitioner inquiry would argue that all research is political, the argument against practitioner research of this kind is that it is simply not research at all, but is instead advocacy, activism, or political maneuvering by disenfranchised groups.

The Personal/Professional Development Critique

The fifth and final critique of practitioner inquiry that we include in our discussion here is the personal/professional development critique, which again has two distinct strands. The first has to do with the fact that practitioner research has generally been regarded in the literature of research on teaching as a vehicle for individuals' personal and/or professional development rather than as a mode of knowledge generation (Cochran-Smith & Lytle, 1998; Zeichner & Noffke, 2001) that has the potential to alter, not just add to the knowledge base about teaching and learning, the processes of schooling, and teacher education. There is little debate about the fact that practitioner inquiry can indeed function as a useful (and even powerful) form of professional development and problem solving. Sometimes the professional development aspect of practitioner inquiry is critiqued, as above, precisely because of its instrumental focus and its tacit sustaining of the status quo. At other times, when advocates make knowledge claims about research carried out by practitioners – either in fact or potentially, the professional development critique of practitioner inquiry is invoked in tandem with the knowledge critique. Then, as we noted in our discussion of the knowledge critique, critics are quick to emphasize the limits of practitioner inquiry, drawing attention to the fact that teachers' experience and beliefs are often

wrongly described as knowledge, and reflections about practice leading to personal growth are sometimes wrongly described as research (Somekh, 1993). Anderson (2002) implicitly refers to this issue in his criticism of the fact that practitioner research is seldom included in doctoral study; he suggests, however, that differences between reflections and "real research" (p. 22) may be more a matter of degree than kind.

The second strand of the personal/professional development critique takes a different tack. Here, the critique is that certain forms of practitioner inquiry, particularly self-studies and those with autobiographical stances, are much "too" personal in that they focus on the person in an ego-centered or narcissistic sense. Along these lines, Cole and Knowles (1998) reveal that characterizations such as "narcissistic, self indulgent, egocentric, and solipsistic" are often used to critique self-study, especially when it is under review for publication. Bullough and Pinnegar (2001) also provide some insight into the personal/professional development critique when they raise questions about whether readers "care" about reading self-study if they are unfamiliar with the person. Following Graham (1989), they point out that when "self-discovery or self-orientation" predominate, or when "balance is lost and the writer slips into confession or worse, egoism" (p. 17), the answer about whether or not the reader cares enough to read on is usually "no." They suggest that readers expect more than personal self-discovery from practitioner inquiry, instead looking for evidence that some of the serious and difficult issues involved in teaching and teacher education have been confronted and dealt with explicitly.

In the preceding sections we have outlined a number of common critiques of practitioner inquiry. Some of these focus on epistemological and/or methodological issues, while others focus on political as well as professional issues. Often these critiques are combined and overlapping with one another, depending on the context of discussion and the stakes that are involved. In certain ways, all five of these critiques are related to basic assumptions about the knowledge in understanding and improving teaching and teacher education.

Practitioner Inquiry in the University Context

In this third and final section of this chapter, we focus on our own experience with practitioner inquiry from our perspectives as faculty members at large research universities in urban areas. We trace the roots of our interest in teacher research in the context of the university to illustrate in a concrete and particular way the issues that connect and divide practitioner inquiry from traditional modes of research on teaching. Then we elaborate what we refer to as "working the dialectic," or, taking seriously and living out in research, teaching and other activities at the university, the fundamental epistemological, ethical, and political premises of practitioner inquiry, as we have understood and helped to conceptualize them over a period of many years. Finally we draw on our experience at the university to explore and illustrate what working the dialectic looks like

within the culture of a research university, a context that is different in important ways from both K-12 schools and other educational settings.

The writing in this third part of the chapter shifts slightly in style and voice from those of the preceding two sections. In the first two sections, we analyzed the major ways practitioner inquiry has been theorized, critiqued, and instantiated in teaching and teacher education over the past several decades. This perspective allowed us to synthesize and comment across the work of many other scholars and also examine the differences between practitioner inquiry and traditional educational research, particularly with regard to knowledge claims, legitimacy of knowers, and ways of knowing. In this third and final part of the chapter, we speak more directly about our own situation and experiences as researchers and teachers in the university setting.

Tracing Our Roots

We trace our interest in teacher research to an increasing dissatisfaction with business as usual at the university – particularly with the way practitioners have been positioned in teacher education and professional development and with the way university-generated knowledge was assumed to encompass everything there was to know about teachers and teaching. From the beginning we worked closely with new and experienced urban teachers at the University of Pennsylvania to develop innovative preservice and professional development projects and programs, particularly the preservice program, Project START (Student Teachers as Researching Teachers), and the school-university collaborative, PhilWP (the Philadelphia Writing Project), an urban site of the National Writing Project. Throughout our time at Penn and elsewhere, we were never solely practitioners nor solely researchers. Rather we saw ourselves as negotiating the uncertain borders of educational practice and scholarship by simultaneously wrestling with the daily dilemmas of practice and at the same time contributing to conceptual frameworks for the emerging domain of teacher research.

From the beginning we regarded our projects as strategic sites for both research and practice, positioned to prompt the rethinking of fundamental assumptions about the intellectual project of teaching and to explore the prospects for reconstructing practice as inquiry across the professional lifespan. It was our close work with teachers that heightened our awareness of the gap between university discourse and the reality of daily life in schools and made us reject the claim that universities could take the major responsibility for creating enduring change in schools and classrooms. Early on we realized that it was not just university scholars who took a critical perspective on the social and political arrangements of schools and schooling. Rather many of the urban teachers with whom we were collaborating (particularly those who were members of the Philadelphia Teachers Learning Cooperative, Teacher Educators for Social Responsibility, and those who worked with Patricia Carini and others at the Prospect School and the North Dakota Study Group) had a long history of

documenting and taking critical perspectives on their work with students and the larger sociopolitical contexts of school and society.

Jointly with these and many other teachers and student teachers, we explored teacher research as a way to rethink practice, question our own assumptions, and challenge the status quo – not only in schools but also in the university. Over time we came to use the term "teacher research" as a kind of shorthand for a larger set of premises about: teachers as knowers, reciprocal school-university relationships, teaching as both an intellectual and political activity, learning to teach as a process that occurs within inquiry communities throughout the professional lifespan, schooling as deeply influenced by culture and history, and the need for parallel transformation of universities and schools.

We trace the roots of our interest in teacher research to a time long before these projects, however. Both of us began our work at the university having been K-12 teachers, and then we were part-time instructors and/or supervisors of student teachers and lecturers for a number of years. Later, after we completed our doctorates at Penn in the early 1980s, we continued as lecturers or adjunct faculty for a number of years until there was an opportunity to "apply for our own jobs" as tenure-track assistant professors.Throughout this time period, we were actively involved in all aspects of the academic programs at the university and also engaged in scholarly and professional work, both before and after we were "officially" faculty members. Despite the important opportunities these positions gave us to teach and to learn, it is also clear that, like women at schools of education at many other research universities, we were marginalized as members of the faculty. In addition, because of our close work with teachers and student teachers, we were identified with practitioner-oriented issues rather than "real" researchers. At many schools of education at research universities at that time in the early 1980s, an individual's status roughly mapped to her closeness to or distance from the daily practice of schools and other educational programs. This kind of hierarchy distinguished those who did social science (i.e., they engaged in scholarship about education broadly construed and/or closely identified with the concerns of a particular discipline, such as psychology, history, or economics) on the one hand, from those, on the other hand, who identified themselves as educators working in the field of education (typically teacher educators and others whose work was directly focused on teaching, learning, and schooling).

In retrospect we realize that our reluctance to privilege neither scholarship nor practice contributed not only to our marginalization as faculty members but also to our need to construct a kind of critical integration that connected our more grassroots work with teachers to our teaching and research at the university. This desire to locate our work at the intersection of two worlds deeply informed and continuously called into question our perspectives on collaboration and power, voice and representation, culture and difference, and the interrelationships of inquiry, knowledge, and practice.

Part of the reason we were able to work at this intersection at a major research university was the relatively small size of our programs in preservice teacher

education and in reading, writing, and literacy. In addition, in those "early" days, both of us had a great deal of autonomy and what we now realize were unusually rich opportunities to invent new program structures, imagine new relationships with school-based colleagues, and figure out how to make our projects critical sites for inquiry. Commenting on our apparent freedom to pursue these ideas, one of our colleagues from another university once pointed out that many administrators and faculty at Penn appeared for the most part "mercifully uninterested" in what was going on in our programs, even though we were by then writing about them and beginning to draw attention to this work.

Our ideas about teacher research were also in sync with the growing interest at Penn's Graduate School of Education in qualitative research. Since the mid 1970s, the University of Pennsylvania has been at the forefront of exploring and fostering qualitative research as a legitimate mode of inquiry into educational problems and issues. Led over the years by well-known researchers from anthropology, linguistics, and literacy, including Dell Hymes, David Smith, Shirley Heath, Frederick Erickson, Bambi Schieffelin, and Nancy Hornberger, Penn was among the first to offer an array of courses in qualitative research methodology and to permit and indeed encourage doctoral dissertations that relied on qualitative approaches to data collection and analysis. Much of this work explored the cultures of schools and classrooms and attempted to represent teachers' knowledge from their perspectives inside schools. Efforts of this kind were intensified and made public via the university's Ethnography and Education Forum, which began in the late 1970s and continues annually. This conference, which we participated in from the beginning, has been known over time for promoting conversations about qualitative research among an unusually wide range of participants, both local and national, including graduate students, school- and program-based teachers and administrators, and university faculty.

Ours and many others' ideas about teacher research were first made public at "Teacher Research Day," a special event we initiated with teachers and student teachers at the Forum in 1986. Since that time Teacher Research Day has attracted teacher researchers and inquiry communities locally and from around the world as well as featured speakers who helped to conceptualize and disseminate the notion of practitioner inquiry as a mode for knowledge generation, professional development, and activism for school change. As co-authors, we used the Forum as a context for sharing our emerging ideas about what it meant to make inquiry central to teaching and learning to teach. Over the years, we had the privilege to present more than a dozen keynote talks that introduced Teacher Research Day by positing conceptual frameworks at once firmly rooted in our ongoing projects and programs and also intended to suggest generative questions and issues for the larger field. All of these were eventually published in one form or another in educational journals and in some cases in professional newsletters and in-house publications. Over these same years, our student teachers and our school- and program-based teacher colleagues also presented their work at the Forum and at a growing number of regional and national conferences

related to teacher education, language and literacy, and urban education. Together and separately, for teachers, student teachers, and faculty members engaging in research on our own practice became the central way of knowing for our growing inquiry community in the Philadelphia area.

Working the Dialectic

As this discussion about our roots suggests, we have worked over time to conceptualize and take seriously the concept of teacher research – and its underlying premises about knowledge, teaching, schooling, and power – and to instantiate and act on those premises in our daily university work, in various partnerships and collaborative contexts, in K-12 schools, and in community-based adult program literacy and other settings. We think of these efforts collectively as "working the dialectic." By "dialectic," we refer to the reciprocal, recursive, and symbiotic relationships of research and practice, analysis and action, inquiry and experience, theorizing and doing and being researchers and practitioners as well as the dialectic of generating local knowledge of practice while making that knowledge accessible and usable in other contexts and thus helping to transform it into public knowledge. When we "work the dialectic," there are not distinct moments when we are only researchers or only practitioners. Rather these activities and roles are intentionally blurred.

By "working" we mean capitalizing on, learning from, and mining the dialectic as a particularly rich resource for new knowledge. Clearly this occurs when we study and theorize our practice as university-based faculty members and teacher educators. But in our teaching and program evaluation efforts, we highlight and learn from the work of those who have engaged in teacher research, self-study, and other practitioner inquiries. Thus, for example, in the construction of reading lists for courses or in the synthesis of research literature for scholarly publications, we recognize practitioners as legitimate knowledge generators and thus include in our reviews the inquiries of school-based teachers and university-based teacher educators. We also "work" the dialectic by collaborating with others to develop the contexts that support the inquiries of student teachers, new and experienced school-based teachers and administrators, university-based fieldwork supervisors and teacher educators, community program-based educators, and many other educational colleagues and collaborators.

As university faculty members working the dialectic, we have explored the ways we and our students and colleagues co-construct knowledge; we have investigated issues of language, culture and literacy; and, we have analyzed the contexts that support inquiry communities and teacher learning across the professional lifespan. Drawing on data collected over more than a decade from a number of sites – preservice teacher education programs, urban professional development projects, and other university or field-based programs – we have explored the complex relationships of inquiry, knowledge, and professional practice. Within this program of research, we have tried to understand how teachers

raise questions, collect classroom and school data, generate analyses and inter-
pretations, and alter students' learning opportunities. We have looked at how
prospective teachers reconcile the issues of race, culture, and diversity with issues
of high standards, content coverage, and accountability as they learn to teach.
We have looked at how experienced teachers understand race, culture, and
diversity as dimensions of leadership in an urban school district undergoing
dramatic change. We have compared the literacies of women in a university
program, women in a community college, and women who are homeless in order
to explore how individuals differently positioned in terms of gender and schooling
construct their learning "herstories." We have traced the attempts of a large
teacher education faculty group from very different disciplinary and method-
ological backgrounds to grapple with the question of what it means to do teacher
education for social justice. We have explored the characteristics of preservice
and inservice teacher inquiry communities as environments that support ongoing
learning in the face of continuous societal and educational change. All these
strands of our research program have informed and are informed by our evolving
theories of the interrelationships among inquiry, knowledge, and practice.

Although many of these questions could be explored by researchers outside
of their own professional contexts, something different results when one's own
professional work is the research site and one's own emerging issues and dilem-
mas are the grist for systematic study. When university-based faculty intention-
ally work the dialectic of research and practice, it makes possible a genre of
scholarship in which rich new ways to "theorize practice" and, at the same time,
"practicize theory" are developed.

In our case, as university-based faculty members, working the dialectic has
been an especially productive way to invent and direct teacher education and
professional development projects and, at the same time, theorize and analyze
many aspects of those projects. Based on this work, we have tried to conceptualize
teacher research through a series of essays presented and published over a period
of now more than 17 years.[1] In each conceptual essay we wrote about teacher
research, we tried to address a particular question or set of questions that had
been problematic in our daily work as teachers, teacher educators, and research-
ers. Thus, in a very real sense, the contradictions in our own practice oriented
our research just as much as did our reading of the wider literature related to
teacher learning, inquiry, school change, and language and literacy. At the same
time, the distinctions we made in our writing provided new lenses on our practice
and on our interpretation of the theoretical and empirical literature. An early
essay on the genres of teacher research, for example, grew out of our extensive
reading of the varied forms in which teachers wrote about their daily work and
also out of our participation with teachers in a range of oral documentary
processes. These experiences contributed to our growing discontent with the
assumption that research by school-based teachers should be expected to follow
the conventions of method and presentation developed in the university. The
conceptual framework we developed influenced us to formalize and rethink the
kinds of inquiry opportunities available in our programs and projects. Working

the dialectic is a decidedly non-linear process. For us, it has been more like improvising a dance than climbing a set of stairs. As we theorized the relationships of inquiry, knowledge and practice based on critical analysis of others' work as well as systematic inquiry into our own practice, we saw many ways to reinvent practice, which prompted further nuances in our theoretical frameworks and posed new questions to analyze; these, in turn, suggested new interpretive frameworks and strategies.

Over the years, working the dialectic changed our work, changed who we are, changed what we do and how we do it. We have found that inquiry changes the people who do it, and for us, in our location at the university, it also challenged many of the formal and informal rules universities live by. It has been our experience that taking teacher research seriously at the university creates issues and tensions that are at once difficult and generative. This creates dilemmas and contradictions about positions and relationships, about research conventions and practices, and about the broader meanings of scholarly activity. If they do not make working within the university context impossible (as they have for some of those involved in self-study, as we indicate in the next section), however, they can be generative – suggesting new questions and prompting further critique about school-university relationships.

Practitioner Inquiry and University Culture

Although there is now a substantial literature about the role of practitioner inquiry in schools and in school-university partnerships, there is much less that focuses on the university, particularly on the contradictions that are generated when practitioner inquiry brushes up against, and sometimes collides with, what has traditionally been valued and rewarded in university culture. Some of the most interesting and provocative work along these lines has been written by teacher educators who are active in the self-study of teacher education practices community, particularly Ardra Cole and Gary Knowles, Jack Whitehead, and Tom Russell and Fred Korthagen (see for example, Cole & Knowles, 1996, 1998; Knowles & Cole, 1996; Russell & Korthagen, 1995; Whitehead, 1995). Their work has exposed some of the raw underbelly of university culture, exploring what happens when those who engage in alternative forms of research and inquiry work in universities where this work is not only not valued, but – much worse – is regarded as improper, subversive, and worthy of censure (or at least denial of tenure). Very recently and along quite different but related lines, some arts and sciences faculty members who have engaged in the scholarship of teaching have begun also to acknowledge the ethical issues that are raised when university teachers engage in research about their own practice and their own students' learning. These involve questions of privacy and respect as well as negotiation of policies regulating human subjects research, such as institutional review board regulations and exemptions (Hutchings, 2002a, 2002b), which often simply do not fit well with practitioner inquiry.

In a certain sense, it is not surprising that there has been relatively little work

of this kind to date. The idea of university-based scholars engaging in research about their own work as practitioners is, after all, relatively new. But it is also the case that examining the culture of universities is in and of itself rather inconsistent with the culture of universities, which have long had a tendency to call for school transformation without parallel self-examination and restructuring. Anderson & Herr (1999) make this point about university-based educators who work closely with school-based educators: "Academics who form alliances with practitioners or who send practitioners out into their schools to generate knowledge about practice should be equally willing to submit their own institutions and practices to the same level of investigative scrutiny" (p. 17). Similarly, Wisniewski (2000) suggests that ethnographic studies of change in the academy are needed but avoided by university researchers who prefer to direct their "gaze" at K-12 school change rather than at their own settings and interactions with students, administrators, and colleagues.

In the final pages of this chapter, we mention just a few of the dilemmas and contradictions that have arisen from our own experience as university-based teachers and researchers, trying to take seriously and act on the concepts and premises of teacher research. In the interest of space, we refer to these in only the briefest way, although we have presented and written about these and other issues more extensively elsewhere (Lytle & Cochran-Smith, 1995, in preparation).

Inquiry as a Stance

As teacher educators, we treat inquiry as a stance on teaching, learning, and schooling (Cochran-Smith & Lytle, 1993, 1999a) rather than as a bounded activity or project. This means that the central tenets of inquiry structure and inform every dimension of our work, and nearly all of the courses, seminars, and institutes we work with have in common posing not just answering questions, taking practice as the site for inquiry, interrogating one's own and others' practices and assumptions, and learning from and about practice by collecting and analyzing the "data" of daily work.

This stance is incongruent with the role many teacher educators as well as new and experienced teachers have been socialized to expect the university to play in teachers' learning. For years, university experts were expected to offer the latest theories (although often considered too abstract and thus irrelevant to "real" school) or to provide training and coaching in "best practices" to be immediately applied in classrooms. In either case, the assumption was that outside experts have knowledge that needs to be "injected" into school practice. Inquiry as a stance disrupts this idea by controverting the expert-novice conception, challenging the knowledge transmission model, and questioning the assumption that learning to teach is accomplished in the early years of teaching and then needs only periodic updating.

There are dilemmas involved with making inquiry a stance, however. For example, in our enthusiasm for the idea of inquiry as a primary pedagogy of teacher education, we urge and in some ways impose this perspective. Of course, in a certain way, all teaching is imposition. And yet, there is a fine line between

inviting teachers to engage in inquiry, on the one hand, and, on the other, requiring them to do it in order to obtain a degree or earn credit for an inservice course. There is a fine line between collaboratively constructing an agenda within an inquiry community, on the one hand, and, on the other, predetermining content, processes, and outcomes. The contradiction between inquiry and imposition is especially visible in discussions of the questions that emerge from inquiry. In our writing about teacher research, we have argued many times that teachers' questions come from their own felt needs and thus are different in important ways from those of university researchers. We have pointed out that these questions come from unique perspectives on classroom life and reflect the interpretive frameworks teachers have developed based on their work inside schools.

Nonetheless, sometimes we hear ourselves reframing or evaluating teachers' and student teachers' questions – casting them in our own language and images and subtly or not so subtly promoting adherence to certain university conventions. Sometimes this is motivated by our desire to "help" the questioner locate her question within a wider conversation, sometimes it involves distinguishing a "researchable" question from one that is more like product-testing, and sometimes it reflects the consensus of a group not to avoid the hard issues of schooling. Whatever prompts our responses, our experience is that two basically contradictory things can occur simultaneously when inquiry is a stance in the university context: genuinely inviting practitioner inquiry to disrupt the hegemony of university knowledge, on the one hand, and "front-loading" our own agenda as university scholars in ways that may actually discourage opposing viewpoints. The result is a set of oxymorons in connection to the concept of inquiry as stance – "imposed felt need" or "transmitted inquiry" or "coerced critique."

Inquiry as Collaboration

To make inquiry genuinely collaborative, we have tried to develop close and equitable working relationships with student teachers, teachers and other educators. We have also collaborated with field-based educators whose positions fit neatly into none of the traditional school or university categories, such as teachers who divide their time between school leadership and university teaching roles. These collaborations have made possible the design, governance, and assessment of inquiry activities at every organizational level and across a wide range of formats such as courses, institutes, on-site teacher research groups, steering committees, and so on.

Obviously these efforts to share power and leadership are intended to disrupt the culture of the university in that policy making is more inclusive, decisions are more widely negotiated, and responsibilities are shifted. But there are contradictions here as well. One set of contradictions occurs when collaborative relationships are nested within degree programs – here students are invited to "collaborate" with faculty who also grade them, and fieldwork supervisors or adjunct faculty are invited to "collaborate" with those who may participate in hiring, firing, and evaluating them. Other contradictions occur in school-university partnerships where the power relationships are more ambiguous – here

collaborative relationships may in fact perpetuate privilege in more (and less) subtle ways or, in quite the opposite direction, may be interpreted by teachers as abdication of responsibility. Unfortunately, instances of silencing and control seem to come with the territory of inquiry as collaboration. In addition, in both degree programs and partnerships, there is almost always tension around critique. Who can critique whom? When is critique appropriate, and when is it destructive of the fragile strands of collaborative relationships? Are private contexts for critique more appropriate than public ones, or do these simply force underground a discourse that could make visible the very issues the group most needs to engage? These issues around critique are complexly related to the alliances and loyalties that structure the lives of practitioners in both universities and schools – the culture of silence about the work of one's colleagues, the culture of social groups based on bonds of gender, race, class background, and ethnicity, and the culture of seniority and experience that makes longevity in a group – and sometimes age, rank, or other markers of prior status – the passports for full participation for some while at the same time inhibiting the contributions of others.

Inquiry Made Public and Accessible

As we have stated throughout this section, we have for a long time now focused some of the research we do on our work with others in various inquiry communities, including at times the learning communities we try to create in each of our courses. These communities, which become the contexts for important inquiries about many issues related to schooling, also function as sites for research *about* inquiry. By studying the communities we are part of, we have the opportunity to explore the ways we and our students and colleagues co-construct knowledge; we can investigate issues of language, culture and literacy; and, we have a chance to analyze the contexts that support the work of inquiry communities and the professional development of teachers across the life span.

Organizing our teaching and research lives in these ways not only alters the content of what can be researched but also intentionally violates a number of research conventions that are part of university culture. Researching our own teaching, researching the research of others, and researching our experiences as participants in inquiry communities deviate dramatically from the more distanced topics that many consider the proper concern of scholarly educators. In addition, this kind of inquiry violates expectations in the research community about the most useful research regarding programs and projects – the norm is more toward evaluation or outcome studies based on data gathered by a researcher who is outside the setting itself. In that we draw on feminist, critical, and interpretive research traditions, we make the relationships of researcher and researched problematic in our work. But because the participants in our projects are in so many complicated ways already both researchers and researched, it is almost ludicrous to fit some of this work into the university's categories. Who indeed are the "human subjects" in this kind of research? Who "signs off" on whom? Who's entitled to write about whom, and who "owns" the data?

The tensions involved in making inquiry public and accessible to others have primarily to do with authorship, ownership, representation, and co-optation. For example, for many years, we have written together looking broadly and synoptically at the Philadelphia inquiry community, theorizing teacher research and professional development by drawing on projects that involved enormous efforts by many other people over many years. We have built our own understandings and arguments out of the work of communities and have explicitly used many examples of the writing of others. In our co-authored work, we have often chosen to represent the work of the community through our perspectives as university-based teachers and researchers. Of course we always had the appropriate permissions, acknowledgements, and disclaimers about not speaking for others. None of these, however, really altered the reality that we, as university-based faculty, got a generous amount of the credit for this work within the educational community. In addition, partly because of "what counts" within the culture of the university, we committed most of our time and resources to writing for academic journals and handbooks rather than for more practice-oriented and/or local outlets. The trade-off here has been that we have not learned what we surely would have learned by writing explicitly for a wider, more inclusive audience.

On the other hand, when we try to address some of these issues by representing the work of communities through collaborative writing with others involved in these projects, there are additional dilemmas. What conventions of writing, what audiences, and what modes of data collection and analysis are ultimately privileged, even when the explicit intention is not to perpetuate the dominance of the university? How are the different roles in writing opted for, designated, and/or valued, even when the intention of the group is to make these decisions jointly? How do the various collaborators participate in conceptualizing, drafting, revising, and editing, and what does collaboration really mean, when often – in the final product – we retain for ourselves the "last word"?

At the heart of many of these decisions is how collaborative groups – in which we as university educators are simply members, though in a certain sense, never simply members – negotiate priorities in purposes and goals for making their joint work public and accessible. Some of the most significant moments in these negotiations are those when we realize that even deciding what to disclose and what to obscure or omit entails very different risks and consequences for the differently positioned writers in the group. What is troubling is that, as university researchers, we tend to argue for pushing boundaries, for opening up and writing about unsettling subjects. But as university researchers, we are also much more likely to get credit for doing this and much less likely than some of our school-based colleagues to have to deal directly in our professional lives with the fall-out of our choices.

A particularly dicey dilemma along these lines is how, when, and whether it is appropriate to make public examples from inquiry communities that may reflect negatively on the participants, or on the group as a whole, or on the students who are being represented. Further, the culture of the university depends

on sharp and even excoriating critique of others' research, and indeed we have been chastised by some university-based colleagues for not being appropriately critical in our analyses of the teacher research that we include in our writing and not making public the full range of the problems inherent in the work of inquiry communities. We realize, of course, that including more of the messiness is probably essential to furthering the wider social, political and intellectual agendas of the practitioner inquiry movement. Finding ways to do this that do not undermine the very relationships that make the work possible and do not yet again reinforce the hegemony of the university, however, is daunting. These may require that teacher educators and teachers together rethink and reinvent approaches to critique that are more congruent with the politics of this movement.

In the preceding section, we have explored some of the consequences of grounding our university lives in the fundamental premises of practitioner inquiry. Conceptualizing our approach as "working the dialectic," we have shown how this framework grew organically from our questions about university-school partnerships, from our relationships with pre-service and school-based practitioners, and from our strong desires to integrate fully the research, teaching and service dimensions of university life. Perhaps the most distinctive feature of this approach to infusing practitioner inquiry into the cultures of large research universities derives from the ways that many of our questions for research have emerged from practice and the collaborative study of practice. Uncomfortable with the seeming ease with which universities have traditionally invoked the notion of 'theory into practice' to explain and rationalize the relationships of research universities and K-16 schooling, we have tried to show how working from a different set of underlying assumptions about inquiry, knowledge and practice structures the work of faculty members in relation to various professional learning communities within and beyond the university. As we have noted, there are a considerable number of universities where faculties have been involved in similar work, and thus much to be gained we think from examining – across contexts – the dilemmas and complications that occur when university-based researchers alter their relationships to their own practice. The infusion of practitioner inquiry into university culture creates a synergistic space for the kinds of critical examination of teaching, learning and research *within* universities that universities have been calling for in the public schools.

Conclusion

In exploring the research traditions and contextual roots of practitioner inquiry, we have argued that major questions about research, knowledge, and contexts of practice play an important role in the history of practitioner inquiry. We have shown how practitioner inquiry, despite or more accurately because of the complexity of its ideological, political and historical roots, provides a useful lens for understanding more generally how inquiry is related to knowledge, practice, and change. This analysis yields three very different inquiry-knowledge-practice

relationships that infuse the various current iterations of practitioner inquiry. Although there are clearly significant differences among the versions of practitioner inquiry, we identify shared assumptions that divide this work from more traditional forms of educational research and also discuss a set of critiques that have emerged from within and outside of the movement because of differences related to epistemology, methodology and the politics of educational research. By using our own experiences to look at practitioner inquiry in the university, we have tried to show how critical issues related to knowledge, knowers and knowing have informed the ways we have constructed our lives as women, researchers, and cultural workers in that setting. The conversations about practitioner inquiry in the field speak powerfully to these issues and provide a forum for essential 21st century debates involving the full spectrum of policy-makers, researchers, educators and the wider public.

Nevertheless, the dominant educational discourse in the U.S. at this time, some of which is mirrored in other countries as well, hardly seems compatible with many of the aspects of practitioner inquiry we have explored in the preceding pages. We have noted, for example, the emergence of scientifically based research as the single most prominent criteria for selecting programs for funding and implementation by the federal government. As we noted, one recent synthesis of research on teacher preparation – a subject seemingly intimately related to the study of the practices of teacher educators – simply excluded studies of single courses or programs. In this era, research rigor is explicitly and often unproblematically tied to cross-site comparisons, randomized trials, and adherence to other uniform procedures and measures. Similarly, the discourse around teaching excellence has veered once again toward a view of teaching as a primarily technical activity and away from the intellectual, deliberative concepts of practice more closely aligned with the rhetoric and conceptual frameworks of teacher professionalism. Market approaches to teacher education, the reconstruction of professional development within the borders of prescribed reform models and publishers' guidelines, and thus the increasing reliance on scripted teaching and teacher-proof materials all reflect and feed into the critique of current approaches to teacher education and schools of education more generally. Furthermore, the search for universal solutions to what we regard as highly complex and contextual problems of educational practice has emerged as the predominant concern of policy-makers who are playing ever more visible roles in determining what counts as evidence of compliance with state and government policies.

Concurrent with these trends, however, there is also a resurgent interest in thinking differently about the age-old problem of how research can become more relevant to practice. Sometimes referred to under the rubric of "usable knowledge" (Lagemann, 2000) or invoked in conversations about the importance of accessibility and applicability of research findings, an idea about the value of 'research on practice' has been circulating among university researchers/practitioners and school-based teachers/researchers that fits quite compatibly with the major tenets of practitioner inquiry. Certainly the concept of practitioner inquiry does not fit easily with a narrow conception of the problem as simply identifying

"what works" and bringing it to scale, or with one-size-fits-all solutions, or with the quest for a canon of "best practices." But if the problem of improving practice takes fully into account the need for a deep, ongoing and site-based discourse about teaching and learning, then the critical role of school-based and cross-school professional learning communities in conducting inquiry and utilizing the inquiries of others becomes more necessary. If the problems of improving practice are conceptualized to take full account of the importance of differing contexts and communities, then the local nature of inquiry and its sensitivity to local conditions and constraints becomes a strong point of practitioner-based work rather than a liability.

The enormous inequities in urban education and the persistence of equity issues in the de-professionalization of teaching would suggest that at the least we need to pay serious attention to the quality and nature of educational opportunities afforded learners and not just the quantity of changes in test scores and numbers of schools meeting minimal levels of performance. Given the urgency of the situation in urban schools across the country, there are compelling reasons for enacting research and research relationships that do not exclude findings that might lead us to question the assumptions built into research designs in the first place. Studies of practice conducted by practitioners have the potential to deconstruct the scripts of so-called direct instruction and to examine the consequences of utilizing, or failing to utilize, the cultural and linguistic resources of diverse learners in the construction of learning environments in schools. Furthermore, the numbers of teacher education programs and professional development projects that do something they call inquiry or self-study or practitioner research has increased exponentially over the past decade or so. Many of these take as their starting point the need for social change and social justice at all levels of the educational system. It would seem, then, that although there are many conditions that conspire to undermine practitioner inquiry, there are at the same time powerful reasons for promoting this work.

Abstract

This chapter addresses the issue of professional knowledge and social justice. It is presented in dialogic form, as a conversation in four voices. The conversation is interspersed with four case studies, each one written by one of the authors. The case studies illuminate, exemplify and resist the arguments within the conversation about self-study, social justice, and epistemology. The paper is divided into four broad sections. The first, "Social Justice and Self-Study," looks directly at the links between social justice and self-study. It begins by considering the resistances and difficulties inherent in addressing social justice issues, and continues by seeking a definition for social justice. The second, "What Kind of Knowledge?", looks directly at the nature of knowledge that is gained in self-study that is rooted in a concern for social justice. From a starting point of knowing ourselves as tellers of stories, it goes on to address ways of telling and listening to stories across divisive social boundaries and hierarchies. The third section, "Professional Knowledge" introduces the idea of "little stories and grand narrative," exploring ways in which professional knowledge might be understood as "little stories" countering, disrupting, critical of and contributing to "grand narratives" of educational knowledge. The fourth section addresses the urgent and difficult question, "Why is There so Little Self-Study on Social Justice Issues?"

This chapter is about three big issues:

1. self-study and its self-reflective, evidence-based approach to the study of education;
2. social justice, what it means and why it is important; and,
3. epistemological questions about knowledge.

The last question includes two sub-questions: first, how it is discovered, constructed and expressed, and second, what professional knowledge might be. These three issues are interwoven and interconnected. The answers to one affect the answers to the others.

A Word to You, the Reader

The chapter is in dialogue. Occasionally, there is just one authorial voice (these parts are in italic) but mostly there are four separate, identified voices. The dialogue addresses a number of inter-related issues and challenges about knowledge, social justice, and self-study. There are four dialogic sections. They are linked by four case studies, each written by one of the authors. In these, we "get real"; we link the issues abstracted in the chapter with the realities of education practices. We show how we have faced up to the challenges we set out for anyone trying to gain understanding about how to enhance involvement in social justice issues in their everyday lives as educators.

Introducing Ourselves

This is who we are:

Mo Griffiths: I teach at Nottingham Trent University in England. I am responsible for leading the educational research there. I regard myself as a teacher and learner as much as a researcher. My students include beginning teachers as well as mid-career (and even some end-of-career) professionals. They also include my colleagues and myself because I see my work developing and nurturing our educational research with colleagues as teacher education – of them and of me.

Lis Bass: I teach in and chair the remedial English department at Camden County College in New Jersey in the United States. I continually struggle to help the faculty (85 full and part-time teachers) and myself work more effectively with our non-traditional students (working class and poor, African-American, Latino, immigrant, and with special needs). I also teach a practicum on the teaching of writing (Rutgers University – Camden) and mentor graduate students from that program and from Rowan University's graduate composition program. I lead diversity and education workshops for K-12 faculty and am responsible for diversity professional development at our campus teaching/learning center.

Marilyn Johnston: I am a professor at The Ohio State University in Columbus, Ohio in the United States. I am situated in the School of Teaching and Learning,

where we have doctoral, masters, and certification programs. For the last 12 years, the School has been involved in teacher education reforms that involve close collaboration with schools, graduate level certification programs, and collaborative inquiry by all those involved. I teach courses in teacher education, social studies education, pedagogy, and research. I am interested in issues of collaborative relations and research and in "difference" of all kinds related to issues of social justice. Self-study grounds my research helping me to study my own situatedness and learning in relation to the students and colleagues with whom I work.

Victoria Perselli: My background is in special educational needs and inclusive education in infant mainstream schools in the United Kingdom. Between 1995 and 2000 I carried out a self-study of the role of the Coordinator for Special Educational Needs (SEN), investigating issues of social justice and diversity within my school community. I am now based at Kingston University, where I teach courses in Inclusion, SEN and Pedagogic and Professional Issues. My research interests include the development of new methods and modes of research that enable teachers to radically critique and improve our own practices, in particular through use of visual and performance arts.

You will notice that whenever we speak in a single, authorial voice, the type is in italics. When we speak in our individual voices and in the case studies we set off that writing by introducing the writer through the heading that introduces their ideas. We hope this makes it possible for the reader to distinguish between our different voices at different places in the text.

What We Hope to Achieve in this Chapter

The form of this chapter is important because we are keen that you, the readers, feel encouraged to:

1. *Find your own best (most helpful, most engaging, most relevant) path through the chapter. We explain our structure in this introductory section – but we expect you may want to read it in the order that suits you (e.g. a case study first, or a discussion of collaboration in self-study research, or something else).*
2. *Find spaces for your own dialogue with and against us. We want you to make your own responses and think of your own ways of resolving issues. This would be to extend some part of the process of writing the chapter to each reader.*
3. *Connect what is said to your own work within self-study. Our hope is that you will be challenged and supported in your own actions for social justice. Further, our hope is that you will be excited rather than daunted by the prospect.*
4. *Find other self-studies and other research that help you as well as illuminate and inspire you. Throughout this chapter, we refer to published material (only some of which was labelled as "self-study" by the authors). There are also a*

number of (as yet) unpublished dissertations and conference papers. We have given a summary overview of them at the start of the Conclusion, in order to point forward to new work in the area.

The Structure of the Chapter: Reflection through Dialogue and Case Studies

We provide one way of approaching the inter-relationship of the three main issues addressed in the chapter. How they inter-relate is complicated, and it is also contested. We do not want to over-simplify, yet we want to help beginners find their way.

Each dialogic section starts with a summary, explaining the overall argument, and how it links with the previous and next sections. We intend the summaries to help you, the reader, find one way of reading through the chapter from beginning to end. But we would be disappointed if you felt you had to follow that path, either now or in future reading. Summaries of the case studies show how they link what has just been discussed to the next topic, but in fact their placing is nearly arbitrary. We did not decide on their final position until late in the process. This is as it should be. The case studies are intended to be illuminative rather than illustrative. They support but they also resist the arguments of the dialogic sections.

All the way through the chapter, reference is made to relevant published studies, including self-studies, sometimes in the body of the text, and sometimes in italicised summary overviews at the end of the sections. Many of these studies are relevant to more than one section: but we have kept multiple referencing to a minimum to avoid needless repetition.

Most of the chapter is in dialogue. In some ways dialogue is challenging to you, the reader, because it asks you to enter into it more, to position yourself, to be active as you read. The arguments do not unfold as smoothly as they would from just one authorial voice. Our four, somewhat different perspectives and positions mean it is impossible to provide a single line of reasoning and explanation. Some ideas appear almost "between the lines" – as they do in a spoken dialogue. An example would be the definition of social justice. It is partly the subject of explicit debate between us, but is also partly assumed in what we say, and in the way the case studies are presented. Another example would be the term "case-study" itself. Later in the chapter it is argued that "case-story" is a better term. One of us picked up on this. The other two did not comment either way. So here we use the more familiar term, but leave it hanging for you, the reader, to accept or reject, as you will.

The dialogue reflects on our experiences, some of which appear in the case studies. We have abstracted some issues to discuss. The case studies, on the other hand, are more holistic, less abstract, addressing a wide range of issues. They report on the complicated, messy, real world of everyday life. We have presented dialogue and case study as interwoven, each illuminating the other. The case studies are not examples to explain theory any more than the dialogue is theory explaining practice. One is more abstracted than the other is. Both forms of reflection are necessary. Neither is sufficient on its own.

There are four dialogic sections. The first, "Social Justice and Self-Study," looks directly at the links between social justice and self-study. It begins by considering the resistances and difficulties inherent in addressing social justice issues, and continues by seeking a definition for social justice. The second dialogic section, "What Kind of Knowledge?" looks directly at what kind of knowledge is gained in self-study that is rooted in a concern for social justice. From a starting point of knowing ourselves as tellers of stories, it goes on to address ways of telling and listening to stories across divisive social boundaries and hierarchies. The third section, "Professional Knowledge," introduces the idea of "little stories and grand narrative," exploring ways in which professional knowledge might be understood as "little stories" countering, disrupting, critiquing, and contributing to "grand narratives" of educational knowledge. The fourth section addresses the question, puzzling to all of us, "Why is There so Little Self-Study on Social Justice Issues?" The conclusion, written by Victoria Perselli, draws on these themes to look forward: "What Now?"

How the Chapter was Written

The chapter was written over a period of several months. The initial contact was made at a conference (the fourth biennial S-STEP "Castle Conference" in Herstmonceux, England). The contact was made in person, easily, conversationally, and in convivial surroundings. We then returned to our separate institutions, a long distance from each other. Simple telephoning was difficult, not just because we all have busy jobs but also because we live across several time zones. By far the greatest bulk of the chapter was written by email. We found that this set of emails added to our workload, yes, but they also excited and cheered us. We had found a group of reasonably like-minded people so the dialogue we had entered supported us and at the same time gave us space to challenge, re-think, and re-construct our own understandings and actions around self-study, social justice, and professional knowledge. We did not try for a consensus, but we seem to have a basic agreement about the following propositions:

1. *We are all individually committed to self-study and social justice.*
2. *We all see and experience the following connections between the two:*
   a. *The process of self-study contains the respect for humanity that is in accord with social justice.*
   b. *The work of social justice involves knowing self.*
3. *We are all wondering why other people don't see this connection: don't understand that social justice work needs self to be authentic and that self-study, well done, involves others, which supports our interconnectedness with the world (the basis for social justice?). We also wonder if our email discussion is a good example of the blocks to social justice work: How much defensiveness is there protecting our identities and privileged social positions? Are we airing dirty laundry?*

In its initial form the dialogue was like most email: rather informal, not always

considered, personal, almost like talk. Naturally, we all came to the dialogue with rather different central interests and concerns. So the result would have appeared unfocussed to an outside reader. But it would be more accurate to say that it was multi-focused. The next stage was to create a linear structure from the email discussion, which you, the readers, would find comprehensible and helpful. The writing was arranged into a structure. Some re-writing and some new writing were needed. We kept, rather than hid, disagreements or differences of emphasis that were there in the original emails, even when they were resolved during the course of the dialogue. Finally the whole was sent to external readers who commented, very helpfully, on how they, as readers, had reacted. More writing and re-writing, some of it collaborative, led to what you read in this chapter.

The way the chapter is constructed is coherent with the main arguments of the chapter. We engage with uncertainty in a collaboration in which each of us speaks in her own voice, drawing on her own professional knowledge. There is some – not much – diversity of perspective. The knowledge to be gained from this chapter comes in and between the different contributions. It is in the form of a continuing process and a living dialogue rather than in a series of pinned down conclusions.

Section 1: Social Justice and Self-Study

The discussion in this section focuses on the links between self-study and social justice. It goes on to explore what is understood by "social justice" and why it is such an important issue for self-study.

Many self-study research projects do not address issues of social justice, yet self-study is rich with possibilities for addressing these types of issues. A self-study does not require asking question about social justice, but moral and political issues are swimming just below the surface if one cares, or dares, to look. We don't always want to look. These are hard questions. Issues related to diversity, difference, equity, discrimination, and injustice have no easy answers and often implicate us personally, at least partially, in the injustices we uncover. Self-studies of a more instrumental character are safer, but can we afford, in teacher education these days, to choose to be safe?

In this section we argue that self-study provides a useful way to address issues of equity and justice. We can use self-study to uncover the ways in which an unjust society is mirrored in our assumptions, teaching practices, and beliefs about the world. We live in a world where injustice permeates most of what we do as educators. Through self-study we can explore, with our current and future teachers, the complex moral issues inherent in the pedagogies they choose and the curriculum they are required to teach as well as in the relations they will have with diverse students, who live in a globalised, interconnected world. What is the cost if we ignore these issues? Self-studies of our own teaching provide processes and avenues for self-reflective explorations of social justice issues.

The section begins by making the link between self-study and social justice. Self-study is a way of becoming conscious of our as yet unconscious responses, in order to reflect on and re-construct them. Social justice requires us all to reflect on our

unconscious responses to others, and to consider if we need to transform them. The dialogue then explores some of the resistances and difficulties inherent in such self-studies. It is pointed out that we reflect in order to change, but questions of social justice are disruptive and there are both explicit and implicit pressures not to be disruptive in education. The question is posed: How might we reduce these pressures? At this point Lis Bass raises questions of what is central to social justice. She and Morwenna Griffiths then go on to look at what a good definition of social justice would include. They discuss diversity, self, and social selves, recognition, redistribution, fairness, caring for people in relationship, and equality.

Lis Bass

Links Between Self-Study and Social Justice

I believe self-study is an important way to overcome unconsciously learned responses. All of us tend toward ethnocentrism because we typically like who we are, so we assume that how we were raised is the best. In order to tease out these assumptions and open us up to people who are different, we need to be not only reflective (because that might just confirm our bias) but also we need to collaborate so that other peoples' world views collide with ours and let us see ourselves, our limits, our biases. Self-study is closely linked to discovering our unconscious biases, prejudices, and learned responses to others. I liked what Tom Russell wrote:

> Just as it is very hard for new teachers to overcome their reflexes and teach in ways that are deliberately and constructively different from the ways they were taught themselves, isn't the issue of diversity related closely to identifying and overcoming one's unconsciously learned reflex responses to "moments of difference?" (Email communication, August 27, 2002)

Self-study, as I understand it, requires this close, sustained collaboration that would help us see what we assume and then to challenge it with the goal of becoming better teachers and teacher educators for all students.

Marilyn Johnston

Resistances and Difficulties (1) Disruptive Questions

I think there are explicit and implicit pressures in schools and universities not to ask disruptive questions. Yet, once you have studied a question deeply and unearthed some social injustice in your practice or your institution, it is difficult not to do something about it. Self-study is a process that forges a path to change realized through reflection; we reflect in order to change. Even when self-studies are focused more strategically – for example, studies of one's effectiveness as a teacher – social justice issues cry out to be addressed.

To take the example further, for *which* students are we effective? Are we equally effective for students from particular cultures, with particular characteristics, with particular attitudes or behaviors? Who defines effectiveness? What

biases/stereotypes limit our effectiveness? Can we through self-studies of our own teaching better prepare future teachers' sensitivities to and willingness to commit to addressing issues of equity and diversity?

Mo Griffiths

Resistances and Difficulties (2) Daunting Questions

Marilyn you say that once some social injustice is unearthed it is difficult not to do something about it. I wonder. If that were the case for everyone, they would all be activists. I am put in mind of a proverb from the Indian subcontinent: "It is easy to wake up somebody who is sleeping, but it is very difficult to wake up somebody who is pretending to sleep." I think we all pretend to sleep from time to time, because being awake can be so daunting. There is the sheer enormity of the task: the untold numbers of ways that injustice manifests itself; the way forms of injustice shift shapes as you try to deal with them. And there is the huge amount of knowledge – facts, skills, and self-knowledge – that would be needed to do it well. I think we have to recognise this, and somehow find ways of making being awake less daunting and of being asleep unthinkable.

Marilyn Johnston

Resistances and Difficulties (3) Becoming Less Daunted?

I should have said that it's hard *for me* usually not to do something about it, but then, honestly, commitments to social justice are always partial, and there are even times when not acting may be the best choice. I shouldn't speak for everyone or in all cases, or even imply that I always take action when I think I should, because choices to act are always situated and complex. I do think, however, that one reason that self-studies are often *not* a choice of research methodology is because they feel risky in this way. Maybe it's easier to keep our gaze on the other. It's less problematic to uncover racism and injustice in others; it's easier to describe and do nothing, if the self is not implicated.

   I wonder how we make being awake less daunting and being asleep unthinkable?

Lis Bass

Defining Social Justice (1) Diversity as Centrally Important

Of all the issues of social justice, one that lies close to the heart of education is diversity. We are facing the contradiction of being a profession that was created for, and is currently staffed with, predominantly middle-class, heterosexual white people. Yet, our classrooms and our future are multi-racial, multi-cultural, multi-national, with students who are differently abled, with different sexual orientations and who are predominantly working class. We want all the students to thrive, but know that the soil favors only certain ones. And in this millennium, the model of having everyone assimilate into the dominant culture no longer holds the moral high ground that it once may have.

While visiting London recently, I read an editorial in the *Sunday Express* that decried the increase in student scores as proof that the system is failing. The writer explains this inconsistency by noting that: "Ensuing governments have toyed disastrously with our once-shining system, leaving in place a generation whose ... knowledge of their country's history and literature is often non-existent" (Callen, 2002, p. 23). Thus, good test scores must mean that someone has reduced the rigor of the tests because, in general, he can tell that this new generation knows less about being English. This columnist also notes that the purpose of education is to equip "the confident recipient to conquer new worlds, build empires and be the envy of the schooling systems of lesser nations" (Callen, p. 23). Someone needs to tell him that there is only one world. It is not awaiting conquerors, nor should we be raising empire builders in the 21st century.

As a citizen of the United States, I immediately think of the Native American child in our classes who learns with everyone else that Columbus discovered America, who learns that American literary history starts with the Pilgrims, but who knows in his heart that there were between 10 and 100 million people already living here producing a rich cultural legacy of story, myth, government, art, and culture. The old model of education as assimilation is a death stroke to children who are not members of the dominant culture. Also, I wonder when Callen writes of a country's history and literature, does it look like the streets of London – lively, global, contradictory, and fascinating.

Mo Griffiths

Defining Social Justice (2) Including Self, Society, Recognition, and Redistribution

Like Lis, I have been shocked by finding some outrageous quotations from our government spokespersons and from the captains of industry. It seems that they would prefer it if we lived in a world without difference and diversity. In their pronouncements, difference and diversity are seen as "problems." Forms of diversity are also simplified into single categories, into one-dimensional stereotypes. A particular category goes with a particular problem. For instance, the British media and the policy makers continually express anxiety about "boys and underachievement", or about "Black boys being troublemakers and getting excluded" (A quick trawl of the websites of the English Department for Education and Skills (www.dfes.gov.uk) or of the influential *Times Educational Supplement* (www.tes.co.uk) shows these links being created and re-created.) It is as if the category "boys" goes with the problem of "achievement" (measured against "girls"). Meanwhile the category "Black boys" goes with the category of "troublesome behaviour and exclusion from school" (and, by implication, with bad behaviour and trouble). The assumption is that there are no differences between boys in relation to underachievement – as if boys were all the same, as if there was only one masculinity, as if there were only one axis of difference (gender). The same applies to the category "Black boys." Kenneth Dunkwu (British born of Nigerian, specifically Ibo, heritage) told me:

The same thing came through in my PhD research into school exclusion. Everyone had heard that Ofsted [The Office for Standards in Education] said that Black boys were six times as likely to be excluded, and because it was "Black" and "race" it caught the headlines in newspapers and journals. And that was it. Everything else falls by the wayside. … To me, it is looking at these things in the context of the environmental effects, social class effects, and behavioural effects. OK, race matters, but there are other variables as well. (Griffiths, 2003, pp. 150–151)

We need to acknowledge the sheer range of intersecting communities. My views resonated strongly with something written by Ahdaf Soueif, an Egyptian novelist living in London, about Al-Jazeera, the independent Arab television station:

It's not that we want to hear our own opinions; rather we want to hear a variety of opinions of which ours is one. The titles of some of their most popular programmes speak for themselves: Against the Current, The Opposite Direction, One Opinion and Another, and so on. (Soueif, 2001, on-line retrieval)

I would hope we would have a model for conversations in a self-study here. It is one in which diverse points of view are given air space and serious attention. And if there are too few points of view, then we should wonder who we are drowning out, ignoring or otherwise silencing – and then we should find a way to do something about it.

My outrage about stereotyping and my model of a good conversation arise from what I think social justice is. I start from Aristotle's (1995) insight that social justice is to be found in the good of both individual and the society as a whole. I go on to develop this insight in ways that he would probably not approve! Here is my most recent attempt to express what social justice is:

Social justice is a dynamic state of affairs that is good for the common interest where that is taken to include both the good of each and the good of all, in an acknowledgement that one depends on the other. The good depends on mutual recognition and respect and also on a right distribution of benefits and responsibilities. It includes paying attention to individual perspectives at the same time as dealing with issues of discrimination, exclusions and recognition, especially on the grounds of (any or all of) race, gender, sexuality, special needs and social class. It is dynamic in that it is never – could never – be achieved once and for all. So getting it is a matter of resolving possible tensions about the well being of individuals, of whole societies, and social political groups. (Griffiths, 2003, p. 50)

This way of understanding social justice for individuals and groups depends on a view of how individual selves relate to the social groups they inhabit. Firstly, the self is constructed in and against relationship with various social groupings, which are themselves constructed, by relationships with individual selves.

Secondly, those social groupings, like the individuals who inhabit them are not fixed. Rather, they are in a continuous process of construction, of changing, of shifting. Moreover, different social groupings intersect with each other. This way of understanding social justice also depends on an acknowledgement of the dual significance of material resources and of cultural identity, i.e. of both "redistribution" and "recognition" (Fraser, 1997; Gewirtz, 1998). It is this view of the self that makes self-study more than a narcissistic, lonely or selfish undertaking. It is this wider view of the self that makes self-study so suited to addressing issues of social justice: necessarily, they affect us personally.

Lis Bass

Defining Social Justice (3) Fairness and Caring?

Your definition of social justice acknowledges the important dialectics of individual and society; self and other; personal identity and social being. However, and this treads dangerous philosophical waters, I wonder about an assumption concerning social justice found in philosophers from Hobbes (1994) through Mills (2002) to Rawls (1999) that justice is fairness and this fairness is based on everyone's equality. Eva Kittay (1999) suggests that there will always be a segment of the population that will need care – will never be "equal." She introduces the phrase "for care" into the traditional Marxist formula, so that it becomes:

> To each according to his or her need for care, from each according to his or her capacity for care, and such support from social institutions as to make available resources and opportunities to those providing care, so that all will be adequately attended in relations that are sustaining. (p. 113)

In education, I believe we have an obligation not to treat everyone "equally" but to treat everyone according to what his or her needs are.

Here's a story. A highly successful businessman was going to reform the schools. He spoke of "how to do it" based on his knowledge of his very successful premium ice cream company. A teacher raised her hand at the end of the talk and said, "Do you use premium cream?" He said, "Of course, I only use the very best to make my product." Then she said, "What would you do if you were standing at the loading dock and a whole truck of somewhat damaged blueberries was delivered?" Luckily, he knew he was caught and thus began his real education about school reform. The truth is that the schools have a responsibility to care for every child – not just to push them onto the assembly line and weed out the "faulty" ones who don't easily conform to the educational agenda of excellence.

So, I wonder if social justice also needs to look at responsibility to sustain relationships that involve care taking. It used to be that if there was an elder, or Down syndrome child, then the "family" took care of him or her. We all know that the family was actually the women of the household. Now, however, that woman is likely to be at work, or that family might be a single mother trying to raise children who might have special needs. I wonder at how schools

are expected to help with these responsibilities, when they are certainly not well supported enough to do so.

Mo Griffiths

Defining Social Justice (4) Equality and Caring for Others

I am ambivalent about understanding "justice as fairness." Maybe that is why I wanted to return to Aristotle. His argument allows for a richer understanding than that provided by social contract theorists. Lis, you tell a powerful story about weeding out those that don't conform to requirements: something known as "zero tolerance" and "permanent exclusion" in current educational policy. Rawls-type justice would not, I think, be on the side of weeding out the "damaged blueberries." His argument depends on each member of society approving an imaginary social contract, which has been drawn up behind "a veil of ignorance", regarding what position he might take in the society. (Yes, it is "he" rather than "she" for traditional social contract theory.) So the businessman would have to provide some very powerful benefits for the poor before they might consent to be robbed of their education. However, like you, I am still critical of justice-as-fairness-means-equality arguments. I think the point here is that they do not go far enough. The concern that we feel for people who are vulnerable does not only come from a rational self-interest. It also comes from a care for others, an outrage when they are mistreated and a pleasure in giving support to others – and in taking it when we, ourselves, are in need of it.

So I want to retain the idea of justice as equality, while at the same time being critical of its limitations. I am put in mind of Patricia Williams's arguments in *The Alchemy of Race and Rights* (1992), where she talks about how different the idea of "rights" is for her as a Black lawyer from the idea it is for her white lawyer friend. The important and interesting thing for me here is that she is not saying that he should change his perspective to hers. She is saying that for a recently enslaved people rights are important as a measure of equality, whatever the problems with "equality" and "rights" as blanket notions. I myself am aware when talking with those who have been denied access to education by structures of class, race, gender, disability, that they talk, rightly it seems to me, of being cheated, of being robbed – in short, of the unfairness of it. They want their rights.

However, the term "justice" may be misunderstood. Another of Patricia Williams's arguments helps me here, this time in *The Rooster's Egg* (1995). She talks about how terms like "multiculturalism" keep getting devalued and hijacked: "stolen, co-opted, filled with negative meaning" (1995, p. 27). So no sooner do we use one than the right wing comes in and devalues it. (She uses the analogy of her, as a middle class and rather well-off Black woman, moving into a neighbourhood, because it is a lovely neighbourhood. Her Black presence immediately devalues it, her neighbours move out, and it soon becomes a ghetto.) No sooner do we start to use a term than it gets hi-jacked. Nowhere is this more obvious than in the discourse of Education in the U.K. The terms used to

discuss the social justice issues of race, special needs/disability, and gender are continually hi-jacked.

I think the term "justice" is still useful – that it has not yet been hi-jacked. I now dislike using the term "equal opportunities" and am very nervous about using the term "equality" (even though some Black and Asian activist friends of mine prefer "racial equality" to "social justice"). I think the term "justice" deflects attention away from those "equality must mean sameness" arguments, which seem to get nowhere. However often it is pointed out that political equality is not mathematical identity, the argument never seems to go away.

Justice as I have construed it from Aristotle is about the good of individuals and society. So it depends (doesn't it?) on real human relationships and what keeps them working. Now it is true that many theorists seem to think human relationships are between very similar human beings. But, that is the exactly the kind of argument one might expect from the homoerotic imaginations of a master race of able-bodied men! The rest of us know that most human relationships are between people who vary in their ranges of dependence and need. So they are between adults and children, old and young, men and women, sick and healthy, and so on. Think of your neighbours. Chances are that, like mine, they are old and need some help, and chances are that you are glad to give it as part of a normal relationship with them. I value and like my neighbours and would be sorry if they left. I don't think of them as needing my sense of duty or charity, nor are they a burden on me in any way. No, I would be sorry if they moved. This is a normal, complex human relationship. Chances are also that I will be old in my turn, depending on neighbours, among others, but hoping that I am not an object of their charity, a burden on them. This genuine pleasure that human beings have in the give and take of relationships is one of the foundations of a just society.

So yes, care for others is central to justice.

Lis Bass

Defining Social Justice (5) Redistribution

I fear and am offended by the blatant inequality of the distribution of material resources. Whereas once in the history of humanity, a ruler might have had twice the material resources of his group, we now have wealthy people who control thousands of times the material resources of others. Jonathan Kozol's *Savage Inequalities* (1991) shows this incredible inequitable distribution of education resources in the United States. The disparity offends me and frightens me. Again, teaching puts one in the midst of major social justice issues concerning not only current distribution of resources, but the future as well. Mostly education reinforces this inequity, with wealthier children receiving the training to keep them wealthy and poor children receiving educational experiences that perpetuate their poverty. I fear the tensions between the rich and poor, because, historically, it erupts in violence.

Some Other Relevant Studies

Cochran-Smith, M. (2000). The author advocates for narrative discourses as an alternative to traditional academic discourses and as a way to help unlearn racism. Narrative in this sense provides a means for self-study.

Cochran-Smith, M., Albert, L., Dimmattia, P., Freeman, S., Jackson, R., Mooney, J., Neisler, O, Peck, A., & Zollers, N. (1999). This article describes a self-study, multi-year, collaborative research and professional development project at Boston College known as "Seeking Social Justice." The authors provide a "proof of possibilities" for other faculty groups who want to infuse social justice into their preservice education.

Clokey, M., Cryns, T., & Johnston, M. (2001). Three teachers who were involved in developing an alternative elementary Open Classroom program (in Salt Lake City, Utah) provide a self-reflective analysis of what they learned from this experience and how this experience has influenced their subsequent careers as educators. Throughout the chapter they consider how their roles and perspectives both facilitated and interfered with their attempts to work collaboratively with each other and with parents and students, and how all of this influenced their learning. The book overall is a collaborative self-study of the 25 year development of this program seen from the perspective of teachers, parents and students.

Hohenbrink, J., Johnston, M., & Westhoven, L. (1997). A doctoral student, classroom teacher, and professor teach a social studies methods course and do a self-study of their collaborative work and relationships teaching this class. Social justice issues are raised as they deal with feelings of intimidation and power/powerlessness ascribed to roles as they try to establish more equitable and collaborative relations.

Haushildt, P., & Wesson, L. (1999). In this study the authors describe their study of their own pedagogical practices studying six graduate education courses using action research methodologies. They describe their gradual shift toward postmodern thinking that is reflected in their pedagogical approaches. Social justice issues are involved as they deal with self-positioning or repositioning multiplicity, and border pedagogies of resistance and solutions-in-process.

Taylor, P. C. & Dawson, V. (1998). The supportive role of the research supervisor in an action research study in science education is the focus of this article. A sense of disquiet and lack of harmony that developed during a year-long action research study prompted this critical account of a relationship between a research supervisor and a postgraduate research student. The writings of Habermas and feminist scholars assisted with their new understandings of the need for a rich communicative relationship, especially in situations where the student is undertaking emancipatory action research and the supervisor wishes to adopt a collaborative research role.

Zoller, N. J., Abert, L. R., & Cochran-Smith, M. (2000). This study is a long conversation among faculty over the meanings of social justice and describes the differences in their beliefs related to teaching for social justice.

Case Study A: Cultural Consultants (Marilyn Johnston)

This case study is about asking students to help teacher educators address issues of diversity in initial teacher education courses. The study links definitions of social

justice within self-study (the topic of the previous section) to issues of the kinds of knowledge discovered or created by self-study (the topic of the next Section). The study works with an idea of social justice that is coherent with the discussions of the previous section, providing corroboration, but also resistance, to particular parts of the dialogue. It allows the reader to re-think issues of daunting conversations, diversity, stereotyping, group identity, justice, care, recognition, and redistribution. The study explores collaborative conversations as a way of dealing with issues of power differentials (a) between teachers and students, and (b) between groups marked by color or culture – among both teachers and students. Disruptive knowledge has been discovered and created through these conversations.

This story is about working with diverse populations of students. My university is large (53,000+). While we sit next to a large urban center and 40% of the population of my city is African American with growing populations of Somali, Hispanic, and other cultural and religious groups, our teacher education population includes only 5–10% minority students. Many of our teacher education students are from the local area, many from suburban and rural contexts where their experiences with persons of other colors, religions, and cultures is very limited, for some non-existent.

For eleven years, since the beginning of some major reforms in teacher education in my college, we have developed what we think is a strong, collaborative, teacher certification program with a focus on urban education. We meet weekly with the teachers who mentor our students, we make collaborative decisions about the program, we often co-teach our methods courses, and generally feel that our students graduate from our program with complex understandings of the "real world" of teaching and issues related to social justice. Of course, this varies by degree among students. In exit interviews each year, however, students of color continued to describe ways in which the program did not "meet their needs." We have worked hard to respond to their concerns, we have made changes, but the comments have continued.

Three years ago we started having separate meetings with our students of color. We asked them to be our "cultural consultants," to help us think about issues of diversity and equity. We ate pizza and talked. These one-hour scheduled meetings often went on for two or three hours.

The students were different in many ways. Most were African American but also we had Asian American or Hispanic students. They varied in age (21–45), background, family structures, religion, gender (although only 2 were men), and particularly in their attitudes toward issues of social justice. They talked about their lives as persons of color, about incidents of discrimination on campus and elsewhere, of different ways they dealt with these encounters, or ways in which they were positioned and made comfortable and uncomfortable in our classes.

I did this self-study project with another colleague, Mike Thomas, and later a Korean doctoral student, Young Ah Lee, joined us. Mostly we listened in these conversations. Occasionally we asked questions. Young Ah shared her own experiences of racism that often paralleled those of the students.

Issues of social justice were apparent throughout these conversations. We

were, after all, talking about ways these students experienced racism in our society. Some had grown up in more protected environments in middle and upper class neighborhoods; others had grown up in the inner city. These differences influenced the depth of their feelings and experiences of racism, but regardless, they all lived lives of "double consciousness" (DuBois, 1996, p. 8).

Three years of conversations with three different cohorts of students have taught me many things. bell hooks (1994) argues that: "To engage in dialogue is one of the *simplest* [emphasis mine] ways we can begin as teachers, scholars, and critical thinkers to cross boundaries, the *barriers* that may or may not be erected by race, gender, class, professional standing, and a host of other differences" (p. 130). Talking with our students never seemed "simple" but the barriers were diverse and complicated. I always left these conversations feeling drenched in complex ideas that were beyond my immediate ability to digest. The content was a clear example of Britzman's (1998) concept of "difficult knowledge." Sometimes I didn't want to hear what they had to say; other times I was surprised and/or engrossed. I often felt unbalanced, like my intuitions were being challenged, like my experience didn't connect in any way that could help me understand their perspectives. Occasionally I could compare my own experiences of gender discrimination with their stories of racism, but my experiences didn't always map onto their stories easily.

At its best, our cultural consultant conversations were supportive for the students and instructive for us as teachers/researchers. After the first year conversations, our group worked with us during the summer to interpret "our data" and we wrote papers together and went to national conferences. We were too over-committed with other projects to do this extensive collaborative work with the cultural consultants the next year, and yet our on-going dialogues with subsequent cultural consultant groups continued to provide a context for the development of close relationships among the students that helped them, and us, better understand the program and their participation in it. They became a support system for each other. This may in fact have been the most important outcome of our conversations. They could share stories and felt left less alone because of the group conversations. In the process, they continued to help us with our understandings of how better to respond to the needs of students of color.

The conversations with our cultural consultants were not always easy. Sometimes the students disagreed with each other. And there were issues of power between the students and between the students and us that were not always visible or easily discussed. They often said things that we were uncomfortable hearing – when they talked about other students, professors, and campus experiences. We took this as a sign of trust, that they were willing to speak with honesty and openness about difficult situations. In contrast, there were also many times when conversations didn't go very far – issues got dropped, individuals didn't say something when it looked like they wanted to, or we asked questions about our teaching and they were hesitant to criticize. Openness has its limits. We were, after all, their professors. Would it have been better to

provide the pizza and leave them alone behind closed doors? Were we impeding their support for each other by our agendas to help ourselves and our teaching, to do our "research?" Were we, once again, white instructors exploiting students of color for our own advantage?

I'm still puzzling about these unanswerable questions, and about "difference," about "othering," about ways to deconstruct my own understandings in ways that will help me better understand my students. If students of color are not getting what they want and need from our program, and white students are, my colleagues and I have social justice issues to address. From the conversations with our cultural consultants, I continue to feel a moral obligation to try to do things differently.

In response to the cultural consultants' critique that issues of race were not deeply addressed, I tried in my social studies methods courses to be more explicit about culture, race, class, and differences in general. I realized at some point that I felt so strongly about these issues personally, that I was more apt to proselytize than develop understandings. I tried to step back and open spaces for dialogue rather than convince (or berate) them about the importance of these issues in their future teaching. With this more dialogic approach, I felt we had better, harder, and more extended conversations about social justice issues.

The cultural consultants did not all agree. This was another thing that I learned. I already knew that groups vary within more than between (Banks, 1993). I certainly didn't expect all blacks, or Asians, or Hispanics, to agree. What I learned from our cultural consultants was the particularities of these within-group differences. I had their stories and points of view in my head as I listened to students talk in class. I could raise issues that I'd heard in our cultural consultant group that the students of color were uncomfortable saying in class. It was easier for me to play the "devil's advocate" in a discussion, something I try to do anyway, but now I had access to more positions and possible points of view.

I felt good about these changes and new insights, but as often happened when I started to feel like I was making progress, the cultural consultants helped me to think more complexly about an issue. In the case of more open and deeper dialogue about issues, this explicit discussion of difficult issues made some of the cultural consultants feel more marginalized, more silenced. On the one hand, they wanted the issues discussed, yet they felt put on the spot, even when I never called on them or made reference to them. The fact that the topic was about race and culture meant that they were positioned, they were more visible as students of color. As a result of more open dialogue, the white students asked them more questions, wanted to know their opinions, etc. – both inside and outside of class. For some of the students, this "positioning" (Davies & Harre, 1999) was a real burden that put additional stress on them in an already stressful graduate degree program. This no doubt happened to male students when we talked about gender issues, or other students whose sexual orientation, social class background, or religious affiliations made them uncomfortable during

particular conversations. The only difference is that I didn't have regular access to these students' feelings and opinions.

The social justice issue here is again about power and positions. I had the power to raise and control the conversations, even when I asked very few questions and seldom interrupted or probed responses. Nevertheless, our roles as researchers, professors and doctoral student held sway over the group in ways that were often invisible. In an ideal world we would have talked about their discomfort. We tried, but the conversations didn't go far. In the real world, we could not make difficult conversations about complex topics comfortable for all of our students of color. These conversations were no doubt difficult for the white students as well. We talked about how talking about difficult subjects is hard but important, that we sometimes had to get uncomfortable to promote learning and reflection. We tried to talk about taking risks so that we can learn from each other. This seemed to work for some students, but clearly not for all.

Sometimes students of color did speak up in class at critical points. They shared personal stories or asked for clarification when someone or something offended them. They explained how they felt. For some, this was easy and they welcomed the opportunity to help educate their peers. For others, they had tears in their eyes as their peers listened breathlessly to their stories of social injustice. Self-revelation can be painful.

Social justice issues in the classroom are omnipresent, even when unacknowledged. My cultural consultants have helped me to think more deeply and to be more uncomfortable with simple answers to questions of race, culture, and power. Similar challenges are inherent in other areas related to social justice – gender, sexual orientation, social class, and the long list of other differences. Bringing questions of social justice to my self-study raised issues that were often not exposed in my earlier research and teaching. The fact that these are difficult questions may help to explain why they so seldom get addressed in self-studies (and research more broadly defined). Avoidance, however, may make us complicit in educating teachers who do not know how to, or have any commitment to, teaching as a means to a more just society.

Section 2: What Kind Of Knowledge?

This section links the definitions of social justice to the kinds of knowledge that can be gained through self-study grounded in social justice. It focuses on the kinds of knowledge that come from self-studies for and through social justice. The epistemological foundations of self-study are both individual and collaborative; the political foundations of social justice are both individual and social. Thus this section discusses (1) Knowledge as individual, that is, expressed through particular voices, empowering themselves and others (i.e. embodied, perspectival, owned by each and all) rather than expressed in abstract terms (i.e. disembodied, value-free and owned by the powerful few); (2) Knowledge as collaborative, that is, made with and in conversation with others, rather than an individual discovery by an isolated, heroic, social atom.

Victoria Perselli reflects on ways that imposed systems of knowledge weigh on children and teachers, arguing that social justice requires more than a large-scale system that obliterates individuals with all their lovely differences. To understand particular perspectives we also need to pay attention to how large-scale structures of class, race, gender, nationality, religion, and so on, shape us; and to how the way we are shaped depends on individuals acting within and against these structures. These individuals can voice their perspectives, their hopes, their visions, their fears and their delights. This can be done through the telling of stories.

The telling of stories in order to discover and create knowledge is not so simple a business as it may appear at first sight. The dialogue takes a longer look, beginning with the significance of telling one's own story – a "case story" rather than a "case-study." It goes on to consider how this might work collaboratively, which raises the whole issue of collaboration in spite of inequitable relations between schools and universities or between teachers and learners. Following on from this is an investigation of how knowledge of inequitable power relations – and trying to work within them; necessarily complicit with them – gives us a way of learning more about power, and about knowledge as unfinished. Thus knowledge can be got by learning from a community of attentive, conscientious, critical listeners. It can also be got by using all the resources of human expression to tell stories and hear them. Finally, Lis Bass argues that these contacts across social boundaries transform our understandings: knowledge is then transformative as well as uncertain and always on the move.

Victoria Perselli

Knowing Ourselves as Tellers of Stories

My doctoral work (Perselli, 2001) was motivated by misgivings about what Len Barton (1998) calls "the language of 'Special'." After moving to the suburbs and working for a number of years as a support teacher and special educational needs coordinator (in a suburban primary school), I became increasingly questioning of the notion that children who were different were in some way deficient. Even today, after many changes and some small improvements (legislative and economic) in the provision for difference and diversity in schools, the dominant discourse still constructs the individual learner against implicit norms surrounding academic attainment, behaviour and what has come to be known as PHSE (personal, health and social education). To me, these norms are dangerous to children, particularly when they presuppose so much about what constitutes "correct" behaviour, learning, morality, emotions, and identity. Whilst I recognise that in very skilled hands, concepts like PHSE, "Citizenship" and their attendant technologies of self (Foucault cited in Rabinow, 1984) can be used with discretion to improve the ethos of a classroom, these concepts can also be used to coerce and to punish wrong attitudes, behaviour or social practice, thrusting certain children out to the margins. (For an illustration read Dika & Singh's (2002) illuminative comparison of Bourdieu and Coleman's conceptualisations of cultural capital).

In the meantime, the curriculum and its methods of assessment define ever more reductively both what is to be learned and how this should be achieved – the teacher-proof curriculum, in other words. It seems obvious to me now that to try to control knowledge and knowledge production in this way has an alienating effect on teachers. I felt it very forcefully when I was teaching in the primary phase, but I had yet to encounter the views of writers on diversity and equity such as Len Barton (1998), Jenny Corbett (1996), and Mike Oliver (1990) (who, incidentally, are as critical of teachers as they are of the systems of Special Needs). I half-believed that my own views and feelings were in some way deviant. Realising that another discourse existed, to which I had little exposure, was in one way a relief. However, I also experienced anger that deviance (in the teacher and/or the child) can be constructed systemically and institutionalised through schooling because novice teachers like me were no longer exposed to alternative approaches or perspectives. In metaphoric terms, it was as though some huge ideological/disciplinary struggle existed in a place removed from my teacherly self and experiences.

When I enrolled for my doctorate I think I had a notion of doing this big "accuse" thing – unmasking the system and exposing it for the sham that it is. But the other thing I realised was that the rhetoric of "special" (and its "othering" effects) had powerfully entered the public consciousness; via education propaganda produced by central government (which preaches inclusion but practices individualisation), and via the mass media, where education has been turned into a consumer/spectator sport. My "rage against the machine" – as well as being just another version of grand narrative really – was also a potential site of self-harm; beating myself up for a "cause" rather than attending to the ways in which, as a teacher, I am inevitably complicit in practices to which I claim not to subscribe, looking specifically at how this happens and what form resistance might take at the site of my own teaching. My thesis thus became a self-study of encounters with my pupils, in the guise of a support teacher; using 'case stories' rather than case studies, since that is a form of individualisation too.

Marilyn Johnston

Knowledge From Understanding Others' Stories – Across Divisive Hierarchies

The typical relations between schools and universities are inequitable. Like you, Vicky, I have come to feel complicit in the institutional hierarchies between schools and universities and the inherent injustices. Some participants in school/university collaboration have power and others don't. Some have positions with social prestige and others do not. These differences are not necessarily because of talent, accomplishment, or commitment. Rather these differences are ascribed institutionally to roles rather than to persons. If social justice, as you have defined it Mo, is taken to include "both the good of each and the good of all in an acknowledgement that one depends on the other" and "the good depends on mutual recognition and respect and also on a right distribution of benefits and responsibilities," then our typical relations between schools and

universities are not typically just. It's not as simple as acknowledging different perspectives. We live in different institutional spaces and must thus learn to understand each other's different realities (Maloy, 1985).

University-based "teachers" get more prestige than school-based teachers. Theory, the bailiwick of the professors, likewise is ascribed more prestige than teachers' concerns. These differences are embedded in long held assumptions about teachers.

> Teachers' prior learning, beliefs, and attitudes are rarely considered an essential ingredient in the process of teaching itself, much less in the process of change ... Educational policy in this country [U.S.A] has started from the assumption that what teachers know and think is of little consequence for the course of teaching ... The teacher is viewed as a conduit for instructional policy, but not as an actor. (Darling-Hammond, 1990, p. 345)

In these relationships teachers are disempowered without avenues of influence. There are obvious social justice issues embedded in these attitudes and dichotomies. They obstruct the more complex, potential relationships between professors and teachers as well as between theory and practice. Deconstructing these hierarchical power relationships is not easy. Unless there is an explicit attempt to name and interrogate the power issues in these dichotomies, they continue to hold sway over interactions and attitudes.

These hierarchical arrangements have hampered universities and schools in the United States from collaborative and productive relationships to reform teacher education. Teachers have felt voiceless and disempowered. Professors have been handicapped because they know little about the practical realities and expertise of teachers. Students in teacher education programs have suffered from the schism between what is advocated by the university and what they see in the schools. Sometimes there is animosity between the two institutions and students are left to their own resources in sorting out the differences. Typically their experience in the schools has more sway on their socialization as future teachers than what they learn at the university (Zeichner, 1993; Zeichner & Gore, 1990).

Issues of social justice permeate arrangements at all levels when teachers and professors work together. There are times when co-researchers begin with separate and unequal relationships, for example an ethnographic researcher and classroom teacher – the researcher and the researched (Allan & Albert, 1987), but through the process of doing the research, more equitable arrangements evolve.

> While ethnographic research by college researchers does focus on what happens in the classroom, the teacher rarely asks his or her own question in conjunction with the ongoing research. In our collaboration, we [eventually] each asked our own questions and searched for answers together. (p. 725)

Jean Baker Miller (1987) writes about "temporary inequalities" that result particularly when there are cross-generational differences between teachers and students, for example, or between teacher educators and their certification or doctoral students. Mentoring roles often require this kind of temporary inequality, but the long-range goal is to support the student until he/she becomes a colleague and peer. Nevertheless, there are multiple social justice questions that can, and should be asked, as self-studies within these kinds of mentoring relationships are enacted. Left uninterrogated, there are multiple possibilities for imposition, inequality, and injustice in intergenerational collaborations. Self-study is one way to examine social justice issues in these relationships and in research on these relationships.

Using a feminist perspective, Mary Belenky (Ashton-Jones & Thomas, 1991) argues for a "dialogic pedagogy of cooperation and collaboration" (p. 28). This is a pedagogy based on both "believing" and "doubting" activities toward cooperative ends. This type of pedagogy, Belenky argues, alleviates the discomfort women often feel with the values of educational institutions. Dialogic pedagogy works against the traditional one-way dispensation of knowledge and acknowledges the relational necessity of more cooperative goals and learning. Lugones and Rosezelle (1995) see sisterhood and friendship as feminist models that honor the complexity of collaborative relationships:

> If reality is complex, plural, then our bonding must honor this plurality. If our bonding misses the complexity of reality, then it will necessarily erase some of us. It will only be the illusion of bonding as it will be among women given some construction of them that falsifies them. (p. 142)

Likewise, Grumet (1989) describes relational modes of working together as fraught with all the challenges and rewards of strong personal relationships.

In some studies of collaboration, *differences* are viewed as destructive to mutual goals and problem solving (Campbell, 1988; Buchmann, 1985; Cuban, 1992); in other studies, differences are the rich soil out of which collaborators learn from each other and solve problems more creatively (Brookhart & Loadman, 1990). Some theorists argue for what Gehrke and Parker (1983) call "egalitarian collaboration," where equality and parity characterize "true" collaboration, while others consider a type of "dialectical collaboration" – an integration of top-down, grass roots, and joint planning modes – as more attainable. Some projects deal with issues of diversity and justice by forming "ad-hocracies wedged in the cracks of the formal organizational structure" (Grossman, 1994, pp. 71–72). Ad-hocracy provides safer spaces for dialogue, collaboration, and reform in teacher education.

For twelve years, my PDS colleagues and I (Johnston & PDS Colleagues, 1997) developed a collaborative teacher education program to prepare teachers for urban contexts. We worked closely with classroom mentor teachers to make programmatic decisions, co-teach courses, initiate school reform and then met weekly to support dialogue and inquiry oriented professional development. Their

self-study of this collaborative work is told from different perspectives and positions with attention to the challenges of doing collaborative teacher education within the contexts of hierarchical, unequal, and complex institutions, where issues of social justice are seldom at the center of attention. Collaboration between professors and teachers was a means to foster more equitable relationships. The goal was to design a teacher education program where democratic principles guided interactions between students, university faculty, and school-based teachers. Attempts to apply democratic principles meant that issues of social justice were always at the forefront of the conversations with questions such as: Are all points of view represented in decision-making? Is there distributed control over inquiry processes and knowledge production? Are the power differences ascribed by institutional contexts continually deconstructed within our conversations? Dialogue about these questions helped to maintain a self-study focus where social justice issues were omnipresent.

Mo Griffiths

Knowledge of Hierarchies from Trying to Negotiate Them Collaboratively

Marilyn writes briefly about the collaborative project with which she was involved. Some of the longer story is to found in her (1997) book. As she has said, it is written with meticulous, rigorous attention to the social justice issues of control, and of power and status differences. She provides an analysis of different forms of dialogue, for instance, referring helpfully to an article by Mary Leach who theorises open, incomplete, unfinished dialogue (such as the one we four are engaged in) as "serious gossip" (quoted in Johnston, 1997, p. 17). Marilyn, you are one of only a very few people who have discussed silence, including its possibilities as subversive. I loved your story of the older teacher telling you as a younger teacher, not to bother arguing with the principal, but just to close your door and do it anyway. I like what you said:

> How does one pay attention to the silences in a collaborative project? … Working one's way through the silences, however is disruptive and difficult. In the disruption of these silences there is a lot to be learnt from a research point of view. Often, however, what is revealed cannot be publicly told. (p. 119)

In 1995, I involved myself in a collaborative project, the "Fairness Project," and was trying to understand the nature of our collaboration, from the point of view of power, position, shared perspectives and so on, and your book helped me enormously. Like you, I found that there were all kinds of ambiguities around even being able to ask questions such as "Are all points of view represented in decision-making?" Like you, I noticed the silences – I have discussed them in a self-study paper called, "Telling stories about collaboration: secrets and lies?" (Griffiths, 1998b).

I learnt a lot about collaboration for social justice from my participation in the Fairness project. I had been instrumental in getting it started with the help

of a fellowship from the ESRC. (I have written about it in more detail elsewhere: e.g. Griffiths, 1998a, 2002.) It had been a productive and happy collaboration so I was not worried about what I might find when I began to evaluate whether it had been successful in relation to its stated epistemological aim of bringing together different perspectives (on race, gender, sexuality, special educational needs, social class and from school, university, and education advisory services). But I should have been worried: trying to understand even a successful collaboration across power differences was very difficult, not just theoretically but also personally – which is why I was so glad to have found Marilyn's book which acknowledged, described, and explored the complexities, rather than assuming it was enough to have good intentions to act with equality, respect and openness.

I continue to be fascinated by the processes of collaboration and to study them, especially my own role in them. Like Marilyn, I enjoy theory, I enjoy argument and spoken dialogue, and I am comfortable with words. Studying the process of collaboration has brought home to me how formal argument is only part of a dialogue. To the question about what you know, the answer, "I know this fact," only reports a small area of knowledge. It misses great swathes of important forms of understanding, wisdom, intelligence, insight, and sensibility. Moreover any monolingual form requires everyone else to translate his/her own language, even when something significant gets lost in translation. I remember when I was a schoolgirl, I read a biography of Jacob Epstein. He had been asked to explain one of his sculptures. He replied that if he could have explained it he would not have gone to the considerable trouble of sculpting it. I have never forgotten this reply – but it seems I needed to re-remember it. Involvement in collaborative dialogue asks participants to be open to real and uncomfortable differences of perspective, of expression, and of ways of engaging with others as well as the continuing ambiguities of the process.

My self-studies of collaboration have helped me understand what Vicky was doing in her article about images (Perselli, 2002a). I think it is a measure of how much I have learnt about the processes needed to understand people who are different not just in their ideas but how they express them, that I so much appreciated her presentation of her self-study. She used the framework of an imaginary picture gallery, playing with the assumptions of her readers/ listeners about how she had established her framework. In effect, she addressed the deeply serious and difficult business of attending to different levels of understanding a mode of expression, as she simultaneously worked with the knowledge that the audience would be more likely to participate if they felt engaged.

Victoria Perselli

Knowledge from Paying Attention to Attentive Listeners to our Stories

I would like to pay tribute to some of the many people who have influenced my learning, by describing the ways that I created a "social stage" where these discussions and arguments took place. Earlier I mentioned some of the U.K. theorists of inclusion/special educational needs who are currently challenging

the status quo, whose work I read and largely sympathised with when I was working on my doctorate. None of these writers were engaged in self-studies, of course, and one mildly exasperating question I had when grappling with their texts was, what do they really know about how entrenched practitioners are in the systems that produce us? Ethnography is problematic in this sense too because it rarely reveals just how hard it is for a teacher to innovate from a "bottom-up" position in a very hierarchised situation, such as a school (or the university, as Marilyn points out).

One thing I was trying to illustrate was how you can have the will to include pupils with disabilities or other "markers of difference," but yet come up against practices as well as systems that exclude. When I wrote my case stories that centred on teaching and learning relationships with pupils with Downs syndrome, language disabilities and behavioural difficulties, I thought I demonstrated aspects of my own heroism in those texts. What I subsequently realised through sharing the stories (usually with my university research group, but more recently to wider audiences, such as S-STEP) was how much of the dominant discourse I had unwittingly replicated through my representations. Although the stories were transformatory in that they helped me to identify and reaffirm a commitment to inclusion for my pupils, they also revealed to me the immense contradictions and tensions between beliefs and actions. This brings me back to Tom Russell's observation, quoted earlier by Lis, in Section 1: "The issue of diversity … [means] identifying and overcoming one's unconsciously learned reflexive responses. …" This needs to be held in mind at all times, because for me, now, diversity is as much about developing self-awareness, as about seeing the problematic as located with the different "other."

Through the stories I became conscious of the dangers of overstating the self/other binary or, alternatively, of identifying with the other in ways that become consumptive rather than emancipatory. I needed an audience of attentive, conscientious listeners to bring this about! Megan Boler (1999) devotes a chapter to "The risks of empathy: interrogating multiculturalism's gaze," and although here she is speaking of "race" and ethnicity, the issue is the same: how to work with difference whilst avoiding "passive empathy … [which] satisfies only the most benign multicultural agenda" (pp. 157). She goes on to outline what she calls "testimonial reading, [which] denies the reader's desires for certainty; the emphasis on language as practice, as action, replaces coherence and resolution with vulnerability and ambiguity … testimony as an attempt to represent events in excess of our frame of reference" (Boler, p. 169).

As a teacher working with the topic of "disability," this was the challenge: to move beyond what I already knew (as a non-disabled person), and what I taught (as a support teacher) through my writing. When I found that my audiences of listeners were engaging in serious criticism of my story texts, rather than giving me the comfort and closure I thought I wanted, I initially experienced surprise and shock. After all, I believed in my abilities as a good and caring teacher. However, by working through these feelings, including my own resistance to

painful messages, I was eventually able to move forward in the work of scrutinising and revising assumptions (around normality, dis/ability and difference) that also drove the practice.

Boler (1999) isn't throwing out empathy, and what I particularly appreciated about her book was her ability to half-reconcile discomfort with comfort. There is a sense of adding layers of feeling to experience rather than of critique as something negative or destructive of one's selfhood:

> A pedagogy of discomfort offers an entrée to learn to inhabit positions and identities that are ambiguous. Once engaged in the discomfort of ambiguity, it is possible to explore the emotional dimensions and investments – angers and fears, and the histories in which these are rooted. (p. 198)

She also claims that:

> To question the familiar may lead to a greater sense of connection, a fuller sense of meaning, and in the end a greater sense of "comfort" with whom we have "chosen" to be and how we act in our lives. Second, the conceptual tool of learning to bear witness to ourselves allows breathing space. Rather than feel immersed in a torn, excavated, gutted sense of self we can understand discomfort as an approach: an approach to how we see. (p. 197)

When I read this I felt a sense of relief but also loneliness, because I don't know of many practitioners in the U.K. who openly share this conceptualisation. I suspect that most of us, most of the time, are concerned more with survival and getting through the day; asserting ideas as though they were truths, covering the curriculum and covering our own actions, rather than revealing our discomfort with the task (of education) in postmodernity.

In my thesis what emerged was a method, consisting of story telling, writing, performance, and critique that invites disruption, interrupts its own narrative line, and occasionally demonstrates the disjunctures between thought and practice, self and others (Perselli, 2001). Ultimately one needs to remember that stories are representations, not realities. There must remain an undecidability about what constitutes the best way to proceed. Indeed this offers breathing space as well as a continuous desire to connect in order to amplify meaning, not reduce it to reliable certainty. I see this (social justice) text as an extension of the social stage in so far as we, too, are actors who neither want nor need confirmation and closure, but rather the opportunity to ask more questions around the how? what? where? specificities of social justice in our working lives. The beat goes on.

Lis Bass

Knowledge as Transformation from Making Contact Across Social Boundaries
Matthew Arnold (Novak, 2002) saw very early that the key to shaping a humanized democracy lay in shaping a humanizing system of public schooling:

that, in a democracy, dehumanizing schooling would lead almost inevitably to dehumanized and banal forms of public life and that only a nation with the vision to help provide each of the individuals composing it with a rich inner life could form an authentically self-governing public with a rich national life (Novak, p. 595). I believe the classroom is the space where social justice begins, not in the family circle where loyalty to clan and self are born, but where each child is brought into the larger world context. This is the place where the training and values of the larger world are taught. Novak (after Arnold) claims that in order for democracy to be great:

> What is above all required is a set of educational policies designed to produce a social condition of universal magnanimity, where everyone is actively encouraged to develop a unique, large, and generous spirit. (p. 600)

How do we get there from here? Given the current "marketization" of education (Bell, Kanner, Weiler, & Maher, 2002) with its focus on, "A continual dance of ever-changing objects (in today's parlance, read "educational objectives"), what [students] will learn is only to attach themselves superficially and, in the end, impotently to a succession of such objects" (Novak, 2002, p. 624).

Globalization and consumerism will be reinforced by the educational system, leaving the world a poorer place both literally and figuratively. To counter this, progressive educators call for, "transformative pedagogies, the need to respect and encourage the voices of (all) students, curriculum which critiques popular culture and analyzes social inequity" (Bell, Kanner, Weiler, & Maher, 2002, p. 2).

Novak (2002) suggests we need a "class of teachers (who) would, in an exemplary fashion, be dedicated to transformative "social work," the kind of work that, in a human, face-to-face, way attaches social value to individual human beings. Teachers would work to bring each and every individual in a democratic society to connect, as Tocqueville (Novak, 2002) recommended, the "vastness" of his or her own being to the complementary depths of others' being and to the vast capacity of the human species to develop itself and beneficently transform the world it inhabits (Novak, p. 607). In other words, teachers would be the ones working in "the contact zone" – the space of possibility for both personal and social change that sometimes suddenly opens when members of social groups, between whom strict boundaries are normally drawn, intentionally or unintentionally come into contact (Pratt, 1991, quoted in Novak, 2002, p. 613).

But I am left asking, "Who am I to teach these students? And how is what I teach going to impact on them?" Self-study is a methodology for addressing these questions, and, I believe, for training oneself to face one's living contradictions and to teach according to one's values (Whitehead, 1993).

Some Other Relevant Studies

There are also discussions in the literature about research methods that are more likely to facilitate collaboration, and, thus, more equitable relationships between researchers and teachers. Much of the research in education was previously done

with quantitative research methods that required particular expertise that teachers did not have nor often appreciated. Quantitative methods may be useful for research questions that need numerical data and analyses, however, the overall methodological expectation for generalized results from large population is not an easy fit with the types of questions that self-study research generates. The interpretive character of qualitative research, by comparison, offers methods more easily adapted to collaboration between professors and teachers (Kyle and McCutcheon, 1984), to multiple perspectives and theories within a collaborative project (Johnston, Lee, and Thomas, 2002a & 2002b), and the reflective orientation of self-study questions (Hamilton, 1998). Inequities between collaborators or within research processes can be identified and examined because this methodology easily accommodates a range of questions, methods, and perspectives within the same collaborative group.

There has been considerable self-study work that looks at school/university collaboration that analyses issues of social justice, either as foreground or background. These studies come in many shapes and size with a variety of partners. Few of them, however, have social justice questions as a central core of their research. For some, questions of social justice are clearly highlighted. LaBoskey, Davies-Samway and Garcia (1998) work together as teacher educators across different institutional contexts to study their own practice. LaBoskey studies the preparation of "new teachers to deal with issues of race, class and gender so that greater social justice for my students and theirs might be achieved" (p. 156), and Garcia analyses her teaching through the self-narrations of her students at the end of the program focused on social justice issues. Their collaboration across institutional contexts supported their professional development.

Clift, Veal, Holland, Johnson and McCarthy (1995) describe a large cross-district collaborative project focused on professional development. They openly and honestly examine the difficult issues involved in this collaboration and their evolving realization that self-study was a critical part of this kind of work. They report: "We came to realize that we must study and analyze our own behaviors, including the norms, patterns, and routines that we perpetuate through interactions among our immediate research team as well as those across teams" (p. 30). Dealing with suspicion, resistance, and parity as well as who was to 'control' the knowledge gained from the research were challenges they faced.

Susan Noffke and Robert Stevenson (1995) edited a book with colleagues who focus on action research using a social reconstructionist framework. For Noffke, in particular, her central focus is teacher education as a commitment to social justice looking at the individual and social dimensions of schooling. Battaglia's project, described in this book, begins with a study of coaching in a school district in western New York that became a study of "a personal journey into the thinking, language, and even the disposition I bring to my work" (p. 76). The authors in this book use action research as their methodology. Throughout their work, social justice themes permeate the questions they ask about themselves and with their students.

Case Study B: A Working Interpretation (Victoria Perselli)

This case study is a "case story." It is told as a puzzled autobiography: the writer's remembered experiences of her younger self, teaching children in inner city London, are set against the dominant narratives of current educational policy. The story points back to Section 1, where definitions of social justice were discussed and to Section 2, where the importance of story telling was explored. Additionally the story also opens up issues of different modes of expression and of the links between the stories we tell and the larger structures within society. Also explored is the possibility of creating spaces for conversations in which poverty, diversity and different abilities to learn are not pathologised, and text, music and image are used to unsettle the status quo. Thus the story points forward to the next set of dialogues in Section 3, where professional knowledge is discussed in terms of "little stories" and "grand narratives."

In order to come to a working interpretation of social justice and diversity, I find myself drawing directly from my experiences of being a teacher and teacher educator. For me, social justice, diversity, and "equity," are inextricably linked to curriculum. But I guess I would also say that in the United Kingdom, teaching and teacher education is not a particularly safe space just now for those of us who harbour strong views about what curriculum is in relation to praxis and pedagogy. Many teachers still remember a time when it was possible to create a curiosity and wonderment about the living world within the classroom that grew from pupils' own experiences, interests and culture. The first class I taught in central London constituted a richly diverse population including 24 different ethnic or cultural groups and as many languages. We (the class and I) worked together to establish themes for learning and patterns of daily work which, as far as possible, enabled everyone in the class to be a participant, contribute meaningfully and develop their particular interests, skills, arguments and sense of "self within the social." At least, that's how I would describe now my intentions and actions as the teacher of that class. (Please don't think that I would have been able to express them so succinctly – or so unproblematically – at the time. Such is the advantage of hindsight.)

I came into the teaching profession – again using the benefit of hindsight – at a time when curriculum was perceived more as a verb than a noun; it was something living, mobile, plastic and therefore constantly changing in dialogic relations with its surroundings. For sure there were bodies of knowledge and discrete skill-sets consensually agreed among teachers as vital elements of primary education. Otherwise, coherence between teachers, classes, year-groups would never have been established. There were also preferred methods of assessment and reporting, devised either by the school or the borough, but these were relatively underemphasised. What actually took place in the classroom was what mattered most and as teachers we were fiercely competitive among ourselves around what our classes could achieve. Sports, performance arts, cultural events, school journeys figured high on the social calendar. At the time, it would never have occurred to me to "privilege" one curricular "subject" over another, or to

be overly concerned if individual children had strong curricular preferences. You stretched each activity from the students' initial level to wherever their curiosities might take them. We could afford to be explicit about our accomplishments (in public performances, local tournaments, project work, assemblies, parents' evenings) because no one was competing for putative prizes. By the same token we also felt safe to be experimental. In the main I believe that the teachers and children trusted each other and we understood that sometimes plans might take unexpected turns.

Fortunately I worked in London at the time when the ILEA (Inner London Education Authority, which, together with the Greater London Council, the Thatcher government later abolished) produced fantastic support materials and in-service education opportunities designed to raise teachers' consciousness around issues like gender, ethnicity and social class. On the top shelf in my office I have a collection of vintage ILEA materials that make for intriguing reading and still seem incredibly vibrant. Situated under the Westway (the flyover that links west London to the M4 and Heathrow airport), in the middle of one of the largest and poorest housing estates, the school always had so much going on in terms of curriculum that it would have been hard not to find some means to engage individual children. I now believe that this largely obviated the necessity for the various mechanisms and procedures of diagnosis, ascertainment, assessment, targeting, and remediation that came to dominate my working life more recently (see Hammerberg, 2002, for a critical discussion of present practices). I'm not suggesting that we never engaged in exact "differentiation" or micro-teaching as a means towards coming to understand pupils' difficulties in a particular subject area. However, when specific concerns arose within my large classroom of 22 pupils plus two professional support teachers on hand, it was a fairly ordinary occurrence to sit alongside a child or a small group and work through the problem together.

Since those days so much has closed down/in/around teachers and learners. When I joined the ILEA I believed I had arrived at the epicentre of the urban education scene. The vitality of my colleagues impressed and awed me with their creativity and inventiveness, along with their range of the differences in age, sexuality, ethnicity and political orientation. Being a probationer with a progressive (by which I suspect I mean liberal individualist) agenda, sometimes the politics irritated me. I thought I knew all of the answers already, although I had difficulty putting them into practice. Certain colleagues with strong views generated some fear in me and forced me to become self-aware in ways that made me uncomfortable. Indeed this was difficult knowledge (Britzman, 1998) – conflictual encounters in the staff room that produce resistance and trauma – direct, customised, and free of charge. This occurred in the early 1980s, and in actuality, the infrastructure of inner city schooling already was in an advanced state of decay; something my more mature colleagues, best positioned to read the "self in the social" and vice versa, must have known all along.

I still find it very difficult to reconcile that version of the past (my version) with subsequent events, and I know I'm not alone in feeling that to speak

unequivocally in favour of curricular freedom (Perselli, 2001) is a high risk activity. This occurs because of its contrast with the accepted ("historicised," Perselli, 2001, pp. 92–109) version of progressive education, and it flies in the face of increasing control by central government of teaching and learning, achieved via relentless legislative and quasi-legislative reform. Beyond curriculum there is the totalising regime of assessment – testing-monitoring-recording – that mitigates against Stenhouse's (Rudduck & Hopkins, 1985, pp. 96–111) doing and making of education (in the simplest sense of time taken) that ought to be at the heart of children's school experience. It seems to me that the current assessment fetish (picked up by Lis on her visit to London) fixates on various "deviant" behaviours and disorders of mind and body, pathologising learners, whether as individuals or groups. These are the tropes of teaching and learning that appear with monotonous regularity in training sessions and tabloid journalism alike. What they really do is steer the discourse far away from the open, engaged conversations one hears at a conference like S-STEP or the bickering matches we might have had in the staff room in those times when it was still safe to argue back.

So what might the project of social justice be? What does it look like? For a start there are what Mo calls "Little Stories" of which the above is only one. There is the knowledge that one's own little story may relate, or not, with the experience of another, and that engagement with each other's stories is the key – it's what keeps the conversation alive. In my doctoral thesis I set out deliberately to create social spaces, or a Social Stage, as I called it, where one might narrate one's story with a certain sense of freedom, not seeking consensus necessarily, but affirmation of a different kind. Clandinin suggests that readers of the story bring their own perspective to the understanding of it (Clandinin & Connelly, 2000).

There are also the margins and boundary spaces, the distance between the centre and the periphery, which I inhabit in my practice in order to come to understand the processes of centralisation and marginalisation, inclusion and exclusion currently taking place – at least here in the U.K. How is it done? What are the technologies that select, sort, shift, label and pathologise human beings and how do human beings resist these forces? How do we, as individuals or collectively, testify against tyranny, how do we recognise it in ourselves, in others? Is my teaching (now in higher education) enabling dissent and disagreement or merely tranquillising and assimilating students? Is there any place, currently, for a feminist critical pedagogy in initial teacher education (as there surely was when I first came to London)? And if not, where has it gone? (In the last job application I made I was told that academia needs more young people, especially women. How young is young, I wonder, and in this instance, how woman is woman?)

There are, finally, the spaces we create, which are also theoretically robust, politically defensible areas, for voices other than our own: as practitioners, as researchers or scholars. Patti Lather and Chris Smithies (1997) achieved this in *Troubling the Angels* as did Michele Wates and Rowen Jade (1999) with *Bigger*

than the Sky, and Peter Clough and Len Barton (1998) with *Articulating with Difficulty*. Here method and methodology are directly linked to a transformatory political intention (Gitlin, 1994). Once read, these books changed the way I worked with my primary pupils, and they presently inform my work with undergraduate students. Whilst none of these writings claim "improvement in practice," all of them seek to educate through language and text. This would be true too of some of the more offbeat examples at S-STEP. Although I hold fast to the idea of direct action for social change, circumstances make me far less confident or convinced in this area than I used to be. Text, music, image are also a means to unsettle the status quo, explore alternative perspectives, engage in interdisciplinary bickering and wrestle against/with method and methodology. None of this work is incompatible with the "classic" self-study – merely different.

Section 3: Professional Knowledge

The previous section looked at knowledge in general in relation to self-study and social justice. This section looks in more detail at professional knowledge gained through self-study. It contains discussions of professional knowledge as uncertain and situated – and as all the better for it. It can be understood in distinction from the more traditional view of ideal knowledge as certain and universal. It is argued that professional knowledge is disruptive of other forms of knowledge, and in being disruptive, contributes to it. At the same time it also uses and gets illuminated by the big, monovocal, linear, wordy, male, white, dominant, academic, forms of knowledge. It is also argued that professional knowledge is expressed in a variety of ways. We make our professional presence felt through stories, performances, pictures and other kinds of creative publication.

Morwenna Griffiths introduces the phrase, "little stories and grand narratives," as a way of expressing professional knowledge in relation to other forms. The dialogue then explores the idea: maybe we should be talking of "counter narratives"? How do little stories and grand narratives hook into each other? This dialogue uses a range of forms of exploration. Some of it is done through little stories, some of it is through reflection on experiences of working within "a system we can no longer believe in." This discussion of professional knowledge, draws, precisely, on the writers' own professional knowledge. As professionals we express a concern for the implications of what is said: Victoria Perselli and Marilyn Johnston consider postmodern disruption and its implications for pedagogy and for ways of challenging policy "truths."

Mo Griffiths

Knowledge and Little Stories (1) Little Stories in Relation to Grand Narratives

Professional knowledge is knowledge of and for specific circumstances and issues. At the same time it draws on knowledge and abstract theory that is more general and generalisable. The idea of social justice itself is a general framework, which

has to be understood in particular contexts. It is difficult for professional knowledge to hold its own against abstract, general, theoretical knowledge, which has higher status and which is produced by people in more powerful roles and with greater chances of making their views known. Self-study can help bridge this gap, bringing both kinds of knowledge into a fruitful interaction. Self-studies give a space for acknowledging diversity, struggle, voice, localised struggles and the claims of the particular and context-bound.

What kind of theory is being produced in such specific contexts and for such specific issues? I like the term "little stories." If generalisable, abstract theories are "grand narratives," then to tell a "little story" is to assert the significance of a particular context (Griffiths, 2002). (Alternatively, they might be termed "modest narratives" as against "tall tales," in order to change the connotations.) At the same time a story and a narrative are, recognisably, similar. The two can link up.

The term "little stories" did not come from me originally. I came across it, at a conference in a paper by Richard Smith, a British philosopher of education. He told a story relating to his own professional knowledge. (See Smith, 2001; Blake *et al.*, 2000.) He was outraged by the way that the Dearing Report into higher education in Britain (Report of the National Committee of Inquiry into Higher Education, 1996) portrayed the work of university lecturers like himself – in managerial, impersonal terms. He said that his understanding of his own work as a university teacher had been ignored and obliterated. He said he felt this as an injustice. In order to talk about this he had found Lyotard's discussion of "grand narrative" and "little stories" (*petits récits*) illuminating. I was so impressed by the idea that I have been using it ever since – but whether either Smith or Lyotard would like how I have used it I do not know. However, I have certainly found that it is a term that has an extraordinary resonance for many people who are concerned with social justice.

Lis Bass

Knowledge and Little Stories (2) Little Stories as Counter Narratives to Grand Narratives

For me, the traditional grand narrative of US education, particularly free education, is a narrative of social justice that does not fit with Mo's dynamic state. The traditional view is that public education provided for a meritocracy – anyone with the raw skills, intelligence, and talents would receive training so that he or she could rise up the socioeconomic ladder. Thus, equality was well served. In the U.S., public education was created to support the most idealized and static version of democracy – wherein each individual could participate fully in the society. Free education was to provide the skills of literacy and science to equalize the playing field and bolster a meritocracy where the "best" would have access to all that he or she would need to fulfil not only his/her social potential, but also his or her personal potential. Without public education there would be no myth of social mobility – a cornerstone of the U.S. grand narrative of social

justice. Again, counter to Mo's definition, this one does not take into account the real inequities that exist in our society concerning "discrimination, exclusions and recognition, especially on the grounds of (any or all of) race, gender, sexuality, special needs, and social class" (quoted from Griffiths (2003) in Section 1).

This grand narrative also has a counter narrative that points to the need for Mo's revision of traditional definitions of justice. One needs only look at the literature describing the schooling of Native American children (*Tracks* by Louise Erdrich (1989) or *The Education of Little Tree* by Forrest Carter[1] (1976) to see how in practice this grand narrative only served to destroy those who would not conform to the dominant culture. Also, writers from the Latino culture like Richard Rodriguez (1981), from the working class (Rose, 1990) and researchers like Jean Anyon (2002) help us see education as implicit in the destruction of those not like the dominant culture and in the reification of class and cultural distinctions through a system that teaches the victims to blame themselves for failing to learn or gain power in the system. In my own field, Barbara Mellix (1996) wrote:

> My concern was to use "appropriate" language, to sound as if I belonged in a college classroom. But I felt separate from the language – as if it did not and could not belong to me. I couldn't think and feel genuinely in that language, couldn't make it express what I thought and felt … when I came face to face with the demands of academic writing, I grew increasingly self-conscious, constantly aware of my status as a black and a speaker of one of the many black English vernaculars – a traditional outsider. For the first time, I experienced my sense of doubleness as something menacing, a built-in enemy. Whenever I turned inward for salvation, the balm so available during my childhood, I found instead this new fragmentation, which spoke to me in many voices. It was the voice of my desire to prosper, but at the same time it spoke of what I had relinquished and could not regain: a safe way of being, a state of powerlessness which exempted me from responsibility for who I was and might be. To recover balance, I had to take on the language of the academy, the language of "others." (pp. 80–81)

But perhaps that is one of the little stories. …

Mo Griffiths

Professional Knowledge as Little Stories (1) Self-Studies in Relation to Grand Narratives of Social Justice

One of the main points of little stories for me is how they hook into grand narrative. Earlier I talked about linking up little stories and grand narratives, and one way of linking up is with a hook. I like the metaphor of "a hook" because on the one hand the little stories get their shape from the grand narrative into which they are hooked. On the other hand, they can hurt – even prick the balloons of grand narrative.

One of the wonderful things about doing a self-study is that it allows researchers to pay attention to the conditions of their own lives. To use a Marxist phrase, it allows them to discover how far they can make their own history, even though not in circumstances of their own choosing. The little stories of trying to make history can disrupt ideas of what those circumstances are.

What stops a little story from being a mere anecdote is precisely that they are told with a sense of what the grand narratives say about circumstances and why they are as they are. All of our case study sections are stories related to the grand narrative, the big idea, of social justice. But they link to that story. They are not just examples of it. They show, in the case of social justice, how the grand narratives of social justice can be disrupted, queered, deepened, given a fine grain and re-shaped, by little stories that pay attention to race, gender, (dis)abilities, sexuality, and social class, that pay attention to power, perspective, voice and self-respect. At the same time they contribute to a kind of professional knowledge that professionals need – not the smoothed out large exhortations, but the particular, illuminating "case-stories" to use Vicky's phrase, which make up our different professional knowledges as educators.

Lis Bass

Professional Knowledge as Little Stories (2) Self-Study, Autoethnography and Epiphanies of Social Justice

My life as a teacher is a little story. For my first self-study, I wrote a 36 page critical autoethnography – a personal narrative that focused on my experiences with literacy learning (because I teach English). I created this based on the critical autoethnography written by Linda Brodkey (and her examination of her graduate students' critical autoethnographies) in her chapter entitled *Writing on the Bias* (1996). She wanted her students to understand the class nature of teaching academic writing and to do that she had them write their stories. Similarly, other educators interested in social justice have written their "little stories." Gary Howard (1999) begins *White Teachers: Multiracial Schools* with a personal narrative he calls, "White Man Dancing: A story of Personal Transformation." Kane and Jones (2002) published their stories in "Walk that Talk – Beyond our Stories About Race."

Writing these autoethnographies brings to light the impact of our upbringings on our teaching and social justice work (for me, it was an empowering recognition that I was a border-crosser – economically working class but intellectually middle-class, Jewish in a Christian country, white in a black neighborhood). Howard (1999) refers to his first work in the neighborhoods around Yale University as his "naïve missionary period" (p. 14). Kane and Jones' (2002) work together taught them how much race impacts every aspect of their life experiences and how the epiphanies they have about racial divides are part of an ongoing dynamic of learning: "only pieces of an unresolved issue, which have finally come into focus in the perception of that moment" (p. 18).

I am a radicalteacher.[2] I don't teach politics, sociology or a subject area more

known as possibly radical. I teach reading and writing. What makes me a radicalteacher is less what I teach and more why I teach, how I teach, and who I teach.

I teach because I believe in ideas – that they enrich peoples' lives, that people are empowered and healed by them. I teach because through my self-studies, I have recognized that these commitments are an important part of how I have constructed my identity. Often, when teaching, I experience the "flow" that Fred Korthagen (2002) describes as occurring when one's essence is aligned with beliefs and actions.

Who I teach is crucially important for social justice. I teach remedial English at a large community college in the second poorest city in the United States. My students are marginalized in this society: predominantly working class, female, many are minority African American, Latino, Asian and immigrant, some have learning or physical disabilities.

How I teach is an evolving critical pedagogy that tries every moment to return power to the learner and fails constantly insofar as I fail, the institution fails, and the curricular demand – to teach the students the language of economic access to a capitalist society, to learn to write and read Edited American English (EAE) – denies the validity, in practice, of their own language and voice. That is my little story.

Victoria Perselli

Professional Knowledge as Little Stories (3) Personal Expression as Disruptive of Dominant Narratives

Here I'll try to disrupt and problematise further the (shifting, socially embedded) meanings of social justice in postmodernity, and the personal/political implications this has for my pedagogy.

Just going back over what we have told each other so far and revisiting some of the issues, there seem to me to be both situated (i.e. different) and communally shared ideas in our stories (Lis, Mo, Marilyn) in relation to what we separately and collectively understand as "social justice." An aspect of this which is particularly problematic for me is where Lis says: "The classroom is the space where social justice begins, not in the family circle where loyalty to clan and self are born, but where each child is brought into the socio-political context." (Section 2)

Speaking from my own situation, I wonder increasingly whether that distinction can still be maintained. I'm wondering just how family life can remain a protected space of shared values, beliefs, experiences (as I understand it from Lis's text) and the extent to which this space is negatively impacted by what we are now being expected to do in the classroom/lecture theatre: the personal/political axis that feminist discourse calls to attention.

My dilemma here is that whilst I do desire transformation, by which I mean the possibility for education to enable its subjects to escape systematic oppression and domination – bearing in mind that, for some children, family can also be the source of oppression – I'm increasingly worried about the ways that current

policy, legislation, practice, are eating into the domestic sphere, changing relations among family members and changing habitual, routine ways of being together. To get to the specifics, what I believe is happening across the U.K. presently is that terms like social justice and equity are being appropriated (hi-jacked, as Mo says) to justify a rampant form of advanced capitalism which declares that only through competition, market values, free choice and individualisation will the class system (which must also include class psyche) be broken and the very poor, the most needy, be "lifted out of poverty." Yet, as you, Lis, have already pointed out, material discrepancies between the very rich and very poor continue to widen, with those who are least able to "help themselves" for whatever reason, remaining at the base of this economic pyramid. The economic argument becomes the economic trap which blames its own victims, at the same time justifying and spawning a number of managerialist equivalences: leaders and teams (wherein the weakest team members are "voted out" by the majority), role models and peers (whereby the least homogenised are personified as Lurkers) and most damagingly of all perhaps, a collective perception, by the moral majority, of an economic and social "underclass."

This pyramidic, hierarchic conceptualisation is everywhere – it penetrates the psyche in ways that make the old divisions of labour and capital seem quaint. Currently in England we have Beacon Schools, Average Schools, Schools in Special Measures, and Failed Schools. We have schools spearheaded by "Superheads," Specialist and Technical Schools, and "bog-standard" comprehensives. Meanwhile, figures presented as hard facts regarding what is being achieved in education ("expectations," "targets," "attainment," the "raising of standards") are impossibly skewed, since catchments are continuously redrawn, school selection procedures rewritten and examination results reinterpreted.

As an educator and a mother I find neither coherence nor progression in education policy. What I hear is the mantra of education reform as the means towards economic prowess (and "freedom"). What I fear, as a convinced Foucauldian, is the extent that this curious form of work ethic colonises mind, body, time, space, irrespective of the personal needs and social concerns of the individuals involved. What I feel for my kin and myself – spiritually, sensually – is held together by an act of will that says – don't let these rhetorics get beneath the skin, exorcise them with something else – a narrative stream which creates rather than just describes (See Perselli, in press, a, b, c). Practice your care of the self, as best you can until this burns itself out, until things change for the better,

Am I making any sense here, or is it entirely different for you?

Marilyn Johnston

Professional Knowledge as Little Stories (4) Little Stories as Critical of Policy "truths"

The scary thing is how similar things are across the Atlantic. Our national rhetoric uses different words, but it is loaded with similar injustices and thus

similar pressures on students and educators. Our "new" national policy, "No Child Left Behind," is pernicious. To make sure that no child is left behind, we will test every year to make sure they are not lagging behind. Accountability abounds as children continue to fail in urban districts across the country because nothing is different except the hike in accountability. Like measuring a cow every day to see if it is growing without attending to its diet or environment, the repeated measuring of "learning" without addressing issues of poverty and inequity that directly impact the quality of educational "opportunity" is a failed policy. The slogan belies the reality of teachers and students' lives in schools that do not show increased test scores.

Children are labelled by their failure on test scores, not by what they know and are able to do, or what they understand about themselves and their world, or the enormous efforts they make to reconcile their family lives and cultures with school knowledge and requirements. Principals and teachers work incredibly hard to help students learn and are forced into instructional and teach-to-the-test practices that ensure superficial learning.

As educators we are implicated. Like you Vicky, many of us are in a system that we no longer can believe in, in a system that denies the very opportunities promised in the slogans. We are burdened by demands and busyness that make political action and critique unlikely. We too are disheartened by promises that are used, not to sustain growth and social justice, but to put every child in his or her place related to the opportunities afforded or not to each by birthright and privilege.

Case Study C: What Am I Teaching my Amazing Students? (Lis Bass)

This case study expresses personal, professional knowledge, which is counter to, hooked into, and critical of orthodox knowledge about teaching. It also points to some of the internal and external barriers to doing self-study: the subject of the dialogues in Section 4. Many of the intersecting reasons for diversity are here – color, culture, religion, gender, poverty – together with how they result in deep injustices due to lack of kinds of cultural capital which would give them access to power. The study is also about the resilience and courage of people most affected by these injustices. Thus it has links with the first section, discussing definitions of social justice, and with the second section, discussing the kinds of knowledge self-study can give. This case study examines the transformations in both teacher and students, dependent on making spaces for careful telling, listening and personal contacts across divisive hierarchies and in the teeth of damaging, large-scale injustices embedded in the way our society operates.

What is a white, middle-class, educated, Jewish woman doing teaching African-American and Latino working class adult students? And what am I teaching them? I have the most amazing students. I teach remedial English at Camden County College, in Camden, New Jersey, the second poorest city in America and recently listed as the most violent. Most of my students are poor African-American, Latino, or recent immigrants. Many are women who became single

mothers while in their teens. My students come from the kind of high schools that inspired Jonathan Kozol (1991) to write *Savage Inequalities*, the kind that make education an anathema. Teachers feel caught in the same prison-like demands made on the students.

Yet they are motivated students. These men and women deal with relentless crises to attend classes. They come sour from emergency rooms where their children lay in asthmatic comas, they come three days after giving birth, after leaving ailing family members with medications and water in easy reach, and most often they miss class because of too-many and too-young funerals, non-negotiable welfare appointments, subpoenaed court dates, jail, and staggering anxieties.

My students are the survivors of their families and neighborhoods. As one woman pleaded with me, the students do not want to be a statistic, but they live the statistics. Almost all of the women have been physically and mentally abused; almost all the men confront street violence on a regular basis; but here they sit in these bare, beige classrooms trying to learn.

Unselfishly, many come to school for their children, not for themselves. Few speak Standard English, read books or newspapers, or write anything if they can avoid it. They lack fond memories of school and remember instead many moments of humiliation that churn below the surface. Yet they come to school for the very children who make it hard for them to succeed. One student for whom discussions of sharing childcare were useless, ultimately told me of how a relative, asked to mind her children, had raped her seven year old daughter. This woman will not leave her children with anyone. She will not let them walk to or from school alone. She will be there for them as no one is there for her, constantly and anxiously. And she will drop out of college because she does not have the time for herself.

My students cleave to education religiously. They believe that education will change their lives completely. These are students with great ambition – to drive away poverty and its ensuing ugliness of spirit. They seek to solve their families' and friends' problems with the good job they are assured is waiting for them at the end of their degree. Their belief in that which is the center of their lives is so steadfast as to make me pause and question my own beliefs about education.

My first self-study was about how the best current theory and educational practice succeeds and fails us both. This study examined the impact of a transformative curriculum and pedagogy on the experiences of a class of minority adult students and this teacher/researcher during one semester's remedial reading and writing courses. Recent theory suggests that transformative pedagogy, which indicates progressive methods such as an inclusive curriculum, collaborative learning, learning communities, authentic assessments, and critical pedagogy, will empower students, particularly non-traditional students. I used narrative analysis to examine the impact of these pedagogies on the students' developing academic literacy and on the students' views of themselves. The belief is that the transformative classroom is effective in bridging different worldviews.

I have seen urban teachers wrestling with evidence and personal experiences

that suggest urban minority students are not faring as well in school as their white middle class counterparts. The stories teachers tell vary from the insightful to the offensive. These new pedagogies assume that it is in part the distance between marginalized students' lives (and home literacies), and what is taught, and how it is taught, that is to blame for this difference.

When marginalized groups enter the academy there are language issues most recently theorized by the term 'academic literacy'. Rather than claim that people who do not read and write as academics are deficient (and then try to "remediate" them), academic literacy theory clarifies college skills and language requirements by providing an operational definition of academic discourse. This theory is considered progressive though, in practice, it fails to be that, insofar as it fails to be critical of hegemonic language practices. On the other hand, to "not-teach" these students academic discourse is to deny them access to power in our culture. The transformative classroom pedagogy attempts to teach and transform, allowing other voices to rejuvenate academic culture without denying the students the best education we can provide.

Many theorists and teachers believe that the traditional liberal arts agenda fails to support marginalized students' needs. In each classroom the educational contradiction of assimilation (when the student learns, uncritically, a traditional worldview), versus respect for diversity (wherein marginalized students' lives and experiences would not be left on the margins) is played out. Since the 1980s, numerous studies in feminist, multicultural, and radical classrooms have informed transformative pedagogy requiring that this educational contradiction be addressed. These experimental curricula and transformed pedagogies aim, in part, to make marginalized students successful. These methodologies also aim to promote social consciousness and activism among traditional students.

First, I created a classroom where the content overtly aimed to simultaneously help students strengthen individual voice and social dignity and gain academic literacy for economic access. Specifically this involved reading materials that reflected their own lives rather than those of the traditional white Christian middle class. The curriculum was multicultural and inclusive. Students read works: by Malcolm X, about the prophet Muhammad, concerning life issues like parenting and political issues like welfare reform. In the writing sections, many of the essays were based on personal experience, not just writing about other texts. And in both reading and writing, students kept personal journals where their thoughts were not corrected by the teacher, but were accepted as a part of developing practice in academic literacy.

The self-study research reinforced that these curriculum and methodologies do support the environment that Novak (2002) calls for:

> … in the all-important battle against "anarchy in the moral sphere" fought most fully in peaceable ways: through eloquence and example, through human understanding, and above all, through careful arrangement of an environment with the capacity to foster reflection. (p. 624)

But since so much of teaching feels intuitive, the what and how we teach is implicit in who we are as teachers.

My next self-study addressed Gary Howard's question (1999) in his narrative essay, "White Man Dancing: A Story of Personal Transformation," "Why would a white person choose to become involved?"

I gave myself a similar assignment, writing a critical autoethnography focusing on my experiences with difference. A critical autoethnography is an exploratory piece of writing. I began journaling short memory pieces. I focused on stories of difference and race. As is typical of both self-studies and critical autoethnography, I shared my narrative with others to help me reflect, particularly asking questions through the filters of race, class, gender, privilege, religion, sexual orientation, and differing ability. I wanted to make sure of who I was when I was in Pratt's "contact zone."

My story became a (huge) quilt of short vignettes. For example: From Childhood.

> I always begin with kindergarten because that was my first clear memory of difference. I had educational experiences before public school, at the Hebrew Sunday School, and it was there that I learned the story of Hannah. In the story (from Judges) Hannah has to pray hard to get a precious child. She is so fervent in her prayers that once she is accused of being drunk. Finally, she swears that she will give her child to the Lord's service and she bears a son. She is true to her word and her reward is manifold: she bears seven sons. But then, her joy is challenged. In one story, King Antiochus demands that her children eat pork or die. One by one they are tortured and murdered before her eyes. In another version, the King's demand is that the family bow down before idols. Again, one by one she watches her precious children being killed rather than break her word and Jewish law.

> Hannah was my first female hero story. The drama of her desires, her faith, her faithfulness, and her sacrifice touched me. This woman was a sister of the Maccabees – the freedom fighters – and she too was a fighter in a particularly female fashion.

> I suppose I aspired to be Hannah. I too was a Jewish female who did not eat pork. My parents kept a kosher home. I also knew that we were not a family to bow before idols. In fact, that was one of the big Ten [Commandments] – to have no other God before him, which I interpreted literally as not to bow before idols. After all, the early Jews spent a great deal of time running around Canaan smashing idols. Having seen churches with all the statuary and comparing it to synagogues that have no graphic representations, I was taught that we were quite different than Christians.

> All of this would have been lost in memory if it weren't for the day in kindergarten when the teacher taught us to pledge allegiance to the flag. And perhaps it wouldn't have been so bad if the flag hadn't been brought front and center into the room, hanging high above us. But it is just true that all these things conspired to terrify me. I knew in the instant that the teacher asked us to put our hands over our hearts and pledge our allegiance

that I couldn't do it. Jews do not bow before idols. And this idol, a frayed colored cloth, loomed larger than the golden calf. This was my first ethical crisis. I would not break my word, whatever the consequences.

I refused to do it. It plagued me through elementary school. I have never, in fact, managed to hold my hand over my heart and pledge my allegiance to a flag. Oh, some years I didn't want to create a stir so I held my hand over my heart (or lower on my stomach) and looked at the flag, but I never said the words. And every time I am somewhere where people say the pledge, I look around me and feel their vast conformity and my difference.

When I forced myself to reflect on my life, I brought to the fore the experiences of circumstance, activism, and friendship that connected me to the African-American and Latino working class community. I felt empowered to return to my classroom and learn from and with my students. Social justice teaching can by authenticated by the practice of self-study reflection and collaboration.

Self-study also does what Tocqueville suggests: "attach less value to the work and more to the worker" (Novak, 2002, p. 672). Who we are as teachers is vitally important if we are to make classrooms humanizing spaces. We either make them places to inculcate social justice, or they will do just the opposite – reinforce crass consumerism, untempered self-interest, and disconnected identities.

Section 4: Why Is There So Little Self-Study On Social Justice Issues?

This section focuses on a thorny issue for us. We notice how few self-studies focus on social justice – or even mention it. So we have to ask ourselves: Is social justice really so relevant/crucial/inescapable in self-study? Or is it perhaps that these issues are avoided because of the pain and difficulty of dealing with them? The argument of the chapter has come round in a spiral as we re-consider the issues raised in the first section, about how daunting it can be to address social justice as part of a self-study.

The starting point of this dialogue could almost be a case study in itself, although we have not presented it as one. In the introduction we explained that we had all met at the fourth Castle Conference. At the closing session a suggestion was adopted that the fifth conference should be themed around diversity. After everyone had returned home, we were all fascinated by the emails that circulated on the self-study listserv about this suggestion. We read the long string of emails, some expressing deep concern and others expressing strong support. It seemed that this correspondence held a clue to understanding the issue of why there are so few published self-studies on social justice issues. We have not attempted to tell what happened about this particular case, either in the short or the long term. How this particular situation was resolved is not our concern here. Rather, it is significant for the way it highlights some perennial issues about self-study and social justice.

Marilyn Johnston opens the dialogue; she has more questions than answers. The ensuing dialogue then explores our feelings that there seems to be a wish to avoid

issues of social justice in self-study and our puzzlement about the possible reasons for that. Suggestions are made about why avoidance (if it is there) would be significant for self-study. It is possible that if more attention was paid to social justice, that the self-study movement itself would begin to look very different. Some reasons for cautious optimism are suggested. They will be taken up in the Conclusion, "What Now?"

Marilyn Johnston

Why Do Self-Studies Avoid Social Justice Issues?
More Questions Than Answers

I was really fascinated by the short flurry of list serve discussions around the suggestion for a future conference theme *on diversity* that occurred shortly after last year's conference. I don't remember other such discussions about themes for previous conferences (although maybe I have a bad memory).

I think it's all very provocative, not because of the responses themselves, but the fact that there were responses. If someone had suggested a more temperate theme, would there have been such a hearty discussion? Would the worried tone about a theme have been evident if someone had suggested research methodologies or artistic representations in self-study? The fact that responses focused on whether we should have a theme, whether a theme would be constricting to those not focused on the theme, whether teacher education necessarily includes, or should include issues like diversity, suggests to me avoidance and uneasiness.

The discussion of the proposed theme obviously touched an edge, as issues of social justice almost always do. In some cases, there was avoidance in speaking directly about the issue and, as always when these topics are discussed, silences at the edges of the conversations. A few people sent their support in unqualified and eloquent prose. Others questioned the process of selecting a theme, sidestepping the issue of this particular theme, or proposing that their own interests were focused on teacher education or self-study, not social justice.

Of course, many people in the organization did not respond – I didn't. I hardly ever respond to these quick-time discussions. But I sometimes puzzle about them for days, and this one, because it was related to our own writing of this chapter has perplexed me since it occurred. There is so little in our self-study literature related to issues of social justice even though many people in the SIG have deep commitments in this area. Why is it that diversity is so often set aside as an issue not relevant to a particular area of study? Why do questions of difference, othering, prejudice and discrimination get marginalized?

From where I stand, there is no corner to hide in teacher education where diversity is not an integral part of what we do as teacher educators, even in a program with homogeneous appearing white female students who will student teach in all-white suburban schools. Unless these students and their future classrooms are closed off to the rest of the world, they, more than anyone, need to attend to these issues because they are missing diversity in their immediate

experience; they are lacking the resources to help them grow in their understandings of social justice. We live in an increasingly complex world where the media, instantaneous news reporting, and threats of terrorism in our previously safe and protected "homeland" have helped to shape a more pressing and pervasive agenda for education related to issues of diversity.

Who are we as mostly white folks managing the educational institutions, at least here in the United States? Who are we as, "innocent identities carved in opposition to people of color" (Fine, 1997, p. 3)? From our privileged whiteness, are we oblivious to the viewpoints of those who are disempowered or marginalized for their difference, even those with white skins? How is it possible to teach a teacher education class without situating it in the privilege we have accrued as white, educated folks. As we prepare ourselves (this is the site of self-study) and our future teachers to teach students who are different, what subject is free of issues related to social justice? Why shouldn't all of us be required to attend to these issues in our work, even if our work is defined by questions not explicitly related to social justice?

I find myself here writing in questions rather than authoritatively or autobiographically. I clearly have more questions than answers. I don't understand my colleagues' resistance or silences on these issues. Can we excuse them because they have different foci – they're interested in school/university relations or mathematics education (as one email magnanimously explained)?

I worry if a community like S-STEP, which is open, supportive, intellectually rigorous, and passionate about teacher education, cannot easily and openly embrace issues of social justice as a non-binding theme of a conference, how much more difficult it may be to address these issues in other sectors of education that may be less open and supportive.

Lis Bass

Some Reasons Why (1) The Issues Are Hard and Stomach Churning

That is exactly how I've felt about the S-STEP discussions – the resistance is incredibly interesting. I find it significant that there is this resistance to theming the next Castle conference around diversity. There was no resistance to the last three themes. If someone's work wasn't connected to the theme, he or she understood that it was fine to do whatever they wanted to do.

However, there is resistance here and I am impressed by it. As I left the conference I spoke to a variety of people. Two people purposefully let me know that self-study has nothing to do with diversity. Two other people spoke of how although they find the Castle a special space – supportive, comfortable, collegial, and interesting – they were not sure they were coming back because sometimes supportive is not enough. Given the conflicting demands on one's time, money, and attention, the Castle is a big commitment. If one walks away without feeling challenged, intellectually stimulated, having learned some really new things, then is it worth a week and so much money?

In this way, the resistance serves to support the theme. The diversity theme

would give some participants what they want – a challenge. A good self-study always seems to chip away at one's resistance to produce new, powerful learning. Yes, I believe a good self-study is hard and stomach churning at times. For others, however, the theme would reduce the supportive, collegial atmosphere.

I believe the diversity theme is consistent with our teacher education work and is challenging both intellectually and emotionally. The value of a theme is that it might inspire researchers to focus on it though, of course, a theme does not dictate. Still, the synergy of a theme, when a group of researchers work on the same problem from the varied lights of their different contexts and selves, can produce a sum greater than its parts. I think it is time for S-STEP to push itself beyond comfort and support into this more difficult, topical, fascinating, and ultimately necessary domain.

Further, I would ask those researchers who are resistant to the topic to articulate their resistance, reflect on it, enter into a situation to see it in a reflexive light. As people, we rarely resist what we don't feel defensive about. We are rarely defensive if some part of our identity is not threatened. My experience with diversity work is that it does raise resistance, defensiveness, and a threat to who I am – but it is in just those arenas that I feel I have learned the most that leads me to become a better teacher in a multiracial, multicultural world.

Marilyn Johnston

Some Reasons Why (2) Apprehensions of Saying the Wrong Thing

As a self-study research community, we appear cautious about these issues. While many might agree that we should talk about these topics openly, it is difficult to confront sensitive issues and natural to feel cautious or afraid. Nevertheless, our email discussions also brought forth some eloquent statements of support for dealing with equity and social justice issues openly.

One of the things that has emerged so strongly from my own self-study of my teaching about issues of diversity is that even after we have spent a lot of class time studying/reflecting on our own cultural backgrounds/privileges, even after we have built a trusting community, there is a lot of discomfort lurking in the corners of students' willingness to be open and honest in class. They are afraid of hurting someone's feelings unknowingly, they are afraid of being misinterpreted, they are afraid of being culturally insensitive because they feel only superficially knowledgeable about other cultures and differences, and this comes up even when I think we have had a deep and productive class discussion. It seems clear to me that such apprehensions are evident in all groups, even S-STEP, and that the varied reactions on the list serve were related to these kinds of deep apprehensions.

Victoria Perselli

A Strategy for Trying to Overcome the Reasons (Whatever They Are)

Ordinarily I tend not to contribute to list-serv discussions, partly because they are so time consuming and partly because, as a colleague of mine put it, e-mail

also tends to be "at the sharp edge of meaning". That is, what you write is neither conversation, which is so locally embedded, nor writing in the reflective sense of the word. Without context, we can misunderstand the message. I therefore uncharacteristically joined the discussion on the S-STEP list-serv on diversity because I had an anxiety that (a) the diversity theme might get excluded, and I couldn't see any reason to justify that, not least because no competing theme or issue was being proposed, so I was baffled by the evident resistance, and (b) I sensed a boundary being drawn around what/whom constitutes S-STEP itself, which could inadvertently exclude those of us who are, for sure, concerned with both social justice and teacher education, but who approach these from oblique or unusual perspectives. However the indirectness I want to defend is in turn particular to my own current situation and past recollections of living and working in the U.K. – so there's a sense of vulnerability too. What gave me pleasure was to see how, in our chapter, a group of female scholars has managed to sustain such a fascinating dialogic relationship electronically; this has enabled me to make my contribution with real enthusiasm.

Case Study D: Complementary Roles? (Mo Griffiths and Joe Windle)

This case study was carried out by two people who hold very different positions in the academic hierarchy. Among other things, the study investigates how they work together to encourage academic colleagues to involve themselves in educational research. Since the self-study considers collaboration across hierarchy – and ways of overcoming a tendency to avoid looking at our own working relationships as structured by power – it is a case study of social justice. The study explores collaborative conversations as a way of dealing with issues of power differentials (a) between academics and support staff, and (b) across differences of power, age, income, social class, gender and educational accreditation. Discomfort with acknowledging differences of power was overcome. The silence around this most commonplace of working experiences has been breached. The result is that others can learn – and take courage – from the knowledge gained and the method used to do so. The study allows the reader to re-think issues of daunting conversations, diversity, stereotyping, recognition and redistribution. It also makes a space for stories to be told and heard; and for little stories to disrupt some of the dominant discourses of management.

This self-study is an investigation of our two complementary roles within the informal education of teacher educators as (better) researchers. It began its life as a formal study when we decided to present it to the fourth Castle S-STEP Conference. We work closely together in the Education Research Unit. We both love our jobs: helping our academic colleagues learn research by doing it. Mo joined the Education Faculty in 1996, as its first "research professor." Joe joined the Unit as its first full time administrator in 1997, at that time knowing little of universities and less of research. At the time we joined the University, the Unit was funded by the government through the national quinquennial

"Research Assessment Exercise" (RAE). It was hoped that the new Unit would lead to improved ratings for the faculty in the next RAE.

The study is a story of bread and roses. It is also the story of damage and repair. It is a story of the love of roses and threatened bread shortages. So it is a story of how we made our story, continue to make our story, but not in circumstances of our own choosing. For both of us the job combines the relatively humdrum but essential tasks of administration and budget balancing (*bread*) with a human, principled, personal engagement with individual researchers and their projects (*roses*). The study is one rather than two because we are mindful that for each of us our own role is defined with and against the other's role.

The import of the study was sharpened considerably when the whole Research Unit lost all its RAE government funding. The whole existence of the Unit was threatened. This was because we had received the same low RAE grade as we had five years previously. Bewildered, we grieved and felt devastated. Yet we knew that by the indicators used by the RAE, we had improved enormously, and what is more, an external evaluation (by Dennis Fox in August 2000) had reported on the strong support in the Faculty for how the Unit operates.

Plainly, this is a "passionate enquiry" to use Marion Dadds' lovely phrase (1995). As we wrote the study, we remembered our delights, griefs, anger, bile, tears, wry smiles and belly laughs. In April 2002 at a time when the future of the Unit was still in balance, we discussed why we cared so much.

> *Joe:* It's something close to my heart. The job and the Unit mean a lot to me. It's something we built up. It was very different when we arrived. I am devastated by what happened. It was ours, we worked so hard and it is so much better – and it has not been recognised. I feel so strongly about it. But though I'll probably be moving on somewhere else, I'll be able to act on what I'm told I have done right or wrong. I can work on one and what I have done right, I can emphasise more, enhance it.

> *Mo:* I want to set the record straight. It feels terrible being told you are rubbish, even if you know, and everyone around you knows, that what was built up was terrific. I want the evidence. And I want to know "what is worth fighting for," especially given that resources will be tight, to say the least. I would also like to know more about the mood of my colleagues now the first shock is over, and what they think should happen now. This feels like self-study at the sharp end.

But could we, should we, carry on? And if so, how?

In April 2002, as part of the self-study, each of us carried out three conversational interviews with academic colleagues. As researchers they were very experienced, very inexperienced, and somewhere in-between. There were three men and three women. We asked them to explain what they thought we do (or don't do) that helps (or hinders) them learn about research by doing it. We then jointly reflected on the conversations. The interviews told us a lot about how we were perceived in relation to what we hoped we were doing. It also gave us the

opportunity to discuss all of this with each other, especially how we viewed our own roles.

What we heard in the interviews was encouraging. It seemed that the Research Unit was perceived to be performing a very valuable role and to be doing it well. Colleagues valued us for the particular roles we played. They thought that Mo was supportive, challenging, patient and understanding. Joe was seen as being efficient, friendly and having empathy for others. They said:

> Trying out specific ideas on you, Mo. I feel pretty certain that if I put something to you as an idea that you thought was completely naff you might not say "That's completely naff," but you would jolly well challenge. Also with good ideas you still push. That feels OK with you. It's to do with the quality of engagement.

> Sometimes you need support from other people for the things you are doing and to support the ideas you've got and Mo is superb at providing you with this support and helping you to carry it through.

> This is going to sound silly but it was really important: going to Joe and saying, "I need a hand-held tape recorder and some tapes," and being given them! And it wasn't lots of questions and: "How long do you need it for?" It was: "Well, I think I can sort that out. Come round now. What would you like? Anything else you need?" And it was new. And beautiful. There was something about that.

They said they liked visiting us in the Unit (which is in a separate building from the most of the Faculty). They said:

> The Research Unit, to my mind, acts as a sanctuary for battered souls.

> Its impact is something spiritual, about being welcomed and encouraged.

> Sometimes you think of things to research or you talk to people about ideas, but you need backup, infrastructure, support, facilities, someone to talk the idea through with and most importantly you need somewhere to escape. The Unit does this for me.

> I feel very warm and welcome there. It's everyone over there.

In the light of this evidence we discussed how we saw our own roles.

> *Joe:*   When I first started in July 1997. I had no idea what the job was. Initially I thought that I would be supporting Mo and the students. I hadn't given any thought to researchers in the Faculty. In fact that is the biggest part of it. I didn't realise how I would help *all* the academic staff. … Talking to people makes a real difference – and not to bully them about their research. I wanted to make sure that I was approachable because I saw myself as the first point of call. I would always say, "It's what I'm here for." When I'm on the phone to somebody in the Faculty, for example, I don't feel that I have to hurry them or that I can't spend time talking to them. I

think it clearly works. It's very effective. The Unit is a sanctuary. It's not just for researchers, and people can see that.

Mo: I arrived in this university in 1996, shaped by my experiences in other universities of being "managed." I have also been strongly influenced by my (enjoyable) experience of teaching at primary and tertiary levels. I hate managerialism. I hate its obsession with pinning people down into systems, with audits, with performance indicators, with strategic planning by objectives. I hate its basic lack of trust in human beings. I don't think it encourages good research.

As we discussed our self-study, and, especially, how to present it at the Castle conference, an aspect of the study started to loom larger: the relationship between us, as determined by our roles. This aspect of the study had always been there, if only in our beginning assumption that we both define our own roles in relation to the other's. Now it came out of the shadow, out of the periphery, and into the light, into the centre. Perhaps just because we share a commitment to the work of the Unit, perhaps just because we work well together, we are able to lift the shade and look directly at how we work across considerable differences of power and role. To emphasise: one of us, Mo, is a member of academic staff, the other, Joe, is a member of support staff. Mo is much older, more accredited, earns about two and half times as much as Joe and is also his line manager. Moreover, as we thought about the conference, we were both conscious that it was going to be very unusual indeed to have a member of support staff at the conference. Yet the Castle is a conference for teacher educators, all of whom work closely in one way and another with support staff!

Our self-study had begun with one aim (see the Castle 4 conference paper, Griffiths & Windle, 2002) and had now raised a new and, we think, important issue. Accordingly, at the Castle, we asked our audience to construct some principles of collaboration with support staff. We also asked if any of them could describe critical incidents, which had helped them reflect on this common and under-researched power relationship. We had wondered if anyone would be interested in this at all. We need not have worried: the participants participated with enthusiasm and energy, producing sheets of ideas for us (see Griffiths, Windle & Jeckells, 2002). It was wonderful to see how an idea that had surfaced for us, with some difficulty, had now surfaced for others. It also appeared, or so we thought, that it was going to be difficult to push it back under the surface. The kind of knowledge produced in this self-study is not something to be remembered or forgotten. It is felt as a personal discovery that can then not be "undiscovered" again.

Conclusions

Victoria Perselli

What Now? Inconclusive conclusions …

One thing that occurs to me here is the tension I am now feeling, as a result of our conversations about equity and diversity, between the individualistic and

the collective. In one sense, you could say by definition, a self-study is bound to be individualistic. This can and probably should be countered by making it a collaborative venture, which will also enable the self-study to become more explicit, more amenable to critique and open to change. For example, a self-study on the very relevant theme of gender and social class helps me to understand in greater depth the complex economic and social conditions of many of my students. Researching this tentatively together we can begin to think about the varying circumstances of women's lives and the constructs of power and economy that define us.

Some students are very young and are away from their homes and families for the first time; struggling with the problems of housing and travel costs in the South East. Some have come onto the programme via access routes and are already used to funding their own education as well as juggling a range of other commitments. Some are older and have waited a good number of years to fulfil their dream of becoming a teacher.

When we discuss these aspects of our professional development, we find ourselves frequently resorting to stereotypical descriptors and assumptions about each other. Our growing awareness and sudden self-consciousness about our use of language, the forms of words we choose when struggling to communicate our various positionings, really helps in the reflexive process which I believe is necessary to becoming a very good teacher. For example, some students are able to be on the course because their partners earn a sufficient wage to subsidise their studies. Money, therefore, is apparently not the bugbear it might be for others, and some of these students have far more material security than the ones who are "going it alone." But by the same token, it can't be assumed that these women have economic independence: their own bank accounts and non-shared income; a fact the solo students may not have considered. Neither have they thought about the fact that many mothers will complete the course and become teachers in order to gain a steady income so that, in turn, their daughters will be able to go through college.

I think these discussions really help us to develop our sense of respect for the parents we encounter in schools, because they help us to see how behind stereotypical categories and descriptors there are always alternative stories to be heard. There is both the "aha" factor of coming to a common understanding and the "yes but …," which hopefully marks nuances of difference of experience, inhibiting coercion or empathetic consumption of the other. In this way schools (like college), can be understood as a heterogeneous collective where diversity will not be perceived by the emerging teacher as a threat to her authority, and where the most disadvantaged will not be demonised for society's (or the individual's) failure to address fundamental issues of power, privilege and discrimination.

When Mo and I met up to discuss this section of the chapter, we found that we each had immediately identifiable views on certain aspects of how to end what should really be seen as a beginning. Firstly, I particularly wanted to emphasise the word "approaches" to social justice, which we had used in the title of a previous project. This signals an on-going commitment, rather than a

set of answers, that is important in all our work, I feel. Secondly, Mo was adamant that she could never see herself as a cheerleader for social justice; which I interpret as meaning, each one of us must be responsible for our own positioning in relation to the issues – and that is where a self-study might start. Finally, I began to say something about how, as a young person I had come into education because I wanted to change the world, whereas now (being older and supposedly wiser or more world-weary or something) I was more concerned with living my life in a way that did not cause anyone major harm. Being a good student of my own teaching, I had to reflexively double back here, because this too is a rather ageist stereotype, which fails to acknowledge the incredibly difficult task of living the self within the social at a particular point in time when very few of us can act with confidence regarding change, and those who do seem to be remarkably un-self-aware about the potential harm this could cause. It is a trans-generational and trans-world difficulty, but hopefully not a paralysis. In our self-studies we may (only) be changing the world at the micro level, however we are at very least locating that in dialogic relations with others, deliberately seeking perspectives that cut across the dialogue and shake up our cosy existence. We hope that you, the reader, might be similarly inspired.

Some Other Relevant Studies

We include here some recent studies, as yet unpublished except as dissertations, theses or conference papers. They give a flavour of some of the directions that self-study may be taking.

Anderson-Patton, V., & Bass, E. (2000). While not overtly about social justice, this chapter examines two uses of teaching portfolios in graduate education classes to increase the possibility of individual teacher voice, the diversity of possible responses to teacher development, and creativity in representation of teachers' knowledge.

Bass, E. (2002). This self-study examines a narrative written to make overt the author's experiences, biases, identity in relation to issues of race and privilege so that she can become empowered to make change.

Bass, L., & Allender, J. (2001). Here two educators examine their ideas of social justice theories and the impact these theoretical commitments have on their current pedagogy.

Haushildt, P., & Wesson, L. (1999). In this study the authors describe their study of their own pedagogical practices studying six graduate education courses using an action research methodologies. They describe their gradual shift toward postmodern thinking that is reflected in their pedagogical approaches.

Pardales, M. J. (2001). In this dissertation study, the author does a self-study of his own teaching. He analyses the theoretical discourses in constructivism and considers how he as a teacher tries to enact a postmodern social constructivist pedagogy while remaining faithful to both subject matter content and students' ideas, experiences, and understandings.

Perselli, V. (2002b). Here Perselli uses the metaphor of a visual artist revisiting her one-woman show in order to represent and reconceptualise her doctoral

research: seeing each of its most important issues and instances as a painting, a photograph or a piece of sculpture, and thus adding further commentary to her original data analysis.

Perselli, V. (2001). Here Perselli performs a section of her doctoral research as a dialogue, in order to explore its central concerns of "difference" and "dis/ability," as they affected her work as a primary practitioner.

Perselli, V., & Cullum, B. (2001). A commentary from a feminist perspective on the technical rationalism prevalent in preservice teacher education in England.

Summers Eskridge, L., Wyatt, T., Thomas, M., & Johnston, M. (2000). In this paper, two African American graduate students and two professors describe their experiences in a yearlong conversation group and self-study in an M.Ed. certification program. Issues of racism and social justice pervade their conversations. The paper discusses what each person learned from this experience from his/her particular vantage point.

Acknowledgment

Notes

1. This text has drawn fire in the U.S.A. on the grounds that it was not written by a Native American, and is therefore fraudulent. As a piece of fiction, however, it shows how the form of traditional education is abusive to those who have alternative conceptions of learning and of one's relationship to the world.

2. Here is the full definition from the journal:

    Radicalteacher (rad I k'l te char) n. First used in 1975, as two words, when a magazine of that name appeared, edited by a group of dissident college teachers of English. By 1982, small groups of academics throughout the United State and England thought of themselves as radicalteachers and began a process of self-examination on this issue. By the year 1999, it was written in its present form as one word and was synonymous with (the archaic) "teacher." 1. one who provides a student- rather than teacher-centered classroom; nonauthoritarian. 2. one who shares rather than transmits information. 3. one who aids in student growth and empowerment by drawing out what is already there and latent. 4. one who respects students. 5. Radicalteachers have a relatively coherent set of commitments and assumptions from which they teach, and they are aware of it; this awareness distinguishes them from rocks, mollusks, and nonradical teachers. 6. Radicalteachers possess the capacity to listen well and the self-control not to always fill silence with the sound of their own voices. 7. Radicalteachers believe that theory and practice are not separable. 8. Radicalteachers are concerned with process as much as product. 9. Good intentions are not enough to create a radicalteacher. 10. Radicalteachers do not divide neatly into four component parts: scholarship, teaching, service, and institutional need. 11. Radicalteachers understand the power of language and do not refer to their part-time faculty colleagues as part-time persons (or people). 12. The teaching of radicalteachers (radicalteaching, v.) is holistic: it assumes that minds do not exist separate from bodies and that the bodies or material conditions, in which the potential and will to learn reside, are female as well as male and in a range of colors; that thought grows out of lived experience and that people come from a variety of ethnic, cultural, and economic backgrounds; that people have made different life choices and teach and

learn out of a corresponding number of perspectives. 13. Radicalteachers work with themselves, their classes, and their colleagues to discover, name, and change sexism, racism, classism, and heterosexism. 14. Radicalteachers demand a lot from their students; e.g., "we refuse to accept passive, obedient learning and insist upon critical thinking" (Adrienne Rich, "Taking Women Students Seriously," Radical Teacher #11, 1979). 15. There are varieties of radicalteachers; e.g., feminist radicalteachers are not in every respect identical with socialist radical teachers. 16. Radicalteachers do not assume they know it all. -Pamela Annas, editor, New Words: A postrevolutionary dictionary, 2008.

EXAMPLES OF PRACTICE: PROFESSIONAL KNOWLEDGE AND SELF-STUDY IN MULTICULTURAL TEACHER EDUCATION*

Ann K. Schulte
California State University at Chico

Abstract

This chapter examines the development of professional knowledge in multicultural teacher education by providing examples of quality self-studies that speak to the need to prepare teachers for diverse student populations. The chapter begins with a description of the persistent challenge of White, middle-class, English-speaking females learning to teach for diversity and then describes the process of transformation, through which this challenge can be addressed. Transformation is the continuous evolution of one's own understanding and perspectives in order to meet more effectively the needs of all students. It is generally marked by a disruption of values or cultural beliefs through critical reflection with the goal of more socially just teaching. The chapter provides analyses of self-studies that show how teacher educators studied their role in transforming preservice teachers' beliefs, attitudes, and assumptions regarding culture, race, sexuality, etc. In the process, the teacher educators also recognized their own beliefs and assumptions that impacted their ability to prepare effective teachers. The studies reveal many insights, some relevant primarily to the practitioner, but many others that speak to the improvement of the preparation of teachers in general. The chapter concludes with ideas about how these types of studies provide incentive for more careful attention to and research about the preparation of teacher educators who prepare teachers for diversity.

In this chapter, I will highlight teacher educators' self-studies that seek to better explicate the transformation of preservice teacher beliefs about multicultural

education by looking at one's own transformation in beliefs and practice. In addition, I will suggest that these kinds of self-studies in teacher education can contribute to a professional knowledge base. Hiebert, Gallimore, and Stigler (2002) suggest that there are useful ways that practitioner research, in addition to traditional educational research, can build the knowledge base for teaching. While the authors focused on knowledge created in K-12 classrooms, in this chapter I will extend their ideas to suggest that teacher educator practitioners can contribute to the professional knowledge base following the same guidelines.

Hiebert *et al.* (2002) contend that in order for practitioner research to become professional knowledge it must meet three complementary and overlapping requirements. First, professional knowledge must be made public with the intent of not only communicating it to others but also making it open for discussion, debate, verification, and modification. Second, once this knowledge is public, there is a need to store it and make it available, over time, to other educators who may use it. Finally, professional knowledge must be verifiable and continually improving. Knowledge that is public and easy to access is much more likely to be tried and evaluated in different contexts. The knowledge created from these trials is then able to be shared publicly, thus revising and improving on the burgeoning knowledge base.

The requirements put forth by Hiebert *et al.* are very relevant to thinking about how self-study of teacher education practice can contribute to better understanding how preservice teachers are prepared to teach diverse student populations. All practitioner knowledge is integrated with problems of practice. Self-study demonstrates that these problems of practice are also indelibly connected to the educator, and that recognizing these connections can serve to bridge one's beliefs and actions in order to improve one's knowledge about one's practice. "Such knowledge informs future action and illuminates instructional decisions, creating praxis – informed, committed action that gives rise to knowledge" (Tidwell & Heston, 1998, p. 45). Cochran-Smith and Lytle (1993) assert that this creation of knowledge will not only add to, but will alter the knowledge base in education.

What follows in this chapter will be a description of the challenge of cultural homogeneity in teaching and how self-study of multicultural teacher education practices can serve to better prepare teachers for diversity. A variety of teacher educator self-studies will be reviewed, measured to a standard of quality, and analyzed for contributions to the professional knowledge base in education. The chapter will conclude with suggested directions for similar research.

Setting the Problem

Let me begin by restating the often professed but rarely solved dilemma in teacher education today. The majority of teachers and teacher education students continue to be White, middle-class, monolingual females (Zimpher & Howey, 1992) who often come from small towns or suburbs with very limited intercultural experiences (AACTE, 1987, 1989). These characteristics make it more difficult

for "typical" teachers to be culturally responsive through curriculum, instruction, and management (Ladson-Billings, 1994). In addition, the mostly culturally homogenous populations of preservice teachers are continuing to be prepared by teacher educators much like themselves (Howey *et al.*, 1994; Zeichner & Hoeft, 1996) who are often lacking in the same kinds of intercultural experiences as their preservice students (Zeichner, 1996).

This marked homogeneity in the teaching force as well as the colleges of teacher education presents a pervasive challenge. How do we prepare teacher educators to prepare teachers to transform schooling into a just and equitable learning experience for all – given that many of them have not experienced marginalization by unjust or inequitable schooling? I will argue that self-study of teacher education practice is at least one way to reflect on and learn from these inequities, and it benefits both teacher educators and those they teach.

The social reconstructionist tradition foregrounds the relationship between social conditions of schooling and practices that take place in classrooms in order to promote social justice (Liston & Zeichner, 1991). Within this framework, there is much research about what teachers need to know to overcome the imbedded structures and practices that work against better education for a pluralistic society. In order to effect change, many teachers must begin by recognizing and then, if necessary, transforming their own attitudes and beliefs about teachers, students, and schooling shaped by the socialization patterns in education. Social reconstructionism also indicates that teacher preparation must equip prospective teachers to, "challenge established practices, institutions, and ways of thinking and conceive new and alternative possibilities" (Pai, 1990, as cited in Ladson-Billings, 2001). But Goodlad (1990) found that most preservice teachers are not participating in teacher education programs that support the social reconstructionist tradition (as cited in Ladson-Billings, 2001).

Much of the research to date emphasizes the difficulty in significantly transforming preservice teachers' beliefs so that they might better be prepared to work with culturally diverse student populations (e.g., Zeichner, Tabachnick, & Densmore, 1987; Borko & Putnam, 1996). Teacher educators have examined their influence on students within a single course (Kennedy, 1998), in the use of action research (Gore & Zeichner, 1991), and through the supervision relationship (Borko & Mayfield, 1995) with poor results. In a review of learning-to-teach literature, Wideen, Mayer-Smith, and Moon (1998) reported that few studies on programs that have sought to change preservice teachers' beliefs were successful. Long-term interventions with a consistent message, small groups, and close relationships often characterized the programs that reported a positive change in preservice teachers' beliefs specifically about multicultural education. The most common recommendation made by researchers in the studies reviewed was that having beginning teachers examine their prior beliefs was an "essential first step in the process" of learning to teach (Wideen *et al.*, 1998, p. 160). Programs that were designed to build upon the preservice teachers' beliefs as opposed to trying to replace them were more successful.

In a comprehensive review of the teacher education research, Zeichner and

Hoeft (1996) agree that there is consensus in the literature that the development of one's own cultural identity is a necessary precursor to cross-cultural understanding. But they say this development is most effective when students are part of a cohort, placed in field experiences with a diverse student population, and provided opportunities for guided reflection. Rarely does the literature report that the reason these efforts are failing is, in part, because teacher educators are not adequately prepared to engage preservice teachers in the critical transformation needed to become more effective with diverse student populations (Merryfield, 2000).

The next section describes in more detail the concept of transformation and how it is used in preparing teachers for diversity. I will provide a review of the literature, some examples, and a caveat. This will be followed by a description of how studies related to transformation are situated in the educational literature.

Transformation and Teacher Education

Transformation is the continuous evolution of one's own understanding and perspectives in order to meet more effectively the needs of all students. It is generally marked by a disruption of values or cultural beliefs through critical reflection with the goal of more socially just teaching. It requires teachers to think critically and challenge ideas of how power and control are constructed in the world and mapped onto themselves. This process can help teachers understand their own cultural positions and to reflect on and analyze the reasons why they might find the behavior or perspective of a culturally different person confusing or objectionable.

One of the more common examples of teachers' cultural assumptions is the different interpretations of direct eye contact. For example, a teacher might request that a student looks at her when she is talking to him. If the student does not readily comply, a teacher may view this as disobedience or disrespect and punish him. However, if the teacher is aware of that student's cultural perspective on the appropriateness of eye contact, she will have a more appropriate response to the student's behavior. Other more subtle examples of cultural assumptions are related to language patterns, acquisition of authority, and the value of collaboration.

The transformation of teachers can also lead to more democratic classrooms where teachers recognize the power dynamics in educational processes and society. When teachers make these power dynamics explicit to their students, they also put up for examination the teacher's power within the classroom. The primary goal is that through better understanding themselves and their positions within their classroom, teachers will begin to better understand their students, especially those who are different from them.

Banks (1999) describes the transformative approach to curriculum as one that encourages student to take a critical stance on the curriculum. This should also include a careful examination of cultural perspectives, including one's own.

Banks describes Woodson, DuBois, and Franklin as historically significant transformative scholars and educators. Grant and Sleeter's (2003) multicultural and social reconstructionist approach to education also includes recommendations to engage students in examining their own life experiences to better understand systems of oppression and privilege. Both of these approaches speak strongly to the need for the process of self-study for all educators.

This concept of transformation has many other comparable terms in the literature as well: for example, cultural therapy (Spindler & Spindler, 1993); political clarity (Bartolome, 1994); critical pedagogy (Nieto, 1999; Brookfield, 1995); critical cultural consciousness (Gay & Howard, 2000); and, developing a minority perspective (Sleeter, 1995). In a review of the literature about professional growth of preservice and beginning teachers, Kagan (1992) provided a particular perception of teacher transformation by highlighting various studies that explained teacher change by means of "developmental stages" and "evolutionary patterns." Likewise, Sarallena (1997) described three stages of cultural awareness, and Tatum (1992) offered a theory of racial identity development. Howard (1999) contended that the goal for Whites is a "transformationist White identity."

Transformation is a continual process, not an end. As in teaching, one does not achieve a level of mastery and then cease to grow. It is not necessarily hierarchical stages of development, so much as it is a rounding out of understanding. The concept of transformation is not static. In fact, Wilkes (1998) suggests that we should expect our students to transcend our own level of transformation. She provides an excellent metaphor:

> There may be no end to this race, no finish line to cross. The ideas keep expanding and traveling from learner to learner, passed from one generation of thinkers to another, each one more vibrant, more exuberant than the one who went before. We have received the baton from our own teachers, mentors, models. We carry it for a time, but we run with it slightly differently than they did. Our arm movement, head movement, leg movement, and breathing patterns are our own. But we run as fast and as well as we are able. Ahead, we can see our team mate – ready and poised to take over the race. As we hand over the baton to them and watch them explode forward, we stand contentedly and cheer them on. (p. 205)

Wilkes' metaphor suggests this process of transformation is continuous movement between and among teachers and students. As teachers examine and reflect on their positions in society, they also model for their students how to continue this process creating a perpetual change action. Our life experiences and cultural assumptions shape how we make meaning of new information. Therefore, teacher educators must be critically aware of how these assumptions are effecting the way they interact with students and be transparent in that reflection.

It would follow that when teacher educators provide preservice teachers with experiences in challenging cultural assumptions, then those preservice teachers'

experiences will have an effect on *their* students' transformation process. In other words, by engaging preservice teachers in transformative experiences while simultaneously modeling one's own transformation process, a teacher educator is providing two experiences to the preservice teacher: how to be transformed and how to transform others. Thus, much like a ripple effect, the ability to critically reflect and challenge would further evolve and produce greater opportunity for change in society at large.

Brookfield (1995) referenced the process of critical pedagogy in which the teacher acts as a "penetrator of false consciousness" (p. 208) and, "students are helped to break out of oppressive ways of thinking and acting that seem habitual but that have been imposed by the dominant culture" (p. 209). Saavedra (1996) wrote preservice teachers, "need the opportunities to confront their own situatedness, as male or female, and as members of diverse racial, ethnic, cultural, and economic groups" (p. 272). Howard (1999) described his experience of transformation as "breaking the seal on his own cultural encapsulation" (p. 17).

Embedded in the many descriptions of the transformation process is the idea of dispelling common assumptions. Spindler and Spindler (1993) referred to the transformation process as "*cultural therapy*" stating, "For teachers, cultural therapy can be used to increase awareness of the cultural assumptions they bring to the classroom that affect their behavior and their interactions with students – particularly students of color" (p. 29). (Note the assumption of the teacher as White. This reinforces the idea that transformation is most often associated with the "typical" teacher population). Ultimately the benefit of this "therapy" is in helping teachers to understand their own cultural positions and the perspectives of those who have culturally different behavior.

Much of the multicultural teacher education literature describes how teacher educators are working to disrupt cultural assumptions through assignments, field experiences, and supervision. The next section will describe how some teacher educators are approaching this transformation process.

Challenging Assumptions with Preservice Teachers

In *Inside/Outside*, Cochran-Smith and Lytle (1993) highlighted Project START, a school-university partnership in Pennsylvania that promotes transformation by encouraging students to problematize what they know about diversity. The program seeks to accomplish this by having students look at, "typically unexamined assumptions about their own histories and the cultural and linguistic backgrounds of others; about the motivations and behaviors of children, parents, and other teachers; and about the most appropriate pedagogies for particular groups of learners" (p. 74). Cochran-Smith and Lytle (1993) noted that when teachers take an inquiry stance on diversity, "they make problematic much of what is usually taken for granted about culture, learning, language, and power … [they] attempt to uncover the values and interests served by the common arrangements and structures of schooling" (as cited in Cochran-Smith & Lytle, 1993, p. 74).

As a teacher educator, Samaras (1998) expressed her desire to assist in the transformation of her students:

> I wanted to create a classroom aura that prompted students to work at the rough edges of their competence and understanding. I had envisioned an environment of cognitive dissonance in which students' notions of teaching were challenged by moral and intellectual discussions with peers, cooperating teachers, and professors, and where students were permitted to make and share their mistakes. (p. 63)

Similar to Samaras, other White female teacher educators (e.g., Ahlquist, 1991; MacGillivray, 1997; McIntyre, 1997; Rosenberg, 1998) have also struggled in their own pursuits to gain insight into how they create these opportunities for cognitive dissonance with preservice teachers who are similar to themselves. It is a complex process whereby one is trying to pass on opportunities and experiences with a particular desired outcome, realizing that assumptions are made about both the process and the outcome. MacGillivray calls it a "struggle within and against myself" (p. 470). Ahlquist (1991) referred to it as a "double-bind situation" where she felt "simultaneously like the oppressor and the oppressed" (p. 165). Young (1998), an African American teacher educator, also described similar struggles she had with her predominantly White preservice teachers. She said her students were initially extremely cautious about talking about race, but open and honest discussion provided opportunities for students to "develop multiple explanations" and "argue multiple points of view" (Young, 1998, p. 111).

Some have criticized White educators for making Whiteness the center of multicultural pedagogy and reducing the complexity of learning to teach into a White teacher identity issue (e.g., Hernandez-Sheets, 2000). Certainly, the preparation of effective teachers for diversity includes a plethora of complex issues, not the least of which is race. However, the necessity for the transformation of student teachers is usually – though not always – based on the idea that most preservice teachers are White and have not experienced significant oppression because of this. Critical reflection about one's assumptions is necessary and can be a transformative experience for any person, no matter what race. However, those who belong to the dominant/power culture, as do most practicing and preservice teachers, may have less experience in recognizing their privilege, and thus others' oppression in our society (McIntosh, 1989).

In education programs, the process of transformation is usually promoted or directed by teacher educators who are also of the dominant culture, that is, White. This means both preservice teachers and teacher educators alike need to work toward transformation (see Garcia, 1997). In fact, the dual influences of white privilege among both teachers and students may indicate an even greater obligation for careful consideration of how that dominant social position affects equity in education.

Transformation: A Caveat

The examination of one's privilege is complex, often painful, and significantly risky. Brookfield (1995) explained that, "experiencing critical reflection sometimes involves us in a return to childlike emotional states. Faced with the prospect of rethinking familiar assumptions, and knowing that this means we may have to change how we act, we run for any pacifier we can find. We are infantilized by the loss of old certainties" (p. 226). Additionally, conducting this transformation in the presence of others (i.e., a university or school setting) can lead to "cultural suicide," which Brookfield said happens when, "people who make public their questioning of taken-for-granted assumptions and expectations find themselves excluded from the culture that has defined and sustained them up to that point in their lives" (p. 235). It is precisely this public vulnerability, however, that makes this kind of self-study of teacher education practice believable and more valid.

There are some serious ethical aspects to consider when challenging students' deeply held beliefs. Pekarsky (1994), in a critical examination of the purposes of the Socratic method, asserted that moral growth is commonly associated with this method and that this technique is often used in transformation, to bring a student, "from smug self-confidence to perplexity" (p. 123). He went on to make the point that "having brought the student from unthinking prejudice to a state of perplexity," a teacher should extend the process to the pursuit of truth. Pekarsky argues that although Dewey claims that perplexity may result in something less than the truth but possibly "a more adequate set of beliefs," teachers can not be sure of the outcome of such perplexity unless they have a sufficient sense of the student's belief system and emotional life (p. 126).

Creating cultural disruption for those not of the dominant culture should also be carefully considered because of the potential harm. Tierney (1993) examined the impact of value disruption on Native American college students. He wrote, "the system we have in place in colleges and universities is not culturally self-sustaining for minority students; instead, it is based on the belief that for success to occur, cultural disruption must take place" (p. 319). Tierney argued that for students who have a strong sense of ethnic culture, the threat of such a transformation could prevent them from attending college or cause them to drop out in order to preserve their cultural identity. This may sabotage attempts to recruit people of color into the field of education.

These warnings speak to the importance of teacher educators being experienced and skilled in the process of transformation, and becoming skilled in the process involves systematically and reflectively studying it. This is the juncture at which the practice of self-study becomes critical to the success of the transformation concept.

What follows is a glance at how self-study in general is referenced within the teacher education literature. Then, the following section will show how self-studies related to the transformation process are situated in the multicultural teacher education literature specifically.

Self-study in Teacher Education Research

A thorough discussion of the many definitions of self-study is beyond the scope of this chapter, but can be found in other chapters within this handbook. It is helpful, however, to look at how self-study, or research similar to it, is described in the teacher education literature. Because it neither prescribes to a particular methodology nor promotes a single goal, self-study remains difficult to define. In the fourth edition of the *Handbook of Research on Teaching*, Zeichner and Noffke (2001) described self-study research as using "various qualitative methods" to focus on a "wide range of substantive issues" (p. 305). They offered examples of self-studies in different genres and compare it to narrative life histories and action research without specifically defining it in its own right. Zeichner and Noffke also noted an increase in recent years of publication of self-studies in teacher education specifically.

In *The Teacher Educator's Handbook*, Richardson (1996) made a case for recognizing practical inquiry as an important contributor to the knowledge base, but she never actually used the term self-study. Within the practical inquiry genre, Richardson included reflective practice, clinical analysis, and action research, all methods that are employed in K-12 classrooms as well as in the context of higher education. Self-study would seem to fit in many of these categories depending upon the extent of the inquiry and the topic, or themes, that emerge. Richardson also points out that higher education faculty seldom conduct this kind of inquiry – inquiry that is rarely rewarded in tenure or promotion. In the second edition of the *Handbook of Research on Teacher Education*, Richardson (1996) defined self-study research as "teacher educator as researcher studies" and qualified them as "high-risk activities" (p. 114). Richardson reiterated that the field is lacking studies on teacher educators' beliefs and practices, and that more of this research "will be particularly helpful in the improvement of teacher education practices" (p. 115).

Ducharme and Ducharme (1996) also suggested that research on teacher educators as practitioners is an area that needs further research. They quote Hall and Koehler in saying that there should be more emphasis on, "*descriptive research* (to understand a phenomenon) as a complement to *improvement research* (designed with intended impact on practice)" (Hall & Koehler, n.d., in Ducharme & Ducharme, 1996, p. 1043). This is an excellent distinction that promotes self-study of teacher education practice as a potential knowledge source for the field, and not just good professional development for an individual.

It is slightly disheartening that there is not a single reference to the term "self-study" in *The Teacher Educator's Handbook*, which is subtitled *Building a Knowledge Base for the Preparation of Teachers*. This is probably due to the fact that the term self-study did not come into more widespread use until after the special interest group (S-STEP) was formed in the American Educational Research Association in 1992. Although the various teacher education handbooks provided ample indications for the need for teacher educator's to study how preservice teachers learn to teach for diversity, there were very few references

to the type of self-studies that focus on how *teacher educators* understand this practice. In the next section, I will show how these types of self-studies would be categorized within the multicultural teacher education literature.

Multicultural Teacher Education and Self-study

In the second edition of *The Handbook of Research on Multicultural Education*, Cochran-Smith, Davis, and Fries (in press) provided a synthesis of eight widely cited reviews that focused on the initial recruitment and/or preparation of teachers for a multicultural society (Grant & Secada, 1990; Ladson-Billings, 2001; Zeichner & Hoeft, 1996; Ladson-Billings, 1999; Weiner, 1993, 2000; Sleeter 2001a, b). Within these reviews of studies, there were many references to how teacher educators play a role in changing preservice teacher attitudes with regard to diverse student populations.

In addition to recommending ways to improve how we prepare preservice teachers, Cochran-Smith *et al.* outlined a variety of reviews (Gollnick, 1992; Haberman, 1996; Ladson-Billings 1999; and Sleeter 2001a, as cited in Cochran-Smith *et al.*, in press, p. 25) that propose new lenses through which to re-examine issues and approaches that may lead to reinventing multicultural teacher education. A theme present in this synthesis of syntheses was the need to move beyond traditional notions of research by including more practitioner research that represents the intersections of scholarship and practice. Cochran-Smith et al. were careful to note that this kind of scholarship should be held to high standards but that, "there may be different notions of what high standards look like" (p. 27).

Banks' Typology of Multicultural Education

In the first edition of *The Handbook of Research on Multicultural Education*, Ladson-Billings (2001) uses Banks' (1993) typology of multicultural education to categorize the research. Although the kind of self-studies being examined in this chapter may overlap in all five areas of Banks' typology, they are primarily studies that could be classified under *knowledge construction* or *prejudice reduction*. Knowledge construction was defined by Banks (1993) as the, "procedures by which social, behavioral, and natural scientists create knowledge and how the implicit cultural assumptions, frames of references, perspectives, and biases within a discipline influence the ways that knowledge is constructed within it" (pp. 5–7, as cited in Ladson-Billings, 2001). Literature in this category primarily focuses on what preservice teachers need to know about teaching for diversity. At least one study (Ahlquist, 1991) represented what would best be described as a self-study of the teacher educator. This study is described in more detail later in this chapter.

Prejudice reduction is the dimension of multicultural education that describes racial attitudes and strategies that can develop more democratic attitudes (Banks, 1993). The four pieces of literature included in Ladson-Billings' review were focused on aspects of teacher education that were effective in changing the

dispositions of preservice teachers. Although these sources provide helpful knowledge for teacher educators, rarely do these authors take into account how the teacher educators experience the process of transforming dispositions, preservice teachers' or their own.

Cochran-Smith's Questions Related to Multicultural Issues

Cochran-Smith, Davis, and Fries (in press) used Cochran-Smith's framework (2002, as cited in Cochran-Smith *et al.*, in press) of eight questions related to multicultural issues to categorize the research on multicultural teacher education. Although there is much potential for studies to overlap, the studies that will be considered in this chapter on self-study would be classified primarily under the framework's questions of *ideology, knowledge*, and *teacher learning*. The description of Cochran-Smith's question of *institutional capacity* dealt briefly with the impact of higher education faculty engaged in professional development related to multiculturalism and could include self-studies.

The *ideology* question within Cochran-Smith's framework involved the ideals, values, and assumptions about the purposes of public education in a democratic society. The studies in this category often referred to the need for both teacher educators and preservice teachers to interrupt ideological assumptions (Jenks, Lee, & Kanpol, 2001; Sleeter, 1995; Yeo, 1997, as cited in Cochran-Smith *et al.*, in press, p. 36) and help preservice teachers interrogate privilege and power (Cary, 2001; Ewing, 2001; Grant & Wieczorek, 2000, as cited in Cochran-Smith *et al.*, in press, p. 36).

The *knowledge* question has to do with the knowledge, interpretive frameworks, beliefs, and attitudes considered necessary to teach diverse populations effectively. In addition to having a significant knowledge base about the subjects they teach, teachers must *know* the attitudes and beliefs necessary to be successful with diverse populations specifically. Some of the studies reviewed in the Cochran-Smith *et al.* chapter suggested that preservice teachers need to examine their own cultures and "think of themselves as cultural beings" (Gay, 1993; Goodwin, 2000; Grant, 1991, as cited in Cochran-Smith *et al.*, in press, p. 39).

Cochran-Smith's question of *teacher learning* dealt with the pedagogies teacher educators use to prepare preservice teachers to teach for diversity. Studies in this category usually reflected how a teacher educator examining his teaching impacts preservice teacher outcomes. One area within this group of studies referred to the practice of learning to teach by inquiring into one's own experiences. All of the studies Cochran-Smith *et al.* summarized focused on teacher educators who engaged their preservice teachers in autobiographical writing, teacher research, dialogue journals, and oral inquiries.

With regard to *institutional capacity*, Cochran-Smith *et al.* briefly highlighted studies that supported faculty professional development in the areas of multicultural education. The studies that were defined as self studies or practitioner inquiries were based on narrative, analyses of a course, and collaborative dialogues among and between faculty colleagues to explore issues related to teaching for diversity. The authors acknowledged both the difficulty and the danger that

may be present with this kind of self-study work. One study recommended the need to better prepare teacher educators for this field (Wallace, 2000).

It is evident that the literature on multicultural teacher education provides adequate recognition of the need for teacher educators to engage in looking at their own practice in order to better understand the process of preparing teachers for diversity. The next section will provide additional support for the need for teacher educators to engage in both the transformation process and a reflective study of it.

Teacher Educators and Transformation

Little is known in general about the process that teacher educators undergo as they learn and develop in their professions as academics (Russell & Korthagen, 1995), but even less is known about how teacher educators make sense of their own identities, dispositions, and assumptions in the context of teaching for diversity. Jenks, Lee, and Kanpol (2001) suggested that most teacher educators have not had the transformative learning experiences necessary to provide them for their preservice teachers. Therefore, the field is ripe for studies that feature teacher educators negotiating the process of transformation both for themselves and their students.

Wideen *et al.* (1998) said that teacher educators' background, perceptions, and images of power, "must be regarded as valuable and fundamental areas for investigation within the learning-to-teach ecosystem" (p. 170). Other studies have indicated a need for teacher educators to examine their own ideologies much like they engage preservice teachers (e.g., Cochran-Smith, 1995; Graham & Young, 2000, as cited in Cochran-Smith *et al.*, in press). More directly than in any other professional preparation, teacher educators exhibit that which they want their students to be. Richert (1997) asserted that, "the cultural milieu of teaching renders it exceedingly important for teacher educators to reveal the learning requirements of their work and to model these learning processes in their practice" (p. 5). It is vital that teacher educators are willing to engage in quality self-study processes that we expect preservice teachers to use. In the next section, I outline a variety of indicators that describe quality self-studies focused on issues related to diversity and transformation. These will serve to contextualize the sample studies that will follow.

Indicators of Quality Self-study

It is important to note that my intent is not to prescribe what makes a study self-study. Rather, I will provide some indicators that will help the reader to recognize not only quality research, but also self-studies that effectively model the process of transformation as a result of, or in concert with, the self-study. Quality self-study in general is indicated by: 1) thorough descriptions of the context, data collection and analysis; 2) thoughtful problematization of the

researcher and her practice; 3) indications for how the study changed the researcher's practice; and, 4) a description of how it might contribute to the knowledge base for teaching.

It is important to remember that self-study is the focus of the study, not the methodology (Loughran & Northfield, 1998). Therefore, a variety of (most often) qualitative methods should be systematically employed to ensure scholarly validity. Feldman (2003) suggested that multiple representations and detailed descriptions of the data would lend to validity of the study. Often self-study is criticized for its lack of rigor or attention to the research process. This is not surprising given that I found very few studies that provided an extensive description of what data was collected and how the conclusions or actions were indicated by the data. I sought studies where the researcher provided adequate explanation of a methodology that reflected sound and ethical data collection as opposed to just the telling of one's story. This kind of story telling has been shown to be meaningful and even effective in professional development of preservice teachers (Carter & Doyle, 1995; Knowles & Holt-Reynolds, 1991), but it does not constitute necessarily a self-study. Even harder to find was an explanation as to how the researcher made the link between evidence in the data and the conclusions or suggested changes to his/her practice. A compounding factor may be the difficulty in articulating this process. Both transformation and self-study require someone to be highly intuitive and continuously metacognitively aware of one's own learning and teaching processes. This is often difficult to comprehend let alone to articulate.

In addition to an adequate description of data collection and analysis, high quality self-studies provide a thorough description of the researchers and their context (Bullough & Pinnegar, 2001). Within the broader multicultural education literature, researchers will regularly list a detailed description of the subjects of the study including their race, class, gender, etc. Often, however, they do not indicate how these specific demographics impacted the results of the study (Grant, Elsbree, & Fondrie, in press). Bullough and Pinnegar (2001) noted that self-study recognizes that who a researcher is, is central to what the researcher does, and this should be reflected in the results of a self-study.

A second criterion for quality self-study is the thoughtful problematization of the researcher's practice. Did the researcher not only appear to genuinely problematize her practice, but did she also involve others in critiquing the findings? This would involve the researcher in carefully examining her beliefs, assumptions, and behaviors through other perspectives. Without this critical perspective it might be seen as merely justifying one's actions or frame of reference, or worse, be considered self-indulgent "navel-gazing."

Many proponents argue that self-study involves an "other" (e.g., Loughran & Northfield, 1998; Bullough & Pinnegar, 2001). The "other" is often preservice teachers, or in many cases it is teacher education colleagues. Within multicultural education studies, the critique is often by the societal "other," people from marginalized groups. Researchers often seek a "critical friend" or someone to

provide another perspective, however sometimes it is this critique that initiates the self-study (e.g., Cochran-Smith, 2000).

Hiebert *et al.* (2002) suggested that when research is made public it becomes open to critique and debate. Published self-studies may act as a critique of or lens through which to view one's own self-study. For example, as a teacher educator engages in studying his own practice, he may read other studies that cause him to consider his data and experiences differently. Themes or dilemmas may be presented in another study that act as scaffolding, in a sense, for the teacher educator's current work. Thus, using other self-studies perpetuates the modification of ideas and creation of new knowledge for the teaching profession.

Genuine problematization portrays a sense of humility and authenticity on the part of the researcher. Loutzenheiser (2001) describes this as an active ignorance, "If I assume that I always have more to learn than I can ever know, especially about those less like me, those different from me, then I am never fooled into thinking that I am 'done'" (p. 199). However, authenticity should be indicated with reference to professional practice, not a purely personal reflection. Bullough and Pinnegar (2001) warned that, "tipping too far toward the self side produces solipsism or a confessional, and tipping too far the other way turns self-study into traditional research" (p. 15). They also cautioned that an, "authentic voice is a necessary but not sufficient condition for the scholarly standing of a biographical self-study" (Bullough & Pinnegar, 2001, p. 17).

Quality self-studies show actions the researchers took in response to the findings and describe how this ultimately changed their practice (Feldman, 2003). Even though the focus of a self-study is constantly changing, there should be a clear description within a self-study report that indicates how the self-learning is reflected in action (Loughran & Northfield, 1998). Without this step beyond reflecting, self-study would not serve as much to further the teacher educator's practice, or the field of teacher education in general. Hiebert *et al.* (2002) suggested that when researchers make public the changes that occur in their practice, others can read the study and apply aspects appropriate for their contexts. Thus, using other's self-studies contributes to the adaptation of ideas and creation of knowledge for the teaching profession.

Finally, a good self-study should explicitly indicate how it connects to educational theory and contributes back to the general knowledge base of teacher education. Questioning the theoretical underpinnings of a practical venture, "is vital to teacher education if the importance of the knowledge base for learning about teaching is to be recognized and valued in the educational community" (Loughran & Northfield, 1998, p. 8). Bullough and Pinnegar (2001) contended that, "for public theory to influence educational practice it must be translated through the personal" (p. 15). This personal study must then be situated back in public theory so as to extend the work of self-study to the broader realm of educational research.

At the very least, good self-study of teacher education practice should provide a thorough description of the educational context, as well as a descriptive analysis of the data and its implications for the researcher's practice. However,

I argue that when a researcher makes explicit her own identity and analyzes it in the way that she has problematized her students' identities, she provides more information about how she understands the context outside of herself. These studies, then, provide other teacher educators with a greater understanding of whether or not her experiences will be meaningful and relevant to their experience. This knowledge construction process will be discussed further in future sections of this chapter.

What follows are the analyses of self-studies that address these criteria, with an emphasis on those that meet the kind of identity problematization that I suggest is so critical to building a knowledge base to better understand the process of potentially transforming preservice teacher beliefs.

Self-studies by Teacher Educators

This chapter focuses specifically on studies by teacher educators preparing teachers for diversity. These studies were obtained through a search of ERIC (keywords: self-study and teacher education: 1992–2003), references in research handbook chapters (e.g., Ladson-Billings, 2001; Cochran-Smith *et al.*, in press), dissertation references (Schulte, 2001), various texts that featured self-study in teacher education (e.g., Cole, Elijah, & Knowles, 1998; Hamilton, 1998), consultation with colleagues with related expertise, and quite literally a random scanning of teacher education journals. It was very difficult to search for studies that could be classified in so many different ways. One way I discovered two important studies was by sitting down with a stack of the most recent *Teaching and Teacher Education* journals and reading through the titles and keywords of the articles. Even then, the keyword "self-study" may or may not have indicated the intent or types of studies represented in this chapter. The fact that these self-studies are not abundant in the general teacher education literature indicates the need for improving both the promotion of and status of the publication of self-study.

There are various studies where teacher educators seek to better understand their role in transforming preservice teachers' beliefs, attitudes, and/or assumptions about culture and race (e.g., Rosenberg, 1998; McIntyre, 1997; Young, 1998), sexuality (e.g., Mulhern & Martinez, 1999), the intersections of race, sexuality, class, gender, religion, and ability (e.g., Loutzenheiser, 2001), and language (e.g., Curran, 2002). These and other studies often focus on strategies or techniques in how to change those dispositions. It should also be noted that there are many other examples of educators who similarly problematize their identity within the teaching process (e.g., Ellsworth, 1989; Martindale, 1997; Orner, 1992; Palmer, 1998), however, this chapter deals specifically with those studies by teacher educators who work directly with preservice teachers.

Some teacher educators of color have published self-studies about the impact of their own race or cultural background on their teaching of multiculturalism (e.g., Oda, 1998; Obidah, 2000). In addition, both queer and straight teacher educators have studied their ability to "queer the curriculum" with preservice teachers (e.g., Ressler, 2001, p. 179). It is unknown what other characteristics or

experiences (e.g., physical ability, religion, class, etc.) might define the researchers' perspectives in the presentation of their research if these descriptors are not identified in the study.

Those researchers, who do choose to engage in this deliberate reflective examination of self, come to the study in multiple ways. Some teacher educators have engaged in self-study because they were actively seeking to align their practice with their theoretical and philosophical belief systems (e.g., MacGillivray, 1997; Regenspan, 2002; Meixner, 2003), or they were trying to better understand the transformation they expect of their students (e.g., Schulte, 2001). Some were moved to study themselves and their practice by White students' resistance to multiculturalism (e.g., Ahlquist, 1991), while still others were motivated by complaints from students of color (e.g., Cochran-Smith, 2000).

There are some men who engage in similar forms of self-study and write about it (e.g., Howard, 1999; Dinkelman, 1999), but it appears that a large portion of these "transformation self-studies" have been conducted by White women (self-disclosed within the report of the study), sometimes in collaborative groups (e.g., Abt-Perkins, Dale, & Hauschildt, 1998; Genor & Schulte, 2002; Guilfoyle, Hamilton, & Pinnegar, 1997). This is corroborated by Sleeter (2001b) who concludes in her review that research about multicultural teacher education in general presented an "overwhelming presence of Whiteness" (p. 94).

An important reason for analyzing these particular studies is that often the way in which we prepare preservice teachers to teach diverse populations is through their own study of self – their life experiences, beliefs, and biases. Loughran and Northfield (1998) noted that, "recognizing dissonance between beliefs and practice is fundamental to action" within self-study (p. 7). I contend that engaging in and examining this dissonance is necessary for teacher educators when preparing teachers to effectively teach students from cultures different than their own because it provides a reason to change. Prior to having examined a disjunction of beliefs, there would be no incentive, no suggestion that change was needed.

Transformation and Philosophical Alignment

One of the important benefits of self-study is coming to understand the contradictions and conflicts present in one's theoretical beliefs. Without a conscious reflection on these events and one's contribution to them, teacher educators would not understand as fully the modifications or adaptations needed for their practice and for others who seek to accomplish similar goals. This demonstrates the same type of commitment that is the goal for preservice teachers who teach diverse student populations. What follows are descriptions of self-studies that demonstrate a significant level of quality as well as address the issue of diversity. All of the studies were conducted by teacher educators who were interested in the concepts of transformation and multicultural education as it related to their preservice teachers.

Many educators conduct self-studies in an effort to align their practice with

their philosophical belief systems. Ahlquist (1991), a White female, examined her teaching of a multicultural foundations class in an effort to improve how she instructs her students, "to challenge the status quo in the hopes that they, as teachers of the future, will choose to take a stand in the interests of social justice" (p. 158). Ahlquist examined her teaching strategies and course materials to better understand how to more effectively engage the students in dialogue that led them to understand their role in contributing to and diminishing acts of oppression.

In this study, Ahlquist provided thorough demographics of her students' race, class, gender, age, and religious beliefs. She described them as not having had a lot of experience with people who are "different" or not having considered the effect of point of view on their perception. Ahlquist analyzed student surveys, belief inventories, and examples of students' writing. She also included her observations of class discussions and conversations with individual students. Although it is not clear what specific analysis process she used, it is evident that Ahlquist used these sources to better understand her students' behaviors. For example, because many of the discussions with students resulted in a debate about teacher authority, Ahlquist questioned her position as teacher and her own agenda. Based on students' reactions and comments, she believed her advocacy for social justice was perceived as imposition. She questioned what part she had in promoting the students' resistance.

As a result, Ahlquist challenged her role as authority within her practice in this study. She considered her position as an academic as well as a woman and how these characteristics influenced her ability to empower students. She problematized how students received her beliefs about multicultural education – weighing the balance between asserting one's worldview and imposing it. Ahlquist provided many ideas for how she might change her practice as a result of this study, however, her study was published before she implemented these ideas.

Ahlquist situated her study as contributing to the broader field of knowledge by outlining thirteen lessons she believes other teacher educators can learn from her study. These lessons included becoming more cognizant of the power relations in a classroom, continuing to expose and critique hidden ideologies, and alleviating student anxieties about dialogical teaching. She noted that this work is critical because most teacher educators have not had the benefit of the kind of education we hope our student teachers enact.

Many teacher educators working in the context of critical pedagogy have struggled with the impact of authority in the classroom. In Ressler's (2001) study, although she told her students she wished to be a facilitator, not an authority, she realized through reflection on her teaching and the students' reactions that she controlled all of the content of the course and tried to control the direction of some of the discussions. Ressler had interpreted the students' avoidance of some issues as resistance not realizing the students needed to explore their own understanding of identity before they could examine the issues with which Ressler was presenting them.

Ressler described this study as both participant research and action research. The study centers on a summer seminar about social issues in urban education with a focus on lesbian and gay issues in the classroom. Ressler provided a thorough description of the students in the course as well as the data collected. She described how she used drama as a primary pedagogical tool to facilitate discussions about the intersections of race and sexual orientation. Ressler explained that drama often allows students to more easily express uncomfortable or difficult ideas and practice new roles as supporters of lesbian, gay, bisexual, transgender, and questioning youth. Drama also allowed Ressler, as the instructor to, "move beyond my limited experience to appreciate the complexity of the experiences of my students" (p. 188). She says that once the students began to, "step into role, I stopped judging them or worrying about their political consciousness" (p. 188).

Ressler described a variety of ways she would approach this course differently if she were to teach it again. She acknowledged that she had done extended internal work around her own identity as a Jewish lesbian and other issues of equity. Ressler made an assumption that her students had similar experiences with critical reflection that would guide them in understanding specifically the oppressive conditions for gays and lesbians in schooling and society. Ressler suggested that it is important for education students to first understand identity and institutional oppression, and then they will be able to dialogue more effectively about how to challenge the, "normative concepts of schooling and society" (p. 190). This is an implication for all teacher educators seeking to transform preservice teacher beliefs relating to diversity.

MacGillvray (1997) provided another example of a White, female teacher educator coming to terms with the contradictions in her theory and practice. She conducted a study about her course for preservice teachers titled *Basic Reading and Study Skills*. Within a feminist and critical pedagogy framework, she used self-study to examine how her authority and preconceived ideas about appropriate interactions between herself and students influenced her ability to be an effective critical pedagogue. MacGillvray recorded data for the whole semester, collecting student work, exit critique cards, in-class writes, in addition to keeping a journal. She also sought a colleague's critique of a "teaching story" (p. 479). MacGillvray used constant comparative analysis to distinguish episodes that defined her criteria for an "appropriate critique" by students. Within the study, she realized that she only recognized a student's critique of her or her teaching to be valid if it was explicit, private, and from an academic stance. This raises an interesting dilemma in seeking critique within the self-study process. Does the researcher censor the type of critique she will hear, making the critique much less meaningful?

MacGillvray provided examples of interactions with various students and closely examined her often-negative interactions with one particular student who did not meet her standards for "appropriate critique." MacGillvray reflected on her own cultural and familial experiences as important determinants of her

beliefs about her relationships with her students. She wrote, "I am also questioning the level of my dedication to actually disrupt a system that privileges me in many ways even as it alienates me in others" (p. 486). MacGillvray articulated the need to live within the ambiguity of teaching. She recognized that the data collection and analysis, as well as the writing of the article shaped her interpretation of teaching and researching. This suggests that the writing of the research actually contributes, in part, to the transformation process.

MacGillvray suggested the need for educators and researchers to consider their own personal biases and how that may influence their understanding of their practice. What MacGillvray did really well was situate her understanding of her own theories and practice in the work of other critical feminists. She also provided a very detailed description of her data and analysis, actually providing a rationale by noting that she does so because she recognized that, "looking within ourselves is not a fully explored process in research" (p. 474). Instead of describing how she would change her teaching, MacGillvray explained that although she is learning how to consider teaching situations differently, she is still wrestling with how to change her teaching. Self-study, just as transformation, is a process that occurs over time and this often prevents researchers from thoroughly describing the effects of their study.

MacGillvray did exactly what Feldman (2003) suggested to make self-study more valid; she did multiple readings and representations of the data. She juxtaposed exit cards with her journal entries, looking for similarities and differences, and then questioning what caused her to decide they were similarities or differences. She defined these analysis procedures as constant comparative analysis (Goetz & LeCompte, 1984, as cited in MacGillvray, 1997) and reconstructive intersubjective analysis (Carspecken & Apple, 1992, as cited in MacGillvray, 1997).

Seeing the Unseen

The three previous teacher educators all noted an ongoing challenge in their studies of how they were responding, in some way, to their students' behaviors or resistance as they struggled to engage them in components central to their educational philosophies. In the next study, the teacher educator had spent years designing a program to accomplish these same goals related to critical pedagogy and had become relatively confident the program was accomplishing them. She discovered, quite surprisingly, that she had been blind to more than she had realized. In the article titled *Blind Vision: Unlearning Racism in Teacher Education*, Cochran-Smith (2000) described how she directed and taught in an education program she felt had been developed to focus on issues of race and racism in the context of schooling. She felt generally successful, until one event where students of color angrily critiqued the program. This led to subsequent discussions and Cochran-Smith's further study of not only the program in which she worked, but her own assumptions about anti-racist teaching.

In the article, Cochran-Smith suggested the need to read teacher education

as a text with explicit and subtext as well as a racial text. She wrote that viewing it as a text allows some "apartness" and ability to look critically at what we do. When Cochran-Smith examined the many sources of data derived from the evolution of the three courses she taught, she found that the attention to culture and race was increased, focusing on the inequities within schooling systems. However, the latter part of the courses focused on pedagogical theory that was drawn primarily from White teachers and scholars. Cochran-Smith wrote, "Reading between the lines of my own courses and of the larger teacher education curriculum revealed a White European American construction of self-identity and 'other'" (p. 181).

Cochran-Smith honestly and articulately described how, in her seminar class, she planned to respond to an impassioned critique about her attention to race in her courses. She revealed the contradictory position in which she discovered herself:

> I was about to teach them [the students] how a White teacher, who – notwithstanding the rhetoric in my classes about collaboration, shared learning, and co-construction of knowledge – had a great deal of power over their futures in the program and in the job market, how that White teacher, who fancied herself pretty liberal and enlightened, responded when confronted directly and angrily about some of the issues of race that were right in front of her in her own teaching and her own work as a teacher educator. (p. 161)

This study meets many of the criteria for quality self-study and offers other teacher educators a great deal. It provided a thorough description of a complex situation with very salient implications for teacher education at large. The researcher analyzed different courses within a particular education program over time. She served both as a director and teacher in this program, thereby increasing her opportunity to examine the issues from different positions. Cochran-Smith described her discussions with colleagues (some with whom she co-teaches) and preservice teachers that broadened her understanding of what the data revealed. She provided myriad of examples of how she attempts to improve her teaching and situates her work in the larger context of teacher education reform.

Cochran-Smith sought to consciously "alter the assumed definition of self and other" by constructing discussions where "we and they" shifted away from "we White people who are trying to learn to teach those other people – those people of color" to "we educators who are trying to be sensitive to, and learn to teach, all students – both those who are different from us and those who are like us in race, class, and culture" (p. 181). Often, much of how we teach "multiculturally" is based in a White perspective and delivered for White women. Therefore, teacher educators should not only teach teachers to critique the system but to think about how and from where the critique is framed. This only bolsters the argument that these self-studies need to be conducted by others than White middle-class women. What follows are two studies where women of color examine how their race and culture impact their teaching of multicultural issues.

When the "Other" is the Transformed

Oda's (1998) study is important in that it is one of a few studies where a person of color examined her own culture and its effect on her teaching of multiculturalism. She undertook the self-study with two purposes in mind: 1) to explore the effects of her Asian-American cultural influences on her classes; and, 2) to establish a foundation to help preservice teachers address multicultural issues. She taped and transcribed her course sessions and distributed questionnaires to the students. Using Kitano's (1969) anthropological values framework, Oda analyzed the data for themes from the Japanese culture (as cited in Oda, 1998, p. 116). She also reflected on her teaching style, prompted by a student response, in contrast to a colleague with whom she jointly taught a multicultural course.

Oda's major finding was that her cultural identity influenced her teaching. The data showed that she strove to maintain harmony, an honorable traditional Japanese value. "Living in harmony means that I consider and appreciate others. I give deference and credence to other people's thoughts, ideas, and actions … I try to defuse anger by imposing thoughtful reasoning. I try to reconcile differences and look for ways of capitalizing on the differences" (p. 121). Oda also recognized that maintaining harmony could also create future conflict. When students were expressing harmful or ignorant ideas, Oda wondered if her desire to promote harmony could actually prevent them from confronting those beliefs, or if her desire for harmony minimized her ability to be assertive or aggressive in the fight for equity. Oda worried that this might ultimately have miseducative effects in preparing preservice teachers for diverse populations.

This teacher educator described how she could use what she learned in this study to be more thoughtful about how she presented material and interacted with her teacher education students. Oda also suggested that self-study serves as an example of how teacher educators can model reflectivity in addition to providing insights into professional socialization and career development in the academe. I would also contend that Oda's study provides an important example of why this type of self-study should not be essentialized as being only for White teachers. Oda aptly demonstrates that we all have cultural assumptions, and it is important to be conscious of them.

In another study, Obidah (2000) suggested that some of us who teach multicultural education, "approach our classrooms far more confident about what we want to teach, than about how we will teach it" (p. 1036). Obidah described her theoretical framework as "critical multiculturalist" (p. 1036) and examined how her experiences and identity as an African American female with strong ties to her working class upbringing impacted the dialogues in her teacher education class *Education and Culture*.

After several of what she described only as "pivotal moments" in the course, Obidah decided to systematically study her practice and sought student permission to write a research paper about their class. The students consented, and what ensued was a collection of various data including course papers, class notes, email messages, personal conversations, and self-completed student profiles. Using case study analysis methods, Obidah analyzed the data for the

effectiveness of her pedagogy and her ability to create a liberatory environment in her classroom. Validity of the analysis was enhanced because Obidah sought feedback on the paper from students who took the course in order to check her perceptions.

The quality of this study is evident in the rich descriptions of five students, and the analysis of their respective transformative experiences using actual quotes and classroom experiences. Obidah also provided a thoughtful analysis of her interactions with these students and her own assumptions about them. She concluded that the impact of the class both on her and her students has made her more aware of the challenges in mediating and disrupting social norms of teaching and learning, especially with regard to race, class, and professorial boundaries.

The most unique aspect of this study was that the researcher presented her findings with her students at the Georgia Educational Research Association Conference. This offers an excellent model for three things: making practitioner research public; including students/preservice teachers collaboratively in presentation of the study; and, growing its status by presenting at an educational research conference. Obidah suggested in her article that reflection on our (educators') assumptions about how to teach multiculturally, "herald[s] the start of honing a more effective craft" (p. 1059). This speaks to the enormous potential of professional development in, especially novice, teacher educators. The next study further describes the significant benefits of self-study to beginning teacher educators.

Collaborative Self-study

What follows is an excellent example of not only collaborative research, but also one that models how self-study can contribute to the professional development of beginning teacher educators. Abt-Perkins, Dale, and Hauschildt (1998) are a group of White female teacher educators who had completed graduate school together and then wrote letters to one another for one academic year in an attempt to better understand how their backgrounds and experiences influenced their practice and commitment to equity in their new environments. Their work drew on the frameworks of other feminist researchers who address equity in schooling (e.g., Cochran-Smith & Lytle, 1993; Hollingsworth, 1994; Hulsebosch & Koerner, 1993; Miller, 1990, as cited in Abt-Perkins, Dale, & Hauschildt, 1998, p. 84). These teacher educators defined it as, "inquiry that is simultaneously personal and social as we seek both individual and institutional renewal and change" (p. 84).

This study provided deep and thoughtful descriptions of the participants and their former and current contexts. The researchers suggested that their letters to one another provided an alternative fulfillment of the research, "cycle of questioning, self observation, and ongoing analysis" (p. 85). In analysis of the letters, two common issues surfaced. One was how to prepare teachers to take into account students' cultural identities in their choices about instructional materials and

content. The other was helping preservice teachers to understand how the context in which they teach and their students' ethnicity affect how authority is interpreted in the classroom.

Through analyzing the letters, the three teacher educators learned that they shared many of the same doubts and fears about teaching the "other" that their student teachers had. The three women discovered they were positioning their preservice teachers as the "other."

> We learned that that perspective was part of our problem. We saw ourselves as teaching 'others,' as wanting to have answers, to give direction, to lead, to be 'expert,' rather than demonstrate through our own reflections how we, like the student teachers we taught, were engaged in a learning process of our own – one that did not differ substantially from theirs. (Abt-Perkins, Dale, & Hauschildt, 1998, p. 92)

Abt-Perkins *et al.* also realized that in teaching student teachers not to make assumptions, they often made assumptions about their student teachers. For example, Abt-Perkins, "coming from a working class background, assumed that her students' economic privilege meant that they were 'without social consciousness' and somehow 'deficient' for learning about equity and justice issues" (p. 87). They learned the value of collaboratively reflecting on their identities and contexts. They contend that it helped them to articulate a confidence in what they know, what they do not know, and what they must seek to know.

Both the honesty and vulnerability expressed within this study are precisely what makes this research useful for others who might carry the same hopes and fears. However, the researchers discuss the vulnerability in sharing this process with their workplace colleagues as opposed to the safe space of the group. They argue that the letter-writing format and their personal relationships with one another integrates "soul bearing honesty" within professional self-study. In sharing their letters with a wider audience, they "hope to model how women in academia can address their work in terms of teaching 'passions, politics, and power'" (see Fine, 1992, as cited in Abt-Perkins *et al.*, 1998, p. 86). The female authors promoted their work from a feminist perspective, but I would argue that this models for all teacher educators the enormous benefits of collaboration and self-study.

The aforementioned studies provided models for my own transformation and supported me in my self-study process. Reading their studies assisted me in ways of thinking about and studying my process of inquiry. In the next section, I will share how my knowledge base has grown as a result of participating in both self-transformation and my study of it.

My own Process of Transformation

For all intents and purposes, my professional study of self began when I started meeting in an action research group with two graduate school friends. We wanted to study our practices as beginning teacher educators through our

respective teaching assistant positions (see Schulte, Genor, & Trier, 2000). What surfaced for me was a need to closely look at how my understanding of my identity was changing and how that impacted my desire to help preservice teachers understand their own identities. It became clear that before I could try to make sense of how to teach teachers to teach for diversity, I needed to first understand my own identity and the transformation of my perspectives on diversity issues.

I was reading the multicultural teacher education literature in my graduate courses, studying White middle-class women and their need for experiences that led them to recognize their privilege. I thought, "Wait a minute! Those teachers we are talking about are me," and I thought that it was so problematic that I was being taught how to transform "those people" when I was not even sure I had experienced it in any depth. It occurred to me that if I figured out my own transformation process first, it would give me insight into how to assist preservice teachers in their own transformation, particularly if they drew on similar life experiences as me. In a way, this served as a terrific opportunity for me to learn *with* my students. However, given the cautions regarding the transformation process, I was unsure about how ethical or even practical it was for me to be attempting these experiences for the first time simultaneously. I felt conducting a study of it would afford me the opportunity to be more systematic and careful in my approach.

Although my professors were assigning me readings and engaging me in dialogue, reflection on my transformation process was largely self-directed and haphazard. I often was asked to think deeply about my identity and there were many personally transformative experiences, but no one really helped me to make sense of my own process in relation to preparing preservice teachers. It was through my dissertation that I structured a study of how I tried to make the connection between who I was and how that influenced what and how I taught.

In my dissertation study (Schulte, 2001) I examined two semesters of my practice as a student teacher supervisor. I collected data from the assignments and discussions in our weekly seminars, observations of the student teachers in their placements, a personal journal, and additional conversations and interviews I conducted with the students. I outlined themes that were present in my data that I categorized as challenges to transformation: white privilege, ambiguity, and the "good student" syndrome. Before I could advise them in how to teach multiculturally, I found I needed to address their individual racial (as well as other) identities and the discomfort many of them had with not being told exactly how to do multiculturalism (or teaching in general) "correctly." In addition to providing examples from many of my students, I created four student teacher portraits to more carefully describe what these challenges looked like in my relationships with these students.

As I wrote the student teacher portraits, I discovered that these challenges were also the same challenges I was experiencing as a *student teacher educator.*

I used these themes to more closely examine my practice and my own transformation. I analyzed my growth across two years as evidenced in my journal and various student feedback. Three ideas stood out: 1) my lack of experience with talking about race and interacting with people of color continued to be a sensitive and difficult issue; 2) I was as uncomfortable with the ambiguity of teaching multiculturally as my students were; and, 3) being passionate about teaching this way was both necessary and painful.

In the dissertation, I suggested a variety of areas that I feel need further study as a result of my experiences. First, the issues surrounding racial (as well as class, language, gender, sexual orientation, religion, etc.) identity need to be unpacked with preservice teachers first in order for them to understand how that identity affects their students and their own ability to teach them. In addition, there are many assumptions about students' identities and their experiences with examining it. Therefore, how a teacher educator approaches issues of identity is complex and varied, highly dependent on both the instructor's and students' experiences.

A second conclusion is that much of the literature that describes techniques and strategies for how teacher education ought to transform preservice teachers often does not address the inherent resistance to ambiguity present in many preservice teachers. Based on my experience, students' resistance to multiculturalism may be less about their non-acceptance of the ideas so much as their lack of skill in living with ambiguity of the concepts. This challenge of not having a "right answer" is true for other instruction related to learning to teach as well, most notably classroom management. I suggested that this stems from being traditionally "good students" who have achieved in the current education system by "doing school" well.

Finally, there is much to be learned from my study about how graduate schools of education prepare teacher educators. Although I consider my education to have been first class, there were certainly opportunities to consider more carefully the population of future teacher educators in relation to what they are being prepared to do. I have read other self-studies with similar dilemmas, and there are undoubtedly even more people experiencing the same challenges but not writing about it. It would further the field of multicultural education to take a closer look at this factor in the learning-to-teach equation.

I offer my dissertation as an invitation for all teachers to engage in similar study. When I read other teacher educators' self-studies, it creates a space for me to relate to another's experience that may also at the same time shed light on how I understand similar questions or challenges in my own practice. Obidah (2000) says such studies may act as, "the entry into our own uncomfort zones" (p. 1059). It also often raises new questions or dilemmas I had not previously looked for. For example, after I read MacGillivray (1997) I looked carefully at my own data to see if I was limiting student critique similar to what she discovered in her own practice. This is the starting point for creating knowledge that stems from the work of other teacher educators who are doing similar work.

Since completing my degree and entering into the "real world" of teacher

education, I continuously reflect on the lessons I learned from my graduate school study. Unfortunately, this reflection is again, largely self-directed and haphazard. The day-to-day work of teacher education does not provide for or support the systematic reflection needed for continued growth, development, and transformation. The next section describes how we as a teacher education community might remedy that situation.

Importance of Self-study in Teacher Education

In the conclusion of her chapter on multicultural teacher education in the first edition of *The Handbook of Research on Multicultural Education*, Ladson-Billings (2001) suggested that preservice teachers continue to resist engaging with multicultural issues because teacher educators are trying to implement superficial multiculturalism without effecting fundamental change in the classrooms and schools. I would further argue that this approach is superficial because it does not address the pervasive problem of teacher educators' lack of understanding and reflection on their own transformation process (see Merryfield, 2000). Although there is a significant amount of literature describing how to prepare teachers to be multicultural, teacher educators rarely share their experiences of coming to terms with their own identities and how that impacts their ability to prepare teachers to be multicultural.

At the heart of this work is Merryfield's (2000) question, "How can teacher educators, who have never examined their own privilege or who have no personalized learning of what it feels like to live as the Other prepare K-12 teachers to teach for diversity, equity and interconnectedness?" (p. 441). It is not clear how many teacher educators are doing this kind of critical reflection, but very few are sharing it publicly. That may be because this kind of research is not valued in the tenure and promotion process or it may be because it is simply too painful or difficult, but it is clear from searching the literature that there is room for much more published research in this area.

A commonality among many of the self-studies noted in this chapter is the novice status of these researchers in the teacher education field. This indicates a very specific audience in need of more studies that will offer insight and knowledge about how to become effective teacher educators. It is also important for experienced teacher educators to continue this type of research. Excitement and humility in continuing to learn about one's own social group memberships, one's access to privilege, and ways to empower one's self, not only make for better social justice education but also keep one in touch with the learning process in which students are engaged.

Self-study and most practitioner research creates very different knowledge than what is usually created through traditional educational research. This kind of knowledge is, "characterized more by it concreteness and contextual richness than its generalizability and context independence" (Hiebert *et al.*, 2002, p. 3). But Merryfield (2000) explains that, "it is the interaction of one's identity and contexts of power with the experiences that leads to consciousness of multiple

perspectives and a process of meaning making that can be generalized to other circumstances" (p. 440). It is evident that this kind of practitioner knowledge has potential not only for the researcher but also for others that read it. The following section will describe in more detail how this research contributes to knowledge base in teacher education.

Contributions to the Knowledge Base

What do the studies described in this chapter teach us? How do they contribute to the knowledge base of teaching about teaching, particularly with respect to multicultural education? I suggest they provide thorough and authentic descriptions of teacher educators engaged in the often-perplexing transformation process that leads to better understanding of issues related to diversity. The teacher educators were able to describe who they were in their respective contexts and the impact this had on their interactions with their students. By reading about their experiences one can learn how to think about or react to similar situations. Just as importantly as recognizing similarities in others' experiences is an awareness of other dilemmas or perspectives that one might have overlooked previously. The self-studies may act as cases to be analyzed and applied as appropriate to one's own context. This is a direct source of knowledge that improves the preparation of preservice teachers.

Another important contribution is that it provides an excellent reflective practice model. The knowledge created may be information about "how to" change practice, relate to students, or examine one's own identity. But maybe the greater knowledge contribution is how imperative this kind of critical reflection is for all teacher educators, but particularly those new to the field. Doctoral programs should be encouraging future teacher educators to engage very consciously and systematically in their own transformation process, personal and professional. If more teacher educators engaged in and shared their experiences with this process, it would contribute considerably to the knowledge base for how to prepare all teacher educators to prepare preservice teachers to work with diverse populations.

In her study of teacher educators who were effective in preparing teachers to make connections between multicultural and global education in their teaching and learning, Merryfield (2000) analyzed personal and program profiles of 80 teacher educators. She concluded that teacher educators who were most effective in preparing teachers for diversity had profound lived experiences with people different from them. Merryfield wrote that most White teacher educators had to have left their home country to experience being the "Other." Haberman (1991) suggested that there are similar criteria that determine the success of urban teachers that should be used in admitting students into teacher education programs. Graduate schools of education might consider how similar criteria could be used in admitting teacher education graduate students. If these criteria are not used for admission, then experiences that provide cultural disruptions that lead to a transforming view of education need to be facilitated for graduate

students. This may mean some kind of field experience abroad, given Merryfield's (2000) findings.

I make these suggestions knowing full well that such admission criteria may have prevented me from getting into a doctoral program. I grew up in a small White town, taught mostly White children, spoke only English, and had not traveled outside of the United States until graduate school. I epitomized that "typical" teacher population that are being prepared to work with diverse students, but I believe there is something to be learned from that as well. If one believes preservice teachers can be transformed, then one must believe that there is hope for teacher educators as well.

Directions for this Research

In their review of needed research in teacher education, Ducharme and Ducharme (1996) recommended that there be more research overall about the preparation of teacher educators. They write that the teacher education research should model the studies of preservice teachers and should include long-term investigations, life studies, and shadow descriptions. This research should also focus on clearer identification of what teacher educators need in characteristics and training. A heavier emphasis should be put on descriptive research (to understand a phenomenon) as a complement to improvement research (designed with intended impact on practice) in order to provide a sufficient base for conceptual and theoretical work" (Koehler, as cited in Ducharme & Ducharme, 1996, p. 1043). The study of transformation clearly fits both of these categories.

Self-study of teacher education practices is an important way of developing and articulating a pedagogy of teacher education (Loughran, 2002). In looking at the studies presented in this chapter, it is evident that careful and systematic reflection on one's practice leads to important insights about the impact of self on teaching and learning. Clearly, one of the themes is that the transformation process is complex for both preservice teachers and teacher educators. These studies do not provide the "Answers" for how to prepare teachers for diversity, but they suggest that there are many people struggling with issues that can inform how we know better. It is perhaps enough, for now, to simply know that. However, we need to move toward using this knowledge to impact teacher education in general.

The fact that these self-studies are not abundant in the general teacher education literature indicates the need for improving both the promotion of and status of the publication of self-study. There is a dearth of teacher educator self-studies in mainstream teacher education journals, and even fewer that deal with issues directly related to the issues of multicultural education. Although people of color, men, and queer teacher educators are conducting this vital research, the studies are not prevalent in the more mainstream teacher education publications. Especially helpful are the studies that deal with the complex intersections of identity in a coherent way (e.g., Loutzenheiser, 2001). Some would argue that

not even the studies conducted by White middle class females are as common as they might be.

The overall status of practitioner research, and self-study in particular, can be enhanced through continued publication and promotion of it. Obidah (2000) set an outstanding example when she described how she presented her research with her students at a statewide educational conference. This models the rare but valuable act of collaboration among teachers and students and improves the status of this work simply by being accepted for an educational research conference. Despite the aforementioned risks of making this work public, the professional knowledge created through self-study in multicultural teacher education will serve but a few people if it is not disseminated in quality and meaningful ways.

Conclusion

This chapter addressed the pervasive issue of the lack of diversity in both teacher educators and preservice teachers who are working to reform education to provide equitable and socially just education for all children. The concept of transformation supports this social reconstructionist reform effort by challenging teachers to think critically about how privilege and power are constructed in the world in general, and in education specifically. This process can help both teacher educators and preservice teachers understand their own cultural positions and to reflect on and analyze how those beliefs impact their teaching.

In reflecting on the self-studies highlighted in this chapter, it is apparent that many teacher educators are authentically interested in improving how they challenge their preservice teachers in ways that will prepare them to meet the needs of all students. It is clear that how teacher educators improve their practice is significantly impacted by who they are and the experiences they have had which challenged how they understand not only diversity, but also preparing teachers for it. Also evident was that although the significant homogeneity of the teaching force may have prompted the idea of transformation (as described in this chapter), this process is not exclusive to educators from the dominant culture. Thoughtful and systematic reflection on how we understand teaching and learning is a requisite of everyone involved in education, regardless of race, status, gender, etc.

These studies illuminate a variety of issues that are critical to better understanding the preparation of both preservice teachers and teacher educators. Teacher educators can use these studies as models not only for how to do quality self-study, but how to scaffold their experiences and understanding of issues related to diversity. We validate the research by making it public, using it, and continually improving on it to construct a new way of understanding how to reform education. This sets up that evolutionary pattern that Wilkes (1998) described in her metaphor of a relay race – knowledge about teaching is "passed from one generation of thinkers to another, each one more vibrant, more exuberant than the one who went before" (p. 205).

[c] *Victoria University of Technology*

Abstract

Self-study research is situated within the discourses of the social construction of knowledge, reflective practice and action for social change. The strong presence of collaboration in the practice of self-study of teacher education is a natural response to this ethical and theoretical location. *Collaborative agency* is the term that best expressed the way we saw educators using collaboration to make a difference to the outcomes and understanding at all stages of self-study research. We subdivided the many examples into three types of action: (1) Establishing the conditions of research; (2) Creating educational knowledge; and, (3) Recreating teacher education. This chapter explores the discourse of collaboration in self-study from three interconnected vantage points: *Section 1* invites readers to share our process as we prepared to critically review the literature; *Section 2* includes an overview of the public discourse of self-study; and, *Section 3* concludes with our assessment of key collaboration related questions that are emerging in the self-study of teacher education community. The chapter begins with anecdotes that situate and personalize the presence of collaboration in self-study research, and is enriched throughout by the words of current self-study researchers.

> We are the inheritors, neither of an inquiry about ourselves and the world, nor of an accumulating body of information, but of a conversation. … It is a conversation which goes on both in public and within each of ourselves … And it is this conversation which, in the end, gives place and character to every human activity and utterance. (Oakeshott, 1962, cited in Bruffee, 1993, p. 113)

The public and private conversation of the self-study of teacher education practices is a vital, lived and international expression of the inquiry and action of teacher educators engaged in the daily recreation of their work. The following anecdotes derived from published self-studies not only reveal the human and personal face of the work of teacher educators, they also reveal and situate the phenomena (and the dilemmas) of collaboration as it is described in the current discourse of self-study in teacher education. We found that collaborative self-study research has many faces. For example:

> … Jennifer and Sean integrated self-study into their team teaching of an introductory unit for new teachers in a bachelor of education program. They collected data individually and together (personal journals, reflective logs, student surveys, analysis of student work), and built reflection and responsive action into their weekly planning cycles. As students became more critically reflective, they not only raised issues related to their work with Jennifer and Sean, but they also began to ask questions about how the whole teacher education program was conceived and structured … Reactions and disagreement emerged in the faculty … Jennifer and Sean were told they were not being realistic …

> … Jeanne, Marie, Jon, Hilda and Carl met in graduate school. Ten years ago – as new teacher educators working many miles apart in different universities – they began an email dialogue. They were each engaged in the formation of their individual selves as teacher educators, and they were each drawn into the public dialogue of the reconstruction of teacher education at their own institutions. Increasingly their conversation became a precious space in which they learned from one another, opened up to different points of view, and enriched one another's ability to see local experiences from fresh perspectives …

> … Njeri took an action-reflection-action approach to her individual self-study of the process of introducing new teachers to critically reflective ways of looking at their experience in elementary school classrooms. She taped classroom sessions, reviewed student narratives and recorded her thinking and her action in a reflective journal. She described the process of knowledge creation as a dialogue or conversation with particular authors in the literature. As she gained deeper understanding of her individual self as a teacher educator she extended this conversation and the process of critical reflection to include students in her classes …

After teaching together for five years, Helga and Steven moved to new

positions and began teaching in different countries (using different languages). They continued to question their teaching and reflect on their practice together through email and phone. As they felt their partnership grow they began to talk about their ''presence'' in one another's work – teaching together long-distance …

Wherever we found self-study of teacher education practices, collaboration was also present: *some authors*[1] portrayed and analyzed collaboration as a critical element of their inquiry; *others* (the majority)[2] described collaboration as simply there, a pervasive presence, the background to the action, or a way of working (e.g., team teaching), and *still others* (a smaller group)[3] did not work directly with other researchers, but maintained a dialogue with voices in the literature, their life history and the broader discourse.

This chapter explores the discourse of collaboration in self-study from three vantage points:[4] *Section 1* invites readers to share our process as we prepared to critically review the literature; *Section 2* includes an overview of the public discourse of self-study; and *Section 3* concludes with our assessment of key collaboration related questions that are emerging in the self-study of teacher education community.

Section 1: Unlocking the Discourse from a Self-study Perspective

The juxtaposition of extensive acknowledgement of collaboration in the self-study literature, and minimal treatment of the topic in the discourse raised questions for us. We asked if there was an intrinsic relationship between collaboration and self-study research, or whether collaboration was just one of the many research tools used within self-study methodology (such as narrative inquiry, action-research, autobiographical research). The simple synthesis of the available information did not address this dilemma. As we struggled[5] to make sense of many examples, we recognized the need to establish "alternate frames of reference" that would enable us to interpret the "data" from self-study perspectives. Two processes shed light on our review of the literature: (1) identification of key understandings which formed the basis of our "self-study perspective;" and, (2) development of critically reflective questions which supported our analysis of the representations of collaboration.[6]

Key Understandings that Underpin a Self-Study Perspective on Collaboration in Research

In 1998, Loughran and Northfield noted, "the importance of collaboration may seem to contradict the personal nature of self-study" (p. 16). This pertinent observation highlighted contradictions that exist in the representation and study of the personal and professional "self" in self-study research and action, and also in the location of self-study research within the dynamic of social, cultural and institutional change. We found the "keys" to unlock these dilemmas in the

meta-literature[7] of self-study and in a review of cultural change and innovation in education.

1)   Self and Agency: The Unique Characterization of "Self" in Self-study

The characterization of the "self" in self-study research represents a quantum leap in the conceptualization of the role of the researcher and practitioner in educational inquiry (and by extension in the nature and process of research collaboration). The locus of the study of practice has moved from the abstraction, description and analysis of professional work (through statistical, qualitative or action research), to the recognition that the personal/professional identity and action of individuals is intrinsically bound to the creation and renewal of their practice.

   This reconceptualization relies on holistic or organic interconnections between personal and professional identity, action and belief, and between individual and collaborative action. The apparent contradiction raised by Loughran and Northfield (above) resides in a different form of abstraction, the privileging of the quest for personal understanding above personal/professional agency and action (Dalmau, 2002; Samaras, 2002).

2)   Collaboration as Essential to the Creation and Dissemination of Knowledge

Deeply based in the person and practice of teacher educators, self-study research transcends the individual through collaborative, questioning, dialogic, and action-oriented processes that have been described as "essential" to the dissemination of authentic educational knowledge.

> [Collaboration] is essential for checking that focus, data collection and interpretations do not become self-justifications and rationalizations of experience. Collaboration provides some confidence that experiences and interpretations can be offered more widely for consideration by others, an important aspect of any study. (Loughran & Northfield, 1998, p. 16; and also see pp. 11–17)

In fact, some form of collaboration is necessary if the personal reflections of individuals are to be translated into action and introduced for consideration within educational discourse.

3)   Implications of Continuous Learning and Action

Closely related to the conceptualization of the personal/professional self (described above) is the necessity for continuous learning and action.

> Learning through self-study unavoidably means that the results of self-study created new opportunities for self-studies. Therefore, as learning opportunities arise, they need to be grasped and acted upon. Thus, the situation of self-study is ever changing and developing because the researcher must continue to give first priority to managing the context that is simultaneously being studied. Researchers are therefore obliged to continually adjust their

activities to improve their interactions with others. (Loughran & Northfield, 1998, p. 14)

Interaction with others is thus deeply bound to constituent elements of self-study research – learning, action and knowledge creation – and the nature of this collaboration will evolve (and be understood) in responsiveness to continuous change.

4)   The Emergent and Overlapping Nature of Changes in Understanding and Practice

Self-study is engaged with change at many levels. It is an innovative and difficult to encapsulate field of inquiry that challenges existing cultures and assumptions about the nature and purpose of research into teacher education practice, plus its avowed and ambitious purpose is improved teacher education leading to improved school-education (Loughran, 2002; Russell, 2002). Kiluva-Ndunda's (2001) study of the efforts of Kilome women to transform their daughters' participation in education, illustrates the emergent and many-layered nature of change in educational and research practices.

> The women are not mere victims of public policy discourses, but they act upon these policies as individuals and as collectives. *They interact within the constraints and opportunities of existing structures at the same time as they act upon and restructure the social system.* (emphasis ours) (p. 42)[8]

> Likewise, self-study researchers work within the constraints and opportunities of personal histories and organizational cultures of teacher education and statistical and qualitative research, at the same time as they explore new paradigms and create new ways of working in self-study research. (Samaras, 2002, p. 5 ff.)

Thus the practice of self-study is continually evolving, continually incorporating and discarding elements of other modalities of research and innovation, and self-study researchers are continually learning, acting and building knowledge within the recreation of teacher education practice.

Questioning the Discourse

The public discourse of self-study research presents a rich, intricate, and ever-changing tapestry of all these perspectives and experiences, and it is within this movement and this richness that unique, self-study related forms of collaboration are emerging. In order to focus our quest we developed a number of perspectives from which to question both the examples we reviewed, and our own interpretations.[9]

- *What is the stance and role of the "self" in collaborative self-study interactions?* How is the nature of collaboration formed by assumptions about the "self" in self-study research? What is the construction of the personal

and professional self? How is individual understanding related to action? Is there a dichotomy between collaboration for self-understanding and affirmation and collaboration for goal-related action? What is the vulnerability of professionals engaged in self-study research?

- *Does collaboration create a safe place where the vulnerable and professional self can be explored and enabled to act?* The bureaucratic, competitive and measurement-driven world of teacher education can be an inclement environment for the study and renewal by educators of their own practice. How has collaboration been used to construct safe spaces where practitioners can support one another to make sense of a challenging world and rebuild energy and action? What is the impact of long-term collaborative research relationships?[10] Have "safe" spaces become a refuge or a place to gather courage for action?

- *Is it possible to navigate collaboration beyond the comfort zone of encouragement and affirmation?* Is there a trade off between the safety of a collaborative group and the need to critically question and revise practice? How do groups create and support environments that will allow them to go beyond affirmation to questioning and reframing? How difficult is it to challenge the status quo from within like-minded groups? Is the conflict that emerged for Jennifer and Sean (above) an expected outcome of effective collaboration?

- *Does collaboration narrow the world?* Linda Tuhiwai Smith's (1999) discussion of the many layered and "deeply embedded' values and practices present in research with indigenous peoples, highlights the importance of framing all forms of inquiry in ways that allow the impact of power and hegemonic thinking on knowledge construction to be revealed. What are the subtle processes of confinement of thought and action that occur in homogeneous groups? How has local and international collaboration been used in self-study to question these processes?

- *Can collaboration be experienced as a harsh and contradictory space?* Does self-study research protect teacher educators from the waltz of power and empowerment? Can oppressive, non-voluntary ways of working together be called collaboration? How are working relationships questioned and negotiated, particularly across different levels of institutional power (for example, professor and student teacher)? Does the literature show embedded questioning of the nature and the impact of collaboration for all involved, particularly the invisible or most vulnerable?

- *What is the dynamism of collaboration?* The overwhelming impression as we surveyed the literature was the constant connection between collaboration and action, and collaboration and knowledge creation. What is the synergy at this intersection of personal beliefs-knowledges-practices? How does it influence and generate professional practices? What happens when various knowledge communities intersect? What are the ensuing challenges?

Collaboration in self-study is, and will continue to be, found in the response of teacher educators to these dilemmas.

Section 2: The Discourse of Collaboration in the Self-Study of Teacher Education Practices

After an overview of the parameters of the public discourse of the self-study of teacher education practices, Section 2 presents a series of snapshots of the current utilization of collaboration in self-study research by teacher educators, and concludes with an attempt to distill a definition of collaboration in self-study.

The Public Discourse of Collaborative Self-Study

The public discourse of self-study of teacher education practices includes refereed and published literature, plus the less formal dialogue within the community of practice.[11] Both of these forms of communication provide information about collaboration in self-study, *and* once made public, become themselves a source of continuing collaboration in practice. In preparation for this chapter we reviewed a broad range of literature across the following categories:

1)   Practice-Related Refereed Self-Study Literature

These publications are extensive, including (but not restricted to) the proceedings of the four biennial Conferences of the Self-Study of Teacher Education Practices Special Interest Group[12] (S-STEP) at Herstmonceux Castle (Cole & Finley, 1998; Kosnik, Samaras, & Freese, 2002; Loughran & Russell, 2000; Richards & Russell, 1996), and edited collections of self-study works (Hamilton, 1998b; Loughran & Russell, 2002; Russell & Korthagen, 1995). We scanned these and other publications selecting a diverse group of papers for review.

2)   Meta-Literature

We used this term to refer to writings with a strong focus on the nature of self-study research and/or an overview of the practice-related literature. Two groups of authors stood out:

   (a) Editors (and section-editors) of self-study collections whose writings situate and frame practice related papers (For example, Hamilton, 1998a; Hamilton & Pinnegar, 1998a; Korthagen & Russell, 1995; LaBoskey, 1998; Loughran, 1998; Loughran, 1997; Russell, 2002); or members of the community who have written analytical overview papers (For example, Barnes, 1998; Loughran & Northfield, 1998).
   (b) Long term members of S-STEP who have taken in-depth (book-length) approaches to reflection on the agency of self-study research in their professional practice (For example, Allender, 2001; Austin, 2000; Loughran & Northfield, 1996; Samaras, 2002).

3)   Dialogue Within the Community of Practice

A knowledge community is defined by both its agreements and its conflicts and dilemmas. The ongoing conversation of S-STEP members through email lists, web sites, and conference programs provided lived examples of collaboration in action as well as the dilemmas that tested this collaboration.

4) "Outsider Voices"

Key challenges, elucidations or agreements from non- S-STEP approaches to self-study, teacher-education and collaboration (For example, Shulman, 1999; Vygotsky 1978, 1994; Zeichner, 1999).

We found three broad approaches to collaboration in the self-study community:

(a) Collaborative Self-Study: In this group of studies, collaboration is acknowledged up front as a critical element of the self-study (e.g., long-term research partnerships),[13] and cooperatively designed self-studies that present collaboration as a key element of the research methodology.[14]

(b) Collaboration in Self-Study: While collaboration was not presented as a methodological characteristic of these studies, we discovered examples of collaboration in the researchers' descriptions of data collection and analysis, knowledge creation, reframing, critical reflection and action.[15]

(c) Meta-Collaboration in the Creation of Self-Study: We also noted the emergence of a third form of collaboration in the self-study community. Since its inception the Self-Study of Teacher Education Practices Special Interest Group (AERA) has brought the self-study community together to share and review members' work, and clarify methodological, ethical and practice issues.[16] While the history and analysis of this process is yet to be written, we introduce the idea here that this international and inter-communal collaboration has been a major influence in the development of the discourse and practice of the self-study of teacher education.

These divisions were useful conceptually as we spanned the topic and selected publications to review, but they did not assist the discussion of the phenomena of collaboration in self-study research. The following notes from our early email discussions chart the beginning of our journey towards understanding the many ways that collaboration made a difference to the process and outcomes of self-study:[17]

> *What difference does it make to self-study if we collaborate or if anyone who is doing self-study collaborates? It's not so much that it's more democratic (though in the current world it's a worthy goal) … it's more about how is the nature of the research and the nature of the knowledge generation changed because we collaborate. What difference does it make at each stage of the self-study process? …*
>
> *… first, we ask a question related to how we can improve our practice in a particular area. Then, we gather data, as we work to try to improve our practice – action and data gathering are inextricably entwined and continuous. So is reflecting trying to make sense of what we find, and eventually come to new understandings? At all stages, we are continuously seeking to reframe our experience and look at it from fresh perspectives. As we continue with this process, we begin to see what we are doing and why it is useful or not useful, but we begin to play with the new knowledge that is emerging … collaboration may be intrinsic to each of the stages …*

… So, how does collaboration manifest itself in the self-study process? What does collaboration look like? With oneself? With other colleagues? With the literature? With students involved in the class (practice) educators are trying to improve? With the larger self-study community?

Collaborative agency[18] is the term that best expressed the way we saw educators using collaboration to make a difference to the outcomes and understanding at all stages of self-study research. We subdivided the many examples into three types of action: (1) Establishing the conditions of research; (2) Creating educational knowledge; and, (3) Recreating teacher education. Each of the self-study reports reviewed described many different configurations and integrations of these conditions of action, but for the sake of clarity we have described a number of these characteristics separately below.

Collaboration as Agency I: Establishing the Conditions of Research

A consistent reason for using collaboration was the desire to make research projects work better. We have included examples (below) of the way collaborative and dialogic processes were integrated throughout the research design, and used to support the participation and action of self-study researchers.

Collaboration as the ground of self-study

Collaboration seems to be one of the processes that came most naturally to self-study researchers. The following examples from Richards (1998), Tidwell (2002) and Hutchinson (1998) illustrate the low-key and persistent integration of dialogic and interactive processes that was typical of many of the reviewed studies.

Creating teacher self-portraits

Janet Richards (1998) wrote about her innovative four-step process of creating self-portraits as "a practical method for documenting and studying teacher practices" and "opportunities for teachers to identify classroom behaviors such as too much 'teacher-talk' that are not congruent with their students' growth" (p. 39). From the first step of the process, where she was prompted to focus on problems with "teacher talk" in her own work by the journal writing of one of her students, Richards' text traced an enacted conversation with the pre-service teachers that she summarized thus:

> Additionally, drawing and sharing self-study portraits of teaching behaviors allow teacher educators to collaborate as partners and to engage in a synergistic process of mutual learning that promote an enhanced understanding 'of the nature and the impact of their performance' (Osterman and Kottkamp, 1993, p. 19). For example, sharing my self-portrait illustrating too much 'teacher talk' stimulated my pre-service teachers to create their own self-portraits. In turn, reviewing my pre-service teachers' self-portraits helped to reveal the similarities in our classroom discourse as well as the possibility that my actions as a teacher educator have the capacity to impact my pre-service teachers' conceptions of teaching. (p. 39)

Thus Richards' strongly individualized method of reviewing personal/professional practice (self-portrait) relied for its success on collaborative dialogue with pre-service teachers in her classes.

Valuing the individual student

Deborah Tidwell (2002) outlined a self-study of her interactions with individual students of education at her university:

> When first conceptualizing this self-study research, I wrestled with the research focus … It became apparent that my first question was not *how do I incorporate* different ways of knowing, but *do I incorporate* different ways of knowing? This led to the realization that I needed to know more about my dynamics when working with different students. These dynamics would then inform me about what it is I actually I *do*. (p. 32) (Emphasis in original text)

Tidwell's text outlines a detailed and meticulous process of data collection, analysis of her interaction with students, and review of the completed case stories with a colleague.

From the beginning Tidwell acknowledged that she could only see and analyze her individual professional practice in collaboration with others (her students) and decided to study three cases representing levels of study (Bachelors, Masters and Doctoral). The first of the case stories (*Martin, Martin, where have you gone?*) reveals a difficult journey, for both Martin and Tidwell as they worked to negotiate his participation in a class. On reflection, Tidwell observed:

> Martin elicited conflicting views within my own thinking about the broader question of the purpose of higher education. His struggle to follow the course-work or to attend class led me to question my belief of the university as an environment that should be shaped for all students. Should the university be a unique environment for students possessing institutionally preferred ways of knowing? (p. 40)

Not only were these stories the personal reflections of a professor about working with a student, they also illustrated the agency of this collaboration in the ongoing work of the research. The contribution of a professional colleague was also important:

> It is that collegial nature of self-study that creates a sense of community that is both unique and powerful. In this self-study, the collegial voice was instrumental in helping me to see the context of my teaching … Questioning led to re-examining the data and patterns, confirming those patterns, and finally reconstructing roles to reflect a clearer explanation of the dynamics involved. (p. 41)

Reflecting critically on teaching

Nancy Hutchinson (1998) focused her self-study on the process of encouraging critical reflection in students. Hutchinson reviewed the practice by which she analyzed student contributions and her fieldnotes after each class looking for information about the students' critical reflection (and her own). She used an action-reflection-action approach and continually modified her teaching based on this process: "Self-study has enabled a focus on my teaching that has led teacher candidates and me to question our assumptions about teaching, whole-heartedly and together" (p. 138).

Even though Hutchinson described her work as an individual self-study, her students, faculty members and certain authors in the literature were active contributors. For example:

> The emphasis, in the group's midterm reflections, on epistemology, and the comments of one reflective teacher candidate came to mind when I read Kessels and Korthagen (1996). They argue ... [continues for two paragraphs – quotes K & K and others] ... Kessels and Korthagen answer my question with the following ... [their] analysis leaves me with many questions about the role of the teacher educator. (p. 134 ff.)

This account reveals a three-way conversation – between Hutchinson, her students and the literature (Kessels and Korthagen) – that extended our understanding of the parameters of collaborative dialogue.

As they reflected on their research projects, Tidwell alluded to the "collegial nature of self-study," Richards remarked on the "synergistic process of mutual learning," and Hutchinson referred to "questioning assumptions together." However, these reports did not present collaboration as a key element of the self-study methodology, but rather recognized it as a way of thinking and acting that was grounded in their beliefs about teacher education and self-study.

Collaboration as Method

The next group of researchers planned collaborative self-study projects. While there was also evidence of integrated cooperation with a range of actors, the primary focus of their collaboration was their work as a research team.

A cross-disciplinary team

Belinda Louie, Richard Stackman, Denise Drevdahl and Jill Purdy (2002) a group of teachers from three different disciplines (education, nursing and business administration) looked at the complex relationship between beliefs and practices. They began gathering data by writing stories of personal success and failure that they then discussed and analyzed:

> ... Until coming together as a research team, we, like so many university professors, failed to use our skills of critical analysis for the purpose of

improving teaching and learning ... our failure to examine our teaching beliefs has resulted in distorted assumptions about teaching. (p. 205)

They took a systematic approach to collaborative self-study because they wanted their results to go beyond self-enhancement to advance the scholarship of teaching. They found social support important because collaborative self-study gave them the opportunity to take "... advantage of multiple perspectives, creating a broad context for interpretation of one's beliefs and practices" (p. 196).

Teaching as research, or researching with teachers, and unpredicted learning

Jeffrey Kuzmic (2002) collaborated with six beginning teachers in their efforts to explore their practice through practitioner research. He also found a danger in doing self-study alone, as an isolated researcher. He recommended that we go beyond the self in self-study and reflect with others:

> Much of this chapter focuses on how the teachers with whom I work have challenged me to rethink the ways in which I understand research as a form of inquiry ... I [also] look beyond the self and raise a number of issues that have also emerged as a result of these interactions ... how we as teacher educators might see self-study as part of a larger project that seeks to extend our collective knowledge of teaching, learning, and schools in the context of wider societal relationships. (p. 232)[19]

This shared self-study enabled Kuzmic to deepen his engagement in his work as a teacher educator through critical reflection on his practice. It also positioned him to hear and understand how his students comprehended, made use of and participated in educational research.

Despite the idealism of his plan to work collaboratively with teachers, Kuzmic also recognized that once collaboration has begun and moved beyond what Hargreaves (1991) called "contrived collegiality" (p. 46), unpredictable and uncomfortable consequences often occur, particularly when collaborators develop a sense of agency within the study. He wrote:

> ... I have come to recognize a danger in the study of self ... My research is certainly connected to the teachers with whom I work, but I did not initiate or conduct this project for them. And yet in the ways I have come to see myself differently, it is through them that I own these understandings. *The danger here for myself (and for self-study perhaps) is in perpetuating and failing to challenge the very boundaries, marginalization, and relations of power and privilege I have come to better understand through my self-study* (emphasis ours). (pp. 232–233)

Kuzmic concluded with the challenge for self-study researchers to learn from these experiences and, "extend ... collective knowledge of teaching, learning and schools in the context of wider societal relationships" (p. 232).

Inquiry into my practice as community

Terri Austin's (2000) thesis contains a detailed narrative analysis of the values that she used as her "living standard of practice and judgment in the self-study of [her] professional life" (p. 1).

> ... I offer an invitation to you, the reader, to share my journey as I work to create and facilitate four different communities. ... My continual self-questioning leads to examining my actions and thinking, and this usually leads to directly (conversations or observations) or indirectly (reading) seeking more information from others. ... I demonstrate how a teacher researcher can create her own knowledge through a combining and recombining practice, personal creativity, intuition, theoretical frameworks, and critical judgement in various degrees at different times. Set in a narrative context, I present a living picture of helping to form and work with communities of students, parents, teachers, and teacher researchers which provides the life-situations in which I created my own knowledge and strive to identify and live out my values. (p. 10)

Austin's extensive text recounts her personal/professional work to build collaboration with colleagues, parents and students, and the power of that collaboration to inform and strengthen the self-study of her professional life and action. She also envisaged that her writing will begin a new form of collaboration as readers interact with her text.[20]

Understanding the interaction

Vicki LaBoskey (1998) highlighted the interaction between researchers as a key element in understanding the unique role of multi-party collaboration in self-study research:

> ... those involved in collaborative self-study are facing one another; they are interacting. Indeed, 'interactive' may be a more apropos referent for multi-party self-study than 'collaborative', especially because, in many cases, the researchers are not just interacting around an external data set; the interactions are the data set, or at least a part of it. (p. 151)

LaBoskey's reflections on the nature of collaboration are based on her understanding of self-study research. She suggests that interactive processes are not merely useful pragmatic strategies for the achievement of research goals, but that the nature of the interactions is in and of itself data about teacher education and a vital element in critical reflection, action and the recreation of practice.

Collaboration as Shared Research: Personal Support, Critical Openness and Strong Action

The bureaucratic, competitive and measurement-driven world of teacher education can be an inclement environment for the study and renewal by educators

of their own practice. In the inclement environment of teacher education, collaboration has been used to create safer spaces where practitioners can support one another to make sense of a challenging world and rebuild energy and action. This is not to suggest that collaboration was used as an escape from the challenges and difficulties of the real world. In the words of Mary Lynn Hamilton:

> My work with the Arizona Group, like my work in my classroom, has addressed my desire to remain true to myself – to converge my theory with my practice, my word with my action. Inspired by the works of Freire and hooks, I have attempted to live my ideas and model my beliefs. (Hamilton, LaBoskey, Loughran, & Russell, 1998, p. 2)

We have included more examples of this genre of collaboration, because these researchers have pursued the discourse of collaborative self-study. They have collaborated with other self-study researchers *and* engaged in shared self-study of their collaboration.

Together for the long-term

The Arizona Group (Karen Guilfoyle, Mary Lynn Hamilton, Stefinee Pinnegar and Peggy Placier) have maintained an active collaborative study for many years:

> Shortly after graduating from the University of Arizona in 1989 and taking positions at four different institutions, we began studying our development as teacher educators and academics. Using letters, journals, and e-mail, we constructed individual and shared stories of our development and played a role in redefining teacher knowledge from a self-study perspective (e.g., The Arizona Group, 1994, 1996). Our early work focused on our attempts to simply understand the social contexts of our practice. We documented our struggles to cope with new roles and new institutions, and traced our paths through the tenure maze. As untenured professors, we were warned against engaging in the politics of reform, although we sometimes ignored those warnings.
>
> After achieving tenure, we became more actively involved in deciding the futures of our programs in an era of reform. As women, we were committed to educational change that supported equity and justice (Weiler, 1988), and committed to teacher education reform if it could be constructed in ways consistent with our values. No longer beginners or outsiders, we faced an obligation to change the system we had often found so alienating. We have found ourselves confronting multiple ideological and structural contradictions as we attempt to collaborate with colleagues to rethink and restructure the context in which we work. (Guilfoyle, Hamilton, Pinnegar, & Placier, 2000, p. 20)

This group of educators continues an active contribution to the discourse until today, and their work has become part of the meta-literature of self-study.[21]

Their current writing shares their exploration of the "concept of dialogue in the self-study of teaching practices" (Guilfoyle *et al.*, 2002, p. 96).

> Using our most current work, an exploration of our resistance to the so-called teacher education reforms and the emergence of research work about this as examples, we explore the methodology of the professional dialogues in self-study of teaching practices. ... We use our dialogues to forward each other as teacher educators, and perhaps more importantly we use each other to support our resistance to the so-called reforms. (pp. 96–97)

The Arizona group's extensive presentation of collaboration includes the intense exploration of each individual's personal/professional experience and identity, in addition to the ongoing "conversation about the relationships among teaching, self-study, the social contexts of academic institutions, and teacher education reform" (p. 97). They have also recognized that their shared experience and their individual perspectives can become catalysts for a conversation within the broader community in which knowledge will be shared and created.

Not waiting for institutional support

Observing that "few professional development support systems and processes are systematically available", Vicki Kubler LaBoskey, Katherine Davies-Samway and Sara Garcia (1998) took the initiative to improve their practice by "working with other concerned teacher educators in their region" (p. 155).

> We are teacher educators who strive hard to improve our practice. ... We have found that membership in an informal, local group for teacher educators has been very helpful to us as we reflect upon and make changes to our practice. (p. 154)

When these educators studied the impact of membership in the teacher educator group on their work (individual action-research projects) they found that it had supported them in three ways: (1) *Motivational*: "the regular meetings provided us with the incentive to keep going"; (2) *Clarification*: the group helped "each of us to clarify our issues"; and, (3) *Providing specific ideas for change*: Shared ideas extended perceptions of possibility and opened up new directions (pp. 164–165). The authors concluded with the observations that: "It is unlikely that the studies would have been done at all had it not been for the group participation" and "the nature and form the studies took was influenced by group interactions" (p. 165).

Going beyond the comfort zone

Sandy Schuck and Gilda Segal (2002) studied life history with beginning teachers through workshop seminars and journal entries and reflections. Schuck and Segal worked as critical friends helping each other to explore the meaning of the data and plan action that might lead to reframing their practices. Through

this process they (unexpectedly) "learned a great deal about the difficulties of being critical friends in a self-study and of critiquing and advising each other ..." The incidents,

> [problematic interactions] highlighted for us the notion that being a critical friend in a self-study is rarely simple and straightforward. Loughran and Northfield[22] have developed a framework for the development of self-study of practice in which they argue that it is "working with an important 'other' that matters" so that the individual conducting the self-study is pushed to explore areas that might be uncomfortable. (p. 89)

This experience led Schuck and Segal to ask the question "How can you be a critical friend without alienating the person you are advising?" In response they made three recommendations: (1) "Building trust is an essential first step;" (2), "Both members should be partners in the self-study;' and, (3) "Critical friendship needs to be tested in private before it is disseminated to a wider audience" (p. 100).

Collaborative performance

Sandra Weber and Claudia Mitchell's long-term partnership in self-study using artistic forms of representation and autobiographical inquiry has opened up new ways of exploring professional/personal identity and action (Weber & Mitchell, 2002, p. 121).[23] Through the performance of their work at two successive Castle Conferences (2000, 2002) Mitchell and Weber also initiated creative and embodied pathways for communication with the larger community of the SIG:

> It was on stage, in the process of performing our own words, that we came to our first tentative and *embodied understanding* of the significance of performance to self-study and professional identity, not only as representation, but as form of inquiry (Weber & Mitchell, 2002, p. 121).

This performance (and the dialogue with the audience at the end of the scripted section) extended the dialogue and the inquiry beyond the research partnership to the meta-dialogue of self-study.

Crossing the oceans

Our own experience in researching and writing this chapter from four international locations across time-zones (Iceland, USA/France, Australia)[24] opens up the rich and problematic area of international collaboration in self-study. Email became a standard communication, but writing in this way lacks the synergetic potential of conversation and shared work ... and yet we strongly feel that this chapter truly represents our shared work and shared self-study. This quotation from another study expresses our experience.

> Our most exciting discussion was around the nature of collaboration. Were we supporting one another in our separate practices, or were we sharing

practice in new ways across the airwaves? … we came to believe that we were truly sharing practice, that in some way we were present on one another's work. (Guðjónsdóttir & Dalmau, 2002, p. 94)

International collaboration has been an important characteristic of the S-STEP community of practice from the beginning – it also offers a unique opportunity to go beyond parochial and local perspectives throughout the processes of research and knowledge creation.

Collaboration as Agency II: Creating Educational Knowledge

Research (including self-study) is about the educational community coming to know, *and* about how that knowledge influences practice and is in turn mediated by practice. The refereed and the meta-literature emphasize the importance of collaboration at each of these stages.

Collaboration for Reflection, Sensemaking and Understanding

At one level, reflective practice is intensely personal and individual, but as these examples will illustrate, collaboration with "trusted colleagues" completes this process by "validating one's experiences, ensuring that they make sense by asking for clarification, by offering alternatives and by reminding one of one's own values".

From reflection to reflexivity to change

After involvement in a variety of self-studies and "functioning as critical friends" for an extended period of time, Liz Bass, Vicki Anderson-Patton and Jerry Allender (2002) embarked on a meta-reflection on their experience. "[We] changed the focus of our research collective to re-analyze our previous self-studies" (p. 57). Through this process, they discovered:

… that small shifts of awareness were made visible through the self-study process. These shifts had significant, though subtle, impacts on how we taught. Throughout this process, we noted how working with critical friends helped make visible these shifts and pushed reflection to reflexivity. (p. 59)

Their appreciation of collective reflection embraces the difficulties and challenges of the process, but also celebrates its rewards.

Working with others is crucial and annoying. Moving beyond simple reflection into a collision of worldviews firmly places all knowledge into a particular context. It is perhaps too easy to think reflectively, for humans are well equipped with defense mechanisms to justify their actions rather than challenge them. (p. 67)

In their conclusion, Bass, Anderson-Patton and Allender note the connections between the self-study process and effective and transformative learning:

"Reflexivity, wherein worldviews clash from the input of critical friends and theory, can push reflection past defensiveness into transformative learning" (p. 67).

Collective self-reflection

Pam Lomax, Moyra Evans and Zoe Parker (1998) embarked on a joint self-study of their practice using "story as a means of representing their implicit theories about their practice." They call this process "living educational theory as it embodies … commitment to live educational values more fully in practice" (p. 167). So strong is their commitment to collective self-reflection, that they have included the personal stories (and poem) on which they based their analysis so that readers were offered the option of participating in the ongoing creation of meaning. Their format was "not intended to be comfortable but to demonstrate a dialectic between different orders of meaning that are signified by different types of text" (p. 175).

Mirrored reflections

Jerry Allender (2001) notes in his own self-study that he used his students as a "mirror that encourages reflection on [his] teaching." As he wrote, he invited his students to incorporate their reflections. This collaborative design provides the reader with a double-lens camera: one that sees the course of study through the eye of the instructor, and the other through the eyes of the students. The collaboration with students is textual. Allender's self-reflections on his teaching come to life and gain meaning and relevance in light of the reflections of his students who, themselves, reflect on their learning experiences and how it affects (or will affect) their teaching practices.

Hearing the voices

When the researchers in David Friesen's (1997) team were ready to present the stories they collected on the complexities, joys, and frustrations of being an aboriginal educator, they realized that they needed to provide more room for aboriginals' voices:

> As we talked to the teachers in a fact-to-face manner, we began to question what we were doing. We began to realize that their voices had not only been silenced because they were teachers but more so because they were aboriginal. How were we to affirm and promote these voices and yet as researchers supposedly produce knowledge about aboriginal education? … We decided to produce a number of teacher stories from the conversation transcripts. (p. 7)

Friesen realized how easy it is for reflective practice to miss the picture, particularly when perception is constrained by socio-cultural attitudes and power structures – a decontextualized and "objectified" knowledge picture in which aboriginal educators and their practices served as objects of study rather than

subjects did not address the real issues of power, discrimination, and disempowerment that define and constrain educational efforts in the region. He realized that "selves can never be defined without reference to those around them, what Taylor calls 'webs of interlocution' (1989, p. 36)," and that he needed to create these webs of interlocution with aboriginal educators if his self-study intended to be democratic and communal:

> Self-study is providing a new horizon pointing teacher educators toward a different way of 'being in the world'. … Teacher educator identity is … a continually shaped and negotiated communal identity always rooted in the context of others with whom we work (p. 20) … Self-study from a postmodern perspective reveals that we become something different as teacher educators as we engage in the game of making sense of our practices … It is coming to know oneself, not as an object, but in relation with others. (p. 21)

The work of Friesen and his team highlights a critical issue for reflection and collaboration (as does the work of the other authors in this section). Collaborative reflection may simply reiterate communally held prejudices and attitudes unless explicit processes are set in place to question perception from divergent perspectives (Loughran & Northfield, 1998). This process is often called reframing.

Collaboration for Reframing

The term "reframing" is often referred to the work of Donald Schön (1983). According to Barnes (1998):

> It was Donald Schön who used the term framing to refer to teachers' taken-for-granted views about the classroom, students and the curriculum. … Genuine innovation depends on changes in the unconscious frames of reference that shape their perceptions of what is possible in their lessons … the central talk for teacher education and the improvement of our work as teacher educators, must be seen as a matter of reframing, making changes in how the various aspects of the task of teaching are perceived by teachers … [including] university teachers. (p. xii)

It has also been claimed that some form of collaboration is essential if researchers are to change these unconscious frames of references and open up to new possibilities:

> Reframing is much more difficult from an individual and personal perspective than when acting in collaboration with others. This point has been highlighted by many authors in this collection[25] when they show that collaboration has been important in framing and reframing their studies. (Loughran, 2002, p. 244)

Modeling experience with a valued other

Amanda Berry and John Loughran (2002) taught a course on developing pedagogy to pre-service teachers with goals of creating a learning environment rich in experiences and supportive of risk-taking.

> Such learning about practice requires a consistent focus on recognizing alternative perspectives and approaches ("reframing" – Schön, 1983). By considering the development of practice in this way, we believed that dilemmas, issues and concerns of practice could be viewed as problematic, and thus we might create a situation through which a diversity of responses might be expected. This could highlight the value and importance of problem recognition as a response to curious and puzzling situations and reframing as a mediating factor in influencing responses and actions. (p. 13)

They saw their collaborative self-study as critical to creating this possibility …

> In order to model this approach, we decided that the first two sessions should focus on one of us teaching specific content to the class followed by a debriefing by the other … Unpacking teaching meant we needed to help student teachers learn to critique the teaching rather than the person, so it was important for us to do it ourselves before we asked them to take similar risks. (pp. 14–15)

Collaborative self-study was deeply embedded in their teaching – so much so that it became part of the teaching process. Berry and Loughran stated that "We believe that [issues] are more sharply brought into focus when teacher educators involve themselves in self-study of their practices and use their learning about teaching to inform their pedagogy" (p. 28).

They identified a number of key learnings from this project. One – "A shared experience with a valued other provides greater opportunity to reframe situations and confront one's assumptions about practice" – applies both to their teaching methodology and their collaborative self-study and demonstrates the interrelationship between both processes.

Reframing and learning in the unexpected

Diane Holt-Reynolds[26] and Sandy Johnson both "teacher educators with a high school teaching past", began a collaborative self-study project by reviewing assignments collected over the previous fifteen years, and "consciously exploring the feedback … received in the form of the students' responses to assignments" (Holt-Reynolds & Johnson, 2002, p. 14). In Diane's vignette, she describes how her engagement with students' work enabled her to reframe her understanding of the purpose and outcomes of her own work in unexpected ways.

> Curiously, I seldom learn very much from students whose responses to my assignment or prompt are exactly what I expected to read. Those papers never wake me up or shake me in any way. I do wake up and learn from

those responses that exceed what I thought I had requested. And when I encounter a student's response that technically fulfills the assignment's parameters but seems to me to have missed the point altogether, I not only wake up, I lose sleep trying to say to myself how that happened … (p. 16)

… when I read those two strong essays, I was able to learn what the authors had done to make their work so strong. I was able to learn how to revise my assignment. (p. 17)

Diane's work is based on two forms of collaboration: her work with a trusted colleague (Sandy) who shared her passion for authentic teacher education, and her thoughtful, silent "conversations" with students' responses to her assignments. Because of her openness, and because she valued and questioned the contribution of colleagues and student teachers, Diane was able to re-perceive, re-design and re-energize her work.

Lived tension or the opportunity to reframe

Carola Conle, William Louden and Denis Mildon (1998) brought up the topic of "lived tensions" arising from "the way in which issues passed through a series of personal filters in our sessions" … After illustrating this reality with an example from their experience that revealed "a continuing tension between citing authorities and writing in our own individual voices", the authors continued:

Arguing from authority does not have the same history within each of us, yet the histories could probably be related, since we live in similar cultures and have similar social value systems. There are, among the three of us, similarities and differences connected to that issue, enough similarities to have us recognize the issue, enough difference to make us name various facets of it. One might say, the issue is filled with a dialectical tension for us. (p. 182)

These tensions became the forum for "personal and group learning" (p. 182) as they moved through an intense and meticulously documented "communal situation, as we hear ourselves and others talk" (p. 192). They also became the opportunity for each member of the group to reframe their perceptions of their own history and current practice. The authors also raised a cautionary issue (somewhat related to Friesen, 1997, above): On the one hand their differences created the opportunity for them to question and re-perceive their experience, but on the other hand their similarities may have tended to restrict their worldview.

Collaboration for Knowledge Creation

In the following examples, researchers describe reaching beyond their personal reflections in order to extend their understanding through collaboration within broader forums. In doing so they contribute to the meta-literature of self-study.

Collaboration and collective knowledge

Howard Smith (1998) reported the development of collective knowledge by a faculty Self-Study Group (SSG) (Angela, Callum, Cari, Chris, Howard, Hugh, Peter, Rena, Sylvia and Tom) that met seven times in six months while the members were engaged in individual self-study projects. Towards the end of the period, group members were interviewed about their participation in the group.[27]

> The formation and workings of the SSG were generally very positive. A number of papers were critiqued and completed, there was some sharing of book titles and contents, and a wide range of academic and institutional concerns were discussed. ... [However] there is a general sense that the SSG did not achieve a full cycle of development. (p. 27)

Smith raised pertinent issues related to the negotiation of authority and knowledge within the group and the support offered to each individual. At the end we wished there had been more information about the shared knowledge of teacher education and self-study and the impact of this knowledge in the teacher education program. However, this paper raised the issue and the dilemmas of finding self-study based ways of researching and developing shared knowledge and action within teacher education.

Conditions of learning

John Loughran and Jeff Northfield (1996) developed a book length study of Jeff's "one-year teaching allotment in a secondary school when he taught mathematics and science and was the home group teacher for one class of students in their first year of secondary school (Year 7)" (p. x). Both Loughran and Northfield agree that collaboration is a "condition that made the experience worthwhile" (p. x) and without it Jeff's individual self-study would not have led to the new understandings and knowledge that are shared in the book. They describe the collaborative process, thus:

> The *first* [condition] was the involvement of Carol Jones. Jeff *needed the opportunity to interact about the student responses to his teaching* and Carol helped him to do this. Carol was also able to interview students and provide a student perspective on the classroom activities and *act as a colleague as the teaching and learning situations were interpreted from the perspective of all the participants and their background and aspirations.* The daily journal record and the variety of data gathered from the class *began to make some sense.* Carol therefore provided the conditions to begin learning from the experience. ... (emphases ours) (p. x–xi)

> The second condition for learning from the experience involved the first author [John] taking an interest in the journal and the data and so continuing the study. The book could not have been written without the involvement of the colleague who was able to remain at a distance from the

experience and see the trends developing over the year. (emphases ours) (p. xi)

Collaboration is defined as an essential condition of the knowledge creation and communication in this study for the following reasons: (1) Jeff's interactions with his colleagues enabled him to appreciate the experience of teaching and learning from all perspectives (rather than just his own); (2) Jeff could not make sense of the experience or begin to learn from it without the dialogue with his colleagues; and, (3) the deep knowledge and making sense (writing and publication) would not have occurred without the other colleague (John) who was removed from the daily experience but deeply involved in the flow and all the data to see the larger trends and enter the dialogue with Jeff from this macro perspective.

How does the community come to know?

After five years of collaborative self-study, Hafdís Guðjónsdóttir and Mary Dalmau (2002) became intrigued with the question of knowledge creation in self-study and practitioner research. In addition to all they learned from the teachers with whom they worked, four factors stimulated this discussion: (1) the return of Hafdís to Iceland and the consequent challenge to extend their action and inquiry to two countries and quite different systems; (2) the challenging discussion of their initial paper at the third Herstmonceux Conference (2000); (3) the opportunity to workshop their paper with a group of experienced self-study researchers at the S-STEP Pre-conference at AERA, Seattle 2001; and, (4) preparing to publish their paper and so extend the dialogue further (Dalmau & Guðjónsdóttir, 2002).

They found that the opportunity for local practitioner knowledge to become public educational knowledge was mediated by:

"(1) research partnerships, (2) critical and supportive contacts with 'questioning others', and (3) support to go beyond unconscious local assumptions about the status quo" (p. 116), plus the opportunity to interpret and test meaning in a range of local contexts and action, the extension of meaning into broader contexts, and a constant questioning responsiveness to ethics, social justice, and the impact of the "knowledge" created on the power and agency of all groups in the society. (pp. 116–117)

We are interested in the flow between the local, the practical, and reflexive dialogue. Knowledge is tested at two levels, both the rigorous demands of practice and the questions from the broader field work together in a dialectical process that keeps knowledge alive and growing rather than stagnant and repetitive. It is equally important that practitioner researchers and academic researchers are contributing partners in the dialogue of knowledge creation. (p. 117)

They recognized that educational knowledge was embodied and refined in the

evolving practice and collaborative self-study of practitioners at the local level, and extended through the living discourse of education (meta-collaboration).

The Ground of Knowing

Knowledge creation is not a simple or logical process that occurs independently of the values and dilemmas of the society to which education is inextricably bound. The modern assumption in western culture, that educational knowledge can be identified, proven and applied as discrete, validated and semi-universal "best practices," is currently under question in scientific, humanistic and educational research forums. Gibbons *et al.* (1997) make connections between the emergence of new forms of research and collaboration, complex changes in the environment, and new modes of knowledge production in contemporary society.

> Knowledge can no longer be regarded as discrete and coherent, its production defined by clear rules and governed by settled routines. Instead, it has become a mixture of theory and practice, abstraction and aggregation, ideas and data. The boundaries between the intellectual world and its environment have become blurred as hybrid science combines cognitive and non-cognitive elements in novel and creative ways ... The impact of this postindustrialism has mirrored and reinforced this drift toward confusion in the intellectual world. (pp. 81–82)

And Carspecken and Apple (1992) raise moral and ideological questions:

> Education does not stand alone, a neutral instrumentality somehow above the ideological conflicts of the society. Rather, it is deeply implicated in the formation of the unequal cultural, economic, and political relations that dominate our society. Education has been a major arena in which dominance is reproduced *and* contested, in which hegemony is partly formed and partly fractured in the creation of the common sense of the people. (p. 509)

In the twenty-first century, these macro-analyses confront all researchers. The difficulty (and the strength) for self-study researchers is that they face the implications of these questions within the day-to-day of the local practice of teacher education. This is the ground of collaborative knowledge creation in self-study inquiry.[28]

At every stage of the knowledge creation process, collaboration may become painful, problematic and confusing, as conflicting ethical, practical, and/or theoretical positions emerge in the discourse, and perhaps make it seem that collaboration is not possible. For example, the S-STEP email-list discussions[29] (in which major conflicts in the global arena entered the self-study conversation, and raised the question of whether or not self-study is apolitical), faced participants with choices: Was this conflict far removed from their work with students, was it inappropriate for a practice-related educational dialogue, or was it a reminder that education (and self-study) is lived amid such dilemmas of society and culture?[30] Episodes such as this may fracture collaboration in the short term,

but they may also reiterate the challenge to approach collaborative knowledge creation as a journey – sometimes exhilarating as new understandings emerge, sometimes enervating in the small steps of meticulous drudgery, and at others a difficult, painful and overwhelming struggle – but always reliant on the diverse voices, beliefs and knowledges of the community of practice.[31]

The following examples consider the extension of collaborative self-study to systemic reform, and also raise new challenges.

Collaboration as Agency III: Recreating Teacher Education

There is a growing concern in the public discourse of self-study about the contradictions and dilemmas that are emerging between the (macro) recreation of teacher education through the (micro) recreation of their practice by individual educators, and the reform of systems and programs of teacher education. This is an emerging discourse – often fraught with pain, questions and a sense of alienation. It also raises strong questions for the self-study community.

Collaboration for Reform

In this first group of stories, we see individuals collaborating to renew courses and programs as they begin to confront ripple out changes in institutions and systems.

Extending from the individual to the institutional

Linda May Fitzgerald, Joan Farstad and Deborah Deemer (2002) used self-study to improve their in-service teaching by writing about their own experience. They described a movement from individualistic conceptions of teaching and assessment toward recognition of the inter-subjective aspects of their practice. As reflective colleagues, participating in a mutually respectful, ongoing dialogue about our practice, we know that no one thinks and acts in isolation (p. 219) … We not only support each other to risk changing our pre-service teaching practice, but also try to change institutional assessment practices to make it easier for others to change their teaching practice as well" (p. 220).

Confronting social invisibility

Enora Brown's (2002) experience as "an African American female professor teaching predominantly European American students" (p. 145) challenged assumptions in the institution (and the culture) that:

> Written and verbal texts constituting the educative process are raceless, unbiased syntheses of a 'common culture', and that the beliefs and values embedded in teachers' and students' racial identities have no bearing on the knowledge that they mutually construct in the teaching/learning process. (p. 220)

Her text "examines *the significance of race in identity formation* processes, and

the pedagogical implications of racial identity for the teaching/learning process … a focal issue that grew out of my observation of the relative (in)significance of race in students' personal narratives" (p. 220).

Throughout the process Brown worked collaboratively with her students on course revision, as she offered them the opportunity: (1) to work on identity formation in the context of interpersonal and societal/structural relationships; and, (2) to explore the meaning, significance and complexity of identity construction for themselves. In addition, she herself reflected on her own history and identity formation process. The thought-provoking nature of the course created some tension and discomfort, but it also energized students as they considered the possibilities before them. Brown ended the paper with this observation about the immensity of the societal change that underlies her work with one group of students:

> The observations, self-reflections, and experiences in this self-study highlighted the disjuncture between our initial views of what it means to be human and the place of our own racialized lives in the phylogenic process. It was clear that the relative social location of one's racial group (social class, gender, and other forms of social inequity) in society may render it in/visible to preserve the social order. (p. 159)

Collaboration at every stage (Including system change)

Joan Gipe (1998) made collaboration an inherent part of her entire self-study, from its inception (colleagues at a conference), during its development (with her students), to its outcomes/implications (with her university and the broader educational community). She described her introduction to self-study during a conference session entitled "Creating Communities of Inquiry: Educators Exploring Together Who We Are" where she made a commitment to that group of colleagues to address "my personal dilemma of 'control' by turning over more responsibility to students for their own learning. I was to report back at the next year's conference on my progress at confronting this dilemma" (p. 142).

Gipe based her self-study around the construction of a Course Portfolio using a process that allowed her "to explain teaching practices" and their impact on what she hoped to accomplish (p. 143). Gipe also used the course portfolio as means of "documenting the scholarship of teaching towards purposes of faculty evaluation for promotion, tenure and/or merit" (p. 145). This work in turn, led to political awareness and action within the system: "I agree with Jack Whitehead when he points out the significance of economic and political relationships as they relate to educational inquiry. I, too, 'want to see the educational knowledge [that is] within the Academy and Society' (Laidlaw & Whitehead, 1995, p. 145).

Collaboration in Contradiction and Systemic Reform

Zeichner's (1999) comment recognizes the dilemmas and alienation experienced by self-study researchers as they move beyond the forum of their own classrooms.

> Researchers in the self-study movement on teacher education have employed a wide variety of qualitative methodologies and have focused on many different kinds of substantive issues. … A whole group of self-studies focuses on the tensions and contradictions involved in being a teacher educator in institutions that do not value this work. … (p. 11)

The self-study literature is in the early stages of grappling with these issues.

Reflections of a secret change agent

Mary Lynn Hamilton (2002) reports a personal experience of an attempt to change a teacher education unit. She explores the complex territory of how beliefs and practices do, and do not interact for both those learning to teach and those who teach them. Despite an agreement that the overall focus of the course would be on social justice, and despite an extended period of democratic dialogue on the topic, her colleagues, in the end decided that they were unwilling to adopt social justice as a program goal. Hamilton stood almost alone with *her* problem …

> In this situation the unexpected occurred and it puzzled me. For me, the best interests of our students were not being addressed, and I did not understand how that could happen. However, my colleagues did not understand my quandary. They felt that the best interests of the students involved *not* addressing social justice. Again, I questioned and wondered "How could this happen?" (p. 181) (Emphasis in original text)

Critical collaborative dialogue within self-study supported reflection and reframing:

> … I was conscious of the need to avoid a narcissistic, self-indulgent exercise in vindicating my position. I could see the need for my work to be a strong, careful self-study that moved from individual experience to program involvement that incorporated a well-grounded exploration of the methods used … Dialogues with colleagues outside the study have also been important. They have served as critical friends, and provided comparative perspectives from other institutions and teaching experiences. (p. 182)

The inquiry continued …

> … it precipitated a number of questions for me: "Was this an act of racism?", "Was it undermining me as the Director?" or was this a careful response to recent state-level (right-wing) decisions to remove elements from our state-mandated curriculum? As the Director of this redesign process and an advocate for a focus on social justice, I had a strong desire to unravel this experience and understand my colleagues' responses. As a scholar interested in the intricacies of the socio-political elements in the process, I believed that the unraveling of the threads of the tapestry may also be of help to others working through their own redesign processes. (p. 181)

> The impact of self-study on my practice included an understanding that my colleagues needed an opportunity to critically examine their views. To some degree they needed to express their resistance to change and my encouragement to keep their minds open. (p. 187)

… and broadened …

> Often schools and colleges of education are unsure about where and how to start their reforms. Importantly the students in our program have been denied the opportunity to study issues of social justice in the context of teacher education. As program planners we have modeled unjust social behavior. (p. 187)

And the dilemma continues in the life and work of this professor, this institution, *and* in all our institutions, in education, and in justice in our communities …

> As scholars, particularly white scholars – as many of us are – we must call attention to our role in confronting these structures as well as our failure to address the tenets of our unjust system. This includes the promotion of social justice. (p. 187)

Hamilton raises the possibilities of the contribution of self-study to the discourse of radical change …

> Research studies by white scholars confronting the hegemonic, racist structures within the institution have only been in the literature within the past ten years. Much of this work, however, has been theoretical rather than from a more self-reflective perspective. … Consequently, it is the aim of this self-study to address change agency and its many roles in confronting injustice, and the methodological quandaries of reporting this experience. (p. 187)

We have chosen to outline this complex situation in some detail[32] because it underlines the significance (and the seriousness) of the conceptualization of collaboration to self-study research in the face of increasing dilemmas. Collaboration, as described and experienced here has moved beyond the genre of writing that would simply identify collaboration with skills of consensus, negotiation, friendship or personal support. This is an emerging issue in the public discourse of collaboration in self-study that we believe will assume increasing importance in the coming years (we will continue with this topic in Section 3).

Theoretical Basis for Collaboration in Self-Study

Vygotsky (1978, 1994) and others,[33] have emphasized the importance of social interaction in problem-solving environments, to higher order intellectual activity and the construction of new understandings, and in 1997, Smith wrote about the "synergistic potential" of collaboration: "When people consciously combine

the various dimensions of critical analysis, interpersonal skills, practical abilities, and inner growth, they have synergistic potential for the development of capacity" (p. 253).

As illustrated in the examples from the literature (Section 2, above), the self-study discourse also emphasizes: (1) the importance of collaboration to reframing and reconceptualizing practice, construction of new understandings, and action to improve teacher education; (2) the intersection of the personal, practical, theoretical, ethical and systemic dimensions of teacher education; and, (3) the energizing potential of personal agency and capacity building. In light of this information can we specify the self-study community's response to these questions?

Does self-study exist without collaboration?
Is there a self-study related definition of collaboration?
Or is collaboration simply a research tool like any other with no unique relationship to self-study research?

We offer below our tentative responses – not to establish an elegant definition of collaboration in self-study – we do not believe that such a definition has yet emerged in the discourse. Rather we hope that the thoughts listed below will contribute to the ongoing and active discourse of the place of collaboration in self-study.

The Emerging Discourse of Collaboration in Self-Study
1) The fact that we found no examples of self-study that did not involve some form of collaboration suggests that there is a strong and intrinsic relationship between collaboration and self-study research.
2) Self-study research is situated within the discourses of the social construction of knowledge, reflective practice and action for social change. The strong presence of collaboration in the practice of self-study of teacher education is a natural response to its ethical and theoretical location.
3) If there is an intrinsic relationship between collaboration and self-study research (we think there is), we will understand this collaboration as we reflect on its agency within key dimensions of the self-study process. As outlined in more detail in Section 1, we believe these dimensions are:
   a) Self and agency: The unique characterization of "self" in self-study.
   b) The creation and dissemination of knowledge.
   c) Continuous learning and action.
   d) The emergent and overlapping nature of changes in understanding and practice.
4) Finally, we believe that collaboration must not be confused with consensus, unity and sameness. The synergistic potential of collaborative agency is always at risk from our (and our colleagues) inability to see beyond our shared comfort zones. "Subtle processes of confinement of thought and action occur in homogeneous groups (particularly if they are aligned with

unchallenged hegemonic discourse) … [and it is therefore important] to include research participants who come from multiple ethnic, national, cultural, status and gender backgrounds, and to ensure that their contributions are active and powerful" (Dalmau, 2002, p. 45).

We will return to a number of the issues raised above in Section 3 where we will provide a brief overview of key collaboration related questions that are emerging in the self-study of teacher education community.

Section 3: Continuing the Discourse: Key Issues as we Move Forward

The earlier sections of this chapter examined the nature, location, and implications of collaboration in self-study research, and revealed an emerging self-study perspective on collaboration that is best described as "collaborative agency" (i.e., the collegial, professional, purposeful and challenging synergy[34] that is intrinsic to understanding and action in self-study research). However, despite the strong presence of collaboration in the practice of self-study, its consideration in the current discourse is largely tacit and implied. Unless this situation changes, critical opportunities for the development of the self-study of teacher education practices may be missed. We therefore conclude this chapter with four broad areas for consideration in the self-study community.

The Characterization and Agency of "Self" and "Selves" in Self-Study

Loughran and Northfield (1998) described the collaborative relationship as a "shared adventure … [that] broaden[s] the understanding of the individual whose situation is the focus of the study and the significant 'other' with whom the sharing of the adventure occurs" (p. 15). Self-study research raises questions about the agency of both researchers and all the others who collaborate in the process.

Key issues for consideration in the discourse include:

1) *Conceptualization of the status and agency of self in collaborative self-study*

   Situating the self: What happens to our understanding of self-study research when the modern notion of an objective self that can reflect on itself as an object (transparent to itself), is replaced with an understanding of the self as interwoven with context and historical formation?

   Finding more holistic ways of thinking about the personal/professional self: What are the organic interconnections between personal and professional identity, action and belief, and between individual and collaborative action?

   Exploring the "contradiction" between the personal and the collaborative: What are the dilemmas faced by self-study researchers as this apparent contradiction is enacted in practice? (See discussion in Section 1).

2) *The agency of the collaborating other*

Questioning the role of the collaborating other: The intentional role of collaborator is variously described in the literature (e.g., valued other, questioning other, critical friend, shared adventure, joint involvement, synergy, partnership), while others whose contributions also formed the inquiry are represented passively and hierarchically (e.g., students, teachers, colleagues). What are the limits, opportunities and histories of these conceptualizations?

Going beyond affirmation to collaborative agency: Self-study research introduces the personal action and identity of individual teacher educators into the public discourse. In light of the vulnerabilities inherent in this process, collaboration has been used to create safe places from which educators can research and recreate their practice. How can this intellectual and critical support extend the safe haven of shared ideology while also nurturing the dynamism of shared agency?

Self-study writers framed the professional-personal agency of self through a wide range of methods of inquiry,[35] and as they responded to the dilemmas raised by the conceptualization of the personal/professional self in self-study approaches, they also informed and extended the possibilities of these methodologies.

Collaborative Pathways from Personal to Public Educational Knowledge

The contribution of collaboration to knowledge creation is already a significant thread in the current discourse as it relates to the development of personal and practical knowledge through self-study. Emergent stages of this discourse include the consideration of the pathways from practitioner to public knowledge, and critical questioning of the nature of public educational knowledge.

Key issues for consideration in the discourse include:

1) *The agency of collaborative dialogue as a pathway to new understandings*

Recognizing the "sense of unease" as the pathway to reframing: Zeichner (1999) identified problematization, deep interrogation of practice, and the ability to influence practice as critical elements of self-study. This form of questioning can lead to the "sense of unease" that was linked by Schön (1983) to reframing.[36] How does collaborative dialogue contribute to the iterative and ongoing process by which uneasiness, and even dissonance, becomes a catalyst for new perspectives, new findings and teachings, new action, and new questions – and a renewed sense of unease?

Re-creating knowledge through questioning dialogue or conscientization: Conscientization "… is a risk-taking and dialogic form of reflection that occurs over time, when educators, (1) recognize and challenge long held

beliefs, assumptions and knowledge, (2) consider the socio-cultural, histori-cal and political factors that shape their practice, (3) reframe and reconstruct their worldview, and (4) deepen their commitment to collabora-tive and transformative action" (Dalmau, 2002, p. 85; Freire & Faundez, 1989; Freire, 1985; Smith, 1997). What new forms of collaborative dialogue are emerging in self-study research? How is educational knowledge trans-formed through this process?

2) *Collaboration in the movement from personal/individual knowledge to public educational knowledge*

Enacting personal and public knowledge: In Section 2, we discussed examples of the work of self-study researchers as they grappled with the collaborative processes by which private/personal knowledge enters the public discourse. We also questioned current understandings of the nature of shared educa-tional knowledge. Does this knowledge consist of: (1) statistically proven best practices; (2) lived knowledge that has been translated in practice; (3) refereed literature; or, (4) other possibilities yet to be created? We believe that self-study researchers are well placed to contribute to this meta-discourse in the broader educational, cultural and political community.

Creating knowledge through meta-collaboration in the community of practice: In Section 2, we also noted the emergence of meta-literature on self-study, and meta-collaboration in the self-study community of practice. At this stage little research and writing has been devoted to these phenomena. We also believe that the critical analysis of this process will make a significant contribution to understanding both collaboration in self-study, and the pathways from private to public educational knowledge.

Bruffee (1993) coined the term "boundary discourse" (p. 224), to signify those conversations at the edges of knowledge communities in which new understand-ings are explored and created. He also noted that at times, these dialogues may seem unformed, problematic and off-center, but he also challenged readers to consider the benefits of this form of discourse to new understanding and action. Collaboration and meta-collaboration in the self-study community provide opportunities for openness to new ideas, plus critical reflection and discernment in the knowledge creation process.

Reaching for Openness through Collaborative Questioning Research

Self-study researchers' commitment to the recreation of teacher education from within underlines the importance of finding ways to question the difficult to see assumptions and privileges that are embedded in their daily work. Irrespective of individual background, idealism, ethnicity, entry-point or personal resistance, researchers' perspectives will be influenced and constrained by the culture, assumptions and ethnocentricity of academia and education.[37] In addition, edu-cators and academics have recognized the *privilege* of their role status (i.e., access

to education, resources, power, socially valued knowledge and position), and also recognized the importance of confronting and questioning both personal attitudes, and the systems and cultures that gave rise to these privileges.[38] What has not been so well recognized is the ivory tower effect of privilege, and the consequent *absence* of key elements of knowledge, understanding and experience, which are critical to the recreation of education. New forms of collaboration are therefore necessary if educators are to access the partners, viewpoints and capacities that will be necessary if self-study is to achieve its goals.

Key issues for consideration in the discourse include:

1) *Seeking out and questioning divergent perspectives*

   Deliberate and planned action: How could self-study researchers maximize opportunities to question their work from divergent perspectives through intercultural, inter ethnic, international collaboration?[39]

   Knowing how to differ professionally, passionately and constructively: Knowledge communities are defined and strengthened as much by their dilemmas as their agreements, and as Common (1994) observed, "differences are essential to knowledge of complex topics within a community diverse in experiences, interests and aspirations" (p. 266). However, this is not always the case. Conflict has also fractured communities, silenced voices and outlawed sensitive topics. What are the resilient and strong forms of collaborative conversation that will persevere in the face of complex and conflictual viewpoints and harsh realities?

2) *Questioning power, social justice, discrimination*

   Misuse of power, social injustice and discrimination are culturally and systematically generated, and therefore potentially embedded in the daily habits of educational communities and environments (including research relationships and processes). These *invisible* scripts may be either reinforced or challenged by collaborative research relationships (e.g., mutually reiterated assumptions about power and agency between students and faculty). How have researchers used collaboration with colleagues, students and significant others to raise consciousness about hidden oppression and misuse of power? How do educators constructively transform these challenges into possibilities for growth and communal knowledge?

Lipka (1998) and Freire (1993) suggest that issues of passionately held differences, asymmetrical power relations, and oppression can form the basis of creative new ways of working if insiders and outsiders, oppressors and oppressed recognize the legitimacy of voices, experience and knowledge and create new ways of working together and new systems in which to work.

Collaboration and Systemic Reform

Systemic change relies on collaboration at multiple levels. In 1999, when Zeichner wrote,

a whole group of self-studies focuses on the tensions and contradictions involved in being a teacher educator in institutions that do not value this work. … Much of this work has provided a deep and critical look at practices and structures in teacher education. (p. 11)

he highlighted both the sense of alienation that is emerging in the work of experienced self-study researchers (e.g., Hamilton, 2002),[40] and the potential of self-study research to contribute to the revisioning and recreation of teacher education. This emerging trend in the discourse raises critical questions about the nature and agency of collaboration in self-study.

1) *Collaboration for revisioning and recreation*

   In self-study, the collaborative processes of critical questioning and reframing within continuous action do not generate new "practices" to be applied by others, but rather open up processes, perspectives and questions which may be useful to others as they engage in self-studies of the practices and dimensions of teacher education. This extended level of collaboration and dialogue questions the processes and the media of communicating self-study.

2) *Collaboration from a position of alienation*

   Hamilton's (2002) "Reflections of a secret (change) agent" (See Section 2) poignantly exposes the human face of the "tensions and contradictions" described by Zeichner (above). What do we know about collaboration from a position of pain and frustration (in the face of conventional metaphors of collaboration center around friendship, consensus, and warm feelings of goodness and light)? What is the synergy of this position?

3) *Collaboration within the ecosystem*

   A possible future direction in the quest to elucidate and understand connections between individual and systemic collaboration in self-study is the organic and fluid concept of the ecology, and understandings of change within the ecosystem of education (Bertrand, 1995; Dalmau, 2002; Hill, 2002; O'Rourke & Dalmau, 2002).

4) *Meta collaboration on the journey to explore these issues*

   Meta-collaboration encompasses all the directional and collaboration issues raised in Section 3: we recommend this important area to the attention of the self-study community of practice.

Conclusion

Self-Study is a way of thinking, acting and living that becomes part of the very fabric of a teacher educator's professional and personal practice and identity. The examples we have used in this chapter, and the self-study literature they

represented, are simply "stills" lifted out of the dynamic reality of lifetimes of commitment to education and teacher education across the world. The literatures of self-study reveal both an attitude of collaboration, and purposeful acts of collaboration at each stage of the self-study process. We believe that the emerging self-study perspective on collaboration shows an intrinsic link between collaboration and self-study research, and we encourage all who collaborate within the educational community by writing self-study, to also share what they have learned about this process, and "to continue the shared adventure" …[41]

As we conclude this chapter, we do so in a world in conflict of horrific proportions where the very hope of human collaboration is threatened – a world facing questions of war, weapons of mass destruction, terrorism, poverty, ethnocentrism and oppression – a world divided on questions of morality, international law, and the very nature of democracy, governance and human worth. A world enlightened by immense international grass-roots hope for peace, justice and cultural open-ness. This is the milieu in which we strive to make sense of collaboration in self-study. The belief that the personal/professional identity and action of individuals is intrinsically bound to the creation and renewal of their work carries within it the recognition that what we do as individuals and together can and must make a difference … (April 2003)

Notes

1. Such as Jeanne, Marie, Jon, Hilda and Carl, and Helga and Steven (in the examples above); and for example, Loughran and Northfield (1998, p. 16).
2. Such as Jennifer and Sean (above); and for example, Hutchinson (1998), Richards (1998) and Tidwell (2002).
3. Such as Njeri (above); and for example, Gipe (1998), Hamilton (1998a), Hutchinson (1998) and Oda (1998).
4. These vantage points are interactive and emerged concurrently during our review – the linear organization is related more to clarity of presentation than the logic of argument.
5. Throughout the process of writing this chapter, but in particular through a three day meeting at Herstmonceux Castle before the Fourth International Conference on Self-Study of Teacher Education Practices, August 2002.
6. We have chosen to share this process because (1) we believe it is critical to the understanding of collaboration in self-study, and (2) we wish to engage the reader in the dialogue.
7. As outlined in *Section 2*: *Collaboration in the Self-Study of Teacher Education* we have used the term "meta-literature" throughout the text to refer to the growing body of studies that have contributed to an analytical overview of the self-study of teacher education practices.
8. See also: Brennan, 2000; Dalmau, 2002; Evans, 1996; Fullan, 1999; Lankshear, 1997.
9. We used these questions to inform and frame our analysis – and now we offer them to readers so that they are aware of our process also will have the opportunity to use these framing questions in their own reflection.
10. Such as the experience of Jeanne, Marie, Jon, Hilda and Carl (above).

23. For example: Mitchell & Weber, 1999: Weber & Mitchell, 1995; Weber & Mitchell, 1996; Weber & Mitchell, 1998; Weber & Mitchell, 2000; Weber & Mitchell, 2000.

24. It seems that whatever time it is one of us will be asleep, and unfortunately we do not sleep all that much!

25. Loughran, J. J., & Russell, T. (Eds.) (2002). *Improving teacher education practices through self-study*. London; New York: Routledge/Falmer.

26. In sharing Diane Holt-Reynolds words and wisdom, we wish to celebrate her contribution to education, to self-study and to our personal lives over our years together in the self-study community. It is with grief in our hearts that we also celebrate the depth and the beauty of what she taught us about the ultimate *reframing*, as she shared the lonely journey from life, as we know it, to her passing on Friday, February 28, 2003.

27. Data was also collected from observations during meetings and written and email correspondence.

28. For example: See these anecdotes in the following section, "Confronting social invisibility" (Brown, 2002) "Reflections of a secret change agent" (Hamilton, 2002).

29. Referenced to our review of a public email dialogue on one of the SIG list-serves over several weeks between 2001–2003.

30. In discussing this event, we do not presume to evaluate choices for others – there will be many pathways to learn from and resolve conflict, and many reasons why conflict will be painful. However, in line with our mandate, it did seem important to us that we address the critical reality that collaboration may be more important in times of strong disagreement or against the background of conflicted inequity or social justice, than in times of peace or harmonious agreement.

31. The conflictual, and often oppressive history, of knowledge creation has been illuminated by many authors. Our work has been strongly influenced by the writings of Paulo Freire (Brazil) (1985, 1989, 1993), and Linda Tuhiwai Smith (New Zealand) (1999).

32. We of course recognize that we have not done justice to the complexity and painfulness of this issue, and recommend readers to follow-up with the complete text of this important study.

33. An enormous body of work has followed Vygotsky's exploration of the social, symbolic, and socio-historical nature of conceptualization, For example: Bruffee, 1993; Bruner, 1984; Chaiklin, 1996; Chaiklin & Lave, 1996; Freire & Faundez, 1989; Gallimore & Tharp, 1992; Lave, 1996; Lave & Wenger, 1995; Moll, 1992; Samaras, 2002; Tharp & Gallimore, 1988; Van Der Veer & Valsiner, 1991; Van Der Veer & Valsiner, 1994; Vygotsky, 1994; Vygotsky, 1978; Vygotsky & Rieber, 1997; Wertsch, 1985.

34. The interaction of two or more agents or forces so that their combined effect is greater than the sum of their individual effects (Excerpted from *The American Heritage Dictionary of the English Language, Third Edition* Copyright © 1992 by Houghton Mifflin Company).

35. For example: narrative inquiry, reflective dialogues, autobiography, performance and artistic representation, auto-critical self-portraits, and action research.
36. Also see Dalmau (2002) and Loughran (2002).
37. Researchers have raised the issue of the creation of dominant and defining patterns of schooling over a century of compulsory public education, and the development of the modern scientific, western and colonizing universities over the last two to three hundred years. For example, Bodone et al., 1997; Bourdieu & Passeron, 1977; Britzman, 1991; Brown, 2002; Carspecken, 1996; Dalmau, 2002; Ishak, 2000; Reagan, 2000.
38. For example Freire, 1993; Friesen, 1997; Gitlin, 1994; Guilfoyle, Hamilton, Pinnegar, & Placier, 2000; Hamilton, 2002; hooks, 1994; Kincheloe, 1998; Kuzmic, 2002.
39. For example: Brown, E. R., 2002; & Lipka, G., Mohatt, G. and the Ciulistet Group, 1988; Tuhiwai Smith, 1999.
40. Discussed in Section 2.
41. Thanks to John and Jeff for this expression which had great meaning for us as our every act of collaboration as we wrote this chapter literally spanned the globe.

THE DIALECTICS OF PASSION AND THEORY: EXPLORING THE RELATION BETWEEN SELF-STUDY AND EMOTION*

Geert Kelchtermans[a] and Mary Lynn Hamilton[b]
[a] *University of Leuven, Belgium;* [b] *University of Kansas*

Abstract

Initially this chapter focuses on three issues that emerge from our reading of the chapters in the Handbook's second section. These issues include the relationship between the individual and the collective in the process and position of outcomes, the content of the knowledge produced, and the ways to, and the consequences for, that knowledge production. We consider the ways individual and collective aspects of self-study work merge and differentiate, the need for integrity and trustworthiness in this work, and strategies that allow expression in various forms. We explore the ways that professional knowledge relates to the pedagogy of teacher education and assert that understanding this pedagogy supports teacher educators in experiencing the satisfaction necessary to maintain the motivation and commitment they need to do their work. We argue that knowledge content needs to be broad and deep to complement the complexity and richness of teaching. We propose a framework that can be used to formulate, evaluate, and develop work in self-study. To do that we look beyond the technicist reductionism from the perspective of "knowing how to" toward a "being some-one who" perspective. We examine the moral dimension of knowledge that includes vulnerability in teaching, the integrity and trustworthiness necessary to do the work, and suggest the need for a language to address this dimension. We investigate the political dimension because the issues and dilemmas that simply appear to have moral ramifications may hide questions about power and interests. We suggest that we need to look at teacher knowledge more broadly and remember that relationships in educational settings are not without emotional currents and that emotions are a central part of teaching. We offer ways to bring these dimensions together

---

*Chapter Consultant: Stefinee Pinnegar, Brigham Young University, U.S.A.

that will keep the passion in teaching and support the development of professional knowledge.

From our own work and from reading the chapters in this section, we find that three crucial issues concerning professional knowledge in self-study emerge: the relationship between the individual and the collective – both in the process of self-study and in the position of its outcomes, the content of the knowledge that is or ought to be produced, and the consequences for the form of that knowledge and the ways to achieve them. Once we elaborate on these issues, we attempt to tease out the ways that attention to emotion can support the development of the professional knowledge of teachers using self-study of teacher education practices as a tool.

As we begin this chapter, we define self-study as a mixture of systematic reflection or a form of inquiry that tries to answer relevant questions through a systematic collection of data and their analysis. To our analysis we bring an interpretative, interactionist and contextualised view. Only from an in-depth analysis of the meaningful specificities of the local context, can we expect to develop insights that have relevance beyond that situation.

The Individual versus the Collective

In the next few paragraphs we address the individual and the collective elements of self-study. Can researchers involved in self-study work individually on their research? What is the role of the collective? Must there be a role? While these issues will be discussed in far more detail in the third section of this Handbook, we believe that it is important to consider them briefly here.

A cursory review of requirements for promotion and tenure in most universities (at least within North America) reveals that in the framework of traditional research, individual work is prized. Professors are warned that they should have more individually authored pieces than collaborative ones. When items on their vitae are done in collaboration with others, researchers are told they must report the percentage of effort they contributed to the piece.

In contrast to the lone scholar sequestered in the Ivory Tower view, self-study research values collaborative efforts. If, as the Arizona Group (See chapter 28 in this Handbook) suggest, the fundamental research stance in self-study is dialogue, and dialogue suggests conversation, the collaboration would seem to be almost part of the essence of self-study and a required element if one wants to establish the credibility and trustworthiness or virtuosity of self-study research (see chapter 11 by Korthagen and Lunenberg for a broader discussion of these issues).

In the first section of this Handbook, one element of a functional definition of self-study research is that the work is essentially collaborative. Bodone, Guðjónsdóttir, & Dalmau offer a more elaborate discussion in this volume. While we accept that self-study is collaborative we always wonder, what does it

mean to work collaboratively in self-study? What does it mean to work individually? What kind of collaboration is essential to self-study?

We ask these questions in light of the fact that we each have had the experience of working on a project and redoing or restarting parts of a project, not so much because we were dissatisfied, but because as we surveyed our product we heard the voices of a teacher, a parent, a friend. Even though this person was not present, we heard their critique and it forced us to reconsider, rework, or in some way fundamentally alter our product. We assert, therefore, that whether teachers or teacher educators work on their self-study individually or in collaboration with others, they carry the collective voices of colleagues with them in their heads. As we examine our data and begin to interpret it, as we determine whether our findings are sufficiently supported, as we read individual interviews or consider journal entries, or questions posed in an e-mail, we hear the critical voices of others reflecting on and critiquing our analysis, our data, and our findings. As the ideas develop and the scholar sorts them out, the collective voices contribute to that process. An internal dialogue with one's self and the remembered voices of critical Others contributes to the development of ideas.

The ability to question and analyse our work is supported by Piaget's work (1977; Guber & Vonèche, 1977) in cognitive development and Vygotsky's work (1978; Wertsch, 1979) on learning. In the last stage of cognitive development we reach formal operational thinking. When we are cognitively mature, we are able to trace ideas and experiences from currency to historical beginnings. We are able to hold the values of all factors constant as we systematically vary the values on one factor after another. We can review a teaching experience that did not go well and re-imagine the results if we had done this or that. In our own minds, we are able to use this process to review and critique our experiences and what we learn from them without re-experiencing in the concrete world that particular experience.

More fitting, to self-study scholarship, however, is the work of Tharp and Gallimore (1988). In *Rousing minds to life*, they outline the ways that thinking develops through Vygotsky's Zone of Proximal Development. The first stage in the process of learning is the stage of assistance (by more capable others) where the more capable Other guides us forward in our thinking and action through questioning. When we move to the second stage of assistance (by self), this more capable Other has taught us a series of questions and statements that we can use to guide our action and thinking as we work in isolation. Next, our action become automatic and we no longer question or probe our action.

Two things can disrupt this situation. The first is we are confronted with a problem that on the surface appears like others that we have routinely solved, but as we work through the process we do not reach appropriate resolution of the problem. The second occurs when we knowingly and intentionally begin to consider our action watching and questioning what we are doing. In these two cases, we immediately move back to stage two where we use the voices in our head – the questions and the thinking – to guide our action. Ultimately, when we cannot resolve the problem we seek out a more capable Other who can show

us where we have gone wrong. But notice, while person-to-person collaboration is essential in the first stage of learning something new, most of the time spent thinking about ideas or trying out actions in a thoughtful way involve stage two where through using our minds and the teachings of the more capable Other we are able to guide our own learning and action.

From this perspective, a teacher or a teacher educator engaged in self-study can be involved at the level of individual and/or collective. An individual can develop ideas in a solitary fashion, using a hermeneutical frame. That is, reading, critiquing, and reflecting on text and the voices of colleagues that supports and reframes ideas within the study. A collective can engage in conversation as they progress through their work as well as use text as a tool. After analysis of journals or other documents, a researcher can seek out others and together review, critique, expand, test, and reform the ideas of the individual. Thus, good self-study scholarship involves collaboration not just with the present others, but with those whose opinions and ideas we value (from personal interaction or from texts) and whose voices become part of our system for considering our own analysis, findings, interpretations, and ideas.

Examples of individual work in self-study include Dinkelman, (2003), Hamilton (2002), Kitchen (2002), Morgan (1993) and a host of others. To better illustrate our point about individual self-study we will briefly discuss the Morgan and the Hamilton pieces in more detail. While Morgan (1993) did not identify her writing as a self-study, the title reveals the focus: "Practical rationality: A self-investigation." This look at her own teaching practices reveals her interactions with self – using notes taken – interactions with research done – citing various texts in discussion – and, interactions with philosophical issues – presenting points in argument form.

In her work, Hamilton (2002) directly addresses the individual nature of her work. Recognizing that she has no colleagues that she might use as critical friends during her self-study of her classroom practices, she details her interactions and interpretations with the theories and perspectives of a particular artist, Winslow Homer. Using journal entries, theoretical texts and the artist's work, Hamilton examines her teaching practices.

Issues of integrity and trustworthiness (Hamilton & Pinnegar, 2000) must be addressed whether engaged in a self-study as an individual or as a collective. This means that we would demonstrate integrity by, "bringing together our beliefs and our actions" (p. 238) and we would demonstrate trustworthiness in the ways that we honestly act in relation to our students. In this way, single authors work individually on their ideas, but carries those collective voices of Others read and known as thinking partners. In this way those engaged in individual self-studies can critically ponder the perspectives they present. Alternatively, those authors working as a collective bring their ready voices to the conversation.

Regarding self-study work that begins at the collective level, examples of this work include the Arizona Group, (1995, 1997, 2000), Freese, Kosnik, and LaBoskey (2000), LaBoskey, Davies-Samway, and Garcia (1998), Lomax, Evans

and Parker (1998), and Kosnik and Beck (2002). Key in this collective work is the Loughran and Northfield (1998) discussion of the importance of a critical Other. For them, the critical Other is a colleague who helps in the self-reflective process by pushing on issues and examining ideas to help develop the researcher's perspective beyond the personal. Work presented in Handbook chapter 19 by Bodone, Guðjónsdóttir, & Dalmau delineates the issues surroungding collaborative self-study in more detail. In the many of the writings of the Arizona Group, who study their teaching practices within the context of their institutions, they discuss the collaborative nature of self-study. Their collaboration provides a range of collective experiences including conversations, artist renditions, and emails as well as interactions with students and texts. These scholars, like others who do this work, critically examine their ideas and experiences in the intimacy of a collegial group and in the public arena through writings and presentations.

Kelchtermans and his colleagues at the University of Leuven have found that when stimulating reflection (as a way to systematically explore one's own learning process – using Korthagen's model – see Korthagen *et al.*, 2001 for a full explanation) among themselves and their students, there seem to be conversational strategies in which they engage as well as more individual strategies. The conversational strategies inspire inquiring reflection when one has the opportunity to engage in a conversation with someone else (in person or through e-mail). The individual strategies work better if s/he can write and engage in a discussion on paper. This may also be stimulated by the school system: in the Belgian system students are required to write less (for example examinations are mostly oral answers to question and there are fewer papers in which one develops an argued case). On the basis of the Belgian experiences they have developed a balanced programme in which collective, individual or work-in-pairs (one-to-one-supervision) actions are all present.

The main points in this section include: 1) individual and collective aspects of self-study; 2) work needs to be done with integrity and trustworthiness; and, 3) strategies to do the work need to be a good mix of reflection and inquiry-based strategies that allow for individual or collaborative work and that allow for writing or oral expression (in whatever form). In other words, we seek out the voices others and their conceptions of what is so that we can consider their ideas against our own. What is essential in self-study is that we intentionally and systematically involve the voices of others in reflection and response to the ideas we generate in our study of ourselves in relationship to our teaching practices.

The Knowledge We (Should) Strive For

Goal and Perspective: Professional Learning and Pedagogy of Teacher Education

This section explores the knowledge for which we as teacher educators (should) strive. To do that we consider the pedagogy of teacher education and ways to broaden the view.

Self-study may be undertaken for many different reasons. One important and complex reason, however, remains the ambition of increasing the quality and depth of one's understanding of one's own practice. In other words, self-study becomes a tool for personal professional learning. Scholars generally acknowledge that becoming a teacher – and self evidently also becoming a teacher educator- is a complex learning process that continues beyond initial teacher training and continues throughout an entire career.

This professional learning results in qualitative changes in both teachers' actions and their thinking. For the teacher's *actions* this means more effectivity. It means judgement. Rather than simply taking action, a teacher or teacher educator makes a well-considered judgement about how and when as well as why to act. Teachers become more effective in choosing and implementing teaching methodology and strategies to help their students learn. Their professional knowledge base as well as the repertoire of their relevant skills becomes wider, deeper and richer (see Hamilton, chapter 10 of this Handbook for more discussion).

At least as important are the changes in teachers' minds. From the expanding research on teachers' thinking we know that teachers' actions are (at least partly) determined by their thoughts, their ideas, cognitions and beliefs. Apart from effective skills, professional learning also suggests changes in their *thinking* in the direction of more *valid professional knowledge* based on a more in-depth understanding of what is actually going on in (our) practices as teacher educators. Further, for many teacher educators, and teachers too, the desire is to take a local focus on something that may have generalizable results that may be accessed by all interested parties.

This is in line with Loughran's argument that we need a deepened understanding of the *pedagogy of teacher education* (Loughran, 1997, p. 3). Although this understanding demands knowledge (subject matter knowledge, knowledge of students' needs and concerns, knowledge of strategies to create learning opportunities and challenge student teachers' beliefs, etc.), this knowledge should not be conceived of in instrumentalist terms (applying means to ends) only. It cannot ignore the context:

> Teaching strategies are both content and context dependent ... knowing how to use a strategy is one facet of teaching, knowing why to use it is crucial, *but* being able to adapt and change, to be responsive to the teaching and learning environment is fundamental to good teaching. (Loughran & Russell, 1997, p. 169)

The professional teacher (educator) not only masters a subject and a set of teaching skills, but is also capable of judging and understanding the specificities of an educational situation in order to make the choices that do justice to a particular situation with the particular people involved. Pedagogy" refers fundamentally to an encounter of people, a relational engagement of persons. *Pedagogy is about a "somebody" who engages in a committed and responsible relationship*

with others to support them in their learning and development. This "somebody" is a person, with his or her personal history and background, his or her appearance, etc. It is not "anybody" but this particular "somebody" that lets him or herself get involved. Van Manen argues that teachers tend to focus on the "pedagogical" – the complexity of relational, personal, moral, emotional, aspects of teachers' everyday acting with children or young people they teach" (Van Manen, 2002, p. 135) and he concludes that, "pedagogy is the condition for the instructional dimension of teaching ... pedagogy makes the practice of teaching possible in the first place" (Van Manen, 2002, p. 137). Understanding pedagogy implies understanding one-self as a "pedagogue" – this places the person, the 'self' of the teacher (educator) and his/her interpersonal relations as a teacher educator, at the centre of professional learning.

Understanding the pedagogy of teaching and teacher education will allow teachers and teacher educators to do "a better job." "Better" can mean two things. On the one hand, it means more successful in its effects (results by the students). Of course we want (teacher) education to be effective. On the other hand, it also means more satisfying to the teacher (educator). This second meaning is of crucial importance since this satisfaction is the necessary condition for teachers and teacher educators to continue to be motivated and sustain the necessary personal commitment. In our own work, as researchers and as teacher educators and in-service trainers we have heard teachers repeat time and again that "making a difference as a person" is what kept them going in their job. Satisfaction in teaching is not a judgement about independent virtuosity and a critical evaluation of skill alone. Satisfaction in teaching and a personal judgement of virtuosity is always relational. It involves a judgement not of skill but impact on influence in relation to the lives of others. Evaluations of teaching competency and skill in using particular methods and strategies of teaching do not produce in teachers the necessary emotional level of satisfaction to enable a teacher to continue to develop and grow as a teacher. Self-study can be a source for creating this depth of satisfaction because even in different situations it can provide teachers and teacher evaluators with evidence of their current influences and signal to them directions for professional growth that can increase their influence.

If self-study wants to contribute to genuine professional learning as well as to a pedagogy of teacher education, what then should be its content? What should the "knowledge" resulting from it be about? We want to argue that its content needs to be *both broad and deep to do justice to the full complexity and richness of "being a teacher"*. We provide a simple, but encompassing framework that can be used to formulate one's agenda in self-study, to evaluate the outcomes of self-study projects or to develop an agenda for future projects of self-study.

Towards a "Broad" Concept of Teacher Knowledge

Often conceptions of the knowledge needed for teaching are unduly narrow. Most often they focus on competence in technique, skill, method, or content.

Yet, teaching and learning are actions embedded in relationships and, therefore, all aspects that promote healthy human relationships must be part of the knowledge of teachers. Further, as Doyle (1986) has argued, classrooms are public places where many things happen at the same time that require immediate response. These actions are carried out in a context where events and actions have historical meaning constructed by participants. Relationships in such settings are not without emotional currents. As a result, only broad and sophisticated conceptions of teachers' knowledge reach a level of complexity that adequately accounts for what good teachers need to know and do. In this section we follow up on our discussion about knowledge and extend this to examine possible dimensions of knowledge.

Beyond the Technicist Reductionism

Although the importance of reflection and inquiry has become widely accepted, treatment in current teacher training programmes is often rather narrow. Reflection and teacher development are mostly treated as technical matters of acquiring knowledge and skills, aiming at improving the technical effectiveness of teaching. Technical reflection puts the *how*-questions at the centre. How can I change, modify or adapt my teaching to make sure I meet the goals? How can I overcome the gaps or holes in my professional knowledge and skills in order to broaden the range of my professional effectiveness?

Many discussions in teacher training institutes that are concerned with improving the organisation of training programmes, or implementing new teaching strategies, also confine themselves to technical matters. Quite often stimulated to do so by the latest trends and a superficial concern to appear up-to-date to the possible "clients" (student teachers; parents). This is "professional" knowledge in the sense of "medical" knowledge. Something that is static can be owned like property rather than seen as a state of being in relationship to others.

Basically all these efforts are driven by a concern for technical problem-solving, the effective application of means to ends (that have been established by others), the efficient ("cost-effective") use of resources, in order to achieve high (and favorably measurable) output. This thinking (and the research based on it) remains embedded in what Schön (1983) called a rational, instrumental and technical approach to reflection. A lot of research aiming at "knowledge for practice" (see Cochran-Smith and Lytle, chapter 16 of this Handbook for elaboration) also echoes this idea. At a more fundamental level this technicist reduction follows what Sachs (2001) calls the dominant discourse of managerial professionalism in policies on teachers and teacher development (Sachs, 2001, p. 151): the belief that effective management of means and ends can solve any problem. In this way, if a teacher education candidate or a teacher educator can display a skill for reflecting we can judge them competent to continue their professional learning. What is actually required to be reflective? (Allender, in chapter 13, offers another discussion of this issue).

Reflection can be viewed as a way of being rather than a competency to be achieved. Loughran (1996) recognizes reflection as "central to teaching and

learning" (p. 3). Before him, Dewey (1933; 1963) identifies the reflective process as conscious involvement with beliefs and understandings. Critical to Dewey's definition of reflection is his view of the importance of the scientific method approach, which contrasts with more current views of the process (Fendler, 2003; for further elaboration on definitions see also MacKinnon & Erickson, 1992; Richert, 1992; Korthagen, 2001). Dewey (1933) also identifies peoples' approaches to openmindedness, whole-heartedness and responsibility as critical attitudes that prepare them to engage in the reflective process (for greater elaboration on these issues, see Loughran, 1996.) Again, rather than competencies, these are approaches that contribute to a way of being.

Of course, technical issues are neither irrelevant nor unimportant. Teachers do need a solid knowledge base and the mastery of a broad range of teaching skills (Korthagen, 2001). Because teachers' technical concerns will often be so central in teachers' thoughts about their teaching, because they reflect the so-called *practicality ethic*: teachers acknowledge certain ideas or methods as valid when they have proved to work in practice (Doyle & Ponder, 1977–1978). Teachers live and work under the pressure of day-to-day practice. They must maintain the smooth functioning of the school. This pressures them to ask for simple, quick solutions, because "schooling has to go on". Osterman and Kottkamp call this the "fix-it model" and use it to explain why educational change so often fails and things remain the same in schools (Osterman & Kottkamp, 1993, p. 4). It also explains why knowledge of content, technique, and organizations are important topics but shallow without being in relation to others as the base of professional knowledge.

Finally, this dominant concern with technical questions is probably also an unintended side effect of the success of formal models for reflection, like the widely used ALACT-model (Korthagen, 2001). These models have proven to be very useful in guiding and supporting the development of reflective skills during the process of becoming a teacher, just because they are formal and can be applied independently about decisions on what counts as good teaching. Because of their formal character, however, they can easily be limited to instrumental interests of effectiveness, even though – for example- the ALACT model clearly emphasises the importance of taking into account not only the teachers' but also the pupils' perspective, and not only "thoughts" but also "feelings" (Korthagen, 2001, p. 210). This is so because it separates the action or skill of reflection from an ongoing state of "being" reflective.

To sum up, technical and instrumental issues of knowledge, skills and their effective use are important to teaching and teacher education, but teaching and becoming a teacher can and should not be reduced to it. *The reductionism lies in the fact that "knowing how to" replaces the "being some-one who."* In other words, there is more to teaching than technical and instrumental issues. In fact, we know that many teachers enter their teacher education programs with a desire to help others and provide support and service to their community (Brookhart & Freeman, 1992). This altruism affects them and their actions in their classrooms.

For our work, we use Hargreaves' claim that teaching includes a moral, political and emotional dimension (Hargreaves, 1995) as a guide to structure our arguments for a broader content of the knowledge aimed at in self-study. If the goals and outcomes of self-study really want to do justice to the fullness of being a teacher and teacher educator they will have to be broad enough to include all of these dimensions and thus restore the "*being some-one who.*" Listing the dimensions without developing an understanding of them in our teaching practices reverts the dimensions to competencies of practice rather than embodiment of practice.

The Moral Dimension

Teaching is "a profoundly moral activity" (Fenstermacher, 1990, p. 132): firstly because it contributes to the creation and recreation of future generations, and secondly because teachers constantly make small but morally significant judgements in their interactions with children, parents and one another (Hargreaves, 1995, p. 14). What seem to be technical decisions on teaching strategies, on the use of instructional materials, or on interventions for classroom management, are moral decisions in their consequences (Oser, Dick, & Patry, 1992). The central question, referring to this moral dimension, is: *to what extent am I doing justice to the students that are entrusted to my responsibility and care as a teacher/teacher educator?* The moral dimension in teaching fundamentally refers to the question of what is educationally in the best interest of the students and thus what I should do as teacher/teacher educator? There is, however, no agreement about what is best for the students and what actions might best achieve that purpose. Hargreaves aptly characterises the complexity of teachers' moral choices:

> Attending to the moral dimensions of teaching usually involves distinguishing between better and worse courses of action, rather than right and wrong ones. There are no clear rules of thumb, no useful universal principles for deciding what to do. … They must live their moral lives in the swamp, … especially when moral certainties grounded in tradition or science are collapsing and people must rely on their own reflective resources as a basis for moral judgement. (Hargreaves, 1995, p. 15; also Sockett & LePage, 2002)

Kelchtermans (1996) argues that this lack of a firm ground to justify one's practice and the moral decisions in it, constitutes a pervasive source of *vulnerability in the teaching job*. Teachers' decisions (and their moral consequences) can always be questioned and with it also the teacher's moral and professional integrity. The social recognition of "being a proper teacher" – a very valuable working condition for teachers which includes their sense of identity – can thus always be withdrawn.

And yet, teachers cannot but act and thus chose among different values and norms. They find themselves continually forced to make decisions with moral consequences in dealing with the multiple, diffuse and even contradictory

demands made by the different actors in and around the school. In a recent study, Tirri and Husu (2002) show how teachers' moral stance on care and responsibility brought them to face ethical dilemmas in conflicts with parents, collegial conflicts and inter-institutional conflicts in the community. All the dilemmas dealt with human relationships and the different views on what was "the best interest of the child" forced teachers to, "mediate between conflicting private and public interests, including those pertaining to personal, professional, organizational, and societal values" (Tirri & Husu, 2002, p. 78).

Tirri and Husu argue for supportive school cultures of extended collegiality in which the evaluation of ethical conflicts becomes an intersubjective judgement and not a personal affair. Kelchtermans (1996) contends that autobiographical reflection and storytelling can be effective ways to explore and better understand the moral dilemmas and the sense of vulnerability they imply. This understanding and the narrative sharing of it can help to endure the inevitable vulnerability in the teaching profession.

Doyle's (1979) elements of classroom life: 1) simultaneity; 2) immediacy; 3) multidimensionality; 4) public; and, 5) history, are also important here. Since each event in teaching can support multiple interpretations and have multiple consequences, a teacher's response to a situation depends on which of the multiple perspectives involved are taken. A teacher is always vulnerable to negative judgement. In the work of Clandinin and Connelly (1995, for example), they identify the cover story as the tale used by teachers to protect the private experience as well as personal levels of vulnerability.

Hamilton and Pinnegar (2000) call for integrity and trustworthiness among teacher educators as well in recognition of their moral obligation toward their students and the students of their students. To facilitate that, Sockett and LePage argue for the urgent need to develop a language to address the moral dimensions of teaching:

> Teachers do not lack moral sophistication because they are not moral people. Just the opposite, most teachers are drawn to teaching because of their moral commitments. Moral language is missing in classrooms: but it is also missing in the seminar rooms and lecture halls of teacher education. (Sockett & LePage, 2002, p. 170–171)

The moral language may be missing because the discourse has to come from teacher educators whose discourse about teaching needs to include reference to the moral and a consideration of what is moral – which can be painful. For some, it is far more embarrassing to be accused of <u>not</u> walking their talk about moral action than their talk about technical, skill-related action. For example, a teacher educator might rather a student say, "you are lecturing us about constructing our own knowledge" than hear how an interaction lacks integrity. Keeping talk at the level of technical competence rather than moral makes the person less vulnerable.

A deeper understanding of the moral dilemmas, of the tension between individual normative beliefs about good teaching and the possibly different views from

others (parents, colleagues), as well as the development of a "moral language" constitutes a crucial agenda for self-study that aims at contributing to teachers' development and a pedagogy of teaching. This is even more true in a policy environment emphasizing accountability, effectiveness and efficiency in education. Hargreaves & Fullan (1998) find that, "It is time we had a new kind of accountability in education – one that gets back to the moral basics of caring, serving, empowering and learning" (p. 49). A more appropriate concept might be justification. Not in the sense of rationalizing, but rather as meaning providing empirical evidence that the person is acting responsibly as a teacher. This may be a more appropriate concept, since it does more justice to the moral aspects of teaching and decision making in teaching, than the technical term "accountability", referring to efficient production processes. Responsibility" refers to a moral relation in which one person "responds", answers to the questions, invitations, needs of an Other. Responsibility fits with the "pedagogical."

Moral dilemmas and living contradictions have always been a focus of the research undertaken by self-study scholars (see chapter 17 by Griffiths, Bass, Johnston and Perselli for an interesting look at these issues). We critique our roles as teachers and learners and ask our students to do the same. While exploring teaching, we explore studenting (Fenstermacher, 1986) inviting our students as well as ourselves to trouble the roles and responsibilities in educational settings. For example, Placier (1995) addresses a series of fiascos that focus on grading and student judgement regarding the appropriate action of a professor – herself. In her work Placier details the ways she engages students in an exploration of their notions about receiving excellent grades. At the same time she critiques her own views about university teaching and grading. We also reveal our dilemmas as Russell (1997) articulates when he examines the ways his teaching practices set examples for his students. His interaction with future teachers, the curriculum activities in which he engages them, and most importantly his response to and interaction with them are the things he wants them to take from teacher education into their work as teachers but he grapples with the uncertainty of perceived results.

The Political Dimension

Issues and dilemmas in teaching that look moral at first sight, often hide questions about power and interests. Who benefits from what I/we as a teacher/teachers do? In whose interests are we working? Who is actually determining the what? – and why? – questions in my/our work?

These are not just matters of values and norms, but refer to the political dimension of teaching and teacher development. *Power* and *interests* are words that carry a strong taboo in educational discourse. Many teachers feel very uncomfortable when these issues are brought up as linked to their work. The political is considered as something improper, marginal, just an unfortunate aspect of their particular working conditions or at best a peripheral phenomenon that does not really belong to teaching. And this denial makes it more difficult

for teachers to see the intrinsically political nature of their work and its fundamental relevance for their effectiveness, job satisfaction, and the quality of learning opportunities for their pupils.

These political issues go beyond the level of the individual teacher/teacher educator and his/her group of students (class) (for broader discussions of these issues, see chapter 14 by Brown and chapter 18 by Schulte). They also include issues at the level of the school as an organisation (e.g., relationship with heads of department, management staff, etc.) and at the policy level (e.g., decentralisation; quality control). Discussions about values, goals, and teaching procedures can in fact carry a strong political agenda that is sometimes disguised as technical or moral. Cole and Knowles address the university-related political issues in chapter 12 of this Handbook.

Other self-studies that address political issues from a variety of levels include the work of Beck and Kosnik (2000). Their study examines the interactions between a teacher education faculty and their university institution. Using journals and interviews they reveal the frustrating experiences that occur when work is not valued at the institutional level. In an interactive class view, Berry and Loughran (2002) discuss the politics of team teaching in a core course that is jointly constructed and where faculty team up with new people. Further, in the course after one person teaches they are publicly critiqued in their teaching by their co-faculty member in front of the students and then given a chance to respond to the critique – in order to reveal to students how they are thinking about teaching. In a view more focused on teacher/student relations, Tidwell (2002) explores needs of individual students, ways to address them, and consequences of attempting to do that. Each example has a unique political flavor.

We can refer here to the growing body of research on the so-called micropolitics within education that provides a more in-depth understanding of these political processes, both at the level of the school and of the classroom (Ball, 1994; Blase, 1997). Micropolitics refers to the, "strategies by which individuals and groups in organizational contexts seek to use their resources of authority and influence to further their interests" (Hoyle, 1982, p. 9). In a recent study about beginning primary school teachers, we found that coming to terms with this political reality in teachers' work is a very demanding task and explains a great deal of the so-called *praxis-shock* that they have to deal with. The focus of training is almost entirely on the classroom level, but once a teacher starts her career she becomes a member of the school organisation and has to find her way in it, deal with its traditions, its implicit norms and value systems, its complicated web of human relations and interests. They must simultaneously establish themselves as creditable and competent in classrooms and as a member of the school community. Beginning teachers and/or teacher educators are often not prepared for this political dimension. Essential in their professional development is what we have called "micropolitical literacy": the attitude and skill to "read" professional situations in terms of different interests that are at stake (Kelchtermans & Ballet, 2002, 2003).

The roles of the teacher educator are important to address here. Teacher

education is about a person-to-person relation. This relation feeds and fuels the teacher educator's commitment to teaching. When the teacher educators have judgements regarding personal inadequacy, they may not recognise a political or moral dimension but the implicit response may contribute to a bitterness that develops into attitudes of learned helplessness. When teachers or teacher educators do not recognize the political dimension, how do they respond?

However, when addressing the issue of professional learning, one should not narrow the relevant moral and political context to that of the school and its micropolitics. Teachers and teacher educators also work in a particular macro-political context of government policies. The research on the intensification of the teacher job, for example, clearly shows how life and work in schools is more and more looked at and evaluated from instrumentalist, economist criteria, that deeply affect teacher identities, educational goals and practices (for example, Apple & Jungck, 1996; Ballet & Kelchtermans, 2003; Gitlin, 2001; Troman, 2000; Vandenberghe & Huberman, 1999). Others have argued that this educational policy environment exemplifies how "performativity" has become the overall frame of reference for policy makers. Borrowing from the work Lyotard, these authors mean by performativity the "obsession with efficiency and effectiveness," with standards and tests, with general accountability procedures and even comparative rankings of schools in terms of quality (e.g., Blake, Smeyers, Smith & Standish, 1998). This particular policy environment deeply affects teachers' professional identities, as well as the goals, content and form of their professional learning (Sachs, 2000, 2001; Troman, 2000; Woods & Jeffrey, 2002). As we addressed earlier, in this environment reflection can be mistakenly viewed as a competency rather than a way of being.

The Emotional Dimension

No teacher or teacher educator will deny that emotions play an important part in their work. And yet it is often hard for them to see that emotions are not simply a matter of personality or idiosyncratic teaching style, but constitute a fundamental aspect of the job. In teacher education programmes the role of emotions is acknowledged and gets some attention, but is generally discussed only in terms of negative effects, such as uncertainty or nervousness, which in essence have nothing to do with teaching the curriculum.

Emotions are, however, a central part of teaching and becoming a teacher since the job demands a high personal commitment and involvement. In her introduction to a special issue of the *Cambridge Journal of Education* on "Emotions in Teaching", Jennifer Nias (1996, p. 296) nicely describes the emotional dimension in teaching: "Behind the ordered control and professional calm of all the teachers … bubble deep, potentially explosive passions, emotions bringing despair, elation, anger and joy of a kind not normally associated in the public mind with work". Once again, *in teaching there is some-one engaging him – or herself as a person in a relationship of care and responsibility for others, which makes it impossible to be emotionally indifferent in this endeavour*. Noddings (1984) asserts and Hamilton and Pinnegar (2000) concur that care is important

to bring to teaching. As teacher educators we must model for our students the care we want them to bring to their teaching.

Hargreaves and Fullan (1998, pp. 55–56) have strongly argued for teaching as a *passionate vocation*: "Emotions are dynamic parts of ourselves, and whether they are positive or negative, all organizations, especially schools, are full of them." More recently, however, Hargreaves warned about a too subjectivist or too social constructivist view on emotions in teaching: "Becoming a tactful, caring, or passionate teacher is treated as largely a matter of personal disposition, moral commitment, or private virtue, rather than of how particular ways of organizing teaching shape teachers' emotional experiences" (Hargreaves, 2001, p. 1057). For that purpose he launches the concept of "emotional geography", referring to different types of emotional distance and closeness that can threaten emotional understanding among teachers, students, parents, principals, etc. The emotional geographies are linked to a particular context, they are both subjective (experienced distance) and objective (for example the socio-cultural distance between a teacher and his/her students of other race or class background), and they reflect the complex tension between subject (agency) and structure. Teachers "make and remake the emotional geographies of their interactions with others but not in circumstances of their own choosing" (Hargreaves, 2001, p. 1062). Through investment of hard emotional labour they can achieve more emotional closeness to or more distance from the others. Clandinin & Connelly (1995) articulate the ways in which our narratives of our experience as educators always contain other educators. Our landscapes include them and their landscapes include us, but the terrain between us may not be easily navigated. Furthermore, in someone else's account the entire terrain may shift.

Hargreaves' concern with the organisational determinants of teacher emotions is taken further by Zembylas (2002, 2003a, 2003b; see also Boler, 1999) in his application of poststructuralist and feminist theories to the debate. Zembylas contends that during the past two decades, two waves of interest for emotions in teaching can be distinguished. The first wave established awareness of the role of emotions in teaching, its interactions with the school systems and (although more implicitly) the relation with teacher stress and burnout. During the second wave, the acknowledgement of teaching as emotional practice increased. Emotions were primarily seen, not so much as intrapersonal phenomena, but as emanating from social relationships and closely linked to issues of school policy:

> Most of the existing research on teacher emotion during the last decade marks a shift from earlier efforts aiming at establishing teacher emotion research as a legitimate area of study to exploring the role of emotion in teachers' social interactions. … However, missing is an exploration of teacher emotion as embedded in school culture ideology, and power relations. … Second, another issue that remains unresolved in the area of research on teacher emotion is the need to develop pedagogies that promote empowerment and teacher self-development. (Zembylas, 2003a, pp. 113–114)

In order to solve these problems, Zembylas looks at emotions in a different way, namely as resulting from discursive practices that are structured by "emotional rules, that determine how teachers should or should not feel about curriculum, teaching, and themselves" (Zembylas, 2003a, pp. 118–119). He argues for studies of emotion with the political agenda of inventing strategies of subversion of those emotional rules and provide teachers with opportunities to become the co-authors of their identities (Zembylas, 2003b, p. 108). The interesting research agenda he sets for the study of emotion in teaching, thus integrates, on the one hand, the issues of teacher identity and identity development, and, on the other hand, the moral, political and technical dimensions in teaching. The agenda makes clear that the argument for "passion" in teaching is not enough, but needs to be complemented by a careful (theoretical) analysis of the emotional reality in teaching and teacher education.

Research on emotions in teaching cannot neglect the *embodied nature* of teaching and learning. *Schools are places where some-bodies meet, engage and build relationships* (see for example Estola & Syrjälä, 2002; Van Manen & Li, 2002). A somewhat provocative example is Pryer's exploration of teaching and learning as "erotic acts." Using Neruda's verse "what spring does with the cherry trees", she concludes that:

> The processes of teaching and learning involve the ecstatic abandonment of self to the Other, the continual losing and finding of self in the Other, the intimate, sensual engagement of self with the world. It is eros, catalyzed by the bittersweet yearnings of ever-unfulfilled desire that moves each of us to seek union with the Other. This vital, erotic coupling of self with environment, giving rise to the reproduction and evolution of both self and environment, is educational in the broadest sense of that word. Clearly, an understanding of eros is crucial to the development of an ecological, non-dualistic ethic of embodiment, and holistic educational theory and practice. (Pryer, 2001, p. 86)

In her analysis she touches the issue of teaching as an embodied practice (see also Estola & Syrjälä, 2002), juxtaposing issues of vulnerability and passivity with risk taking.

Hamilton and Pinnegar (2000) suggest that, "acting in caring ways makes … teachers vulnerable" (p. 237) as it does teacher educators. This is underscored by the work of Wilcox (1998) whose self-study recognizes that teachers "witness" the learning process. As a result of the witnessing they are made vulnerable by the situation as well as held within a political power relation between themselves and their students. The act of caring for the student can foster or inhibit the learning experience.

To sum up, a concept of teacher knowledge that can operate as a guideline in our efforts on self-study needs to take into account the full richness and complexity of teachers' work. Thus, it has to meet the challenge of integrating all four dimensions: the technical, the emotional, the moral and the political.

Only then justice is done to the "breadth" of the job. Recent research agendas inspired by post-structuralist and feminist theory provide powerful and promising guidelines for this endeavour.

Towards "Deep" Knowledge: Moving Beyond the Action Level

If the knowledge that self-study aims at wants to contribute to professional learning, it not only needs to be "broad" or "wide" in its content, but also "deep" enough. By this "depth" we mean that it should move beyond the level of surface action to the level of underlying beliefs, ideas, knowledge, and goals. In a sense this image of "deep knowledge" connects to what Schön (1983) and Argyris (1985) have called "double loop learning." This contrasts with "single loop learning" that remains focused on instrumental effectiveness, without ever questioning underlying assumptions or beliefs.

The Personal Interpretive Framework: Professional Self and Subjective Educational Theory

In our efforts to conceptually grasp this level of underlying beliefs, we have argued (Kelchtermans, 1993, 1994, 1996; Kelchtermans & Vandenberghe, 1994) that teachers and teacher educators throughout their career construct a *personal interpretive framework*: the set of cognitions (ideas, representations, schemata) that operates as the lens through which teachers perceive their job situation, give meaning to it, and act in it. We reconstructed this framework on the basis of teachers' *professional biographies*, the narrative accounts of their professional experiences over time. Two interwoven domains could be distinguished in this personal interpretive framework: the *professional self* and the *subjective educational theory*.

As we already argued, teaching/teacher education is a job that inevitably demands an investment of one's person:

> it matters to teachers themselves, as well as to their pupils, who and what they are. Their self-image is more important to them as practitioners than is the case in occupations where the person can easily be separated from the craft. (Nias, 1989, pp. 202–203)

Contrary to many other jobs, who one is as a teacher and teacher educator matters as much – or even more – as what one knows or what skills one masters. In teachers' selves we analytically distinguish five interacting components, that allow for a more differentiated concept of the self (Kelchtermans, 1993, 1996).

First there are a descriptive and an evaluative component, the teacher's self-image and the self-esteem. They include one's personal answer to the questions "who am I as a teacher?" The selfesteem of the teacher refers to the evaluative beliefs and representations s/he has about him/herself: How well am I doing my job as a teacher? How do I feel about my work as a teacher? Am I satisfied with myself as a teacher? What are the sources of joy and contentment, or – in

contrast – what makes me doubt my own personal and professional qualities. The risk of losing the social recognition as "proper teacher" (and the positive self esteem that is linked to it), constitutes a major source of vulnerability for teachers (Kelchtermans, 1996).

Job motivation is the conative component in the self, referring to the motives that made one choose to become a teacher, to remain a teacher and possibly to leave teaching. An enlightening example of the central role of this motivational component in the self of a teacher educator can be found in Bullough (1997) where he presents a reflective autobiographical account of his 'becoming a teacher educator'. These motives emerge even more clearly in Baughman and Bullough's (1997) *First year teacher eight years later*. In the opening pages of the book, we learn that Baughman has decided to leave teaching. Through the book, the question of why she is leaving hangs over the chapters and each of the issues of what motivates teachers to teach is explored as the book documents her growth and change across eight years of teaching.

The fourth component in the self reflects the normative side of teaching: the task perception. Every teacher has a more or less clear understanding of what one has to do to be a good teacher, of what should one count as part of the job and what not. This component is about one's personal answer to the questions: what are the norms and values, the basic purposes and goals that I feel I need to achieve (or at least strive to) in order to be a good and proper teacher? And why do I include them in my personal professional programme? This task perception plays a key role in teacher's moral decision making, since it refers to the personally held values and norms that guide teachers' practices. The task perception is also at stake in the experience of ethical dilemmas or in teachers' resistance to particular changes, imposed by policy makers that challenge their personal value system (Kelchtermans, 1996; Gitlin & Margonis, 1995).

Finally, the future perspective is the prospective component in the self: what are my expectations for the future and how do I feel about them? How do I look forward to the rest of my years in teaching? These distinctions allow for a more differentiated and analytical study of the teacher's self, especially since any self-study that goes "deep" enough has to conceptualize and make explicit the idea of "self" it is using.

The second domain in the personal interpretive framework is the subjective educational theory: the teacher's personal system of knowledge and beliefs about teaching (content knowledge, beliefs about effective teaching strategies, and rules of thumb) (Kelchtermans, 1993). It is the teacher's professional knowledge, their own personal answers to the questions of how to act as a teacher and why to act that way. Subjective educational theory develops out of the teacher's formal and informal learning experiences and day-to-day practice. It is thus *embodied experiential knowledge*, embedded in the career experiences of the teacher. Subjective educational theory operates largely unconsciously as a form of *tacit knowledge* (Schön, 1983), and because of its partly unconscious and experiential character, it can be incomplete, inadequate or simply wrong. Through intentional reflection, careful self-study, however, it can be made explicit, confronted with

other sources of knowledge (literature, comments or stories by colleagues, etc.), checked and if necessary adapted to the needs of the particular situation.

This process of explicating and checking subjective educational theory is what we mean by enhancing the validity of one's knowledge, as part of professional learning (see above). For teacher educators it implies that the personal interpretive framework that student teachers bring with them from their own schooling needs to be taken as a starting point for explication, critical examination and further development. Of course, the same applies to the teacher educators themselves.

Critical and Contextualised

There is another reason why self-study should dig as deep as the personal interpretive framework: only then it can be genuinely *critical*. By examining and unmasking the moral and political agendas in the work context and their impact on one's self, one's thinking and actions, self-study can start to open up perspectives for empowerment and for re-establishing the conditions of working, teaching and learning that allow for "pedagogical" processes to take place in which people can regain the authorship of their (professional) identity (see also Zembylas, 2003a, 2003b).

The critical character also has to do with avoiding what we think is one of the strongest caveats threatening self-study: *self-sufficient navel-gazing*. Although personal relevance is probably the most powerful incentive to engage in self-study, the relevance of its outcomes (in terms of knowledge being produced) should lie beyond that personal agenda and address a wider audience.

This further implies a *contextualised* approach in which the particularities of one's working context (and thus of the object of one's study) are on the one hand carefully taken into account, but on the other fundamentally questioned. Self-study should aim at understanding one's actions in the context of that particular school, institute, at that particular time, in that particular social, political and cultural environment. Experiences and actions have to be looked at and understood in their context. But the analysis cannot stop there, but should be pushed to a level of more general conceptual phrasing that makes it possibly meaningful for other contexts.

Without this deep and critical character, self-study runs the risk of being only a procedure, a method or coping strategy that confirms and continues the status quo, producing knowledge that will not "rock the boat. In that case, self-study contributes to the strengthening of the existing power structures and agendas in the educational system as well as to a further devaluation of the professionalism of teachers and teacher educators.

Instead, self-study scholars must account for the particular, recognizing that their readers will judge for themselves the ideas presented regarding their application to the world beyond. The analysis must be deep enough for potential generalization, the presentation of ideas clear enough, and the contextual information detailed enough to allow judgement on the part of the reader.

Narrative-Biographical Approach as a Powerful Vehicle to Critical Knowledge

The Narrative-Biographical Approach

Like all humans, teachers have a personal life history. Their present actions and thinking are grounded in, and thus can only be properly understood from, their past experiences and their more or less conscious expectations and goals for the future. This is the core idea of the narrative-biographical perspective, an approach to teacher development that is enjoying growing international attention among both researchers and practitioners. As a theoretical approach it can be characterised by five general features: it is *narrative*, *constructivistic*, *contextualistic*, *interactionist* and *dynamic* (Kelchtermans, 1993).

Narrative refers to the fact that people tend to reconstruct and present their life experiences in a narrative form (Carter & Doyle, 1996). Ask a teacher why s/he is doing what s/he is doing and you will get a story, an anecdote about former experiences, funny incidents, a moment of golden advice from a colleague. There is little chance that s/he will answer by quoting a proposition from some generally approved educational research handbook. Events and incidents are transformed into stories, anecdotes, images, metaphors, and so on. Those stories are told, rethought, retold and continually adapted. The text is not fixed, but modified over time as new experiences are lived and the stories of these experiences are told.

Teachers organise their professional experiences into an autobiographical story. Therefore this approach is also *constructivistic*. They actively construe their career experiences into a story that is meaningful to them. The biographical approach focuses not so much on the facts or events in themselves, but on the meanings they have for the respondent. The stories are always *contextualised*, referring to particular experiences in a particular school at a particular time. This contextual element is important because it implies an *interactionist* stance. Human behaviour always results from meaningful interaction with the environment or context (social, cultural, material and institutional). Here one should acknowledge the contribution of postmodern and poststructuralist analysis to the conceptualisation between agency (meaningful actions, based on deliberation and choice) and the structural realities that determine this agency. Here we can make a link to what Clandinin & Connelly (1995; and see chapter 15 in this Handbook for greater elaboration) call the "professional knowledge landscape" that determines what can be told, what knowledge can be acquired. Also Hargreaves' notion of "emotional geographies" (Hargreaves, 2001) or Zembylas' use of the concept "emotional rules" (Zembylas, 2003a) refer to these structuring patterns of agency.

The work of Lomax, Evans and Parker (1998) addresses these issues. Within the text, Parker revisits and re-questions her autobiography. As she does, she seeks to liberate herself and her students in their teaching. To do that, she makes herself vulnerable to them and to her doctoral advisor, shifting back and forth in power relation and agency.

The *dynamic* aspect finally emphasises another core element in the biographical approach: the temporal dimension and the developmental dynamic. The teacher's current thinking and acting constitutes one moment, a fragment in a continuous process of assigning meaning to the perceived and experienced reality.

Teachers' professional biographies constitute a powerful starting point for the kind of broad and deep professional learning we have been arguing for as the envisaged outcome of self-study. First, narratives are both descriptive and evaluative. They have a referential and an evaluative function (Labov & Waletzky, 1973). The referential function refers to the narrative description of events from the past in their temporal order. The evaluative function connects these events to the present situation of the storyteller by explaining what the events meant to the story-teller. Narrative accounts thus reveal a teacher's subjective experience of events.

Second, the narrative form seems to be the way in which teachers tend to talk spontaneously about their work. In fact, they do so all the time: in staff rooms, during in-service courses (coffee breaks are particularly interesting times to hear them), at family parties and so on. Whenever teachers meet they tell stories. Most teachers love to talk about their classrooms and their pupils. All of them carry a rich load of stories about funny, challenging, or demanding experiences from their professional lives. It is their natural voice. Consequently, teachers' narratives are powerful and valid sources for understanding their actions and thoughts. The narrative approach not only recognizes this voice, but even argues that it should be given a central place in research, training and policy making.

Third, professional biographies do justice to the context in a double sense: experiences are narratively situated in time (temporal context) and space (spatial context).

Fourth, some events in teachers' professional biographies are recounted as particularly significant. They are experiences that created a problem or challenge, and forced the teacher to react by reconsidering or rethinking some of his/her routine actions, or more importantly his/her opinions or ideas. In other words, these incidents lead to a reconsideration, adjustment or adaptation of the teacher's personal interpretive framework. Therefore they are called *critical incidents*, or – if they consist basically of an encounter with a particular person – *critical persons* (e.g., a positive role model or its opposite, a model of the kind of teacher one would never want to be). These critical incidents and/or persons are particularly interesting because they "reveal, like a flashbulb, the major choice and change times in people's lives" (Sikes, Measor, & Woods, 1985, p. 57).

Two remarks are to be made here. Firstly, these critical incidents, persons and phases are identified in retrospect. Only afterwards and on reflectively looking back does the teacher realise clearly the scope of the experience and attribute a significant meaning to it. Secondly, critical incidents are often non-dramatic, ordinary events, which may look almost banal in the eyes of others. A critical remark by a parent, the unintended effect of poorly phrased feedback to pupils on their assignments, an unexpected classroom visit by the principal, can take on immense significance when it happens to a particular teacher at a particular

time in their professional career and leads them to change their thinking or attitude. Insight to one aspect of our teaching may make us blind to others. Just as in an American history lesson on the sixties, Lee Harvey Oswald becomes important at the death of John F. Kennedy, so in our teaching we sometimes must recover what was hidden during teaching and focus on what was typical or mundane when it reveals itself later as a "nodal moment" in our teaching.

Yet, exploring those critical incidents/persons in professional biographies has proved to be a very effective way of moving reflection beyond the descriptive level and entering the deep level of underlying beliefs, assumptions ("deep" inquiry).

To conclude, the experiences with collecting professional biographies through methods of autobiographical reflection:

> demonstrate how these stories can help teachers construct new discourses and enact new performances, as well as how these new discourses and performances can become political forces for changing the ways in which teachers interpret educational matters and for helping them constitute new forms of teacher subjectivity. (Zembylas, 2003a, p. 126)

Some Final Thoughts

From a distance one might wonder whether self-study demands an almost masochistic attitude. Is there something like the "unbearable heavyness of being" for those engaging in self-study? It seems clear that self-study does indeed make life more difficult, less self evident. The continuous questioning and studying of one's own practice and ideas, in the permanent critical checking on deeply held and often anxiously cherished values and personal truths, does demand a particular state of mind. One needs the strength to live with uncertainties, open-ended questions, doubts and hesitations. It makes life more difficult. Maybe a handbook on self study should therefore carry the warning: *Self study is harmful to your health … or at least to your peace of mind*. But at the same time, the experiences with self-study show this inquiring, questioning and searching attitude to be the most realistic road to professional learning and the best suited to successfully dealing with the complexities of the teacher's job. Success should then be understood both in terms of student achievements and personal professional satisfaction. It preserves one from unrealistic reductionism and superficial technicism, which will disappoint in the long run. And it keeps the passion in teaching.

SECTION 3

Representing Self-Study in Research and Practice

Section Editor: Vicki Kubler LaBoskey

FOREWORD TO SECTION THREE

This section articulates and examines the "how" of self-study – how teachers and teacher educators engage in their professional practice and the investigation of that practice. In other words, the subject matter herein is the methodology of self-study. The first chapter, chapter twenty-one, serves as an introduction to the section. In it I summarize the epistemological, pedagogical, and moral/ethical/political theoretical underpinnings to the field that together serve as the conceptual framework for self-study methodology. I elaborate on the dominant trends in the three components of that methodology – pedagogical strategies, research designs, and research representations – and explicate the "why" for these choices by relating them to the field's conceptual framework and to one another. I identify five features of the methodology: it is initiated by and focused on self; it is improvement-aimed; it is interactive at one or more points during the process; it employs multiple, primarily qualitative, research methods; and, it achieves validation through the construction, testing, sharing, and re-testing of exemplars of teaching practice.

In chapter twenty-two Whitehead continues the general discussion of self-study methodology by considering the question, "What counts as evidence in self-studies of teacher education practice?" Arguing that the fundamental question of self-study research should be, "How do I improve what I am doing?" he concludes that something can only be deemed as evidence if it shows that improvement has been made – it has contributed to the growth of educational knowledge. He proceeds to clarify and support this contention by presenting rationales for and examples of five types of possible contribution: to educational theory; to educational standards of judgment; to educational research methodologies; to the logic of educational enquiries; and, to understandings of educational influence to self, others, and social formations.

The next six chapters explore in greater depth particular research and practice methods or methodological approaches that are especially prevalent in the self-study literature to date. In all cases, the authors provide brief indications of the historical roots for these methods in general educational research. But the primary aim is to summarize and clarify how and why these approaches have been employed in self-study. To do so, all offer general descriptors and rationales, as well as representative exemplars.

The first of these, chapter twenty-three, is devoted to the use of various forms of personal history, including for example autobiography, journaling, story telling, and recordings of one's teaching in various media. The authors, Samaras, Hicks, and Berger, suggest that personal history self-study is about self-knowing in the interest of personal and professional growth. They describe its nature as collaborative, contextualized, and conducted by employing diverse qualitative methods. They identify three uses for personal history in the field of self-study: to better understand and reform one's own professional identity; to influence others, especially one's students, by modeling and testing effective reflection; and, to "push the boundaries of teaching" by transforming practice and its institutional contexts – categories similar to the areas of influence identified by Whitehead. They use a self-study of Samaras' to illustrate and further explicate these purposes.

In educational literature self-study has often been compared to, or even made synonymous with, action research. Therefore the authors of chapter twenty-four, Feldman, Paugh, and Mills, discuss the use of action research in self-study through an exploration of the question, "What are the ways in which self-study is and is not related to action research?" Drawing upon previous analyses and their own stories of moving from action research into self-study, they conclude that what distinguishes self-study from action research is its methodology rather than its methods – a methodology they suggest has the following three features: the self has central importance in the investigation; the teacher educator's experience is a resource for the research; and, self-study researchers problematize their role as researchers in addition to their role as teacher educators. They then proceed to test and support these proposed features by applying them to an analysis of three self-study reports that utilize action research methods.

Weber and Mitchell, in chapter twenty-five, consider how and why self-study researchers have and could use visual culture and arts-informed research methods in both their inquiry process and in the representation of their work. They suggest several key features that might make these modes particularly useful for the reinterpretation, representation, and communication of self-study research. These features include: reflexivity; capturing the ineffable; being memorable; holistic communication; revealing the universal in the particular; carrying theory; making the familiar strange; embodiment; accessibility; making the personal social and more activist. They further explore and explain these features/qualities by applying them to their descriptions and illustrations of four of the most prevalent visual artistic modes in self-study thus far: performance; photography; video documentary; and, art installation/multi-media representation.

In chapter twenty-six Hoban discusses the use of Information and Communication Technologies (ICTs) in self-study and their historical and potential contribution to the construction of teacher knowledge. He argues that ICTs can help at multiple stages of self-study research and practice. First, they can provide different ways to both engage in and represent teaching that can capture its complexity and provide us with new lenses. Second, these tools can enhance the self-study research processes of representing, editing, accessing, analyzing,

retrieving, and sharing data. Third, and very importantly, ICTs can easily and powerfully disseminate the results of self-study work to the educational community. He highlights these strengths in the presentation of three case studies wherein he and the authors discuss the hows, whys, and benefits of different ICTs – e-mail, multimedia (e.g., videos, CD-ROMs), and the World Wide Web. He also identifies some possible limitations of, and concerns with, ICTs in self-study, concluding that we need to strive for quality and seek balance in order to maximize their current and future promise.

In chapter twenty-seven Lyons and Freidus take a similar approach to their focus method – reflective portfolio inquiry – by framing their task as an exploration of how this process for interrogating teaching and learning might advance self-study. They consider reflective portfolios to be simultaneously a mode of inquiry and a means for documenting and representing knowledge that has a particular structure including: collaborative effort; gathering of evidence; critical reflection; and, a final presentation in a form that comprises, at a minimum, a description of the intended course or strategy, a representation of its enactment, and evidence of its outcomes. They explain and justify the use of a reflective portfolio in self-study by encapsulating its historical roots and theoretical groundings. Identifying several strengths and a few possible limitations, they give greatest emphasis to the method's potential to embody a redefined validation process, one previously described in the literature and in chapter twenty-one as "trustworthiness." They illustrate the workings of this validation system by inviting the reader to engage in a representative deliberation of three exemplars of portfolio self-study.

In chapter twenty-eight the Arizona Group, Guilfoyle, Hamilton, Pinnegar, and Placier, portray professional dialogue as a research stance or methodology in self-study, "the purpose of which is to explore ideas, theories, concepts and practice so that we develop understandings that allow confident action." They do so by first identifying the core features and mechanisms of professional dialogue and its potential benefits through a presentation and analysis of excerpts of their e-mail dialogue regarding the writing of this chapter. They further clarify and justify their conceptualization by situating it within the historical and theoretical literature on dialogue. Finally, they support the idea that discourse is a way of knowing by reviewing their previous work and tracing through it the evolution of their own understandings of this epistemological perspective. Throughout their discussion they maintain the disparity in their viewpoints, thus emphasizing the value of diversity to professional dialogue and exemplifying that resultant findings do, and should, exist in a zone of inconclusivity.

In the final chapter in this section, chapter twenty-nine, I revisit the features of the methodology of self-study that I identified in chapter twenty-one and reconsider them in light of the intervening discussions. In doing so I highlight existing strengths of self-study methodology and make suggestions for future efforts regarding its explication, construction, and application. This chapter thereby serves as an afterword to chapter twenty-one and provides a brief summary of the section's key contributions.

Finally, I express my appreciation of Catherine Dunwoodie. Editing this section of the Handbook has been a long and time-consuming task made easier by her help and support.

Vicki K. LaBoskey

21

THE METHODOLOGY OF SELF-STUDY AND ITS THEORETICAL UNDERPINNINGS*

Vicki Kubler LaBoskey
Mills College

Abstract

In this chapter I summarize the epistemological, pedagogical, and moral/ethical/political underpinnings of self-study, which serve as the conceptual framework for the field. I then offer a characterization of the methodology of self-study in relationship to those theoretical foundations by encapsulating the predominant pedagogical strategies, research methods, and research representations in the literature to date. I conceptualize self-study as "a methodology for studying professional practice settings" (Pinnegar, 1998) that has the following characteristics: it is self-initiated and focused; it is improvement-aimed; it is interactive; it includes multiple, mainly qualitative, methods; and, it defines validity as a validation process based in trustworthiness (Mishler, 1990). The chapter thus serves as an introduction to this section on the methodology of self-study.

Many have argued that the methodologies of research and practice employed by educators do and should derive from our conceptions of knowledge and learning (e.g., Cochran-Smith, 2002; Cochran-Smith & Lytle, 1999; Gudjónsdóttir & Dalmau, 2002; Eisenhart, 2001; Eisner, 1997; Fenstermacher, 1994; Gitlin, Peck, Aposhian, Hadley, & Porter, 2002; Paul & Marfo, 2001; Whitehead, 1989). In Eisner's (1997) words, "What we think it means to do research has to do with our conception of meaning, our view of cognition, and our beliefs about the forms of consciousness that we are willing to say advance human understanding – an aim, I take it, that defines the primary mission of research" (p. 5). Educational researchers need, therefore, to be explicit about our theoretical stance and take steps to ensure that our methodologies are consistent with those theories. As Fenstermacher (1994) argues, there is a, "quite tight connection between the form of inquiry one uses and the type of knowledge one

---

*Chapter Consultant: Mary Lynn Hamilton, University of Kansas, U.S.A. and John Loughran, Monash University, Australia.

produces" (p. 20). If we want to generate the knowledge and understanding that we need, we must engage in appropriate forms of inquiry. By implication, a discussion of the methods of research and practice in self-study must be situated within the context of its theoretical underpinnings.

Research in teacher education[1] is attempting to answer questions about how best to prepare new teachers and facilitate ongoing teacher development. Typically, when teacher educators raise such questions, we are deriving them from our own practice. In the investigation of these questions, we, like teacher researchers, are endeavoring to meet the "dual demands" of producing knowledge and informing "the complex and ever-changing process of teaching" (Gitlin *et al.*, 2002, p. 313). We feel responsible for the immediate implementation of any new understandings that result from our research. Thus, the rationale for self-study needs to extend beyond the epistemological into learning theory, beliefs about the nature of teaching, and moral, ethical, and political values regarding the means and ends of education. As Cochran-Smith (2002) has noted,

> Questions about how to prepare teachers can never be answered solely on the basis of research evidence. These questions also have to do with ideas, ideals, values, and beliefs about teaching and learning, the resources available to communities, and the purposes of education in a democratic society. Ultimately, we will need to debate values and beliefs, as well as the "research-based evidence" if we are to make progress in our thinking about how to prepare new teachers. (p. 285)

The epistemological foundations for self-study were explored in depth in the previous section. This chapter will highlight the key theoretical points that provide the grounds for and connections to the methodology of self-study research and practice, derived largely from post-modern, feminist, and post-colonial paradigms. The resultant perspective considers knowledge production and development to be context and culture sensitive; indeed the aim is not the identification or acquisition of knowledge as traditionally defined. In the words of Bullough and Pinnegar (2001), "The aim of self-study research is to provoke, challenge, and illuminate rather than confirm and settle" (p. 20). The advancement of the field is, therefore, exemplar-based and validity is redefined as "trustworthiness" (Lincoln & Guba, 1985; Lyons & LaBoskey, 2002; Mishler, 1990). Self-study researchers are concerned with both enhanced understanding of teacher education in general and the immediate improvement of our practice. We are focused on the nexus between public and private, theory and practice, research and pedagogy, self and other. Also relevant to self-study methodology, then, are theories about learning and the nature of teaching.

Wilson and Berne (1999) have delivered a mandate to researchers concerned with teacher learning: "All research on teacher learning and the acquisition of professional knowledge would benefit from more systematic theorizing about the mechanisms by which teachers learn" (p. 204). Self-study scholars are engaged in this effort. Grounded in social constructivist learning theory, the

evolving perspective of the field at this point includes such notions as: ''change cannot be effected from outside a person'' (Korthagen, 1995); learning is processed through previous experience so personal history and cultural context must be considered; and learning is enhanced by challenging previously held assumptions through practical experience and the multiple perspectives of present and text-based colleagues.

Again, the way in which self-study researchers are engaged in developing and testing these theories about teacher learning is through the investigation of our own practice, our own efforts to facilitate such learning. This means that we are simultaneously concerned with our own learning; indeed, evidence in the field consists of substantiation for ''reframed'' thinking on the part of the teacher educator (e.g., Loughran & Northfield, 1998; Schön, 1983), transformed practice, and the resultant effects on the reframed thinking and transformed practice of our student teachers. The impetus for the research often derives from a recognition of, ''shortcomings in [our] work and the gaps between [our] rhetoric and the reality of [our] practice'' (Zeichner, 1999, p. 12) or of what Whitehead (1989) refers to as ''living contradictions.'' This, according to Zeichner (1999), offers ''a challenge to academic theories of teacher education that are formulated at a distance from the practice of teacher education and new possibilities for reformulating and strengthening those theories'' (p. 12).

But we do not engage in the process of self-study research solely for the purpose of theorizing. We have pedagogical imperatives, responsibilities to our current student teachers, as well as their students.

> Self-study is about the learning from experience that is embedded within teachers' creating new experiences for themselves and those whom they teach. … Our goal may well be the reinvention of learning to teach, enabling others to understand learning from experience by showing them how we do it ourselves. (Russell, 1998, p. 6)

We recognize and accept the uniqueness of our circumstances – since we are teaching about teaching, we serve as powerful role models for our students, whether we acknowledge it or not. Thus, ''practicing what we preach'' must be an inherent guide to our pedagogy and one that needs continuous monitoring.

Because we are concerned about our immediate interactions with students, as well as the long-term transformation of educators, our student teachers, and ourselves, and of educational programs and the institutional climate in both universities and K-12 schools, we must also be guided in our self-study research by our moral, ethical, and political values and ideals (e.g., Bullough & Pinnegar, 2001; Hamilton, 1998). Equity and social justice are core values for self-study researchers. Interested in ''anti-oppressive education'' (Kumashiro, 2001),

> [We] are intellectuals with liberatory intentions [who] take responsibility for transforming our own practices so that our empirical and pedagogical work can be less towards positioning ourselves as masters of truth and

> justice and more towards creating a space where those directly involved
> can act and speak on their own behalf. (Lather, 1991, pp. 163–164)

We honor, therefore, the insider perspective and the marginalized voices and
consider the subjectivity of both researchers and their students to be important.

Like Coulter and Wiens (2002), who base their arguments on the philosophy
of Hannah Arendt, we acknowledge that knowing more may not necessarily
lead to good teaching. We must also strive to "foster educational judgment in
students, teachers, and researchers" (p. 23). Educational judgment "links actors
and spectators in two activities, acting and thinking" (p. 22) so that they can
exercise their freedom understood as responsibility: "If our aim is to foster
people who are educational judges, then separate discussions of acting and
thinking, teaching and researching, are incomplete. The challenge involves help-
ing teachers and researchers become both actors and spectators, that is, good
judges" (p. 23). Self-study researchers are both actors and spectators who act
and think with regard to educational questions; they are attempting to be "good
judges" who help others to be so as well.

These moral/ethical/political underpinnings of self-study interconnect with the
epistemological and practical to provide a guide for the selection and design of
pedagogical strategies and research methods. Approaches to teaching consistent
with this conceptual framework might be generally characterized as student-
centered, process-oriented, and inquiry-based (Guilfoyle, 1995). They are models
for what we hope our students will do with their students and they are context-
sensitive. We characterize our work in ways similar to Robert Bullough (1994):

> My task as a teacher educator is to encourage my students through a
> variety of means to identify the assumptions – many of which are hidden
> – that compose their implicit theories about teaching and themselves as
> teachers that are embedded in their personal histories. Then, I prompt them
> to reconstruct these assumptions in ways that are likely to lead to increased
> control over future professional development. In particular, my aim is to
> help them to develop a kind of understanding of self as teacher that will
> enable them to establish a role in a school and within the community of
> educators that is educationally defensible and personally satisfying, congru-
> ent with a desired teaching self. (p. 108)

Our instructional techniques derive from our theories of teacher learning so that
they will be most likely to benefit our students and our students' students. But
this conceptual framework also implies that we can never be sure; that this
intensely interpersonal, highly complex, always changing, moral and political
act requires continual monitoring and adaptation, which is self-study research.

Self-study methodology is, therefore, *initiated by and focused on us* as teachers
and teacher educators in relation to the others who are our students (Bullough
& Pinnegar, 2001). It seeks to determine whether or not our practice is consistent
with our evolving ideals and theoretical perspectives. The research is *improve-
ment-aimed*; we wish to transform ourselves first so that we might be better

situated to help transform our students, their students, and the institutional and social contexts that surround and constrain us. In order to guard against the inevitable limitations of individual interpretation so affected by personal history, self-study is *interactive* at one or more stages of the process. Since the aim is greater understanding rather than immutable law, the methods of self-study are largely qualitative; but they are *multiple* because "a mix of methods will tell you more than a single approach" (Hutchings, 2000, p. 6). As Craig Nelson, a Carnegie Scholar, pointed out, "Learning and teaching are complex activities where approximate, suggestive knowledge can be very helpful, and, indeed, may often be the only kind that is practical or possible" (Hutchings, 2000, p. 6). "Approximate, suggestive knowledge" cannot be validated in the same way as that aspired to by positivist paradigms. Therefore, validation, as Mishler (1990) has noted, is redefined "as the social construction of knowledge. With this reformulation, the key issue becomes whether the relevant community of scientists [teachers and teacher educators] evaluates reported findings as sufficiently trustworthy to rely on them for their own work" (p. 417). We advance the field through *the construction, testing, sharing, and re-testing of exemplars* of teaching practice.

How we do this – represent and share our self-study – is also derived from our conceptual framework. As Eisner (1993) makes clear, "The meaning that representation carries is both constrained and made possible by the form of representation we employ. Not everything can be 'said' with anything" (p. 7). So, in aiming to expand the depth, breadth, and nature of our understanding, we employ multiple means of representing our experiences, our knowledge, our emotions, and our values to ourselves and to one another.

There are many reasons, epistemological, pedagogical, and moral/ethical/ political for the methodology of self-study. These reasons, and the interconnections among them – the resulting conceptual framework – lead to particular ways of teaching, of coming to understand that teaching through research, and of representing that understanding to others. This chapter will expand upon both the theoretical underpinnings of self-study and the instructional strategies and research methods that derive from them. It will thereby serve as an introduction to the other chapters in this section, each of which explores the methodology of self-study in greater depth.

Theoretical Underpinnings

Epistemological

The call for a *knowledge base for teaching* is widespread and frequent. Many policy makers, community members, and educators want us to figure out what it is and how it might be fostered and assessed. The assumption is that once we understand this, we will have the foundations for successful programs of teacher education and professional development. A central challenge of this effort is that there are differences, whether explicit or implicit, in what people mean when

they talk about knowledge. Epistemological questions are not, of course, new, but the current environment has spawned renewed attempts to articulate and debate what we mean by such terms as knowledge, cognition, understanding, and scholarship.

According to Sleeter (2001), "Epistemology refers to how people know what they know, including assumptions about the nature of knowledge and 'reality,' and the process of coming to know" (p. 213). It seeks to examine these questions:

1. To what extent is reality "out there," to be known through detached sensory observation or systematic data collection? Or, to what extent is our knowledge of it a product of our own mind?
2. What is the nature of knowledge?
3. What is the nature of the knower and who can know? (p. 213)

She suggests that research on teacher education has been framed by four epistemologies that answer these questions differently: positivism; phenomenology; narrative research; and, emancipatory research. After considering each one, she concludes by proposing that all have their merits and have the potential to benefit the field in different ways. She recommends, therefore, that teams, whose members have different theoretical perspectives, conduct research – one possible way to resolve epistemological variation.

Fenstermacher (1994) argues that there are different forms of knowledge used by and useful to teachers: formal and practical. One has to do with knowing *that* and the other with knowing *how*. The former is knowledge about teaching that can be made available to teachers for their use: "Such knowledge is gained from studies of teaching that use conventional scientific methods, quantitative, and qualitative; these methods and their accompanying designs are intended to yield a commonly accepted degree of significance, validity, generalizability, and intersubjectivity" (p. 8). In contrast, practical knowledge is concerned with what teachers already know, as revealed in what they do – the aim of those who study this form of knowledge is the illumination of classroom practice. This knowledge might also become useful in informing future teaching, according to Fenstermacher, but only if it can be shown to meet appropriate evidentiary standards. He critiques much of current research in this area as lacking in epistemic merit, but suggests *practical reasoning* as a way to enhance such study. Thus, he, like Sleeter, concludes that there are different forms of knowledge, generated in different ways, which might be of benefit to teacher education.

These scholars have, at least to some degree, built upon the earlier groundbreaking work of Jerome Bruner (1985), who made the claim that there were two irreducible modes of thought – narrative and paradigmatic:

Each of the ways of knowing … has operating principles of its own and its own criteria of well-formedness. But they differ radically in their procedures for establishing truth. One verifies by appeal to formal verification procedures and empirical proof. The other establishes *not* truth but truthlikeness or verisimilitude … one seeks explications that are context free and

universal, and the other seeks explications that are context sensitive and particular. … one mode is centered around the narrow epistemological question of how to know the truth; the other around the broader and more inclusive question of the meaning of experience. (pp. 97–98)

Bruner suggested that, at that point in time anyway, "The psychology of thought [had] concentrated on one mode, the paradigmatic, at the expense of the other" (p. 102). Since then, researchers have attempted to equalize the field (e.g., Clandinin & Connelly, 2000; Lyons & LaBoskey, 2002; McEwan & Egan, 1995; Witherell & Noddings, 1991), especially since many have come to believe that narrative knowledge, which "is concerned with the explication of human intentions in the context of action" (Bruner, p. 100), better characterizes the knowledge of teaching.

In their article, "What Do New Views of Knowledge and Thinking Have to Say About Research on Teacher Learning?" Putnam and Borko (2000) summarize current conceptions of cognition, or the act of knowing. They describe it as situated, social, and distributed. Therefore, research on teacher knowledge and learning, in their view, must include ways of identifying and representing the physical and social contexts, communal interactions, and distributed expertise in and by which that knowledge has been developed and revealed in order for it to be understood by and informative to others. Because so many factors influence knowledge construction, they suggest that "various settings for teachers' learning [will] give rise to different kinds of knowing" (p. 6). Thus, teacher knowledge may be more contextual than categorical.

Lee Shulman and his colleagues at the Carnegie Academy for the Scholarship of Teaching and Learning are attempting to advance the knowledge base of teaching by focusing their attention on the questions of *who* and *how*. They see teaching as "an extension of scholarship" (Edgerton, Hutchings, & Quinlan, 1991, p. 2). But scholarship is more than just good teaching:

For an activity to be designated as scholarship, it should manifest at least three key characteristics: It should be *public*, susceptible to *critical review and evaluation*, and accessible for *exchange and use* by other members of one's scholarly community. We thus observe, with respect to all forms of scholarship, that they are acts of mind or spirit that have been made public in some manner, have been subjected to peer review by members of one's intellectual or professional community, and can be cited, refuted, built upon, and shared among members of that community. Scholarship properly communicated and critiqued serves as the building block for knowledge growth in a field. (Shulman, 1998, p. 5)

Hiebert, Gallimore, and Stigler (2002) propose a similar set of criteria in their consideration of what it would take, "to transform teachers' knowledge into a professional knowledge base for teaching" (p. 4). But they have a different conceptualization of the *who*. They suggest teacher/researcher collaboration, rather than self investigation.

Shulman and his colleagues, like Fenstermacher, do not consider the knowledge generated from the scholarship of teaching to be the only building block; it is an addition to the general principles achievable through more traditional forms of research (Shulman, 2000): "The strategy we must pursue is an approach to scholarship that legitimates more than one kind of research. Research that renders one's own practice as the problem for investigation is at the heart of what we mean by professing or profession" (p. 11).

Others in the field are also addressing the epistemological question of *who*, but in a somewhat different way. Feminist, post-modern, and post-colonial scholars (e.g., Eisenhart, 2001; Foley, Levinson, & Hurtig, 2001; Kumashiro, 2002) are urging us to respect multiple epistemologies: "Given a new sensibility toward epistemological racism, ethnographers of color are increasingly questioning the universality and neutrality of all educational theories" (Foley *et al.*, p. 50). The attempt should not be to generate "a coherent picture or story of class, ethnic, or gender groups, but a collage of their similarities and differences" (Eisenhart, p. 23). We are to find ways to maintain the complexity, include more voices, detect bias, and disrupt our own ways of knowing.

This brief overview of some of the most predominant and recent work with regard to knowledge in teacher education should help to situate the epistemological perspective of self-study scholars. That is not to say, of course, that there is universal agreement; as with any healthy discipline, debates exist and will continue. Nonetheless, certain consistencies or at least dominant trends in our definitions of teacher knowledge and our beliefs about how and by whom that knowledge might be generated, fostered, and shared can be identified. Indeed the way in which self-study scholars have answered these questions helps to distinguish it as a field of study.

Again, Section Two of this handbook is devoted to a substantive explication of the epistemology of self-study so I will not go into depth here. Using Sleeter's (2001) questions, as delineated above, I will iterate a few of the aspects most directly relevant to the current status of the methodology of self-study.

Coming to Know

We question the distinction between producing/generating knowledge and becoming knowledgeable or coming to know and thus also, the distinction between research and practice. In the words of Korthagen (1995), we believe that, "knowledge about teaching develops in the interaction between the individual's hopes, ideals, and desires, on the one hand, and the feedback, or 'backtalk,' from the other participants in the concrete educational setting on the other" and that "knowledge created in this way is uniquely relevant for practice" (p. 102). Teacher knowledge, therefore, develops "through a better understanding of personal experience" (Loughran & Northfield, 1998, p. 7).

How we achieve this better understanding of our teaching experience is through critical reflection (Guilfoyle, 1995; Hamilton, 1995). According to Wilkes (1998),

> Brookfield (1995) suggests that reflection becomes critical when it has two distinctive purposes: the first is to understand how considerations of power undergird, frame, and distort educational processes and interactions. The second is to question assumptions and practices that seem to make our teaching lives easier but actually work against our own best long-term interests, and I would add those of our students. (p. 206)

Self-study is not the same, therefore, as reflective practice. Not only should such political questions as these be asked and explored, but the practice setting must also be framed and reframed in sequences of reflective instances that are responded to with action. In addition, a variety of viewpoints must be employed in the reframing process; divergent rather than convergent learning outcomes are sought (Loughran, 2002a). The only way this can be accomplished is with the input of others: "Reflexivity, wherein worldviews clash from the input of critical friends and theory, can push reflection past defensiveness into transformative learning" (Bass, Anderson-Patton, & Allender, 2002, p. 67). So critical reflection must be publicly articulated and self-study collaborative; it "requires a commitment to checking data and interpretations with others" (Loughran & Northfield, 1998, p. 12).

In their review of the last twenty years of research on the relationship between knowledge and practice, Cochran-Smith and Lytle (1999) identify three different conceptions of teacher learning or of coming to know. They situate self-study in the category entitled "knowledge-*of*-practice," along with much of their own work. And I would agree that self-study does fit all of their articulated attributes. But they go on to posit a fourth conception of teacher learning toward which we might all be moving: *inquiry as stance*. Its characteristics are articulated in the section headings, which might be abbreviated as follows: beyond certainty in teacher learning, against dualisms, teaching as praxis, local knowledge, learning across the life span, questioning the ends, and the culture of community. They summarize in this way: "The idea of *inquiry as stance* is intended to emphasize that teacher learning for the next century needs to be understood not primarily as individual professional accomplishment but as a long-term collective project with a democratic agenda" (p. 296). This seems to be an image of teacher knowledge development that self-study could embrace, and in many ways, already has.

The Nature of Knowledge

We question the distinctions that have been made between formal/theoretical and practical knowledge. Because we believe that knowing is experiential rather than conceptual (Hamilton & Pinnegar, 1998), we consider it to be more of a "flexible and generative" process than a product (Hamilton, 1995, p. 32). A distinction between formal and practical is only sensible and useful if the aim is to "assert with certainty a particular claim of meaning" (Pinnegar, 1998, p. 31). Since we believe that that is neither desirable nor possible with regard to most teacher knowledge, we endeavor rather to understand the meaning of particular

situations or phenomena (Pinnegar, 1998), or to develop local knowledge, that may also be useful to other educational communities (Cochran-Smith & Lytle, 1999).

In Smith's (1998) words, we tend to take the "cultural psychological perspective" that "all knowledge [is] constructed, distributed, mediated, and situated" (p. 21). Teacher knowledge, in Bruner's (1985) terms, is narrative rather than paradigmatic. What is more, we believe teacher knowledge to be historically embedded and culturally imbued (Hamilton, 1995, p. 32). The particulars of time, place, content, process, and persons matter.

The Knower

We question distinctions between expert and novice, teacher and researcher. All teachers and teacher educators who engage in self-study can generate knowledge and theory (Hamilton, 1995). Since knowledge is experiential and knowledge generation is critical reflection or *inquiry as stance*, teacher knowledge can best be understood, transformed, constructed, and articulated by the teacher self in collaboration with others. In Ross Mooney's (1957) words, "We want a way of holding assumptions about research which makes it possible to integrate the pursuit of science and research with the acceptance and fruitful development of one's self" (as cited in Bullough & Pinnegar, 2001, p. 13). The way in which we do that, according to Bullough and Pinnegar, is to join biography with history: "When the issue confronted by the self is shown to have relationship to and bearing on the context and ethos of a time, then self-study moves to research" (p. 15). In self-study, private experience and public theory offer insight and solution to one another.

The self is central and that means the whole of the self – past and present, emotional and cognitive, mind and body (Weber & Mitchell, 2002). And because each self is different, all offer an important, yet necessarily constrained perspective. Therefore, the knowledge of teaching can only be developed in a diverse and inclusive, particularly of previously marginalized voices, teacher-learning community.

Pedagogical

Our beliefs about teaching and learning – about pedagogy – are, of course, well connected to our epistemological perspectives. The way in which we generate knowledge about teacher learning is to carefully examine our own efforts to facilitate that learning; what we learn from this self-study, when articulated and shared with our teacher education community – when *formalized* (Hamilton & Pinnegar, 1998) – contributes to the knowledge base of the field. "Such connections between our learning and teaching are the essence of self-study" (LaBoskey, 1998, p. 153; see also Gudjónsdóttir & Dalmau, 2002; Lomax, Evans, & Parker, 1998; Loughran, 1998; Russell, 2002b).

As Hamilton (1995) points out, "Freire (1973) identified the act of teaching as a knowledge-producing process that involves a critical look into a person's

experience. Praxis, the interrelationship of theory and practice, uses research to inform the other about a situation with the goal of change" (p. 34). Self-study exists, then, at the intersection between theory and practice, research and pedagogy (Allender & Manke, 2002; Hamilton & Pinnegar, 1998; Russell, 2002a). Teacher education has a history of struggling with making connections between theory and practice. We believe that a major contributing factor to this difficulty has been the artificial epistemological and pedagogical separation between the two. Self-study holds promise, therefore, of reducing this problem (e.g., Hamilton, 2002a; Korthagen & Kessels, 1999).

Fenstermacher (1994) has argued that,

> The critical objective of teacher knowledge research is *not* for researchers to know what teachers know but for teachers to know what they know. … The challenge for teacher knowledge research is not simply one of showing us that teachers think, believe, or have opinions but that they know. And, even more important, that they know that they know. (pp. 50–51)

Implied in this statement is a distinction between teachers and researchers. Teacher educators engaged in self-study are both. And our work is about showing ourselves and others that we know, and inherently, that we know that we know. As Hamilton (1995) has pointed out, we do not need to go to the public schools to study teaching: "We can examine ourselves in our own acts of teaching. If we can understand how we ourselves teach, we can inform ourselves about how others might teach" (p. 39).

Seeing such close connections between learning and knowledge construction, we believe in facilitating the learning of our student teachers in ways analogous to our own knowledge producing processes. Thus, we engage our student teachers in "self-study-like" activities. I say self-study-like because I do not consider strategies to facilitate the learning of our students to be the same as self-study. Though some in the field would disagree with me, I believe that, in most instances, student teacher assignments are lacking in certain requirements of self-study, most particularly in the metacognition involved in theorizing the learning experience and in the formalization of the work. There are many ways, however, in which the activities are very similar.

Inquiry Orientation

Since we want our student teachers to understand teaching as an activity with knowledge-producing possibilities, we want them to take an inquiry orientation toward their work and to develop the skills and attitudes that will allow them to do so. Furthermore, since knowledge of teaching is uncertain, complex, dynamic, responsive, and context and culture dependent, we need them to see themselves as lifelong learners engaged always in the "troubling" of their own practice and the imagining of different possibilities for teaching and learning (Kumashiro, 2001, p. 11).

Because knowledge develops through a better understanding of personal

experience, we must offer our students opportunities to engage in inquiry themselves and to observe and participate in the disciplined and systematic inquiry of others. The latter can be accomplished by our engagement in self-study, as long as we involve our students in the process, which of course we should do, since their learning, in addition to our own, is the aim of our efforts. "We believe that we should model the learning that we expect in our students and that we should account for ourselves in the same way that they must account for themselves" (Lomax *et al.*, 1998, p. 16; see also Bickman, 2000; Fitzgerald, Farstad, & Deemer, 2002; Guilfoyle, 1995; Russell, 1998, 2002a; Zeichner, 1999).

This means that we consider all student work to be potential evidence or data in our investigations. Since the purpose of teaching is the facilitation of learning, we can only understand and evaluate our efforts and monitor the improvement of our practice, by attending to the cognitive, emotional, physical, social, and moral/ethical development of our students. We need to employ strategies, therefore, that will make transparent to us, as well as to our students, their learning processes and outcomes, in all of its variation, complexity, and fluidity. Simultaneously, we need to use methods that will provide evidence to us, to our students, and to our colleagues that we are learning from what we are discovering; that we are reframing our thinking and transforming our practice in defensible ways.

Reflective Practice

Another way to characterize such inquiry activity is as reflective practice. Although reflective practice is not the same as self-study, it is foundational – necessary but not sufficient. Therefore, we aim to help our students become reflective educators (e.g., Korthagen & Kessels, 1999; Ladson-Billings, 1999; Lewis & Johnson, 2002). This means that their knowledge of teaching is never conclusive; it must be "subjected to careful reconsideration in light of information from current theory and practice, from feedback from the particular context, and from speculation as to the moral and ethical [and political] consequences of their results" (LaBoskey, 1994, p. 9). And again, we do so by both involving them in such activity and modeling it for them.

We endeavor, then, to engage our students in ventures where they will experience conflict in competing knowledge claims and moral positions (Eisenhart, 2001, p. 24); that will slow down their thinking, "so that they can attend to what is rather than what they wish were so" (Rodgers, 2002, p. 231); and that will allow "questions to surface within themselves" (Cooper & McNab, 2002, p. 56). We try to provide them with ways to get to know their students, with a broad repertoire of instructional strategies, and with adequate subject matter background, and then with reflective processes for mediating among the three systematically and justifiably (Freidus, 2002, p. 84).

Assumption Challenging

A vital feature of reflective teaching involves the challenging of previously held assumptions about all aspects of the educational process. There is widespread

agreement in the field of teacher education that there is "a strong relationship between what a teacher believes and how teaching occurs in the classroom" (Tidwell & Heston, 1998, p. 45; see also Fitzgerald, Farstad, & Deemer, 2002; Knowles, 1994; Knowles & Holt-Reynolds, 1994; Lewis & Johnson, 2002; Tidwell, 2002; Wilson & Berne, 1999). Thus, to influence practice we must transform teacher thinking, but this, for a variety of reasons, is easier said than done. For one thing, our beliefs, values, and knowledge of teaching are derived from our experiences – our personal histories, which are necessarily limited and variant. In addition, many of these assumptions are implicit; they have never been articulated even to us. What is more, some of these ideas are deeply held and intimately connected to our identities as teachers and learners.

The challenge for teacher education is then to provide ways for students to articulate and interrogate their personal histories and resultant understandings. We need to engage them in contexts discrepant from what they have previously experienced so that the limitations of their autobiographies might be exposed and reframed; that is, we need to put them into appropriate disequilibrium. But this requires considerable risk-taking on their part. Thus, we need to provide adequate scaffolding and emotional support; a key way in which we do this is by taking similar risks ourselves (Loughran, Berry, & Tudball, 2002). In engaging them in our self-study where we investigate our "dilemmas, tensions, and disappointments" (Loughran & Northfield, 1998, p. 15), we demonstrate to them how the process of learning requires vulnerability and the courage to problematize our practice and confront our living contradictions.

Identity Formation

The process of learning to teach, therefore, has much to do with identity formation or *reconstruction*: "Education is more a process of rethinking and rebuilding the past" by "learning to tell and retell educational stories ... with added possibility" (Connelly & Clandinin, 1994, pp. 149–150). We teach who we are so learning to teach is not just about coming to know a series of behaviors or accumulating subject matter knowledge; it has to do with constructing an identify of self as teacher (Hamilton, 1995; Palmer, 1998; Wilcox, 1998; Wilson & Berne, 1999) – it is an "on-going quest for authenticity" (Bullough, 1994, p. 110). When we speak of the authentic self, we mean the whole self, e.g., the intellectual, emotional, and spiritual (Palmer, 1998); the gender and racial identity (Brown, 2002; Hamilton & Guilfoyle, 1998); the body and its dress (Weber & Mitchell, 2002). We thus need to create ways for our students to reinvent all aspects of themselves, again both by engaging them in identity reconstruction activities and by showing them how we are continuing the process ourselves.

We do so not only because they need to begin to think like teachers, but also because, in the words of Pinar (1988), "Understanding of self ... is a precondition and a concomitant condition to the understanding of others" (as cited in Casey, 1995, p. 217). Likewise, the "development of one's own cultural identity is a necessary precursor to cross-cultural understanding" (Schulte, 2002, p. 102). By

implication self-development must be accompanied by efforts to enhance our understanding of others. In fact, we see those as mutually dependent endeavors.

Social Constructivist

Believing in the social construction of knowledge, including self-knowledge, and considering teacher knowledge to be distributed, situated, and mediated, we feel the need to create for our student teachers communities of learners of which we are a part (e.g., Griffiths, 2002). These communities must value individual differences and provide multiple and varying opportunities to process together our different ways of making meaning from our shared experiences. We can only influence learning, we cannot control it (Senese, 2002); but the Vygotskian theoretical perspective suggests that we will be better able to do so in desirable ways if we build on "local funds of knowledge" through culturally relevant pedagogy and curriculum that appropriately scaffolds individuals within their zones of proximal development (Foley *et al.*, 2001). In Bickman's (2000) words, "Teachers should be encouraged to join with their students in a pedagogical alliance founded on self-reflection and openness that will 're-form' every educational situation" (p. 301). Students are thereby engaged more as, "culture-creating agents than as vessels for the reception of culture" (p. 300). Similarly, Ladson-Billings (1999) advocates for an approach of Cochran-Smith's that, "relies less on received knowledge than on knowledge in the making. It is a risky but sincere effort at generating theory – a generation that must occur with each new cohort of teachers" (p. 229).

   We are building relationships with our students – relationships that are aimed at individual and social transformation. Of necessity, therefore, self-study is also generated from and guided by our moral, ethical, and political beliefs, values, and agendas.

Moral/Ethical/Political

We consider teaching to be not just a pedagogical task, but also a "social-pedagogical" task (e.g., Fenstermacher, 1994; Korthagen & Verkuyl, 2002). That is, we agree with Korthagen and Verkuyl (2002) that, "one of the central aims of education is … to ensure that students of every race, social class, sex and age are aware of, and give shape to, their own inner potential, strength, talents, value, and dignity, whereby others, including teachers, can provide support and guidance" (p. 44). So good teaching includes, as Shulman (Tell, 2001) suggests, "nurturing." Thus, in teacher education, we believe we need to be as concerned with the moral, ethical, spiritual, emotional, and political development of ourselves and out student teachers as we are with the cognitive and strategic. We conceptualize our work, therefore, as moral and value-laden (e.g., Cole & Knowles, 1998; Hamilton, 2002b; Hamiltion & Pinnegar, 1998; Whitehead, 1989).

Integrity

As always in self-study, we believe we need to begin with ourselves. Accepting our responsibility as powerful role models, we are concerned with the integrity

of our work, with "walking our talk" by bringing together our beliefs and actions (Loughran & Northfield, 1998). We are centrally involved with the asking and investigation of the question, "How do I live my values more fully in my practice?" (Loughran, 2002b, p. 240). We are willing to do what Ladson-Billings (1999) suggests we need to do – deal with the difficult issues, with the challenges of anti-oppressive teacher education that require us to examine and problematize our assumptions, to attend to both the intentional and the unintentional in our teaching (Kumashiro, 2002), and to emphasize and interrogate the "enduring ties between the rational and the emotional" (Smith, 1998, p. 56; see also Cooper & McNab, 2002).

Ethic of Caring

Since we agree with Noddings (1984) that, "the primary aim of all education must be nurturance of the ethical ideal" (p. 6), we embrace the notion that all teaching must be grounded in "an ethic of caring." This was apparent to Douglas Barnes (1998) when he attended the first conference sponsored by S-STEP at Herstmonceux Castle in 1996. Providing the "outsider" perspective on the proceedings, his first impression was that:

> "Caring" seemed to be an underlying concern for them. Almost everywhere I heard about caring for other people and their experiences. I heard about the importance of supporting colleagues, of helping pre-service teachers find their own voices so that they are able to express and organize their experiences in the classroom and of responsibility for the young students who will be the eventual recipients of all the efforts to help teachers to teach more sensitively and reflectively. Underlying self-study was an essentially *humane* approach to education. (p. ix)

A humane approach to education with an equity agenda has been identified by many as a social justice orientation (e.g., Griffiths, 2002; Hamilton, 2002a; Kumashiro, 2002). Accompanying this perspective is an acknowledgement that we have not yet achieved these goals in our world, our communities, or our educational institutions, which means that education must be about change rather than the preservation of the status quo. It also implies that we cannot rely upon what we already know and practice; we must work against "harmful repetitions" (Kumashiro, 2002, p. 69). It involves risk-taking, attention to insider and marginalized voices, and, because social justice is never achieved once and for all, constant vigilance (Griffiths, 2002) – that vigilance is self-study research.

Political

Power

Research that is concerned with challenging and transforming existing inequalities and relationships of power is inherently political (Kuzmic, 2002). We thus find ourselves in agreement with and drawing upon the theoretical and methodological work of many feminist and post-colonial scholars who emphasize "the

relationship among knowledge, power, and research" (Foley *et al.*, 2001, p. 70). These authors define critical ethnography, for instance, as "well-theorized empirical study with serious political intent to change people's consciousness, if not their daily lives more generally" (p. 42). Casey (1995) in her explication of "The New Narrative Research in Education" characterizes these researchers as having "progressive political intentions," often "represented in the form of the metaphor of voice" (p. 223). She goes on to speculate that "the most important development within this strand of narrative research has been a reconceptualization of what it means to be 'political.' Central to this redefinition is the recognition that the personal is political and, furthermore, that power is exercised in all relationships, not just those connected to the state" (p. 223). Accepting this definition of political, self-study researchers like Ann Schulte (2002), believe that teacher education is about transformation.

> I define the transformation process as the continuous evolution of one's own understanding and perspectives in order to better meet the needs of all students. It is marked by a disruption of values or cultural beliefs through critical reflection with the goal of more socially just teaching. Transformation requires teachers to think critically and challenge ideas of how power and control are constructed in the world and mapped onto them. (p. 101)

We engage in self-study to both orchestrate our own transformations and to monitor and understand our progress in facilitating the transformations of our student teachers. We consider this personal work to be a necessary, but not sufficient, part of our reform agenda.

Reform agenda

The larger effort includes the reform of teacher education, of institutions of higher education and K-12 schools, of the enterprise of educational research, and ultimately, of society in general, which we see as closely interrelated. In that regard the perspective of self-study researchers is consistent with much of the current school reform literature, which also considers the essence of institutional reform to be teacher development (Bullough & Pinnegar, 2001; Darling-Hammond, 1993; Fitzgerald, Heston, & Miller, 2002; LaBoskey, Davies-Samway, & Garcia, 1998; Little, 1993; Loughran & Northfield, 1998). Representative is Lieberman's (1995) suggestion that schools need to be transformed into "learning organizations" by giving teachers opportunities to develop, implement, analyze, and modify new practices within the context of a professional community. Similarly, Sykes (1996) proposes that the promotion of teacher learning that can lead to improved practice on a wide scale might best be accomplished by engaging "teachers in learning about their own learning, in studying their own teaching, and in sustaining relationships with other teachers, both near and far away" (p. 467). Or, we might say, by involving them in self-study research.

But what we have found, when attempting to engage in such efforts within

the context of existing institutions of higher education, is that there are considerable barriers to the initiation and sustenance of this orientation to research and practice. The proverbial "chicken/egg dilemma" might be one way to characterize this problem. We need to reform conceptualizations of what counts as knowledge and research in order for our self-study work to be appropriately supported and acknowledged, but we can only demonstrate its legitimacy by doing the work. One of the reasons our research has not been honored or attended to as much as it should be, either within or outside our colleges and universities, is that teacher education suffers from a tradition of low status (Zeichner, 1999). The reform agenda of self-study thus must include the simultaneous transformation of us, teacher education epistemology and practice, and our institutional contexts. Though we have experienced discouraging setbacks (e.g., Hamilton, 2002a; Myers, 2002), we have also made considerable progress, as this handbook represents. We have done so by creating a community of scholars that helps support our local resistance (Guilfoyle, Placier, Hamilton, & Pinnegar, 2002) and by engaging in research and practice that can not only improve teacher education and contribute to the knowledge base of teaching, but also develop the "voice" and thus, political power of teachers, including teacher educators, and their respective students (e.g., Bass *et al.*, 2002; Hamilton, 1995; Hamilton & Pinnegar, 1998).

We acknowledge that all questions about knowledge – what it is, how it is developed, and who decides – are political questions. We accept the impossibility of moral, ethical, or political neutrality when it comes to education and educational research. We recognize that the privileging of certain pedagogies and particular research methodologies is as much about power as it is about intellectual responsibility. "This struggle over legitimate knowledge is not simply an individualistic conflict between academics and teachers but rather a historical struggle that has shaped institutional priorities and structures as well as the knowledge-power nexus found in the educational community (Gitlin & Burbank, 2000)" (Gitlin *et al.*, 2002, p. 304). We realize that we are both products of this tradition and enmeshed in institutional and social contexts that help to perpetuate it. We know, then, that our methodological decisions must be guided not only by our epistemological and pedagogical theories but also by our ethic of care and our reform agenda. We must select and construct instructional strategies, research designs, and research representations that will, for instance, attend to the "insider" perspective, where all voices are listened to and heard, but also examined and questioned (Gitlin *et al.*, 2002; Grumet, 1991); require us to interrogate our own power and privilege, especially in relationship to our students and our teacher colleagues (Gitlin *et al.*, 2002; Kuzmic, 2002; Luttrell, 2000); render problematic both the content and process of our teaching (Kumashiro, 2001); and include multiple perspectives, especially those traditionally marginalized, in ways that encourage universal and repetitive reframing (Dalmau & Gudjónsdóttir, 2002). We understand also that these decisions about how to undertake our self-study work are not additive, but transformative: "As long as we look at (or fail to look at) the challenges that teacher research poses

to educational research more generally seeing them as merely methodological or as merely adding teachers' voices to the research community, we ignore the reality that this is also about power and the authority of the voices heard" (Kuzmic, 2002, p. 231).

These moral/ethical/political values and ideals combine with our epistemological and pedagogical theories to form the underpinnings of the methodology of self-study. In the remainder of the chapter I will summarize this methodology by highlighting the predominant methods of pedagogy, research design, and research representation that have been derived from that conceptual framework.

Methodology

Pedagogy

The pedagogical practices employed by self-study researchers are an integral part of the methodology of self-study because it is those efforts that we are investigating. They are the interventions in our research design. These are the activities that embody our theoretical perspectives and pedagogical goals, our moral, ethical, and political values and agendas, at least we hope they do, which is the impetus for and essence of our central research questions: "How do I live my values more fully in my practice?" and "How do I improve my practice?" (Whitehead, 2000).

Our conceptual framework suggests, of course, that there cannot, and indeed should not be any singular or final answers to these questions. They must be asked with regularity; the quest must be career-long. Furthermore, the pedagogies that are selected, constructed, and adapted need to be context-sensitive and individually responsive, and they must be multiple and variant. Nonetheless, we can identify certain instructional genres that are particularly compatible, both on theoretical grounds and research evidence. The categories into which I have placed these strategies are not discrete; creative and conscientious teacher educators have and will combine these in a multitude of productive ways. They are also not meant to be exhaustive; more options have and will be chosen and created. But they can help to provide us with a sense for the current field of self-study practice.

Dialogic Communities

Especially prevalent in the practice of self-study teacher educators are activities that aim to create an interactive community wherein student teachers and their instructors and mentors can engage in critical dialogue about all aspects of their educational experiences and understandings. The aim is to position, "the student teacher as a learner in a curriculum constructed as a result of real experiences and reconstructed through interaction between learners" (Loughran, 2002a, p. 41). Particular variations within this category include "communities of learners" (Peterman & Marquez-Zenkov, 2002); relational teacher education (Kitchen, 2002); learning circles (Fitzgerald, Heston, & Miller, 2002);

Participatory Interview Approach (Bodone *et al.*, 1997); micro-teaching (Loughran *et al.*, 2002); and "think-pair-share" (Gudjónsdóttir & Dalmau, 2002). Various forms of information and communication technologies (ICTs) have been utilized for this purpose with varying degrees of success. Though some have noted limitations to the interpersonal quality in such exchanges (e.g., Ham & Davey, 2002), others have found that, if appropriate adaptations are made, critical dialogue can indeed be facilitated, and even enhanced, by ICTs (e.g., Hoban, 2000).

The general preference in the field is for group talk rather than unilateral lecture so that knowledge can be socially constructed, all voices heard, personal responsibility encouraged, and assumptions challenged (e.g., Guilfoyle, 1995; Kaplan, 2002; Tidwell, 2002). Such a perspective is consistent with what Wilson and Berne (1999) have found to be main characteristics of good pedagogy for adult learners in preservice and inservice programs: "The privileging of teachers' interactions with one another" often situated in "communities of learners that are redefining teaching practice" (pp. 192–193). Frequently included in such interchange are stories of experience.

Narrative

Conceptualizing teacher knowledge as narrative knowing means that the writing and sharing of teacher stories are common occurrences. But since we consider the aim of teacher education to be transformation, the simple telling is not enough. As Connelly and Clandinin (1994) make clear, opportunities for teacher educators and their students to rewrite and retell new stories that imagine other possibilities need to be provided. This is fostered by collaborative contexts that include multiple perspectives, particularly those of typically marginalized voices. Though best if these variant interpretations come from the verbal input of colleagues, they can also be supplemented by other sources, e.g., written cases of special needs students (Hutchinson, 1998) and theoretical literature that challenges the "myth of racelessness" (Brown, 2002). Grumet (1991) sees story-telling as "a negotiation of power" and suggests that "we are, at least partially, constituted by the stories we tell to others and to ourselves about experience" (p. 69). Thus, as we engage our students in the construction of their identities as teachers, we often connect their stories of teaching with their personal histories.

Autobiography/Personal History

In response to the self-posed question, "Why write about personal histories?" Knowles and Holt-Reynolds (1994) propose that it is

> Because in one sense, they *are* teacher education. Teachers' lives as school pupils, before they become teachers, their lives as scholars while they prepare to become teachers, their lives as variously contributing members of the work force and society, and their lives as professionals in a career of teaching present few clear boundaries. (p. 6)

But again, they argue that personal histories cannot be simply elicited, they must also be analyzed; cherished beliefs need to be acknowledged and then challenged. Holt-Reynolds (1994) suggests further that if we do not engage our student teachers in explorations of how their past experiences influence and necessarily limit the choices they make as teachers, then we run the risk of mistaking "practical proficiency" for "conceptual change" (p. 31). That is, even if student teachers employ strategies we suggest, we cannot assume from behavior alone that their theoretical understandings have been transformed. All courses, in her view, thus need to be safe contexts where teacher educators and their students come together to debate specific pedagogies and possible rationales underlying them in light of their variant and equally valuable backgrounds, which, if so respected, will necessitate a shift toward a more inclusive perspective.

Coia and Taylor (2002) also emphasize care in the use of, in their case, autobiography, which they define as personal narrative "written with an audience in mind" (p. 48). If the ultimate purpose is to be realized, the making and remaking of meaning in the context of community, then a democratic environment must be created where vulnerability is shared and, "the idea of critique as demolition from a privileged viewpoint" is eschewed (p. 51).

Personal history/autobiography in its various forms including journaling recognizes and therefore allows for the inclusion of the emotional in the process of teacher development; the whole of the individual is thereby incorporated and addressed, as it should be. Another realm commonly believed to include both feeling and cognition is that of the arts.

Visual and Dramatic Art

Self-study teacher educators often engage student teachers in visual and dramatic art activities. They do so not only because art is potentially holistic, but also because it can allow us to see the world in new and different ways; it can promote what Maxine Greene (1978) refers to as the "wide-awakeness" so essential for critical reflection.

> I am convinced that, if teachers today are to initiate young people into an ethical existence, they themselves must attend more fully than they normally have to their own lives and its requirements; they have to break with the mechanical life, to overcome their own submergence in the habitual, even in what they conceive to be the virtuous, and ask the "why" with which learning and moral reasoning begin. (p. 46)

She argues that the arts and aesthetic education hold particular, though not unique promise, for triggering these necessary questions of the status quo. Eisner (1995) emphasizes an additional advantage of the artistic – it can capture and reveal those aspects of our experience and understanding that cannot be expressed in words.

Exemplary of this pedagogy is the Theater of the Oppressed (ToO) used by Cockrell, Placier, Burgoyne, Welch, and Cockrell (2002) which invites audience

members, in this case students, to participate on stage in the resolving of the educational problems portrayed by the actors. Cockrell *et al.* have found that ToO has helped to create "visual imagery from which learners may explore [the assumptions embedded in an imposed ideology] and problematize the conditions of their [teaching] lives" (p. 43).

Richards (1998) has had her student teachers create self-portraits for similar reasons. She has found that they help her learners to, "develop a conscious awareness of their own performances with students and to address discrepancies" between what they believe and what they do (p. 34). Drawing and acting actively engage student teachers in the process of learning; they involve the body as well as the mind, another common feature of self-study pedagogy.

Active Learning

Berry and Loughran (2002), believing that "experience precedes understanding," have employed micro-teaching in their teacher education courses. One of their reasons for this choice is that it, "would help [their student teachers] explore and understand the relationships between what they taught, how they taught and what was learnt" (p. 16). This focus is consistent with what Wilson and Berne (1999) have found to be another of the main characteristics of good pedagogy for adult learners in preservice and inservice programs: It must, "engage them as learners in the area that their students will learn in but at a level that is more suitable to their own learning" (p. 192). Pereira (2002) in mathematics and Bencze and Bowen (2002) in science teacher education have taken this approach. Pereira, for instance, in aiming "to reacquaint teachers with themselves as learners of mathematics in order to help them to re-conceptualize themselves as teachers of mathematics" had, as one of his course's central activities, "the construction, description, and analysis of geometric objects" by the inservice teacher participants (p. 79). Bencze and Bowen found that by engaging their preservice students in a variety of activities that incorporated aspects of scientific inquiry, their prospective teachers had "increased tendencies to promote contextualized student-directed open-ended scientific investigations" (p. 30). Tasks that involve learners in inquiry of one form or another are not unique to science teacher education, indeed quite the contrary.

Reflective Inquiry

Most predominant in the practical methods of self-study teacher educators are inquiry activities and assignments, which makes sense given that we believe teacher knowledge is constructed and advanced through critical reflection on personal experience. In fact a reconsideration of all of the previously identified strategies would reveal that each has an inquiry aspect to it. In general, such strategies are characterized as reflective practice or teacher research (e.g., Dalmau & Gudjónsdóttir, 2002; Kuzmic, 2002; Loughran, 2002a). The emphasis is on finding ways for our student teachers and in turn their students to raise and explore their own questions. Freidus (2002) summarizes the approach well:

> It is not our role to impose our vision, but to help students understand what we value and why. Then, to help them become the best teachers they can according to their own visions, teachers who are willing to grapple with hard questions, listen to conflicting opinions, and articulate and implement their own ways of being in the classroom … to separate expert from expertise, acknowledge what each participant knows, working together to learn from and with each other, moving beyond the traditional power structures in search of new and better ways to meet the needs of all learners. (p. 86)

Because cognition is situated, we recognize the need to provide our students with different contexts for learning. As Putnam and Borko (2000) suggest, "Thoughtfully combining university- and field-based experiences can lead to learning that can be difficult to accomplish in either setting alone" (p. 7). Furthermore, case-based teaching can expand access to meaningful settings; in fact, they speculate that "this experience *of* the setting may afford reflection and critical analysis that is not possible when acting in the setting" (p. 8).

In addition to the pedagogies already iterated, other inquiry approaches have included Professional Working Theory (Dalmau & Gudjónsdóttir, 2002); "discrepancy analysis" workshops (Korthagen & Verkuyl, 2002); the exploration of paradox in education (Wilkes, 1998); and deliberative questioning (Cooper & McNab, 2002). Especially widespread in this category of teacher education practice are variations of action research and portfolio.

Action research

Geoff Mills (2000) defines action research as a, "systematic inquiry done by teachers (or other individuals in the teaching/learning environment) to gather information about – and subsequently improve – the ways their particular schools operate, how they teach, and how well their students learn" (p. 21). Since the theoretical underpinnings and practical goals of action research and self-study are so similar, it is no wonder that self-study teacher educators choose to engage their students in comparable cycles of inquiry that rely upon and promote critical reflection. Mills suggests that action research holds particular potential for challenging "the intractability of reform of the educational system" because it engages teachers in change-oriented practice with requirements for immediate implementation (p. 14). Because the research is their own, the results are necessarily more persuasive and authoritative, relevant, and accessible.

Portfolios

Connecting theory with practice and the development of critical reflection are also cited as primary reasons for the use of portfolios in self-study teacher education. As Lyons (1998) has noted, the portfolio process not only, "helps [preservice and inservice teachers] to identify for themselves the critical features of their own teaching platforms and philosophies" (p. 248), it also obliges them to find evidence in their practice of the appropriate enactment of that knowledge and those values. In other words, it asks them to engage in an investigation of

potential "living contradictions" in their teaching, and thus, in the asking of the central research question of self-study, "How do I live my values more fully in my practice?" Anderson-Patton and Bass (1998) engage in the construction of their own portfolios in collaboration with their student teachers as they develop theirs, in part to create a democratic community of learners and in part to model the practice.

Modeling

Many in the field believe in modeling for their students both particular pedagogical strategies and reflective practice in general. Since we are teaching about teaching, it is essentially, as Bullough (1994) makes clear, an issue of authenticity: "For me, authenticity in teaching requires that I be able to articulate for my students my own teaching metaphors as they arise from life-history and that I be actively exploring myself as teacher, just as I require that they engage in such exploration" (p. 110). We believe we need to "practice what we preach" or "walk our talk." We must create safe learning environments by exposing our own vulnerability, as well as promote the necessity of life-long development by making explicit our own efforts to do so. Engaging in self-study is a primary vehicle for this modeling of practice, and thus provides a bridge between our pedagogy and our research.

Connections Between Pedagogy and Research Design

The well-known Biblical phrase "Physician, heal thyself" is commonly enlisted to suggest that doctors need to attend to their own well being before they can expect or presume to care effectively for others. Self-study teacher educators believe that this admonition applies similarly to us. This impetus for self-study influences our choice of research methods and designs. Wanting our student teachers to become critically reflective practitioners who will engage in teacher research, we employ research strategies that are particularly appropriate for teacher inquiry – that will exemplify what we hope they will do themselves. Since we cannot teach something we do not know, nor advocate for a practice we do not embrace or emulate, one critical connection between our pedagogies and our research designs is that the latter are meant to instantiate the former.

A second connection resides in our belief that we have a pedagogical responsibility to continuously monitor our progress; to check for discrepancies between our ideals and our practice, our practice and student growth; to challenge our assumptions; and to articulate and support for ourselves, our students, and our colleagues what we know about our teaching. We need to justify the pedagogies we employ and advocate on evidentiary, as well as theoretical grounds and moral/political ideals. We thus utilize research methods that will rely upon and give access to evidence of student learning, that will capture the complexity and particularity of what we do and of the ways in which what we do result in, or not, the reframed thinking and practice of our students and ourselves.

Instantiation

The self-study literature is replete with instances where there is explicit acknowledgement that, "one of the purposes in this self-study is to model professional learning in ways that support candidates just beginning to understand the nature and challenges of professional action and learning from experience" (Russell, 2002a, p. 84; see also Hutchinson, 2002; Kitchen, 2002; Lomax *et al.*, 1998; Peterman & Marquez-Zenkov, 2002; Schulte, 2002; Schwabsky, 2002). But the modeling of which we speak is somewhat different than that intended by more traditional pedagogies. This is due in part to the nature of *what* we are instantiating, and in part to the *rationale* for it. We are not simply presenting a "model" of practice for our students to imitate; we are engaging in the process to improve ourselves, as much as we are to improve them.

Because we are as limited by our own personal histories and cultural identities as are our students, we cannot expand their horizons if we do not expand our own. Similarly, we cannot help them to detect and interrogate their biases if we do not detect and interrogate ours. As a result, when our goals are to enhance the multicultural teaching of our students, for example, we might engage in the self-study of our own cultural influences (e.g., Brown, 2002; Oda, 1998; Schulte, 2002). Or when our focus is on the transformation of our institutional contexts, we might undertake a critical analysis of our teaching myths (Louie, Stackman, Drevdahl, & Purdy, 2002). We believe that in order to facilitate the transformation of our students, we need to transform ourselves by developing our "voices," which provide us with "the power to critically examine a situation and confront it, rather than be dominated by it" (Hamilton, 1995, p. 39). This position is well-illustrated by Korthagen and Verkuyl (2002) who engaged in a self-study to investigate whether or not they could help student teachers become aware of and develop their professional identities and gain "a renewed sense of mission." "From the very beginning it was clear to us that we could not undertake this enterprise without questioning our own professional identities and missions as teacher educators" (p. 43). But at the same time we recognize that we cannot be sure that this modeling is making any difference. We need to assess our inquiry-based pedagogies by seeking evidence of growth.

Assessment

Our self-study research projects, then, are meant to serve as "reality checks" (Schuck & Segal, 2002) on our pedagogy. In pursuit of enhanced understanding of our practice settings so that we might improve as we go, we pay attention to our learners:

1. We attempt to find out who they are and what they already know, including their cultural proficiencies (Kumashiro, 2001), so that we can target our interventions appropriately and have a basis for comparison over time. One way in which we do this is by generating and examining their initial metaphors of teaching (Knowles, 1994).
2. We analyze their responses to our assignments and activities, especially

because, as Holt-Reynolds (2002) points out, "Assignments or tasks seem to lie at the core of a teaching/learning exchange" (p. 14). They represent what we "value enough to insist that students address" (p. 16). Understanding, as McNiff (1993) warns us, that living contradictions can go both ways, that is, students can not only espouse verbally theories they do not exhibit in practice, they can also engage in practices they do not theoretically support, we attempt to employ curriculum that will "reveal learning rather than just answers" (Rodgers, 2002, p. 232). As an example, Tidwell and Heston (2002) prompt their student teachers to provide their "practical arguments" for what they have done in practice, thereby making explicit the rationales for their observed behavior.

3. We attempt to document our work as accurately as possible so that we can have a more reliable record of what we are actually doing, as opposed to what we think or hope we are doing, which we then can relate to those identified student outcomes. For instance, we might audiotape our teaching sessions (Bullough, 1994) or have students dialogue with one another and us on the computer (Ham & Davey, 2002) or keep anecdotal journals of our interactions with students (Watson, 2002).

4. We obtain alternative perspectives on what we are doing and finding from our colleagues, often by engaging in collaborative self-studies with them (e.g., Coia & Taylor, 2002; Feldman *et al.*, 1998; Fitzgerald, Farstad, & Deemer, 2002; Kosnik, Freese, & Samaras, 2002; Louie *et al.*, 2002).

5. And we solicit our students' reflective reactions to our practice and their learning (e.g., Bullough, 1994; LaBoskey, 1997; Russell, 2002b).

Our research methods are thus interactive and responsive: "In teaching, there is a sense of the need to act immediately on new possibilities and to adjust one's teaching in accord with these possibilities. The research focus therefore alters and, as adjustments are made, new insights and possibilities emerge. Hence the intertwining of teaching and researching is such that as one alters so does the other" (Loughran, 2002b, p. 243; see also Lighthall, 2002; Schuck & Segal, 2002).

Though "self-study is about identifying existing strengths as well as pinpointing places for improvement" (Freidus, 2002, p. 82), the impetus is more likely to be the latter. As has been mentioned before, Whitehead (1989) has referred to self-study as the exploration of "living contradictions." Others have also identified discrepancies or gaps between our ideals and our actions (Zeichner, 1999) and dissatisfaction with existing practice (Loughran, 2002b) as the likely initiator. Kuzmic (2002) has employed the particularly compelling term, "hauntings," in this regard: "It is, indeed, those issues, questions, and experiences with teachers or students that continue to haunt me that I see as deserving of both reflection and self-study" (p. 226). Childs (2002) might find this descriptor particularly appropriate for referring to the brief interchange wherein she felt she failed one of her students most egregiously: "Nobody trips over mountains. It's the little stones – the pebbles – that cause us to stumble and slip. It is the memory of that one tiny moment – an entire incident of no more than perhaps thirty-five

seconds – that still keeps me contrite and eager to confront the contradictions and the complacencies in my practice as a mentor" (p. 39). And this confrontation takes the form of on-going self-study research.

So there is a quite tight connection between our pedagogy and our research design because, as Hamilton (2002b) has noted, the work, "strives to explore ways in which methodologies used in self-study can support the development of teachers' ideas about teaching" (pp. 112–113). According to Pinnegar (1998), self-study researchers,

> Observe their settings carefully, systematically collect data to represent and capture the observations they are making, study research from other methodologies for insights into their current practice, thoughtfully consider their own backgrounds and contribution to this setting, and reflect on any combination of these avenues in their attempts to understand. They utilize their study to represent for others what they have come to understand in their own practice and ultimately to perfect and improve the quality of their own practice setting. (p. 33)

Thus, she concludes, "Self-study is not a collection of particular methods but instead a methodology for studying professional practice settings" (p. 33). The predominant characteristics of this research methodology will be explored in the next section.

Research Design

Self-Initiated and Focused

A critical identifying feature of the methodology of self-study involves the question of "Who?" – both who is doing the research and who is being studied. In self-study the *self* is necessarily included in the response to both queries. Thus, the professional practice settings we study are our own. We agree with the argument that those engaged in the practice of a particular profession are particularly well qualified to investigate that practice (Zeichner, 1999; see also Cochran-Smith & Lytle, as cited in Fenstermacher, 1994; Schön, 1983). In the words of Bass *et al.* (2002), "Self-study re-centers research and grounds it in classroom practice, using the language of teachers rather than the distancing voice of erudite theoreticians" (p. 66). We believe that challenges to the validity of research on one's own practice that are based in a supposed inherent lack of "objectivity" have political overtones. As Eisner (1997) has stated, "This question – what should count as research – leads to a very deep agenda. It is also an agenda with high stakes for it pertains to matters of legitimacy, authority, and ultimately to who possesses the power to publish and promote" (p. 5). As Casey (1995) has pointed out, objectivity is a problematic aim even in the researching of others – it marginalizes "the authenticity and integrity of narrators' stories" (p. 231). It is possible, of course, for research to be overly subjective, but we suggest that the other characteristics of self-study methodology can serve as appropriate and adequate checks to this eventuality.

Believing that teacher knowledge develops through a better understanding of personal experience – by cycles of critical reflection on that experience – we assume that critical reflection on our personal experience as teacher educators will produce knowledge of teaching and teacher education. Granted it is knowledge of our context, but we also accept that all teacher knowledge is situated and contextual. The local knowledge that is thereby generated, when made available to others, can still serve as a trigger to their question-asking and expand the possibilities of their activities and explorations, thus making a contribution to "the long-term collective project with a democratic agenda" (Cochran-Smith & Lytle, 1999) that is *inquiry as stance*.

Since the goal of research on teacher education is to improve that enterprise, then by implication a main purpose is to enhance the learning and practice of teacher educators. Self-study research combines the two aims and, social constructivist learning theory would predict, may make the latter more likely and more robust. As Lee Shulman (1998) and his colleagues in the Carnegie Scholarship of Teaching and Learning Project have found, when faculty engage in a scholarly inquiry into their teaching for the purpose of preparing a course portfolio, they "often report that the process of investigation, selection, and reflection entailed in writing the portfolio caused them to change the way they teach – to be more self-conscious about purposes, more vigilant about data collection, more thoughtful in assessing what works" (p. 12). Jean McNiff (1993) has said of action research that it is, "a form of educational enquiry that empowers practitioners to generate and control their own process of change" (p. 37). By extension, it can contribute to the development and recognition of the "voices" of teachers and teacher educators, which is consistent with our political agenda. It might also help to make us the "good judges" we want to be since we are, in the process of doing this inquiry, both acting and thinking about educational issues (Coulter & Wiens, 2002).

Self-study researchers are, therefore, not only the selves doing the research, they are the selves being studied, which does not mean the self is the sole focus. Nor does it entail the opposite extreme – the study of our practice or our students' learning without also attending to our personal role in that process. As Bullough and Pinnegar (2001) make clear, there should be a balance between the two. Acknowledging that teaching is an interpersonal act, that we teach who we are, and that though there is a close connection between our beliefs and our actions, we can sometimes behave in ways contradictory to our values, we accept that to better understand and improve our practice, we must incorporate self-analysis and tools of self-transformation. An example of such a mechanism is "memory work." According to Weber and Mitchell (2002), "The object of critical memory work is to make the past usable – a remembering in the service of future action" (p. 122). The assumption is that the accuracy of our memories does not matter; whatever shape they take, they influence the construction of our identities, our current thinking, and our future behavior. Therefore, if we begin to access and interrogate those memories, we can have more control over them and their impact on our teaching:

> The process of memory work can offer us insights into how and why we became who we are; help us make connections between our pasts and what is occurring in our lives today; give us a framework for action; illustrate how influential and powerful our own words and actions as teachers and teacher educators may be; and provide us with possibilities for self-growth, greater understanding and transformation. (O'Reilly-Scanlon, 2002, p. 75)

She suggests that the real power of memory work may be in its ability to generate questions: "Paradoxically, the more we learn – the more questions are generated. And the more we learn about ourselves, the more questions we begin to ask about others" (p. 77). The questions about teacher education posed by teacher educators are especially significant and relevant to the field because they are generated from within the practice by actual dilemmas, puzzles, and ambitions. And these questions lead to research that is conducted by the teacher educator self, thus connecting both aspects of the *self* in self-study.

The literature includes numerous examples of self-studies that explicitly emphasize both manifestations – the self as the researcher and the self as the researched (e.g., Bass, 2002; Feldman, 2002; Gitlin *et al.*, 2002; Hamilton, 2002b; Lomax *et al.*, 1998). Whitehead (1989), for instance, describes an action research project wherein the participants, including him, videotaped their teaching and then viewed and critiqued the recordings together. In the process of doing so, they were able to see their own "I's" existing as living contradictions (p. 4). That is, they could detect instances where they seemed to be nullifying in their practice the educational values they claimed to hold. These discrepancies caused tension, which moved them "to imagine alternative ways of improving [their] situations" that they then put into practice (p. 4). "In this cycle we can study the gradual emergence of our values through time as we struggle to overcome the experience of their negation" (p. 5).

The goal of self-study teacher educators engaged in such research is to better understand their practice – to generate knowledge about teaching – but the process does not end there, which is another way in which this work is differentiated from more traditional research. Self-study scholars are interested in the resolution of current problems and in the achievement of short- and long-term educational reformation. Indeed an essential requirement of this research methodology is that it results in and provides evidence for the reframed thinking and transformed practice of the teacher educator researcher. Self-study thus aims to improve teaching and teacher education and the institutional contexts in which they take place.

Improvement-Aimed

In a special edition of the *Teacher Education Quarterly* published in 1995, Fred Korthagen served as respondent to five self-studies written by Stefinee Pinnegar, Peggy Placier, Tom Russell, Mary Lynn Hamilton, and Karen Guilfoyle. In his comments he made some distinctions between conventional research and self-study, one of which is this: "We might say that traditional research helps us

realize that education is often bad and unsuccessful. Stefinee, Peggy, Tom, Mary Lynn, and Karen prefer to apply their time and energy to the improvement of education" (p. 104). He acknowledges that this statement is an exaggeration and recognizes that traditional research has contributed much to our understanding of educational phenomena. But he justifies the critique on the grounds that conventional researchers have not tried hard enough to put the implications of their theories to the test in practice. He warns though that we need to understand an educational setting before we attempt to improve it. He commends the work under review on that basis – that the improvement intentions of the authors are generated from the "critical issues" they discover in studying their contexts. Korthagen concludes, "[The critical issues developed by practitioners] make it possible for action research [or self-study] aiming at the improvement of educational practices, and research aiming at the understanding of those practices, to go hand in hand" (p. 104). Feldman *et al.* (1998) would agree: "We assume that the goal of action research is both the improvement of practice and an improved understanding of the educational situation in which our practices are immersed" (p. 7). Self-study methodology is designed to understand and improve our professional practice settings.

Holt-Reynolds and Johnson (2002) provide us with an example of this bringing together of understanding and improvement. They analyzed the responses of their students to one of their course assignments:

> As we read through these, we see our assignment come back to us in twenty-five different forms. We learn what any author learns from listening to her work come back to her from an other – how our assignment was ambiguous, how it omitted invitations for thinking we had hoped to see, and where it led students down a not-so-productive-after-all-path. We learn how to make it a "better" assignment. (p. 17)

We aim to improve our practice based upon a careful and thorough understanding of our settings, which in turn results in an enhanced understanding of that practice. By making changes in this way and then taking them public, we also hope to contribute to a larger reform agenda.

In her introduction to a book of cases of the scholarship of teaching and learning, Pat Hutchings (2000) summarizes the value of the work: "[The cases] both benefit from and contribute to changing conditions on campuses that can make the scholarship of teaching and learning (and its various cousins and relations, whatever they're labeled [e.g., self-study]) more central and valued – an outcome supported by the efforts of scholarly and professional societies that have been working to give prominence to teaching [e.g., S-STEP SIG]" (p. 9). The work, then, has the possibility of reforming our institutions of higher education. It might also, as the Arizona Group (Guilfoyle, Placier, Hamilton, & Pinnegar, 2002) suggests, support our resistance to the sometimes-problematic reform agendas of our institutional, state, and national contexts.

The ultimate hope is that if we and our student teachers continue to engage

together in this practice of critical self-inquiry that takes into account, and thus begins to challenge, "how our lives are mediated by systems of inequity such as classism, racism, and sexism (Lather, 1992, as quoted in Guilfoyle, 1995, p. 23), we might strengthen "the quality of schooling for all students, including culturally and linguistically diverse learners" (LaBoskey, Davies-Samway, & Garcia, 1998). As Griffiths (2002) put it: "[We are] keen to understand – to do self-study on – what it is to work for social justice, so we (me, you, me and you, me and they, you and they) can do more of it better" (p. 162).

A particularly illuminating example of self-study research aimed at educational improvement on both the individual and institutional level is one done by Gitlin and Russell (1994) that investigates a method for structuring the storytelling process they call Educative Research. The strategy includes several steps: the writing of two texts – one personal history and one school history without analysis; personal reflection on the texts to consider what is missing and to raise questions; the sharing of the narratives with others who then analyze them looking for themes and categories; the reading of relevant literature that can help reveal "oppressive formations" in their stories; and a comparison across histories to identify common themes and apparent differences, identify constraints, and raise questions about assumptions of possibility or impossibility at the school level (p. 126). The authors make very explicit the assumptions upon which their work is based:

1. Research/Subject Relationship – They engage in a "'dialogical process' where meanings are negotiated and both can be changer and changed. The intent of the dialogue is not to discover absolutes or *the truth*, but to scrutinize normative 'truths' that are embedded in a specific historical and cultural context. In this way, taken-for-granted notions can be challenged as educators work to better understand schooling."
2. Voice – "The central motivation for encouraging a dialogical approach is that it can further the aim of developing voice among those who have been historically silenced. ... Voice as a form of protest is directed both outward at the social construction of meaning making and the structures that reinforce those meanings, and inward at the way the individual takes part in the production of certain constrained beliefs, roles, and practices."
3. Understanding and Practice – "To confront this threat to the linkage of understanding and practice, Educative Research is viewed primarily as a process with turning points that redirect inquiry, rather than being seen as a product. This allows the research process to alter the questions asked and influence practice as insights are gained."
4. Authenticity – "However, the author is part of the research not only because the questions posed reflect a focus on one set of concerns rather than another, but also because the constructs developed ... are linked to the perspective and orientation that the author brings to the research project. For research to be authentic, the relationship between what is said and the person(s) doing the talking must be made apparent. Put simply, the author must be included in the story being told."

5. Validity – "The validity, or 'truthfulness' of the data [can be understood] as a mutual process, pursued by researcher and those studied, that recognizes the value of practical knowledge, theoretical inquiry, and systematic examinations. … The influence of the research process on who produces knowledge, who is seen as expert, and the resulting changes at the level of school practice are also part of an expanded and political view of validity."

6. Reliability – "Reliability, therefore, cannot be based on duplicating procedures, but rather must center on attempts to satisfy the underlying principle of voice and its relation to a desired type of school change." (pp. 122–124)

In summarizing what they have discovered about the value of this approach in the process of doing their own self-study research on it, they say: "This give and take between questions, analyses, and actions differs from traditional methods by taking an activist stance toward research and giving more weight to the process of question posing. … When successful, this sort of dialogical process makes it possible for those traditionally silenced to have a voice in educational matters. It can also encourage protests about one's actions and the school context" (pp. 126–127). The efforts to improve both individual practice and institutional contexts described in this exemplar were made possible by a variety of interactions, e.g., interactions among participants, interactions of individuals with their own histories, interactions of individuals with the literature and with the stories of their colleagues. Interactive structures and activities like these illustrate another characteristic of self-study methodology.

Interactive

Social constructivist learning theory requires interactive/collaborative pedagogy and research strategies. Likewise, conceptions of cognition that consider it to be social, situated, and distributed mean that we must capture and attend to group interactions and knowledge development, as well as individual. Loughran and Northfield (1998) have given considerable emphasis to the collaborative nature of self-study methodology, not only because it is consistent with the above theories, but also because if genuine reframing is to result, as it needs to, then alternative perspectives and interpretations must be included in the process. Many others have similarly stressed this rationale: "It [is] clear how important reframing must be to the process of self-study. It is not sufficient to simply view a situation from one perspective. Reframing is seeing a situation through others' eyes. … The issue of collaboration often revolves around the need for interpretations of data to be checked against a valued or trusted other" (Gitlin *et al.*, 2002, pp. 243–244; see also Bass *et al.*, 2002; Guilfoyle *et al.*, 2002; Johnston, Summers-Eskridge, Thomas, & Lee, 2002).

Despite the frequent use of the term *collaborative* in the field, I have deliberately chosen the term *interactive* to refer to this aspect of self-study methodology because, as I have said elsewhere (LaBoskey, 1998), "There are distinct differences between typical collaborative research and collaborative self-study. … Indeed,

interactive may be a more apropos referent for multi-party self-study than *collaborative*, especially because, in many cases, the researchers are not just interacting around an external data set; the interactions are the data set, or at least a part of it" (p. 151). I would now add another reason for this choice: Interaction within self-study for the purpose of studying our professional practice settings takes many forms, in addition to collaboration among researchers.

First, self-study teacher educators do collaborate directly with colleagues in an effort to better understand and improve their own practice and institutional contexts. Berry and Loughran (2002), for instance, partnered in the teaching of a course and in a self-study on what they and their students were learning from the experience. They found that the modeling of their pedagogical risk-taking, cooperative critical reflection, and resultant transformed practice facilitated the learning of similar practices and perspectives by their student teachers. Cockrell *et al.* (2002) collaborated on an action research project designed to help two different student groups learn to focus on issues of diversity via a performance activity. They discovered that the differences in their areas of expertise resulted in the identification of different trends in the data, thus enhancing and diversifying the knowledge generated by the study. Similar examples include Griffiths' (2002) study of the long-term practice of a reform group of which she was a part, Russell and Upitis' (1998) study of their efforts to establish a professional community in their department through e-mail communications between the new Dean and a faculty member, and Conle, Louden, and Mildon's (1998) study of the nature and impact of their graduate student support group on one another.

Second, self-study researchers also collaborate with colleagues near and far who are working on different professional practice agendas. Louie *et al.* (2002) worked together on a self-study where they interrogated the various teaching myths they held as professors of different disciplines, which resulted in changes in their respective beliefs and behavior. Tidwell (2002) called upon a colleague of hers to "confirm or oppose" the findings that resulted from her self-study of her teaching in a large group instruction situation. Several folks have engaged in cross-institutional self-study that has allowed them to gain multiple perspectives on and emotional support for their efforts to improve their practice in sometimes similar, sometimes different arenas (e.g., Freese, Kosnik, & LaBoskey, 2000; Gudjónsdóttir & Dalmau, 2002; Guilfoyle *et al.*, 2002; LaBoskey *et al.*, 1998; Schuck, Brown, & Schiller, 2002). If face-to-face meetings are not possible due to distance, ICTs and telephone conversations have been found to facilitate this potentially challenging process that depends upon trusting relationships and respectful interaction. A caring approach to collaborative research is required if assumptions and interpretations are to be adequately interrogated and perspectives reframed. One way to characterize collaborators who participate with us in these ways is as critical friends (Schuck & Segal, 2002).

Third, self-study researchers also interact with their own students in a variety of ways. In fact, since self-study is always conducted in relation to the others who are our students (Bullough & Pinnegar, 2001), input from them, whether direct or indirect, with regard to the aspect of our practice under investigation

is important. They may become informants in our self-studies (e.g., Bass *et al.*, 2002; Johnston *et al.*, 2002). Or their work and reflections on that work may be a primary data source and interpretation check (e.g., Hopper & Sanford, 2002; LaBoskey, 1997). Or they may actually engage with us as co-researchers in the self-study project (e.g., Kaplan, 2002; Lomax *et al.*, 1998).

Fourth, self-study teacher educators interact with "text" of various kinds in varying manners. For example, researchers may engage with the professional literature in ways that will inform their personal experience: "We approached our study from an insider standpoint – the perspective of those enmeshed in the everyday politics of practice – and tried to reflect on this standpoint by looking at its relation to the data collected from an outsider point of view (academic research) to help make sense of this experience" (Gitlin *et al.*, 2002, p. 309). Similarly, they might use texts in alternative media like video, audio, or, in Hamilton's (2002b) case, visual art to expand on the potential interpretations of the collected data of practice. Or they may bring into their deliberations the multiple perspectives available in collections of personal narratives or cases (e.g., Hutchinson, 1998). The texts with which they interact might also be ones constructed by themselves that they then revisit with new lenses in the process of their critical, or in Feldman's case (2002), existential reflection on their practice. The critical autoethnography of Bass' (2002) and the performance of Austin, Gaborik, Keep-Barnes, McCracken, and Smith's (1996) are examples of such practice. Perselli (2002) articulated one of the merits of these approaches in describing the rationale for her performance self-study where she portrayed an artist disguised as a visitor to her own show, who could ask questions about the work: "This was one way of achieving reflection and reflexivity at a time when no 'outsider' audience was available. In other words, it was a device which enabled me to get into a dialogue with myself and to theorize the work once more, in preparation for the wider audiences to whom it was about to be exposed" (p. 82).

Interaction in self-study can take many forms. Garnering multiple perspectives on our professional practice settings helps to challenge our assumptions and biases, reveal our inconsistencies, expand our potential interpretations, and triangulate our findings. This variation is representative of another characteristic of self-study methodology.

Multiple, Primarily Qualitative, Methods

"Self-study research is a research methodology in which researcher and practitioners use whatever methods will provide the needed evidence and context for understanding their practice" (Hamilton & Pinnegar, 1998, p. 240), as was recognized by Zeichner (1999) in his review of the field at that point. To develop an understanding of all aspects of the self and its development in complex and differing educational contexts, multiple means for defining, discovering, developing, and articulating teacher knowledge must be employed (Loughran & Northfield, 1998). According to Hutchings (2000), those in the field of the scholarship of teaching and learning would agree: "A key principle of this volume

is that there is no single best method or approach for conducting the scholarship of teaching and learning. Indeed, the cases illustrate a need for approaches that are useful and doable in the varied contexts represented by their authors" (p. 1).

Though there is diversity in the methods we use to study our professional practice settings in self-study methodology, the majority of it is qualitative. The primary reason is that the qualitative approach is more consistent with our conceptual framework, as is apparent in the distinctions made by Smith (1983), as summarized by Paul and Marfo (2001):

> He points out that the two approaches have different procedures and different epistemological implications. Specifically, Smith observes that (a) the quantitative approach takes a subject-object position, whereas the qualitative approach takes a subject-subject position; (b) the quantitative approach separates facts and values, whereas the qualitative approach views them as inseparable; and (c) the quantitative approach searches for laws, whereas the qualitative approach seeks understanding. (p. 540)

Self-study researchers have employed qualitative, and sometimes quantitative, methods already quite prevalent in the general domain of educational research, but also have developed new strategies. One of the approaches most prevalent in self-study research is action research; as a matter of fact many have considered the two to be synonymous – a question that is explored in Chapter 24. One of the key aspects of action research that is particularly appealing is the inclusion of cycles inquiry that incorporate the immediate practical application and testing of insights gained. This recursive and ongoing process allows for responsive adaptation with regard to the forms of data collected and the means of analysis. It is possible to subsume other research strategies within this overall format.

Another method category especially common in self-study is narrative research. Believing that teacher knowledge is primarily, in Bruner's (1985) terms, narrative knowing, this is no surprise. As an example, Cooper and McNab (2002) have employed narrative inquiry and hermeneutics in their self-study work because they see these approaches, "as necessary to understanding the reciprocity of shared experience and meaning-making in the classroom where a multiplicity of perspectives is valued. The larger lessons and implications of the human story are infused with life and meaning, are illuminated, made relevant and understood best, through the tangible immediacy of stories of individuals" (p. 53). Wilson and Berne (1999), in summarizing the research on teacher learning, have found that capturing teacher knowledge has been difficult and speculate that "one way of measuring teacher knowledge within [teacher learning] communities would involve documenting and assessing what [their] stories were and what meaning they held for the teachers" (p. 179). Such stories have been captured in a variety of forms by self-study researchers, for example, as small and tall tales (Griffiths, 2002) and as autobiographies of home school decision-making (Muchmore & Sayre, 2002).

A related and comparably popular method category in self-study is dialogue,

because it often includes story-telling. But there are additional reasons for its frequency, e.g., it allows for the social construction of knowledge, can capture the distributed and dynamic nature of teacher cognition, provides for immediate opportunities to confront misconceptions, supports the development of caring communities, and helps to strengthen the voices of the teacher and teacher educator participants. The Arizona Group members (Guilfoyle, Placier, Hamilton, & Pinnegar, 2002), who have engaged in dialogue-based self-study over a several year period, have found that their dialogue "seemed to run in cycles of personal reflection, professional interchange and public analysis, followed by private analysis" (p. 99). The end result is not answers to the questions they originally posed to the group; instead, "We come away renewed because we have reached new epiphanies about the analyses that brought us together and new questions to explore – we leave with new ways to walk our talk and learn" (p. 99). Since we are not seeking to confirm and settle, then such an outcome is quite appropriate.

Yet another major type of self-study method is the artistic mode. Fischman (2001) has suggested that there has been a growing interest in inquiry into visual experiences in the scholarly world in general because, "images have become an omnipresent and overpowering means of circulating signs, symbols, and information" (p. 29). Complementary reasons within the self-study domain are that the artistic medium can convey emotions (Derry, 2002), as well as other important aspects of human consciousness that cannot be represented in words, and that the visual and performing arts can help us to see our educational experiences with new eyes.

These and other qualitative research methods, which will be discussed in greater depth in subsequent section chapters, are often combined within a single self-study in order to capitalize on the assorted advantages of each. Bencze and Bowen (2002), for instance, used students' course assignments, semi-structured repertory grid interviews, and photographs of apprenticeship workshop activities as data sources in their research. The data in Tidwell's (2002) study included course notes, meeting notes, student response cards, her journal, and pictures she drew of events. In a project designed to better understand and improve their supervision, Paris and Gespass' (2001) data were comprised of excerpts from collaboratively written reflections following classroom visits; the researchers' own reflections and notes from visits; records of individual meetings with student teachers; course evaluations; and records of the dialogue from focus group meetings.

This mix of mainly qualitative methods can enhance our understanding of our professional practice settings and help us to reframe our thinking and our teaching in appropriate and defensible ways. But since it can only provide us with situated and local or approximate, suggestive knowledge, validation has to be conceptualized differently than it is in positivist paradigms. The final characteristic of self-study to be discussed here has to do with its redefinition of validity as trustworthiness, meaning that the field is advanced by the construction, testing, sharing, and re-testing of exemplars of teaching practice.

Exemplar-Based Validation

Pinnegar (1998) has emphasized the "authority of experience as a warrant for knowing in self-study research" (p. 32). Dalmau and Gudjónsdóttir (2002) have proposed that knowledge in self-study is tested at two levels: "Both the rigorous demands of practice and the questions from the broader field work together in a dialectical process" (p. 17). But ultimately, according to Loughran and Northfield (1998), it is the "reader" who assesses the reliability and validity of a self-study of our professional practice settings. Therefore, the report: "Includes sufficient detail of the complexity and context of the situation for it to 'ring true' for the reader; provides and demonstrates some triangulation of data and a range of different perspectives around an issue; makes explicit links to relevant educational literature and other self-study accounts and literature" (p. 13).

Others have made similar arguments. Eisner (1997), for instance, has stated: "What succeeds in deepening meaning, expanding awareness, and enlarging understanding is, in the end, a community decision. Conversation and publication are, in part, aimed at testing ideals in that community" (p. 6). All of the criteria for the scholarship of teaching and learning proposed by Shulman (1998, 1999), as previously noted, have to do with the public review and testing of one's work by the relevant scholarly community.

Elliott Mishler's (1990) articulation of a rationale for and approach to such a reconceptualized notion of validity in "inquiry-guided" research is especially illuminating and, I believe, not only supports self-study's current position on the question of validity, but can also serve as a guide to our future endeavors. Thus, I will discuss his views at greater length. Mishler grounds his argument for change in a recognition that though inquiry-guided qualitative researchers have long been aware that the traditional approach to validity testing is inappropriate, experiment-based methods of validation have still been applied, which has resulted in their studies being judged as lacking in scientific rigor: "With failure built in from the start, they are systematically denied legitimacy, and the dominance of the experimental model is assured" (p. 416). A new approach to validation is therefore necessary, he claims – one that will accommodate the distinctive qualities of this research methodology and still address the intended aims.

He then proceeds to describe and support his posited alternative, which he describes as follows:

> I propose to redefine validation as the process(es) through which we make claims for and evaluate the "trustworthiness" of reported observations, interpretations, and generalizations. The essential criterion for such judgments is the degree to which we can rely on the concepts, methods, and inferences of a study, or tradition of inquiry, as the basis for our own theorizing and empirical research. … By adopting a functional criterion – whether findings are relied upon for further work – rather than abstract rules, validation is understood as embedded within the general flow of scientific research rather than being treated as a separate and different type of assessment. (p. 419)

This perspective is particularly consistent with self-study in that it seeks, as does narrative knowing, trustworthiness or verisimilitude rather than truth; it eschews objectivity; and it moves validation into "a world constructed in and through our discourse and actions" (p. 420).

In formulating this new notion of validity, Mishler tries to avoid making lists of rules or criteria and instead, drawing on the work of Kuhn (1970), utilizes the notion of "exemplars" to address the problem of "how claims for trustworthiness may be made and evaluated" (p. 421). By exemplars he means documentations of "normal practice" within a community, e.g., self-study researchers, that as a whole constitute, "the ordinary, taken-for-granted and trustworthy concepts and methods for solving puzzles and problems within a particular area of work" (p. 423), e.g., teacher education practice. Validation is accomplished when "the results of a study come to be viewed as sufficiently trustworthy for other investigators to rely upon in their own work" (p. 429). To encourage such reliance the author of a report needs to include sufficient information with regard to what was done and why. Mishler proposes that the reader of one of our studies should ask the following questions: "What are the warrants for my claims? Could other investigators make a reasonable judgment of their adequacy? Would they be able to determine how my findings and interpretations were 'produced' and, on that basis, decide whether they were trustworthy enough to be relied upon for their own work?" (p. 429). This means, he says, that we must make visible our data, our methods for transforming the data into findings, and the linkages between data, findings, and interpretations, features that map well onto the aspects of a self-study report previously identified by Loughran and Northfield. But no matter how much is provided in the write-up, according to Mishler, the assessment of the validity of a single study must remain provisional. The trustworthiness of an approach or of a finding needs to be tested repeatedly within a field and can thereby gain in strength over time. The mandate to a community of scholars that accepts the notion of validation as trustworthiness is, "to develop a collection of relevant exemplars ... a range of alternative approaches" (p. 437), a call comparable to that made by Shulman (1999) with regard to the scholarship of teaching and learning. A response to that mandate requires us to attend to the ways in which we represent our research on our professional practice settings to the community so that it will be appropriately trustworthy and in this manner advance our understanding and practice of teacher education.

Connections Between Research Design and Research Representation

Bullough and Pinnegar (2001) acknowledge the use of multiple qualitative methods in self-study methodology and suggest that in using "borrowed methods" we can to some extent, "assert authority ... from the frame or frames of the borrowed methodology" (p. 15). Not wholly, however, because of the differences caused by bringing in the self. In self-study not only must we employ established research methods competently, we must also attend to the form in which the study is organized and the quality of the story told; that is, we need to give

careful consideration to the way the research is presented and represented. They suggest further that narrative methods, such as autobiography and correspondence, are predominate choices because "they capture the concern with 'self' that distinguishes this body of research" (p. 16).

Others seem to agree that our conceptual framework and research methodology might tend to favor narrative forms of representation, in part, because self-study involves cycles of inquiry that result in changes over time; the research is responsive and progressive. Even "usual" data is thus gathered and analyzed in a storied way (Griffiths & Windle, 2002). Likewise, the "publication" of the research is seldom seen as an endpoint, as it typically would be; instead, it is meant to continue to advance the field by serving as an exemplar of practice that will contribute to the transformed thinking, teaching, and research of the reader – to keep the story going. For instance, Hamilton (2002a) has suggested that the story form "might help other white scholars recognize their (personally unseen) privilege, and the study itself might contribute to our understanding of the change process related to teacher education reform efforts" (p. 187).

This is indicative of another reason why self-study researchers might select narrative forms of representation – they may better support our reform agenda and interest in social justice. As Ladson-Billings (1999) has argued, a major principle of Critical Race Theory is, "that people's narrative and stories are important in truly understanding their experiences and how those experiences may represent confirmation or counter knowledge of the way the society works" (p. 219). But as Grumet (1991) warns us, we need to be careful of the potential "dogmatism of a single tale" (p. 72), which leads us back to the requirements of representation called for by Mishler, Loughran and Northfield, and Bullough and Pinnegar that both make the foundations of the story explicit and invite alternative tellings and interpretations.

But narrative is not the only reporting method we utilize. As Eisner (1993) has repeatedly emphasized, "Humans have the capacity to formulate different kinds of understanding and that these understandings are intimately related to the forms of representation they encounter or employ and the way in which those forms are treated" (p. 9). Therefore, since our research methods vary and combine in order to capture the complexity of the teaching-learning process and to expand and deepen the nature of our knowledge of it, so do our representational modes. Consequently, our research representations are tightly connected to our research designs. In fact, our forms of inquiry and of presentation often develop simultaneously and interactively rather than linearly (Berry & Loughran, 2002), so much so, in some cases, that they can become one in the same. For instance, Weber and Mitchell (2002), said this of their readers' theatre performance:

> It was on-stage, in the process of performing our own words, that we came to our first tentative and embodied understanding of the significance of performance to self-study and professional identity, not only as representation, but as a form of inquiry … in enacting and retelling our stories, we

became aware of the significance of the *processes* involved not only in the autobiographic writing and staging of a literary self-study, but also in the very performance itself. ... The rigour of the methodology is its emphasis on formal or systematic re-visiting, re-questioning, re-writing, re-imaging, and re-thinking. The writing and production of a play necessitates thoughtful acts of symbolic interpretation that are subject to public scrutiny. (pp. 121–122)

Also apparent in this example and many others in self-study is that we are often pushed by our "breakthroughs in epistemology" and resultant new research methods to "create new forms and formats for representing our accounts" (Guilfoyle *et al.*, 2002). As noted by Hamilton and Pinnegar (1998), "Representing living educational theory is more problematic than communicating statements about practice that work and about which the researcher only feels compelled to state that it works" (p. 240). The challenge when validation is reconceptualized as trustworthiness is to bring the details of the work into the public domain so that both the research process and the resultant reframings and evidentiary supports can be as fully and fittingly understood as possible. This is particularly difficult, according to Gitlin *et al.* (2002), in practitioner research wherein a primary purpose is to improve our teaching. "We have not," they say, "developed a form of representation that does justice to the process orientation of teacher research" (p. 311). But, we are making progress.

Research Representation

We seem to be approaching this task of developing appropriate forms of research representation in self-study in two ways. Some in the field have worked on the explicit delineation of aspects to be included in self-study reports. Some have also or instead focused on developing the rationale and theoretical support for alternative representations, usually within the context of a specific study and its public rendering.

Explicit Delineation

The list generated by Loughran and Northfield (1998), as cited above, is representative of the former category. Bullough and Pinnegar (2001) present and discuss fourteen guidelines for autobiographical forms of self-study, which they summarize as follows:

As we have said, articles need to be readable and engaging, themes should be evident and identifiable across the conversation represented or the narrative presented, the connection between autobiography and history must be apparent, the issues attended to need to be central to teaching and teacher education, and sufficient evidence must be garnered that readers will have no difficulty recognizing the authority of the scholarly voice, not just its authenticity. (p. 20)

Barnes (1998), in serving as outside respondent to the first S-STEP SIG castle conference, inferred from his readings that the "best" papers were those that made obvious the "process of self-study": "The papers that did this began by explaining the institutional context, quoted next (rather than summarized) some of the evidence used, illustrated the processes of interpretation, including alternative views, outlined any changes made in the course being studied, and discussed general conclusions" (p. xi). These factors are comparable to those identified by Mishler as necessary for the validation process.

Particular Rationales

Illustrations from the latter category might be sorted by the nature of the rationale used to justify the alternative form of representation. One contention that has been made is that there needs to be a match between the research design (or the nature of the knowledge/understanding being generated) and the structure of its presentation. Eisner's (1993) work could be seen as foundational to this perspective. He argues very explicitly that different forms of representation and their treatments can both render and make feasible different kinds of thinking, which in turn can both illuminate and encourage the construction of different meanings. He notes, for example, "That poetry and pictures, literature and dance, mathematics and literal language" make possible unique kinds of understanding (p. 8). An exemplar of a self-study report from this group is a chapter by Griffiths (2002) where she creates a unique form that consists of a primary text written in a more typical style and an accompanying lengthy set of endnotes that includes "the rest of the story" in two styles – "notes *about self-study in italics* and about **small tales (examples of them, and also reflections on them) in bold**" (p. 162). She does this, she claims, because "neither life nor thought are as tidy or as linear as they are when presented in this form, so popular in academic presentations" (p. 162).

Another rationale is that the report should continue the process of deliberation about the investigated practices and the accompanying understandings for both the author and the reader; that is, the representation needs to promote and support further testing of the exemplar. Emphasizing the self-benefits, Bass *et al.* (2002) note that the activity of trying to represent their research creatively helped them to learn even more about teaching than they already had. Lomax *et al.* (1998), on the other hand, stress the desire to engage the audience in the research effort: "We invite the reader to be not just an observer but an active participant with us in the process in the same way we are active participants and not simply observers in the action research processes within which our own students engage" (p. 167). Shulman (1998) strives for a similar goal when he considers how to represent and report on the scholarship of teaching. He says that it needs to be done "so that it can become part of the community's intellectual property; so that it can inform other members of the community, engage them in deep and significant conversations, provide a basis for the formation of communities of scholars, and be evaluated in that community" (p. 7).

Still another justification is also for the continuation of the process, but in

these cases the emphasis is on the reform agenda, on the desire to transform educational contexts and activities. Both Fischman (2001) and Eisner (1997) have argued that alternative forms of data representation, particularly those dealing with visuality, "have the potential of making our work not only more comprehensive and clear, but also politically more relevant because images not only carry information in the constant battle over meaning, but they also (or even fundamentally) mediate power relations" (Fischman, 2001, p. 31). Cole, Knowles, brown, and Buttignol (1999) understood this potential in making the choice to represent their study of the constraints of their institutional contexts in visual art formats. The visceral experience of "witnessing" their confinements and challenges might serve as a powerful inspiration for viewers to engage in the questioning and transformation of higher education's approaches to research evaluation, teacher education design, and promotion and tenure systems.

Eisner (1997) has suggested that we choose tools of data representation on the basis of whether or not they will do the jobs we want done. His response to the question of what jobs need to be done might be summarized as follows:

1. To engender a sense of empathy because understanding human lives may require an understanding of their/our feelings.
2. To provide a sense of particularity and dimensionality because those are conditions of something being "real."
3. To be evocative rather than denotative so that it "generates insight and invites attention to complexity."
4. To "increase the variety of questions that we can ask about the educational situations we study" or to stimulate our "capacity to wonder."
5. To "exploit individual aptitude" and thus "activate wider varieties of human intelligence." (p. 8)

These and more are good reasons for continuing to explore alternative forms of representation for our self-study research. Clearly, the aim is for all aspects of our research methodology to be consistent with and supportive of our epistemological, pedagogical, and moral/ethical/political theoretical underpinnings so that we can produce the knowledge and understanding that we need for the continuous improvement of teaching and teacher education.

Conclusion

Self-study is "a methodology for studying professional practice settings" (Pinnegar, 1998). The purpose is to *improve* that practice, in this case teacher education, in order to maximize the benefits for the clients, in this instance preservice and inservice teachers and their current and future students. Thus, the aim for teacher educators engaged in self-study is to better understand, facilitate, and articulate the teaching-learning process. What we currently know of this endeavor tells us, among other things, that it is enormously complex, highly dependent on context in its multiple variations, and personally and

socially mediated. Since the knowledge of teaching is more narrative than para-digmatic, we must be concerned with the "explication of human intentions in the context of action" (Bruner, 1985). Teacher educators are actually engaged in the effort to enact their intentions in practice so our perspectives and explana-tions add a critical dimension to an understanding of teacher knowledge develop-ment. As many have argued (e.g., Cochran-Smith & Lytle, 1999; Schön, 1983; Shulman, 2000; Zeichner, 1999), the professionals in a field are particularly well situated to construct knowledge of that profession by engaging and investigating their own authentic questions of practice. So self-study researchers study our own professional practice settings; it is scholarship *initiated by and focused on us*.

Because we are simultaneously engaged in practice and in the investigation of that practice, we aim to both generate knowledge of teaching and enhance our own pedagogy by immediately applying what we have learned. Thus teaching and research in self-study are iterative and responsive. We are actively engaged in the reform of our particular contexts, in part by transforming us, our teaching, and our programs. But we also hope to contribute to a larger reform agenda by making the "local knowledge" we have generated available to the whole educa-tional community in ways that will raise new questions, stimulate debate, and suggest other possibilities.

We begin with and include the self not only on epistemological and pedagogical theoretical grounds, but also because of our professional responsibilities and our moral, ethical, and political values. We care deeply about the current and long-term welfare of our students and their students. Thus, we consider it imperative to engage in the continuous monitoring of our relations with and influence on them – to check for consistency between our espoused theories, values, and aims and our actual interactions and outcomes. We strive for what has been variously described as integrity (Loughran & Northfield, 1998), authenticity (Bullough, 1994), and fidelity (Shulman, 1998) in our teaching and our research on that teaching. We link acting and thinking, teaching and researching because we are aiming to be and to nurture "good judges" (Coulter & Wiens, 2002).

We feel that this can only be accomplished through a genuine and systematic interrogation of our work in teacher education. This means that we need to be prepared to "problematize our practice" (Zeichner, 1999) and acknowledge our "living contradictions" (Whitehead, 1989). "This willingness to admit that we stumble in our teaching practice is a central part of work in self-study. From this stumbling and our efforts to both understand and act differently that the knowledge we produce about teaching emerges" (Hamilton & Pinnegar, 1998, p. 243). But it takes courage to expose our shortcomings, to make ourselves vulnerable not only with our professional colleagues, but also with our own students. We do the latter to enlist them into our self-study, to model for them the process of life-long learning, and, most importantly, to help them feel safe enough to take the similar risks necessary for their own development. We want them to embrace the notion of an inquiry orientation toward practice and recognize the potential for teacher and teacher educator research to make

significant contributions to our understanding of teaching and learning to teach, a goal with political intentions.

Giving more "voice" to the professionals engaged in the practice of teaching in both higher education and the K-12 schools is one of our political reasons for the self in self-study. Like many feminist and post-colonial scholars, we believe questions regarding knowledge and research, e.g., who gets to produce it and how, necessarily involve issues of power. Our claim is that those who are supposed to have, acquire, and employ the knowledge of teaching are quite capable of identifying, generating, understanding, theorizing, and communicating it. Granted there are needs for checks on the biases and limited perspectives of the researcher self, but all research is necessarily constrained and influenced by the subjectivity of the investigator(s), at the very least by the questions deemed worthy of study. More traditional research paradigms have developed means to minimize, though not eliminate, this problem. So too has self-study; the ways are necessarily different, not only because of who is doing the research but also because of the questions asked and the aims intended.

First, the methodology of self-study, being *improvement-aimed*, looks for and requires evidence of the reframed thinking and transformed practice of the researcher, which are derived from an evaluation of the impact of those development efforts. As Gitlin *et al.* (2002) argue:

> It is vital ... for teacher researchers to find ways to expose their perspectives and assess these perspectives in relation to the knowledge produced. ... Put differently, the contextual demands of teaching require teachers not only to produce knowledge but also to see the relation between knowledge and self on a continuous basis. A process approach to assessment fits well with the epistemological demands of teaching. ... We want to replace the charade of neutrality with a more authentic approach to research that will allow us to interrogate our perspectives and their relation to knowledge production. (p. 312)

We look with regularity for evidence of progress and, depending upon what we find, make immediate adjustments to our understandings of practice.

Second, self-study methodology is *interactive* at one or more points during the research process. Those interactions with our colleagues near and far, with our students, with the educational literature, and with our own previous work help to confirm or challenge our developing understandings. They provide us with multiple perspectives and require us to justify and interrogate our assumptions, assertions, and values. "The need to honestly hold up practice to critique by colleagues, by oneself, and by ones' students is an important hallmark of self-study work" (Hamilton & Pinnegar, 1998, p. 240).

Third, the methodology of self-study employs *multiple, primarily qualitative, methods*, some that are commonly used in general educational research, and some that are innovative. With regard to the former, competent use of these methods allows us to draw, at least in part, upon the frames of those "borrowed

methods" to assert authority (Bullough & Pinnegar, 2001). For the latter, self-study researchers are attending to explications of the conceptual frameworks for these new approaches, in addition to revealing their structure. Inclusively, these multiple methods provide us with opportunities to gain different, and thus more comprehensive, perspectives on the educational processes under investigation.

Fourth, self-study methodology demands that we formalize our work and make it available to our professional community for deliberation, further testing, and judgment. Several scholars within the field have articulated criteria or guidelines for acceptable self-study "reporting" (e.g., Barnes, 1998; Bullough & Pinnegar, 2001; Loughran & Northfield, 1998). These map well onto the characteristics of the scholarship of teaching identified by Shulman (1998) and to the validation process described by Mishler (1990) for inquiry-guided research, which self-study certainly is. Due to the latter, I have argued in this chapter that Mishler's redefinition of validity as validation through the social construction of knowledge is an appropriate way to conceptualize what has been done in self-study: We advance the field through *the construction, testing, sharing, and re-testing of exemplars* of teaching practice. As Mishler has noted, this formulation means that validation of a single study, though important, must remain provisional until the knowledge generated and procedures employed establish a history of trustworthiness within the field. Thus, bodies of work become the more relevant domain for the validation process than individual investigations, an idea I will explore in greater depth in Chapter 29.

The methodology of self-study is well conceptualized, well grounded in epistemological and pedagogical theory, and well justified by interconnected moral, ethical, and political values and ideals. It has clear features that, though they may and should evolve over time, will allow us to proceed with integrity and evaluate with confidence. It is, of course, not the only viable methodology for engaging in educational research, but it is an important one that has resulted in a considerable body of literature on the professional practice of teaching and teacher education, as represented by and summarized in this handbook. This methodology suggests that the validation of the local knowledge, the approximate, suggestive knowledge, thus generated must be on going. Those of us in the field need to continue the process by incorporating into our teaching and research practice the understandings and procedures we deem trustworthy enough to risk trying, with appropriate adaptation and assessment, in our own programs with our own students. In this conscientious bringing together of the hearts and minds of a professional learning community over time, we stand to not only contribute to our understanding of teaching and teacher education, but also improve our practice settings and enhance the learning opportunities for all of our students and our students' students.

Dedication

This chapter is dedicated to the memory of my daughter, Sara LaBoskey, who died on July 28, 2002 of a rare form of bone cancer at the age of 21. Her wisdom,

optimism, strong moral character, and genuine care for the world and all of its inhabitants have been my inspiration. Engaging in this work in the year following her passing has made it ever more clear that the enhancement of life's opportunities for all children everywhere must be our central purpose and that a better understanding of what role teaching and teacher education can play in this effort can only be attained by the conscientious interconnection of our epistemological and pedagogical groundings with our moral, ethical, and political values that begins with and always includes attention to our own integrity.

Note

1. The emphasis in this chapter will be on teacher education since that is both my personal area of expertise and the birthplace of the S-STEP SIG. This is not meant to imply that self-study cannot be done by educators in other venues and/or professions.

WHAT COUNTS AS EVIDENCE IN SELF-STUDIES OF TEACHER EDUCATION PRACTICES*

Jack Whitehead
University of Bath

Abstract

Answers to this question depend on what you and I are looking for and the contextual influences in our ways of seeing. Each reader could be looking for something different. My gaze is focused on evidence from the self-studies of teacher education practices that show contributions to the growth of educational knowledge. These contributions include my own self-study 'How do I improve what I am doing?' as a teacher-educator and educational researcher at the University of Bath between 1973–2003. I will undoubtedly bring some of my biases as a white, middle-class male, working in the Academy, into this enquiry. However, I have learnt much about my own biases from the enquiries of others who work with different perspectives to my own. My analysis of this learning is focused on the evidence of five kinds of contribution to the growth of educational knowledge. These contributions are to educational theories, to educational standards of judgement, to educational research methodologies, to the logic of educational enquiries and to understandings of educational influence. The evidence of understanding educational influence is considered in the education of the s-step researcher, in the education of others, and in the education of social formations.

Often it is challenging enough to look critically at one's own teaching practices. While the obvious purpose of self-study is improvement, it is even more challenging to make changes and seek evidence that the changes did indeed represent improvement. (Russell, 2002, pp. 3–4)

---

*Chapter consultant: Elisabeth Bass, Camden County College, New Jersey, USA.

Tom Russell is right about the focus on improvement in self-studies of teaching education practices. He is also right about the challenges of making changes and in seeking evidence that the changes represent improvement. The significance of clarifying what counts as evidence in relation to the growth of educational knowledge has been well expressed by Catherine Snow (2001) in her Presidential Address to AERA when she stressed the need for developing, "agreed-upon procedures for transforming knowledge based on personal experiences of practice into 'public' knowledge" (p. 9).

This chapter is based on the premise that teacher-researchers have the capacity to create and test their own educational theories through their self-studies of their teacher-education practices (Whitehead, 1972). I hold these educational theories to be the descriptions and explanations of their learning in educational enquiries of the kind, 'How do I improve what I am doing?'

The chapter is organized in terms of the five questions that have emerged from my desire to contribute to educational knowledge through educational research. They are questions about evidence in relation to the nature of knowledge and theory, of values-based standards of judgment, of educational research methodology, of a logic of educational enquiry, and of educational influence:

1. Is there evidence of the generation and testing of educational theories from the embodied knowledge of s-step researchers?
2. Is there evidence of the transformation of the embodied values of the s-step researcher into the standards of judgment that can be used to test the validity of s-step accounts?
3. Is there evidence of the emergence of educational research methodologies as distinct from a social science methodology in s-step enquiries?
4. Is there evidence of a logic of educational enquiry?
5. Is there evidence of educational influence in educating oneself, in the learning of others, and in the education of social formations?

I have used a similar structure in the answer to each question. I start by explaining why I see the question as having significance in relation to the growth of educational knowledge. I then show how s-step researchers have contributed the evidence that answers the question.

To avoid confusions that could arise because I have not clarified the way I am using particular words I want to begin by distinguishing the ways I am using the words: data; evidence; living; I; self; validity; inquiry; and, enquiry.

I make a clear distinction between data and evidence. I am thinking of data as the information that is collected during an enquiry. I am thinking of evidence as data that is used to support or refute a belief, assertion, hypothesis, or claim to knowledge. An s-step report that explains an individual's learning at a particular time can itself become data and used as evidence in a later report that explains the transformations in learning through time. In other words data only becomes evidence in relation to testing the validity of a belief or claim to know.

A distinction I need to make concerns the traditional forms of scholarship that produce theory as a "spectator" truth in the form of interconnected sets of

propositions, and new forms of scholarship that produce theory as "living" truth in explanations formed from embodied values:

> Existentialists such as Gabriel Marcel (cf. Keen, 1966) distinguish between "spectator" truth and "living" truth. The former is generated by disciplines (e.g., experimental science, psychology, sociology), which rationalise reality and impose on it a framework which helps them to understand it but at the expense of oversimplifying it. Such general explanations can be achieved only by standing back from and "spectating" the human condition from a distance, as it were, and by concentrating on generalities and ignoring particularities which do not fit the picture. Whilst such a process is very valuable, it is also very limited because it is one step removed from reality. The "living" "authentic" truth of a situation can be fully understood only from within the situation though the picture that emerges will never be as clear-cut as that provided by "spectator" truth. (Burke, 1992, p. 222)

Because a key word in this Handbook is *self-study* I do want to be clear that I am not starting with a conceptual definition of the *Self* in the form of a linguistic abstraction; I am starting from the experience of my own enquiring *I*; I am starting from the assumption that you, I, and others, experience the content of our own enquiring *I* and can make sense of this content. I am assuming that we can communicate the content of the embodied knowledge in what we are doing in a way that transforms it into public knowledge. This assumption carries Patti Lather's notion of the ironic validity that the embodied knowledge can never be represented as it is, in and for itself:

> First the practical problem: Today there is as much variation among qualitative researchers as there is between qualitative and quantitatively orientated scholars. Anyone doubting this claim need only compare Miles and Huberman's (1994) relatively traditional conception of validity < "The meanings emerging from the data have to be tested for their plausibility, their sturdiness, their 'confirmability' – that is, their validity" (p. 11)> with Lather's discussion of ironic validity:
>
>   Contrary to dominant validity practices where the rhetorical nature of scientific claims is masked with methodological assurances, a strategy of ironic validity proliferates forms, recognizing that they are rhetorical and without foundation, postepistemic, lacking in epistemological support. The text is resituated as a representation of its 'failure to represent what it points toward but can never reach (Lather, 1994, p. 40–41).' (Donmoyer, 1996, p. 21)

Because enquiry and inquiry are used interchangeably by self-study researchers, I prefer to use both in this text rather than change the words actually used by researchers for the sake of consistency. With these meanings in mind I will now address the five questions of evidence.

Is There Evidence of the Generation and Testing of Educational Theories From the Embodied Knowledge of S-Step Researchers?

Significance of the Question

The significance of the question in relation to the growth of educational knowledge has been well expressed by Hamilton and Pinnegar (1998) in their writings about the living educational theories of members of the s-step community.

> We have thought through this phrase often and assert that this book generally and self-study specifically is indeed an example of living educational theory in two ways. It is living because, as people engage in understanding it, they learn more and their theory changes as they understand more. Further, because they are living what they learn, new knowledge emerges. The work in the special issue of *Teacher Educational Quarterly* (Russell and Pinnegar, 1995) provides one example of that, while McNiff's *Teaching as Learning* (1993) is another good example. McNiff explains action research techniques that might be used to not just create better classroom practice and thus learn as one teaches, but also to conduct systematic study of the practice using action research principles so that educational theory continues to grow. As one's educational practice improves, accounts of it and therefore knowledge about it is added to the knowledge base of the teaching and research community. (Hamilton & Pinnegar, 1995, pp. 242–243)

Evidence from S-Step Research

In my search for evidence from s-step researchers that they have transformed their embodied knowledge into publicly testable educational knowledge and educational theory I analyzed the accounts in *Improving Teacher Education Practices Through Self-Study* (Loughran & Russell, 2002).

With sixteen chapters from some 24 contributors one of the editors, Russell, distinguishes the contribution from Bass, Anderson-Patton and Allender: "Perhaps more than any other chapter in this collection, this one offers detailed accounts of what self-study is and how self-study can lead to changes in teaching practice" (Russell, 2002, p. 3). Accepting Russell's point, I want to focus on the evidence in the self-study teaching portfolios described in the text. Here is the description of the contents of the teaching portfolios that I found most telling in terms of its reference to five pieces of evidence:

1. a dialogue that represented the process students went through while creating their teaching portfolios (based on Vicky's and Lis' teaching journals, students' comments, and pieces of student writing);
2. students' artifacts – selections from their teaching portfolios;
3. meta-narratives (our version of their stories);
4. alternative representations (a collage and a drawing) of our self-studies; and,
5. the paper.

> Thus our portfolios used drama, narrative writing, academic writing, and graphic arts to present our self-studies. (Bass, Anderson-Patton, & Allender, 2002, p. 58)

The evidence in the portfolios included meanings expressed through drama, narrative writing, academic writing, and graphic arts. These meanings are very different, as Eisner (1993, 1997) has pointed out, from the meanings that can be communicated through a solely propositional discourse.

I am thinking of the significant meanings that can be shown through portfolios of evidence that include visual media such as the video-ethnographies of Carl Harris (2000) and his collaborators. Harris uses video-clips from classrooms, interviews, and lectures, together with written and audio text to communicate the meanings of educational practice. The Carnegie Media Laboratory (2002) and other researchers (Fletcher & Whitehead, 2003) have also presented multi-media portfolios of evidence in a narrative form that include visual images of educational practices to communicate meanings that cannot be adequately represented through words on pages, even the most poetic.

In my search for evidence of theory generation and testing through s-step research I have been particularly impressed with that offered by Dalmau and Gudjónsdóttir (2002). They use the term *Professional Working Theory* to symbolize professional understanding that evolves through the constant interplay of professional knowledge, practical experience, reflection, and ethical or moral principles:

> Explicit Professional Working Theory is developed through systematic and comprehensive critical reflection and collegial dialogue, and also contributes to the construction of professional identity, the creation of professional knowledge, and the development of collegial approaches to practice. The Professional Working Theory process outlined below, offers teachers (and academics) an opportunity to frame their reflection on the living theories implicit in their practice. (p. 104)

Dalmau and Gudjónsdóttir demonstrate, through their dialogue, reflections, and analysis, that they value the unique knowledge and experience that teachers bring to educational discourse. They also demonstrate that self-study can provide an important opportunity for university and school researchers to do their "separate work together" and frame a shared discourse. Theirs is a most exciting contribution to evidence of theory generation and testing in self-study research. Yet, having said that, when I compare the quality of the evidence in Dalmau's (2002) doctoral thesis on *Taking a Fresh Look at Education: Reconstructing Learning and Change with Teachers* with the evidence in the previously discussed chapter, I am struck by how much more convincing the evidence is when presented as a longitudinal study in a doctoral thesis than when it is constrained within 6000 words or so of a chapter in a book.

Such constraints can be overcome using web-technology. Using an address for a web-site you can access directly the evidence and judge its validity for

yourself. Consider for example the following *I* enquiries, accredited by the University of Bath for Doctoral and Masters degrees.

Laidlaw*, M*. (1996) *How can I create my own living educational theory as I offer you an account of my educational development?* *Ph.D.* http://www.actionresearch.net/oira.shtml

Holley, E. (1997) *How do I as a teacher-researcher contribute to the development of a living educational theory through an exploration of my values in my professional practice?* *M.Phil.* http://www.actionresearch.net/erica.shtml

Cunningham, B. (1999*) How do I come to know my spirituality as I create my own living educational theory?* *Ph.D.* http://www.actionresearch.net/ben.shtml

Finnegan, J. (2000) *How do I create my own educational theory in my educative relations as an action researcher and as a teacher?* *Ph.D.* http://www.actionresearch.net/fin.shtml

Each self-study was sustained over more than five years. The researchers transformed their own embodied knowledge as professional educators into the public knowledge of a contribution to educational theory. The evidence of the inclusion of the enquiring *I* in the titles show that self-study researchers have been accredited in research degrees with making significant contributions to educational knowledge and educational theory. In meeting Snow's (2001) point about the importance of developing agreed-upon procedures for transforming knowledge based on personal experiences of practice into *public* knowledge, this evidence shows that such procedures are already well established in the Academy. Where there is still much work to be done is in developing the shared understandings of the values-based standards of judgment used by examiners of s-step accounts. For example, there is much agreement in the Academy that the growth of knowledge requires the exercise of originality of mind and critical judgment. These are standards used to judge contributions to the growth of knowledge. Because education is a value-laden practical activity, value judgments are necessary in determining whether or not something has made a contribution to educational knowledge. Hence it is important to understand the nature of the values-based standards of judgment for testing the validity of this knowledge. This brings me to my second question.

Is There Evidence of the Transformation of the Embodied Values of the S-Step Researcher Into the Standards of Judgement That Can Be Used to Test the Validity of S-Step Accounts?

Significance of the Question

In this chapter I am assuming that Schön (1995) is correct about the need for a new epistemology for the new scholarship. Developing a new epistemology

requires new standards of judgment (Coulter & Wiens, 2002; Hiebert, Gallimore & Stigler, 2002).

In pointing to different kinds of evidence in s-step research I know that s-step researchers have been concerned to offer definitions of quality in autobiographical forms of self-study research. Bullough and Pinnegar (2001) for example, offer some 14 assertions of the kind:

- Autobiographical studies should ring true and enable connection.
- Self-studies should promote insight and interpretation.
- Autobiographical self-study research must engage history forthrightly and the author must take an honest stand.

These helpful linguistic assertions can be related to the recognition of what counts as evidence of the values-based standards of judgment that are emerging from s-step research. I am thinking of the evidence that shows the transformation of embodied values into communicable standards of judgment for testing the validity of the contributions to educational knowledge of s-step researchers.

One of the challenges in writing this chapter is the conceptual complexity and range of evidence that can be used in answering the question about the transformation of embodied values into educational standards of judgment. Shulman (2002) has argued that the scholarship of teaching is the highest form of scholarship because, unlike any of the other forms, it necessarily includes all of the others. Because each of us is different, it is possible for every self-study to produce different evidence in relation to claims to knowledge about teacher education practices. Yet, to count as a contribution to knowledge within an academic community it is necessary for the validity of our beliefs to be evidence based and tested for validity within standards of scholarly discourse. I am thinking of standards that can be used to judge what counts as evidence of a valid and legitimate contribution to educational knowledge.

At this point I want to be open to the most radical possibility that all concepts of validity in relation to evidence should be abandoned in s-step research. Judith Newman (1998) has made a case for this position as she questions the value of a concern with validity:

> I think I've abandoned a concern with "validity" and replaced it with a need to find/create an interpretive community within which data, ideas, arguments resonate. I am concerned about making "significant and original contributions" not to knowledge but to the understanding of the interpretive community.

I am concerned with both kinds of contribution to educational discourse. The contribution Austin (2000) made to both in her s-step research into her practice of community was made while President of S-STEP. Before considering this evidence, I want to distinguish between the truth of power and the power of truth (Foucault, 1980). I see that the truth of power can legitimate what counts as evidence. I see that the power of truth can validate the standards of judgment

that can be used to distinguish what counts as evidence. History has countless illustrations of the truth of power being used to legitimate what counts as evidence with no concern for validity. The case of Galileo being shown the instruments of torture, as if they were to be used, to make him recant his evidence-based belief that the earth moved round the sun is an illustration of the truth of power.

In relation to the power of truth, I see the procedures being used to validate educational knowledge as being focused on values-based standards. I think the values-base brings something distinctively ontological into s-step research. This is because the nature of *first person* or *I* enquiries provides an ontological connection to the epistemological standards. In other words, it is a form of research that requires of researchers a willingness to hold themselves to account in terms of values. It also requires, as part of being a researcher, a willingness to offer the account for public validation as a contribution to educational knowledge – hence the importance of ensuring that the values-based standards of judgment that are being used by the s-step researcher can be communicated for use in public tests of validity. This is not to say that the standards must be accepted by others as useful in their enquiries. It is to say that the values-based standards must be comprehended by others in order to publicly test the validity of the account with the researcher's own standards. The validity of these standards, within an open society, must be open to question.

In my view of education and educational research, values-based standards characterize educational judgments. I cannot accept/judge something as educational, without approving it. My judgments that something is educational draw on my embodied values. This is not to deny that others have different values in defining what constitutes something as educational. Belonging to any community usually involves the acceptance of a constellation of values with each individual's educational development being constituted by their own.

Evidence From S-Step Research

In searching for evidence that the embodied values of s-step researchers can be transformed into publicly communicable and living standards of educational judgment, I turned to the s-step research of Terri Austin (2000), a former president of S-STEP. I focused on the evidence in her doctoral inquiry: *Treasures in the Snow: What Do I Know and How Do I Know it Through my Educational Inquiry Into my Practice of Community?*

In the abstract to her thesis Austin claims to have demonstrated how a teacher researcher can create her own knowledge through combining and recombining practice, personal creativity, intuition, theoretical frameworks, and critical judgment in various degrees at different times. Austin claims that her thesis shows an alternative to traditional forms of criticism frequently found in academic work related to the growth of knowledge. She presents this alternative as a written representation of, "values that I use as my living standards of practice and judgment in the self-study of my professional practice" (Austin, 2002 p. 2).

My central point about the values-based standards of judgment that Terri Austin uses in both her practice of community and in her contribution to educational knowledge is that they can be communicated to others and used to judge the validity of her account. This process of communication involved the clarification of the meanings of her values as they emerged in her practice of community and enquiry.

One of the characteristics I have noticed in s-step accounts, especially within those that are awarded doctoral degrees, is the researcher's persistence in the face of pressure. Understanding the meanings of embodied values, as these are clarified through their emergence in practice, seems to involve this persistence. Consider the meanings of Austin's embodied value and living standard of integrity as the meanings emerge in "Chapter 6: Leaving Community: An Unexpected Event."

Austin's Chapter 6 tells a story of leaving a school community that means a lot to her in her life as a professional educator. This includes her practice of community. The narrative includes a description of the tension of being faced with the imposition of a curriculum related to literacy that deeply offends her understanding of education and pedagogy. She explains her decision to leave the school community, at some professional risk, and communicates the meanings of her embodied value of integrity as self-criticism in a way that communicates these as educational standards of judgment.

The evidence in Austin's thesis also supports her claim that she has shown an alternative to traditional forms of criticism. These traditional forms of criticism are invariably found in academic work because of the significance of critical judgment in the growth of knowledge. Rather than engaging in a form of criticism that argues solely from within propositional forms of discourse, Austin offers for public evaluation and criticism, an explanation of her own learning in her enquiry into her practice of community. Learning to use her living standards of judgment involves a form of criticism that requires an appreciation and engagement (D'Arcy, 1998a) with the meanings of her ontological values of community and relationship as well as an ability to engage in propositional discourse. Where current criteria for both story writing and story reading tend to focus on the skills of the writer, equivalent criteria could be introduced which focus the examiner's attention on the effect of the story on the reader, in relation to the writer's achievements in handling the narrative.

I am suggesting that the unique constellation of values, embodied in the practices of each s-step researcher, moves the researcher to accept a responsibility to account for their own practice and learning in terms of their values. These accounts, in the form of descriptions and explanations of learning, are contributing to the growth of educational knowledge. For example, in Terry Austin's s-step enquiry into her practice of community, I can see that the list of criteria of quality offered by Bullough and Pinnegar (2001), are helpful in making a judgment on the quality of her autobiographical self-study. However, something more, in addition to these criteria, is needed in developing an understanding of

the embodied meanings of community, emerging from Austin's practice as educational standards of judgment. I think it bears repeating that an understanding of such living standards of judgment and their use in testing the validity of the evidence in s-step accounts, requires the kind of engaged and appreciative reading advocated by D'Arcy (1998). It needs this response in order to see how an embodied value of community has been transformed into a sufficiently stable and comprehensible living standard of judgment, for others to use in testing the validity of the knowledge-claims.

For example, this is how Austin expressed her value of trust in a letter to her 6th grade students in a research proposal on Travel Together in Trust:

> Dear Students.
> Welcome to sixth grade. I'm looking forward to working with all of you. This will be a year when you grow taller, change shoe size and learn a great deal. Last year, my students learned to assess themselves as learners. They learned to critically examine their growth and set goals. It is important for you to know yourself as an intelligent responsible person, and student/parent conferences will assist you. I will help you through this process, but I will not assume responsibility for you. I have faith that you can do this and we will travel together in trust. Love Mrs. A. (Austin, 1992. p. 49)

In considering what counts as evidence in s-step research I do not want to avoid the contentious issues surrounding the legitimation of claims to knowledge. I am thinking of the motivational and explanatory power of living contradictions connected with spiritual and aesthetic values.

Evidence of Transforming Embodied Spiritual and Aesthetic Values Into Standards of Judgement?

In his Presidential Address to AERA Eisner (1993) called for and used a multimedia presentation of alternative forms of data representation in educational research. The iconic images of Martin Luther King, Jr. and the chimneys of Auschwitz carried spiritual and aesthetic meanings. Eisner has also pointed out the problems and perils of this form of data representation (Eisner, 1997).

In thinking about evidence of spiritual standards in s-step research I am drawn to the desire for recognition by others described by Fukuyama (1992):

> Human beings seek recognition of their own worth, or of the people, things, or principles that they invest with worth. The desire for recognition, and the accompanying emotions of anger, shame and pride, are parts of the human personality critical to political life. (p. xvii)

The nature of the spiritual quality of recognition I am seeking in evidence of spiritual standards in s-step research might be communicated more clearly through Martin Buber's (1970) "I-You" relation: "It is essential that he should

awaken the I-You relationship in the pupil, too, who should intend and affirm his educator as this particular person" (p. 178).

In seeking evidence in s-step research of the recognition in the I-You relationship I have found that it is often accompanied by evidence showing that the s-step researcher has engaged with, or overcome, a tendency to megalothymia. This is distinguished by Fukuyama in the sense of a search to be recognized as superior to others. In Schön's (1995) terms, I see that, "the problem of introducing and legitimizing in the university the kinds of action research associated with the new scholarship is one not only of the institution but of the scholars themselves" (p. 34).

What Schön means by this is that the development of an epistemology of practice for the new scholarship will be hindered by a double impediment. He says that on the one hand there is the power of disciplinary in-groups that have grown up around the dominant epistemology of the research universities. On the other hand there is the inability of those who might become new scholars to make their practice into appropriately rigorous research.

Moira Laidlaw (1995) is an s-step researcher who has overcome such impediments and made her practice into appropriately rigorous research in an original contribution to the growth of educational knowledge. I am thinking of the evidence in her 6-year doctoral enquiry, *How Can I Create my own Living Educational Theory as I Offer You an Account of my Educational Development?* Her insights into the living nature of spiritual and aesthetic standards of judgment for evaluating evidence in s-step accounts are now part of my understanding of how ontological standards of living and being can become epistemological standards of judgment in testing the validity of knowledge-claims in s-step research. Laidlaw communicates her embodied spiritual and aesthetic values with the help of Coleridge's "The Ancient Mariner." The general prologue to her thesis was commended by her examiners as amongst the most persuasive pieces of reflective writing they had read. The following points are consistent with Winter's (2000) comments about a thesis he has also examined:

> The most powerful and persuasive quality that came over from the text, as I read it, was an evocation of practice at its most intense. It seemed to describe the thought processes of an inspired teacher thinking inspirationally about the relationships of teaching and learning and about the curriculum, which mediated these relationships. It documented the extremely impressive pupil insights that had been provoked and simulated, and the whole text seemed to move towards pushing back the boundaries of interpreting what teaching is about, in ways which were both practical and highly theoretical. On the one hand it seemed to be a brilliant description of a brilliant series of English lessons; on the other hand, it brought out and theorised the way in which this had been an intense existential, aesthetic, spiritual experience for all concerned. (Winter, Griffiths, & Green, 2000, p. 29)

Winter goes on to raise questions about rigour and the nature of research. Such

questions are important to address in looking for evidence of new living standards of judgment in s-step research. In communicating the nature of her living spiritual and aesthetic standards of judgment, Laidlaw integrates reflective commentaries and extracts from conversations with her pupils as she makes public her embodied knowledge as a professional educator. The evidence in Laidlaw's thesis show how poetic communications contributed to her moral insights and enabled her to explain the connections between her desire for beauty, truth, and goodness with her pupils in the creation of her own living educational theory.

Perhaps the most challenging evidence to seek in s-step research is that associated with living spiritual standards, including love. Finnegan's five year doctoral enquiry on *How Do I Create my own Educational Theory in my Educative Relations as an Action Researcher and as a Teacher?* shows evidence of living spiritual standards through his embodied value of love. He does this by focusing on one of the most powerful s-step questions I have encountered, "How can love enable justice to see rightly?"

In creating his own living theory Finnegan gathers data using the methods of an analytic scientist, a conceptual theorist, a conceptual humanist, and a particular humanist. I will return to the significance of these social science methodologies when I consider the evidence below that s-step researchers, like Finnegan, have contributed to a distinctively educational research methodology. Finnegan presents the evidence in his answer to his question in a detailed and publicly accessible form in his thesis on the internet (Finnegan, 2000). I am drawing your attention to this evidence as it also demonstrates how a self-study researcher can integrate insights from the conceptual theories of others in a way that meets the highest standards of scholarly discourse when answering the question, "How can love enable justice to see rightly?"

As Finnegan considers his question, he takes care to acknowledge the sources of the different contributions to his theory construction. He shows how "exercising a preferential option for the most disadvantaged" students has been influenced by Catholic liberation theology. He also notes the high degree of resonance, from his viewpoint, between the value of "exercising a preferential option for the most disadvantaged" students and the value of producing "the greatest benefit of the least advantaged" within Rawls's Second Principle of Justice. The quality of his critical engagement with the ideas of others may be judged from the point that:

> My noting of the above "high degree of resonance" does not mean that I am adopting Rawls's meta-theoretical social justice construct or "calculus," but, rather, that I prize the value of giving preferential treatment to the "weakest" within the "maximin formula" of Rawls's Second Principle of Justice. It is also worth stressing here that I am not creating or promulgating a meta-narrative of social justice in my own educational action research theory construction. (Finnegan, 2000, p. 217)

A recent contribution to the evidence from self-study that shows the transformation of embodied spiritual and aesthetic values into epistemological standards

of judgment has been made by Jacqueline Scholes-Rhodes (2002). In her doctoral thesis, *From the Inside Out: Learning to Presence my Aesthetic and Spiritual "Being" Through the Emergent Form of a Creative Art of Inquiry*, Scholes-Rhodes provides the evidence to establish her meanings of exquisite connectivity in relation to presencing both her aesthetic and spiritual "being." The evidence requires the engaged and appreciative response of a reader who is able to make informed judgments on how writing, images, music, poetry, and the arts can communicate such meanings. These involve the recognition of the contexts and the sometimes-difficult relationships out of which the meanings of the standards of judgment emerge. The recognition also involves the aesthetically engaged and appreciative responses to writings with the following qualities:

> I wanted to understand, to sustain and nurture these emotional and aesthetic glimpses as an experience of spirituality in my life. Each image engenders a sense of connectivity, sometimes emerging from the aesthetic curve of a natural landscape or from perfumed scents on the wind, and other times overwhelming in the simplicity of human relationship. It can flow simply from a memory of beauty, precious in its cocoon of silence, the silence itself so precious in a cacophonous world. I wanted to feel this "exquisite connectivity" daily – to wake sure in its power, to absorb its energy and nourishment. (Scholes-Rhodes, 2002, p. 10)

In judging what counts as evidence in s-step research I have focused on contributions to educational theory and to standards of judgment. Because of the importance of understanding how s-step researchers conduct their enquiries, in terms of their methods, I now want to question whether there is evidence that shows a distinctively educational research methodology is emerging from s-step accounts.

Is There Evidence of the Emergence of Educational Research Methodologies as Distinct From a Social Science Methodology in S-Step Enquiries?

Significance of the Question

The focus of educational discourse about the methods for transforming embodied knowledge into public knowledge concerns the nature of educational judgment (Coulter & Wiens, 2002). Educational judgments are value-laden because of the nature of education as a value-laden practical activity. Hence the development of educational judgments by s-step researchers requires an understanding of how the embodied values of educational practitioners can be transformed into communicable standards of judgment for publicly testing the validity of the evidence in educational knowledge-claims (Whitehead, 1999, 2000, 2002).

I want to emphasize the importance of insights from Lyotard (1984) and Dadds and Hart (2001) for an understanding of the methods that can transform

data into evidence in s-step accounts. I am assuming that s-step researchers are postmodern writers in Lyotard's sense that in producing our accounts we are giving a form to our lives as we express our arts as educators and s-step researchers:

> A postmodern artist or writer is in the position of a philosopher: the text he (or she) writes, the work he produces are not in principle governed by pre-established rules, and they cannot be judged according to a determining judgement, by applying familiar categories to the text or to the work. Those rules and categories are what the work of art itself is looking for. The artist and the writer, then, are working without rules in order to formulate the rules of what will have been done. (p. 81)

In their work on doing practitioner research differently, Dadds and Hart (2001) stress the importance for some practitioner-researchers of creating their own unique way through their research by trusting their own methodological inventiveness. They believe that this may be as important as a self-chosen research focus. Their crucial insight is that how practitioners choose to research, and their sense of control over this, can be equally important to their motivation, to their sense of identity within the research, and to their research outcomes.

My analysis of the evidence from s-step accounts has led me to the conclusion that researchers create their own unique way through their research by exercising their methodological inventiveness. Just as each s-step researcher can be characterized by a unique constellation of values, so their research can be characterized by their forms of methodological inventiveness. Because of the evidence of this inventiveness in s-step accounts, I want to clarify a methodological question. The question is whether there is an educational research methodology, which can be distinguished from social science methodologies, for self-study enquiries.

In our different autobiographies of research Allender (1991) and I (Whitehead, 1985, 1999) have used the Mitroff and Kilmann classification of social science methodologies. The typology can be represented as follows in Figure 22.1.

Each methodology is distinguished by differences between its preferred logic and method of enquiry. It is my contention that s-step researchers are creating distinctive educational research methodologies that cannot be validly categorized within the above social science methodologies. Because of their ontological commitment to study their own learning in enquiries of the form, "How do I improve my practice?" s-step researchers do engage in systematic action/reflection spirals in which researchers:

(i)   (I) experience a concern because educational values are negated
(ii) (I) imagine a solution to the problem.
(iii) (I) act in the direction of this solution.
(iv) (I) evaluate the outcomes of action.
(v)   (I) modify problems, ideas, and actions in the light of evaluations.

While there has been much pain and struggle in legitimizing such views in the

Academy (Whitehead, 1993), I can now recall with some humour the responses by other scholars to my insistence that the personal pronoun, my *I* and the *I* of others could be included in a question worthy of research. Yet, I know of a recent case where a university research committee has asked for the personal pronoun to be removed from an action researcher's question! Suderman-Gladwell's (2001) dissertation on *The Ethics of Personal, Narrative, Subjective Research*, provides evidence of a sustained engagement with the politics involved in conducting s-step research in the face of a university ethics committee that applied guidelines from social science research. While Suderman-Gladwell graduated with his degree for the quality of his study, he had to abandon his classroom based s-step research in the face of the application to his research proposal of inappropriate ethical guidelines from the social sciences.

Evidence From S-Step Research

Maura McIntyre's and Ardra Cole's (2001) performance text at the Third International Conference of the Self-Study of Teacher Education Practices Special Interest Group of AERA, showed methodological inventiveness at its most inspiring:

Performance of the research text is an embodiment and representation of the inquiry process as well as a new process of active learning. The possibility

of active learning in each performance or recreation of the text exists through our ongoing commitment to maintaining the conditions of our relationship. Each performance is an experiential basis for reflection, analysis, and learning because in relationship we are "participants-as-collaborators" (Lincoln, 1993, p. 42). Together we were able to draw out each other's knowledge and strength. (McIntyre & Cole, 2001, p. 22)

The brilliance of their performance text was in the way they communicated the nature of an educative relationship that focused on learning to tap-dance. Without the visual and auditory communications, included in the performance text, significant meanings are lost in the textual representation on pages in a book.

Mitchell and Weber (1999) have also provided evidence on how they relate their own performance texts to their idea of theorizing nostalgia. They recognize that the term nostalgia can lead us into an arena laden with competing ideologies and perspectives. As they use it, nostalgia can be a liberating concept in the sense of a reinvention which uses what we know now to inform and critique what could have been. Much of what they explore involves a reclaiming of the past that acknowledges the fact that it is gone and can never be relived in the same way. As they say, it may never have existed in exactly the way that we think it did. This does not mean that it is of no use, for memories can evoke a utopia towards which we can work:

Reinvention through self-study can be a powerful and highly effective means of self-transformation and a catalyst for professional growth. It can strengthen or weaken hidden bits of self, challenging us to incorporate certain ignored elements into our professional identity, or forcing us to wrap our imagination around a different image of ourselves in action. It can be wonderfully motivating in its ability to bring home a painful or a beautiful truth, and help us appreciate and even bring about our most meaningful moments as teachers. Studying ourselves does not always involve major change; sometimes it is just about revaluing what was already there and using it in new ways that are informed by both the personal and the social. (p. 232)

Their performance text on "The Prom Dress" in relation to a developing awareness of the significance of the dress in the learning and life of North American women carried emotional meanings whose communication required the experience of their relationship as well as a linguistic text.

As Mitchell and Weber provide evidence of a process of re-inventing ourselves as teachers, they are "living" rather than "spectating" their contributions to educational knowledge. Their research methods are being created from the inside of educational practice itself. The nature of their methodological inventiveness is being clarified in the course of its emergence in the practice of their enquiry.

Any research account of an educational practice must make sense to the reader if it is to be judged as a contribution to educational knowledge. What I

mean by making sense is that the account has a logic in that the reader can comprehend the form that the reasoning is taking. Hence my interest in the logic of educational enquiry. I now want to consider in the fourth question the evidence that a logic of educational enquiry is also emerging from s-step research.

Is There Evidence of a Logic of Educational Enquiry?

Significance of the Question

My concern with the logic of education began in 1970 while studying the philosophy of education. The following statements from two of my professors of philosophy will serve to highlight the need to exercise a philosophical imagination in developing a logic of s-step enquiries.

> It is the purpose of this book to show the ways in which a view of education must impose such a structure on our practical decisions. ... The thesis of this book, therefore, has relevance at a time when there is much talk of "integrated studies". For one of the problems about "integration" is to understand the way in which "wholeness" can be imposed on a collection of disparate enquiries. ... All it attempts to do is to sketch the ways in which this conception of education must impose its stamp on the curriculum, teaching, relationships with pupils, authority structure of the school or college community. (Hirst & Peters, 1970. pp. 15–16)

The logic of education which structured their discipline's approach to educational theory, led its proponents to impose a conceptual structure on practical decisions, to impose wholeness on disparate entities, and to impose its stamp on the curriculum. As s-step enquiries that are directed at improvement appear to be open to the possibilities that life itself permits, I felt the need for a different logic of education to one that imposed such structures on the practical activities of s-step researchers. I needed a logic of educational enquiry.

In distinguishing what counts as evidence in s-step accounts in terms of their contributions to a logic of educational enquiry I have been influenced by the following ideas from Gadamer and Collingwood. Without them I would not have been able to distinguish what counts as evidence of a logic of enquiry. I have acknowledged this elsewhere (Whitehead, 1993).

Gadamer (1975) highlighted the importance of developing a logic of the question and drew my attention to Collingwood's (1939) ideas on the logic of question and answer. Gadamer's ideas appealed to me because I could identify with his emphasis on the importance of forming a question. For Gadamer, questioning is a *passion*. He says that questions press upon us when our experiences conflict with our preconceived opinions. He believes that the art of questioning is not the art of avoiding the pressure of opinion. Drawing on Plato's Seventh Letter, Gadamer distinguishes the unique character of the art of dialectic. He does not see the art of dialectic as the art of being able to win every argument. On the contrary, he says it is possible that someone who is practising the art of

dialectic, i.e., the art of questioning and of seeking truth, comes off worse in the argument in the eyes of those listening to it.

According to Gadamer, dialectic, as the art of asking questions, proves itself only because the person who knows how to ask questions is able to persist in his questioning. I see a characteristic of this persistence as being able to preserve one's openness to the possibilities which life itself permits. The art of questioning is that of being able to continue with one's questions. Gadamer refers to dialectic as the art of conducting a real conversation:

> To conduct a conversation … requires that one does not try to out-argue the other person, but that one really considers the weight of the other's opinion. Hence it is an art of testing. But the art of testing is the art of questioning. For we have seen that to question means to lay open, to place in the open. As against the solidity of opinions, questioning makes the object and all its possibilities fluid. A person who possesses the "art" of questioning is a person who is able to prevent the suppression of questions by the dominant opinion. … Thus the meaning of a sentence is relative to the question to which it is a reply, i.e., it necessarily goes beyond what is said in it. The logic of the human sciences is, then, as appears from what we have said a logic of the question. Despite Plato we are not very ready for such a logic. (pp. 330–333)

I was shocked by this last sentence. What could it mean? Despite Plato we are not very ready for a logic of question and answer. I read on with increasing excitement to the point where Gadamer states that R.G. Collingwood developed the idea of a logic of question and answer, but unfortunately did not develop it systematically before he died. I found myself in complete accord with the following ideas of Collingwood (1939, chap. 5) on the relationship between a dialectical, or question and answer form, and the propositional form:

> I began by observing that you cannot find out what a man means by simply studying his spoken or written statements, even though he has spoken or written with perfect command of language and perfectly truthful intention. In order to find out his meaning you must also know what the question was (a question in his own mind, and presumed by him to be in yours) to which the thing he has said or written was meant as an answer. (p. 31)

> Here I parted company with what I called propositional logic, and its offspring the generally recognized theories of truth. According to propositional logic (under which denomination I include the so-called "traditional" logic, the "idealistic" logic of the eighteenth and nineteenth centuries, and the "symbolic" logic of the nineteenth and twentieth) truth or falsehood, which are what logic is chiefly concerned with, belongs to propositions as such. (pp. 33–34)

I accept and live with Collingwood's point that there is an intimate and mutual

dependence between theory and practice. I also accept the implications of working in education as a vocation in the sense that education, as a value-laden practical activity, places a responsibility on the educator to live values of humanity in practice.

These assumptions are open to challenge. They will not be abandoned lightly but have been opened up for your criticism because of my commitment to a view of research-based professionalism in education in which it is a responsibility of the researcher to submit her or his work to public tests of validity. I relate this commitment to Macintyre's (1988) view that, "the rival claims to truth of contending traditions of enquiry depend for their vindication upon the adequacy and the explanatory power of the histories which the resources of each of those traditions in conflict enable their adherents to write" (p. 403).

Evidence From S-Step Research

It may be too early to talk of s-step research as a tradition of enquiry. Yet, there is evidence that this research is contributing a logic of educational enquiry to educational knowledge. What evidence am I referring to?

Because contradiction has such a central place in the 2,500 year old arguments between philosophers about the validity of dialectical and formal logics, I want to focus on the evidence that s-step researchers have embraced the inclusion of *I* as a living contradiction in accounts of their learning. I also want to focus on the evidence from s-step researchers that can be used to criticize my claims about the significance of their contributions to a logic of educational enquiry.

Another former President and Founder Member of S-STEP, MaryLynn Hamilton (2001), has described the data and evidence she has used in researching her life of learning as a university academic who is living her contradictions. The contradictions are focused on the value of social justice. As Director of the Redesign Initiative for the Teacher Education Division at the University of Kansas, she worked with colleagues to support social justice in theory:

> However, when pressed into the actual undertaking, we stepped back. We needed to take ownership of our own privileges and prejudices. Because white people often do not recognize their own biases, we needed to probe issues of white privilege and racism and ask ourselves critical questions about our own behavior. (Hamilton, 2001, p. 30)

Hamilton recorded her academic experiences in letters, journals, e-mail communiqués, interviews, field notes, and observations. Over some three years she worked with colleagues in writing a mission statement, a conceptual framework, a Program plan, and a curriculum framework. She describes the data she draws on for the evidential claims in her analysis:

> To document this self-study, I drew on notes written during meetings, documents created during our work, informal interviews with colleagues, and communiqués among colleagues. Colleagues external to my institution

also served as critical friends and offered important comparisons. These data sources helped me identify and consider aspects of the process, particularly the aspects of our living contradictions. In reviewing the data, I attempted to escape taking an unrestrained approach to exploring my perspective. (p. 22)

Evidence of further contributions to a logic of educational enquiry grounded in living contradictions in *I* enquiries is provided by the legitimation of the following doctorates by the University of Bath:

Eames, K. (1995). *How do I, as a teacher and educational action-researcher, describe and explain the nature of my professional knowledge?* http://www.actionresearch.net/kevin.shtml

(One of the points of note about Eames' work, is that as Schön (1995) was writing about the possibility of creating a new epistemology for the new scholarship, Eames (1995) constructed an epistemology of practice for the new scholarship).

Bosher, M. (2001). *How can I, as an educator and Professional Development Manager working with teachers, support and enhance the learning and achievement of pupils in a whole school improvement process?* http://www.actionresearch.net/bosher.shtml

Delong, J. (2002). *How Can I Improve My Practice As A Superintendent of Schools and Create My Own Living Educational Theory?* http://www.actionresearch.net/delong.shtml

Each of these researchers acknowledges their existence as a living contradiction in enquiries of the kind, "How do I improve what I am doing?" The logics of their educational enquiries emerged in their accounts of their life of enquiry as they live their contradictions (Hamilton, 2001), as they form their questions and as they produce their accounts of their learning.

In living their contradictions s-step researchers can clarify the meanings of the spiritual, aesthetic, ethical, and other values they embody in their practice. In the course of this clarification they can transform the embodied values into living and communicable standards of judgment. In saying this I think it bears repeating that I am accepting Lather's notion of ironic validity in the sense that s-step accounts can be seen as a representation of its failure to represent what it points toward but can never reach (Lather, 1994) in the embodied knowledge itself. I am thinking in particular about a failure to represent the meanings of the spiritual and aesthetic values which are embodied in educative relations and that can be used as explanatory principles of educational influence. I am relating to failure in the positive sense that it connects with a motivation to get closer to the meanings.

In making these points, I do not want to avoid the uncomfortable evidence from s-step researchers that shows I might be mistaken. Taking the contents

page of *Improving Teacher Education Practices Through Self-Study* (Loughran & Russell, 2002) at face value, it might appear that there was no evidence that these s-step researchers were contributing to a logic of educational enquiry from the ground of living their lives as living contradictions and by engaging in educational enquiries of the kind, "How do I improve what I am doing?"

Of the 16 contributions, three chapter headings are in the form of questions. Tom Russell asks, "Can Self-Study Improve Teacher-Education?" Charles Myers asks, "Can Self-Study Challenge the Belief That Telling, Showing, and Guided Practice Constitute Adequate Teacher Education?" Linda May Fitzgerald, Joan Farstad, and Deborah Deemer ask, "What Gets 'Mythed' in the Student Evaluations of Their Teacher Education Professors?" These questions are in a form recognized in traditional scholarly discourse as being asked at a level of linguistic generality that does not commit the researcher, through including their own *I* in their question, to explore the implications of asking a self-study question in relation to their own life and work. This is definitely not saying that these self-study researchers have not engaged in self-study. It is to say that the ways they form their questions do not explicitly focus on a self-study of their own educational practice in a way that would support my point about the contributions of self-study to a logic of educational enquiry. The chapter headings of the other 13 contributions are not in the form of a question and conform even more closely to a traditional scholarly canon for reporting research findings that remove the enquiring *I* from the heading. In his excellent contribution, Joe Senese does include *I* in his heading, "Opposites Attract: What I Learned About Being a Classroom Teacher by Being a Teacher Educator."

In speculating about the reasons for the removal or omission of the enquiring *I* from the heading of an s-step account I am drawn to Lyotard's (1984) notion of terrorism and Bourdieu's (1990) notion of the habitus. Lyotard writes about *terror* in relation to repression of ideas by institutions of knowledge. I have certainly felt the disciplinary power of my university in ways which resonate with Lyotard's analysis (Whitehead, 1993).

For Lyotard countless scientists who have put forward original points of view have seen their move ignored or repressed, sometimes for decades, because it too abruptly destabilized the accepted positions, not only in the university and scientific hierarchy, but also in the problematic. He believes that the stronger the move the more likely it is to be denied the minimum consensus, precisely because it changes the rules of the game upon which the consensus has been based. He refers to behaviours that deny the minimum consensus as terrorist. By terror he means the efficiency gained by eliminating, or threatening to eliminate a player from the language game one shares with him or her. The person is silenced or consents, not because the ideas have been refuted, but because his or her ability to participate has been threatened. He says that, "The decision makers' arrogance, which in principle has no equivalent in the sciences, consists of the exercise of terror. It says: 'Adapt your aspirations to our ends – or else'" (Lyotard, 1984, p. 64).

Given that no contributor to one of the most recent texts from s-step research-ers has presented their contribution as an *I* enquiry it may appear that I am being premature in claiming that s-step researchers have provided evidence of contributing to a logic of question and answer from the ground of living contra-dictions and educational enquiries. Yet, I do wonder if I am correct about the significance of the evidence provided by researchers such as Holley (1997) in her, "How Do I as a Teacher-Researcher Contribute to the Development of a Living Educational Theory Through an Exploration of my Values in my Professional Practice?"

Having considered evidence of contributions to educational theory, values-based standards of judgment, methodology, and logic now I want to turn to my last, perhaps most important, question about the evidence of educational influ-ence. I say most important because the self-study of teacher education practices is focused on improvement. For the teacher-educator working with a student to improve learning, it is important to understand the growth of the student's educational knowledge.

Because everything that we do can be seen to be influenced by the social formations in which we are living, the extension of one's cognitive range and concerns in understanding these influences can be a part of the individual's educational development. Learning to enhance one's influence in the education of such social formations can also be part of this educational development. Hence the final question:

Is There Evidence of Educational Influence in Educating Oneself, in the Learning of Others, and in the Education of Social Formations?

Significance of the Question

My focus on *educational influence* in relation to evidence in s-step research is because of my point of view that I cannot claim to have educated anyone other than myself, but that I can claim to have had an educational influence in the learning of others and in the learning of social formations. The reason that I do not claim to have directly educated anyone is because I acknowledge the impor-tance of each individual's originality of mind and critical judgment in their own education. For me to recognize learning as educational in relation to my influ-ence, whatever I do in my educational practices has to be mediated through the originality of mind and critical judgment of the learner. Hence my emphasis on the importance of evidence of educational influence in s-step research.

The significance of focusing on evidence of educational influence was high-lighted for me by Edward Said's (1997) engagement with the ideas of influence in relation to an open field of possibility from the poet Valery's (1972) "Letter About Mallarme":

No word comes easier or oftener to the critic's pen than the word influence, and no vaguer notion can be found among all the vague notions that

compose the phantom armory of aesthetics. Yet there is nothing in the critical field that should be of greater philosophical interest or prove more rewarding to analysis than the progressive modification of one mind by the work of another. (Valery, 1972, p. 241, quoted in Said, 1997, p. 15)

Said points out that Valery converts *influence* from a crude idea of the weight of one writer coming down in the work of another into a universal principle of what he calls "derived achievement." He describes a complex process of repetition, refinement, amplification, loading, overloading, rebuttal, overturning, destruction, denial, invisible use, as completely modifying, "a linear (vulgar) idea of 'influence' into an open field of possibility" (p. 15).

In the process of educating oneself, in influencing the education of others, and in influencing the education of social formations, the s-step researcher is faced with the choice of what to bring into this "open field of possibility." Such choices are likely to define the quality of the contribution the s-step researcher makes to the growth of educational knowledge. My own choices are in the following questions.

Is There Evidence Of Educating Oneself In S-Step Research?

One of the great strengths of the s-step movement in relation to the growth of educational knowledge is that the evidence shows that the studies do focus on the learning of the s-step researcher. This extensive, accumulated evidence has emerged from some ten years of activity by contributors to S-STEP of AERA. To see the extent of the evidence on the education of the s-step researcher, one has only to look at the collections of papers from s-step researchers in the conference proceedings of the four S-STEP Conferences at Herstmonceaux Castle supported by Queens University. An analysis of the learning of contributors to two or more of these conferences shows the growth of their knowledge over time (see http://educ.queensu.ca/~ar/sstep.html).

The books and articles of s-step researchers, as referenced throughout this handbook, produce further evidence of the extent of their learning. I want to distinguish the evidence produced by Karen Guilfoyle, Mary Lynn Hamilton, Peggy Placier, and Tom Russell on their own learning as teacher educators in the 1995 Special Issue of the *Teacher Education Quarterly* on "Self-Study and Living Educational Theory." Since the forming of the S-STEP SIG of AERA in 1993, these teacher educators have sustained their enquiries into their own learning and have unique portfolios of evidence of their growth of educational knowledge.

Jerry Allender's (2001) s-step research into his practice of humanistic education can also be distinguished as an original contribution to educational knowledge. What is unique in Allender's self-study is that he combines a contribution to the growth of educational knowledge with a contribution to Gestalt Theory for teachers. For Allender, humanistic research requires a creative investigative structure that frames the inquiry, even if the structure shifts in the process. He sees it as a framework that invites and stimulates reflection with built-in concerns

for honesty and empowerment with the opportunity for everyone to have an expressive voice. His goal is to connect idealism, practicality, and people in an interconnected web of respect flowing in every direction. Allender uses the methods of narrative inquiry to study his teacher self. The evidence in his text shows that he justifies the following claims:

> Stories written by students about their experiences in my classes were interwoven with stories of my reflections. I became aware of problems and imagined new possibilities. My teaching changed. ... As a result, the students changed too. They became more articulate. The stories affected subsequent classes by giving support for the stronger expression of voice. With a flow of respect between teacher and students, and among students, supportive communities developed in which, though we certainly didn't all agree, there was an increased interest in listening to what others had to say. Empowerment and relationship grew hand in hand. ... This text begins with the structure of a semester; moves through the stories, which are interrupted at the midpoint for a discussion of concepts that gird the stories; and concludes with an underlying Gestalt theory. (pp. 2–3)

Good evidence of the originality and depth of the education of the s-step researcher is also in the research degrees of s-step researchers described in this chapter.

The evidence in the work of Jean McNiff also deserves special mention. The passion and sustained commitment shown by Jean to self-studies of her teacher education practices have influenced practitioner researchers around the world. Since offering her explanation for her own educational development in her doctoral thesis (1989), Jean's publications have shown the growth in her educational knowledge. She has provided the evidence of this growth through self-studies of her teacher education practices in tutoring masters and doctoral programs, in pedagogising living theory texts in the curriculum of teacher education programs, and in bringing teacher educators together in areas of conflict such as Ireland, Israel, and Palestine. Being able to access this evidence at http://www.jeanmcniff.com, and appreciate the achievements of this remarkable educator and s-step researcher is a constant source of inspiration for my own productive life in education.

Is There Evidence of Influencing the Education of Others in S-Step Research?

In many ways this evidence is the most interesting. What I mean by this is that in teacher education practices, teacher educators have a responsibility to seek to influence the education of their students. If the evidence of an educational influence is to be presented in the student's own voice and narrative of their learning, this has implications for the development of a view of an educational relationship as a form of co-enquiry. I am thinking of an enquiry in which both teacher educator and student can explore the implications of asking, researching, and answering questions of the kind, "How do I improve my practice?"

For example, Karen Collins is a member of a school-based teacher-researcher group at Westwood St. Thomas School in the South West of England. She has received a merit (Collins, 2003) from her examiners for her Educational Enquiry Module, "How Can I Effectively Manage Students' Learning to Take Account of Self-Assessment Within Modern Foreign Languages?" Collins is engaging with her enquiries in a way that shows her responses to her students as she takes into account their self-assessments of their own learning.

Delong and Black (2002) have edited a collection of accounts of self-studies of teacher-education practices that focus on students' learning. The evidence for this focus can be seen in the enquiring *I* titles such as: "How can I more effectively teach my primary students to communicate their learning in math with greater confidence; namely to express their learning clearly, using pictures, numbers and words?" by Anita Richer; "What can I do to improve students' reflective writing using electronic portfolios?" by George Neeb; "How do we integrate issues of power and ethics in valid explanations of our educative influence as a teacher-consultant and superintendent?" by Jackie Delong and Heather Knill-Griesser; and "How can I improve my ability to balance my elementary school administrative role with my assigned teaching load to adequately meet the needs of other people as well as my own?" by Cheryl Black.

Is There Evidence of Influencing the Education of Social Formations in S-Step Research?

In examining the evidence of influence in the education of social formations I use Bourdieu's idea of the habitus in his analysis of how these formations reproduce themselves (Bourdieu, 1990, p. 145). For Bourdieu the habitu*s* is a product of history. It produces individual and collective practices in accordance with the schemes generated by history. He says that it ensures the active presence of past experiences, which become deposited in each organism in the form of schemes of perception, thought, and action. These tend to guarantee the "correctness" of practices and their constancy over time, more reliably than all formal rules and explicit norms (p. 54). The removal of 'I' from research accounts has been a tradition of the academic habitus.

I imagine, maybe mistakenly, that the omission or removal of the enquiring *I* from the headings of s-step accounts is a product of the habitus in the Academy. My own interest in the education of social formations is focused on the learning of these formations as they are changed and transformed into better social orders through the living educational theories of their citizens.

At this point I am drawn to Susan Noffke's (1997) powerful criticism of self-study/action research as seemingly, "incapable of addressing social issues in terms of the interconnections between personal identity and the claim of experiential knowledge, as well as power and privilege in society" (p. 329). As a member of the scholarly community of S-STEP I think that I have a responsibility to search for evidence that can support or refute such criticism in terms of the education of social formations. I think the evidence in Hamilton's (2001) self-study answers Noffke's criticism. Hamilton provides evidence of an engagement

with living contradictions between valuing social justice and denying it in practice while seeking to live more fully the values of social justice:

> As I asked myself hard questions, I looked to find answers that did not evade honesty. I returned to my notes, to the literature, and the meeting minutes to jolt and challenge my initial responses. My concern about the possibility of institutional racism seemed verified. When I informally interviewed colleagues, they stated with certainty that racism was not involved. However, the content of the discussions during the meetings could not be avoided. As I reviewed the minutes of the meeting, the evidence seemed clear. Since we worked with our select student body, we apparently felt that our students did not need to explicitly concern themselves with issues of social justice. The data seemed to indicate that, from our perspective, our students would select suburbia for employment after Program completion. From my review of the data collected, we seemed to be living our contradiction – acting in a socially unjust way when we discussed issues of social justice. (p. 27)

Russell (2001) also provides evidence of his engagement with issues of power and privilege in an attempt to establish the significance of the authority of experience within a teacher education program. He shows how the power relations within the social formation of a university helped to eliminate an existing educational innovation in a teacher education curriculum. The innovative curriculum was designed to support self-study. Russell's study shows just how much work is yet to be done in educating social formations as to the validity of s-step research. It also shows the evidence that s-step researchers can engage with power and privilege in society in relation to experiential knowledge and identity.

Perhaps the best evidence of an s-step researcher influencing the education of social formations has been presented by Jackie Delong (2002) in her thesis, *How Can I Improve my Practice as a Superintendent of Schools and Create my own Living Educational Theory?* Delong has enquired into her systems' influence. While President of the Ontario Educational Research Council in 2002, Delong graduated with her doctorate for her five year self-study into her teacher-educator practices and her educational leadership as a Superintendent of Schools of the Grand Erie District School Board in Ontario. Her doctorate included images of her relationships with the individuals she worked with to emphasize the significance of her personal value of relationship in her professional practice. It included images of works of art to communicate her spiritual connection to a life-affirming passion for education. The evidence from her analysis of her influence on policy shows how Delong affected the growth of a culture of enquiry within a School Board. This demonstration included the self-study accounts of numerous teachers on the Board (Delong & Black, 2002). It also included the evidence of how her educational leadership influenced the management of this innovation. The OERC award in December 2000 for leadership in action research acknowledged this contribution.

What I have noticed within recent publications from s-step researchers is the evidence that knowledge-claims are becoming more participatory (Reason & Bradbury, 2001) in the sense that concerns and enquiries are shared with others. In support of this I am drawn to Dadds' (1998) *we* questions:

> If we choose to write together with those we support, what challenges do we face as we attempt to represent a partnership ethic in collaborative publications? How is a collaborative text composed? How do we handle differences of perspective, meaning, style, preferred genre? How is the "final say" achieved? What processes do we establish to ensure the most democratic and representative end texts possible? (p. 50).

Somekh and Thaler (1997, p. 158) also stress the importance of participatory research, in which dialogue and discussion between the participants are central to the process of defining commonly accepted research questions (the *we* questions). I agree with their point that to succeed in this difficult endeavour, of breaking down established routines of interaction and what, in effect, are taboos established by the culture and traditions of the group, it is essential to have an understanding of the multiple nature of the many *selves* involved. And as Day (1998) has rightly pointed out in his work on the different selves of teachers, "There is still limited evidence of action research which combines both the story, the different selves of the teacher, the action and change" (p. 272).

Closing this chapter on what counts as evidence in the self-study of teacher education practices brought to mind a quotation from A.N. Whitehead about imagination, as well as the most challenging question I have been asked as an s-step researcher, by Paul Murray, a former doctoral student and a mixed race educator:

> Where is the evidence of the critical engagement with the ideas of critical race theorists, critical non-racial theorists and post-colonial theorists in the formation of the identities and practices of individuals you are working with? Where is the evidence of your influence in respect of alerting them to enhancing the quality of their work by making themselves familiar with these epistemologies? (Why should you/they when they can get their PhDs/do their AR writing without making reference to their critical knowledge?) (Murray, 2003, e-mail)

Having doctoral students who ask their supervisors such questions does not make for an unreflective life. Yet, taking such questions seriously offers the possibility that the s-step researcher will be able to look back on a life of inquiry (Marshall, 1999) that has focused on living values of humanity more fully. It is something that the s-step researchers I work with appear to be dedicated, through their critical questioning, to making sure that this is something I can look forward to! As Whitehead (1929) says:

> Imagination is a contagious disease. It cannot be measured by the yard, or

weighed by the pound, and then delivered to the students by members of the faculty. It can only be communicated by a faculty whose members wear their learning with imagination. … The whole art in the organisation of a university is the provision of a faculty whose learning is lighted up with imagination. This is the problem of problems in university education. (p. 146)

In the ten years since the formation of the S-STEP SIG of AERA, s-step researchers have exercised their imaginations in making significant contributions to the growth of educational knowledge. These contributions include their educational theories, their living, values-based standards of judgment, their methodological inventiveness, their logics of educational enquiry and their accounts of their educational influences.

Where does my imagination take me as I speculate about some of the future possible contributions of s-step communities of educational researchers to the evidential base of educational knowledge? I am thinking of contributions related to inclusional ways of being, to contributions that combine learning circles with action research, and to contributions that focus on the pedagogisation of the living theories of self-study researchers with the help of web-technologies. I am also thinking of the influence of post-colonial theory and ecological feminism as well as ideas of sustainable development in the growth of educational knowledge of s-step researchers.

Rayner (2002a, 2002b) has provided a way of understanding inclusional ways of listening to dissonant voices in self-study research. In Rayner's view, inclusionality recognizes that the unique identity of each researcher is constructed within a network of relationships with others. It enables us to see all *things*, including ourselves, not as isolated, independent bodies, but rather as "dynamic inclusions" – interdependent embodiments – that are connected through boundaries. For Rayner, these boundaries are both co-created by and give identity to "one another," making them distinct – recognizable – but not discrete – alone.

I imagine that Leong's synthesis of learning circles and action research in Singapore will connect with Rayner's notion of inclusionality to extend the contributions of s-step researchers to the education of individuals and social formations on a global scale. Leong (1991) and Leong and Hong (2003) have presented web-based evidence in photographs, videotapes, feedback from students and colleagues, as well as their articulation of their experiences in a report on the development of learning circles combined with action research approaches, in the Academy of Best Learning in Education (ABLE, 2002) at the Institute of Technical Education in Singapore.

Adler-Collins (2003) at Fukuoka University in Japan, is extending the notion of the self-study of teacher education practices to include the pedagogisation (Bernstein, 2002) of the healing nurse curriculum. The multi-media evidence of his assessment practices and the processes of transforming his embodied knowledge as a healing nurse into a healing nurse curriculum, through a self-study of

his teacher education practices can be accessed from http://www.living-action-research.net. Farren (2003) has developed insights into a pedagogy of the unique through her use of web-technologies at Dublin City University.

I imagine that Adler-Collins' use of web-based communications will connect with Farren's use of web-technology for developing a pedagogy of the unique and with Laidlaw's contribution to exploring the value of s-step research in sustainable development in Guyuan Teachers College in China (Laidlaw, 2003). I imagine that the next ten years of s-step activity will take more seriously post-colonial theory and ecological feminism. In relation to ecological feminism I am thinking of the shift of attitude from *arrogant perception* to the *loving eye* as being worthy of integration into s-step *I* enquiries:

> When one climbs a rock as a conqueror, one climbs with an arrogant eye. When one climbs with a loving eye, one constantly must look and listen and check and question. … One knows "the boundary of the self," where the self – the I, the climber – leaves off and the rock begins. There is no fusion of two into one, but a complement of two entities, acknowledged as separate, different, independent, yet in relationship; they are in relationship if only because the loving eye is perceiving it, responding to it, noticing it, attending to it. (Warren, 2001, p. 331)

It could be that the loving eyes of s-step researchers will also engage more fully with post-colonial educational projects in the growth of educational knowledge:

> With the construction of whiteness having been a colonial project, discriminatory and racist, the ethical imperative – necessary participation in a liberatory project – is that of affiliation with Africa. Coming to terms with these facts is one of the most important and difficult challenges for coloured people. Coloured black and African ways of being do not have to be mutually exclusive. There are ways of being coloured that allow participation in a liberatory and anti-racist project. The key task is to develop these. (Erasmus, 2001, p. 16)

I am hopeful that the next ten years will show an extension of the dialogic influence of s-step researchers in contributing to the future of humanity. I am hopeful that this contribution will continue to focus on improving the quality of each s-step researcher's influence on his or her own learning and on improving students' learning. Finally, I am hopeful, given the evidence of the last ten years, that it will show that we have continued to improve our contributions to the education of social formations as we contribute to the growth of educational knowledge through our self-studies of our teacher education practices and our practices as global citizens.

Dedication

Dedicated to the life and memory of Fran Halliday, who died on October 5, 2002.

SELF-STUDY THROUGH PERSONAL HISTORY*

Anastasia P. Samaras, Mark A. Hicks, and Jennifer Garvey Berger
George Mason University, Virginia

Abstract

The profession of teaching, historically, has struggled with the degree to which the personal experiences of the teacher can or should influence classroom practice. This chapter explores the benefits of including "the personal" both for the teacher and student. Personal history – the formative, contextualized experiences of our lives that influence how we think about and practice our teaching – provides a powerful mechanism for teachers wanting to discern how their lived lives impact their ability to teach or learn. In this chapter, the authors explore the historical evolution of personal history self-study and the multiple ways in which it can promote deeper learning. Specifically, this form of self-study can be used to: know and better understand one's professional identity; model and test forms of reflection; and, finally, push the boundaries of what we know by creating alternative interpretations of reality. The benefits of this method are further illustrated through a case study of the lived experiences of a teacher educator surfacing her own struggle to "unpack" how her identity impacts her teaching and her quest for modeling self-study as she reshapes a preservice teacher education program.

> To know the past is to know oneself as an individual and as a representative of a socio-historical moment in time; like others each person is a victim, vehicle, and ultimately a resolution of a culture's dilemmas. (Bullough & Gitlin, 1995, p. 25)

Personal history self-study is increasingly becoming an essential methodology towards teacher educators' personal and professional growth and especially to improving their teaching practice and impacting their students' learning. Through a personal history self-study approach, professors and their students

---

*Chapter consultant: Tom Russell, Queen's University, Canada.

are able to reconstruct significant life events to inform them of their professional identity formation and to help them make meaning of their pedagogy and the connections of their practice to theory. In that process, teacher educators are finding a need to model – to show and not just tell, that life-long learning is vital for the teachers' professional development. In collaborative teaching and research circles, teacher educators are using critical reflection on their practice with feedback from their students on their perceptions of the changed teaching practices. This work is nested in the institutional contexts that both challenge and support teacher educators as they experiment with diverse and non-traditional pedagogical and research methodologies. This chapter on personal history self-study is informed by the widely shared belief that teaching is a fundamentally autobiographical act (Finley, 1998; Goodson, 1998; Jersild, 1955; Knowles, 1998; Pinar & Grumet, 1976). Most importantly, personal history self-study researchers are providing support for the notion that who we are as people, affects who we are as teachers and consequently our students' learning.

The teacher's day is filled with individual complexities, dilemmas, and choices that are too improvisational to be scripted with rational guidelines and processes (Greene, 1986; Pinar, 1980), although many have attempted to create such scripts. Because of this improvisational nature, the connections between external processes or theories and actual action in the classroom are not always linear (Clark & Yinger, 1979; Clark & Peterson, 1986); instead, beginning with Dewey (1933;1938) in the 1930s and continuing especially in the last several decades, the work of many researchers has been to find the genesis for teacher action deep in the personal histories of teachers (e.g., Goodson, 1980; Knowles & Holt-Reynolds, 1994). These teacher educators – in whose number we count ourselves – believe that an examination of the personal history of teachers and teacher educators is a key piece in transforming teacher action and ultimately transforming the educational experiences of schoolchildren everywhere. These teacher educators also study their teaching while exploring the sociocultural (Vygotsky, 1978) milieu that has impacted their practice.

As we write this chapter on personal history self-study, our own context too plays an enormous role in our view of the field and our belief in the necessity of personal history self-study for teachers and teacher educators alike. For the three of us who circulate drafts of this chapter at coffeehouses, faculty meetings, and through e-mail, unpacking our own personal history through self-study is not an option or luxury but a necessity. Unlike many who find their work in the academy to be isolating, we find our work to be filled with talk and collaboration. The intensity of our collaboration comes from the structure of Initiatives in Educational Transformation (IET)[1] an innovative professional development program for practicing K-12 teachers designed to encourage teachers to rethink their professional role and to transform through active reflection and self-study.

In this non-traditional program, we co-create every piece of curriculum and co-teach every class. Together, we question our everyday taken-for-granted practice as we reconceptualize the practice of teachers' professional development. We

have witnessed first-hand how personal history self-study enhances teachers' personal and professional development and contributes to professional renewal for teachers as well as ourselves. In this chapter we are most concerned with how teacher educators are making a difference in teacher education through their personal history self-studies.

We open our chapter with earlier research, which has influenced and intersected with personal history self-study research. We then turn our discussion to three major reasons why teacher educators find personal history self-study a necessary and generative form of research. While these categories are certainly neither exclusive nor singular, they have helped us name some of the ways self-study can help transform teaching and learning. In these loose, overlapping categories, which emerged from a review of the literature, personal history self-study is used for:

1. self-knowing and forming – and reforming – a professional identity;
2. modeling and testing effective reflection; and,
3. pushing the boundaries of teaching.

These three section reviews are offered to illustrate and elucidate the valuable ways personal history self-study can help change teacher action and contribute to the teacher knowledge base. After the section reviews, we share a case study that highlights each of these very purposes. We invite our readers to do what we ask our students to do – to consider the "so what" of research, its practical applications to their teaching so that they might better know their teaching selves. We close the chapter by raising questions about the future of personal history self-study**.**

Historical Outgrowth of Personal History Self-Study

The interaction between teachers' thinking and beliefs and their actions in the classroom is not a new subject. In his examination of thinking, John Dewey (1933) claimed that reflective thinking, "converts action that is merely appetitive, blind and impulsive into *intelligent action* [italics added]" (p. 17). His premise, that unexamined thinking leads to acts based in random or irrational beliefs or ideas, has been trumpeted by many who wish for more purposeful action on the part of teachers and others. Dewey's early interest in thinking (and its relationship to belief) was not taken up by those who studied teacher practice, however. In fact, Sprinthall *et al.* claim that, "Not until relatively recently has the importance of *the teacher* [italics added] in the process of education received adequate theoretical and research attention" (p. 666).

Sprinthall *et al.* trace research on teacher practice through examinations of earlier paradigms of research on teaching. They discuss the "trait and factor model," which focused on "studies of fixed personality characteristics"; the "dynamic model from the psychoanalytic tradition," which saw "current behavior as an overdetermined function of very early experience"; and the "process-product model," which tried to link student outcomes to specific, measurable

teacher practices (p. 666). They conclude that, "the paradigms were insufficiently robust to provide adequate understanding for program development" (p. 666).

After years of looking for other factors that might influence the way teachers teach, researchers and teacher educators have returned to studying in more complex ways the connection between what teachers think and believe and the way they teach. Unlike those who enter professions such as law or medicine, teachers begin their work with vast amounts of personal history in their future workplaces. These past experiences create hidden personal narratives about education, school, and schooling that have a profound and sometimes intractable impact on the way teachers teach their students.

Teacher educators sought in many different ways to uncover or explore these hidden narratives, which are so central to teacher practice. Early work in personal knowledge and the nature of knowing (e.g., Polanyi, 1958), teachers' socialization (e.g., Lortie, 1975), changes in teachers' lives and careers (e.g., Ball & Goodson, 1985), teacher beliefs (e.g., Munby, 1983), teachers' practical knowledge (e.g., Elbaz, 1981; van Manen, 1977, 1994), the development of teachers' self-concepts (e.g., Nias, 1989), teachers' stories (e.g., Ashton-Warner, 1963; Bullough, 1989), and more recent work in teacher educators' life-histories (e.g., Ayers, 1993; Foster, 1997; hooks, 1996; Miller, 1998; Neuman & Peterson, 1997) all laid a foundation for understanding the role of personal narrative in demystifying teaching and its political and social constraints. Theories on adult development (e.g., Kegan, 1982; Kitchener & King, 1981) and women's development (e.g., Belenky, Clinchy, Goldberger & Tarule, 1986; Bateson, 1990) broadened the knowledge base about the ways adults grow and change over time and also emphasized the importance of self-reflection for the growth of consciousness and increasing capacity for abstraction and perspective-taking.

The connection between personal reflection and action was also a vital ingredient in the growth of personal history self-study. Schön's (1983) early work on reflective practice was extended by Russell and Munby (1991) to examine the authority of experience in learning to teach. An outpouring of work in action research (e.g., Carson & Sumara, 1997; Kemmis & McTaggart, 1982; Wells, 1994; Whitehead, 1995) and teacher reflectivity (e.g., Bullough, 1989; Calderhead & Gates, 1993; Clift, Houston, & Pugach, 1990; Cruickshank & Applegate, 1981; Goodman, 1984; LaBoskey, 1994; Tom, 1985; Valli, 1992; Zeichner & Teitelbaum, 1982) all played a role in teachers' thinking critically about how their actions might be interpreted from multiple perspectives, although not necessarily drawing the connections from the personal experiences that led them towards those actions.

Similarly, the growing awareness of the political nature of all forms of research led to studies that explicitly derived from feminist methodologies and worked towards including alternative pedagogical viewpoints and issues of social justice (e.g., Haug *et al.*, 1987; Hulsebosh & Koerner, 1994; Reinharz, 1992; Weiler, 1988, 1991). Researchers began to address the role of authority in teachers' lives and a need to examine personal experience as both a source of knowledge and as a political commitment to oppressed groups. Clandinin and Connelly's (1994)

use of story narratives to awaken and educate the self and others highlighted the power of telling and retelling – a component of much of personal history research – as did the work on narratives by Casey (1995), Florio-Ruane (2001), Witherell and Noddings (1991) and Jalongo and Isenberg (1995).

What most distinguishes personal history research from other research on education is that the researcher is not simply the one with the Ph.D. who works in the university; instead, researchers are all people, in the academy or in K-12 schools, who study themselves and the relationship between their own stories and their current teaching practice. Arguing for *insider knowledge* or the experiential knowledge of teachers as valuable and legitimate research, personal history self-study researchers make the case that knowledge does not reside only in academia or outside of teachers' lives (Cochran-Smith & Lytle, 1993; Gitlin, Peck, Aposhian, Hadley, & Porter, 2002). Rather, life histories legitimize the personal voice of the writer and also require teachers to be critically reflective, authentic, and attuned to outside interpretation promoted through discourse with others (Fendler, 2003, p. 22).

Perhaps because so many previous forms of educational research inform personal history self-study, defining its boundaries is a tricky task. Wary of Kennedy's (1989) warning that reflection is variable and subject to idiosyncratic and self-interested interpretation, Loughran and Northfield (1998) clarify the intersection of reflection and self-study and note:

> Reflection is a personal process of thinking, refining, reframing, and developing actions. Self-study takes these processes and makes them public, thus leading to another series of processes that need to reside outside the individual. Self-study can be considered as an extension of reflection on practice, with aspirations that go beyond reflection and even professional development and move to wider communication and consideration of ideas, i.e., the generation and communication of new knowledge and understanding. Reflection is important in self-study but it alone is not self-study. Self-study involves reflection on practice. (p. 15)

Still, even with Loughran and Northfield's helpful explanation, the many-pronged histories and purposes of personal history self-study have made the field open to misinterpretations and misconceptions from many different fronts. In the next section, we clarify what we see as self-study and the nature of this methodology. Afterwards, we provide research examples to demonstrate these definitional components set within a discussion of the major contributions of personal history self-study to the field of teacher education.

What is Personal History Self-Study?

We refer to personal history as those formative, contexualized experiences that have influenced teachers' thinking about teaching and their own practice. Personal history research is reviewed as the historical or life experiences related

to personal and professional meaning making for teachers and researchers. This includes both the autobiographical and life-history research of teacher educators' personal history work about themselves as well as teacher educators' work in using a personal history approach with their teacher-students towards improving teaching practice at both K-12 and university levels.

Holt-Reynolds (1991) notes that a major purpose of personal history self-study is to move away from generalizability and towards real learning, and explains:

> It is not reasonable to expect that every conclusion based on the personal experiences of one individual will be appropriate to generalize to all students. Some of the beliefs that preservice teachers bring to their study of teaching will, in fact, be based on insufficient data and will, therefore, be invalid for generalizing to larger groups of students – Changing, challenging, enlarging, informing, and reforming the premises upon which preservice teachers base their arguments become our primary and legitimate concerns. (p. 21)

A review of the research reveals that personal history self-study serves this very purpose and especially because of the nature of this methodology as: (1) collaborative; (2) contextualized; and, (3) conducted through diverse methodologies of qualitative research.

The Collaborative Nature of Personal History Self-Study

Personal history self-study is about self-knowing towards personal and professional growth that is necessarily enriched through conversation and critique within a self-study community of scholars. Eisner (1991) talks about how personal biographies make it possible for individuals to experience and interpret the world from multiple perspectives as they recognize and alter their frames of reference. But the self-studier does not travel the road alone. Though the term "personal" here would suggest that singularity, one of the hallmarks of personal history self-study is its collaborative nature. Personal history self-study entails the opportunity to disrobe, unveil, and engage in a soul-searching truth about the self *while also* engaging in critical conversations, and most importantly, continuing to discover the alternative viewpoints of others. For example, it was through critiquing each other's personal history writing that Gitlin *et al.* (1992) came to realize that the personal histories their students brought to the classroom created a curriculum of difference. Teachers are finding that personal history self-study is part of the fabric of what it means to be a teacher and that a dialogue with others enhances that process. Westerhoff (1987) explains:

> We are at our best when we make our lives and our search for meaning available as a resource for another's learning. To be a teacher means more than to be a professional who possesses knowledge and skills. It is to have the courage to enter into a common search with others. (p. 193)

Neilsen (1994) explains its threatening nature – most threatening, perhaps, to

ourselves: "Looking at ourselves up close, we risk exposing our insecurities, revealing bad habits and dangerous biases, recognizing our own mediocrity, immaturity, or obsessive need to control. In some cases, we find the price of growth is simply too high" (p. 35). Taking the autobiographical public is a bold, yet critical research undertaking for teachers' personal and professional development. Perhaps no one better exemplifies the power of longitudinal collaborative interpretation in personal history research than Knowles and Cole (1994a, 1994b, 1995; Cole & Knowles, 1993, 1995, 2000b) who have used personal history self-study to challenge and deepen their work for more than a decade. Cole and Knowles (1996) view personal history self-study for the purpose of self-understanding and professional development as essentially being thoughtful about one's work. Their personal history self-study is courageously discussed within the geo-political climates and institutional contexts where their work has been situated.

The Contexualized Nature of Personal History Self-Study

Personal history self-study is about the self *in relation to others* in historical and social contexts that facilitate the educative experience. The individual "uncovers biography" by situating herself/himself within history. Britzman (1986) writes that the connection between self and history,

> Allows the individual critical insight into both the nature of her/his relationship to individuals, institutions, cultural values, and political events, and the ways in which these social relationships contribute to the individuals' identity, values, and ideological perspectives. In this way, individuals do have the capacity to participate in shaping and responding to the social forces which directly affect their lives. (p. 452)

One of the difficulties that may arise when teacher educators encourage their students to write personal history self-studies, occurs when they say, "just tell your story." Miller (1998) discusses why "telling your story" cannot be an end in itself and explains,

> Many (teacher stories) do not explore and theorize social, historical, or cultural contexts and influences, including language and discourse, on constructions of the "selves" who have those "experiences." Such autobiographical work does not incorporate situated analyses of specific contexts that influence the constructions and representations of selves and others. (p. 150)

Personal history self-study stories should avoid the problems of simple story telling by addressing the multiple selves, the never-ending, complex, and incomplete self. The stories should deal with the surprises, failings, contradictions, and the desire to know relevant to a particular space and time. Within their settings, self-studiers also raise alternative interpretations and visions of their teaching realities and show their lived contradictions and failings. It is not a seamless,

transparent story with a beginning, middle, and end but an ongoing story, which speaks of a process and highlights mistakes, understandings, tensions, and insights. It is honest and specific to the context and time in which it is placed. For example, Macgillivray (1997) and Schulte (2002) each explore how their life history biases their interpretation of their pedagogy and how they reconstruct their teaching realities in the contexts in which they work through self-study.

Bullough and Pinnegar (2001), two major pioneers in the self-study of teaching practices movement, speak of this necessity of contexualization in autobiographical writing and the need to show how the issue of quality and validity are represented in personal history self-study. They developed "guidelines" for conducting autobiographical research because, "determining just what it means to be involved in self-study research has proven very difficult" (p. 14). They emphasize the need for attention to context so that the story is grounded. As with other qualitative research, the reader gains insights into the person under study when placed within a rich, in-depth description of the scene, situation, and action. Particularly because of its context specific nature, Bullough and Pinnegar (2001) emphasize that the aim of a personal history self-study approach is to, "provoke, challenge, and illuminate rather than confirm and settle" (p. 20). The different forms that personal history self-study has taken affirms this effect.

The Diverse Methodological Nature of Personal History Self-Study

Although we speak of *a* methodology or approach in personal history self-study, there are a wide variety of qualitative methods that have been employed in personal history research e.g., narratives, journaling, correspondence, electronic mail exchanges, audio-taped discussions, videotapes of one's teaching, story telling, memory work, emotion work, education-related life-histories, interviews, and multiple forms of artistic expression such as drawing, photography, poetry, and artistic installations. For example, Richards (1998) sketched self-portraits of her teaching to ask questions about the origins of her pedagogical style and how she might teach differently. Muchmore (2000) and Gabriel (2000) engaged themselves and their students in personal history literacy experiences using poetry. Archibald, Chamberlain, and Gerrits (2000) used mask-making as a medium for their students' self-knowing as teachers.

Cole and Knowles (1996) view the various forms they employ in their personal history self-study work as a form of their professional development. They use writing about their personal histories as a means for understanding themselves and also as the data collection method. Their personal histories, as well as those of their students, have been represented through various formats such as case study, narrative, or life history representation and more recently through arts-based inquiries. For example, Cole (1999) and Knowles (1999) used artistic expression in their representations of self in art installation formats at an international conference to showcase their inquiries of how personal history influenced their professional lives. Finley and Knowles (1995) considered how their

aesthetic and artistic experiences shaped who they are as researchers and their views on what they consider research to be.

Cole and Knowles (1998a) explain how the diverse methodological, subjective, and practical nature of personal history is antithetical to scientifically based research and doctrines of positivism, measurement, quantification, and predict-ability, which are highly valued in conservative-minded institutions (p. 47). Consequently, self-studiers using personal history face challenges similar to those encountered by other qualitative educational researchers. In response to this dilemma, Feldman (2003) presents concrete suggestions to self-study researchers for increasing the validity of self-study through: (1) more explicit description and identification of how data was collected; (2) a discussion of how the researcher constructed the representation of data; (3) an exploration of multiple ways of representing the same self-study; and, (4) evidence of the value of the changes that were promoted through the self-study (pp. 27–28). Indeed, the literature in personal history self-study gives credence to the fact that personal history, in its many forms, serves key functions in furthering the knowledge base of teaching and prompts significant changes in teacher education.

To What End Do Teachers and Researchers Use Personal History?

In this section, we discuss how personal history self-study research is aimed at the production and advancement of knowledge to improve education, to expand the knowledge base of teacher education, to explore programmatic reform, to construct personal and professional knowledge, and to model complexities of education. Personal history self-study is a setting within which teachers and researchers struggle to make sense of their work and ultimately transform the educational experience. In other words, personal history self-study is useful for:

1. self-knowing and forming – and reforming – a professional identity;
2. modeling and testing effective reflection; and,
3. pushing the boundaries of teaching.

Self-knowing and Forming – and Reforming – a Professional Identity

One of the major reasons teachers and researchers have engaged in personal history self-study is for self-knowing and for the development of their professional identity. There has been an abundance of research on *what* teachers do and less on *why* they do what they do. Research about teacher beliefs first began to focus on the *whys* of teaching and the personal history approach extended this focus by having teachers ask *themselves* where their beliefs were generated. While teachers may focus on many different elements in their personal history work, the two most central areas are: 1) exploring personal history connections to teaching and learning and subsequently transforming curricula; and, 2) under-standing their home culture and its influence on who they have become as teachers.

Exploring Connections of Personal History to Teaching and Learning

Pinar (1980) speaks of the need for autobiographical study as a "voyage out" where teachers can examine the taken-for-granted everydayness of their teaching lives and make them conscious by exploring autobiographical issues (p. 91). Pinar and Grumet (1976) have worked extensively with preservice teachers using autobiography as a form of curriculum theorizing in order to, "create dissonance, to dislodge the comfortable fit of self-as-object, self-as-place, self-as-agent, for where there is a neat complicity between these three there is no movement, personal, or professional" (p. 79). In her many thoughtful writings about her work with teachers, Grumet (1981, 1987, 1988, 1990a, 1990b) provides a rationale for the use of autobiography as a form of curriculum inquiry. Addressing the potential concern that a retrospective look will only affirm what we already value, Grumet (1990b) states:

> I would be naïve if I refuse to admit influence in what we notice, what we choose to tell, and in how and why we tell what we do. Nevertheless, autobiographical method invites us to struggle with all those determinations. It is that struggle and its resolve to develop ourselves in ways that transcend the identities that others have constructed for us that bonds the projects of autobiography and education. (p. 324)

Similarly, Bullough and Gitlin (1995) note that autobiography is a means not simply for reflecting on the past but a vehicle for shaping the future. In their research with beginning teachers, they found:

> The writing of autobiographies does not free teachers from their histories but rather enables them to take charge of those histories, to assert ownership, and to recognize their place as actors who can shape contexts and as authors who have before them choices that matter. (p. 25)

In reflecting on his teacher self, Bullough (1997), recalls his need to know about the principles that underlie his teaching while he questions if his teaching makes any difference in his students' learning. He recollects the early influences of his father and several teachers, "whose lives testified that ideas matter and have social consequences" (p. 15). With his own principles in hand, he then attempts to educate beginning teachers into the habit of mind that self-knowledge is crucial to their professional growth. Bullough, along with his colleagues, collects data through student assignments such as education-related life histories, personal metaphor analyses, and personal teaching texts, and discovers how personal history profoundly influences their teaching experiences, especially in the first year of teaching (Bullough, Knowles, & Crow, 1992). Bullough and Stokes (1994), basing their analysis of preservice teachers' work completed with a focus on the self in teaching, found that as their students progressed throughout the year, they developed more sophisticated conceptions of the complexities of teaching and their students' learning.

Patti Canzoneri, who teaches grades 7 and 8, supports Bullough's contention

that a personal history self-study approach enhances professional growth, writing:

> The power of personal history inquiry is that it has allowed me to explore my implicit theories – those ideas that shape my notions of what teaching and learning are really all about. The project even took the process one step further and allowed me to deeply examine what had come before and how that had shaped what was now. My hope, of course, is that this new understanding will continue to shape and influence what is yet to come. (Cole, Knowles with Canzoneri & Diakiw 2000, p. 39)

Researchers have noticed what happens when personal history self-study with reflection is absent in teacher education programs. Since preservice teachers come into the profession with notions of what "good" teaching entails (Lortie, 1975), if their teacher education program has only a training or technical teaching skills model without any vehicle for exploring their past experiences with education, they will enter into the process of role negotiation without reflection on the pedagogical and moral implications of their actions (Bullough, Knowles, & Crow, 1992). Feminist poststructural theories raise further questions about teachers' shifting identities, discourse, power, and agency in teacher training modules (e.g., Youngblood Jackson, 2001).

Greene (1978, 1995) also writes about how being conscious about one's self and one's teaching encourages teachers to examine and explore the unexamined reasons for their everyday actions. She asks teachers to consider what is not obvious and what is yet to become because a grounding in personal experiences encourages consciousness and being awake to themselves and to the contexts in which they are embedded. Collaborative personal history exploration also helps them see that others have a sense of reality that is different from their own. Being wide-awake encourages an inquiry about the forces that appear to dominate them. A personal history approach has enabled teachers to see themselves as knowers and producers of knowledge or as Hamilton (1995) explains, "I had always been looking outside to find which person or theory matched my ideas – I never looked inside to see what fit with myself" (p. 32). Making sense of their own taken-for-granted position helps to name and demystify a "false consciousness" in order to see that there are many points of view.

Personal history self-study is not simply a way to reflect upon and record issues of personal and professional identity, however. It is also a way to put that identity on the line and risk needing to reform and recreate the self while also attempting to transform curricula. For example, Louie, Stackman, Drevdahl, and Purdy (2002) an interdisciplinary team of university faculty, wrote of their personal teaching success and failures over a six-month period with weekly meetings to collect and analyze their taken-for-granted assumptions learned from their experiences when they were students themselves. The process led them to a discussion of socialization processes and an identification of their beliefs, which subsequently changed their viewpoints about myths of teacher control of learning, preparation, and approaches to teaching.

Similarly, Lomax, Evans, and Parker (1998) use collective memory work where they write and then share memories of their identities as learners while asking teachers who work with special needs students to do the same, so that they might come to know, live, and practice their educational values more fully. In this process Lomax, Evans, and Parker become vulnerable as they show themselves as learners to their students and discover that when they do so, they liberate themselves and others. They reflect:

> The form in which we have presented our self-studies is not intended to be comfortable but to demonstrate a dialectic between orders of meaning that are signified by different types of text. ... We have punctured our original narrative with insights that we have come to through discussing our texts with different groups of teachers and academics, and this has been a source of enrichment. (p. 175)

Teacher educators engaged in personal history self-study do not consider their identities in isolation. They also have to consider their institutional contexts and learn to mediate among a variety of complex forces as they create and re-create their own professional identities. Teachers' collective personal stories speak not only of their pasts but also of their current values, beliefs, and morality in terms of what they challenge, what they lay aside, and what they model for others.

A good example is the work of Guilfoyle, Hamilton, Pinnegar, and Placier (1995;1998) known also as the "Arizona Group" who speak out about their difficulty as women entering academia as they worked against academic socialization and towards educational reform. They explore their professional biographies to inquire about their experiences as new professors at their respective institutions. Their work explores the struggle to meet the demands of being tenured while trying to hold on to who they are as people. Using the tools of metaphors, images, and memories, they consider the impact of the personal on their professional roles. In the process, they rediscover their individual commitments to students and find support in their risk taking to reshape the educational experiences for students. They assert: "We have become and are becoming teacher educators" (1995, p. 53). Through their personal history self-studies they analyze how they respond to those in power. They utilize a "walking our talk" frame to model a commitment to their students, teaching beliefs, and hopes. In correspondence, one writes:

> Our personal histories and away-from-academic lives determine our responses to, our analyses of our academic work. It is not just our College of Education and the people in it that we are attempting to understand, but ourselves in relation to that institution and those people. (1998, p. 186)

In step with the Arizona Group's findings, there is much research to support that teachers are influenced by their pasts and by the broader and current social sphere, the sometimes invisible forces that shape their teaching lives. For example, in their study of seven community college teachers who were career changers

with no formal teacher preparation, Goodson and Cole (1994) found that these teachers' developing professional identities were contextually dependent on their evolving notions of professional community and on their access to the micro-political realities of school life. Based on their research of teachers' life histories and discussions over a two-year period, Goodson and Cole note that teachers' understandings of professional identity changed over time. In the first year teachers' professional identities were bounded by the classroom walls but as they progressed, they gained a clearer understanding of contextual factors that impinged on their development. There was a re-identification process of what teaching entails, nourished through critical reflection in personal history self-study. They became interested in the politics and constraints of their institutions while they developed a concept of professional community. Also in the second year, teachers thought more deeply about how they represented the self within a specific context and system and how they were affected by the privileges and status the institution granted or did not grant them. In a similar light, Russell (1995), through the discoveries he has made in a personal history self-study examining his pedagogy, calls for support systems to facilitate the professional development and identities of both beginning and experienced teacher educators.

Berger (1999) affirms Russell's call for such support systems for professional development yet views them through the lens of adult developmentalists. She explores the connections between the self-study hopes of teacher educators like Zeichner and Liston (1987) and Bullough and Stokes (1994) and the research on the way adult capacities grow and change over time (Kegan, 1982, 1994). She comes to the paradoxical conclusion that some kinds of self-study reflection may be beyond the current capacities of many preservice teachers, yet it is exactly this kind of self-study that may lead towards increasing their capacities.

Also with a focus on adult development and teachers' shifting conceptions of self, Trumbull (1998), in a five-year longitudinal study, reflects upon the levels of support and challenge that she provides for her secondary education science students. She interviews her students during their progress in the program and later during their beginning years of teaching. Through the lens of Kegan's (1982, 1994) theory of adult development, Trumbull explores her students' notions of "self" based in their own histories and then as they develop and "evolve" as secondary science teachers. As she investigates their histories and begins to understand their relationships within the cultural rules that operate in their schools, she begins to question her role as a teacher educator and the role of her perspective and history in guiding and supporting the growing perspectives of her students.

This work portrays that personal history self-study for self-knowing and professional identity formation is a continuous and evolving process constructed throughout teacher educators' careers. It can include looking at one's teaching self, looking at issues of teaching and learning in one's classroom, and looking at self-knowing and professional identity from a developmental perspective. Personal history self-study researchers have also examined self-knowing and

professional identity through a particular cultural lens to consider how their teaching has been shaped by their cultural pasts.

Exploring the Connections of Culture and Home to Teaching and Learning

Research in personal history with the goal of self-knowing also explores key, and often hidden, issues regarding the influences of culture, race, and gender in teaching and learning. Butler, Herndon, Kumar, Oda, and Wong (1998) examined their immigrant/emigrant pasts to discover how those life experiences, particularly motivational factors of migration, manifested themselves in their teaching. As immigrants from various generations, they each sought to trace back and investigate their families' emigration to the United States. They conducted interviews with family members and researched historical journals and diaries and other documents related to the time period and immigrant experiences of their families. Their personal history documentation helped raise their consciousness and helped them connect with emotions of their pasts and, in so doing, connected their families' stories to the stories of others. Butler *et al.* (1998) found collaborative personal history self-study particularly useful to explore how they might think differently about their teaching with immigrant children in public schools. The impetus of their research was to model for preservice teachers how to use and connect personal narratives to their own teaching so they could better relate and interact with immigrant children in public schools. Their students in turn, were able to learn about the significance of "otherness" embedded in their stories.

Oda's (1998) quest was more personal. As a Japanese American growing up in a lower socio-economic, multicultural neighborhood, she remembers that the fight to survive, which characterized her youth, ran counter to her cultural upbringing of seeking harmony and dignity. As she traces her process of becoming a teacher in her former elementary school, her personal history self-study shows her that her curriculum and pedagogy centered on her original quest for harmony and dignity. She comes to a better understanding of why she teaches the way she does and what affect that has on her students. Through her personal history self-study she is better able to articulate, and thus understand the implications of, this connection. She reflects:

> My childhood experiences influenced how I responded to my students –
> with harmony and dignity. I tried diligently to create an atmosphere where
> students were winners, not losers. I created plays where everyone participated in cooperating with each other. In my classroom, cooperation was more
> coveted than competition. … Conflict was dealt with honestly and openly.
> (Oda, 1998, p. 115)

Whereas ethnicity helps demystify professional identity for some, others have centered their study on race and gender. For example, Brown (2002) examines the issue of race as she searches for the connections between her curriculum and its match, or mismatch, with the lives of her students. She was bothered by the

fact that the European American preservice teachers in her human development course did not acknowledge their sense of racelessness in their personal essays. Instead of looking for what was wrong with her students, however, she searched her own history to understand her relationship to race. As she examined the social roots of her identity as an African American woman, she saw how her connection to her own history compelled her to reorganize her course with race as an explicit identificatory dimension and as significant to the identity formation process. She exclaims:

> Why is race not addressed in the autobiographies of European American students? Why did I expect it to be? ... Having grown up in a middle-class, integrated community, [for me] race consciousness was a daily reality. It was a social marker determining my rights, others' reactions to me, and the meanings attributed to my personhood, my experiences in school, church, and other public institutions, and the familial guidance that prepared me for life as an African American woman. (Brown, 2002, p. 146 & 155)

Also exploring issues of race, Givens Generett (2003) interviews an elderly black woman about her personal history experiences as related to education. After exploring the life history of this older African American educator, Generett decides to look at her own relationship to schooling and education and her role as an African American woman in the academy. As Generett investigates the myth of black inferiority, she notes, "The construction of Mrs. Lacewell's story forced me to consider who I am as an African-American female student-educator and how my lived experiences are similar to, yet different from hers" (p. 91).

But personal history self-study as memory work is not limited to explorations of culture, race, or gender. Any element of the past that is a shaping force of the present, or future, is worthy of exploration. For example, Mitchener (2000) realizes that the wonder of science, which embraced her as a child, came from her home culture and her fond memories of her father as a gardener. She uses it to inform her work as a science teacher educator and explains: "From such personal knowing, the kind that optimally comes from self-study, I find myself in a new relationship with science teacher education, one that fuels my future work as both scholar and practitioner" (p. 186).

When the home *is* the school, understanding the history of the parent/instructors is doubly important. To this end, Knowles (1998) explores the life histories of parents who have made the decision to home-school their children. He discovers that their personal histories, particularly related to conflicts in their schooling pasts, played a major role in their reasons for home schooling and in their educative practice. Muchmore and Sayre (2002) write of their own biographical and dissimilar underpinnings and consequent disagreement about home schooling their daughter Grace. Through his autobiographical writing, Muchmore reflects on his negative schooling experiences in a small private school where he recalls, "I hated the regimentation; I hated the control; I hated not being able to talk. And I hated being yelled at, and sometimes hit, for not

paying attention" (p. 54). Sayre, who was schooled in her home surroundings, notes gaps in her knowledge. Ultimately, they come to a better understanding of their rationales and beliefs about teaching their daughter and contribute to the existing research literature on home schooling through personal history self-study.

These studies illustrate how personal history aimed at self-knowing contribute to the field of self-study in ways that have informed curriculum, teachers' understanding, and subsequent reshaping of their teaching. It has given power to their knowing and to their process of becoming teacher educators. As researchers examine the connections of their cultural pasts to their teaching, they gain a clearer vantage point from which to consider the consequences of their students' perspectives on learning. These examples also highlight that personal history self-study is one that marks teachers' journeys and their development as they struggle to improve their practice through self-knowledge and understanding, which, in turn, models that evolving process for their students.

Modeling and Testing Effective Reflection

Future teachers are exposed to thousands of images of teaching before they ever stand at the front of their first class. In these images, teachers of greater or lesser skill create examples of what teaching is that are inscribed into young minds and take shape both in the make-believe school games children play and in real classrooms once those children grow up to be teachers. This cycle of teachers teaching as they were once taught must be interrupted so that teachers can make more thoughtful decisions about how and why they teach. In the previous section, we explored how the *surfacing* and *examination* of those past histories can change the way teachers practice in the present and the future. In this section, we explore the importance of having teacher educators create new, intentional models of teacher reflection and how personal history can contribute to that effort.

Many teacher educators and researchers have been trained to preach, but not necessarily practice, professional habits such as reflection and self-study. Teacher educators talk about the need for teachers to critically analyze theoretical connections to their teaching, to write about critical incidents and people who have influenced their decision to become a teacher, or to keep a journal on their meta-conversations of teaching as related to personal experiences, which might have impacted their current teaching. Yet many teacher educators, when asked, will admit that the complexities of the negotiation between the academy and the practicum site, the on-going pressure to publish (or perish), and the higher number of students and classes which typify a teacher educator's schedule leave little time for personal reflection (Elijah, 1996; Olson, 1996). The growth of personal history self-study as a legitimate form of research and writing may encourage teacher educators to see reflection itself as a necessary part of their work, as teachers and as scholars.

Indeed, Hamilton (1995) argues that the focus of teacher education research

be rethought as teacher educators become models of self-study to their peers and students. She writes: "It is time to start looking inward, instead of outward … we can examine ourselves in our own acts of teaching" (p. 39). Even when teacher educators want to practice what they preach, personal history self-study is no simple undertaking. Because historically good teaching has been viewed as impersonal and objective, taking the plunge into the murky water we ask our students to explore puts our "objectivity" at risk and exposes us in all our human frailty to our students and ourselves. Grimmett (1997) recognizes the "sweet poison" of self-disclosure as he shares personal experiences that have shaped him as a teacher educator and his attempts to reform his pedagogy. He writes:

> Such learning is as profound as it is painful. However, it is crucially important that scholars who write about "reflection" and "teacher research" actually do it with their own teaching and students. … Only when professors act in these inquiring ways can the traditional, oracular university mold of didacticism be broken. (Grimmett, 1997, pp. 133–134)

In a similar way, Clandinin (1995), who found herself dissatisfied with "living the same story" of how to teach, models a restructuring of her pedagogy. From her dissatisfaction, she created an alternative program for teacher education that encouraged a questioning of hierarchical arrangements between teacher and student and a re-storying of what teaching should look like. She reminds us that modeling reflection and self-study is not something that ends. It takes courage, imagination, and a willingness to always be a learner:

> Without imagining, living and telling new competing stories that question the plot line of the sacred story, little in my lived story as a teacher educator and little in the professional knowledge landscape can change. Without opening up to the many possible visions that serve as possible storylines, I may find myself no longer still learning to teach. (Clandinin, 1995, p. 31)

Bullough (1994) also finds a new story line through his re-storying but only after sorting through a period of indifference and distance from his students. He writes about how his later experiences and interest in teachers' professional development led him towards a personal history approach and a reshaping of his teaching. Now he strives to model that approach for his students. Before asking his students to write education-related life histories and analyze personal teaching metaphors, he first shares his own with them. On his continuing search of the truth of who he is as teacher, he shares:

> For me, authenticity in teaching requires that I be able to articulate for my students my own teaching metaphors as they arise from my life history and that I be actively exploring myself as a teacher, just as I require that they engage in such exploration. (Bullough, 1994, p. 110)

Bullough explains that this modeling and usage of a life history approach

scaffolds his students towards greater control of their professional development and towards their goals of whom they seek to become as teachers.

In a similar effort to encourage her students to gain the confidence to willingly scrutinize, analyze, and communicate their own personal histories, Middleton (1992) models the interplay between her biography, history, and social structure. She makes her private life public when she writes her autobiography and shares it in her "Women and Education" course. Retracing her early experiences in a girls' boarding school where she was constantly surveyed and monitored under the watchful eyes of teachers and matrons and burned her diaries in fear that her notions of self-support and independence would be discovered, she now pronounces to her students that, "change in women's lives (and education) is both desirable and possible" (p. 45).

Cole and Knowles (2000a) assert that becoming a teacher is a lifelong process of development rooted in the personal. Knowles (1998) sees his personal self-study as a necessary extension of his teaching, explaining, "Believing in the importance of a personal history pedagogy in teacher preparation programs I am only doing what I have long asked others to do" (p. 22). Cole and Knowles suggest and use a "reflexive" inquiry stance where teachers attempt to make sense of who they are as people and how their formative and continuing experiences have influenced and continue to influence their professional practice. The reflexive inquiry they require for their teachers is their own stance as well:

> Because we see the practice of teaching as an expression of who we are as individuals – that is, an autobiographical expression – we assert that to understand teaching in its complex, dynamic, and multidimensional forms, we need to engage in ongoing autobiographical inquiry. (Cole and Knowles, 2000a, p. 15)

Many have begun to follow Cole and Knowles' example of holding themselves to the same standard as their students. As she considers the research-based practice of building on students' prior learning and identifying the misconceptions they hold, Holt-Reynolds (1991) wonders if she is modeling and practicing what she teaches:

> I am keenly aware – often uncomfortably aware – of the recursive nature inherent to my argument as I broach this principle with preservice teachers. Like a woman who stands between parallel mirrors and sees her reflection reflected back on itself in an infinity of progressively diminishing images, I ask myself whether I have acted according to the principle I am advocating … "Do not the principles we are discussing apply to us as well?" (p. 6)

Subsequently, Holt-Reynolds (1998) used personal history-based teacher education classroom activities to elicit preservice teachers' tacit beliefs about a course-specific concept and to construct a window into her students' as well as her own understanding of teaching.

Kaplan (2000) comes to a similar conclusion as he changes his stance as a

teacher who remains on the side while he guides students in writing about their personal experiences. He writes:

> More and more, I found myself responding with my own stories – stories that have made a difference in my teaching and living – and how these experiences have shaped my teaching philosophy. Where before I was reluctant to write along with my students, I found, in time, to be writing with them. Where before I was resistant to share my life stories, I found myself talking more about myself. ... My letting down my guard has made me a better teacher and added a spontaneous instructional style that has emboldened my teaching practices and personal development. (Kaplan, 2000, p. 129)

In making their self-studies public like this, teacher educators have modeled and demonstrated the importance of collaboration to reflection to their students. Getting multiple perspectives, including their students', is a necessary component for reflection, which they also model during this process.

Bass, Anderson-Patton, and Allender (2002) offer a good example of modeling practice with the incorporation of critical friends in personal history self-study. They developed their own self-study teaching portfolios while mentoring students to do the same. Their students worked in collaborative groups where they wrote personal narratives, discussed their values, shared samples of work, and conducted peer observations. In a similar fashion, Bass invited Allender to observe her teaching for a semester and notes that she openly shared her vulnerabilities while she gained confidence, agency, and learned to hear multiple perspectives. Anderson-Patton learned to recognize her own biases, -isms, and entitlements in this collective personal history self-study but admits that she was at first uncomfortable with focusing on the self because as she states, "my personal history and culture taught me that this is indulgent" (p. 65). She finds that her collaborative research circle helped her to overcome this misconception as she came to a better understanding of herself in the context of her teaching. Afterwards, she learns to provide more time for her students to develop their voices through collaborative forums.

These examples of personal history self-study, demonstrate how teacher educators and researchers are finding ways to question, reframe, and reformulate their understandings about their teaching innovations while also modeling that process for others. While teacher educators move through these discoveries of self within a specific context and share their stories in larger circles, they model the process and approach of personal history for others, and especially for their students. The teacher educators and researchers discussed here represent a growing number of people who also insist that this modeling supports their ecology of living and enhances their learning as well as their students'. Thus, it calls into being alternative ways of knowing about one's practice, which results in a reframing of that practice.

Pushing the Boundaries of Teaching

The very nature of personal history research with its multiple and alternative methods pushes the boundaries of teaching and teacher education programs as it challenges the status quo of traditional research. In that manner, researchers seek alternative interpretations of the rhetoric, including their own, that surrounds teaching. They examine the inconsistencies involved in their teaching and showcase their failings so that they and others, especially their students, might learn from their mistakes. Personal history self-study research is part of a larger teacher education reform movement that involves extending the boundaries of thinking about teaching and teacher education (Cole & Knowles, 1996; Knowles & Cole, 1994a).

Personal history self-study is a method for educational transformation in two key ways. First, as a unique form of reflection, personal history self-study opens what was once hidden so that those unexamined assumptions and beliefs about the world no longer drive the production of curriculum and assessment. Second, the teaching of personal history itself, because it deals with things that tend to be buried far beneath the surface, often requires non-traditional pedagogies in order to help teacher-students mine the depths of their own past.

Teacher educators tend to be conservative and fear alienating and offending their conservative students, K-12 school personnel, and governing institutions (McCall, 1998; Liston & Zeichner, 1990). One way to move away from that conservative paradigm is to explore both what forces are at work in the support of such tendencies and also what has enabled more reform-oriented teachers and teacher educators to break away. Personal history self-study has done both of these things. Moving away from the status quo and pushing the boundaries of the work of teachers and teacher educators is a key feature of Zeichner's work (1995). As one of the few students in his high school graduating class who went to college, he writes of becoming, "politicized by growing up in the city of Philadelphia, and by attending Philadelphia public schools" (p. 12). He has taken a consistent stand in his commitment and work in preparing teachers to work for social justice and believes it to be an important part of his being. Zeichner (1996) and others continue to push the boundaries of teacher preparation practices toward social reconstruction by encouraging teachers to reflect on the social and political consequences of their teaching and on the institutional, cultural, and political contexts in which they work (Zeichner & Liston, 1996).

However, teachers generally are not political activists and do not tend to challenge the politics of schooling. In her quest to better understand this phenomenon, Rumin (1998) corresponded with four "dedicated" teachers who had vowed to be silent about their disillusionment about teaching and their devaluation by society. Subsequently, Rumin now works to ensure that student teachers hear these stories as well as consider how their own personal histories inform their teacher knowledge and teacher politics. She provides time for her students to reflect and write about their experiences with power and its influences on their learning. Personal history work provides a space where her students can examine

the development of their beliefs and challenge their assumptions about what it means to be a teacher. As teacher educators reshape status quo curricula, they find that teaching about perspective-taking, diversity, social justice, and teacher empowerment are more effectively studied within a personal history self-study landscape and through non-traditional pedagogies. There is a plethora of literature in personal history self-study where teacher educators employ new pedagogies to rethink their practice and to reframe curricula. We offer some exemplars to demonstrate the uniqueness and usefulness of these novel pedagogies to teaching and learning.

For example, Hamilton (1998) asks her students to explore their beliefs using the tool of autobiography clubs, which she adapted from the work of Florio-Ruane (1994) to, "allow students to push beyond their own world to see themselves and others in new ways" (p. 118). She searches for a better way to prepare preservice teachers to work for social justice and teach in diverse settings through a personal history approach. Hamilton found that using autobiographical text helped her open an honest dialogue about teaching in diverse settings with her students but that students did not change their beliefs, and subsequently their teaching practice, in any significant manner. This research illuminated that she needed to continue to search for more effective ways to facilitate this difficult transformation.

While much of personal history self-study for pushing the boundaries of teaching and learning is grounded in, and explored through words, images are also strong and visceral components. Mitchell and Weber (1998, 1999) use images to boldly assert that it is time for teachers to look at the identities crafted from their schooling past and reinvent themselves. Working back through a memory space, they employ multiple atypical methodologies to that end. With the use of narratives, they walk teachers through replaying their childhood dress-up time as want-to-be teachers to help them understand their teacher identity then and now. They talk about issues of authority and control, play and work, gender, and purposeful forgetting. Inspired by the work of Solomon (1995), they conduct memory work to explore the feelings associated with their school photographs. A school photograph workshop yields data that helps them to ask questions about specific memories of their schooling. Pedagogical tools also include writing poetry, thinking about the, "teacher's body and how it is adorned and clothed … how it looks, sounds, moves and smells" (Mitchell and Weber, 1999, p. 124). Popular culture such as teacher stories and movies about teachers are examined as cumulative cultural texts, i.e., for their multidimensional, intergenerational, and intertexual qualities (p. 169). Videotaping is also used to look at old and reinvented identities all aimed at rethinking the body of knowledge about teaching, learning, and adult identity.

O'Reilly-Scanlon (2002) has also conducted memory work with photographs and narratives for her own professional development and then employed the strategy with her students. She collected, analyzed, and appraised her memories to ask questions about herself and think about other's questions. Showing the power of personal history self- study to examine what was, change what is, and

shape what is to come, she contends: "Through the careful consideration of what was once there and what is there for us now, lies the potential to 're-invent' ourselves as we reflect upon and examine how our memories are manifested in our lives today" (p. 77).

Salvio (1997) emphasizes the need for emotive elements in teachers' and children's learning as she challenges standardized forms of expression. She adapts tools of theatre to education to teach emotion using improvisation, narratives, and autobiography as she works to help teachers recognize the interplay of their emotions, their teaching beliefs, and the actual curriculum of their classrooms. In the narratives that were performed and reflected upon, Salvio finds that teachers' educational experiences were highly contingent upon their emotional life. Through theatrical improvisation, teachers were able to recognize emotions as a path toward making connections between their pedagogic intentions and their classroom curricula. She asserts:

> Embedded in the emotional responses teachers have are beliefs, judgments, and values which, if confined to the private realm of the faculty or seminar room, disassociate them from their selves, from their relationships, and from what they know about the world in which they teach. (p. 252)

Equally provocative and potentially transformative experiences in the personal by educational philosophers, college and school practitioners, and artists/educators employing critical perspectives in pedagogy and aesthetic education are showcased elsewhere (Diamond & Mullen, 1999; Mirochnik & Sherman, 2002).

Knowles and Thomas (2000) use the arts to explore how their "place experience" and "place memory" of the Arctic and Tropic poles influence their pedagogy and ecologic identities. They study how place is emphasized in their personal and teaching lives and question how geographical experiences and ideological notions of place influence the educative experiences of their students. In two-dimensional installations and with poetry, they craft their vision of new curricula and a "pedagogy-of-place." They discover through a life-history approach that the personal is connected to the social and attest:

> We promote learning that extends beyond the confines of the classroom and the development of interconnecting links with community – our pedagogical perspectives support a sense-of-place in community, that engenders an awareness of the nature of our connectedness, interrelatedness, and interdependence within the natural environment and social/political contexts. (Knowles & Thomas, 2000, p. 136)

Their research highlights the usefulness of innovative pedagogies in personal history self-study that help forge new ways of understanding the self in the world. Moving away from more traditional ways of teaching, teacher educators like Knowles and Thomas, are finding that personal history self-study transports

them and their students towards transformative learning and towards reframing programs of teacher education.

Through personal history self-study, and especially through the arts, teacher educators have discovered new and powerful ways of promoting teachers' professional growth towards the end of self-knowing and professional identity, modeling and testing effective reflection, and pushing the boundaries of teaching. In the following case study, we focus on a teacher educator's quest to "make herself" against the grain through her personal history self-study of: (1) synergy of person and practice, i.e., her search in coming to know her professional self and the contexts that help form and reform her theoretical orientation; (2) walking the talk, i.e., her research in the modeling of a Vygotskian approach involving collaborative partnerships; and, (3) making the familiar strange and the strange familiar, i.e., her crafting of a new pedagogy for preservice teacher education, which includes the arts, towards educational change.

A Case Study of the Utility of Personal History Self-Study

This case study is framed from a three-year investigation and book by Samaras (2002) and provides a compelling account of how personal history self-study can lead to new insights in professional identity and innovations in teacher education. Samaras interrogates her pedagogy within the social cultural milieu of her past while she also questions the taken-for-granted assumptions of preparing teachers. She models her examination of self-knowing for her students through her own education-related life history study. She discovers how her personal history and pedagogy impacted her decision and efforts to reshape the preservice teaching experience by structuring ways for preservice teachers to learn by doing in real classrooms.

Synergy of Person and Practice

Although this work describes Samaras' search for professional self-knowing, she did not set out with that goal in mind. Interestingly enough, Samaras begins her self-study work with the purpose of studying how she utilizes Vygotskian (1981) principles of learning in a teacher preparation program and what effect it has on her students' learning. Yet, as a self-study educator, her writing soon changes from *how* to use such an approach to a questioning of *why* it resonates with her. She employs a personal history self-study approach so she can understand what she asks her students to do – reflection on their teaching with personal history self-study. She explains:

> When I began to write about using and studying the model, I recognized that something was missing. I asked myself, "Why Vygotsky? Why was I attracted to this theory?" One of Vygotsky's basic themes is that higher mental functioning and individual cognition are derived from social life. He insisted that an individual's historical, cultural, and institutional context

was an important factor in his or her intellectual development. In order to understand the individual, one must first understand the social context in which the individual exits ... What were the cultural forces that shaped me and affected my beliefs about teaching? In a Vygotskian sense, I too am a knower who exists in a sociohistorical context that influenced the way that I understand the phenomena I investigate. (Samaras, 2002, pp. 4–5)

This pull towards a personal history self-study approach was largely triggered by one of the projects she offers her students – an education-related life history assignment which Samaras has adapted from the work of Bullough (1997). She writes: "Because of the openness I ask of my students, I begin with my own snapshots of schooling and perspectives on learning in the hope that they will feel comfortable when they share theirs with our class" (Samaras, 2002, p. 47).

In her education-related life history, she retraces her early schooling and life experiences and analyzes how four Vygotskian principles get played out in her personal and professional life: (1) how social and cultural influences have shaped her development as well as her need to know her students' cultures; (2) the manner in which her learning experiences were situated and collaborative and her belief and use of field-based teaching; (3) how her thinking was socially meditated and the ways she structures social mediation for her students; and, (4) her apprenticeship experiences and the scaffolding of her students' growing capacities.

As she looks back, she sees the seeds of her values as an educator, a feminist, a caretaker, a humanist, and a bicultural Greek American in her childhood and young adulthood. Each of these identities is important in her work as an educator, and each of them is an integral part of her because of her life experiences. She remarks, "I did not try them on for size as an experiment; they passed through my body and became part of my being" (p. 8). As a Greek American, Samaras reflects on the connections of her personal and cultural experiences with her chosen pedagogy. Her story raises important issues of ethnicity, class, and gender and particularly illustrates the tug-of-war among those of immigrant heritage, who longed to hold on to the values of their native culture while they also tried to immerse themselves in the new American culture they were living in.

Examining her education-related life history writing and the wider social and ideological forces that shape her past, Samaras begins to understand the underpinnings of her practical theory and explores the way her commitment to Vygotskian tenets in her teaching change and grow over time. This connection helps her to appreciate her attraction to Vygotskian principles of learning that center her research and pedagogy while she begins to see herself as a theoretician. She writes of her agency as a knower that she gained through a personal history self-study:

Now I move away from using only Vygotsky's words as I tell of my teaching. I am developing my voice as I suggest practices in keeping with my intentions and values. This process will help me move my students toward

formulating their own theories rather than simply parroting mine. I can better understand now where my students must pass because I have journeyed there. I am a practicing theoretician, modeling and studying theory in practice. (Samaras, 2002, p. 8)

The discovery of seeing herself as a knower is supported by the critical friends and audience she finds in the Self-Study of Teacher Education Practices SIG of the American Educational Research Association. She thinks deeply about the questions they pose:

Finding like-minded communities in which to share and refine my work helped me sort through the theories that inform my teaching. But did the theories I subscribed to translate into practice in my classrooms? In other words, did my teaching have integrity? I found that the theoretical model for my teaching grew out of my cultural context: my intellectual experiences, my relationships and interactions, and the historical-political era of teacher education that encircled me. Self-knowledge enabled me to better understand how my model for teaching grew. (Samaras, 2002, p. xiii)

Through her quest of self-knowledge, she finds that by articulating her practical theories to her students, she is able to model a necessary professional inquiry for them, i.e., personal history self-study. She also demonstrates the need to question the given curriculum or "how things are done here" and asserts that curriculum belongs to teachers, after all. Teachers construct and hopefully examine their practical theories of how to teach. This creative ownership of the curriculum will be an invaluable asset in helping her students to cope with mandated curricula.

Walking the Talk

Samaras believes it is critical for teacher educators to model what they profess and writes:

Like my students, I found that just talking about theory was not enough; in my case, it was essential for me to practice and model the theory of self-study for educators. Professors serve as role models for their students as they pose questions about their practice and seek answers to those questions through research and reflection. I share questions I posed about developing and using Vygotskian principles in my teaching … I examined my graduate studies and the university context that enabled me to try out my theory in practice. As I wrote, however, I realized that my Vygotskian orientations were rooted much earlier. (Samaras, 2002, p. xiii)

Accepting the necessary exposure that comes from this work, she acknowledges the "disrobing" in making public the connections she draws between her past and her interest in a teacher education program restructuring effort. She finds

the journey unpredictable and enlightening as she comes to know the possibilities of those innovations because she has searched for them through self-study supported by others. Now she wants her students to begin to embrace personal history self-study towards their professional development.

In her early work, Samaras (1991) researches Vygotskian theory as related to young children's learning, although she cannot locate research on this approach in teacher preparation. When she became a teacher educator, she asked herself why she wasn't modeling a Vygotskian approach in teacher preparation, especially so her students could experience it before trying to use it with their pupils. To address this gap, Samaras begins to consider how she can integrate Vygotskian tenets in her work and conducts research on the impact of her efforts.

In collaboration with colleagues (e.g., also see Samaras & Gismondi, 1998) Samaras works to restructure a teacher education program, with a focus on situating teacher education methods courses with field experiences. The research involves the experiences of four elementary education preservice teachers and their cooperating teachers. While she experiments with a Vygotskian approach to teaching teachers, she simultaneously conducts a personal history self-study and gathers data on her students' experiences and perceptions of the ways she uses Vygotskian principles, i.e., how she comes to know her students, situate their learning, structure social mediation, and scaffold their growing potentials. For example, the value she places on knowing the social and cultural influences that have shaped the development of her students gets played out in her pedagogy in multiple ways, e.g., projects like education-related life histories, professional growth papers, developmental portfolios, exit conferences, and interviews. These efforts were generally supported in the larger milieu of the institution where she worked. She taught the same cohort in a year-long methods course in early childhood and elementary education. This arrangement incorporates Vygotsky's emphasis on personal history and the importance of understanding the development of teachers' social interactions and relationships over time.

Multiple data sources are collected, including feedback from her students and their cooperating teachers, e.g., one-on-one audiotaped semi-structured interviews, professional papers, written self-reports, mid-term and final evaluations. She also examines the reflective journals kept by her students as well as herself and analyzes the data to see if her teaching is making any difference in her students' learning. The analysis suggests that socially shared cognition in field work and course work makes a significant difference in enhancing preservice teachers' sense of what it means to teach in terms of using partnership for cognitive and collegial support, perspective-taking, social negotiation, and ownership. Control and feedback styles of cooperating teachers had an impact on preservice teachers' perceived readiness for student teaching, opportunities for reflection, and spirit of social reconstructivism.

Samaras models how she came to know and understand classroom life and pedagogy through her personal history self-study. She thereby helps extend the knowledge base of practicum experiences and the need for their connection to education methods courses. Additionally, she creates an alternative forum for

her students to view themselves critically so that they can reflect upon their actions to improve their teaching and their pupils' learning.

Making the Strange Familiar and the Familiar Strange

Throughout her career, Samaras has attempted to shift the normative structure of teacher preparation in which preservice teachers have limited opportunities to explore personal history and social history, particularly through the arts (e.g., Samaras & Pheiffer, 1996; Samaras & Pour, 1992; Samaras & Reed, 2000; Samaras, Straits, & Patrick, 1998). Samaras, working with Reed, a drama professor, recognizes how teachers, including herself, can learn about themselves and human diversity through the arts. She writes: "I had been dancing around the arts, notions of feminism, and the connections between the cognitive and the emotive realms [in her teaching]. I looked back, and it suddenly all made sense" (p. 146).

Samaras understands that preservice teachers are typically given little information about how to use the arts in their teaching and consequently many are uncomfortable in using it in their own classrooms. This led her towards exploring non-traditional pedagogy using drama to encourage preservice teachers' self-knowing and to unearth their biases. As a part of her continuing efforts to restructure a teacher education program, she co-created a drama/education course with the major course objective for students to use drama as a conduit for perspective-taking, or taking the perspective of someone other than themselves. Perspective-taking exercises enable students to experience abstract principles such as the life and dignity of the human person. She emphasized a commitment to social justice and moral reasoning by asking students to improvise solutions to human problems and discuss the dilemmas inherent in personal points of view. Students explored ways to empathize and understand better what it is like to be in someone else's world or on someone else's path. It's a learn-by-doing course with enactive representation. It's a course where students use their bodies to learn. Their expressions of what they are learning become iconic as they are asked to create images in their minds and symbolic when they use language to represent their experiences.

Through drama exercises, students were pressed to come to understand the self through others or, in Vygotskian (1981) terms, to move from intrapersonal to interpersonal knowledge. The Vygotskian approach of social interaction and verbalization of ideas affects the cognitive development and cognitive restructuring that lead toward self-knowledge. Language helps students classify, interpret, and make sense of new and ongoing experiences in ways they can't do alone. It served several purposes in this research: They learned by retelling their stories to others; it provided a platform for peer and professors' scaffolding; it offered redirection; and it facilitated bonding within the class. The drama activities required students to use their bodies and language to communicate their intentions and feelings. Placing their thoughts and emotions in body movements and actions helped them see themselves differently. The drama strategies invited

students into a discussion and doing of "otherness" and gave them a space for rewriting versions of themselves. The collaborative nature of the drama work cultivated a sense of community, care, trust, and respect that hopefully they will promote in their own career settings.

When students observed and then improvised a street person or when they enacted an oral history interview or when they read a poem in the voice of a character or when they told a favorite story about values, they began to know a part of other's pasts. The exercises allowed them to recognize that one can understand others on the inside even if on the outside they seem very different from who they are. Students spoke of the similarities they found between themselves and street people they observed. They noted similarities such as, "getting through the day, survival, trying to hold on to our human dignity, and tuning out the world around you if the world around you tunes you out." A student observed a man who appeared to be homeless. He rocked back and forth and sang about how Jesus loves him. After she enacted his actions, she wrote:

> While singing, I didn't feel foolish like I thought I would. Instead, I imagined that no one else was in the room with me and I really concentrated on being happy and joyous. When I was asking [fellow classmates] if they loved Jesus, I felt hurt like my character. The blank faces and faces of confusion were expressed to me through the class reactions, so I understood his feelings more because I was treated in the same manner to a certain degree. This was a great experience. It really challenged me to walk in someone else's moccasins, to feel another's emotions and feelings. (Samaras. 2002, p. 139)

In written and oral post-enactment reflections of the street person observation assignment and following their presentation of a family oral history interview, which they enacted in the role of the storyteller, students expressed how they came to know a side of others and themselves. Many pointed out how they could now see a part of themselves in their mothers and sisters through role-playing. After reading in the voice and playing the body language of her mother, a student announced to the class, "Adults really [are] little kids too." Another student became very interested in her father's escape from a war-torn country after she interviewed him and spoke to the class in his voice. She reflects, "He doesn't see his story as interesting; [he] only [sees it] as a negative story that makes him look bad, even though he is the hero in it." One student brought us closer to her mother's struggle and other young, single mothers' lives and writes: "Thinking back on the interview with my mother, I know that being a teenage mother was a difficult, difficult thing for my mother. It makes me proud every time I think of her story." Another reflected in her oral history assignment:

> Realizing what my mother's life was like reveals the reasons why she acts in certain ways around people and also kind of tells why she raised my brothers and sisters and myself the way she did. I think I understand a little

more about where my mom came from and what important things meant
to her as a little girl. (Samaras, 2002, pp. 141–142)

Students were not the only ones to benefit from this pedagogy. In this personal
identity work, Samaras journals about her epiphany in drama work:

> I realized that I had been trying to teach preservice teachers to understand
> how to see things from the point of view of the student, of parents, and of
> society, but I had only taught it as a purely intellectual process. I observed
> how when they cast themselves into someone else's nature, they embodied
> it. They were learning dramatic empathy and possibly caring empathy that
> would help them to know the people they would work with and the students
> they would teach. (Samaras, 2002, p. 140)

This research showcases how the arts can be utilized for self-knowing and to
push the boundaries of teacher education, especially in our efforts to teach about
humanity. It also demonstrates the value of collaboration in personal history
self-study work towards professors' professional growth and the benefits of such
connections for preservice teachers' growth.

Through this case study, the contributions of personal history self-study
become evident as they are linked in ways that do lead to differences in teacher
education. Samaras' personal history self-study enriched her self-knowing, or
personal and professional development, as she struggled to sort out the connec-
tions between her Vygotskian orientation, her past, her teaching, and how they
impacted her pedagogy. Although she models both the process of personal
history self-study as well as a Vygotskian approach to learning, she continues
to experiment with new ways to both research and utilize such an approach in
her teaching. The interdisciplinary work Samaras conducted with others moved
her closer to an understanding of the Vygotskian principles she professes, and
especially through the arts. Her incomplete story serves to further demonstrate
that this process is ongoing as her knowledge is socioculturally constructed and
her practices continuously reframed. The case study suggests that personal
history self-study is a lifelong process enriched by collaboration and by question-
ing the status quo of teacher education towards the end of improving students'
learning.

Conclusion

Personal history self-study can be used to transform our relationships to our-
selves, to our students, and to the curriculum. A review of the literature reveals
how teacher educators use this approach towards self-knowing, modeling the
process for students and others, and to push the boundaries of teaching as they
reframe teacher education. Also woven throughout the literature, the collabora-
tive and contexualized nature of personal history self-study becomes evident.
Diverse pedagogies have been employed towards the end of making a difference

in teaching and teacher education. The case study highlights how personal history self-study contributes to teaching and learning and can lead to transformative learning both for students and teacher educators alike.

We have used personal history throughout our work and find, as have the many others whose work we have discussed throughout this chapter, that it is a necessary and vital part of who we are as teachers and learners. We hope that this chapter highlights the usefulness of personal history in the growth of teaching and learning and the transformation of education. The variable, context-specific nature of every individual, multiplied exponentially when you think of collaborative educational contexts, requires research that is as complex and multifaceted as its subjects. We believe that personal history can expand the edges not only of teaching and teacher education but also images of what research is and should be. If that were true, Zeichner's (1999) prediction that the birth of self-study would likely be the single most significant development ever in the field of teacher education research would be fully realized – to the benefit of teachers and teacher educators everywhere.

SELF-STUDY THROUGH ACTION RESEARCH*

Allan Feldman[a], Patricia Paugh[a] and Geoff Mills[b]
[a] *University of Massachusetts Amherst;* [b] *Southern Oregon University*

Abstract

This chapter discusses the ways in which action research is and is not related to self-study. The many approaches to action research are outlined through comparing and contrasting the nature of action research with that of self-study of teacher education practices. The authors argue that what distinguishes self-study from action research is its methodology rather than the methods used. They suggest three methodological features that would be present in self-studies: 1) A self-study would bring to the forefront the importance of self; 2) it would make the experience of teacher educators a resource for research; and 3) it would urge those who engage in self-study to be critical of themselves and their roles as researchers and teacher educators. The authors explore these features through an analysis of the stories of their own journey to self-study and an analysis of three self-study reports.

Our purpose in writing this chapter is to discuss the ways that action research is and is not related to self-study. In doing so we examine the many approaches to action research to compare and contrast it with the self-study of teacher education practices. We do this in three ways. First, we review the varieties of practitioner research, relying primarily on the chapter by Kenneth Zeichner and Susan Noffke (2001) in the fourth *Handbook of Research on Teaching* (Richardson, 2001). We then, using a narrative approach, tell several stories that relate action research to self-study. Third, we turn to a structural analysis of the methods and methodologies of the two forms of inquiry. We end the chapter by looking closely at a set of action research and self-study reports, using them to further our comparison.

In much of what follows in this chapter there will be a tendency to see self-study as an outgrowth of action research. This bias arises from our professional biographies in which we first had experience with action research and then became involved with self-study. Therefore, we believe that it is important for us to acknowledge that while our paths may be a common one for self-study researchers, they are not the only ones. For example, there are those who began from other methods and methodologies, such as ethnography, performance, life history and biography, and portfolios (see other chapters in this handbook for examples). From these perspectives, the connection between action research and self-study is not the linear evolutionary one that we present in this chapter. Rather, to stick with the biological metaphor, the relationship is more like convergent or parallel evolution in which very different species look and act the same because they occupy the same niche. Knowing that there are multiple ways to compare action research and self-study, we invite our readers to accept our teleological metaphor as one way to understand the relationship between the two forms of inquiry.

A Taxonomy of Practitioner Research

In their chapter "Practitioner Research" Zeichner and Noffke (2001) develop a taxonomy of the variety of ways that teachers and others study their own practice. By examining the personal, professional, and political purposes of the research (Noffke, 1997), they divide the domain of practitioner research into what they refer to as "five major traditions" (Zeichner & Noffke, 2001). These include traditional action research, the teacher-as-researcher movement, the North American teacher research movement, participatory research, and self-study research. In this chapter we use the term "practitioner research" to refer to all these traditions, and "action research" when we want to include only traditional action research, the teacher-as-researcher movement, and the North American movements.

Traditional Action Research

In their chapter Zeichner and Noffke (2001) develop the history of the action research tradition from the first use of the term by Kurt Lewin and John Collier in the 1930s through the work of the Horace Mann-Lincoln Institute for School Experimentation under the direction of Stephen Corey, Dean of Teachers College Columbia University, in the post-war period. Corey was a strong advocate of a scientific version of action research in which teachers engaged in hypothesis formulation and testing (Corey, 1953). This variety of action research continues to be practiced in a formulaic manner, often as a form of inservice education, but more often as an assignment for preservice teachers.

This variety of action research can also be seen in taxonomies developed by James McKernan (1988) and Geoff Mills (2000), one of the authors of this chapter. To McKernan, this "traditional countenance of action research" is

research done by teachers using a technical orientation. Shirley Grundy, building on the work of Habermas (1971) and van Manen (1977), describes a technical orientation as one that includes a problem defined at the outset and a search for a solution to that problem. It is grounded in experiences and observation, often relying on experimentation. The outcomes of such research usually include rules, theories, propositions, and confirmation of hypotheses with empirical content (Grundy, 1987; Schön, 1983). Many educators are familiar with it as the technical-rational approach described by Donald Schön in *The Reflective Practitioner* (1983). As can be seen, this traditional variety of action research places an emphasis on problem solving and a "how-to" approach to action research (Mills, 2000). It assumes, to some degree, that individual teachers or teams of teachers are autonomous and can determine the nature of the investigation to be undertaken. Although it appears to have had its heyday in the US during the 1950s and 1960s, we suspect that it remains the most common form of action research practiced in preservice teacher education in the US.

The Teacher-as-Researcher

Zeichner and Noffke also take an historical approach to their discussion of the teacher-as-researcher tradition. They trace its development in the UK as a way for teachers to engage in school-based curriculum development, and then fostered along by the efforts of university researchers such as Lawrence Stenhouse (1981), John Elliott (1991), and Jean Rudduck (1985). It then took a more critical-emancipatory turn as modified in Australia by Wilfred Carr and Stephen Kemmis (1986).

The teacher-as-researcher tradition appears to include at least two significantly different orientations toward research – the practical and the emancipatory (Grundy, 1987). A practical orientation focuses more on understanding the knowledge of teachers, teacher educators, and students involved in the study (Grundy, 1987). The action arises through group interactions in which meaning is made. In studies with this orientation, the researcher acts "within" rather than "upon" the environment. Studies framed within an emancipatory orientation aim to uncover societal structures that oppress teachers or students and limit their freedom. The intent of this research is to uncover assumptions that reinforce these limitations, critique and act on these assumptions to empower those whose freedom is limited (Grundy, 1987).

It is important to distinguish Mills' use of *practical* with Grundy's. Mills used it to refer to traditional action research. By this he was using its everyday meaning of being functional and dealing with problems. Grundy, on the other hand, uses it in a way that relates to *practical reasoning*, a form of deliberation described by Aristotle (1985). Practical reasoning is an activity used to decide upon an action to take, given the circumstances and the values of the actor (Carr & Kemmis, 1986). It is a process in which the deliberator chooses an action to take in order to resolve a problematic situation by taking into consideration, through reflection, his or her knowledge, the moral and ethical aspects,

as well as the context, of the situation. Action research done using a practical orientation looks very different from the technical variety described above. Rather than seeking answers to well-formed technical questions, or testing hypotheses, action researchers working in this tradition wade into the "swampy lowland where situations are confusing 'messes' incapable of technical solutions" (Schön, 1983, p. 39).

According to Grundy, researchers who work within an emancipatory orientation aim to uncover societal structures that oppress teachers or students and limit their freedom. The intent of their research is to make explicit and critique assumptions that reinforce these limitations, and then generate and act on new assumptions to empower those whose freedom is limited. Similarly, Mills has argued that the rationale for critical action research is provided by critical theory in the social sciences and humanities and by theories of postmodernism (Mills, 2000). He has shown that critical theory in the social sciences and humanities and action research share several fundamental purposes (Kemmis, 1990). These similar interests or "commonalities of intent" include:

1. a shared interest in processes for enlightenment;
2. a shared interest in liberating individuals from the dictates of tradition, habit, and bureaucracy; and
3. a commitment to participatory democratic processes for reform.

He has also argued that the postmodern perspective challenges the notions of truth and objectivity that the traditional scientific method relies so heavily upon. Instead of claiming the incontrovertibility of fact, postmodernists argue that truth is relative, conditional, and situational, and that knowledge is always an outgrowth of prior experience. Postmodern theory pulls apart and examines the mechanisms of knowledge production and questions many of the basic assumptions on which modern life is based. It thus inspires us "to examine the ordinary, everyday, taken-for-granted ways in which we organize and carry out our private, social, and professional activities" (Stringer, 1996, p. 148). Critical-emancipatory action research provides the means by which teachers and other practitioners can undertake this examination and represent their contextually and politically constructed experiences.

It is important to note, however, that in much of the writing about this tradition the methods of inquiry are similar to that of other types of educational research (Altrichter, Posch, & Somekh, 1993; Carr & Kemmis, 1986; Elliott, 1991). For example, qualitative studies use ethnographic methods such as interviews and participant observation, and there is the expectation that data is collected in response to some problem, dilemma, or dissonance in practice, which is then analyzed to uncover findings that will help determine what actions to take. It differs from other forms of educational research because of its focus on the researcher's own educational situation, an assumption that actions will be taken within the system being studied, and that it occurs in cycles.

The North American Teacher Research Movement

In their chapter Zeichner and Noffke describe a teacher research movement distinct from the others described above, that originated in North America during the late 1970s and early 1980s. They link its beginnings to a variety of influences including the growing acceptance of qualitative and case study research in education and the efforts of individuals and groups to improve the teaching of writing (Atwell, 1987; BAWP, 1979; Carini, 1975; Goswami & Stillman, 1987). This can be seen, for example, in the work of the various Writing Projects in the US. The first of these, the Bay Area Writing Project, was founded in 1971 by university teachers of writing in response to their realization that incoming freshmen were lacking in writing skills. The Writing Projects began to recognize that teachers are an important source of knowledge about ways to teach writing. In response to this they organized their first summer institute. They invited preschool, elementary, secondary, and college teachers of writing to gather together to share their expertise on teaching how to write, and to learn how to help other teachers use and critique the methods that they were collaboratively developing. As a result, a form of teacher research emerged in which: (1) there is the recognition of the teacher as expert; (2) the knowledge that the teachers have has been gained by taking actions within their classrooms and seeing how they work; and, (3) there is an ethos of presenting work to others and having it critiqued.

By the late 1980s university researchers of teachers, teaching, and teacher education began to see the possibilities of the use of narrative (Connelly & Clandinin, 1990), biographical (Goodson, 1992), and autobiographical (Lawrence-Lightfoot, 1994) forms of inquiry. As university researchers embraced these methodologies to study the teaching and learning of others, it became more legitimate for teacher researchers to study their practice using these forms of inquiry. While this is speculation, we believe that the growth of this North American teacher researcher movement combined with the growing use of narrative forms of inquiry among teacher researchers, as seen in the journals, oral inquiries, and essays identified by Cochran-Smith and Lytle (1993), provided the opening for university researchers to use these same methods to study their own practice.

Participatory Research

Participatory research (PR) and participatory action research (PAR) also have emancipatory goals, but differ from other forms of action research because of their explicit goal to bring about a more just and humane society. Both PR and PAR seek to promote the interests of oppressed groups by stressing "participatory" processes and seeking to combine research and action to transform social systems. Both see practitioner research as a collective knowledge generation process in which oppressed groups articulate and act to implement social change agendas. This is accomplished by people, often assisted by an outside researcher, coming to understand the social forces that operate in their situation and by

then engaging in collective action (Zeichner & Noffke, 2001). There are also forms of participatory research that have a more technical orientation and are tied to organizational structures (Greenwood & Levin, 1998).

While PAR is often seen to be educative by definition, it is rarely practiced in formal education in industrialized countries. For example, in the US PR and PAR have been implemented in urban and rural communities, labor unions, and citizen organizations to advance grassroots efforts concerning environmental, economic development, women, ethnic minorities, and other progressive social change agendas. It has also been used extensively for purposes of adult literacy in industrialized countries and the Third World.

Collaborative Research

Zeichner and Noffke began their discussion of the North American movement with a brief review of "interactive research and development (IR&D) (Tikunoff, Ward, & Griffin, 1979)" and other forms of collaborative research (McKernan, 1988; Oja & Smulyan, 1989), even though it was not one of their five traditions of teacher research. It is important to note that the collaboration in these modes of research is between university researchers or other outsiders, and schoolteachers, rather than among equitable groups of teachers and others (Feldman, 1993b). While this is structurally similar to participatory research, collaborative research does not usually have the democratic or emancipatory ideals associated with participatory research. We return to this later in this chapter.

Self-Study Research

Zeichner and Noffke's remaining tradition is that of self-study research. They distinguish it from the other traditions of practitioner research in two ways. First, while it has been common to talk about this form of inquiry as simply self-study, it has been developed within the context of teacher education by teacher educators as the "self-study of teacher education practices." As a result, many if not most of the practitioners of self-study inquire into their teaching practices in higher education. Second, although they found in their review that self-study researchers use a wide variety of qualitative methods, there has been a focus on the use of life history and narrative forms of inquiry among its practitioners. In short, Zeichner and Noffke distinguish self-study from other traditions of practitioner research by the role of the people engaged in the inquiry – teacher educators – and by their preference for particular methods.

Distinguishing Characteristics

From our reading of Zeichner and Noffke's chapter, it appears that each tradition of practitioner research has some set of characteristics that distinguish it from the others. Traditional action research has a technical orientation toward research that relies on a "how-to" approach and does not make problematic the

nature and context of teachers' work. The teacher-as-researcher tradition maintains to some degree the technical approach to research while making problematic the work and lives of teachers, students, and others. The emancipatory approaches within this tradition also make problematic the political, social, and economic aspects of schooling. The North American tradition is distinguished from traditional action research and the teacher-as-researcher traditions by its conceptualization of writing and other narrative processes as a research method. What we mean by this is that the ways in which people construct narratives are the methods for research. The analysis of data, construction of findings, and representation of research all occur through the writing process. Participatory research and participatory action research are characterized by the relationship between the outsider as expert who helps insiders gain knowledge and other forms of expertise in order to increase their political and economic power. As a result it has a development goal that is not inherent in other traditional forms of practitioner research. In collaborative research, the research agenda is explicitly that of the outsider, and there is not necessarily a commitment to changing the status of the practitioners.

Overall it appears that Zeichner and Noffke distinguish among these varieties of practitioner research by their research orientation (e.g., technical, practical, emancipatory) or methodology (e.g., ethnography, narrative), by the relationship between outsiders and insiders, and the degree to which they problematized political, social, and economic issues. However, returning to self-study, its distinguishing aspects, according to Zeichner and Noffke, are the type of practice in which the researcher is engaged – teacher education – and the preferred method of inquiry – narrative. As we suggested earlier, we find this interesting, but for the purposes of this chapter these distinctions do not adequately distinguish self-study from other traditions of practitioner research.

Tactical and Methodological Identifications

Researcher/Researched Relationships

In our attempt to understand the ways that action research is and is not related to self-study we decided to take another look at Zeichner and Noffke's use of research orientation and the relationship between the researcher and what is being researched. Both lead us to the somewhat obvious conclusion that what distinguishes self-study as a form of practitioner research is its focus on the self. We begin by looking more closely at the relationship between researcher and the research subject.

When practitioners engage in research, they can relate to the subject of their research in a variety of ways. We illustrate this in Figures 24.1 and 24.2. In general they fall into two categories – research on the other (Figure 24.1) and research that is self-directed (Figure 24.2). In the former we find what McKernan (1988) called "collaborative action research" in which teachers act as research assistants in projects conceived of and directed by outside researchers. For
Figure 24.1.   Practitioner research as the study of others.

(a) Research on the self

(b) Research on one's self in practice

?

Self in practice

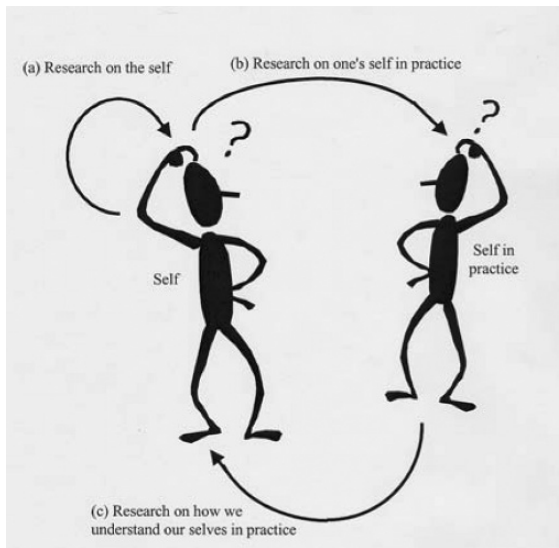
(c) Research on how we understand our selves in practice


Figure 24.2.   Study of the self.

example, the principal investigators of the California component of the National Science Foundation funded the *Scope, Sequence and Coordination* project. They saw action research as a way for teachers to work, "with university researchers to explore the ways in which science is learned and to assess the implementation of the reform. The teachers' roles would be to assist the university researchers in their inquiry in order to get a closer look at schools and to return the findings to the teachers in a timelier manner" (Feldman, 1995, p. 190). In this model

teachers helped the outsider researchers to study the effects of the reform effort on student learning.

In other varieties of practitioner research the teachers are the primary researchers and focus their attention on others. The most obvious cases of this occur when teachers are enrolled in graduate degree programs that require them to complete a thesis or other research project. Unless the assignment is structured so that the expectation is that the teacher will study his or her practice, the focus of the inquiry often shifts elsewhere. Even when the subjects of the research are the students in the teacher's class, it is possible that the inquiry does not examine or influence practice.

In school wide action research (Calhoun, 1994a, 1994b) the focus of the research is also on the other. Calhoun describes school wide action research in this way:

> A school faculty selects an area or problem of collective interest, then collects, organizes, and interprets on-site data. … The process is cyclic and can serve as formative evaluation of the effects of the actions taken. (Calhoun, 1994a, p. 3)

Calhoun identifies three foci for school wide action research:

- to improve the organization as a problem solving entity;
- to improve equity for students; and
- to increase the breadth and content of the inquiry itself.

What is important to note here is that while teachers are part of the research team, the focus of the inquiry is on the organization rather than on the self or one's own practice.

Teachers can also focus their inquiry on their practice and/or themselves (Figure 24.2). For the most part the studies that fall within the traditional action research, teacher-as-researcher, and North American traditions of practitioner research, are ones in which teachers or teacher educators inquire into their own practice. Clearly this is also done in self-study – the relationship between research and researched is one of the three possibilities illustrated in Figure 24.2. Later in this chapter we examine examples of action research and self-study in which this relationship exists. However, before doing so, we would like to revisit the ideas of research orientation and methodology to help set the stage for that analysis.

Orientations, Tactics, and Methodologies

In our summary of Zeichner and Noffke's review of practitioner research we showed how theoretical orientation differed among the traditions of practitioner research. These orientations – technical, practical, and emancipatory – are defined in part by the ways in which practitioners problematize their practice. While theoretical orientation seems to be an important characteristic of most of

the traditions that Zeichner and Noffke reviewed, it does not appear to be a way that self-study is defined by its practitioners.

We also saw in our analysis of their chapter that some of the traditions are defined by the methods that they use, where a research method is a technique for gathering evidence. We will refer to a set of methods as a tactic, "an expedient for achieving a goal; a maneuver" (AHD, 1992, p. 1826).

Methods and Tactics

People engaged in practitioner research may use a variety of tactics depending on the nature of their investigation. These tactics are often classified as either quantitative or qualitative. The term "quantitative research" is usually used to describe what people think of as scientific research methods, such as the controlling of a small number of variables to determine cause-effect relationships and/or the strength of those relationships. Typically this involves the use of numbers to quantify the relationship. Qualitative research uses narrative and descriptive methods of data collection to understand the way things are and what they mean. Qualitative research methods may include, for example, conducting face-to-face interviews, making observations, and recording interactions on videotape.

As one might expect from these definitions, the use or non-use of numbers is often seen as the primary distinction between quantitative and qualitative tactics. However, we believe that it is more fruitful to see the choice of tactics as being based in the methodology within which the study is framed. A methodology is a stance that a researcher takes towards understanding or explaining the physical or social world (Harding, 1989). The methodology may have a particular theoretical orientation, which then leads to the choice and formulation of the research question, and ultimately to how data is collected, analyzed, and represented. In addition, discussions of methodology raise questions about what counts as knowledge and who gets to determine what is and is not legitimate (Harding, 1989). It is related to what Joseph Schwab called the *syntactic structures* of a discipline (Schwab, 1978).

If all things were equal, we would expect to see similar numbers of action research studies being done using quantitative and qualitative methods. However they are not equal, and the choice of methods used depends upon the methodology – how research and knowledge are defined and who is doing the defining. At this time the most common venue for educational action research is as part of coursework in a university or college teacher certification or degree program. As a result, the methods used by the students in these courses are dependent upon the ways that the course instructor and the institution define research and knowledge. As interpretive methodologies have gained legitimacy in academia (Gage, 1989), the tendency has been for teacher educators to base their own research in these methodologies and to encourage their students to do the same. And, as we argued earlier, it is not surprising to see teacher educators use these same methods to study their own practice.

As can be seen in this brief analysis, we do not feel that it is fruitful to examine

methods or tactics to understand the ways that action research is and is not related to self-study. That is why, although Zeichner and Noffke claim that self-study researchers tend to favor narrative and artistic methods and forms of representation (Bullough & Pinnegar, 2001), this does not necessarily serve to define the tradition because self-study researchers use an eclectic set of methods.

Methodology of Self-Study

Again, our purpose in this chapter is to look at the ways that action research is and is not related to self-study. We now ask this question in relation to the methodologies of the two research genres. We do so by looking at the relationship between "action" and "research" and between "self" and "study." One way to do the former is look at whether the accent is on action or on research or both. When the accent is on action, there is an assumption that when people do action research, their primary purpose is to modify or transform their practice or situation, or those of their community or institution in some way. This may mean that the collection and analysis of data are used to guide the development of a plan of action or to articulate a critical analysis of the individual and institutional barriers that are shaping their lives. Others do action research by changing a system through action and evaluation as a way to determine what works and does not work, and why. When research is accented, action research is seen as a modification of traditional research that seeks practitioners, workers, or citizen's input and involvement in substantial ways.

Similarly we can compare the different meanings of the term self-study by looking at how each word is modifying the other. For example, "self" can be the subject for the very "study." This suggests that the self is doing the research. But because the researchers are referring to themselves as self it suggests that they are studying something that has some special relationship to them. For example, when we engage in institutional self-studies, the selves doing the self-study are stakeholders in the institution. However, the self is not necessarily the object of the study.

When self is the object of study, then it is clear that the focus of inquiry is on one's self. What we want to argue here is that this is the distinguishing characteristic of self-study as a variety of practitioner research – that self-study is a methodology in which the focus is on one's self. To unpack this a bit we use Sandra Harding's discussion of the idea of a feminist research (Harding, 1989). Harding points to three features that distinguish feminist research. They are:

1. the "discovery" of gender and its consequences;
2. women's experience as a scientific resource; and,
3. the reflexivity of feminist research.

The importance of the first feature is that before the advent of feminist studies, gender as we know it was invisible. Feminists discovered/illuminated/invented the, "idea of a systematic social construction of masculinity and femininity that is little, if at all, constrained by biology" (Harding, 1989, p. 26). Harding goes on to show how this "discovery" led to us beginning to see gender and its effects

everywhere. This leads us to ask whether self has the same relation to self-study as gender does to feminist research?

Harding's second feature acknowledges that the perspective of women, rather than biasing feminist studies, becomes both the origin of the question asked in feminist research and the "reality" against which it is tested (Harding, 1989). Do the experiences that we have as teacher educators serve as the same type of resource for self-study?

In the third feature Harding notes that one of the contributions, "to the power of feminist research is the emerging practice of insisting that the researcher be placed in the same critical plane as the overt subject matter" (Harding, 1989, p. 29). When this is done, the entire research process, as well as the researcher, comes under scrutiny. Again in comparison we ask, is the same true for self-study? Taking this all together, is self-study distinguished as a form of practitioner research by bringing to the forefront the importance of the self; by making the experience of teacher educators a research resource; and by urging those who engage in the self-study of teacher education practices to be critical of themselves and their roles as researchers and as teacher educators?

Telling Stories

As self-study researchers we believe that we can provide some answers to these questions by examining our paths from action research to self-study. We believe that our stories are important in helping us to understand the ways in which action research is and is not related to self-study because we have walked this path.

Allan's Story

My involvement with action research came about as a result of my interests, my concerns, and through serendipity. When I look back at my years as a teacher, I see myself as some one who inquired into his own practice. I developed curricula, wrote essays about science and science education, and tried to bring the political awareness that I had outside of school in to my classroom. However, even though I was engaged in the types of activities that Marilyn Cochran-Smith and Susan Lytle (1993) described in their typology of teacher research, I did not see myself as a researcher. It was not until I returned to the university for my doctorate that I was able to see myself as a teacher researcher after I was exposed to the literature that describes, explains, and critiques action research.

My graduate education also provided me with access to living people, not just their work. Through my advisor I came to know about the British variety of action research, its practitioners, and its emancipatory leanings. I also became aware of the philosophical literature that placed action research in the realm of practical reasoning, which tied it to moral and political action.

By the time that I became aware of the self-study movement, my conception

of action research had evolved so that it focused on the researcher's practice. In addition, I had engaged in second-order action research (Elliott, 1988) on my own practice as a facilitator of action research (Feldman, 1995). And so self-study seemed like a natural for me. But what made it even more so was the community of scholars who find it important to make problematic their work and their own selves.

Pat's Story

For me, self-study is entangled with my development as a teacher and eventually a teacher educator. Self-study existed within my "world of inquiry" before I realized it existed as research genre. I consider self-reflection as a catalyst that has pushed me along a path towards understanding teaching and learning. This understanding began as a quest to discover my own role in the teaching and learning process to becoming a researcher and teacher educator working with novice teachers. From the start, my role as an elementary school teacher prompted me to explore questions about student learning. Exploring ideas of constructivism and hegemonic notions of school discourse drew me to teacher research as a way of examining the culture of my school and my classroom. As I transformed notions of myself as "transmitter" of knowledge to my students, I relied on interactive observation of my classroom environment, which included challenging my own role within the classroom community.

   During this time I "discovered" the work of teacher research and explored the work of Cochran-Smith and Lytle (1993), Vivian Paley (1986), and Eleanor Duckworth (1987) as I began to systematically collect data on my questions as a part of my teaching. The interactions of self and community were important to this process. These interactions included not only ongoing communication and development of my research process with my students but also dialogue with colleagues within my school about how these questions related to curricular and structural foci with our school. For example, as a classroom teacher my preferred means of "professional development" consisted of ongoing conversations about teaching and learning with a close colleague. Eventually this became a group of colleagues in my school interested in constructivism as a theoretical frame for our work. Alone and with these colleagues I pursued literature on constructivism, critical literacy, and feminist notions of learning in relationship. My experiences suggested that collaborative inquiry held promise for greater involvement for teachers in informing school policy and instructional decision-making.

   As an "inquiring teacher" I followed a road traveled by many experienced school-based practitioners, I pursued doctoral work that led to a career change from classroom teacher to teacher educator. It was during this transition that I read *Reconceptualizing Teaching Practice: Self-Study in Teacher Learning* (Hamilton, Pinnegar, Russell, Loughran, & LaBoskey, 1998). Concepts such as "authority of experience" and interrogating "living contradictions" described my goals and work as a teacher researcher. These ideas fit with my emerging

investigation of participant action research as a model for teacher inquiry. Opportunities for involvement in self-study with doctoral colleagues, and as a presenter and discussant for self-study research at meetings of the American Educational Research Association (AERA) all contributed to my developing research agenda on oral inquiry research connecting teachers and university researchers (see Paugh, 2002).

Geoff's Story

My journey is perhaps a little different from Allan and Pat's. My graduate studies focused on education and anthropology, which led me into a culture perspective of schools and schooling. All of my research has utilized qualitative methods, which combined with my interest in applied teacher research working primarily with neophyte teachers opened up the world of action research. For many years my focus at professional organizations such as AERA was on qualitative research, teacher research, and action research.

However, as my own career as a teacher educator progressed, I became increasingly interested in reflecting on my own practice and how I could do a better job teaching about teaching. In particular, I began to focus on the efficacy of the online teaching of action research. I did not know at the time what to call what I was doing beyond action research. It is perhaps humorous to consider exactly how I "discovered" the Self-Study of Teacher Education Practices (S-STEP) Special Interest Group (SIG). In short, I had some travel money that I had to "use or lose." I had just completed what I considered an action research study with a twist – I had focused on my teaching about online teaching and was looking for somewhere to present it. I entered the phrase "action research" into a search engine on the web and the first hit I received was a notice for the first S-STEP Castle Conference.

I contacted the conference organizers, submitted my proposal, and the next thing I knew I was on my way to Herstmonceux Castle in East Sussex, UK to present my paper. I spent a good deal of time at this first and following Castle Conference trying to get a handle on the characteristics of self-study that warrants its own classification as a genre of research as distinct from action research or teacher research. This struggle ultimately led to an invitation to participate in the writing of this chapter with other action researchers interested in helping all of us to come to grips with the differences between action research and self-study.

From Action Research to Self-Study

The three of us came to self-study in what seemed to us a natural movement from inquiry into our own work as teachers, to learning more about research and action research, and then in some ways back to where we began by researching our own practice, but now as teacher educators rather than teachers. Our stories suggest that what distinguishes the self-reflective form of action research that the three of us practiced from self-study is that we did *action*

research as teachers and now do *self-study as teacher educators.* As we pondered this statement, we began to realize that the brief stories that we told had little of the quality of self-study because for the most part they are descriptive and contain little or no critical reflection on our selves as teacher educators. We decided, therefore, to revisit our stories to unpack the meaning that we have for each of our journeys. Again, we begin with Allan's story.

Allan's Story Revisited

In rethinking my story I see three dilemmas or dissonances in my practice as a teacher educator that are relevant to my coming to self-study. The first is that when I went back to university to pursue my doctorate after 17 years of classroom teaching, I could not find myself or my colleagues in how teachers were depicted in the research literature. Second, it became clear to me that not only had I not used most of the constructivist and inquiry-oriented teaching methods that I now teach to my students, most of my teaching methods could have been labeled "bad." Third, once becoming a professor, I found myself being pulled between being a science educator and being a teacher educator.

The first dissonance was one that helped lead me to action research. My feeling then, as it is now, was that if teachers were to research and report on their own practice, then the accounts of teaching would better resonate with my memory of being a teacher. In addition, my lack of awareness as a teacher of much of the research on teaching and learning, even though I was active in professional societies and had published several articles on science teaching, questioned the relevancy of that research for teachers. If teachers researched their own practice, then they would set the agendas based on their interpretations of what is important.

Second, although I studied my own practice as a facilitator of action research (Feldman, 1993a, 1995, 1996), it was the dissonance between what I taught as a teacher educator and how I taught as a teacher that led me to begin to examine myself as a teacher educator. I have not engaged in any systematic inquiry into this, but my attempts to understand the feelings that I generated in myself through a critique of my high school teaching enabled me to have a better sense of the struggles that inservice teachers go through when they are urged to reform their practice.

I wrote about the tension that I feel between science education and teacher education for the Fourth Castle conference (Feldman, 2002a). In this self-study I examined my role in the college of education, paying close attention to what I saw as real and mythic constraints (Tobin & McRobbie, 1996) on my practice. The focus of my inquiry was myself in practice, and not disembodied practices. Clearly this was a study of myself as a professor in a college of education.

Pat's Story Revisited

Reflecting back on my story, I see self-study and action research as emerging simultaneously within my inquiry as it took on more formal dimensions. My

driving questions concerning equitable educational opportunity for all students led me to a closer examination of the interactions between the roles of teacher and learner and to new questions about those roles. For example, I clearly remember exploring my role as co-learner with my first grade students in a graduate school paper. This led to a teacher research project within my classroom where I systematically taped and analyzed collaborative conversations with my students. This data revealed how those conversations reconstructed the roles both teacher and students assumed in the learning process. Eventually as a graduate student, I utilized self-study and participant action research methods as a collaborator with fellow doctoral students who were also former teachers and were now teacher educators. We discussed our ongoing study of our questions regarding constructivist pedagogy in the university classroom in a paper presented at AERA (Gallo-Fox, Paugh, & O'Day, 2002). In my dissertation work, I explored my role as collaborator with classroom teachers as we problematized dominant beliefs and instructional practices designed to teach students who struggle in school (Paugh, 2002).

What interests me is how this body of work involves self-study both implicitly and explicitly within an action research framework. The action research framework allowed me to identify problems of practice from which questions evolved; data was collected and systematically analyzed leading to further inquiry and understandings. In my work as a classroom teacher, it was the realization that understanding my own role in conjunction with students' roles in the learning process encouraged me to reflect on my "self" in practice. In my work with doctoral colleagues, we deliberately designed our study to forefront our "selves" as practitioner/instructors to connect our K-12 classroom teaching to our work with future teachers. In my doctoral dissertation study, I focused upon my role as co-researcher with classroom teachers as together we interrogated traditional notions of struggling students and transformed those notions through reconceptualized classroom practice. Throughout this work, the evolution of my thinking about teaching and learning necessarily included an examination of my role within that process. The findings from this work include my expanded notions of learning from a more traditional focus on the individual as a repository of knowledge toward sociocultural definitions of learning as constructed within situations and learners as constructed within learning environments. In two of these studies, the initial focus was not on my "self" in practice, but I found that my evolving notions of learning necessitated inclusion of the self within the learning environment in all three studies. The evolution of my investigation into problems of practice (action research) has led me to understand learning as an interaction where participants co-construct knowledge. Therefore as a participant in that process, I cannot separate my "self" as researcher, teacher, and learner from the practice I investigate.

Geoff's Story Revisited

My first professorial appointment after completing my doctorate at the University of Oregon was to work in an undergraduate teacher preparation

program with a focus on elementary science and math methods. However, for "fun" I would teach night classes in our Masters of Education program specifically the "Introduction to Educational Research" class that is a typical cornerstone research class in a masters education program.

Over time this survey research class approach evolved to a more applied teacher-as-researcher class and I started to focus on action research. This also coincided with an effort in Oregon to link *Goals 2000: Educate America Act* funding to teacher participation in action research. In short, if teachers wanted access to the federal funding they were required to sign a contract to do action research. As a result of my involvement in a number of school district grants throughout the state I began offering action research professional development courses for teachers who were participating in the grants.

In the early 1990s my institution moved from an undergraduate to a graduate teacher preparation program. Influenced by the Holmes Group trilogy in the US, the *National Board of Professional Teaching Standards* (NBPTS), the *National Council for the Accreditation of Teacher Education* (NCATE), and the Oregon *Teachers Standards and Practices Commission* (TSPC), our teacher education program embedded teacher-as-researcher knowledge, skills, and dispositions as part of our identified teacher candidate competencies. At this time I began teaching action research to our preservice and inservice teachers as a full-time commitment, and working on the manuscript of an action research book (in my spare time) intended for an audience of preservice teacher/professional development teacher audience. I also began to systematically inquire into the effectiveness of my own teaching of action research, specifically, the impact of teaching an online action research class on my students' outcomes. I began to model an action research process to my online action research students – an activity that ultimately lead me to my involvement with the Self-Study of Teacher Education Practices (S-STEP) special interest group (SIG) of AERA.

As I reflect on this journey it is clear that my personal journey to self-study through action research has been idiosyncratic and serendipitous. I believe that my willingness as a teacher educator to focus on my effectiveness at teaching about teacher research is a natural evolution to a self-study focus where I am clearly at the center of my reflection and writing. In fact, in recent years I have moved into educational administration and used the same self-study tactics to help me understand my self-efficacy as a teacher education dean.

Self-Study Methodology

Our reflection on Harding's (1989) work led us to suggest that a self-study methodology would have the following features:

1. it would bring to the forefront the importance of self;
2. it would make the experience of teacher educators a resource for research; and,
3. it would urge those who engage in self-study to be critical of themselves and their roles as researchers and teacher educators.

In our revisiting of our stories we shifted our focus from the events that led us from action research to self-study to stories of our growing sense of our selves as teacher educators. For example, in the second version of Allan's story we see something more than a progression of events that led from action research to self-study. That is, rather than the shift from action research to self-study being due to his change from having a job as a teacher to his new job as teacher educator, what we see is that while he was being a teacher educator he became aware of concerns that challenged the way in which he thought of himself and his practice. This awareness led him to ask different types of questions that could best be answered by focusing on himself as a teacher *becoming* a teacher educator. In this we can see some evidence of the "self" being highlighted and Allan's experiences as a teacher and teacher educator being used as a resource for his research.

Pat and Geoff indicate the same type of switch in focus. For example, Pat tells us that her realization that she needed to understand her role in conjunction with her students' roles encouraged her to reflect on her "self" in practice. We see the same in Geoff's story when he tells us that he is at the center of his writing and reflection. Pat also tells of how she and her teacher educator colleagues put their "selves" into the forefront so that they were under scrutiny along with the teachers with whom they worked.

Analysis of Self-Studies

In telling and examining our stories we engaged in the process of self-study. We put our selves in the forefront and we relied on our own experiences as teacher educators. In this section of the chapter we look closely at three reports of self-studies to analyze how the self is present and to distinguish, through the method-ological features described by Harding, how the self is present within these self-study reports and influences teacher educators' inquiries into their practice. We chose these studies because they differ in the ways that they relate the self to practice. The first of these is an effort by Barbara Henderson to examine the intersection of her constructivist pedagogy with the learning of her culturally, ethnolinguistically, and experientially diverse teacher education students (Henderson, 2002). In it we see how a focus on her self emerges as a result of her inquiry into this intersection. The second is a self-study in which Clare Kosnik interrogates her work as a teacher educator and director of a teacher education program that is engaged in redesigning and implementing an "innova-tive teacher education program" at the Ontario Institute for Studies in Education at the University of Toronto, Canada (Kosnik, 2001). Lastly, we look at a collaborative self-study conducted by five Chilean teacher educators involved in national reform efforts to introduce a constructivist approach to their teacher education program (Montecinos *et al.*, 2002).

What we have here is a set of three studies in which first the researcher is focusing on her practice as a teacher educator (Figure 24.3), a second in which the researcher is looking at her practice as teacher educator in collaboration
Figure 24.3.   Self-study of one's role in a collaborative group.

with other teacher educators (Figure 24.3), and third, a study in which a group of teacher educators collaboratively study their practices (Figure 24.4). For each we begin with a brief summary of the report including the research methods used. We then look to see how our modifications of Harding's methodological features – the "discovery" of self and its consequences; teacher educators' experiences as a research resource; and the reflexivity of research – are evidenced in each of the self-studies.
Figure 24.4.   Collaborative self-study of a collaborative group.

Self-Study #1: Reconstructing Constructivism

Summary

After nine years of using a particular assignment to teach constructivist pedagogy to her teacher education students, Barbara Henderson initiated a self-study to reflect on what and how her students were learning from the experience (Henderson, 2002). Henderson's assignment consisted of a demonstration of a classic Piagetian conservation experiment. After this demonstration, Henderson asked her students to explain the change in composition when two liquids are combined in unequal amounts. Her goal for this activity was that students reflect on their processes for solving this problem and relate this reflection to their teaching of young children. Henderson provided several participation structures for this process of reflective problem solving. She combined individual, small group, flexible grouping, and jigsaw grouping experiences. She encouraged social learning both inside and outside of the class, over a period of three weeks. In addition, she provided a variety of materials and encouraged creativity as students worked toward solving the problem and explaining their solution.

Henderson's intention in encouraging a variety of learning opportunities was to address diversity among her students as learners and have them reflect on this need in their own early childhood classrooms. She drew on a constructivist epistemology for her pedagogy based on the theories of Piaget and Vygotsky. That is, her practice encouraged students to construct their learning through action and reflection on action. She utilized Vygostkian notions of scaffolding, encouraging her students towards social learning involving interactions with the instructor, peers, and outside informants. Over the years she taught using this assignment, students who pretended to understand the assignment, but did not, presented a problem for Henderson. She wished to increase her students' willingness to take risks with their learning and to reflect more deeply on the assignment as a whole.

Methods

Henderson's definition of constructivism also drove her choice of research methods. She utilized reflection on her actions, informed by her students' reflections over time, to shape and reshape her teaching. As we will elaborate upon later, she included her past as well as her present selves within the cycle of reflection.

Henderson chose to study two teacher education classes that she taught during one semester. Her sample included credential students and more experienced graduate students who were or would be teachers of young children. The students in both classes represented cultural, ethnolinguistic, and educational diversity. Drawing on the traditions of action research, Henderson's methods of data collection and analysis were cyclical. In short, she raised questions, systematically collected data, organized and created categories from that data, reflected and developed hunches, and raised new questions that led to ongoing reflection and plans of action. She described her data set and the cycle of analysis in detail as

she shared her developing views of her teaching in relation to her students' learning.

As data, Henderson collected all graded papers elicited from students enrolled in both classes. She also distributed and collected a questionnaire on learning preferences, attitudes, and family background from students in the credential class. In addition, she kept detailed teaching notes from the semester. Student grades and earlier assignment sheets from the previous nine years completed her data set. She began her analysis at the end of the semester by reading and rereading papers as part of her evaluation and feedback during the semester. She then reread again, creating a categorization scheme to highlight observed trends. Eventually she created a spreadsheet for these trends, adding columns for background information. She then put this data aside and spent a month reflecting on her own teaching of the class. This included keeping a journal of memories on past teaching experiences as well as the two most recent. For her journal, she drew on her teaching notes and older versions of the assignment sheet given to students in past classes.

After this month-long process, Henderson took emergent themes from her initial spreadsheet and her journal analysis to create a second spreadsheet. She checked these themes against her initial evaluations of student responses. Through this process, she was able to select papers that were categorized differently between the two analyses and also to cross check the credential group against the graduate group. She found the majority of students in both groups were successful and did not struggle with the assignment, but identified others who for different reasons were either frustrated and successful students or unsuccessful students who did not acknowledge any form of struggle. Her analysis included cycles of questioning and ongoing investigation focused upon these students that led her to discover contradictions between her intentions and their experiences, as well as toward implications for improved practice.

Distinguishing Feature

We now draw upon Harding's features to locate the self within Henderson's study and how this presence of self influences her inquiry into her practice. First, we build upon Harding's notion that discovering gender and its consequences makes gender visible within the research and thus reveals its effects. We ask, "Does Henderson, through her focus on self, make the self visible in the research process?" and "If so, what are the consequences of this visibility?" In claiming self-study as research methodology, Henderson includes her self as intrinsic to the research cycle. She constructs the research question as a problem requiring an intertwined analysis of her own understandings in conjunction with that of her students. As a consequence she is able to focus on her self in practice (see Figure 24.2), that is, on her self constructed within her practice. Thus, she includes her experiences as well as her students' reports of their learning as intersecting lenses for interrogating the research question.

Second, we utilize Harding's notion that gendered (women's) experience becomes a resource for scientific research. "Is Henderson's experience as a teacher

educator a resource for her analysis?" "Is Henderson's 'self in practice' the source for her question?" "Is her experience the 'reality' against which her questions are tested?" For Henderson, self-study as action research allows her to utilize a cycle of selves in her research. That is, she draws upon her past selves constructed as part of her teaching interactions as data for more current cycles of analysis. For example, she used past evaluation feedback she gave to students as representing herself in past practice. Doing this enabled a cross-reference as she constructed categories for analysis from more current data (and more current evaluations). Thus she was able to contrast past selves in practice, with a more current self in practice. This analysis revealed patterns of student involvement as well as a retrospective of her thinking. She found that despite her intentions to provide inclusive participation structures for diverse learners, there were students who resisted risk taking with their learning. These patterns existed over time. These resisters, revealed through their responses to her assignments, were usually bilingual and multilingual teachers. Her findings suggested to Henderson, the need to further scaffold the inquiry process within her constructivist pedagogy. Thus, she was able to examine and reconstruct her pedagogical actions at the intersection of her constructivist and her inclusive beliefs.

Third, we ask, "How is Henderson critical of self in the role of researcher and in the role of teacher educator?" In keeping with Harding's notion of reflexivity, Michelle Fine (1994) argues that including the self in action as a focus of research allows for change in the self as practitioner and researcher. In this study, Henderson examines her experience in order to critique herself as a teacher educator. The research question and analysis primarily focuses on this role. Her discussion focuses on the contradictions revealed between her intentions in practice and her students' learning experiences. Her implications for instruction emerge from this increased awareness and her plans to adjust her practice to address these contradictions while maintaining her epistemological integrity. Thus Henderson engages, through her research, in a reconstruction of her self as a teacher educator. On the other hand, Henderson's discussion bypasses reflection on her self as a researcher or on the relationship of the research process to her ongoing understandings of her practice. Why is this so? Could it be that the changes she claims in her practice are inseparable from her perceptions of herself as a researcher? What are the consequences when the research is not explicitly scrutinized within the process? Henderson's self-study was conducted after her teaching was completed for the semester. Does the location and timing of self-study have consequences for breadth of the reflection? For example, does active collaboration between the researcher and the researched or the researcher and other researchers engaged in self-study have consequences for the reflexive process? Further analyses of two other self-studies will allow further discussion of these questions.

Self-study #2: Inquiry-Oriented Teacher Education

Summary

Clare Kosnik undertook a self-study of her personal development as a reflective practitioner as she, "redesigned and implemented an innovative teacher educa-

tion program at the Ontario Institute for Studies in Education at the University of Toronto, Canada" (Kosnik, 2001, p. 65). Kosnik and her colleagues engaged in redesign of the program with the aim of ensuring that preservice teachers linked theory and practice through an action research framework. Their goals included: forging links between the academic program and practice teaching; making connections between courses; interconnecting assignments; building the cohorts of students into learning communities; encouraging students to ask questions; and, creating a team environment among the faculty involved in the program. This faculty team utilized Schön's (1987) concept of reflective practice to engage together in, "research[ing] our practice and better understanding our work" (Kosnik, 2001, p. 66). The team adopted an action research structure that was based on community for themselves as well as for the students in the program. This stemmed from their beliefs that learning communities are essential for providing a "safe, supportive environment that would sustain and encourage reflection" (Kosnik, 2001, p. 67).

Methods

Kosnik embarked upon her study when she noticed several gaps between her beliefs and her actions within the design process, which she identified as "critical incidents." She utilized the action research cycle in developing and implementing her research methods. For the first year of the study, she simply kept notes and recorded her reflections, asking the question, "How does working in an inquiry-oriented program affect me?" (Kosnik, 2001, p. 69). Through her first year of reflection, she was able to notice critical incidents and fine-tune her second and third year questions. These became: "What is my response to the event [critical incident] saying about me?" and "What are the values inherent in my decision and the situation?" (Kosnik, 2001, p. 69). She also restructured her recording and analysis during the second and third year through charting critical incidents. For example, she noted the date and context of each critical incident, each step of the event as it occurred, and finally her response to each step guided by her two research questions. Her refining of the questions and her analysis of the data occurred using Schön's (1987) reflective practitioner framework. She utilized the themes of, "mentoring, repertoire, artistry, reflective conversations, goals and processes, theory and practice, knowing in action, and problem setting" (Kosnik, 2001, p. 69) to guide her analysis of critical events as thematic cases. That is, understanding her actions and her actual work became "dialectical" – one informing the other. At the end of each analysis, she included a third step to reflective practice. This step involved the inclusion of ethical and moral consideration. For this, she identified strategies and solutions for overcoming institutional barriers as part of reframing her practice.

There are several features of Kosnik's study that place it within the domain of self-study of teacher education practices. Her focus on critical incidents was a way for her to interrogate the living contradictions (Whitehead, 1989) in her ongoing relationships between her action research collaboration with her fellow faculty, through her interactions with her students, and through self-reflective

writing. In doing so, her research coincides with Hamilton and Pinnegar's (1998) discussion of other self-studies, that they, "strongly demonstrate a reciprocal relationship between the researcher and the researched" (p. 32). In Kosnik's case, her self-study became part of the action research cycle. In doing so, she demonstrated how she was engaged in practice, but in practice with others. Kosnik included the multiple layers of the, "process, product, content, and context" (Hamilton & Pinnegar, 1998, p. 32) of her professional practice in her ongoing analysis. Finally, her findings utilize systematically gathered evidence that demonstrates to her and to her readers a fundamental reconceptualization of her practice (Hamilton & Pinnegar, 1998, p. 1). For Kosnik, self-study became a continuous and integrated factor in this ongoing reconceptualization. That is, her self-reflection took a central role in the teaching process.

Distinguishing Features

Does Kosnik's self-study incorporate the features we have borrowed from Harding's work on feminist studies? First, we ask, "Does her discovery of self lead to seeing the effects of self everywhere?" Kosnik's methodology implies that her self is integral to her practice. Early in her discussion, she defined self-study as professional practice, aligning her beliefs about the relationship of reflection and action with those of Schön (1987) and Dewey (1938). This perspective focused the lens of self on her reflections on critical incidents. For example, as she problematized a conflictual relationship with a clinical faculty member, Kosnik's view of her self as collaborator forced her to problematize her own role in conjunction with that of her colleague. This dual perspective blurred the self and other dichotomy and offered a solution to her dilemma. That is, she learned that in order to reach mutual understanding about program guidelines with her colleague, she needed to co-teach a course that encouraged both parties to dialogue in the act of sharing their different professional strengths. Thus, her focus on self, led her to understand herself within the contradictions she noticed in her practice.

Second, in keeping with Harding's framework we ask, "Does Kosnik's experience serve as a resource for her research?" That is, "Does her self become the origin of her question and the 'reality' against which it is tested?" Kosnik's reflective stance revealed early on that "the new program was having a significant impact on me" (Kosnik, 2001, p. 68). She quickly decided to engage in a self-study in conjunction with her involvement within the group action research project. Thus she added her self as a resource for research. The reciprocal nature of her self-reflection and interaction with others, including colleagues and students, shaped her actions and provided a resource for not only her own research but that of her colleagues. For example, identifying critical incidents led to a method of recording the events of the incident and also her analysis of her self-involvement in the progression of the event. Through this analysis she was able to test her actions against the reality of self and simultaneously share her method with her research partners. Thus she expanded the resource of self as a resource for the larger research process.

Third, we ask, "Is Kosnik's self-study reflexive?" That is, "Does her research forefront the self, placing it on an equal plane with the study of practice?" "If so, in what way?" The reader may remember that Henderson's discussion of her self-study was limited to direct commentary on her reshaping of self in practice, but no commentary on her self as a researcher. Kosnik provides evidence of an understanding of her self in practice as a teacher educator and a researcher. In her discussion she emphasizes four intersecting features that led to the reframing of her practice in conjunction with the process of her colleagues' and students' simultaneous reframing. These included her self-study, her collaboration, her reframing of problems, and her research. She describes the reflexivity between "being a reflective practitioner" and being an "example." In analyzing Kosnik's conclusions, we notice that she conducted her research in collaboration with others, both colleagues and students. We continue to wonder about the role of collaboration in self-reflection. As we consider one final self-study, we examine how collaborative self-study takes on a central role in professional practice.

Self-Study #3: Relearning the Meaning

Summary

The authors of this study, four of whom are teacher educators at Pontificia Universidad Católica de Chile, and a fifth who works extensively in the United States and who agreed to serve as a "critical friend," were involved in a project to implement national reform policy within their teacher education program (Montecinos *et al.*, 2002). The group's goal for their collaborative self-study was to transform their own beliefs and practices as they transformed their teacher education program from a transmission to a constructivist orientation. Embarking on this project, the group established two goals: 1) to develop a self-study protocol to fit their intentions; and, 2) to transform their practices as teacher education supervisors within new program guidelines. The latter included: "principles of critical and emancipatory consciousness, collaboration, professional autonomy and responsibility, professional identity and ethical commitment, active participation in the construction of knowledge, and reflective practice" (Montecinos *et al.*, 2002, p. 783).

Both goals emerged as intertwined within the cyclical progression of the study. That is, the researchers report on how their development of systematic conversational inquiry and eventual writing and reporting about their findings intersect with their emerging understandings of themselves as practitioners. For example, in wondering how best to report to the readers of the study, they collaboratively developed a deeper understanding of how they had reconstructed their practices. Through the group narrative they were able to go beyond individual descriptions of changes, to develop a more complex understanding of this reconstruction within the program. The reconstructions they identify at this point in the study (after a year) are shared thematically. They include: attending to learning needs of the supervisor; attending to learning needs of the student teacher; attending to the student teacher's autobiography; giving the student teacher reassurance;

distinguishing good questions from bad questions; and, attending to the structure of group and individual supervisory meetings. Given the ongoing nature of the study, the authors project how these reconstructions to both the research process and the program will continue.

Methods

Self-study was an obvious choice to the authors based on its history of providing systematic opportunity for teacher educators to study, "what they do in the process of educating prospective teachers" (Montecinos *et al.*, 2002, p. 782). A dimension of self-study that attracted the group included the emphasis on dialogic reflection as a means to "rethink and reinterpret" both underlying actions and rationale for those actions. That is, self-study methodology encourages collaborative inquiry that is transformative to both the practitioners and the program. As the authors explain: "Collaborative self-study is a promising professional development activity for creating the communities of practitioners necessary to sustain the transformation of teacher education programs" (Montecinos *et al.*, 2002, p. 782).

Toward that end, the authors utilized methods that included a cycle of data collection and analysis that, like Kosnik, both produced new methods and resulted in an ongoing reshaping of practitioners' knowledge of practice. Using the questions: "How might [we] build supervisory supports that scaffold students' decision-making and self-evaluation of their actions within the context of their own work and within their own learning?" and "How could we better help students, and ourselves, understand in a novel way, the situations of uncertainty that characterize classroom life?" (Montecinos *et al.*, 2002, p. 783) led to the first step in the research process. This step consisted of "relatively unstructured" weekly meetings where the group focused upon the self-study process and also encouraged an understanding of what was problematic for each group member's particular practice. For each meeting one member would initiate a conversation based upon the literature on self-study as well as a specific supervisory incident experienced by that member, and finally a group airing of more general concerns about the supervisory tasks required by the institution.

After four months, the group felt that this step had allowed them to develop a necessary group ethos of "mutual trust and respect" as well as a realization that a more structured meeting protocol would move the research forward. Thus, the agenda for each meeting during the second four months included: formal note taking; a group member preparing a written summary of each meeting to be distributed at the next meeting; sharing of a journal entry by one member to spark conversation; and, one participant suggesting a focus for each meeting based on data from her supervisory practice. Although the group continually encouraged flexibility within this structure as needed, the structure gave focus to the group study. This step also included eliciting feedback from the "critical friend" both through attendance at some meetings and through written e-mails and conversations outside of the meetings.

The next step in the cycle occurred when the group considered how to write

and report their findings for a more public venue. This step in the cycle forced the group to interact with manuscript reviewers as well as with each other. This resulted in a shift in focus – a restructuring of the paper itself from a singular look at scaffolding their students' reflectivity to a structure that, "reveal[ed] the kind of processes and thinking that may lead one to revisit and change beliefs about supervision" (Montecinos *et al.*, 2002, p. 785). This restructuring included meeting the challenge of providing trustworthiness by presenting new perspectives on practice in a way that rings true to the reader (Bullough & Pinnegar, 2001). This next step encouraged the research team to present their reconstruction of practice through themes relevant to the group, rather than as individual stories of change. Developing these themes included a process where each participant created individual reflections on their learning and on the research process. These were developed into a narrative and checked by the critical friend. Finally, these narratives were returned to the group process and from them common themes were elicited.

Distinguishing Features

Using Harding's features allows us to understand the nature of self-study utilized for this collaborative study. We begin by asking, "Does the discovery of self in the research process lead the group and the reader to see the self and its effects everywhere?" For the Montecinos group, the self takes on a collective dimension that differentiates it from Henderson and Kosnik. In this study, individuals engaging in self-study formed a "collective self" through the process. That is, while they brought individual problems encountered while rethinking supervision of student teachers, they analyzed these within a collective question that included a lens of self. In contrast, Kosnik engaged collaboratively with colleagues in restructuring her program, but her self-study remained focused solely on her individual self. For the Montecinos group, this collective self developed as they investigated self-study as a methodology and as they problematized their practice within the first cycle of their research process. They were able to use this lens to reflect on the emergence of this collective self. For example, analyzing the group's initial research process, they realized that an important outcome of the first cycle was the development of an ethos of mutual trust and respect that emerged from the group relationships. Thus relational selves contributed to a collective self through which the group was able to shape their research methods, process, and eventually findings.

Second, we ask, "For the group, does the self become the origin of the question and the 'reality' against which it is tested?" and "Does the experience of the group as teacher educators serve as a resource for self-study?" The authors make the claim that from the start, they held a dual goal for their choice to engage in self-study. They explain: "We engaged in a collaborative self-study to create self-knowledge as well as shared collective knowledge" (Montecinos *et al.*, 2002, p. 785). The emergence of the collective self, however, posed an unanticipated problem in writing and reporting on their investigation. Deciding between structuring their reporting as separate narratives or around common themes created

a new reality against which to test their findings. That is, choosing the latter involved a further cycle of investigation and the creation of a group experience from the individual experiences.

Third, we question the reflexivity involved in this group self-study, "How is the researcher (in this case the research group) critical of self in the roles of researcher and teacher educator?" Responding to this question parallels our analysis of Kosnik's study in that examinations of self as a part of the research cycle included the ongoing focus on self as both researcher and researched. In addition, the cycle involved others such as students, a critical friend, and eventually outside manuscript evaluators. Therefore, this study aligns with Hamilton and Pinnegar's (1998) contention that self-study research always attends to "process, product, content, and context" (p. 32). Yet, the collective nature of this self-study included another dimension, that is, interaction between individual and collective selves. As the group moved through the cycles of this process, these dimensions moved in and out of the forefront of analysis, yet they were always present. This interaction supported the ongoing development of the research process that held equal focus in the discussion, along with the group's reconstruction of the teacher education program.

This interaction also provided challenges to the future cycles of the research process. For example, interacting with manuscript reviewers, and returning to their original self-study literature when writing, allowed the group to test their own experiences against the experiences of others who have undertaken self-study. This strengthened their process and their findings. It also presented challenges to future work on the program. Debating whether to allow outsiders into the group resulted in the group members' support of new research groups for which they would serve as consultants, while retaining the structure of their initial group. Thus, like Kosnik, who shared the methods she developed with colleagues, the Montecinos group shares their group self-study process with others in their program. This ongoing reconstruction involves continued development of the research process and projects the cycle toward restructured beliefs and actions not only for the group but also for others within the program.

Action Research and Self-Study

In Harding's answer to her question, "Is there a feminist method?" she argued that research methods do not necessarily define a methodology (Harding, 1989). That is, a feminist engaged in research used the same sorts of methods as other, non-feminist researchers. A look back at the three studies we examined in the previous section indicates the same is true for self-study as a methodology. When one looks at the methods used in those studies, there is little that distinguishes them from action research, or in fact any qualitative research in education. All of these self-study researchers engaged in cycles of research, they collected data in the ways that would be familiar to any qualitative researcher, and reported the outcomes of their studies using representations that are typical for educational research conferences and journals. Therefore, as we have argued previously, if we are to distinguish self-study from action research, we need to look

at what characterizes it as a methodology, rather than a set of methods. That is what we did in the previous section by exposing our hypothetical methodological features of self-study in the three self-study reports.

As a way to review what we now understand about the relationship between self-study and action research, we return to Figures 24.1–24.4. In Figure 24.1 we have the researcher standing back to examine, using the methods of the methodology that corresponds to the ideology under which she works, herself working with others. As we have seen in our review of Zeichner and Noffke's traditions of practitioner researcher, there are a variety of ways that that teacher can study her practice without focusing on her self (Zeichner & Noffke, 2001).

In Figure 24.2 we show three possible ways in which one can study the self, all of which illustrate the methodological feature that self-study focuses on the self. The first (a) is a form of inquiry that is based on reflection on the self. We believe that this is the impression that critics have of self-study research when they label it as "navel-gazing." While it does focus on the self (the first methodological feature), it does not use the experience of the researcher in practice (e.g., being a teacher educator) as a resource for the study.

The second form (b) illustrated in Figure 24.2 is an inquiry into one's self in the role of practitioner. In it self-study researchers problematize their selves in their practice situation. It, like (a) is a study of the self; but because it is the self in practice it makes use of the practice experiences. In a sense what we do when we engage in inquiry into our self in practice is to create a projection of our self into the situation so that we can stand back and research who we are when we teach. Therefore, in form (b) both the first and the second methodological features of self-study are illustrated.

Figure 24.2 illustrates a third possibility (c) for study of the self. In this case we use what we have learned by attempting to understand and improve our selves in practice as a focus for inquiry. It may at first seem that there is little difference between (b) and (c), but it is here that we see the third methodological feature of self-study; that those who engage in self-study are critical of themselves and their roles as researchers and teacher educators. We believe that this self-reflexive[1] form of inquiry can lead to fundamental changes in our selves. For example, it could lead to a reframing of one's educational philosophy, or it can lead to a change in one's stance towards practice (Feldman, 2002a).

It is important to remember that self-study is not a study of the self in isolation, but rather a study of one's self in relation to other people. In both the Henderson and Kosnik pieces, we are aware of the researcher's acknowledgement of the problematic nature of studying their selves in relation to people with whom they collaborate, whether they are students or colleagues, and with whom they are in a supervisory role (Figure 24.3). Figure 24.4 extends the reflexivity of self-study to the idea of a collaborative group studying their selves in collaboration. Again we can see all of the methodological features that distinguish self-study. We can see the way in which the self is highlighted as the focus of the research, the importance of one's own experience, and, especially in Figures 24.2(c), 24.3 and 24.4, the reflexivity of self-study.

Self-Study and Existentialism

We conclude this chapter by suggesting a theoretical basis for the methodological features of self-study. Recently one of us (Allan) has been exploring the ways in which existentialism can be used to understand what it means to teach and to be a teacher (Feldman, 2002b, 2002c). This is part of what appears to be a larger movement towards the use of existential concepts to understand why there has been little effect of the findings of educational research on teachers' practice (e.g., Allender, 2001; Roth & Tobin, 2001; Stengel, 1996), or on the practice of teacher educators. Existentialism is attractive as a theoretical basis for self-study because of the themes with which it is concerned, including, "the nature of the individual, the central role of passions and emotions in human life, the nature and responsibilities of human freedom, and the irrational aspects of life" (Johnson & Kotarba, 2002, p. 3). These are just the sorts of things that we associate with the self.

A key to understanding the existential approach is the idea that teaching is a way of being. That is, to say that "I am a teacher" or "I am a teacher educator" is to include our actions, intentions, and beliefs within the educational situation in which we are immersed (Feldman, 1997, 2002b; Stengel, 1996). To accept the teacher as a way of being perspective requires the acknowledgement that teaching is more than:

> a set of characteristics such as knowledge, reasoning skills, gender, class, or personality. Instead, our way of being a teacher educator is the way we are, immersed in educational situations that extend web-like through time and space, and across human relations. (Feldman, 2002d, p. 5)

This idea that we are immersed in situations is one of several tenets of existentialism (Greene, 1973).

A second tenet is that the self emerges from experience (Greene, 1973; Sartre, 1956). That is, the self is not something that is predetermined but is constructed through the choices we make in our experiences (Dewey, 1916). This notion of the person's self being shaped not only by what we experience in a passive sense but also by what we choose to do, and therefore experience, is an integral part of existential thought. Maxine Greene (1967) put it this way:

> And his existence comes first, his brute being-in-the-world. If he is to become an identity, he must plunge into action and relate himself reflectively to the situations making his life in time. Also, he must choose. He must create values, and indeed create himself; by choosing the kind of person he is moment by moment, year by year. His essence, that which he "really" is, turns out to be the identity he defines for himself as he lives. (p. 8)

In order to actively choose, it is necessary to be conscious, interested and committed, rather than mechanical and routine (Greene, 1978). And, in order to actively choose, people must be aware of their freedom to choose, even though their freedom is finite (Greene, 1973; Sartre, 1956). This is a third tenet of existentialism.

An important implication of this existential perspective is that for us to change our teaching requires us to change who we are, that is our selves, as teachers. While this has rarely been stated explicitly in the self-study literature, self-study recognizes at least implicitly that to improve our teacher education practices, we need to change our ways of being teacher educators. Therefore, from an existential perspective, self-study is a form of inquiry in which we inquire into our self as a teacher educator to improve our way of being a teacher educator. This does not mean an improvement toward a set end or even toward some hidden potential, but rather towards gaining, "the capacity to surpass the given and look at things as if they could be otherwise" (Greene, 1988, p. 3). This happens because when we engage in self-study, we begin to feel the disquietude, the "incompleteness of our vocation" (Greene, 1989), our "living contradictions" (Whitehead, 1989), or "the incompleteness, contradictions, dissonances, and dilemmas that we have in our way of being teachers" (Feldman, 2002b, p. 243). Not only does this lead to an improvement in our own way of being teachers or teacher educators, it leads to a better understanding of our practice situations as a result of our use of, "a certain mode of human attending, active attending and active interpretation, not the blank passivity of powerlessness" (Greene, 1989, p. 36).

An existential perspective on self-study provides a theoretical basis for the methodological features of self-study. First, it should be clear that existentialism puts at the center of its focus the self and what it means to be. Second, existentialism highlights the importance of our experiences in shaping who we are. Therefore, it is impossible to understand our ways of being teacher educators if we do not use our experiences as a resource for research. Third, an existentialist perspective, by acknowledging our freedom to choose, makes explicit the responsibility that we have not only for our actions and for those we care for, but in addition a responsibility for who we are. An existentialist perspective also makes us aware of the way that we relate to others and of the need to distinguish between an I-it and an I-thou relationship (Buber, 1937). Therefore, we must include in our self-studies an examination of our selves as researchers as well as our selves as teacher educators.

Conclusion

In this chapter we attempted to answer the question of how action research is and is not related to self-study by first reviewing the various traditions of action research, or more broadly, practitioner research (Zeichner & Noffke, 2001). We found that in this analysis self-study was considered one among these traditions that has as its defining characteristics a focus on teacher education and teacher educators, and that it tends to favor narrative forms of inquiry. This led us to question the relationship between methods and methodology, utilizing an adaptation of a theoretical framework for understanding feminist inquiry developed by Sandra Harding (1989). To begin to "test" to see whether a set of self-study methodological features based on Harding's feminist ones were useful for our

inquiry, the three of us related our stories of coming to self-study from action research. Our initial tellings, which were descriptive but unreflective, were in-line with Zeichner and Noffke's conception of self-study. However, when we revisited our stories seeking to gain understanding of the meaning of our journeys, we found our selves being highlighted and our experiences as teachers and teacher educators being used as a resource for research. We ended our inquiry into the relationship between action research and self-study by testing our hypothetical methodological features against three research reports self-identified by their authors as self-studies.

To conclude our chapter we return to the question that has guided our inquiry: What are the ways that action research is and is not related to self-study? First, we must repeat the disclaimer that we made at the beginning of this chapter that we have examined self-study in relation to action research and deliberately chose to look at examples of self-study that are most similar to action research. We did this because we felt that there is little to learn by comparing and contrasting widely different modes of research. We also took this route because it paralleled our own professional journeys from action research to self-study. Therefore, our focus should not be taken as a dismissal of more artistic or narrative forms of self-study.

Second, given our focus, we saw action research as a vehicle for systematic critical inquiry into one's self. In a sense what we are saying is that action research provides the methods for the self-studies, but what made these *self-studies* were the methodological features that they display.

Third, the ways that action research can make use of researchers' own experiences makes it a useful tool for self-study. This is in-line with the second methodological feature of self-study. But it is important to recognize that not all traditions of practitioner research privilege one's own experience in this way.

Fourth, it is only when we look closely at emancipatory traditions of practitioner research that we find the call to be self-critical of one's role as both practitioner and researcher. We feel that this is an important methodological feature of self-study that is assumed by many of its practitioners, but is not always made explicit in the literature.

We end by reiterating that while there are many ways in which the methods of some traditions of action research and some varieties of self-study are similar, the difference between these research genres are methodological – what makes self-study distinct is its focus on the self in a way that has opened our eyes to the importance of identifying and changing our ways of being humans who are teacher educators if we are to make significant changes in the ways that teachers are prepared.

Note

1. From the OED online: reflexive "A.2.c. *Social Sci.* Applied to that which turns back upon, or takes account of, itself or a person's self, esp. methods that take into consideration the effect of the personality or presence of the researcher on the investigation."

VISUAL ARTISTIC MODES OF REPRESENTATION FOR SELF-STUDY*

Sandra Weber[a] and Claudia Mitchell[b]
[a] *Concordia University;* [b] *McGill University*

Abstract

In this chapter we explore some of the innovative ways in which teachers and teacher educators are using visual culture and arts-informed research methods to reinterpret, represent and communicate their self-study research. Our focus is on how educational researchers and teachers are modifying and using these methods to craft artistic representations and interpretations of their self-studies. The reflexive nature of artistic inquiry makes it particularly well-suited to self-study. Section 1 examines the tradition of visual arts-based research and explores its usefulness to self-study. Sections 2–4 of this chapter explore four of the most prevalent modes of visual artistic expression that are being used to interpret and report on self-study in education: (1) performance; (2) photography; (3) video documentary; and, (4) art installations/multi media representations. Each of these sections contains detailed exemplars of these modes of representation. This chapter concludes with questions and quandaries about the uses and interpretation of these modes of inquiry. More detailed exemplars are included on the accompanying CD.

In this chapter we explore some of the exciting ways in which teachers and teacher educators are using visual culture and arts-informed research methods to reinterpret, represent, and communicate their self-study research. The methods and genres we describe are rooted in the rich body of autobiographic work within the visual and performance arts community, and within visual studies in the social sciences. Our focus is on how educational researchers and teachers are modifying and using these methods to craft artistic representations and interpretations of their self-studies. One of our main contentions is that certain

*Chapter consultant: Francoise Bodone, University of Oregon.

theoretical stances and practical methods derived from cultural studies, visual studies, and the visual arts are particularly important to self-study in teacher education because they hold up another mirror to facilitate self-reflection, and force critical consideration of the social and cultural dimensions of personal experience. And further, using the visual and the artistic can make self-study highly meaningful and pleasurable.

Sections 2–4 explore four of the most prevalent modes of visual artistic expression that are being used to interpret and report on self-study in education: (1) performance; (2) photography; (3) video documentary; and, (4) art installations/multi media representations. Through the use of examples, we highlight key aspects of the methodologies within these genres, and provide some useful references and reflective comments. Because we think it important to go into detail, describing a few examples thoroughly rather than listing the hundreds of possible ones, there are many omissions, including wonderful doctoral dissertations and journal articles that would be of potential interest to readers. Accordingly, to give a better idea of the range of scholarship in the field, we include on the accompanying CD-ROM an extensive selected bibliography, which goes beyond the references listed at the end of this chapter. We are also aware, of course, of the irony of writing about artistic representations using the dry, scholarly prose of the methods handbook genre. We try to punctuate the chapter with artful excerpts and literary accounts of visual representations, and we provide a few photographs and graphics to complement the text (in this chapter itself and also on the CD-ROM), but we realize that the paradox remains unresolved in this format.

Before turning to discussions of performance, photography, video documentary, and art installation, let us begin with a section that provides some historical and theoretical background about visual and arts-informed research in order to set the context of their application to self-study.

The Context for Visual and Arts-Informed Research in Self-Study

Using Visual and Material Culture for Self-Study

We live in an increasingly designed visual world, one that includes the innumerable images that are manufactured and manipulated as part of the expanding media, advertising, and cyber communications that occupy a growing share of urban, and even rural life. Billboards, television, movies, magazines, posters, web-sites, signs, window and museum displays, seasonal festive decorations, buildings, paintings, furniture, clothes, appliances, book covers, photo albums – cultural images and material artifacts are all around us. Since visual culture is everywhere, inside our classrooms and out, it provides a useful and convenient lens through which we might look back to how we came to be teachers, look deep into our experience to inform our current work as teachers, and finally, look ahead to how we might change professional practice. Mitchell (1988) points out that as teachers, we are accustomed to "making do," to using and tinkering

with whatever is lying around for educational purposes. Books that don't arrive, last minute changes in teaching assignments, ill-equipped classrooms, poor visual aids – all these contribute to a flexibility and open-ness to creatively using what ever is "at hand." It is not surprising, then, that teachers and teacher educators are turning to visual artifacts, popular culture, and the material culture of our everyday lives to explore their own teaching.

Some self-studies use narrative writing, popular movies, television programs, and novels as entry points for self-reflection (e.g., Weber & Mitchell, 1995); others use drawings done by students to gain new perspectives on how they are perceived and how they perceive themselves (Weber & Mitchell, 1996); still others use everyday artifacts and photographs as prompts for what we term "critical memory work" (Mitchell & Weber, 1999); yet other studies incorporate objets d'art such as paintings as useful prompts for autobiographic self-study or as a way to explore hard-to-access feelings and beliefs (Hamilton, 2002). Not only do these varied uses of the visual generate data useful to self-study, but the theoretical stances and methods of inquiry that underlie some of these approaches offer particular advantages and vantage points, as we shall discuss later on in this chapter.

Image-Based Traditions

There are some longstanding and important traditions of using visual data and methods as part of the research process in the social sciences and humanities (Collier & Collier, 1986). Lister and Wells (2001) stress the unprecedented importance of imaging and visual technologies in contemporary society and urge researchers to take account of those images when conducting research. And, indeed, in the last three decades of the 20th century, qualitative researchers in the social sciences began to pay serious attention to the use of images to enhance their understanding of the human condition (Prosser 1998). These uses encompass a wide range of visual forms, including films, video, photographs, drawings, cartoons, graffiti, maps, diagrams, cyber graphics, signs, and symbols. Further grounding for using the visual to theorize and represent can be found in the work done by scholars in visual and image-based studies, represented, for example, in the journal of *Visual Culture*, now published as *Visual Studies*. The exploration of how the visual is used to construct and deconstruct meaning often draws on the seminal theories of philosophers and scholars such as John Berger (1982) and Susanne Langer (1957). As we shall discuss in relation to specific genres, later on in the chapter, it is this theoretical grounding, as much as the images, that makes these research approaches so powerful and applicable to a variety of social sciences, including education.

Using Images for Self-Study

As we have already suggested, a growing body of scholarship in education is incorporating certain image-based techniques into its research methodology (e.g.,

Connolly, 1997; Walker, 1993; Weber & Mitchell, 1995). Some of the most provocative and influential early uses of images for self-study can be found in the photo-essays of the late Jo Spence (1986) who worked with photographs of her own body to reflect critically on how advertising and social constructions of gender and the body played into her life as educator/activist/photographer, studying and making public her fight with the breast cancer community. Several promising methods for using the visual to conduct self-study are outlined in detail in a book on self-study entitled, *Reinventing Ourselves as Teachers* (Mitchell & Weber, 1999). An overview and critique of the use of images in educational research can be found in an article by Fischman, (2001) that appeared in *Educational Researcher*, although much of the work he reviews does not necessarily involve the kinds of artistic and symbolic uses of the visual for representation that is the main concern of this chapter. The incorporation of the visual or the artistic into a particular self-study research design does not automatically or necessarily lead to the use of visual artistic genres for the interpretation, representation, or reporting of the self-study. Nor does merely referring to art or visuals in the course of the inquiry make a study "artistic." Indeed, it may be entirely suitable to use traditional academic discourse and/or one of the increasingly accepted personal narrative genres to write about self-studies that have incorporated visual or arts-derived elements into aspects of the study.

Art-Informed or Art-Based Inquiry in Education

As Eisner (1991), Greene (1995), and Lawrence-Lightfoot & Hoffman-Davis (1997) point out, the use of art as a serious form of scholarly inquiry has a substantial theoretical heritage from which we can draw inspiration and methodology. There is a rigour and discipline implicit to most art-making processes. Eisner (1991) agrees with Arnheim (1985) that most knowledge is visual in nature. According to McNiff (1998), the intent of arts-based research is, "to apply the discipline, rigor and intelligence that we commonly associate with science, to the process of aesthetic inquiry" (p. 15). As we shall explore in later sections, it is also the reflexive nature of artistic inquiry that makes it so particularly well-suited, we think, to self-study.

Interpretive inquiry and critical approaches necessarily blur the traditional boundaries between data gathering and interpretation, and between investigating and reporting, something anthropologist Ruby (2000) describes as also inherent to evolving approaches in visual anthropology. What interests us, in particular, is not so much what phase of the study involves the visual or the artistic, but rather how the research is grounded in an understanding of artistic processes and/or critical visual theories, bringing perspectives from the visual arts and cultural studies to bear on the interpretation and representation of the self-study.

Within the field of education, an array of stunning publications attests to growing interest and expertise in using visual artistic elements for research reporting. A useful overview of the history of arts-based research traditions in education can be found in a chapter entitled "Arts-Based Educational Research"

in *Complementary Methods for Research in Education* by Barone and Eisner (1997). Much of this work is autobiographic and makes an explicit use of arts-informed methodologies as a mechanism, "to challenge the tyranny of the academy … in an effort to build bridges between theory and practice, research and action" (Lawrence-Lightfoot & Hoffman Davis, 1997, p. 7). Noteworthy examples can be found in *Dancing the Data* (Bagely & Cancienne, 2002a); *Dare Devil Research* (Jipson & Paley, 1997a); *The Art of Writing Inquiry* (Neilson *et al.*, 2001); and special arts-based themed issues of education journals such as *Qualitative Inquiry* (Finley & Mullen, 2003); *Alberta Journal of Education* (Norris & Buck, 2002); *Teacher Education Quarterly*, (Nelson, 2002); and *Journal of Curriculum Theorizing* (Diamond, 2001a). Indeed, the number of education journals that are devoting themed issues to arts-based research is indicative of an emerging sensibility/open-ness to the arts, and an acknowledgement of the potential contribution arts-based approaches can make to educational research and knowledge.

Work by scholars such as Elliot Eisner (1972, 1976, 1978, 1985, 1991, 1993, 1995, 1997), Tom Barone (1992, 1995, 2000, 2001), and Maxine Greene (1978, 1995, 2001) serve as theoretical grounding for much arts-based educational research. But that is not to say that all arts-based research is based on the same assumptions or employs the same methodology. Differences in chosen media of expression, for example, will engender different research approaches, although, happily, there is also much overlap and inter-disciplinarity. The breadth and differences that can be easily discerned in the arts-informed or arts-based work of researchers such as Ardra Cole (2001, 2002), Patrick Diamond (1996, 1998, 1999, 2000, 2001b, 2002), Robert Donmeyer (1981, 1994, 1995, 1998), Susan Finley (1995, 2000, 2001), Jo Jipson (1997a, 1997b, 1997c, 1997d, 1997e), Gary Knowles (2001, 2002), Carol Mullen (2000, 2002a, 2002b), and Nick Paley (1995, 1997), to name just a few, illustrate how varied and rich the field is becoming. While our focus here is on the ways that scholars are engaging in visual artistic modes of expression to analyze and report on their own self-study practices, other artistic genres of self-study are dealt with in other chapters of this handbook.

The Potential of Arts-Informed Methods for Self-Study

Artistically crafted novels, poems, films and paintings, and photography have the capacity to awaken us from our stock responses. (Eisner, 1995, p. 2)

Real artists … aim to disturb, to interrogate personal and cultural assumptions that have come to be taken for granted; to do so, they employ design elements that are appropriate for their intent. These elements (which vary according to art form) are important for their usefulness in recasting the contents of experience into forms with the potential for challenging (sometimes deeply held) beliefs and values. (Barone, 2001 p. 26)

Some research is particularly noteworthy in that it ensures that both the modes

of inquiry and the forms of dissemination include an action-oriented interactive approach. Examples that inspire us include video documentary (Benin, cited in Paley, 1995), participatory theatre, such as the work of Augusta Boal (1995) in Brazil, *Small World Theater* and *Theater in Motion* (Mavrocordatos, 1998; Rohd & Patterson, 1998; Dargon, 2001), and the kind of photography used in Caroline Wang's work with women on health care issues in China (Wang, 1999, 2001). What follows is a list of the key features of arts-based research that make these approaches so powerful for self-study.

Reflexivity: Connects to the Self Yet Distances us From Ourselves, Acting as a Mirror

By its very nature, artistic self-expression taps into and reveals aspects of the self and puts us in closer touch with how we really feel and look and act, leading, potentially, to a deepening of the self-study. Yet paradoxically, such acts as self-photographs, drawings of or by the researcher, and putting oneself into a role for autobiographic performance also force us to *take a step back* and *look* at ourselves from the new perspective provided by the medium itself, increasing the potential for a deeper self-analysis.

Can Be Used to Capture the Ineffable, the Hard-To-Put-Into-Words

Eisner (1995) views the aesthetic as inherent to our need to make sense of experience, and argues that visual forms afford us an "all-at-onceness" that reveals what would be hard to grasp through language and numbers alone (p. 1). Arts-based methods of inquiry can help us access those elusive hard-to-put-into-words aspects of our practitioner knowledge that might otherwise remain hidden, even from ourselves.

Is Memorable, Can Not be Easily Ignored – Demands Our Sensorial, Emotional, and Intellectual Attention

Art is a heightened experience, one that simultaneously engages our senses, our emotions, and our intellect. The reason we need and create art has to do with its ability to make us feel alive and to discover what we didn't know we knew, or to see what we never noticed before, even when it was right in front of our noses. Because the visual and the artistic elicit a multi-sensory and emotional as well as intellectual response, they can be more memorable than many written texts are and therefore more likely to have influence. Images or experiences that have emotional overtones stay with us, although perhaps, hidden, for a while in a corner of our consciousness, only to come back and provoke later. Using artistic modes of representation thus increases the likelihood of finding a voice, of making an impact (whether negative or positive) on the reader/viewer/community – and, of course, on oneself.

Can Be Used to Communicate More Holistically, Simultaneously Keeping the Whole and the Part in View

Those who put up billboards or design magazine ads know that it is possible to convey a lot of things with just one image. For example, looking at a telling

and artful juxtaposition of candid snapshots of our students, or of ourselves at work can sometimes reveal as much information as several pages of written text, or convey a different kind of information that keeps a context always present. Or consider the power of the statement a teacher makes when she draws herself in her classroom gagged and tied up, or swaddled like a baby and portrayed as sitting in the large white masculine hands of a school administrator.

Through Visual Detail and Context, Shows Why and How Study of the One Can Resonate with the Lives of Many

Artful representation works well when it facilitates empathy or enables us to see through the researcher-artist's eye. Hearing or seeing or feeling the details of a lived experience, its textures and shapes, helps make the representation trustworthy or believable, and helps the viewers see how the researcher-artist's experience relates to their own as well as the ways in which it differs. As Eisner (1995) writes, artistically crafted work creates a paradox, revealing what is universal by examining in detail what is particular (p. 3). The more visual detail that is provided about the context of the researcher's experience and interpretations, the better able the audience is to judge how it may or may not apply to their practice or concerns, and the more trustworthy the work appears, leaving the reader to decide or "see" for themselves.

Through Metaphor and Symbol, Can Carry Theory Elegantly and Eloquently

The possibilities for the visual to use cultural codes to make effective and economical theoretical statements is, for the most part, dismally under-tapped and under valued in education, except by those statisticians who use graphs effectively. The advertising industry and political cartoonists seem to be way ahead of education in this regard. Imagine, for example, a cartoon or collage or manipulated photo display of a teacher educator knocked-down, reeling, half-lying against a brick wall while a menacing, bomb-shaped missile labeled "program objectives and standards" heads directly for his head. Such a visual statement may be simplistic and not necessarily artistic (it could be), but it very quickly alludes to a model or view of our work. Some visual statements are deliberately more ambiguous or nuanced, like Escher's provocative graphics, or Magrite's memorable drawings of a pipe that is labeled "this is not a pipe." Such art conveys multiple meanings that can be used to evoke the complexity of our work and the contradictions that are inherent to it.

Makes The Ordinary Seem Extraordinary – Provokes, Innovates, and Breaks Through Common Resistance, Forcing Us to Consider New Ways of Seeing or Doing Things

As Grumet (1988) observes, "the aesthetic is distinguished from the flow of daily experience, the phone conversations, the walk to the corner store, only by the intensity, completeness, and unity of its elements and by a form that calls forth a level of perception that is, in itself, satisfying" (p. 88). There was nothing

extraordinary about the ubiquitous Campbell soup can until Warhol thrust it in our faces, writ large. Giving a new symbolic twist to plain old things works well because we do not have our guard up against the mundane. This makes it a powerful weapon for breaking through our everyday perceptions. Accordingly, self-study art installations, plays, or photo essays may feature novel uses or attention to such mundane objects as pointers, apples, school bells, desks, books, school uniforms, academic caps, shoes, and so forth.

Involves Embodiment and Provokes Embodied Responses

If educators are acknowledging the importance of the body to models of learning in their rhetoric, it is important to acknowledge that self-study, like all research, is an embodied enterprise (see Chapter 4 "Undressing and Redressing the Teacher's Body" in Mitchell & Weber, 1999, for a detailed discussion). We are not ideas, but flesh and blood beings learning through our senses. Visual methods help researchers keep their own bodies and their students' bodies in mind and push for a more sophisticated analysis and theorizing that considers learning and teaching as embodied.

Can be More Accessible than Most Forms of Academic Discourse

We agree with Williams and Bendelow (1998) that artistic forms of representation provide a refreshing and necessary challenge to prevailing modes of academic discourse. The use of widely shared cultural codes and popular images make some visual expressions far more accessible than the usual academic language. To the degree that the mandate of the academy is to provoke discussion and thinking, and to communicate research to a broader audience (even within the academy) the use of the visual arts becomes significant.

Makes the Personal Social and the Private Public. Going Public Leads Researchers to Assume a More Activist Stance

As Florence Krall (1988) so eloquently puts it, "the journey inward becomes an ongoing process that leads outward to a more complete understanding of the human condition. Self understanding is not merely a reflection on what we are but what we are in relation to the world" (1988, p. 119). When the purpose of art is "to break through the conventionalized and routine consciousness," arts informed representations become the medium for messages needing to be heard (Dewey, 1958, p. 184). And, contrary to the stereotypes some might hold of self-study as a private activity of self-indulgence – we contend that self-studies need to be heard.

In light of the above discussion of the potential benefits of using visual arts-informed methods for self-study, what are some of the specific ways in which teachers and teacher educators are incorporating these methods into their work? The next four sections will provide some useful examples, questions, and guidelines.

Using Performance to Interpret and Represent Self-Study

> All the world 's a stage, And all the men and women merely players. They have their exits and their entrances; And one man in his time plays many parts. (Shakespeare, As You Like It. Act ii. Sc. 7)

Researchers such as Baskwill (2001), Denzin (1997), Diamond and Mullen (2000), Donmoyer and Yennie-Donmoyer (1995), Fels and Stothers (1996), Norris (2000), and Spry (2001) have written convincingly about the suitability and potential of performance as research method in education. Indeed, the reported use of performance as a mode of inquiry is increasing, especially in the area of self-study (e.g., Donmoyer & Yennie Donmoyer, 1998; Poku *et al.*, 1999; Bagley & Cancienne, 2002b; Mullen & Diamond, 2002b; Rasberry, 2002; Snowber, 2002). And yet, perhaps because of limiting academic traditions and conference formats, live performance, whether it be dance, play, monologue, reader's theatre, street theatre, mime, or stand up comedy, remains one of the least utilized modes of both conducting and communicating research. Of course, as scholars such as Grumet (1978) and Felman (2001) assert, one could say that all teaching, all academic presentations, and indeed all human interactions are performances of one kind or another. In a sense, then, performance becomes simultaneously a metaphor for self-study as well as a vehicle for conducting or communicating it.

The potential of performance for self-study seems fairly obvious, even on the surface. Performing is so blatantly about the self – you can't "not be there," both mentally and physically. You can not hide in the same way you might while others read your books and articles or watch your videos or view the photographs that you posted on a web-site or CD-ROM. For performance, you have to be there in the flesh to confront yourself, to witness yourself, to hear yourself, and to see how others respond to you. All of this, of course, can be very humbling and daunting, perhaps even intimidating or shaming, but it is also wonderfully revealing of what we know and how we know it. In other words, the focus is dead center on self-study, and the potential for learning about the self is enormous. The capacity of performance to represent self-study in an embodied way reminds us constantly that we teach and learn through, with, and in our bodies. But performance is not only about the self. Its roots in public storytelling, morality plays, and "Carnivale" (Martin, 1990; Diamond, 2001b) attest to the fact that performance, like education, is, at heart, a community-based, social activity.

Plays are seldom written and directed and staged and performed by only one person. Work-shopping, trying things out, getting feedback, involving the audience – these are often integral parts of theatre-based work. Performance can turn self-study into a collective or group enterprise, especially when elements of collective brainstorming and authorship are added. The emancipatory and critical methods pioneered for community consciousness-raising and social critique discussed and practiced by people such as Gray, Ivonoffski, and Sinding (2002),

Berry (2000), Fels and Stothers (1996), and Boal (1995) can be adapted for the purposes of self-study. This brings a collaborative effort to bear on individual self-study, forcing us to incorporate other people's eyes and feedback and to entertain collective interpretation and notions of the social construction of self.

In a series of brief scenarios, we will now examine the nature and potential of performance for self-study from perspectives both on and off the stage.

Performance and Self-Study

Scenarios

Scenario I: In The Audience For "Dance Me To An Understanding"
(see Cole & McIntyre, 1998a, 1998b)

> At the end of a long day of sessions on self-study for teacher education, we are seated, finally, in an anteroom of the Herstmonceux Castle in southern England, waiting for the final research paper of the day, billed as a performance. We are not sure what to expect as Ardra Cole, a teacher educator at University of Toronto (wearing tap shoes), and Maura McIntyre begin to perform their interpretation of Ardra's self-study of her own learning processes. We quickly find ourselves engaged – fascinated by the use of tap dancing as a metaphor for learning and teaching – and raptly following Ardra's journey from childhood to adulthood, from obedient young learner following the recipes to risk-taking, independent thinker/graduate student/ teacher educator. The performance flashes back and forth from scenes of Ardra's childhood and adolescence when she was "a good girl," dutifully following her teachers' instructions to scenes of her learning to tap dance, trying to decide whether to study with the step-by-step drill method of one teacher, or the go-with-the-flow, feel your own way, holistic method that another tap teacher uses, to scenes of graduate school where it was initially strange and even threatening to be set adrift and told to think for yourself.
>
> Watching, in one memorable scene, Ardra stamp her feet, painfully resisting Maura's attempts to free her from the recipe way of learning – we suddenly and viscerally "GET IT" – we see/feel/know in an instant what it is like to resist ideas, to be afraid of new ways of learning, to want to change but to find it a struggle.

Afterthoughts: The performance encapsulated the essence of what it can mean to learn or teach against the grain, not only intellectually, but physically and emotionally. Was it the adamant and loud stamping of feet that drove home the message? Or Ardra's use of laboured, resistant breathing that literally made us gasp for breath, feeling what she had felt? Or was it the metaphorical use of children's familiar clapping games as a narrative device that underscored the importance of childhood experience to how and why we teach? Was it the involvement of another actor/researcher (Maura) that helped us see the connections to our own lives? In any event, the performance stuck with us and made

us think about teaching and learning in compelling ways. Not every one else in the audience responded the way we did. Some didn't seem to connect, to "get it." But then, the same observation could be made of almost any and every research presentation in any genre on any topic.

Scenario II: On-Stage for " Robe To Robe" (see Weber & Mitchell, 2002c, Act I)

Convinced that learning and teaching are embodied acts, and very aware that educators and researchers have neglected and even abused the body in teacher education, we set out to interrogate our own embodiment as professors: Sandra, by writing a monologue about her academic gown, using the garment as a way to unpack some of the theoretical knots that we get ourselves into in teacher education; Claudia, by presenting short monologues based on memory work around the role that different items of clothing have played at different points in her teaching career: "Little black turtleneck" "Suit yourself" "Was it something I wore?"

The more we researched our individual pieces about the body, the more we felt the need to "perform" them; it seems so evasive, even perverse to write at length about how we ignore our bodies in teaching without finding a more embodied way of testing and re-presenting the ideas. After all, we are always performing our bodies (Butler, 1990), and teaching is a special kind of performance. Indeed, the essence of our critique of current scholarship on embodied learning is that it is mainly written in jargon so dense it rarely evokes in any way the material bodies we live through.

To even begin to embody what we were theorizing, we realized we HAD to use our bodies and perhaps our clothes more concretely. And so the written monologues gradually evolved into performance pieces. But, then, as we performed them, we gained further theoretical insights into what our self-studies were really about, and so then we had to re-write our pieces again, and so on. Performance in the service of self-study is as much an *on-going process of inquiry* as it is communications of results. It was *in the performing* that we grasped just how slippery some of our dearly held theoretical notions can be. As an example, we offer some *re-written* passages from Sandra's monologue on academic robes and the body, "Robe to Robe," in which she occasionally finds her body in contradiction with her theorizing:

Sandra (holding up folds of gown she is wearing): <u>This</u> is my academic robe. It usually hangs somewhere in the back of a closet – dusty, seldom used, and out of sight. I don't even really think of it as mine – or as something I would ever choose to wear (does that mean that after more than 25 years in the academy I still don't identify with it?). This reluctance of mine is perhaps understandable – considering that, much to my mother's dismay, I categorically refused to wear an academic gown or even attend convocation to pick up my first university degree, a B.A. in psychology. It was the 1960's, and I suppose I was simply acting the self-respecting, establishment-hating, pseudo-activist and aspiring intellectual, like so many

other North American students of my era. What would I have thought, back then, I wonder, if some one had told me that, one day, not only would I eventually routinely wear an academic gown, but that some day, I would even own one! At any rate, idealism and self-delusions aside, the fact is that, nowadays, I dutifully trot out my academic robes on those occasions when I resign myself, for my students' sake, to being part of the platform party at convocation ceremonies.

I never know what to wear <u>under</u> the robe. Should I wear dark pants as I usually do, like the men do, seeking to blend in, first and foremost, as a scholar, showing that women can wear the pants as well as the robes of the academy? Or, should I stress and celebrate my womanhood, standing out from the sea of male scholars by wearing what they can't, although perhaps a few of them secretly would like to – things like nylons, high heels, silky underwear, and a skirt or dress?

Should I dress all in black, my habitual choice, so that it is the academic robe that is featured? Or, for once, should I wear something silver or gold or bright red that distracts from the gown and features my fondness for fashion eccentricity? Oh, what does it matter, anyway? Whatever I choose will be mostly hidden by the bulk of the robe. And so will my body, for that matter – something I am increasingly grateful for as the pounds slip on and the flesh sags and bulges in ways I had not anticipated when I was younger. Yes, to be honest, I sometimes find myself quite content to hide beneath this gown.

Robed nudity is not an option that ever occurs to me, well, at least, it didn't until writing this piece. It can get so hot up under those stage-lights, that little or no clothes underneath might be a sensible choice if the darned robes weren't so scratchy and flappy … But of course, in our culture, nudity would not be read as a practical decision, would it? But rather as … as what? An erotic or exhibitionist act? A political stance? A way of privately subverting or mocking the whole meaning of the ceremonies? A thumbing not of one's nose, but of one's privates at the Academy? Perhaps there are some who entertain romantic or erotic notions of the naked academic (male or female) coyly reposing half-robed on a worn leather couch in a twilight wood-paneled office, perhaps with a fire glowing in the stone hearth that seems requisite to such fantasies but so absent in the ugly, modern serviceability of our real university digs?

To each her or his own, I say, but frankly these are not the sorts of preoccupations that occur to me as I stand before the mirror. It's the covering over – not the exposing of the body that concerns me. Never mind my body – look at my Beautiful Mind! In saying this aloud, I am startled, finding myself complicit in that ubiquitous Cartesian myth of Body as separate from and subjugated to Mind. How can that be? Me? I am thoroughly opposed to that devious dichotomy! Why I have even been known to imagine giving that bastard Rene Descartes a swift kick in the balls and telling him "Think on that!" (Sigh) … I guess I am neither the

first nor the last to discover that my theoretical convictions and my practical actions are not always in sync.

At convocation, covered up as we all are, students and professors, in academic gowns, it thus amazes me to see how often the focus shifts to the bits of body parts and clothes that stick out or that are momentarily "flashed" when a robe gapes open unexpectedly – we seem determined to note the differences, seeking the individual body under the sea of robed sameness. With our eyes and comments we dis-robe each other. Are we seeking areas of vulnerability under the armour of our uniforms?. ... (Shakes head a bit, sighs, pause, turns and walks away, removing gown) ... Whatever their function, or whatever meaning we wish to attribute to them, academic robes are costly to dry clean, cumbersome to carry, and not nearly as silky and comfy as the robe I choose so readily to wear at home.

Sandra (Takes off gown to reveal bathrobe underneath**):** This (holds up fold of bathrobe) is the sort of scholarly uniform I wear as I hunch over my computer keyboard for hours on end, writing an article or a report or preparing a course syllabus in what used to be my daughter's bedroom when she was younger and lived at home. It is now officially the guestroom as well as my home office, but I still like to think and speak of it as "Stephanie's room," a way of holding her close I guess. Her essence is in the air, her imprint on the bed and the walls. The room feels warm and loving, not demanding. Seated in the comfort of that room, my bathrobe gradually and imperceptibly becomes a ritual-wrestling robe, as I struggle with ideas and my own inability to find the right words. Its amplitude allows me space to thrash, until things eventually settle down to a steady working rhythm and I lose myself altogether, abandoning the here and now to follow the threads of my thoughts ... It usually takes the sharp stabbing pain in my protesting joints or the jarring shrill ring of the telephone to bring me back.

Sandra (spoken as an aside): "Bring me back?!" Wait a minute! Back from where? Here I am, again, berating the Cartesian Mind/Body split one minute and then talking the next minute about how I leave my body as I engage in the intellectual pursuit of writing. (Sigh) How slippery this all is. But I did say that I forget "my Self," didn't I? At least I am locating my self in my body, if not my mind! An embodied and ontological philosophy of Mind and Identity is indeed a tricky thing to articulate, and an even harder thing to live. (Weber & Mitchell, 2002)

Afterthoughts: The above performance was both the mode of situated discovery and the mode of communication. Literally catching herself in the act, and then writing the discovery into the act, Sandra recognizes a specific instance of a much broader and common phenomenon: Our thoughts and our actions are often necessarily contradictory (Whitehead, 1989). This leads us to speculate that any adequate conceptualisation or theorizing of teaching and learning will

have to be broad enough or flexible enough to take the paradoxical nature and the complexity of our teaching lives into account.

Scenario III: On-Stage for Accessorizing Death: A Monologue for Two Voices (Weber & Mitchell, 2003)

As part of a larger inquiry into the role that clothes and the body play in teaching, we set out in search of our pedagogical roots through some autobiographic writing that centered on memories of our deceased parents (Claudia's mother and Sandra's father), and on the role that the material culture of clothes can play in structuring theoretical accounts of personal knowledge. As we wrote, performed, and re-wrote, we found ourselves discovering new connections between our past and our teaching.

Often, the physical act of performing sparked an insight that was simultaneously emotional and intellectual. For example, it was only when standing on-stage, holding a shoe in her hand while playing the role of Claudia's mother, Elsie, that Sandra began to see the symbolic role that shoes have played, not only in her relationship with her father, Avi, but also in shaping her professional work. This resulted in the following excerpt from Act II "When the Shoe Doesn't Fit: Death of a Salesmen" (Weber & Mitchell, 2002a, 2003). The lines occur at the end of a long scene in which we have witnessed both Avi's love of shoes and the care he gave to fitting them on ladies feet "no matter how calloused or swollen or aged they might be." (Sandra is playing herself as both child and adult, and Claudia is playing the role of Avi, Sandra's late father).

> **Sandra:** Growing older didn't mean growing out of the need for Avi's advice on shoes, at least not as far as he was concerned. (Sandra walks to stage left and sits on step.) I remember, for example, an incident that occurred not long after we had finally gotten back in touch with each other after many years without contact. He was up visiting me in Montreal for a few days.

> **Claudia/Avi** (walking into spot, looking towards Sandra): How can you walk around in those flats? Here, give me that – let me see that shoe! (Sandra gives Avi shoe) Look at this, there is no arch support whatsoever. Darling, never buy a shoe without a steel shank – you will ruin your feet. Go and get yourself some Cappezios or something with proper support. This shoe is a piece of crap! And it's ugly – no style! Honestly, Princess, I'm shocked.

> **Sandra** (standing up, keeping left): (sigh) ... I think I have always been relieved that Avi had so little to say on the subject of my teaching or university career. Worrying about whether or not my shoes fit was just about all the fatherly attention from him that I could handle. Indeed, all this worry about fit still spills over to my adult life and work. Is there enough room and support? Is the material fine? Am I comfortable? Are my

students? Is the curriculum made for walking and running, or just for show? And is it beautiful? Is my sense of aesthetics offended or pleased?

   Not long after Avi died, a relative commented on how similar my job is to Avi's. I was taken aback. Me – a salesman? (Sandra turns towards Claudia/Relative).

Claudia/Relative (looking and maybe moving towards Sandra) Yes – but instead of loving, designing and selling shoes, you love, design and peddle ideas.

Sandra (turning back towards audience): Initially, I was almost insulted at the comparison – is that what I spent nine years studying at university for? But then, I began wondering if there is not a certain truth to her words. Do I notice and comment on delicate high arches, charming my students while caring for, and even loving, their feet, looking for something that suits them, that fits? Hmmm … Sometimes, though, when I am trying to squeeze myself into some one else's curriculum, or research paradigm, or struggling to convince others that my ideas are worth considering, I find myself despairing that nothing in Education will ever fit me perfectly. And then I wonder – couldn't we all just go barefoot? (Claudia comes down to join Sandra, they both remove their shoes). (Weber & Mitchell, 2002a, 2002b, 2003)

Afterthoughts: If it had been put forth as a straightforward analogy in another genre, would the metaphor of fitting shoes be as helpful to understanding education as the audience members seemed to find it in discussions after performances of the play? Perhaps the metaphor works so well because it is embedded in the lives of the characters in the play, fleshed out in the detailed context of specific people. It is the *details* of the script, not reported here, of corns and bunions, of foot measures, and sizes, of materials, colours, and craftsmanship, as well as the acting on stage of the charming (nauseatingly so, at times!) salesman and his relationship to both his customers and his daughter that show how this all could happen, how it might be so, how it could apply to other people and other contexts.

Scenario IV: Imagining Ourselves in the Audience for Dancing Identity (see Snowber, 2002)

   Seated in the audience at a conference on education, waiting for a presentation that was billed as a dance performance, you wonder apprehensively if we, the audience, will also have to dance. Is this going to be one of those interactive open communal events where we will have to participate with our whole bodies, and not just our voices? You fervently hope this isn't going to be one of those blasted touch-y feel-y things. … You don't like those – they seem too artificial – too forced. And the inevitable invitation to the audience to participate is really a command, isn't it – and then you're trapped. You don't want to disappoint or embarrass the speaker by refusing

(we are in Canada, after all) -you know you'll just have to "force" a response, fake something, just to get through it ... hoping you don't make a total fool of yourself or reveal how stupid you are …, and maybe inside you're feeling pissed off and resentful at having wasted your time, or having forced yourself to be genuine. Theoretically you are in favour of "provoking curriculum" as long as you're the one doing the provoking, not sitting there waiting for some lame activity to begin that you don't really care about. Apprehension and resistance – that's the stance you're in right now.

   And then Celeste Snowber begins a performance that combines poetry, dance, and laundry – and you're too busy feeling the frustration she is trying to communicate, and pondering the impossibility of living a balanced life as a teacher educator. You'll not be called on after all (there isn't time), and somehow you're almost disappointed because for once, dialogue between audience and performer seems voluntary, natural, and meaningful. And you start to think of your own life as teacher educator/parent and realize you are not alone in sometimes finding it an impossibly disorderly and difficult juggling act. (This piece is an imaginative composite based on real experiences attending dance presentations at conferences.)

Afterthoughts: Here, too, it is bodily tensions, the physical and emotional responses that make the memory vivid, fixing the themes of the presentation much more clearly in memory than most lectures do, getting the message across. Further, there is that empathic response that performance, like good writing and good films, triggers – a natural identification with the protagonist that makes it possible to consider their experience from the inside, even if it is different from your own. And it is especially when the character or his or her experience is different from your own that you are forced to broaden your conceptualization of what teaching or learning or working can be like.

Autobiographic Performance As Self-Study: Selected Features

In analyzing the above examples and reflections on performance, we note several aspects or features that are worth exploring further in the sections that follow.

Immediacy, Sense of Public or Audience or Community

Just knowing that there will be a live audience instead of some anonymous potential reader forces the researchers/actors to focus acutely on the content, process, feeling, and format of the self-study report. Unlike the audiences in many conventional forms of dissemination (conference papers, journal articles), the members of some of our target audiences cry, hoot, go silent, are moved, yawn, clap, and otherwise register their fears and concerns both during the performance and during follow-up discussion sessions. In short, they use their bodies to communicate reactions, and readings of our research as they see/experience it, providing a more immediate and authentic form of feedback than any post-presentation questionnaire can usually elicit.

From the audience's perspective, there is an immediacy to live performance, an "in-your-face," "NOW" quality that makes it much harder to ignore – it's not like a journal article you can put down if you are bored or disappointed after a page or two. Live performance demands attention and response immediately, as it takes place. From the researcher/performer's point of view, this can be downright scary (people will actually be listening/watching our work – what if they hate it and use the anonymity lent by cover of darkness to hiss or boo?). But immediacy and audience also constitute a wonderfully effective litmus test for autobiographic work – indicating whether or not others can make sense of and relate to our experience in ways that might benefit other students and teachers.

The embodied reactions of both researchers and participants in turn provide more useful data and raise further questions to investigate. Moreover, all types of performances hold the potential for a community to develop, a collective interpretive enterprise that makes the self-study not only public but subject to collaborative re-interpretation. The involvement of audience helps us address through performance one of the central but necessary challenges of self-study: how to go beyond the self to gain critical perspectives from others, sometimes in ways that are transformative.

Embodiment/Putting Our Bodies on the Line

Although any kind of writing, including scholarly work, is an embodied act, representing our work through performance also shows materially, in three dimensions, who we are – revealing even aspects of ourselves that we may not have consciously chosen to include as foci of our self-study. Performance calls attention to the body in very powerful and effective ways, whether through movement, gesture, appearance, costume, or voice. And as Aalten (1997) reminds us, the body is a locus of meanings. The use of body in performing self-study could thus constitute a form of theorizing. Butler's (1990) notion of the body as "not merely matter but a continual and incessant materializing of possibilities" (p. 272) points to the ways that we can convey through performance the imagined implications of our work and new directions for further inquiry.

In a performance mode, it is almost impossible for the researchers not to also be confronted immediately with their own embodied reactions. We weigh our words carefully before we speak them out loud in public. But then, we are caught up in the process of performing, in the being of it, an almost physical but more-than-physical transformation of self that has to be experienced to be understood – words simply fail us here. Sometimes, you come out the other side with heightened feelings and reeling senses, questioning who you are and who you might be, but suddenly very much aware of being there.

Through Our Voices

The materiality of voice, its presence and its forcible absence, is an essential aspect of the pedagogical experience … Voices, as embodied, participate in

> complex performances of gender, class, race, locale and sexuality using semiotic resources every bit as conventionalized as those involved in other forms of bodily performance. Even a phenomenon as apparently profoundly physiological as basic voice pitch can be demonstrated to be a complex combination of the cultural (the learned) with the biological. (Poynton, 1996, pp. 105–109)

> We are so caught up with the symbolic value of "voice" that we risk forgetting to take seriously the very real and physical voices of teachers and students that are integral to voice-as-power, voice-as-authority, voice as resistance, and "multiple-voices." (Mitchell & Weber, 1999, p. 202)

In most forms of performance, we literally use our voices to give voice to both our own and other's experience and perspectives, putting our physical voices out there for public scrutiny. The nuance and tone and expression we use can go far beyond the written text, allowing us a broader range of means to express and critique our experience as teachers and teacher educators. It's not only *what* we say (content), but also *how* we say it (or don't) and *what we do* as we say it that shapes our communication and determines how others may interpret us. If what a person says contradicts what she or he does, the savvy listener gives priority to the non-verbal message as more genuine or significant, as having greater truth-value and better representing the speaker's internal intentions and feelings (Watzlawick *et al.*, 1967). But deliberate contradictions between spoken text, expression, and gesture help convey the nuances of our work and the complex reality of social situations such as teaching. Through performing, we learn to use our voices, and in so doing, find our voice.

Models of Teaching and Everyday Life

As Goffman (1959) compellingly theorized, not only does theatre often mimic what we perceive as the reality of our everyday lives, but our everyday lives can be usefully analyzed and understood as a special form of theatre (one that has no exit!) – complete with *roles* (e.g. teacher, mentor, advisor, administrator, teacher educator, friend, rival, parent and so forth), *scripts* (e.g. both improvised and pre-written through social expectations: curriculum, syllabi, classroom interaction, lectures, meetings, gossip), *on-stage areas* (e.g. classrooms, meeting rooms, council halls, school grounds), *backstage areas* (offices, hallways, staff rooms, washrooms), and *offstage areas* (homes, streets, shops). The context and situation at hand help determine the roles and stage areas, but we are always engaging in the presentation of self, even to ourselves. Performance thus becomes simultaneously a metaphor for self-study as well as the vehicle for conducting or communicating it.

Verisimilitude

To what extent is any self-study believable as a possible human experience? To what extent does it resemble or evoke what we naively view as "real life?" What

connection does it make to the situations and knowledge of other educators? Along with apparency, verisimilitude has been put forward by scholars such as Eisner (1991), van Maanen (1988), and Connelly and Clandinin (1990) as an important criterion for judging the trustworthiness of narrative research accounts. Performance often puts itself on the line regarding these criteria – to succeed, to engage, to mean anything, it has to be believable not only, as with all narrative accounts, in its script or text, but also in its interpretative and embodied portrayal of that account. Another way performance becomes believable is through its use of material culture. For example, the use of props, often the everyday objects from our teaching lives, helps both researcher and the audience "see" what the self-study means, enhancing a piece's ability to visually theorize the problem and its potential meanings and solutions.

Distancing Eye, Self as Other

Turning one's self into the subject/object/character/role in a performance piece provides a distancing eye and an imaginative turn or interpretive lens onto one's work and way of teaching. In order to write and play oneself, one has to look at oneself as "other," and work out a credible interpretation of the role. Assuming the role of oneself (or multiple selves) on stage requires a critical examination of the roles we play everyday, forcing us to see aspects of our teaching/ learning/ living selves that we might overlook in other forms of inquiry. By treating ourselves and others, including our students, as characters or personages, we are encouraged to *reinvent ourselves* by looking back critically and/or looking ahead imaginatively, seeing ourselves in the future.

During group productions where colleagues or students help us represent our self-study, the exchange and trying on of roles allows for further insights and nudges us to take multiple perspectives. In writing the script or taking the part of another, we are forced to look at ourselves through a more dispassionate lens. And playing the role of one's self forces a conscious re-interpretation of the self as teacher, leading to new self (and public) revelations, sometimes during the actual performance.

Dialogics: Performance as Interactive Conversation

Even in traditional theatre formats, there is always an emotional and embodied response – the audience members' bodies engaging in a silent dialogue with the actors' usually more vocal ones. As the performance continues, there is an often-palpable relationship forming between audience and players (whether negative or positive), a feedback loop in which the response (or lack of response) of the audience shapes in often subtle and unnoticed ways the tenor and tempo of the performance. There may be, for example, an encouragement from the audience of one form of dramatic interpretation that pushes the performer to exaggerate or modify the way a text is being recited or read, emphasizing the humorous side of one event, prolonging the poignancy of another. In a sense, then, even in traditional research performance contexts where the audience is merely

required to watch, the actual presentation of research thus becomes a collaborative interpretation that incorporates some aspects of the reader/audience response. In the inevitable post-mortems after the performance, the researcher-performers may thus see new meanings of their text in retrospect.

In concluding this section on performance, we note that the above discussion is very general. Each genre of performance (e.g., mime, improvisation, audience participation, multi-media, dance, etc.) has its own internal structure that offers a different twist to self-study. Performance could perhaps best be viewed as something we all do in one way or another, a natural and obvious choice for research dissemination. Although its temporality, its fixedness in time, along with its space, rehearsal, and technical requirements may present challenges, performance does leave behind vivid memories as well as the textual script or filmed record. Perhaps getting together for public performance is an inherent part of education that needs to be cherished, nurtured, and revived. Going public is what research is all about, isn't it?

In the next section, we will turn our attention to another artistic genre that is being used with increasing frequency: photography.

Photography and Self-Study

There is a well-established tradition of photography and self-representation in the vast body of work on photo-elicitation and photovoice (Ewald, 1992, 1996, 2000, 2001; Lykes, 2000; Mateo, Sanchez, & Lykes, 2000; Fehily, Fletcher, & Newton, 2000; Hubbard, 1994; Kun Yi *et al.*, 1995; Wong, 1999). In our book on self-study entitled *Reinventing Ourselves as Teachers* (Mitchell & Weber, 1999), we devote an extensive chapter, "Picture This: Using Photographs to Study Ourselves", to describe ways of working with beginning teachers during a "school picture day" workshop. This format engages them in a systematic examination of their own class pictures, photos from childhood through high school or even university. We ask them to bring in whatever school photographs they can find, and through the use of protocols for group and individual work, ask them to consider some of their memories of schooling and the ways in which their memories link to how they think of themselves in their developing role as teacher. While asking pre-service teachers to reflect on their experience is not the same as self-initiated self-studies that are the focus of this handbook, the methods we piloted with these beginning teachers proved to be invaluable to self-initiated self-studies. Later in that same chapter, for example, we describe various photo projects that in-service teachers and teacher educators have devised around photographs of classes they have taught. Sandra, for example, looks back on the official school photo taken with the very first class she ever taught and wonders about her own idealism as a beginning teacher (pp. 133–136). In another section, Claudia looks back on a photograph of herself taken during her first year of teaching and through a poetic piece, explores her resistance to becoming a teacher (pp. 118–119).

In the remainder of this section, we highlight ways that teachers and other

researchers could engage artistically with photographs for self-study. The methods and protocols draw, in part, on "reconstructing the family photo album" projects done by photographer-scholars such as Spence (1986), Spence and Solomon (1995), and Holland and Spence (1991). Their autobiographic work, like that of many other photographers and scholars in cultural studies, disrupts and contests common notions of the idealized family. Our focus here is on using similar approaches to school photographs or other photographs, working critically to disrupt and contest our identities and practices as teachers.

Photography and Critical Writing

A number of researcher-artists have explored childhood and schooling artistically through photographs. For example, Valerie Walkerdine (1990), a former primary school teacher and author of a number of critical texts on schooling and girlhood, describes a photo project that includes looking at slides of herself, some of them "school-girl-type" photos drawn from family snapshots. For her, as she describes in an essay called "Behind the Painted Smile," the project is focused on the mouth (voice) and body:

> I projected these [the photo-slides] onto a wall, placed a piece of paper on the wall and drew and coloured the projected image, so that with the slide the image looked like a tinted slide, but without the slide the image itself became another and separate representation. On the first image of myself as a smiling and pretty little girl, I first wrote the caption "as pretty as a picture." But I knew that was not all there was to say. I drew a second. I crossed out the mouth and stuck a piece of tape over, obliterating the mouth altogether. As a caption I wrote "all mouth." This was a profoundly shocking piece of self-mutilation to the image, since the one thing I worked hard at not being was a talkative and cheeky child who could possibly be described in the negative connotations of "shouting her mouth off." I think what I achieved was a kind of censorious silencing of myself, without ever necessarily having an adult to tell me to keep quiet. I mean that I have no recollection of being told to keep quiet or even of being told off. I suspect, then, that what I was doing was censoring myself so that I could not possibly be in the position where I would have to be told off. (Walkerdine, 1990, p. 149)

It is her use of slide projections, drawings and captions that takes Walkerdine more deeply into the space of self-study by causing her to ask herself questions about the particular photographs, and about why she drew and wrote what she did. It is an *artful* exploration.

Similarly, in an essay entitled "Phototherapy: The School Photo (Happy Days are Here Again)," Rosy Martin (1986) uses a series of photographs of herself for a project in which she re-examines her outsider identity as an adolescent school-girl. The photo essay features Martin, now as an adult, clothed in a school

uniform, and with schoolbooks and a cigarette. A key issue for Martin is the role played by class in a school environment. As she writes:

> The good schoolgirl, the academic achiever, was the part of me that sought solace in pleasing the teacher. However, I was constantly anxious, afraid both of failure and success, a perfectionist, who always managed to get something wrong. … In "learning to smoke" as a schoolgirl I was taking up the rebel position, and being "adult." I used to smoke when I was out with my working-class friends. (Martin, 1986, p. 42)

She goes on to note:

> Adolescence for me was a time of complex self-denial. Within each attempt I made to try on a particular identity, was the requirement to deny or not develop other aspects of myself. To negotiate my own position, within a set of conflicting demands, to try out various positions, and often to experience failure in these attempts, was part of the agony of adolescence. In creating these images, [photographs of herself as an adult in various poses as a schoolgirl and in school uniform] I have been able to examine how much I still carry with me of those experiences. These images act as a reminder to me of my past, and whilst accepting the "silenced" part of myself, I now know that behaviour is no longer appropriate. (Martin, 1986, p. 42)

What we think is central in the autobiographical work of Walkerdine (1990) and Martin (1986) is both their attention to the visual itself and how they write *about* the visual in ways that are informed by the critical approaches of visual and cultural studies. In terms of autobiographic analysis, their methods are not unlike the critical memoir approaches of Hampl (1996) and Hirsh (1997). Their artful close readings of photographs evoke the imaginative, even artistic, work about photographs done by scholars such as Chalfen, (1987) and Langford (2001).

To help orient researchers to working artfully with photographs, we present below two protocols that we have found especially useful. The first is adapted from Annette Kuhn's (1995) work to support what might be called a "disrupted viewing" or reading of photographs; the second is a protocol for doing arts-based projects using visual layouts, based on Jo Spence's (1995) work.

Working With a Single Photograph

In her book, *Family Secrets*, Annette Kuhn (1995) provides a very useful protocol for engaging artistically with photographs. The questions that she raises are ones that are characteristic of work within visual sociology and feminist visual studies:

1. Consider the human subject(s) in the photograph. Start with a simple description, and then write an account in which you can take up the position of the subject. In this part of the exercise, it is helpful to use the

third person ('she,' rather than 'I,' for instance.) To bring out the feelings associated with the photograph, you may visualize yourself as the subject you were at the moment the picture was taken: this can be done in turn with all the photograph's human subjects, if there is more than one, and even with the inanimate objects in the picture.

2. Consider the picture's context of production: where, when, how, by whom and why was the photograph taken?

3. Consider the context in which an image of this sort would have been made: what photographic technologies were used? What are the aesthetics of the image? Does it conform to certain photographic conventions?

4. Consider the photograph's currency in its context or contexts of reception. Who or what was the photograph made for? Who has it now, and where is it kept? Who saw it then, and who sees it now? (Adapted from Kuhn, 1995, p. 7) [Reprinted from *Reinventing Ourselves as Teachers: Beyond Nostalgia*, Mitchell & Weber, 1999]

Visual Lay-Outs

Below, we draw on Jo Spence's (1995) work on visual lay-outs as an orientation to both the process and the production for studying one's own teaching practices. The key steps are:

Assembling: Get together all the pictures of yourself (particularly school-related) that you can find. Also look through other people's collections in the family. Lay them all out on the floor, and sort them into piles with a separate one for each year. Now sort out and select one single picture for each year of your life, and lay them out on the floor, starting with the earliest year. Lay the chosen pictures out on a long piece of white paper and write down the approximate date of each photograph. Try to remember key emotional events in your own life which link up to the years you are dealing with, and write them down. At a later session, concentrate on key events for each year organized around social or economic factors. Add a layer of comments or captions to each photograph: who took the photograph? What is their relationship to you? If there is space, tack the whole thing to a wall so you can work with it in an easily accessible, highly visual way.

Working With One Or Two Key Photos: Take one or two photographs from your "self-history" and find a quiet space to do more detailed work on them. For example, talk into a tape recorder (giving date and time) or write in a scrapbook or "creative journal" everything you can think of about the photograph and the events surrounding it. If you have a close friend to work with, ask him/her to interview you. This person should be there as a prompter, not as someone who comments.

Photo Revisiting: What's Missing? Photo Reinvention: Once you have done enough initial work around this photograph(s), go back to your original

"self-history" and start to think about what's missing. Make notes about pictures that might have been taken but never were. Start to think about how you might want to photograph a day in your own life. Notice what patterns are there, what gets repeated day after day, what seems trivial, what seems important. When you are ready, put a new roll of film in the camera and record the day as you go along. Do you want to do it from your own vantage point, or do you want to be included? Make a close-up photographic self-portrait of somebody in your family, a friend, or a partner. Concentrate on making yourself or them as idealized as possible. Then restage it to show them at work, or doing something active. Think critically about the differences between the pictures and what they do and don't show.

(Adapted from Spence, 1995, pp. 192–4 and cited in *Reinventing Ourselves as Teachers: Beyond Nostalgia*, Mitchell & Weber, 1999)

What we have found useful in adapting these protocols for our own self-study is that they encourage a simultaneous process of reading, viewing, writing, and creating. We are asked to identify a particular theme related to our practice (e.g., teacher identity, teacher's body, teaching in relation to issues of race, class, gender, and so on), and to read the critical literature in this area. At the same time, we engage with the visual evidence – photographs both real and imagined. It is also very helpful to examine other scholars' and photographers' photo-essays and writing. Contact with such work can help us learn to write more artistically in the genre of cultural critics and photographer-scholars.

Protocols such as the ones we have just described can be adapted even further and may inspire a variety of creative self-studies. Consider, for example, the following excerpt from an essay written by Cheri Killam, a teacher who used digital photography to help describe a project she carried out as part of her work as a second language teacher in Korea. Using the metaphor of what she calls the "fish bowl effect," she asks such questions as "Who am I to my students?" and "How do they really see me?", exploring the uses of digital photography to "re-make" herself in the likeness of the descriptions that her students give her.

Exemplar 1: Cheri Killam: "The Fish Bowl Effect"

A few years ago, after completing my BA, I decided to travel to South Korea to live and teach for a year. During my time in the city of Kyongju, I learned a lot about Korea, a lot about myself, and a little bit about teaching. In particular, I learned about such things as racism, stereotyping (both negative and positive), sexism, eroticisation, and how to live under an entire different set of social mores and customs. As a visible minority in a homogeneous society – and particularly, in a small town in that society, – I learned all about what it means to be the object of scrutiny. My experience taught me that to be curious is natural and normal, but to be intolerant or racist is learned. I also learned something about my own

Figure 25.1.   My interpretation of students' comments.

Figure 25.2.   The "real" photo.

assumptions and difficulties. To allow others to understand what effect my time in Korea had on my self-perception, I have altered a photo of myself, which was taken on my way to Korea. This altered image conveys the various messages that my students gave me about my physical appearance. If you turn to Figure 25.1 you will see the altered image of my face, juxtaposed with Figure 25.2, the unaltered image of me.

I've often said that my time in Korea allowed me to understand what it means to be a minority. It is a rare thing for a white, middle-class Canadian woman from a rural background to understand what it means to be visibly different. The photo that I have altered (see Figure 25.1) is not just a

representation of how my students saw me. In fact, after a month or two in Korea, I found myself staring at myself in the mirror. My eyes <u>did</u> look weird, my nose <u>did</u> look ridiculously huge, and I was <u>fat</u>! ... I spent so much time peering at myself, I think I became naturally inclined to view myself like this: squinting and unsmiling. I also found myself staring when I would spot the occasional foreigner in my town. I understood how different I was. I even understood the reaction of those who were soliciting the autographs of the foreigners! How exciting and different we were. These pictures, in a sense, are me through a fishbowl.

Upon re-examining my time in Korea, I have come to a slightly different conclusion with regards to my understanding of what it is to be a minority. Yes, I do know what it is to be different, but in Korea I was envied my difference. I was envied for my white skin, my round, double-lidded eyes, and (in some cases) I was envied my freedom as a western woman ... I was called "beautiful" on a daily basis. I believe that my actual understanding of being different has been – and will continue to be – an asset in my teaching. I believe, as I said above, that curiosity is natural. As a teacher, I have never encouraged my students to point out differences in one another. Rather, I try to encourage them to talk about themselves. An interesting example of this has to do with a student I had who had only two fingers on each hand (and no other digits at all). We were doing an exercise in which we had to say what we would change about ourselves if we could. When we came to the "physical" question, she raised her hand. Her dream of changing herself physically, to my surprise, was that she would like to be a little bit taller. Again, I do know what it is to be different, and to have people steal covert glances at me as they did with this student. From this perspective, I felt that I was very aware how far beyond her "handicap" this girl had come. To say that I learned to be a tolerant, accepting teacher who welcomes difference and has a complete understanding of what it means to be a minority is massively overstating the case. I think that my experience in Korea has helped me get started on a lifetime of achieving these attributes. It made me very aware of my own limitations – and it made me examine myself very carefully. I began this project thinking about how different I was from my Korean students, and how hard it was to exist in such a different society.

One of the fascinating things about this kind of project is its connection to social portraiture and visual studies, work that was highlighted at the *Visual Data: Uses and Abuses* conference held at the National Portrait Gallery in London in 2001, which coincided with an exhibition called *The Beautiful and the Damned: The Creation of Identity in Nineteenth Century Photography* (Hamilton & Hargreaves, 2001). At that conference, scholars working on projects such as examining practices around "policing the face" in passport photos and other identity documents as well as those working with digital photography came together to consider the social uses (and abuses) of portrait photography. Cheri's

project connects, as well, to the very interesting scholarship on "the photograph manipulated," drawing attention to the many social and political uses of images (see, for example, discussions of historical and contemporary manipulation by Graham Clarke, 1997). Cheri's manipulation offers both a playful and a serious look at cross cultural identity and serves, we think, as an exemplar for teachers working in a pluralistic society. Her use of the visual and personal makes a theoretical statement that interrogates commonly held social values and ideas.

Photo Installation

Mounting a photo exhibition is another way of engaging artistically with photographs for self-study. Such an exhibit could be based on items drawn from collections of photos, organized and displayed according to a particular theme connected to teaching and self-study, or it could use photographs taken specifically for a self-study project, mounted, organized, and displayed to represent the critical elements or themes that emerged.

Such installations might take place within a number of public display contexts. Agatha Yeo, for example, an experienced teacher and graduate student at McGill found herself going through 10 years of photographs from a variety of international school settings in which she had taught in order to select and mount photographs that could be used in a career fair for recruiting new teachers. In that fair, each exhibiter was given a display wall and table. The result of Agatha's work was a beautifully mounted set of photos that highlighted the diversity of the school settings in which she had taught: Singapore, Morocco, Saudi Arabia, and so forth. It was important, she observed, that the photographs be both aesthetically arranged, but also meaningfully ordered. What surprised her, she recounts in an interview later, was how the aesthetic construction of the exhibition contributed to how she thought about herself and the images she wanted to project to others. It was not just "how time flies" and "I looked so young" but more "look what I did, then" and "look what I can still do and more."

When we asked her what this exhibition meant to her, she referred to the ways that it instilled in her now a new sense of confidence in being able to teach. Being able to stand back and look at the arrangement of enlarged photographs and captions all mounted on Bristol board was the "textual moment" – the place where image, memory, and imagination come together. While this example has an obvious post hoc quality to it – after all Agatha had not set out to study her own teaching – it exemplifies nicely, we think, the ways in which artfulness might provide self-consciousness and reflexivity.

Turning to another installation, we describe the work of Jo Visser whom we view as a recycler of photographs, in the genre of the artist Christian Boltanski (cited in Gumpert, 1994) who works with old photographs and recycled clothing. As we see in Figure 25.3 (Visser, 2001), Jo used her living room wall as the backdrop for exhibiting family photographs (from both sides of her family) in a disrupting exhibition that examines issues of class and gender in relation to teaching. The wall, though, is symbolic, and ultimately her work has a more

Figure 25.3. The Living Wall.

public space character to it when she writes about it, shows slides and so on. Jo started by working in the critical literature on women and identity, women and co-dependence and women as teachers, all areas that she saw as a backdrop to engaging in self-study: "how did I come to be a teacher," and "how do I teach?" (Visser, 2001).

Exemplar 2: Jo Visser "The Living Research Wall"

Engaging in my own self-study, I use memory work and the construction and analysis of visual texts as a way to explore women's identity and the ways in which women resist or accommodate the people and systems around them (including, but not limited to, the educational system). As part of this process, I look to Jo Spence (1986) and Annette Kuhn (1995) who use photographs as a way of exploring the social construction of identity and as a way of interpreting, remembering, and reconstructing the self.

While I draw on the work of these various researchers, I blend a variety of tools as a practical approach to creating what I come to regard as my own specific methodology for doing self-study: the creation of a Living Research Wall ©. Exploring the social construction of women's identity through autobiographical self-study and memory work, I use several tools in order to engage in this process: the reading of visual texts as memory prompts (family photographs, Judy Chicago's art installation, "The Dinner

Figure 25.4. Detail from the Living Wall.

Party", and various artefacts); the creation and interpretation of my own visual texts (my collages, the Living Research Wall ©); formal interviews with my mother and father; conversations with friends and colleagues; my own experience in analysis and in Gestalt therapy.

Jo sees her display as having implications for teacher education, reflective prac- tice, and curriculum design, but also for work with students at all levels. "Self- study" as she writes in her thesis, "is not just how we look at ourselves as practitioners, but how we see and interpret all aspects of our life. I would argue that the most important thing we 'bring into the classroom' is our Self. I am adamant about the importance of our responsibility of being fully present and aware beings in the lives of our students" (Visser, 2001, p. 127).

In the course of her work with this photo display, Jo examines issues like sexuality and the body, and themes of resistance to patriarchal structures, but always in relation to her teaching: how does she teach, what does she teach, and most importantly, who does she teach? When she first presented her work at a session on self-study at the AERA (Visser, 2000) it was not without controversy. Some participants in her session shook their heads, "If this is self-study, I want no part of it?" "How does one link old photos to teaching a lesson on Donne's poetry?" "Judy Chicago's Dinner Party – how does one link a radical feminist artist to teaching?" For the purposes of this chapter on arts-based approaches to self-study, Jo's work highlights, we think, the very "disrupting" function that art is supposed to have, not just to the artist (or teacher) but also to the public. "Is this art?" and "Even if that is art, do we have to look at it?" questions are

evidence that a work is, at the very least, breaking through everyday complacencies and understandings and provoking reflection. The audience's critiques are not to be dismissed, however, but rather to be engaged with respectfully and used as an opportunity to go deeper and to clarify.

Reflecting on Photography as Both a Tool of Inquiry and Representation in Self-Study

We do not want to give the impression in this section that self-study through photography is just about rifling through a box of old photographs, altering a photo digitally, or tacking up a few photographs on a living room wall. Rather, what we consider key is that there are many aspects of teaching, grounded within the literature of teacher education – resistance, marginalization, career choice, curriculum planning – that can be explored and represented through photography and photo-writing. What follows is a list of key features of critical arts-based photography for self-study.

Working with Critical Literature on Teaching

Each of the teacher-artists we refer to has located his or her work within critical literatures, for example, on multiculturalism, post colonialism, gender studies, body studies, and so on. This theoretical work provides a useful grounding for self-study using photographs, helping us see the social and political overtones of the most personal photos.

Reading in the Area of Visual Studies

All of the teacher projects that we refer to in this section come out of readings in the area of photography and memory work (see for example the work of Jo Spence, (1995); Richard Chalfen, (1987); Annette Kuhn, (1995); and the chapters on memory and photography in Mitchell and Weber (1999)). It is this methodological orientation that cultivates an artful gaze and that encourages a more thoughtful analysis.

Being Systematic

As illustrated in the two protocols that we included above, an important feature of the work is method – re-examining, noting responses, looking for themes, asking questions, and so forth are ways to ensure that the self-study has a strong yet flexible structure.

Working with Techniques of Visual Display

Whether it is working with images scanned into a photo essay, or whether, as in the case of Jo, the work takes on a life of its own as an installation mounted in a public space, the idea of organizing photographs artistically is part of the overall project. Techniques of display provide a mode of theoretical speculation, enable evocative descriptions and critiques of experience, and facilitate the envisioning and representation of pedagogical possibilities.

Invoking Memory and Imagination

Much of the methodology that we have described relies on finding artifacts (such as photographs) of material culture that can assist in retrieving or remembering the past, but with an eye to our future actions as teachers – even if, as in the case of Valerie Walkerdine or Rosy Martin described earlier, the project is to re-imagine the past. Asking unusual questions about the usual helps researchers use photographs to examine possibilities for re-interpreting and representing their work.

Drawing on Technical Tools

Entz and Galarza (2000) observe that visual tools such as digital cameras and editing programs, scanners, and instant photography put the user "where the action is." While they are speaking specifically of the significance of such work in relation to young children, we see the potential for researchers to work with photo technology to re-imagine, re-invent, and re-present their findings visually.

Going Thick and Deep

Something that often surprises the teachers with whom we have worked is how much knowledge can be derived from doing close readings of even a single photograph. It is remarkable how much can be said about one image, the multiple readings and critical perspectives it can provoke, and the directions for reflection and further inquiry that it can inspire.

In the next section we turn our attention to a very promising genre of representation for self-study: video documentary.

Video Documentary and Self-Study

> To begin … a moral tale for anthropologists, a fantasy in which an anthropological cinema exists – not documentaries about 'anthropological' subjects but films designated by anthropologists to communicate anthropological insights. It is a well-articulated genre distinct from the conceptual limitations of realist documentary and broadcast journalism. It borrows conventions and techniques from the whole of cinema – fiction, documentary, animation, and experimental … This fantasy is more like science fiction than anything else. It is not remotely close to being realized. But it is an ideal worth pursuing. (Ruby, 2000, pp. 1–2)

Anthropologist Jay Ruby's fantasy is one that also resonates with teachers and teacher educators interested in visual culture and representation: What would happen if teachers became documentary filmmakers? While the video camera has long been regarded as a tool for self-study in professional development, particularly in relation to viewing and re-viewing a particular lesson or class (see "Turning the video camera on ourselves" in Mitchell & Weber, 1999), it is the process of artistic production that particularly interests us here. For example,

imaginative films can be made as hypothetical models or as critiques of the status quo of our lives, or as expressions of the pedagogical possibilities we would like to propose or envision. For instance, in the context of a collaborative project, two of our pre-service students experimented with video to produce a short film, a pseudo-documentary called Dangerous Kids, as a parody of the Hollywood film Dangerous Minds. They wished to voice their disagreement with the way Hollywood is shaping public and private notions of teaching in a way that infiltrates their everyday ways of framing their work as teachers. Working on the film together also enabled them to see that self-study does not have to be a solitary enterprise.

With the insertion of camcorders and digital video cameras into the realm of domestic photography, along with the development of relatively user-friendly video and editing equipment over the last few years, the idea of teachers-as-film-makers really only mirrors what is already out there in the general population. Indeed, much of our own work draws inspiration from the work with video documentary that we see amongst adolescents (see for example the work within media studies of Buckingham and Sefton-Greene, 1994) and from those studying with the visual gaze of children in popular culture and arts-based research (Mitchell & Reid-Walsh, 2002; Paley, 1995).

This section is not meant to provide a crash course on video production, although, as noted above, the accessibility and usability of digital technology means that teachers who are interested in this medium can indeed work with relatively little training. The iMac, for example, comes with its own tutoring program. This does not necessarily mean that the resulting productions are film festival material – although we may anticipate that as more teachers and teacher educators become involved in video documentary – there will be video documentary-in-education film festivals – but it does mean that we can have ways of working with visual data that go beyond simply including film clips in our presentations at a conference. Thus, while our audience is not the film world, but rather teachers and teacher educators interested in self-study, there is nonetheless an artistic mediation to how we present the work.

Central to this discussion are the narrative structures adopted within the video production, which provide a framework for interpretive analysis in and of themselves. Editing, the inclusion of captions, titles, production information, complementary images, music, and so on all contribute to evoking a particular interpretive space involving the educator-film-maker and educator-viewer. Henley (1998), while pointing out that some might argue against this visual manipulation of the data, reminds us:

> Ethnographic film-makers drawing on documentary conventions argue that they are not distorting the material so much as using the medium to its best effect to evoke their understanding of the situations portrayed. In this sense, they claim, they are no different from the authors of ethnographic monographs, who, it is increasingly recognized, routinely call upon their writerly skills and the conventions of textual presentation to communicate

their understandings. (Henley, 1998, p. 44; see also Hammersly & Atkinson, 1995, pp. 239–62)

As a tool for both inquiry and representation in self-study, video documentary can draw on important scholarship within feminist visual studies (e.g., Citron, 1999; Knight, 2001) as well as excellent work on home movies in family photography by Chalfen (1987), Kleinhans (1986), and Zimmermann (1995). But it is the work of visual anthropologists that is of particular relevance to self-study in terms of method and theory. Reflexivity, autobiography, and self-consciousness, as Jay Ruby (2000) points out, are central issues within critical anthropology – both in relation to representation (including self-representation) and to a consideration of viewing the viewers: how do other anthropologists respond as viewers? Along with others working in the area of visual anthropology and visual studies (see for example Hocking, 1995; Martinez, 1995; Rabiger, 1997; Rollwagen, 1988), Ruby discusses some of the ways that a number of ethnographers have artfully "constructed" their work using video (see for example the work of Robert Gardner, 1986), producing a range of films that have become "classics" within visual anthropology: Nanook of the North, The Hunters, Dead Birds. Educational researchers, too, could be producing their own classics, instead of leaving it up to Hollywood.

In our own work in video documentary (see for example, Mitchell, Walsh, & Larkin, 2003; Weber 2002a), and in a session on working with visual data that we organized at AERA (Mitchell, 2002; Weber, 2002b), we have been particularly interested in the sort of reflexivity that Ruby noted above. This reflexivity emerged, for example, from the multiple screenings to various audiences – schools, principals, women's studies students, counselors in a shelter for refugee women – of *Unwanted Images* (Mak & Mitchell, 2000), an 8 minute documentary on gender-based violence in South Africa. The short documentary features a set of vividly-colored drawings done by young people in rural South Africa to express their ideas on gender based violence. On the movie screen, these pictures depicting scenes of violence take on a larger-than-life quality and assume a dramatic presence that is different from the effect one would have simply looking at the $8\frac{1}{2}$ by 11 drawings on a table or wall. This, taken together with the haunting melody of the music of "Blow Ye Winds Softly" and the eye of the camera slowly scanning the pictures in close-up, produces a distinct emotional impact. In a sense the documentary is more powerful than any other genre we have ever used to talk about gender and violence in schools. People cry, are horrified, are angry and outraged, and we wonder why we have been protecting ourselves by presenting this kind of data in more conventional forms.

We have found ourselves after each screening of *Unwanted Images* asking ourselves such questions as: Who is the film for (South Africans who are dealing directly with the issues, or Canadians who need to be less complacent)? Who *should* the audience be? Just who do we think are? As another example, during the making of *Dress Fitting* (Weber & Mitchell, 2000), a 22 minute documentary on women's memories of dressing for the prom, we learned as much about our

practice in the making of the documentary as from the video itself. How do we work with the other women in the study? What kind of facilitators are we? What is the role of collective memory in re-writing individual memories? What modes of representation (for example, the choice of background music) convey the inter-generational aspect of the group, and so on – these are the kinds of questions that emerged to shape self-study about how we do self-study.

The more detailed example that follows describes a self-study video documentary made by Paula Charbonneau-Gowdy, a second-language teacher working for a NATO-sponsored program for military personnel from Eastern Europe who are currently posted to Canada. Paula is also a doctoral student in Claudia's graduate class on Textual Approaches to Research for which she produced a short documentary *Over the Rainbow*. The documentary highlights, we think, some of the ways that her text operates to both represent findings from her self-study of her own teaching practices, but also, as we read in this account written by Claudia (with reflective "inserts" by Paula), to invoke in the audience of teachers and teacher educators our own process of self-study.

Paula Charbonneau-Gowdy: Over The Rainbow. The Viewing

Paula's film combines a "talking head" narrative with edited "cinema vérité" scenes of her classroom at a military base near Montreal. The opening scene shows Paula, the narrator/"talking head," holding the microphone and speaking directly to the audience, telling us about some of the problematics of second language teaching generally, and something more specific about the small group of NATO officers from Eastern Europe who are currently in Canada and learning English. Her class. In this role, Paula is in the reporter/journalist mode that we are used to seeing live from the Kennedy Space Centre. She speaks firmly – no nonsense – but a little haltingly in places and we think of her as someone who knows about and cares about her teaching. No actor could play her any better.

From that opening scene, we go into Paula's classroom to where a group of 6 or 7 men in military uniform are sitting in a semi-circle around Paula. In the scenes in her classroom, she explores a number of issues – themes in the data that she has been collecting – that she sees as barriers to effective language learning: teacher control, the marginalization of students from their own learning (and from each other) – and she demonstrates, too, the ways that status and rank, in particular, enter this picture. We hear the men laughing, talking amongst themselves, groaning at the types of assignments they are required to do, and lamenting their test scores by expressing "how dumb they are." At one point, we see them making fun of one of their colleagues who is struggling with the language tasks, and they demonstrate what might be regarded as typical excluding behaviour (derogatory comments directed towards Vlad or meeting in a group at coffee time without him, etc.), something that Paula also sees as yet another feature of the classroom she controls. As she demonstrates in the video, there is something

not quite adult-like about some of the classroom scenes. While the men do not misbehave, they are, in some ways not unlike a group of adolescent boys, and Paula, who may not be much older than some of them, is "the mom" – to a point that, in itself, may be a barrier to learning.

At another point in the film we visit their dormitories, which, as Paula narrates, are Spartan in appearance. Nothing on the walls, no ornamentation, nothing, of course, out of place. Clearly it is important that we understand where they are located when they are not in class. But then, in the last scene, we see something else – the men are all sitting around the table in the cafeteria chatting and laughing with Paula who is in her coat and ready to leave for the day. Class is out. A Keith Jarrett rendition of "Somewhere Over the Rainbow" plays in the background and we are drawn in to seeing that, notwithstanding the built-in barriers to learning in these kinds of government-run programs, there is after all a huge bond between Paula and these fellows. They have all – teacher and students – "let their guard down."

Not only were the members of the graduate class where Paula first screened the video (close to the end of the 13-week course) enthusiastic about the visual quality of the work, but also, and more to the point, as a group, we were all fascinated by what she had done in relation to her data. During the course she had spoken extensively about this group of learners. We knew of her frustrations in trying to understand them. We had already been told a little about their dormitories and how they refuse to make these rooms anything other than army barracks. They aren't homes to them. From hearing about them for most of the course, it is as if we already knew them quite well. Or so we thought. Somehow seeing these learners – grown men in their military uniforms – as real people laughing and joking but also, at others points, clearly worried about their progress, puts a different spin on the project.

In the video, Paula tells us about how she controls "her class": she is the one who writes on the chart paper what the class is going to do each day; she is the one who dishes out the assignments; she is the one who decides if they can skip an assignment. Paula's overall thesis pertains to how she is realizing just how powerfully inhibiting this kind of external control is to adult learners (and maybe to any learners). The final scene in the cafeteria is particularly poignant in driving home this point because we see the actors in a new light. Paula, wearing the coat that we all recognize from the times that she slips into our class a few minutes late, now covers up her "dressed as a teacher" outfit that we saw in the teaching scenes. The few bars of "Somewhere Over the Rainbow" that are playing in the background and that could be regarded as "getting sentimental," aren't so much that. Rather they move us to think about these men from the other side of the ocean and far away from home (where they are truly in control of their lives) as another version of "somewhere over the rainbow." And there is something so much more collegial about the relationship between teacher and learner in this scene – Paula is on her way home. The men will return to their

dormitory rooms that night. But for now, they are all taking a break from what we have come to think of as their roles (teacher-learners), laughing and talking easily, as people do.

Creative Representation and Self-Study

As we watch Paula's video, it is impossible for those of us in the room not to think about the context of our own teaching and learning, including the then-and-there fact that we are in a graduate seminar course with a teacher (Claudia) and students. Like Paula's class, we are all adults. How do we each think about the impact of teacher-centred decision-making – the assigned readings, the 'control' of the 3 hours (When do we take a break? When will class actually end? Do we go over-time)? How do teachers, the students in this graduate class, act as learners? Clearly the film can evoke a myriad of issues that pertain to introspection and self-study – regardless of whether it is the film-maker who is the teacher, or the viewer who is the teacher. This is one of the main reasons for taking self-study public. One person's inquiry into their own practice sparks similar questions for the viewers.

When Claudia asks Paula to reflect on representing her work in this form, Paula writes about the kind of "artistic control" that appeals to her:

> It made me think back to when I was a child. My response to what I wanted to be when I grew up was always, "an artist," even though I knew that reaction would be met with snickers from my siblings. I really did feel like an artist, however humble the product. For example, I was able to choose the song "Over the Rainbow" for the final few seconds of the video. It happens to be played by a jazz pianist I particularly like, Keith Jarrett, and it was the song I most sang to my children growing up. He speaks to me of promise and of freedom. ... What was so thrilling, I think, and what the video making has helped me to see more plainly than I ever realized before, was that with this medium I could express myself and have power over my own message to say what I wanted to say. Moreover, I felt that I was free from the multitude of rules that my background and education have instilled in me and that weigh on me consciously and unconsciously as I create with words on a page. As for the argument that I was proposing, I realized that with the video I could build a case that "readers" could "interpret without the bias of my choice of words, but by "seeing" it for themselves. It also allowed me a springboard for discussing what viewers saw and to gain new insights into my own practice from a variety of perspectives (Charbonneau-Gowdy, 2002, p. 10)

As we noted earlier, the point is not to make films for other film-makers, but rather to have some impact on other teachers. Production skills can be acquired through working with video editing software programs themselves, but they can also be enhanced through working with those who have more experience in

film-making. In Paula's case, she strikes up a collaborative relationship with her teenage daughter who has been working with media technology:

> The filming was all done in a day. We (my daughter and I) used two powerful cameras; one we kept stationary in a corner of the classroom; the other my daughter and I used to film outside the space of the classroom – in the halls, student rooms, the school layout. The moveable camera was also used for close-ups while the class was in progress so that when a student spoke or was involved particularly in some way, my daughter would focus in on that particular student. Finally, I gave this camera to my students for them to film what they thought was important to document. Some students were initially shy but, as the day wore on, they seemed to forget the cameras and became very natural. It felt to me, judging from the way we interacted, that it was a "normal" day. After the day of filming, I spent three ten-hour days preparing the video. It involved looking at the enormous amount of footage from both cameras and deciding what was important to clip for the sake of my argument or thesis. I, with my daughter's help, used Final Cut Pro3 for this process. After compiling the clips, I then decided on a storyline – when I would speak and generally what I would say and what clips would fall under each section. Encouraged by my daughter to speak spontaneously rather than from a prepared speech, we filmed my short blurbs. Then I gathered, arranged, and cut the clips into even smaller bits. Next, I chose a title and typed it in along with the credits at the end. I chose first names and a picture of our group to ensure that they would be acknowledged and be recognized for their participation. Finally, I chose the song and added it to the credit timing. (Charbonneau-Gowdy, 2002, p. 13)

Clearly, the process itself is not something that can be easily left out of evaluating the role of the final product.

The Power of Video Documentary

While the video data can be powerful regardless of whether it is shown on the small screen or the big screen, it is its artfulness in evoking a particular narrative that is significant in understanding the role of video documentary and arts-based research more generally, with regard to self-study. As Paula points out in her reflective log:

> I have talked about my research interests to other groups before and it always appears afterwards that the essence of my message has not been entirely understood. On the other hand, after I showed the video to my colleagues in the class for which I did the project, I felt immediately from their responses that they understood exactly what I was trying to say. They added personal examples of their own that added to the argument of how language learning and our investment in it has a lot to do with the context

of that learning and the nature of the relationships in it. I was really taken aback by their response. I wondered afterwards if it is because we have become so dependant on visuals in our society. Or does it suggest the power of visuals in supporting the spoken word? (Charbonneau-Gowdy, 2002, p. 15)

It is Paula's selection and arrangement of the data, as well as her inclusion of captions, music, and even the conventions of naming her production company, that contribute to the overall artfulness. But, it is important to emphasize, this artfulness is related to the point of her work overall. Her reference to freedom and control throughout her reflective work is particularly significant in relation to the group of language learners, NATO military officers, something perhaps less obvious to the outsider viewer but central to the work of someone like Paula who has been working for a number of years in NATO-sponsored programs. As she observes:

> As I worked with this and other groups of military, I encounter certain tensions. These tensions, I think, stem from the marginalizing which results when some feel they are more powerful than others. In this case, learners who are marginalized do not invest in using the language. They leave the program discouraged and disappointed. On the other hand, when I see relationships develop in my classroom, friendships form, people accept the uniqueness in one another, and I see changes. The fellow who smiled at the end of the video is an example of one of the students who seemed to discover some potential within himself during the course of the program. There were others who also did this. Some, like Vlad, didn't. As a teacher of second language, I see my role as far more than passing on rule formation. It involves helping students to see their potential. Maybe someday "over the rainbow" more and more of my students will be able to do this. Maybe someday, I will be more of an instrument by my teaching of enabling this process. This video and my research are about just that. (Charbonneau-Gowdy, 2002, p. 8)

Reflecting on Video Documentary and Self Study

When we pose the question as we did at the beginning of this section, "What would happen if teachers made films?" we are mindful that research does not simply become visual without involving a great deal of writing. As Susan Finley (1998) demonstrates so vividly in her doctoral work that incorporates a screen-play on teacher identity, artistic uses of video come out of thinking visually (and writing) about particular scenes, sounds, dialogue and so on. As noted earlier, Jay Ruby's (2000) work on anthropological film in his book *Picturing Culture* provides an excellent background for those working in teacher education who are interested in exploring video documentary as a reflexive, self-conscious and aesthetic tool of inquiry and representation. He talks about training, venues for screenings and exhibitions, the role of exemplars of video documentary, course

work and theory, and ethical issues for informed consent. He also considers the actual reception of such works – what he calls 'the viewer viewed' – and in particular, the troublesome possibility that the real-life, every day, raw material of our films (e.g., scenes from our classrooms) might be viewed as soap opera, something that might be exacerbated, we worry, within the context of the recent popularity of reality television.

Clearly, many of the same issues pertain to our own teaching settings, professional organizations, and academic conferences and could also include the following:

Multiple Screenings

How, as academics used to presenting a paper once, do we think about (and represent on our CVs) repeat showings and repeat performances? As noted in our discussion of the multiple screenings of "Unwanted Images," each screening offers a new "take" on the meaning of the work. This creates a different kind of knowledge base or text, a cumulative one that evolves with each showing.

Educating Audiences

In the same say that we need new spaces at conferences for photo displays, art installations and so on, we also need new ways of thinking about video screenings (big screen/small screen). We need to consider the challenges of having a 20-minute video documentary in place of a 20-minute academic paper.

Ethical Issues

How might teachers work in video documentary in our own classrooms in relation to protection of minors, confidentiality and anonymity? How might we use work in video and self-study as an occasion to engage in dialogues with our colleagues about representation? These are questions we need to consider.

The next section examines some of the most challenging and exciting modes to represent self-studies: art installation and multi-media.

Art Installation and Multi-Media Representation

> Nothing I would tell you could be copied and used. It could be experimented around, but to experiment you would have to look at/experience the art and, if you so chose, imitate and alter, find out about its workings by trying to do it. Nothing I can say, so I think, can lead you toward that understanding, which will only flow from you doing. (Blumenfeld-Jones, 2002, p. 90)

As Donald Blumenfeld-Jones (2002) writes in a chapter from the book *Dancing the Data* (Bagley & Cancienne, 2002b), "If I could have said it, I would have." It is not easy to define artistic representation. Perhaps art installation is the most difficult to define simply because it can incorporate all of the genres we've noted earlier – performance, photography, and video projections – as well as

many others we have not (collage, painting, performance art, sound-scapes and so on). And yet, art installation is so highly suited to the study of teaching and teacher education practices. It draws on the "everydayness" of our teaching, taking into account the ways that the layout and design of our offices and classrooms, bulletin boards, seating arrangements, classroom art, posters and other semiotic markers contribute to constructing the "textual space" and lived reality of our work/learning environments. This is something that Jon Prosser (Prosser & Loxley, 2002) highlights in his visual study of classrooms, play-grounds, and staff rooms. But it is also, we would argue, the foundation of understanding and doing art installation for self-study of teaching practices.

The well established body of feminist scholarship on installation (see for example, Carson & Pajaczkowska, 2001; Reckett & Phelan, 2000), which high-lights such works as Judy Chicago's Dinner party and the public art of Suzanne Lacey (1995), is particularly useful in providing a framework for teachers seeking to examine their own teaching practices through art. Many of the central themes and images in the work they describe – identity, difference, personalizing the political, corporeality – are all themes that have also come to be central to the published narratives of many female teachers and teacher educators (Lesko, 1988; Steedman, 1989; hooks, 1995; Mitchell & Weber, 1999; McWilliam & Taylor, 2001). In writing about installations, Reckitt and Phelan (2000) refer to the use of clothing, images from popular culture (Barbie, Marilyn Monroe), childhood artifacts, and household products in such works as Su Richardson's *Burnt Toast* from Feministo (1975–77), Kate Walker's *Death of the Housewife* from Found Objects Assemblage (1974), Annette Messagrer's *Les tortures volun-taries* (1972), *Histoire des robes* (1990) and Suzanne Lacy and Leslie Laborwitz's performance installation, *In mourning and in rage* (1995). The very 'everydayness' and domesticity of material culture featured in these installations has a great deal of relevance to our work as teachers, pointing to how researchers could use installation for self-study.

Art installation is characterized by its two and three-dimensional quality, the use of physical space, and most importantly, a way for both the artist and the viewer to engage experientially with the artistic text. In addition to including the uses of photographs, visual projections, film loops, sound (recorded music, voice-overs, etc.), collage and paintings and objects, installations can incorporate writing – poetic pieces, excerpts from diaries, letters, field notes, and signs, along with written conventions of artistic display such as curatorial descriptions and artistic statements and performance texts. The choice of the images and objects for any given installation is rooted, of course, in particular conceptualizations of the thematic areas to be explored, and draws on semiotic readings of "things" and "spaces" to represent and communicate the inquiry's intentions, process, and findings.

Clearly, both the themes of feminist visual art (identity, body, etc.) and also the objects and spaces of schooling – school uniforms and other school wear, chalkboards, textbooks, globes, teachers' desks, staff rooms, and other school and memory-of-school paraphernalia – can be significant markers in relation to

teachers' self-study. While we cannot offer a precise method for *doing* art installation, we can recommend the work of Stephen Riggins (1994) on social semiotics as being particularly useful for "going deep" into the exploration and interpretation of the personal and social meaning of objects and spaces. In his autoethnographic work on his parents' living room, Riggins outlines the use of the terms *denotative* and *connotative* in relation to material culture and space. By denotative, he is referring to the factual and social history of an object: where it comes from, why it was invented, and so on. By connotative meaning, he refers to the personal meanings attached to a particular object.

In a recent book, *Researching Children's Popular Culture* (Mitchell & Reid-Walsh, 2002), a chapter on material culture called "Physical Spaces: Children's Bedrooms as Cultural Texts," describes how Riggins' work can be applied to studying the ways that popular culture is inserted into children's spaces in the home – bedrooms, cribs, playrooms and so on – looking in particular at the social and denotative history of bedrooms in North America (the invention of cribs, the expectations of one-child-to-one-room, and so forth), juxtaposed with the connotative meanings associated with the material culture (Disney paraphernalia vs. an upmarket Victorian nursery). This close and multi-faceted reading of material culture and space can be useful to art installation in that it provides a concrete framework for being methodical and methodological, something we can see, for example, in Paula Cameron's installation on private and public spaces described below.

Paula Cameron's Bathroom Cabinet Installation
(a multi-media installation, McGill University, 2002, see CD-ROM that accompanies this book)

A graduate student in education at McGill University, Cameron focuses her research on a social semiotic reading of a bathroom cabinet. In her semester-long project she works with the idea of the tension between the private and public, and is intrigued by the ways that the bathroom cabinet, which has a "hidden from view" quality, contains so many of the products that are both private (in the bathroom cabinet) – particularly beauty products and personal care products – and are yet so public in that they are meant to enhance our public appearance (e.g. hair products, make-up and so on). She is also interested though in the ways that the privacy of the North American bathroom opens up as a public space – behind closed doors!

Using Riggins' (1994) work, she starts with an exploration of the denotative and connotative meanings of the personal care products that she finds in her room-mate's half of the bathroom cabinet in their apartment. In that exploration, she looks closely at the meaning of branding – and what particular brands such as Aveda, Gillette, and Body Shop are meant to sell. Her work includes visiting the various websites of these companies. Along the way, though, she delves into the social literature on bathrooms (Alexander Kira's book *The Bathroom*, a

Figure 25.5.   The Bathroom Cabinet.

video documentary *The Bathroom*), and also conducts interviews with her room-mate about the products that she buys. Her denotative analysis of Aveda products and the history of bathrooms give over to a connotative autobiographical analysis:

> Kelly's half of the bathroom cabinet held very different connotations for each of us. ... To Kelly it was a "product playground," and an area where she could be childlike and play with appearances. She said she felt emotionally attached to many of these products, noting that these reflected her personality in some way. ... For me, on the other hand, the products, so different from what I was used to, seemed symbolic of the mystery of living with a stranger. Although my older sister was well initiated into the world of beauty products, and I had also delved into them myself in junior high, these more high-end products were fascinating to me. There was definitely an exoticism, particularly because I was coming from Nova Scotia, generally a much less wealthy and glamorous region. I felt torn between the luxury of these products, and my resistance to the emphasis in our culture on the physical appearances of women. (p. 69)

Paula's art installation, set up for one evening, was installed, literally, in a shower stall in the women's washroom of the Education building where her class in Textual Approaches to Research met each week. Because of the size of the shower stall, only one person at a time can actually experience the work – a display that includes a slide projection of images of items in the bathroom cabinet, an audio recording in which she herself reads from Kira's book, along with recordings of interviews with her room-mate, and a list of the 32 objects

Figure 25.6. Detail from the Bathroom Cabinet.

in the cabinet. At the same time, as each one of us "experiences" the installation by being "in stalled" ourselves inside the shower stall with the door closed, it is as though we have entered that public/private space of the domestic bathroom where we might secretly peek into the bathroom cabinet. Although Cameron's work is not a self-study, it provides a useful template for using installations to represent educational inquiry.

Increasingly at conferences, even the AERA, there is at least some space (and time) allocated to art installation, and it is within a conference context that we offer the following description of a self-study multimedia installation, *Living with Paradox: A Multimedia Representation of Teacher Educators' Lives in Context*, created by Ardra Cole, J. Gary Knowles, brenda brown, and Margie Buttigno that was first displayed at the AERA in Montreal in 1999. This work is also featured on the website of the Centre for Arts Informed Research (http://home.oise.utoronto.ca/~aresearch/airchome3.html).

According to their artists' statement that accompanied their exhibit, these researchers' inspiration was drawn from the tableau art form – particularly as interpreted by American contemporary artist Edward Kienholz (1927–1994). Kienholz' work incorporates all art forms and all manner of method and material. His use of multimedia is intended to fuse art into life in order to do away with the distinctions between artist and artisan and to enable us to see the various aspects of "truths." His raw, often shocking, realistic renditions are intended to make bold cultural and political statements allowing no room for the viewer to escape. According to Raskin (1996), Kienholz's art invites us "to judge our present social conditions and then we are begged, through a visual scream, to create another reality, one which celebrates human dignity" (p. 43). For Kienholz, the reality of human suffering is best expressed through art with the use of

absurdity, exaggeration, or distortion, which forces the viewer to become an active participant in the representation.

The process of engaging with and making sense of the teacher educators' experiences engendered the metaphors represented through the installations that constitute *Living with Paradox*. What follows is an account of Sandra Weber's viewing experience of one of the installations, *Wrestling Differences* (media: plastic action toys; plastic; nylon; elastic; wood; acrylic paint; narrative text; slides).

Reaction to "Wrestling Differences" (Cole, Knowles, brown, & Buttigno):

> In the corner of a cavernous ballroom of a Sheraton or Hilton Hotel, I can't remember now which, but you know what I mean, one of those ubiquitous AERA rooms dedicated to poster sessions, I spot what looks like a tiny box, or doll house set up on a table. Approaching, I notice that there are slides being projected on the wall behind the table, short textual fragments in brown and black – some unpleasant words, not academic – words of anger and despair at working in the academy. But as the box that originally attracted me comes into focus, it demands all of my attention. It turns out to be a tiny wrestling ring, maybe a foot and a half square – complete with little ropes and posts – quite realistic – or so I imagine, never having actually been to a wrestling match myself, although I sometimes glimpse those hilarious "Wrestle Mania" TV shows in sporadic flashes, as I flip channels. At any rate, this ring was the kind of miniaturization you see in doll houses or Christmas villages, but somehow, not as cute. More serious. There is something grim about it. Facing off within the ring are unsmiling action figure wrestlers – but one of them seems to be female, and not a wrestler. Oh, yes! Of course! The perfect metaphor, in at least some respects, for the academy. I don't read the researcher-artist's statement until later. I am too busy applying the wrestling analogy to my own work as a teacher educator. The tiny, real-looking ropes of the little ring remind me
Figure 25.7.   Wrestling Differences.

that I certainly have felt what it is like to be "on the ropes," and what it is like to be a spectator of power struggles – wrestling is, after all, a spectator sport.

The artists' statement, posted nearby on the wall, read, in part:

> While the number of women holding full-time academic positions has increased in most areas of the university, in large part due to affirmative action policies and practices, the climate for women faculty in universities is still chilly. In education this is particularly ironic because education (along with other professional faculties such as nursing and social work) has been and continues to be perceived as women's work. Education faculties, as feminine structures with low standing in the academy, continue to struggle for acceptance as legitimate members of the academic community. Within education faculties women struggle both for acceptance by their male counterparts and against the norms and values upon which the dominant male culture is built (even in a feminized profession). For many women teacher educators, this is the paradox that defines their struggle.

Although the written explanatory text is of interest, and indeed, is an expected and integral part of the conventions for most art installations, I am struck by its redundancy, so simply evocative were the visuals (which of course included the projected words). The intentional act of miniaturization is also noteworthy – it served to increase, rather than decrease the impact of the wrestling ring. What is actually mocked or reduced in its impact by being enlarged for the television world of wrestling, ironically, becomes greater or larger, more serious, in this miniature display. Curious. Through the power of metaphor as a mode of communication and an analytic construct, such installations provoke, engage, and convey.

We will offer, as a final example to end this section, an account of a multi-media and performance self-study installation that combines all the genres we have discussed in this chapter. Elements of the installation can be found on the CD-ROM that accompanies this book.

Viewing Dita Behnke: Seeing Myself Looking at Me (a multi-media performance installation, University of British Columbia, 2002)

Seeing Myself Looking at Me is an elegant multi-media performance installation initiated by Dita Behnke at the University of British Columbia in the context of a graduate course taught by Sandra Weber on using memory work and photography for self-study. To represent the results of her self-study, Dita designed an installation that combined: projected slides of photographs and text featuring both manipulated cultural images and family album photos; a wrapped box and other objects arranged on a square carpet in a labyrinth pattern, and a performance during which she moved slowly amongst the objects, against a background of projected images. She began by placing her fingers and hands in

front of her eyes, the way photographers do, creating a lens or frame through which she was looking at her own installation while reciting a simple but poetic text:

> Looking at my personal photographs, the lines between my carefully arranged multifaceted roles are starting to blur. The images are overflowing with memories and multiple truths. There are images screaming at me, others are trying to charm me, and there are the ones which are wonderful diving platforms catapulting me into a sea of lulling memories. What do the hidden layers hidden in the images speak of? Who gives them meaning? My current me? The narratives accompanying them? (… They never seem to change …)
>
> In this performance I am trying to tell about my interpretation of the "horrors and wonders I have seen" during my explorations of self. I am the ancient mariner who is doomed to tell the tale of his journey. (Is there an albatross around my neck?)

As she continued the recitation, Dita walked about briefly, turning and peering until she bumped up against a classroom chair on which sat a large box wrapped in bubble wrap, one of the featured objects of the installation. Still reciting, she unwrapped the box and coiled the bubble wrap around her own body, almost from head to toe. Of course, being swathed in bubble wrap hindered her progress, making it awkward for her as she proceeded through the installation, performing her poetic musings of identity and isolation, dropping large signs representing Kubler-Ross's stages of grief. This physical and vocal performing added layers of potential meaning, both connotative and denotative, to how we might read the bubble wrap. The projected photographs included photos from her past, including one taken just before the Berlin Wall went up, an event that split Dita and her mother off from the remainder of their family. She and her mother were caught on the "wrong side." The wall itself and photographs of related events that help us "remember a wall was there" and "remember before a wall was ever thought of" become significant artefacts for representing aspects of our lives as educators (I couldn't help thinking of Pink Floyd's song, "another brick in the wall.") The installation performance ended with Dita in profile against the projected photographs, writing the word ME on a large post-it that she added to the screen.

Questioning Through Art Installation

Through the power of metaphor as a mode of communication and as an analytic construct, installations such as the ones we have described here provoke, engage, and convey a variety of perspectives. Through contact with installations, we can learn and infer a great deal about how to read them as well as how to do them. A series of questions that could guide the reading/viewing audience can also function as a method for teachers and teacher educators seeking to represent their self-study through installation:

Venue/Space

Space is of course a key component of any art installation. Projects can entail costs such as storage, transportation, renting gallery space, and so on. But installation can also lend itself very nicely to the spaces found in buildings that we as teachers and teacher educators already occupy or to which we have access. Display cases in schools and universities, offices of school boards and professional organizations, lobbies and hallways of institutions, and even corners of our own offices are venues that we should be making better use of. Beyond the decision of what space is the challenge of the artistic use of space. How to display and hang? From what angles can it be viewed? What about lighting or changing light? How to arrange objects? How best to take advantage of the space itself (although the particular installation often dictates these things). What approach or path leads the viewer in and out?

Message and Materials

What is it that the teacher-artist is conveying to the audience and how is it represented in the display itself and also in its title, curatorial description, and artistic statement? What cultural signs and symbols are being used? In what ways? Are there any twists – ways of drawing attention to the usual by making it unusual? How are objects chosen, manipulated, fabricated, positioned, and juxtapositioned to represent and provoke re-interpretation? To what extent is the research process transparent? How is the message contextualized?

Artistic Engagement

How does the audience enter the artistic space? What is required for members of the educational community to engage artistically with the work? What audiences are implicitly or explicitly targeted? Does it include or exclude them? How might the teacher-artist obtain feedback, especially from other teachers? For example, in an exhibition at the McCord Museum in Montreal in 2002, *Clothes Make the Man*, the viewer encounters a large "reflective space" at the end of the exhibition – a mirror but also a public notebook for writing down notes and comments. The interpretive potential of installations allows for a participatory experience and critique that can push a self-study beyond its original intent.

Quandaries, Quests and Frequently Asked Questions in Visual Arts-Based Self-Study

In this final section we highlight a few key questions, not so much because we have a satisfactory answer to them, as that we think they are valuable touchstones for reminding us what this kind of research is all about.

What Does This Have to do With Teaching?

In the examples that we have used in this chapter, we have alluded to the ways in which some of them directly link to teaching: Paula Charbonneau-Gowdy's

video insights about the significance of control issues to her teaching; Sandra Weber's performance on fitting and selling shoes as a metaphor for teaching and curriculum; or Cheri Killam's use of digital photography to study herself in cross-cultural teaching situations, and so on. But even work that, at first glance, may seem less clearly linked to teaching (for example, our description of Paula Cameron's Bathroom Cabinet installation on the use of private and public spaces) upon closer inspection and reflection, can have much to say about teaching. Like Cameron's art, teaching is very much about the social construction of meaning. The paradoxes evoked by events and spaces that are simultaneously both private and public in her installation find resonance, for example, in Lortie's (1975) classic portrayal of the classroom as both very public in one sense, but very private in another. The point of working within artistic frameworks *is* that they are more symbolic and representational than traditional formats. As we have suggested throughout this chapter, the tools of social semiotics, audience reception, and visual representation are central to our work as teachers and teacher educators, challenging us to think creatively. Self-expression using these methods leads to deeper understanding of teaching and learning processes *even when the ostensible focus is not on teaching practices*. A self-study does not have to be classroom-based in order to be relevant to what goes on in classrooms.

Artistic forms of representation can place new demands on those involved in the review process in selecting papers, articles, and chapters for education conferences, journals, and books (how is *this* about teaching?), and in so doing, prod the academy to re-evaluate what constitutes useful knowledge. It is also important to ask why we seem to think our sphere of influence as professionals is limited to teaching. Or rather, where does our teaching end? Surely, not as soon as we leave the building. When Sandra performs *From Robe to Robe*, for example, to academics outside of faculties of education or to people outside of teaching or academia altogether, the engaged audience responses suggest that the pedagogy of academic dress strikes a chord that goes way beyond programs of teacher education. Perhaps, paradoxically, it is when self-study of teaching reaches out through artistic representation beyond teaching that it may have the most to say, even to teachers.

"What Will We Know When We Know It?" Evaluating Our Work

When Ursala Franklin raised the above question in a CBC broadcast of a talk given at McGill University in November, 2002, she was speaking of the research enterprise more generally. In her address, she was calling for more careful attention to the kinds of questions that are asked by researchers in the physical sciences as well as the social sciences and humanities. Those of us working in self-study and teaching may feel particularly vulnerable when this question is posed. Why study the self in teaching, and why represent our findings in ways that incorporate yet another level of interpretation? As with almost any research project, whether or not a particular approach was "worth doing" is more easily

and completely determined in retrospect. Additional questions that help determine the success of a self-study piece include: a) whether it provokes discussion or engages a wider audience in meaningful conversation; b) whether the audience, researcher, and/or her or his students learn anything that helps them better understand their own learning and teaching experience; c) whether useful re-framings are made possible for other scholars/teachers/policy-makers; d) whether imaginative possibilities for future action are evoked; e) whether new links with people, knowledge, and community are facilitated; and, f) whether anything transformative occurs in the doing or the viewing, leading to new ways of being. These questions could, and maybe should, be applied to all forms of self-study in teacher education.

Taking inspiration from the genre and work of other artists can be appropriate and useful to self-study. When done systematically and with care, adapting the method of one inquiry to another similar kind of inquiry can lead to improved research designs. One of the gravest mistakes scholars and artists can make is naively thinking that doing something once is sufficient; for example, thinking that once one person has published their story, there is nothing further to be learned from anyone else's. Each variation, each painting, photograph, film, story, performance has the potential to take us further, confirm the experience of others, add nuances to an emerging collective picture, extend what we perceive as the possible range of human experience, offer an important caveat, contradict or call into question previous works, or suggest alternative interpretations.

But is it Art?

> The issue of researcher identity is different for those of us who, before engaging in arts informed inquiry did not identify ourselves as artists. Perhaps we did artful things: we grew gardens, we made pastries, or we wrote stories – but we didn't call ourselves artists. … I'm not asking you to start calling yourself an artist. I am suggesting, though, that as researchers we are all, each and every one of us, regardless of our relationship to the arts, capable of infusing our work with artful qualities … This belief, that we all have the potential to be artist-researchers, is tied to my belief that art exists in the everyday, in ways of being, and processes and relationships between people. (McIntyre, 2000, pp. 179–180)

Like Dewey and so many educators, we believe that everyone has the potential for aesthetic sensibility and artistic expression. And indeed, we view art as a mode of inquiry. But does that instantaneously make researchers artists in the conventional sense? Taking courses on video production, art appreciation, drama, reading up on the field, studying or hanging out with film-makers and other artists, viewing lots of art, attending film festivals, practicing techniques, collaborating with artists, and bringing in consultants are some of the things teachers and other researchers can do to hone their skills and sensibilities, increasing their capacity for artful inquiry. In the same way that we may need

guidance, practice, and training to move into interdisciplinary and multi-disciplinary work, we may require similar experiences as we develop our capacity for artistic expression. But everyone has to start somewhere, and spontaneous and intuitive work has a power and authenticity of its own.

"What constitutes art?" is obviously not a question that can be answered in this or any other chapter. Aesthetic tastes vary, and are both personally and culturally shaped. One only has to listen to people argue about their favorite film or painting or novel to realize that. At times, our enthusiasm or disdain for one genre of autobiographic inquiry might boil down to a serious matter of aesthetic preference, a matter of taste or cultivated habit, or a familiarity with one genre over another. Some of us prefer poetry to novels, or historic tales over science fiction. Others have acquired a taste for post-modern texts whereas still others prefer the linearity of the ancient Greeks. Even when we agree on genres, we differ in our tastes, we argue over what the latest David Lynch film really means, whether Rabelais was better than Shakespeare, what the greatest novel ever written was, and so forth.

To identify oneself as an artist does not mean that others will see us or label our work that way. Researchers wishing to also be identified by others as artists will likely be pressured to subject their work to the same kinds of scrutiny and judgment that other artists do. Alternatively, advocacy for more democratic definitions of art may be in order. Increasing public access to art participation in both making and judging art is a related issue that needs attention.

Sometimes, art-making becomes so engrossing that it is the aesthetic quality of the product as a work of art and not as research reporting that becomes primary. High production standards and consideration of aesthetics are important and in fact, may deepen the interpretation and hone the representation of findings. We are not arguing for a lowering of artistic standards, but rather reminding ourselves that the self-study and the conveying of research is the raison d'être of the enterprise.

Aesthetic concerns can be good sources of criteria for judging the worth of a piece, but as Eisner(1991), Barone (1992, 2001), and Greene (1978, 1995) have cautioned, it may be inappropriate to judge the value of a piece done in one genre according to the criteria of another. Autobiographic self-study takes many forms, something that obligates us to become conversant with a variety of methods and purposes and aesthetic guidelines. But genre concerns notwithstanding, there are some criteria, such as trustworthiness, that may be applicable across genres. In our view, it is the ability of the final representation to evoke and convey the essential processes and findings of the self-study that are paramount, along with the ability to project an outward gaze or gesture or path back to the reader/viewer's experience.

What Difference Can Arts-Based Research Make?

The emergence of arts-based research as a viable approach is putting pressure on the traditional structures and expectations of the academy. Space, time, and

equipment requirements often make it difficult for researchers to present their work in the conventional venues and formats of research conferences. Imagine trying to set up your props and squeeze your performance into the 12 minute time-slot of an AERA paper session, or hauling your bulky and perhaps fragile art installation across the country only to show it for 30 minutes, in an inappropriate venue requiring extensive installation time. And yet that is exactly what an astonishing number of scholars are doing, so convinced are they of the importance of these alternative approaches. As their numbers increase, more pressure is being exerted on conference organizers to take into account in their planning the need for better and more flexible spaces and schedules. Creative approaches to conference scheduling are starting to emerge, often involving subversion of round table or poster sessions, transforming them into a performance or carnival or art show. And a sense of community is starting to build, often organized around specific organizational groups such as the SIG for Arts-Based Educational Research http://www.usd.edu/aber/ or the S-STEP group of the AERA http://www.ku.edu/~sstep/, or around local groups of scholars such as The Centre for Arts Informed Research http://home.oise.utoronto.ca/ ~aresearch/airchome3.html, or the Image and Identity Research Collective www.iirc.mcgill.ca.

In presenting the examples that we use in this chapter, we have included some "viewer accounts" as a way to talk about the meanings of artistic works. This additional dimension of textuality – the responses of other teachers and teacher educators to an individual's self-study – needs to be incorporated into visual artistic approaches. It is a way to build in transparency, reflexivity, and critical reflection by creating community and dialogue. In accessing multiple viewpoints, we can test the utility of our representations against audience and participants' experiences, and insert artistic representation into the context of practice rather than viewing it as an isolated work of art.

As the importance of sharing self-study with the wider community and of inviting others to become part of it becomes more widely acknowledged, alternative venues in public spaces become more appropriate. Convincing the academy, for example, that Cole and McIntyre's autobiographic art installation (Cole & McIntyre, 2002), displayed for several months in the large foyer of a prominent downtown building, housing the Canadian Broadcasting Corporation, and viewed by a conservative estimate of 30,000 people, is a laudatory example of dissemination of scholarship and should count at least as much as a conference paper for purposes of promotion, is another matter. As inter-disciplinarity increases, as it inevitably must, and as promotion committees in the social sciences become more familiar with the criteria used by their colleagues in fine arts, where multiple screenings of the same film do count, we hope that alternative modes of presentation will be more valued by the academy.

Audience/viewer reactions to particular artistic representations of self-study vary; so do reactions to any research presentation or book or article, whatever the genre or research approach. A community of consensus may or may not evolve around the worth of a particular work. Using the arts or being artistic is

not a panacea for self-study; it does not guarantee research quality, nor does it automatically lead to a significant contribution to the research literature. No single method or design in any paradigm can do that. We suspect, however, that the kinds of approaches we have described in this chapter do increase the likelihood of a fulfilling and satisfying sort of inquiry, the kind that encourages teachers and teacher educators to continue, and inspires practitioners to become more the kind of people, teachers, and researchers they want to be. That is no small recompense.

USING INFORMATION AND COMMUNICATION TECHNOLOGIES FOR THE SELF-STUDY OF TEACHING*

Garry F. Hoban
University of Wollongong, Australia

Abstract

This chapter provides an overview of the relationships between self-study as a field of research and technology. A distinction is made between technology as a tool and technology as a social and cultural practice. The focus of the chapter is on the contribution of Information and Communication Technologies (ICTs) to knowledge construction in self-study. In particular, the research processes facilitated by ICTs such as representing, accessing, analyzing, retrieving, sharing, communicating, and editing data are discussed. These processes are highlighted in three case studies of self-study that feature either e-mail, multimedia, or the World Wide Web. Limitations of technology for self-study are discussed including how technology can weaken our sense of reality and identity. The conclusion of the chapter summarizes the key arguments and presents future directions and considerations for using technology in self-study research.

Interesting parallels have developed over the last 10 years between the emergence of self-study as a field of research and innovations in educational technology. In 1990, when I commenced my employment as a teacher educator at a rural university in Australia, I did not use e-mail, had never heard of the World Wide Web, and I thought "cyber" was a new type of car. At the same time, the Self-Study of Teacher Education Practices (S-STEP) special interest group (SIG) of the American Educational Research Association (AERA) did not exist and the public spotlight was not on the quality of teacher education. As a newly appointed teacher educator, I was supposed to be an "expert" in my field –

science education – and my job was to "train" preservice teachers by passing on my knowledge and skills to them. How times have changed!

Towards the end of the 20th century there was a tidal wave of technical innovations that have permeated how we do research and made common communication channels that once we only saw in science fiction movies. Simultaneously, the landscape of teacher education has rapidly changed with a growing emphasis on qualitative research methods, on understanding multiple perspectives, and on improving the pedagogy of teacher education (Cochran-Smith & Lytle, 1999; Korthagen & Kessels, 1999; Scannell, 2002). Self-study has emerged from this context as a feature of professional practice and has a growing presence in teacher education literature. It is timely, therefore, that we consider advances in technology and how they can enhance self-study processes in this first International Handbook of Self-Study of Teaching and Teacher Education Practices. However, this co-emergence of technology and self-study does not mean that we should assume that the use of technology is always helpful. Too often, educational writers publish one-sided views about technology assuming that it is the way forward for improving teaching practices (Blacker, 2002). Instead, I contend that there are limitations for using technology, especially in regard to self-study, and so we need to think about how, what, and when to use it.

The purpose of this chapter is to explore the use of information and communication technologies (ICTs) for self-study research and professional practice. First, I explain different definitions of technology taking into account interpretations that range from technology as a tool to a social and cultural practice. Second, I outline the processes underpinning knowledge construction in self-study research and focus on ways in which ICTs can help us to facilitate these processes. These research approaches enhanced by information and communication technologies will be demonstrated in three case studies that each focus on a particular ICT – e-mail, multimedia, and the World Wide Web (WWW). It should be noted that non-electronic tools such as paper-based portfolios and reflective journals are also forms of technology and are used to support self-study research; these are discussed elsewhere in the handbook so will not be addressed here. Third, I identify some limitations of using technology in self-study research. The conclusion of this chapter summarizes the main arguments and discusses the future implications of using technology in shaping methodologies for self-study research.

Definitions

The word technology originates from the Greek word "techne", meaning art, artifice, or craft which focus on the making or use of products. For example, a common interpretation is that technology is a tool or object; as described by the *Oxford Dictionary of Sociology* (1998), "technology includes machines, equipment, and possibly the productive technique associated with them" (p. 665). This definition portrays technology as a neutral tool or process to be used as needed for a specific purpose. The locus of control is in the hands of the user so that

technology simply becomes a means to an end. The assumption that underpins this view of technology is that the tools are inanimate objects that have no influence on the people who use them.

However, this interpretation of technology as being a collection of neutral tools for convenient use has been labeled by some as simplistic and naïve (Braun, 1995; Zerzan & Carnes, 1988). In contrast, some researchers view technology as a social and cultural practice with embedded values that underpin its design and use (Pacey, 1983; Postman, 1993; Rybczynski, 1983). Pacey (1983) includes culture and structures in his definition of technology as, "the application of scientific and other knowledge to practical tasks by ordered systems that involve people and organizations, living things and machines" (p. 6). Cultural aspects include people's goals, values, ethical codes, and beliefs, whilst organizational aspects include how technology interacts within the economic, political, and industrial activity of a population.

According to this latter interpretation, the use of technology is a cultural practice that is mediated by the socio-historical context: "The social consequences of particular technologies are not fixed or determined by that tool or technology. Rather, they are mediated by the social contexts and uses made of them, as well as by context-specific sociocultural factors such as gender, class, ethnicity and age" (Kapitzke, 2000, p. 212). Jacobsen (2000) argues that users of technology and their relevant social and cultural values have a mutual influence with each one shaping the other: "Technologies emerge within an intricate web of cultural constructs that they in turn affect, so that they are both agents and products of cultural change" (p. 4). The presence of e-mail, for example, can promote a social expectation that users will participate in work practices whilst at home in the evening or on weekends. Similarly, as teacher educators are exposed to and use new technologies in their teaching, new pedagogies develop which may not have been thought of before. Kellner (2000b) contends that the rush of new technologies has created a need for new literacies beyond the print medium; multimedia literacies means interpreting and manipulating print text, images, and graphics such that, "new technologies and cultural spaces require us to rethink education in its entirety, ranging from the role of the teacher, teacher-student relations, classroom instruction, grading and testing, the value and limitation of books, multimedia, and other teaching material, and the goals of education itself" (p. 257). An implication of the mutual interactions between technology and the people who use them is that we need to be cautious in employing technology as it can influence the methods and values to which we aspire: "as technologies become more powerful and more widely used, the need for scrutinizing their unintended effects on people, activities, and communities, becomes more urgent" (Araya, 1997, p. 1). For the purposes of this chapter, Information and Communication Technologies (ICTs) are defined as tools and practices that involve electronic documentation, storing, retrieving and sharing of information which often involves the use of computers. The next section outlines the nature of self-study and how ICTs can contribute to the processes that underpin knowledge construction in this form of research.

Using Information and Communication Technologies (ICTs) to Support Knowledge Construction in Self-study Research

> It serves to distinguish genuine knowing from mere true belief, by reference to appropriate evaluation of the belief by the believer: the surplus strength of knowing consists, in short, in the knower's having adequate evidence for the belief in question. (Scheffler, 1965, p. 56)

It is a paradox that self-study, by name, implies a personal inquiry to examine one's own practices because as a form of research, self-study is more than personal reflection and needs to have a "relationship to and bearing on the context and ethos of a time" (Bullough & Pinnegar, 2001, p. 15). A similar argument was presented by Loughran and Northfield (1998) when they contended that self-study is more than reflection because personal thoughts need to be made accessible for others to consider:

The Nature of Self-Study

> Reflection is a personal process of thinking, refining, reframing and developing actions. Self-study takes these processes and makes them public, thus leading to another series of processes that need to reside outside the individual. … Self-study can be considered as an extension of reflection on practice, with aspirations that go beyond professional development and move to wider communication and consideration of ideas. (p. 15)

Cochran-Smith and Lytle (1999) concur that self-study is more rigorous than reflection and categorized it as a form of teacher research involving, "systematic, intentional, and self-critical inquiry about one's work" (p. 22). Zeichner and Noffke (2001) included self-study as one of the five forms of what they called "practitioner research." The other forms included action research, teacher-as-researcher, teacher research, and participatory research. Whilst all of these forms of research have an emphasis on the personal – data collection that involves the examination of personal practice and the fostering of self-awareness – what distinguishes self-study is that it has an emphasis on change and/or understanding of one's own teaching, which is sometimes transformative (Zeichner & Noffke, 2001). In short, self-study, as a form of research, implies a systematic inquiry into beliefs and practices about one's own teaching, necessitating that these personal insights are made public for the purpose of constructing knowledge.

The Process of Knowledge Construction in Self-Study

In the process of sharing these personal insights, beliefs are confirmed or disconfirmed by feedback from others (colleagues or students) or by comparison to existing educational theory. This iterative process justifies some beliefs as knowledge and is consistent with Gettier's (1963) definition of knowledge as a "justified true belief" (p. 121). Importantly, it is the process of justification that is fundamental to the social construction of all forms of knowledge:

> If the potential of the notion of practical knowledge, knowledge-in-action, personal practical knowledge, or teacher knowledge is to be realized, all who would study it face an obligation to take seriously the fact that they are studying notions of knowledge, and, as such, must work through matters of warrant and justification. (Fenstermacher, 1994a, p. 49)

Yet it is widely accepted that knowledge is not exclusively generated from one perspective. A postmodern view of the world promotes multiple perspectives leading to the "relative status of knowledge and practice" (Tom & Valli, 1990, p. 389), such that truth is "relative, conditional, and situational" (LaBoskey, 2003). These procedures for justifying beliefs as a deeper understanding or knowledge are dependent on the quality of evidence that substantiates a claim.

Adequate Evidence

Scheffler (1965) highlighted three conditions necessary for the establishment of propositional knowledge: (a) the belief condition; (b) the truth condition; and, (c) the evidence condition. In particular he emphasized the importance of the third condition referring to the term "adequate evidence" which means good reasons or a good case to know something. This implies a judgment about evidence by the believers based on the way they understand evidential data and, "appreciating their value as data, in the light of an appropriately patterned argument" (Scheffler, 1965, p. 70). The implication for self-study is that what constitutes "adequate evidence" may vary from researcher to researcher. For example, what self-study researchers value and understand in helping them build knowledge may include direct feedback from students, the opinions of immediate colleagues, formal theory, or the opinions of colleagues at other universities. Consequently, it is imperative for researchers to engage in the justification of their beliefs or personal insights using evidence that they understand and value as, "something more is required before we can speak of knowledge (or even confirmation) as opposed to plausibility" (Longino, 1993, P. 102).

Hamilton and Pinnegar (2000) argue that insights from the self-study of teacher educators can contribute to the development of a knowledge base for teacher education. They suggest that this knowledge base can be established but, "only if we carefully study our practice. We must systematically collect data, question our students and our colleagues, and reflect on our motivations and thoughts" (p. 238). This iterative process between personal reflection and public sharing not only encourages the researcher to document his/her ideas clearly, but also exposes personal interpretations to scrutiny by others. In addition, the research methodology needs to establish rigor by making explicit how data are collected, analyzed, and interpreted. Self-study therefore, is by nature a personal type of inquiry, hence the emphasis on "self", but also needs a process to make data and their interpretations available for public inspection.

However, self-study is not objective research removed from biases and emotion. On the contrary, LaBoskey (1997) talks about the moral and ethical implications of teaching stating that it is guided by "passionate creeds":

> My passionate creed is that educators need to be thoughtful about their work, which means they must question assumptions, consider multiple perspectives, avoid judgements, recognize complexity, and be primarily concerned with the needs of their students. (p. 161)

Hamilton and LaBoskey (2002) highlight the sensitive nature of this type of research suggesting that self-study can make us more aware of our own values and biases, and if done collaboratively, it helps us to realize that these may be different from others with whom we work. As such, participating in self-study can sometimes make researchers feel uncomfortable, as it can lead to challenges of one's values and biases. At a recent conference on self-study, (4th International Conference on Self-study of Teacher Education Practices, Herstmonceux Castle, East Sussex), one delegate stated that a hallmark of self-study was "vulnerability" (Allender, 2002). My interpretation of vulnerability means taking personal risks, not only to initiate inquiry into how one teaches, but also having to make these personal insights public. But these insights are often not simplistic and clearly defined. Instead, self-study research requires us to be honest, trustworthy, and caring about making our practice explicit whilst making public the contradictions and complexities of teaching (Hamilton & Pinnegar, 2000).

Quality in Self-Study Research

Recently, Bullough and Pinnegar (2001) noted that establishing quality in self-study research means finding the right balance between personal reflection or biography on the one hand, and how these ideas are made public within a historical context on the other. They argue that it is the nexus between "private experience" and "public theory" that is the main criterion for those who seek quality in self-study research. If the research places too much emphasis on personal reflection, then the study can slide into a confession, whereas an emphasis on the latter presents the study as traditional research. The key for quality in self-study, therefore, is to find the right balance between these two key attributes. This interplay between personal reflection and public theory in self-study, which is indicative of the social process of knowledge construction, is represented in Figure 26.1.
Figure 26.1.   Quality of self-study research as interplay between personal reflection and public theory.

The Affordances of ICTs for Knowledge Construction in Self-Study Research

Information and communication technologies can assist in both attributes of self-study research to facilitate the processes involved in knowledge construction. For clarity, the research processes highlighted in this section will be presented in italics. In regard to reflection, technology is useful for *representing* teaching experiences in many different forms. For example, data can be presented in the form of written text in electronic journals and in e-mail messages, as images in visual text in pictures, or in videos, which may lead to different types of understanding of the experiences represented. ICTs can also support simultaneous representations such as providing written text, visual images, and sound together in multimedia presentations using CD-ROMS. Indeed, Zeichner and Noffke (2001) contend that multimedia is a more complete representation of experience than written text alone. ICTs, therefore, can provide us with multiple ways to represent teaching, which provides different ways for reflecting upon our experiences and so can lead to deeper levels of understanding.

Using technology, therefore, requires us to become informed about different types of literacies. Kellner (2000b) defines literacy as, "gaining competencies involved in effectively using socially-constructed forms of communication and representation" (p. 249). He argues that technology is permeating all forms of communication so rapidly that we need to develop new forms of literacy beyond print such as media literacy, computer literacy, and multimedia literacy if we are to democratize and improve education. For example, self-study research represented in multimedia could mean analyzing the visual setting, sound, discourse, and actions by a teacher and students in a classroom. Indeed, the non-participation of students in a classroom, as documented by a video camera, could also be data for self-study research. Computer and information literacies mean learning how to use e-mail, list-serves, construct web-sites, use web-based search engines, download information, and read hypertext. In short, advances in technology are creating the need for "multiple literacies" (Kellner, 2000b) to represent our experiences in different ways to ourselves and others and so enhance the process of knowledge construction.

ICTs are also helpful in *accessing* information, as digital data can be easily stored and retrieved quickly to help recall events at a later time and as many times as required. This makes reflection more flexible as data can be readily retrieved to support the process of rethinking experiences, which is fundamental to reflection (Dewey, 1933). In addition, technologies provide *flexibility* for when personal refection occurs as a person can document insights for *retrieval* at anytime as long as a person has access to a computer. As well, software tools can enhance the research process by assisting in *analyzing* data. For instance, the software package "NUDIST" (Non-numerical unstructured data indexing searching and theorizing) can be used to assist in qualitative data analysis and "Inspiration" can be used for mapping out concepts or relationships in our research. Importantly, software packages, such as word processors, can help

researchers to *edit* texts using word processes and functions such as cutting and pasting to help us *communicate* more clearly and expediently with others.

However, it is for the second attribute of self-study – *sharing* personal insights with others and *accessing* public theory – that the affordances of ICTs really excel. There is no other medium that can make ideas so public and provide access to information as well as the Internet. It is this sharing of personal reflections with others and the comparing of insights with public theory that is fundamental to the knowledge-building process. Also, this sharing of insights and accessing knowledge can occur using a variety of *methods*. A person can download and read information from the internet, such as educational literature, and seek new information about teaching practices from all over the world. Alternatively, a live chat can be held with teachers in other countries in a synchronous discussion space. Interestingly, for some people, the internet may provide a more comfortable medium for expressing their personal insights than face-to-face interactions, as people may prefer to be anonymous in disclosing their experiences or shy about expressing opinions directly. In sum, ICTs can facilitate the processes of knowledge construction in self-study research. They enhance personal reflection by *representing*, *retrieving*, *editing*, *accessing*, and *analyzing* data. But more importantly, technology enables these insights to be *shared* with others in *expedient* ways; in addition, it provides access to public theory that is central to the knowledge-building process. Moreover, technology provides *flexibility* for when, where, and with whom this sharing occurs. As such, researchers can use ICTs to reflect on personal experiences and share insights with others in expedient ways, thus creating the basis for further reflection and sharing. This dynamic interplay established between reflection and sharing provides the basis for quality in self-study research. The next section exemplifies the research processes supported by ICTs by demonstrating their use in three case studies of self-study research.

Cases of Self-Study Using Information and Communication Technologies

> As we enter a new millenium, most people are by now aware that we are in the midst of one of the most dramatic technological revolutions in history that is changing everything from the ways that we work, communicate, and spend our leisure time. (Kellner, 2000, p. 245)

This section demonstrates how ICTs can enhance the research processes of *representing*, *editing*, *accessing*, *analyzing*, *retrieving*, and *sharing* that are fundamental to knowledge construction. In this section three different information and communication technologies will be featured – e-mail, multimedia, and the World Wide Web – and how they supported teacher educators to change their practices.

Electronic Mail (e-mail)

Overview

Although e-mail has only been in regular use by academics since the early 1990s, it is one of the most commonly used tools for self-study research. This is because

researchers can *share*, relatively quickly and simply, personal insights with others in the world that have access to a computer. Not only can messages be sent to another country in seconds, they can also remain on a server to download when required, similar to an asynchronous discussion which does not occur in real time. E-mail therefore helps us to *reflect* upon our experiences as we can read a comment or report from a colleague, think about an appropriate response, and reply in our own time. Although this can occur with pen and paper communication, the response time is not as immediate. Hence, e-mail is one way to *represent* and reflect upon our experiences as written text and share ideas with others at our own pace, which is like having a "slow motion conversation" (Hoban, 2002).

In some research, e-mail has been used to overcome the problem of distance when engaging in self-study conversations with colleagues who work at different universities (Anderson-Patton & Bass, 2000; Freese, Kosnik, & LaBoskey, 2000; Guilfoyle, Hamilton, Pinnegar, & Placier, 2000; LaBoskey, Samway, & Garcia, 1996). For instance, e-mail was used to support a collaborative self-study with a group of five female teacher educators from different programs at the Pontificia University in Chile. They held face-to-face meetings regularly over two semesters to discuss their self-study experiences regarding the supervision of student teachers (Montecinos *et al.*, 2002). In addition they used e-mail to include a Chilean teacher educator who worked in the US as a "critical friend" to extend their conversations and to help them document their experiences. E-mail can also be used to keep "the conversation going" with colleagues within the same university and so provide *flexibility* in communicating with colleagues who may not have the time to meet face-to-face as often as they would like (Berry & Loughran, 2000; Corbett-Whittier, Guidry, Sowa, & Arbab, 2000; Griffiths & Windle, 2002; Guojonsdottir & Dalmau, 2002; Ham & Wermoth, 2000; Schuck, Brown, & Schiller, 2002; Upitis & Russell, 1998).

In one study, e-mail was used to supplement face-to-face interactions and keep 10 members of a self-study group (SSG) from Queen's University, Canada, connected between meetings. They were interested in sharing ideas about their teaching practices and met on a regular basis (usually monthly) from 1995 to 1996 (Smith, 1998). Each member had a personal goal associated with their own teaching similar to an action research project. Some people used e-mail to simply organize meetings, others used it in a more personal way to sustain dialogue about sensitive issues. Whereas some people are comfortable sharing personal thoughts on e-mail, others are not, perhaps in part because using e-mail removes the physical cues of body language as occurs when ideas are shared face-to-face. This means that sometimes written ideas in e-mails are not interpreted in the way originally intended. Nonetheless, e-mail can provide a very powerful tool to help teacher educators collaborate in self-study, as shown in the following study by researchers from Hawaii, Canada, and the USA.

Anne's Case of Self-Study Using E-mail

This example highlights a collaborative self-study conducted primarily by e-mail among three researchers who live over 10,000 miles apart – Clare Kosnik from

OISE/UT in Canada, Anne Freese from the University of Hawaii, and Vicki Kubler LaBoskey from Mills College in the USA. Importantly, the three had met at a self-study conference in 1998 which helped to establish communication. They then decided to maintain contact via e-mail that lasted over a period of 15 months. Their views about the social construction of knowledge were grounded in the work of various researchers (Clandinin, Davis, Hogan, & Kennard, 1993; Hollingsworth, 1994; Schön, 1983) believing that knowledge is, "relational, personal, practical, constructed, reconstructed, and open to different interpretations" (Freese, Kosnik, & LaBoskey, 2000, p. 75). Anne now tells a brief story of how the collaborative self-study using e-mail changed the way she structured assignments in her courses. Interestingly, the learning was reciprocal – because as Anne learned about herself, she changed what she expected from her preservice teachers:

> *History of our e-mail exchange.* The benefits of conducting self-study via e-mail are many. As a result of our fifteen-month exchange of e-mails, we developed personal and professional relationships. Through e-mail we shared our ideas, questions, concerns and struggles in a public, yet safe forum, always knowing we would receive honest feedback. Our e-mail correspondence began with long, thoughtfully constructed e-mails that articulated our personal and professional fears, concerns and questions. Over time our exchanges became more informal. We became "critical friends" to one another in a safe cyberspace community of caring and inquiry.
>
> Our e-mail exchanges started with rather general philosophical questions and concerns about self-study. Clare and I were interested in defining self-study and determining how it can be considered scholarly research. In an e-mail dated 3/17/99 Anne asked, "What can self-study contribute to the larger body of knowledge? What about sample size, reliability and generalizability?" After many exchanges Vicki helped to narrow our focus. Her approach to self-study emphasized a more personal approach. She stated "I could greatly benefit from looking at what the two of you are learning from your practice and research. By looking at our papers, what we have defined as self-study will help us determine what we mean by it." 11/13/99.
>
> In a follow up e-mail Clare responded positively to the shift in focus: "My aims are two- fold: first, understand the process of becoming a teacher more fully; second, examine our program to determine its effectiveness, which includes understanding the usefulness and appropriateness of our assignments." 1/5/00
>
> Vicki's next e-mail emphasized that an important aim of self-study is to transform practice. She stated, "I do like the direction you have taken in the last e-mails received – to talk about our own practice and the changes we have made as a result of self-study. I agree with you about shifting the focus of our work together from defining self-study to more of an exploration of our work as teacher educators. I have papers I could send you all. The topics have to do with teaching, portfolios, unit plans, etc." 2/20/00

I agreed with Clare and Vicki's suggestions and wrote: "I am interested in systematically exploring the effectiveness of specific assignments." In the same e-mail, I continued: "After I sent my previous e-mail, I went back and reread all the e-mails you both sent over the past few months. I got motivated and started jotting down notes and reflecting on what we have written." 3/20/00

We followed with an exchange of research papers between the three of us. Reading Clare and Vicki's papers helped me reframe my thinking and revisit my assignments in a more focused, systematic way. When I read Vicki's portfolio paper, my initial reaction was that it was too open-ended for me. Her assignment requirements included the following: "There is no set format and there are no specific requirements for content – those decisions are up to you. Each item ought to represent some belief about teaching that you have, some value or goal." This sounded a bit radical to me compared to my more structured portfolio assignment. However, as I reflected on her process and revisited my assignments, I began to see how my portfolio assignments were not aligned with what I believed.

Insights and changes to my teaching. On the one hand, I wanted the students to develop habits of reflection so they would continuously examine their beliefs, their attitudes and see how they construct and reconstruct their beliefs about teaching and learning. Yet at the same time, my assignments were quite structured and not connected. They did not provide an opportunity for the students to make the connections and see how their beliefs and attitudes had changed over time. As a result of Vicki's papers and Clare's insights about the process of becoming a teacher, I adapted a portfolio approach that is less structured and focuses on helping students examine the process of becoming a teacher. My current assignment requires the students to go back and reread their first and second year self-evaluations. I also ask them to reread previous assignments such as their philosophy of teaching and videotaped analyses of their teaching, and create a portfolio that reflects on their journey, and the process they went through as they reframed their thinking about teaching and learning. I discovered how valuable it was for me to read and reread the e-mails to reflect on what Clare, Vicki and I had written over a fifteen-month period. I realized what I wanted my students to do was similar to the process I went through.

Through our e-mail collaboration, I gained insight into the value of visiting and revisiting one's beliefs and practices over an extended period of time. Similarly, I wanted my students to revisit their assignments and reflections. The result is a portfolio approach that includes assignments that are more cohesive and connected. The portfolio is personally constructed by each individual student and is designed to help students synthesize their work over three semesters and systematically reflect on how their field experiences/assignments and learning events have influenced their thinking and development. My experience exchanging e-mails allowed me to better

understand the process I want my students to engage. The portfolio assignment now serves as an ongoing means of reflection on one's reflections at different points in time. Vicki and Clare helped me ask myself "Why am I doing what I'm doing and how is my practice aligned with my beliefs?"

Although there were some technical hitches in the e-mail communications, the interchange of ideas between Hawaii, Canada, and the USA via e-mail shows that the technology enabled the researchers to overcome the conventional barriers of distance and time. Accordingly, e-mail helped the researchers to represent their experiences which they accessed when needed but more importantly helped them to reflect and sustain the sharing of ideas and feelings that is fundamental to knowledge construction: "We found that self-study goes beyond self. It is about relationships, interactions, and exchanges of ideas that contribute to framing and reframing our thinking" (Freese, Kosnik, & LaBoskey, 2000, p. 75).

Multimedia

Overview

The use of ICT described in the previous section is a useful method for self-study research, but e-mail only shows written text as a representation of ideas for teaching. Teaching experiences recorded on video, however, show visual and auditory experiences over a period of time and can be replayed as many times as required. Also, there is more detail in videos – there are pictures and sound, which has the ability to capture experiences more fully. Mitchell and Weber (1999) proposed six distinguishing characteristics of using video for self-study:

(i) It provides more detail – there are pictures, sound and movement over time. These details provide more information about the context and hence a better understanding of the complexity of an experience. Because of this detail, experiences may be more confronting or comforting, depending on the interpretation.

(ii) It provides a different perspective – all of us interpret our experiences from our own thinking but a video may capture events that we do not see or may take a different angle. This different perspective may help us to realize that there are multiple ways of viewing events.

(iii) It makes public experiences that are private – video captures real classroom events for others to see who were not there.

(iv) It captures events as they occur – no one can prepare for a video capture in totally prescriptive ways. As such, a video will always capture events as they occur.

(v) It is immediate – a video can be viewed as soon as it is filmed and so can be presented for immediate analysis.

(vi) It captures everyone in focus – a video can focus on one person such as the teacher or can focus on a whole classroom capturing the students' actions and noise as well.

In some studies, video has been used to capture the instruction of teacher

educators (Cobb, 2002), but it has been used most frequently for the self-study of teacher educators as they examine the growth of their preservice students (Clarke, 1995; Freese, 1998; Harris & Pinnegar, 2000; Hopper & Sanford, 2002; Loughran, Berry, & Tudball, 2002; Tidwell & Heston, 1996). One way in which video has been used for preservice teachers is to show them footage of how they teach in light of them providing a practical argument for why they teach the way they do (Fenstermacher, 1994b). Tidwell and Heston (1996) used this process by videoing preservice teachers as they taught remedial reading on a one-to-one basis, which they later watched in light of their practical arguments. In presenting their arguments, the preservice teachers stated: (i) What was happening?; (ii) How did they know that to justify their description?; and, (iii) Why was it happening that way? Tidwell (1996) found that over time, the quality of the practical arguments increased:

> These more sophisticated practical arguments included rationales for practice, connections between a child's actions and subsequent instructional changes, critiques of both positive and negative aspects of instructional moments, and less dependency on the supervisor's other voice for argument elicitation. (p. 187)

Freese (1998) used video as another way for preservice teachers to reflect on their practicum experiences. In her study, a three-phase framework was used: phase one involved a pre-lesson conference between a preservice student and a mentor teacher to determine their anticipatory reflection; phase two involved a viewing of the videotape of the practicum teaching by both the mentor and the preservice teacher to identify key decision making points; and, phase three involved analyzing what worked in the lesson, what could be changed, and what information could be gained for future teaching. The data can then be replayed as many times as desired as a stimulus for personal or group reflection.

Because CD-ROMs can provide multiple ways of representing experiences – written text, sound, video, and images – they can be linked in different ways to promote self-study. Carl Harris from Brigham Young University, Utah has developed a pedagogy for using videoethnography on CD-ROMs based on constructivist learning principles:

1. Learners must be confronted with problems and frame questions that genuinely mirror the world beyond the classroom.
2. The problems and questions must come to have personal meaning for the learners.
3. The process of teaching learners how to frame questions and inquire after solutions must model active inquiry pedagogy, i.e. practice in inquiring about and finding their own answers.
4. The display of learning must be to real audiences, i.e. those who can benefit from and have a vital interest in the problems and questions, in addition to their teachers and peers. (Harris & Pinnegar, 2000, p. 116)

One of the CD-ROMs produced at BYU, *The Mara Mills Case: A*

Videoethnography of Biological Science in a Sheltered English Classroom, by Annela Teemant, Stefinee Pinnegar, Roland Tharp, and R. Carl Harris, features a collection of digital videos of Mara Mills, a science teacher presenting a range of lessons. There are video clips to view for each of these themes: Working Together; Language Development, Contextualization, Cognitive Challenges, and Instructional Conversations; as shown in Figure 26.2.

What is unique about this use of multimedia is that the CD-ROM provides access to a variety of perspectives to assist reflection – a language perspective, a science education perspective, a professional literature perspective, Mara Mills' perspective, and her students' perspectives (Teemant, Pinnegar, Tharp, & Harris, 2002). The authors state that videoethnography is an excellent stimulus for self-study for both the students in the video and for teacher educators: "The real power of this tool comes from the ways in which others can examine and investigate teaching. … It will enrich and extend our own experience in classrooms as well as develop our ability to see practice more theoretically and to see theory more clearly in practice" (Harris & Pinnegar, 2000, p. 115).

In Australia, video was used to record preservice students participating in micro-teaching (small group teaching), which was viewed by the preservice teacher and a teacher educator (Loughran, Berry, & Tudball, 2002). These have been the basis for reflective conversations between the preservice teachers and teacher educators. Other studies have used video cameras to record data of

Figure 26.2.   Screen shot of CD-ROM, the Mara Mills case.

preservice teachers instructing in classes and refined this data to form case studies (Bencze, Hewitt, & Pedretti, 2002). In the following case of self-study using multimedia, the process of collecting data for the CD as well as the CD itself led to a change in the instruction of the teacher educator.

Tom's Case of Self-Study Using Multimedia

As video cameras become more common and easier to use, many researchers are making digital videos of classroom interactions or interviews, editing them and then storing the data on a CD-ROM. This allows for different representations of experience, which is relatively cheap to produce and disseminate. Tom Russell at Queen's University has been producing several CD-ROMs for self-study research over the last few years based on the notion of "sharing the authority of experience" as shown in the screen shot in Figure 26.3.

In the following case example, Tom outlines how the process of producing the CD-ROM helped him to talk less about reflection in class, and instead, structure assignments to encourage it:

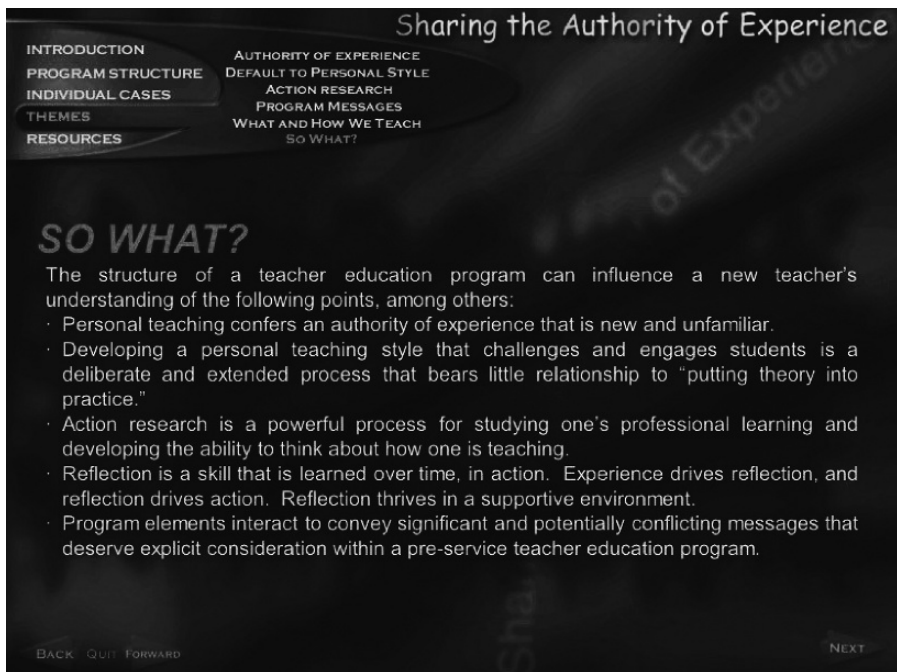
> *Constructing the CD-ROM and presentation of data.* Over an 18-month period from September 2000 to March 2002, I recruited a small number of "video volunteers" to help me explore this use of video and CD-ROM technology. Michael and Joseph were members of a chemistry-physics


Figure 26.3. Screen shot of the CD-ROM, sharing the Authority of Experience.

method group. After Michael's first interview in December, 2000, I gave him a VHS copy of the tape of our discussion. When he watched the tape soon after the interview, he became fascinated by the opportunity to revisit how he was thinking about his practicum experiences. A first interview with Joseph in the same month captured his attention, and in January and March of 2001, I interviewed Michael and Joseph together. Simply sitting with them in front of a video camera provided me with significant insights into their perceptions of program strengths and weaknesses as I listened to their conversations and probed for clarification. Late in January, 2002, I recorded a conversation with four people for whom I had been Faculty Liaison to the schools where they completed a 10-week practicum in the October-December period of 2001. Megan, Sarah, Kate, and Ena spent an hour exploring with each other a broad range of their personal reactions to the program they were experiencing. Again, the insights seemed clear and powerful. With a substantial quantity of video-based data, I turned to the challenge of constructing a multimedia CD-ROM presentation that I hoped would be of value to future students and of interest to teacher education colleagues.

I was fortunate to have the university's Video and Multimedia Presentations unit located in the building where I teach. Selecting and "capturing" video clips is a time-intensive activity that forces close attention to what people are saying; clips of 60 to 120 seconds seemed to be an appropriate size for my purposes – long enough to convey a point but not so long that a viewer loses interest. Working with the expert on video "capture" introduced me to the first step in the production process. Once I had about 40 video clips, I was ready to work with the individual who would construct a program to allow viewers to access the data within a CD-ROM presentation.

Structure of the CD-ROM. Introduction, Program Structure, Individual Cases, Themes, and Resources became the five main headings for navigating through data on the CD-ROM. Introduction and Resources are the familiar opening and closing areas, while Program Structure, Individual Cases, and Themes carry the weight of the presentation's arguments. The Program Structure documents the changes instituted in 1997-98 and the subsequent moves to reduce some of the changes that were viewed negatively by many faculty members. Individual Cases identify the area of the CD-ROM in which all of the available contributions from each of the six individuals may be viewed to get a clearer sense of each person. Themes identify the area in which I found myself forced to better understand the interaction between my teaching and research.

Constructing the Themes area required me to review my teaching for the perspectives I most hope my students will understand; constructing this area also required me to review papers I have written over the last 10 years to identify the focal points of that writing. A deadline I had set myself for

completing the CD-ROM prevented this task from becoming endless, and the final CD-ROM contains these six themes: "How Experience Confers Authority," "Default Teaching to Personal Style," "Action Research, Professional Learning, and Metacognition," "Program Messages and Interaction among Program Elements," "What We Teach vs. How We Teach," and "So What?" The CD-ROM, titled "Sharing the Authority of Experience: Perspectives on Learning to Teach," was completed in my 25th year as a pre-service teacher educator.

Insights and changes to my teaching. Use of the CD-ROM has led me to change my teaching in some ways but in another way it has made me appreciate that there are many different ways to teach. Some of these changes or insights are now outlined:

(i) Perhaps the most significant change arising from studying my teaching by producing a multimedia CD-ROM is that I have reduced my explicit talk about "reflection" while making efforts to increase the implicit structure and support for reflection. My students regularly report that they rapidly grow weary of exhortations to be reflective practitioners, and so I use the "R-word" less but structure activities and assignments that I hope will encourage reflective practice.

(ii) While the CD-ROM presentation works to bring program-structure effects to the attention of those within the program, designing the presentation emphasized to me that my own teaching also occurs within that program structure. As candidates work with six or more members of faculty, they encounter different emphases as well as conflicting messages; conflicts can be between individuals teaching them and also between courses and practicum. This has inspired me to restructure an assignment that asks them to produce a story of their year of learning to teach.

(iii) Many new teachers are surprised that teaching is such a personal activity. There is no agreement about "best teaching practices," and that is just as true in a preservice program as in a primary or secondary school. Collecting data from a few of my students in the form of videotaped conversations about program experiences has inevitably led to much richer one-to-one relationships with a few of the individuals in my classes. Am I giving special treatment to some? Definitely! Is this unfair to others? I think not. In an ideal preservice program, I would work closely with each individual. In a structure that is less than ideal, I do my very best for my classes, but I also work more extensively with those who are willing to take the risk of videotaped conversations. Those who contributed data to the CD-ROM are now in their first or second year of teaching, and we correspond electronically in ways that allow me to follow and support their development as teachers.

(iv) The Multimedia presentation on the CD-ROM illustrates my personal

conviction that listening to students is one essential strategy for improving education. What we hear when we listen is often not what we want to hear; the messages are critical as well as constructive and supportive. I force myself to request open-ended comments at several points before the end of the program, partly to model listening but also to hear what I am not hearing in any other way. I usually assume that 10 weeks of teaching provides enough experience to generate a list of topics and issues to be explored, but a recent request for comments brought numerous requests for more structure from me, reminding me that acquiring first-hand experience of teaching does not automatically develop skills of self-directed learning.

Although the collection and presentation of video data on the CD-ROM were time consuming, the technology enabled a large quantity of student data to be *stored* and *collated* in themes and allowed Tom to process information in different ways. Not only can a CD-ROM store a variety of digital data – pictorial, text, and sound – but it can also provide multiple methods for *accessing* the data depending on its structure. For example, text can be read, video clips viewed, sound listened to, or a combination of media used together. In addition, some CD-ROMs have a search function, which can help as well in the *retrieval* of data. Also, as in the example of the Mara Mills CD, the capacity of a CD-ROM provides the potential of *representing* multiple perspectives (literature, student, teacher, and peers) to extend our "frames" for how users interpret information. The next case example demonstrates the use of the World Wide Web, which highlights the *sharing* of data for self-study.

World Wide Web

Overview

This medium is unchallenged in terms of its ability to *share* personal insights with others and for providing *access* to public information or theory. The web has been used in various types of self-study (DeMeulle, Anderson, & Johnston, 1996; Guilfoyle, Hamilton, Pinnegar, & Placier, 1996; Hamilton, 2000; Hoban, 1997, 2000; Mills, 2000). Once put on the WWW, most data can be accessed by anyone in the world as long as they have a computer and connections for the internet. However, some sites are security protected and need a password for access. Online discussions such as a synchronous chat space provide "live" data so that individuals or groups can respond immediately to insights sent to them. For example Johnston, Anderson, and DeMeulle (1998) engaged in a collaborative self-study using e-mail to exchange journal entries and then meet online once a week for a real time discussion. The group of three used an Internet environment known as a MOO (Multiple user dimension Object Oriented) for their real-time (synchronous) discussions. They found the MOO environment *convenient* to use as they could have a real time discussion from their own offices and found that the text made it easy for *documentation* and *retrieval*. Although

they did have some minor technical hitches, they found that writing about their experiences assisted their *reflection*. They stated that the self-study created changes in teaching such as replacing some lectures with literature study groups and incorporating authentic assessment practices. In particular, as the three developed an understanding of how to employ technology in their collaborative self-study, they became more confident in using technologies in own teaching situations. The next section will highlight a case of self-study using the WWW for preservice students to provide weekly feedback to their instructor on his teaching.

Garry's Case of Self-Study Using the World Wide Web (WWW)

This case highlights the use of the WWW to enable preservice students to *share* ideas about their learning and to give feedback to their instructor for the self-study of his teaching. A FileMaker Pro data base was used so that the preservice teachers could log onto a website after a three-hour science methods class and give the instructor feedback on his teaching as well as other influences on their learning. It highlights how preservice teachers can present different inter-pretations of being in the same class and highlights the "living contradiction" (Whitehead, 1993) of teaching, as students interpreted the same class in different ways. As such, the data presented the researcher with dilemmas and contradic-tions in his teaching.

> *Design of the site.* After each university class the preservice teachers logged onto the WWW site and reflected upon their immediate class experiences to identify the personal, social (teaching and peer), and physical factors that influenced their learning. When students accessed the website, they were provided with a template that identified the four main categories or influ-ences on their learning. This categorization is consistent with a social constructivist perspective that views learning as an individual process of knowledge construction, which is supported by social interactions with the outside world (Duffy & Cunningham, 1993). The template was structured with a dialogue box for each of the following four categories:

1. *personal* factors attributed to each student, such as prior knowledge, feelings, self esteem, motivation, and personal learning strategies;
2. *teaching* factors attributed to the instructor/tutor, such as class organisa-tion, teaching strategies, class goals, and rapport;
3. *peer* factors attributed to other students such as how they encourage each other, share ideas, and cooperate in tasks; and,
4. *physical* factors attributed to the task, setting, and environment.

A screen capture of the database is shown in Figure 26.4.

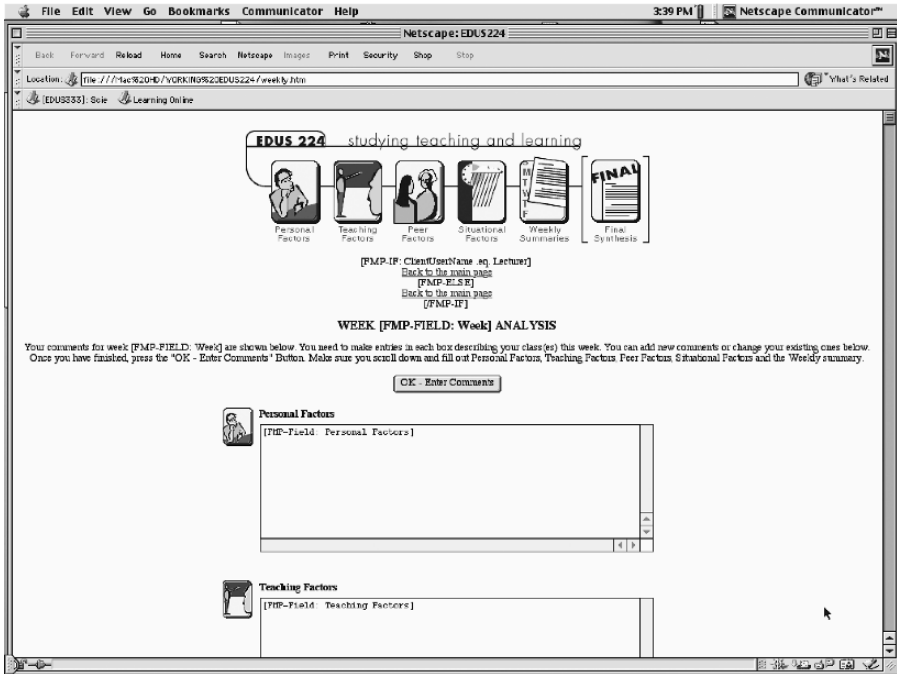
After each class, the students identified factors that enhanced or inhibited their learning according to these four categories and documented these processes or strategies in the dialogue boxes on the WWW site. The students continued to document their experiences on the web site on a weekly basis


Figure 26.4.   Screen shot of the website template for recording student feedback.

for eight weeks. As each of the preservice students is analyzing and documenting teaching strategies each week, the teacher educator can scan the comments by different students as data for self-study. This provides insights into what strategies are "working" and "not working" for different students. For example, Table 26.1 shows data on my teaching by two students for the same class in week 2 of the subject. Positive comments have a "+" sign and negative comments have a "−" sign.

Insights and changes to my teaching. The data from the WWW showed that the two students had some different views on the class experiences. Whereas student A thought that the content and sequence of the lesson was fine, student B did not, stating that "not all of us are at the same knowledge level." This creates a dilemma in my teaching in terms of how I cope with students who are at different levels of understanding about the topic. Also student A suggests that I did not allow this person to ask follow-up questions implying that I did not make them feel valued in the class. This was a surprise to me as I thought that I made many attempts to make students feel valued. From monitoring the students' comments on my teaching (Table 26.1 only shows a small sample of the data), I have introduced the following changes to my instruction:

- try to interact with each student to monitor "where they are at" in terms of their learning, as they may have different levels of background knowledge;

Table 26.1. Comparison of Two Students' Comments on my Teaching from Week 2

Student A's comments on my teaching in week 2	Student B's comments on my teaching in week 2
+ The way that the content and sequence of the 3 hour tutorial is structured is great. We (the learners) know that we will have approximately an hour of lecture, questioning and discussion of last weeks' and this weeks' work.	− there were stages in which Garry perhaps forgot that not all of us are at the same knowledge level (year) when talking of planning units of work. I could understand what was being discussed, but I felt that I had nothing to contribute as I do not have the background knowledge of the 3rd years because they have planned units of work, whereas so far in 2nd year, we've only really just come to terms with lesson plans.
+ The reflection time allows every learner in the class to give feedback to the teacher, so that he may follow up any problems.	
− I think that even if a member of the class has already contributed some information to the discussion, this should not disallow them from speaking up a second time. Every student in the classroom is valuable and all their relevant ideas and comments should be acknowledged – this is how we learn. The first thing that a teacher needs to do, even in university classes, is to make us feel valued. This directly influences our attitude to and enjoyment of the class.	+ A good point that I got out of this was that a Unit of work focuses on an "objective" and lessons focus on "outcomes". That's always something that has messed me up in Curriculum and Pedagogy.
	+ The fact that the lessons were based on something that could be pre-read in the Curriculum Resource Centre, was good, because I didn't feel like Blind Freddy going into class without a clue.
	+ I love the use of diagrams as I learn things better through visuals, pictures, graphs, maps etc. The mind-map type thing that Garry constructed on the board to explain the simple structure of this journal was good.

- try different strategies to ascertain students' prior knowledge at the beginning of lessons;
- begin a lecture or tutorial with an advanced organizer in the form of points to be covered or a concept map;
- take time to know each student personally and find out their interests, as this shows that I value their input;
- tell anecdotes to illustrate points about teaching and try to relate to students' experiences;
- encourage students to try out their ideas and learn from mistakes;

- tap into students' ideas by listening to their feedback and be prepared to modify my teaching;
- model different ways of teaching and justify why I teach the way I do; and,
- conclude each class with a revision of "what did I learn."

> One of the benefits of using the database on the web is that it is has given me a deeper understanding of the complexity of teaching. Using the WWW was a good way for students to *share* their views of classroom learning on a weekly basis and much more beneficial than end of session evaluations – I could change my teaching along the way! I also now believe that I will never "master" teaching but I can try harder to understand the dilemmas and dynamics of classroom interactions.

Throughout this second section of the chapter, I have tried to highlight the many benefits of technology for assisting self-study and in particular, when using ICTs. But if technology is only viewed through a positive lens, there is a danger of misunderstanding the possible negative influences that technology can have on our research processes. As pointed out at the beginning of this chapter, technology is not a one-way process that produces only beneficial results. Instead, the influence of technology is reciprocal; it can have a social and cultural influence on our values and methods for research. In the next section of this chapter I examine some of these possible limitations of using technology in self-study research.

Limitations of Using Technology for Self-study Research

> Both the mooring of one's place and the identity of one's friends get confounded when frequent email makes a distant and unknown person seem closer and more responsive than your friend next door, or when a colleague on the same floor remains cool and distant until he or she begins to open up and confide in you through email. (Borgmann, 1999, p. 5)

Recent literature on learning theory that has evolved from a socio-cultural perspective emphasizes the influence of the context or the situation on learners (Lave, 1988; Lave & Wenger, 1991; Wertsch, 1991). Included within this notion of context is the use of tools that have a reciprocal influence on the people who use them, "the culture and the use of a tool act together to determine the way practitioners see the world; and the way the world appears to them determines the culture's understanding of the world and of the tools" (Brown, Collins, & Duguid, 1989, p. 33). This reciprocal interaction between users, tools, and culture is accentuated in times of rapid technological change similar to what the world has been experiencing over the last 30 years. The outcome is that such rapid change can result in a transformation of our ontological perception of the way the world works: "I suggest that the way in which the world appears to us in these activities, or, informally, how we experience the world through them, influences the way in which the world in general appears to us" (Araya, 1997,

p. 6). Many of these social and cultural interactions are beneficial for researchers such that new technologies or needs of students may cause the creation of new pedagogies. Conversely, other interactions present some limitations for conducting self-study research.

Blurring Our Sense of Reality and Identity

Borgmann (1999) contends that one of the effects of technology is that it can blur our perception of reality and sense of identity. He claims that information technologies have provided us with access to so much information and there is such pressure on us to communicate with others with technology that we can lose contact with our core values or cultural foundations. These include our moral, ethical, and political beliefs about what is important in life. For example, he uses the term "virtual ambiguity" to describe the uncertain type of relationship that is established through information technologies without face-to-face interactions: "It characterizes to various degrees an acquaintance that is established entirely through cyberspace, be it in a MUD, a MOO, through email, a list, a bulletin board, whatever. ... Authors may have a distinctive voice, but finally to meet them in person is usually a surprising resolution of one's vague anticipations" (p. 354).

In agreement, Michelfelder (2000) contends that, "human interaction without significance leads to disengagement" (p. 221), suggesting that computer-mediated communication sometimes encourages individuals to take on a different persona, such that many electronic communications are like "staging performances." Not only is this a form of deception to others, but it can weaken an individual's inner character. As such, Michelfelder argues that the increasing use of electronic communication is undermining the core values of our culture – self-respect, dignity, community, and personal responsibility. In relation to teaching, Brabazon (2002) believes that the internet is saturating us with so much information, that we are in danger of losing our sense of what is real in our teaching:

> The Internet is framing our understanding of the real. The time has come to take that power back. A computer is not simply composed of hardware, software and data. It is not only a physical entity, but a running system – a social network – with permeable borders that spill into politics and ethics. (p. 192)

In short, developing an over reliance on using ICTs for documenting and sharing ideas about teaching can possibly make us focus too much on the tools and less on the reality of teaching. It is important, therefore, that researchers do not get so absorbed in their own "virtual world" that they lose sight of the important goal of understanding the complexity of teaching and communicating with real students and colleagues who work within that complexity.

Diluting the "Self" in Self-Study Research

Although technology can enhance the processes of self-study research, as shown in section one, we need to be cautious that it does not compromise the essence

of self-study. One of the key attributes of self-study highlighted in this chapter is individual reflection and so the question needs to be asked if using technology can depersonalize this attribute? There is a potential trap in using technology of making the research less personal and hence losing the sensitive emotional nature or "vulnerability" that is vital to the integrity of self-study. Using e-mail to investigate a personal aspect of teaching and sharing this with others cannot capture all the complexities of teaching for a holistic self-study project.

Accordingly, an individual who only uses e-mail to document personal interpretations of his/her own teaching neglects to consider the interpersonal relationships and body language that observers see in a face-to-face situation. Kellner (2000a) notes that relying solely on electronic communication to share insights is limited because it fails to represent many of the nuances of teaching that can only be captured in a face-to-face situation: "While using computer-mediated communication, there are undeniable losses due to the absence of concrete presence, voice, personal interaction, and other semiotic features of personal interaction" (p. 245). As such, sharing self-study insights electronically can lose some of the holistic, emotive meaning embodied in face-to-face interactions. In support, Brabazon (2002) talks about the importance of reclaiming a teacher's body from the clutches of technology:

> The body is the repository and vehicle for social justice and disciplinary action. Lives are written through facial lines, swollen hands, roughened feet and scarred knees. The future – an imagination of what could be-is written in our students' bodies. ... Education is a passionate formation, triggering deep, lasting change. ... If I have one criticism of our present school and university sector, it is that we do not feel enough, we do not allow the well of sorrow, the ache of grief and the dark disappointment to drip through our bodies. (pp. 109-126)

In short, sharing interpretations, especially via e-mail can only represent part of the experiences of teaching. Although, video captures more, it still lacks the "atmosphere" or emotion of sharing ideas with those involved in face-to-face interaction.

Monitoring the "Distance" in Self-Study Research

Because self-study research is often sensitive, consideration has to be given as to who it is shared with and how widely it is shared. For example, some inquiry may be very personal and the researcher may only wish to share it face-to-face with one or a few colleagues. On the other hand, some inquiry may not be so personal and the researcher may wish to use technology, such as e-mail or the World Wide Web, to share the insights more widely with colleagues at another university. Conversely, some people wish to remain anonymous and are more willing to be personal with people whom they do not know and so would prefer to use ICTs. Technology, therefore, has the potential to make the research more "public" than is necessary and this may devalue the sensitive nature of the

research. For this reason we need to be thoughtful in our use of technology and question why and how we use it.

As such, researchers need to be aware of the balance between "self" and "public" which means making judgments about the most appropriate "distance" between the person and the data. Tidwell (1998) struggles with a similar notion of distance when thinking about her teaching and her relationship with her students. In her view, paying attention to distance means monitoring how personal or "close" are the details of her private life that she shares with her students. Although, she claimed she knew a great deal about her students, her knowledge had more to do with their academic achievements than their "personal lives and personal needs." When she investigated how "personal" her students thought she was, to her surprise many of them felt that she was only interested in "teaching experiences" and not details about their personal lives. Although this surprised her, it presented a dilemma, as she preferred not to share her personal life experiences with her students. She concluded that there were two dimensions to the notion of "distance" – one related to the personal lives of students and how they can be incorporated into teaching and one related to decisions as to what should be made public as, "I believe each person needs to decide what, if any, aspects of his or her personal life should be shared and what aspects are more comfortably kept private" (Tidwell, 1998, p. 79). Attaining the right balance or distance in self-study means being "comfortably uncomfortable," so that researchers are taken beyond their zone of comfort, but at the same time can maintain a sense of identity or agency when sharing the data with others.

Equity and Technology in Self-Study

As the "digital divide" (Negroponte, 1998) increases across the world, the question needs to be asked as to whether the use of ICTs for self-study should only be open to the "haves" in the technologically oriented countries. Unfortunately, only 1% of the world's population has a computer and access to the internet in their homes. This growing chasm between the technology rich and technology poor is a consideration for proponents of self-study as it should not become an elitist form of research. Moreover, hardware, software and systems in different countries need to be compatible and this is a major issue even in technologically advanced countries.

Conclusion

> In modern life we swim deep in a sea of technology, surrounded by artefacts and patterns of our own making. These artefacts and patterns, like water, are often transparent to us. They are everywhere and nowhere to be seen as we find our way along chasing after whatever is new, stylizing and restylizing our lives. (Strong & Higgs, 2000, p. 19)

In this chapter I have presented an overview of the relationships between

technology (especially ICTs) and self-study research. However, technology is evolving so rapidly that it is impossible to cover all types and to explain all the influences on self-study research. Instead, I focused on the main examples used in ICT – e-mail, multimedia, and the WWW – and showed how these technologies enhanced the research processes that underpin personal reflection and the sharing of insights in self-study. In particular, the case studies in section two, demonstrated special activities that could not happen without the use of technology: in Anne's case the collaborative self-study occurred over 15 months with communication across three different countries; in Tom's case the multimedia format allowed him to process information in different ways; and, in Garry's case the WWW gave him access to a variety of students' perspectives on his practice which highlighted the complexity of teaching. Importantly, the particular technology highlighted in each case study supported the teacher educators in actually changing their practice.

But these benefits do not mean we should blindly assume that the use of technology is always positive. If technology is not considered to be a passive tool, but rather an active social and cultural practice, then we have to be wary about if, how, and when to use it. And with the exponential use of technology in our society today, it is not unrealistic to conclude that its influence on our culture and social practices is increasing. Indeed, we constantly need to remind ourselves of our core values so that we do not lose our sense of reality and identity (Borgmann, 1984, 1999). It could be argued that the growing presence and use of technology in our society will increasingly penetrate how we think about and conduct our teaching. A pessimist might well ask, "Where will it all end?"

We therefore need to constantly re-examine our values and purposes in self-study to maintain its integrity. We need to keep thinking of the moral and ethical basis of teaching (LaBoskey, 1997) and be aware of the complexities of what we do in the classroom (Hoban, 2002). Simultaneously, we need to examine the assumptions that underpin the design of technologies and investigate their particular biases. Perhaps we should be more proactive and contemplate the consequences of using new technologies in self-study before we use them and anticipate their benefits and limitations by considering key questions like these: Will it compromise the purpose of my research? What would happen if I did not have the technology? What are the negative aspects of using the technology? What will the technology do for the research? What will the technology not do for the research?

So should we avoid using technologies in self-study? I think not. There is so much technology around us that I believe that it is unrealistic to take a luddite stance and completely reject its use – how could we write this handbook without it? Conversely, I do not believe that we should take the opposite stance, called "techno-utopianism" (Murphy, 1998), which is a one-sided view that only sees the positive aspects of technology. Murphy (1998) opts for a middle stance, which he called "technorealism" in which "we seek to expand the fertile middle ground between techno-utopianism and neo-Luddism." In seeking this middle

ground, one always needs to be skeptical about technology, whilst at the same time looking for ways to improve the purposes of our research: "Our goal is neither to champion or dismiss technology, but rather to understand it and apply it in a manner more consistent with basic human values" (Murphy, 1998, p. 5). So keeping a healthy skepticism towards technology is wise, and at the same time being a regular user of technology is important so that we can analyze its benefits and limitations.

In section one of this chapter, I explained the relationship between ICTs and knowledge construction in self-study. It was evident that ICTs can assist research processes in many ways – supporting reflection by *representing*, *editing*, *accessing*, *retrieving*, and *analyzing* data as well as in *sharing* insights with others and *accessing* public theory that is central to the knowledge-building process. But technology can produce and disseminate so much data, that we need to consider whether it becomes simply information for the researcher or is personally understood and valued as knowledge. An inquiry into teaching practices primarily needs to be personal to be a self-study, and at a minimum, should lead to a changed or deeper understanding of why we teach the way we do. Researchers, therefore, need to keep reflecting on what type of data or feedback gives them the most personal meaning so that data becomes their "adequate evidence" (Scheffler, 1965) for claiming that their beliefs are knowledge. That is, the data must be valued and understood in a way that makes the researchers rethink their practice. For example, some researchers may consider the most "adequate evidence" for a self-study to be sharing data face-to-face with students in a class or with a teaching buddy in the next room. In other projects, sharing ideas about teaching electronically with colleagues at other universities or with anonymous readers over the internet may be more valued for the researcher and necessitate the use of ICTs. So the use of an ICT may vary from researcher to researcher or from study to study. Perhaps a mixed mode is the best so that face-to-face communication complements the use of ICTs.

Importantly, to change teaching a researcher needs to stay "vulnerable" so that the data being collected cause some confusion, dilemmas, or uncertainty to initiate and sustain reflection. Otherwise, there is a tendency to collect data about trivial aspects of teaching that simply confirm existing interpretations of practice. Importantly, data from personal reflection needs to be made public in some way, as we all interpret experiences from our own thinking; it must at least be shared with a colleague and in some cases with a wider group. Tidwell (1998) concluded that each researcher needs to determine the appropriate "distance" in terms of how personal a study is and with whom information is shared, which of course, is an individual decision. A possible concern, therefore, in using technology, is that the researcher may lose control over the appropriate distance and over who can access such personal data; thus one needs to constantly review this issue.

Inevitably, new technologies will evolve over the next few years. An issue that needs to be considered is whether research methodologies should shape the use of technology or should the technology shape the methodology used? In short,

which is the chicken and which is the egg? Salomon (2000) contends that not enough thought is given to how we use technology in teaching and so its introduction has not helped us to reconceptualize our practice. Rather, he argues that technology has been "domesticated to be totally subservient to the ongoing practices" (p. 6). Both Salomon (2000) and Means and Olson (1994) contend that a stronger educational rationale is needed to provide a vision for change in teaching rather than adapting new technologies to accommodate and reinforce existing practices.

My view about the use of technology in self-study is somewhat different from those expressed by Salomon and Means and Olson. Although I agree that it is important to consider the educational purposes of self-study, technologies are often so complex and evolving that people may not be aware of possibilities for their use. For example, as one becomes familiar with using a technology, such as a WebCT discussion space, then new ideas for its application often emerge. So we need to use technology to understand it and so be able to envision new ways to enhance our practices. Consequently, I believe that our conceptualization of how to do self-study research should be considered in conjunction with how to use technology as an iterative process with one informing the other. In short, technology should inform our self-study purposes and vice versa. For this reason we need to keep informed about current self-study methods as well as advances in technology. Thinking about these two aspects simultaneously should increase the possibilities for theorizing in self-study and sustain the interplay between personal reflection and public theory.

Clearly, there is a reciprocal influence. On the one hand, as new possibilities for teaching evolve, new possibilities for self-study are created. Online technologies such as e-mail and the internet have created opportunities for universities to run courses in other countries with all the teaching conducted fully online using e-mail, chat spaces, bulletin boards, and the electronic submission of assignments. Use of technologies in these fully online subjects has a social influence on the pedagogy used; for instance, teacher educators running such courses need to develop the art of knowing when and how to moderate online discussions. Indeed there are cultural nuances involved when teaching students online in another country that should be very carefully considered and monitored. How could a teacher avoid using technology for self-study when only teaching online?

On the other hand, as new technologies are developed, then new opportunities for teaching and self-study are developed. For example, the new broadband "internet2," which is currently being tested in the USA, can send more data 3500 times faster than current broadband connections. For example, two movie-length DVDs were recently sent across the Atlantic Ocean from the USA to Britain in less than a minute. Think of the possibilities! In the future, digital video cameras can be set up in classrooms in different countries so that a collaborative self-study can occur in real time using video rather than the text formats of e-mail or a chat line. As such, researchers in different countries will be able to see the emotion, body language, student-teacher interaction, and other factors that make

up the passion of teaching. As well, the feedback will be immediate and possibly whilst the teaching is occurring for an instantaneous response. No doubt, as technologies assist us to unpack the complexities of teaching, then other possibilities for self-study will emerge.

Finally, one of the central arguments of this chapter is that we need to aspire for quality in self-study, which means developing an appropriate balance between personal reflection and public sharing (Bullough & Pinnegar, 2001). To determine that balance, questions of how personal the data should be and with whom it should be shared, in what form and how quickly, must be addressed. Importantly, this determination should be an iterative process with a regular exchange between personal reflection and public sharing. No doubt ICTs can help the expediency of these processes, keeping our research "on the boil" rather than "on the backburner." Questions about whether technology can assist the reflection, public sharing, and interchange between the two needs to be asked for each self-study project. The answers to these questions will help us to examine whether it is useful or detrimental to use technology and how to maintain a level of scrutiny in our research since: "Uncritical acceptance of all forms of knowledge that is generated through practitioner research inquiry without any attention to research quality will serve only to undermine the acceptance of practitioner research as a legitimate form of knowledge generation" (Zeichner & Noffke, 2000 p. 315).

As self-study research strives for a greater presence in teacher education literature, the issue of quality must be foremost in the minds of researchers. Information and communication technologies can contribute to this quality by supporting the processes underpinning reflection, by sharing insights with the teacher education community, and by providing access to public theory for self-study researchers. But using technology may not be the best or only way. We constantly need to re-examine our purposes and methods in self-study research in light of the possible affordances of technology, whilst ensuring that we do not lose the "personal" in the process.

THE REFLECTIVE PORTFOLIO IN SELF-STUDY: INQUIRING INTO AND REPRESENTING A KNOWLEDGE OF PRACTICE*

Nona Lyons[a] and Helen Freidus[b]
[a] *University College Cork;* [b] *Bank Street College*

Abstract

This chapter introduces and explores how reflective portfolio inquiry as a process of interrogation of teaching and learning can advance self-study. After delineating this conceptualization, the chapter provides three case studies to demonstrate the process. Validity of the knowledge of practice uncovered through portfolio inquiry is discussed as determined by a method called validation. Although a portfolio process is widely used in teacher education, to date few systematic studies of it have been carried out. The authors argue for its utility, pointing to existing evidence such as the case studies. They contend that a reflective portfolio process can provide a highly accessible structure that scaffolds practitioner inquiries, makes public the knowledge of practice, and opens it to debate to advance a new scholarship of teacher education.

We are poised on the threshold of an outpouring of practitioner inquiry that will force important redefinitions of what "counts" as research. ... Academics tend to be comfortable with practitioner research as a form of local knowledge that leads to change within the practice setting itself, but are less comfortable when it is presented as public knowledge with epistemic claims beyond the practice setting. (Anderson & Herr, 1999, p. 13)

Self-study, one of the fastest growing areas of research in teacher education, has been heralded as holding the potential to foster practitioner inquiries into teaching that can advance teacher education and contribute to a new knowledge

---

*Chapter consultants: Amanda Berry, Monash University, Australia and Clive Beck, University of Ontario, Canada.

of practice (Bullough & Pinnegar, 2001; Cochran-Smith & Lytle, 1999; Zeichner, 1999). By privileging "teacher educators as researchers of their own practices" (Loughran, 2002, p. 240; see also Russell, 1995), self-study holds up to scrutiny teaching how to teach. As such, self-study implies critical questions: Who creates this new knowledge? By what methods? With what kind of validity? Self-study thus joins what Donald Schön (1995) calls an epistemological battle: For even though we are in the midst of a radical transformation and understanding of the relation between the researcher and the researched, self-study pits the inside practitioner/researcher against the traditional outside objective/observer of experimental science, challenging the standard of scientific rigor. While self-study represents a move away from a traditional view of science, some advocates admit, "an adequate grounding and authority for this work has yet to be found" (Bullough & Pinnegar, 2001, p. 15). At a time of intense national scrutiny of educational research (Grossman, 2002), how are these questions to be answered?

Addressing these concerns, this chapter introduces a method of inquiry that legitimates the practitioner as researcher yet provides a means of validating the knowledge uncovered through investigation. We speak of a reflective portfolio inquiry process. Portfolio inquiry is, we believe, particularly useful in that it provides a structured yet highly accessible process that simultaneously can be *both* a mode of inquiry and a means of documenting and representing knowledge. It can document investigations into practice, make public that knowledge, and open it to scrutiny so that a community of researchers and practitioners can engage in its use and/or in rigorous dialogue about its validity – three characteristics the American Association of Higher Education finds necessary for "an activity to be described as scholarship" (Hutchings, 1998). The portfolio inquiry process, then, provides one method – a structure for inquiry – in the service of self-study, validating its role in advancing a new scholarship of teacher education.

Although not all portfolios meet criteria as reflective inquiry, this chapter demonstrates how they can. It also reveals the complexity and subtlety of the portfolio process and some of its tensions, especially as it entwines issues of assessment and professional development and can incorporate a range of divergent purposes for interrogating one's teaching. While the portfolio has become commonplace in teacher education programs in the United States, as yet there are few systematic studies documenting their uses or long-term consequences (Lyons, 1998a; Zeichner & Wray, 2001). For this chapter we turn to the literature and our own teaching and research, some 15 years experience with portfolio inquiry, mentoring teacher candidates through portfolio development, interviewing people about the process and, most recently for one of us, introducing arts and sciences faculty to the process (Lyons, Hyland, & Ryan, 2002).

The chapter first places "Portfolio Inquiry in Historical Perspective" and outlines the critical structure of the process. It then explores "The Centrality of Reflection" within the process and identifies related "Theoretical Groundings." After describing "The Validation of Evidence of Portfolio Inquiry," it presents "A Sampler of Cases of Portfolio Inquiries in Support of Self-Study." The chapter concludes with a discussion of the "Implications of the Portfolio Process for

Advancing Self-Study and the Knowledge of Practice." Here we advocate a means of validating portfolio evidence through a process Elliot Mishler (1990) first introduced and calls validation as trustworthiness: That is, in brief, by the willingness of other researchers/ practitioners to try out a practice in their own settings. Throughout this discussion we consider how ideas and purposes of self-study overlap with portfolio inquiry *and* where they differ.

Portfolios in Historical Perspective

> A teaching portfolio is the structured documentary history of a (carefully selected) set of coached or mentored accomplishments substantiated by samples of student work and fully realized only through reflective writing, deliberation, and serious conversation. (Shulman, 1998, p. 3)

A brief review of the history of the portfolio in teaching and teacher education details how the portfolio first came into teaching and teacher education. It is important to note that the portfolio entered as a new mode for assessing teachers and documenting their practice and, simultaneously, as part of a larger search for alternative means of validating research on teaching. An examination of portfolio development since that beginning reveals a subtle shift in emphasis from the portfolio as document of assessment to the portfolio as a deliberate and intentional method for practitioner inquiries into a range of issues.

The Portfolio as a Theoretical Act

Why portfolios? Portfolios have a long and valued tradition with many professionals – with artists, writers, photographers, and architects, for example. These professionals use portfolios to keep copies or drafts of their work – their writings, models of projects, and sketches of their art – charting how over time it has changed. Some portfolios include only what is considered one's best work, others include a range of work. Although most portfolios typically are housed in a paper/notebook format, they are fast moving into electronic modes. But portfolio uses in teaching and teacher education are only a recent phenomenon.

Portfolios came into teacher education on the second wave of school reform in the late 1980s and early 1990s (Lyons, 1998b). Then, reformers finally acknowledged that there would never be any lasting reform of education unless competent and caring teachers were at its center. How would such teachers be identified? Certified? If competent teaching is a complex, uncertain, and often messy activity, it could not easily be documented or assessed. Traditional ways of credentialing teachers – by grades, courses completed, or a national teachers' exam – seemed inadequate to capture teaching's dynamics or dimensions. Portfolios emerged as one possible medium (Bird, 1990). Life in classrooms, teachers at work could be caught through a portfolio with its entries and evidence of work over time. A portfolio could document how a teacher and his or her students were progressing, recording lessons taught, assessments made. It could carry a syllabus,

a course plan, videos of classes, and ample samples of student work, revealing levels of student understanding – some even including student portfolio entries. Lee Shulman, who introduced the portfolio idea into teacher assessment, argued that portfolio making was far from a casual activity. It is, he claimed, a theoretical act:

> By this I mean that every time you design, organize or create in your teacher education program a template, a framework, or a model for a teaching portfolio you are engaged in an act of theory. Your theory of teaching will determine a reasonable portfolio entry. What is worth documenting, worth reflecting on, what is deemed to be portfolio worthy is a theoretical act. (Shulman, 1998, p. 24)

Portfolio making for a teacher or a teacher education program is a theoretical act.

Elements of a Portfolio Structure – the Scaffold

Several elements of a portfolio inquiry process emerge in the act of creating this kind of documentary history of learning to teach, especially for purposes of assessment within a teacher education program. It is these elements that create the critical *structure* of the portfolio process:

- the collaborative process of mentoring portfolio development, an activity taking place over time through critical conversations with mentors and peers, usually over a semester or year or, in some cases more, of a teacher education program;
- some set of goals or standards held up to a portfolio maker describing what teachers entering today's complex classrooms should know and be able to demonstrate;
- the collection of a body of portfolio evidence – portfolio entries, what some call artifacts – of learning about teaching and student learning, such as videos of classes, student portfolios or other work, curriculum units, lessons that succeeded or failed, etc; or evidence exploring some puzzling aspect of teaching or of student learning (Dewey, 1933, 1998);
- a set of critical reflections or interrogations that accompany each entry articulating what was learned about teaching and learning; and, summarize a portfolio as a whole; and,
- a public presentation of the portfolio evidence and documentation narrated to a community of colleagues, cooperating teachers, and teacher educators.

Typically, a completed portfolio begins with an introduction, a statement of one's teaching philosophy, followed by the set of entries and evidence, each entry labeled with a title, accompanied by a rationale for its inclusion and a reflection. It concludes with a final reflection.

The Centrality of Reflection

Importantly, in this process each portfolio entry carries the crucial element: that is, a reflection. We define reflection as an intentional act of mind, engaging a

person alone or frequently in collaboration with others in interrogating one's teaching, especially a compelling or puzzling situation of teaching or learning to construct an understanding of some aspect of it (Lyons, 2002a, p. 99; see also Lyons, 1998a). Through reflection portfolio makers revisit their own teaching and learning, identify strengths or areas for refinement, critique what succeeded or failed and why, or pursue some aspect of student learning. In this reflective process, teachers uncover the knowledge of the meanings and interpretations they make of their own practices, their refinements of theories, their understandings of what students know and understand, and how they as teachers need to change or try-out new practices (Dewey, 1933, 1998; LaBoskey, 1994; Schön, 1983). This reflective interrogation, then, looks both ways: to past experience and forward to the future, especially to new ways of teaching. Most portfolio-makers claim reflection is the core of the process, essential to bringing new knowledge to consciousness, making it available to themselves and others (Lyons, 1998a, 2002a; Zeichner & Wray, 2001). Most self-study researchers similarly claim a connection to reflective inquiry, seeing reflection as the historical starting point of the movement as well as of individual self-studies (see Chapter 1 of this Handbook and Loughran, 2002). Through reflective interrogation the portfolio shares deeply in the purposes and processes of self-study.

The work of Shulman and the National Board for Professional Teaching Standards, in adopting the teaching portfolio as its primary means of assessing experienced teacher candidates for Board certification, proved pivotal to reflective portfolio development. That work garnered national recognition and support for portfolio assessment and for reflective portfolio-making as a critical experience in the education of teachers (Shulman, 1998; Valli, 1992; Zeichner, 1999).

But the emergence of the portfolio at that time was in part a response to increasingly urgent calls by other researchers to find alternative modes for validating research on teaching. Shulman, for instance, argued for attention to consequential validity, for asking the context-specific question: What difference does this practice make to students and teachers? To their learning? To teaching practice? (Shulman, 1994). Pamela Moss's (1994) answer to the question, "Can there be validity without reliability?" suggests that there can. She offers the idea of an interpretive approach to assessment and its validity along side of independent observers of traditional models in judging the evidence of teaching, even for high stakes. Portfolios, then, emerged in research as a needed alternative for documenting and validating research on teaching.

This portfolio history, with its roots in teacher assessment and development, differs from the historical development of self-study in teacher education. While portfolios began straddling sometimes nearly antithetical purposes – as an assessment for credentialing, as documentation of learning for professional development, even, as a showcase of accomplishments for purposes of employment, self-study emerged in teacher education because of a more focused purpose: the desire and need of teacher educators to experience for themselves how practices they were advocating as teachers of prospective teachers matched the reality of classrooms. Teacher educators returned to teach in elementary and secondary

classrooms to gain a new purchase on learning to teach (Russell, 1995; Russell & Korthagen, 1995). Their broad purposes were to test out and document what they encountered, studying their own practice and contributing to developing a needed body of knowledge: the goal was not the assessment of teachers but of teaching itself (Hamilton, 1998; Loughran & Russell, 2002). Yet both self-study and portfolio inquiry share a significant connection to reflection as a pivotal element of their processes.

Theoretical Groundings

Three other strands of research intersect here to provide additional grounding for a portfolio process. These strands are more directly shared with self-study. They include: recent research on situated cognition that identifies the significance of contexts and collaborative inquiry in learning; research on narrative as a mode of knowing, inherent in both a portfolio process and self-study because of their emphases on the stories and meanings of experience; and, the growing need for a new epistemology of practice, a view of knowledge that validates the claims of insider practitioners to engage in investigations into their own teaching practice. This view, pioneered by teacher researchers such as Cochran-Smith and Lytle (1999), Lampert (2000), and Duckworth (1987), was dramatized by Ernest Boyer's (1990) bold argument for new forms of scholarship for the academy, including a Scholarship of Teaching. Here we elaborate briefly on each of these strands.

Situated Cognition and Collaborative Inquiry

Contemporary research on learning throws light on portfolio processes. It articulates a view of knowledge as a social construction, situated in specific contexts (Brown *et al.*, 1993; Bruner, 1996; Lave & Wegner, 1991; Putnam & Borko, 2000; Rogoff, 1990). This perspective is significant as it takes into account both the importance of meaning and the knowledge of situations, contexts, and particulars – of this class of students, this school, this historical moment, etc., instead of general rules about teaching. It calls attention to the social nature of cognition, to how teachers themselves learn, and to ways of teaching that will foster both teacher and student learning. This perspective shifts attention from the individual learner to the interactions of the people in a common environment as major determinants of learning. These communities of discourse provide individuals with ideas, theories, and concepts that enable them to make sense of experience (Putnam & Borko, 2000). Portfolio construction and development is itself a collaborative activity, deliberative and intentional, that engages oneself and others – one's students or other colleagues – in interrogations into issues or puzzles of teaching and learning one seeks to understand at some new level (Lyons, 2001). So too does self-study.

Narrative in the Portfolio Process

It is a commonplace that teacher discourse about classroom experience or knowledge often takes the story form of narrative. This is not surprising. As psychologist Jerome Bruner (1986) suggests, narrative is a mode of knowing that deals not so much with how to know the truth but rather with the question of the meaning of experience. Narrative as a way of knowing seeks explications that are context sensitive and particular. Because narrative operates on two planes, one of action and one of consciousness, it is uniquely able to capture all the vicissitudes of human intention and action, characteristic of the uncertainty of teachers' work and classroom practice, often messy and unpredictable. Portfolio and self-study processes deal in meaning, interpretation, and under-standings. As such, the inherent role of narrative in both is identified.

The Need for a New Epistemology of Practice

Recent history of the portfolio in teaching and teacher education highlights an important development: the subtle shift from the portfolio as a mode of represen-tation and documentation for the assessment of teaching to the portfolio as a more deliberate method for reflective inquiry into teaching. This development underscores, too, a dramatic and fundamental shift to a view of teaching as a kind of scholarly activity. Ernest Boyer's (1990) book, *Scholarship Reconsidered*, helped to precipitate this development. There Boyer made a daring suggestion, calling for new forms of scholarship for the academy that would go beyond traditional research, what he termed the scholarship of discovery. Boyer outlined three new forms: a scholarship of integration of knowledge across disciplines, a scholarship of application to real-world problems, and, a scholarship of teaching that would not only transmit knowledge but transform and extend it.

As Donald Schön (1995) rightly saw, practitioners themselves could best carry out these investigations into teaching. But Schön saw, too, that such a view would trigger a long-standing argument, that is, how practitioners could claim the legitimacy of their own authority to interrogate and name the knowledge of practice. Although teacher research of the last 15 years privileged the teacher as investigator (Cochran-Smyth & Lytle, 1999; Lampert, 2000; Lytle & Cochran-Smith, 1992), such claims raise what Schön terms an "epistemological" battle, even if "a battle of snails." Alternatively, others term it the "slow revolution" (Grant & Murray, 1999): they anticipate the eventual legitimation of the right of teachers to carry out investigations into their own practice – however long it takes. These political and epistemological considerations provide a context for understanding the slow evolution of practitioner research and why issues of validity of portfolio and self-study processes continue to be raised and need to be addressed within today's politicized climate of educational research.

The Validation of the Evidence of Portfolio Inquiry

Acceptance or rejection of a practice or theory comes about because a community is persuaded. Even research specialists do not judge a conclusion

as it stands alone; they judge its compatibility with a network of prevailing beliefs. (Cronbach, 1988, p. 6)

When Boyer in his role as President of the Carnegie Foundation challenged the academy to advance a new scholarship of teaching, he effectively carried the argument of earlier proponents of practitioner research into the heart of academia and a new audience: American higher education. Researchers took up the questions: What is a scholarship of teaching? How can it best be carried out? Represented and documented? Validated? Two portfolio models resulted from this work: the teaching portfolio – already making its way into teaching and teacher education – and a course portfolio. In these developments one can trace the growing emphasis on teaching as scholarly inquiry, as well as the strengthening of the idea of the portfolio as a mode of reflective interrogation. Now portfolios were not used primarily for the assessment of teachers, but rather for the interrogation of teaching itself (Huber & Morreale, 2002; Hutchings, 1998).

A Template for Inquiry: The Design, Enactment, and Results of Teaching

In brief, the *teaching portfolio* – the portfolio model first developed for the documentation and assessment of teachers, primarily surveys various tasks of a teacher's work: of several courses being taught; methods of assessment of students; student work; etc. In contrast, *the course portfolio*, developed by the American Association for Higher Education and the Carnegie Foundation for the Advancement of Teaching, focuses solely on a single course of a practitioner. The course itself is conceived of as an investigation (Hutchings, 1998; see also Huber, 1998). Three critical conceptualizations suggest the evidence for a course portfolio: *its design*, that is, how the course is conceived by the teacher as demonstrated by its syllabus, its tasks for students, etc.; *its enactment*, that is, all the ways students interact with it, through assignments, performances, assessments, etc.; and, *its results*, that is, evidence of what it is that students have actually learned from the course. It seeks to answer: How does a teacher know what students of this course have learned and now know? By what evidence?

This template for investigation – course design, enactment, and results – also provides a map of a possible way of inquiring into teaching. It is clearly applicable as an organizing set of ideas to all kinds of portfolio models. But it is the structure of the portfolio process – the collaborative effort, the gathering of evidence, the critical reflecting, the final presentation – that provides the scaffold for carrying out the process. These conceptualizations structure the portfolio process and make it useful to practitioner inquiries for self-study. If self-study fundamentally implies an interrogation of one's practice in the service of meaning and new understandings about teaching and learning (Loughran & Russell, 2002), then the reflective portfolio can provide one method to scaffold and support that work.

Validity through Validation

We consider that validating the evidence of portfolio inquiries may best be thought of as occurring through a process of validation, a method first put

forward by Elliot Mishler (1990) for inquiry-based research. Mishler argues that certain research practices that serve as potential models of how a practice works are and can be validated, but not by traditional experimental methods. For, rather than relying on an investigator's strict use of standard procedures, these researchers rely on their own understanding of the actual situation of practice in a field of inquiry. Exemplars – models of how a practice works – are tested, not through hypothesis testing but through a process Mishler calls validation: "The essential criterion for such judgments is the degree to which we can rely on the concepts, methods, and inferences of a study, or tradition of inquiry, as the basis of our own theorizing and empirical research" (p. 419). If our assessment of a research or teaching practice is positive enough so that we act on it, trying it out in our own setting, we grant the finding a sufficient degree of validity to invest our own time and energy and put our reputations at risk. Mishler in effect redefines validity as validation. "Validity claims are tested through our on-going discourse about these practices and in this sense, scientific knowledge is socially constructed" (p. 415). We argue that this process is at work with exemplars of practice revealed through portfolio inquiry, one equally applicable to self-study.

In that spirit, we present a set of three case studies that explore the portfolio inquiry process as self-study investigations. We offer these as potential exemplars for debate and discussion that others may decide to try out, or validate.

A Sampler of Cases of Portfolio Inquiries in Support of Self-Study

A central feature of this chapter is a set of descriptions of portfolio inquiries. Three cases are presented here. While of necessity these cases do not include all of the entries, evidence, and reflections of a complete portfolio, they do provide enough data so that a reader can begin to see how the portfolio process works. We do not look to make distinctions here of portfolio types. Rather, we wish to emphasize the kinds and purposes of interrogations undertaken by a range of practitioners engaged in a portfolio process and how the process structures self-study, when explicitly named as self-study or when not; and, even as in Case #2, when the portfolio process itself is a first-time experience. The cases include:

- "Case #1: Using Narrative Teaching Portfolios for Self-Study." In this example, two teacher educators describe their intentional use of portfolios for self-study for themselves and their student teachers. After introducing teaching portfolios as a means to scaffold self-study, they then assigned students a narrative portfolio as their cumulative assignment as they "concurrently … worked on our own self-study." The teachers describe their use of narrative in this process, outcomes achieved, and their sense of the power and vulnerabilities of the process as they "pushed our self-study work and engaged more educators, our students, in this valued process."
- "Case #2: The Portfolio Process as Self-Study – an Embedded Perspective." This second case, "A Post-Tenure Review: A Collaborative Venture," describes the efforts of a tenured professor to use a portfolio process for a

post-tenure review of his teaching and professional development. In this example, the portfolio process is not identified as "self-study." Rather, the case demonstrates how self-study can be embedded in a portfolio process, even when that process is also new.

- "Case #3: The Bank Street Model: Portfolio as Nested Self-study." This case shifts attention specifically to the relationships and the interactions between teacher educators and students who create reflective portfolios. In particular, this case reveals mutual learning that emerges through the portfolio process.

These three cases invite consideration of the purposes of a portfolio process, of how subtle differences in intentions or purposes can alter and shape the experience. Case #2 is provocative in this regard. What, we ask, was the author's purpose? Was it achieved? Case #1 reveals how narrative interacted in self-study because of the explicit, intentional uses of narrative by the authors. Case #3 reveals the interactive nature of the self-study/portfolio process between participants when reflection and self-study are intentional and how it is not simply a linear process but rather is better thought of as recursive. Case #2 is a cautionary tale; it also reveals how rare a process reflection is in academia. The author, appreciative of the chance to ask the "So what?" question about his own practice, is aware how infrequently it is formally introduced into academic life. The cases invite also consideration of the following larger questions and implications of using a portfolio process in the service of self study:

- How does a portfolio process serve as a scaffold for self-study?
- What is necessary for the process? What is validated through it?
- What may stand in its way?

Case Study #1: Using Narrative Teaching Portfolios for Self Study

This case is excerpted from a larger work of the same title written by Vicky Anderson-Patton and Elisabeth Bass for Narrative Inquiry in Practice: Advancing the Knowledge of Teaching (Lyons & LaBoskey, 2002). The authors provide a context describing how they came to engage their students in using a portfolio for self-study as they carried-out self-studies of their own.

We want to be good teachers and we want our students to be good teachers. Previous experiences convinced us that merely reading research on teaching is not effective in transforming practice. We started doing self-studies in 1997 and discovered how powerful this methodology is. We developed narrative teaching portfolios to further our ongoing self-study and used this narrative process to guide our students' self-studies.

In the fall of 1999, Lis conducted a practicum for new writing teachers and Vicky was teaching creativity in elementary school; both are marginalized courses. Our outsider status enabled us to experiment more freely, so we engaged our students in self-studies. Self-study is a methodology for examining one's own teaching, carried out collaboratively, with the goal of transforming one's practice.

Studying one's own practice may seem, at first, methodologically unsound. Yet for teachers who have experienced force-fed best practices, working with what is real is a great palliative. However, self-studies can become cumbersome; when anything related to our classrooms becomes data, most of us are overwhelmed. To manage this we used narrative teaching portfolios to scaffold a focused self-study.

We introduced our students to self-study (Hamilton, 1998; Loughran & Northfield, 1998) and teaching portfolios (Lyons, 1998a) then to research where portfolios were used to scaffold self-studies (Cuban, 1998; Gipe, cited in Hamilton, 1998). We assigned students a narrative teaching portfolio as their cumulative assignment. Concurrently, we worked on our own self-study narratives. This project pushed our self-study work and engaged more educators, our students, in this valuable process.

In self-study and teaching portfolios, narrative is both research process and product. We reflect on what we do, tell our stories, and then create portfolios to share our stories with others. Narrative methods allow us to explore the complexities of teaching, incorporate self and context, and more fully understand the lives of others. Narrative enables imaginative identification (Achebe, 1990) and personal voice, two ingredients we believe are necessary for transformative learning. In the context of the stories we tell, we can see the small moves of transformed practice that might otherwise disappear. The narratives make these changes real and allow more complex reflection because they help us get outside ourselves and connect with others.

The portfolio assignment was a seemingly open-ended process, yet we carefully guided its structure. First, we asked students to write a personal narrative (their creative self for Vicky and a literacy biography for Lis). We structured reflection on their teaching values and practice through journal starters and group activities. Students discussed their teaching artefacts – such as their students' work, lesson plans, and student interviews – and captioned them. Students also experienced other classrooms. We provided a guiding question and asked students to develop sub-questions to focus their portfolios (Grant & Huebner, 1998). Finally, we invited students to experiment with alternative representations in their portfolios and presentations. To reinforce the reflective nature of the portfolio process, we required an introduction and a concluding reflection. For our self-studies, we conducted follow-up interviews with these students three months after the semester (Lyons, 1998a).

Our Narrative Teaching Portfolios

Over the past two years, our teaching portfolios have grown to include five parts:

Part I: A reflective paper presented at a conference and published as part of the proceedings.

Part II: A dialogue representing the process students went through while creating their portfolios.

Part III: Student artifacts – selections from their teaching portfolios and our

version of their stories.

Part IV: Alternative representations of our process.
Part V: Feedback from presenting at the conference.

We include segments from each part below to provide a sense of our overall portfolio process and product. [NOTE: Here only a sample of each section is included].

Part 1: Reflections

The following segments are from a group of 14 reflections. ... These reflections articulate our teaching values and allow us to explore how we enact them.

Vicky asked, How do I structure freedom in the classroom to foster creative expression and development?

> REFLECTION 1: Owning creativity. I tried to give students space to talk about their creativity and engage in the process. The final portfolios evidenced students experiencing themselves as creative. Further, the students value their creativity and saw the importance of role modeling it.

Lis reflected on the role of personal involvement and self-study:

> REFLECTION 6: I am intellectually committed to doing personally meaningful work. I don't buy the mind-body split. I can't teach writing without making room for voice. I can't help teachers become teachers without helping them to connect deeply with themselves. It's harder this way. I become more vulnerable when I am not the expert glibly providing pre-digested theoretical texts. Self-study forces me to do personal work and allows students to do the personal work that they are ready for.

Part II: Dialogue.

This narrative dialogue tells the students' story of developing their portfolios. We created it from our teaching journals, their comments, and pieces of their writing.

THEME 1: PROCESS ANXIETY
A: What does she want?
B: What's a teaching portfolio?
A: She said we could do anything we want.
B: But we need artifacts, and it has to be about our teaching.
A: What's an artifact? This is too loose for me. I need more structure. Tell me how many words, and I'll do a research paper. I'm good at that.
B: I just want to learn some new tricks to be more creative in my classroom.
A: Self-study – what's that?
B: She's not clear. She said it is a process and will emerge.
A: I guess it has to be about self. That's so different than research.
B: I just don't get it.

THEME 2: COLLABORATION

A: Where are you teaching?

B: I'm teaching in West Chester. I have 22 kindergarten kids.

A: I teach adults.

B: That's interesting work, but kids are so cute. Today they made picture books with new endings to their favorite stories.

A: I'd love to see them. Could you bring them as an artifact?

THEME 3: CREATIVITY AND ALTERNATIVE REPRESENTATION

A: I'm teaching college writing and it's not creative.

B: Well, I'm not really creative, either.

A: I like creative writing.

B: Maybe you could do that for your portfolio. What can I do?

A: Didn't you tell me you redid all the bulletin boards in your classroom because they were so boring? That's creative.

B: What am I supposed to do, bring in 6-foot bulletin boards?

A: Why not take photographs?

THEME 5: REFLECTION

A: How much have you done on your portfolio?

B: I was really worried that I wouldn't have enough artifacts, but now I have so much stuff, I don't know where to begin.

A: What was your portfolio focus?

B: How can I teach for creativity when I don't feel creative.

A: But when you look at all the stuff you do, you are creative.

B: It's funny, but when I started captioning the artifacts, I realized I was being creative.

A: Because I decided to write a short story for my portfolio, I have to create student characters. I decided to interview students. I'm learning more about teaching from talking to them than I thought I would.

Part III: Student artifacts

We include a few brief excerpts from some student-teaching portfolios. These portfolios intrigued us because (1) they showed the insight and transformation of the student's ideas, (2) they resonated with our teaching (both struggles and values), and (3) they included something creative that moved us. We conclude each excerpt with a reflection.

[NOTE: Only one example is included for each author.]

Vicky's Student Artifacts

Jackie's Portfolio. Jackie created an imaginative storybook filled with her art, photographs, and writing. She concluded:

I learned so much about my creativity. I will teach for creativity by encouraging imagination, non-conventional thinking and constant exploration of the world. I will practice my creativity by being awake to the world around me, thus finding inspiration everywhere. It's too easy in life and in teaching to just keep our feet on the ground and steadily move forward, the way we always have. It's much more rewarding to fly; to shoot for the stars, to spread our wings, and see what is possible to create by leaping into the unknown, by attempting what we aren't yet sure we can achieve.

VICKY'S REFLECTION

I found the rich artistry, insight, diversity of ideas, and media experimentation in Jackie's portfolio compelling. These elements are central in teaching for creativity. Teachers must encourage students to fly, take risks, and be flexible.

Lis's Student Artifacts

Pam's Portfolio. In Pam's poem about her fear of teaching, she noted that her success as a teacher "depended on courage and the ability to make conscious contact with that fear." Her process became "one of remembering to incorporate into my teaching the practices that I have found helpful in my life: taking risks to push past my comfort zone, reflecting on my life experiences, and asking for help."

LIS'S REFLECTION

Unlike a victory narrative, Pam's poem maintains the tensions that she feels. She sees herself as living the contradictions, involved in the dynamic process of learning to teach.

Part IV: Alternative representations of the process

To facilitate transformative learning, we felt if necessary to integrate the arts with research. ... Also, a guiding principle of self-study – walking the talk – required us to incorporate alternative representations into our portfolios because we asked the students to do so. Our first discovery was that the process is more important than the product. We struggled with how to articulate our learning in artistic forms and how to work with our vulnerability. ... Do alternative representations stand by themselves as art? We don't believe so. But the process: trying something different, being vulnerable, exposing oneself, articulating one's teaching, and interacting with a wider world were engaging and valuable experiences. ... We presented our narrative teaching portfolios at the Self-Study Conference (July, 2000) at Herstmonceux ... [a] process akin to our students final portfolio presentations.

Conclusions

We continue to use narrative teaching portfolios because they did scaffold self-study. The process of responding to them, however, was time consuming and stressful. Because the self-studies required individuals to examine their teacher-selves, many issues emerged. We spent hours crafting responses that were attentive to the work, respectful in relational terms, and real to us. Each student received a lengthy feedback letter. ... Another dilemma we wrestled with was how to respond to the diversity in vulnerability and insight revealed in the portfolios. We had to be aware of each student's level of proximal development and psychological comfort. ... Bringing the self-study process into the classroom means modeling it. We discovered that we needed to provide space and time, support the development of personal voice and group collaboration, give up traditional authority, and openly share our vulnerabilities balanced with our confidence in the process. ... Developing a narrative teaching portfolio with the goal of engaging in self-study brings the self into the process at the deepest level through sharing stories. But it is vital to balance the danger of narcissism with the potential learning. ... The great benefit of self-study narrative teaching portfolios ... lies in the potential for teacher transformation through creative expression.

Afterword (Lyons and Freidus)

This case most clearly and succinctly reveals teacher educators crafting a self-study portfolio process. By uncovering the actual process they modeled for their students as they created their own self-study portfolios, these authors bring a reader through the experience. Having witnessed their portfolio presentation at the Herstmonceaux conference, we attest to the power of their work, their creativity in engaging others, helping them think through some of the dilemmas and ethical issues likely to arise in this work, and making present the evidence of their own and their students' work.

Case #2: The Portfolio Process as Self Study: An Embedded Perspective – Post-tenure Review Portfolio

In this case, Larry Cuban's "Post-Tenure Review Portfolio: A Collaborative Venture," Cuban engages in a portfolio development process as a form of self-study, although it is not named as such. Indeed, Cuban came to a portfolio process for the first time because he desired a self-study of his own teaching and learning, especially a chance to have colleagues at Stanford University review and comment on his work. Although the case is quite different in purpose from that of Case #1, both indicate how a portfolio process may embed self-study. This case is a cautionary tale: a quite adventuresome undertaking – creating an unrequired post-tenure review – seemed to have little impact on the author's institution. The case raises sobering questions about the sustainability of self-study/portfolio inquiry. (for the full case see Lyons, 1998a)

All I ever wanted from my colleagues was a tough and fair post-tenure review.

I got that *and* a portfolio, something I had barely heard of previously. Therein lies a story.

Between November 1990 and May 1991 a committee of three colleagues appointed by Dean Mike Smith met with me five times, read at least 35 pages of memos and an additional 100 pages of articles and book excerpts that I had prepared and gathered, watched a videotape of one class that I had taught, and discussed at length with me particular facets of my teaching and research agendas. In January 1992, both the committee and I reported to our faculty what we had done and there was an hour-long discussion of my post-tenure review.

Rationale

No such process is authorized in Stanford University's Faculty Handbook, the document that includes the policies guiding faculty rights and responsibilities. So why did I want such a review, what did I want to be reviewed, how was it done, and of what worth was it to me? I will answer these questions in turn but I want to make clear that what I produced had been called a "portfolio" but it was not my intention to create one. Having done so, I am glad that I did and will know better what to put into one next time. I say this because the portfolio is not central to my experiences; what it did was permit me to examine in depth, with colleagues I trusted, selected activities that I had been doing as a professor.

Why Did I Want a Post-Tenured Review?

I had already been a teacher and administrator in urban public schools for a quarter-century before coming to Stanford in 1981 as an associate professor. In 1986, after failed attempts to return to being a superintendent, I decided to seek tenure and a promotion. In the process of the tenure review, I requested from the dean a review in 5 years. He spoke with the provost and found out that no condition – such as a future review – could be attached to acquiring tenure and if I wanted to have such a review, I would need to negotiate that with whomever was dean then. So it was that in 1990 I approached Dean Mike Smith and requested such a review. My reasons were familiar ones. Most of my career had been spent moving from post to post. So new challenges kept me dancing intellectually as fast as I could. Being a professor for almost a decade was the longest time in my adult life that I had spent in one position. Moreover, I had discovered that faculty colleagues of national and international repute were anxious to protect a precious autonomy that they had cultivated for themselves. In other words, being a member of such a distinguished group did not automatically or easily translate into sterling exchanges of ideas over lunch, coffee, or at the mailboxes in the main office. Isolation was the norm. I needed re-potting.

But why approach the dean? I could have just as well asked a few trusted friends on the faculty to help me. My reasons for making it an official request are laid out in a memo. …:

> I have come to believe the rhetoric that we are a community of scholars in a professional school. I owe my community the full and best performance

I am capable of in discharging the roles of teaching, research, and service that are expected of me. … When I do well in these areas it reflects well on me and the institution that I serve. The flip side of my institutional obligation … is the responsibility of my colleagues to help me improve in the performance of my central roles, especially when I seek their assistance. … I want, simply put, a collegial dialogue about my work. To be tenured, in my judgment, does not relieve the institution of its obligation to me. Or I easily could have added, my responsibility to myself to examine what I do.

Dean Smith appointed Mike Atkins, John Baugh, and Lee Shulman.

What About my Work Did I Want to Have Reviewed?

Two areas in particular interested me: my teaching and my current and future research agenda. … For my teaching, I figured that the committee would examine my syllabi since they are maps that would give the committee members ways of inquiring into both my pedagogy and how I organized content conceptually. I expected the committee to examine evaluations of my teaching, and especially, consider the pedagogical dilemmas that I have wrestled with continually over the years both in high school and graduate teaching.

For my research agenda, I wanted the committee to appraise my past publications, less for their content and more for their direction, and reflect on my proposed project of examining how professors have taught, which had grown out of earlier research on a history of how teachers taught. I also wanted their thoughts on the dilemmas that I faced as a researcher committed to impartial scholarship while actively trying to improve teaching and administrative practice.

How Was the Review Conducted?

The dean assigned one of his staff to collect my materials (evaluations of previous classes; articles and books that I had written in the previous 5 years), distribute them to committee members, and set dates for the meetings.

The staff person that the dean assigned kept notes and from those summaries, the flow of the hour-and-half meetings became clear. They were highly interactive and we worked as equals; there was no sense that heavy consequences loomed for me or for the committee in completing their deliberations. This was not a tenure or promotion committee meeting, by any means. On the contrary, I sensed a strong feeling that these discussions about my work were sincere probes into not only my teaching and research but opportunities for each member to consider for himself the points we lobbed back and forth about the details of my teaching and research. It was a chance to talk about things that we had never spoken about except, on occasion, to trusted friends. These discussions became, I believe, proxies for other members' self-examination as well as mine; at least two of them expressed this to me privately.

At the meetings themselves, I usually set the agenda; members also raised items as we met. … At another meeting on January 31, 1991, we discussed what

I had already submitted and members asked for the following additional information from me: examples of student work, both exemplary and problematic; comments on my present and future use of case study methods; comments on the first time that I taught a social studies methods course and future plans with it; on how it helps or impedes in the areas of research and teaching; comments on institutional obligations to the professor; on this institution and my relationship with it; on how it helps or impedes my research and teaching. ... This discussion of agenda points and negations of another set of tasks became customary for subsequent meetings. These memos and other written tasks became the de facto portfolio.

The portfolio included memos on how I analyzed my teaching and research agendas; a videotape of an hour-and-a-half class with a nine page, single-spaced typed analysis of my teaching and student responses; an exploration of a new course I had created; a memo on the mutual obligations of a professor to a school of education and the faculty to each other; and a final memo on the process of review itself and its overall worth to me.

The Contents of the Portfolio: Teaching and Research

To give readers a flavor of items in the portfolio, let me offer excerpts. I begin with the course "History of School Reform" co-taught with David Tyack. This portfolio item contained the syllabus; a videotape of one class that I taught; a close analysis of the videotape, which I wrote with materials from the class itself (questions I handed out to students, a tally of students participating, etc.); and the readings that the class discussed.

[NOTE: This section of the portfolio contents can be read in full in *With Portfolio in Hand*, Lyons, 1998a. The headings for this section are: Teaching the "History of School Reform" Class; Objectives After Viewing the Videotape; and My Research Agenda.]

Of What Worth Was This Post-Tenure Review to Me?

I had promised the committee that I would prepare a memo for them to use in assessing what our deliberations and my work had meant to me. Let me quote. ...

> The most beneficial part of all the memos I produced ... has been how it forced me to rethink old ideas and open up new areas that I had not considered. ... If there is one over-riding benefit to such a review it is the requirement placed upon the person seeking the review to lay out for others the issues that puzzle the person, the conflicting values, unclarified questions, and the like.

> Another important benefit that I came to see was the opportunity to have colleagues take a step back to examine seriously a body of work that I had accumulated over time, from where it came and where it might be leading, and to ask the seldom explored "so what" question. The only time that had

occurred was when I sought tenure in 1986 and a committee of peers examined my work and got opinions from outside the university.

Yet, even at that time, all one hears … is what the outcome is: yes, you got tenure and a promotion; no, you got neither. You do not find out what others consider as strengths and limitations of your work and direction, since the letters and committee report are confidential. … What made this review remarkably different from the usual tenure review was the clear focus on improving rather than judging and concentrating on issues raised by me or by others as we met together.

What about Shortcomings to the Process?

If there were any weakness. … it would be around my lack of structuring the discussions during the four times that we met and the uncertainty I have about what a portfolio (focusing on a review of teaching and research) should contain. …

The concept of the portfolio is most appealing to me. I am afraid, however, that I have yet to grasp its essence. I understand that it is both to document and to inquire into teaching and research. It is to be selective rather than overwhelming. The pieces that I have produced for this portfolio have the traditional items with a number of reflective pieces from me. What is still missing form the portfolio is what my students have learned or at least an attempt to get at that. What I still fail to see is a coherence, an underlying weave to the fabric. Perhaps that is what you are to see. And perhaps that will come in time.

What Happened After the Review Was Completed?

The faculty exchanges in the hour's discussion explored the worth of such voluntary reviews, whether such reviews should be made mandatory, and the time each one would take. I believe a fair summary of the faculty's discussion would be that there were strong reservations about any post-tenure review requirement being instituted.

Since then, nothing much has happened with post-tenure reviews in the School of Education. … the fundamental reason may be close to what the colleague who reported to the faculty said in his closing paragraph:

During our deliberations I observed that the gatherings were among my most enjoyable meetings, but they received low priority. I value the freedom that allows us to devote substantial blocks of time to teaching, researching, and writing. Even though I recognize the importance of committee assignments to our institutional welfare, I prefer to keep bureaucracy to a minimum.

The dilemma of professional autonomy and institutional obligations emerges from the colleague's words; it persists and no easy reconciliation is in sight for him or the rest of my peers.

Afterword (Lyons and Freidus)

Lee Shulman, a member of Cuban's post-tenure review committee, has commented on this experience and offers another perspective on the usefulness of the portfolio process to those who act as critical friends and why having such mentors is necessary to the process. Although Cuban comments that "nothing much has happened" at Stanford following his experience, Shulman points to how the collaborative nature of portfolio work and self-study has unexpected outcomes for all involved. Shulman (1998) says:

> What was clear was that it was not only Larry Cuban who profited ... each of us benefited. When do we get a chance to peer into the window of our colleagues' teaching?

> My insights were somewhat different. I realized that Larry and I both taught the same students. I came to see some aspects of my students through Larry's eyes and through Larry's course, and in ways I never saw them before because we were doing different things. The students were performing in different contexts, and, suddenly, a two-dimensional view of students became three-dimensional. I became much more sensitive to Larry's teaching and he to mine, and that is also very important.

But Shulman offers another and more sobering comment, this time on the fate of his own portfolio making – which he admits remains unfinished.

> One of the reasons that my own portfolio has remained incomplete, although I've got all the parts around, is that I am not part of an ad hoc community organized to discuss my portfolio. It was Larry who was thoughtful enough to make sure that we provided such a community, created a group to discuss his portfolio. I am left with the question: What would happen if we as teacher educators organized ourselves to review each other's work in this way? If we supported each other in this way, what would that do for us and our students? ... The argument for peer review and portfolios in teaching is that they contribute to making teaching community property in colleges and universities and, therefore, put teaching and research into the same orbit. We will see whether that argument or hypothesis works. (pp. 33–34)

Self-study and portfolio work can support peer review. But, as this case reveals, a self-study portfolio process needs a scaffold of which critical friends may in the end be a most crucial element. Such exchanges are not casual conversations. Rather they are critical to the intentional interrogation which is at the heart of the process. Lee Shulman's story turns out to be a cautionary tale as well.

#3 Case: The Bank Street Model: Portfolio as Nested Self-Study

In this case a teacher educator, Helen Freidus of Bank Street College of Education, describes the experience of two students who are involved in the creation of a

reflective portfolio. This case especially highlights not only the self-study aspects of the portfolio process for students but for faculty as well.

At Bank Street College of Education in New York City, students must complete an integrating project in order to fulfill the requirements for the Masters Degree. Those choosing portfolio for this requirement work independently with a faculty mentor, and with a peer group. They pull upon personal and professional knowledge landscapes (Clandinin & Connelly, 1995) to explore their beliefs and practices and to document their competency in the field.

Invariably students draw upon widely different experiences to document their understanding of a common area within the discipline. Their diverse points of reference provide an opportunity for students and faculty to engage in discussions of what is valid and why. Through this process, each participant has the opportunity to frame and reframe his or her understanding of teaching and learning. And, as students demonstrate their perceptions of meaningful practice, faculty have the opportunity to observe the meaning students have constructed from courses and field experiences and consider the implications of this meaning for their own practice.

Structure of the Portfolio at Bank Street

Becky and Alice are two students who chose the portfolio option. They began to study their own practice by:

1. identifying and representing teaching and learning experiences that have been meaningful to them both personally and professionally;
2. providing explanations grounded in theory to explain the success or failure of their experiences;
3. setting goals for future professional growth guided by their findings.

Becky and Alice had a range of portfolio options to choose among. These included traditional, multi media, and e-portfolios. Whichever structure they chose, it would include:

Artifacts

It must have six artifacts documenting their understanding of and competency in four domains (human development, curriculum, history and philosophy of education, and the social context of teaching). At least two of these artifacts must be in formats that are not text based, e.g., picture collages, charts, graphs, a variety of writing genres, videotapes and/or other digital technology. By moving beyond traditional text-based representations of learning, students and faculty revisit content, examine familiar concepts through new lenses, and frequently emerge with more complex understandings.

Captions

There need to be one to two page statements to clarify each artifact. These captions, informed by theory and personal reflection, provide a rationale for the

inclusion of the artifact in the portfolio and serve as a scaffold for self-study. In these captions, responses are provided to the following questions:

- What have I learned from the experience represented by this artifact?
- What implications does this experience have for my classroom practice?
- How has this artifact shaped and been shaped by my personal and professional vision of education?
- How does the artifact bring to life the theories I have studied?

Framing statements

There must be an introduction and conclusion to integrate artifacts and captions with an identified theme. With references to theory, these statements demarcate students' personal and professional journeys, identify ways in which they frame their vision of teaching and learning, examine the alignment of their beliefs and practices, and lead to the setting of goals for future professional development.

Process Requirements of the Bank Street Portfolio

In addition to these *product* requirements, Becky and Alice were required to fulfill *process* requirements. These process requirements provide additional feedback for students' own investigations and insight for the faculty members with whom they work.

Individual process

Becky and Alice each worked independently to identify benchmarks of professional growth and development and to identify future goals.

Dyadic Process

Becky and Alice met with their mentors on an ongoing basis. These meetings provided opportunities for looking at personal interpretations of practice through the eyes of another.

Group Process

Becky and Alice joined a monthly series of faculty-facilitated peer group meetings. Collaborative in nature, the dialogue engendered in these meetings served to support and extend the professional development of self and other. Becky and Alice also participated in a presentation celebrating the conclusion of the year of portfolio work. Here, they engaged in dialogue with and received feedback on their work from the greater community. These presentations provide an additional source of dialogue for students and help faculty to understand the ways in which course work has been internalized.

Becky's Portfolio: Understanding Culture (1999)

Becky is a Chinese American woman who was matriculating for a Masters Degree in Infant and Toddler Development. At the time she completed her

portfolio, she was an in-service teacher working with a mixed age group of babies and toddlers in a program that provided childcare for adolescent single mothers. The program, aimed at helping young women to complete their high school education, was housed in the public high school in which these women (ages 15–18) attended classes.

Becky chose the portfolio process because she wanted to meet the requirements for graduation by studying her own practice. She knew instinctively that her identity as a Chinese American/American Chinese woman had played a major role in determining who she was both personally and professionally, but she wanted to understand more about how this happened, what it meant for her students, and how her personal understandings could be informed by theory in the field. She used the portfolio process "to increase her imagination" in order to problematize her current beliefs and practices: "I realize it is a challenge to try to understand one's culture and upbringing. This is an essential ingredient in becoming an effective teacher."

Becky began her artifact selection by looking back on an autobiography she had written as part of her application for graduate study. She thought back to the person she was at that point in time and compared that person to the self who was now nearing graduation. Describing the immigrant stories of self sacrifice and hard work that her Chinese American parents told, Becky talked about how she, as a young American Chinese child, responded with disbelief, thinking that her parents' words were exaggerations told for the purposes of moral instruction. She writes:

> This all changed when my family went back to China for the first time. My eyes opened as we traveled back to the villages where my parents were born. There was physical evidence of poverty everywhere and yet the living conditions had improved since the time when my parents left. When my mother saw my facial expressions, she smiled at me realizing maybe for the very first time I would understand my parents a little better and my heritage.

Here, it is possible to see how Becky uses this biography as a basis for analyzing and reflecting upon the ways in which her family structure, family expectations, and her lived experiences fostered her own belief in the immigrant dream of hard work as a pathway to success. She begins to identify the ways in which the goals and expectations she set for herself as a student could influence the goals and expectations she sets not only for the young children with whom she works but for their mothers as well. In this analysis, one can see Becky's emerging understanding of the social construction of learning.

Subsequently, Becky extends her emerging insight by looking at her practice through the lens of human development. She sets the stage for this artifact by describing how cuts in her program budget had diminished the amount of support available to the teen mothers by the program social worker. Recognizing how badly the mothers needed the services that had been cut, Becky began to take on some of the roles previously played by the social worker.

In order to identify and prioritize needs, she conducted a survey among "the moms" with whom she was working. The information she elicited differed from what she had anticipated. She began to see that while these young women, like herself, were children of immigrants, their experiences had been very different from her own. Theirs was not the immigrant dream with which she had been raised. Moreover, these women were not only young adults but also teenage mothers struggling with the developmental issues that trouble many young people in today's urban culture.

Becky's caption, supported by her portfolio mentor's field notes, document her efforts to imagine and re-imagine herself as a professional. She recognizes her own tendency to "assume that the way 'we' do things is the right way, the only way," and begins to see the truth in Delpit's (1995) statement that, "When one 'we' gets to determine the standards of appropriateness for all 'we's', then some 'we's' are in trouble" (p. 28). She begins to understand not only cultural difference but also the intersection of cultural influence and developmental stages. She writes: "I need to continually remind myself that they (the moms) are developing themselves and maturing as they are trying to raise their own children."

Motivated by this awareness, Becky decided to follow her surveys with an in-depth interview with the mother of one of her students. In the caption accompanying the interview, she reexamines her own value system, demonstrates a new appreciation of the efforts of one teen mother to juggle being a mother and a high school student, and questions rather than condemns the apparent disinterest in school that seems so prevalent among many of the mothers with whom she works. She engages with such questions as: "Why do some immigrant groups hold on to the vision that hard work will enable them to attain the American dream? How do such dreams influence individuals? What is the role of environment? Of disposition?" Thus, she once again challenges her own more comfortable assumptions about teaching and learning. In her caption, Becky reflects:

> It was through her [the adolescent mother's] voice that I was able to hear my parent's voices speaking to me. … I have had to reshape my own views and perceptions. I have reflected upon my own cultural history and background. I have been constantly sifting through my questions and the answers I provided.

Summing up her portfolio experience, Becky writes:

> Examining who I am and what I bring to others has been a vulnerable exercise. It has unveiled my strengths and weaknesses. I have learned and relearned what are my fears and insecurities . … My thought process is different now than it was in September. I did not really understand the true influence of the decisions that I was making in the classroom.

Alice's Electronic Portfolio: The Universe Behind Each Face (2002)

Alice is a career changer coming to education with a background in child development, a graduate degree in social work, and training in laboratory research in the field of child development. She is a recent graduate of the Bank Street College program that prepares men and women for careers in the field of clinical literacy. At the time that she was completing her portfolio, Alice was just beginning to establish a clinical practice. She wanted to use her portfolio not only to fulfill requirements for her graduate degree but also as a way of exploring her new understanding of the field of literacy. She hoped to identify new and deeper connections between her past experiences, current theory in the field of literacy, and the application of these to the practice that she hoped to develop.

In her introduction, Alice writes: "I offer this portfolio as a reflection of my own exploration of what it means to learn to teach literacy." Believing strongly in a holistic approach to teaching and learning, Alice was moved by the images she had discovered in Rilke's poetry. She turns to these as a way of framing her understanding and creating a context for her self-study.

> My effort as a clinical teacher is to identify and build upon existing strengths in order to provide my young explorers of the universe of education with the ideas, skills, and strategies that they will need to experience success. I have chosen the theme of "the universe behind each face" because to me this phrase encompasses the notion of the uniqueness of and complexity within each individual. … Acting as a guide in the exploration of the terrain of new concepts, information, and ideas, the role of the clinical teacher is to assess the skills of the children whom he or she will join on this "mindtrek", listen to the needs of the neophyte explorers, learn the culture of these child explorers, and prepare the new explorers for the differences they will encounter in each new realm of exploration.

As Alice set forth on this self-study through portfolio, she posed one additional goal for herself: "This portfolio is designed to be presented through two mediums: the first is that of printed text and the second that of an internet web page." By applying technology to the portfolio process, Alice believed that she would be better able to synthesize her experiences, develop new ways of thinking about her practice, and extend her repertoire of the technology skills that would support her work with children and colleagues.

Alice begins by revisiting a children's book she had written to fulfill a requirement in children's literature. The story Alice wrote captures a moment in the daily life of a family. Children eat their breakfast, listen to music, and practice their violins while their mother gets ready to go for an appointment with her oncologist. The story is based on a real life experience in which Alice, observer and participant, witnessed the children's responses to their mother's illness. She describes her growing awareness that individual children respond in very different ways to such moments. Drawing upon all of her past personal and professional

experience, she describes how the act of framing and reframing this event has led her to a deeper awareness of the ways in which children make sense of the world. In some cases, she writes, sense making is done in the cognitive domain, in others through motor responses, and – in some – understanding is grounded in the social-emotional context. An awareness of these possibilities, she reflects, has important implications for teaching and learning; scripted curriculum will not suffice if all children are to learn.

Building upon this insight, Alice selects as an artifact, the representation of an experience that emerged during a field trip to a local museum. Working with a child over time, Alice had seen her student's language skills develop in quantum leaps. Since the trip was the culmination and celebration of the semester's work, the child's father was invited to join in the visit. In his father's presence, the child's communication skills reverted to the form and language, he had used when Alice had first begun working with him. Alice was amazed. In her caption, she writes: "Until I had the opportunity to work together with both R and his father, I did not understand how R's style of communication was tied to his family culture." Having gained a powerful insight into the ways in which both ability and disability may be grounded in socio-cultural norms and values, she writes: "This experience helped me to realize that as a teacher I wish to find ways to enable children, teachers, and parents to experience a sense of inclusion, collaboration, and sharing."

These two artifacts, together with others drawing upon experiences in assessment and curriculum development, enable Alice to look at the intersection of home and school, teaching and learning, in increasingly complex ways. They provide her with an opportunity to stand back and look conjointly at the clinical skills she developed in her training in social work, the observational skills that she developed in her work as a laboratory researcher, and the instructional skills that she has learned as part of a teacher education experience.

For Alice, the construction of portfolio scaffolded the integration of past and current practice, the discovery and re-discovery of meaningful theory, and the importance of pursuing instructional practice that is congruent with this theory. She writes:

> My first re-discovery is the importance of play in learning. … I have also reaffirmed through this [portfolio] the importance of creating activities that provide children and their families opportunities to share their unique family and cultural heritage … and ways in which I might support each child's learning while respecting his or her culture and family values.

And how did Alice's goal of presenting portfolio in digital format influence her experience in this process? When asked to reflect upon her initial technology skills in an interview following portfolio completion, Alice responded:

> I came with relative facility in my ability to use the PC, but I didn't know how to use a digital camera, manage images, edit images, or use

Dreamweaver (a program that lets you create html files and integrate words, images, media). I didn't know how to manipulate data.

She continues her discussion pointing out the tremendous learning with which she emerged, but noting that there was a struggle involved in mastering so many new skills in the midst of a process designed to facilitate reflection on and the synthesis of a course of study.

Nested Self-Study: Reflections of a Faculty Member Working with Becky and Alice

Becky and Alice's completed portfolios look very different. Personal interests, experiences and priorities, and strengths led them to construct their documentation of competency in ways that made sense to them. And yet, their reflections, their comments during the final presentation, and their discussions with faculty members and peers pointed out many similarities in the outcomes.

Each reported that the portfolio process had afforded her a fuller – visceral as well as cognitive – understanding of inquiry learning and authentic assessment tools and processes. Each saw great value in being able to meet requirements in ways that were personally meaningful. Each came to see how assessment could be used to extend learning as well as to document it. And, each described a growing sense of confidence emerging from having been protagonists in the debate around the questions: Whose knowledge counts? What counts as knowledge?

As a faculty member working with Becky and Alice, I found that, as always in the portfolio process, their portfolio process pushed me to critically review my own beliefs and practices (Freidus, 1998, 2000). My self-study was directly informed by their questions and concerns. Areas that were particularly impacted include inquiry learning, the cultural context of teaching and learning, and the application of technology to the portfolio process. First let me address the ways in which my work with portfolio students has helped me to reaffirm my belief in inquiry learning. Then I shall discuss the ways in which their portfolio experiences have helped me refocus my own teaching to emphasize the cultural context of teaching and learning. Finally I will discuss how the experiences of Alice and other students choosing to construct digital portfolios have influenced my understanding of the strengths and challenges posed by technology enhanced portfolio construction.

Inquiry learning

With ongoing pressure from legislatures and media to prepare teachers whose primary focus is preparing children to do well on standardized tests, it is very easy to begin to doubt the validity of one's own belief system. As I read article after article in professional and popular journals, I find myself beginning to wonder "Is an inquiry model of teaching and teacher education a luxury that cannot be afforded in today's classrooms? Should I substitute more direct instruction for the process-based pedagogy I so value? Are there more effective ways

to prepare teachers to meet the needs of today's children? Will the teachers we prepare be able to find meaningful work?"

My work with and observations of Becky, Alice, and their peers has enabled me to gather new evidence to support my belief in constructivist pedagogy. Left to pose their own questions and fashion their own evidence of competency, Becky and Alice – like most portfolio students – at first faltered. The responsibility of identifying what they knew and producing evidence to support their statements was daunting. Frustration replaced initial enthusiasm as they began to recognize the challenge of focusing their inquiry. But then, as they began to look closely at their practice, they posed important questions, and began to chart courses of action for themselves. Required to compile evidence of their competence in each domain, they were frequently surprised at how much they had learned. Proud of their accomplishments, they became quite articulate about the ways in which their practice embodied exemplary standards of practice. However, when the evidence suggested that their instructional practices were not aligned with their beliefs and/or when they were not in the best interests of the children, each of them was willing to acknowledge this reality and chart a new course of action. The inquiry honed their skill at and willingness to critically review and modify their practice on an ongoing basis.

Cultural context

This was particularly true in the area of the cultural context of teaching and learning. I doubt that a lecture about the impact of culture on classroom behavior could have had so powerful an impact on Becky's practice as did the survey and interview she conducted, analyzed, and reflected upon. Direct instruction about home/school relations could not have shown Alice how great an influence family expectations can have on school behavior. Constructivist theory (e.g., Dewey 1938, 1963; Moll, 1996; Putnam & Borko, 2000) purports that only when new learning is closely linked to prior knowledge, will the learning be fully internalized. Becky and Alice's inquiry portfolios grew out of their own needs and interests. The authenticity of the requirement enabled them to look critically at themselves as teachers and learners and motivated them to acquire new skills and information in response to identified needs. My own data collection as participant/observer in this process gave me new energy and evidence to advocate for the Bank Street approach to teacher education, an approach that is learner-centered, constructivist, experiential, and developmental (Darling-Hammond & MacDonald, 2000).

Moreover, I found that as my students' understanding of the field developed, my own understanding was extended as well. Not only did their writing and discussion offer me new examples to use in my classroom presentations, they alerted me to the importance of foregrounding this understanding across both the methods and the foundations courses I teach. As I saw these experiences through their eyes, I gained a new understanding of the complexity of helping students who were themselves from diverse cultures learn to teach children who come from worlds quite different from their own. And, rather than relying on

the power of the printed word to convey this information, I renewed my belief in the importance of embedding inquiry projects that support recognition of ties between culture and classroom performance.

There are courses in our teacher education curriculum with particular focus on these parent-school connections, culture and language, culture and literacy. However, separate courses are important but not sufficient. These portfolio experiences demonstrate how important it is to weave opportunities for exploration and discussion of these topics across the curriculum. Consequently, as we develop a new course for the Reading and Literacy Program in writing and interpreting case studies of children with reading and writing problems, we are looking at the ways in which we can help our students to identify cultural impact and work more closely with parents to develop common goals. As we revise our basic course in the teaching of reading and writing, we are exploring ways to help students use multi-cultural and bi-lingual children's literature to develop voice as well as decoding and comprehension skills. My commitment to clear communication of this information has been heightened by the discoveries of the portfolio students with whom I have worked.

Technology

Bank Street students have been constructing portfolios as a culminating project since 1991, years before technology was as ubiquitous and relatively user friendly as it is today. In 1998, Bank Street made an articulated commitment to increasing the use of technology in teaching and teacher education. As resources and support staff have grown, faculty have been debating the role technology should play in the portfolio process. Should all students construct digital portfolios? Should it be an option? Should hard text portfolios be digitalized?

The advantages of digital portfolios, e.g., opportunities to incorporate graphic representations, ways to document instructional competencies within actual classroom contexts, tools for readily accessing documents that support artifacts, portability, ease of revision for different audiences, and convenience of storage, are well documented (Barrett, 2001; Hatch, 2001; Mullen, Doty, & Rice, 2002; Kilbane & Milman, 2003). Moreover, there is no question but that by creating digital portfolios, teachers extend their own technology skills and become more likely to use these skills within their own classroom. However, the portfolio process at Bank Street was implemented as a way of allowing students to step back and integrate and reflect upon the learning they had experienced during their teacher education programs. How would requiring the acquisition of new technology skills affect the likelihood of students' achieving this goal?

The portfolio process has always been a highly demanding experience for all involved. Would we have the knowledge, staff, and resources to support students through an even more complex process? As Mullen, Doty, and Rice (2002) caution, "When caught in the morass of mechanical difficulties, reflection and self-study do not flourish" (p. 4). But, were our concerns examples of resistance to change, or was there a potential conflict between the process of digital portfolio and the specific goals underlying the Bank Street portfolio process?

Alice's portfolio experience provided an opportunity to reexamine the beliefs and practices we had put in place over the past decade.

Alice began the process with enthusiasm and a better than average knowledge base in the uses of technology. However, neither she nor the faculty and staff with whom she worked had any idea how sophisticated were her goals. The faculty understood the content she hoped to express but had limited understanding of the steps required for digital organization and presentation. The technology support staff understood the mechanical skills but had little understanding of the complexity of the content. At the point of completion, Alice saw her experience as overwhelming but worthwhile. Her high motivation and personal dedication coupled with an existing knowledge base made it all possible and worthwhile. There were indeed times during the portfolio construction when it looked as if the process of developing new skills might be diminishing the energy she had to devote to the reflective process. And, Alice was, at times, frustrated when left to figure out needed skills by herself. For despite the technology staff's commitment to supporting students through the process, the competition for their services was great.

In considering the implications of Alice's experience for our decision about the uses of digital portfolios at Bank Street, Dewey's (1938) words come to mind: "Does [the experience] ... create conditions for further growth, or does it set up conditions that shut off the person who has grown in this particular direction from the occasions, stimuli, and opportunities for continuing growth in new directions?" (p. 36). The value of digital portfolios is very clear. However, it is equally clear that the students, faculty, and support staff must all have greater understanding of what is involved and the time and skills to support students before they can be required.

Afterword (Lyons and Freidus)

In this final case several aspects of a portfolio process in support of self-study are important to note, especially the recursive nature of inquiry for all involved. Self-questioning can rebound to all participants, as it does here for students and faculty. We also know from previous research that cooperating teachers often comment on how witnessing a student teacher's portfolio presentation makes them more reflective in their own practice. The portfolio presentation can help participants understand how a portfolio is created out of the experiences and the puzzles of teaching and/or learning and how a reflective process works. In this case, we see too and can further imagine the possibilities and potential pitfalls of technology for the process.

Implications of the Portfolio Process for Advancing Self-study and the Knowledge of Practice

The cases and arguments we have presented here reveal a portfolio inquiry process that can be linked to the goals and purposes of self-study. Portfolio inquiry may be defined now more fully:

> A portfolio, as a mode of inquiry, engages teacher-practitioners and their students or other colleagues in an intentional and deliberate interrogation of some compelling or puzzling situation of teaching or learning in order to forge some understanding and meaning of it. It likely involves narrative for it is a story of meaning and it may hold ethical dimensions. (Lyons, 2002b, p. 117)

The cases point to how portfolio inquiry and self-study may serve each other but alert us as well to important considerations and implications, discussed below.

The Reflective Portfolio Process as a Scaffold for Self-Study

The portfolio inquiry process can provide an important structure to scaffold self-study. Through reflection, portfolio inquiry involves an interrogation of one's professional work as a teacher, including efforts to explore the alignment of one's beliefs and practices. Through its requirement of data for each entry, portfolio inquiry gathers together the body of evidence of professional investigations that explore the puzzles of teaching and learning. Through its emphasis on collaboration, it enables teacher educators to see their practices through the eyes of others. Through its suggestion to make a public presentation of one's learning, it brings to public view the results of inquiry and, importantly, the knowledge of practice. These processes can take place even when a portfolio-maker does not intend to engage specifically in self-study, or, for that matter, feels any special competence about portfolio making. However, we caution: not all portfolio practices include these requirements. But, if they are acted on, the reflective portfolio inquiry process can scaffold self-study investigations.

Privileging and Making Public Practitioner Inquiries

The portfolio inquiry process privileges practitioner investigations into teaching practice and underscores the importance of such investigations. It is clear from this small sample that there are important insights, knowledge, and understandings that are developed by the practitioner through the lengthy investigative process. It is also clear that this knowledge is possible because of the position the practitioner holds in relation to the teaching and learning process. The portfolio inquiry process makes that knowledge conscious to the practitioner yet open to public interrogation by other teachers or researchers (Lyons, 1998b).

Validity of Teacher Investigations Through Validation

The portfolio process can contribute to the validity of self-study. It makes public not only the specific ways in which practitioners go about their practice but the results of such inquiries. It opens that work to scrutiny by one's peers and to dialogue and discussion by members of a larger research and practice community

– characteristic features of a scholarly activity. Such self-studies can serve as exemplars of work that can be validated through a process Elliot Mishler (1990) calls validation, that is: Another researcher or practitioner deems a process worthwhile and is willing to try it in his or her own teaching or research (Lyons & LaBoskey, 2002). The purpose is not simply replication: it is the extension of the work to a new context. Such trials lay the foundation for evidence-based knowledge.

Sustaining Self-Study and Portfolio Inquiries: What Possibilities?

There are costs to portfolio making. As Lis Bass and Vicky Anderson-Patton realize, it is time consuming to engage in creating self-study portfolios and to learn how to be reflective. In addition, care is needed by mentors to attend to special vulnerabilities that may occur through the process: Some students have reported deep feelings of vulnerability when simply declaring their teaching philosophies. Thus, personal and professional identities can be at stake. And while it is clear that new technologies can support and facilitate portfolio self-study, it is also clear that technological skill must be in place or adequate resources available.

But perhaps it is most important to acknowledge what we would call a critical next step: that is, for systematic studies of all aspects of portfolio and self-study processes. The need is urgent. As Donald Schön (1995) warned, there is no guarantee that institutions hold a view of knowledge that can always sustain practitioner inquiries and acknowledge the value of the knowledge they assert. At a time of increased government scrutiny about educational research, when efforts to set national standards for research are underway that privilege traditional hypothesis testing, cause and effect methods, it is clear that threats exist to practitioner inquiries that use other modes for their investigations and employ such methods as narrative to communicate their findings (Shavelson, Phillips, Towne, & Feuer, 2003). Practitioners must be vigilant in their pursuits and rigorous in their claims (Anderson & Herr, 1999; Cochran-Smith & Lytle, 1999; Grossman, 2002; Lyons, 2002a).

For example, although portfolio uses in teacher education are acknowledged as wide-spread, nearly ubiquitous, to date no systematic studies have been undertaken to determine their consequences or long-term benefits (Lyons, 1998a; Zeichner & Wray, 2001). Claims of the value of self-reflection are asserted for portfolio processes, yet little research has been undertaken to validate them. It is also clear from the cases presented that different purposes for self-study or portfolio inquiries may prompt different emphases. How can or do they effect outcomes, such as reflective development? Our understanding of these differences is only in its infancy. We need to take up these investigations and extend to another level of evidence-based knowledge. Through portfolio processes, we clearly see the possibilities not only for teacher transformation but for advancing self-study and a new scholarship of teacher education practices.

THE EPISTEMOLOGICAL DIMENSIONS AND DYNAMICS OF PROFESSIONAL DIALOGUE IN SELF-STUDY

Karen Guilfoyle[a], Mary Lynn Hamilton[b], Stefinee Pinnegar[c] and Peggy Placier[d]

[a] *University of Idaho;* [b] *University of Kansas;* [c] *Brigham Young University;* [d] *University of Missouri-Columbia*

Abstract

In this chapter, we articulate dialogue as a research stance or methodology. We begin by outlining our process in exploring dialogue. We propose that professional dialogue allows researchers to explore ideas, theories, concepts, and practice so that the understandings or assertions for action uncovered provide a basis for confident action: physical, mental, or explanatory. Once an idea is put forward in this method of inquiry, it is met with reflection, critique, supportive anecdote, or explanation and analysis which interrogates and thus establishes the power of the learning as a basis for meaning making, understanding, or practical action. In a similar way, a situation, context, or experience is met with critique and analysis whereby competing, modified, or deeper supportive response can follow. Even if the dialogue gets passionate at times, it is not argument or disputation. In dialogue, practice, theory, and experience are intertwined. Since the investigation is focused on human interaction, the "findings" or "results" that emerge and the inquiry itself exist in an inconclusive state within a zone of maximal contact in the time frames of past, present, and future. To anchor this definition, we provide an analysis of segments of on-line chats. Next we position our ideas concerning dialogue against other historical and theoretical perspectives. We consider what dialogue is rather than what it should be; explore the use of dialogue for a purpose rather than just to converse, and, finally, articulate the dilemma of reaching consensus or truth in contrast with embracing multiple interpretations. We further support readers'

---

understanding of what we mean by dialogue as methodology or research stance through the presentation of our past work in terms of our current understanding of dialogue. Finally we re-present our definition of dialogue through an analysis of an audiotaped conversation recorded while writing this chapter. A method for examining professional practice must embrace the inconclusive nature of human interaction and yet allow for findings about which one can have sufficient confidence that action can be taken and that understanding from one situation can be used in analysis of another.

The Arizona Group started when, as former graduate students from the University of Arizona in Tucson, we became interested in the difficulty we faced as we brought new paradigms of teacher education and research on teaching into the academy as beginning professors. Our work in self-study was actually initiated by our struggle to understand what we were experiencing by engaging in dialogue with others from different universities who seemed to share our experiences. We engaged in dialogue through the use of letters, e-mail, on-line chat, and face-to-face talk. In our conversations, we struggled to understand what we knew about teaching, teacher education and academic institutions and the relationship between our public and private lives. While we shared a commitment to doing qualitative research and teacher education, we were quite different from each other in terms of our academic training, passions about teacher preparation, religious and theoretical orientations and use of research tools. We were approximately the same age, had all taught in public schools, and grew up in the United States; yet, our backgrounds and history were more diverse than similar. Part of what had always brought us together in conversation is that while we shared similar politically liberal ideologies, we found each others' opinions and reasoning diverse and the interpretations and insights interesting, intriguing, and often controversial. Discussions always helped us think differently about research and teacher education because our differences gave us new lenses to think about the issues we confronted and the ideas we were pursuing. The shared aspects of our ideology and worldviews meant we did not have to re-argue the basics of constructivism rather than behaviorism and quantitative rather than qualitative research paradigms. Our divergence of interpretation, analysis, methodology, and level of commitment provided fodder for discussion and development as well as giving us confidence to act in our institutions. As a result, we have always known that our work began with and is sustained through talk.

Before we were asked to write this chapter on professional dialogue in self-study, we had not yet considered the fundamental nature of talk itself in our research and relationship with each other. As we developed this chapter, we had deep questions about what dialogue was, how it related to talk and conversation and even whether we would characterize our research process as one of dialogue. In fact, we wondered why our work had been labeled in this way. We began by

examining what dialogue was, analyzing what the characteristics of our current and past conversations about research projects were, and synthesizing what we believed about research, our analysis of our practice, and our new understanding from the research. Once we began to consider dialogue seriously, we interrogated our understanding of the conditions upon which we made and acted on claims for knowing our practice. We now know that dialogue is the process of coming to know and upon which we base our claims for action (in knowing, understanding, and doing). In the writing of this chapter, dialogue is the tool that supports the process and provides us with an authoritative basis for the claims we make. As each of us wrote specific sections, the text took on a multi-vocal stance – the diversity within our voices, personal as well as collaborative theories, and multiple views intertwined to become a dialogue between us that hopefully engages readers in exploring their own basis for making claims for action.

For us the purpose of professional dialogue is to explore ideas, theories, concepts, and practice so that we develop understandings that allow confident action: physical, mental, or explanatory. Research need not begin in hypothesis or statement but can begin with consideration of ideas, theories, experiences, contexts, and processes. It can begin with a fulsome statement of an idea or an anecdote that concerns a participant. Once an idea is put forward in this method of inquiry, it is met with reflection, critique, supportive anecdote or explanation and analysis which interrogates and thus establishes its power as a basis for meaning making, understanding, or practical action. In a similar way, a situation, context, or experience is met with critique and analysis whereby competing, modified, or deeper supportive response can follow (ideas can be ignored as well). Even if the dialogue gets passionate at times, it is not argument or disputation. In dialogue, practice, theory, and experience are intertwined. Since the investigation is focused on human interaction, the "findings" or "results" that emerge and the inquiry itself exist in an inconclusive state within a zone of maximal contact of the time frames of past, present, and future.

When a researcher seeks to understand or make a claim about a phenomenon that includes human actors and interaction, the mere attention of the researcher can alter what is being studied and the human participants. In the same way, mere attention by the researcher may in fact change the researcher in ways that alter analysis and conceptualization. As a result, using the scientific method as the pattern for inquiry may hold out the promise of providing foundational criteria for knowing because of the assumptions upon which that method is based; but its promise can never be met because studies involving human beings always exist in a state of inconclusivity – time and agency and thus alteration can never be removed from the equation. Dialogue as a method of inquiry (on the level of the scientific method) provides a unique authority for moving true beliefs to a basis for physical, mental or explanatory action. It creates a knowledge base of sufficient power to allow for appropriate response and action.

Through living the experience of moving through tenure and studying our process, watching the demise of at least two reform efforts at our individual institutions, and exploring critical moments in our intersecting practices as

teachers, teacher educators, policy makers, and consumers of research, we recognize that research focused on self-study of teacher education practices (unlike positivist research anchored in the scientific method) resists the separation of the researcher from the practice(s) being studied. For this reason, anchoring our inquiry in the scientific method has never been particularly useful or compelling as an epistemological basis for knowing teaching practice. Bohm (1996) argues that a central concern of dialogue is not truth. He says, "[Dialogue] may arrive at truth, but is concerned with meaning" (p. 37). We agree that the method of dialogue is a way for developing understanding or insight that can guide and determine practice. We believe that in studying teaching practice and taking action on our understanding, we become more purposeful and strategic. As researchers, we observe and articulate our experience to gain further understanding. Because our experience involves different people and contexts, more than one path for action is possible.

We also believe that self-study researchers who have participated in the business meetings and conversations of the Self-Study of Teacher Education Practices Special Interest Group (S-STEP) will recognize the elements, processes, and characteristics of dialogue from their experiences in these dialogues – both in their own research and in the discussions that characterize S-STEP as a whole.

As we explored self-study research, we agreed on certain characteristics of that research. First, it always involves, at some point, humans in interaction with each other. Thus, our research methods must take into account the essential nature of interaction among human beings. Second, we recognize that the researcher and the researched are temporal (exist in time and context), indeterminate (make choices about action that are not predetermined), and changing (focus on learning and therefore involve growth and development). As a result, findings from this research, while they can form a basis for action or further investigation, are inconclusive and may shift and change in new contexts or research studies. Third, we attempt to understand all that contributes to the aspect of practice we want to understand. Therefore our work includes understanding the history of the context, the background of our students, their purposes, goals, social relationships and learning, and our own background, purposes, goals, relationships and learning. We often bring these together simultaneously in the moment of action or insight. We seek to understand the whole of teacher education practice: the context, the content, the process, and the humans. Fourth, we recognize that the humans have an impact on each other and the content and processes in which they are engaged.

Unlike other research, self-study of teaching practices, regardless of the research tools and strategies it borrows always exists in the here and now. Even when our study involves the past (our own, the institutions', our students'), we position our work to connect that past with the present and move it forward into a future state. Bakhtin's (1981) work on narrative theory is instructive, for like the novel, we conduct our work in the zone of maximal contact with the present. By this we mean that the past represented by the lives of ourselves, our students, our culture, and the content being studied are always present in the

immediate classroom interaction and are always targeted toward a goal (to be ultimately fulfilled in the future). As a result our work always exists in a zone of inconclusivity. In other words a state where the outcome of our action and understanding will potentially change. It is uncertain, not predetermined, and always open to doubt. The central role of humans in teaching and learning and the fact that they focus on a future state of being, knowing and acting, in and of themselves, create this zone. The intersection of contexts, processes, and histories increase the potential for volatility. As learning takes place, what people do and think will change. Students and teachers become more proficient and advanced action or constructions of knowledge emerge across time. Often the learning path we begin with students today or engage in as teachers will continue to evolve across our lifetime. We may be confident with the current state because we understand how this state will lead to a potential and future better and often unknown state.

To present a multi-vocaled representation of our conception of dialogue as a fundamental stance for research in the social and human sciences, which forms the methodological basis upon which other research tools may be utilized, we present an analysis of the interchanges we have participated in as we have worked on building this chapter; next, we review other conceptions of dialogue, comparing and contrasting it with our view, then we present examinations of our past research and that of other self-study researchers in order to probe the ways in which dialogue as a method is evident in self-study research. Finally, we present an example of a dialogue focused on articulating dialogue as a method and conclude with a comprehensive definition of dialogue as method and propose further explorations.

Features and Characteristics of Dialogue Revealed in Dialogue

The segments presented in the first section are taken from two of a series of online chats we participated in as we worked on the chapter. Online chat is distinct from oral communication, because it is focused, and the act of writing rather than speaking requires contemplation, organization, and editing of ideas in real time interaction, which produces a written record (e.g., Weedman, 1999: Hawkes, 2000). Again, it is one of many methods of dialogic interaction that has formed the basis of the dialogue we have engaged in in pursing our inquiries about teacher education. The selected quotes are purposefully short and perhaps almost cryptic to allow space to follow the progress of these exchanges across sessions and across idea development. Each segment is followed by explication of what the segment reveals about characteristics and elements of engaging in the process of dialogue and anchors our assertions. While our exchanges with each other contained discussion of topics beyond dialogue, including teacher education reform, individual conflicts and trials, as well as plans for future meetings, for this chapter we intentionally selected segments that focused on the topic of dialogue. In our initial example of dialogue, we wanted our readers to see how our discussions led to our understanding of dialogue as a method of

inquiry. In these segments we articulate the characteristics that promote dialogue, the processes of commonality and difference in interaction in dialogue, temporality in dialogue, the potential authority of dialogue for establishing a basis for making assertions for action and understanding (Berry & Loughran, 2002), the interaction of public and private voices in dialogue, and finally the definition of dialogue as inquiry method.

Segment One: Characteristics that Promote Dialogue

January 31, 2002

> Peggy Placier (PP): Yay! Karen is here.
> Karen Guilfoyle (KG): I made it!! Have I missed much?
> PP: Not really. Just what we're wearing.
> MaryLynn Hamilton (ML): This is cool.
>
> … . .
>
> ML: So now that we're here how should we proceed?
> PP: Okay so now I've got to start thinking … Could we go through the outline from top to bottom?
> Stefinee Pinnegar (SP): So let's start with the purpose.
> ML: I have the outline in front of me … let's look at the purpose.
> PP: Great minds … .
> ML: Do we like [the purpose statement]? Want to change it?

Echoing in the conversation in Segment one are characteristics of the context, which our experience and study reveal as most productive for dialogue. These characteristics include respect for each other, caring, strong voices, focus on practice or concrete situation, and inconclusivity.

Respect

The phrase "Great minds …" signals the respect we have for each other. Wheatley (2002) identifies "listening curious" as an essential part of productive dialogues. When we listen curious, we are consistently curious about what others will say. We are more interested in listening to what the other will say than we are in composing what we will say in response. Bohm (1996) suggests that in dialogue participants do not listen at a detail level, but respond to the gestalt of the meaning they hear. Both conceptions indicate participants come expecting the topic will be important and of interest and that the others involved will have good ideas and be honest.

Placier's compliment indicates the deep regard we have for each other's ideas and voices. Hamilton's comment: "This is cool." reveals our naturalness in our interaction our willingness to allow each other to see our inexperience and learning – a clear indicator of the respect we hold toward and feel from each other.

Caring

A deepened form of respect is caring. Peterson (1992) argues that dialogue and talk are not the same things and that in the conversation both will emerge and be interspersed, because we use caring talk and story talk and other kinds of talk to set the context and to repair impasse in the dialogue. Caring talk is conversation that shows interest and acceptance of other participants. It often focuses on the lives, challenges, and ideas of other participants. Story talk includes conversation peppered with anecdotes and experiences participants want to share but which may not seem immediately germane to the purpose. By creating this basis of support and acceptance, discord or disagreement can be accommodated. Difference is treated not as a competition but as exploration. Bohm (1996) argues that in dialogue groups facilitated according to his methods caring talk comes much later and may not occur at all. He, in fact, feels it is not an essential condition for dialogue in general. Yet, he also reveals that in his experience with dialogue, when groups develop relationships where trust and caring can emerge, the group allows the personal to become part of the dialogue and the work is more complex, understanding is richer, more powerful, and more applicable across a wider range of settings. In fact, we would argue that we have been able to develop deep dialogue with each other because of the mutual respect and care we experience in our dialogues with each other.

We begin with what Peterson (1992) labels caring talk and talk story. With us this is usually because we do not have the chance to meet as often as we like and so there are usually many details of each others' personal and professional lives that we want to be brought up to date on. By beginning in this talk, our dialogue work can be more productive because we come away feeling we have renewed our relationships and been able to empathize and commiserate and reestablish our personal acceptance and bond. The caring talk is not a matter of strategy. We genuinely care about each other as hinted at here in our exchanges, but attested to by our history of mutual support and collaboration over the years. This caring talk is evidenced in Placier's exclamation at Guilfoyle's arrival. Her exuberance reveals how pleased we are to converse with each other. It is also evident in Placier's cryptic reply to Guilfoyle's question: "not really" And "just what we were wearing." This communicates to Guilfoyle that we were waiting for her arrival and provides a synopsis of what we have already discussed, suggesting what we have said thus far and in this case was not a matter of concern. We do not always wait for each other because time is precious, and we trust that if the person could be there they would. Interestingly, if one of us is absent, another member of the group will raise the absent person's voice around an issue when we know that absent person has different views than those being expressed.

Guilfoyle's exuberant: "I made it!" is an abbreviated reference to a talk story about having to leave class early to meet with us. This talk story later becomes the focus for our discussion on teacher education reform.

Strong Voices

Placier's comment "Great Minds …" signals respect, but it also signals an understanding that we come prepared to work and think and we expect to do that. Her other comment – "Okay now, I have to start thinking." – is another example of this. Two things are not as clearly evident in this passage: our diversity of opinion and belief and the ideas we share. Both commonality and divergence are crucial in dialogue. Without questioning and interrogation of ideas we cannot have confidence in the understanding we develop. This does not mean that the conversation is bitter or divisive. Our confidence in the understandings we gain and the actions we decide to take is based on the strength with which we have interrogated our ideas. Without proposing alternate views, identifying limitations of our position, or presentation of ignored features or facts, the rigor of our work will be compromised. Our voices provide the centrifugal – diversity that pulls us apart – and the centripetal – the commonality that emerges and holds us together (Bakhtin, 1981).

Bohm (1996) in fact, ensures commonality and difference in dialogue groups by his insistence on a size of at least 30. In this way, he feels that the group will contain enough diversity on an issue and enough commonality that the group will represent the community as a whole. Our dialogue group usually consists of the four of us, but when we participate in discussions in S-STEP dialogues the numbers can be greater. In our research work, the smaller number is helpful because we often are discussing topics that we may feel are politically dangerous to us and trust is an important issue. We need to trust the confidentiality of participants so that ideas can be pursued more intimately. When the size of the group is limited, one of the responsibilities of the group members it to raise alternative views that have credence but are not represented or might not be expressed by this more limited group. We recognize that the size of the group can limit or expand the diversity in the dialogue. However, Bohm's method of dialogue is not meant to be a research method. Instead it is method for reducing violence and disruptive conflict in the community. In dialogue groups, according to Bohm, cantankerous issues can be considered in a way that uncovers hidden assumptions in a discourse in order to enable acceptance of a greater range of diversity of views around discussion of those issues in the larger community and thereby lead to resolution of such issues without resorting to violence and disruption.

With just four of us, having strong voices becomes important. Larger groups will contain more diversity of opinion and idea. In this smaller research group, we want to be confident that people will provide crucial response that will adequately interrogate and refine our ideas and analysis. The dependability, integrity, and trustworthiness of understandings that emerge from dialogue as an inquiry method require that alternate plausible and possible views in contradiction or expansion of the one presented are considered. Without strong voices, critical issues might be ignored and confidence in action and understanding will be undercut.

Focus

Dialogues usually have a topic or focus. We come together to explore ideas and understandings we have about the topic. Or as practitioners we may dialogue to develop understanding of an experience or situation. Whatever the topic, example, idea, or situation on the table, the dialogue has a focus. Dialogue does not have a specific goal. In other words, we come knowing what we want to begin on, but we do not know what the end should, is, or will be. In this way, dialogue as an inquiry method for research is distinct from Socratic dialogue.

Like Bohm's (1996) dialogue groups, we take action to organize our dialogue so that it will be productive. While we engage in all kinds of talk (as detailed by Peterson, 1992), in this dialogue, fairly quickly after Guilfoyle's arrival, we move directly to consideration of the issue at hand – the construction (but not the completion) of a chapter on dialogue in self-study of teacher education practices.

Inconclusivity

The results of dialogue can be labeled assertions for understanding or action. Whatever those assertions, we understand that as practitioners, we will try out the ideas and actions. As we explore our practice using these assertions, they will be shaped, refined, molded, and expanded. We have no expectation that they will remain unchanged. Hamilton's question shows how rapidly anything under consideration moves from a basis of acceptance and understanding to be used as a basis for further reflection, to a topic to be questioned, analyzed, explored and perhaps abandoned. We do not mean to imply here or elsewhere that all change is good. But in dialogue, participants must be willing to rethink, reconsider, or defend and re-establish ideas, positions, and conclusions. In his discussion of the novel, Bakhtin (1981) argues that the novel always exists in a zone of maximal contact between the past, the present, and the future. This zone of maximal contact is a zone of inconclusivity. We argue that self-study work has a similar form. Self-study dialogue always projects forward to an anticipated response in practice. Therefore, whether we are considering autobiography or history, a current situation, or a proposal for action, dialogue always occurs in this zone of maximal contact, which has the potential to change both the past and lead to change in the future.

Segment Two: The Processes of Commonality and Difference in Dialogue

January 31, 2002

> KG: It will grow as we move forward.
> PP: Well, one question we had was whether we really had had dialogues …
> SP: When we start with the purpose do we want to look at what dialogue has gotten people in terms of professional understanding?
> [interspersed conversation about how to save the document]
> PP: Everyone okay with the purpose? …

SP: I wrote a series of questions that might guide the chapter outline: What is dialogue? What was its role in our professional development? What was the role of dialogue in our self-study? What was the role of dialogue in our teaching development? What was the role of dialogue in development of self-study? What was the role of dialogue in the conversation in the field?

ML: I think we are about changing and about change ... Remember though this chapter is not just about us.

KG: Stef, those are good guiding questions. I think the purpose will move us in a good direction.

ML: How can we tie all this together?

PP: Maybe after the conversation we can send out another outline. I've been trying to jot notes.

This segment begins with three statements that direct our conversation in startlingly different directions. Such vectors are common in dialogue and are evidence of the centrifugal force – the force of divergence. Hamilton's move pulls the group further apart. Guilfoyle straddles this difference with her statement about both the purpose and Pinnegar's suggestion of questions. Hamilton resists by saying, "How will we tie this together?" Then Placier suggests that we just need to continue the dialogue and sort things out later. When Foucault (1978) discusses the reality of the operations of power, he compares the ways in which alliances of power in a group converge and diverge, he uses the metaphor of a stream to capture the movement.

The pattern of reasoning, consideration of ideas, explanation and analysis in dialogue ebbs and flows as participants speak in favor of, raise objections, present alternatives. Like water, the course of the dialogue can meander like a stream or gather force like a flash flood. All of us, as desert dwellers, have seen a dry creek bed suddenly fill, gather force and become such a flood. This divergence and convergence leads to eddies, dams, rapids, whirlpools, or froth. A single sagebrush that holds tenaciously to its anchor on a rock can dam a river. Initially the stream of talk flowed smoothly. Once Placier puts the purpose on the table, however, cacophony emerges as Pinnegar proposes questions to guide and Hamilton reminds us that the chapter is not about us. Guilfoyle redirects the flow by referring us back to Placier. Now, if Pinnegar insisted on her questions or Hamilton wanted to talk further about how others were involved, the dialogue would feel differently and we might have moved forward differently. While short, this snapshot of our dialogue captures the core mechanism of coming to know in dialogue – the mediation and assertion of difference and commonality. It also shows the ways in which we agree and disagree. It reveals how we accommodate and modify and restate. In other words, it shows the way in which not only the conversation, but the concepts that develop out of dialogue emerge in it. An examination of the structure of a previous paper reveals the way in which some of what was articulated shaped the chapter you are now reading.

Segment Three: Temporality in Dialogue

January 31, 2002

> PP: So we had a "live dialogue" and that evolved into the shared journals. And as ML said, we are just one case. How do we fit other work in?
> ML: Remember being attacked for being so revealing?
> PP: Or whining?
> ML: Ah, Yes whining.
> SP: … Our dialogue with each other and the field led to the lives we are currently living as academics and to the crashes in reform we have all experienced.

Dialogue provides several situations that reveal coming to know. One of these is that we come to know what we know by saying it. As we hear ourselves talk, we may in fact discover what we think. We also may in listening to what we say realize we do not believe what we are saying at all and have to recant. Another occurs when someone else comments, and we recognize what they are saying is something we know and either believe or reject. As we talk together we shape an idea together, and through the discussion we come to understand the idea we are constructing.

After a dialogue or a period of dialogue, someone provides a summary of what we have been saying, and we recognize that as what we have been implying. In this segment, both Placier and Pinnegar give summary statements that provide a convergent representation of our account of how our dialogue began. Interestingly, Hamilton's comments about being revealing, and perceptions of us as whiners add consequence to Pinnegar's comment about "the lives we live now."

This ironic reminder by Hamilton represents an additional benefit of dialogue. As we share difficulties in dialogue we develop strength. Our irony reveals our rejection of the characterization of us as whiners. Further, our willingness to revisit this idea, which was painful when it happened, shows how our mutual respect and response has given us the strength to continue to address the issue honestly. Dialogue has provided us with this benefit in other aspects of our practice. Loughran and Northfield (1996) suggest a similar view on the benefits of dialogue. Northfield's open and honest account of his teaching is transformed through the dialogic components of the text wherein his colleagues and students push his understanding of what he knows about teaching science and what he learns from the public school students he teaches.

Segment Four: The Authority of Dialogue

January 31, 2002

> ML: This is still a "she said", then "she said" relation … Is that what dialogue is? …

PP: I was thinking that dialogue happens every day, all the time, but what does cleaning it up and publishing it do to it? Did both the dialogue and that process help us grow? Reinterpret what we had written?

ML: Do we clean our dialogue?

SP: Dialogue is to me conversation ... But then we have to think like Roland Tharp says, "What makes a good conversation?" It is inclusive, it is responsive ...

KG: Peterson would say it that constructing meaning is a primary concern in dialogue: Thinking critically and using the knowledge to move forward. ... Dialogue is something like praxis to me.

[What follows in this space is a further discussion of praxis, dialogic, dialectic]

KG: In a dialogue, people co-construct meaning. I see that being an important factor in my work with all of you. I got somewhere that I might not have been able to go by myself.

PP: Now we're getting into the learning part. We did something, which we have not yet defined and we learned from it.

ML: Oh great!

SP: When Jack talks about the dialogic, he is talking about keeping the tension between the question and the answer.

PP: Did we ask each other hard questions?

ML: Well, I'm not sure I knew the question and I know I didn't have the answer ...

SP: I think actually that our lives were the statements and we asked ourselves the hard questions.

PP: I like that.

ML: So, lived experience?

KG: Yes, dialogue helped us to address our "hard questions" but not always answer.

This longer portion moves through stages of convergence and divergence to a position of acceptance and understanding of Pinnegar's statement about how our lives are statements and to move our practice forward we must question those statements. It also provides evidence of our acceptance of inconclusivity as part of using dialogue as a method since understanding does not always provide answers to questions of practice. In addition, we move to understand more clearly the ideas Guilfoyle expresses from Peterson's work (1992) on distinctions between conversation, dialogue, and talk. Past research on the uses of "dialogue" produces a rich and varied array of advocates of dialogue and its uses in many different social contexts. But interestingly, in all of these contexts there has been an emphasis on the participants' learning through the construction of a new understanding. Therefore our understanding of dialogue as an epistemology can be placed in a long historical context; yet at the same time we were using this epistemology to construct something new. Berry and Loughran (2002) label their findings as assertions for action. This means that what they learn in

self-study research is powerful enough to serve as an assertion about their practice or their understanding, which can be used to explore understanding of practice further or which can form a basis for acting in their practice. When we act on these assertions more consistently, our experience and our reflection and critique can develop understanding further. As Schön (1983) argued the practice situation speaks back to us. Placier articulated her intuition about our struggle in writing this chapter. She pointed out that we were trying to study and understand dialogue in our very act of trying to write about it. We were trying to develop assertions for action and understandings for action on the chapter from our dialogue rather than using dialogue to build a clearer conception of something we already understood well, like our dialogue about teacher education reform, for example. Our collective dialogue leads to deepening understanding but also becomes a basis for our assertions to action. This is similar to Berry's comment in her work with Loughran that (Berry & Loughran, 2002) through discussion she developed assertions that could guide her action in similar work with other participants.

Consensus in dialogue as a goal is Habermas's (1984) solution for a foundational criterion for knowing in this kind of research. He suggests that by establishing consensus through discussion with each other we establish a shared and agreed upon community basis for action. In fact, currently, many groups that study practice or develop informal assessment base their work in Habermas's ideal speech community. In our analysis of our work, we have come to reject the idea of an ideal speech community that can take as a basis for its warrants the consensus of that community. The difficulty of this concept is clearly revealed in an analysis of the discussion by participants that led to the creation of standards for assessment (Moss & Schutz, 2001). In an analysis of the dialogue of participants around setting criteria to guide standards for judgment in alternative assessment, they demonstrate that silencing and time constraints more than consensus led to the criteria developed. They provide evidence that the language of the standard, in fact, allowed for a range of diversity so that completely opposite views of teacher action could be valued depending on the philosophy that guided the writing instruction of the evaluator.

In our work, we have accepted as central the inherent diversity of opinion and worldview that each of us brings. While we share a theoretical commitment to constructivist learning paradigms and liberal political beliefs, we do differ from each other in terms of our political, religious, and philosophical understanding and commitments. This diversity may not seem drastic to others, but in a group of this size it represents a productive range that promotes exploration of ideas while not requiring that we re-debate basic ideas about teaching and learning (the major focus of our dialogue) each time we meet. In fact, we believe it is our willingness to learn from differences, our acceptance of each other, as well as the range of that difference that has led to the power in our work. We believe it is our diversity that leads us to move forward in our thinking. In some ways, we may wish we agreed all the time, yet, we come away from our dialogues with confidence to act on the ideas we have developed together. Our point here

is that complete consensus does not allow us to develop confidence powerful enough to become a basis for strategic action.

We have explored what happens in our dialogues that gives us confidence to act on the knowledge claims we develop. Moss and Schutz (2001) propose agreement as a basis. In fact, we believe that our confidence to act on the knowledge claims we develop emerges from a sense of surety that our ideas are understood by the others and accepted as a basis for action and yet they have been critiqued. This does not mean that the understanding and acceptance offered by the others means they agree. It simply means that given our arguments, our understanding of what we are saying seems to be a reasonable basis for action. Unlike foundational claims for knowing required in positivistic notions of research, we believe that in the human sciences, particularly those that involve teaching, we do not need to have foundational surety and secure generalizability, instead, we need to be certain only that this is a possible next step in our practice that could lead to better experiences in learning and teaching. This is a much different position from which to act than positivism presupposes. It allows for more immediate, direct experiment with ideas. It is also based in the idea that possible useful responses in an educational setting are never singular, but always particular and individual with a range of appropriate and possible responses.

Segment Five: The Interaction of Public and Private Voices in Dialogue

February 3, 2002

[We have each written part of the outline for this chapter. In this segment, Guilfoyle, Hamilton and Placier question Pinnegar about her section of the outline.]

KG: I was wondering what you were thinking when you referred to private/public and how we would share that.

SP: The frame of contrasts is the contrasts, conflicts, congruencies in our lives at each phase. Sort of like when you start a braid, you have all of the things at the beginning and then you start to weave them together. I was trying to show how we came together and developed but then developed apart.

ML: Nice metaphor

KG: Yes, I saw those as excellent ways to approach it.

PP: What did you mean by Methodology or methodology?

SP: Methodology is the philosophical theory under our work and the methodology is just the tools of research we used.

…

ML: Probably we will have to be very clear in the chapter but in the overview this is fine.

KG: For me, I separate out the two. Methods are tools, methodology is the framework that influences how we use the tools.

...

SP: Not the capital is the point for me. The M is about philosophy the m is about the tools.

KG: Most research literature makes a fuller distinction.

This fragment from our dialogue shows the ways in which ideas are explored in dialogue and then emerge in later dialogue or work. An important part of dialogue is that we carry the voices that our colleagues raise in dialogue into our thinking about our work when we are no longer together. In this way, the voices of our colleagues provide ongoing internal questioning and response to the ideas with which we struggle.

The image of the braid, for example, is similar to our current representation of dialogue flowing like water. While the water metaphor is better able to represent a more sophisticated and complex view of divergence and convergence in dialogue, the braiding metaphor captured well the interweaving of ideas and the valuing of diversity of opinion and stance. The more concrete nature of the braid is also a better metaphor for revealing the way in which the dialogue itself holds the centrifugal forces together and results in centripetal ones. The debate about Methodology, methodology, and method are still ongoing. While we have a shared understanding of how we see dialogue as a primary process of inquiry that forms an epistemological basis for that process, Pinnegar's background in English leads her to continue to question the accuracy of our description and of distinctions we are making. Guilfoyle's grounding in research methodology texts (e.g., Lather, 1991) leads her to question Pinnegar's use of "big and little M." She wants a more sophisticated and complete explanation of what Pinnegar proposes grounded in the language of qualitative research she teaches her students. Pinnegar distinguishes between dialogue as the process of inquiry (similar to the scientific method in logical positivism), self-study as the methodology we use to do our work, and various methodological research tools as the specific techniques we use to do self-study work. Guilfoyle does not completely agree. But it is this very controversy that led to the language of this chapter.

Segment Six: The Definition of Dialogue as Inquiry Method

August 29, 2002.

SP: It was when we began dialogue in our own voices about our own selves in relation to others that self-study began.

ML: I suppose.

...

KG: and helping each other to know it was okay.

PP: I agree.

ML: If I understand what you are saying, you are suggesting that dialogue is conscious; and I don't think we were all that conscious in the beginning. No offense intended.

PP: But self-study began in that conscious moment of thinking that our exchanges were worth studying.

ML: What moment were we conscious?

KG: In the chapter we could talk about the process and how it developed over time.

SP: We don't need to be conscious then for that to be the moment it was created. It is that we can create an account that connects what was happening then to now.

ML: Stef, I thought you said dialogue was conscious.

KG: There was also commitment. We wanted to learn – to understand – to support each other.

SP: ML, Dialogue is conscious and we were taking a stand – not to dialogue, but to understand together.

This segment of dialogue comes back to a consideration of where it all started. It attempts to answer the questions of what is dialogue and have we been using it as a process of inquiry (our method of knowing) across our work in self-study. Dialogue as a process gives us a foundation for action in our practice. As a result, it links Freire's (1990) concepts of verbalism and activism in praxis. Freire (1990) argues that if in our consideration of practice we only talk then we produce verbalism. He suggests if we act without reflection on what we are doing we are engaged in activism. It is only when our reflection and action become intertwined and responsive to each other that we develop praxis.

In this segment, the context for productive dialogue, the tension between convergence and divergence, and dialogue as a way of knowing from which claims for action can be made are evident. In this segment we explore the relationship of dialogue and self-study as part of trying to understand what we mean when we say we are using dialogue as a process of inquiry. We are trying to determine if we are using dialogue in the same way that positivism would say they are using the scientific method as the process of inquiry through which something can be established securely enough that action can be taken on the basis of the research findings that emerge from this inquiry process.

Other work in self-study reveals the characteristics and elements of dialogue discussed here through our own work. Loughran and Northfield argue (1996) "In self-study recognizing the dissonance between beliefs and practice is fundamental to action … It may be equally important to include others in the interpretation and response to contradictions" (p. 7). They argue here that agreement and contrast are fundamental in self-study if practice is to be moved forward. In seeking understanding, dissonance, alternative constructions as well as agreement are needed if we are to develop findings of sufficient power for practical action.

In other self-study research, we find elements of dialogue similar to those we

have articulated in this analysis. For example, in Berry and Loughran's (2002) study of team teaching in a teacher preparation course, they highlight how in trying to create a teacher education experience where professors and students engage in a public reflection on the pedagogy experienced by the student in the classroom, it was not enough that the teacher educators were committed to this form of pedagogy and shared certain views of teaching and learning, but they also had to respect and trust each other's teaching and judgment. Parker (1995) presents a self-study of three researchers who explore their past history as researcher through memory work. Their conversations about what they learned about research together are grounded in specific transcripts of research sessions from past research studies. In re-examining the autobiographical memories of their shared professional history, they reveal the way in which bringing the past into the present to reconsider the future provides an important venue for exploring professional growth and practice. Their work clearly reveals the power of the zone of maximum contact for self-study work. In Upitis and Russell's (1998) analysis of e-mail correspondence between a dean and a faculty member, we find clear evidence of how voice, respect, diversity and allowance for inconclusivity are fundamental when dialogue is the method of inquiry. All four of these published studies, provide a basis for considering how the authority of dialogue allows the self-study research community to build knowledge for teacher education practice.

Historical and Theoretical Perspectives

In our discussions during the construction of this chapter, we found that coming to a common definition of "dialogue" was difficult, in part because the four of us brought different background knowledge to the table. Guilfoyle defined dialogue in the context of literacy studies and critical/feminist pedagogy. Pinnegar located dialogue in her knowledge of literary criticism and narrative methodology. Hamilton was skeptical about the possibility of dialogue in an "ideal" sense, based on her critical feminist readings and classroom experience. Placier tended to think of dialogue in sociolinguistic terms, as a kind of talk or "speech event."

Reading the literature did not eliminate our confusion, because definitions of dialogue in the literature vary, and sometimes writers who use the term prominently in their work never really define it. Moreover, each definition we considered had its problems. Bohm (1996) traces "dialogue" to the Greek *dialogos*, with *logos* as the meaning of the word, and *dia* meaning "through," rather than "two" as is often assumed. This derivation, Bohm says, suggests a "stream of meaning flowing through us and between us" (p. 6), out of which comes a new understanding, a new creation. This is in contrast with "discussion," which entails a "ping pong game" of breaking things up for analysis (p. 7) (a distinction also made by Freire & Macedo, 1995). We wondered about the differences between "dialogue" and "conversation," and when we would label our group talk *dialogue*

versus "just talk." The following literature review informed but did not determine the conception of "dialogue" that we constructed during our writing process.

Writing about dialogue as a method of inquiry spans many centuries, dating at least to Plato's depiction of Socrates' dialogues with his students. Today, dialogue is an important concept in social theory that marks an intersection among several disciplines, including philosophy, sociology, linguistics, literary criticism, and communication. Theorists and researchers who write about dialogue focus on a wide variety of social contexts, from everyday conversation to international diplomacy. In all of the sources in which we located dialogue, there was a common emphasis on how participants in dialogue change through the construction of new understandings. There was also a common emphasis on cultural identities, religions, nationalities, and/or political ideologies, as well as roles that entail differences in power (e.g., teacher and student). Both of these commonalities are relevant to our discussion of dialogue in the self-study of teaching and teacher education. In this section, we will discuss three interrelated themes from previous writings about dialogue that are pertinent to the topic of our chapter. In each case, the conversation began in disciplines outside of education, but was taken up by educators.

Descriptive vs. Prescriptive: Dialogue as What is vs. Dialogue as What Should Be

According to some authors, social life is inherently "dialogic." Dialogue is a process that happens all the time, because it is built into our communication and meaning-making processes. Observation and self-consciousness help us to understand how dialogue works, but not necessarily in order to control it. For example, Shotter (1996) investigates Wittgenstein's argument for studying practices of everyday life, rather than over-theorizing, describing rather than prescribing:

> Attempting to articulate how, in fact, moment by moment, we conduct our practical, everyday affairs … in responding to the gestures of others, one's replies are never wholly one's own; they are always, to an extent, 'shaped' by being spontaneous, situated 'answers' to their 'calls.' Thus what any one individual is doing is a part of what a 'we' is doing. Such joint activities have a dialogical or mixed character to them … It is as if the particular situation itself were a third agency in the exchange. (Shotter, 1996, p. 297)

Interactions are spontaneous, unpredictable, and novel. Wittgenstein's "primary concern is with us being able to 'go on' with each other, with us being able merely to make 'followable,' 'responsible,' or 'answerable' sense to each other – simply reacting or responding in ways that make it possible for us to continue our relationships in accountable ways is sufficient for him" (p. 299). It is a kind of Zen meditation, a becoming conscious of practice as it happens. Wittgenstein's work "suggests to us not some new theories as to what is 'out there' in our surroundings as self-oriented, scientifically included, self-contained individuals,

but a new way for us 'to be': that is, as relationally-oriented, poetically-included, dialogical individuals" (p. 307).

Shotter (1996) also cites Bakhtin's writings on the dialogic quality of everyday interaction. Bakhtin (1981) made the sweeping claim that *all* language is dialogic because there is no single meaning of any utterance (heteroglossia). Although there are supposedly agreed-upon or common meanings in any language, the social and historical context entails multiple interpretations of any utterance. Bakhtin labeled these the "centripetal" and "centrifugal" forces in language (p. 271). Holquist (1981b) defines "dialogism", as used by Bakhtin, as "the characteristic epistemological mode of a world dominated by heteroglossia [multiple meanings] … there is a constant interaction between meanings, all of which have the potential of conditioning others" (p. 426). Because of this "dialogic imperative," there can "be no actual monologue" (p. 426). There is also no one or unitary language – it would always be overpowered by heteroglossia. "Dialogue and its various processes are central to Bakhtin's theory, and it is precisely as verbal process … that their force is most accurately sensed. A word, discourse, language or culture undergoes 'dialogization' when it becomes relativized, de-privileged, aware of competing definitions for the same things" (p. 427).

Most commonly, dialogue is used to mean an oral conversation between two or more people. But written language is also dialogic, because "all rhetorical forms, monologic in their compositional structure, are oriented toward the listener and his answer" (Bakhtin, 1981, p. 280). Citing Bakhtin, Dysthe (1996) says that "all texts may serve two functions – univocal and dialogical – and one or the other, is dominant in a given context" (p. 391). When an individual's writing is shared with others, it takes on a dialogic function. Individual writing is most obviously dialogic in the genre of letter writing. For historians, letters from teachers to family and friends have provided one of the best windows on their teaching practices and contexts (Hoffman, 1981). However, authors working alone, composing texts for publication or presentation, must assume or imagine an audience in order to begin writing. That is, they are oriented toward readers or listeners and their possible responses to the writing.

According to Moffett (1982), the language development process begins with dialogue and then moves to monologue.

> Children first learn to speak from conversing. Dialogue is verbal collaboration, which means that utterances are chained by the reciprocal prompting of each speaker by the other. Sender and receiver constantly reverse roles. Feedback and correction are plentiful and fast. Statements are mixed with questions, because speakers can get immediate answers, and mixed with commands, because speakers are localized together in the same space-time and hence more personally related. The I-you relation dominates the discourse, in fact, so that the organization is determined by a succession of social exchanges even when the dialogue is an earnest intellectual discussion sticking close to a topic. Dialogue may of course vary tremendously in maturity but the less developed a speaker the more she is limited to dialogue.

> Growth consists of extending one's range of kinds of discourse by learning to monologue at different abstraction levels. (Moffett, 1982, p. 56)

We are cautious of positing such a linear, developmental process, because in our work we see an interplay between dialogue and monologue that suggests something more complex. From Bakhtin's (1981) perspective, monologue is still dialogic. In fact as we develop into adulthood and are able to think more abstractly and take the perspective of others, we are able to engage in internal dialogue where we intentionally interrogate our ideas using the perspective of others or proposing alternative interpretations. Although we are engaged in a monologue, the form is dialogic. From the perspective of our next group of authors, dialogue is arguably a more "mature" and difficult form of communication.

According to other authors, social life (in modern western societies) is not dialogic, but *should* be, because the failure to practice dialogue creates problems such as misunderstanding, conflict, violence, or miseducation. Dialogue is an ideal communication situation that requires great effort to achieve, and even then may be fleeting or unstable without continuing effort. The work required is educative, because it requires unlearning old ways of thinking and/or communicating and learning new ones (e.g., Gustavsen & Englestad, 1986; Janlink & Carr, 1996; Keedy & Rogers, 1991; Padilla, 1992; Palmer, 1993). Thus, there is a pedagogy involved.

The best-known proponent of dialogic pedagogy is, of course, Plato. He conveyed many of his ideas through accounts of dialogues between his mentor, Socrates, and men from different walks of life in Athenian society (Cahn, 1997). According to Teloh (1986), Socrates rejected the methods of other educators of his time: poets who taught memorization and recitation, sophists who taught speech-making as a display of knowledge, and gentlemen who taught good citizenship in the city state. "All three sources act as authorities who produce passive recipients" (p. 7). Socrates, in contrast, intended dialogue to result in active thinking and perplexity.

"Why does Plato present Socrates through dialogue, and not a treatise?" (p. 5). Socrates did not claim to be the final authority, but an advocate of inquiry. Dialogue allows the reader to see his pedagogy in process. Teloh observes that Socrates' teaching was based on the principle of adapting questioning to the psyche of the interlocutor. A treatise could not demonstrate this adaptability. Teloh also believes that Plato intended readers of the dialogues to be affected in ways similar to Socrates' interlocutors – with perplexity. Reading a dialogue "should make them want to engage in dialectic" (p. 5), a systematic process of dialogue.

A dialogue began with Socrates' interlocutor stating one of his "core beliefs." Socrates responded with a question that began to draw out the implications of that belief. In the ensuing interchange, Plato showed Socrates "thinking on his feet," responding to each new statement by the interlocutor in a way that moved the dialogue forward – not toward "truth," but toward a better way of thinking.

He usually guided the interlocutor not through direct, aggressive questioning but through "innuendo, suggestion, and paradox" (Teloh, 1986, p. 2). Stating one's core beliefs can be threatening, especially as the dialogues were conducted in public settings. Therefore, Socrates employed irony, proclaiming his own ignorance and creating a seemingly safe space in which the interlocutor could feel that "he is the expert and is in control of the conversation" (p. 16). Some readers have interpreted this ruse as arrogance on Socrates' part.

According to Plato's Socrates, characteristics of a good dialogue partner were: shame, admitting that one's beliefs are contrary to one's action; frankness or honesty, saying what one really believes; listening; flexibility; memory; and sufficient knowledge and ability. However, everyone has their limitations. Socrates responded to each interlocutor based on his perception of the interlocutor's ethical or intellectual flaws. Socrates always had a point to convey, and he conveyed it by asking questions through which the student made the discovery or came to the point himself. He was "student-centered" in our current sense, in that he began "where the student was" and looked for a means to improve the student's thinking and/or virtue. Whether or not one agrees with the outcomes, it is evident that this required a great deal of skill. That is, not everyone could dialogue as well as Socrates. Furthermore, in dialogue as inquiry, no one participant is always Socrates and everyone is Socrates. In dialogue as inquiry this is a place to express beliefs about practice not to push the thinking of the other, but to come to understand the implications and alternative explanations. It is a place to confront and account for alternative beliefs and explanations.

Teloh's (1986) interpretation of Socratic dialogue provides a link to self-study, especially the action research work of McNiff (1993) and Whitehead (2002). "Socrates views the psyche as a web of beliefs. For Socrates there is an isomorphic relationship between beliefs and motives for action. The stronger the belief, the greater the motive force for action, and every motive force has a correlative belief. To know oneself is to observe the condition of one's psyche which means both to test one's beliefs to see if they are justified or not, and *a foriori* to see how one's desires – motive forces for action – are arranged" (p. 6). So one should look at both beliefs and actions, what people say and do. Teloh says the dialogue is a way of "giving an account of one's life … If one cannot state, clarify, and defend an account of an excellence, then one is both an intellectual and a moral failure" (p. 6).

In the 1980s and 1990s educational advocates of Socratic dialogue linked this practice to national calls for "active learning" and "higher order thinking." Achieving these goals would require changes in teaching, away from the teacher-as-transmitter model that has been amazingly persistent since Socrates' time. However, educational appropriations of Socrates' methods are designed to fit into late 20th century educational reform discourse. As Brogan and Brogan (1995) argue, "Dialogical learning is the reciprocal exchange between persons who are open to one another and who, through the exchange, are in search of mutual agreement and common understanding" (p. 290). Note that this version of Socratic dialogue emphasizes social consensus, not individual intellectual or

moral development. These authors admit that "Socrates insisted that all knowledge must come from within oneself" (p. 290), but note that paradoxically, self knowledge emerges in dialogue with others. Dialogue thus constructs a relationship among the individual, knowledge, and the community. Amid claims that Socratic methods produce both higher achievement and more positive school communities, professional development for teachers in the "how to's" of Socratic seminars has grown (e.g., Socratic Seminar Society, 2002).

The best-known recent prescriber of dialogic teaching is Paulo Freire (1998). An article by Freire and Macedo (1995) is an example of scholarship represented as a dialogue. In the dialogue, Macedo in particular expresses the concern that educators construe a dialogic approach to mean just "talking" about experience or laissez-faire approaches, without rigorous analysis. Or they adopt the role of the nondirective "facilitator" who adds nothing to the conversation. Freire agrees that teachers need to claim the role of teacher and the power that goes with it. They can be authorities without being authoritarian. Education must have a direction, an objective, and teachers should not be indifferent but active. A teacher should not "renounce his or her duty to teach – which is a dialogical duty" (p. 379).

Another concern they express is that educators adopt dialogue as a "technique" or "method" divorced from theory (note the contrast with Wittgenstein). Dialogical practices "enable us to approach the object of knowledge" (p. 379). Dialogue is not a technique, but a "way of knowing" or "epistemological relationship" (p. 379). "I engage in dialogue because I recognize the social and not merely the individualistic character of the process of knowing. In this sense, dialogue presents itself as an indispensable component of the process of both learning and knowing" (p. 379). Macedo takes issue with dialogue as just talking about experiences, "feel-good" sharing, or "group therapy," because "sharing must always be understood within a social praxis that entails both reflection and political action" (p. 380). Dialogue must involve theorizing about experiences. This would include reading critical and challenging texts, without "over-celebration of theory" over practice (p. 382).

For these two authors, dialogue does not come naturally; it is "not easy to be a dialogical teacher because it entails a lot of work" (p. 383). "What dialogical educators must do is to maintain, on the one hand, their epistemological curiosity and, on the other hand, always attempt to increase their critical reflection in the process of creating pedagogical spaces where students become apprentices in the rigors of exploration" (p. 384). Dialogue is not "a kind of verbal ping-pong about one's historical location and lived experiences." Yet no one "can seriously engage in a search for new knowledge without using his or her point of view and historical location as a point of departure. This does not mean, however, that I should remain frozen in that location, but rather that I should seek to universalize it" (p. 385).

Other writers, however, have questioned the certainty of this prescriptive perspective on dialogue. In the context of teaching, Burbules and Bruce (2001) define dialogue as "a pedagogical relation characterized by an ongoing discursive

involvement of participants, constituted in a relation of reciprocity and reflexivity" (p. 1112). They argue, however, that every key term in their definition should be critically questioned. They examine the commonly posed opposition between the much-maligned teacher-centered pedagogy and the Freirian ideal of dialogic pedagogy, and conclude that classroom dialogue should be as problematized as its supposed "opposite." Reciprocity and reflexivity are especially difficult to practice in a classroom context in which teachers have more power than students and little time or encouragement to reflect. In *Teaching Positions*, Ellsworth (1997) similarly questions the ready adoption of dialogic pedagogy by educators who fail to problematize their positions and relationships.

Research in dialogue as a pedagogic technique can indeed generate ideas and questions that will support the development of dialogue as a method of inquiry. However, in dialogue as a method of research, the participants are all peers. While the participants interrogate ideas, unlike Socrates, they may or may not be using the questions to "guide" the other participants toward discovery of a particular idea. For us this may be one of the big differences between dialogue, as pedagogy in a classroom where the teacher has responsibility to support students in learning a particular content, and in inquiry, where all participants have more equal status. In professional dialogue using inquiry as a method, the purpose is the exploration, analysis, and questioning of ideas or situations leading participants toward understanding. In pedagogy, a teacher might use dialogue as a technique to lead participants toward an understanding of ideas being taught, but the teacher may actually not leave the ideas being examined open to disputation. This does not mean we believe that dialogue as inquiry method can not or does not occur in the classroom, but in a classroom teachers assume responsibility for the learning that takes place and may or may not allow the complete interrogation of ideas that occurs when the goal is the creation of knowledge and pushing the boundaries of knowledge within a field. So while a teacher may organize the classroom as a place of dialogue, in such situations the ultimate responsibility for learning rests always in the hands of the teacher. In dialogue as inquiry method, every person holds that responsibility for him or herself and no one person has that overarching responsibility for the group as a whole.

Means vs. Ends: Dialogue to Achieve a Purpose vs. Dialogue for its Own Sake

This theme is related to the previous one, because those who take the prescriptive point of view generally see dialogue as means to an end, e.g., to reach consensus, to end a dispute, to become a more productive team (or to write a chapter like this one). In order to achieve the best outcome, dialogue must be done well. This is complicated, because some advocate using nondirective means to achieve particular ends. Consider the contradiction, for example, of attempting to construct a more democratic society through coercion or even through too-directive "leadership." The means are contradictory to the ends. Therefore, democratic

dialogue should not be shaped or contorted to conform to one individual's or one small group's conception of democracy. This also underscores our final point in the last section, in dialogue as inquiry method for research, no one person consistently assumes the responsibility of teaching across the entire group for the entire dialogue. Instead each person assumes that role for herself. More importantly, the ends of dialogue as inquiry just as its assertions and findings are generally more inconclusive than those who would assume a prescriptive stance would allow.

Most education research on dialogue among teachers can be located here (e.g., Clark *et al.*, 1996). Generally, researchers or teacher groups who adopt dialogue as a method have an end in mind: teacher learning or professional development, collaboration, or participation in school decisions. Further, these dialogic processes are not ends in themselves, but practices that are supposed to lead toward improved outcomes or experiences for students. Dialogue is part of the trend toward reconstructing the culture of the "egg crate" school (Lortie, 1975) that has kept teachers isolated from each other. Dialogue may reduce teacher alienation or make work more rewarding, but benefits to teachers themselves are often not sufficient for "investing" in such activities. There must be a claim of benefits to students as well. The danger, then, is that dialogue could be prescribed by school leaders as a form of "contrived collegiality" (Hargreaves, 1991).

Other proponents of dialogue claim that it could reduce conflict on a small or worldwide scale. Habermas holds out the hope of rational, ethical, social life made possible by correcting the problem of distorted speech (Gurevitch, 2001). Bohm's (1996) theoretical analysis is that "hate is a neurophysiological, chemical disturbance of a very powerful kind, which is now endemic in the world" (p. 31). There is "a reason to dialogue. We really do need to have it" (p. 32). Defending opinions is violent, not intelligent. "I think this new approach could open the way to changing the whole world situation" (p. 35). Even if one "side" will not participate, Bohm says, those who are willing should take dialogue as far as they can go and as accurately as possible insert the arguments, ideas and perspectives of the group who refuses to participate. "I'm suggesting that there is the possibility for a transformation of the nature of consciousness, both individually and collectively, and that whether this can be solved culturally and socially depends on dialogue" (p. 46). Decrying the adversarial or even violent forms of interaction that seem to have become prevalent in society, including academe, Tannen (1998) likewise calls for dialogue as a solution.

Dialogue may be a strategy for deconstructing and dismantling postmodern racism (Flecha, 1999). According to Flecha's dialogic perspective (based in Freire and Habermas), it is possible for people who are different to live together, under three conditions. First is equality of differences, in which everyone has the right to be him or herself. Each group, ethnicity, or individual would have an equal position in the dialogue, "to prevent marginalization and exclusion" (p. 164). Nostalgia for homogeneity is mistaken – society today is marked by hybridism or *mestizaje*. Schools should be places that invite everyone's participation in

decisions that enhance academic learning and teach how to live together peacefully. The second condition is the possibility of shared territories rather than possession of territory by a single group. Dialogue is designed to create conditions of possibility, by promoting equal positions in the dialogue and challenges to inequality. The third condition, according to Flecha, is radicalization of democracy. Western democracy based on capitalism is not the only model, and through dialogue different forms of democracy may emerge.

Others seem to view dialogue as an expressive, poetic, consciousness raising experience that is intrinsically valuable and/or cannot be controlled in order to reach a particular end. Dialogue from this perspective is art or play around a topic. Bohm (1996) actually warns that attempts to control or direct dialogue will paradoxically subvert its capacity to reach the desired end. But there may not be a desired end. The "product" of dialogue is ambiguous, contingent, ongoing. According to Gurevitch (2001), the conversation/dialogue is a continuous exchange, not an arrival anywhere. Habermas's hoped-for consensus may be elusive. Dialogue is not owned by any participant. Conversation is in the middle, decentered, plural rather than dialectic. The one "requirement" is that it be sustained through active participation, keeping the ball in the air. Even if the end of pedagogical dialogue is marked by the end of a class or the end of a term or the granting of a degree, it usually has an end. Epistemological dialogue does not.

Modernity vs. Postmodernity: Reaching Consensus or Truth vs. Living with Multiple Realities

It is clear from our discussion so far that dialogue has been identified with both modernism and postmodernism. Dialectical reasoning, the legacy of Plato, Aristotle, Hegel and Marx, has been the philosophical basis of modernism, the idea of progress through rationalism. Dialogue could be a method for generating knowledge claims. "How can a dialectic produce knowledge? If by 'knowledge' is meant a final certainty with guaranteed truth, then it cannot. But dialectic can produce justified claims to knowledge … One possesses a justified claim to knowledge when one can state, clarify, and defend that claim against Socratic interrogation and objection" (Teloh, 1986, p. 22). Surprisingly, Socrates himself treated all his knowledge claims as revisable. For him, knowledge is an "ideal of a completely defended and defensible account. We never in fact achieve this ideal" (Teloh, 1986, p. 22). We have only degrees of knowledge.

Many modernists, however, became convinced that the scientific method could generate a single Truth. A critique of modernism entails a critique of this mode of reasoning and methodology. For example, action research theorist Kemmis (2001) discusses how Habermas's thinking on dialogue later took a postmodern turn. In his earlier work, "Truth could only emerge in settings where all assertions are equally open to critical scrutiny, without fear or favor" (p. 93). Habermas hoped that critical action research would be "democratic" in that, "participants should be committed to reaching mutual understanding and unforced consensus

about what to do" (p. 93). Habermas's thinking changed as postmodernism challenged the possibility of consensus and progress through reasoning. Postmodern conceptions of dialogue emphasize ambiguity, contingency, and multiplicity.

Two pieces on dialogue by Gurevitch also illustrate this move. Gurevitch (1991) lays out the dimensions of dialogue as an ethical ideal. The "morality of presence" rarely reaches its full potential (p. 191), but it is always there as a possibility, as a "vision of humanity" (p. 191). "By reaching beyond one's individuality one extends the boundaries of the private realm into that of the other – the specific other and through him or her into the generalized 'Other'" (p. 192). This process constitutes society. Ten years later, Gurevitch (2001) presents a postmodern view of dialogue as characterized by multiplicity and indeterminacy.

As our own ideas about dialogue "developed" (not to imply a linear movement toward a final position) through the writing of this chapter, we visited and revisited these themes and generated new ones. Like "self-study," dialogue is a slippery concept. Many self-study researchers, ourselves included, can be characterized as using "dialogic methods," without using this label. In the case study of our self-study research that follows, we will pragmatically and inductively define what we mean by dialogue. In the conclusion, we will present what we have come to mean by "dialogue" as a method in self-study research through this process.

Understanding the Discourse of Dialogue – A Way of Knowing

Long before we could so smartly delineate our views about dialogue, in academia and beyond, we were at the point of beginning – again – as teachers, thinkers, and theorists. As beginning teacher educators, we were exploring the different ways of understanding research and ways of knowing. We had some sense of what did *not* work for us, given our theoretical and educational backgrounds, but we were less clear about our perspective of what did fit with our views. In this section of the chapter, we unfold the process that anchors our vision of dialogue as a way of knowing. Here we present a perspective on our growth as researchers. Further, we assume the possibility that other researchers experienced this same movement through different levels of understanding about the assumptions concerning relationships among researcher and researched and the epistemological demands for establishing belief as knowledge.

Setting the Stage

The examples presented in this section attempt to spin a tale about research. For our first foray into conference presentations that explored our views of teacher education we wrote journals about our classroom experiences and engaged in discussions about our practice as teachers. As academics, we used those same documents to validate, explain, and explore experiences. Doing that,

we unintentionally pushed ourselves into a breakthrough from one level of discourse on research to another.

During this early work, we talked about ourselves as beginners, as experts, as innocent, as experienced. We collected, organized, and analyzed massive quantities of information. Critical to the development of our ideas was the initial discovery we made in the preparation of the work presented here. While we had some experience as researchers, we also knew we were pushing ourselves, and others, along a different path. This discovery, however, came with hindsight.

Upon our arrival at the 1991 AERA Conference in Chicago when we shared our papers amongst ourselves in preparation for our presentation, to our surprise we saw that our use of the journal entry selections varied and we each offered different perspectives on the presentation of data. How could that be, we wondered. How could responsible researchers vary in their understandings of the same texts? What did this tell us about the research process? Our research process?

Developing Discourse as a Way of Knowing

Our understanding of dialogue as a way of knowing did not emerge fully formed. The selections presented below demonstrate the precognition of our eventual understanding of the discourses of dialogue. Long before we began grappling with these discourses, we developed our understandings of qualitative research, teacher education, and the power differentials within the university.

As we have come to understand ourselves as scholars and thoughtful teacher educators, we see that we have walked through a variety of discourses. In the next few paragraphs we describe our walk among these discourses. Our understanding of these discourses has been influenced by scholars engaged in qualitative research. In hindsight, as we view our progression through the discourses, we can see links between our development and the development of ideas surrounding qualitative research in the larger research conversation in research on teaching and teacher education and the paradigm wars of the 1980s and 90s (e.g., Denzin & Lincoln, 1994; Lather, 1991).

An important note here is that while we present this in a linear fashion, we do not necessarily consider these ideas as a linear progression. Instead, we attempt to propose a possible progression as well as a possible wavering of ideas as one grows and develops as a thinker.

First Discourse

In what we call our *First Discourse* we accepted the role of the researcher as defined in modernist and scientific terms and we attempted to live that role in our own research. Researchers could be bounded, atemporal, and static. In other words, we felt that as researchers we were capable of distancing and separating ourselves from what was being researched. We felt we could maintain our perspective during the process and remain unchanged. Finally we could establish objective boundaries between ourselves and the people, contexts, and events that

we were studying. Within this discourse we looked for and attempted to find the Truth. Here we valued objectivity and attempted to manipulate the context to draw forth the Truth we sought. Having been educated in a traditional setting and in a time most focused on a positivist perspective, we had little experience that suggested an alternative view of knowing for educational social science research. However, in our other professional roles as historians, teachers, and literary critics, we knew and often used other epistemologies. Along this pathway, we claimed an ability to generalize about what we saw and believed that that generalization would remain unchanged until we undertook another study that might disconfirm our findings. As thoughtful novice scholars with training that eventually reached beyond quantification, we felt discomfort within this discourse. Here we experienced uncertainty but lacked the language to articulate about or understand that uncertainty.

The Second Discourse

As we read and considered new ideas and began to pose ideas to each other, we moved into a *Second Discourse*. In this discourse we recognized a lack of boundary around what was being researched. The writings discussed and the selections presented accelerated our move into this discourse. Further, we recognized that knowledge could be seen as contextual and dynamic. This means that the TRUTH shifts to a possible truth and can be context specific. Interestingly, in this discourse, as researchers we continued to act in our role as researchers as if we were capable of remaining in some way intellectually and objectively separate from what we were studying – we did not remove the boundaries we had drawn around ourselves as researchers. We felt that in our role as researchers the self was unchangeable. However, because we were exploring our understanding and action in our own practice, we sometimes struggled to keep our self as researcher separate from our self as researched. While we acknowledged the struggle we experienced in maintaining these boundaries, we continued to accept the claim regarding the existence of boundaries.

The Third Discourse

Eventually our view of self and approaches to research moved us further along our path. In the *Third Discourse* we, as researchers, saw the self as dynamic, unique, existing in time and context, and a part of an unfolding process. Here we recognized that we were not all knowing or fully objective. In this discourse we had insight about things that are knowable in the moment. The multifaceted, complicated understandings of the moment were incorporated into the view of the context. In this discourse, we claim that anything studied may change as we study it. Within this discourse we remain current and attempt to make sense of context as it makes sense of us. Only in this discourse can we be comfortable with the fact that others have different views. Until this point along the path we seemed dedicated to convincing others to adopt our particular view.

The Fourth Discourse

In the *Fourth Discourse* we broaden our understanding of researchers and contexts. We come to see that just as what is being researched can change as we study it, the researcher may change in the processes in interaction with and response to what is being studied. Here there is a closer relationship where the researched and the researcher come together and have impact on each other. The fear of subjectivity subsides and we recognize that in research involving humans, research findings will always exist in a state of inconclusivity because they exist in the zone of maximal contact of past, present, and future.

An Example

An example of the move from the first discourse to the second discourse can best be illustrated by an in-depth discussion of the writings from our 1991 AERA symposium. When Guilfoyle (1991) addressed the process of developing as teacher educators, she indicated the breadth and complexity of the process when she noted that she had *realized the nightmare of last fall* [referring to her initial year] which made her feel as *off-balanced and harried* as she had felt the previous year.

Hamilton (1991) used this same statement in a section entitled "Finding Balance" to address the desire of new faculty members to balance lives, families and expectations. This extract embodied our concerns about the uncertainty of the situation, particularly in the absence of mentors:

> I had thought the beginning of school would be easier the second time around, but I feel as off balanced and harried as I did last year. (Hamilton, 1991, p. 6)

Both Guilfoyle (1991) and Hamilton (1991) utilize the selection from our writings to express the tension a new faculty member experiences. However, the actual presentation of the selection as well as the editing of words, suggests that each author had a different view of the meaning within their own writing and raises interesting questions about method. For the purposes of this chapter, the striking element here is that clearly we were using materials that we had studied and been involved with for quite some time, yet questions about validity and perspective on the data emerged.

Each paper for the 1991 symposium, entitled "Using Experience to Put the Pieces Back Together: Examination of the Process of Becoming a Teacher Educator," focused on our experiences as novice teacher educators and academics. We used all of our journals as the data source. We had hundreds of pages of materials. When we sat down to do the analysis we assumed we would view our entries from similar perspectives. Naïve though that may be, it provided rich theoretical moments.

This point is further underscored when we look at the ways that Pinnegar (1991) and Placier (1991) used another selection from the data. Pinnegar's paper

focused on the process of becoming an expert practitioner. Placier's paper looked at the politics involved in moving through the tenure process.

Nudging the reader beyond the traditional elements of classroom interests like routines and evaluations, Pinnegar talks about our interests in providing the evidence for what works in our classrooms. Supporting her assertion that we are experienced, effective teachers, she likens the descriptions of our classrooms to the claim by Jackson (1965) that teachers provide accounts of successes to sustain decisions made about classroom structure. Pinnegar states that Teacher Educator D in one letter provided a poignant description of connectedness from her own youth. She ends her description with this statement,

> I think that somehow the university ought to be like my **memory of my childhood** – where the president actually knows and communicates with faculty. Where faculty know each other across disciplines and care deeply about the training of each other's students and are concerned that fairness prevails – I know fairy tale stuff (9/10/90). (used by Pinnegar, 1991, p. 11)

Clearly Pinnegar sees this statement as drawing a relation between the writer's past history and her current approach to teaching.

For Placier, this description offers something quite different. Within Placier's text (1991) she looks at the common voice we, as a group, had about the despairing view of academia. According to Placier, "Two of us professed to being physically repelled, 'sickened' by it. Other verbs were 'appalled,' 'tired,' 'angered,' 'frustrated' ('so much I could scream'), and 'hate.' The 'game' metaphor came up several times." All of us criticized the institution in comparison with our image of what it should be. One of us dreamed of a university that would be:

> Like my **memory of my childhood** – where the president actually knows and communicates with faculty, where faculty know each other across disciplines and care deeply about the training of each other's students and are concerned that fairness prevails – **I know, fairy tale stuff**. I don't really expect this perfection but a minimal approximation would be helpful at times. (used by Placier, 1991, p. 6)

For Placier this selection captures a vision of the university, one of repression and hopelessness. Rather than connecting the author's past history, this selection captures the imagery we convey in our writings about the institution.

In one final look at the use of our writings, three of us – Guilfoyle, Hamilton, and Placier – used a particular selection to address an issue in our papers. In the use of the phrase "dance to *their* little song" or the words directly associated with it, we each attempted to capture our dissatisfaction with the system. We also demonstrated our different understandings of the situation. In her paper, Guilfoyle looks at the increasing tensions we experienced between the role of researcher and the role of teacher. From her view, we valued the role of teacher and we wanted our institutions to honor that role. To illustrate the tension, she used this selection:

> You know I want to research and write because I love to do both. ... But, I feel that at this point in my life, learning to teach at the college level is the most important thing to me and it should be to them too. (11/1/90–#4)

For Hamilton, the legacy of tradition at our various institutions caused us difficulties. From her perspective, we sought transformation, while we attempted to avoid explicit resistance. To depict how we used "our rebellious natures ... in writing," she selected this entry:

> You know I want to research and write because I love to do both. But it is almost getting like I don't want to do it just to "dance to their little song."

Placier (1991) analyzed the politics of the classroom and the school. Rather than draw out an extended quote, she pinpointed words or a phrase to underscore her point. She stated that:

> "Politics" ... seemed to have become a dirty word to us, associated with power grabbing and conflict, which we claimed to eschew in favor of empowerment and cooperation. On the other hand, all of us more or less defined our teaching as "political," in a positive sense. The politics of the first three contexts left us feeling powerless, confused, overworked, "employees," "dancing to their song," etc. In the classroom we were in charge. We attempted to create a micro version of the educational utopia we longed for in the institution at large.

We could debate our use of quotations from a traditional research perspective, but that is not the point here. Here we are illustrating that for the first time, the Arizona Group realized when seeing our papers and our use of our writings, that there was no one right way to understand and use text in our approach to our research.

Although initially we did not recognize the multifaceted nature of the postmodern approach, in hindsight, we can connect these writings as the initial realization. At this point we began to ask how could evidence be used in different ways? How could the same ideas be used in different ways? What are the ways in which dialogue could bring multiple voices together as a whole? How is the power of the work at once similar and dissimilar? There were issues here of which we were aware and there were a few that only seemed relevant with hindsight.

We find similar insights in Holt-Reynolds (1996) self-study in which she comes to understand that her students bring into her classroom a self-as-student and a self-as-teacher and that only when the self-as-teacher comes alive does what she teaches future teachers have any hope of moving beyond their practice as students into their practice as teachers. When students' self-as-teacher comes alive, future teachers identify what is being taught not just with a body of knowledge to be learned as a student but interpret it within the context of their images of themselves in the role of a teacher. In other words, students have a

different level of understanding of the meaning of what they are learning based on the level of interpretation they are responding with.

Another example which reveals a similar aspect of the movement from the first discourse to the second is found in the collaborative work of Cole and Knowles (1996) where within their letters they reveal alternative interpretations or expanded interpretations of similar situations. In this piece, their analysis takes on a dialogic form since they must account for each of their voices as the researcher and yet they are also the researched. Presenting edited versions of their letters as a major part of the article invites readers into a dialogic interpretation of their work.

Self-Studies: Monologues or Dialogues

Self-study seems to connote a genre of monologic research, in which a researcher writes in the first person about her/his thoughts, experiences, perceptions, or learning. In this section, using examples of our own work and that of others for support, we will develop the theoretical perspective that even very individualistic self-studies can be "dialogic" in several senses and that these dialogic characteristics provide evidence that dialogue as a method of inquiry can provide an authoritative basis for making knowledge claims.

As beginning teacher educators steeped in our graduate school readings of theorists such as Freire (1990) and Vygotsky (1978), our group members expressed the belief that teaching *should be* "dialogic," in opposition to the "transmission" model of teaching (Burbules & Bruce, 2001). However, in our teacher education classes we found that the dialogic teaching we espoused was as fraught with problems as the "traditional" models we had rejected, an insight discussed at length by Ellsworth (1997) and Burbules and Bruce (2001).

> Dialogue is assumed to be capable of everything from constructing knowledge to solving problems, to ensuring democracy, to constituting collaboration, to securing understanding, to building moral virtues, to alleviating racism or sexism, to fulfilling desires for communication and connection. But it's just not that easy. (Ellsworth, 1997, p. 49)

While we seemed to be able to dialogue with each other across our differences, dialoguing with students (and colleagues) who did not share our beliefs was hard if not impossible (Burbules & Rice, 1991). Our exploration of differences between talk, conversation, and dialogue (during the construction of this chapter), helped us understand that for dialogue to work there has to be as shared commitment by participants to respect each others' growth and allow for disagreement where uncomfortable ideas or opinions could be expressed and pursued. One explanation for the longevity of our group dialogues may be that they created a context for sharing and understanding this painful contradiction between belief and practice, or self and institutional norms, in our work.

As the examples in this section will show, dialogue may also appear in self-studies as internal reflection or "talking to oneself." Inner dialogue is the basis

for "mature self-consciousness" (Gurevitch, 1991, p. 193). "Language ... is some-body talking to somebody else, even when that someone else is one's own inner addressee" (Holquist, 1981a, p. xxi). The researcher may ask and answer questions such as: Why is it so hard for me to act in ways consistent with my values (McNiff, 1993)? When an internal dialogue is recorded and shared, it becomes dialogic in the social sense of the term (Dysthe, 1996). Hegel used the term dialectic (from the Greek for conversation) to describe a thinking process in which contradictions or oppositions could be synthesized or reconciled into a new idea. Inner dialogue can take the form of a dialectic between one's beliefs and one's practice or between one's values and the norms of the institution.

Reflection also prepares the individual inquirer to engage in dialogue with others. Advocates of dialogue argue that under ideal conditions each participant would prepare for the process by examining his/her assumptions (Bohm, 1996; Isaacs, 1996). Elinor and Gerard (1998) suggest that the, "practice of dialogue begins with a process of self-inquiry and self-reflection. Listening for one's own assumptions and most deeply held beliefs and values is essential in dialogue" (pp. 177–8). According to Gurevitch (2001), the middle term of the dialogue is the "fulcrum," where separate speakers meet for a shared activity that still recognizes their separateness and subjectivity. But to engage in the middle, each speaker must acquire his/her own voice, through monologism. Therefore, mono-logic self-studies surface individual assumptions for further examination in dialogues with others and help each inquirer find a voice.

Evidence of Dialogue in Monologic Self-Studies

With one exception, examples of the Arizona Group's work in this section appeared in a special issue of *Teacher Education Quarterly* (1995, Vol. 22, No. 3) on "Self-Study and Educational Theory." After conference presentations of the collaborative self-studies discussed in the previous section, our conversations expanded to include colleagues such as Jack Whitehead, Tom Russell, and Fred Korthagen. Jack in particular challenged the group in a Socratic fashion with questions about the purposes of our work and the evidence we could muster of our educative relationships with students. We decided that our next step should be to study our individual practices more closely. The paper Pinnegar wrote for this set of four self-studies was not included in the TEQ issue, but was published as a chapter in *Teachers Who Teach Teachers* (Russell & Korthagen, 1995). To keep the original set of self-studies together, we will discuss the book chapter here.

The TEQ volume was another step toward legitimation of self-study and narrative research in the mid-1990s (Gitlin & Russell, 1994). Surrounding our stories of beginning women teacher educators with commentaries by better-known male researchers may have been part of this legitimizing process. Tom Russell co-authored the introduction with Pinnegar and contributed a self-study of his own, Jack Whitehead wrote a response to each author, and Fred Korthagen composed a final reflection on all five pieces. The introduction described our

group's work as emerging from dialogue: [The four authors] "made a commitment to share their personal journals in which they would detail the 'trials and tribulations' as well as the rewards of their early years as assistant professors." In addition, Jack Whitehead would be providing "dialogic responses" to each piece (Pinnegar & Russell, 1995, p. 5).

Therefore, although we did not use the term at the time, our work was becoming identified with "dialogue." Karen Guilfoyle (1995) described us as using "ethnographic field methods," and borrowed from the discourses of qualitative, constructivist, feminist and participatory research in order to position our work within familiar, accepted research traditions. We were unaware at the time of the practice of "dialogic research" among action researchers such as Cunningham (1988), Randall and Southgate (1981), Steeves (1993), and Tandon (1981).

Sharing Struggles Through Conversation

Guilfoyle (1995) introduced "Constructing the meaning of teacher educator: The struggle to learn the roles," with a history of our self-study work, in which dialogue is evident throughout. For example: "Data from our first year (1989–90) were generated informally over the telephone and through letters as we shared 'stories,' [and] sought help. … In the second year (1990–91), more formal methods of inquiry were used to study our process … field notes were recorded and expanded in the form of dialogue journals. Weekly to bimonthly entries were written, shared, answered, and analyzed by the four participants" (pp. 12–13). Guilfoyle portrayed the individual self-studies in this volume as part of the ongoing flow of our work – not a retreat from collaboration or dialogue, but the next phase.

Rather than "dialogue," Guilfoyle used the term "conversation." For example, she said, "In sharing my interpretations, I join the conversation with others who choose to use a form of participatory research (Maguire, 1987) not only to educate but to participate in transforming education, academia and society" (p. 14); and "We hungered for colleagues with whom to enter into a critical conversation (Fine, 1992, p. 17)." Thus, she conveyed the sense that an individual self-study is the researcher's attempt to begin or enter a dialogue with others.

Guilfoyle's self-study centered on "struggle." For her, this usually means political struggle, a dialectic between self and institution, but in this piece she focused on classroom interactions with students. To represent her struggle to transform her practice in the direction of constructivist, whole language approaches, she quoted from student journals and her personal journal. She depicted herself as a dialogic teacher, with students learning through talk in small groups and through dialogue journals. Yet some of her interactions with students were troubled, full of misunderstanding or resistance – in essence, the problems and contradictions of dialogue described by Ellsworth (1997) and Lather (1991). Some students did not understand her intentions and wondered why her teaching went against the grain of their expectations and the norms of

the program. Their comments stimulated an internal dialogue about her practice in the context of an institution that did not nurture her way of teaching or recognize the value of teacher research.

While this piece is personal and context-specific, Guilfoyle did not present herself as alone; she consistently used "we," not just "I," making it clear that her struggle was also ours. She characterized "our voices" as women teacher educators as for a time growing stronger, as we "figured out" our work, and then growing weaker under the intensifying pressures of tenure (p. 24). However, she ended with a hopeful quotation from Nel Noddings, (2002) herself an advocate of dialogue, about how women may modify traditional ways of knowing in academe and create new kinds of teaching and research.

For each of the articles, Jack Whitehead wrote a response that spoke directly to the author, initiating a dialogue between his conceptualization of self-study and hers. He noted that in this paper, in contrast to some of Guilfoyle's other work, "There is a noticeable lack of dialogue that shows you making connections with your students" (p. 27). For Jack, dialogue meant dialogue between teacher and students, ideally providing the reader with evidence of the teacher's contributions to their learning. Whitehead (1995) argues that "In the form and content of an action research account from a reflective teacher educator I expect to hear dialogue both internal and with others in which evidence of learning can be seen" (p. 119). Guilfoyle's work showed that self-study can also explain why such dialogues may be absent from one's practice, and why educational institutions are settings in which dialogue can be difficult if not impossible to achieve.

Mary Lynn Hamilton: The Self as Protagonist in a Story Told to Friends

Hamilton (1995) described her history in self-study as a self-journey, "As well as a quadralogue with colleagues, highlighting shared experiences" (p. 30). The title of this paper, "Confronting Self: Passion and Promise in the Act of Teaching, or my Oz-dacious Journey to Kansas!" introduced Hamilton to the reader as a protagonist in the familiar "Oz" story, employed as a heuristic to inquire about her own situation. In contrast with Guilfoyle, the pronoun in her self-studies is always "I." She labels her work "intimate scholarship," a revelation of the self that makes her vulnerable to her audience. Nevertheless, although this was lost in the editing process, this piece was originally framed dialogically, as a letter to the group beginning "Dear friends." Even this existential self-study work was constructed as a story told to friends.

The focus of this paper was an internal dialogue, a dialectic of voice and silence in the life of a beginning teacher educator. Dorothy/Hamilton was caught in the cyclone of epistemological conflicts in social science. She would like to have expressed her point of view on research, to use the discourse of the teacher-researcher or the teacher (in collaboration with students) as knowledge-generator, but in the political context of her institution she would not be heard. Thinking back to her public school teaching experience, she realized that what she knew about teaching was not recognized as "Knowledge" in academe. This

was true even though she had added, through her academic studies, a rich theoretical layer to her deep experience.

Appropriating characters from the Oz stories (thereby exploring Aristotelian conceptions of reason, will, and emotion) metaphorically, Hamilton wrote that she had a brain, but needed heart and courage to continue alone. It would have been ideal to have partners on the journey, but there were none in her immediate social context. Would-be colleagues instead silenced her voice; she could not dialogue with them. In the classroom, Hamilton wanted to be an empowering critical pedagogue, but students told her she lectured too much, that her classroom was monologic. She asked herself: Why do I talk so much? Could it be because I am silenced outside of the classroom? Faced with this contradiction between belief and practice, she tried to change her practice, to "engage students in conversations," to ask questions, to not be put in the "all knowing expert" role (p. 37). "Over time, with my students talking with me and interacting with me, in addition to my own reflecting on my experiences, I have shifted, and I think I have reached a much better plane as a teacher … I am talking to them about what is really happening in our classroom" (p. 37).

Where was Glinda, who would show her the way home? Instead, she found, the answers were within. Like Dorothy, "I had only to look to myself, not to external forces, to discover the power I had to offer … I am no longer looking outside myself and my experience to discover reality. Knowledge, once outside my grasp, is mine, and I enjoy learning with students and colleagues as we critically examine our worlds, weaving our theories and generating new ideas" (p. 38). However, dialogues with students and distant colleagues were not sufficient to empower the beginning professor. The classroom may become a learning community, but the institution remained hostile territory. Despite this, she ended on a hopeful note, arguing that finding voice and using it, "looking to ourselves for answers" (p, 39) could make a difference. Here she shifted to "we," and although the reference is unclear, recall that this was originally written as a letter to the Arizona Group. She seems to be saying: Friends, here is the lesson for us all that I draw from my story. Dialogue may give the self-study researcher the courage to put thoughts into writing and to imagine a receptive audience for the writing.

In his response, Jack Whitehead expressed concerns that this self-study did not represent Hamilton's educative relationships with students as well as one of her other papers, based on a dialogue with a student. He seemed uneasy with her close focus on the self, saying that self-study should not *start* with "I" but *include* "I." He also questioned her citation of so much theoretical literature, if she were really going to rely on herself and students to generate knowledge about teaching. Hamilton might have responded that understanding self and finding one's unique voice may be a prerequisite to engaging in dialogue (Elinor & Gerard, 1998; Gurevitch, 2001).

Peggy Placier: Disclosing Teaching Mistakes to Others

In this paper, "But I have to have an A: Probing the cultural meanings and ethical dilemmas of grades in teacher education," Placier mentioned the Arizona

Group's collaboration only once. However, the group was in the background, as a sympathetic audience for her embarrassing accounts of learning to teach in higher education. Placier began conventionally with a review of research on her topic, although the self-study was completed *before* she read all of this work. She learned after the fact that psychologists and sociologists had both studied college grading more "systematically" and had generated theoretical concepts and empirical claims about it. But rather than asking, "Does my research confirm or disconfirm these claims?" Placier asked, "Do these other researchers' findings help me interpret my own experience?" Another dialectic in self-study work is between the self-study researcher's knowledge and the claims of other researchers.

Placier introduced the dilemmas of grading with data from field notes of conversations with her students, in which she heard the refrain, "I have to have an A." She listened to her students but did not really understand them; these were not dialogues. Working within the traditions of her department and discipline, and being thrust into teaching a large "lecture" class, she was using the "transmission" model of teaching that is posed as the "opposite" of dialogue (Burbules & Bruce, 2001). Following the advice of a senior male colleague, she was beginning to distance herself from her students, giving "objective" examinations, grading on a "curve," and not concerning herself with their problems. However, this was contradictory to the belief in dialogic teaching she brought from graduate school and shared with the members of her group. She felt responsible for some students' evident lack of learning, and wanted to understand why they had not received the "A" for which they hoped.

Placier presented findings from her studies of two grading "fiascos," investigations too messy to be described as "action research." The fiascos developed when she tried to open up conversations with students at the "bottom of the curve" on an objective examination, and then tried using written grade "appeals" to give students a second chance to succeed on an essay exam. In both cases she saw that by trying to make things better, she created a new dilemma. Finally, she asked her students to write end-of-semester responses to the question, "What grade do you think you deserve in this class? Why?" From these she identified several perspectives on grades, not one monolithic "student" perspective.

In this work Placier did *not* succeed in having reciprocal dialogues with her students, or "educative conversations" in Jack Whitehead's terms. Students were the natives of an alien tribe she was trying to understand. Their responses to her questions revealed the cultural and political gap between herself and her students, and unveiled the paradoxes of her pedagogy (Ellsworth, 1997). This personal, confessional kind of self-study work was difficult for her: "In retrospect and as a researcher, I am embarrassed by the ad hoc, individualistic qualities of my development as a college teacher" (p. 60). Nevertheless, as hopeful as her other Arizona Group colleagues, she ended with a naive call for a dialogue with students to "resolve the grading dilemma together" (p. 61).

Jack Whitehead was not impressed with the "inchoate nature" of this self-study (p. 62). He preferred another piece in which Placier applied a structured action research approach that, "integrated dialogues with students and drew

upon the writings of other academics within the action reflection cycles of presentation" (p. 63). He also worried that by questioning something so fundamental to the academic culture, Placier might cross a "bridge too far" (p. 63). Yet this work sparked many more conversations with other researchers than the action research study. The process of becoming a teacher educator can be chaotic and confusing, and sharing mistakes with colleagues might stimulate more dialogue than sharing successes.

Stefinee Pinnegar: Providing Others with Evidence of Self-Examination

While in this self-study Pinnegar did not mention our group even in passing, the group had set the direction for her study. We had decided that each of us would delve into one of our toughest problems in teacher education. Pinnegar asked herself a very tough question indeed: "Could I teach in the ways I was telling future teachers they should?" (p. 56). This is a risky proposition for a teacher educator. Pinnegar arranged to teach English for several weeks in an alternative high school. She taught four days a week, one hour each day. It was analogous to a student teaching experience, because the regular teacher did not grant her control over many aspects of the situation: classroom management, room arrangement, scheduling, grading. "In most ways," she said, "I felt like a guest in the classroom" (p. 57). Thus, she titled the study, "Re-experiencing student teaching."

The "dialogue" in this self-study was primarily internal self-reflection. Pinnegar reflected on what she knew about teaching, how she knew it, and where she could see it in her practice. In journal entries she recorded observations and interpretations of the classroom situation, the students' engagement (or lack of it), her plans and purposes and what happened when she attempted to put them into action. She coded and analyzed the entries, looking for evidence of theories she espoused as a teacher educator, such as problem representation, reflection, planning and management. While she did not use the term "dialogue," she was looking for signs of student engagement with her in the Vygotskian "zone of proximal development," and some sociocultural theorists describe interactions in the ZPD as "dialogic inquiry" (Wells, 1999).

The study included a bit of writing by Jay, the classroom teacher, and some description of interactions with him, but Pinnegar did not report any extended conversations with him. Like his students, Jay was one of the "observed" in her study, someone she was trying to understand and with whom she wanted to build trust. She and Jay may not have been able to engage in dialogue because of the micropolitics and time constraints of the situation. Dialogue with Jay might also have been an instance of "dialogue across difference" (Burbules & Rice, 1991), because Stefinee and Jay represented classroom problems differently, and therefore came to different solutions. Yet she also came to respect Jay's "ingenious forms of management" (p. 66), and for his part, Jay borrowed some of her approaches to teaching. Perhaps given more time and more trust-building, the two of them might have engaged in dialogue.

Jack discussed this study in the TEQ issue, noting that Pinnegar emphasized the importance of gaining trust in order to gain student involvement. He appreciated Pinnegar's "stories" and said there was much to learn from them, but suggested that she include more correspondences and conversations with others (i.e., dialogue), rather than only her own voice. While the "dialogue" in this study was primarily Pinnegar's self-reflection, she wrote it for an audience of the growing self-study community. Holding herself accountable to that community, she asked herself questions that have been the source of many S-STEP dialogues: What evidence can I provide of my ability to teach in ways consistent with the theories I am purveying to preservice teachers? Can I create a trustworthy, systematic approach to self-study that would demonstrate this to others?

In his response, Fred Korthagen (1995) said that, "These five teacher educators have strongly supported and stimulated each other during their inquiries. In spite of geographical distance they were in close contact with each other by means of electronic mail. This is heartwarming, but it makes one wonder at the same time: How would they have persevered in their struggles without e-mail? What support do teacher educators, and especially beginning teacher educators, receive?" (p. 103). Could long-distance dialogues ever accomplish the transformative, collective changes in teacher education that the authors espoused? Fred's questions have become even more pertinent in our subsequent dialogues, as teacher education reform seems to be moving away from the directions we support. These individual self-studies depicted the loneliness of the teacher educator who does not fit the institutional mold, and the need to create communities of dialogue, as we have in the Arizona Group and in the S-STEP SIG.

Implications for Self-Study Research

Several implications for dialogue as a method of self-study emerged from this analysis. First, the absence of dialogue in the context of one's teaching practice may be as important as its presence. Self-studies can explain why educational institutions make dialogue difficult or demonstrate what happens when a teacher or teacher educator tries to initiate dialogue with others. The self-study researcher must be cautious, however, about attributing the "failure" of dialogue to others or taking an uncritical stance about the ideal of dialogic teaching (Ellsworth, 1997; Burbules & Bruce, 2001). Second, finding one's unique voice through monologic self-study may be a prelude to expressing that voice in dialogue with others. The interplay between monologue and dialogue is very complex. Monologic self-study researchers assume an audience; thus their work could be considered dialogic – perhaps one very long "utterance" in an ongoing dialogue among colleagues. Third, as risky to the self as this may seem, self-studies that entail sharing "mistakes" may stimulate more dialogue than sharing teaching triumphs. They open the door for others to voice their vulnerability, and from there to further dialogue about what we could do better. And finally, our group dialogues gave us the courage to share our individual self-studies with each other and with wider audiences. An area for further research would be an

exploration of how collegial dialogue contributes to self-study research, even if it is not evident in the writing itself.

In this section of the chapter we have suggested three ways in which dialogue may be evident in seemly "monologic" self-study research: dialogue as interactions with colleagues or students, dialogic teaching, and internal dialogue or dialectic. The self-study by Tom Russell (1995), which appeared in the same TEQ issue as our group's work, is an example of the first category. Russell reports on his return to the high school physics classroom, where his teaching would be observed by his teacher education students. In the appendices of the article he includes excerpts from dialogues with two preservice teachers and with the practicing teacher who "traded places" with him, as evidence of his self-reflective learning process.

Many more examples in this category can be found on the Action Research website created and maintained by Jack Whitehead at the University of Bath (http://www.bath.ac.uk/~edsajw). In an early example of his dialectic method, Whitehead (1981) presented two examples of his teaching, in the form of interactions with a student, as evidence of improvement. Since that time, the group at Bath have generated numerous studies that demonstrate the development of "living educational theory" through examination of dialogues with students and whether they constitute evidence of educative relationships. Such studies also originate in an internal dialogue, self-questioning about "How can I improve my practice?" that reveals the inquirer as a "living contradiction" whose values are negated in her/his practice (Whitehead, 1993). In his chapter, "Educative Relationships in the Writing of Others," Whitehead (1995) includes samples of the kinds of educative dialogues he would accept as evidence in such studies.

Other self-studies in the *Teachers Who Teach Teachers* volume (Russell & Korthagen, 1995) demonstrate the struggle to implement more dialogic teaching. For example, Zeichner (1995) writes about transforming a very traditional "foundations of education" class into a class that more directly placed his student teachers' experiences at the center.

Using Dialogue to Explore Dialogic Contexts in Teacher Education Classrooms

> I do have a desire for shaping my own practice through questions and modes of address that move and are moving. I'm interested in questions that shift and change what is asked and unasked by theory and practice in curriculum and teaching. Such questions can provoke an event – rather than an answer – at the scene of address between teacher and student, researcher and researched. (Ellsworth, 1997, p. 12)

As the Arizona Group grew in our awareness of research paradigms, dialogue as a way of knowing is even more evident in our work. We found ourselves also adding and shifting the lenses we were using to understand our teaching of teachers and use of critical pedagogy to support social justice and equity. As we

explored the dilemmas and tensions in our practice/research, these new lenses, developed through our growing understanding of feminist theory and postmodernism, were also influencing our methodologies and the ways in which we attempted to represent dialogue in our work – both in articles and in presentations. In this section of the chapter, we explore several of the shifts in the work of the Arizona Group during the mid 90s. It was at this time, we began exploring and embracing more fully other epistemologies we used when we claimed to know things about our practice as teacher educators. One of these alternatives was the feminist perspective grounded in the view "that all knowings are partial, that there are fundamental things each of us cannot know – a situation alleviated only in part by the pooling of partial, socially constructed knowledges in classrooms" (Ellsworth, 1992, p. 101). This exploration emerged as we realized even more personally as researchers that individual data could support more than one interpretation and that because we were constantly studying the context, content, and process of our practice we became aware of the dynamic interactive nature of this kind of research. We learned to trust our intuition and instincts in the moment but interrogate them in reflection. Just as importantly, the literature on feminist pedagogies (e.g., Luke & Gore, 1992) had made us aware of the unexamined power issues within critical theory involving the authoritarian nature of the teacher/student relationship and its influence on dialogue. As Guilfoyle said, "Through self study, I began to 'see again' the meaning of events in the transformative classroom. ... I began reflecting on my 'talk' as well as my 'walk,' learning the difference between 'tell vs. share,' 'should vs. could,' and 'talk to vs. talk with.' "

In our exploration of dialogue, we realized that in the mid 90s the use of self-study also shifted beyond our own experience to the students in our classrooms and the students they would be teaching. To understand this widening circle and its connection to dialogue, dialogic classrooms, and methodology, this section will foreground the discussion in a chapter we collaboratively constructed through e-mail dialogues in the early summer of 1996. This chapter, "Obligations to Unseen Children," appeared in *Teaching about Teaching: Purpose, Passion and Pedagogy in Teacher Education* (Loughran & Russell, 1997). In constructing this chapter we engaged in an exchange of e-mails similar to the on-line chat format. We then used the e-mail exchanges to construct the chapter. In the chapter itself, we tried to edit the e-mail interchanges in ways that invited the reader to construct their own interpretation of the chapter. In the form of this article and in our representation of our data we were not only attempting to capture and represent our dialogue, but the construction of the chapter was an attempt to invite readers into that dialogue.

Understanding the Arizona Groups' Meaning of Dialogic Teaching

Dialogue is a special kind of talk where learning is concerned. ... Dialogue ... has a focus, and participants join for the purpose of understanding, disclosing, and constructing meaning. ... Dialogue occurs when people share

a common interest and join together to understand … when people share a
common interest. … Dialogue requires thoughtful listening and responding.
It is a time when participants collaborate and co-produce meaning. …
Dialogue respects how people come to know … its best chance to flourish
is when it takes place between people … who care for one another. This
care and trust create a social condition where participants open up and
accept not only the other person's ideas, but the other person, too. (Peterson,
1992, pp. 103–104)

As the Arizona Group became more aware of the role dialogue played in
understanding our experiences and generating assertions for action, we began
to critique its use in the classroom through self-study to explore how to move
our developing theories to practice as we walked our talk. Each of us used
frameworks that were influenced by our personal beliefs, theories, and knowledge.
Our view of critical pedagogies deepened as several of us moved beyond
Peterson's view of dialogue and added a feminist thread, while others more fully
examined and enacted their spiritual beliefs. This further influenced our dialogic
classrooms and moved them towards the kinds of interactions contexts described
below by Freire (1990):

It is not our role to speak to the people about our own view of the world,
or to attempt to impose that view on them. We must realize that their view
of the world, manifested variously in their action, reflects their situation in
the world. Educational and political action, which is not critically aware of
this situation, runs the risk either of "banking" or of preaching in the
desert. (p. 96)

Making these kinds of shifts was complex and complicated. Moving developing
knowledge to practice in the name of praxis was a process that had "ups and
downs" for the students as well as for us as teachers. Just as dialogue is not a
smooth linear journey, dialogic teaching is not either. Issues of power, caring,
and trust must be addressed.

Dialogue is offered as a pedagogical strategy for constructing these learning
conditions, and consists of ground rules for classroom interaction using
language. These rules include the assumptions that all members have equal
opportunity to speak, all members respect other members' rights to speak
and feel safe to speak, and all ideas are tolerated and subjected to rational
critical assessment against fundamental judgements and moral principles.
(Ellsworth, 1997, p. 106)

This complicated issues further, since we were restructuring not only the social
context of the classroom but also the content. "Dialogue encompasses two
qualities that are central to learning: *critique* and *inquiry*" (Peterson, 1992,
p. 104). Asking students to think critically about issues and to be collaborative
and actively involved in constructing meaning was a change in roles in which

they had little experience and/or did not match their expectations. While we were truly interested in supporting students in developing their thinking and their voice and we took care to allow for and accept diversity of opinion, past experience with teachers who used discussion as another form of coercive pedagogy may also have contributed to their resistance. In addition, similar to the change in our role as researcher when using dialogue as a way of knowing, our roles as teachers shifted. This was often met with resistance, which we commented on in more than one inquiry over the years.

Examining Dialogue in Classrooms Through Collective Dialogue

"Obligations to Unseen Children," written in 1996, built upon the intersections and interactions of talk and practice each of us had experienced over the previous six years. During this time, we continued to share and critique our hopes, dreams, struggles, and inquiries through dialogue with e-mail, telephone conversations, conference presentations, and personal journaling as we attempted to move the knowledge we generated into our lives in academe and into our practice. We took the position that we could make these changes through the support offered by the Arizona Group.

> This position takes the purposes of such speech to be survival, expansion of [a people]'s own understandings of their oppression and strength, sharing common experiences among [the people], building solidarity among [that group], and political strategizing. (Ellsworth, 1992, p. 104)

Quotes from our article and a discussion of the issues we addressed reveal the process and time commitment involved in learning to "walk one's talk." In 1996, some of the issues we explored included: relationships among theory, belief, practice, and experience; resistance; role of community; and, obligations to unseen students.

All of us grounded our understanding of learning and teaching in a social constructivist framework and we were committed to supporting equity and social justice in education. Some of us embraced feminist pedagogies to reach this goal while others used responsive teaching and spiritually centered pedagogies. We were all simultaneously attempting to change both the roles of the teacher and learners in our classrooms to a more participatory stance and to address beliefs – ours and the students. As Pinnegar wrote, "I think we respect and accept our students and their beliefs – even when we do not agree – because we know that we cannot change their beliefs, but we also know that they can choose to change their beliefs" (p. 190).

Another facet of classroom life explored in the text was the formation of community. Grounded in our experience as the Arizona Group and our theories and beliefs, we saw the possibilities of dialogue emerging out of a social context that supported community. Guilfoyle said, "Community implies a caring for one another, a sense of collaboration, as risk-free a learning environment as possible"

(p. 200). We understood that talk is important in forming this kind of community – all kinds of talk. As Hamilton stated,

> Beliefs and community – I think that the notion of acceptance of divergent beliefs is a part of community, and a successful community can be formed and survive when people are willing to accept differences and not force one view upon an opposing view. As a family we try to understand the other perspective in order to figure out where the other person was coming from. It does not make you agree with them, but it helps in understanding the motivation and the perspective. (p. 203)

Our frames for understanding classroom talk are grounded in several bodies of literature and we have come to realize that often writers/teachers/researchers use terms interchangeably – talk, conversation, discourse, dialogue. One helpful frame has been Peterson's (1992) analysis of the kinds and patterns of classroom talk – each having a role in building and maintaining a community and supporting learning. These categories of talk include caring talk, talk story, conversation, discussion, critique, and dialogue (a combination of inquiry and critique). While we were striving to use dialogue in our classrooms, we came to recognize that with the limited amount of time we have with students and the issues of power embedded in the system, it may not often occur but we continue to explore the use of talk through our collaborative self studies. We also continue to hope that our students will come to value the role of classroom talk and use it in their classrooms. This is our obligation to unseen children.

Using Dialogue to Push our Thinking and Reveal Contradictions

In most instances, members of the Arizona Group focus on the power of their dialogue as a way of knowing as represented in Guilfoyle's comments during the writing of this chapter:

> While collaborating with my students is helpful in extending my understanding, the insights I gain from sharing my inquiry with colleagues are very important. Our interchange over the past few days and returning to the texts of other inquirers in teacher education is pushing my thinking much further than my ritual personal reflection at the end of the semester. The questions that have been posed and the issues discussed help me to re-view the semester in additional ways. Talk is so powerful in learning. (Guilfoyle *et al.*, p. 185)

Within this celebration of the power of talk, there also comes recognition that it can create tension. Upon closer reading of the obligations chapter, one can also see that dialogue was used to critique theory, actions, and perceptions and, consequently, push participants out of their comfort zone. The reader can also see through the course of the dialogue how shifts in understanding occur within the context of the talk. It should be re-emphasized again here that this could

occur for us because of the context and our relationships. As Ellsworth (1992) stated, "One of the crucial features of discourse is the intimate tie between knowledge and interest, the latter being understood as a standpoint from which to grasp reality" (p. 96). As colleagues, we respect each other, our knowledge, and way of being in the world. We care about each other and value our friendship. We also want to grow in our understanding as teacher educators and in our use of pedagogies that allow our students and their students this same freedom. In addition, it takes time and practice working together before adults, let alone young students, are able to attune themselves to the thinking of others. Often the four of us admit that the conversations in our classroom over the semester rarely move to a dialogic experience.

In our processes of using dialogue, we have found it to be both confirming and a call for further examination. This is demonstrated in this chapter in at least two places, making visible that dialogue is not always smooth, has "edges" to it, and is a powerful tool to help participants "hear what they said." As an example, in one section, Hamilton calls attention to a comment that seems to her to be contradictory:

> Guilfoyle, I noted your comment, "transforming student beliefs." I suppose that comment caught me up short. Do you really want to transform their thoughts? Can you do that? Can we do that? When I hear language like that, I become concerned because I do not really think we can transform thought but we can take them up to the choice. (Arizone Group, 1997, p. 190)

While the written text can not represent the feelings that Guilfoyle experienced, she later indicated that the comment did feel like a scratch on a blackboard. In the text, she responded, "Yes, I, too, have come to realize that I cannot transform anyone's beliefs just as I cannot empower anyone." In her mind, she puzzled over why Hamilton's comment was so disconcerting. Reflecting on Hamilton's comment pushed her to later realize that while her "talk" was at one stage, her "walk" may not be matching her talk. Even at the time, Guilfoyle's comments in her next response revealed that she might need to further re-analyze students' actions.

> But I think I need to be honest. When one teaches using a transformative model, some students see this as making them change their views because of the authority they have always given the teacher and the difference in power they see between students and teachers. (Arizona Group, 1997, p. 191)

It takes courage in dialogue to critique yourself as well as others. There are no rules on how to do this – each is context and subject-specific bound by the topic and the relationship between the participants.

This one example highlights another dilemma one faces when using dialogic teaching as proposed by critical theorists and problematized by feminists. Issues of power, resistance, and transformation take on new stances. Participants have

to sift through all that one has learned through being in institutions for years. Two quotes from Lather (1991) support the concept that re-thinking about these issues is necessary.

> The work of Ann Berlak (1983) began to focus my attention on the sins of imposition we commit in the name of liberatory pedagogy. And an emergent focus began to take shape: to turn the definition of resistance inside out somehow so that it could be used to shed light on efforts toward praxis in the classrooms of those of us who do our teaching in the name of empowerment and emancipation. (p. 78)

> This is exemplified in Joycechild's (1988) movement "from their resistance to mine" where the object of her inquiry shifted from their resistance to liberatory pedagogy to her own resistance to the assumption that "their problem:" was not buying into "our" version of reality. (p. 142)

Before the dialogue moved on in the chapter, Hamilton's closing remarks presented an opportunity for Guilfoyle to think further about actions she might take in her classroom. Dialogue, which requires inquiry, thinking critically, and taking risks, encompasses a degree of uncertainty and accompanying tension as illustrated in the above exchange. In dialogue,

> It's the immediacy of the responding, the calling forth of the other, and the listening that moves participants to insights that cannot be realized through solitary thinking … When interest is strong and purpose clear, dialogue can bring about new insights as long as there are people wanting to know and willing to give themselves imaginatively to the encounter. (Peterson, 1992, p. 111)

Role of Dialogue in Understanding: Restructuring and Reform in Teacher Education

In this section, dialogue as a way of knowing comes full circle for the Arizona Group. In 1997, we moved back to using self-study and dialogue to help us understand change in teacher education. While we continued to explore our practices, we extended our focus to include the restructuring and reform efforts in our institutions – only this time the context has changed, the participants are different, and our roles have shifted. Each member of the Arizona Group came into teacher education with aspirations of changing how teachers were taught. Change had various meanings to each of us but collaboratively we understood this as a commitment to transforming not only the context of teacher education but also the content. We saw a place for practitioners' knowledge and wanted to more actively involve all participants in the teaching community in the education of teachers. We hoped to help not only the students but faculty members rethink learning and teaching from alternative perspectives, including a social justice and equity view. Much of our beginning dialogue focused on

addressing and understanding the tensions and dilemmas we encountered as we attempted to weave these issues into classrooms and faculty meetings. Lately, we sometimes laugh at our efforts to be *Crusader Rabbit* – the name one member gave to our role as change agents. Now, as we take stances questioning many of the restructuring efforts within our colleges, we are seen as resistant to change. In addition, we now see the dialogue moving out of our department and colleges of education where it resided in the past to the larger university and general public. At this level, we are finding dialogue almost impossible and, instead, talk more often about silencing or inability to enter the conversation – terms that we have seldom used in the past. How did the power of dialogue within teacher education reform shift and what does this mean for using dialogue as a way of knowing? What can we learn about dialogue from this experience?

Using Dialogue to Explore Teacher Education Reform

It is within this context, we explore our last examples of dialogue. In this section, the discussion is grounded in a set of papers presented in an AERA-Division K Symposium: "Critique of the Political, Social, and Practical Context of Restructuring/Reform in Teacher Education: Narratives of Four Teacher Educators" (2002). While each paper is grounded in the experiences at our individual institutions, it is one of our strongest efforts to enter the dialogue on teacher education at a state, federal, and national level. The purpose of these papers was to make visible the connections and concerns we have in seeing teacher education as a site of resistance as well as a site to deregulate the teaching of teachers or to "professionalize" the process based on standards and mandates. Similar to much of our other work, we entered this dialogue from various perspectives, interests, and contexts.

In these papers, we continued to explore alternative ways to represent our dialogue as well as our meanings. Hamilton returned to the Land of Oz and attempted to act as a cultural cartographer as she "mapped" the dialogue and process of reform in her institution. Placier embedded her discussion in the historical context of her college and used multiple fonts to talk to the reader. Pinnegar used a form of narrative and placed efforts in her college and department as well as the conversation in the teacher education research community as a whole within a family story about the "near enough cabin." Lastly, Guilfoyle developed her discussion around the metaphor of howling at the moon to address her experience of feeling silenced within restructuring efforts. As in our other work, we wanted not only to make our dialogue visible but invite others into the conversation to: 1) extend understanding of our view of the hidden agenda of the politics of teacher education reform; 2) make visible the ways restructuring is influencing teacher educators' practice; 3) offer a critique from several perspectives-political, social, and practical; and, 4) generate ideas to move reform forward in ways that will continue to support equity and social justice in schools and society.

The analysis of these papers also revealed a shift in tone from our earlier

work. When dialogue includes a postmodern perspective, one has to account for multiple meanings and perspectives and probe how to be part of the dialogue without closing off space to others.

Extending our Understanding of Dialogue

As can be seen in the above sections, silencing brings us full circle to the issue of dialoguing across differences. Using our experience with dialogue, we came to understand it as a powerful tool for knowing and taking action. We also began to more clearly recognize how it supported inquiry and learning. With this knowledge, we thought it could be a tool to understand and explore current reforms in teacher education. Since in the past, even when our colleagues did not support our ideas we had a space for our voice. As we have studied the practices of teacher education, been actively involved in the profession presenting at conferences, writing papers, and publishing in journals and books, we always believed that we would be part of the dialogue. After all, we had been teacher educators for the last 8–10 years and studied our practice in teacher education. In early teacher education reform efforts, teacher educators were at the center of plans and designs for restructuring teacher education. More recently, deans, university presidents, funding, or accrediting agencies seem able to simply impose the structure and any discussion of the proposal seems to be a mere formality of due process. Each of us have had experiences with situations where regardless of faculty protest or disagreement what has been proposed has simply been implemented without adjustment. While each one of us served on some committee at some time, none of us were invited into the dialogue. In fact, in one state, a committee was formed to set the standards for teacher education and not one teacher educator was on the committee. Discussion at the college and department level never even raised the question of how teacher educators could resist. Instead the focus was on whether our course work met the mandates. In such situations, an attempt to employ dialogue to move understanding and action forward becomes difficult; if not impossible.

Conclusion

In the literature on teacher education and related fields, the documentation of professional dialogue has been infrequent. While the works of Freire and Macedo (1995), Hollingsworth (1992), and others have provided a look at the conversations conducted by scholars about their ideas and the ways to push them forward, this approach to exploring the profession has never been widely used. In this chapter, we provide evidence that we hope will establish dialogue as useful and creditable for asserting and exploring the knowledge claims that emerge in self-study of practice. We assert that the use of dialogue to explore and interrogate professional understandings is valuable in the classroom and beyond and provides a basis for making assertions for action and understanding. Using a method of dialogue as the basis for inquiry into professional practice

allows practitioners to reveal what they know, uncover evidence to support their knowing and develop sufficient confidence to act on that knowledge.

To understand dialogue as a way of knowing in self-study, we analyzed our developmental process over the past ten years, read what theorists and researchers have said about dialogue, and dialogued with each other – in person and electronically through e-mail and in a chat room. To this collaborative inquiry, we brought our history as a group of four teacher educators who graduated from the University of Arizona at the end of the 1980s and have nurtured a research relationship to explore through self-study women in academe, the roles of a teacher educator, classroom practice, the tenure process, and teacher education reform. In 1990, we began by sharing weekly/bi-monthly reflections to understand our entry into academe at four different institutions, and in 1991, we presented our first self-study. Since that time we have published together in journals and books and have presented collaboratively at many conferences. In practice and research, we are committed to constantly pushing our boundaries, and considering alternatives, in the service of being better able to "walk our talk." We have found that we must be absolutely scrupulous in studying and living our educational theory (Whitehead, 1993) if we want our findings to have integrity as well as our lives, talk, and actions (Bullough & Pinnegar, 2001).

While we have been involved in self-study since the early 90s, we had never thought rigorously and collectively about the characteristics of the epistemological basis supporting the individual methods we had used. The writing of this chapter prompted us to re-examine past self-study work in new ways. Through this process, we have come to understand that most of our collaborative self-study work could be labeled "dialogic" even though we had not previously used that framework.

Just as the scientific method is the basis of research in the physical sciences and some areas of the social sciences, like economics for example, dialogue is the method of inquiry that lies below social construction of new knowledge in self-study. Fundamentally, the concept of dialogue represents a space of interaction, which allows for more than one way of representing a state of being or way of thinking. Even when we agree with others in a conversation about an idea, each participant will have a slightly different understanding or unique expression of the shared idea. In this way, as these ideas are expressed the understanding of the group is moved forward and expanded. For example, early in our explorations of our work in academia, we all agreed that academia had a masculine feel; however, when Hamilton labeled the corridor leading to her dean's office as "famous white-men's hall" this metaphor organized our conversation and provided boundaries for this concept. As a result, we could explore more productively our experiences, as we could now consider how would a "famous women's hall," "famous person's hall" or a "hall of service to others" look and feel differently.

Conversation moves from beyond mere talk to become dialogue when it contains both critique and reflection – when ideas are not simply stated but endure intense questioning, analysis, alternative interpretations, evaluation, and

synthesis. These two characteristics, reflection and critique, appear in the text of a dialogue in moments of both agreements and disagreements. They appear as we restate the position of someone else. We expand what they have said and anchor it with a story or example from our experience, from our reading, from what we know. We disagree and provide as counter evidence our experience, research findings, or the theories of others. Reflection and critique occur when we grapple with the position, the theory, the evidence presented. We disagree, we provide further support, we expand on it, we alter it. This can happen in individual critical reflection. However, since understanding from a dialogue appears in actions taken on the always-public stage of practice there is a sure possibility that faulty assertions for action and understanding will be confronted with the reality of this experience. An example of this process is evident in Upitis' and Russell's (1998) account of the correspondence between a new dean and a member of her faculty. Both participants are confronted with how the other responds to and interprets their actions as Dean and Faculty member. While their initial understandings have been built on internal dialogue and that process of critique and reflection, their acting on that understanding, revealed in the experience of the e-mail correspondence, confronts their initial characterizations. In this way, their experience calls into question their individual assertions of how they understand practice. In the process, their understanding and their actions change.

One of the on-going dilemmas in the conversation of teacher education as a field is the relationship between theory and practice and the position of teacher's knowledge in relationship to those. As Cochran-Smith and Lytle (1993) have suggested:

> We have proposed that teacher researchers stand in a different relationship to their own knowledge, to their students as knowers, and to knowledge generation in the field; as Freire (1971) has suggested, they are "knowing subjects," constantly learning from the process of teaching. Knowledge from the academy is not accepted unproblematically, but is taken to be rich and generative, providing conceptual frameworks, detailed information from other contexts, new problems and dilemmas, confirming and disconfirming evidence, and grist for further deliberations … When teachers themselves conduct research they make problematic what they already know, what they see when they observe their own students as learners, and what they choose to do about the disjuncts that often exist in their classrooms, schools, and communities. (p. 65)

In characterizing and making assertions about the knowledge of teachers, Cochran-Smith and Lytle reveal the ways in which beginning in practice rather than in theory results in all research findings (positivist, empiricist, or intuitive) existing in a state of inconclusivity – a state that can be a foundation for action, but that can be expected to shift as one acts.

Unlike other research paradigms, self-study in teacher education practices

takes practice as the starting point, as the ground on which what matters most – educating teachers for acting in their own practice – is negotiated. The arena for examining theory/practice relationships is the ground of experience. That ground is a dialogic one in which a consideration of our experience and the conflicting and converging planes of practice and theory can be examined. Theory represents the formal assertions and claims for knowledge found in the published scholarly research in the fields and disciplines that can illuminate experiences in teaching and learning. Practices represent a kind of embodied theoretical knowledge labeled by Polyani (1958) as "tacit," and more recently by Clandinin and Connelly (2000) as personal practical knowledge for teaching. Teachers' practices represent embodied and idiosyncratic theoretical understandings gleaned from experience and organized as ways of acting and being in the classroom. These include routines of action that teachers use over and over again. Some, like signaling students to get back on task, are simple and can be directed at an individual or a full group. For example, catching a student's eye and nodding or flicking the lights both signal that students need to get back on task. Other practices are more complex, such as the elementary teacher's patterns for organizing a school day or running a reading group and the secondary teacher's typical organization for a biology lab or the English teacher's structure for a process writing experience.

Experience in a practice brings with it narrative, autobiography, assessment, issues of representation, and knowledge and all of the complications of knowledge and power. In this way, the ontology and epistemology of self-study research must allow for the use of a broad spectrum of methods for inquiry. In order to justify the use of assessments in high stakes situations, educators need certain levels of surety about the validity and reliability of the assessment itself. That level of surety might not be needed in teachers' informal tracking of their own growth of knowledge about teaching and learning or their insightful understanding of the development of an individual student gleaned from observation and anecdotal records. Further, when trying to see how much power particular assertions for practice might have in settings different from the one in which it was created, quantitative research methods that allow for claims of generalizability might be useful. However, since self-study research is always based in practice with the conflicting demands that time, context, and human interaction call forth, regardless of tools for research design or analysis, the findings will always exist in that zone of inconclusivity. In that zone, action in a practice with fellow humans may lead to actions and responses from students leading to unique and new understandings that can inform the practice of others. For self-study research, the nodal moments of experience in a practice are mined in ways that develop holistic understandings of theory and practice and, regardless of research design or analysis tool used, are most often the starting point of the work.

Dialogue, as a method of inquiry in self-study, begins because we are caught off-guard by experience. We may not understand what happened or we perceive a contradiction between our practice and our belief or perhaps what happened

was not only totally unpredictable but disastrous as well. At this point, practitioners want to understand that moment better. They want to have explanations, alternatives, or patterns that control practice, avoid troubling classroom events or provide new insights into teaching and learning. Teachers may want to understand an experience to use that understanding in different teaching situations and settings. For example, having read Bullough and Gitlin's (1995) conceptualization that who we are as teachers emerges from who we are as humans, we are watching a student teacher struggling in a classroom, we wonder how their own past experience as a student contributes to the problem. We wonder how we could use Bullough and Gitlin's ideas to help this student and others enlist past experiences to develop as a teacher rather than be trapped by routines borrowed from their own experiences as a student. We wonder how we could use this understanding in teacher education coursework, or student teaching or inservice teacher seminars. We begin looking at our practice.

As a community, self-study researchers are quick to recognize that theory always exists in a zone of indeterminacy, any interpretation leaps back to a past state of action, thinking, or belief, or is acted on in particular contexts, with particular people, at a particular time. Our theory unfolds in practice as we act on what we have learned and the decisions we make about how to use theory. In experience, theory becomes embodied and living. In this way the theory used takes on a quality of living. This means that it has the potential for growth. While that might just mean getting larger with more branches and leaves, it might also mean that it flowers and is in this moment qualitatively different from how it was in the last. It also means that no single theory exists alone, but in order to respond appropriately in action we must bring all we know and all that is experienced into account in our physical instantiation of our beliefs.

Self-study based on dialogue contrasts with other methods of inquiry where the researchers objectify what is being researched, segment it into preconceived factors and variables to control variance and make action predictable, generalizable, stable and conclusive. The theory must be imposed back into the practice. Self-study research based on dialogue dissolves that distance because experience is the ground from which theory and practice are being explored and developed.

Dialogue as a method of inquiry holds diversity in relation. First, as we come together in conversation with others we have no choice but to bring to the table as humans our knowledge, our past experience, our experience in the moment, our understanding, our thinking about issues and ideas. No matter how similar participants are they are never identical, and so there is always a range of diversity represented by the actual participants in the conversation. This range is expanded as stories from experience, the views of absent others, quotes of others texts or research studies, and other ways of knowing or being are raised within the dialogue.

Dialogue is not based on an ontology where agreed upon meaning is futile. Instead, while the world is real, we acknowledge that we experience it from different worldviews, expertise, cultural frames, and perspectives. We have agreed upon meanings for words that allow talk to move forward, but always around

those agreed upon meanings flows alternative interpretation or expansion of meaning that may not be shared. Exploring, uncovering, revealing, illuminating that range of difference and the core of commonality through conversation, the sharing of concrete examples, providing further explanation, and probing questions during dialogue is why this method of inquiry results in the construction of new knowledge which can result in assertions for action and understandings for practice.

Knowledge grows in dialogue because ideas are articulated and analyzed. As the centrifugal and centripetal forces of dialogue ebb and flow and coalesce around the ideas and thoughts voiced in dialogue and in the thinking of those involved, knowledge grows. We come to know in dialogue through these same two processes. When an idea or understanding is articulated, just the act of saying or the act of listening to may be an act of coming to know. Disagreeing with an idea, or slight modification of it leads to recognition of your position on that knowledge. Every form of research genre and its findings may be produced as part of a dialogue.

In positivistic research, the scientific method is simplistically represented as beginning in the statement of a hypothesis, the design of an experiment or use of a situation that allows for systematic records of observation, analysis of the observation leads to acceptance or rejection of the hypothesis. Under this method of research, inquiry has beginning and end points. In dialogue, inquiry always exists in a state of inconclusivity that embraces the characteristics of the humans involved (both the researched and the researcher). In the method of dialogue it is expected and assumed that either or both the researched and the researcher are human, temporal, dynamic, particularistic and possibly interactive. Because the findings are built from the ebb and flow of diversity, agreement, convergence, divergence (or centripetal and centrifugal forces to quote Bakhtin) an assumption of the study itself is that of change, evolution, and growth. Education always presupposes change and growth. We expect teachers, teacher educators, and students to learn and grow throughout their lifetime. Thus, a precondition of educational practice is an assumption of inconclusivity. We conclude with a final example from our conversation together in July 2002 in Park City, Utah followed by an analysis which illustrates how it represents our understandings about dialogue as a method of inquiry.

PP: Usually we aren't thinking about all this; but in self-study you do. You say, "I will think about all the complexity of this context, my belief about it, what I am doing."

KG: And why am I doing it?

SP: Yes, and how am I doing it? What impact does it have on the others around me? and how is their history affecting this? and that's the fourth move right there. It's when you recognize that that you're in a setting where someone's acting back on you. Their history, their belief, their experience is coming back on you and changing you, just as you're trying to study what you're doing in that moment.

ML: So are we saying that in self-study there must be dialogue? Because then dialogue becomes – I'm not sure of a metaphor – but it becomes maybe a metaphor for all of life.

PP: Without being in dialogue with an other, how can you be certain of what you are doing?

SP: It seems to me that there's sort of a general meaning of dialogue, but you can take an everyday word and make it a technical word for a specific purpose. We might capitalize it. It seems to me that's what we're doing here. As soon as I read Vicki's note, I was willing to say yes, what we do collectively in our self study is a method of dialogue, I just had never thought of that, so if it is a Method of dialogue then what is it that we're doing that it would, that we would consider it a Method.

PP: Yes, so the dialogue is more of a big M …

SP: To me that's an essential character of self-study.

KG: Yes

PP: And that because we …

ML: Okay wait a second. What is it that we're doing? We would consider, why would we consider this something, and then we got into big D and little d and I'm afraid I got a little lost. I don't think we would have agreement in the self-study group that all of that we've said about self-study is true. So I have my own little subtext going. So let me just say that that's interfering.

As you examine the interaction here, our respect and consideration for each other is evident. It shows up when Hamilton says: "Okay wait a second." Our tone with each other communicates respect and caring. Hamilton's objections and Placier's analysis point to the strong theoretical grounding behind our commentary. We are clear about what we mean about self-study. Hamilton raises the question of whether others would agree that dialogue is an essential feature of self-study and in doing so marks in this conversation that we do not have a great need for everyone in the self-study of teaching practices research community to agree with us.

We are not trying to make each other different. In fact, just prior to this segment one of us actually comments that for them the goal of our dialogue is neither consensus nor forcing anyone to change. Though some might say our backgrounds are not very diverse, each of us comes from a different discipline in education. We have different cultural heritages and past life experiences. Hamilton's minor objection here is typical of other objections we raise. Guilfoyle frequently questions the meaning behind the words we use and articulates her reasons for avoiding some words or using others. In another part of this dialogue, she talks about the value of the term "successive approximations" in accounting for her development as a teacher educator in response to Pinnegar's representation of it as "striving for perfection."

The pattern of convergence and divergence is in the text. It is most evident at

the beginning when we each contribute further questions to Placier's statement about what we are doing in self-study. What is also evident is that in this moment, we refer to how self-study brings past, present, and future together. Pinnegar says, "When you recognize that you're in a setting where someone's acting back on you. Their history, their belief, their experience is coming back on you and changing you, just as you're trying to study what you're doing in that moment."

In this quote self-study is located in the zone of maximal contact and the issues of temporality, inconclusivity, and subjectivity are all evident – the very characteristics that make dialogue based inquiry capable of providing a basis for taking action in creating praxis or as Whitehead (1995) labels it, "living educational theory."

Positivistic research and a modernist view rests on the assumption that both the researcher and the researched are static and knowable. The scientific method enables researchers to bound themselves in objectivity in order to examine the researched which they can then safely consider objectively. Care in design, operationalization, and manipulation of variables coupled with random assignment will create a condition where the researcher and the researched are freed from a context and from time. This makes their findings generalizable because interpretation has been made unitary.

While empiricists who use qualitative frames do not appear to act on assumptions that the researched is objective and static, and in fact attention to context and the particular are important to their assumptions, in most cases like the positivist they still assume that the researcher can have a certain degree of objectivity. They may acknowledge that their research may cause some disturbance but they are confident that triangulation, audit trails and member checks shore up results and allow them to develop findings about which external judgments of trustworthiness that exist between researchers not inside them can be made. This focus on surety leads them to claim multiplicity of interpretation and yet act as if interpretation for their study and in this case is unitary and transferable.

We have come to realize that positivistic methods work in this way not because this is so, but because researchers and scholars who use them chose to believe it is so. Our experience in the use of dialogue as method of inquiry in self-study leads us to conclude that neither the researcher nor the researched can be bound. Both are in fact, temporal, indeterminate, dynamic, particular and interactive. A method for examining professional practice must embrace the inconclusive nature of human interaction and yet allow for findings about which one can have sufficient confidence that action can be taken and that understanding from one situation can be used in analysis of another. However, recognizing that professional practice is always about growth and development and never about arrival means that research in this area must always exist in a zone of inconclusivity.

We have decided that instead of beginning research in teacher education with either practice or theory as king, we begin with experience and examine the relationship and interplay of theory and practice. Such work requires intense

response from others with different views – such work can most profitably be based in dialogue.

AFTERWORD

MOVING THE METHODOLOGY OF SELF-STUDY RESEARCH AND PRACTICE FORWARD: CHALLENGES AND OPPORTUNITIES

Vicki Kubler LaBoskey
Mills College

Abstract

This chapter serves as an afterword for this section of the handbook devoted to the articulation and examination of the methods and methodology of self-study research and practice. I compare and contrast the section's eight chapters and conclude that there is significant and corroborative consistency in the conceptual framework for and methodology of self-study. The differences that are revealed are mainly in the details and suggest promising avenues for future deliberation and development. I propose and encourage four possible foci for our efforts to move the methodology of self-study research and practice forward: the role of the subject matter of teacher education in our self-study methodology; the differences and relationship between the methods and methodology of self-study; the further articulation and application of a validation process defined as trustworthiness; and, our grounding in and goals for the ethic of care and social justice in our self-study practice and research.

The eight chapters in this section were written by different authors working in various institutions around the world. What we have in common is that we are all teacher educators who have an interest in and history with the field of self-study, though the nature and length of that history does vary as well. We were all responding to a brief and simply stated request – to present and examine one or more of the methods/methodologies most widely employed in self-study to date. We were to explain these by articulating their theoretical underpinnings and presenting examples from the self-study literature. The chapters were independently constructed from that kernel of information. Though various drafts

were, of course, fed through me, as the section editor, the feedback and guidance I provided had to do, in the main, with issues of structure, clarity, and flow. Though I did give some indication of my definitions, e.g., that student teacher assignments were not necessarily the same as self-study, I did not prescribe the analytical categories to be employed, the features to be highlighted, or the theories to be referenced, and my approach to the introductory chapter was formulated apart from these other drafts. Given the open-ended and isolated nature of the task, I consider the similarities across chapters with regard to these aspects to be noteworthy and corroborative. Identifiable differences seem to be related to varying areas and degrees of emphasis rather than to fundamentally incompatible or contradictory stances.

Agreements

The methodology of self-study, therefore, does seem to be grounded in and derived from a clear and consistent set of epistemological, pedagogical, and moral/ethical/political underpinnings. Like the Practical Working Theory of Gudjónsdóttir and Dalmau (2002), our methodology is based in the dynamic interaction among *similar* practices (what we do), theories (how we understand what we do), and ethics (why we do what we do) (p. 92). In our community of teacher educators concerned with the facilitation and understanding of teacher and student learning, our own and our preservice and inservice teacher students and colleagues and their students, we have begun to achieve what Wilson and Berne (1999, citing Ball and Cohen, 1999) suggest – we are shifting, "the discourse of teaching from 'a rhetoric of conclusions' to a Schwabian 'narrative of inquiry' that focuses on practical reasoning (Fenstermacher & Richardson, 1993), to a discussion of conjectures and possibilities rather than of definitive answers and scripts for behavior" (p. 200). We are in agreement that the aim of our research is to generate local, situated, provisional knowledge of teaching that will not only transform ourselves and our own practice, but trigger further deliberations, explorations, and change by other educators in their contexts.

What is more, the methodology of self-study seems to have a well-defined structure, purpose, and set of operating mechanisms. The five characteristics of this methodology "for studying professional practice settings" (Pinnegar, 1998) I identified in chapter twenty-one are repeated with frequency in the other seven chapters. The first, that it is self-initiated and focused, is mentioned by all. This is not surprising, of course, given the title for the field; what is significant is that everyone speaks about the role and meaning of the "self" in self-study in similar ways. The authors stress that the self is both the researcher and the researched and that personal professional change is a necessary outcome. Given this latter point, all are also in agreement with the second feature – it is improvement-aimed – though the nature and scale of transformation considered and sought varies, a point to which I will return.

Although the other three characteristics are not always addressed explicitly, or given great emphasis, most are implied and none are obviously refuted. The

third, that it is interactive at one or more points during the process, is often stressed. One of the attributes of self-study identified by Hoban, for instance, is the *sharing* of personal insights with others and the *accessing* of public theory. Similarly, "collaborative" is one of the three aspects named by Samaras, Hicks, and Berger in their description of the nature of personal history self-study.

Another of their three is that self-study is "conducted through diverse methodologies of qualitative research," which is virtually synonymous to my fourth characteristic, that it includes multiple, mainly qualitative, methods. One difference apparent here, and at many points throughout this section, is in the use of the term *method* versus *methodology*, a circumstance I explore further below. Others who also make overt mention of this fourth trait are Feldman, Paugh, and Mills who state that self-study is, "conducted through diverse methodologies of qualitative research" and the Arizona Group (Guilfoyle, Hamilton, Pinnegar, and Placier) who assert, "The ontology and epistemology of self-study research must allow for the use of a broad spectrum of methods for inquiry."

The fifth characteristic, that self-study methodology defines validity as a validation process based in trustworthiness, receives more implicit attention in most of the chapters. That is, other authors describe similar processes for judging the outcomes of our research, but do not label them in the same way. A notable exception to this is the chapter by Lyons and Freidus, and with good reason. This conceptualization of validation is based on one previously articulated by Mishler (1990), who was seeking a more appropriate way to validate "inquiry-guided" research. Mishler was a keynote speaker at a portfolio conference in January of 1999 organized by Nona Lyons and attended by the three of us. Nona and I applied this notion to our work in portfolio in particular and narrative research and practice in general in our book *Narrative Inquiry in Practice: Advancing the Knowledge of Teaching* (Lyons & LaBoskey, 2002), to which Helen Freidus and other handbook authors contributed. Since self-study is also inquiry-guided research aimed at the social construction of the narrative knowledge of teaching and learning, the use of this approach to validation in self-study makes sense. Besides, in my analysis of the self-study literature, it seems apparent that the field is already employing versions of this process – it has just not been named as such, a point I expand upon below.

The other authors in this section support all five of the characteristics I identified in the section's opening chapter, either explicitly or implicitly. Most of the features they specify are directly comparable to, subsumable under, or inclusive of these aspects. A similar claim can be made for other efforts to articulate the field, e.g., Barnes (1998), Bullough and Pinnegar (2001), Hamilton and Pinnegar (1998), and Loughran and Northfield (1998). Additionally, these aspects have much in common with more general characterizations of self-inquiries by educators, e.g., Cochran-Smith and Lytle's (1999) inquiry as stance and Hutchings (2000) and Shulman's (1998) definitions of the scholarship of teaching and learning. Therefore, nothing in these readings would imply a need to eliminate any of the five qualities; they appear to be true identifiers of and requirements for self-study methodology.

Additions

A careful read of these chapters and other relevant literature does suggest, however, that the list may not be complete; additional features/criteria might need to be added. The first most likely candidate has to do with the content of what it is we are teaching and learning about – the type of knowledge we are attempting to construct. As Hutchings (2000) noted with regard to the scholarship of teaching and learning, "[It] is deeply embedded in the discipline; its questions arise from the character of the field and what it means to know it deeply" (p. 7). The subject matter for teacher educators is the teaching and learning process itself. As Hutchings' comment would suggest, this does not seem to be an incidental factor in the self-study research of teacher educators. I had made a conscientious decision not to specify this factor in my characterization of the methodology of self-study because I was attempting to be inclusive of the work of educators in other venues and professional domains. Now, for many reasons, I believe this choice should be reconsidered.

My intent in this brief afterword is to summarize the section and illuminate challenges and possibilities for further development of the methodology of self-study. Therefore, I will not try to resolve the issues I identify, but merely suggest why I think we should consider them and possible ways of doing so. In this instance, part of my rationale has to do with the fact that our practice is literally an embodiment of our content knowledge. Teacher educators are not just teaching about something else, such as biology or history or mathematics; we are teaching about teaching. I believe, as do others, (e.g., Bass, Anderson-Patton, & Allender, 2002; Loughran, 2002; Tidwell, 2002; Watson, 2002) that this close interconnection between our teaching and our research impacts how we go about engaging in self-study, which necessarily makes it a factor in our methodology. One of the guidelines identified by Bullough and Pinnegar (2001) for establishing quality in autobiographical self-study speaks directly to this point: "Biographical and autobiographical self-studies in teacher education are about the problems and issues that make someone an educator" (p. 17). Additionally, Kuzmic (2002) stresses that the conceptualization of teaching as research has political as well as epistemological groundings and implications: "Doing teacher research becomes less a project that serves to validate research in general (that is, to see its professional efficacy), and more a project that serves to validate one's role as a teacher and one's teaching" (p. 227).

Some of the attributes identified by the section authors for self-study in general and their focus methods in particular are suggestive of both why and how we might go about including this factor in the conceptualization of our methodology. Samaras, Hicks, and Berger, for instance, propose that one of the primary purposes of self-study is for "modeling and testing effective reflection." Thus, our decisions about how to engage in our self-studies have to do, at least in part, with whether or not they will serve as appropriate and effective models for our students' reflective practice. Most directly relevant to this argument are the three methodological features of self-study identified by Feldman, Paugh, and

Mills. The first has to do with the importance of self, but the others speak to this role of the content in our pedagogical and investigative endeavors and the relationship between the two. They articulate these methodological features in this way: "It would make the experience of teacher educators a resource for research and it would urge those who engage in self-study to be critical of themselves and their roles as researchers and teacher educators."

The fundamental question to be posed and explored is whether or not this factor can still be subsumed under the self-focus characteristic, as I have done, but with a more thorough explication, or whether it deserves and demands its own criterion. Another question we will need to consider has to do with how this point should be expressed. Should we do so in a general way, as does Hutchings, by simply saying that discipline matters, which will keep it more inclusive of other areas, or do we need to address very specifically this embodied quality of the content knowledge of teacher education? I encourage the field to continue to contemplate whether and how the discipline of teacher education might influence the structure and conceptualization of our self-study methodology.

Method vs. Methodology

Another issue we need to address may be more semantic than conceptual, but still warrants our attention. The variation in the use of the terms *method* and *methodology* in this section is not insignificant and suggests a need for us to strive for more consistency in our utilization of these words. Two chapters take on this deliberation very directly, chapter twenty-four by Feldman, Paugh, and Mills and chapter twenty-eight by the Arizona Group. The latter authors include an excerpt of the dialogue in which they engaged for the purpose of formulating their chapter that involves a discussion of the meanings the different individuals hold for the term methodology. Though they agree to disagree, for the time being anyway, on the details of the distinctions they are making, they nonetheless conclude by defining dialogue as a research stance or methodology.

The former group, drawing upon previously articulated meanings in the literature, defines methodology in a similar way, as, "a stance that a researcher takes towards understanding or explaining the physical or social world." Having conceived of their task for the chapter to be the identification of what distinguishes action research and self-study, they conclude by saying, "Action research provides the methods for the self-studies [that they included and analyzed], but what made these *self-studies* were the methodological features that they display."

The question we need to explore with regard to this issue may not reside as much in the definition of the two terms – a closer look suggests there may be more similarity than difference in that regard – but on the relationship between the two in self-study research. Furthermore, we need to more consistently acknowledge the distinctions that we are making and apply them accordingly. I have suggested, and would continue to do so, that self-study is a methodology, a stance toward research, which employs many methods. We select the methods

we do either because they are consistent with this methodology or they are embodiments of other methodologies that are compatible. I might argue further, however, that unless those other methodologies also include all aspects of the methodology of self-study, the latter must provide the overriding stance to the research if self-study is the intent. If so, does this mean that methodologies like dialogue and action research become or provide methods for the methodology of self-study? The action research authors seem to say yes, while the dialogue authors seem to suggest not necessarily.

Earlier in the history of this field, Pinnegar and Russell (1995) said: "We feel that, while the research methodologies we use are not new, we are developing new ways to use them" (p. 7). Another way to think about this question, then, is whether or not the process of using old methodologies in new ways requires or results in the transformation of or move away from those original methodologies. One point that is often made, for instance, is that research done by the self on the self necessitates a fundamental shift in any methodology previously employed otherwise.

One point that is clear in reading the chapters in this section is that there is much overlap in the methods/methodologies under consideration. For instance, Weber and Mitchell, in discussing visual and artistic modes in self-study, speak of them as autobiographical and dialogical, as well as often inclusive of technological media. On the flip side, Hoban talks about the visual advantages of many Information and Communication Technologies (ICTs), as well as their potential in the facilitation of dialogue – a technique used with frequency by the Arizona Group. Lyons and Freidus include in their chapter on the use of reflective portfolios in self-study a consideration of electronic portfolios.

Again, the conclusion to which these interconnections tend to lead me is that these are compatible methods, derived from comparable methodologies, from similar epistemological, pedagogical, and moral/ethical/political underpinnings, that then become subservient to the methodology of self-study. As Casey (1995) has said of narrative research, "[It] is, at present, distinctly interdisciplinary, including elements of literary, historical, anthropological, sociological, psychological, and cultural studies. … What links together all these lines of inquiry is an interest in the ways that human beings make meaning through language" (p. 212). In the case of self-study the link, or at least a link, is self-initiated and focused research for the purpose of better understanding and improving teaching and learning. How much this linkage changes the borrowed approaches and the rationales for them is the question. But this issue will not be resolved here. I do think, however, that we need to continue to explore these and related questions because this deliberative process should help in the refinement, clarification, and strengthening of the methodology of self-study. Another way we can do this is by giving increased attention to our validation process.

The Validation Process

In fact, I would urge the field to give first and frequent consideration to this feature of our self-study methodology. I believe that we need to continue to

work toward more consistency and explicitness in this domain, and I am not alone in making this suggestion. Calls for appropriate rigor in our research and adequate justification for our evaluations based in explicit evidence of transformed thinking and practice for us and our students are widespread in both this section and the general self-study literature. The entire focus of Whitehead's chapter, in fact, is on this very issue. Lyons and Freidus base their arguments for the value of reflective portfolios in self-study on their ability to bring needed rigor to the field because their structure can provide the evidence required for claims of influence. The Arizona Group makes a similar assertion with regard to dialogue. They contend that self-studies are in many senses dialogic, a mode whose characteristics, including diverse communal reflection and critique that takes practice as the starting point for the negotiation of meaning, "can provide an authoritative basis for making knowledge claims."

The field has always accepted its responsibility for validating its findings. In the book documenting the research presented at the first international conference of the American Educational Research Association's Self-Study of Teacher Education Practices Special Interest Group (S-STEP), Hamilton and Pinnegar (1998) summarize the work as follows:

> The commitment of this group not just to understand or to discover "new knowledge," though there is plenty of commitment to do that, what is unique here is the commitment to provide insight for others of how the understandings of the authors became part of their actual day-to-day practice. ... As one's educational practice improves, accounts of it and therefore knowledge about it is added to the knowledge base of the teaching and research community. (pp. 242–243)

Apparent here is that the aim has never been generalizability, as would be consistent with our conceptual framework, so we have attempted to justify our claims to knowing in ways different from traditional research. We have done so primarily by testing our knowledge in our own practice and by making our claims available to the community so that others can do so as well.

More recent self-study literature, e.g., the book sampling the work of the third S-STEP conference edited by Loughran and Russell (2002) and the proceedings from the fourth conference, edited by Kosnik, Freese, and Samaras (2002), contains many comparable acknowledgements (e.g., Gudjónsdóttir, & Dalmau, 2002; Hamilton, 2002a; Kuzmic, 2002; Loughran, 2002). Louie, Stackman, Drevdahl, and Purdy (2002), for instance, state: "We were purposeful in taking a systematic approach to our collaborative self-inquiry so that the results of our work could go beyond self-enhancement to advance the scholarship of teaching" (p. 196).

Bullough and Pinnegar (2001) address the question of quality in self-study research quite directly by iterating a set of suggestive guidelines to be used in producing and evaluating autobiographical forms of self-study. They conclude by reiterating the need for those engaged in this "infant" field to respond to the "burden of proof":

> [Self-study's] endurability as a movement is grounded in the trustworthiness and meaningfulness of the findings both for informing practice to improve teacher education and also for moving the research conversation in teacher education forward. Like other forms of research, self-study invites the reader into the research process by asking that interpretations be checked, that themes be critically scrutinized, and that the "so what" questions be vigorously pressed. In self-studies, conclusions are hard won, elusive, are generally more tentative than not. (p. 20)

I believe that Mishler's (1990) conceptualization of validation, so consistent with this articulation of the needed effort, can help us be responsive to such internal, and similar external, admonitions. His work both encapsulates what we are already doing and reveals foci for improvement.

Providing Evidence

Mishler proposes that the essential criterion for judging inquiry-guided research like self-study is that the results can "be viewed as sufficiently trustworthy for other investigators to rely upon in their own work" (p. 429). In order for that to be possible, authors of such studies must make visible our data, our methods for transforming the data into findings, and the linkages between data, findings, and interpretations. Hoban agrees with this point: "[Self-study] needs a process to make data and their interpretations available for public inspection."

A part of the problem for the field is how to answer this need in ways appropriate for "approximate, suggestive" knowledge (Hutchings, 2000) that is also consistent with our sometimes innovative methods. The Arizona Group responds to this challenge in representative fashion by articulating how judgments might be made in dialogic self-study:

> We believe that our confidence to act on the knowledge claims we develop emerges from a sense of surety that our ideas are understood by the others and accepted as a basis for action and yet they have been critiqued. This does not mean that the understanding and acceptance offered by the others means they agree. It simply means that given our arguments and our understanding what we are saying seems to be a reasonable basis for action.

As Eisner (1993, 1997) has repeatedly emphasized, alternative forms of representation will reveal different meanings and allow us to understand education in unique ways. Not everything can be said with anything, which, by implication, means that our inquiry needs to include multiple approaches: "My conception of research is broad. I will count as research reflective efforts to study the world and to create ways to share what we have learned about it. Research can take the forms that echo the forms of the arts and humanities or those of the natural and social sciences. Its forms of data representation are open to invention" (1997, p. 8). Many in the field of self-study have been doing just that. As Eisner (1997) states further, "Ultimately its value as research is determined by the judgment

of a critical community" (p. 8) – a notion quite consistent with Mishler's validation process. Thus, I encourage the self-study community to follow the latter's suggestion for judging the adequacy or "trustworthiness" of the evidence provided. It consists in part of sets of appropriate evaluative questions to be applied to our "readings" of self-study reports and presentations.

Evaluative Questions

An earlier more general suggestion of the same ilk is implied by Hamilton's (1998) characterization of the investigative processes of self-study researchers: "They systematically bring to bear all of their past experiences, understandings, scholarly perspectives, and theoretical frames to make sense of the experiences within which they are engaged. Critical reflection becomes an essential tool in this form of study" (p. 64). She is, of course, referring here to the authors of the research, but the same could be said of the readers. Since we are aiming for local, contextualized understanding, the personal nature of this approach is appropriate. However, it would also be possible and desirable to formulate more general sets of questions to be considered, which is the intent of Bullough and Pinnegar's (2001) article.

Several of the authors in this section provide us with other potential interrogatory approaches and collections. Whitehead, for instance, suggests that we ask categorical questions about the research evidence. That is, we are to judge the value of a self-study's contribution by considering the evidence issue in relation to the different ways it might advance the field, including the following:

- Is there evidence of the generation and testing of educational theories from the embodied knowledge of s-step researchers?
- Is there evidence of the transformation of the embodied values of the s-step researcher into the standards of judgment that can be used to test the validity of s-step accounts?
- Is there evidence of the emergence of educational research methodologies as distinct from a social science methodology in s-step enquiries?
- Is there evidence of a logic of educational enquiry?
- Is there evidence of educational influence in educating oneself, in the learning of others, and in the education of social formations?

Taking a different approach, Weber and Mitchell propose a list of questions that might assist us in determining the value of not only a visual artistic self-study but also most others in the field by having us focus on the impact of the research: a) whether it provokes discussion or engages a wider audience in meaningful conversation; b) whether the audience, researcher, and/or her or his students learn anything that helps them better understand their own learning and teaching experience; c) whether useful re-framings are made possible for other scholars/ teachers/policy-makers; d) whether imaginative possibilities for future action are evoked; e) whether new links with people, knowledge, and community are

facilitated; and, f) whether anything transformative occurs in the doing or the viewing, leading to new ways of being.

Their emphasis on determining value by attending to what happens as a result of the self-study research – what comes next – is consistent with Mishler's position that our aim is not to determine the validity of an individual study in a circumscribed or conclusive manner. Judgments about a particular investigation can only be provisional, awaiting further trial by the relevant community. Thus we might do well to identify each self-study as an exemplar of practice that provides a beginning rather than an ending to the validation process.

Bodies of Work

Again, there are many indications in the literature that we already conceive of our validation process in this way (e.g., Hutchinson, 1998; Korthagen, 1995; Kuzmic, 2002; Loughran, 2002). Dalmau, Hamilton, and Bodone (2002) express it well:

> One of the reasons [S-STEP] exists and sponsors programs at conferences is to promote and support the improvement of teacher education practice through self-study. Papers and presentations are not simply about telling the world what we have done – they are about facilitating dialogue, creativity, and scholarship among us. Thus, at the end of our writing and presentation, authors, readers, and participants will have learned something new, reframed issues in their own practice, and developed new questions. (p. 60)

Many other educational scholars have argued for a similar means for advancing the knowledge base of teaching and learning and for comparable reasons, particularly related to the contextual, distributed, and uncertain nature of that knowledge (e.g., Cochran-Smith & Lytle, 1999; Coulter & Wiens, 2002; Eisenhart, 2002; Kumashiro, 2001; Lyons & LaBoskey, 2002; Shulman, 1998; Wilson & Berne, 1999).

The implication is that we need to develop bodies of exemplars of teacher education practice and understandings of that practice. Even though validation as trustworthiness can never be accomplished once and for all, it can be strengthened through repeated trial and analysis. It seems to me, then, that we can begin to formulate and accomplish this task in at least two ways. First, we can engage in a process very much like that envisioned by Cochran-Smith and Lytle (1999) when they spoke about inquiry as stance, which emphasizes, "that teacher learning for the next century needs to be understood not primarily as individual professional accomplishment but as a long-term collective project with a democratic agenda" (p. 296). We thus both co-develop and take into account widespread bodies of relevant work and their resultant changes over time.

Though such a sustained communal process is the ultimate aim, I believe we can also continue to think about validation on a smaller scale. Therefore, the second way in which we might approach the validation of bodies of work is by focusing on an individual's accumulated evidence of growth – segments of their

professional portfolio or curriculum vitae, if you will, that reveal personal improvement. Since one of the universally agreed upon requirements in self-study is to provide evidence of the reframed thinking and practice of the teacher educator researcher and since we recognize that the impact of such change can be difficult to detect in the short run, then the long-term tracking of progress, accompanied, of course, by efforts to make sense of that overall development, should be of benefit to the community as well as to the particular scholar. Many in the field have already engaged in this kind of work (e.g., Hamilton, 2002a, 2002b; Senese, 2002; Wilcox, 1998). The Arizona Group utilizes such a process in the presentation of their section chapter, by tracking over time their developing understanding of dialogue in self-study. In detailing the how's and why's of their changing perspectives, they both document and justify their transformations, as well as give us reason to do likewise. Feldman, Paugh, and Mills use personal stories of their journeys to self-study via action research and their re-analyses of those journeys not only so that they can gain greater understanding of the nature and relationship of the two fields, but also to offer to the reader support for the distinctions they are making.

We seek evidence for individual and community improvement; it is a defining characteristic of our methodology. Indeed the central questions of self-study are "How do I live my values more fully in my practice?" (Loughran, 2002) or "How do I improve my practice?" (Whitehead, 2000). The wording of these queries tends to favor a negative impetus; that is, our self-study investigations are often initiated by discrepancies between our intentions and our actualities. As I have noted previously (LaBoskey, 1994), I believe that we could also benefit from more positive promptings. By that I mean that we should engage as well in self-studies that raise questions about our "successes" both so that we can better understand our strengths (Freidus, 2002) and also reconsider them from alternative perspectives. Additionally, I think there is much merit in exploring and expanding areas of interest not necessarily driven by manifesting difficulties. Knowledge thus gained can also advance our practice.

And what do we mean by advancing our practice? All of the authors in this section agree that the methodology of self-study is improvement-aimed – that we evaluate our bodies of work with that criterion – but there is variation in the scale and focus of the progress attempted and valued. The final suggestion I would like to make to the field has to do with this issue.

Improvement as Social Justice

I argued in chapter twenty-one that self-study has moral, ethical, and political underpinnings and aims. The other section authors support this contention to varying degrees. At the very least most acknowledge our responsibility to our students – the need to act with integrity and to monitor our practice for consistency and impact. Many also speak about the necessity of gathering input from them – of hearing and being responsive to their voices in our research and practice. Others take it further. Weber and Mitchell, for example, include the

following in their list of the key features of arts-based research that make it a desirable choice for self-study: "Makes the personal social and the private public: Going public leads researchers to assume a more activist stance." They expand upon this point by discussing the role that the arts have long played in constructing and de-constructing cultural contexts and provide examples of where it has been used to challenge prevailing values and norms. They advocate for its use in self-study in part on that basis – its political potential.

Samaras, Hicks, and Berger make a similar suggestion with regard to personal history self-study. They emphasize the political, moral, and ethical potential of personal history in both the pedagogy and research of self-study scholars, as is apparent in this statement: "As teacher educators reshape status quo curricula, they find that teaching about perspective-taking, diversity, social justice, and teacher empowerment are more effectively studied within a personal history self-study landscape and through non-traditional pedagogies." The primary exemplar of personal history self-study included in their chapter is a description of Samaras' efforts to construct and implement a teacher education course and program committed to social justice and the development of moral reasoning.

Whitehead takes a particularly strong stance with regard to the moral, ethical, and political nature and potential of self-study by ending his chapter with an explicit call to the community to give more attention to post-colonial and ecological feminist theory. Citing international examples of self-study scholarship, he urges us to build upon that work in an effort to become more global and more inclusive of dissonant voices, something he feels we have yet to achieve.

My review of the self-study literature for the purpose of preparing this section of the handbook would lead me to agree with Whitehead on this point. The range of treatment the moral/ethical/political aspects of self-study receives in this section is representative of the field. In the main, it is more implicit than explicit and more limited in scope than it could be, with some notable exceptions where such questions and aims take center stage (e.g., Bass, 2002; Brown, 2002; Griffiths, 2002; Hamilton, 2002a; Kuzmic, 2002; Schulte, 2002). But it is clearly present, as Barnes (1998), who provided the "outsider" perspective on the first S-STEP castle conference, would agree:

> "Caring" seemed to be an underlying concern for them. Almost everywhere I heard about caring for other people and their experiences. I heard about the importance of supporting colleagues, of helping pre-service teachers find their own voices so that they are able to express and organize their experiences in the classroom and of responsibility for the young students who will be the eventual recipients of all the efforts to help teachers to teach more sensitively and reflectively. Underlying self-study was an essentially *humane* approach to education. (p. ix)

Such a foundation means that self-study has strengths that reside in its personal and interpersonal nature – in its acknowledgement of the humanity of the teaching/learning endeavor and the need for us as teachers and teacher educators

to take responsibility for our actions. If we take this charge seriously – of caring for *all* of our students and our students' students – then, I believe, we necessarily need to acknowledge the current inequities that exist in our classrooms, our institutions, and our societies. This in turn will require us to actively engage – in ways guided by a social justice agenda – in the transformation of these contexts and the individuals, including ourselves, who support and sustain them. It means we need to strive with explicit intentionality for what Kumashiro (2001, 2002) and others have termed anti-oppressive education. Since self-study is a field of educational inquiry constructed to eschew artificial, and thus inherently political, distinctions like those between teacher and researcher, expert and novice, emotion and cognition, subject and object, we are well situated to take such steps. I believe that we have yet to adequately capitalize on this potential and I would urge us to do so.

Conclusion

As Zeichner (1999) has previously noted, self-study is a viable field of educational inquiry:

> Contrary to the frequent image of the writing of teacher educators in the wider educational research community as shallow, under-theorized, self-promotional, and inconsequential, much of this work has provided a deep and critical look at practices and structures of teacher education. This work can both inform the practices of the teacher educators who conduct it and contribute to knowledge and understanding of teacher education for the larger community of scholars and educators. (p. 11)

The authors of this section of the handbook provide substantial corroboration to that perspective. Self-study is well grounded in epistemological, pedagogical, and moral/ethical/political theory and is recognizable in its methodology. Are there inconsistencies and disagreements within the field? Are there exemplars of self-study research and practice that are more or less trustworthy than others when judged by our developing guidelines and questions? Absolutely, which is also true of all viable disciplinary niches; it is their nature. Do we have more work to do with regard to the articulation and construction of our theories and methodology? Of course we do, which is again an inherent characteristic of professional scholarship. But this section demonstrates that we have a solid foundation from which to build that includes a common research stance and a substantial body of exemplars.

I have made some suggestions as to where we might focus our efforts in the near term: on the role of the subject matter of teacher education in our self-study methodology; on the differences and relationship between the methods and methodology of self-study; on the further articulation and application of a validation process defined as trustworthiness; and, on our grounding in and goals for the ethic of care and social justice in our self-study practice and

research. In a manner consistent with the conceptual framework of self-study, I close this afterword with an invitation to join in these deliberations. I urge both authors and readers to apply our collective hearts and minds to this effort to better understand and improve teaching and teacher education in ways aimed to benefit us all.

SECTION 4

Self-Study in Teaching and Teacher Education

Section Editor: Tom Russell

FOREWORD TO SECTION FOUR

Section 4 concludes this handbook with a series of chapters that focus directly on self-study in teaching and teacher education. Although teaching and teacher education have been discussed implicitly and explicitly in the chapters of the preceding three sections, this section provides an opportunity to consider issues specific and unique to these areas.

Chapter 30 offers an interpretation of the development of self-study as a theme in the evolution of research and practice in teaching and teacher education. This chapter reviews chronologically a range of positions indicating the growing attention to "self" in professional education, as put forward in the 1980s and 1990s, when self-study emerged and became a significant theme within research on teaching and teacher education.

Chapter 31 looks at the issue of scholarship in self-study. Trumbull identifies several familiar adages, both conserving and reforming, and explores them to identify implicit premises about knowledge, learning and schooling. Particular attention is given to the role played by emotions in attempting to change the way in which one teaches. Perceptual knowledge, contexts, cultural myths, and the intrinsic uncertainties of teaching are identified as playing influential roles in the scholarship of self-study. Special attention is given to case study and quality control in scholarship. The chapter closes by revisiting the familiar adages in ways that illustrate the progress achieved. One of the strengths of this chapter is its attention to the broad range of elements that count as context in the scholarship of self-study.

Chapter 32 takes us into the world of two teachers who display strong commitments to self-study in the context of teaching in schools. Austin and Senese speak from their experiences as teachers and administrators to advance a range of arguments for self-study by teachers. Although directed to teachers in schools, the detailed attention to the requirements of self-study in school classrooms will prove just as valuable to teacher educators working in the university context. A strong list of important reasons for conducting self-study in one's classroom precedes an account of the importance of sharing one's findings. Throughout, the authors emphasize the benefits of self-study while being careful to acknowledge the challenges as well. The chapter concludes with discussion of the importance of being "practical, pragmatic, and realistic."

The single most important element of pre-service teacher education is commonly taken to be the practicum. In Chapter 33, three teacher educators with significant experience in and commitments both to self-study and to the practicum consider a broad range of practicum issues from the perspective of self-study. Throughout their argument, Beck, Freese and Koznik recognize that the practicum is the earliest phase of the central feature of a teacher's career – working with students in classrooms. What better context, then, to introduce self-study and to link it to efforts to improve and reform teachers' work in classrooms? The authors link self-study with a "personal-constructivist-collaborative" approach rather than a "technical-transmission" approach and use the personal-constructivist-collaborative approach to explore a broad range of issues associated with the preservice practicum. They are particularly attentive to the importance of coherence and consistency and to the significance of modeling in the fostering of self-study.

Chapter 34 focuses on the heart of the teacher education enterprise – teaching *about* teaching. While it is common for teacher educators to recommend reflective approaches to the development of personal practices by teachers, it is much less common to read teacher educators' accounts of the development of their own professional practices. Berry leads readers through a range of issues associated with the work of teacher educators and offers important arguments about the place of self-study in the development of teacher educators' professional knowledge. She acknowledges that self-study is a complex process involving significant tensions, and her account of these tensions offers valuable insights for teacher educators who attempt self-study or recommend it to beginning and experienced teachers. This chapter is particularly helpful in exploring the nature of the knowledge that is unique to teacher educators.

Chapter 35 invites readers to consider issues associated with self-study at the program level and provides an important reminder of the international context of teacher education. Because self-study is so frequently an individual affair, we may easily overlook the reality that self-study is always set in a context – historical, political, and organizational. Clift's chapter begins with descriptions of teacher education contexts in four different countries – Colombia, Japan, South Korea and the USA. The remainder of the chapter considers "themes and variations" in self-study research, including orientation to practice, method of teaching and learning, prospective teachers' actions in field settings, issues of diversity, and collaboration. The consideration of entire teacher education programs draws illustration from three particular programs. The chapter closes with a broad range of questions about self-study research in relation to understanding and improving the quality of teacher education programs.

Chapter 36 reminds us that, in addition to teaching and research, administration is another significant element of teacher education to which self-study approaches are both applicable and important. Certainly, administrative policies and practices can influence not just the outcomes of teacher education programs but also the opportunities for research using self-study approaches. Speaking as a teacher turned teacher educator who has moved into administration as an

associate dean, Manke identified relevant studies on the basis of three features of self-study – reflection on context and practice, considering previous contexts and practices, and collaboration. Her analysis of a number of self-studies related to administration yielded four main themes: power; community; social justice; and, teacher education reform. The largest part of the chapter discusses studies grouped within these four themes. Highlighting the contributions of self-study to self-understanding, Manke urges administrators within teacher education programs to both support and practice self-study.

Chapter 37 takes readers into the complex realm of professional ethics in the context of self-study research in teaching and teacher education. Mitchell's extensive personal experience leading school-based groups of teachers in action research constitutes a strong background for his wide-ranging consideration of ethical issues in research, particularly as they are often interpreted by institutional committees charged with conducting ethical review of research proposals. An analysis of the many differences between "experiments" in bio-medical contexts and education is illustrated with several cases. Mitchell argues that experimentation is ongoing in teaching, for there is no place to test new teaching practices other than in real classrooms. Intervention, data collection, and data analysis and reporting are examined, and again cases are used to drive home the conclusions about practitioner research in teaching. The chapter closes with a list of 18 questions relevant to risk, approval, consent procedures and protection strategies in teacher research.

Chapter 38 reviews and interprets the achievements of Chapters thirty-one through thirty-seven, with a view to drawing out themes, issues, tensions, similarities and differences across the arguments in this fourth and final section of the handbook. What is self-study, who does self-study, and why and how they do self-study are the overarching issues explored by Baird. This chapter will be particularly meaningful to those who have read all seven chapters, but it may also serve as a different type of introduction to this section on self-study in teaching and teacher education. Five possible interpretations of "self" in self-study are drawn from the content of the seven chapters, and each chapter is summarized in terms of who is doing self-study, the purposes of the author or authors, and the way in which the chapter interprets the self in self-study. In reviewing various purposes for self-study, four sets of beneficiaries of self-study research are identified – teacher educators, classroom teachers, those learning to teach, and administrators and leaders. Baird next considers how self-study is conducted and reported. The chapter closes with an insightful account of how the authors in this section view self-study, educational scholarship, and the progress of self-study within that scholarship.

30

TRACING THE DEVELOPMENT OF SELF-STUDY IN TEACHER EDUCATION RESEARCH AND PRACTICE*

Tom Russell
Queen's University

Abstract

In this opening chapter of Section 4, which focuses directly on teacher education, I argue that the evolution and development of teacher education itself have made self-study both necessary *and* inevitable. Teacher education has been slow to come of age – as a ''discipline'' and as a domain of research. Within the generally low-status domain of education itself, identifying with a recognized discipline such as history, chemistry, or psychology is often a teacher educator's most direct route to some sense of status. The enterprise of teacher education itself has waited patiently to be noticed. Just as Western societies generally assume that ''teaching is easy'' because it looked easy to all who remember their own schooling, so it has long been assumed that teacher education – teaching other people how to teach – is ''easy.'' Preservice teacher education programs are rarely characterized as challenging or demanding, apart from the personally intense and often complex practicum experiences, when the beginning teacher first discovers that teaching is not as easy as it looks. Although their academic status remains weak and although they are not readily accessible to teachers in schools, teacher education research and practice can meet and interact in self-study. This chapter provides a chronological account of important shifts in perspective with respect to teaching, teacher education, and educational research and practice, with special reference to the appearance of self-study.

Since the 1970s, new perspectives have emerged as all who seek to improve our schools have come to realize the challenges and complexities of educational

---

reform. As Sarason (1971) demonstrated in *The culture of the school and the problem of change*, the "modal process of reform" in universities is remarkably similar to that in schools. Over time, the challenges of teacher education reform, set in universities, have come to be seen as far more similar to than different from the challenges of educational reform, set in schools. As background for the chapters that follow in this section, the argument here is that the most important shifts in perspective since the 1970s have pointed in various ways to our growing awareness of the importance of *self* in teacher education. As teaching and teacher education research and practice continue to struggle generally with the problem of achieving in practice what we understand from theory and research, self-study has appeared as one powerful way forward. I argue here that the appearance of self-study in the 1990s was not only necessary but also inevitable.

Changing Assumptions about Research and Practice since the 1970s

Many individuals have described and interpreted the evolution of educational research in the last half of the 20th century. The following comments by Calderhead (1996, p. 709) are indicative:

> The research on teaching in the late 1960s was strongly characterized by a behaviorist stance that sought to describe teaching in terms of sequences of behavior, and then to investigate the relationship of that behavior to children's learning. The research in the next two decades, however, became far more concerned with how teachers understand their work and the thought processes, judgments, and decisions that their work involves.

When we recall the process-product paradigm that characterized much research on teaching prior to 1980, a fundamental premise seems to have been that observers would be able to identify teaching behaviors that correlated with increases in average test scores for classroom groups. Once such behaviors were identified, the familiar premises of fundamental research suggested that good teaching behaviors could be taught to both experienced and beginning teachers. The average test scores of the classes they taught could then be expected to rise. Much of this work is summarized in terms such as "knowledge base for teaching" (Reynolds, 1989). Despite several decades of relatively unproductive effort, politicians continue their search for ways to increase children's scores on an ever-increasing array of tests. The "theory-practice problem" persists, and some researchers seem to see teachers as never quite able to demonstrate the required array of proven practices. It appears that those who would reform education and teacher education from the outside have failed to understand and act upon Calderhead's point about the importance of how teachers think about their work and how they make judgments and decisions.

1983: Schön sees Individual Professionals Learning IN their Experiences

Schön (1983, 1987) suggested a new approach to the persistent "theory-practice" problem by assigning significance to the individual practitioner's learning from

personal experience. Schön directed attention to the explicit "reframing" of experiences by the practitioner in the action context. He suggested that new ways of thinking about puzzles and problems within the practice setting can generate new actions that can be tested in the practice setting. These moves to the personal in professional education occurred about the same time as two significant events within the American Educational Research Association (AERA). In 1980, the legitimacy of qualitative methods in educational research was proclaimed and, in 1984, AERA accepted a petition to create a new division called Teaching and Teacher Education. Prior to this event, research on teaching and teacher education had to be framed within divisions focusing on curriculum or instruction. This new division grew rapidly to become one of the largest divisions within this very large association of educational researchers. As teacher education research turned its attention to a new area of *reflective practice* and as new teachers were exhorted to become reflective practitioners, it was clearly appropriate for teacher educators to begin to examine their own behaviours from a reflective practice perspective.

Schön's (1983) argument for the significance of reflection-in-action in the development of professional knowledge focused on a critique of "Technical Rationality" as the dominant epistemology in the academic context. The following quotation indicates one strand in his argument:

> Between 1963 and 1982, however, both the general public and the professionals have become increasingly aware of the flaws and limitations of the professions. ... The professions have suffered a crisis of legitimacy rooted both in their perceived failure to live up to their own norms and in their perceived incapacity to help society achieve its objectives and solve its problems. Increasingly we have become aware of the importance to actual practice of phenomena – complexity, uncertainty, instability, uniqueness, and value-conflict – which do not fit the model of Technical Rationality. (Schön, 1983, p. 39)

Schön went on to contrast the emphasis in Technical Rationality on problem *solving* (the application of research knowledge to practical problems, built on the familiar premise that the individual practitioner puts theory into practice) with the reality of problem *setting*, which he describes as "the process by which we define the decision to be made, the ends to be achieved, the means which may be chosen" (p. 40). Here we can see *growing attention to the individual practitioner within the professions.* Here we can also see the emergence of attention to the *self*, for it is the individual practitioner who must assess and interpret the practice setting and set the problems to which knowledge might be applied. This seems particularly true for teachers working in their individual classrooms.

> In real-world practice, problems do not present themselves to the practitioner as givens. They must be constructed from the materials of problematic situations which are puzzling, troubling, and uncertain. ... [Professionals]

are coming to recognize that although problem setting is a necessary condition for technical problem solving, it is not itself a technical problem. When we set the problem, we select what we will treat as the "things" of the situation, we set the boundaries of our attention to it, and we impose upon it a coherence which allows us to say what is wrong and in what directions the situation needs to be changed. Problem setting is a process in which, interactively, we *name* the things to which we will attend and *frame* the context in which we will attend to them. (Schön, 1983, p. 40)

Schön's two books (1983, 1987) about the reflective practitioner launched a wave of attention to reflective practice as a significant theme within preservice teacher education. Ten years later, in 1993, that attention was formally extended to teacher educators themselves when a special interest group devoted to self-study of teacher education practices was formed within the American Educational Research Association. In hindsight, Schön's work can be seen as part of a shift in perspective toward the importance of the individual practitioner attending to his or her own thoughts and actions in relation to each other as well as to knowledge developed through research. Despite high value placed on objectivity, the self could no longer be ignored.

1984: Goodlad Assesses the State of America's Schools

There were many developments in the decade of the 1980s that can now, in hindsight, be seen as preparing the way for teacher education research to recognize the need for an approach designated as "self-study." In a variety of ways, professional education was experiencing developments that paralleled the opening up of teacher education as a field that needed more research based on a broader array of methodologies. It is instructive to recall the state of American schools as observed and reported by Goodlad (1984):

> The gap between the rhetoric of individual flexibility, originality, and creativity in our educational goals and the cultivation of these in our schools reveals a great hypocrisy. From the beginning, students experience school and classroom environments that condition them in precisely opposite behaviors – seeking "right" answers, conforming, and reproducing the known. These behaviors are reinforced daily by the physical restraints of the group and classroom, by the kinds of questions teachers ask, by the nature of the seatwork exercises assigned, and by the format of tests and quizzes. They are further reinforced by the nature of the rewards – particularly the subtleties of implicitly accepting "right" answers and behaviors while ignoring or otherwise rejecting "wrong" or deviant ones. Only in the "less important" subjects and the advanced sections of academic courses are there evidences of some significant cultivation and reinforcement of more creative or intellectually independent behaviors. (p. 241)

The gap between the "rhetoric" of goals and the "cultivation" of goals is a

powerful critique of schools and teaching, and it is instructive to consider the extent to which this gap is also applicable to teacher education. Can the classrooms of preservice teacher education courses also be characterized as rewarding conformity and reproduction of the familiar, rather than rewarding "flexibility, originality, and creativity"? Are the patterns of question asking and the nature of written assignments in preservice teacher education similar to those that Goodlad found in schools? Apparently, many who experience teacher education courses would agree with Goodlad's observations, and this critique foreshadows the need within teacher education research for research approaches that include self-study. Goodlad's analysis also points to a central dilemma faced by teachers as individual professionals: Most of us who become teachers did very well in the school environment that Goodlad describes and became quite accustomed to the very contradictions he describes. Most new teachers hope to move well beyond and away from right answers and conformity, but it is very much an individual task to do so. Given the persistence of the gap between rhetoric and school reality, the individual teacher needs an approach such as self-study to make progress.

1987: Hunt Begins with the Professional Self

One of the earliest presentations of the importance of turning to the self to address these issues of professional knowledge and action is also one of the clearest presentations of the issues and challenges. In *Beginning with ourselves*, Hunt (1987) sets out arguments and strategies not just for teachers and counselors (pp. 53–83) but also for consultants and supervisors (pp. 85–104) and for theorists and researchers (pp. 105–121). He introduces his perspective in these words:

> My theme, beginning with ourselves, is based on George Kelly's belief that every person is a psychologist. Psychology is the study of human affairs, and each of us has a wealth of knowledge based on a lifetime of direct experience. … By beginning with yourself, therefore, you are taking advantage of this rich reservoir – tapping what you know about yourself and others to bring out your experienced knowledge on topics that psychologists would call interpersonal relations, self-awareness, individual differences, teaching and learning, and so on. (Hunt, 1987, p. 1)

Hunt continues by reporting that his idea of beginning with oneself developed in his work with classroom teachers. Here we see concerns about "theory into practice" and the importance of the practice setting that are similar to Schön's concerns:

> My ideas on beginning with ourselves originated when I was working with classroom teachers to help them adapt to the wide variation in learning styles among their students. Working as a practical theorist, I became dissatisfied with the conventional view that if a logical theory were developed

and verified through research, then it could be directly applied to classroom practice. The abstract idea that "theory leads to practice" is logical enough, but it did not offer a satisfactory account of how we were actually working together. Describing our work together in this abstract way cut us off from our direct experience, thereby removing us from the realities of the practice we were trying to improve. (Hunt, 1987, pp. 1–2)

Hunt gives further indication of the novelty of attention to self, particularly to beginning with self, by summarizing the challenges involved and by noting that such an approach normally encounters significant "resistance."

Simple as it seems, beginning with yourself is not so easy to put into practice. To begin with yourself requires that you temporarily suspend your belief in psychologist-as-expert and your belief that social science will solve human problems. It is an *Inside-out* psychology, rooted in your own experience, and it is totally opposite to the traditional *Outside-in* approach which leaves human affairs to the experts. My suggestion to start Inside-out does not require that you completely reject Outside-in, or formal, psychology. It calls for Inside-out to come first, because, among other things, this approach provides a valuable base from which to consider Outside-in information.

I did not realize when I began to use Inside-out psychology how much resistance I would encounter. (Hunt, 1987, p. 2)

Speaking from within a field as traditional as psychology and driven by experiences of trying to help teachers connect his field's research to their classroom practices, Hunt names the self not only as significant but also as the starting point. Thus Hunt illustrates clearly the developing recognition of the importance of the self in professions that had been seen for many decades as domains in which researchers studied practical problems and constructed theories that would be returned to practitioners for application to practice. Inside-out contrasts sharply with the far more familiar outside-in approach.

1990: Action/Teacher Research is Noticed in USA and Canada

Since 1990, there has been a rapid increase in the USA and in Canada in awareness of, attention to, and support for an action-research approach to the improvement of classroom teaching. Action research has been advocated and supported for a much longer period in the UK and in Australia. Cochran-Smith and Lytle (1999, p. 15) wrote that, "the current wave of interest in teacher research in the United States is now a little more than a decade old," and they cite a range of publications from the period 1985–1988 that appear to have launched the North American interest. Cochran-Smith and Lytle describe four different developments that contributed to interest in teacher research. Again, the recognition of the teacher-self, the individual teacher examining personal practices, appears at the core of this development:

Part of what makes the current wave of interest in teacher research a

movement and not just the latest educational fad is that teacher research stems from these different, but in some ways compatible intellectual traditions and educational projects. Each constructs the role of teacher as knower and as agent in the classroom and in larger educational contexts. ... The intellectual and educational projects that fueled the current U.S. teacher researcher movement had in common a critique – either implicit or explicit – of prevailing concepts of the teacher as technician, consumer, receiver, transmitter, and implementor of other people's knowledge. (p. 15)

This account links directly to Schön's critique of Technical Rationality, a critique that seems not to be broadly accepted, just as the turn to action research and teacher research is far from complete or universal. Additionally, the turn to teacher research tends to be viewed by some educational researchers as a turn away from full-fledged research. Nevertheless, this attention to teacher research since 1990 can be interpreted as a significant professional turn to the self – allowing and encouraging teachers to develop a measure of independence not typically associated with programs of deliberate change or with programs of professional development for teachers.

1990: Goodlad Calls for Teacher Education Reform

By 1990, Goodlad had extended his concerns about American schools to a major survey of teacher education programs in the USA. A single paragraph from his report confirms the strong parallels between schools and teacher education institutions:

We found very little intellectual wave-making in the programs we studied. The very listening, responding to questions, and participating in teacher-directed discussions that go on in schools, according to much research, characterized almost all of most teacher education programs. As we concluded in our earlier research on schools, teachers teach as they observed and experienced teaching in schools, colleges, and universities during sixteen or seventeen years of attendance. In general, students in teacher education programs did not see teaching as "deliberate action"; they did not think in terms of the ability to use knowledge to inform their actions. "Instead, they seemed to be trying to squirrel away as many specific solutions and techniques as possible against the challenges to come." The rush to cram it all into the limited time available in teacher education programs appeared to abort the emergence of sustained inquiry and reflection. (Goodlad, 1990, p. 265)

Here we see Goodlad writing in 1990 that teachers are teaching as they were taught, in teacher education institutions as in schools. Almost 20 years earlier, Peck and Tucker (1973) had concluded that teaching as we have been taught is not good enough for teacher education:

Teacher educators should practice what they preach. When teachers are

treated in the same way they are supposed to treat their pupils, they are more likely to adopt the desired style of teaching behavior. (p. 943)

"Do as I say, not as I do" is a notoriously poor formula for getting people to act the way you want them to. Nonetheless, teacher education has largely followed that formula for centuries. Generations of student teachers in America have sat through unnumbered hours of lectures on the virtues of educating children through democratic discussion. (p. 955)

The logical need for a self-study approach to the relationship between goals and actions, between personal theory and personal practice, continues to be clear. Countless external critiques of teacher education have produced floods of words that have had little impact on action. Just as words have not changed teachers' practices in schools, so too they have not changed teacher educators' practices in universities. One of the most obvious ways forward involves teacher educators studying their own practices, just as teachers in schools may undertake action research in their own classrooms.

1991: Argyris Recommends "Teaching Smart People How to Learn"

Several readings of "Teaching Smart People How to Learn" (Argyris, 1991) encouraged me to take Argyris' title quite literally and to explore its relevance in my own classes within a teacher education program. The teacher candidates in my classes are smart people. Would-be teachers tend to be drawn from the ranks of those who have learned how to succeed at the tasks given them by their teachers in schools. In his paper, Argyris focuses on highly skilled professionals who work as management consultants; his studies of their behaviour led him to the conclusion that these "smart people" were *inclined to blame everyone but themselves* for weaknesses within organizations. "The professionals were using their criticisms of others to protect themselves from the potential embarrassment of having to admit that perhaps they too had contributed to the team's less-than-perfect performance" (p. 102). Argyris suggests that the defensive reasoning he observed in the consultants' behaviour emerges from designing actions around four basic values that seek to "avoid embarrassment or threat, feeling vulnerable or incompetent" (p. 103). The following quotation is central to his argument and is also the basis on which I extend his reasoning to the teaching behaviors of those who are learning to teach.

> Ironically, their very success at education helps explain the problems they have with learning. Before they enter the world of work, their lives are primarily full of successes, so they have rarely experienced the embarrassment and sense of threat that comes with failure. As a result, their defensive reasoning has rarely been activated. People who rarely experience failure, however, end up not knowing how to deal with it effectively. And this serves to reinforce the normal human tendency to reason defensively. (pp. 103–104)

This account seems readily applicable to the early reasoning about teaching

displayed by student teachers in relation to their first lessons in a classroom. Teachers need to be optimistic to survive the many opportunities offered by the classroom context for falling short of one's goals. Teachers want every student to learn and to succeed in school, but this readily becomes an impossible aspiration. Faced with considerable pressure to achieve objectives or outcomes, it is only natural to want to assume that one's teaching was as good as it could have been "in the circumstances." How many teacher educators have observed a student teacher's lesson and then begun a discussion by asking, "How do you think it went?", only to be told, "I thought it went well"? This response may simply be another way of saying, "I think I did what I planned to do, and there were no obvious disasters." Classroom teaching tends to offer few immediate or direct clues about the extent to which a lesson could be described as successful or unsuccessful. Such initial responses are consistent with Argyris' view that people who have almost always succeeded tend to reason defensively. The practicum is the fundamental test that must be passed on the route to qualifying to teach. Recognizing, accepting, and learning to deal with failures in one's teaching may be one of the most important sets of skills a new teacher can learn. Implicit is the significance of coming to terms with *self* as teacher at the front of a classroom.

Fourteen years after beginning to teach preservice science teachers, and as a result of spending a year's leave in the UK where teacher educators were being urged to have "recent, relevant and successful experience" in the classroom, I arranged an exchange of services with a local physics teacher. He would teach one of my two weekly preservice classes with a physics method group and I would teach one of his three classes that met daily for half the school year. I felt that I needed to return to the science classroom to re-experience the work for which I was preparing new teachers. The personal impact was dramatic, refreshing my images of daily life for students and teachers in schools; there are many similarities to the life of students and teachers in universities, but there are many important differences as well (Russell, 1995). Videotapes of my teaching serve to remind me that there are many "ordinary and routine" moments in my teaching, whether in a school or in a university. This teaching was an obvious opportunity to look inward and to study my teaching actions in relation to the ideas and activities I offer to those learning to teach. Notes recorded on my computer on most days provided a way to revisit that teaching, but those notes also reminded me of the potential of note-taking to help me understand the challenges and dilemmas and identify new strategies. I was more than ready for an organization of teacher educators interested in studying their own practices. Attending the 1993 AERA meeting in Atlanta provided just that opportunity.

1993: The Founding of the Self-Study of Teacher Education Practices SIG

The rising interest in action research and teacher research seems confined to teachers in elementary and secondary schools, with no significant extension to university professors and the quality of teaching in undergraduate education.

Some would argue that the value of action research in universities and colleges could be even greater, given that most academics have little or no formal preparation for their work as teachers. Here again, teacher educators tend to be something of a different breed from their university colleagues. Many have earned certification as a primary or secondary teacher and have some record of successful teaching experience in schools prior to moving into teacher education. Yet it has seemed only too easy to assume that preparation for and experience of teaching equate automatically to preparation for teaching others to teach.

There is no reason why action/teacher research should not extend to teacher educators, who always have a need for first-hand experience of strategies and approaches they recommend to future teachers. Those who formed the Self-Study of Teacher Education Practices (S-STEP) special interest group within the American Educational Research Association in 1993 recognized the need for *studies of their own practice settings*. At the same time, they recognized the importance of *self* in such research as well as the possibility that teaching others to teach may require different skills and perspectives than teaching subjects. The ways in which *self* can be interpreted are, of course, many and diverse, and this openness of self-study to multiple interpretations has been an exciting and positive feature of the first decade of the S-STEP group. One way of viewing the development of self-study in post-secondary preservice teacher education contexts is as action research conducted with special reference to the significance of *self*. Among the growing collection of examples produced by individuals within the S-STEP group are Cole, Elijah, and Knowles (1998), Hamilton (1998), and Loughran and Russell (2002).

1994: Continuing Tension between "Formal Research" and "Practical Inquiry"

When Richardson (1994) published "Conducting research on practice" in *Educational Researcher*, the widely-read journal of the American Educational Research Association, many who were drawn to action research, teacher research, and self-study were disturbed to see an argument that seemed, on first reading, to support and reinforce a sharp distinction between developing a "knowledge base" and improving practice.

> This article explores two forms of research on practice: formal research and practical inquiry. Formal research is undertaken by researchers and practitioners to contribute to an established and general knowledge base. Practical inquiry is undertaken by practitioners to improve their practice. It is suggested that practical inquiry is more likely than formal research to lead to immediate classroom change; that these two forms of research are fundamentally different; and that both are useful to practice, but in different ways. (p. 5)

The major distinction between these two forms of research is that practical

inquiry is conducted in one's everyday work life for purposes of improvement, and formal research is meant to contribute to a larger community's knowledge base. (p. 7)

One could suggest, then, that practical inquiry may be foundational to formal research that will be truly useful in improving practice. (p. 8)

More than 10 years earlier, Bolster (1983, p. 308) had responded quite differently to the same issue:

The minimal effect that university-sponsored research has had on classroom practice is itself a forceful argument that our traditional modes of inquiry are inappropriate to the production of knowledge that teachers will believe in and use. If we wish to achieve that knowledge, we must first rephrase our questions to ask what teachers genuinely need to know.

Bolster was arguing for the potential of "symbolic interactionist ethnographic research on teaching" to produce knowledge that teachers need and will use. Action research has the potential to turn the individual teacher into an ethnographer in her or his own classroom.

Here it is useful to look back to the American Association of Colleges for Teacher Education's (AACTE) publication of *Knowledge base for the beginning teacher* (Reynolds, 1989). The preface is instructive:

The book is an attempt to define the knowledge that beginning teachers should possess. … At another level, however, the book addresses one of the major problems in teacher education: the difference between the "state of the art" and the "state of practice." (Gardner, 1989, p. ix) [preface is ix-xii]

While these words might appear to relate to the challenge of "putting theory into practice," it actually has quite a different meaning, as Gardner argues that it is time for the practice of teacher education to reflect what we actually "know," *from research.*

The basic premise of this book is that teacher education has for too long been a normative enterprise, and it is now time to become a state of the art enterprise. … Teacher education can and should become more deliberate and rational. … Because the business of teaching is of utmost importance, so too is teacher education of utmost importance, and for that reason we must strive to know and use the state of the art. (p. ix)

Gardner's words take us directly back to issues associated with Technical Rationality. Whether logic or experience alone can improve practice is a complex question. There remains a strong current of faith in the power of research to improve practice. Both Richardson and Gardner seem to maintain a strong faith in the production of research-based knowledge, as an end in itself, regardless of the long-term influence of that knowledge on teachers' (and teacher educators')

individual and collective classroom practices. It is possible to read Richardson's paper as having a purpose of encouraging those who believe in knowledge production to at least allow those pursuing practical inquiry to be accepted as legitimate players on the broad field of educational research. The individual (teacher or teacher educator) trying to improve personal practice and the organization (school or teacher education unit) trying to improve programmatic practices must work to blend research findings and experiences of practice in specific contexts of practice. Research and experience meet in the self – the individual or the organization that may elect to engage in self-study.

1995: Borko and Putnam Name the Importance of the Prior Knowledge of Those Learning to Teach

Looking back, it may seem remarkable that teacher education could so easily assume that those who enter a preservice teacher education program could be treated as "blank slates," growing in knowledge of the subjects they will teach but "starting from scratch" in terms of how to go about teaching. The emerging recognition that those who enter teacher education arrive with extensive "conceptual baggage" of which they often seem to be quite unaware is another strand in the recognition of the need to consider self in the context of professional education. Each individual admitted to a preservice teacher education program with a view to preparing to teach arrives having spent a significant fraction of her or his life in classrooms. Images of the work of teachers are countless; memories of good and bad teachers are many. Assumptions about how teachers think about their work are abundant but rarely checked against reality.

Borko and Putnam (1995) offer relevant perspectives in the conclusion of their analysis of research on learning to teach. In a discussion of personal factors that present challenges to learning to teach, they provide this summary of their findings:

> New teachers are likely to bring to their initial teaching experiences a host of assumptions that shape the instructional skills and routines they learn. In many cases, these beliefs about how students learn and the teacher's role in facilitating learning – beliefs acquired over years of experience as students in traditional educational settings – are incompatible with the views of learning underlying the instructional approaches advocated by teacher education programs. These beliefs often remain implicit, serving as filters that help to shape how novice teachers interpret and learn new instructional strategies and approaches. (pp. 699–700)

Then, in a section on "facilitating teachers' learning," Borko and Putnam offer the following recommendations:

> Because the knowledge and beliefs that prospective teachers bring to their teacher education programs exert such a powerful influence on what and how they learn about teaching, programs that hope to help novices think

and teach in new ways must challenge participants' preexisting beliefs about teaching, learning, subject matter, self as teacher, and learning to teach. … They must help prospective teachers make their implicit beliefs explicit and create opportunities for them to confront the potential inadequacy of those beliefs. They should also provide opportunities for prospective teachers to examine, elaborate, and integrate new information into their existing systems of knowledge and beliefs. (p. 701)

This call for preservice teacher education to direct attention to the "self" of each candidate learning to teach would be unnecessary if our teacher education programs had a strong history of beginning with the unique experiences and beliefs of each individual new teacher. At the same time, although Borko and Putnam (1995) do not make this extension, the very same conclusions about existing knowledge and beliefs can be extended to those who are teacher educators. Thus I see a dual sense in which teacher education can be said to need self-study:

1. Teacher educators preparing individuals for a career of teaching need to show those individuals how to understand "the self" in terms of assumptions and beliefs about teaching and learning. In short, they need to teach self-study as an element of professional learning.

2. Teacher educators need to study their own assumptions and beliefs about teaching, learning, and learning to teach. They need experience of self-study not only to improve the quality of their own teaching but also to understand what they are asking of those they teach. Modeling their own professional learning to the beginning teachers in their classes may be one of the most powerful teaching strategies available to the teacher educator.

The Unique Nature of Teacher Education as a Discipline

Teacher education is unique among academic disciplines because everyone working in teacher education already has an initial discipline, whether it is a familiar school subject such as English or geography or a foundational subject such as sociology or philosophy. For most, if not all, "teacher education" is a second and subsidiary discipline. In many instances, teacher education itself is not the primary research interest of individuals who teach preservice teachers. A second feature of the route to becoming a teacher educator adds to the complexity of teacher education as a field and highlights the need for attention to self within teacher education. Many individuals who teach preservice teachers have prior, often highly successful, experience as teachers in primary and secondary schools. Preservice teacher candidates understandably credit recent, relevant and successful experience as an important element of their professors' backgrounds. These assumptions about teacher educators remind us that it is easily taken for granted within the domain of teacher education that successful personal classroom experience is not just necessary but also sufficient preparation for the task of teaching preservice teachers.

Observations in my own teacher education context suggest that classroom teachers who step into the university teacher education enterprise for a few years are often highly successful in the eyes of the preservice candidates they teach, and this reinforces the assumption that successful classroom experience is sufficient preparation for a teacher educator. Yet a permanent appointment in a university teacher education program usually requires a doctoral-level qualification in education, with successful classroom experience deemed an asset. In the case of a part-time or short-term teacher educator, classroom experience may be sufficient; in the case of a permanent teacher educator holding tenure, training in educational research is essential.

In neither case does the required background for teaching in a teacher education context show any attention to the unique differences between teaching a subject to children and teaching professional perspectives on teaching practice to adults preparing for a career in teaching. Mueller (2003) is one new teacher educator brave enough to address this issue explicitly:

> It is widely assumed that if you are a classroom teacher, then you can also be a teacher educator. However, the expectations and demands of the profession are neither well understood or adequately documented. The pedagogy of teacher educators is very different from that of a classroom teacher. No specific training exists for teacher educators. In general, you simply are "stamped" teacher educator if you get the job. (p. 68)

Mueller goes on to link self-study directly to her learning how to teach in a teacher education context:

> Self-study provides me with an opportunity to articulate what it is I am learning about my teaching within a teacher education program. My practical inquiry … into my own teaching leads me to make immediate changes in my classes, and hence, it is invaluable research to me as a teacher educator. (pp. 68–69)

Here we see clear signs of Mueller working to learn from her earliest experiences as a teacher educator.

The issue of *learning from experience* is particularly complex for teacher education, not only in establishing qualifications for those who teach new teachers but also in fostering the professional learning of those new teachers. Learning from experience is anything but automatic, yet schools and universities often act as though they assume such learning to be straightforward. Schools and universities alike are inclined to present theory *before* experience and to assume that students will make connections between the two as they gain experience. The theoretical and research-based literature on constructivist approaches to learning suggests that the issue of learning from experience is far more complex. Practicum experiences within preservice teacher education programs are always seen by new teachers as the central and single most valuable program feature, yet those practicum experiences are so personal and demanding that there is little if any

opportunity for linking theory with practice and applying research-based knowledge to personal actions.

In this context of the problematic nature of learning from experience, self-study can assume a significant role, for it is the individual teacher (or teacher educator) who, like Mueller, must ask questions such as "What am I learning from my teaching experience?", "How might I document and improve my learning?" and "How does my experience as a successful student influence, positively and negatively, my efforts to become a good teacher?" Individuals moving from completion of a Ph.D. or Ed.D. program that was rich in training in research methods need to explore questions such as, "How does my preparation in research influence, positively and negatively, my efforts to become a good teacher educator?", while those moving from successful classroom experience need to consider "How does my success as a teacher influence, positively and negatively, my efforts to become a good teacher of teachers?" These issues about learning from experience create a convenient context for introducing an additional perspective on the growing need for self-study in teacher education and research.

1996: Kessels and Korthagen Contrast Phronesis and Episteme

Working from a longstanding interest in the issue of putting theory into practice, Kessels and Korthagen (1996) challenged teacher educators to go beyond the technical-rational view of epistemology (episteme) to include the concept of phronesis, often expressed as "practical wisdom." In the worlds of everyday and professional thinking that most of us occupy, adjusting to an unfamiliar concept is a challenge, as the following words suggest:

> The ultimate appeal of phronesis is not to principles, rules, theorems, or any conceptual knowledge. Ultimately the appeal is to perception. For to be able to choose a form of behavior appropriate for the situation, one must above all be able to perceive and discriminate the relevant details. These cannot be transmitted in some general, abstract form. … This faculty of judgment and discrimination is concerned with the perception or apprehension of concrete particulars, rather than of principles or universals. (p. 19)

The reference to "perception or apprehension of concrete particulars" reminds us of Schön's (1983) attention to problem setting, rather than problem solving, in his critique of Technical Rationality. And what could be more personal and linked to the *self* than perception? Phronesis and episteme are clearly just as different as phronesis is unfamiliar. In an academic world built solely on objectivity and episteme, incorporating a concept such as "practical wisdom" can seem both risky and complex. The following quotation indicates how Kessels and Korthagen relate phronesis to the student teacher preparing to teach:

> The point of phronesis is that the knowledge a student needs is perceptual rather than conceptual. Therefore it is necessarily internal to the student, it

is in the student's experience instead of outside it in some external, conceptual form. It is thoroughly subjective. … And so there is nothing or little to transmit, only a great deal to explore. And the task of the teacher educator is to help the student teacher explore and refine his or her perceptions. This asks for well-organized arrangements in which student teachers get the opportunity to reflect systematically on the details of their practical experiences, under the guidance of the teacher educator – both in group seminars and in individual supervision. (p. 21)

This may take us closer to the full meaning Kessels and Korthagen are attempting to convey, but it also takes us further into an uncertain and unfamiliar world of exploring perceptions rather than transmitting concepts. I include this discussion of phronesis because it seems closely related to the overall point of this chapter: New perspectives introduced in the period since 1980 give considerable attention to the self, to the individual professional (generally and in teaching and teacher education) and to how the individual interprets professional experiences.

1999: Zeichner Outlines Teacher Education's Shift from Non-Scholarship to New Scholarship

As we approach the conclusion of this chronological account of the appearance of self-study in teacher education practice and research, Zeichner's (1999) paper on "The new scholarship in teacher education" provides essential historical perspective on the development of teacher education research as a field of academic inquiry. Highlights from his account of that development help reveal the significance of self-study for practice and research in teacher education. Zeichner also sees the already-mentioned creation of Division K (Teaching and Teacher Education) within the American Educational Research Association in 1984 as a significant reference point. For example, he explains that "in the pre-Division K era, there were a few notable exceptions to the lack of study of teacher education programs and of the process of learning to teach." Generally, educational researchers simply did not see teacher education as a significant or productive domain for their efforts.

Around the time that Division K was formed in 1984, a shift in the nature of scholarship in teacher education that reflected developments in the larger field of educational research accelerated. … This shift in the character of research in teacher education involved much more attention than in the past, to both the process of teacher education as it occurred, its connections to the learning of the teachers and prospective teachers who were enrolled in preservice and professional development courses, and to the cultural, historical, social, and institutional contexts in which teacher education was embedded. (p. 6)

Zeichner recalls the difficulty locating teacher education within AERA prior to the creation of Division K and offers the following explanation:

> The invisibility of teacher education research within the structure of AERA was a reflection of the historically low status of research on teacher education within the educational research community. This low status of teacher education research was in turn a reflection of the marginal status of the activity of teacher education in colleges and universities around the world. Today, as then, the work of teacher education is often viewed as an activity to be avoided as much as possible by faculty who have aspirations to make a name for themselves in the educational research community. (p. 7)

This was hardly a context in which there would be either a need or a place for self-study as a research method. Yet 15 years after the creation of Division K, the "playing field" of teacher education research had a very different appearance, allowing Zeichner to speak of and describe "the new scholarship." "Most noticeably there has been a shift … to the use of a broader variety of research methodologies and the investigation of a much broader range of research questions and issues" (p. 8). Then Zeichner arrives at the statement that is most relevant to the argument of this chapter:

> Another significant development in the new scholarship of teacher education is that more and more of the research about teacher education is being conducted by those who actually do the work of teacher education. The birth of the self-study in teacher education movement around 1990 has been probably the single most significant development ever in the field of teacher education research. (p. 8)

The historical perspective and interpretation provided by Zeichner emphasize the basic issue of whether teacher education is seen as an appropriate domain for research. Perhaps an even more fundamental question concerns *whether or not those who actually teach new teachers are seen as competent and qualified to do research*, once the domain is accepted as researchable. The point to be taken is that it is only recently, perhaps since 1980 in the American context, that research attitudes and methodologies moved beyond the earlier academic traditions to allow and enable those who do teacher education to also do teacher education research. One obvious result is that the processes and experiences of learning to teach are much more widely discussed than ever before. Once the opportunity to do self-study research became available, the challenge was readily accepted by a segment of the teacher education community. Zeichner closed his analysis of the new scholarship with a dramatically worded challenge:

> There is no more important responsibility for a school, college, department, or faculty of education than to do the best job that it possibly can in preparing teachers to teach in the schools of our nation and to support the learning of teachers throughout their careers. If we are not prepared to take this responsibility more seriously and do all that we can to have the best possible teacher education programs, then we should let someone else do the job. Taking more seriously the new scholarship in teacher education

and using it to help us make our programs better is one important part of this responsibility. (p. 13)

Few could disagree with this reminder of the importance of having the best possible teacher education programs. How we collect, interpret and share relevant data about the quality of our teacher education programs is quite another issue. Teacher educators are rarely criticized for the quality of their values; criticism seems to arise concerning the quality of their teaching practices – individually and programmatically. Self-study as a research methodology offers a great deal and plays an important role in what Zeichner terms the "new scholarship."

2001: Bullough and Pinnegar Place Self-Study in the Research Mainstream

Bullough and Pinnegar (2001) also provide valuable and insightful comments about the context in which self-study appeared as an element within teacher education research. They support the present argument relating self-study to changing perspectives by discussing four developments in the 1980s that contributed to the appearance of self-study: (1) the introduction of qualitative research methods; (2) "the influence of the Reconceptualist movement in curriculum studies" (p. 13); (3) "the growing involvement of international researchers in teacher education" (p. 13; Kessels and Korthagen are excellent examples); and, (4) the growing attention to action research and the study of practice. They see the interest in self-study growing most rapidly among relatively young teacher educator-researchers who had not already established programs of research.

> Many of those who first worked in self-study were young scholars, mostly female, mostly experienced teachers then teacher educators, who were committed to improving teacher education and schooling while struggling to negotiate the pathway to tenure and promotion. This struggle took place just when many universities were increasing their demands for scholarship and publication to achieve tenure. The questions that grabbed hold of these teacher educators were quite different from those typically valued by the academy. The questions that inspired the imagination of those who engaged in self-study work revolved around how their practice as teacher educators could be improved. They anticipated a conclusion that is now commonplace: that teacher development is the essence of school reform … (Bullough & Pinnegar, 2001, p. 14)

By 2001, the conclusions reached by Bullough and Pinnegar suggest that self-study is well on its way to entering the mainstream of educational research.

> Self-study as an area of research in teacher education is in its infancy. Its endurability as a movement is grounded in the trustworthiness and meaningfulness of the findings both for informing practice to improve teacher education and also for moving the research conversation in teacher education forward. Like other forms of research, self-study invites the reader into

the research process by asking that interpretations be checked, that themes be critically scrutinized, and that the "so what" questions be vigorously pressed. In self-studies, conclusions are hard won, elusive, and generally more tentative than not. The aim of self-study research is to provoke, challenge, and illuminate rather than confirm and settle. (Bullough & Pinnegar, 2001, p. 20)

The final sentence from Bullough and Pinnegar reminds us just how many complex issues about the relationship between research and practice are raised by the advent of approaches such as self-study. In 1980, few questioned the importance of ways in which research generates new knowledge to inform practice. By 2000, the improvement of practice can be seen as far more complex. Teacher educators need to understand their personal values, the knowledge available from research, their theoretical perspectives, *and* their personal practices. "To provoke, challenge, and illuminate" is a different world from "confirm and settle," but our schools and our teachers seem to realize that their enterprises are no longer viewed productively as anything other than complex. Self-study of teacher education practices has developed as a major contribution to how we move from what we value to what we actually achieve in our schools and our teacher education programs.

Conclusion

Teacher education compounds and confounds the many complexities of educating students in our schools. In school classrooms, pedagogy tends to be invisible and taken for granted – students become accustomed to working with teachers in similar ways, year after year. In teacher education classrooms, pedagogy suddenly becomes highly visible and those learning to teach immediately notice contradictions between the content of a lesson and its pedagogy. Students about to become teachers still rightly complain about the experience of a lecture on the importance of not lecturing.

Words are clearly not enough, yet teacher educators, like their teacher colleagues in schools, tend to be most comfortable when they are using words to convey messages about issues related to teaching and education in today's schools. Modeling is not enough either. Those learning to teach certainly appreciate consistency between the content and process of their classes, but such consistency alone is inadequate as preparation for the *personal* challenges they will face when they themselves attempt to foster such goals as self-directed learning, critical thinking, and conceptual understanding.

New perspectives on teaching and teacher education that have developed since the 1970s are only beginning to work their way beneath the veneer and façade of our school and university classrooms. Learning to teach should certainly involve some awareness of what educational research has learned in recent decades. Yet learning to teach seems to be far more about *self* than our formal program structures (often established decades ago) tend to acknowledge. Teacher

education research and practice need self-study if they are to accommodate the significance of the *self* in learning to teach and in the improvement of educational practice. Self-study is an important perspective that links practice and research in ways that seem long overdue.

FACTORS IMPORTANT FOR THE SCHOLARSHIP OF SELF-STUDY OF TEACHER EDUCATION PRACTICES

Deborah Trumbull
Cornell University

Abstract

This chapter links the scholarship on teaching to some central points in the scholarship on research approaches. It begins by presenting and analyzing some common adages regarding teacher education in order to clarify assumptions about the nature of teacher education. Each adage is examined to explicate its implicit views of knowledge, learning and schooling. The chapter then considers how the contexts of schooling affect the processes of teacher education and argues that complex contextual factors are central to our work in teacher education. It further argues that emotional reactions to the processes of growth encouraged in teacher education cannot be ignored. The chapter ends by arguing that all the factors discussed shape how our scholarship needs to be conducted in order to be useful and relates this to the wider literature on educational research.

As the chapters of this handbook indicate, teacher educators have a deep desire to improve their work, to contribute to the improvement of their students' learning and development and, by so doing, to contribute to productive societal change. They hope to help teachers, both in-service and pre-service, practice differently to ensure that their own pupils will learn more and develop into better people. The desire to contribute to change acknowledges that there are dilemmas to be explored and possibly resolved (e.g., Berlak & Berlak, 1981; Lampert, 1985), issues to be examined, and problems to be solved. Teacher educators who do self-study also realize they must continually evaluate both their commitments to produce change and the practices that they use in teacher

---

education. They accept the "living contradictions" (Whitehead, 1993) that are an ineluctable aspect of their practice.

How do we conceptualize the work of the teacher educator and its scholarship? Different adages, some quite common and some less so, shape how we look at teacher education and the kind of scholarship considered relevant. I begin by considering several adages that address teacher education and then exploring the associated theories of knowledge and learning. I see five adages implied in our common discussions of teacher education; different adages make different assumptions about required change or reform in education.

In this analysis, I use the term "teacher educator" to refer to people who could be working either with practicing teachers seeking to change their practices or with preservice teachers enrolled in a teacher preparation program. Having to point out these two possible groups each time I refer to those with whom teacher educators work quickly becomes cumbersome. For the purposes of this chapter, I refer to all the people with whom teacher educators work as "students," asking us all to keep in mind the range of those who could be so named. The people whom *they* teach, or will teach, are referred to as "pupils." (As Clarke and Erickson point out in Chapter 2 of this Handbook, the distinction between teacher and learner, however named, can and should be interrogated. I use the terms here for expedience.)

Adages of Teacher Education

Conserving Views

"Good teachers are born, not made" – Taken at face value, this common adage limits the work of the teacher educator to eliminating students who show no evidence of the natural abilities and talents required by teachers. The innate qualities are undefined and presumed obvious.

"Experience is the best teacher" – Here the work of the teacher educator is a relatively straightforward enterprise of brokering experiences. Teacher educators arrange apprenticeships for their students where they acquire and practice the needed skills. Working in real classrooms with experienced teachers allows the student to observe and gradually learn what works. This image clearly does not allow much attention to innovation in schooling practices, assuming as it does that what works for one master teacher is what will, and should, work for the student. The notion of what works also remains unexamined.

Reforming Views

"Good teachers have been trained to master the proper techniques" – The teacher educator is the one who ensures that students practice and master needed techniques. Unlike learning from experience, this adage assumes that there are specialized techniques that can be described explicitly and mastered *before* entering an actual classroom.

"Good teachers are those who best facilitate learning" – Taken at face value, this adage deemphasizes teachers' actions and focuses more on what pupils do in the classroom. Teachers who fully understand what their pupils need for effective learning will be the best teachers.

"Good teachers have progressed through carefully structured and analyzed experience" – Mere experience is not sufficient. Experiences must be thoughtfully structured to support student growth. The teacher educator must also ensure that students analyze and learn from their experiences, using relevant existing theories and conceptualizations in the analysis.

Assumptions about Knowledge, Learning, and Schooling

Each of these five adages captures certain assumptions about learning, knowledge and schooling that have implications for teacher educators' work and how we study it. In this section I spell out the assumptions that provide a framework for thinking about teacher education and identify some relevant research within the framework. As a science teacher educator, the literature on which I draw relates primarily to science teaching, but the central points are echoed in the wider literature.

Conserving Views

The first two adages – "Good teachers are born, not made" and "Experience is the best teacher" – are essentially conservative. If we assume that being a good teacher is a matter of natural talent, the teacher educator only needs to know how to recognize the students with potential. It is assumed that teacher educators have a clear conceptualization of good teaching. There is little or no theoretical framework for this view, so we can infer that the conception of good teaching is based on unanalyzed prior experience. "Experience is the best teacher" is also a view that is under-theorized. Because the relevant experience is in existing schools, there is little discussion of conceptions of what could or should be occurring in those schools and scant room for innovation or reform. Both adages fail to acknowledge the dilemmas of schooling (e.g., Berlak & Berlak, 1981).

"Good teachers have been trained to master the proper techniques." The process-product research represents a research-based attempt to render the work of the teacher educator more systematic and explicit (for reviews, see Rosenshine & Furst, 1973; Brophy & Good, 1986). Process-product research seeks to identify the teacher behaviors and classroom organizations most correlated with increases in pupil learning. Novices are then given explicit coaching to master these effective behaviors and organizational techniques. Unlike the school apprentice-ship model, this approach strives to distinguish between effective and ineffective teaching behaviors and assumes that key techniques can be learned more efficiently in specialized training away from the classroom. The teacher educator has a clear role in this model, both as researcher and as instructor. Although this research project does recognize the possibility and the need for reform and

for doing things differently, it gives scant attention to the issues inherent in measuring student achievement. The research project assumes that the tests used to measure student achievement are adequate and that existing schooling practices, when done well, need no reform.

Reforming Views

"Good teachers are facilitators of student learning." Constructivist researchers have criticized the tests used to measure learning in process-product research, pointing out that these tests are not adequate measures of student understanding. Constructivist and cognitive learning theories emphasize the complexity of the processes of developing and assessing understanding. Early research documented the many ways in which apparently successful pupils actually *misunderstood* the content that standard testing showed they had mastered (e.g., Stavy & Berkovitz, 1980; Gunstone & White, 1981). The early constructivist research made the process of determining pupil understanding much more complex because it delineated how pupils could interpret content in unorthodox ways, even content presented by teachers using research-based techniques. These research studies pointed out just how hard it might be to help pupils move from their initial interpretations, which made sense in everyday experience, to the more orthodox and accepted notions in science and mathematics (e.g., Hewson & Hewson, 1984; Strike & Posner, 1992).

The constructivist emphasis on learning and understanding echoes Dewey's early commitment to educating teachers as scholars of the psychology of learning, prepared for continual growth and development. The role of teachers is to learn how their pupils grasp the content and then arrange experiences to help pupils develop other and better ways of understanding the content. The critique of standard testing practices central to much constructivist research gives this adage a strong reformist agenda. Although a clear theoretical and research framework supporting this adage of teaching exists, there is far less work focused on the role of the teacher educator. Some of the later constructivist research has examines how teachers' actions could facilitate pupils' engagement with the content (e.g., Driver, Asoko, Leach, Mortimer, & Scott, 1994; Beeth & Hewson, 1999). However, it is not clear how teacher educators can help their students learn to implement these reforms. Within this adage, then, there is some tendency to focus on helping students understand pupil learning in all its complexity, which entails a thorough grasp of the content area and learning theory and research and a grasp of the faults of standard assessment and evaluation procedures. There is also a tendency to ignore how teacher educators will help their students learn how to structure their classrooms to implement the theories. This adage can embody what Clandinin (1995, p. 2) called "the sacred theory/practice story." This sacred story imagines teacher education as a highly intellectual enterprise in which experts well grounded in current theories, and perhaps researchers contributing to the theories, help learners to understand the theories. The assumption is that students will then use these theories to guide their actions.

Schön (1983) referred to this approach as the technical rationality model and provided an influential critique. Indeed, the theory-practice distinction has not worked for teacher education.

"Carefully structured and analyzed experiences produce the best teachers." Korthagen and colleagues (2001) provide a profound critique of the theory-practice story and offer an approach they call realistic teacher education. Central to this last adage is a distinction between phronesis and episteme, a distinction first developed by Aristotle. Episteme is the knowledge we typically envision when we think of theory; it is abstract, context-independent, generalizable, and fully explicit. Phronesis, on the other hand, is practical, context-dependent and particularistic knowledge with a tacit component. It is the kind of theory needed for wise practice in specific situations. Phronesis develops only through *thoughtful* experiences: assessing a situation, acting in that situation, and dealing with the results of that action. Phronesis is knowledge that resists being codified or generalized, in contrast to episteme. Phronesis is, and must be, unique to the person who has built up that knowledge. Korthagen and his colleagues use this distinction to explore and make the case for teacher education that focuses on developing phronesis by providing structured experiences.

> *Phronesis*, practical wisdom, or perceptual knowledge, uses rules only as summaries and guides. … An important prerequisite of this type of knowledge is that someone has enough proper experience. For particulars only become familiar with experience, with a long process of perceiving, assessing situations, judging, choosing courses of action, and being confronted with their consequences. This generates a sort of insight that is altogether different from scientific knowledge. Of course, experience is precisely what the student in our example lacks. So he cannot possibly have the corresponding sort of insight. But the point is here that such insight cannot possibly be transferred to him (or induced, provoked, or elicited) through the use of purely conceptual knowledge. (Korthagen, 2001, p. 27)

Others have also stressed the importance of practical knowledge rooted in daily life. For example, Connelly and Clandinin (1985, pp. 194–195) argued:

> The primary entailment of the school perspective on knowing is a focus on the experiential rather than upon the conceptual. It is a focus on the making, and remaking, of meaning in teaching and learning situations. This experience of knowing school situations is one in which personal practical knowledge composed of such experiential matters as images, rituals, habits, cycles, routines, and rhythms is brought to bear.

Does this emphasis on experience take us back to an apprenticeship model of teacher education? Not at all. It emphasizes experience, but emphasizes equally systematic thinking about experience. There is a role for episteme in fostering the thinking about experience. The addition of an emphasis on phronesis helps us to think about the design of teacher education programs and about how

teacher educators can structure the reflection central to this view. This adage also suggests the complexity of scholarship on teacher education.

How can we conduct systematic study of work in realistic teacher education in ways that allow us to learn from each other but that also honor the role of phronesis and the specific circumstances of practice? Before turning to that discussion, there are two other facets of teacher education that influence scholarship in the self-study of one's practices. The first concerns the roles of the milieu of teacher education; the second concerns the effects of emotional struggles in learning to teach.

The Roles of the Milieu of Teacher Education

Different adages imply different stances regarding the need for reforms in schooling. The first two adages give little or no attention to reforming present teaching practices. The third adage, represented by process-product research, assumes that we need only ensure that all teachers be helped to teach like the best teachers, not really presenting a reform agenda. The last two adages regard reform as essential. The demand for change places an extra tension on teacher education and the project of the teacher educator.

Individual Conceptions

Constructivist studies of students' understanding of science topics contribute to a demand for reform because they document the ubiquity and persistence of pupils' ideas alternative to the accepted scientific version. Pupils' existing alternative ideas have served them well in everyday life, but do not allow integration of the knowledge into a functioning framework. Research findings clarify how important it is that teachers convince their pupils that their existing ideas are less useful than the standard science ideas. The process is not an easy one (Strike & Posner, 1992; Hewson & Hewson, 1984), involving as it does a major change in conceptualization. Understanding conceptual change in science clarifies a major challenge in teacher education.

Just as in the science classroom, students begin teacher education with pre-existing ideas about teaching and learning. Students have well-developed ideas about what should occur in classrooms, what counts as learning and as evidence of learning, what teachers should do, and so on. As with alternative ideas in science, these ideas have developed in everyday experiences over many years. Students entering teacher education programs have been successful pupils. Their successes have helped solidify their interpretations of what schooling is and should be. Many of their theories about learning and schooling are in the form of phronesis because they have developed through extensive successful practice. Much of students' phronesis will likely have formed in classrooms that would *not* be the kind of classroom teacher educators would fully endorse. It is important to consider the role of contexts as this phronesis has developed.

Contexts and Individuals' Conceptions

To understand better our work as teacher educators, it is crucial that we consider research and theory that link individuals and context, that remind us that teacher education is not just about changing individuals. There is a range of scholars whose work is helpful. The work comes from areas referred to as social constructivism, activity theory, and interpretivism (e.g., Scribner, 1997; Wertsch, 1995; Taylor, 1982). Vygotsky influences much of this work, although many theorists have rejected some of his ideas and elaborated others. Here I do not examine the serious debates that exist in the field; instead, I use what I see as ideas helpful to understanding the scholarship of teacher education. What I take as key is the importance of the sociocultural contexts of schooling and how these influence, and are influenced by, the actions of individuals. "The goal of sociocultural research is to understand the relationship between human mental functioning, on the one hand, and cultural, historical, and institutional setting, on the other" (Wertsch, 1995, p. 56).

Individuals do not learn and develop independent of their contexts. Contexts do not exist as invariant entities. Each is mutually shaped by the other, as humans go about their activities. Wertsch continued: "I propose that mental functioning and sociocultural setting be understood as dialectally interacting moments, or aspects of a more inclusive unit of analysis – human action" (Wertsch, 1995, p. 60).

The acts and meanings that are available to us are mediated by the context(s) in which we act and interact. The kinds of experiences that we can have are shaped by the cultural practices in which those experiences occur. Contexts and cultures are the accumulation of countless interactions over long and short periods of time; cultures and individuals have their respective histories. The behaviorists had something right when they refused to speculate about abstract mental representations and mechanisms to the exclusion of what people actually do. However, by focusing solely on behavior they ignored meaning. The sociocultural theorists would have us instead think about actions, which include both behaviors and the meanings of those behaviors for the actors in their contexts.

Contexts for Change

As teacher educators, then, we need to create a culture in our programs, a culture that can work to support the kinds of changes in acting, in phronesis, that we wish to see. We need to remind ourselves, though, that when we interact with our students we are interacting with their life histories and how they have interpreted them, how others have reacted to their interpretations, and so on. And our own life histories play in our interactions. We are all products of more than one context. All of us operate in a range of *different* cultural systems that are not necessarily consonant. In fact, to borrow from Kuhn (1970), some of these systems may be incommensurable at the abstract level. Researchers such as Ladson-Billings (1994) or Delpit (1988) document the stresses on pupils who

must learn to operate within one system at home and another at school. Many – certainly not enough – do manage to do so successfully.

Although most people cannot articulate just how they know to act one way in one setting and another way in a different setting, the fact that they do perceive differences provides teacher educators with one way to help teacher candidates begin to examine their assumptions. When teacher educators work to foster unfamiliar ways of acting and interacting in their programs, the tensions created in students can be used to explicate their previously unexamined assumptions. Developing a new culture in teacher education in ways that will shape, encourage, and support the development of teacher candidates' phronesis, though, is not a simple project. Students may resist changing their habitual ways of acting.

The beliefs students have developed by participating in a culture dictate the limits of the conceivable, the do-able. For example, students might experience an activity in a teacher education program and conclude: "That was intriguing and fun, but it wouldn't work in a real school," without ever questioning their conception of what a real school is. In teacher education, we who would educate our students as reformers must work hard to influence our students' cultural assumptions. Our scholarship should enable us to share our approaches and how they have worked.

As we teacher educators work to change our students' notions about teaching, we need also to think about the future contexts in which they will work. If we can help them develop new ways of being while in the shelter of a teacher education program, we still need to prepare them for practice in other settings, settings in which their newly learned actions may conflict with pupils' expectations for schooling. Pupils influence teachers. Doyle and Carter's (1984) classic study provides explication of just how the culture of the classroom can be modified by concerted student effort. Significant pupil resistance, resistance that can be expressed in many different ways, may confront a novice teacher who enters a particular classroom and school and begins to teach in the way learned in a realistic teacher education program. This resistance could be supported by the milieu. For example, a science teacher might engage pupils in debate about different possible interpretations of data. A supervisor might critique the teacher as unable to control the pupils, who in turn might complain that the teacher refuses to tell them right answers; refuses to teach them. A parent might object that the teacher is not preparing the pupils to succeed on a mandated test that stresses recall of correct answers.

There are also wider societal cultural assumptions about teaching, learning and schooling, assumptions that are so pervasive as to be invisible until questioned. Britzman (1998) has explored what she terms the standard dream of education in many societies, that

> how one learns, what one learns, and why one learns may be consciously deliberated and controllable, and that, if learning does not occur, that too may be explained and corrected (or at least that the failure will be accompanied by a suitable category to contain it). (pp. 2–3)

This dream of certainty is unattainable. McDonald (1992, p. 84), among others, has noted that teaching always involves tension and uncertainty. "In fact, to feel conflicted in teaching is a healthy and authentic response to the conditions of teaching." To embrace such uncertainty flies in the face of the standard societal myth and the technical-rational model of professional practice. To embrace uncertainty renders the theory-practice distinction equally impotent, for there can be no uniform effective generalizations to guide practice.

McDonald illustrated how this uncertainty is denied at the level of school policy makers when he wrote of his experiences in a school that had joined the Coalition of Essential Schools, an organization of progressive schools with goals quite different from the ones espoused by many governments today. His book illuminates the relations between policy statements and teachers' work. The school with which McDonald worked held nine principles, which were "typically expressed in common Coalition parlance by still vaguer, nearly Zen, aphorisms: 'less is more,' 'student as worker'" (McDonald, 1992, p. 69). When McDonald analyzed these principles he noted there were contradictions among them, which he then interpreted:

> The vagueness and paradoxical quality of the principles constitute in themselves a tenth, unspoken principle. It is an acknowledgement that school change, like school itself, is full of ineluctable uncertainty; and that this uncertainty can only be handled in the local present, crafted into something else by means of vision, skill, luck, and principled believing. (McDonald, 1992, pp. 69–70)

In summary, individual's beliefs, values, and aspirations develop through their experiences in schools and in society as they act in, and interact with, the norms and values held by members of the cultures in which they participate. Individuals come to accept as given key assumptions about knowledge, about learning and teaching, and about schooling. When we as teacher educators set out to challenge and interrogate some of these key assumptions, we confront major barriers. The scholarship of teacher education must take into account the ways in which people resist change or act in response to our attempts to initiate change.

Emotional Struggles in Learning to Teach Differently

A central societal-cultural myth about schooling is that learning can be controlled. As suggested earlier, the technical-rational model of knowledge use also promises control. And yet many scholars point out that there is no possibility of such control in teaching and learning. McDonald's work illustrates one of the myriad ways in which schools act that can obscure the uncertainties of teaching. Individuals becoming teachers also experience the tensions between the myth of certainty and control and the actualities of teaching, even as myth denies such tension. The scholarship of teacher education done by those who would study their practices closely must take the effects of the tension into account.

There is a further difficulty engendered by a myth of control. As Britzman elaborates: "This condensed wish makes it almost impossible to separate the question of education from the will to power, the desire for mastery, and the quest for an omnipotent knowledge unencumbered by psychical life" (Britzman, 1998, pp. 2–3). Psychical life, as Britzman calls it, cannot be denied. The emotions engendered in learning to teach – which is actually a life-long process – affect all of us involved in the enterprise, student and teacher educator alike. Psychic life, our emotions, are inextricably part of learning to teach and significant for our work and scholarship in teacher education in two ways. First, the emotional responses of students are inevitable and important. Second, these emotional responses engender responses in us teacher educators. When we ignore our emotions, we lose important insights into how to work with our students, at best, and create havoc, at worst.

Students' Emotions

When we ask our students to be teachers in ways unfamiliar to them, in ways that embody new conceptualizations of teaching and learning, we challenge ideas developed over years. Emotional reactions are inevitable when we ask for such change. Emotions are far more than mere affective responses. Zembylas (2002) used Noddings' and Nias' work to clarify the psychical sides of teaching.

> Nias (1989, 1993, 1996) ... identified the need to study teachers' emotional experiences because teaching is not just a technical enterprise but one inextricably linked to teachers' personal lives. Nias observed that teachers invest themselves in their work, and so they closely merge their sense of personal and professional identity. They invest in the values they believe their teaching represents. Consequently, she added, their teaching and their classroom become a main source for their self-esteem and fulfillment as well as their vulnerability. (Zembylas, 2002, p. 80)

Students come to teacher education with a vision of the teacher they wish to be. They may want to be just like a well-liked former teacher; they may wish to be the opposite of a well-remembered, but disliked, former teacher. Regardless of their vision, they expect to be in control and thus they inevitably experience some degree of failure when they start to practice. They find unexpected difficulties in acting as they envisioned themselves. They also confront the uncertainties of teaching. Dominant cultural myths that deny uncertainties and dilemmas conspire to convince struggling teacher candidates that they are failing. Sustaining students through this state, supporting their self-esteem and helping them achieve some fulfillment, is crucial to the work of the teacher educator. Our students' vulnerability is heightened when we hope to have them teach in ways that are both new to them and also new to the settings in which they are practicing.

We can do more than assuage the emotional agonies of our students. We can

make use of their emotional reactions in our teaching. Zembylas (2002) summarized current research on emotions to make the case that emotions are not simply the private reactions of an individual. Rather, just as with conceptions of learning, teaching, and schooling, emotions are shaped also by one's social and political experiences and structures. As he summarized, emotions "have crucial epistemological and ontological components and are closely interrelated with evaluations, motivations, values, and practical reasoning" (pp. 80–81). When, as teacher educators, our programs evoke emotional responses in others, we can use these reactions to help students to explore and question their central beliefs, assumptions, and perceptions.

Teacher Educators' Emotions

The second reason I argue for the centrality of emotions, the psychical life, in our work as teacher educators is that our students' emotions inevitably affect *us* in profound ways. How we react to those emotions plays a significant role in shaping our relations with and responses to our students. Britzman (1998) built on reconceptualizations of early psychoanalytic theories to interrogate teaching and learning. She looks at relations between teachers and students using the notions of identification, transference, and projection, among others. These processes – identification, transference, and projection – can help us to understand mechanisms that can distort the pedagogical relation between teacher and students and muddy our efforts at self-study.

Identification occurs when the teacher educator views the student as a younger version of herself, leading the teacher educator to respond to the student as she believes she would have wanted to be responded to. The difficulty arises when this empathy is misplaced, when the learner is not like the teacher as she remembers herself. The teacher educator acts in ways not suited to that student, ways likely not to be productive.

Transference happens when the student reacts to the teacher as he once reacted to an authority figure from childhood, ascribing to the teacher the love (or antipathy) and the authority (or disrespect) once held by a prior significant figure. Transference can cause the student to bestow power and credibility to the teacher educator. Britzman points out that transference may make the teacher's task easier, but it is also a process that interferes with students' abilities to decide on their own views as they develop their phronesis. As Britzman (1998) writes, students who ascribe power to the teacher may easily fail to "confront the fragility of all knowledge and the meaning of the wish for mastery" (p. 35). The student who perceives the teacher as a powerful benevolent force may wish to become that force in her own teaching and model herself uncritically on the teacher educator. She can then fail in two ways; her pupils may not regard her as a benevolent force, and she cannot develop her own identity as a teacher. Further complicating the teacher educator-student relation, the transference response may actuate student ambivalences and unresolved tensions from childhood. When this happens, the teacher educator is confronted with strong negative

reactions, seemingly irrational reactions that do not fit the present situation. Productive interactions, which generally involve coaching and critique, will then be constrained, if not impossible.

Teachers also may be moved to act through unconscious mechanisms. Teachers can project their own concerns about themselves on to their students. Projection operates when a teacher ascribes his self-critique to others. The teacher who feels unsure of his knowledge of the topic he is teaching can interpret a sincere student request for clarification as a strident challenge rather than an effort to understand. The teacher may then react according to his interpretation of the student question as a challenge. The teacher's reaction will then elicit a negative response from the student, creating a nonproductive interchange.

As teacher educators, we need to be alert to the play of these mechanisms as they are mobilized in our relations with our students and our students' relations with their pupils as they practice teaching. As with phronesis, these mechanisms play out only in actual practice. For teacher educators to use these psychoanalytic notions constructively, it is not sufficient to learn the theoretical definitions and explications of these terms. What is crucial is the ability to realize how the mechanisms might be coloring the myriad interactions in teaching, particularly in highly charged interchanges. I am not arguing for extensive psychological training in teacher education, but for us to leave space for considering our emotions and the seemingly irrational or inexplicable events that trigger emotions. When we, as teacher educators, can embrace the uncertainty of the whole enterprise of learning, we need not tell only the hero stories, the stories of triumph and successful resolution. We can embrace the full range of experiences in helping others start the process of becoming teachers.

Self-Study and the Scholarship of Research and Teacher Education

In the preceding sections, I have highlighted lines of thought that provide lenses on our work as teacher educators. Each has implications for our scholarship. All of these concerns – the role of phronesis in teaching, the cultural myths about learning and mastery, the role of contexts, the mechanisms that operate in human interchange, the ineluctable uncertainty in our enterprise – contribute to the requirements for self-study scholarship in teacher education.

Audiences for Our Work

As many have observed, our self-study work can be done for a range of audiences. We can study our practice on a very personal level, raising issues that ethics and tact would prevent us from sharing with most others. Such questions as "Why is student A such an annoying pest?" and "Why do I want to scream whenever student B starts expressing her feelings?" are best explored only with a trusted colleague, optimally with someone who knows the students also. As I write these questions, I see the particular people before me and I experience again my frustrations and concerns and realize how someone else's insights can

help me analyze my reactions and begin thinking of what I might do or how I might work to change my reactions. This personal focus is not self-indulgent yet it is probably best kept confidential. However, thoughtful analysis can generate insights helpful to others, once we ensure confidentiality and anonymity.

In discussing field research, Hunt (1989, p. 13) also used a psychoanalytic framework. She noted the familiar refrain that in fieldwork research, "the researcher's self is the primary instrument of inquiry," which parallels the role of the teacher educator. Why did Hunt choose to use a psychoanalytic frame to examine her research work? It was her recognition that,

> much thought and activity takes place outside of conscious awareness. It follows from this that everyday life is mediated by unconscious images, fantasies, and thoughts. … These make their most overt appearances in the jokes, paradoxes, dramatic themes, dreams, fantasies, and affective intonations that punctual social experience. They can also be disguised more subtly beneath what appears as rational instrumental action. (Hunt, 1989, p. 25)

As we try ways to improve our practice, we look for evidence to evaluate effects of the changes we make. We need to attend to clues about our own reactions to our changes in order to ensure that they best serve the needs of our students. Hunt (1989, p. 33) noted that, "the mobilization of transference in fieldwork is important to understand because it may result in the construction of defensive measures to avoid the problematic situation." Thus the researcher's or teacher educator's reasons for change may well be, as Hunt describes, "situationally derived and reality-based but nevertheless mobilize intrapsychic conflict" (p. 61). The danger of the conflict is that we cannot successfully determine the efficacy of our change because of our reactions, causing us to fail to meet students' needs, with the result that they do not receive the support and challenge they need to work through a problematic situation.

Teacher educators can do quite personal and local work, greatly improved by collaboration with a critical friend, who can help them grapple with immediate issues. As we call in another, though, we begin to move the work from the immediately personal and to grapple with the demands of more public scholarship, scholarship that must meet accepted requirements for quality. As we think about more public work, sharing with wider audiences who are removed from our immediate contexts, we can turn to the paradigm dialogues in the educational research literature to provide a number of helpful insights to support how we do our research. In thinking about this scholarship, we grapple with some of the issues central in the educational research literature. These issues have become apparent as the field of education has moved from one dominated by an experimental view of research (epitomized by Campbell & Stanley, 1966) to one that embraces a range of research approaches.

Generalizability and Case Study

One of the perceived strengths of research influenced by experimentalism is that it aims to produce episteme, abstract knowledge that can be applied in any

context. Much care is given in experimentally influenced work to delineating abstract claims in the form of generalizations that will extend across time and place. Phronesis, however, requires a different view of generalization because phronesis values the knowledge that is used in practice in specific situations. It is knowledge intimately connected to the knower and the setting. The driving assumption is that context matters and must be carefully attended to.

The approach that I argue is most valuable for self-study of teacher education practices is the constructivist research approach as outlined by Guba and Lincoln (1994). They claimed the result of constructivist research is not the production of abstract theories meant to be applied in any setting by any informed person. Rather, the goal of constructivist research is to generate, "more informed and sophisticated reconstructions; vicarious experience" (p. 166). Donmoyer (1990) elaborated on this notion of vicarious experience. He favored a similar notion of generalization and likened the generalizations developed from reading cases to what occurs as one develops a new schema. The reader of a good case study has a form of experience in reading the research and is then able to develop a new way to interpret, and hopefully act in, particular settings. Case study research demands that the research be presented to engage readers in the particulars of the setting and the actors.

Stake (2000) has written about vicarious experience as an aim of intrinsic case study, a form of case study that focuses on thick description and deep understanding of the particular case, without concern for generalization, at least as understood in an experimentalist frame. He argued that it is important to explore the particular. The focus on the particular also calls into question the notion of cause inherent in experimentalism.

> Qualitative researchers … more often tend to perceive, as does Tolstoy in *War and Peace*, events not simply and singly caused. Many find the search for cause of little value, and dramatize instead the coincidence of events, seeing some events as purposive, some as situational, many of them interrelated. (Stake, 2000, p. 440)

Through reading a case study of the type favored by Stake, the "reader comes to know some things told, as if he and she had experienced it" (p. 442). Spiro and colleagues (quoted in Stake, p. 443) talk about the cognitive flexibility gained from reading cases and also introduce a way to bring in more abstract theories.

> The best way to learn and instruct in order to attain the goal of cognitive flexibility in knowledge representation for future application is by a method of case-based presentations which treats a content domain as a landscape that is explored by "criss-crossing" it in many directions, by reexamining each case "site" in the varying contexts of different neighboring cases, and by using a variety of abstract dimensions for comparing cases. (Spiro, Vispoel, Schmitz, Samarapungavan, & Boerge, 1987, p. 178)

As teacher educators seeking to improve our own practices and to help others

practice differently, we can, and must, write our research so that others can see themselves in that setting and can understand in emotional and practical ways what is going on. We can link our particulars to abstract ideas, to episteme, in ways that will enlarge the understandings of particulars but not replace it. Actions, both our students' and our own, are central to phronesis. And phronesis is central to the actions of teaching.

To return to an earlier point, actions are not behaviors, nor can they be unambiguously described. Our descriptions of our work must strive to capture actions. Wertsch (1995) used Burke's notion of a "dramatistic pentad" to characterize action. The dramatistic pentad consists of act, scene, agent, agency, and purpose. The goal of this image is not to,

> provide a set of formal, static categories that could be used to produce a frozen description of an action and its motives. Instead, Burke's goal was to outline a set of elements that exist in dynamic tension, or dialectical opposition. In this view action is often, if not always, open to further interpretation because there are ambiguities that emerge in taking the dialectically interacting elements into account. (Wertsch, 1995, p. 15)

These elements enable us to interpret in many ways. I take it to mean, also, that there may be several possible and defensible interpretations of any event, not just one right interpretation. We who study our practices as teacher educators must present our work not only in ways that attend to the setting and the emotions and interactions, but also in ways that can support other plausible readings of the situation and thus honor the uncertainties inherent in teaching and learning.

Quality Control

Our self-studies must meet accepted standards for quality in research. Of course, the view of what counts as acceptable research in education has changed greatly since the days of Campbell and Stanley (1966). Qualitative and interpretive research approaches have introduced a range of new methods for gathering and analyzing data, generating new ways of thinking about presenting and using claims based on research. Lincoln and Guba have continued to think about how to do good interpretive, constructivist research. They see trustworthiness and authenticity as criteria of quality, and they claim that validity is intertwined with action (Lincoln & Guba, 2000). As teacher educators whose research is profoundly linked with our practices, we should have no problem linking our research with action.

Lincoln and Guba also point out that validity concerns address both method and interpretation, and these concerns we share. All of us work to ensure that the data gathered are not mere fictions, even as we acknowledge that our own views will affect how we see the world. We work to capture the fleeting complex interactions and musings that characterize teacher education. Doing so is not an easy task, and it is one we consciously attend to in our work. We strive to

look at our data systematically, to ensure that we do not attend only to the findings that support our hopes and wishes. We work to ensure our interpretations are ones that others could support, and this is the reason why self-study requires not only a critical friend, but also a critical community.

Assumptions about the World

As outlined in prior sections, a number of authors from different perspectives have found the myth of certainty in teaching to be only a myth. Smith and Deemer (2000) have identified a similar myth about certainty in discussions of research. The conclusion of their argument emphasizes the importance of work in a community of scholars who are committed to careful, consistent and critical examination of their work. They argue that a strong community discourse tradition is central because of the fall of foundationalism and the recognition of relativism.

Smith and Deemer highlight developments in philosophy that have led to rigorous questioning of the ontological assumptions on which Campbell and Stanley (1966) based their view of research. Smith and Deemer argue that experimentalism was built on a belief in objectivism, an assumption that knowledge claims can and must be built on sure and certain knowledge of an objective reality. Certain methods and procedures are identified to best capture that reality. One then could judge a research project by how well the agreed-upon methods for determining reality were applied and how closely the research results matched reality. Use of approved methods to capture external reality was the standard to judge research quality.

However, modern philosophers have provided strong arguments that human reality is not external, given and independent of human activity. Foundationalism, the hope of founding claims on certain objective knowledge of a reality that can be known unequivocally, is a myth. The loss of certainty means that determining ways to judge the quality of qualitative inquiries has become more problematic. Because there is no hope of the strict separation of observer and observed, and because there is no God's-eye view as the worldview of traditional objectivism assumed, "we have witnessed the demise of the methodological solution to the problem of criteria" (Smith & Deemer, 2000, p. 879). Smith and Deemer point out, though, that the necessity of accepting relativism, the view that no knowledge claim can be built on theory-free observation, does not mean that there can be no criteria to evaluate how well qualitative research is done.

The work of determining criteria is made more difficult when we accept relativism. Doing research that aims to improve phronesis, rather than only episteme, simply increases the difficulty again. We must recognize that we are, "finite human beings who must live with and make judgments in concert with other finite human beings [which] can be, with some frequency, very tough work indeed" (Smith & Deemer, 2000, p. 885). Smith and Deemer would have us replace the metaphor of discovery with images of constructing or making. Why

change language? "The problem is that to continue to employ the language of a 'discovered world' is to continue a 'passivity in regard to responsibility for the world' [Hazelrigg, 1989, p. 168]" (Smith & Deemer, 2000, p. 886). Self-study of teacher education naturally places the researchers' responsibility central to the enterprise. A community of self-study involves us in the "very tough work" of examining how we construct our worlds. The work included in Lyons and LaBoskey (2002) addresses many of the concerns I raise here and provides exemplars that demonstrate the power of narrative inquiry into teaching practices.

We are working at an exciting moment in teacher education. The philosophical arguments about reality and method are accompanied by an increasing interest in teacher research and self-study. Schön's (1983) ideas about reflection on practice have been developed by Munby and Russell (1994) to highlight the "authority of experience" as a key to knowledge and understanding of teaching and learning. The work of Korthagen and colleagues (2001) clarifies the knowledge developed and used in teaching. There is the realization that there is no educational change without people change. With the concern to focus on personal practice and experience, teacher educators undertake high quality enquiries, which lead to a better understanding of the complexities of teaching and learning and to better practices.

Back to the Adages of Teacher Education

When I stopped to think deeply about the adages for teacher education with which I began this chapter, I realized that I had initially valued some more than others. I included some because I thought that they could be easily dismissed as my argument developed. As I have thought about our self-study work and my own work in the self-study community, it seems that elements of each adage play a role in our thinking and enable us to think more about doing the scholarship of teacher education. At times, I do feel that there are students who are just better, and that I have developed some skill at figuring out who will have real problems. However, these judgments can easily be distorted by unexamined psychical reactions. It is not enough to stop at initial evaluations if we wish to contribute to the scholarship of teacher education. I, and we, must explicate the bases for our judgments, clarifying the evidence that we use to make our initial judgments and to track the progress of our students.

Good technique *is* important in good teaching, but what counts as good depends on the setting and the individual. There are some excellent research studies done in the process-product tradition that alert us to ways of doing things in classrooms. What a focus on technique does not do is help us see a situation and then use the technique that will work for us. Practicing several techniques, though, will provide a new teacher with a range of ways in which to respond. Having a chance to practice and master particular ways of acting may help to allay a student's anxiety in the face of the inevitable uncertainty of teaching.

The constructivist emphasis on student learning provides us with a framework for looking at and analyzing classroom work, for determining whether techniques have been effectively applied. A well-managed classroom that leads to pupil success at a meaningless task is not a desirable outcome. As we consider how people learn, we can think about the things that we ask new teachers to do. And, of course, as Korthagen and colleagues (2001) have argued, when we honor phronesis, we can think of ways to incorporate meaningful experiences and apposite theories into our work with developing teachers.

In our scholarship, I argue that it is key that we, as teacher educators, attend to all aspects of our contexts of practice, including our own psychic lives and the cultural, societal and historical surrounds of our work and our students. When we communicate our work in case study and rich stories, we can contribute to others' understandings of the processes of teacher education. It is crucial that we continue to explore how best to provide good case studies that attend to the features of our specific contexts and that help readers gain vicarious experience, experience that can support the development of our own phronesis. We can help ourselves work better by attending to the psychical features of our work with students. By sharing how we have analyzed the ways that emotions engage us in our work, we can help other teacher educators work through their own concerns.

I close with one final thought about context. Teacher education exists within a world that is controlled by overlapping external bureaucratic organizations, sometimes with conflicting agendas. Some external forces are essentially conservative, holding to the existing curricula, imposing standard format tests that expect specific right answers. Some forces place tremendous pressure on new teachers working to change the existing worlds of schools to ensure social justice. How do we help prepare our students to understand and act in these settings? How do we work to influence these factors that shape schooling?

SELF-STUDY IN SCHOOL TEACHING: TEACHERS' PERSPECTIVES*

Terri Austin[a] **and Joseph C. Senese**[b]
[a] *Chinook Montessori Charter School, Fairbanks, Alaska;*
[b] *Highland Park High School, Highland Park, Illinois*

Abstract

This chapter defines self-study for classroom teachers and points out potential benefits and the conditions necessary to begin. The chapter also provides information about realistically carrying out self-study in a school setting. Having a core set of beliefs that inform daily practice, a reflective nature, and a yearning to improve self and practice can lead teachers to the resources they need to conduct meaningful research and self-study. Benefits for teachers range from the practical (imparting an endorsement and authority for practice) to the personal (informing teachers about who they are) to the professional (inviting teachers to join a community of learners). Self-study urges teachers to find their own voices, to improve their practices, to extend their relationships, and to discover and document their potential as leaders of change. Because self-study concentrates on what matters most to teachers, the chapter encourages teachers to include self-study in the ever-growing list of professional expectations and responsibilities. Self-study is about who teachers are as well as what they do. The authors argue that there is no better way to strengthen teaching practices, to recognize the influence of personal values and beliefs, and to enrich students' learning.

Setting the Stage (*Terri*)

Visualize this setting, please: An authentic 15th-century English castle, immaculate rose garden, arched-ceiling medieval banquet hall, broad wooden staircases, grass-filled inner courtyard, wide moat complete with gliding swans, clear blue sky, bleating fluffy sheep. This idyllic setting was merely the backdrop for a

---

more exciting event taking place inside Herstmonceux Castle: the Second International Conference of the Self-Study of Teacher Education Practices. This was where Joe Senese and I met. For five days, educators from various locations around the world gathered within the walls of the castle to share self-study focused research. In the opening session, Vicki LaBoskey (1998, p. 4) noted that, "self-study encourages me to articulate, examine and, on occasion, re-define the fundamental principles that guide my teaching." This conference convinced me that self-study is the most powerful instrument available to us in our efforts to transform teacher education. While those teaching or holding positions within the university arena write the majority of chapters in this handbook, Joe and I are here to share how we, as public classroom teachers, use self-study to transform our teaching practices. For me, self-study is the single most effective way I can create change, not only in my classroom, but also with other educators in my school district, state, and around the world. We have all sat in various teacher gatherings, faculty rooms, and staff meetings where some teachers helplessly complain about what "they" impose on us. Self-study is the all-time "Empowerment Bar" for me.

When I look closely enough at my practice, actions, and beliefs to question myself then I am taking charge of my on-going education. When I creatively formulate a plan to gather data to see what is actually happening and then spend the time to openly consider all that is there, then I am enlarging my knowledge. When I include others in my questioning and looking, then I am broadening my perspective and views concerning my questioning. And finally, when I require myself to articulate and record my journey, offer it to others to consider, reconsider my views based on their feedback, then I am sharpening my personal understanding. All of this makes me a better educator.

In this chapter, Joe and I share our understanding of self-study from our unique teacher's perspectives. Although we began by trying to blend our voices, perspectives, and experiences in an attempt to give the reader a glimpse of what is possible within self-study, we found that as researchers and writers we take very different approaches. We hope that by indicating the writer of each section we will offer you both a description of an individual journey as a researcher (Terri) as well as generalizations offered from personal experiences (*noted in italics*) (Joe).

Throughout this chapter we work to define self-study for classroom teachers and, along the way, to define other research terms that may be familiar. As we attempt to convince teachers to jump into self-study by pointing out the benefits and conditions necessary to begin, we also note the drawbacks associated with self-study. Finally, we provide information about carrying out self-study in a school setting, attempting to be realistic about conducting a self-study amidst all the demands of teaching while also maintaining a life outside of school.

Definitions: Keeping It All Straight (*Terri*)

In 1989, I discovered teacher research. It came at the perfect time for me, for I was a relatively new teacher. I was introduced to the power of teachers teaching

teachers through the National Writing Project. I was enrolled in a master's degree program in language and literacy, and I was eager to learn as much as I could about strong teaching practices. I learned the value of posing a question, gathering data systematically, analyzing and discovering patterns, and finally arriving at an answer. This linear plan served me well for a number of years. Then I began my doctoral degree and was introduced to the newly formed Self-Study of Teacher Education Practices (S-STEP) group, a special interest group within the American Educational Research Association. My world turned upside down, and my nice neat research format now seemed so inadequate. I began hearing terms like teacher research, action research, and reflection used in various ways, so I realized I needed to do my own research on these terms. As educators, we hear of so many theories, philosophies, and approaches that it is hard at times to keep them straight. I began keeping lists of ways these terms were being used and the meaning an author gave to a particular term. Many terms seemed to be used interchangeably. The following is my interpretation of these terms, presented with the hope that others teachers will find them helpful.

Reflection

Reflection is a common term used frequently in reference to students re-examining a specific product or an on-going process such as writing. It is also a term often used within qualitative research. Reflection implies an active rather than passive stance (Perrone, 1991). Wilson and Jan (1993) support this view as they list active stages during the reflection process: self-questioning; thinking critically; deliberating creatively; and, finally applying the new realizations. In teacher research, self-study, and action research, reflection is an important element of the study and the role of self-questioning is stressed. It is through this self-questioning that a research question is identified and a research plan developed. Ultimately, self-questioning leads to control of the reflection process, empowering the one posing the questions (Barell, 1995).

Teacher Research

There are many definitions of teacher research, flowing from the general to the specific. Mayher (1990, p. xv) uses the general term "teacher learners" to focus on the educator-self through examination of teaching. He defines teacher learners as educators who are, "trying to reopen deeply held convictions about learning and teaching." Duckworth (1987, p. 134) seems to put equal emphasis on teaching and research when describing the teacher as "both practitioner and a researcher." Goswami and Stillman (1987) view teacher researchers as educators who ask themselves questions, observe, record and draw conclusions. Bissex (1987) supports this view when she describes a teacher researcher as an observer, questioner, and learner. Cochran-Smith and Lytle (1993, p. 5) added another important element by defining teacher research as "systematic, intentional inquiry by teachers."

Action Research

Both action research and teacher research claim Kurt Lewin as a founding father. Lewin laid the foundation for a cyclic approach to inquiry with the ever repeating fact-finding, conceptualization, planning, execution, more fact-finding, and evaluation (Sanford, 1970). Both teacher research and action research use this structure as a basis for inquiry, but each has a different emphasis (Cochran-Smith & Lytle, 1993). Noffke (1994) points out the strong focus that action research gives to social and ethical concerns, and Hubbard and Power (1993) suggest that teacher research seems to be more localized within the teaching sphere of the practicing educator. McNiff's (1988) visual spiral of action research demonstrates that the act of questioning is a natural element of the research process. Another element of action research is an emphasis on social action (Elliot, 1994; Winter, 1987; McNiff, 1993; Whitehead, 1999; Laidlaw, 1994); these writers profess a broad and public purpose to their work. Noffke (1992, p. 15) contends that, "the intent of action research, as seen by a growing number of proponents, is to connect the work of teachers to issues of social, economic, and political justice that are considered as embedded in the practice of teaching." Whitehead (1992) takes this idea one step further by adding the element of a personal and deliberate effort to work for the wider good.

> Whatever the new world order brings it is certain that what counts as educational knowledge will have a profound influence on whether or not the world is moving to a better place. The increasing numbers of people who are associated with action research movements throughout the world are committed to asking questions about improving their practice and to judging their effectiveness in relation to their contribution to the construction of a good social order. What impresses me about educational action research is the way in which individuals hold themselves both personally and socially accountable for their action within a democratic forum. (p. 2)

Self-Study in Teacher Education Practices (S-STEP)

The S-STEP group not only incorporates elements of both teacher researcher and action research, but also moves beyond these two practices. Using a cyclic approach to inquiry, similar to action research, as well as assuming the role of teacher researchers examining their own practices, those involved in S-STEP look beyond the immediate surface of research. A critical element of self-study is the awareness of the underlying values that guide personal teaching practices. Hamilton and Pinnegar (1998, p. 1) point out that self-study involves a "commitment to examining one's own practice to bring into action the values that underlie their practice." There is often a discrepancy between our actions and their underlying values (Whitehead, 1992), and it is this discrepancy that is at the heart of self-study.

Defining Self-Study for Practitioners (*Joe*)

In 1997, during a routine search for internet sites about action research, a website popped up on my screen announcing a conference of self-study of teacher education practices. That was a mouthful! I was not sure what it meant. As I read the requirements to present at the conference, I concluded that self-study was simply a codeword for action research. As a matter of fact, when my team of classroom teachers applied to present at this conference, we took something we had already written about our classroom action research and substituted "self-study" every time "action research" appeared. Miraculously, our proposal was accepted, we did present our work at the Second Castle Conference (in August 1998), and that lucky chance introduced me to a refined but still hazily defined practice.

I have not always understood a difference between self-study and action research, and now I think that is because these two terms contain such similar practices and such similar ultimate purposes. The methods of self-study and action research, in fact, bear striking similarities, as others have noted.

> Self-study seems akin to practitioner research in that it seeks to examine one's practice as a foundation for change. While distinctions might be made about the systematic character and intentionality of practitioner research (Cochran-Smith & Lytle, 1993) and the reflective analysis of practice embedded in self-study, the two share a fundamental concern with change, at both individual and institutional levels. (Kuzmic, 2002, pp. 233–234)

For me, the difference between self-study and action research lies not so much in the methods or even in the purposes of the two approaches. I believe the difference lies in the focus of the two experiences.

Action Research and Self-Study

When I conduct action research, I am attempting to discover the means within my control to help my students improve the quality of their learning. In order to help students, I conduct action research to find out how, as a teacher, my planning, thinking, and behaviors can affect student learning and success. I want to improve my practice by studying it and systematically collecting data and information to show how what I do (and do not do) influences student learning (Senese, 1998, 2002). The focus of my action research has always been my practice and its effect on student learning.

Action research still maintains a distance between the teacher researcher and the study. While conducting action research, teachers examine what goes on in a classroom and, more specifically, their own role in those interactions with the intention of improving their practices. In my mind, action research is more about what a teacher does and not about who a teacher is. When I reframe my research as self-study, I enter through another door, the door of the self. Self-study is much more challenging for me because it requires that I put myself, my beliefs, my assumptions, and my ideologies about teaching (as well as my practice) under scrutiny. The outcomes of the two approaches may be similar, but the

focus of the study in self-study is the person of the teacher. A scan of self-study research reveals that each researcher is looking inside at the person of the teacher to help discover or uncover underlying beliefs that help to determine who that teacher is.

Action (or teacher) research is not necessarily undertaken so that teachers can understand themselves as persons. Action research, like self-study, does put teachers' practices under the microscope and thus may make teachers feel vulnerable. After all, presenting one's classroom practices to colleagues (or strangers) for their scrutiny can be intimidating and threatening. But even if teachers encounter those fears while conducting action research, they can still feel an emotional separation from the research. On the other hand, in self-study, the focus of the research *becomes* the person of the teacher: who the teacher is, how the teacher acts, what the teacher says, how the teacher thinks and responds, and how the teacher decides. The focus can be narrow and intense. Self-study requires an openness and vulnerability. It demands a profound curiosity about who the individual is as a person and as a teacher. The impact lies in the belief that how one teaches and what one teaches is a product of who one is and what one believes to be true. Consequently, learning more about the self as a person/teacher *is* the means to improve practice. They are one and the same, inextricably bound.

Self-study is creating a niche in today's educational world because the culture of schooling is undergoing a gradual but significant change. Teachers are no longer content to work in isolation. They seek camaraderie, collaboration, and companionship in their profession because, "as we work together in collaborative professional cultures, we grow together" (Lambert, 1995, p. 42). Teachers are now seeking like-minded individuals within and without their school building walls in order to learn from their own practice and the practice of other teachers about what they can do to help students learn. The model of teacher as lone expert in a sea of students is receding into history. More recently, teachers are developing expectations that schools should be places where they, as well as students, continue to learn. Those expectations demand a social context in which teachers share themselves and their work with others.

Reasons for Conducting Self-Study (*Terri*)

In a paper entitled "Hierarchies, or Who's in Charge?" Ohanian (1994, p. 171) states that teachers can "survive and even triumph in the classroom only by informing our own best instincts and finding our voices." This is especially true now as teachers are bombarded by voices from all sectors demanding specific programs, mandating tests, and ranking schools. The way I attempt to withstand these constant outward pressures is to look inward and, as Ohanian suggests, find my voice. Credibility is a huge issue for me. If I wish to be a credible educator, I need to know why I teach the way I do, how my beliefs influence my actions, and how to best align my beliefs with my practice. Self-study is my vehicle to reach this end.

By using consistent reflective practices, sharing with peers and, with their help, re-examining my assumptions, I move to a more realistic picture, not only of my actions, but also of my underlying values and beliefs. I have found that when I better understand myself, I can better understand my practice and be a better educator for my students. Through this process, I have gained confidence in explaining my teaching practices to students, parents, and other educators. I do have confidence in what I do, but that is also mixed with a healthy dose of questioning. Empowerment is a word frequently invoked in educational circles. I have found that by regularly engaging in self-study, I have become truly empowered. I have an internal feeling of being in control of my continuing education and of moving closer to the teacher I wish to become.

As I move closer to my "ideal" teacher, I realize that my continuous practice of self-study moves me into a different role with my students. My classroom is my laboratory and my students are my research partners. They live my practice. When I step back and offer them a partner role, my ability to see my actions widens and becomes sharper. In addition to searching out ways to reflect on my teaching, I have shared ways the students can examine their own learning. All students at my school, from kindergarten through Grade 8, spend part of each Friday reflecting on their learning in the week that is ending.

The implications from my self-study ripple outward to the entire school community. As part of each trimester assessment, parents write a letter to their child in which they review the child's growth within the home. This letter offers students a broader perspective on their learning. Within my classroom, I write a weekly letter to all my parents in which I share not only the events of the week, but also (thanks to confidence from self-study) my thinking about educational issues and my teaching practices. Parents are now becoming stakeholders in my self-study as I become more articulate about my intentions and the supporting reasons for particular actions. Some parents are now requesting copies of the research that I cite in my weekly letters. In addition, as a school, we structure reading and discussion time during our monthly all-school parent meetings.

On a broader level, self-study has allowed me to enter into world conversations about teaching. I can speak with confidence about my research and, at the same time, take part in the public examination of my work. It is through this open dialogue that I gain new insights and that others see new ways in which to view their practice. Shannon (1992) notes that asking questions is a constructive way to create change. Self-study is based on asking questions – questions asked by myself, by students, by parents, and by colleagues. Self-study requires me to consider those questions and this in turn reshapes my practice.

Diving into the Pool or Merely Dipping a Toe? (*Joe*)

Self-Study Redefines Teachers as Researchers

Classroom teachers in general are not trained to be researchers. Teachers have neither the time nor the skills to conduct in their classrooms what society regards

as "scientific" research. Teachers rarely see themselves as researchers, and this perception of the teacher's professional self is both social and cultural. Yet as Wheatley and Kellner-Rogers (1996) point out, this reading of self as non-researcher comes at a price:

> Many of us have created lives and organizations that give very little support for experimentation. We believe that answers exist out there, independent of us. We don't need to experiment to find what works; we just need to find the answer. So we look to other organizations, or to experts, or to reports. We are dedicated detectives, tracking down solutions, attempting to pin them on ourselves and our organizations. (p. 21)

Society, in general, tends to view all practitioners as non-researchers. Practitioners (a term that smacks of condescension at times) are characterized by some higher education professionals as those who put the work of others into practice. They are crafts people rather than inventors, innovators, or experimenters. Governmental bodies and publishing houses have often attempted to reduce the art and science of teaching to a set of how-to prescriptions in order to take the guesswork out of the profession, often in a misguided attempt to achieve high student scores on standardized tests.

Self-study of teaching practices, whether by teachers or by teacher educators, changes all this. Inspired by experiences of action research and self-study, my personal perspective now leads me to recognize how incorrect and misleading the familiar view is! Today's teacher has no choice but to invent curriculum, lessons, techniques, and programs. Professional survival dictates that teachers adapt teaching situations to the materials available, to the students present, and to the expectations of the community. My experience confirms for me that "schools and teaching are going through a shift that not only engages practice but also affects fundamental beliefs in what teaching is meant to accomplish, how it is done, who our learner is, and what is possible for the average human being to achieve" (Caine & Caine, 1997a, p. 5).

A creative and egalitarian part of me demands that I meet the needs of the students who are assigned to my classes, which are unique sets of unique individuals. Consequently, I cannot follow someone else's design. I cannot follow the dictates of someone else's teaching agenda. I cannot blindly obey another's plan in teaching and learning. My own understanding of those processes, my students, and my self determines how well I can succeed in each school year. Self-study not only provides teachers with the tools to be researchers, but also redefines teachers as learners.

Self-Study Redefines Teachers as Learners

I know that I cannot do this alone. It would be foolish to assume that I start from scratch each time I teach. But I have created a path for myself that casts me in the role of a learner in my own classroom. I acknowledge freely to my students that I, too, am a learner with them. Yes, I may know much more about

teaching and learning in general, but they know far better how to make learning real and meaningful for themselves. They are all different and, to be life-long learners, they need to discover what works best for them. As their teacher, I take my place at their side, not at the front of the room. This view of a modern classroom disturbs some and upsets many, teachers included. Some argue that it robs teachers of what little status they have had as arbiters of learning and keepers of the flame of knowledge. I am inclined to argue that now is the time to abandon the role of teacher as sage and to adopt a new model of teacher. No one but the teachers and teacher educators in our profession can do this. This redefinition cannot be legislated or coerced or written into policies. A shift in the meaning of "teacher" requires an understanding, appreciation, and commitment to what it means to be a teacher in the 21st century.

Many school reform efforts have been developed outside of schools and without teachers. Some have striven to mandate change. Most of these efforts have floundered. To have any merit, reframing what it means to be a teacher will have to come from within the profession.

> True transformation within ourselves, our schools, and our systems rests with us. It will not occur if we somehow expect others to do it for us. The paradox rests in the reality that both the positive and the negative – the good, the bad, and the ugly – are part of what it means to be human. When we accept personal responsibility for cultural and structural school change, we come to recognize the complexity and contradictions that are a natural and inevitable part of the change process. (Brown & Moffett, 1999, pp. 148–149)

Once teachers accept this challenge, they will discover new ways to legitimize what they do with students and to professionalize their work. To join the ranks of other professionals, teachers should take it upon themselves to define and regulate what they do. Reliance on other bodies, (august as they may be) to "tell" teachers what to do, how to do it, and when to do it, simply will not work anymore. The recent rise of teacher professional development methods that respect teachers and concentrate on their individual growth and learning assumes an intelligence inherent in teaching professionals and hints at the possibilities that can develop.

> Reflection is at the heart of recognizing the breach between what people say they do (espoused theories) and what their moment-to-moment actions say about them (mental models or theories-in-use). By becoming aware of their actions and recognizing how these are or are not congruent with their explanations, people begin to create the possibility for genuine change. (Caine & Caine, 1997b, p. 140)

This redefinition of teaching is not an effortless or instant shift in practice. Many dedicated and successful teachers have already expressed an enthusiasm to take on this role of teacher-guide. More often than not, in my experience, teachers

seek others to give them direction. Many teachers have relied on others to give them direction throughout their careers. This was the way they were taught in school when they were students; it was the way they were trained as teachers at the university; and for many, it was the way that they have attained success in the classroom for years. Taking the responsibility for creating and meeting professional standards means not relegating the accountability of the teaching profession to others. If a student does not learn, teachers can no longer shrug it off or blame the student, parents, or community. If what teachers do in the classroom is not working, it is a professional responsibility to find out why and to provide the necessary change. That is teaching nowadays. A teacher can no longer say, "I taught it, so they learned it." Teachers now know better.

Consequently, comprehending the latest research about teaching and learning is a prerequisite for today's teachers. Knowing themselves as individuals and uncovering their assumptions and beliefs are mandatory for today's teachers. Turning that self-knowledge into best practice for students is obligatory for today's teachers. Self-study, just like teacher research, requires that teachers depend on themselves in their particular situations to collect data about themselves and their practice in systematic ways. These data inform teachers' decisions as they design and execute the best structures for student learning. In my experience, both teacher research and self-study empower teachers as no other professional development can. This process is embedded in being authentic and honest.

> As people become more aware of the beliefs and assumptions that drive them, they can access their mental models. They can become aware of the dissonance between what they say and what they do. And with that awareness comes the capacity to change and align espoused theories and theories-in-use. That work is how authenticity develops. To be authentic, therefore, begins with being honest with oneself. (Caine & Caine, 1997b, p. 141)

Self-Study Opens the Classroom Doors

The reality of school in the recent past has included and accepted the practice of closed doors. Expressions about being "behind closed doors" have been ubiquitous in schools. Teachers have a much easier time when the doors are closed; there the teacher can remain the expert – the proprietor of all knowledge. Behind closed doors, teachers can parcel out bits of knowledge in carefully measured doses so as not to overfeed their students. Teachers thought they knew what was best for students, and what was best consisted of spoon-feeding the parts to students, hoping that the whole would emerge from this Newtonian worldview of teaching the parts.

When I began my teaching career, I remember realizing that no other teacher knew what I was doing in my classroom as class after class of students paraded through each day. As long as the noise level did not attract attention (and my classes were always in danger of exceeding the acceptable limits for noise), I was

pretty much left alone. As a matter of fact, in my first two years of teaching, even though I begged the principal to observe me and provide feedback, she never did. She claimed that when she wandered the halls, she could tell if a teacher was good or not – even with the doors closed!

In this new century, teachers need to fling open their classroom doors. Teachers are recognizing the importance of reflecting on their experiences and analyzing their practice, of creating a new principle for professional development that embraces personal growth and reinventing themselves.

> Just as the sea moves in upon itself, feeding life and information continuously into the flow and depth of its own creations, educational leaders and participants must reinvent themselves through continuous reflection on the experiences, beliefs and values that give daily interpretations and meaning to their lives in schools. (Lambert, 1995, p. 197)

Operationalizing this invitation can mean that teachers are more open about inviting others into their classrooms. It can mean that students are freer to take their learning outside walls of the classroom. It can mean that teachers are making themselves and their practices accessible to other practitioners. It can mean that teachers admit that they do not have all the "answers." This more open atmosphere can be invigorating for both teachers and students. I am always amazed at how teachers want students to collaborate, work with each other, and share their work with authentic audiences, but how resistant teachers can be to sharing their own practices in similar ways.

Today I see teachers creeping closer to the belief that who they are is an integral part of what they teach. Compared to how teaching has been approached until recently, this represents a huge shift in understanding. Teachers are being urged to consider this change and to make this leap.

> Changing our thinking is the first thing we have to do both individually and collectively, because without that change we cannot possible change what we really do on a day-to-day basis. Regardless of what new "method" or latest technique is attempted, the mind-brain will always choose to reduce such practices to fit entrenched assumptions and beliefs. To really restructure anything means to restructure our thinking and shift deep connections to our psyche. We cannot just rearrange the pieces in the box; we need – collectively – to conceive of what we do in fundamentally different ways. (Caine & Caine, 1997a, p. vi)

Whether teachers like it or not, in addition to expert teaching skills, content knowledge, and pedagogical competencies, relatively unconscious habits such as how a teacher speaks, looks, dresses, responds, reacts, and thinks are part and parcel of what students learn during the school day. All these elements reflect who the teacher is and influence what and how the teacher works. Just ask parents! Because no one learns easily from someone who is unenthusiastic about students or about a subject, parents require assurances that their children have

enthusiastic, intelligent, compassionate, and just plain nice people as their children's teachers. I can always turn to the school experiences of my two sons for evidence. Both Alec and Nicholas would invariably come home after the first day of school and respond in similar ways to the question, "How was it?" From kindergarten through university, they would anticipate the quality of the new school year's educational experiences by how much they thought that the teachers liked them. First impressions of their teachers made such a difference for both of them.

Learning is much more impressionistic than teachers realize or care to admit. How many adults still characterize certain subjects by saying, "Oh, I was never good in that subject in school"? When probed, many admit that a specific teacher convinced them that they could not do art or mathematics or writing. And these adults often carry such impressions for the rest of their lives. What power teachers have! How many of today's teachers were motivated to become teachers by their own teachers?

In my present job I interview many teaching candidates. I always try to ask candidates why they became teachers and then why they chose to teach their subjects. I have never tallied the responses but, more often than not, the candidates seem to have chosen teaching because of one or more teachers they had in primary or secondary school. To want to teach, the subject matter must be of interest, but sparking that interest and protecting the flame usually can be traced to a teacher or two. These candidates will reminisce not about how they learned their discipline, but about how they were inspired and encouraged by a teacher of that discipline.

As models, teachers reveal the world of learning to their students, most often teaching them more than the subject matter. How can teachers think that who they are as people would not have a profound effect on who they are as teachers? Intuitively, teachers know that they are one and the same, but teachers may not always recognize what to do with that knowledge. Self-study capitalizes on that understanding, insisting that teachers remain learners about themselves as they continue to learn about their students and their practices. If teachers accept this view of teaching, they must accept that "new learning is mediated by prior experience, values, and beliefs" (Walker, 1995, p. 171).

That seemingly simple proposition exposes teachers in very personal ways. If teachers accept the premise of self-study, they should also accept that many audiences will not appreciate the risk involved when professionals expose themselves to scrutiny. Teachers should consider the following assertion:

> Improved teaching will require a reconception of the role and responsibilities of the teacher. It will require the creation of professional communities where sharing one's work is possible and taken seriously, and it will require a willingness to have colleagues see you teach and a willingness to dialogue with them about what they have seen. (Eisner, 1998, p. 29)

Think for a moment how anyone learns something, really learns it well, in or

out of school: riding a bicycle, playing an instrument, speaking another language, navigating a foreign city, or computing taxes. Why is learning to teach any different? Teaching is not a skill or art that one either has or does not have. Teaching pushes teachers to learn more about themselves and others so that they can structure the environment for students' optimum learning. How can teachers achieve that if they do not even understand their own learning? Effective teachers are in touch with their own beliefs, biases, proclivities, and assumptions. Beyond that, excellent teachers are so in tune with themselves that they fully understand that others may learn differently from the way they learned.

Self-Study Fosters Good Teaching

Realistically, not every student approaches a subject in the same way. Students' attitudes and aptitudes depend on many personal attributes. How does a teacher approach the student who enters the classroom announcing (usually quite loudly) that he hates this subject or was never good at it? Good teachers understand multiple approaches to a subject, the contexts students bring to the classroom, and elements that interfere with learning. More than that, good teachers understand themselves. Constantly aware of their own learning, their own decisions, and their own influences, teachers who conduct self-study strive to become and remain these "good teachers." Allender (Bass, Anderson-Patton, & Allender, 2002) summed it up ardently:

> What a great way of life. Many of us became teachers because we loved learning and self-study challenges us to continue to learn. We became teachers because we loved discussion and ended up isolated in our classrooms, but self-study connects us to caring, conscientious, and critical friends, and to a larger worldwide web of research. Self-study offers us research that puts us back in touch with who we are, what we do, and how we change – to consciously be working on ourselves so that we are agents in our daily lives. Finally, self-study creates a vision of ourselves as flexible, open, and creative; we can work with our defensiveness and vulnerabilities; we can grow as we continuously learn to teach. (p. 68)

Teachers who conduct self-study admit that they may not know all the answers, may not have all the information, or may not possess all the knowledge, but those teachers know how to learn. Those teachers understand that:

> When new experiences are encountered and mediated by reflection and social interaction, meaning and knowledge are constructed. Learning takes place, as does adult development. When actively engaged in reflective dialogue, adults become more complex in their thinking about the world, more tolerant of diverse perspectives, more flexible and open toward new experiences. Personal and professional experiences require an interactive professional culture if adults are to engage with one another in the processes of growth and development. (Lambert, 1995, p. 28)

In my estimation, those teachers who are active learners are ranked above others because a heightened level of self-awareness affords those teachers a perspective that can ultimately result in improved student learning.

Self-Study Nurtures Personal and Professional Growth

Perhaps the greatest benefit of self-study for teacher-practitioners resides in the personal and professional growth that self-study generates. This does not simply mean that teachers who conduct self-study learn more about themselves as people or as teachers, although that is certainly part of it. It does mean that teachers become better at what they do as teachers because of a deeper understanding of self, both as teachers and also as persons. Simply put, many researchers agree that "The more I know myself through self-study, the more available and open I can be with my students" (Bass, Anderson-Patton, & Allender, 2002, p. 65).

This benefit of self-study is difficult to explain to others because, as one participant at a conference on self-study said to me, "We are in danger of being perceived as navel-gazers." I believe that comment stuck with me because I thought that some of the self-studies that I saw presented were either self-indulgent or so esoteric that I could not comprehend them. And sometimes self-study can be accused of either of these faults. I have come to be more generous now when I approach a self-study because I, too, have felt that my own work might totter on the self-indulgent. After all, how can I justify the time and effort I put into a self-study just to learn more about myself? At times, it can seem like a merry-go-round of therapy. But it definitely is not. Self-study in its various forms has a higher purpose for reflection and study: to make teachers better teachers by developing individuals who have a deep understanding of who they are. "While experience is powerful, learning from experience is far from automatic, perhaps because all levels of formal schooling pay little attention to learning from experience" (Russell, 2002, p. 84). Simply put, teachers who do not reflect on their role in the classroom and the effects they have on their students' learning cannot be as effective as those who do. Every person's life is a journey that includes a professional life. This journey helps people to understand themselves better, know themselves, and use that self-knowledge to help others.

Self-Study Reshapes Beliefs that Produce Change

How important is self-study to those who practice it? From my personal experiences, I can state that it has forged my vision of school, shaped my professional growth, inspired my personal view, and activated my personal sense of truth and value. Putting it that way sounds very "highfalutin" and ethereal, yet self-study is anything but. It is down to earth, essential, basic, and real; it can also be difficult to communicate to others without sounding theoretical or vaguely spiritual. Even the name self-study often scares teachers who either fail to see its practicality or develop suspicions about it. Classroom practitioners need to

move past those misgivings to discover the benefits of self-study for themselves and their profession (Dalmau & Gudjonsdottir, 2002, p. 115).

The strongest reason for conducting self-study as a teacher is that self-study has applications that make schools better. If a teacher only conducted self-study to become more inward looking or contemplative, I would know that she or he did not understand the purpose of self-study. By assigning importance to self-knowledge and encouraging students in the same vein, self-study transcends some of the mundane, day-to-day distractions of school. It forces teachers to keep a higher purpose in mind because conditions for learning, concerns for individuals, and relationships in the community are larger than individual lessons or correcting homework. It throws a bright light on assumptions teachers make about students and learning. It opens the window to the role of the teacher. Because of these effects, self-study can threaten teachers. Teachers who attempt self-study need to possess a self-concept strong enough to be able to have others scrutinize not just their practice but also who they are and what they believe. Researchers have noted that self-study, "requires me to get very close to my own teaching and to my own thinking. It forces me to ask questions that are not always easy to answer, and this can be a painful process" (Tidwell, 2002, p. 41). Self-study compels all to recognize the status of the self as integral to what is taught and what is learned in schools.

Thus how a teacher interprets the content of a lesson is a product of how that teacher learned it (first as a student and then as a teacher), the kinds of experiences that teacher has had with the content, and even how that teacher got to that point in life. As evidence of this, consider that the very same content is taught differently in different classrooms. A 20-something teacher will relate differently to content from a 40-something teacher. Similarly, female teachers relate differently to content than do male teachers, and females take on different roles in a classroom than do males. It can even be reduced to how a teacher dresses!

> *I remember teaching a high school class in which the students were obviously distracted. After trying to ignore it, I finally blurted out. "Who is going to tell me what you are all buzzing about?" One brave girl elucidated the situation, explaining that every day students checked which socks I was wearing. Unknown to me, this practice had become a "thing" with all my classes. My colorful socks (hidden by my pants, I thought) were just as important to a group of 16-year-olds as reading William Faulkner. No, it might have been even more important for them! After that, part of the class routine was for me to "reveal" the day's footwear. It became a class tradition and the ritual was handed down from year to year. I have little doubt that, years later, many of those students still remember that routine in their English class with me.*

I tell this story not because it is about self-study, but because it illustrates the importance of the person of the teacher in the learning process. My choice of hosiery in and of itself was unimportant, but the students' interest in it became

part of who we were as a class. That, in the end, shaped and influenced the relationships in those classes.

I now look back on my career and realize that my interests, my understandings, my reasoning, my learning style, and my expectations have structured and influenced what I have decided to do in my classes. And that was not necessarily a bad thing. Rather, I would say that students had good experiences when I determined the learning criteria. Influenced by my current realization that who I was had such an impact on how I taught and was such a controlling force in the classroom, I have learned to relinquish control. Oddly, I have found that by relinquishing control to the students, I actually have more influence with them. But during this shift from teacher to student control, the students learned to gain control, and this created a healthier and more helpful situation for them as learners. Because of what I have learned from conducting self-studies, greater control of learning gets placed where it belongs: with the students (Senese, 2002).

Self-Study Creates Partnerships with Students

As the teacher, I control or at least influence so much more than the content of what I teach. I have understood for some time that the means for learning, the context for learning, and the atmosphere for learning are all part of what I can shape and structure for students. More recently, I have realized that students also need to be a part of that structuring and shaping. Their input is the most valuable contribution to the curriculum. I have learned to relinquish control of learning to my students, and this is not an easy task, given the training experiences of most American teachers (and I deliberately use the term "training" here). As I become, the students become, and vice versa.

Curriculum is often interpreted as the content of a course. Lately, schools have included the methods by which that content is offered. As expertly as those two elements may exist in curriculum guides, the curriculum does not exist without students and their unique contributions. Students have been trying to teach us this for years, but teachers rarely seem to listen. As Cook-Sather (2002, p. 8) observes, "The challenge to listen at all is equaled by the challenge to learn to listen differently once one decides to listen." Now that I accept students as an integral part of the curriculum (their likes, interests, foibles, histories, strengths, weaknesses, and personalities), I can relinquish the control that I once thought was mine by right of position. I can proudly say that I learn in my classroom, too. We all learn together.

For me, that partnership was forged through self-study. Self-study helps me understand myself better as a person and as a teacher, but what distinguishes self-study from reflection is that self-study takes into account, indeed depends upon, the complexities involved in learning and teaching (Senese, 2002). The relationships among all the participants and the multiplicity of interdependencies are acknowledged and celebrated in self-study. I not only learn about myself, but I deepen an appreciation of who the students are in relation to me, to themselves and to each other. That shift revolutionizes the role of the teacher

who is conducting self-study. In a classroom in which self-study is conducted, teachers and students certainly influence each other, sometimes affect each other, and ultimately create each other. As I conduct self-study, I recognize that I am not the tour guide to the content waiting to be tapped by the students, but rather, I am a fellow traveler, making the journey beside the students. There is no class without the community and all that that term entails. Furthermore, self-study can benefit students indirectly as well as directly. Cook-Sather (2002, p. 10) puts it this way: "When students better understand how teachers work – the complement to teachers better understanding how students work – they can participate more constructively in the educational process."

Self-Study Benefits Student Learning

Because of the profound nature of self-study and its relationship to student learning, some have criticized it as experimenting on students. I respond to that concern in this way: Because I am studying myself, the students are not guinea pigs. Yes, I change practices based on my new understandings, but the students are the beneficiaries, not the subjects of my self-study. In various ways, all teachers at some level already test out new methods and content by trying them with students. A new curriculum document is an experiment that may seem more acceptable because it was produced by a small group of people and is being "tested" on all students in the relevant jurisdiction. Self-study simply makes this practice more apparent because sharing results puts the issues in front of others. If, in their hearts, teachers believe that a teaching practice, a method, or a topic in their self-study is ultimately beneficial to the students' learning, the profession does not merely encourage the change; it demands the change be made. When teachers acquire deeper understanding of how and why teaching and learning occur because their own research informs them, they should act on that knowledge. Self-study provides them with the tools to nurture their students and themselves. Self-study also provides a community of critical friends with whom teachers can share their knowledge and new practices which translates into additional benefits for students.

Self-Study Values Student Contributions

A teacher does not reach this level of self-awareness alone. The classroom door has to be propped open or, better yet, removed. The classroom becomes larger than the four walls that hold the students and teacher. By their very practice, teachers who conduct self-study encourage their students to be reflective, to gauge their metacognition, and to tap into something deeper than grades or scores. By its very nature, self-study values student contributions because it elevates the role of students.

Doing this exposes and explores possibilities. Learning is not limited to a textbook, a curriculum guide, or a calendar. Teachers conducting self-study realize that self-study happens all the time and greatly influences how and what

they teach and what students learn. Teachers using self-study become natural inquirers.

> I see [self-study] as both a means of investigation and analysis that starts with one's self, and as a tool for professional improvement. I think of it as a conscious, conscientious, honest, organized probing into one's professional work. Its focus, for me, is on what I and my colleagues do, or should do as teacher educators. Its guiding questions include: "What do I actually do as a teacher of teachers and as an investigator of teacher education?", "Why do I do what I do?", "How good is my practice?", "How can I improve?", "How can I inform others about teacher education?", "How can I, my colleagues, and those whom we inform make teacher education better?" In short, I see self-study as a form of self-analysis that leads to self-improvement for individuals, groups, and institutions. (Myers, 2002, p. 130)

Students in the classes of self-study researchers recognize that self-study sparks conversation outside of class, in the home, and with adults. As the students move from class to class, subject to subject, school to school, self-study transfers. Students are more apt to look at the whole because they are encouraged to think of themselves as whole, not as a drawer full of parts waiting to be assembled.

Redefining the teaching profession this way is not just risky for the teacher. The changes it prompts in the classroom can often alarm students. In my own experiences teaching high school English, I have let students into my mind as we studied literature or writing. I cannot always tell if they are comforted or terrified by my responses. For example, when reading *Beloved* by Toni Morrison, I freely admitted the difficulties I was having understanding the book. As we read parts or listened to the author read parts in class, I would exclaim that as many times as I had read the book, I did not actually understand something until that moment in class.

I know that students are certainly unaccustomed to teachers admitting that they are still learning, and I suppose it may be discomforting for some students to discover that their teacher does not understand everything about the material. I do think, however, that some students relish the admission. One student, responding to my spirited comment that I was frustrated by a D. H. Lawrence character who came across as a wimp, shared with me that "I have never had the opportunity to actually discuss a book with an adult before. I didn't realize that you struggled with literature the same way I do." Experiences such as this prompt me to admit that I have learned more about any subject when I include learning about who I am, both as a person and as a teacher, in the lesson. Being a learner along with my students has translated into increased learning for all.

Essential Ingredients (*Joe*)

Teachers Reflect on Themselves and their Practice

If teacher-practitioners are serious about reaping the benefits of self-study, they should take it upon themselves to regulate the profession and themselves. This

would require at least three changes in teacher culture that would support self-study.

Understand the Process

Practitioners performing self-study in their practice should understand what self-study is and how it works. A modern teacher should follow new developments and understandings, making this process part of a natural reflective practice. Teachers should know how to articulate what they do and why they do it because they have a deep understanding of themselves. Without a deep understanding of themselves and the process of learning, teachers will never be able to grapple with the issues facing their own profession.

> Reflection on one's own processes, what is generally called metacognition, and on parts of what we call active processing is the core of high-level learning, because reflection is how people extract meaning from experience. We now see that metacognitive capacities can themselves be further developed. (Caine & Caine, 1997b, p. 21)

This does not mean that teachers must have all the answers. They do need to know the questions, though, and *they* should be the ones to pose these essential questions.

Communicate Understandings

Experience tells me that teachers often insist that students, parents, and administrators trust their judgment without question. True, a university degree and experience inform and guide teaching professionals. But beyond accepting that assumption, how do teachers communicate to others their understanding of the learning process and the teaching decisions they make? Teachers have often been negligent in keeping others informed of what they do and why they do it. That tradition has not worked to their benefit. If teachers can explain in lay terms what their best thinking is and what information or theory it is based on, they have entered into a conversation about teaching and learning that is far more valuable than a perceived status grounded in holding on to information and doling it out piecemeal. I envision teaching as an endless conversation, endless because the players and situations are organic and always evolving. Teachers can initiate these conversations or suffer the consequences. Some may argue that teachers place themselves in a precarious spot by doing this. I applaud those who place themselves front and center in such conversations. They model for all teachers what learning and teaching are about. There is no right answer; there are only better answers for specific circumstances and players. Keeping the conversations alive includes others and embraces differences, a healthy and ultimately more productive position for any teacher.

Share the Results

Although this recommendation for changing the profession resembles the one about communication above, it differs in that this communication is with other

teaching professionals. Teachers who fashion themselves as entrepreneurs in the classroom, closing classroom doors and shutting out the world, deny the soul of teaching and the world in which students live. Teachers should work together by learning together as professionals. Wagner (1988, p. 517) urged that teachers should "reinvent school systems together if they are to have a realistic chance of accomplishing this goal for all students, and we need a methodology for change that involves all adults in a collaborative process of learning and reinvention." Discussing and sharing meaningful and substantive issues of learning and teaching should become a natural part of what professionals do in schools.

For years I have promoted the practice of teachers sharing their thinking and their research with other teachers. In that time I have repeatedly discovered that teachers need experience in explaining what they do. The average teacher has not been taught to share with others, and schools are organizations that rarely structure opportunities and experiences for teachers to benefit from this kind of meaningful conversation, a time to share their stories.

> Throughout their lives adults engage continually in the construction of meaning from the events of their lives. Narrative or story is a central tool in that process. Stories have the power to help define who we are, to foster growth and development, and to help us envision our possible futures. School leaders need to provide opportunities for educators to engage continually in the process of retelling and reliving the stories of their lives, both individually and organizationally. (Cooper, 1995, p. 132)

In this arena, teachers themselves should be the force for change, so that they have both the means and the occasion to develop as learning professionals. Their own professional growth is central to making schools better and more productive places for learning for everyone. Self-study is one excellent way to organize these conversations.

Standards for Self-Study

Teachers themselves, then, should set the standards for conducting self-study to make it meaningful for individual and institutional uses. The standards for self-study in education fall into three categories, each pertaining to the kinds of evidence and analysis that cause us to learn. The type of evidence teachers collect and the quality and the quantity of that evidence need to reach the highest standards possible. Measuring the success of children's learning relies on adhering to the highest standards for conducting self-study and teacher research. As important as it is, this search for excellence need not be intimidating.

Multiple Methods to Collect Information

Teachers conducting research must base their work on information of high quality. Many interpret this to mean that the information must be collected using the scientific method and analyzed using statistical analysis. Yet so much

of what happens in the classroom cannot be reduced to these methods. If teachers have access to quantitative information, they are certainly encouraged to use it. Learning and teaching, however, are often much more subjective than that, as in the first time that a shy student presents to the class or that a student essay strikes at a truth that cannot be reduced to numbers. Anecdotes, opinion surveys, observations, and case studies are all valuable sources of information. Researchers should recognize and acknowledge the authority and limitations of each of these data-collection methods. No one method will suffice. The types of information that teachers collect should be correlated to what they are trying to study.

Teachers are sometimes unaware of the types of information that a school or district has available. Schools have a surfeit of data and reports from which evidence can be culled. Teachers should be aggressive in asking to obtain attendance reports, reports to the community, budget reports, or standardized test scores. Teachers need only to mine these rich sources and analyze them for patterns and meaning. Once the information begins to flow, the question becomes what the researcher should leave aside.

Quantity of Information

Collecting too much information is probably more favorable than collecting too little. So often, when teacher researchers collect information in research, they do not know the significance of what they are amassing until after the fact. The element of surprise is part of all educational research, including self-study. Teachers should recognize and acknowledge bias in themselves as well as in the information they collect, so that they can dodge one of the pitfalls of teacher research: pretending to research by asking questions to which we already know (or think we know) the answer. Self-study maintains its honesty when teachers are not simply using it to justify or affirm current practices.

Multiple Sources that Converge

Like both action research and teacher research, self-study draws power from the confluence of multiple sources of evidence. No one piece of evidence can ever suffice. Learning is a complex process that can be measured in various ways. The more that various pieces of evidence point in the same direction, the more persuasive the conclusion becomes. This does not simply mean, "Pile it on!" It does imply that teachers should investigate the direction of the flow of the evidence and confirm their conclusions by seeking additional evidence. If two pieces of evidence point to similar conclusions, three make the analysis stronger and more persuasive. Think of what four types of evidence can do! Of course, researchers can become anxious that there is never enough evidence to "prove" what they have learned. That is the nature of self-study because its purpose is not to prove anything but to illuminate relationships. Bass (2002) captures a common awakening that self-study often generates:

Self-study took away my straw-man version of research and challenged me

to do something meaningful. The value of the study was to be judged by all the participants. Nobody funded it; no particular conclusion was desired; no prescribed set of protocols had to be followed. I could trust myself, with help from my collaborative, to keep relationships primary. (p. 59)

At best, teacher-researchers can indicate what direction the evidence seems to be pointing and look for more confirming evidence as well as disconfirming evidence. Teaching is not an exact science, but it is a living science. Teachers should not become lost in the trees of the data and forget to appreciate the forest. They should seek the patterns in the events that are right in front of them.

Being Practical, Pragmatic, and Realistic (*Terri*)

As classroom teachers, we all lead busy and intense lives, both inside and outside our school building. After a year or so of attempting research and feeling overburdened and overwhelmed, I realized I needed to find ways to make my research process easier. Here I share with you my discoveries in the hope that they will help and encourage you to give self-study a try. I discovered that flexibility, integration, and idealism are three important elements to consider throughout all stages of one's research.

Getting Started: Flexibility

Flexibility was a continuous lesson. In the beginning, I spent hours formulating and articulating the perfect question to pursue, only to find that as I gathered my data, observed, reflected and read the work of others, I also reworked my question. Over the years, I have learned to relax, formulate my intention generally, and then understand that the exact question would emerge as I continued my research.

Living with uncertainty was hard. I am a planner and I like to have everything laid out clearly; I like to know what to expect. My first piece of research focused on gathering data from a single student. All was fine until she moved and then I had to start all over. Now I either gather data from a small group of students or from the entire class. This gives me a broader base from which to pull information and I am not stuck if a single student moves or is gone for a prolonged period of time. Once I have all the data, I can narrow down the number of students I wish to study.

I tend to gather data from many more sources than I need because I am afraid that I will miss something interesting. In one study, I might plan to collect data by videotaping my literacy groups, collecting student samples from reading response logs, taking observational notes on specific students, writing systematic memos to myself, tape-recording literacy discussions, and including observations from other teachers.

Idealism

I find I do most of my thinking and planning for my research over the summer when the daily demands of classroom teaching are gone. I have found this to be both a good and a bad practice. I find the long days of summer perfect for thinking through a research plan and beginning a review of literature. That is the good part. The bad part is that in the summer I tend to lose sight of the everyday pressure of teaching when I plan how to carry out my research. I forget how full the days are and in how many ways I am stretched. I frequently make my research plan too complicated or time intensive. I have never fully resolved this issue. I attempt to keep it in mind when I plan my research, but somehow the summer sun always fools me. I have learned to be adaptable come September and, if my plan is too much, I am willing to rethink.

Integration

Integration is the hardest and also the most fun to consider. After my first research study I realized that I had to find ways to meld all elements of my research into what I already do. In that first study, I was trying to take field notes on the class as well as observational notes on specific students, to write memos to myself, to videotape my teaching practices, to read research, and more. I went crazy. I could not sustain that level of intensity on top of my teaching. One Saturday, I sat down and considered what would be the most effective way to gather the information I needed. Once I had my list of research essentials, I thought about my classroom practices and routine and tried to identify ways to match the essentials with the routines. For example, I could do some of my research reading during the daily school-wide sustained silent reading time.

When I taught my students about writing nonfiction, I used my research writing as mini-lesson examples. This forced me to write. A side benefit was the sustained level of enthusiasm. When I shared my work with the students, they became excited and, in turn, this helped me when my energy level dipped. A major problem for me was finding a time and a way in which to take observational notes. When I first started, I tried to watch everyone all the time. Over time, I discovered that I really did not take notes on everyone, but only those who demanded my attention. I was not getting a full picture of the classroom happenings. In thinking about what I already had in place, I realized that I had asked a specific small group of five students to write to me each day. I also held a short conference with each of these five on that same day. I used this small group framework to focus my data gathering. Since I was meeting with a specific five students, I could easily take observational notes on them. It helped me narrow my vision for the day and, in the end, this broadened my vision of the classroom because I had more data to examine.

The other issue with observational notes involves organization and ease. I struggled to find an efficient way to write my observations and then organize them in a usable fashion. I began with a spiral notebook, but after a month I

found it hard to organize my notes. I also realized I was trying to write too much; I think I was trying to fill up the page. This system was simply unmanageable. So I switched it to the small, sticky-type note pads. This was better because, after writing my notes, I could rearrange them in any order. The down side of this system proved to be the ease with which I misplaced the notes. I had to remove the top one to write the next. This forced me to move to using a sheet of address labels, and this is my current system. The small size forces me to consider what I am watching and to be precise in my description. In the corner of each label I write the name of the student and the date of the observation. I leave the labels on the sheet until it is completely filled then, pull them off and place them on a master sheet for each student.

When I begin a study, I set up an artifact box complete with blank file folders. I tuck it away somewhere in the classroom. Whenever I run across an artifact that I think may be important to my study, I place it in the box. Periodically, I review and categorize the contents. The box in the corner is a constant reminder to look for important items that may inform my study.

Video-recordings allow me to revisit the day's events, but I found these had some major drawbacks. Video-recording has a high disruption factor. I began with a videocamera sitting on a tripod in the corner of the room. The students and I had to climb over it to get to our library. It was easy to bump and many times I ended up videotaping the wall. Now, however, thanks to technology, I use a smaller lightweight camera. This camera is mounted on the top shelf of my bookcase; it is non-obtrusive, it stays focused, and I can easily turn it on and off as needed. I also learned to have the camera in the room for a week or so before I actually plan to record. By the time I am ready to turn it on, the students have tired of waving and making faces at the camera.

Once I had the issue of how to videotape unobtrusively, I had the problem of sound. After trial and error, I bought a special microphone for my videocamera and I use a tape recorder. This provides me with a back up in case the videocamera does not pick up all the conversation. I have found that a small battery-operated tape recorder does not inhibit the students.

The final part of data collection for me includes my personal reflections. I have tried a variety of ways to incorporate consistent writing into my day. I have tried writing for 10 minutes before school, writing directly after school, and writing during school. There is no easy way for me to fit this in. For the past two years, I have introduced sustained silent writing. As with sustained silent reading, the students write for 30 minutes without getting up or talking. This gives me the opportunity to do some of my own writing as well.

In the Middle

Once I have gathered data, I next need to begin to examine what I have. I have not found a way to integrate this into my teaching day so I use my weekends to spread out all my data. I remind myself to remain flexible and open as I search for possible patterns and unexpected surprises. I find it is easy to look at

all the written data, but I usually get bogged down in the media collections. A colleague suggested that I begin examining the videotapes by fast-forwarding through them. With this technique, I could quickly scan the tape, looking for interaction patterns and isolating the parts I wanted to study more carefully. I also found it helpful to invite a colleague to watch the recordings with me. Colleagues often notice things that I miss.

The audiotapes proved more problematic. I have yet to find an easy way to transcribe them. Sometimes I listen to them in the car on the way to and from school, listening for sections to transcribe. Most of the time, however, I just bite the bullet and transcribe everything because I am usually not sure what will be relevant as I pull everything together. I attack my personal writing with a set of colored highlighters, going through my writings and color coding recurring ideas. I also begin to make comments off to the side of my writing, noting any connections to readings, media data or classroom observations.

Throughout all of this, I read. I try to discover what others have done or said on similar and related issues. Keeping track of everything was hard for me at first, but I now have a system. As I read, I make notes in the margin with a pencil. At the end of each chapter, I write a summary and clip it to the chapter. As I begin to write up my research, I use the chapter summaries as aids in locating specific information.

Pulling It All Together

Writing is hard. There is no easy way to write *and* to do all the work involved with teaching. It helps me to set a deadline and then tell someone what it is. I try to find someone who will check in with me and ask about my writing. I have also learned to narrow my topic. I cannot write about everything that pertains to my question, so I have to be ruthless to make it manageable. I have also learned to toss the "chocolate chips" into my writing. These are the bits that add life and make my writing come alive. The quotations, personal observations, and classroom stories add credibility for the reader. My final trick in helping me write is to visualize the audience. Often it is a very tired teacher sitting on my couch on the other side of my computer. I write directly to her. If I can write in such a way that she will read it even after a long day of teaching, then I know I am on the right track.

For me, the most important element in conducting self-study is my membership in a supportive community. It is through their questioning, support, and encouragement that I become a better researcher. I have also learned that a community does not have to be a large number of people. In the past, it has been my husband or the teacher next door. The number is not important. The important thing is the sincere desire to listen, question, and help me re-see what is before me.

Research is never easy, no matter how many ways I work to incorporate into my teaching life or work to be flexible. The benefits, however, far out way the work involved. By choosing my own question in order to examine my practice,

I gain confidence in my teaching abilities, I gain understanding of my beliefs, and I gain strength by sharing my discoveries with other teachers.

Conclusion (*Terri and Joe*)

We have had three major purposes in view as we prepared this chapter. First, we wanted to *define self-study for classroom teachers*. The exact terms we defined are not important in and of themselves. The importance is in teachers possessing the characteristics needed for self-study, including possessing a core set of beliefs that inform daily practice, a reflective nature, and a yearning to improve self and practice. Those characteristics lead teachers to the resources they need to conduct meaningful research and self-study.

Second, we wanted to *convince teachers to launch into self-study*. The reasons for teachers conducting self-study range from the practical (self-study imparts an endorsement and authority for practice) to the personal (self-study informs teachers about who they are) to the professional (self-study invites teachers to join a community of learners). Self-study urges teachers to find their voices, to deepen and multiply their relationships, to improve their practices, and to discover their capacity as leaders of change.

Third, we wanted to *provide information about carrying out self-study in a school setting*, including being realistic when conducting a self-study amidst all the demands of teaching as well as maintaining a life outside of school. As classroom teachers, all of us are stretched in many directions. We are expected to be experts in the practice of teaching, knowledgeable about professional issues, skillful in managing groups, wise regarding child development, and continuous in our own learning. Our time is limited as we work to manage all the demands that teaching makes on us. Now, as difficult as it has been for the two of us, we find ourselves suggesting and encouraging other teachers to add self-study to the ever-growing list of teachers' professional expectations and responsibilities.

No matter how we explain it, self-study is hard work. It does demand time outside the classroom. It does require new skills that are sometimes perplexing to teachers. We also recognize that self-study revolves around what matters most to us. Self-study inspires us. Self-study is not just what we do; self-study is about who we are. The rewards are so great that they far outweigh any drawbacks. Day (1999) summarizes the value of reflective practice:

> Without routinely engaging in reflective practice it is unlikely that we will be able to understand the effects of our motivations, prejudices and aspirations upon the ways in which we create, manage, receive, sift, and evaluate knowledge; and, as importantly, the ways in which we are influencing the lives, directions and achievements of those whom we nurture and teach. (p. 229)

Because we embrace Day's optimism, we invite you to join others who have grown deeply and found rich personal and professional rewards in systematically

reflecting on personal practice through self-study. We believe there is no better way to strengthen our own teaching practices, to recognize the influence of our values and beliefs and, most importantly, to enrich our students' learning by becoming better teachers.

THE PRESERVICE PRACTICUM: LEARNING THROUGH SELF-STUDY IN A PROFESSIONAL SETTING*

Clive Beck[a], Anne Freese[b] and Clare Kosnik[a]
[a] *OISE/UT;* [b] *University of Hawai'i*

Abstract

With its emphasis on personal, constructivist, and collaborative teaching and learning, a self-study approach has the potential to significantly enhance the preservice practicum. We begin by outlining various dimensions of the self-study approach and then note some of the challenges to implementing this approach in teacher education. In the central portion of the chapter we highlight four conditions or practices for achieving a self-study approach in the practicum. Under ''integration of the campus program with the practicum,'' we discuss the need for an overarching philosophy of teaching and learning, modeling a self-study approach on campus, interspersing the practicum throughout the program, designing assignments that cut across the campus program and the practicum, establishing a cohort and faculty-team structure, building close school-university partnerships, and involving university instructors in practicum supervision and school liaison. Turning to ''satisfactory practicum settings,'' we consider the selection and development of mentor teachers and partner schools. With respect to ''appropriate practicum activities,'' we note the need for flexibility with regard to teaching content and method and for an experimental, research approach to teaching. Finally, under ''student teacher support,'' we consider the importance of strong support from fellow students, university staff, mentor teachers, and the practicum evaluation system.

The practicum component of preservice programs is widely acknowledged as critically important and presenting a number of challenges (Goodlad, 1994;

Knowles & Cole, 1996). We believe that the self-study approach, which is the focus of this handbook, has the potential to address many of these challenges and to significantly enhance the value of the practicum to those learning to teach. In our own preservice programs, we have found that when student teachers experience a practicum designed in accordance with self-study principles, they tend to acquire a greater sense of ownership of their learning. They also obtain support and insights from each other, achieve a more collaborative relationship with their faculty supervisors and mentor teachers, and view the practicum as an opportunity for personal and professional growth rather than as application of pre-determined teaching strategies. As a result, teacher candidates generally experience a high level of satisfaction and achieve considerable professional learning.

The emergence of the self-study approach in teacher education, including various reform initiatives, is well documented in other chapters in this handbook (notably Loughran's chapter, "Learning through self-study"). It has also been addressed in earlier works by Cole & Knowles (1998), Zeichner (1996), and Zeichner & Noffke (2001). With respect to the practicum, key works from a self-study perspective include Zeichner (1990, 1996), and Knowles & Cole (1996). Given the coverage elsewhere of broad developments and themes in self-study of teacher education, this chapter focuses on more specific aspects of the practicum, showing in detail how a self-study approach may be – and has been – implemented in the practicum setting.

In this chapter, we use the term "preservice program" in a relatively broad way to cover all teacher preparation programs as distinct from inservice programs. In our usage the term includes not only four-year preservice programs but also five-year concurrent programs, fifth-year baccalaureate programs, and one- or two-year master's programs that include a major preparation component. Our concern here is both with the principles of self-study and with their implementation in practice, namely, in the preservice practicum. Accordingly, we use the term "approach" to refer to self-study rather than terms such as "perspective" or "point of view," which have a largely cognitive connotation. We sometimes refer to self-study as a "paradigm," in the sense of an example or pattern that combines theory and practice.

The term "self-study" as employed recently in teacher education refers to a complex set of components and is not necessarily easily understood. Although the term works well for those who have used it for some time and have discussed its meaning at length, teacher educators new to the expression may find the term puzzling. Before proceeding to our discussion of the self-study approach in the practicum, we attempt to clarify the general concept by analyzing several of its components, indicating how each is connected to the overall idea of self-study.

The Self-Study Paradigm: A Personal-Constructivist-Collaborative Approach rather than a Technical-Transmission Approach

Dewey argued against seeing teaching as the transmission of ready-made ideas to students, saying that "no thought, no idea, can possibly be conveyed as an

idea from one person to another … Only by wrestling with the conditions of the problem at first hand, seeking and finding [his or her] own way out, does [a person] think" (Dewey, 1916, p. 188). Similarly, Freire (1972) rejected the "banking" concept of education according to which students are receptacles for "deposits" of knowledge to be stored for future use. Schön (1983) made a parallel point about professional learning, arguing that practitioners must generate their own professional knowledge in the context of practice. They cannot take the "expert" knowledge developed in universities and simply apply it as mere technicians, because expert knowledge is largely unusable in real-world contexts. We refer to the paradigm of teaching, learning, and professional practice that is criticized by these theorists as the "technical-transmission" approach.

The self-study paradigm stands in contrast to the technical-transmission paradigm and might be referred to as a "personal-constructivist-collaborative" approach. Even this compound expression fails to capture the complex nature of self-study. Other terms used to refer to the approach include inquiry, progressive, critical, experiential, inclusive, and social constructivist, each of which has distinct connotations and emphases. Because of the reference to "study" in its name, self-study could be understood just as a research orientation. However, we use the term to refer to a broad approach to teaching and learning that, while including research and reflection as a central dimension, does not necessarily involve formal data gathering. In the remainder of this section we briefly outline what we regard as the main components of the approach in question, showing in each case the link to self-study.

Personal Involvement, Personal Narrative, Building on the Past

The term self-study has a strong personal reference: it points both to study *of* the self and study *by* the self. Bringing the self into the academic and professional domain goes against objectivist conceptions of research and practice, according to which being at arm's length is necessary for clarity of insight. Self-study advocates argue that, on the contrary, those personally involved in a setting are more likely to understand it; hence participant observation is important for knowledge generation. To the objection that personal involvement results in bias, advocates reply that participants in fact usually have greater incentive than detached observers to achieve understanding and sound practice, since they have to live with the results of their inquiry and program modifications. There is a paradox here: trusting *personal* experience is essential if we are to achieve insight and contribute to *general* knowledge in teacher education (Cole & Knowles, 1998, p. 42).

Personal narrative, equally, is a component of a self-study approach. Coming to understand one's own life history is essential in grasping what one believes and why and in making appropriate modifications to one's beliefs and practices (Feiman-Nemser & Buchmann, 1987; Knowles & Cole, 1998; Zeichner, 1990; Zeichner & Noffke, 2001). Story is an important means of communicating the knowledge we generate. As Schön observes, professional knowledge is to a large

extent communicated through images, metaphors, or exemplars passed on by experienced professionals (Schön, 1983). This life history emphasis is not a recent, isolated development found only in the teacher education field; it links to a central insight of hermeneutic philosophy, namely, that knowledge builds on the past, so discovery is an historical process rather than a sudden rupture with the past (Gadamer, 1975). Growth in knowledge takes place by gradually modifying tradition or, in Dewey's terms, breaking "the crust of convention" (Rorty, 1989, p. 66).

Inquiry, Critical, and Constructivist

Self-study accepts the special notion of inquiry developed within progressivism, namely, that one is *constantly* inquiring, never content with present ideas, aware that knowledge is always partial and can always be improved upon. As Rorty says, "the point of ... philosophy is to keep the conversation going rather than to find objective truth" (Rorty, 1979, p. 377). While our ideas can improve in a particular area, or even in general, inquiry never ends, both because we can never have full knowledge of phenomena and because reality is constantly changing. There is no static, underlying reality that knowledge mirrors (Rorty, 1979).

Self-study is also "critical" in that it is applied to all aspects of the educational situation, including accepted goals and ways of doing things, authority structures, prejudices, and inequities (Carr & Kemmis, 1986; Zeichner, 1999). It focuses on problems, puzzles, inconsistencies, tensions, and conflicts (Cole & Knowles, 1998; Loughran, 2004; Samaras, 2002). Finally, self-study is "constructivist" because knowledge is not taken as a given, a pre-set package. Rather, it is constructed by individuals and groups in an interactive process that enables them to give expression to their distinctive experiences, insights, and interests (Fosnot, 1989, 1996; Richardson, 1997). There are differences within the self-study movement about the degree to which construction is an individual or social activity (Vadeboncoeur, 1997).

Experiential and Practical

Another aspect of the self-study approach is its valuing of experience. It rejects the idea that problems can be solved at an abstract, theoretical level and then simply applied by practitioners (Dewey, 1938; Schön, 1983). Theories developed apart from local experience will not only be largely irrelevant; they probably also will be largely mistaken. Theory is certainly very important to the self-study view, but its generation must be integrated with practice: neither should occur without the other. Also, practitioners, as much as academics, should be seen as generating theory (Carr, 1995; Loughran & Northfield, 1996). Advocates of self-study also take an experiential approach to teaching: they maintain that in order to learn, students must, as far as possible, experience what is being discussed.

Collaborative and Communal

While the term *self*-study might suggest an individualistic approach, in fact the movement emphasizes collaboration to a considerable degree (Freese, Kosnik, & LaBoskey, 2000; Loughran & Gunstone, 1996; Wertsch, 1991). It accepts that the views of individuals must be constantly brought into dialogue with the views of others. Vygotsky's notion of learning situated in a social context is valued by self-study advocates (Samaras, 1998, 2002; Zeichner, 1990). One might ask, then, why call it self-study? However, we are faced here with the problem of the limitations of any one term. The label self-study is used because the absence of the self from academic and professional contexts is a particularly significant and pressing problem; but emphasis on the self is not meant to exclude collaboration, which is also viewed as crucial. Nevertheless, the collaboration in self-study honors the self because it involves personal and emotional expression and not merely intellectual exchange.

Beyond collaboration, self-study emphasizes community building in teaching and learning contexts. Genuinely communal environments support collaboration and broaden opportunities for social experience and learning. Interestingly, they also support the self, since allowing for self-expression is essential in building a community to which individuals will be prepared to commit themselves.

Inclusive and Equitable

The self-study movement emphasizes inclusiveness. This flows in part from its community orientation, but also from ideals of equity, meeting personal needs, and fostering personal growth (Darling-Hammond, 1997; Zeichner, 1999). Self-study advocates believe the self can only flourish in an inclusive, equitable community. The self-study approach extends the inclusiveness and equity focus beyond the school, relating teacher education also to the communities in which field experiences take place (Boyle-Baise, 2002; Murrell, 2001; Zeichner, 1990).

These, then, are the central components of the self-study approach, as we understand it. We are aware that significant differences exist among self-study advocates about the precise meaning of the above components and the emphasis to be given to each. For example, constructivists and *social* constructivists differ in the degree to which knowledge construction is seen as an individual or a social process. And those who advocate a *critical* approach often stress the political aspects of teaching and learning more than traditional inquiry-oriented theorists do. Despite the differences, however, we believe there is a significant measure of consensus on the above components among those who advocate and conduct self-study.

While we normally employ the term self-study in this chapter, we sometimes use the composite term "personal-constructivist-collaborative" to remind readers – and ourselves – of the many components of self-study. Using these three words to summarize what we have said in this section, then, the self-study approach is *personal* because of its emphasis on the self, narrative inquiry, and participant research. It is *constructivist* because it includes elements of unending inquiry,

challenging of prejudice and convention, respect for experience, and personal construction of knowledge. And it is *collaborative* in that it stresses collaboration, community, social construction of knowledge, inclusiveness, and equity.

Challenges to a Self-Study Approach in the Practicum

Despite the self-study ideal – personal-constructivist-collaborative – outlined in the previous section, the prevailing conditions in teacher education programs and practicum settings frequently discourage student teachers and program staff from developing such an approach. We now outline several of the major challenges to achieving this approach in teacher education, especially in the practicum.

The Traditional Nature of Many Practicum Settings

The practicum often occurs in rather traditional schools and classrooms where a technical-transmission approach to teaching and learning is prevalent. One difficulty is that practicum schools and mentor teachers (the term we use here for "cooperating," "associate," or "host" teachers) are often chosen on the basis of availability rather than for their skills of fostering optimal student teacher development (Cole & Sorrill, 1992; Guyton & McIntyre, 1990; Knowles, Cole, & Presswood, 1994; Slick, 1998). Another problem is the frequent lack of programs for preparation of mentor teachers (Cole & Sorrill, 1992; Knowles, Cole, & Presswood, 1994). As a result, as Britzman (1991) points out, "practice" in such settings often does not "make perfect"; rather it tends to reinforce traditional practice. As Goodlad (1994) says, more field experience is not necessarily a good thing; what matters is the setting in which the experience occurs.

The Traditional Nature of Many University Settings

A further challenge is found not in the schools but on the university campus, where preservice teacher education also frequently exhibits a technical-transmission approach. Traditionally, it has been assumed that theory is to be learned on the university campus and then applied during the practicum; accordingly, campus courses are theoretical in content and student teachers are largely passive learners (Darling-Hammond, Berry, Haselkorn, & Fideler, 1999; Furlong, Barton, Miles, Whiting, & Whitty, 2000; National Commission on Teaching & America's Future, 1996). Some researchers assume a stage theory of teacher learning and see student teachers as at an early, concrete stage of development. On this view, general theory of teaching and learning may be taught on campus but must largely be stored for future use; in the meantime, student teachers should be given basic strategies and skills to enable them to manage in the classroom (Barone, Berliner, Blanchard, Cassanova, & McGowan, 1996). The result is that material is largely transmitted to student teachers on campus, and

this negative modeling undermines achievement of a self-study approach in the practicum.

Absence of University Course Instructors from the Practicum Setting

A third challenge is that few preservice instructors spend much time in the practicum with their student teachers. The reasons for this vary from country to country. In the U.S.A., for example, status and reward structures work against a professional commitment to time in the field (Holmes Group, 1986, 1990; Samaras & Gismondi, 1998; Snyder, 1994; Whitford & Metcalf-Turner, 1999). In addition, it is often assumed that specially appointed practicum supervisors – graduate students, retired professors, retired teachers, and the like – can provide substantial assistance to student teachers. Typically, such field staff has insufficient status or knowledge of the campus program to provide adequate support (Beck & Kosnik, 2002a; Slick, 1998). In the U.K., the factors at work are rather different but the end result is similar. While practicum supervision by university instructors has traditionally been quite strong, recent cutbacks in teacher education staffing have necessitated reducing the field involvement of these instructors (Furlong *et al.*, 2000).

Pressure to Please Mentor Teachers

Another challenge to implementing a self-study approach in the practicum arises because student teachers are under considerable pressure to satisfy their mentor teachers, who may be practicing a technical-transmission approach. This is especially so where the mentor teachers do part or all of the practicum evaluation and hence strongly influence the future employment prospects of student teachers. But even where this is not the case, student teachers are dependent on the mentor teachers to help them survive in the classroom, and so are inclined to follow their lead (Borko & Mayfield, 1995; Britzman, 1991; Samaras & Gismondi, 1998; Slick, 1998).

Pressure of a Climate of Criticism and Control

A further challenge to a self-study approach in the practicum is the general climate in education today. There is a trend throughout North America and the U.K. to control teachers' and teacher educators' work, prescribe coursework, and script lessons (Cochran-Smith, 2001; Furlong *et al.*, 2000; Maynard, 1996). Teachers in schools are frequently criticized by both government bodies and the public, and they are increasingly required to follow detailed curricula that are developmentally inappropriate and do not support open, problem-oriented, personalized teaching. As a result, both mentor teachers and student teachers often feel they must adhere to a technical-transmission mode of teaching if they are to survive and be rewarded in the education system (Britzman, 1991;

Cochran-Smith, 2001; Thiessen, 2000). In this climate, university staff who advocate a constructivist approach are often viewed as out of touch with the realities of schooling.

Lack of Support for Preservice Education within the University

Finally, preservice programs attempting to implement a self-study approach are often challenged by lack of support from their school of education and the wider university (Kosnik & Beck, 2000b; Winitzky, Stoddart, & O'Keefe, 1992; Zeichner, 1990). With respect to the campus program, resources and structures are usually unavailable for cohort-based, community-oriented approaches; similarly, valuing of this kind of approach is not evident in tenure, promotion, and merit pay decisions. In the practicum, involvement of regular faculty is typically not provided for; time and resources for training mentor teachers are unavailable; the work of building school partnerships, training mentor teachers, and supporting student teachers in the field is not rewarded; and structures are not in place for building school partnerships. To some extent this is a financial matter: much of the revenue generated by teacher education programs is siphoned off and not enough remains for a quality program. But beyond this, the structure and general ethos of the school of education and the university are often incompatible with such an approach.

Conditions and Practices for Fostering a Self-Study Approach in and through the Practicum

We turn now to the main argument of the chapter. Here we consider measures that can help overcome the challenges noted above and establish a practicum that promotes a self-study approach to teaching and learning. Our interest is in fostering this approach both among student teachers and among preservice staff: university instructors, field supervisors (if they are a separate category), and mentor teachers. It is basic to a self-study approach that teacher education is not something preservice staff do *to* student teachers. Rather, staff and student teachers *learn together*, jointly refining their philosophies of teaching and learning and the self-study paradigm itself. Unless those who offer the program are themselves growing in a self-study approach, they are unlikely to be able to assist student teachers in such growth, and the example they set may in fact work to undermine student teachers' learning along self-study lines. We highlight four conditions or practices important for achieving a self-study approach in the practicum:

- Integration of the campus program and the practicum.
- Satisfactory practicum settings.
- Appropriate practicum activities.
- Student teacher support.

Integration of the Campus Program and the Practicum

Many researchers committed to a self-study approach have stated that the campus program and the practicum should be closely integrated, with various types of connection and constant interchange and collaboration (Bullough & Gitlin, 1995; Campbell-Evans & Maloney, 1997; Fosnot, 1996; Goodlad, 1990; Howey, 1996; Samaras & Gismondi, 1998). On the one hand, the integration of theory and practice is a basic principle of the self-study paradigm; on the other hand, linking the campus program and practicum is essential if each is to be effective. In a report on the Master of Education in Teaching (MET) program at the University of Hawaii, Freese (1999) provides an illustration of the kind of integration we believe is necessary.

> [Loughran's] three-part reflective framework … was a primary vehicle for assisting the preservice teachers in thinking about their teaching … During the first semester I introduced the framework at the weekly seminar with the preservice and mentor teachers. I started by modeling the reflective framework. Since it is hard to observe the act of reflection, I demonstrated the various parts of the reflective model by verbalizing my thinking while I was teaching … By making public my thinking about my teaching, the preservice and mentor teachers were able to gain access to my thoughts about what I anticipated would happen in my lesson (anticipatory reflection), what was going through my head as I was making "on the spot" decisions while teaching (contemporaneous reflection), and what my thoughts were after I taught the lesson (retrospective reflection).
>
> In addition to my modeling the framework, the mentor teachers modeled and practiced the framework with the preservice teachers. During the first semester when the preservice teachers visited the mentors' classrooms to observe their classes, the mentor teachers analyzed several of their lessons using the three-part framework. … After the lesson they addressed the preservice teachers' questions and shared specific situations or events that prompted contemporaneous reflection, such as any surprises or "on the spot" decisions. … Debriefing the lesson together allowed the preservice teachers to see that even highly skilled mentor teachers cannot anticipate everything that may arise during the course of the lesson, and that teachers are continuously making adjustments in their lesson in response to the students and the context.
>
> In the second semester when the preservice teachers began teaching lessons, they became actively engaged in analyzing their own teaching. In collaboration with the mentors and myself, the preservice teachers used the framework to explore their reflections in the context of actual teaching … The day before the lesson, the preservice teacher, mentor, and I met to plan and engage in anticipatory reflection … In addition to the informal planning sessions, debriefings took place after the lesson to explore contemporaneous and retrospective reflection … Debriefing using the reflective framework

helps the preservice teachers become more aware of the complexities of teaching, go beyond the technical aspects of teaching, and focus on student learning as well as teacher decision-making.

The result of the modeling and practicing of the framework was shared understanding and shared language about reflection. When we talked about anticipatory reflection, contemporaneous reflection, and retrospective reflection, we understood what these terms meant … These opportunities to talk about reflection and inquire into our teaching enabled us as a group to discuss our practice in a manner that was accessible and comprehensible to one another. (Freese, 1999, pp. 898–900)

Achieving such a high degree of integration of the campus program and the practicum is usually difficult for a number of reasons. There is often difference of viewpoint and lack of communication between campus instructors and mentor teachers, and even among the campus instructors. We now review in turn several conditions and practices needed to bring about integration.

An Overarching Philosophy of Teaching and Learning

In order to achieve integration of the campus program and the practicum, it is essential to have a philosophy of teaching and learning that pervades the whole program, both on the university campus and in the field (Darling-Hammond, 1994; Goodlad, 1990, 1994; Zeichner, 1990). The broad shape of the philosophy we have in mind here, of course, is the self-study paradigm outlined earlier, although there will be many local features. The philosophy of a program should not just be known to the faculty; it should also be made explicit in a vision statement, elaborated in program handbooks, and shared among university faculty, mentor teachers, and student teachers (Beck & Kosnik, 2002a; Freese, McEwan, Bayer, Awaya, & Marble, 1998). All parties should collaborate in ongoing discussion and review of the philosophy. As Goodlad says:

A reasonable expectation for teacher education programs is that they be oriented toward a conception of what education and teaching ideally are and what schools are for. A further reasonable expectation is that this conception be shared and continually examined by the faculty group responsible for each program – not just the tenure-track professors but everyone, including cooperating teachers. These expectations would be evidenced in the presence of cohesive programs geared to this philosophical conception and ongoing processes of planning and evaluation. (Goodlad, 1990, pp. 29–30)

The small (20 students) graduate teacher education program at the University of California-Berkeley is "centered within a coherent conceptual orientation to teaching and learning." In essence, the program's goal is to develop "teachers who bring to their classes an ability to mesh the developmental needs of children with the cognitive demands of the curriculum" (Snyder, 2000, p. 98). This goal

is pursued in both the campus courses and the practicum. Similarly, the Mid-Town elementary cohort program at OISE/University of Toronto has an explicit philosophy that is presented in its handbooks for student teachers, mentor teachers, and university faculty:

> Its emphases include an inquiry approach to teaching and learning; teachers as researchers; a close student-teacher relationship; an interactive, dialogical pedagogy; integration of academic learning with life learning; collaboration in teaching and learning; and a strong class community. (Beck & Kosnik, 2002a, p. 8)

Alverno College in Milwaukee, Wisconsin also has an overarching philosophy of teaching and teacher education:

> The education department faculty and staff share a common vision of teacher education that is made explicit through an ability-based curriculum. This curriculum provides a common language for faculty to talk with each other, with students, and with their school-based collaborators about teaching and teacher education. Cooperating teachers are introduced to this language and vision during a course on supervising teacher education students … Several faculty [commented] that to successfully work in the education department at Alverno College you must want to work as part of a team and participate in the ongoing refinement of the program's vision. Some of those who do not believe in this vision or who want to work on their own without extensive participation in the culture of collaboration end up leaving. (Zeichner, 2000, pp. 12–13)

From a self-study point of view it is crucial that student teachers be involved in dialogue about the philosophy of the program so they understand it and contribute their distinctive insights in its ongoing development. They should be "co-researchers" in the program. Russell and Bullock (1999) provide an example of a preservice instructor and student teacher working together to refine their views of teaching and learning. Russell, the teacher educator, and Bullock, one of his student teachers, dialogue via e-mail. Each participant in the collaborative research is helping the other identify and interpret his professional knowledge as a teacher by reading and commenting on e-mail accounts of teaching-learning experiences.

> Sharing our personal experiences of teaching drives the process of naming our professional knowledge as teachers. By grounding our analysis in experiences of teaching and critical dialogue about teaching, we demonstrate how we come to understand our knowledge and our ongoing efforts to extend, refine, and consolidate that knowledge. (Russell & Bullock, 1999, p. 132)

Modeling the Self-Study Approach in the Campus Program

Having a common philosophy by itself is not sufficient; integration of the program as a whole requires modeling this philosophy in the campus program

(Barr, Watts-Taffe, & Yokoto, 2000; Clandinin & Connelly, 1995; Franklin, 1992; Short & Burke, 1989). Russell (1997, p. 32) states simply that "how I teach *is* the message." Modeling is important to make clear what a program's vision statement means in practice. Student teachers see right in front of them the implications of the abstract terms; they see what the approach is and how to achieve it. Most importantly, they see that it *can* be achieved; it is not just bandwagon idealism. Modeling also shows that staff members are serious about the philosophy. Student teachers are quick to detect what the real agenda of a program is and behave accordingly. If campus instructors "walk their talk," student teachers feel more secure in adopting a similar approach both on the campus and as they go to their practicum placements. When the campus instructors arrive in the placements as supervisors, the student teachers already know what they believe in and what they will expect and support.

Samaras discusses how she incorporates life history into her campus work with student teachers, asking them to share and reflect on significant events in their educational experience. She adds: "Because of the openness I ask of my students, I begin with my own snapshots of schooling and perspective on learning" (Samaras, 2002, p. 47). Freese conducts action research on her own program at the University of Hawaii in collaboration with her students, thus modeling both collaboration and reflection on her teaching practice (Freese & Kato, 1997). Johnson describes how she modeled a non-transmission approach to teaching in her campus classes:

> As a way to advocate alternative instructional choices, I modeled lessons some of which are purely discovery, inquiry-based, and that work very well in cooperative learning environments. During class sessions, I purposefully modeled lessons for my students that would engage them in hands-on activities and force them to learn by discovery. (Holt-Reynolds & Johnson, 2002, p. 15)

Similarly, Loughran, Berry, and Tudball (2002, p. 67) use intensive microteaching episodes in a Developing Pedagogy course "to model particular aspects of teaching for the student teachers," in particular to model a sensitive kind of "professional critiquing." Students take turns teaching and observing and commenting on each other's teaching. They then engage in a short practicum during which they teach lessons and seek feedback on the impact of their teaching. "This experience is designed to build on the process from their classes at the university, so that post-class debriefing focuses on their teaching actions, not on them as individuals to be criticized or judged" (Loughran, Berry, & Tudball, 2002, p. 67).

Practicum Components Interspersed throughout the Program

A further way of integrating the campus program and the practicum is to have the field experiences at various points during the program, rather than just toward the end. Many writers have criticized the paradigm of "theory first,

practice later" that often characterizes preservice programs (Darling-Hammond, 1996; Darling-Hammond, Berry, Haselkorn, & Fideler, 1999; Goodlad, 1994; National Commission on Teaching & America's Future, 1996). There need to be constant opportunities throughout the program to apply theory and to reflect in and on practice. Goodlad speaks of how "conventional programs ... tend to comprise a series of discrete courses ... followed by a rather abrupt transition into student teaching." He favors instead a situation of "courses and field experiences blending into one and flowing into dominantly school-based activity accompanied by reflection" (Goodlad, 1994, p. 187). Tom (1997, p. 143) is critical of programs where most teaching responsibility is "withheld until the end of the program," professional knowledge being "introduced prior to – and often separated from – teaching practice." This leaves student teachers in the difficult position of having to "apply" the knowledge acquired on campus largely on their own. He favors an arrangement where "the methods courses are offered concurrently with student teaching so that relating ideas from these courses to teaching practice [does] not require the student to stockpile methods content for a later semester" (Tom, 1997, p. 143).

At OISE/University of Toronto, two practicum blocks occur at different points in the year, with campus classes before and after, thus providing opportunities for both preparation and debriefing (Beck & Kosnik, 2002a). There is a similar arrangement in the four-year program at the University of Delaware:

> One of the most unusual features of this program is the use of variable credits for most courses in years 3 and 4. Students take classes in 1 or 2 credit increments instead of the traditional 3-credit course. This permits a portion of a course to be offered in a given semester; then provides teacher candidates and cooperating faculty opportunity and time to reflect on the teaching and clinical experience. This is followed by the offering of another portion of the course in a succeeding semester, a repetition of the reflection process, and a continuation of this recursive, reflective process until the course is completed. (University of Delaware, 2002, p. 6)

> This [variable credit strategy] permit[s] the faculty to significantly embrace the reflective practitioner component of the School of Education's conceptual framework ... This established cycle of learn, experience, and reflect, repeated at least twice for each course, permit[s] students to grow professionally and improve their confidence in the classroom. (p. 10).

While practicum experiences should not be left until the end of the program, we also question whether a program should begin with a full-scale practicum. At that stage, the program community has not been established and student teachers have not had an opportunity to get to know their supervisors and feel secure in that relationship. Another difficulty is that mentor teachers may be too preoccupied at the beginning of the year to help student teachers understand what is actually happening in the classroom. Tom notes that a "disruptive" teaching experience at the beginning of a preservice program may not by itself

serve to "jolt" a student teacher out of a conventional view of teaching, because "the unaided beginner tends to be captured by the immediate demands of teaching. A 'sink or swim' teaching experience will lead some novices to sink; many will survive but cannot be expected necessarily to be cognitively enriched by the experience" (Tom, 1997, p. 139). It may be best, then, to have the first practicum several weeks into the program or to begin with *part-time* practicum experiences, as at the University of California-Berkeley where there are "field experiences throughout the DTE Program," with "increasingly complex teaching responsibilities over the course of the five placements" (Snyder, 2000, pp. 108–109). It is important to note that there is far more opinion than research on this topic. Opinions differ dramatically on the timing and significance of the initial practicum experience, and this is an area that calls for experimentation and research.

Projects and Assignments that Cut Across the Campus Program and the Practicum

Integrating the campus program and the practicum calls for activities for student teachers that span the two domains. The most common type of project fulfilling this role involves action research, which is conducted during the practicum but is prepared for and followed-up on campus (Clandinin, Davies, Hogan, & Kennard, 1993; Kosnik & Beck, 2000a; Ross, 1987; Zeichner, 1996). According to Ross (1987, p. 147), "the goal of an action research course is not to make researchers of preservice teachers, but rather to help them view teaching as integrally related to research and as a process that involves inquiry and experimentation." In the Mid-Town program at OISE/UT, action research is the central academic requirement:

> Having a major action research component in a teacher education program is an effective way of linking theory and practice … As the faculty supervisors visit the student teachers the action research is a constant topic of discussion, thus connecting the campus program with the practicum. As the students come back to the campus, there is further discussion of the action research in that setting, thus bringing the practicum experiences forcibly into the campus program. (Kosnik & Beck, 2000a, p. 118)

Other projects linking the campus program and the practicum include reflection papers that use examples from the practicum, field-based journals, and in-class group assignments based on the practicum. In the MET program at the University of Hawaii, an assignment called "Portrait of the School" is designed to help preservice teachers be more than passive observers by adopting an active, constructivist approach to the partnership school. Students use qualitative research strategies to discover and uncover the complexities of schools and schooling. The assignment helps them and their mentor teachers look beyond their classrooms to the school as a whole (Marble, 1997). Samaras (2002) describes a project on the dilemmas student teachers face in implementing theory and skills learned in their university courses.

[This project] structures the development of preservice teachers' personal decision making and action in dynamic teaching situations ... Through inquiry into dilemmas found in practice, preservice teachers discuss actions and strategies that are based on professional knowledge, careful observation, and reflection. They are asked to consider the consequences, both positive and negative, of their actions. They write about their dilemmas, multiple perspectives, and alternative action plans and are encouraged by faculty to consciously examine the consequences ... During the practicum and student teacher seminars, students make meaning of their individual observations through much dialogue with their peers and professors. (p. 23)

At Bank Street College of Education in New York, the Observation and Recording Course (O and R) is "constantly identified by students, graduates, and faculty as a ... critical means for prospective teachers to learn how to look closely at children, to see them as growing individuals, and to find ways to foster their learning" (Darling-Hammond & Macdonald, 2000, p. 42). Central to this course is an assignment that cuts across the campus program and the practicum.

The main assignment for the [O and R] course is an Individual Child Study for the purpose of "developing an increased awareness of the child's uniqueness, the relation of specific behavior to overall functioning, and the implications for learning." This document is developed over several months from a number of different assignments, including short weekly written observations of the child at school; a paper that examines the child in the context of his peers or group; an age-level study designed to see the child in light of developmental theory; and observations and interpretations of the child as a learner and member of a learning community. (p. 43)

A graduate of the program in her first year of teaching commented: "'O and R' was very important because it showed me how to look at the children in my class and make nonjudgmental assessments of what's going on with them" (p. 45). It is clear that the assignment bridges theory and practice, exploring fundamental themes of the campus program and having a major impact on the student teachers' learning and effectiveness in the practicum.

A Cohort and Faculty-Team Structure

Another way of facilitating integration of campus and practicum experiences is by establishing a cohort program led by a faculty-team (Beck & Kosnik, 2001; Bullough & Gitlin, 1995; Freese *et al.*, 1998; Howey, 1996; Peterson, Benson, Driscoll, Narode, Sherman, & Tama, 1995; Thanos, 1990; Winitzky, Stoddart, & O'Keefe, 1992). Under this arrangement, the program and team are small enough to allow development of a common philosophy and ensure that it is implemented both on the campus and in the practicum. On the campus, joint planning and team-teaching of courses result in a coherent program. In the practicum, as mentor teachers are selected and trained and problems are dealt

with by the team, the program philosophy gives general direction and informs particular decisions. A program of this kind occurs at Washington University in St. Louis:

> The professional semesters were team taught, with a small faculty group responsible for both methods instruction and supervision of 15 to 30 students. After beginning the semester with intensive methods instruction, the faculty team used Fridays (elementary program) and periodic afternoon sessions (secondary program) to continue this instruction. Holding the dual roles of methods instructors and university supervisors, in the same semester, greatly facilitated the use of situational teaching. Moreover, members of the faculty team also taught the educational psychology and philosophy of education courses taken by students in earlier semesters. With common instructors, links between the ideas in these courses and teaching practice were easier to make than when foundational courses are offered by faculty unconnected to the professional semesters. (Tom, 1997, p. 143)

At the University of Utah a cohort approach was adopted over two decades ago because of "a perception of the disconnectedness of individual courses and the feeling that there was really no 'program' in any sense of the word" (Arends & Winitzky, 1996, p. 546). The cohort organization makes it possible for faculty to explore the same concepts in both the classroom and the field and to keep revisiting those concepts throughout the year (Bullough & Gitlin, 1995, pp. 5–6). Similarly, in the fifth-year cohort program at Portland State University, student teachers "take classes together, are grouped in field placements, experience retreats and team building activities, share a faculty team, and engage in reflection about their work." As a result, student teachers have access to the same faculty throughout the year in different settings, there is integration of course theory and classroom practice, and there is closer collaboration between the program and the partner schools (Peterson *et al.*, 1995, pp. 30–33).

Apart from program integration, the cohort arrangement also affords a basis for community development on campus; the community is then extended into the practicum and provides support for the student teachers from fellow students and the program staff. This support gives the student teachers courage to implement the program philosophy in the practicum. It also gives them "critical friends" who are familiar with the program philosophy. For example, at the University of Utah the cohort structure means that "candidates take the same classes together, pursue field experiences together in the two or three PDS sites assigned to each cohort, and lend each other professional and moral support" (Winitzky, Stoddart, & O'Keefe, 1992, pp. 11–12). Peterman and Marquez-Zenkov describe how a cohort structure can help overcome "the chasm that sometimes exists between the theoretical and practical stances of our urban teacher preparation program and those of some of the interns and their mentor teachers." The strong "community of learners" made possible by the cohort organization, among other factors, gives interns "the resiliency, resistance, and

persistence required to be successful in the classroom" (Peterman & Marquez-Zenkov, 2002, pp. 87–88).

Close School-University Partnerships

If the campus program and the practicum are to be integrated, it is important to have strong relationships between the university and a small number of partner schools. One type of partnership is the professional development school, or PDS (Abdal-Haqq, 1998; Darling-Hammond, 1994; Fullan, Galluzzo, Morris, & Watson, 1998; Goodlad, 1994; Kochan & Kunkel, 1998; Teitel, 1997; Whitford & Metcalf-Turner, 1999). A school and university agree to work together in a combined program of inservice and preservice teacher development and school-based research. The teacher education program is "jointly planned and taught by university-based and school-based faculty. Cohorts of beginning teachers get a richer, more coherent learning experience when they are organized in teams to study and practice with these faculty" (Darling-Hammond, 1999, p. 232). As university faculty become involved with PDSs, there is significant improvement in their approach both to practicum supervision and campus teaching (Teitel, 1997).

Despite the positive features, PDS arrangements present a number of challenges. Clift, Allard, Quinlan, and Chubbock (2000) state: "While partnerships may be desirable, they demand attention to nuances and details ... Partnerships are mortal, not immortal; because they expire at any time, they require thoughtful, strategic consideration on the part of all the partners" (p. 40). Goodlad (1994), while advocating the use of professional development schools in teacher education, speaks of the problem of the extra resources required and the fact that these schools typically provide only a small proportion of the practicum placements needed. He advocates a modification of the PDS model whereby a preservice program has a less formal and less resource-rich relationship with a larger number of partner schools, which nevertheless engage in school renewal in a manner similar to that in a full-blown PDS. This is the type of arrangement employed in the elementary cohort programs at OISE/University of Toronto. Because of the lack of resources, a number of informal methods had to be used to build the partnerships and involve and prepare the mentor teachers (Beck & Kosnik, 2000).

Involvement of University Instructional Staff in the Practicum

Finally, a key means of integrating the campus program and the practicum is to involve all campus faculty, including subject and foundations instructors, tenure-stream and contract staff, in practicum supervision. In this way, ideas and community experience are brought from the campus into the practicum, and the practicum in turn influences the campus program. While a degree of integration can be achieved through meetings between university instructional staff, practicum supervisors, and mentor teachers (Casey & Howson, 1993; Cole & Knowles, 1993; Freese *et al.*, 1998), supervisory staff who are not involved in

teaching the campus program often have difficulty representing the program philosophy in the field. In our view, it is extremely important that the program instructors themselves make frequent visits to the practicum sites (Bullough & Gitlin, 1995; Bullough & Kauchak, 1997; Ducharme & Ducharme, 1999; Murray, 1999). There needs to be extensive dialogue between university staff and mentor teachers, in the practicum settings (Borko & Mayfield, 1995; Bullough & Kauchak, 1997; Cochran-Smith & Lytle, 1993; Freese *et al*., 1998). In this way faculty can model an interest in practice, keep in touch with the field and learn from it. Practicum experience also places faculty in a position to discuss the practicum in their campus classes. Finally, with all faculty sharing in the important and often stressful field experiences of student teachers and providing them with support in that context, community in the program is strengthened.

At Bank Street College of Education, faculty are involved in every dimension of the program, including the practicum:

> Program directors and advisors balance administrative roles with teaching, advising, and recruitment, interviewing, selection, and ongoing mentoring of students. There is an institutional belief that participation in these different roles informs courses, advisement, and program decisions. Faculty who engage in field advisement learn the realities of schools and contribute directly to their improvement by taking their needs into consideration when teaching courses and advising students how to teach the children they both meet in the field placements. The involvement of directors in teaching, advisement, and supervision keeps them cognizant of the field and of the kinds of placements where students experience exemplary teaching. Through direct engagement with the work of teaching and the work of schools, they learn what programs need to prepare teachers for. (Darling-Hammond & Macdonald, 2000, pp. 18–19)

In the small, five-year teacher education program (50 graduates per year) at Trinity University in Texas, there are four "clinical faculty members" who play a key role in bridging between the university and the practicum schools:

> All [the clinical faculty] hold doctorates and tenure-track positions in the department of education … They spend half of their time (on average, one half of the work day for four days a week) in the university's professional development partner schools. The other half of their time is occupied by the typical pursuits of university faculty – teaching, research, and writing.
>
> Because these university faculty spend such concentrated hours in the schools, they come to know these institutions well and to be accepted as part of them … "Working in reforming schools," says Trinity's Bruce Frazee, "brings added professional perspectives to faculty. It's the kind of professional engagement that keeps faculty rejuvenated and in touch with the real world of school." (Koppich, 2000, pp. 20–21)

Satisfactory Practicum Settings

From a self-study perspective, attempts at integrating the campus program and the practicum will not get very far if the approach to teaching and learning evident in the schools is of a technical-transmission variety. According to Goodlad (1994), we cannot have good new teachers without good schools as practicum settings. This is perhaps overstated, since individual new teachers will often rise above the norms of their school, but Goodlad's concern is an important one. Practicum settings are needed in which there is a self-study approach: personal-constructivist-collaborative. Unless student teachers see practiced in schools the approach that is being discussed on campus, they will tend to think their campus instructors are overly idealistic and out of touch with reality. Also, they will not have a chance to see in detail what the approach means or an opportunity to try it out for themselves during their preservice program. There are two main aspects to having appropriate practicum settings: good mentor teachers and classrooms, and appropriate schools.

Selection and Preparation of Mentor Teachers

It is sometimes thought presumptuous for preservice programs to take strong initiative in choosing mentor teachers, but in our view it is essential. According to Schön (1987), "cooperating teachers are often casually selected because of availability, and too often lack essential knowledge and skills needed to strengthen the learning of prospective teachers" (p. 27). At the University of Delaware, "faculty choose the teachers working with the students" (University of Delaware, 2002, p. 8). While being decisive on this matter may sometimes give rise to tensions with the partner school, especially with the principal, we have to keep the well-being of our student teachers firmly in mind. The program must take charge not only of selection but also of de-selection of mentor teachers who, however unfortunately, do not prove suited to the role. One reason for frequent school visits by program staff is so we get to know the teachers well in our partner schools and hence can make sound decisions about their involvement in the program.

Just as important as careful selection is the inservice development of mentor teachers (Cole & Sorrill, 1992; Freese, 1999; Knowles, Cole, & Presswood, 1994; Zeichner, 1996). Over time, teachers who are not initially very effective in their role can gain the insights, attitudes, and skills required. According to Borko and Mayfield (1995), preservice staff need to work with mentor teachers to help them explore their assumptions and beliefs about their role and develop skills of providing feedback, active listening, and communication generally. Once again, a close school-university partnership with frequent visits by university staff is important for this to work. The University of Delaware report describes how inservice programs for mentor teachers take place in their PDS-based program:

> Cooperating teachers receive an orientation at the beginning of each place-
> ment. Here they receive a handbook outlining in great detail the program,

assignments students must complete during the placement, an explanation of their responsibilities, and assessment forms. In addition, throughout the semester, teachers receive electronic newsletters through e-mail that include a review of what the preservice students have been learning in the classes, remind them of upcoming lessons and activities teacher candidates will be doing in the classroom, answer frequently asked questions, and thank them for their work. Finally, teachers are asked to complete a written survey and invited to attend a meeting to reflect on the semester and make suggestions for changing the program. (University of Delaware, 2002, p. 8)

Zeek, Foote, and Walker (2001, p. 377) describe how they had mentor teachers create narratives around pivotal incidents in their mentoring work with student teachers, thus helping them become "reflective practitioners interactively examining their beliefs and practices." The mentor teachers are involved in workshops, sharing, analyzing, and writing about their experiences. At Trinity University, close bonds develop between mentors and university faculty, with various activities used to develop the teachers in their mentoring abilities:

They meet formally once a month at Trinity to reflect together on the month just ended, discuss mutual issues of concern regarding the Trinity students, and share successes ... Annually, Trinity faculty, together with the mentors at the PDS with which each of them principally works, organize "retreats," more concentrated and uninterrupted periods of self-study, program analysis, and review of the reform efforts underway in the schools. (Koppich, 2000, pp. 18–19)

In the Mid-Town Program at OISE/UT, lack of resources for professional development for mentor teachers has driven the faculty team to more informal methods.

Professional development, including the "training" of associate teachers, takes place through constant interaction between university faculty, school-based teachers, and student teachers within a comprehensive program of teacher development and school renewal ... It occurs specifically through lunch-time inservices in partner schools; conversations between associate teachers and university supervisors about student cases; modeling by university faculty of relationships with student teachers; ideas brought to the classroom by student teachers; interactions between associate teachers clustered together in a partner school; research conducted in the partner schools and on the teacher education program; program-wide inservices and liaison meetings; guidelines, statements of philosophy, and letters sent to associate teachers; involvement of associate teachers in the admissions process and in the campus program; attendance by associates at the year-end Action Research Conference; and encouragement of associate teachers to attend professional conferences and do graduate work. Through this informal

process our associate teachers have grown significantly over the years both as teachers and preservice supervisors. (Beck & Kosnik, 2000, p. 220)

Selection and Development of Partner Schools

Beyond finding and developing good individual mentor teachers, appropriate whole-school environments are needed for the preservice practicum (Darling-Hammond, 1994; Goodlad, 1994; National Commission on Teaching & America's Future, 1996; Teitel, 1997; Whitford & Metcalf-Turner, 1999). It is difficult for individual mentor teachers to have a self-study approach if the school as a whole does not. This is the incentive behind the movement to create professional development schools. Goodlad (1994) maintains that we must develop teachers and schools together in an iterative process. Darling-Hammond and Macdonald (2000) note the general problem of finding adequate practicum schools:

> Perhaps the most difficult issue for schools of education that seek to prepare teachers for a complex form of practice ... is the relative scarcity of schools in which such practice is represented. The age-old dilemma of whether to prepare teachers for schools as they are or for schools as they might become is particularly acute for those who work at the most sophisticated end of the pedagogical continuum. Can teachers who are prepared to treat children with care and treat curriculum as an opportunity for genuine exploration transform schools that are organized for impersonal, superficial teaching? Can they even survive in such schools? (p. 85)

Darling-Hammond and Macdonald (2000) point to Bank Street College of Education as an institution that has given high priority to the selection of practicum schools.

> Bank Street advisors and program directors know a lot about schools ... and they work closely together discussing students' needs and identifying the best school or teachers for particular students ... In contrast with some teacher education programs for which cooperating teachers volunteer or are selected by their principal ... Bank Street selects cooperating schools and teachers with great care. Advisors visit schools and make observations of potential cooperating teachers in their classrooms, as well as observing student teachers. They revise, update, and maintain a roster of current "good" spots for learning to teach particular age children ... The range of choices for field placements for preservice students in the early childhood and elementary preservice programs is very broad, including dozens of well-known progressive public and private schools ... For teachers of young adolescents, the choices are more limited ... Bank Street looks for middle schools that feature interdisciplinary curriculum aimed at critical thinking and performance in settings where students are homogeneously grouped. (Darling-Hammond & Macdonald, 2000, pp. 68–69)

We see here the concern to find schools that are in accord with the philosophy of the program, as well as some of the methods employed in the school selection process.

Appropriate Practicum Activities

Not only should the classroom and school settings exhibit a self-study approach, but also the activities in which the student teachers engage during the practicum should allow them to explore and pursue such an approach. This requires openness and flexibility on the part of both university supervisors and mentor teachers, and a good sense of the type of experimental, inquiry-oriented "curriculum" needed for a self-study practicum. It is possible for university and school staff involved in the program to have quite progressive practice themselves and yet be overly prescriptive in their requirements for the student teachers. This may arise out of a sincere concern to provide a "thorough" preparation, but it can hinder the development of student teachers in a self-study direction.

Openness and Flexibility of Mentor Teachers

Many university researchers maintain that student teachers must be encouraged to strike out in new directions (Maynard, 1996; Zeichner, 1990). As reported by Britzman (1991), however, mentor teachers are often too controlling with respect to the activities of student teachers. As a result, student teachers may be unable to take ownership of their teaching and adopt a critical and experimental approach. Similarly, Lanier and Little (1986) observe that student teachers tend to conform to the expectations and teaching practices of their cooperating teachers rather than attempting innovative lessons or activities. In many cases, the student teaching experiences emphasize imitation of the cooperating teacher as opposed to inquiry, reflection, and problem solving. According to Feiman-Nemser (2001), good mentoring lies not in easing entry into teaching but in helping student teachers confront difficult problems of practice and use their teaching as a site for learning. This requires that student teachers take *responsibility* for their learning. Feiman-Nemser sees two opposing dangers in working with student teachers: imposing one's own style, and being too laissez-faire. It is important to find a balance between these extremes.

In the view of Paris and Gespass (2001, p. 398), in student teaching supervision "we have been hounded by theories that assume teacher-centered instruction, focus on the evaluation of teachers' observable behaviors …, and grant authority to the supervisor/teacher over the experiences of the student teacher/learner." The authors describe how they established a structure for moving the student teachers/learners into the center of the supervision process. The result was a process that involved the student teachers in setting out clear expectations, shared tasks, and personal goals for each visit. They co-planned their visits and co-constructed the reports. "By focusing on the student teachers' questions, concerns, and experiences we could provide the students with opportunities to construct meaning out of those experiences in the writing and talking we did

together" (p. 410). They propose that student teachers take responsibility for their professional growth by "naming their purposes and finding the questions, sharing responsibility for shaping the process, and taking account of learning" (p. 411). They further recommend that we be aware that "when we impose too much of ourselves, we rob our student teachers of valuable opportunities for professional learning" (p. 411).

In a Mid-Town Program self-study of the practicum at OISE/UT, student teachers were asked about the degree of flexibility they had in their practicum. Tina (a pseudonym) felt excessively controlled in both content and method throughout most of her second practicum. "There was really no flexibility. She told me which science unit to do, which social studies unit to do; and with grammar and spelling it was straight from the textbook." Rita's associate also exercised a great deal of control:

> In one of the math lessons I wanted to do something on area, and I wanted the kids to trace their shoe on graph paper and then figure out the area using yarn, counting the squares, and so on. I was starting to teach the class and she said to me, "So you're going to do it exactly by the textbook?" and I said, "No I'm going to do it a little differently; why, what do you think?" She said, "Well maybe you should do what the textbook says"; but when I pressed her on it she said, "You do what you want to do." So I did it the way I wanted to, and the next day she did the lesson over again. (Beck & Kosnik, 2002b, p. 91)

In other cases the topics were largely prescribed but the methodology was fairly open. Sandra reported: "It was pre-decided which chapters I would deal with, but it was up to me how I wanted to teach and what I wanted to focus on … I did a lot of activities with them, a lot of hands-on stuff; in some ways my associate was far more structured than I was" (p. 91).

Others found their associates fairly open with respect to both content and approach, so long as what they did was broadly in keeping with curriculum requirements. For example, David, who was teaching in a Grade 8 class, commented: "I wouldn't say I had complete flexibility, because there are the guidelines put out by the Ministry [of Education] that we have to meet; but I had a wide range to play with. There was just one time when I was going to show a Rap video, and I told her ahead of time, 'There's no profanity, there's no rude language, there's no nudity.' She seemed a bit apprehensive, but once I assured her and gave her the scenario she said, 'Okay, fine.' In fact, she never said no to me" (p. 91). Similarly, Brian said:

> My associate had a good balance. Some associate teachers, from what I've heard, are very demanding … Whereas she was in the middle, not one extreme or the other. I thought it was the best thing. She gave support and a bit of structure and then gave me the freedom I needed to do things like action research and the geography unit I was working on for my specialist teaching subject. (p. 91)

An Experimental, Research Approach to Teaching in the Practicum

Borko and Mayfield (1995) maintain that student teachers need to examine and revise their belief systems. This has to be the central focus of teaching activities in the practicum, as of all good teaching according to the self-study approach. Ross (1987, p. 131) argues that, because campus courses are so distinctly different from practice teaching experiences, working in schools with experienced teachers may foster passivity rather than active inquiry:

> While their attitudes may become more progressive as they take coursework in education …, their experiences in public schools during their internships encourage them to focus on learning "what works" with little consideration of broader educational objectives and principles … By the time most students complete their final field experiences they have become "passive technicians who merely learn to execute pre-packaged instructional programs" (Goodman, 1986, p. 112).

In contrast, having action research as a major component of a teacher education program can help student teachers adopt an inquiry approach to teaching. Carrying out action research is certainly a more effective way of fostering inquiry than merely talking about it. Through first-hand experience new teachers learn the methodology of action research and see its challenges and advantages. Zeichner (1996) offers several examples of the integration of action research into a preservice program. At the University of Delaware there is a large component of explicit reflection by faculty and student teachers during the practicum:

> A major role of the faculty is to promote reflection by the students. Students are asked to reflect in writing on their daily teaching in the form of lesson plan reflections, journals, and in-class discussions. Students are made to feel safe in sharing both their successes and failures in the classroom, each seen as a valuable learning tool for themselves and others. In addition, faculty provide daily opportunities for students to meet with them to discuss their teaching and learning. Students are encouraged to talk with an instructor after each teaching experience and analyze the experience and revise plans when appropriate. After classroom observations, students meet with faculty members to debrief and set goals for future teaching. Indicators of candidate reflection include surveys and could include interviews, journals, group discussions, and other evidence of changes in reflection, thinking, dispositions, and teaching practices. (University of Delaware, 2002, p. 5)

Student Teacher Support

Even in a good school and classroom environment, with appropriate practice teaching activities, student teachers are unlikely to develop a self-study approach unless they are supported by their mentor teacher, university supervisor, and fellow students. Their long "apprenticeship of experience" (Lortie, 1975), present-day pressures on the school system, and the rigors of the first years of teaching

tend to steer them in a technical-transmission direction. Like all students, they must feel secure in order to learn. We discuss four different sources of support for those learning to teach.

Support from Fellow Students

Many self-study advocates propose clustering a number of student teachers in the same school for mutual support and collaborative learning (Goodlad, 1994; Howey, 1996; Samaras & Gismondi, 1998; Tom, 1997). Such an arrangement also facilitates school visits by faculty and the development of school-university partnerships and school renewal efforts. As with all cohort arrangements, the structure alone does not necessarily ensure development of community and mutual support. A key role of program staff during school visits is to bring the student teachers together and encourage dialogue.

At the University of California-Berkeley, student teachers experience support from their peers in a small cohort. "In the intense two years they share, students, in the words of one graduate 'have to stay together or die.' Several graduates likened their cohort bond to a family" (Snyder, 2000, p. 138). This is especially so in the fifth placement, when "the program clusters student placements in a small number of urban schools" (p. 117). At the University of Southern Maine, even more emphasis is placed on peer support:

> The interns are encouraged to begin to build their own community of learners that, during the year, will provide both support and critique aimed at continuous progress as they commence their formal development as teachers. Interns work together as a total team as well as in various small groups on various projects designed to facilitate their learning about key program expectations such as collaboration, ongoing assessment, and reflection. Developing a spirit of camaraderie – and using this team spirit to get them through "hard times" – is deemed essential by the coordinators. (Whitford, Ruscoe, & Fickel, 2000, p. 198)

Support from University Staff

It is essential not only that supervisory staff visit partner schools often, but also that they conduct their supervision in a supportive manner. Where university supervisors are excessively judgmental and prescriptive, "jump[ing] in with critical advice or helpful suggestions that fail to acknowledge the careful deliberation" that student teachers are capable of, the growth of the student teachers as reflective educators will be hindered (Burn, Hagger, Mutton, & Everton, 2000, p. 277). Edwards and Collison (1996, p. 30) suggest that teacher educators should view teaching as, "a community of practice in which all participants are learning and at the same time shaping the understandings that operate within the community." Much of the focus should be on *self*-analysis and *self*-evaluation rather than on external assessment (Zeichner, 1990, p. 115). According to Feiman-Nemser (2001, pp. 23–24), our concern in supervision should be to be a co-thinker with our student teachers, open up lines of thinking, and set the stage

for life-long professional learning. Paris and Gespass (2001) describe how they engaged in an activity of "supervising each other" in order to try to develop a more supportive approach to supervising their student teachers.

At Trinity University, faculty members play a supportive role but also seek to "push" student teachers in a reflective direction:

> Students describe the internship year as a "hybrid between support group and think tank." Intern meetings focus on knotty topics such as, Whose is the responsibility for learning? Does it rest solely with the teacher? Are students responsible for their own learning? What professional roles ought teachers to assume? … In their schools, interns are simultaneously protected and pushed. Given the freedom to experiment and the permission to make mistakes, they are also held accountable for their professional actions.
>
> In the intern year, a tense and intense period for all students, reducing stress and sharing stories become even more important. Laura Van Zandt's advisees have "taking care of themselves" evenings in which they socialize, exercise, and generally take care of their own physical and mental health as a way of reducing stress. Students, in the company of their advisors, are also provided the opportunity to meet first- and second-year teachers to share experiences, and they participate in annual retreats in order to share information about jobs and interviewing techniques. (Koppich, 2000, pp. 35–36)

Support from Mentor Teachers

Student teachers often view their relationship with mentor teachers as the most important in their preservice experience. Accordingly, it is essential that they see support coming from this individual. Some university researchers mention the need for support from mentor teachers (Williams, 1994), but it is not always clear what kind of support they mean. Others suggest that associate teachers are *too* supportive, not "challenging" the student teachers enough (Maynard, 1996). Associate teachers typically emphasize the need to be friendly and provide emotional support of a kind they sometimes did not receive in their own practicum experiences as student teachers (Calderhead & Shorrock, 1997; Maynard, 1996). In practice, however, even associate teachers are often more distant with their student teachers than they realize, not in fact setting them at ease (Beck & Kosnik, 2000).

Self-study research in the Mid-Town program at OISE/UT indicated that student teachers view support of an emotional kind from their associate teachers as crucial for the success of their practicum. In in-depth interviews, 9 of the 11 student teachers interviewed emphasized the importance of this aspect, even though it was not mentioned by the interviewer (Beck & Kosnik, 2002b, p. 86). For example, Liz found the lack of warmth from her mentor teacher in her first practicum placement very disconcerting:

> My mom was very sick and my associate was not even a little accommodating about that. I just killed myself over that practice teaching block, and

the reports I got were so tepid; they were not even a little indicative of the person I was … I just wanted some acknowledgement of what I was doing, the amount of work I was doing, anything like that. I felt my work was not being acknowledged at all. (p. 86)

In her second practicum, however, Liz's mentor "made me feel very comfortable …; she gave me the freedom to experiment that I didn't have during the first practicum" (p. 86).

Apart from emotional support, the student teachers in the Mid-Town study indicated that they wanted a peer relationship with their mentor teachers and a sense of collaboration. All 11 of those interviewed expressed opinions along these lines. They felt such support was necessary if they were to gain the respect of the students, get on with their teaching, and grow professionally. For example, Sandra observed that in one of her practicums "he was Mr. Russell and I was Sandra," and this undermined her relationship with the students, who were a "pretty rambunctious, high energy" group (Beck & Kosnik, 2002b, p. 88). By contrast, Liz said of her experience in the second practicum: "All the student teachers at this school worked more as peers than as subordinates. And I think the children sensed that, because I certainly didn't have to work to earn their respect the way I had to in my first block; in the first block the children sensed the hierarchy immediately. In this block I felt like a teacher" (p. 88). Rita commented that, "the more responsibility you have, the more opportunity you have to figure things out" (p. 88). And Linda said that through being "an equal with the teacher," being "considered to be a teacher by the class," she could put her own stamp on the class and develop her own style:

> The first day I was there she had assigned a writing-in-role assignment for the children to wrap up the Medieval Studies unit. She said to me: "*We* are going to have to model this for them." So she wrote her letter and I wrote mine, we photocopied them and gave them to the students. It seems really simple but it spoke volumes, absolute volumes. I started seeing that I was in an entirely different role (from in my previous practicum). (p. 88)

Another form of support student teachers desire from mentor teachers is feedback (Borko & Mayfield, 1995; Calderhead & Shorrock, 1997; Williams, 1994). While most university researchers stress the importance of feedback (Darling-Hammond, Wise, & Klein, 1995; Maynard, 1996), some mentor teachers are reluctant to give it, maintaining that student teachers should develop in their own way and indicating that the main thing they need is experience (Borko & Mayfield, 1995; Calderhead & Shorrock, 1997). In the Mid-Town interviews, student teachers indicated that they wanted a considerable amount of feedback from their associate teachers (Beck & Kosnik, 2002b, p. 92). For example, Sandra commented: "I felt the interim evaluation should have given me more direction than it did … What I really wanted to hear was: This is what I think you are doing; this is where you can work to improve; this I think is outstanding. So I

would know where I was going. But that didn't happen." (p. 92) Similarly, James reported:

> I honestly didn't get much feedback this last block; it was really informal, and just once or twice a week. I would have liked to sit down at the end of the day and go over the strengths or weaknesses of the day, going through things in a systematic way. And my formal evaluation was all positive, there were no areas identified for growth; so it was hard to take it seriously, it really had no impact. (p. 92)

Some of the interviewees noted, however, that not just any kind of feedback will do: it has to be provided in a positive, supportive manner, with opportunity for two-way conversation, a point made also in the research literature by Britzman (1991) and Glickman and Bey (1990). Linda remarked:

> In my first placement I received lots of feedback, but it came so fast and there was so little discussion it wasn't useful. I have Kindergarten experience, I knew what I was doing. She would have done it differently but it wasn't how I would do it. (p. 93)

In contrast, David described the great value of the constructive criticism he received:

> Andrea is a perfect person to have as an associate teacher because she gives valid feedback, a lot of feedback that is very useful. I quickly amended how I approached things and it made a big difference right away ... She would sit at the back of the class observing and taking down notes to review with me later, about what needed improvement. For example, she told me that when you have a group assignment every student in the group should have a role. And after that my group assignments worked very well. She was very helpful. (p. 92)

Supportive Forms of Assessment

Both the university staff involved in the program and the mentor teachers have to develop forms of practicum assessment that make the student teachers feel secure in developing a self-study approach to teaching and learning. Forms of student-teacher assessment are needed that encourage ownership and experimentation (Feiman-Nemser, 1987; Knowles & Cole, 1996; Zeichner, 1990). There should be a broad, holistic approach to student teacher evaluation, one that refrains from "assessing performance through periodic evaluative snapshots" (McIntyre, Byrd, & Foxx, 1996, p. 187). Support of student teachers in the practicum and their growth as reflective practitioners are best served by an approach to student teacher evaluation that involves collaboration between university faculty and mentor teachers. Even with frequent visits, university staff are still not in the school long enough to carry out the teaching evaluation on their own (Borko & Mayfield, 1995). Having the mentor teachers as the main

assessors also overcomes the traditional student teacher fear of teaching a "disastrous lesson" the day the university supervisor visits. However, where difficulties arise, university staff must become involved, whether to support the mentor teacher when a student teacher's performance is problematic or to support the student teacher if the difficulties are due to shortcomings of the mentor teacher or other aspects of the setting (Beck & Kosnik, 2002a).

Pajak (2001) asks whether we want practicum supervisors to rely heavily on monitoring standards that are externally imposed on universities. He argues that the stress on standards in supervision can shift emphasis away from reflection and thoughtful inquiry among colleagues and toward enforced compliance with external criteria. Successful teaching demands a high degree of self-investment and even personal identification. "Teacher educators must guard against clinical supervision becoming merely a mechanism of quality control by fostering a personal identity among teachers that incorporates high levels of idealism and personal dedication" (Pajak, 2001, p. 239). In any given case, supervisors must take student teachers' perceptions of the situation into account in suggesting what course of action may be needed to further emergence of their professional style.

Conclusion

We began by presenting a broad definition of the self-study approach to teacher education. The self-study movement, in our view, has gone beyond the literal meanings of "self" and "study" to conceptualize an interconnected set of components including study of one's own practice, life history and personal narrative, critical inquiry, constructivist pedagogy, respect for experience, collaboration, community building, and inclusiveness. While these components are largely in accord with traditional progressivism, self-study advocates have significantly modified progressivism and made it more concrete, drawing especially on the insights and practices of such movements as action research, ethnography, social constructivism, feminism, poststructuralism, and postmodernism. The self-study approach stands in contrast to a technical-transmission approach. Because of the breadth and complexity of the self-study approach, we find it helpful to use a compound expression such as personal-constructivist-collaborative, although no single term can capture all its elements.

While our conception of self-study is broad, our concern here has been to focus on the implications of self-study for the preservice practicum, with a view to showing how the practicum may be enhanced. We have drawn not only on formal theory and research literature but also on case studies. Our review of various materials reveals that developing a self-study approach in and through the practicum cannot be accomplished by focusing only on the practicum itself. Our first conclusion, then, is that *the campus program and the practicum must be integrated*, so that they reinforce (rather than undermine) each other. Such integration requires a number of components, such as having an overarching philosophy of teaching and learning, modeling a self-study approach in the

campus program, interspersing the practicum throughout the program, having assignments that cut across the campus program and the practicum, establishing as far as possible a cohort and faculty-team structure, building close school-university partnerships, and involving the program's university instructors in school liaison and practicum supervision.

Our second general conclusion is that *satisfactory practicum settings are needed*, ones which as far as possible embody a self-study approach to teaching and learning. Establishing such settings requires considerable attention to the selection and development of mentor teachers and partner schools. We take a firm line on this, noting that while school boards and individual principals may sometimes take exception to our selection and de-selection initiatives, we must above all keep the interests of our student teachers at the forefront.

Our third main point is that *the activities engaged in by student teachers during the practicum must be appropriate*, that is, ones that enable them to develop a self-study approach to teaching and learning. Both university staff and mentor teachers must allow and encourage flexibility with regard to teaching content and method and must foster an experimental, reflective approach. An overly structured practicum, no matter how well intentioned, may undermine student teacher ownership, development of a distinctive style, and ongoing professional growth both before and after graduation. There is a paradox here. While we want to provide student teachers with strong initiation into a self-study approach, we can do so only if we apply the very approach we are advocating, namely, one that permits the self to grow and flourish and allows room for experimentation and risk-taking.

Our final general conclusion is that *student teachers need a high level of support during the practicum*. Support is important for all learning, and this is especially so when acquiring an approach as challenging and radical as self-study. The support must come from several quarters: from fellow students, university staff, the mentor teacher, and the practicum evaluation system. From the mentor teacher, who is the student teachers' most significant "other" in the practicum, student teachers need friendliness and emotional support, a collaborative peer relationship (to the extent feasible given differences of status and role), and a substantial amount of constructive feedback.

How can all this be achieved? Early in the chapter we outlined challenges to a self-study approach in the practicum: the practice of transmission pedagogy in both schools and campus programs, the reluctance of preservice faculty to go into the field, the current climate of criticism and control in education, and the frequent lack of support for preservice education in schools of education and universities as a whole. While it will not be easy to achieve the approach to the practicum described in this chapter, a clear sense of direction should help teacher educators to take advantage of all available opportunities. We believe that, even under existing conditions, it is possible to make significant progress toward a self-study approach in the preservice practicum and in preservice education generally.

SELF STUDY IN TEACHING ABOUT TEACHING*

Amanda Berry
Monash University

Abstract

Growing interest in the development of preservice teacher educators' professional knowledge has been accompanied by increasing activity by teacher educators as researchers of their own professional practices. Self-study of teacher education practices has emerged as one important way of understanding this work, helping teacher educators explore questions about how knowledge of teaching about teaching develops, what informs approaches taken to examine and develop such knowledge, and how teacher educators' choices affect their students' learning about practice. This chapter addresses the motivations of teacher educators engaged in self-study of their own practices and the growth of knowledge of teaching about teaching that has developed through such work. The chapter illustrates how the nature of the knowledge developed by teacher educators about their practices is often rich in complexity and ambiguity. Within the problematic world of teaching about teaching, one way of conceptualizing this knowledge is as a series of tensions that influence teacher educators' learning about practice developed through self-study.

Substantial research efforts in past decades have resulted in the accumulation of a considerable body of knowledge about teaching and teacher education. A good deal is known about the background and experience of teacher educators, the nature and purpose of teacher education, the status of teaching and teacher education and the work of faculties of education. Yet teacher educators turning to the research literature to locate knowledge that addresses the nature of teaching about teaching or to hear the voices of teacher educators themselves

---

in education research will uncover comparatively little (Richardson, 1996; Wideen, Mayer-Smith, & Moon, 1998). The paucity of such research is hardly surprising. Teacher educators, as a group, are often the least experienced writers and researchers amongst their academic colleagues, and there is a longstanding academic attitude towards teaching (and teaching teachers, in particular) as relatively simple, unimportant work. However, despite this initially depressing scenario, interest in better understanding the work of teacher educators is growing, particularly among teacher educators themselves (Zeichner, 1999).

This chapter explores the growth of knowledge of teaching about teaching that has developed through the self-study of teacher education practices. The knowledge that directs teacher educators' practice through researching teacher preparation in concert with the needs and concerns of student teachers dramatically shapes that which is helpful and relevant to beginning teachers. The confluence of the knowledge and practice that can inform this relationship is important and is being better understood and articulated through self-study. One way of exploring this development is through consideration of a number of questions: How do teacher educators develop their knowledge of teaching teachers? What informs the approaches they take and how do their choices affect their student teachers' learning about practice? What happens when teacher educators research their own teaching, and how does this influence their understanding of themselves, their students and the process of teacher education? Such questions comprise the essence of self-study that is described in this chapter.

This chapter has five sections. The first section presents a brief overview of research related to the practice of teacher education and explores various factors that have set the scene for the emergence of self-study. The second section examines the ways in which conceptions of knowledge have influenced the development of self-study as a field of research. The third section considers the motivations of teacher educators who have chosen to study their own practice and the ways in which they have approached the self-study of practice. The fourth section considers what teacher educators have learnt from the self-study of their practice, while the fifth section concludes the chapter by posing some challenges for the future of self-study.

Why is There so Little Research about Teacher Educators' Practice?

For many years, there has been limited (published) research attention investigating the practice of teacher educators, particularly by teacher educators. Reasons include perceptions of teacher educators within the university, stereotypic views of teacher preparation, and the ways in which traditional research paradigms have influenced teacher education. This section suggests an explanation that helps to account for the lack of research on teacher educators' practice.

Roles and Status of Teacher Educators

Typically, teaching in preservice teacher preparation has not been a field for those wishing to advance their status within academia. Higher-status teaching

(for example, masters and doctoral programs) has been viewed as a much more desirable alternative to teacher preparation, so that the number of senior academics directly involved in, and committed to, teacher preparation remains comparatively few (Fenstermacher, 1997). The implicit message is that ground-level practice in teacher education is relatively unimportant work, particularly in institutions whose reputations rest on research and publishing (Dinkelman, 2001).

One consequence of this perception is that scant research attention is paid to what happens in teacher education (Zeichner, 1999). Because it is not the direct concern of those most able, or encouraged, to research it, teacher education remains predominantly in the hands of those least experienced in writing and research. The often heavy teaching loads carried by teacher educators and the difficulties of obtaining research funding for research on teacher education further contribute to low levels of participation by teacher educators in research about learning to teach (Tabachnick & Zeichner, 1991).

This means that researchers who do write about teacher education may well be disconnected from the practice context and driven by concerns that are different from those who work within it. As a result, the research produced has tended not to be directly linked to the needs of teacher educators and the contexts in which they work, with little to say to them as the end users of that research (Loughran, 2002). Additionally, the academic 'club' from which much of this writing has emerged uses a language that is unfamiliar to many teacher educators, often making it inaccessible to them (Tabachnick & Zeichner, 1991). This is not to suggest that such work *on* teacher education is not important, only that it does not necessarily speak to teacher educators in a manner that is helpful for the development of their work.

Pedagogy of Teacher Education

Another reason why teacher educators' work has received so little research attention is that knowledge of teaching about teaching has not been regarded as a form of specialised expertise within academia, when compared with subject knowledge in other fields such as science, mathematics, and history. This may well be linked to notions of teaching itself as an under-theorized field being extended to teaching about teaching. Korthagen (2001, p. 8) notes that, "although for many school subjects an explicit subject matter pedagogy exists, this is not the case in the area of teacher education itself."

Teacher education often seems to be perceived by those outside the profession as little more than the transference of pedagogical tips, tricks and techniques, most of which will be rendered irrelevant when new teachers enter the classroom and begin their real learning about teaching. The assumption appears to be that teacher educators require little more than subject specific expertise and prior experiences of teaching in order to be qualified to prepare prospective teachers. Added to this is the view that teacher education should acclimatize student teachers to cope with the demands of full-time teaching and the view that their

preparation is both a starting and ending qualification. The pursuit of under-
standing of teaching about teaching thus remains undervalued and poorly
informed by research.

Preparation of Teacher Educators

The ways in which new teacher educators are typically prepared for their roles
reinforces the notion that there is no specialised knowledge of teaching about
teaching. The following extract is from Mary Lynn Hamilton's account of her
transition into the role of teacher educator.

> When I ask myself how I became a teacher educator, I am left puzzling
> about the first time I thought about doing that or left wondering if I ever
> really initiated a learning-to-be-a-teacher-educator process. I suppose
> though that I first began the process long before I became conscious of it.
> In the unconscious moments I worked hard to train teachers to integrate
> their curricula with multicultural perspectives or gender concerns. I spent
> long hours designing materials to be presented to teachers for use in their
> classrooms. But who taught me how to do that? Really no one taught me.
> I learned by watching those people around me, by reminding myself what
> happened in my own classrooms with high school students, by trying to
> remember the stages of development and how these might fit with what I
> needed to do. I also learnt my making errors, major errors in front of the
> classroom. No class at the university discussed the process of becoming a
> teacher educator. (Guilfoyle, Hamilton, Pinnegar & Placier, 1995, p. 40)

This account of Hamilton's early experiences highlights a typical scenario for
many new teacher educators. After an often informal recruitment procedure, the
teacher educator is handed responsibility for a group of student teachers and
is left alone (Korthagen & Russell, 1995). The prevailing idea is that teacher
educators learn by themselves how to teach about teaching, through trial-and-
error in practice (Kremer-Hayon & Zuzovsky, 1995; Guilfoyle *et al.*, 1995). In
this way, learning to teach teachers is often experienced as a private struggle.
The culture of isolation (Brookfield, 1995) that commonly exists within teaching
institutions reinforces the message that sharing questions or concerns about
their teaching is not something that teacher educators do. Amongst higher
education institutions, individual scholarship and the creation of intellectual
property are promoted and rewarded, so that existing conditions serve these
anticollectivisit endeavours, rather than promoting shared, high quality peda-
gogy. As Brookfield (1995, p. 249) observes, "Time, space and money are denied
for teacher collaboration. Academic excellence is measured in terms of indivi-
dual effort."

This view of teaching is compounded by the evaluation of teaching practice
according to externally defined standards. The links among successful teaching
evaluations, publishing and gaining tenure reinforce this institutional situation.
Notions of teaching as individual, isolated and competitive can diminish the

desire to research the work of teacher education and reduce opportunities to better develop an understanding of the pedagogy of teacher education. Paradoxically, in order to be viewed differently by the academy, establishing the importance of teaching about teaching and researching these endeavours are crucial.

A small number of studies have been conducted that have investigated the professional development of teacher educators (see, for example, Kremer-Hayon & Zuzovsky, 1995 and Dinkelman, 2001). These studies show that, in the absence of a professional knowledge base and lacking the support of colleagues for learning about teaching teachers, new teacher educators inevitably draw upon their own experiences of teacher preparation as a source of pedagogical knowledge. As one of the teacher educators in Kremer-Hayon and Zuzovsky's (1995, p. 163) study of the professional development of Israeli teacher educators recalls, "In facing difficulties, I tried to remember what my school and university teachers did, and I employed the same ways."

Often these same ways are based on a traditional technical-rational paradigm of professional knowledge development that involves, "the transmission to its students of the generalized and systematic knowledge that is the basis of professional performance" (Schön, 1983, p. 37). Implicit in this view is that teacher educators present expert knowledge about teaching to student teachers, who are then expected to successfully reproduce this knowledge in their classrooms. Clandinin (1995) calls this "the sacred theory-practice story" because of its powerful and persistent influence on teacher education, as successive groups of teacher educators re-tell it through their work.

Numerous studies have reported the failure of this approach to teaching, yet it has continued to dominate the practices of new teachers (Korthagen, 2001; Wideen *et al.*, 1998; Zeichner & Tabachnick, 1981). What seems to be too easily overlooked is that the knowledge required for teaching about teaching is much more context-specific, personal and dynamic than simply transferring theories of good teaching into practice (Korthagen & Russell, 1995). Inevitably, then, a technical-rational approach offers limited value in teaching about teaching and learning.

A growing number of teacher educators dissatisfied with these traditional 'plot lines' (Clandinin, 1995) have been prompted to investigate alternative approaches to teaching about teaching. This has led some to construct new and different 'stories' about teacher education for teacher educators caught in the demands of daily practice and the authority of traditional practice. Self-study research, with its emphasis on teacher educators' collaborative learning about their practice, has emerged as a response to such challenges.

Research Traditions and Teacher Educators' Work

For many years, the perspectives and voices of teacher educators have been missing from educational research literature. Cole and Knowles (1995) report that it is only in the last decade that teacher educators themselves have been

the subject of any significant research attention and, until recently most of this research has centered on their roles, responsibilities and problems. As previously noted, this is because researchers of teacher education have not necessarily been involved in the daily practice of teacher education. Therefore, their research priorities do not always match with the needs and concerns of the practitioners. Also, the particular methodologies that have dominated research in education have privileged a view of knowledge production as detached from the practice context, conducted by an external observer, and developed through 'objective research techniques' (Kincheloe, 2003). Hence the emergence of research outcomes presented as 'expert' knowledge: developed, organised and transmitted by experts for experts, but not always useful for practitioners. Such a traditional, positivist view excludes the involvement of teacher educators from researching their own practice and neglects the messy, context-specific problems that occupy teacher educators in their everyday work. Also implicit in this approach is a premise that the reform of teacher educators' practice and teacher education programs is possible through the unproblematic application of research findings (often in the form of theory) to practice. This traditional form of theory as expert knowledge contrasts with an alternative view of theory as practitioner knowledge that is more relevant to the work of teachers (Korthagen, 2001) and is discussed in later sections of this chapter.

The failure of traditional paradigms in educational research to improve teacher education has paved the way for new forms of research to emerge, forms that more faithfully reflect the experiences and concerns of those who participate in it. More than a decade ago, Tabachnick and Zeichner (1991) recognised the difficulties created by the absence of teacher educators' voices and perspectives in the research literature and called for,

> greater representation of the perspectives of teacher educators in teacher education scholarship, more genuinely collaborative research efforts involving external researchers and teacher educators, and greater support for and recognition of the action research efforts of teacher educators who engage in serious study of their own practices and programs. (Tabachnik & Zeichner, 1991, p. xi)

Clearly the problem was recognised, but knowing how to address it was much more difficult (particularly given the status of teacher educators), and so at the time there was limited response. In hindsight, it appears obvious that teacher educators were being called upon to research their own practice through engagement in reflective inquiry and to engage in studies that examine relationships between beliefs and actions in order to get closer to understanding their own needs and concerns. The impact on their teaching of outcomes of such forms of research would be more valuable, useful and applicable to teacher educators' practice.

Fortunately, the growth of interest and involvement of teacher educators in research on their own work has been supported by particular changes in the

research climate over the past decade. Changes include increased attention to the concept of a profession and the knowledge base of professionals (how professionals 'know' and use what they know), growth in research methodologies that more faithfully represent the experiences of those who are portrayed in research (particularly women, and research employing feminist methodologies), and the development of forms of research that explore the particular pedagogical concerns, tensions and dilemmas that drive everyday practice (for example, action research and practitioner research).

A significant early example of practitioner research is found in the work of Lampert and Ball (Lampert, 1990). Lampert, a teacher educator with an elementary teaching assignment, and Ball, a classroom teacher, worked together to use their classrooms as research sites in order to investigate the specific relationship between subject matter knowledge [in mathematics] and pedagogy. Interestingly, even though practitioner research such as this had started to gain ground, the 'practitioner' aspect has been most frequently associated with classroom teachers, as though the label 'practitioner' excluded academics. Nicol (1997), in a study of her own teacher education practice, noticed this point when she reported that teacher educators and researchers are rarely "seen as practitioners who might benefit from investigating their own practice through such forms of research" (p. 52).

One of the reasons to account for the limited participation of academics in practitioner research is the potential professional risk involved. Academics who choose to work outside the boundaries of mainstream notions of acceptable research may find, for instance, that prospects for tenured employment can be severely disadvantaged. The efforts of a 'trail blazing' few have initiated and supported the pursuit of such new endeavours, so that teacher educators as research-practitioners, learning from their own experience, can begin to be taken seriously by the academic community.

What is the Role of Experience in the Process of Learning to Teach?

Examining programs of teacher education and the process of learning to teach have been the focus of considerable study. Recent changes in the research climate have meant that researchers of teacher education have begun to examine the experience of teacher education more closely for the ways in which student teachers have interpreted and given meaning to programs as they experience them over time (Zeichner, 1999). Such studies have highlighted the often limited influence of preservice education on the thinking and practice of new teachers, an outcome that seems to result from the expectations and experiences of student teachers combined with the traditional structure and organisation of many preservice programs.

Resistance and Persistence: Beliefs about Teaching

Student teachers' expectations of their preservice programs are strongly influenced by their prior experiences as learners, together with popular stereotypes

about teachers' work. Student teachers commonly enter their teacher education with a view of teaching as simple and transmissive. They believe that teaching involves the uncomplicated act of telling students what to learn – a consequence of years of uncritical observation of their own teachers at work (Britzman, 1991; Pajares, 1992). One common expectation of student teachers is that their teacher education program will supply them with a comprehensive set of practical teaching strategies to ensure their success in the classroom; they are often critical of their preparation if this does not occur (Britzman, 1986).

> Prospective teachers, then, want and expect to receive practical things, automatic and generic methods for immediate classroom application. They bring to their education a search for recipes and, often, a dominant concern with methods of classroom discipline, because they are quite familiar with the teacher's role as social controller. Education work that does not immediately address "know- how" or how to "make-do" with the way things are in schools appears impractical and idealistic (Britzman, 1986, p. 446).

There is little doubt that student teachers' prior experiences as learners serve as powerful templates for the ways in which they practice as teachers. Their beliefs about teaching are informed by the accumulation of experience over time and, once formed, these beliefs are extremely resistant to change, even when they are shown to be inconsistent with reality. For many student teachers, their beliefs about teaching remain relatively unchanged throughout their experiences of teacher education (Wideen *et al.*, 1998) and continue to shape their behaviours as new teachers in the classroom. This situation is a consequence of teacher education programs that do not address the deeply held nature of belief (Pajares, 1992) or the particular needs and concerns that prospective teachers bring about learning to teach (Korthagen, 2001).

Experiencing change in deeply held beliefs is a relatively rare phenomenon in adulthood. Pajares' (1992) research on teachers' beliefs reveals the intimate relationship between beliefs and identity, which helps to explain why most people instinctively resist challenges to their beliefs. "People grow comfortable with their beliefs and these beliefs become their 'self' so that individuals come to be identified and understood by the very nature of their beliefs, the habits, they own" (Pajares, 1992, p. 318). Pajares suggests that change in beliefs is possible only through "conversion or gestalt shift," a deeply personal form of transformation that is rarely experienced in traditional programs of teacher education. So for teacher educators and student teachers alike, some of the underlying issues associated with change and development through a teacher education program may well go unnoticed, or may simply not be addressed, in the rush to complete a set curriculum. This is an insight into the type of concerns that underpin why teacher educators studying their own practice is important. These issues are part of the everyday activities of teacher education and need to be addressed, through their teaching, by the teacher educator and the student teachers. This helps to explain how important insights and challenges offered from such research are

relevant not only to teacher educators wishing to better understand how student teachers respond to their teacher education, but also in prompting teacher educators themselves to critically examine their own beliefs about teacher education, including the impact of their own prior experiences of learning to teach on their present practice.

The Hidden Curriculum of Teacher Education

The hidden curriculum of teacher education and teacher socialisation literature (Ginsburg & Clift, 1990; Zeichner & Gore, 1990) indicates that it is not only the tenacity with which student teachers maintain their beliefs about teaching that makes change difficult, but also the fact that tacit messages conveyed through the structures and practices of teacher education programs serve to further reinforce traditional notions of teaching, learning, schools and teachers. This is evident, for example, in the way that many teacher education programs lack an integrated internal structure and so communicate messages about education as fragmented rather than holistic; teach course work that is very similar across institutions, reinforcing ideas about a public conception of knowledge and knowledge as product rather than learner- and context-responsive; disconnect theory from practice, thereby emphasizing their separation in learning; and have teacher educators working in isolation from one another, so that messages about teaching as an individual, rather than a collaborative, act are reinforced (Ginsberg & Clift, 1990).

One additional and powerful aspect of the hidden curriculum of teacher education is the often present but implicit contradiction that student teachers should learn to do as teacher educators say, not as they do. Examples include teacher educators who lecture about the importance of group learning, who espouse the importance of reflection while presenting teaching as a technical act, or who assert the need for establishing caring relationships while at the same time maintaining emotional detachment from their students. These practices can readily undermine the very ideas they wish student teachers to learn because teacher educators are not seen to be practicing them themselves. Russell (1998) acknowledges this contradictory nature of teacher educators' work: "In teacher education, what and how we teach are interactive, and we ignore this interaction at our peril. Just as actions are said to speak louder than words, so how we teach may speak more loudly than what we teach" (p. 5).

Not all messages in the hidden curriculum contradict the 'official' curricula messages, as teacher educators recognising the significance of aligning message and practice have called upon each other to more closely 'practice what they preach.' The task is an extremely challenging one though, as teacher educators come to recognize the difficulties associated not only with seeing themselves as "living contradictions" (Whitehead, 1993), but also in attempting to reduce these contradictions in their own work.

Despite these significant challenges, teacher educators continue to exhort each other to teach in ways that are congruent with the ideas about teaching that

they wish new teachers to practice and to share what they have learnt from the process of investigating their work. Out of this background of teacher educators' concerns with the ways that academia views teachers and teaching practice, together with the knowledge of the limited influence of teacher education on the practice of new teachers, the self-study of teacher education practices has developed.

What is Self-Study of Teacher Education Practices?

Self-study grew out of teacher educators' concerns for the learning of their student teachers and for the learning of the future students of these student teachers:

> Unlike the assertions about what works, which were the hallmark of earlier teacher education research (Wittrock, 1986, for example), this research leads teacher educators to understand their work, question what might be possible in their practice, and then move to create such practice that more might be learned both by the future teachers thus educated and by teacher educators studying what they are doing. (Hamilton & Pinnegar, 1998, p. 241)

Teacher educators who engage in the self-study of their practices recognise teacher education as an enterprise that is fundamentally problematic by virtue of the complexity and ambiguity of its various demands. By researching their own practice, teacher educators ask themselves about the problems of teacher education and question how their own actions contribute to these problems. Developing a better understanding of the relationship between what teacher educators say and do is an important first step towards addressing such issues in their own work. In this way, the development of knowledge of teaching about teaching becomes both a personal quest, supporting the development of the teacher educator as an individual, and a professional responsibility, supporting the development of teacher education as a profession. At the same time, it becomes a powerful and significant approach to researching teacher education. In his review of research in education between 1978 and 1999, Zeichner (1999, p. 8) identified the emergence of self-study as, "probably the single most significant development ever in the field of teacher education research." Self-study, then, has developed largely as a result of individuals responding to these issues. Still in its infancy, self-study has not yet truly developed as an institutional approach. (Although self-study is used as a descriptor for institutional evaluations – see Chapter 1 – it carries a different meaning than that attributed to self-study in this handbook). This means that self-study work has been driven largely by the concerns of teaching and the development of knowledge about practice and the development of learning. The next section of this chapter turns to a consideration of some of the issues and difficulties associated with understanding the meaning of knowledge in the context of researching teacher education.

Self-Study and the Development of Teacher Educator Knowledge

Views of knowledge have traditionally been categorised as belonging to one of two different forms: knowledge that is propositional or theoretical; and, knowledge that is experiential or practical. This dichotomous approach has led to the notion of a theory-practice divide. The separation between forms of knowledge has inevitably shaped the ways that knowledge has been organized, understood and valued in researching education (Munby, Russell, & Martin, 2001). As a consequence, a pervasive and enduring tension exists within teacher education concerning the status accorded each of these forms of knowledge production and the usefulness of each form in the work of teaching.

As already noted, much of the knowledge produced about teacher education (and education more generally) has been reported in the form of theory and made available through a science-oriented research approach. Knowledge produced in this way is usually in the form of generalizations, or propositions, that are considered applicable to a wide range of context-independent situations (Kessels & Korthagen, 1996). Such forms of knowledge production have long been privileged within academic circles because they fit with academic ideals of technical 'elegance' and the pursuit of knowledge as 'timeless truths.' And, while knowledge produced in this way is intended for teachers to use, it has proved to have limited use for teachers because it does not recognize or respond to the difficulties associated with individuals' needs, concerns and practices. This is due to the fact that such knowledge is often stripped of the particulars of individual situations that are most relevant to the work of teaching. Teachers (and teacher educators) want, and need, more practically oriented knowledge than what has traditionally been made available through empirically driven research. This is not to suggest that such knowledge is not useful but to observe that it is not commonly made available in a form readily accessible to the practitioner.

In contrast to the form of knowledge described above, practical knowledge is a form of knowledge gained through experience. It is personal, context-bound, and includes implicit knowing, that is, a kind of knowledge that is embedded within action that cannot be separated from that action. Practical knowledge has not been accorded the same high status as 'traditional theoretical' knowledge within academia because the individual nature of what is learnt and how it is learnt does not conform to the paradigms of standpoint, validity and reliability. Despite this, the concept of practical knowledge has attracted increased attention by researchers looking to more faithfully capture the nature of experience in their work. A variety of constructs have been associated with the acquisition of such knowledge, including tacit understandings (Polanyi, 1962), reflection (Schön, 1983, 1987), authority of experience (Munby & Russell, 1992, 1994), nested knowing (Lyons, 1990) and reframing (Munby, 2001). Munby and Russell (1994) use the term "authority of experience" to capture the status of knowledge derived through personal experience, compared with other traditional forms of authority such as the "authority of position" or the "authority of scholarly argument."

An important element of practical knowledge that is inevitably connected to the practice of self-study is self-knowledge. Acquiring practical knowledge involves the study of self and the notion of "putting the I in the centre of research" (McNiff, Lomax, & Whitehead, 1996, p. 17). Central to this process is developing increased awareness of how one's philosophy of teaching has been informed by the deeply embedded images, models, and conceptions from experiences as a learner(Brookfield, 1995) and the impact of these on teaching relationships with others.

Differentiation between knowledge types is apparent in the literature in many ways and to varying levels of specificity. For example, Fenstermacher (1994) differentiates between two types of practical knowledge: embodied knowledge or personal practical knowledge, exemplified through the work of Elbaz (1983) and Connelly and Clandinin (1985), and practical knowledge that is developed through reflection on practice, based on the work of Schön, and researchers who have built on Schön's work, including Munby and Russell (1992), Grimmett and Chelan (1990), and Erickson and Mackinnon (1991). Both types of practical knowledge, Fenstermacher (1994, p. 14) argues, "seek a conception of knowledge arising out of action or experience that is itself grounded in this same action or experience." For self-study practitioners, conventional social science methods have been unhelpful for the development of understanding of practice; hence the search for new forms of representation that can capture the complex and personal nature of the knowledge acquired. Self-study has built on this development of alternative approaches to framing knowledge as the need for more appropriate and helpful conceptualizations for researching, understanding and describing teacher educators' work have been sought (see, for example, Carson, 1997; Korthagen, 2001; Fenstermacher, 1994). The work of Korthagen has, for many, been a useful way of revisiting these issues about knowledge and knowing through his differentiation between episteme and phronesis.

> *Episteme* can be characterised as abstract, objective, and propositional knowledge, the result of a generalization over many situations. *Phronesis* is perceptual knowledge, the practical wisdom based on the perception of a situation. It is the eye that one develops for a typical case, based on the perception of particulars. (Korthagen, 2001, pp. 30–31)

Episteme and phronesis are useful in understanding the knowledge developed through teaching about teaching because they help to define the nature of the knowledge that is sought, developed and articulated both by teacher educators themselves and by the student teachers whom they teach. However, simply categorizing knowledge differently does not necessarily reduce concerns about how knowledge influences practice for, as Korthagen further notes, "many teacher educators actually work from an episteme conception" (p. 29), even though they want that knowledge to be useable and useful to their student teachers. This leads to teacher educators' ongoing dilemma of better aligning intentions and actions in practice, a dilemma that is often a catalyst for self-study. Korthagen sees promise in understanding the difference between episteme

and phronesis, as he asserts that a better understanding of the interaction between both kinds of knowledge is important in the development of understanding of learning to teach others effectively. This kind of understanding is a crucial issue in self-study.

Munby, Russell, and Martin (2001) report "overwhelming evidence" (2001) to support the idea that knowledge of teaching is acquired through personal experience of teaching. Phronesis, then, offers an excellent means of conceptualising the knowledge developed through experience. This involves becoming aware of the salient features of one's experience, trying to see and refine perceptions, making one's own tacit knowledge explicit, and helping to capture the particularities of experience through the development of perceptual knowledge (Korthagen, 2001). It also involves selecting epistemic knowledge that links with particular contexts and situations to further make sense of experience, rather than imposing epistemic knowledge as the starting point. Korthagen's proposal for teacher educators "to help student teachers explore and refine their own perceptions. ... [by creating] the opportunity to reflect systematically on the details of their practical experiences" (p. 29) is also important in the process of knowledge development of teacher educators in their learning about teaching about teaching.

Teacher educators who engage in self-study may be viewed as responding to the development of knowledge as phronesis. Recognising the need to develop knowledge in this way does not automatically equip a person to do so, because holding knowledge in the form of phronesis requires both a collection of particular experiences and a grasp of generalities that arise from them. This means that inexperienced teacher educators, lacking a store of specific experiential knowledge to draw from and attempting to respond to traditional forms of research and knowledge, often find themselves in 'unchartered territory' as what they seek to know and their ways of coming to know are not always congruent. Phronesis links closely with Munby and Russell's (1994) notion of "authority of experience." An important consequence of viewing knowledge through the frame of phronesis is that perceptions of knowledge and its status change. The perceived privilege of traditional research knowledge is moderated as it becomes only one part of the professional knowledge required for understanding practice.

Reconsidering the different forms of knowledge and knowledge production in the light of episteme and phronesis frames traditional research as the production of epistemic knowledge and practical inquiry, as the investigation of phronesis. In many self-studies, teacher educators develop their phronesis as they learn how to make their knowledge available, practical and useful in their teaching about teaching. For some, investigating practice often begins by searching for knowledge about practice in the form of assumptions or taken-for-granted beliefs (Brookfield, 1995) that guide teaching actions. Practical inquiry aims to uncover such assumptions and to explore their effects in teacher educators' work. Often these assumptions elude investigation because they are so deeply embedded in an individual's approach. Brookfield (1995, p. 2) describes the process of assumption hunting as "one of the most challenging intellectual puzzles we face in our

lives." He identifies the process of critical reflection as crucial to the assumption-hunting endeavour. Self-study involves locating one's assumptions about practice through the process of reflection, in order to facilitate the development of phronesis. Thus it appears that self-study involves developing knowledge as phronesis, understanding the conditions under which such knowledge develops, understanding the self, and working to improve the quality of the educational experience for those learning to teach.

Why Does Defining Knowledge through Self-Study Matter?

Teacher educators working to understand their own practice in their individual classrooms may not necessarily be concerned with what kind of knowledge they are developing about practice, but rather that they *are* developing a better understanding of what they do. However, examining the knowledge arising from self-study is important because if the efforts of individuals are confined solely to their own classrooms and contexts, the problems of teacher education will continue to be tackled individually and in isolation. In self-study, there is also a need to find ways to share what comes to be known in ways that are both accessible to others and that can serve as a useful foundation for the profession. This inevitably involves discussions of the nature of knowledge since self-study seeks to position teacher educators as knowledge producers, and therefore challenges traditional views of knowledge production as external, impersonal and empirically driven. When what teacher educators know from the study of their practice is able to be developed, articulated and communicated with meaning for others, then the influence of that might better inform teacher education, generally.

Motivations for Self-Study

Teacher educators engaging in self-study commonly share a broad motivation to improve the experience of teacher education through improving their own teaching practice. Whitehead (1998) articulates this motivation to improve practice as a series of questions: "How do I improve my practice?" "How do I live my values more fully in my practice?" and "How do I help my students improve the quality of their learning?" Teacher educators who choose to study their practice also draw on the idea of credibility as a motivating influence in their work. They ask themselves, "How can I be credible to those learning to teach if I do not practice what I advocate for them?" Heaton and Lampert (1993) remind us that the credibility of teacher educators is at risk if they do not use the practices that they envision are possible for others. Teacher educators' specific reasons for engaging in self-study vary and include the four reasons that follow.

Articulating a Philosophy of Practice and Checking Consistency between Practice and Beliefs

Some teacher educators seek to better understand the various influences that guide their thoughts and actions, so that more developed understanding may lead to more informed practice. For some teacher educators (particularly those

new to self-study), this may involve learning to articulate a philosophy of practice through investigating practice (see Nicol, 1997). For other teacher educators, this might mean exploring the coherence between philosophy and practice to uncover possible discrepancies between espoused beliefs and the realities of practice (see Conle, 1999; Grimmett, 1997; Tidwell, 2002). Conle (1999, p. 803) identified her desire to become more informed about aspects of her teaching practice that may have been otherwise hidden from her view: "I undertook to study my teaching not because I saw particular problems (I did see several), but in order to discover if there were problems I did not see."

The desire to investigate practice can also be linked to a personal need to ensure that one's teaching practice is congruent with expectations of student teachers' developing practice (Loughran & Northfield, 1998). Lampert (1993) identified the importance for her colleague, Heaton, of bringing her practice as a teacher educator more closely in line with her expectations of her students' practice as teachers. Lampert observed that "the pedagogy of mathematics she [Heaton] wanted to teach teachers differed from her own practice of teaching mathematics. She could not live with the dissonance" (Heaton & Lampert, 1993, p. 77). Ongoing reflective examination of professional practice challenges thinking about teaching and teacher education and raises awareness of curricula and pedagogical decision-making (Cole, 1995).

Another facet of developing informed awareness appears in teacher educators seeking to understand more generally what is going on in their classrooms or deciding to study the implementation of particular educational philosophies. Schuck's (1999) investigation of the impact of teacher education reform on the practice of new teacher graduates is an excellent illustration.

Investigating a Particular Aspect of Practice

Some self-studies are focused more specifically on the influence of a particular approach or task on student teachers' thinking about or approach to practice. For example, Holt-Reynolds and Johnson (2002) investigated artifacts of their practice (assignments for students) as a way of learning about their student teachers' needs and concerns. Each of these two teacher educators had developed assignments for their student teachers that were intended to provide opportunities to work in different ways and to promote student teachers' professional growth. Both teacher educators were puzzled to find that few of their student teachers took up these opportunities in their assignment work. Through critical analysis of the assignment tasks they had set and their students' responses to these tasks, Holt-Reynolds and Johnson learned that student teachers' concerns about time constraints and their habitual, ingrained ways of working had outweighed their desires to work differently. Other examples of self-studies investigating particular aspects of practice include Trumbull's (2000) analysis of the kinds of written feedback she provided on students' work and the congruency of her feedback with the messages about reflection that she was trying to promote, and Mueller's (2001) study of the journal task she was using to promote reflection with her student teachers.

Developing a Model of Critical Reflection

Teacher educators wanting to make explicit to their student teachers their approaches to learning about teaching may use self-study as a means for so doing. Heaton identified that, "by making her teaching available for study to people who do not ordinarily engage in the careful analysis of actual practice …,[she] makes available a situation in which the problems entailed in implementing those practices can be directly examined and understood from alternative points of view" (Heaton & Lampert, 1993, p. 46). Loughran's (1996) self-study of his modelling of reflection for his student-teachers and Hudson-Ross and Graham's (2000) investigation of the effects of modelling a constructivist approach in their teacher education practice are further examples of this approach to making approaches to learning to teach explicit.

Generating More Meaningful Alternatives to Institutional Evaluation

Some teacher educators seek to find ways of representing their practice to their institution for the purposes of promotion or tenure that are more meaningful than the data that standard teaching evaluations provide. The kinds of values about teaching that are implicit in standard teaching evaluations may be incongruent with the kinds of values that teacher educators believe are most helpful for student teachers' learning about teaching. For example, teaching evaluation questionnaires are often based on a 'teaching as telling' model. By choosing to evaluate practice through self-study, teacher educators may be in a better position to more faithfully represent their intentions for practice to others. The experiences of Fitzgerald, Farstad and Deemer (2002), described later in this chapter, belong to this category.

An alternative way of categorising the purposes for self-studies is according to the 'levels of concern' that the study addresses (Hamilton & Pinnegar, 1998). 'Microlevels' are local; they begin from the immediate context of the classroom and involve questions such as, "How do I encourage participation of all students, rather than allowing a few to dominate?" Self-studies that begin from 'macro-levels' are initiated from more global concerns such as, "Can I help promote social justice in schools through my work with student teachers?"

Distinguishing and classifying different purposes for self-study is a difficult and potentially misleading task. The nature of investigating practice is such that these purposes cannot be easily categorized or 'held still in one spot.' The boundaries blur because what is being studied gives insights into practice that then change practice and inevitably alter the focus of the study. Categorizing according to purpose is also difficult because teacher educators rarely study one aspect of their practice at a time; what is central at a particular time can move to the periphery as other issues come to occupy the teacher educator's focus of attention. For example, a teacher educator seeking to learn more about a particular teaching practice may be led as a result of her enquiries to a more

general investigation of practice, which may lead to the uncovering of assumptions about teaching and the articulation of a philosophy and then back again to the original practice.

What this illustrates is that knowledge developed in teaching about teaching usually emerges from teacher educators' efforts to solve pedagogical problems. These problems may present themselves as 'surprises' encountered in the course of their work, or they may be the result of a teacher educator's deliberate decision to investigate a particular aspect of practice. An important common element of teacher educators' self-studies is that they begin from inside the practice context, from a real concern, issue or dilemma. The individual nature of pedagogical problems encountered in daily work inevitably leads to the pursuit of different questions about practice and different actions that result from their study. The following section begins to explore this issue in detail.

How Do Teacher Educators Begin to Investigate Practice, and What Happens When They Do?

While the term 'self-study' seems to suggest an exclusive focus on the teacher educator, the 'self' in self-study encompasses a more diverse variety of selves than the teacher educator alone. Inquiry into the nature of teacher preparation to better understand the experience of teaching prospective teachers can begin from a study of self where 'self' is the teacher educator, or through investigating an aspect of student teachers' experience where 'self' is a student. Alternatively, collaborative conversations with the 'selves' who are colleagues may serve as the starting point for the study of teaching about teaching.

Although the beginning points may be different, the 'selves' are intertwined in such a way that the study of one 'self' inevitably leads to study of an 'other.' For instance, teacher educators who begin by investigating their students' understanding of an aspect of their teacher preparation may be led to apprehend something about the nature of their own actions as a teacher and about the unintended effects of those actions. This, then, may set in motion an investigation of the teacher educator's own actions that were not part of the initial intention of the investigation. This is illustrated in Dinkelman's (1999) inquiry into the development of critical reflection in preservice secondary teachers, a study that unexpectedly evolved into a powerful examination of Dinkelman's own teaching. By interviewing student teachers from his classes about their processes of reflection, Dinkelman came to learn that his own teaching approach was "unknowingly squelching ... the most valued objectives of his teaching" (p. 2). Dinkelman was drawn into a new kind of investigation of his teacher-self as a consequence of his willingness to listen to and learn from the student-teacher-selves who experienced his teaching.

In other studies, teacher educators intentionally begin from their students' experiences in order to access understandings of their teaching practice that might otherwise be invisible to them. Freese's analysis (2002) of a student teacher's apparent resistance to reflect on his own teaching and Hoban's (1997)

investigation of his student teachers' understanding of the relationship between his teaching and their learning are two examples of self-studies in which the teacher educator deliberately sought to use student teachers' experiences as a mirror to look into personal teaching practice. Hoban describes the reciprocal learning process that occurs when student teachers are asked to study their own learning, which then stimulates the teacher to study personal teaching practices.

Critical conversations with a colleague about her practice led Bass, a teacher educator, to scrutinize her own classroom interactions more closely (Bass, Anderson-Patton & Allender, 2002). Bass invited a colleague, Allender, into her classroom for a semester to give her feedback about her practice. Through the critical conversations they shared, Bass came to recognize 'points of vulnerability' in her approach to practice. Using this heightened awareness, Bass began to investigate how these vulnerable points were played out in her interactions with her students. The above shows that self-study is not a straightforward process, and this leads to a consideration of the ways in which learning from self-study is conceptualized.

Self-Study as a Messy Process

Teacher educators' efforts to address problems of practice rarely result in tidy answers when such problems are viewed through the lens of self-study. Knowledge that is developed through teacher educators' investigations of their teaching about teaching reflects the "indeterminate swampy zone" of practice described by Schön (1983). It is a complex and messy terrain, often difficult to describe. Grimmett (1997) found this when he attempted to capture the complexities of implementing a changed pedagogy in his classes: "I was to learn that, although there are solutions to some problems, every solution creates further problems in a classroom of diverse learning needs and expectations" (Grimmett, 1997, p. 131). Grimmett's words reflect the process of self-study itself, a series of recursive spirals that lead to continuing investigations of practice.

For many teacher educators, the difficulties associated with researching personal practice lie not so much in recognizing the complexities inherent in their work (these they readily see) but in finding ways of representing that complexity to others. Because so little of the "swamp" has been mapped, it is hard to know how to proceed. An important purpose of this chapter therefore, is to bring together teacher educators' different accounts of their work to offer possibilities to others also wanting to learn to find their way around in that swamp of practice. Equally important is finding ways to represent these accounts in ways that preserve the complexity and ambiguity of the process of teacher educators' knowledge development yet, at the same time, are meaningful to the reader. Addressing this issue has been a significant challenge in the construction of this chapter because teacher educators often learn from self-studies that they experience competing tensions, but they do not necessarily learn to articulate what those tensions are. That they are present within teacher educators' practice stands out clearly from individual self-study accounts in the literature, but these

tensions are rarely organised or examined across studies to illuminate the patterns that exist. Invariably, these tensions do not present themselves neatly as well defined packages; rather, they interconnect. The following section attempts to portray the different tensions in a way that makes them accessible to the reader.

The notion of tensions is intended to capture both the feelings of internal turmoil that many teacher educators experience in their teaching about teaching as they find themselves pulled in different directions and the difficulties that many teacher educators experience as they learn to recognize and manage these opposing forces. The idea of tensions is portrayed variously in research accounts as "deliberating about alternatives rather than making choices" (Nicol, 1997, p. 96), "deciding which voices to listen to" (Brookfield, 1995, p. 45), and "conflicting stories" (Clandinin, 1995, p. 30). Loughran and Northfield (1998) identify tensions, together with disappointments and dilemmas, as "elements that dominate data gathering … [in self-study, that] occupy the study's centre of attention" (p. 14). Hence drawing on tensions seems an appropriate way of representing what happens in a self-study and how it shapes data gathering and the knowledge outcomes. The tensions that are described here include those that teacher educators have recognised in their own work as well as those that I have recognised from my reading of their work.

Tensions that Influence Learning about Practice Developed in Self-Study

Many of the tensions described in this section have grown out of teacher educators' attempts to match their goals for their students' learning with the needs and concerns that student teachers express for their own learning. These at times conflicting purposes are part of the ever-present ambiguity of teachers' (and teacher educators') work and are, as Lampert (1985, p. 194) observes, "more manageable than solveable." Tensions focus on the following areas; although presented as a list, they are not intended to represent a hierarchy. Each is elaborated in turn.

Telling and Growth (a tension):

- between informing and creating opportunities to reflect and self-direct;
- between acknowledging student teachers' needs and concerns and challenging them to grow.

Confidence and Uncertainty (a tension):

- between making explicit the complexities and messiness of teaching and helping student teachers feel confident to proceed;
- between exposing vulnerability as a teacher educator and maintaining student teachers' confidence in the teacher educator as a leader.

Working With and Against (a tension):

- between working towards a particular ideal and jeopardising this ideal by the approach chosen to attain it.

Discomfort and Challenge (a tension):

- between a constructive learning experience and an uncomfortable learning experience.

Acknowledging and Building upon Experience (a tension):

- between helping students recognise the 'authority of their experience' and helping them to see that there is more to teaching than simply experience.

Planning and Being Responsive (a tension):

- between planning for learning and responding to learning opportunities as they arise in practice.

Telling and Growth

The first area of tension is embedded in teacher educators' learning how to balance their own desire to tell their student teachers about teaching with their understanding of the importance of providing opportunities for students to learn about teaching for themselves. The tension is between informing and creating opportunities to reflect and self-direct and between acknowledging student teachers' needs and concerns and challenging them to grow. Managing this tension is made all the more difficult by student teachers' desire to be told what works and by teacher educators' desires to be seen as helpful, thereby fulfilling traditional and subconscious perceptions of their role as teacher. Teacher educators often express this tension in comments such as "How can I do my job and not come off as the only one in the class with all the answers?" (Pope, 1999, p. 1) or "How can I wean [student teachers] … from looking for recipes for good teaching?" (Adler, 1991, p. 164).

Both the teacher educator's role and student teachers' expectations of teacher educators' behaviours can strongly reinforce the traditional 'telling' roles associated with teaching (Britzman, 1991). This creates a role dilemma for teacher educators as they are no longer sure about how and what to teach. For example, Carson (1997, p. 78) recognised the role dilemma associated with no longer allowing himself to fall into "the trap of telling" and he wanted to challenge this simplistic notion of teaching. Withdrawing the "authority of his experience" however, meant that he was left confused about how he should proceed as a teacher educator. He began to question what knowledge would be most helpful for student teachers if he could not tell them how to teach? "The student's [sic] frustrations were mirrored in the dilemmas that I felt in trying to negotiate the tension between informing students and creating opportunities for them to reflect" (p. 78). Carson learnt to deal with his own concerns about how to withdraw the authority of his considerable experience as a teacher educator and yet, at the same time, use his experience to help student teachers to grow professionally through reflection on their own experiences.

Grimmett's (1997) experiences of learning to implement a pedagogy of inquiry displayed concerns similar to those of Carson.

How do I step out of the role of presenting into the role of facilitating? How do I cast off the role of problem solving to engage in problem posing? How do I cease pouring energy into my performance as a teacher in order to channel it into meeting the needs of learners and monitoring the process of learning? (Grimmett, 1997, pp. 121–122).

Through his investigation of his practice, Grimmett learnt that being well-intentioned and knowledgeable about reflection was not sufficient for addressing the complexities of learning to practice a reflective stance with his students. He needed to experience this first hand, in his own practice, and so consider anew through these experiences the meaning of practicing reflection.

Louie identified the emotional ties that can bind teacher educators to a particular belief about teaching and the difficulty of letting go of such ties, even when it is clear that they are not helpful for students' learning: "I gradually became aware of my belief that lecturing was an essential element of good teaching … [and] I realised the discrepancy between my cognitive sense of good teaching strategies and my emotional tie to lecturing" (Louie, Stackman, Drevdahl, & Purdy, 2002, p. 203). Her collaborative self-study led her to identify and better manage the tension between providing opportunities for her student teachers to develop independently and falling prey to her subconscious desires to fulfill the 'telling' role.

While the previous examples are drawn from the work of experienced teacher educators, this tension is also apparent in the experiences of new teacher educators, such as the collaborative action research undertaken by Dinkelman, Margolis, and Sikkenga (2001). Sikkenga and Margolis, two former high school teachers making their transition into university-based teacher education, found themselves experiencing the competing desires of wanting to tell their student teachers about good teaching while, at the same time, acknowledging the importance of student teachers constructing this knowledge for themselves. Margolis came to recognise that his desire 'to tell' was a result of his "finally start[ing] to get good teaching, and you want your students to do the same thing" (p. 40). Telling is a powerfully seductive notion that can be extremely difficult to resist. It not only seems right but is also easy to do. It is not surprising, then, to find that this first area of tension is well explored in the self-study literature, particularly given the prevalence of the transmission model in teaching and the mounting research evidence to suggest its limited impact on learning.

Tensions associated with teacher educators' attempts to build an environment that encourages student teachers to actively direct their own learning processes are further intensified in contexts where formal assessment systems are imposed. What would motivate student teachers to seek their own solutions to teaching problems when their formal assessment is at stake? Student teachers anxious to learn what they must do in order to be academically successful may be reluctant to risk sacrificing grades to respond to their real needs and, as a consequence, reinforce the 'teacher as informer' role. The background experiences of 'typical' teacher education candidates tend to reinforce this scenario. Given these circumstances, teacher educators find that attempting to recognise and respond to the

particular concerns of the student teachers with whom they work can be extremely challenging. Tidwell's (2002) self-study articulated these difficulties, as she investigated the question of how she attempted to incorporate valuing individual students' ways of knowing with "institutional standards and institutional norms" (p. 31). As a consequence of her self-study, Tidwell came to the unexpected finding that her *own* beliefs tended to limit the ways in which *she* valued differences between individuals.

Another aspect of this first area of tension for teacher educators (particularly in the USA) is the influence of individual accountability, tenure and formal evaluations of teaching on perceptions of teaching. Fitzgerald, Farstad and Deemer (2002) describe the challenge of enacting an interactive, learner-centred model of teaching, while being held formally accountable for their teaching based on "an instrument developed for linear teaching ('teaching as telling')" (p. 208). Fitzgerald recalled the conflicting feelings that the end of year student reviews evoked in her.

> While members of my promotion and tenure committee were supportive, rarely did they fail to point out the poor ratings by students on some items of the student evaluation survey. Uncertain if my interpretation of the ratings would be convincing, I dreaded seeing the numbers come in, and became anxious about their presence. At the same time, I resisted changing my practice in ways that might lead to higher scores on items which presume teacher dominance in the classroom." (Fitzgerald, Farstad & Deemer, 2002, p. 214)

Fitzgerald, Farstad and Deemer learnt to manage this tension by reframing the criteria for promotion and tenure to include data from the self-studies of their practice. They were successful in illustrating for their institutions the value of self-study for examining the interactive forms of practice they valued.

While there are some situations in which student teachers' negative evaluations of approaches to teacher education that seek to challenge the 'telling' model can hinder teacher-educators' employment opportunities, in other circumstances, student teachers can be reluctant to provide critical evaluation of teacher educators' practice because they do not want to disadvantage their own formal assessment. Hoban's (1997) study of his student teachers' reflection on their learning about teaching from their experiences in his classes identified this aspect. Both Hoban and the student teachers in his classes felt the difficulties associated with honestly critiquing his teaching and their learning while, at the same time, knowing that their efforts would contribute to formal assessment. Hoban came to learn that his students needed to trust that he valued constructive criticism before they would engage in it. Ungraded teacher education courses (or ungraded subjects offered within teacher education courses) offer some relief from the pressure to conform to role expectations for teachers and students. However, it would be naïve to think that grading is the only obstacle to honesty and the pursuit of genuine, personal understanding in learning about teaching.

A further strand of this tension between telling and creating opportunities to learn lies in acknowledging student teachers' needs and concerns and then challenging them to grow beyond these. Nicol (1997) investigated her teaching about mathematics teaching and recognised that her desire to teach teaching in such a way that her student teachers became willing and able to reflect on the purposes and consequences of their actions conflicted with the expectations of many of her student teachers. (Their desire was to be told how to teach mathematics and what mathematics to teach). Through her experiences of studying her interactions with students, Nicol's perceptions of the balance, "between accomplishing … [her] own teaching goals and experiencing teaching from prospective teachers' eyes" (p. 112) were sharpened. She learnt to 'reframe' this tension in terms of the differences between introducing her own agenda and responding to her student teachers' particular needs.

The notion of 'telling and growth' as competing tensions is well summarized in the words of Noddings (2001, p. 103). "I do not think the tension between shaping students toward some preestablished ideal and encouraging them to grow in directions they themselves choose can be resolved. It is a tension that has to be lived."

Confidence and Uncertainty

As teacher educators begin to explore new ways of working with their students, many begin to experience feelings of self-doubt and uncertainty about how to proceed. This leads to a second area of tension, between making explicit the complexities and messiness of teaching and helping student teachers feel confident to proceed. Similarly, there is a tension between exposing one's vulnerability as a teacher educator and maintaining student teachers' confidence in the teacher educator as a leader.

An important goal for many teacher educators is to help their student teachers become more aware of their processes of pedagogical decision-making, so that they might be more thoughtful about the pedagogical choices they make. One way of helping to work towards this goal is for teacher educators to model their own decision-making processes for their student teachers. Berry (2001) identified the difficulties she encountered as she sought to make explicit to her student teachers in her biology methods class the problematic pedagogical decisions she faced in her own teaching about teaching. She wanted to encourage her student teachers to see into teaching practice in ways that challenged their views of teaching as the straightforward enactment of a 'script' (White, 1989). However, in choosing to make available her thinking about her teaching, she found that some student teachers experienced a loss of confidence in her ability to successfully guide their development. In the following extract, in which she is writing about her own practice, Berry explores this dilemma:

Even though I have identified that articulating my thinking about teaching during the act of teaching is an important goal of my teaching, I have also found that this is not an easy goal to 'live' as a teacher educator. I am not

always consciously aware of my actions, in action, nor am I able to readily articulate my pedagogical reasoning on the spot. Usually, there is a multitude of thoughts running through my head as I teach. How do I know which of these is useful at any particular time to select to highlight for my students? … Making a choice about what to make explicit both in my talking about practice during classes and in my journal entries was a constant dilemma for me. I had to choose carefully what I held up for public examination that would be useful and accessible for these student teachers and in hindsight, I don't think I really recognised how the different 'scripts' that we carried for teaching may have affected their perceptions of what I said or wrote. I wanted to convince them it is OK to be unsure in your own practice, that teaching is problematic. (Berry, 2001, p. 3)

Berry shared her writing with Lisa, one of the student teachers in her Biology methods class, who responded as follows:

I think it was important for us to trust that you would be able to teach us well, and that opening up your vulnerability and uncertainty about things was unsettling for many … It was like 'whoah! She doesn't know what she's doing all the time – holy hell! – what hope have we got?' (L. Corteen, personal communication, March 15, 2001)

Teacher educators report feelings of uncertainty as they begin to enact new approaches to practice. These feelings can be conveyed to student teachers who may interpret them as a shortcoming on the part of the teacher educator. Deciding what aspects of practice to make explicit, how to make them explicit, and when, so that they are useful and meaningful for student teachers, lies at the heart of this tension. It is a risky business for the teacher educator and requires the establishment of a trusting relationship with the class, as Hoban and Berry learnt, and as Loughran also discovered in his efforts of 'thinking out loud' with his student teachers.

Choosing an appropriate time to explain that I would be "thinking out loud" and my purpose for doing so was important. I had to have a sense of trust in the class and they with me otherwise my behaviour could appear to be peculiar rather than purposeful. There was a danger that talking aloud about what I was or was not doing, and why, could be interpreted as lacking appropriate direction. This could be exacerbated by the fact that many beginning teachers enter the course believing they can be told how to teach. It could be a risk which might compromise my supposed "expert" position as someone responsible for teaching teachers. (Loughran, 1995, p. 434)

It is interesting to note that the view expressed by Loughran about the possibility of compromising one's position through what one selects to share with student teachers echoes the ideas expressed by Lisa. The fact that their two views are in

accord suggests that this is a tension that teacher educators would be well advised to pay careful attention to in their work.

Clandinin (1995) uses the analogy of the competing authorities of different 'stories' to describe the professional risk associated with stepping out into new approaches to practice. Some university teachers choose to, "give up a familiar and privileged story for the uncertainty of a new one" (Clandinin, 1995, p. 30), a decision that can be extremely challenging both personally and professionally. White (2002) found this as she experienced the 'acute discomfort' of implementing a new teaching 'story' with her elementary mathematics methods classes.

> Finding myself in the middle of a class peopled by students and content, I was uncertain what specific actions to take that might be constructivist in nature, or when to take them. Knowing what not to do did little to nothing to inform me about what to do. My teaching was analogous to trying to walk on quicksand. I had no lodestone from which I could launch my teaching to begin to establish a foundation from which to operate. Most of the students in the elementary maths methods class became frustrated with me saying I was unclear and did not provide adequate leadership or direction. Frustration for them translated into anxiety for me. (White, 2002, p. 308)

In a different example, Schulte (2001), a teacher educator whose self-study focused on transformation in preservice teachers' beliefs, built new understandings of practice through learning to manage the ambiguous notion of being confident about uncertainty, and coming to see its value.

> Doubts and insecurities about my teaching continued to plague me despite my best efforts to understand them and learn from my mistakes. I regularly felt guilty about having to "practice" this process on my students. My coping mechanism was to share the process with my students so I was explicitly modeling the same kinds of fears and anxieties they were having. If I truly wanted my students to be life-long learners of teaching, then it makes sense that I should demonstrate the same by exposing my process to them. Russell (1998) agrees that "teacher educators must learn to learn from experience and self-study is a way for teacher educators to do that" (p. 6).

> I was insecure and doubtful, but this study also led to a certain confidence. Forcing myself to "risk" my relationships with students so that I might challenge them to better understand multiple perspectives has provided me with a base of experiences to draw upon in the future. My students have said that many of the strategies and activities I used were successful, at least in the short term, in helping them to challenge their assumptions about teaching and themselves. I was often scared and anxious about my behaviors that were intended to disrupt students' thinking; however, I feel a little bit more prepared for the next time I will have similar interactions. Practice

and my students' positive feedback have given me courage. (Schulte, 2001, p. 109)

Teacher educators who choose to share authority with their student teachers expose their limitations, which can lead to a shared vulnerability that student teachers may be very unwilling to accept. "Thinking of one's job as figuring out how to live with a web of related problems that cannot be solved seems like an admission of weakness" (Lampert, 1985, p. 193). Teachers (and teacher educators) need to exhibit confidence so that students can trust, and then risk doing their best. Examples from the work of beginning teacher educators engaged in self-study highlight the difficulties of trying to establish oneself as a teacher educator (particularly when unsure of how to do so) and trying to provide a credible and convincing model for student teachers at the same time. (See Nicol, 1997; Berry, 2001; Carson, 1997; Peterman, 1997).

One currently underdeveloped area of self-study seems to be the way in which *student teachers* experience this tension. Perhaps one reason why so little is reported in this area is due to a reluctance on the part of student teachers to offer this kind of feedback about their feelings. Perhaps also, research traditions dictate the dominant modes of reporting practice and limit what is published. It is interesting to note that the strongest examples of this area of tension come from outside of North America.

Working With and Against

A third area of tension arises from the approaches chosen by teacher educators to bring about change, between working towards a particular ideal and jeopardising this ideal by the approach chosen to attain it.

Much of what is learnt by teacher educators from the self-studies of their practice connects to the realisation that often the goals they set out to achieve are inadvertently undermined by their own choice of actions to achieve them. Senese (2002), in his study of his efforts to hand over responsibility for their learning to the students in his classes, sums up this idea as the attraction of opposites. Senese's self-study resulted in his coming to understand that in order to free his students to be the independent learners that he hoped they would become, he had to set boundaries for their learning, an approach that seemed contradictory to his instinctive predispositions. While Senese's work was predominantly concerned with high school students, the same ideas about the tension of opposites apply equally well to the way in which the learning of adults is conceptualized and organized, as the following extract suggests.

I had long believed that my primary job as a teacher was to make my students independent of my instruction and of me. I had strongly subscribed to providing students with multiple opportunities to learn, with choices, and with creative outlets. But as often as I turned the curriculum over to the students, I had still maintained control of it, doling out pieces as I saw fit, gauging how much was good for them, and allowing them to move forward only in measured steps. (Senese, 2002, p. 44)

In a similar example, Grimmett (1997) (had the desire to create a situation that involved all his student teachers in free-flowing discussion, but learnt that he could not do this simply by letting discussion flow freely. He recognised that "there could not be an *equitable* distribution of student voice when I, as teacher, was not creating the structures and opportunities for *equal* student access to the classroom discourse" (p. 129).

These examples from Senese and Grimmett focus on the contradictory effects of their conscious actions to influence student learning. In a different example, Macgillivray (1997) highlights the ways in which practice can be sabotaged by one's unconscious beliefs, as she unwittingly undermined her efforts to create more equitable discourses in her classes by "reinforcing much of what … [she] had attempted to disrupt" (p. 469). By researching her practice, Macgillivray identified her subconscious assumptions about power structures that served to distort her best intentions for her students' learning and that caused her to work "within and against myself" (p. 470). Although Macgillivray does not name her work as self-study, (she calls it "turning my philosophical stances inwards to see the contradictions in myself" p. 470), Macgillivray's research offers important insights for self-study practitioners about the powerful effects of one's unconscious assumptions on one's practice. Similarly, Tidwell's (2002) research, described earlier, is a further example of uncovering unconscious biases in practice that work against beliefs. An outcome of the self-studies of Macgillivray and Tidwell is that each teacher educator identified the tacit rules that guided her interactions with others. The rules that Macgillivray and Tidwell uncovered related to perceptions of effectiveness and success and the influence of their perceptions on their abilities to play the role of teacher in certain ways. For Tidwell, this meant being able to inform, direct and facilitate students; for Macgillivray, this required students to be calm and explicit in dealing with their concerns and to approach her in a private setting if they wished to discuss matters. Interactions with students who did not fit comfortably within these conceptualisations of role and students' willingness to explore the reasons for "interactional misfires (Macgillivray, 1997, p. 479) provided these teacher educators with the opportunity to acquire new self-knowledge.

Brookfield (1995) suggests that teacher educators need to question the assumptions and practices that *seem* to make their teaching lives easier but are actually working against their long-term interests. Before teacher educators can begin to question assumptions, they must recognize that they exist. Questioning a familiar and comfortable practice becomes much more fruitful after realizing that it is counter-productive. When particular patterns of teacher educators' behaviour become habitual, they come to be thought of as 'natural' and 'self-evident,' even though they may be working against the intended goals for student teachers' learning (Wilkes, 1998). With many demands on their attention, teacher educators may not readily see the ways in which they themselves may be contributing to the 'opposites' effect, even though they may be readily apparent to their students or colleagues. Wilkes (1998) draws on an example from her own practice, recalling student teachers who struggle and seek help (a situation

familiar to many teacher educators). Her example also illustrates the first area of tension, between telling and growth, thus highlighting the recursive nature of categorisation.

> Often when a student comes to me for help, and they are truly struggling, my intuition tells me to help them either by giving them the answer or telling them where to find it. It is painful for me to listen to them struggle and not give them the information they need. I often have to resist mightily what I want to do, what my gut tells me, and fix the momentary crisis. But I have learned that if I become the source of answers, then I often enable students to stop searching for themselves. So I now employ what, for me, is a counterintuitive practice. I just ask them questions instead, such as, 'Why do you think it is important to know this?' ... Later they often come back and thank me for not telling them the answer. But at the time, they often leave angry with me for withholding information from them. (Wilkes, 1998, p. 199)

The realisation by teacher educators of the need to work in ways that are counterintuitive, and the problem of doing so, point to a growing area of the self-study literature. The difficulties that may be encountered as a result of working in different ways can test the relationship between teacher educators and student teachers, and this issue is explored in the following section.

Discomfort and Challenge

A fourth area of tension comes from the process of engaging students in forms of confrontational pedagogy and being hurtful. New approaches to teaching about teaching encourage opening up practice to the scrutiny of others through honest discussions about the impact of teaching on the development of others' learning. Inquiry conducted into practice in this way confronts the usual 'rules of politeness' that generally guide the ways that student teachers or teacher educators speak about each others' practice. Working with student teachers in ways that genuinely open up practice for honest critique requires a sensitive appreciation for others' feelings; the caring described by Noddings (2001) is relevant here.

Berry and Loughran's (2002) work with their student teachers provides insight into this tension as together they attempted to set up opportunities for their students to experience and to articulate the uncertainties of practice as they encountered them through microteaching situations. Berry and Loughran wanted to find ways to help student teachers to see into their practice, and sometimes they did this by confronting their students with problems or possibilities as they were teaching – an approach they acknowledged as risky, given the vulnerability of the student teachers in this situation. In their self-study account they note the following:

> Making decisions about which approach to take, with whom, and what

aspect of the teaching to highlight is risky and it cuts both ways. Not just [student teachers'] self-esteem was at stake, so too was our credibility as teacher educators. Students need to know that we genuinely care about them. It is imperative that we do not belittle or humiliate them, but, at the same time, we want them to feel uncomfortable enough about their practice to begin to examine the implications of their teaching decisions and actions. (Berry & Loughran, 2002, p. 21)

Within the field of self-study this tension tends to be hinted at more than explicitly examined. Shulte's (2001) work suggests why: teacher educators often find it difficult to ask hard questions of their students because their sense of identity is bound closely to their ability to develop good relationships with their student teachers and they may feel that challenging their students' views may compromise this role. (Interestingly, although issues associated with the use of confrontational pedagogies are frequently discussed by teacher educators at self-study conferences and are clearly felt within their work, these discussions, or the episodes that give rise to them, are rarely transformed into print.) The role dilemma induced by working in this way is illustrated through the following extract from Schulte (2001).

Engaging students in this kind of confrontational pedagogy was a challenge for me, because my self-identity is often closely tied to my ability to relate to others. Jordan (1991) explains this in saying that a woman's deepest sense of being is continuously formed in connection with others. I am often worried about compromising my relationships by appearing to be conde-scending or presumptuous. Because I am continuously weighing the consequences of my actions on my relationships, assisting others in transformation is even more stressful for me (Shulte, 2001, p. 7).

Schulte's efforts to induce student teachers' self-examination and critical questioning through her attempts to reflect reality in an unproblematic way led to struggles in her teaching that she had not anticipated. Just as Berry, Loughran and Schulte highlight the effects of confrontational pedagogies on student learning, so too Guilfoyle draws on Piaget's notion of disequilibrium to describe what takes place when learning is disturbed.

Our students perhaps are seldom faced with 'real' learning so they do not know how to deal with the disequilibrium and take it out on us. Most were good students and did not have to struggle. Why should they have to struggle with ideas now[?] (Guilfoyle, Hamilton, & Pinnegar, 1997, p. 194)

Acknowledging and Building upon Experience

Helping students to see that their learning about teaching comes from more than acquiring experiences of teaching sets up a fifth area of tension, between helping students recognise the 'authority of their experience' and helping them to see that there is more to teaching than simply experience.

Munby and Russell (1994) use the term "authority of experience" to express the significance of the knowledge that individuals develop as a consequence of their personal experiences. Such "authority of experience" is often valued less in teacher education than other modes of authority, such as research texts or the teacher educator's own authority of position. Developing ways to both acknowledge and extend student teachers' "authority of experience" is the focus of Loughran and Russell's (1997) collaborative examination of their different programs of teacher education. Loughran and Russell identify the importance of "meeting students on their own terms" through valuing the ideas and experiences that student teachers bring to teacher education and "challenging them to interpret their own meaning in ways that they have not had to before and to translate insights into future teaching" (p. 164). The pedagogical challenge in this for teacher educators, as well as the source of tension, comes from developing approaches that do more than simply (re)confirm student teachers' existing beliefs, so that they may be prepared to willingly suspend their beliefs in order to entertain alternative approaches to pedagogy.

It has been difficult to find examples from the available literature that clearly illustrates this tension in action. An example would involve moving student teachers beyond the knowledge developed through their experiences of teaching into new kinds of knowledge and new ways of understanding practice. One way of pursuing this may be through teacher educators and student teachers using each other as pedagogical sounding boards, sharing personal experiences of teaching in such a way that each can encourage the other to identify and make sense of the knowledge gained through experience.

Planning and Being Responsive

A sixth area of tension focuses on the way in which learning experiences must be both planned in advance and also recognised and responded to within practice. Thus there is a tension between planning for learning and responding to learning opportunities as they arise in practice. The most powerful learning for student teachers and teacher educators alike can came from unplanned 'teachable moments' (van Manen, 1990; Hoban & Ferry, 2001), but for this learning to occur, teacher educators must be open to understanding the learning situation from the point of view of the learner, rather than imposing predetermined frames.

Nicol (1997) identified the difficulties she experienced as a teacher educator having particular goals and intentions for her students' learning yet, at the same time, wanting to be responsive to the kinds of issues and concerns that her student teachers raised in her classes. Through her self-study she became aware of the delicate balance between her listening *for* her own agenda and her listening *to* what her students are saying. She came to recognise that "a focus on only listening *for* makes it difficult to listen to students' experiences ... [and] a focus on only listening *to* may make it difficult to interpret students' experiences" (p. 112). Learning to see possibilities for responding was an important outcome

of her study, which she found came from learning to see through others' eyes so that she was not just responding to her own preplanned agenda.

Heaton and Lampert (1993) identify what they see as the requirements of teacher education that operates in such a manner: "Teaching *teaching* for understanding requires the teacher educator and the learner to interact in the context of actual teaching problems and to try to understand these problems in terms of the circumstances in which they arise" (p. 56).

Discovering when to let go of a prior agenda in order to respond to student teachers' needs as they arise through experiences in teacher education is something that Pope (1999) also began to better understand through her self-study. She recognized that part of the process involved letting go of her own defensiveness, to shift her thinking away from herself and to view situations from the perspective of her students. In situations such as this, rather than prescribing and controlling the learning experiences, creating conditions for learning becomes much more important (Northfield & Loughran, 1996, p. 126).

Summarising the Tensions: What Has Been Learnt?

While represented here as separate, the tensions that influence learning about practice in self-study do not exist in isolation from each other. The following account is offered as a summary of this section because it encapsulates several of the tensions described (discomfort and challenge, planning and being responsive, confidence and uncertainty) and is offered here as a way of 'seeing' how these tensions interact in practice. Taken from Berry and Loughran's co-teaching experiences working with third year Bachelor of Education students, it describes a situation in which student teachers are challenged to move beyond the routines in their peer teaching activity.

> Through our experiences of developing and teaching this subject, we came to see the value in creating uncomfortable experiences of learning: by publicly confronting assumptions about learning, we could extend the learning possibilities. We wanted to help our students be critically aware of significant features of their experiences so that they could better understand their perceptions of given teaching and learning situations. For example, in planning for their peer teaching, most student teachers spent a considerable amount of time and effort on *what* they would teach as opposed to *how* or *why* they would or would not use a specific teaching procedure.
>
> This is to be expected, as their inexperience in teaching is inevitably driven by their initial concerns about mastering the content they want to *deliver*. As a consequence, their teaching is often focused on their front-of-the-class delivery and performance, limiting what they can see happening right in front of them. We wanted to push them beyond this perspective so that they might consider the why and how of their teaching. *We wanted to find ways to show them what they could not yet see.* Sometimes we did this by asking questions or making our observations explicit during the

debriefing at the end of a peer teaching episode, encouraging participants to describe how they felt during the teaching. Sometimes we did this by confronting them with what was going on as they were teaching.

Making decisions about which approach to take, with whom, and what aspect of the teaching to highlight is risky and it cuts both ways. Not just their self-esteem was at stake, so too was our credibility as teacher educators. Students need to know that we genuinely care about them. It is imperative that we not belittle or humiliate them, but, at the same time, we want them to feel uncomfortable enough about their practice to begin to examine the implications of their teaching decisions and actions.

Student teachers' planning often set the class up to play the familiar game of "question and answer," but they would not disrupt this game by asking challenging questions or changing the script (for example, giving an opinion that challenged the teacher). In one particularly memorable episode, as this script played out, it was obvious that everyone was "playing the game," and when an uncomfortable situation arose for the group doing the teaching, the feeling became very real.

> Adam and Ben chose to teach the group about Buddhism. They had prepared a long and difficult text to explain Buddhism and they put it up for the class to read on the overhead projector.

> "How could anyone see that, let alone understand it?" I thought. "Yet no one is saying anything! Why are they all so polite?," I asked myself. "I can't read that!" I said aloud, sounding more aggressive than I actually intended. "It doesn't make sense!"

> Adam's response to this interjection was to read the overhead text aloud. John picked up on my intervention and pushed it along: "Yeah, what's the difference between Buddhism and Hare Krishna anyway?" Adam began a polite explanation but John interrupted: "Sounds stupid to me. Buddhism is dumb." Adam paused. Ben, his teaching partner, stood silent.

> "Come on, are you going to deal with me?" John continued. Adam and Ben did nothing. In fact, no one did anything. I wondered whether John had pushed this too far. What did he think he was helping them to learn about teaching? "Deal with me!" he repeated. But Ben and Adam didn't seem to know what to do, where to look, or how to act. I could feel their anguish. A long and painful silence followed. Finally, a class member spoke up.

> "That's inappropriate behaviour, John. Stop it!" she said. Claire had picked up on what was happening and she used the moment to show the others how a confrontation like this might be handled. The purpose had now been realised and Ben and Adam 'felt' what it was like to be in a confronting classroom situation. All of us had!

John's intervention was direct and persistent, pushing the boundaries of commonly acceptable teacher educator behavior. This incident highlighted for everyone how learning about teaching can be both confrontational and constructive. It also highlighted important differences about approaches to interventions that we were prepared to risk. Intervening in this way was not an option Mandi had considered or would have felt comfortable trying, but it provided a valuable opportunity to see what could be learnt when someone is prepared to take such a risk.

In his reflective report Ben described what he learnt in the following way:

> Instead of thinking on our feet, we aimed to try to get through the lesson and stick to our plan ... at the expense of the students' learning.

This episode was risky for all involved and is difficult to re-create in text; it is the *purpose* of embedding genuine learning in experience that we wish to highlight. A vicarious experience of a classroom confrontation could not be as powerful. The learning was real and was felt by all of us. (Berry & Loughran, 2002, pp. 20–22)

The ambiguities and complexities inherent in teacher educators' work often become more apparent through their investigations of practice, as they come to recognise themselves as "living contradictions" (Whitehead, 1993) and as they learn to be more comfortable with "build[ing] a working identity that is constructively ambiguous" (Lampert, 1985, p. 178). In fact, what is frequently learnt from self-studies of teacher educators' practice is the importance of acknowledging, living within, and even embracing the ambiguity in one's work. Instead of interpreting the tensions as situations that evoke despair and frustration, and trying to eliminate them from one's work, teacher educators begin to reframe them as elements that are necessary and pleasurable for the growth and learning that they bring.

One way of viewing this reframing process is through the concepts of *episteme* and *phronesis*. Teacher educators engaged in self-study often struggle with the frustration that they may know what changes they wish to make to practice and possess the formal knowledge to support their reasoning (episteme) but do not have the personal, experiential knowledge (phronesis) to carry out their role in the manner they wish. As Mueller (2001, p. 3) observes, "There is no script for teacher educators." Learning how and when to enact their knowledge or indeed what kind of knowledge to bring to bear in a particular situation remains a central focus of ongoing research efforts. One important purpose of sharing knowledge of practice in this way becomes clearer: In recognising aspects of practice that have been identified by others, teacher educators may begin to be more sensitive to what is happening within their own teaching about teaching and be aware of possible ways to respond. In other words, they may begin to reframe their situations, by seeing through different eyes or by seeing anew what they had previously taken for granted.

Conclusion

We have developed considerable expertise with regard to the personalisation of knowledge. We are not yet so expert at portraying it to others, because it seems to require new ways of doing so, but we are experimenting (Hamilton & LaBoskey, 2002). Teacher educators have learnt a great deal that is worth sharing from the self-study of their practices. Their work makes significant contributions to our understanding of the pedagogy of teacher education. Self-study research illustrates both the development of personal perceptions while trying to (act to) improve one's own teacher education practices and the results of personal efforts to take research-based findings and enact them in practice. One of the major challenges for the self-study of teacher education practices continues to involve finding ways to remain true to itself in communicating the particularities of experience while, at the same time, drawing out generalisable knowledge that can be widely available to others.

SELF-STUDY RESEARCH IN THE CONTEXT OF TEACHER EDUCATION PROGRAMS*

Renee Tipton Clift
University of Illinois at Urbana-Champaign

Abstract

This chapter summarizes selected peer-reviewed studies as a backdrop from which to examine issues surrounding research conducted within one's own teacher education classroom or program. Although the field of self-study research has developed an international cadre of proponents who are engaged in serious and important investigations of teacher education, researchers have not yet begun to address their connectedness to the county, the state, the nation, or the world. The values and practices held by self-study researchers, who have long championed the concept of data-based reflections on practice and who argue that qualitative investigations by ''insider'' practitioners give us access to knowledge that no other paradigm can or does, are clearly influenced by the larger social context, but it is entirely possible that the influence is not multi-directional. The chapter offers an argument that although programs, courses, and participants are embedded within political, social, and historical contexts, current self-study researchers most often focus only on the individual and her/his students, thus diminishing the potential for wider relevance of the research.

Rebecca: I never told you about that letter Jane Crofut got from her minister when she was sick. He wrote Jane a letter and on the envelope the address was like this: It said: Jane Crofut; The Crofut farm; Grover's Corners; Sutton County; New Hampshire; United States of America.

George: What's funny about that?

Rebecca: But listen, it's not finished: the United States of America;

Continent of North America; Western Hemisphere; the Earth; the Solar System; the Universe; the Mind of God – that's what it said on the envelope.

from Act I of *Our Town* by Thornton Wilder.

For Thornton Wilder, *Our Town* (1937) was connected to other towns, to other countries, and indeed to the entire universe. A fictional case study, if you will, the play elaborates the daily lives of characters bound to one another in family and in friendship – and bound to us though the universal themes of life, living, death, and the living that goes on. Of course, the play does not address other, equally important, themes of living in a community. For example, Wilder's townspeople are not engaged in advocacy for social reform, an absence noted by a character in the play. The family structure he depicts does not resemble the many and varied forms of family we know to exist, and the nature of town society is overly simplified. And yet, even within the simplified framework, the connectedness to others, known and unknown, remains. The play is not life; it is an artistic interpretation of lives and events.

Just as playwrights provide us with interpretations that enable us to view our world in new ways and with new understandings of events and relationships, educational researchers also provide us with data based interpretations of familiar and not so familiar phenomena. Just as the Wilder's townspeople are connected to one another and to the world, so teacher education and teacher education research are also connected enterprises – ones that are embedded in socio-historical, institutional, and political contexts. Whether individual researchers acknowledge it or not, research reflects the commitments, epistemologies, and values of the researcher(s) and is inextricably bound to histories, to other researchers and to teacher education program participants. In other words, self-study teacher education research can and does have implications for far more than the self who is conducting the study.

In this chapter I do not summarize or review all of the recent research in which self-study is employed as a means of examining teacher education. Instead, I summarize selected peer-reviewed studies as a backdrop from which to examine issues surrounding the conduct of research within one's own classroom, which is embedded within the political, social, and historical context of local departments, campuses, states, and countries. The importance of looking at self-studies within embedded contexts becomes clearer when one looks at recent policies that affect both research and teacher education. For example, the current U.S. government is concerned that policies and practices be based on scientific research (Shavelson & Towne, 2002). For some researchers, this means experimental, or at least correlational, studies that compare practices whenever possible. For some researchers, this may suggest that self-study is not a valid research methodology. Similarly, teacher education in England has been increasingly separated from the universities as policies have shifted responsibility for the bulk of preservice teacher education into schools and, possibly, away from a research context (McBride, 1996). A final example is that institutional review boards at some universities have ethical concerns with self-study research and may be

reluctant to grant clearance for research on one's own students (Pritchard, 2002) and hence on one's own practice. The values and practices held by self-study researchers and the general teacher education communities, both of which have long championed the concept of data-based reflections on practice and who argue that qualitative investigations by "insider" practitioners give us access to knowledge that no other paradigm can or does, are clearly influenced by the larger social context, but it is entirely possible that the influence is not multi-directional.

For many teacher education practitioners, improving one's teaching and one's teacher education program is a never-ending process, one that begins with an awareness of the need to, "control and explore the significance of the teaching strategies we adopt" (Loughran, 1997, p. 5). Drawing in part from Schön's (1983; 1987) explication of reflective practice, in part from action research models (Zeichner & Noffke, 2001; Feldman, Mills, & Paugh, this volume), and in part from content area models such as practitioner studies of children's and adolescents' writing and language (Chorny, 1988; Cochran-Smith & Lytle, 1993), many teacher educators are engaged in forms of self-study. Some of this work is deliberately acknowledged as such, and some of it is not explicitly named as self-study. Indeed, the examination of self and one's own students within the context of a teacher education program is currently one of the most prominent modes of scholarly inquiry addressing questions of the impact of teacher education (Clift & Brady, 2003; Hollins, 2003).

The first section of this chapter acknowledges the increasing globalization of teacher education (Elliott, 1999; Merryfield, 2002) and provides an overview of some international concerns for and about teacher education programs. Through summaries of teacher education issues in four countries (Colombia, Korea, Japan, and the United States), based on papers written by graduate students from each of these countries, this section documents similar and disparate issues across countries and the demands placed on teacher education programs located within these countries. I argue that there are ways in which self-study research might inform these issues at the program level and beyond. The second section of this chapter provides examples of self-studies from many countries that have been published recently in peer-reviewed journals, with two exceptions of book-length descriptions of entire programs. By selecting these examples I do not intend to diminish the contributions of chapters and books devoted to self-study, nor of the many conference papers given at national and international meetings. Instead, I wish to emphasize the many ways in which self-study of teacher education has become an important part of accepted scholarly practice. In the final section I speculate on relationships among the questions addressed by the studies in the first section to issues across the wider context of teacher education.

The International Context of Teacher Education

In Fall 2002 I taught a graduate course entitled *Programs in Teacher Education.* I revised my previous syllabus, readings, and expectations based on my first

offering of the course, but when I received my class roster I stopped revising; eventually, I abandoned the syllabus completely. I could not teach about United States programs – their history and their development – as I had in previous semesters, for I could not overlook the increasingly diverse, international composition of our University of Illinois at Urbana-Champaign graduate population. I walked into class and told the Turkish, Korean, Colombian, Japanese, Taiwanese, Chinese, Mexican-American and European-American students that we were going to co-create much of our reading and all of our class sessions.

At the same time, I was working on this chapter. One evening, following a detailed series of students' presentations on teacher education developments around the world, I realized that one element missing from many of the studies I was reading was the connection between the research and the external national and international context. My students taught me that I was far too ignorant of teacher education in other countries and that the research I was reading for this chapter was often limited in the focus on one teacher education classroom or even one teacher education program. I invited several of the students to contribute to this chapter by describing some of their countries' issues and concerns. What follows is my editing of their work to meet space limitations.

The Colombian Context (based on a report by Raúl A. Mora)

In Colombia teacher education is located in 102 colleges and universities that offer 772 accredited (combined undergraduate and graduate) programs. Six basic components span all programs: pedagogy, research foundations, subject matter instruction, communication/ aesthetics, ethics/socio-political concerns, and a student teaching period. The teacher education curriculum is established by individual schools of education, based on their unique orientations and philosophies and on accreditation standards from the Colombian Ministry of Education and a National Council of Accreditation (CNA). The programs are monitored primarily by the CNA, which provides a series of standards for accredited programs (Consejo Nacional de Acreditacion, 1998). CNA, however, does not tell the programs what they should teach or specify their areas of emphasis. Teacher educators have the autonomy to design courses according to needs assessed by the different schools of education, and they can teach the course upon syllabus approval from the academic offices in the schools. They are autonomous with respect to making decisions regarding their courses, methodology, and materials, provided that they follow the internal regulations for faculty and students at each university.

Teaching and teacher education in Colombia are currently facing two big challenges. One is the teacher shortage in some geographical areas. The other is an increasing need for teachers to be able to use a second language (especially English) as a means of acquiring information and, sometimes, for classroom instruction. The Colombian government has established policies and incentives to encourage teachers to relocate and teach in underserved areas around the country. Furthermore, the local social and political conditions in Colombia have

also encouraged people outside of education to think of teaching as a feasible career. Universities and other providers can now propose alternate route training programs approved by the corresponding office within the Secretariat of Education (such as the Committee for Educational Agents' Training). Such alternate training is offered in opposite schedules to the normal school hours, i.e., afternoons, evenings, and weekends. Sometimes the government subsidizes people who choose alternate routes, sometimes the prospective teacher pays him/herself. Some common areas where alternate routes have high demand include sciences (biology, physics, and chemistry), mathematics, and English.

Preservice programs are also beginning to address the concern over acquisition of a second language. One example of a teacher education program that seeks to address this concern is the pre-service program at Universidad Distrital Francisco José de Caldas in Bogotá, D.C. The university requested that the Modern Language program at the School of Education create a proposal to implement second language learning on a more widespread basis in all education programs. Professors in the English teacher education program are currently designing a language program with an emphasis on learning a foreign language for academic purposes (i.e., in order to prepare future teachers to use that language in academic settings) to be offered to students in eight of the nine teacher education programs at the university. The BABEL project (Spanish acronym for Autonomous Search for Bilingualism and Foreign Language Excellence) is one of the ways the University intends to help their teachers be better prepared to face the current needs of schools and communities. BABEL will be fully implemented by 2004. Currently the implementation plan includes research by professors and undergraduate students in the program to measure the impact on the student population in order to provide feedback for continuous improvement of the program (Castillo, R., 2002).

Mora's account identifies the following issues within the Colombian context: national policy on teacher education standards; university autonomy to design courses and programs; uneven distribution of teachers across Colombian communities; teacher shortages in some content areas; routes into teaching that are alternative to more traditional university based routes; and second language acquisition for professional concerns. All are potentially topics that can be informed by ongoing research and his example of how one university is responding to the issue of second language acquisition includes the presumption that there will be some research – some of it potentially self-study research – that will inform continuing program development.

The Japanese Context (based on a report prepared by Miho Young)

In Japan, teacher education programs are available at 459 universities (115 national and 344 private) and 145 community colleges (Curriculum Center, 2002) authorized by the. Ministry of Education. Individual institutions are basically responsible for monitoring their own teacher education programs (Ministry of Public, Management, Homes Affairs, Post and Transportations. Office of

Administrative Management 2002b), but as a part of the current teacher educa-
tion reform process, some programs at national universities are being monitored
by certain national-level councils and committees. These evaluations will be
reported to the Ministry of Education as a part of reform investigation.

Three of the largest challenges facing teaching and teacher education at
national universities in Japan at present are: 1) developing a national core
teacher education curriculum, 2) establishing an assessment system that evaluates
students, curriculums, and departments, and 3) unifying or reducing teacher
education programs among national universities (Ministry of Education, Culture,
Sports, Science and Technology 2001; Kokuritsu, 2000). According to ongoing
discussion by the National Committee of Teachers Colleges and Teacher
Education Departments *(Kokuritsu no kyouin yoseikei daigaku gakubu no arikata
ni kansuru kondankai)*, the above-mentioned challenges are being addressed as
national projects involving a number of universities and educational organiza-
tions. For example, Tokyo Gakugei University and 11 other national universities
are establishing a national teacher education core curriculum (Moderu koa,
n.d.), with an evaluation system to be developed by member universities of the
Japan Association of Universities of Education. In order to consolidate teacher
education programs, some universities, like Yamagata University and Fukushima
University, have given up their teacher education programs (Yamagata, 2002;
Kita, 2002). In addition to self-monitoring and monitoring by councils, some
universities are choosing to be evaluated by the University Assessment
Association (UAA), which outlines program evaluation criteria and accredits
universities and/or their programs. Accreditation by the UAA is thought to
influence positively a university's chance of survival.

Curriculum development within teacher education programs is also the
responsibility of individual departments and institutions; however, each teacher
education program must provide the courses and credit hours specified by the
Educational Personnel Certification Law (Ministry of Public Management,
Homes Affaires, Post and Transportations, Office of Administrative Manage-
ment, 2002a). Teacher educators have the autonomy to teach content areas,
conduct research, publish findings, advise students, and serve on committees;
however, national requirements affect content autonomy differently depending
on the type of teacher education in which one is engaged (e.g., educator for
subject area, educational methods, or pedagogy).

Young identifies several national concerns that are different from those in the
previous section: a national curriculum for all teacher education programs in
Japan; a decreasing school-age population; an over supply of teachers; an over
supply of teacher education programs in general; and no established means for
students and programs. She does not specifically discuss a research agenda, but
there are clearly topics that could be investigated. Program evaluation, specifi-
cally might include a self-studies of courses. The processes of consolidation and
curriculum revision might also include self-study components.

The South Korean Context (based on a report prepared by TaeWha Kim)

In Korea, teacher education is provided by 13 universities of education; 41 colleges of education in general universities; 33 departments of education in general universities; 126 education courses in colleges; 128 graduate schools of education and 299 accredited programs for kindergarten teachers, special education teachers, nursing teachers and librarians (Ministry of Education and Human Resources Development, 2001a, 2001b). Programs are monitored by the Ministry of Education and Human Resources Development (MEHRD) and Korean Educational Development Institute (KEDI), which jointly developed the evaluation criteria for preservice teacher education programs in 1997. Colleges of education were evaluated in 1998; graduate schools of education in 1999; universities of education in 2000; and departments of education in 2001 (Korean Educational Development Institute, 2002). Although teacher educators have the autonomy to develop the curriculum at the department level, they are actually affected by the MEHRD, which has the authority over teaching certificates. Students are required to take over fifteen credit hours of general pedagogy as the major requirement for teaching certificate – which is conferred without additional testing by the president with the authorization of the Deputy Prime Minister of Education and Human Resources Development.

The biggest challenges facing teaching and teacher education are: 1) the shortage of elementary school teachers; 2) the oversupply of secondary school teacher candidates; and 3) the uneven distribution of novice teachers across South Korea. In order to resolve the shortage of elementary school teachers, which was caused mainly by increasing numbers of retirements after the 1998 International Money Fund (Teacher Education and Development Division of MEHRD, 2002) crisis and teachers' reluctance to work in rural areas, the MEHRD made an effort to encourage teacher candidates with secondary teacher certificates to retrain based on the recommendation of the superintendents of local offices of education (Teacher Education and Development of MEHRD, 2002). To address the oversupply of secondary teacher candidates, the MEHRD has tried to reduce the number of secondary teacher programs by limiting the number certification programs based on the results of teacher education program evaluation; encouraging programs whose graduates have low employment rates to change merge with related departments; and forcing graduate schools of education to focus on inservice teacher education (Teacher Education and Development of MEHRD, 2002). Overall, programs with good evaluations will get active support administratively and financially, whereas the programs with bad results will converted into general departments in the universities (Korean Educational Development Institute, 2002). This is causing many teacher education programs to redesign their curricula.

The problem of the uneven distribution of high quality teachers began when local offices of education began administering teacher employment exams. Most teacher candidates applied to local offices of education reported to have good working conditions, which caused both the teacher shortage and low-quality of

teachers in the local offices of education with bad working conditions. In this manner, the teacher employment exam has not only caused the phenomenon of "the rich-get-richer and the poor-get-poorer" in terms of teacher recruitment. In addition, the teacher employment exam is of consequence to the teacher education programs. For example, Chonnam National University is trying to help senior students with the teacher employment exam by providing them with a special course to prepare for the exam.

Kim's account identifies issues that relate to both of the preceding sections. The uneven distribution of teachers is somewhat similar to the Colombian context and the over supply of teachers and the need to evaluate programs is somewhat similar to the Japanese context. Kim also introduces the issue of examinations as the primary evaluation mechanism, foreshadowing what McCullough will mention in the following section. Like Young, he does not specifically discuss a research agenda, but again it is evident that there are questions about the impact of policies and programs that could (and possibly should) be answered with evidence gathered through systematic inquiry and self-study. Certainly, studies by graduates who enter contexts in which there are poor working conditions might be very helpful in seeking the means to improve those conditions.

The United States of America Context
(based on a report prepared by Heather McCullough)

The *College Blue Book – Degrees Offered by College and Subject* (2003) lists approximately 600 teacher education programs in the United States, but this figure is misleadingly low because of the numerous routes to teaching that are not based at universities and are not connected to degrees. Monitoring of teacher education programs in the United States varies from that of the countries discussed above in that each state has an independent department, often called a State Board of Education, which monitors and accredits teacher education programs in that state. There are also two voluntary national accrediting organizations, the National Council for Accreditation of Teacher Education (NCATE, http://www.ncate.org) and the Teacher Education Accreditation Council (TEAC, http://www.teac.org/). Twenty-eight states now use the NCATE standards as a guideline for the state standards established to monitor teacher education programs. Illinois is one of these states.

Two of the biggest challenges facing teacher education in the United States are 1) the implications of two pieces of federal legislation – Title II of the reauthorization of the Higher Education Act (http://www.ed.gov/index.jsp) and the reauthorization of the Elementary and Secondary Education Act, known by some as *No Child Left Behind* (NCLB) (http://www.nochildleftbehind.gov/), and 2) promoting quality across various routes to teacher education.

Millikin University in Decatur, Illinois, is an example of a non-NCATE accredited teacher education program that addresses the new challenges faced by teacher educators in Illinois and across the nation. Millikin University has

been engaged in continuous program improvement for several years. They have revised early field experiences and student teaching and incorporated more technology into the curriculum. They have begun to document students' performance through a requirement that each student compile a professional portfolio based on the Illinois State Learning Standards upon which all Illinois teachers are required to build their curriculum. NCLB legislation will require more changes in the Millikin curriculum to ensure that the pre-service teacher will meet the "highly qualified" status demanded by the federal legislation. University based teacher education programs such as the one at Millikin University are increasingly challenged by programs that by-pass the traditional undergraduate and graduate routes to certification. Legislation in Illinois and other states allows people with baccalaureate degrees to begin teaching after a few months of pedagogical training, which may be provided by a university, school district, or private company. There are continuing debates over the nature of these shortened programs and whether or not they will provide highly qualified teachers. Similar debates surround the accreditation processes, with some arguing that universities that offer more traditional programs are over-regulated while alternate route providers are under-regulated. These ongoing debates are likely to continue at both state and national levels.

McCullough raises issues that are similar to those in Colombia, including standards-based program design, university autonomy, and alternate routes into teaching. Issues that are similar to Japan and South Korea include evaluations of programs and candidates. More than the three previous accounts, the United States context is affected by the tensions that arise among the federal government, the states, and the universities as all three struggle for control over teacher education. Data-driven arguments are sometimes used to inform the debates, but it is entirely possible that the data are insufficient or that they are not persuasive when opinions and beliefs are entrenched.

What is clear across the four accounts is that much attention is being paid to teacher education and that changes are occurring as a result of national policies as well as local conditions. Less clear is the nature of the data to support policy mandates or the intentions to collect information on the results of policies. Does self-study research have a role to play here? Possibly, but as I discuss in the following section, published self-study research seldom addresses the policy context of the teacher education program.

Themes and Variations in Self-Study Research within Teacher Education

From its inception, the Self-Study of Teacher Education Practices Special Interest Group (S-STEP SIG) of the American Educational Research Association has deliberately embraced a wide range of research foci, multiple methods of data collection and analysis, and alternative representations of members' work. Accordingly, members and non-members of the SIG have published their work in book chapters, books, and, increasingly, in peer-reviewed journals targeted for both content-specific and general audiences. In this part of my chapter I

discuss selected studies from peer-reviewed journals to illustrate the ways in which a space for self-study research has been created within the academy. In selecting the studies I have adopted a working definition of self-study research, drawing in part on Korthagen & Russell's (1995) commentary on self-study as an emerging field. In self-study, teacher educators draw from the interplay of theory to practice and of practice to theory in order to confront the relationship between their own practices, connections to their prospective teachers' practices and the ways practice may affect students in schools. I have found especially useful four prompts from Loughran and Northfield's (1998) framework for the development of self-study practice. The first and second are a focus on the context and nature of one's work as a teacher educator and a commitment to action as a result of one's study. The third and fourth are a commitment to checking data and interpretations with others and a report of one's work that can be understood by the target audience. Finally, Rearick and Feldman's (1999) framework for action research, which shares many features with self-study research, indicates the importance of attending to theoretical orientations, purposes, and the nature of reflection that guides research intended for use in action settings.

With considerable assistance from Patricia Brady, I have identified numerous papers that illustrate the variations in self-study research that has been published in peer-reviewed journals beginning in 1995, some of which are described in more detail below. In some papers the researchers explicitly stated that they were engaging in self-study; in others, they did not. In some, impact on practice is specifically discussed; in others, impact is only implied. The duration varies; the focus varies; and the ways in which teacher educator-researchers have attempted to demonstrate trustworthiness or believability also varies. I have grouped the articles by commonalities in the focus of the research, which illustrate a variety of theoretical orientations and purposes. Each of the selections, however, provides an audit trail – a connection between research questions, data collected, analyses methods, and conclusions – and was intended to inform an audience beyond the researchers and their colleagues. In addition to the papers selected, I have included two book-length reports of teacher education programs in which the research was conducted by the participants because they illustrate forms of self-study research that can extend beyond investigations of one course or one set of experiences but that cannot be reported within the confines of one journal article.

Focus on an Orientation to Practice

The examples that comprise this section share the authors'/researchers' commitments to practice based on a well-articulated conceptual orientation and to investigating their abilities to engage in that practice themselves, as well as to encourage similar practices among their students. Freese (1999) based her instruction and her practice on Loughran's (1995, 1996) framework for reflection, but she wondered if that framework was, indeed, appropriate to guide secondary

students teachers' practice. Dinkelman (1999, 2000) was also interested in reflective practice, but based his orientation to reflection on van Manen's (1977) concept of critical reflection to which he added his own conceptions of democratic education and connections to wider social issues in social studies classrooms. Fecho, Commeyras, Bauer, and Font (2000), were interested in issues relating to democracy and democratic teaching. Specifically they hoped to enable their literacy education students (and themselves) to re-imagine how authority might be co-constructed and shared in classrooms. Steele (Steele & Widman, 1997; Steele, 2001) was interested in teachers' abilities to put constructivist learning theories into practice in mathematics classrooms. Fecho, Commeyras, Bauer, and Font's study covered one semester. Dinkelman's study crossed two semesters, the second of which was student teaching. Freese's research covered four semesters, and the last semester was a paid internship in which the interns assumed full-time teaching responsibilities and were paid for their work. Steele's investigations went beyond the teacher education program as she followed her students through her methods course and into their second year of teaching.

Freese (1999) worked with 11 preservice secondary teachers (7 male; 4 female) across four content areas in a two-year Master of Education program. She carefully documented her use of the reflective framework in her own classroom and with the mentor teachers who supervised early field experiences. As her student teachers began fieldwork, they practiced using the framework in conjunction with videotapes of their teaching. Then, in the fourth semester, she interviewed the students about their perceptions of their preparation for student teaching. While none of the questions asked specifically about reflection, their answers did reference reflection and reflective activity. She found that, despite complaining about reflective activities during three semesters of coursework, the preservice teachers reported that they used the reflective framework during their teaching and that they valued it for self-evaluation, on-the-spot decision making, and collaboration. The framework was identified as one part of the program that helped to prepare them and they noted that reflection was an integral part of the teaching profession. Freese's analysis also indicated that they all had relatively sophisticated understandings of reflection. The study reinforced her commitment to continue using Loughran's reflective framework collaboratively with both preservice teachers and their mentors and to further develop her role as a co-inquirer, one who makes her thinking public and engages in discussions with other professionals.

During the first semester of his year-long study, Dinkelman (1999) served as the secondary social studies methods course instructor. He selected three students from among those his class who volunteered to participate in the study and interviewed them at the beginning, middle, and end of the semester. He also observed their work in class and collected their assignments. He then categorized the data into topics and actions that indicated any evidence of critical reflection and wrote case studies of each student, followed by a cross-case analysis. Dinkelman reported that while he did find evidence of critical reflection and of critically reflective teaching present in all three cases, he found no connection

to critical democratic citizenship nor to any transformation of their views concerning the purpose of teaching social studies. Indeed, none of the participants seemed to construct an overall rationale for teaching social studies, although they did have general goals for their students.

Through an analysis of interviews, observations, field notes and written artifacts he obtained while serving as the university supervisor, Dinkelman (2000) again constructed case summaries for each participant in the study discussed above. He concluded that during student teaching all three participants showed evidence of understanding and practicing critical reflection, which he acknowledged was due, in part, to their interaction with him as researcher/supervisor. He also found evidence that during student teaching the three preservice teachers began to develop a somewhat stronger emphasis on democratic education, due in part to journal assignments and participating in the research project. Unlike Freese, Dinkelman reported that the cooperating teachers did not factor into the student teachers' use of reflection, although they also served other important purposes.

Fecho, Commeyras, Bauer, and Font (2000) described an inward-focused study that was somewhat different from the previous researchers' depictions of students' responses as a function of their classes. The first three authors, all reading instructors, used different methods of data collection and analysis within their classrooms, but all wrote reflective notes after each class and e-mailed them to the others. These e-mails served as the basis for challenging one another to consider alternative explanations for classroom interactions and to the students' responses to sharing classroom authority throughout the semester. Other data included conferences with students, class interactions, students' responses to readings, and written coursework. After the semester ended, the group analyzed their teaching around the question of sharing authority within the context of a (hopefully) critical-inquiry classroom. Each created stories around this theme and Font provided a cross-story analysis.

Bauer described her attempts to share authority with three students through the metaphor of dance. With two female students she felt she succeeded in establishing synchrony – a situation in which ideas were openly shared and in which all parties had times when they controlled classroom flow. For one of the male students, however, the refusal to "dance" resulted in his constant critiques of her teaching. The idea of sharing control became a struggle for control. Fecho's report centers on one incident within a class wherein inquiry into meaning and meaning making was his overall frame. In this incident he described a situation wherein the students' were discussing integrating literature from minority groups into the reading curriculum. An unanticipated and unwelcome response during this discussion prompted him to argue with the students instead of asking clarifying questions, thus setting himself up as the authoritative voice and crushing oppositional voices. Commyeras discussed her continuous struggle with turning curriculum decision making over to the students and the students' negative responses to spending time making those decisions. Her students did not like the ambiguity of not knowing what was expected and she found herself

struggling to satisfy their needs while, at the same time, trying to remain consistent with her decision to let them make decisions. Across the three narratives, the co-authors found that simply acknowledging the authority relationships that pervaded their classrooms and their struggles with both their own expectations and those of their students was an important place to begin self-analysis. While they encouraged a high tolerance for uncertainty and, therefore, frustrated some of the students, they felt that this was an important step in preparing students for their own classrooms. By engaging in the practices they recommended for their student they learned, firsthand, just how difficult putting recommended practice into actual practice could be.

Steele was one of a very few researchers who followed students beyond the teacher education program and into the first years of teaching. Initially (Steele & Widman, 1997), she described her elementary mathematics course and her students' progress in developing problem solving strategies and explanations for mathematical procedures. She randomly selected five female elementary education students from among 19 elementary and middle school preservice teachers in a mathematics methods course designed to make children's mathematical thinking more accessible to the teacher. She conducted interviews at the beginning and the end of the methods course; she also collected written assignments, journals, and math logs, and kept field notes and classroom group discussion notes. She found that all five of the preservice teachers' understanding of mathematics learning shifted from mathematics learning as a passive, receptive process that followed from drill-and-practice activities to an active process in which learning was defined as problem solving and exploration of concepts. This resulted, she concluded, in a shift from seeing mathematics as computation to seeing problems as a way to encourage mathematical discourse and conceptual learning.

Two years later, Steele (2001) conducted six formal interviews with four of the five teachers, who were then in their second year of teaching; she also observed each person's class for two days and interviewed teachers and administrators at the schools in which they were working. She found that two of the teachers had internalized the use of cognitively-based teaching strategies, used multiple sources for mathematical activities, and evidenced reflection on their teaching. Two, however, had become very procedure-oriented and their instruction was teacher-directed and based solely on textbooks. Steele noted that, in the case of the first two teachers, the administration and the school culture reinforced constructivist teaching. This was just the opposite in the schools of the second two teachers.

The studies in this section raise the possibility that teacher educators who study their own practice can realize a short-term impact on their students' conceptions of practice or desirable practice – but the issue of long-term impact is far from certain. These studies also raise issues about the inherent power and authority that resides with the professor-instructor-supervisor and about the nature of his or her influence on students' conceptual orientations. How this authority affects teacher education students' thoughts, self-reports, or actions in

the classroom is not well understood and merits further study and debate. Finally, each of the studies provides a rich description of the course and, where relevant, student teaching, but do not provide detailed, contextual information on the programs or, the institutions in which the programs resided.

Focus on a Method of Teaching and Learning

The three examples in this section inquire into instructing students through specific, field oriented teaching methods. Donahue, grounding his inquiry on the moral and political foundations for service learning, investigated lessons his students created for the Third World Women's Center about girls and women's economic rights (Donahue, 1999). He then studied two student teachers as they attempted to follow through on the methods course and implement service learning activities in their cooperating teachers' classrooms (Donahue, 2000). Schuck (1997) was interested in the potential of a simulation to encourage an inquiry orientation to teaching and to challenge preservice teachers' beliefs in mathematics. Mosenthal (1996), who worked within a teacher education program that had just begun to implement field-based methods courses, drew from the constructs of situated learning (Lave & Wenger, 1991) in order to understand more about the nature of his students' learning while engaged in a field-based methods literacy course.

Donahue (1999) analyzed the reflective writings, curriculum plans, field notes, and interviews of four, female, white middle class undergraduates as they worked together to fulfill a service learning requirement for his secondary social studies methods course. He analyzed their work for examples of dilemmas they encountered and for connections between the plans and the belief statements. In addition, he analyzed interviews with the administrators and cooperating teachers in order to better understand the students' comments. His analysis indicated that the curriculum they wrote provided evidence that the process of designing the curriculum helped the four students become more competent in addressing issues of race and class in lesson design. They also became aware of the possibility of inadvertently putting students at risk with certain assignments as they worked through real assignments for real students whose families or friends might object to the discussions or actions that would result from the curriculum.

In his second study (Donahue 2000), two white, female, middle-class secondary-level social studies student teachers worked in two different classrooms and sought to design and implement service learning projects with their students. It is not clear if these young women participated in the previous study, although one has the same code name as an earlier participant. Data included reflective writing, audiotapes of class discussions, interviews, and curriculum developed by the preservice teachers for one year. Donahue coded these for indications of the student teachers' construction of the purpose and meaning of service and their experiences with service learning. He also documented the classroom context in which they were working using multiple sources of data, including

what participants reported to people not connected with the study, to check the validity of his interpretations.

The two student teachers had very different experiences. One embraced an activist, change-oriented approach to service learning and used it extensively in student teaching. The other did not use service learning in student teaching, even though she did espouse a charity-oriented approach to service learning. Donahue attributes their actions, in part, to their differing backgrounds with social activism and, in part, to their cooperating teachers' receptiveness (or lack of) to service learning projects. From this study, Donahue concluded that mandating an inflexible service learning model works against the best interests of his students and, therefore, their students. His requirements should be elastic enough to accommodate a variety of his students' backgrounds and orientations.

Schuck (1997) was both researcher and lecturer in her students' first course in which she developed a simulation that allowed her students to become researchers. She began the study by having students develop interview questions about mathematics and mathematics teaching and learning, which they used to interview a peer and, then, to be interviewed by a peer. The students then analyzed the interviews and wrote summaries, focusing on the information that could be used to improve their future teaching. The students then shared their work with experienced researchers in mathematics and their peers. They also began reading about similar research conducted in Australia and the United States.

Schuck analyzed the interview data across all of the students, categorizing their beliefs as oriented to problem solving, Platonist, or instrumentalist. She found that the students had competing conceptions about mathematics, but that they asked no questions about the nature of mathematics or mathematical thinking. They also appeared to realize that their own attitudes toward mathematics would need to change if they were to be successful teachers. Schuck noted that the simulation gave her considerable insight into her students' thinking and enabled her students to examine their own attitudes. She found that the discussions with other researchers were most helpful in that the students were able to engage in authentic discussions, which were more engaging and challenging than merely listening to one lecturer's opinions.

Mosenthal (1996) collected data on all of his students during two semesters of coursework and fieldwork and selected one female elementary education student's data to analyze after coursework ended (with her permission). The data set included course assignments, audiotapes of conferences, end-of term interviews, field observations and debriefings, small group conferences, teaching logs, and her portfolio. He also kept an instructor journal during this time. The student created a timeline of important field experiences, which Mosenthal used as the basis for his analysis as he organized data chronologically. Her teaching assignments and conversations served as primary documents, but he also coded comments directly related to her work with her reading group. His analysis suggested that early in the field experience the she felt accepted by her cooperating teacher, and she was given a good deal of autonomy in her teaching. This

made it possible for her to focus on her teaching, as opposed to her relationship with her cooperating teacher.

Early in the semester the student found it difficult to generate discussions within her reading group, as was advocated by Mosenthal's class, but by mid-semester she was able to resolve this problem. As her ability to generate discussion increased, so did her ability to engage the students in other activities, such as *cloze* reading activities and reading contracts. Mosenthal concluded that as her confidence in her ability to engage in practice increased, she was then able to consider the questions of when certain practices were appropriate. He also concluded that the move to field-based courses was desirable in that it enabled him to gain an understanding of how her learning in the methods course informed her professional practice – but with the caution that two courses would not be enough for her to internalize such practice without continued support within the context in which she would work.

All three of the authors in this section were concerned with the short-term impact of their teaching and with critiquing, understanding, or perhaps validating an instructional strategy in the courses. All reported that they learned about their own practice from the studies and indicated changes they would make in the future. As with the studies in the previous section, discussions of the context for inquiry were limited to the context of the courses. Neither Donahue nor Mosenthal describes the field setting in much detail, even though those settings were central to their investigations and to their conclusions. Schuck does not discuss the context of the teacher education program, specifically the degree to which the entire program might have contributed to the effects of her simulation of a learning community.

Focus on Prospective Teachers' Actions in Field Settings

The three examples that follow differ from those in the previous section in that the researchers are seeking to develop detailed descriptions of how their students do and do not engage in practices recommended within the teacher education program. While some might argue that these are not self-studies *per se*, I include them because they are studies conducted by the supervisors or methods instructors and the intent of the research is to better understand how recommended practice interfaces with actual practice. I also include comments by the researcher/instructors that indicate ways in which their research has affected their own practices.

In the first example, Graham (1999) served as the university supervisor for a male preservice teacher who was working with two cooperating junior high teachers, 1 female and 1 male. In this study, Graham had not yet completely embraced the concept of self-study, but was moving in that direction: "I must acknowledge that my dual role of supervisor and researcher created several disadvantages. First, I faced an ethical dilemma – to separate my responsibilities as a supervisor from my responsibilities as a researcher … I made the supervisor role my top priority, seeking to remain *respectfully* curious in my researcher role

... my case write-up does not focus markedly on my part in the narrative ... I am aware that my dual role of supervisor/researcher and the asymmetrical power relationship created by those roles were problematic" (p. 527). She conducted interviews at the beginning and end of the student teaching semester, made notes on classroom observations and post-observation conferences, and kept records of the evaluations, lesson plans, student teaching journals, tapes of student teaching seminars and notes on informal conversations throughout the semester. Her analysis began by identifying themes, dilemmas, and tensions from the conference tapes and interviews and mapping them against the other data sources.

The student teacher began his assignment with a teacher-centered style, using the image of teaching as athletic coaching. He found it somewhat curious that the female cooperating teacher was the one who was more teacher-centered, not the male, who worked with the state's Writing Project. He bonded strongly with the male cooperating teacher – even though he did not appreciate or agree with his teaching style. Graham documents their continuing discussions and debates as the two of them argued and negotiated views, with neither appearing to change views, but still respecting one another. Graham noted that teacher education programs must encourage prospective teachers to know themselves through self-study and, also, to understand the power dynamics that are inherent in field settings. What she failed to note was her role as a supervisor in shaping the young man's practice.

Mallette, Kile, Smith, McKinney, and Readance (2000) used the framework of symbolic interactionism to create case studies of six female elementary education students who were enrolled in a course focusing on reading difficulties. Mallete was the course instructor, Kile was her faculty mentor, Smith taught a second section of the course, McKinney led the cohort program, and Readance served as an external reactor and consultant. Data included written assignments plus the instructor's comments on the assignments, class discussion notes, instructional notes, and the field notes and written summary of the preservice teachers' semester-long study of one child. Descriptive coding of each data source related to the child study was then compared to previously collected data for each participant. Case studies were prepared for each participant, followed by a cross-case analysis. What is interesting about this study is that final analysis of the data was shared with the participants, which became a teaching-learning experience for teachers, researchers, and the prospective teachers.

The research team noted that the preservice teachers became more critical of their own classroom practices over time and began to see reading difficulty as an instructional issue as opposed to a problem inherent within the child. Multiple and continuous assessments became important to enable continuous monitoring of their student's learning and their own learning. They concluded that each student's individual stance toward reading difficulties predisposed the preservice teachers to construct reading difficulties in different ways, but that the stances were typically unknown to the preservice teachers until they reflected on their own data. Once they acknowledged the limitation of their views they were free

to make changes. This led the authors to think of, "providing a way for all the preservice teachers to have the opportunity to look at our interpretations of their data as a forum for discussion of their initial stances and indices of their development of new meanings they construct" (Mallette, Kile, Smith, McKinney, & Readance, 2000, p. 611).

Weaver and Stanulis (1996) drew from social constructivist learning theory in a collaborative analysis of their experiences working with one female student teacher in a middle school classroom in which Weaver was the cooperating teacher and Stanilus was the university supervisor. Data included transcripts of weekly three-way conferences, and their own individual reflections throughout the student teaching semester. Their analysis revolved around collective discussions of the transcripts, and written reflections noting the development of their collaborative relationship over time.

They concluded that even though the coursework and the field setting complimented one another and both promoted and demonstrated the use of writers' workshops, the student teacher did not feel confident about implementing them and was especially concerned about the workload involved. This led both the cooperating teacher and the supervisor to adapt their expectations so that the student teacher could try some ideas of her own. This included planning directly from the textbook, in part because the student teacher anticipated not having resources other than a text in her first years of teaching:

> We feel that the common negotiations of beginning teaching, including classroom models of instruction, personal teaching styles, and appropriate teaching materials, can be faced squarely through a collaborative model of student teaching. Perhaps, as we have come to believe, classroom life for the student teacher is not a hard reality to be adjusted to, but an adventure to be created and studied together. (Weaver & Stanulis, 1996, p. 35)

In addition to the ways that they have been used to inform teacher educators' practices, these examples make more complex what we already know about relationships between coursework and fieldwork and, also, between research methodology and impact on teacher education students. In two of the studies (Graham, 1999; Weaver & Stanilus, 1996) we have reports of student teachers actively resisting influence from cooperating teachers so that they might focus on their own beliefs about how teaching should occur, even when messages from the field and the university were unified. The study conducted by Mallette, Kile, Smith, McKinney, and Readance (2000) reveals that member-checking and sharing the data and research summaries with the participants can provide an important impetus to further reflections and change.

Focus on Issues of Diversity

The examples in this section share a focus on teacher educators' awareness of the ways in which gender, race, cultural background, and educational background of teacher educators, prospective teachers, and students interact with

one another to affect teaching and learning. Four of the studies also illustrate the ways in which the teacher educator researchers attempted to validate their work by bringing others into the data collection and analysis processes. McGinnis (McGinnis & Pearsall, 1998) and Rodriguez (1998) worked with graduate assistants, who served as independent analysts. Wolf (Wolf, Ballentine, & Hill, 1999; Wolf, Ballentine, & Hill, 2000) worked with undergraduate assistants (who had also been members of the courses she taught) in order to interpret data and their shared experiences.

McGinnis, an elementary science educator, became concerned that, as a male, he was not behaving in gender inclusive ways, nor was he sensitizing his students to issues of gender in science teaching and learning (McGinnis & Pearsall, 1998). McGinnis enlisted Pearsall, a female graduate student, to serve as his co-researcher. She interviewed the instructor and the preservice teachers at the beginning of the semester and a subset of the students at the end of the semester. She also observed all classes. In addition, the instructor and two African-American females, one Chinese-American female, six white females and four white male students kept journals. Formal course evaluations for previous classes and for the current class were also used as data points. The students were aware of the study and of McGinnis's desire to be more gender inclusive.

Pearsall and McGinnis each analyzed the data separately and then met to compare notes throughout the course. They also provided drafts of their report to selected participants as a form of member checking. Then each researcher wrote separate perspectives on the data, followed by a concluding section in which the perspectives were combined. From the instructor's perspective, the male students seemed uncomfortable with his attempts to be more gender inclusive, but he felt as though the females noted his attempts and some (but not all) appreciated them. He began to consider ways he might be even more gender inclusive. Pearsall disagreed somewhat. Her analysis indicated that the gender of the professor was not important to the students, but that male students had different expectations of the science class climate when the instructor was male. She also concluded that, while instructors' gender biases are noted, students seldom speak out against bias. Member checks suggested that the students felt uncomfortable by being part of the study and that it diverted attention from the focus of teaching science.

Wolf and colleagues (Wolf, Ballentine, & Hill, 1999; Wolf, Ballentine, & Hill, 2000) have been working collectively to understand how Wolf's instruction in a year-long literacy course enabled her students to understand reading and writing. It is important to note that Ballentine and Hill were undergraduate students in the course and volunteered to become co-researchers once the course ended. In Wolf, Ballentine, and Hill (1999), six graduate students and four undergraduates agreed to participate in a study of preservice teachers' conceptions of voice and authority in writing about different racial, linguistic, and cultural groups. Two of the female students were Japanese-European and six were European-American; there were two European-American males.

Wolf conducted three formal interviews throughout the year, took notes on

all conversations, e-mail conversations, and kept copies of all completed assignments. Primary data for the article were an assignment to create multicultural book handouts and final interviews about authenticity in writing. Using qualitative software, the handouts were coded for the represented groups, literary elements, illustrations, author's background, and their evaluations of the text. The interview transcripts were coded for hesitations, arguments, support for arguments, changes, and hopes and fears. As a team, the researchers recorded Wolf's changes in instruction over the year and also their own interactions throughout data analysis and writing. They concluded that, as a group, the preservice teachers moved from a simplistic notion of who has the right to speak for whom to an understanding of the complexity of this issue. Their understanding of who has the right to write about cultures changed over the year as they examined text authenticity, historical and visual accuracy, aesthetic heat, and children's reactions to books. The last part of the article focuses on Wolf as she reflects on what other assignments she might have given to introduce the idea of *de facto* and *de jure* censorship and the impact teacher choice has on legitimizing what gets studied and what does not.

The team also studied three Anglo-American, middle class preservice teachers from the class as they worked through a "Child as Teacher" project in which they worked with students from backgrounds very different from their own (Wolf, Ballentine & Hill, 2000). This study could have also been located in the previous section because it, too, is based on a field project conducted by the preservice teachers. Data included the preservice teachers' reading autobiographies, notebooks for the "Child as Teacher" project, and interviews at the beginning, middle, and end of the academic year. The team then constructed narratives for each of the preservice teachers based on literary theory, features of language that marked the ways they constructed themselves, the influences on thinking, their cognitive or emotional responses, their understandings of child's literary engagement and of the children themselves.

The first preservice teacher worked with an African-American male in Grade 3 and learned how insightful the young man could be, how much he enjoyed reading, and how much the school did not realize these strengths. The second preservice teacher worked with an African-American male and became involved in some of the family dynamics. He learned about their hectic lifestyle and his student's difficulties with homework. He further learned that when the student was interested in a text he became involved in reading, but that his teacher did not realize this. The last preservice teacher worked with a Grade 2, Mexican-American student and learned that she had to learn to ask good questions in order for her student to respond. She also learned that the Spanish language was important to her student and that family privileged education. She learned that her student enjoyed teaching her Spanish and that she was a very insightful reader. Wolf and colleagues reported that all of the preservice teachers learned that school for their students was not the same as it had been for them and that their students' views of books were different from their own – but that it was

possible to engage the students in reading and that the students found certain types of reading quite enjoyable.

Luwisch (2001), using the lens of story (Carter, 1993; Connelly & Clandinin, 1990), studied herself in the context of the Coexistence Workshop, a course taught in Israel to both Jewish and Arab students. She begins with a description of her work within the course and then describes an incident in which a courtyard exhibit of caricatures drawn by an Arab provoked heated arguments and almost violent confrontations among the students. She discusses her class's discussion of the event, her return visit to the exhibit and her shift in understanding, the class's restorying and re-understanding of the event, and how her teaching changed during the process. She includes several of her students' stories in the paper and then steps back to consider what the event and the subsequent class sessions meant for her.

She found positive changes in the ways her students began to relate to one another and she provided anecdotal evidence of students overcoming barriers, such as inviting one another for coffee. She also noted how the media had shaped her own negative image of Arab countries and that she shared her own development and evolution in her reinterpretations with her students. In the final section of the article, Luwisch not only discusses personal meaning, but the ways in which the students began to ask for small changes in the institution to value and support other groups and other religions. She also reflected on storying and restorying as far more than a pedagogical tool – but one which might affect survival. "Only by telling and listening, storying and restorying, can we begin the process of constructing a common world" (Luwisch, 2001, p. 145).

Rodriguez (1998) studied his secondary science students during their methods class and on into student teaching. He was interested in what teaching strategies seemed to help students deal with resistance to ideological and pedagogical change using what he terms a "sociotransformative constructivist" orientation to teaching and learning. His goal was to move from talking about issues related to education for all children into action. He collected the students' assignments in his class, kept detailed fieldnotes, and used data from anonymous course evaluations. During student teaching he interviewed four of the students (three Anglo-European females and one Anglo-European male) and videotaped two lessons taught by each student. He noted that he was the only Latino and the only member of a traditionally underrepresented group among the science faculty members.

To analyze the data, Rodriguez asked an Arabian-American female graduate research assistant to code all interviews and materials collected from the methods class. They separately analyzed the videotapes and then conferred on the themes and categories they had developed independently from one another. Analysis indicated that many of the students became more aware of how their actions as teachers could promote or inhibit learning for a diverse student population while others remained uncomfortable with the issue. Among those who reported greater awareness, there was a desire for concrete examples of how one could be a classroom change agent. Rodriguez acknowledges that as a teacher educator

he was obligated to provide specific guidance on *how* to teach. Three of the four student teachers were among those who were receptive; one was not. In his discussion of the findings he noted that many of the students translated issues of diversity into a discussion of race or ethnicity, ignoring issues of gender, ability, and sexual orientation. He also noted that his own gender and ethnicity possibly influenced the students' responses. He concluded his report by calling for a tighter integration of research combining the individual, constructivist framework with social justice and multicultural frameworks.

The examples in this section all attended to the teacher educators' backgrounds, as well as to those of the students with whom they worked. All attended to issues of cultural hegemony and of developing changes in prospective teachers' understanding of students, as well as with their own changes as teacher educators as they sought to understand *their* students. In addition, four of the five researchers noted the importance of diverse perspectives within a research team and how those perspectives influenced the analysis and interpretation of data.

Focus on Collaboration

The articles in this section are studies of the process of collaboration itself. The first example (Hudson-Ross, 2001) is not clearly an example of self-study research because it is a survey of participants with whom Hudson-Ross had worked over a number of years in a collaborative, statewide network of field-based and university-based teacher educators in order to better understand her own work. I include it because she introduces political issues in both collaboration and self-study that others do not acknowledge. Hohenbrink, Johnston, and Westhoven (1997) and Montecinos, Cnuddle, Ow, Solís, Suzuki, and Riveros (2002) wrote joint analyses of the impact of working together over time. Tobin and his colleagues (Tobin, Seiler, & Smith, 1999; Tobin, Roth, & Zimmermann, 2001) have departed from the standard journal reporting format and have created cogenerative dialogues in which multiple viewpoints are documented and left without an attempt to reach consensus.

Hudson-Ross (2001), a university teacher-educator and one of the founders of the University of Georgia Network for English Teachers and Students (UGA-NETS), worked with a graduate student to document the formal professional development work that had occurred since the network began in 1994. This document served as the basis for a survey of professors and secondary English teachers from seven participating professional development schools. Teachers identified four sites for professional development: individual classrooms (through self-examination and having student teachers), the secondary school and college departments, the teacher network (through its positive culture and leadership opportunities), and the field of teacher education locally and beyond. The teachers also reported changes in their daily interactions, with an increased focus on professional dialogue and looking at themselves, not just the student teachers. The teacher educators reported creating more flexible syllabi, time for classroom talk, a continuous search for enabling preservice teachers to embrace complexity,

and an ongoing critique of self. They reported many experiences with the secondary teachers in that they had learned to work more collaboratively and to defend their work with research based evidence. The teacher educators were seeking to influence a university culture that does not necessarily reward collaboration. Toward the end of the article, Hudson-Ross reflects on the links between UGANETS and policy with the *hope* that they will be able to stay ahead of public policy pressures. She concludes that "we need more and thicker descriptions of the interaction between top-down and bottom-up strategies for educational reform and how local players are negotiating the current milieu in the US and elsewhere" (Hudson-Ross, 2001, p. 449).

In what is a more familiar self-study format, Hohenbrink, Johnston, and Westhoven (1997) audiotaped their conversations, kept journals, and interviewed one another about their collaborative teaching of a social studies methods course over four years. Basing their work in post-stuctural, feminist and interpretive-hermeneutic theories, the graduate assistant (Hohenbrink), classroom teacher (Westhoven) and university instructor (Johnson) conducted periodic joint analyses of their data and identified ongoing themes as well as changes in their understandings of their data. These then guided future conversations. At the beginning of their relationships they were uncomfortable working together, but their joint analysis indicated that co-teaching, over time, resulted in diminished competition for whose knowledge counts and a concurrent increase in the trusting and valuing of one another's knowledge. They concluded that even though they had not resolved all potential conflicts, it was essential to acknowledge and work through issues of role, personality, and the like. They were continually amazed at how hierarchical and familiar relationships kept creeping back into their work. Without weekly interactions and conscious attention to the issues, their working together would have been much more difficult.

Tobin, Roth and colleagues have been conducting some particularly interesting research revolving around the concepts of co-teaching and co-generative dialogue. In one such study (Tobin, Seiler, & Smith, 1999), Tobin (Ken) was the science teacher educator, Seiler was the doctoral student/supervisor, and Smith (Mac) was the high school science student teacher. Employing hermeneutic, phenomenological theory with references to theories of habitus and cultural capital, the authors constructed a conversation, or metalogue, based on data from fieldnotes, narratives, artifacts, videotaped lessons, student interviews and assistance from a student as a participant on the research team. The metalogue focused on the nature of the methods course and the role of the cooperating teacher. The issue of quality as it relates to any one participant becomes increasingly irrelevant as all become learners with one another. Methods courses focus on talk; teaching is an action. "Mac saw his methods class instructor struggling with a habitus that did not fit and realized that even after many years of teaching, one is still a learner. Ken saw how much more potent it was to teach side-by-side in the setting where the student teachers are placed. One can not observe a habitus, one must experience it, if one wants to know it" (pp. 83–84).

In a related study (Tobin, Roth, & Zimmermann, 2001), Tobin was the teacher

educator, Roth the external researcher, and Zimmermann the secondary science student teacher. Videotapes of the classes, recorded debriefings, videotapes of the analysis sessions, journals, e-mail, and face-to-face interactions during student teaching were collected. Recursive, dialogical analysis and discussion of data became the base for further action. Part of the article focuses on one lesson and presents a multivocal interpretation of that lesson, followed by a metalogue on the co-teaching experience in general. In the lesson example, the gaps within one teacher's instruction were supplemented by another's. All of the co-teachers debriefed the lesson and talked about where to go next (short term and long term). The metalogue on co-teaching represents the different and complex inter-pretations of the participants, but also models the essence of the co-teaching process. Sections included reflections on co-teaching in urban schools, societal-level issues, learning from dialogues, the changing roles of stakeholders, and curricula and learning in urban schools. They continued the article with a discussion of their increased awareness of the hegemonic forces prevalent in US society, particularly in standards-based instructional mandates.

> The problem of acting in accordance with hegemonic forces is ever present and can be addressed explicitly in cogenerative dialogues. However, this process only addresses those parts of teaching that can be described with language. To address those parts of teaching that are unconscious or that are internalized societal contradictions, it is desirable to have outsiders participate in coteaching. (Tobin, Roth, & Zimmermann, 2001, p. 959)

Their concluding section, however, is sad in that a female high school student who had been identified early in the article as having made significant progress later experienced difficulties at home and at school. The team intervened to move her to a different science class in which she could be (and was) successful.

> We are concerned that the hegemony is vast and beyond what we have described here or have identified in our study … What guarantee do we have that curricula of the types enacted by Andrea and Sonny are trans-formative and provide the students with cultural capital that can propel them to a more advantageous spot in social space? Is it desirable to focus on school district standards, or are these standards part of the hegemony?" (Tobin, Roth, & Zimmermann, 2001, p. 961)

Montecinos, Cnuddle, Ow, Solís, Suzuki, and Riveros (2002) were interested in improving the ways in which they worked as student teaching supervisors within the context of teacher education reform in Chile. As the reforms gave schools and teachers more authority to make decisions about curriculum, the authors were specifically interested in enabling their students to become more proficient in situation specific decision making, self evaluation, and reflection on practice. Representing four different areas (early childhood, elementary math, elementary language arts, and secondary Spanish/philosophy) and with the assistance of an external, critical friend, they created a process for self-study and,

after four planning months, began weekly seminars in which they reviewed previous discussions, read through journals, and planned for the next meeting. To reflectively analyze their progress each participant prepared an account of significant learning within the study and a comment about the self-study process. They then identified six themes that crossed the narratives: 1) attend to learning needs of the supervisor; 2) attend to the learning needs of the student teacher; 3) attend to student teacher's biography; 4) give the student teacher reassurance; 5) distinguish good questions from bad questions; and 6) attend to the structure of group and individual supervisory meetings.

The themes then served as an experiential basis for a re-reading of articles on self-study and the ways in which their experience mirrored that of others. Their visits to other countries and conversations with teacher educators from other countries led them to concentrate on similarities across countries – and to wonder why their external reviewers had expressed surprise they did not find major difference because of the Chilean context. They speculated that the similarities were due in large part to the influence of the U.S. teacher education literature. They concluded their article with their plans to improve their teaching and with wonderings about the possibilities and promises of including other supervisors in the self-study effort.

The examples in this section illustrate a few of the difficulties, challenges, joys, and opportunities that arise when teacher educators work together over time. Moreover, they specifically acknowledge the political dimensions of teacher education, which may be overlooked by those who investigate issues contained within one set of courses and a short period of time. Only Hudson-Ross (2001) acknowledged the pressures and tensions created by an ever changing state political context.

Focus on Entire Programs

The three examples in this section are reports of research on and within entire programs of teacher education. While I could have embedded the brief descriptions of these studies within three of the above sections, I chose to group them together because they represent three different ways of studying entire programs. The first is a qualitative study by a single author who taught in an experimental program. The second is represented by two articles, selected from several published in different journals, written by two collaborators who have been reporting on their ongoing program development and the ways they use continuous evaluation to improve the program. The final example is a book in which different chapters are written by different participants in the program. Although I have only selected a few of the chapters to include, the entire book provides a good example of how entire faculties can work together to examine and improve their teaching and their program.

Teach for Diversity at the University of Wisconsin-Madison

Ladson-Billings (2001) wrote about her experiences working with a three-year pilot program in which post-baccalaureate students were admitted to prepare

specifically to teach in diverse urban settings. For three years, during which three cohorts of students completed the program, she collected data on her students' responses to the program through their coursework, lesson plans, field observations and interviews. She then developed descriptions of eight prospective elementary education teachers, all assigned to the same school. All of the students were female, six were European-Americans, one was Latina, and one was African-American. She organized the data around the themes related to culturally relevant pedagogy: academic achievement, culture and cultural competence, and sociopolitical consciousness. Their stories document the understandings they reached as they worked to become good teachers for children with whom they had little or no prior experience or understanding.

In the final chapter Ladson-Billings reflects on what she and her colleagues learned from their students, based in part on her data and in part on their experiences within the program: 1) Prospective teachers working in diverse communities need the chance to learn about the students in the context of the community. 2) Prospective teachers working in diverse community schools need an opportunity to apprentice with skilled cooperating teachers. 3) Prospective teachers working in diverse communities need an opportunity to ask lots of questions about teachers and teaching. 4) Prospective teachers need the opportunity to do serious intellectual work. This chapter also noted what was missing from the program, such as attention to second language acquisition, a requirement of action research with insufficient attention to how that could be accomplished, professional development for cooperating teachers, and insufficient planning to provide cooperating teachers with time to participate in the methods courses. The pilot study has served as ground work for ongoing program development for the entire elementary teacher education program, which demonstrates the power of self-study to influence others.

The OISE/UT Midtown Option

The Ontario Institute for Studies in Education, University of Toronto (OISE/UT) has been working with a cohort model for preparing teachers since the mid-1980s. Beck and Kosnick have published several studies of this teacher education program, and two are discussed here. Beck and Kosnick (2001) employed the framework of community (citing, among others, Barth, 1990, and Darling-Hammond, 1999) to reflect on the ways they have been able to build community within their program, which places students in multiracial, multicultural urban Toronto schools. In their essay they discuss the process of forming a compatible faculty team, the initial process of building community, and the continuing process of sustaining the community over time. Deliberate attention to program structures, ongoing communications, and modeling have been built into the program. Their four-year study of the program included participant observation, open-ended interviews and observations, and questionnaires. Their study documents the fluctuations in the community building process including, but not limited to, faculty involvements, individual students as they affected the cohorts, and the influence of external mandates. The study also documents the

steady progress the program has made toward building community over time, including an increase in student loyalty to and support for one another and increased attention to academic and technical aspects of the program.

A second study (Beck & Kosnick, 2002) evaluated the campus portion of the Mid-Town program utilizing semi-structured interviews with nine randomly selected student teachers. The courses and experiences included those taught by the authors and by other faculty members. Their analysis suggested that all nine felt that the program had a positive effect on their teaching and that this was due to well planned courses, faculty modeling, and both faculty and peer support. They felt that the program could be improved by a stronger orientation to the practical and by more experiential learning. Beck and Kosnick concluded that the evaluation data lend support to reforms in university-based teacher education, but that without support from the school of education many reforms are not possible. They discuss how their data have enabled them to make desirable changes in their programs, noting that continuous improvement is always an unfinished task.

Unified ProTeach at the University of Florida

In 1995 the University of Florida began a major revision of the elementary education program based, in part, on two pilot programs in which special education and elementary education were combined. A forthcoming book (Bondy, Ross, & Webb, in press) describes the planning and implementation process and the details the ongoing data collection and analysis process in which teams of faculty studied themselves, their colleagues, and students. Many of the chapters describe the challenges of learning to work in faculty teams, across departments, and across university boundaries. The data are not always flattering and the authors' stories are not always tales of overwhelming success. For example, Brownell, McLesky, Ashton, Hopey, and Nowak (in press) address the tensions inherent in collaborative planning and teaching through a description of three teaching teams working across two departments to enable prospective elementary teachers to think about emergent literacy, classroom management, and teaching methods.

Their interview data documented that the nature of collaborative planning and instruction varied with the team, and that planning and teaching responsibilities were negotiated very differently within each team. Some of the negotiation involved differing views of the classroom teacher's role on managing behavior (prevention vs. intervention) and focus (whole class vs. addressing individual behaviors). Some of the negotiation involved differing views of knowledge (assessing convergence on concept attainment vs. divergent expressions of concepts as applied in practice) and the need to acquire skills (diagnosis-prescription vs. open-ended tutoring). In two of the teams, the negotiation was never resolved – individual instructors acted as they were accustomed to act, regardless of the accord that was negotiated – and their counterparts were unaware that they did so.

In a second example two faculty members (Amatea & Jennie, in press) examined their abilities to both collaborate and to teach prospective teachers how to work collaboratively with families. Their first task was to model collaboration, which they did through simulations of family teams and situations that were likely to occur in field settings and through making their own collaborative teaching public in order to demonstrate the need for ongoing analysis and improvement. For the authors, all of this meant transforming their position of faculty instructors into the role of guide, in which professors get to know their students before class, discuss their needs ahead of time, and work with them to create a meaningful curriculum. The authors noted that such collaboration transformed department meetings so that teaching activities might be shared and questions concerning teaching and learning might be raised and discussed.

In the final example, Bondy, Adams, and Mallini (in press) interviewed nine prospective teachers, nine classroom teachers, and two university teachers about their experiences with collaboration during field experiences. The students reported stronger links between coursework and fieldwork and felt that they were able to discuss how they would use strategies form the program in their own teaching. They also reported that they learned about themselves. Specifically, they realized they did not know about the nature of students and about the activities and routines involved in teaching. The classroom teachers reported learning new instructional strategies, but they also felt that the program validated and appreciated their teaching expertise. They were especially pleased when students and faculty reported about learning new things from them. In addition to learning about teaching from the teachers, university teachers commented positively on the challenges to connect ideas to practice when courses became more and more field-based. Not only did this serve as an opportunity for professional development, it increased the notion that all participants – students and teachers – are teacher educators.

These chapters, and indeed the entire book, represent a strong commitment to continuous self-study with an entire program. They provide us with considerable insight into the human and institutional elements that must factor in to the change process. They also document the difficulty of change, which is especially interesting given that the curriculum advocated that teachers change the ways in which they practice. Perhaps the most important contribution of the book was to tell the collective story through the contributions of many faculty members, not all of whom agreed with one another, nor with program specifics.

What Can We Learn from Current Research, and What is Missing?

From the studies summarized in this chapter it is clear that self-study research has become an accepted form of teacher education research within the academy. Peer-reviewed articles are published by researchers from around the world and are published in teacher education journals as well as journals focusing on specific content areas. Well-respected publishers are providing opportunities for book-length descriptions of self-studies within the context of experimental, short

term teacher education programs and within the context of changing, but mainstream teacher education programs. The foci of the researchers are varied, and both collaborative inquiry and single researcher inquiry are accepted for publication. At present, the concept of self within self-study is also varied. Self as being is a topic of study, but so are self as teacher of students, self as learner from students, self as collaborator, and self as a co-construction within collaborative relationships.

To conduct self-studies, researchers employ predominantly qualitative methods, typically drawing from a variety of data sources within a single study. For researchers working alone, triangulation across sources is often discussed as one means of establishing believability or some sense of validity; for research teams, triangulation is often only one strategy for establishing validity. The teams enable colleagues to collect data for an instructor, to conduct separate initial analyses of data, and to debate with one another over meaning. In some cases the debates seek to achieve consensus. In other cases the debates are published and enable the reader to access multiple viewpoints. It is very clear that self-study researchers are in the process of formulating research methodologies that preserve the valuable insider's view, but that also seek to diminish probabilities that the researchers are seeing what they want to see or that those who are being studied are producing data that are designed to please the researcher/instructor.

Laudably, the researchers include discussions of success and discussions of failed attempts. They also illustrate the ranges of their teacher education students' responses to instruction. By providing examples of the many ways in which teacher education students accept, reject, and transform course and field experiences, the researchers give the reader access to a complex, multidimensional concept of impact – or lack thereof. But there are very, very few references to the emotional, personal, political or institutional consequences of failing as a teacher educator – with either groups of students or with individuals. There are even fewer references to how one's teacher education students then begin to succeed, stall, or fail once they begin to implement their own practices, although there are discussions of contextual school level constraints that promote or inhibit implementations of practices recommended in teacher education courses.

For the self-studies discussed above, it is quite possible to infer that the related and overlapping purposes of self-study research are to either better understand the effects of one's instruction or to improve a course or a program. It is also evident that the instructors have the autonomy as well as the authority to make decisions about curriculum, pedagogy, and, to a great extent, content. While some of the researchers reference content standards in their discussions of how they can and do shape their practices, there are no references to the importance of negotiating permission for doing so. Indeed, constraints on teacher education or forces that shape teaching within teacher education are noticeably absent from the research.

At the same time, much of the research is disconnected from the specific country or context in which it occurs. Few of the researchers locate their courses

in relation to other courses or program experiences. Few acknowledge the connections to the political, social, or historical forces that have been and are making teacher education programs more and more relevant, or more and more irrelevant and even obsolete. While much of the research is focused on issues related to diversity, that which does not have diversity as a major focus sometimes neglects to identify the race, ethnicity, nationality, or class of the participants. The language of social activism and societal critique or cultural critique has seldom been employed; the goals of change are limited to the individual teacher educator or teacher education student.

The field of self-study research is beginning to provide a teacher education database, of sorts – a collection of qualitative, often complex, descriptions of teacher education goals and practices within a course or, increasingly, across a course and a related field experience. What was once referred to as a "black box" may now be characterized as a montage of people, courses, curricula, and pedagogies. This is progress, but it is only limited progress. From the international character of the research we are learning that many issues within courses and programs cross countries and continents.

By focusing on individual instances of teacher education and by neglecting the broader context it appears, perhaps wrongly, that the researchers intend to speak only to themselves and like-minded colleagues. Furthermore, when we recall several of the national level issues raised in the second section of this chapter (e.g., What should be the curriculum for future teachers? How should programs be evaluated? How do we contend with the oversupply of teachers and the uneven distribution of qualified teachers across contexts?), we find that there is no easy way to map national issues onto dominant self-study research questions (e.g., What is the impact of my requiring "x"? How do my students receive my curriculum and my instruction? How can I better work with other teacher educators?) It seems important, as we look at the future of self-study research within teacher education, to ask ourselves some hard questions.

Why is self-study research important and to whom is it important? Part of the answer is given above. Self-study research is important to teacher educators seeking to improve their practice and to understand their students' learning. In some instances, it is also an important contribution to understanding overall program impact and how the program and its intentions have evolved over the years. And, to the degree that the similar studies might be aggregated over time, we may be able to derive a common understanding about the nature and influence of selected pedagogies, curricula, and philosophies within similar courses. So part of the answer is that the research is important to those who do it because they feel it is making them better teacher educators, and this is a perfectly reasonable answer. But if self-study research seeks to move beyond the particular and if the researchers seek to have influence beyond self, then we need studies that explore more issues that go beyond a course or a field setting. We need to ask questions that can only be answered across time and across contexts. We need to ask better questions about how our programs can encourage prospective teachers to work in areas of need and how we can prepare them to be

successful in these settings and support them once they leave our campuses. We need to continue developing methods that diminish the impact of the inherent power relationships that cannot be ignored when a researcher is also the giver of any part of the grade.

If we are to diminish power relations, then how might self-study research develop guidelines for researchers and who needs to be informed about what? The participants in the research discussed above were often volunteers who agreed to being studied before the research began or, in some cases, agreed to let their data be analyzed once a course ended and a grade was given. These are the obvious participants. But if we do look at teacher education in context and if we seek to understand the overlaying complexities, there are many potential accidental participants such as the administrators who set policies or enforce university or district policies; the university-based and field-based instructors who shape understanding and practice but who are not a part of the study; the other students in the setting, who shaped learning but who did not agree to be analyzed; and those who did agree to participate but who felt they had no choice or who felt misrepresented by their researcher(s).

In summary, the field of self-study research has developed an international cadre of proponents who are engaged in serious and important investigations of teacher education, but who have not yet begun to address their connectedness to the county, the state, the nation, or the world. In part, this is because the field of teacher education research is young and self-study research is even younger. In part, it is also because the research foci are necessarily limited in scope by the frameworks that guide the research, by temporal considerations, and by research methodologies. The research cited in this chapter, and indeed this entire volume, makes it clear that there is progress toward viewing self as a relational construct and progress toward illuminating the complexity of such relationships.

ADMINISTRATORS ALSO DO SELF-STUDY: ISSUES OF POWER AND COMMUNITY, SOCIAL JUSTICE AND TEACHER EDUCATION REFORM*

Mary Phillips Manke
University of Wisconsin-River Falls

Abstract

Self-study of teacher education practices includes self-study of administrative practices in teacher education. Practitioners become administrators and wish to continue their self-study; practitioners who are not formally designated as administrators may recognize the importance of administrative practices in the institutions of which they are a part. These studies include those by administrators (deans, school superintendents, head teachers, school principals) who maintain their practice of self-study even though they have moved to an administrative role, by practitioners who have conducted self-studies with an administrative focus at the program level, and by practitioners writing self-studies with an administrative focus on teacher education reform. Key themes in administrative self-studies include issues of power (its source, purpose and use), issues of community (its development and purpose), efforts to incorporate social justice in teacher education, and the impact of teacher education reform. The chapter surveys a broad range of studies, primarily from authors within the Self-Study of Teacher Education Practices Special Interest Group. Because studies of educational administration are typically quantitative or, if qualitative, are done from an exterior perspective, these self-studies are unusual in the field of educational administration. They have considerable potential for revealing the impact of today's educational changes in the world of practice.

A narrow conception of self-study of teacher education practices would focus only on the work that is done in programs, schools, classes, and field experiences

---

with preservice and practicing teachers. Two forces, however, have broadened the field of self-study to include studies of administration in teacher education and in schools. One force acknowledges the reality that the programs, schools, classes and field experiences where teacher education takes place exist within institutions – departments, colleges, universities and their subdivisions, and schools and school districts. These institutions are organized to require administration, and the nature of that administration has a crucial influence on the teacher education practices that occur within an institution. A second force acknowledges that the line between teaching and administration is never clear and distinct. Faculty members leave their classrooms to become program directors, accreditation coordinators, chairs and deans. School administrators leave their offices to become teacher educators, whether in schools or in universities. Researchers who have been drawn to self-study, who have acquired its habits of reflection and of focus on one's own work or the role of self in one's own work, wish to continue to focus in this way on their work as administrators. Thus it has been possible to sort out from the larger body of self-study of teacher education practices a considerable group of studies that offer an administrative focus.

Research in administration, whether in higher education or in schools, is typically quantitative in methodology (or, if qualitative, based in the more rule-bound areas of qualitative research) and pragmatic in focus. Thus this group of research studies provides an unusual perspective on issues of leadership, styles of interaction, and the ways that the demands of administration affect individuals. There is, of course, a tradition of autobiographies by higher education administrators (e.g., Kolodny's [1998] memoir of her tenure as dean at the University of Arizona) and, in a few cases, by school administrators (e.g., Cuban's [1970] early study of his work as a teacher and then as superintendent of schools in Arlington, Virginia). These works, often much focused on self-study, may provide a model for larger works yet to be written in the field of self-study of teacher education practices. Yet they do not provide the attention to the relationship between administration and teacher education that characterizes the work reviewed in this chapter.

Self-Disclosure

In the tradition of self-study, I begin with self-disclosure of my own history as an administrator in teacher education and of the role of self-study in my work. After teaching for a number of years, I entered the Ph.D. program in Social Foundations of Education at the University of Virginia at the age of 43. As a graduate student and single parent supporting my children, I spent much of my time working on research projects for a variety of professors, often poking my head into a professor's office to ask whether there was any work for me to do. Some of this work involved practice in administrative tasks, including organizing projects and persuading others to carry out activities needed to complete the research. This administrative work, while carried out far from the Dean's office,

was valuable preparation for future work in administration. I developed skills in performing administrative tasks and values for how I wanted to interact with others in an administrative role.

My experiences as a graduate student served me well in my first faculty position. The academic coordinator of the university center where I was to teach soon let me know that he wanted to pass his responsibilities on to me, and he offered significant mentoring as I learned the role. In this position I recruited, supervised, and provided professional development for the many adjunct faculty who taught in the program. I also solved student problems, kept track of a budget, and organized a series of large professional development events for the teachers who were participants in the program. While the program involved practicing teachers, rather than teacher education candidates, it had enough students to feel like a college of its own.

When I moved to another university, I began to take on some administrative responsibilities in my second year of teaching; by the end of my third year I was teaching only one course. I administered a grant, organized an action research collective involving 20 teachers from a nearby district, and carried out some of the responsibilities of an accreditation coordinator. As a result, I recognized that my interest in administration and my competence in administrative tasks were signals that this was a path I wanted to follow.

My next move was into my current administrative position as associate dean in a college of education and professional studies. My work has included administration of graduate studies at the university, program improvement work in teacher education, grant administration, and service as accreditation coordinator, communications officer, and diversity coordinator for the college. I also perform a range of tasks in support of the dean. It is in this role that I have carried out some self-study of teacher education administration practices and of the power relations that underlie my own practices (Manke, 2000). My self-study has focused primarily on naming and understanding the values that underlie the administrative practices that I prefer and choose. Through that analysis I have identified relationships between my teaching practices and my administrative practices. These include the way I model as an administrator the same kinds of values that underlie my modeling of teaching practices in educating future teachers, as well as the understanding of power relations that defines my work as teacher and administrator.

In reviewing the self-study of administrative practices in teacher education, I have found only a few papers written from the dean's office, where I find myself. However, there are many studies that illustrate the self-study practitioner writing from some other administrative perspective, such as chair, program director or coordinator, accreditation coordinator, principal or head of school, or school superintendent. Thus defined, there is a rich literature on which to draw in considering administrative approaches to the self-study of teacher education practices.

A Definition of Self-Study of Teacher Education Practices

Practitioners of self-study of teacher education practices have engaged in a continuing dialogue focused on the definition and value of this work. The issues raised in this dialogue are by no means resolved as this handbook is prepared. Years of dialogue have led to rich development of the issues, but I suspect (and indeed hope) that single answers to our questions may never be proposed and accepted. Nevertheless, agreement has been reached on certain key concepts, while the nature of differing points of view on others has been established.

Fundamental to self-study is the practice of *reflection on context and practice.* Self-study does not simply describe the context in which teacher education practices take place or the practices themselves. The self-study practitioner is one who seeks, through reflection, deeper understanding of context, practice, and their interaction. This key element of self-study rescues it from at least two potential pitfalls – the fear that self-study will be reduced to the retailing of raw anecdotes of practice, and the concern that self-study will become some solipsistic ritual of self-reflection, of interest or value to no one but the self-study practitioner (see Weber, 2002). The self-study practitioner must *reflect* on practice, not simply describe it. The self-study practitioner must also reflect on *the context of practice*, a context of which the practitioner's self is a part, but not the whole.

Self-study is enriched when the practitioner engages in *looking back at past practices and past contexts to assist reflection on current contexts and practices.* This element of self-study allows for linkage with the published and presented work of other practitioners, thus alleviating the concern that a field that focuses on *self*-study will be fragmented into as many parts as there are practitioners. This handbook is an important element in a process that unites the field; future practitioners will be able to refer to a useful compendium of past practices and contexts in reflecting on their current study. In addition, this same element of self-study practice leads to the practice of re-analysis, in which the practitioner returns to the artifacts of her or his own previous self-study and engages anew in reflection on the practices and contexts that are contained in the artifacts. In this way the ever-changing self of the practitioner can be understood and represented not just as a series of snapshots, but as a richly interconnected developmental process.

Also important to self-study, somewhat surprisingly, is its focus on *collaboration.* At first glance, it seems improbable that a field of study that focuses on the self would include collaboration as a vital element. Certainly, collaborative practices work against the concerns about solipsism and fragmentation already noted. Collaborative practices may be selected by practitioners who have these concerns, but they also arise naturally in the contexts in which individuals work together in similar roles (as teacher educators and as administrators, for example) and in which individuals learn of others who are engaged in the self-study of similar practices or contexts. Collaborative self-study supports the credibility of the work, providing simple triangulation and also a context for mutual critique that becomes part of the self-study. This critique functions like the discrepant

case analysis (Lincoln & Guba, 1985) of qualitative research, displaying for the reader the commitment of the practitioner to a critical approach to the work. In addition, practitioners of self-study know that it is rigorous, demanding work, and that collaboration provides support and commitment when other demands call more loudly.

I have used the three elements of reflection on context and practice, looking back at past contexts and practices, and collaboration as criteria in the selection of studies reviewed in this chapter. Studies lacking these elements have not been included.

Origins of Self-Studies of Administrative Practices in Teacher Education

The reviewed studies fall naturally into three major categories: self-study by practitioners who become administrators and proceed to apply self-study methodology to their work, self studies at the program level that include reflection on administrative practices, and self-studies that focus on teacher education reform. Inevitably, there is some overlap among these categories, but I use them to introduce the range of studies included in the chapter.

Self-Study Practitioners Who Have Become Administrators

Hamilton, writing as part of the Arizona Group (1996, 2000) as well as independently (2000, 2001), is a teacher educator who served as head of a division of

Table 36.1. Origins of self-studies of administrative practices in teacher education

Studies by self-study practitioners who have become administrators	Studies by self-study practitioners reflecting on administrative practices at the program level	Studies by self-study practitioners engaged in fostering teacher education reforms

Upitis & Russell (1998)	Evans (1995)	
Deer (1999)		
Manke (2000)		

teacher education at a major American research university. She describes both her efforts to use a review process as a tool for reform centered on social justice and the frustration she experienced when colleagues resisted the reforms.

Senese (2000) is assistant principal of a high school in Illinois, with responsibilities for professional development of the staff. His study focuses on how he applied to his work in professional development the insights he gained through self-study of his own teaching practices in the high school classroom, including his students' response to innovative practices.

Austin (2001), a head teacher at a school in Alaska, led a professional development effort that brought together student teachers and experienced teachers to reflect on their work individually and collectively. She looked explicitly at the ways her work with this group paralleled her teaching practices in an upper elementary school classroom.

Griffiths and Windle (2002), respectively Professor of Educational Research (an administrative position) and Research Administrator at a university in England, inquired into the administrative practices that can create support for faculty members' interest in and practice of research. They also explored ways to support the development of research in an era of financial constraints and erratic government decisions.

Mills (2002), dean of a graduate program preparing teachers at a university in Oregon, wrote about the way his intentions were frustrated by conflicting faculty agendas.

Upitis (1996) carried out a self-study early in her deanship at a university in Ontario, looking at how she was able to establish time to allow her to continue important aspects of her personal and professional life while serving effectively as dean. Later (1998), she collaborated with Russell, a colleague, to explore how she had developed improved communications and stronger community in the faculty.

Deer (1999), an administrator of a teacher education program in Australia, focuses on her role of leading major structural reform as well as a move from a teaching to a research culture in her unit.

My own study (Manke, 2000) returns to the question of the nature of power relations that I had explored in previous self-studies (Manke, 1995, 1998) and also in ethnographic research (Manke, 1997). The study considers whether the theoretical framework I had previously developed for the classroom is applicable in the administrator's office.

Self-Studies at the Program Level

A second group of self-studies includes those in which the unit of study is the program rather than the individual course or field experience. Studies focused on courses and experiences may note the roles or effects of administrative practices, but they do not make them central to the analysis. Program-level studies can hardly ignore the role of administration in the functioning of the program, and in some studies the role of administration is a central element.

Vavrus (Vavrus & Archibald, 1998) studied his experiences as an administrator seeking to institute reform in two contexts, first in a small private college (Iowa, US) and then in a state college with a strong tradition of faculty self-determination (Washington, US).

Hamilton, again as part of the Arizona Group (2000), experienced similar difficulties in dealing with issues of administrative versus faculty control of programs. She also writes of her work in trying to advance a social justice agenda in her program (2000, 2001).

Delong (1996) explored the values and attributes she brought to the work of school superintendent in the province of Ontario as she sought to promote reform through self-study.

Kosnik (1998) wrote about her work as director and faculty member in an elementary teacher education program at a university in Ontario. She focused on the collaborative work with both students and faculty that led to changes in the meaning of teaching.

Upitis, dean of a teacher education program at a university in Ontario, worked with a faculty member to study the methods she used to create a positive environment for change and reform in the program (Upitis & Russell, 1998). This collaboration led to their collaborative conclusion that "good pedagogy leads seamlessly into good deaning."

Johnston (Johnston with The Educators for Collaborative Change, 1997), a professor at a university in Ohio, directed a professional development school collaboration and wrote with many of the teacher participants. She offered her reflections on the kind of leadership position she tried to assume.

Self-Studies of Teacher Education Reform

Teacher education practices today exist in an era of reform, a time of political forces as well as internal intentions to improve the preparation and professional development of teachers. These forces exert intense and often contradictory pressures in both teacher education and the schools where teachers work. Thus many self-studies are set in a context of reform, and often are written by those leading or intending to lead reform processes. This kind of leadership is usually closely tied to administrative roles within the hierarchical settings of schools and universities. Previously mentioned studies by Vavrus & Archibald (1998) and Hamilton (2000, 2001, and also in her role in the Arizona Group, 2000) must be included in this category. This category also includes a study by Squire (1998), who went from a teaching position to a bureaucratic job creating standards of practice for teachers through a professional regulatory body in Ontario. Squire's study focuses on how her work in the Ontario College of Teachers, especially in the area of action research, helped her make sense of her own teaching life, sorting out its multiple strands as she worked through the tasks assigned to her.

The third category also includes research by a number of individuals who wrote self-study dissertations in educational administration at the University of

Bath. Studies by members of the group supervised by Whitehead consistently focus on discerning how the living values of the administrator/researcher are expressed in the context of their work. Because of the rich and multiple focal points of these studies, I have selected a single portion of each thesis to review for this chapter. Austin (2001), already mentioned, is part of this group.

Loftus (1999), head of a primary school in England, examined how the culture of the English school where he was head teacher was developed, within the context of bringing a marketing approach to the school.

Delong (2002), a superintendent of schools in Ontario, brought a penetrating lens to her work in developing Action Research as a focus for professional development in her district.

Holley (1997), head teacher of a secondary school in England, explored the frustration she experienced in a setting where both monitoring of teacher compliance with reform initiatives and a more personal and interactive form of professional development were expected of her in working with the same set of teachers.

Topical Threads in Self-Studies of Administrative Practices in Teacher Education

In the remainder of this chapter, I review in some detail the papers described above, organized this time by major topical threads found in the literature. These include papers that focus on *issues of power* (Upitis, 1996; Upitis & Russell, 1998; Manke, 2000; Mills, 2002; Delong, 1996, 2002; Senese, 2000; Kosnik, 2002; Austin, 2001; Holley, 1997; Evans, 1995; Loftus, 1999; Johnston with The Educators for Collaborative Change, 1997); papers that raise *issues about community* (Upitis & Russell, 1998; Manke, 2000; Senese, 2000; Griffiths & Windle, 2002; Austin, 2001; Evans, 1995; Loftus, 1999); papers that raise *issues of social justice* (Hamilton, 2000, 2001; Griffiths & Windle, 2002; Vavrus & Archibald, 1998); and papers that consider *issues of reform in teacher education/teacher professional development* from an administrative perspective (Hamilton, 2000, 2001; Squire, 1998; Arizona Group, 1996, 2000; Vavrus & Archibald, 1998; Deer, 1999; Delong, 2002; Holley, 1997). Naturally these categories overlap. For example, the nature of community is strongly affected by the ways power is perceived and used. Both social justice and teacher education reform are sought or imposed in environments of power and community. Conversely, the exercise of power and the development of community are strong influences on efforts for social justice and teacher education reform.

Issues of Power

Having written a dissertation focused on issues of power in classrooms (Manke, 1990), my memories of the literature review do not allow me to suggest that there are only a few ways to understand the nature of this elusive concept. However, most of the work reviewed here relies on one or more of the following ideas about issues of power considered more broadly:

Table 36.2. Papers focused on major themes in the study of administration

Issues of power	Issues about community	Issues of social justice	Issues of reform
Upitis (1996)	Upitis & Russell (1998)	Hamilton (2000, 2001)	Hamilton (2000, 2001)
Upitis & Russell (1998)	Manke (2000)	Griffiths & Windle (2002)	Hamilton (Arizona Group, 1996, 2000)
Manke (2000)	Senese (2000)	Vavrus (Vavrus & Archibald, 1998)	Vavrus (Vavrus & Archibald, 1998)

Evans (1995)			

- Power can come from several sources, such as that inherent in a position such as dean or president, that inherent in acknowledged expertise (of which professors and medical doctors are often said to be examples), and that inherent in the possession of economic, political, or social power (corporate leaders, presidents, and high society leaders are examples) (Barnes, 1998).
- Power can be exercised either *over* others or *with* others, in autocratic or collaborative structures (Kreisberg, 1992).
- Power is most obvious as it is exercised by the strong, but it also available to weaker members of a society (Janeway, 1980).
- Power is evident not only in political documents, weapons, and punishments, but also in administrative and social structures and in the nature of the gaze that the powerful cast upon the weak (Foucault, 1980).

The self-studies in this section do not reflect all these ideas about power at the same time. These ideas are not mutually exclusive, but authors assume one or more of them as an underlying understanding(s) of power. This is appropriate, given that administrators and their faculties, employees, or subordinates typically accept the idea that power is assigned to them by the nature of their positions.

Upitis (1996; Upitis & Russell, 1998) exemplifies an administrator who intends to exert "power with" her faculty. If she accepts at all that she has power as a dean, she attributes it only to the position to which she has been assigned. Her interest is in developing strong communication with faculty and a sense of shared

enterprise that will lead everyone to work together for change and improvement. She grasps the existence of the "powers of the weak" (Janeway, 1980) as she struggles with some faculty who make it clear that her way of being dean is not for them and who interfere with her progress toward her goals. Interestingly, the power she struggles against is the power of the position to shape her personal and professional life, as she seeks time for research and learns to do academic writing "curled up in the economy class of a crowded airplane" (Upitis, 1996, p. 76) She uses this struggle for her own ends, as she seeks to model for faculty a balanced lifestyle that, even in a demanding job, allows time for her to feel in control of her own life and her own pleasures.

I appreciate Upitis' work because my own view of what it means to be a dean and my own values are similar to hers (Manke, 2000). Like Upitis, I prefer "power with" to "power over." I recognize that there is power of position assigned to the dean's office and that I am exercising it whether I want to or not, even as an associate dean. In my paper, I reflect on the idea that, even though I take pleasure in solving student problems and receiving their thanks and smiles, I am exercising the power of my office as much as did a predecessor who reportedly liked to make students cry. In my earlier studies of classroom power, I was strongly aware of the mutual possession of power by the teacher and the students, and I resisted any analysis that gives power (and therefore responsibility) to the teacher alone. This awareness, however, was based on the intensive and long-lasting interaction that occurs in classrooms. Writing the paper, I continued to doubt that without such interaction the "powers of the weak" (Janeway, 1980) could be as significant as those of the strong. After a longer period in the dean's office, though, I would suggest that multi-year interactions with faculty allow the powers of the weak to be quite well developed.

Mills (2002), the third and last dean in this group, offers a distinctly different view of the nature of a dean's power. He understands his power to come from his position and, most specifically, from the resources his position allows him to control. He is displeased to discover that his exercise of "power over" changes irrevocably the relationships he has built as a peer of the faculty members in his college. The powers of the weak include the ability to refuse social comfort to the strong (Janeway, 1980), and Mills describes himself as losing friends when he makes decisions without taking into account their points of view. He also exercises "power over" when he uses the resources he controls when faculty behave in ways he judges to be unprofessional.

Delong (1996) defines the core of her administrative work in a school district in Ontario as one of building trust. This places her squarely with Upitis and Manke as one who prefers "power with" to "power over," and who recognizes that the powers of the weak (Janeway, 1980) are not only present but also able to interfere with her effectiveness as an administrator if the necessary relationships are not developed. More than any of the authors previously reviewed, Delong places her administrative position in a larger context, one that includes forces that limit the success of her efforts. As she attempts to build an action research group in her district (2002), Delong is frustrated by interference from

colleagues and university staff. Perhaps she, located in an administrative power structure, is able to place these frustrations in public view because they do not come from her superiors in school administration. This frustration also may arise from her assumption that, in addition to power of position, she should be recognized as having the power of expertise.

Senese (2000) understands his power as being based on the skill with which he interacts with students (in the classroom) and faculty (in the professional development program). Perhaps realistically in an American high school, especially one in a wealthy and progressive community, he is aware that the power of his position as assistant principal is severely limited vis-à-vis the faculty. He *must* use "power with," developing relationships with the faculty that lead to shared work in the improvement of teaching through action research. Thus Senese (2000, p. 229) develops three counterintuitive axioms based on his classroom teaching:

- Go slow to go fast.
- Be tight to be loose.
- Relinquish control in order to gain influence.

The first and third of these are fairly obvious as examples of accommodating the weak (Janeway, 1980) or of exercising "power with." You do not rush people faster than they want to go, and you can affect their actions more easily if you are not seeking to control their lives. The second axiom, though, reflects Senese's understanding of what his teacher colleagues want: they are uncomfortable when he seeks to make them more independent by refusing to provide a clear sense of direction or procedure for them. As assistant principal and leader of professional development, he has the power of expertise, and the teachers are unwilling to allow him to completely abrogate that power. (See also the discussion of Evans, 1995, below.)

Kosnik (2002) describes her work as director of a teacher education program focused on intensive field experiences for the students. As a faculty member in one program cohort, she has been able to engage in systematic research on a variety of aspects of the program over a five-year period. She indicates that is through this research that she has been able to influence others in making needed changes in the program. Although she makes some use of the power of position, her primary source of power, she suggests, is the power of expertise. As a researcher, she brings her results to bear as powerful change motivators, affecting action research, student workloads, communication between students and teachers, and arrangements for practicum supervision.

Johnston (Johnston with The Educators for Collaborative Change, 1997) is a university professor who writes thoughtfully about the ways she used the power of her position in her work in a professional development site where she was designated as co-coordinator. Her thinking has strong connections for me because she makes an effort, as I have in the past, to deny her own power. She positions herself not as weak, but as neutral with respect to power. She seeks to be out of the arena of power. She refuses, on most occasions, to offer the group

of teachers she works with either the power of her position as university representative and co-coordinator or the power of her expertise as experienced teacher and educated professor. She goes beyond not wishing to exercise "power over" to seeking *not* to exercise "power with": "In retrospect, I think I overdid the attempt to position myself in nonhierarchical ways" (p. 28). Interestingly, she finds that this attempt on her part made her role and the relationship with the university central to the discussion, which she thought was valuable. Yet she found that it also worked against possible learning for the teachers in the group. Later she defines her role in the group in three ways taken from the world of the newspaper: as an advertiser, a reporter, and an editor – but not a managing editor. She assigns herself roles that are vital to a paper's functioning, but are not directive. She continues to look for ways to position herself away from the location where power is used.

Four members of what I term the Whitehead Group (all masters and Ph.D. students of Jack Whitehead at the University of Bath) also reflect on issues of power. Evans (1995) is a deputy head teacher of a comprehensive school in England, responsible for professional development and deeply committed to a constructivist approach to this work. The relationship between teacher and learner in a constructivist philosophy of education has one of its roots in "power with," and Evans sees her role as one of working with the teachers as they work out changes they can make in their classrooms that will lead to better student learning. To her dismay, some of the teachers would prefer that she tell them what to do or, if she is unable to tell them what to do, that she send them to be taught by someone who can. She is asked to appear as a confident leader, but she is left in confusion as to whether it is sufficient to be confident that constructivist methods are best.

Austin (2001) writes as leader of a professional development group at a school in Alaska (US) that brings together student teachers and teachers in a course setting that allows them to reflect on and discuss their practice each week. Austin, who has considerable expertise in teacher reflection, attempts to assume neither the power of expertise nor the power of position, but focuses on exercising power with the teachers in developing their process. She tries to conceal the power she does exercise, by arranging the room, the music, and the process of sharing floor time in the discussion. At the same time, she is acutely aware of the power that the teacher members of the group have in deciding whether or not to participate in this activity and how it will proceed. She writes from a perspective of unease that reflects her understanding of her power. Will anyone sign up for the class? Will anyone come to the first meeting? Will this afternoon's session go well? Will anyone sign up for the second semester of the class?

Holley (1997), head teacher of an English secondary school, parallels Delong in her frustration with the ways that the power conferred on her by position and expertise are limited by the larger social context in which she must work. She is called on to carry out, simultaneously, roles that she sees as antithetical to one another, especially because they involve relationships with the same teacher colleagues. On the one hand, she must serve as a monitor who checks

to see whether and how well they are carrying out the prescribed actions and process of their teaching. On the other hand, she is expected to engage the teachers in a self-directed appraisal process of professional development in which they reflect on their own teaching with regard to their understanding of themselves as teachers. Eager to exercise power within the latter process, she is required to assume the power of position and the power of expertise while she exercises "power over" in monitoring the teachers. The power of administrative structures, the power of her gaze as she engages in monitoring the teachers, is controlling not only the teachers but also herself as she carries out her work. She and the teachers, co-located as "the weak" (Janeway, 1980) in this structure, seem unaware of any power they can use.

Finally, Loftus (1999) writes as an English head teacher who works to bring an "industrial marketing perspective" to his primary school, but who learns in the process that maintaining the culture of the school in a marketable condition requires approaches to power other than those implied by that phrase. The portion of his work reviewed here is more relevant to the ensuing discussion about community than to this section about power, but it is useful to note here that his data indicate that members of staff felt that the culture they viewed as highly positive was actually created by the senior management of the school. One staff member said that it would be unfair not to support the management group because of the effort put into their work. Loftus himself indicates that, despite many external pressures and internal changes, the culture of the school continued to be a positive one. This remark and those of the staff members seems to indicate that power was used collaboratively in a "power with" environment, even though Loftus apparently saw his power coming both from his position as head teacher and from his expertise in marketing approaches.

Power and its many facets emerge as a significant theme in these 13 studies by 11 administrators from three English-speaking countries. A majority of the administrators prefer "power with" approaches, recognizing the powers of the weak (Janeway, 1980) while acknowledging the sources of their own power in their positions and their expertise.

Issues of Community

The idea that developing community is important in administration derives directly from concepts discussed in the preceding section on issues of power. Developing community is important if power-with (Kreisberg, 1992) is to be used and if the mutuality of power implied in the notion of the powers of the weak (Janeway, 1980) is to be recognized. Community, however, is an object of analysis with a history far shorter than that of power. Community has existed as long as humanity, but for most of those centuries community simply existed, unanalyzed, as a sort of artifact of human interaction. Even in the 18th and 19th centuries, when intentional communities, often utopian in nature, began to be developed, their purpose was not simply to create community but to achieve some particular goal of religion or socialism or agriculturalism. The complex

analysis of power that is so well-developed in the literature is not present in literature on community, which typically assumes that community is a positive and productive condition and proceeds to explore how community can be created. This is the stance of the self-studies focusing on community that are discussed here. An example of such literature is Sarason's (1972) *The Creation of Settings and Future Societies* (cited by Upitis & Russell [1998]), which discusses what is needed to create strong new communities from the broken materials of failed communities.

Upitis and Russell (1998), for example, find their faculty of education in some disarray, with faculty divided into factions and an overall aura of mistrust. Upitis as dean and Russell as faculty member work to build a functioning community, to transform the same people who are so divided into a single working unit. Their paper focuses on just one of the tools employed to achieve this end, the development of improved communication among members of the community. Also briefly mentioned are structural changes that imply a reduction of distributed power and a concentration of power in a more democratically focused center, with positive motivation promoted by, "delivering carefully worded and passionate messages in large assemblies" (p. 78). Among the communication activities used are individual conversations, larger gatherings at which difficult topics are raised and confronted, and electronic messaging. This last is the focus of the self-study the two have written. Upitis establishes a list serve that she uses to communicate not only information but also a vision of her deanship and of the community she wants to create. This featured idea of communication for community-building is thematic in a number of other self-studies.

My own self-study (Manke, 2000) includes reflections on the leadership style I prefer, which I call relational leadership. Somewhat like the style of a teacher who channels classroom interaction through herself, so that the students all interact with her and not with one another, I pictured myself at that time, shortly after assuming my position, as the center of a web of relationships that could be described as a community. This web of relationships, still to some extent a feature of my work as associate dean, allows me to move an agenda forward in the community while avoiding the confrontations between individuals that had characterized the community into which I came. As I write this I am questioning whether this kind of community interaction is healthy, yet I must admit that it has allowed some important changes to begin in an environment that has historically buried needed changes under a mountain of conflicts. I might conclude that it has not contributed to changing the nature of the community, and that I must wait for time and change to alter the balance of influence. But I also acknowledge that over several years the kind of interaction experienced among faculty members has become consistently gentler and more focused on working together.

In his self-study of his role as assistant principal and professional development leader in an American high school, Senese (2000) describes his role in creating a community by setting standards for the behavior of members. Participation

in the Action Research Laboratory is voluntary, and Senese has set clear expectations for how teachers will function if they choose to join. He indicates that this firmness in setting expectations (enacting his axiom "be tight to be loose") has been effective in developing a community in which the teachers show respect for one another by accepting their responsibilities. Deadlines may be negotiated, but the premise that everyone will do the work and do it well is accepted by all. This strategy on his part may be related to Upitis' (Upitis & Russell, 1998) provision of messages about the kind of community she is trying to create.

Austin (2001), who studied her leadership of professional development in a school in Alaska, combines features of Senese's, Manke's, and Upitis' concerns in seeking to create a community in which teachers can reflect together on their work. She worries that teachers will interact in negative or unproductive ways, that certain teachers (especially males), will dominate the discussion, and that teachers will not attend the class or will not participate in the activities she suggests. Like Senese, she reflects constantly on the lessons she has learned from her teaching to understand how to respond to the teachers and what to expect of them. She gives them time to get started writing about their classroom experiences, knowing how her sixth-grade students often have trouble getting started with writing. As she does in her classroom, she provides entertaining ice breakers and amusing gifts to loosen the tensions of the day. She uses structured tools for sharing the floor, tools she has found effective with her students. Her work to create community has a tone of nurturing, mothering care (Noddings, 1986; Ruddick, 1995), not surprising in an elementary school teacher.

Evans (1995) focuses part of her study on her effort to build community among a certain group of teacher-administrators in her comprehensive school in England. She is convinced that they will be more effective contributors to school improvement if they have a sense of collaborative community. Though they have been working together, they insist that their lack of knowledge about one another is an impediment to their work. Evans takes the risk of asking them each to write a list of their own characteristics and then to give words describing the personal characteristics of the other group members to them. It is hard for them to agree to do this, but in the end they do, and they find that in general their understanding of one another is quite similar to their individual self-understandings. Later, Evans shares with the group an edited transcript, or story, of their meeting. She is clearly convinced that self-knowledge and group reflection on their interaction will lead them to a stronger sense of community.

Griffiths is working to create a community for the specific purpose of developing a research culture in her university, but she is also working to create one that is in tune with the political and social values that are so important to her. She demonstrates what these values look like by co-authoring and co-presenting a paper (Griffiths & Windle, 2002) with the research administrator of her unit, a member of the support staff. She describes her "research principles" as, "partnership, small-scale relevance, involvement in teacher education, [and being] inclusive of all levels of research experience" (p. 88). These principles require only a small amount of translation to be seen as social justice principles of

community, local action, goal-centered action, and inclusion of all people. Thus Griffiths has created a strong link between the purpose of the community and the guiding values for its creation. The paper suggests that this cohesion gives strength to the growing community. Interviews with participants produced descriptive words like encouragement, welcome, support, ownership, warmth, security, and understanding (p. 89). Windle's role in providing prompt, courteous support on request is highlighted. Griffiths indicates that a core value is a basic trust in human beings (p. 90). Griffiths and Windle conclude that "peace, laughter, enjoyment, and excitement" are essential (p. 91). In the world of social justice that Griffiths envisions, communities maintain precisely these values for all.

Loftus (1999) provides an interesting contrast with Griffiths and Windle. He enters his research with the intention of applying industrial marketing knowledge to the English school where he is head, planning to sell the school as a desirable product to the parents of children who will attend. But an important focus of his work turns out to be the culture of the school community. He marvels at the ability of the culture/community to remain whole under the battering of personnel changes and increasing demands from the education establishment. Collecting data from the school staff, he seeks to understand what strengthens the school community and finds that staff support each other without relying heavily on senior management. Loftus perceives caring support among colleagues, as well. He asks not how he could or did create community but what his place was in the community. Based on data from the staff, he concludes that his ability to intercept negative interactions and to help reduce the stress of work in school was essential to the maintenance, if not the creation, of the school community. He also notes the potential for senior management to destroy, rather than support, the positive culture of the community.

These self-studies of issues about community in American, Canadian and English teaching-learning environments portray self-study researchers who are convinced they have an active role in building community. Only Loftus' (1999) study even questions the role of the "senior management," and he finds that he has an important role in maintaining, if not creating, the community in his school. In addition, these researchers have a clear sense of both the kind of community they want to create and the pragmatic purposes of creating such a community. Senese wants to create a community with clear expectations in which members take responsibility for their share of the tasks to be completed. Manke wants a community in which problem-solving takes place in an orderly and civil manner. Griffiths wants a community that exemplifies social justice and supports change in the research culture. Austin seeks to create a space in which all can participate in an equitable manner in order to encourage reflection and improved teaching. Upitis seeks to put an end to the divisiveness and lack of focus she perceives in the community's past in order to move forward with reform. Evans wants a community that can work collaboratively for change, and Loftus wants to maintain a community of mutual support among staff, a community that will encourage parents to see the school as a desirable place for

their children. Self-study has helped these eight administrators to clarify their intentions in building community.

Issues of Social Justice

Only three self-studies related to administration look explicitly at concerns about social justice. This may reflect a sense on the part of some self-study practitioners that social justice and teacher education are not closely linked. For the authors of these studies, however, that relationship is not only clear but also preeminent. In the preceding section, I discussed Griffiths' social justice agenda (Griffiths & Windle, 2002), highlighting the significance of social justice both in the purpose of her work and in the kind of community she wants to build in an English university. Earlier in this chapter, I could also have examined her preference for using "power with" and her recognition of the "powers of the weak" (Janeway, 1980). None of this is surprising in view of Griffiths' work as a feminist philosopher of education who emphasizes social justice in many publications. It is in this paper, however, that she makes explicit the connection between social justice and her administrative role.

Hamilton (2000) initially titled her paper, "Change, social justice and reliability: Reflections of a secret (change) agent," and then revisited the same events in a second paper (Hamilton, 2001). As she positions herself as a secret agent, an undercover worker in the effort to secure social justice in an American university, she implies that it is not an agenda pursued by many in the program of which she was the director at the time the paper was written. Her self-study shows her using traditional academic governance activities – preparing position papers, sending informative e-mail messages, holding meetings – to promote an agenda of social justice for the teacher education program. Academics know how lengthy and intensive such processes are. Despite the fact that reform at her university followed a demand from the Board of Regents that the university "meet the needs of America and Kansas," (Hamilton, 2001, p. 109), a demand of a type that rarely calls for social justice, Hamilton set out to use the reform process to promote that very end. After two years of work, the committee tabled the issue of social justice and had not returned to the topic when the papers were written.

Hamilton's review of her journals at this time reveals her sense of "horror that colleagues could vote against social justice" (p. 111). In her self-study, she explores explanations for this event, ranging from racism to personal animosity to the effects of a changing and hardening political climate. She concludes her paper by foregrounding the responsibility of white scholars to raise and pursue issues of social justice against all odds.

Vavrus, writing in Vavrus & Archibald (1998), also studies his role as an administrator in pursuit of a social justice agenda in two American universities. Vavrus' central assumption is that a clear conceptual framework, adhered to in practice and belief, is the essence of teacher education reform and of quality teacher education. In his first position, he found a faculty with no interest in or knowledge of their mission statement and, in addition, with no interest in the

social justice agenda that for Vavrus equates with reform. Thus he spent years struggling to interest, convince, and move the faculty in the direction he strongly believed was right. His account indicates that his only success came because he was able to hire two new faculty members (in a group of 15) who agreed with his agenda. By the end of his tenure in this position, he was able to achieve a conceptual framework to which faculty members were at least superficially committed and which met his criteria for reform.

Moving to another position, Vavrus found another set of problems. Faculty seemed to share the values that underlay Vavrus' desire for teacher education reform with a social justice perspective but feared that written articulation of those values would inhibit the creativity of their teaching and curriculum design. It would seem that at some level they held liberal values of individual freedom more deeply than the democratic and social justice values they also espoused. Just as in his previous position, Vavrus made use of the demands of state and national accrediting bodies for a clearly articulated conceptual framework. He employed this tool to push the faculty into creating "a structure and thread of their curricular ideology" (p. 154). This appears to be an instance of "power over" operating under the guise of "power with." Vavrus had a definite ideological goal, which he promoted by stating that "they" (the accreditation bodies) want "us" (faculty and Vavrus, the director) to do it.

This small group of studies raises the interesting question of what administrative paths will actually lead to an increase in the social justice orientation of faculty. In writings on the benefits of accreditation, it is often stated or hinted that accreditation weaknesses are useful to schools of education as a way to get funding for improvements from their universities. The parallel benefit of using accreditation weaknesses as a way to induce faculty to move in a direction preferred by leadership is rarely mentioned. There is a definite contrast in the leadership focus of Griffiths, who seeks to model social justice in her administrative work, and of Vavrus, who uses the tools that come to hand to push faculty further into a social justice approach to teacher education. This point recalls comments by Guilfoyle (Arizona Group, 1996), who writes about the tendency of critical teacher educators to embrace a transmission style of teaching, not taking responsibility for teaching others how to pursue social justice in the classroom. Hamilton is in a somewhat different position as she describes her belief that faculty must surely support social justice when given the opportunity, and her distress at learning that they do not.

Issues of Reform in Teacher Education and Teacher Professional Development

As the 21st century begins, we appear to be living in an era of intense efforts to reform teacher education. Some might say that reforms led by conservative political forces seeking to achieve a deprofessionalized, state-controlled curriculum in schools throughout the English-speaking world have now made teacher education reform the arena for erasing the last vestiges of progressivism in

schools. Others might hold up the standards-based reform movement as a road on which to realize the twin goals of equality and quality in education for all children. As self-study practitioners in administrative roles choose one of these views, or take a path between the two, their efforts at or responses to teacher education reform become quite different stories.

Vavrus, for example, recognizes the anti-progressive aspects of much current teacher education reform, but seems to see the movement as having the potential to make a reform agenda oriented to progressivism more effective (Vavrus & Archibald, 1998). The discussion of his work in the previous section highlights his views on this issue. He seems to believe that, however reform is enacted, it can remain progressive in effect. At the end of his portion of the paper, he reflects that he feels confident that even if he were to leave his institution, the faculty would continue in the direction he has made possible for them. When he speaks of the faculty at his first institution and their resistance to his efforts, he does not recognize that they are using the "powers of the weak" (Janeway, 1980) to resist his power, the power of the strong. His work is an interesting example of an effort to create community around a set of ideas, with the ideas very much in the mind of the administrator, especially in his first position.

Hamilton (2000, 2001), also discussed in the previous section, seems to reason much as Vavrus does. She hopes to use the process of curriculum redesign, stimulated by accreditation pressures, to achieve progressive reform, only to find her efforts collapsing around her because of faculty resistance to the values she seeks to promote.

Squire (1998) is not so radical a reformer. Precisely because she believes that standards-based reform will lead to better educational outcomes, she accepts a position creating the standards for the Province of Ontario that will guide the work of teachers and teacher educators. At the end of a teaching career, she almost luxuriates in her office job, where she has a phone on her desk and the time and quiet to see a task through. She wonders, "How could she share with her peers her beliefs about the positive new directions?" and "How can we keep the teachers' voice as we frame policy?" (p. 13). Answering her questions involves a process of engaging groups of teachers in action research to help develop the new standards. Her role was to analyze the data they created, uncover themes, and share those themes with the teachers while weaving them into the standards she was helping to create. It must be noted that this is a very power-filled set of tasks. Many have noted that one way to control the outcome of a meeting is to take one's place at the chalkboard to make notes and outlines of what is said. The opportunity to shape the results according to one's views is obvious. Yet the tone of Squire's self-study implies that she is genuinely striving to let the teachers' voices be heard. Thus, although Squire clearly believes that standards-based reform is a positive influence, she also believes that such reform will be ineffective without the participation of representatives of the group that will teach to the standards. The power of her position allows her to influence the development of standards, but she seeks to share that power ("power with") with teachers.

Deer (1999) undertook the position of Head of the School of Teacher Education at the University of Technology, Sydney, at a time of change and restructuring in teacher education, when her institution was required to change the culture of its teacher education school from one of teaching to one of research. One of her areas of professional interest was the theory of change, and she expected that the change would not be easy and would require much professional development for the faculty. She planned to "lead by example" (p. 4) and to get feedback from the faculty on the effectiveness of her leadership. She also expected to be supported in the change process by her superiors. (The relationship of leaders to *their* leaders is a topic that receives relatively little discussion in most of the self-studies reviewed in this chapter).

Deer does not give a clear sense of what she means by "lead by example," and her knowledge of change theory seems to have done little to cushion her against the expected negative responses of some of her staff and the unexpected lack of support by senior administrators who met with her as she proceeded on the road to reform. Still, when she retired after five years in her position, she had been able to accomplish the reforms that were her goals from the beginning. Faculty had learned to be researchers and were including research as well as teaching in their professional lives. There had been a large increase in the number of graduates in her program. And she had been able to obtain much of the financial support needed from the university administration. The internal successes she attributes to the provision of formal professional development opportunities for the staff. In effect, she approached the internal aspect of her administrative work as a teaching task. What learning experiences could she provide that would enable faculty to accept the changes she had in mind? This is a straightforward and systematic approach that seems quite different from the styles of other administrators included in this chapter.

Deer's study was presented under the aegis of the Self-Study of Teacher Education Practices Special Interest Group at AERA. However, she defines self-study as, "working out how to proceed and then reflecting on how my chosen course of action works" (p. 4). One reason for including it in this chapter is to highlight the contrast between a study like this and the more revealing self-study that actually looks at the self, at one's own beliefs, actions, relationships and the like, in trying to understand events and processes. Without this aspect of self-study, it is difficult to know much about the underlying aspects of actions described and processes used by the administrator.

As a superintendent of schools in a school district in Ontario, Delong's (2002) self-study dissertation focuses on her efforts to reform teacher professional development by introducing action research for teachers, in collaboration with university faculty. In some ways her task was parallel to that set for Deer, who was asked to change the culture of her School of Education to a research culture. Like Deer, Delong provided professional development opportunities to staff so they could learn a new way of working and of thinking about the work they were already doing. Like Deer, Delong identified an area of professional expertise for herself. For Deer, that area was "change," and for Delong, it was "systems."

In the early years of her project, Delong used her political understanding of systems to forward her goals, whether with teachers or with administrators. She assumed an active teaching role, working with teachers to increase their understanding of action research and bringing in university-based consultants to teach them more. After three years she was able to assume a supporting role that allows her the luxury of observing the teachers working out the results of her project, while she has time to enjoy observing what they are doing. Support activities include moving the actual administrative work of the program to selected participants, assisting teachers in producing written representations of their work, and arranging conferences and publications for dissemination of the research in environments that would feel safe to the teachers.

Certainly Delong's growing expertise in action research was a starting point for her power, and in the early years she made use of the power of her position. However, if we see her goal not as ensuring that teachers did action research but rather as ensuring that they became better teachers through the action research process, it is clear that she has chosen a "power with" approach to the reform of teacher professional development. Her development of an action research network was carried out in collaboration with the teachers, who shared her goal of educational improvement.

Holley (1995) was involved in teacher education reform from her role as deputy head of a comprehensive school. In the preceding section on issues of power, I described the conflicts she experienced between dual expectations for her relationships with teachers. Here I frame those same conflicts as warring approaches to education reform, particularly the reform of faculty professional development. On the one hand, Holley was asked to "monitor" the teaching of a group of faculty, observing them in their classrooms, rating them on a set of predetermined criteria and informing them of what they had done "right" and "wrong." This activity embodies a "power over" approach to teacher professional development that treats teachers as lacking in the abilities necessary for good teaching and capable of improvement only by being chastised for their failures. This is the approach to education reform that has been implied in many government-sponsored publications and in many publications sponsored by non-profit and political groups in the United States. It is an approach that casts teachers in the role of "the weak," and thus invites them to use the "powers of the weak" (Janeway, 1980) to resist and subvert what is being done to them.

At the same time (and this simultaneity was what frustrated her so deeply), Holley was also involved with the teachers in a process of "appraisal" that asked the teachers to reflect on the strengths and weakness of their teaching and then work out what kinds of changes were needed in order to make them more effective as teachers. Holley's role was supposed to be one of talking with and listening to the teachers as they carried out this process. Such a role is similar to the role of "critical friend" often held up as a model in self-study research. This process gives teachers responsibility for their own development and for the quality of their own work, avoids deskilling them in the improvement process, and moves them toward increasing professionalization of their roles. It is a

"power with" process that invites teachers to co-create improved teaching and learning in their schools and classrooms.

The imposition of two opposing processes at the same moment was not painful only for Holley; it was almost guaranteed to fail. How could the teachers change their responses to Holley depending on whether she came to them wearing her "monitor" hat or her "appraiser" hat? How could they assume different stances related to power with the same person, depending on what she said her role was? How could trust be cultivated? This situation is analogous to teacher education reforms in the United States that say to teacher candidates, "We will work with you, using performance assessments and rubrics, to ensure that you can meet the pedagogy and content standards needed for good teaching" and then add, "But, by the way, you will not be allowed to complete the program unless you pass content and pedagogy tests over which neither we nor you have any control."

The Arizona Group, a collaborative of four women faculty in teacher education, wrote in 1996 of their journey through a "maze of contraindications" in dealing with teacher education reform. For Pinnegar, the role of candidates' experience in teacher education was in the foreground. Would they be treated as "blank slates" or as slates covered with misinformation, or would they be treated as owners of valuable experience that could be incorporated in their new learnings? The parallel with Holley's concerns (above) is obvious. For Guilfoyle, teacher education reform must not involve efforts at "transmission of even the most desired values, but a feminist, collaborative approach to learning that respects the learner." Placier speaks of the need to respect the value of existing practices, to seek change without denigrating the worth of what is being done now. Hamilton echoes Pinnegar in seeking to foreground the role of experience and weave needed theoretical learning into spaces within and around experience.

When these four came together four years later (Arizona Group, 2000), they chose not to identify themselves by name as they addressed "myths and legends of teacher education reform." One of them asked how reform could take place in deeply divided faculty groups where a dean was exercising "power over" to define and impose changes called for by outside groups. One found that little change was taking place, despite much talk of reform, while another feared the conservative political power that was mandating reform. How could it be that the reform pressures that had been working on schools for years had now penetrated the perceived safety of teacher education?

During the 1996–2000 period, the Arizona Group's perception of teacher education reform seems to have shifted from one that saw it as a problematic internal process involving decision-making within schools of education to one that recognized it as imposed by exterior political forces that gave little consideration to the knowledge and expertise of teacher education faculty, even at major research universities. This shift moves teacher educators from the position of "the strong," who may need to be aware of the "powers of the weak," (Janeway, 1980) to that of the weak, who may be able to exercise their power subversively. It ceases to ask whether they use "power-with" or "power-over" (Kreisberg,

1992), and positions them as the recipients of power-over, dreaming of the possibility of at least having access to power-with. It exposes them to the gaze (Foucault, 1980) of politicians and bureaucrats, who claim the ability to control their every move. And it robs them of the power of expertise, of position, and even of their status as white, middle-class, educated professionals at high-prestige institutions (Barnes, 1988).

I have arranged this section so that these self-studies by administrators can portray what I see as the progress of teacher education reform in my own country, the United States. What I hear from colleagues in other English-speaking countries suggests that the reform process is the same in varied contexts, differing only in how far it has gone. I conclude that self-studies by administrators have the potential to broaden our view of what is transpiring in the name of reform.

Conclusion

As a participant in the Self-Study of Teacher Education Practices Special Interest Group, I have been both faculty member and administrator and, for the past several years, only an administrator. I typify the self-study practitioner who will not give up the methodology and practice of self-study just because the classroom is left behind or is not the sole focus of her professional life. I began this chapter asking myself what might be the special value of self-study of administrative practices in teacher education. I recognize that self-study can lead to deep self-understanding when it involves reflection on context and practice, review of past reflections, and collaboration with fellow self-study researchers or critical friends. I conclude the chapter in the belief that this self-understanding can raise and consider critical questions about the ways people in education work together (issues of power and community) and about the goals they set (social justice and teacher education reform, for example) that may be unique to self-study by administrators. I urge self-study practitioners who are administrators to continue this revealing work. I also urge administrators who work with self-study practitioners to consider self-study as a mode of learning about administration that can make great contributions to educators' understanding of the context and practices that surround them.

IDENTIFYING ETHICAL ISSUES IN SELF-STUDY PROPOSALS*

Ian Mitchell
Monash University

Abstract

The origins of this chapter lie in persistent reports of difficulties that proposals for practitioner research in education encounter with institutional review boards (IRB) and the frustration of teacher researchers at the inappropriateness of the ethical protocols for their genre of research. The discussion is restricted to what is defined as insider research and to the ethical issues associated with IRB processes. The chapter analyses the ethical issues in different forms of practitioner research in education and contrasts these with those that are important in the bio-medical domain in which many standard protocols originate. The starting point for this analysis is the ethical parameters that already exist in the workplace of teachers and teacher educators. These provide a basis for a discussion of consent issues that facilitates decisions about what should and should not be part of the consent process. The discussion considers separately the ethics associated with the intervention, data collection and data reporting phases of practitioner research. In most cases, the ethical problems and dilemmas are associated with the last of these. The chapter concludes with a set of questions designed to provide a framework for decision-making in this area.

This handbook is a result of increasing interest in and recognition of the importance of the kinds of wisdom that can come from self-studies by teachers and teacher educators. These sorts of studies have had to battle for their place in the sunny fields of legitimised research. Debate continues as to whether or not they should and could be regarded as belonging to one or more separate and distinctive genres of research and, if so, what cannons would be used to

---

define excellence. What is clear is that they routinely raise ethical issues, problems and dilemmas that are, "ambiguous, context-sensitive and therefore resistant to generic regulations" (Zeni, 2001, p. xi). The principal motive for writing this chapter is the persistence of reports of problems that research proposals in this area encounter when submitted to university ethics committees (hereafter referred to as Institutional Research Boards, or IRBs) for approval. *A constant theme in these reports is the inappropriateness of the protocols used by IRBs for identifying potential ethical problems in practitioner research in education.* Protocols that are well established and appropriate in bio-medical research, where the researcher is positioned as a neutral outsider, are often criticised by those involved in practitioner research as being inappropriate when applied to the insider research that is the focus of this handbook.

A spectacular example of this was reported at a roundtable on ethics at the 2003 International Conference of Teacher Research. A teacher, who had submitted a proposal for a 12-month study in her classroom, was asked by her IRB: "How will you ensure that, at the end of the research, your subjects [her students] will be returned to the state they were in when the research began?" As someone who spent 17 years with a role as a secondary classroom teacher researching his own practice, 19 years with a role of leading and supporting groups of teacher researchers in my own and other schools and 10 years with a role in nudging research grants and Masters and Doctoral proposals through our ethics committee, I share this dissatisfaction.

The following relatively recent case brings out some of the issues and dilemmas in this area.

Case 1:   Jill

Jill was a science teacher in a very low socio-economic area, very high permanent unemployment, parents with very low levels of education, students with very low aspirations and expectations. She was concerned that large numbers of students were entering Year 7 each year excited by the idea of doing science, but with very low literacy skills. By mid-year, they commonly were alienated from science, partly, it seemed, because of demands for writing. Jill wanted to do two things. One was to develop approaches to Year 7 Science that involved good science, but minimal perceptions of writing. The second was to monitor students' reactions to and opinions of different activities during the year to find out more about which sorts of activities were engaging/not engaging and why. She was particularly interested in the data from the low-achieving students most likely to be alienated by mid-year.

One form of data was 'fortune line' graphs where students rated their enjoyment of individual activities and (separately) of science overall on graphs. Jill had two Year 7 classes and intended to (separately) aggregate the graphs of students in each class; looking for highs and lows in individual activities as well as overall trends during the year. To supplement the graphs,

the students were invited (not required) to add brief reasons for lessons they found unusually interesting or unusually boring.

This form of data was further complemented by occasional short interviews of individual and pairs of students by another teacher (who was on family leave). The interviews were to be voluntary and Jill only needed a representative sample of students, however it was important to her to be able to aggregate all the fortune graphs to monitor the whole class.

The Ethics Committee expressed concern about Jill using her position to coerce the students into benefiting her research. They refused to allow all fortune lines to be used, arguing that she could not use any student work without written consent from the parents, consent that had to be given before the intervention began. This proved very difficult. One problem was ensuring that parents received the consent form at all. Then many of the parents in the area did not read well, were suspicious of all letters and/or could not be bothered returning them. Forty per cent were not returned and this heavily biased the sample away from the very students the research was most intended to help. None of the students, it needs to be said, showed the least concern in class about completing the fortune lines, indeed they were pleased to be regularly consulted about whether the activities and teaching were interesting and effective. They appreciated and supported the value of this.

Jill did not seek interviews from any students whose parents had not completed consent forms, however these students all knew what was going on and why and several of them expressed interest in the process and disappointment at being excluded. One girl in particular came to Jill quite upset that she could not contribute to the research. She understood and valued what Jill was doing and had opinions that she wanted to share. Jill asked if she would like another consent letter to take home. The student said unfortunately no, any communication from the school caused her grandmother (her guardian) stress and anger. The first letter had been binned in a stressful argument (that had nothing to do with the research or consent) and she did not want to provoke a similar incident that would probably end with the same outcome.

There are at least two sorts of problems. Firstly, IRBs commonly claim areas of potential harm, coercion, unethical or unprofessional behaviour that, from the perspective of a teacher or teacher educator, do not carry these dangers. Secondly, and in reverse, IRBs do not identify areas of potential harm that are real, unappreciated by the researcher and result in problems that have no satisfactory solution. The first sort of problem understandably is the one normally raised in practitioner research forums as an IRB problem. The second sort of problem emerges in reports of individual projects that have run into difficulties. Because these difficulties generally do not become apparent until the reporting phase of the project, they often emerge explosively late in the research process, and do damage that cannot be undone and could have been predicted. My point here is that the IRBs are not the only group that may misdiagnose ethical issues.

A search of the literature shows that, while there are extensive literatures on the ethics of educational research, ethnographic research and qualitative research, ethics in the areas I cluster as practitioner research in education is a very under worked area. *My intention in this chapter is to provide a framework for identifying the ethical issues in self-study research by teachers and teacher educators that ought and ought not to be of concern during the review and planning processes.*

In keeping with the focus of this handbook, I try, as far as possible, to restrict myself to 'insider' research. This means that I restrict practitioner research to research done in a practitioner's own workplace that either solely or partly includes those individuals (students, in most cases) with whom the practitioner has a direct professional role and responsibility. By far the most common examples of this are classroom teachers researching their own classroom practice with their own students – henceforth referred to as teacher research or teacher self-study.

Teacher educators are also classroom teachers, although they often also teach postgraduate students in non-classroom settings. I include in this chapter research by teacher educators when they are studying their own practice. However, their students are not minors, a fact that is of paramount importance to IRBs. For this reason, as well as some other differences, I sometimes discuss self-study by teacher educators separately and, for convenience, under the label 'teacher educator self-study.' Many teacher educators supervise or collaborate with teacher researchers; I include this as teacher self-study unless the focus is on the teacher educator's own practice. Collaborative research (including school students) involving teachers and teacher educators – what Zeni called insider-outsider research – generally is also best considered under teacher research. Even so, this (common) type of collaboration can involve various degrees of self-study and I exclude some forms that I regard as outsider research. I exclude, for this reason, projects where a university academic is working with a fully consenting teacher in a study of that teacher's classroom, but where the teacher is merely a research participant, not a research partner. Deciding on this question can be tricky. I also exclude projects where an academic is a (paid) evaluator of a project, even if this project involved teacher research. Projects where the academic is a facilitator and critical friend as well as an evaluator raise complex ethical issues and sit on the boundaries of this chapter.

I also include research by teachers on their own students that includes data collected in other teachers' classrooms as well as their own but, for reasons detailed later, I exclude from my definition of practitioner research any research by a teacher on students who are not their own or where the data collection is entirely in other teachers' classrooms and where they have no role in that classroom except that of researcher. Included also is research by people such as school welfare coordinators[1] on students for whom they have responsibilities for counselling as well as English as a Second Language or Special Needs teachers on students whom they directly support in other teachers' classrooms. Finally, I include school leaders or administrators researching with their staff in areas that involve the researcher's professional work – an example would be an

associate principal who has direct responsibility for staff professional development who is researching in that area. I exclude from practitioner research those principals who wish to conduct research that focuses only on the practice of (other) teachers.

My reasons for the above restrictions are not just to keep the chapter manageable. *The move from outsider to insider research substantially changes many of the ethical issues and raises what is perhaps the most common concern of IRBs: the tension between the teaching role and the research role.* In addition to restricting the research that I consider, I also restrict (less tightly) the ethical issues to ones that are (or ought to be in my view) associated with the IRB process. This means issues that involve the potential for some form of harm to identifiable individuals that is associated with and a product of the processes of research. In this context, 'identifiable individuals' means that anyone planning or reviewing the research proposal can state who they are; this is a somewhat different meaning from saying that individuals can be identified when reading the research report. This latter meaning of 'identifiable' is used later when discussing reporting issues, but there are instances where individuals who cannot be identified in the report can nevertheless be harmed by activities associated with doing research.

The above attempt at delineation leaves many grey areas and needs to be fleshed out with brief discussion of some examples of issues that I regard as outside the focus of this chapter. Hajj (2001) was a Grade 5 teacher who began to research and, as a consequence, improve her own practice. She intricately integrated her curriculum and had considerable success with groups of learning disabled and low achieving students. Her research (and the students' prior unfortunate history) suggested that these students would be unlikely to develop further if they entered a more traditional classroom and would benefit from another year (in Grade 6) with Hajj. After in-school discussion and debate, the principal decreed that this should happen. This had negative consequences for one Grade 6 teacher, who had to move unwillingly to Grade 5, and for the other Grade 6 teachers, who used to team for subject specific teaching that could not be mapped onto Hajj's integrated approach. The principal later mandated the (in some cases unwilling) attendance of all staff at a session where Hajj and teacher researchers reported their work.

These changes and decisions caused understandable strain for Hajj and her colleagues. The story can be framed (as Hajj and Zeni did) as raising an ethical issue associated with insider research: Hajj had to live in the place where these decisions were made. From my perspective, however, these issues arose as a result of the way that Hajj's research findings were used by her principal. It is true that Hajj intended to continue her (perhaps life-long) journey of self-study in Grade 6; however, this research would be about new, consequential issues. She had two years of convincing findings about the benefits to her students, and the school made structural changes that drew on these findings. The changes left some teachers unhappy and Hajj with unresolved dilemmas about her

research, but they were not changes associated with the conduct of the research that had led to Hajj's findings. These issues fall well outside any IRB process.

Clay (2001) tells a story that at first sight could be regarded as an example of a researcher coercing others over whom they have a power relationship to benefit their research – an issue of high concern for IRBs. However, all the coercion was a function of her job, not her research. Clay was employed as an 'instructional supervisor' in her school. As such, she had power and responsibility for acting as a change agent who, when negotiation failed, would require teachers to behave in certain ways in their curriculum planning. Clay reports high levels of resentment of, opposition to and lack of understanding about what she was trying to do and why.

After reading her account, I formed the opinion that her job and how she should operate had been poorly thought through, poorly communicated and certainly not negotiated with the teachers she was expected to 'change.' For me, all of the ethical problems she reports are problems with her role and the extent to which teachers can and should be told how to operate. Clay's self-study allowed her to build a better understanding of at least some of the problems she faced, but this act of research was not responsible for the problems. She was coercing teachers because she was their instructional supervisor and for tasks associated with that role, not because she was a researcher coercing them for data.

Zeni, using Kirsh's (1999) frame of location, raises ethical issues associated with situations when the researcher is of a different race, gender or culture from what van den Burg (2001) would call the inhabitants of his or her research. I return to Zeni's use of location in the next section, but I have two reasons for excluding this issue from detailed discussion. The first reason is that, from the perspective of an IRB process, this issue is more a question of research validity than of research ethics: to what extent will the researcher be able to tell the story of 'others' in ways that are sensitive and responsive to and knowledgeable about their location? Does the researcher have the right to tell the story of others? These can be very important questions for researchers and supervisors to consider but, in my own institution at least, it is not the role of the IRB to make judgements about whether or not the research will achieve its goals or will be seen as credible, only whether there are individuals who may be hurt. In framing questions such as these, the researcher is repositioned as an outsider researching on (different) others. This leads to my second reason for excluding the issue. The problems emerged as an important issue in outsider ethnographic research. It is true that in North America there are many cases of teachers of one race and culture teaching classes that are composed mainly of students from another race and culture. However, any such teacher has the same right to engage in self-study and to tell her story as any other; she is a part of the story, as are any racial or cultural discontinuities.

Locating This Chapter in the Literature of Research Ethics

As mentioned earlier, there is only a limited literature that is specific to the ethics of the insider, practitioner, self-study research that is the focus of this

chapter. Later, I raise a number of problems associated with transferring proto-cols from the domain of bio-medical research to that of teacher research. Zeni (2001) and Lee and van den Burg (2003) make parallel criticisms of how research protocols that work well in outsider research are often inappropriate in insider research.

> We find the ethical safeguards of the outsider doing quantitative, experimen-tal research (random selection, control groups, removing the personal influ-ence of the researcher) either irrelevant or problematic for us as insiders. In the same way, the ethical safeguards of the outsider doing qualitative research (anonymous informants, disguised settings) are subverted as soon as the inside author is named; in addition, anonymity may defeat the insider's goal of open communication with students, colleagues, and parents. (Zeni, 2001, p. 155)

Lee and van den Burg criticise the automatic application of both anonymity and informed consent as ways of protecting human subjects. They argue that a unilateral decision to, "protect human subjects without even consulting them reflects the arrogance of privilege" (Lee & van den Burg, 2003, p. 93).

Lee and van den Burg go on to argue against the use of the term 'subjects' of the research. They argue that this misrepresents both what teacher and teacher educator self-study normally is and what it should be. They position the students as 'collaborators' and 'co-researchers' (Lee) and 'inhabitants' (van den Burg). This move away from the label 'subjects' matters in a number of ways that I address later; Lee and van den Burg argue for it on the grounds that good research in this genre should retain the voice and perspectives of all the inhabi-tants, not just of the teacher. They report that, from their experiences, when students (with parental approval in the case of minors) have been given the choice of being named or anonymous, they have always chosen the former. Case 1 supports their views.

In their critique of informed consent, Lee and van den Burg point out that it can be very difficult for consent by research inhabitants about a complex project to be even reasonably informed; Zeni raises the same issues. Moreover, the notion of action research as a cyclical process, where initially unknown and unknowable outcomes influence future actions, means that important aspects of what is being consented to are equally unknown and unknowable (Eisner, 1991). I agree with this and take it a step further. As illustrated in Case 1, as the research process proceeds in the classroom, the students, if treated as collabora-tors, build up a sense of the meaning, purposes and outcomes of the research that is far richer and more informed than the meaning their parents, who have not shared these experiences, could ever construct. Yet IRBs commonly give students little or no place in the consent loop by insisting on 'informed' consent from parents in advance of the research commencing.

A main goal of this chapter is to analyse precisely what it is that does and does not require consent as well as when that consent should be sought. On this latter

point, I agree with Zeni, who argues for an ongoing ethics process rather than a single event. Lee and van den Burg argue for the same sort of thing, with researchers being clear about and meeting what they label as 'ethical obligations' to the other inhabitants.

Zeni (2001) has edited the only book dedicated to ethical issues in (insider) practitioner research that is listed on ERIC. This book contains 12 chapters that contain a rich mix of very different participants and research foci. While almost all the authors have considerable experience in action research, only two of the 12 chapters are written by classroom teachers describing research on their classroom practice and only one or two describe teacher educators researching their own classroom practice. As Zeni acknowledges, several of the chapters describe outsider research or research that involves collaboration among various groups. Each chapter raises interesting issues, but, for the reasons detailed in the previous section, I exclude a number of these issues from the focus of this chapter. None of the chapters makes reference to a university IRB process, although Zeni discusses some typical problems in this area in her introduction. Given this selection of cases, I am not surprised that Zeni's analysis and framework for analysis places only a minor emphasis on what I identify as the major concern that IRBs voice about teacher research. This concern is about conflict between the role of teaching and the role of researching and the consequential issues of coercion and exploitation of students by teachers, together with the danger of teaching, learning and hence students' best interests being compromised because of the teacher's extra research role.

Zeni adapts and extends a framework suggested by Kirsch (1999) for coping with ethical dilemmas in feminist research. To three checkpoints of 'location,' 'interpretation' and 'publication,' Zeni adds 'relationships' and 'institutionalisation,' uses this framework for her analyses and uses parts of it as part of a detailed list of questions (detailed in her Epilogue) intended to help researchers reflect on their proposed research. As Zeni says, Kirsch's framework was developed to deal with issues in outsider ethnography and I do not find Zeni's extension of this well suited to providing a basis for coping better with IRB processes, given the unique problems raised by insider practitioner self-study in education. As Zeni also says, many instances of these smoulder in teacher researcher newsletters and list servers, and (I would add) in conference forums that bring together practitioners in this field.

Zeni, as far as I can see, did not set out with the same agenda that I have here. As I have in the final section of this chapter, she has produced a series of questions for researchers in an Epilogue. However, her questions are intended to promote reflection on the research and have a broader range of purposes than mine. She includes questions to help (novice) researchers clarify their research focus, questions and design and she includes other questions that raise issues that can be regarded as ethical but which fall outside the questions of causing harm to identifiable individuals that are associated with acts of the research. One consequence of this broader focus is that only a few of Zeni's questions aid identification of what are likely to be high and low ethical risks.

As Zeni and I have somewhat different purposes, it is not useful to exhaustively contrast our frameworks. However, I give three examples for illustrative purposes.

Under Interpretation, Zeni states that practitioner research is strengthened by collaboration, a point I agree with very strongly. She then goes on to frame as an ethical problem how a teacher researching alone may find that personal perspectives depart from those previously shared with colleagues. I agree that this can happen, that it is a strong argument for collaboration, and that her frame identifies a potential dilemma. However, I do not classify this as an ethical issue of relevance to IRBs and to the smouldering stories on list servers.

I referred earlier to Zeni's use of Location to usefully remind researchers to reflect on the extent to which their race, gender and culture are similar to or different from other inhabitants of their research. Also included by Zeni under Location are issues of the role of the researcher and their status in the institution. Clay, for example, had a role as instructional supervisor that was critical to how her research played out. As I argue later, these latter *insider* aspects of location *are* commonly critical to identifying high and low risk aspects of the research. Reflecting on them helps avoid harm. I am not convinced of the value of conflating these with aspects of location that derive from outsider research. As I argued earlier, a poorly framed or reported study by (say) a white female teacher that is insensitive to the racial and cultural perspectives of Afro-American males who constituted the majority of her class may well be poor research, but harm that derives from invalid stories about this (large) group (Afro-American males) is much more a methodological than an ethical issue – any research paradigm can result in such findings. Issues of whether the *particular* Afro-American males in the study can be hurt are, of course, very different and central to this chapter, but addressing these issues requires different questions.

My third example of how Zeni's frames throw up issues different to the focus of this chapter considers how her frame of Institutionalisation helped identify the considerable problems that arise when, with good intention a school system tries to *impose* teacher research. This is an interesting and important issue that certainly has ethical aspects, yet these aspects are associated not with the process of research, but with the rights of systems to dictate how teachers should work.

Hammack (1997) focuses on the issue of the potential conflict between teaching and researching roles raised earlier. He does this in ways that mirror much of the ignorance and many of the misunderstandings that have been prominent in my first- and second-hand experiences with IRBs. For this reason, it merits a detailed analysis. Hammack's article reflects a lack of understanding of classroom teaching and a lack of familiarity with teacher research. He acknowledges that dissatisfaction with university-based research has led to a call for teacher research, but he is deeply troubled by the potential of this to conflict with and hence compromise the teachers' teaching role.

Hammack (1997, p. 249) asserts that, "something other than normal [teaching] practice happens when research takes place; otherwise it would not be called research." He assumes that these (unspecified) changes must imply some

degradation or lessoning of the teacher's attention to teaching. The issue of when good teaching becomes research is not easy to define (Zeni, 2001), but I agree that teacher research does contain elements of 'something other than normal (teaching) practice.' Cochran-Smith and Lytle (1993) define teacher research as involving systematic, intentional inquiry. As Zeni (2001, p. 155) says, this typically involves, "more systematic documentation and data gathering, more self reflection in writing and more audience collaboration, presentation, publication." Noticeably absent, however, from Zeni's list is what Hammack makes clear that he meant by "other than normal practice": different, experimental teaching practices as well as a lower willingness or capacity to respond to classroom events from a teaching role, because of immersion in a conflicting research role. Hammack's assertion, together with its subsequent elaboration is one reason for my strong criticisms of his arguments in the previous paragraph. There are two serious flaws in Hammack's assertion. Firstly, Hammack is wrong in his assertion that the decision to do research must always mean that the teaching will be different to what it would have been without a decision to do research. Tidwell (2002), for example, reports a self-study of her teacher education practice where she was very careful not to change any aspect of her practice. Her focus was exploring whether she was actually doing what she thought she was doing (in terms of genuinely valuing individuals). Moreover, teacher researchers often choose to research the effects of a change in practice that is not an artefact of the research. Sometimes this change is the result of a department, school or system level decision (e.g., a new reading program). Russell (2002) researched the effect of a major structural change in his institution's teacher education program and how this affected his practice. Sometimes, the teacher has already changed his or her practice, for teaching reasons, and sometime *after* this change, begins research to explore more systematically what is happening. Case 2 (below) provides an example of this. The second flaw is that Hammack fails to understand the extent to which innovation and change are normally a part of good teaching practice. Both of these issues are elaborated later in this chapter.

Hammack makes a second assertion that is in conflict with all of my experiences with teacher researchers. "Those [teachers] who become involved with research may develop an "interestedness" in research that can compete with the obligations to keep the "interests" of their students paramount" (p. 249). Teachers, in my experience, are *not* drawn to research to make an abstract, generalizable contribution to the knowledge base of education. On the contrary, they are driven by a desire to improve their teaching and their students' learning. In other words, it is the teaching role that drives and is always pre-eminent over the research role. This assertion is readily tested with a glance at any collection of accounts of teacher researchers. Clarke and Erickson (2003) edited a set of accounts from the 2001 International Conference of Teacher Research. None of these accounts maps on to Hammack's assertions; all are clearly driven by a desire to enhance the teaching role.

In 1985, I co-founded the Project for Enhancing Effective learning (PEEL), a teacher research project that has continued for 18 years, involving hundreds of

teachers in dozens of schools. *Learning from teacher research* (Loughran, Mitchell, & Mitchell, 2002) contains accounts from 11 teacher research teams from this project. All of these accounts, as well as a much larger number published in the internal literature of the project (Mitchell, Mitchell, McKinnon & Scheele, 2003), support the assertion that teachers do not set out on studies of 'what is' in their classrooms; rather, they set out to change them. Rather than allow (hitherto unsuspected) flawed learning to continue, all opportunities for improving practice are immediately taken (Mitchell, 2002). This immediate teaching action that flows from each new research insight can compromise the research, but the reverse has never happened in my experience.

Hammack asserts that the rewards for teacher researchers are the same sorts of rewards that he experiences: 'visibility' and 'publication.' This is disconnected from the reality of teachers' work: the primary reward for teacher researchers is that their classroom becomes a better, more satisfying place to work. Hammack further argues that, "teachers' primary obligations are to their students, while researchers have obligations to the field to which they seek to make a contribution" (p. 250). I agree with both parts of this statement if by 'researcher' one means an outside researcher. Teacher researchers do not position themselves as members of the academy and do not feel such obligations. Hammack assumes that, by taking on a research role, teachers take on the perspectives and values of non (school) teacher researchers.

Hammack builds his whole paper on the conflicts of the dual role. He makes a long and in many ways sensible argument about the practical impossibility of allowing some students in a class to opt out of a new, experimental teaching approach. His argument here is one that I have heard several times from my own university's ethics committee. It is based on a misunderstanding of what constitutes an 'experiment' in education, a failure to appreciate the existence of what Zeni calls the 'zone of accepted practice' and an inability to conceive of students as informed collaborators in research whose subject is the teacher's practice. All of these issues are explored in subsequent sections.

Much of Hammack's argument is based on an exchange of articles in *Educational Researcher* (Baumann, 1996; Wilson, 1995; Wong, 1995a, 1995b). Wong began this debate by reporting on the experience of returning to the classroom to teach and conduct research in a natural setting. Wong reported that his research role compromised his teaching role in two ways. Firstly, he abandoned his responsibilities to the rest of the class in order to collect data (by asking her more questions) from a student who was publicly thinking in ways that Wong (the researcher) wanted to capture. Secondly, he believed that he abandoned his responsibility to 'teach' this student by not quickly helping her to the 'correct' answer. Wong argued that this role conflict was unavoidable. This article produced a vigorous rebuttal by Wilson, who reported a high level of compatibility of the two roles when she had (also) returned to the classroom to teach. Baumann weighed in with his own experiences and reported that he did not find any role tension in terms of purpose and conflict, but did find role tension in terms of time and task – his teaching role sometimes left him no time

for his research role. Faced with this tension, Baumann compromised his research (not his teaching). I have two comments on Hammack's use of this debate. Firstly (and less importantly), he overlooked or failed to understand Baumann's point that he did *not* experience the same sort of role conflict as Wong, but rather the opposite – Hammack lumps both articles together as supporting his point. Secondly (and more importantly), Wong's experiences are a very fragile base on which to build a substantial edifice about role conflict for two reasons, both associated with the fact that Wong was not anything like a typical teacher researcher. Firstly, on my interpretation, he was not very experienced in the kind of discussion where he ran into difficulty. I spent many years researching and refining classroom approaches that emphasise the kind of discussion that Wong was running. I built up a sophisticated body of knowledge about how to bring out students' ideas as part of the teaching-learning process as well as how to balance the need to attend to a whole class while keeping one student publicly thinking (Gunstone & Mitchell, 1998; Mitchell & Mitchell, 1995). Wong's problem was not an intractable conflict of roles; rather, it flowed from his lack of the relevant classroom skills. To his credit, Wong recognised that he might have been able to do better in a classroom where the whole culture of student and teacher roles had been renegotiated. However, his one-off return to the classroom meant that, unlike a full-time ongoing teacher, he did not frame the incident as one where, over the next four years, *he* could develop new skills and achieve these changes. Tellingly, Wong labelled himself a researcher teacher, not a teacher researcher. This (accurate) difference in labels leads to the second, more important problem with building on Wong. He *was* someone who saw himself primarily as a member of the academy and had made a temporary return to teaching for research purposes. I intend no criticism of Wong for doing this, quite the reverse, but it is fallacious to suppose that tensions that *he* felt as a researcher taking on a teaching role could and should be generalised to teachers who take on a research role.

Ethical Parameters Already Present in Teachers' and Teacher Educators' Work

The practice of teacher research is inextricably intertwined with the act of teaching. As stated earlier, ethical protocols for teacher research cannot be constructed from protocols that position the researcher as a neutral outsider who is trying to minimise his or her influence on other inhabitants of the research. For this reason, one sensible starting place for discussing the ethics of teacher and teacher education research is to begin by examining the ethical parameters already present in their work (R. Small, personal communication, November 12, 2002).

Teachers' Work

Teachers in schools act in *loco parentis* and are given important responsibilities for the personal, social and educational well-being of the children in their classes.

By sending a child to school, parents have voluntarily surrendered to the school a great deal of responsibility for a wide range of decisions. This ceding of responsibility is relatively open-ended, as parents have little idea of the decisions schools and teachers make on a daily basis. All of this means that teachers have been given a range of privileges (not rights) to make decisions about what will and will not happen in their classrooms.

Within the very broad boundaries that mark out 'unprofessional' or 'unacceptable' behaviours, teachers have considerable freedom to decide how they will operate in the classroom: their classroom rules and the consequences when these are broken, decisions about teaching style and teacher behaviours (e.g., how they respond to unexpected questions), the way they organize the classroom (e.g., whether and how to use group work), the types of tasks they set, the resources they will use and at least part of what and how they assess. These are all within Zeni's 'zone of accepted practice.' In schools in my state (Victoria), teachers are encouraged and often expected to demonstrate an on-going focus on their own professional growth. This means demonstrating that they are regularly exploring and refining new approaches, ideas and resources and incorporating these into their practice. In other words, they are seen as having a professional responsibility to experiment. There are similar expectations in many other educational systems (Clarke & Erickson, 2003). As stated earlier, nearly all these decisions are made by the school without consulting parents, and most of them are made solely by the teacher, often at short or very short notice. Schools are necessarily structured around the expectation that teachers have the professional knowledge, competence and ethical judgement to operate within the tacitly negotiated range of professionally and ethically acceptable behaviours. They do not have the right (for example) to use high levels of public humiliation and shame as a behavioural modification device, but they do have the privilege of directing students to do tasks that the students may not otherwise choose to do and they certainly have the right to try something different in their classroom. A decision to incorporate a research role into their teaching role does not suddenly remove teachers' privileges to make the sorts of decisions just listed. This is a major reason why, as argued later, most of the ethical issues in teacher research arise not from the 'intervention' but from the reporting of what happened and the use of classroom artefacts for new (research) purposes.

Teacher Educators' Work

The students of teacher educators are adults who are legally capable of informed consent. This means that there is no legal equivalent of *in loco parentis*, in the sense that parents are not asking teacher educators to act in their place as guardians of their children. There is still, of course, a power relationship present and an obligation not to act in ways that are detrimental to students' interests or that abuse this power.

All the issues of freedom to operate in a zone of accepted practice are still present; indeed, teacher educators typically are under fewer constraints than

teachers as they are commonly given more autonomy than schoolteachers in areas such as curriculum design. Berry and Loughran (2002), for example, documented and published their experiences in developing a new type of subject in a new type of degree at their institution. Their freedom was almost total: there had never previously been curriculum time for a whole subject devoted to microteaching and hence there were no precedents. Most of what they did could be labelled as 'new,' 'different' and 'experimental.' As they report, their public debriefings of micro-teaching and their search for teachable moments were always likely to result in moments of awkwardness or embarrassment for their students, and they ran a risk of this developing into feelings of humiliation. My point here is that the institution assumed that they would develop and refine this subject in ways sensitive to Lee and van den Burg's 'ethical obligations' to their students. Among other things, this means that it was taken for granted that they would not engage in practices that they thought unlikely to be useful, merely to see what might happen.

One ethical parameter highly relevant to self-study by teacher educators is that many teacher educators are required to collect data from their students about their teaching in the form of institutional course, subject and class evaluations. The students, while not forced to fill in these forms, are expected to be in the classes when they are given out and are not consulted about whether the process should occur. It is worth noting that this process is (correctly) regarded as unproblematic. The students do not feel coerced, they understand that the focus of this research is the teaching (and not them) and they seem happy to collaborate with the researcher (the institution) in having their voice heard. I comment that, in my long experience in this area, school students react in exactly the same way.

There is another way in which teacher educators regularly get feedback on their practices from their students as part of their practice. Mainstream practice in pre-service teacher education includes promoting a metacognitive awareness among students of their beliefs, values, conceptions and perceptions of teaching as well as regular reflection about whether and how these have changed. This means that, as part of their teaching practice, teacher educators routinely receive pieces of student reflection about not only whether any of the above has changed, but why and how. This does not, of course, mean that the teacher educators have any automatic right to *publish* these pieces of reflection, but it does mean that they are, as part of their teaching role, requiring students to give feedback on their effectiveness in this role. Once again, this is not regarded as involving any abuse of the power relationship held by the teacher educators.

Many key learning outcomes in teacher education are related to what students *do* (when in school classrooms) rather than to evidence of understandings that they provide in written assignments. These outcomes are displayed away from the university classroom. For this reason, the teacher education workplace is full of stories, often potentially very harmful stories, about non-consenting others such as supervising teachers and school students. The stories often have important (if not critical) roles in activities such as debriefing and reflecting on

practicum experiences. They cannot and should not be suppressed within the confines of the teacher education classroom. Having said this, teacher educators are expected to keep these stories in house and to protect the other players from harm through identification and publication. This ethical responsibility is non-trivial. I recall a telephone meltdown in our institution when a story in our students' annual magazine that named a school slipped through our vetting procedure. Cohn and Kirkpatrick (2001) relate another spectacular example. My point is that this is another ethical parameter already present in the work of teacher educators.

Teaching and Teacher Research

As already mentioned, there is no clear dividing line between what could be described as high quality reflective teacher practice and teacher research. Teachers in many systems are at least strongly encouraged and often required to regularly explore, if not develop, new classroom approaches and to share the results of these (including student work) with colleagues. A current example is the incorporation of Information and Communication Technologies into class-room practice. There is an almost universal acceptance by both the lay community and systems that schools and classrooms need to change in this area. This pressure is very reasonable. The development of hardware, of software packages and of educational websites is occurring rapidly. As a consequence, most things that teachers do (and will do) in this area must be experimental and developmental. In the context of this chapter, it is important to note that no permission is, or could be, sought from students or parents for these changes; new interventions are a constant feature of classrooms. Having said this, it is equally important to note that most new interventions are evolutionary rather than revolutionary in nature. Some elements, sometimes important elements, of practice change, but teaching is a very multi-faceted activity that includes a range of components. It is most uncommon for all or even most of these to change at once. *This means that phrases such as 'new teaching approach' have different and more limited meanings for teachers compared with people outside education.*

   The sorts of questions that any researcher sets out to explore have important influences on the ethical issues that arise. As discussed earlier, and as illustrated by Case 1, teachers are typically interested in improving their classroom. They commonly set out to explore how the teaching is going: what sorts of learning are and are not occurring and how are the students reacting. There is an important consequence of this sort of question; as Lee and van den Burg (2003) argued, it means that the teacher is (often) researching *with* the students rather than *on* the students. Case 1 was a typical example of this. The real target of this sort of research is the teaching and sometimes some of the teaching resources that are being used. The students are being asked to collaborate in evaluating these. In all my experiences, I have found that students are perfectly capable of understanding what the teacher is trying to do, why the teacher is not just fishing

for compliments and are almost always very willing to contribute their perspectives. They appreciate being given a voice. Jill's students were only 12 years old, but they wanted their voices to be heard. This typical student response means that research into how the learning and teaching are going is a far less ethically sensitive endeavour than research projects that have a greater (albeit legitimate) emphasis on research on the students – such as researching bullying in the school yard. The extent to which the research is with or on students should not be regarded as a measure of the quality of a research proposal, but it is often one useful way of predicting the extent to which ethical dangers are real.

The facts that the overwhelming majority of teacher research projects are driven by a desire to improve classrooms and that this teaching agenda is always subordinated to any research agenda are crucial to reacting to another important issue that is of major concerns to IRBs. There are differences between a research agenda and a teaching agenda, but it is a major error to regard these as largely orthogonal. Hammack (1997) and Wong (1995a, 1995b) took this perspective and argued that it damaged the teaching role. In my experiences, IRBs have concerns that the teacher researcher is exploiting his or her teaching position to satisfy a selfish (in the sense that it is for personal benefit) research role. This is a different concern from that of Hammack, but it suffers from the same flawed premise: that the research role can only be diminishing the teaching role and that the teacher has to manage this zero sum game.

I stress that while research on rather than with students *may* be more sensitive, this is not always the case. There is a large body of research (some done by teachers) in science classrooms, for example, on the conceptions and explanations that students construct from out-of-class experiences in the world around them (Driver, Guesne, & Tiberghien, 1985). These conceptions have proved highly resistant to conventional teaching; students use the teacher's science on tasks they see as 'school' tasks, but (without realising it) revert to their unreconstructed prior views on tasks that are not so regarded (Gilbert, Osborne, & Fensham, 1982). Appropriate survey instruments can be used to collect data and what is reported is the range of views held. Although the findings commonly describe a comprehensive failure of the teaching to change student's views, the students were clearly the *subjects* of this sort of research; however, they were not exposed to any risk as they were positioned as representative of a typical class – a point confirmed by much replication. This example is one of the rare times (in my experience) in teacher research where it is important that the students not be told that any research is proceeding. To do so would be likely to change the way they responded to the surveys. Another consequence of the fact that much teacher research involves researching with students on the *teaching* is that research that involves *another* teacher's classroom often raises very sensitive ethical issues. I return to this point later.

Exploring the Limits of the Bio-Medical Analogy

Many of the ethical protocols for 'protection of human subjects from harm' during research are drawn from the bio-medical domain. In this section, I explore

some limits of this process in ways that provide a basis for protocols that I develop later. *My fundamental argument is that there are important differences between the work of doctors and teachers that lead to serious shortcomings in current IRB processes as they apply to practitioner research in education.*

Fullan (1991) reviewed a long literature on the repeated failure of systems and curriculum-package driven change. Central to his argument was a failure to appreciate the complex, multi-faceted and interconnected nature of teaching and hence of classroom change. He listed three dimensions of teaching that new programs may be intended to change:

1. changes in materials or resources;
2. changes in teachers' strategies and activities; and,
3. changes in teacher beliefs. (Fullan, 1991, p. 37)

Fullan went on to argue that changes in all three dimensions are necessary for any change outcome to be regarded as significant. He illustrated this by arguing that change in the first dimension was no real change if nothing changed in the other two. I agree, but I comment that he did not consider changes in dimensions 2 and 3 that did not involve dimension 1. Fullan was writing as a sociologist interested in capital-C system-level Change. The idiosyncratic changes associated with teacher self-study were not the focus of his interest; significance for Fullan includes system-level impact. However, he mounts a detailed argument for the importance of understanding the complexities referred to above and for the assertion that change has many levels and hues.

I would add a fourth dimension to Fullan's list – changes in teacher behaviours – and then argue that classroom change and experimentation has almost infinite shades of meaning. This is one important source of misunderstanding between practitioner researchers and IRBs. I give meaning to this argument via a seminal event in my own (school) classroom teaching.

Case 2: Ian

In 1981, while a fulltime teacher of secondary science doing a part-time Masters degree, I was influenced by three pieces of research. One (labelled 'children's science') was research into the conceptions that students were bringing into science classrooms and constructing in science classrooms (e.g., Gilbert, Osborne, & Fensham, 1982, then in press). These conceptions were in conflict with the teacher's science, but were also unsuspected by both teachers and students and unaltered by the teaching. The second piece of research was Mary Budd Rowe's (1974) work on wait-time – how long a teacher gives a student to think before moving to another student. The third was Douglas Barnes' (1976) research into the type of student talk that was (differently) promoted by what he called transmission as distinct from interpretation teachers. Barnes argued for more tentative exploratory, hypothetical talk and for the teacher behaviour that I label 'delayed judgement': accepting, for a time, all responses without attempting to correct 'incorrect'

ones. All three of these challenged my teaching and, to me, were intercon-
nected. I decided to experiment with applying them in my classroom.

I had been teaching a Year 7 Science class about the arrangement of
particles in solids, liquids and gases. I had shown a film of a simulation of
this movement and had (rather idly) noted, but not responded to, a student
who, at the end of the lesson, had asked, 'Are those particles alive?' I decided
to invest five minutes in checking whether this question represented a piece
of children's science by throwing it back to the class and then making two
changes to my normal teacher behaviours. One was to increase my wait
time to at least four seconds, and the second was to delay judgement,
conceal my views and accept all answers with equal encouragement. If I
got no response, or no interesting response, then I would go on with my
previously planned lesson.

I received a fascinating series of responses indicating that a number of
students thought that the particles were alive. One student then argued that
they were alive in living things, where they were called cells. This was hugely
important. I decided to extend the discussion and found that a number of
students saw particles, bacteria and cells as being essentially the same, with
only non-living things made of 'particles' while the label changed in living
things. I was horrified at the difference between what I had taught and what
they had learnt, but as soon as they said it, I wondered how I could not
have anticipated this constructed meaning.

I decided to extend the discussion: as they argued about how and why
particles moved, someone mentioned wind and asserted that the air particles
on a windy day were moving faster than those on a calm day. I experienced
more fascinated horror and more recognition of how sensible this (com-
pletely wrong) statement was. I decided to keep the discussion going and
discovered more and more about what was really being learnt in my
classroom.

There was a second important reason why I kept going what I soon
labelled an 'Interpretive Discussion': I had never had a class like it. The
students, finding I was genuinely interested in their ideas, were literally
leaping out of their seats in their eagerness to contribute, debate, think,
reflect, raise new situations and link our science to everyday life. The lunch
bell went and they ignored it for 20 minutes.

I was never the same again. Neither were my classes.

This lesson involved the greatest single change that I ever made in my teaching
practice, but what was new? Where and what was the experiment? There were
no new materials, resources or course content. In one sense there was no new
activity, for discussion was a well-established part of my practice. I planned two
changes in behaviour for five minutes. The outcomes of this led to a series of
decisions that ended up with my abandoning the rest of my lesson plan for that
day, but any experienced teacher could give instances constructing a new lesson
in response to unexpected events. The lesson both stimulated and confirmed a

change in my beliefs about what was important in student talk. It changed my conceptions of students' understandings in this area and barriers to student learning about particles, and (consequently) led me to rethink what ought to be the big ideas in this topic.

The Types of Risks are Very Different

I do not argue that it is never useful to draw on the well-established protocols of bio-medical research for advice in educational self-study, but it is essential to understand key differences between the two domains and hence the limits of the analogy. The subjects in medical research usually are primarily at risk from the *intervention* – trying a new treatment. In educational practitioner research, the treatment usually carries little or no risk, and the risks, when present, come from the *reporting:* 'telling on people' (Pritchard, 2001). Doctors deal with patients who are ill and hence will suffer adverse consequences (and perhaps serious harm) if a new treatment turns out to be ineffective. Students are not ill and face no equivalent deterioration or crisis from a few lessons that turn out not to be very effective. Moreover, as Case 2 illustrates, teachers who are trying something new are continually monitoring the outcomes and adjusting what they do against a desire to maximise learning.

The Meaning of 'Experiment' is Very Different in Teaching

A related issue is that the interventions of general practitioners and surgeons, while (generally) based on very sophisticated medical knowledge and research, are structurally both much simpler and less flexible and reactive than teachers' interventions. (I exclude medical practitioners such as psychiatrists from this discussion.) The treatment for any particular medical condition involves only a small number of factors – often one (a particular drug or surgical procedure). The ways that these factors interact are reasonably predictable and not subject to short-term contextual factors such as the weather or time of day. This means that 10 different doctors will commonly all use the same or a very similar treatment for any given condition. Teaching is not at all like this.

One consequence of this distinction defines an important difference between the educational and bio-medical domains in what is meant by a 'new' intervention. A new medical treatment may be completely different from the old – a new type of drug or even the types of treatment such as those currently being predicted from stem cell research. A 'new' teaching intervention, as stated earlier and illustrated by Case 2, means that some facets of the multi-faceted act of teaching change, but many others do not. Moreover, in teacher research (owned and controlled by the teacher), the teacher is constantly tinkering with the intervention and all other related facets of teaching in response to classroom events. The cycle of outcomes feeding into refining and developing the intervention occurs over much shorter periods of time than in most medical research.

Teachers Differ Far More in What They Do Than Do Doctors

Another consequence of the differences between doctors' and teachers' interventions is that different groups of students (albeit of the same subject and year level) are *always* receiving different treatment from different teachers. A school may have a common textbook and syllabus and even (some) common assessment tasks, but these impose only minor similarities on what happens in the classroom. Different teachers interact with and organise students in different ways and use different sets of teacher behaviours, flowing from differences in skill, experience, personality and educational values, which are profoundly important for learning. Ten different doctors who say they are using the same treatment generally are. It took years of research into educational change to realise that even when following the same externally developed 'program' (something now uncommon in schools), 10 different teachers will still differ very substantially in ways that are important to learning outcomes (Fullan, 1991; Fullan & Pomfret, 1977; Goodlad, Klein, & Associates, 1970). The need to explore and explicate the complex professional wisdom that lies behind these differences is one important reason for teacher research.

It would be a serious error to suggest that these variations could be mapped onto any single good-bad or better-worse scale. The zone of accepted practice is very broad, in part because there are commonly so many ways of achieving quality learning. A research question such as: "Should a class learning topic X in subject Y operate via group work or whole class activities?" is nonsensical, for the influence of variations within what either of these could mean is vastly greater than the influence of the differences between them. I am not arguing here that there are no identifiably better good and worse teaching practices. What I am arguing against is using the experiences of bio-medical research to suggest that different teaching approaches in any one topic can be ranked on any single scale that can lead to a single 'best,' one-size-fits-all approach.

Unfortunately IRBs, in my first- and second-hand experience, often assume the existence of an agreed best practice that encompasses all the important dimensions of teaching. Any suggested change to teaching in a research proposal is assumed to be outside agreed or understood best practice and hence risky for the research 'subjects.'

Experimentation is a Constant in Teaching Practice

Trying a new medical treatment on human patients is the last step that (in most cases) builds on earlier laboratory research. You cannot test a new teaching approach on rats. 'Experimenting' with humans (students) must always be the first step and, as discussed earlier, teachers are often expected to engage regularly in such experimentation. Hammack (1998) pointed out that, in other professions, all the professional knowledge can be devised by non-practitioner researchers. This is not the case in education. What is misleading to outsiders is the word 'experiment.' An Australian teacher who says 'I am going to experiment with setting up and using e-mail links between my students and some Swedish

students' is making a very different sort of statement from a doctor who says: "I am going to experiment with a new type of drug?" My experiment with delayed judgement and increased wait-time initiated a 17-year journey in exploring this aspect of my teaching (Gunstone & Mitchell, 1998; Mitchell & Baird, 1985; Mitchell & Gunstone, 1984).

Gaining Consent is Either Impossible, Inappropriate or Unnecessary for Most Changes in Teaching

Issues of consent and informed consent are different in medical and educational settings. Doctors work one-on-one with patients and hence individual patients (or their parents) can consent or not consent to suggested treatment or changes to treatment. Teachers work with whole classes and (as illustrated by Wong and by Case 2) often make decisions to change tack in response to unexpected events. Sometimes students can be given opportunities for choice and decision-making, and sometimes teachers can engage students in a decision to change tack, but many teaching decisions require class-level enactment and cannot allow for individuals to opt in or out. For this, and for the more important reasons detailed earlier in this section, it is only rarely that it is either feasible or appropriate for teachers to need to seek permission from students, parents, or even their principal to change what they do in the classroom. There is no question that, for several reasons, a principal should be informed and give consent to any formal research project, but parents do not acquire rights they have ceded to the school to veto classroom interventions merely because data are going to be more formally collected and reported.

A related issue, already discussed and relevant to consent procedures, is that the 'intervention' in much teacher research is not an artefact of the research. The changes in teaching were determined before the research, either by the teacher or by his or her department, school, university or system. A year *after* the lesson described in Case 2, for example, I began formal research into what was now an established dimension of my practice.

Ethical Issues in other Forms of Practitioner Research

Thus far, the discussion has focussed on teachers (including teacher educators) researching the teaching and learning in their own classrooms, where the class is the unit of analysis and all students are seen as no more individual than representing the range of students in a typical class. As stated at the outset, this is a research process with few ethical risks. All the other forms of practitioner research that follow are more ethically sensitive. This is, of course, not to say that they should not be undertaken, only that the research protocols should be informed about and sensitive to the specific risks involved.

Teacher Research on Issues of Teaching and Learning that Includes Reporting of Out-of-Classroom Events

When teachers research what is happening *in* their classroom, the only players are themselves (and they have consented to the process) and students – who

have the right to decline to share their perspectives (Homan, 2001). As soon as the research explores what happens *out* of the classroom – such as research on reading that explores home reading – then the behaviours of other players (such as parents) become part of the data. As Homan points out, parents may have consented to their children being part of the research without being aware of how *their* behaviours (such as whether and how they support reading at home) may be exposed. As discussed above, non-consenting others (supervising teachers and school students) are a part of the stories told in teacher-educators' classrooms. Depending on the research questions and design, they can become vulnerable subjects of the research.

Supervising teachers, who have opened their classroom in the role of expert teacher, may find stories being told about them that position them, at least sometimes, as being non-expert. This can be very sensitive. However, a saving grace is that if data is being collected and reported from a number of anonymous student teachers each of whom had several (anonymous) supervising teachers, then the number of possible supervising teachers is large and these teachers are a further step removed from the (teacher educator) researcher. This makes identification much more difficult. However it also means that issues of how the data is reported (e.g., of how much detail is provided on specific incidents) are important. I repeat that this issue arises regularly in teacher education whether or not practitioner research is going on.

As Loughran (2002) noted, teacher educators sometimes publish self studies that, "focus on [their] educational institution and its practices" (p. 244). Colleagues of the author can appear in these studies as players in institutional decision-making. Hamilton (2002) reports a particularly sensitive example of this. There are certainly ethical issues of fairness and balance associated with such accounts (issues handled very scrupulously by Hamilton), but I do not regard these as falling within the focus of this chapter. The data used were not collected from any teacher-student (i.e., power-based) situations, but rather from public documents such as meeting minutes. These sorts of 'after the event' accounts are not expected to go through any IRB process.

Research Involving Teaching Interventions that are Outside What Teachers Can Attempt Without Consent

I have commented that teachers do not need explicit permission to explore new teaching approaches. To outsiders, this may sound ethically radical, but, for the reasons given earlier, it is no more than a statement of the obvious to anyone in education. Clearly however, there must be limits to this freedom and there is a tacit understanding among teachers and principals about what these limits are. They are so seldom tested – except in cases that involve clearly unprofessional behaviour – that in writing this chapter, I had trouble thinking of realistic examples of interventions that would raise issues of consent. Obviously a teacher who decided to follow the approach used in A. S. Neill's famous Summerhill School and give students total freedom to come or not come to classes could

not do so without school and parental consent – it may breach the school's legal duty of care. However, in most education systems that I am familiar with, it is inconceivable that an individual teacher would make a unilateral decision to implement such a massive structural change.

The only realistic type of intervention I could think of that might sometimes fall into this category are ones that set out to generate very strong and long lasting emotional reactions or to make challenges to students' beliefs or values that were so profound that they might damage students' well-being. Teachers often engage students' feelings, emotions and values as part of (for example) a study of Macbeth. We are not talking about this sort of intervention, but one where the whole focus is on students' feelings about themselves and their out-of-class behaviour. Teachers of subjects such as human relations, involving topics such as drug or sex education do need and are expected to dig deeper into students' feelings and emotions than teachers of other subjects. However, this need to tap deeply into students' experiences and beliefs does mean that practitioner research by these teachers, while still having a focus on the teaching, does increase the focus on the students as subjects and hence raises the ethical stakes.

An extreme example, now well known and operating as a college level program, occurred in 1968 in the USA in the Grade 4 Classroom by Jane Elliott. Elliot wished to explore issues of race and, without revealing her intentions, told her class that brown eyed students were superior to blue eyed students and spent several days running the classroom in this way, mimicking discriminatory racist behaviours she then reversed the roles (blue-eyes became superior). The video footage, as well as interviews done ten and twenty years later with the students, testify to a massive emotional impact. It appears that the debriefing on the purpose and relevant racial issues was successful and the students testified to its value, however it was a very high stakes intervention that these days certainly falls outside the range of actions that teachers have professional autonomy to use without consultation. If proposed now in my school system, it would need principal and parent support and approval.

Practitioner Research on Identifiable Sub-Groups or Individuals

Important to issues of vulnerability and the extent to which teachers are researching with students or on students is the extent to which the research positions the students as members of a typical (school) class. The research becomes more ethically sensitive when its focus shifts in ways that positions students as members of identifiable groups or as identifiable individuals. A study that has a focus on peer group dynamics, which are idiosyncratic, increases the likelihood of the students being identifiable.

Research by classroom teachers or teachers who work with sub-groups carries these dangers. A study of how members of a particular ethnic group or students with a disability are reacting to the teaching also makes these students more a subject of the research. As such, they are in greater danger both of being identified and of being portrayed in ways that may be hurtful. I comment that anyone

who has worked with integration students (e.g., those with a disability) know that these students' greatest desire is to be perceived, as much as is possible, as being a part of the class, not as being 'different'

   The above comments are intended to apply to situations where the research focuses on a relatively small number of the teacher researcher's class. If a teacher has (for example) four Turkish boys in the class, where ethnicity is a (public) parameter in the research report, then anonymity in these situations, as Zeni says, will be a very thin disguise. If all (or most) members of the class belong to one (labelled) ethnic group then the risk of individuals being identified is much lower.

Research on Students' Out-of-Class Lives

A study by a teacher such as a student welfare coordinator on (important) issues such as bullying or use of contraception clearly is extremely sensitive. The students are now very much the subjects of the research and may well be at considerable risk from reporting. We repeat that this does not mean that the research should not proceed, but that the protocols for researching need to be very carefully thought through.

   There is another issue that arises when research explores these sorts of issues. The students may be promised confidentiality, but they may report conduct that cannot, often for legal reasons, be kept confidential, but whose release will be explosive. Sexual abuse or exploitation by adults of children is one example. The students need to understand this.

Research Involving Other Teacher's Classrooms

On a number of occasions, our ethics committee has suggested – or attempted to direct – that a proposed teacher research project be conducted in another teacher's classroom as a way of reducing the ethical risks by *reducing* a perceived conflict between the teacher's role as researcher and teacher. As stated earlier, researching in another teacher's classroom raises rather than lowers the ethical stakes, as the other teacher is now very vulnerable. His or her teaching is an important part of the ecosystem being explored and, as the only teacher, one that is virtually impossible to render anonymous. Studies of 'what is' and hence what is not happening in a classroom, no matter how neutrally they are reported, always end up including, even if indirectly, conclusions about how well the classroom is operating. There are two problems here. The first is that such studies almost always result in some findings about ineffective learning that were unexpected by the teacher and may be very unwelcome. This is equally true when a teacher is researching their *own* classroom, but now the researcher has begun from a premise that there are aspects of their classroom that they would like to improve. This premise means that the specifics of what is not working now become useful clarifications of the problem and ways into dealing with it.

   The second problem is that the (outside teacher) researcher may have different

positions from the class teacher concerning what is productive or appropriate or effective. These differences inevitably emerge in the reporting and the teacher, now a subject of the research, can be shocked (these differences were unexpected) and badly hurt. What the teacher regarded as 'good' is portrayed as 'bad' in the research report. Tobin, Kahle, and Fraser (1990) describe a painful example of this.

We are now describing 'outsider' ethnographic research in classrooms and there is a considerable literature on the problems that this entails. In addition to these published works, I have also attended a number of conference presentations where researchers have verbally reported reactions from devastated teachers too explosive and sensitive to put into print – including a threat of suicide. I do not say that outsider research should never be done, but rather that the issues are complex and so different that I have specifically excluded from the domain of this chapter research that is conducted entirely in another teacher's classroom. I have included, however, research where data is collected in more than one classroom, including that of the teacher researcher. Depending on how the data is reported, this design can make the individual classroom harder to identify, but not much harder, and the risk to the other teachers is still high unless two pre-conditions have been met.

The first pre-condition is to give the other teachers shared ownership of the research. Even if only one teacher is the formal researcher (e.g., the only one enrolled in a higher degree), control over the research questions, design and data interpretation can be shared. If this is done effectively, then all teachers have agreed on some likely problems that they are interested in exploring. This approach is likely to significantly reduce the first, and also to some degree the second problem just detailed.

The second pre-condition is to negotiate, over an extended period of time, a reasonable and genuine level of consensus and shared meaning for what is productive/unproductive, effective/ineffective, appropriate/inappropriate teaching and learning. The worst accounts of outsider ethnographic classroom studies that we have heard – those that ended in greatest hurt and bitterness – have been where the teacher's classroom was selected as one with a reputation for being 'good' and outsiders were invited in on this basis with no checking of mutual definitions of or criteria for what was meant by good. This is a recipe for disaster. If one teacher believes, for example, that a lesson where students happily engage in and complete a practical activity is a successful one and another dismisses this as mindless busy work unless it is also clear that the students understood both the purpose of the task and its links to earlier lessons, then they should not collaborate in classroom research.

The Practitioner is a Principal or Other School Leader

If the practitioner is a member of the principal class (which includes vice principals) then the research may or may not involve sensitive issues depending on the extent to which she/he is researching with or on other teachers.

The structure of schools means that teachers have relatively little room for *unreasonable* use of their power over students. The constraints on principals are more uneven. Depending on the system, there may be effective safeguards in place to protect teachers from actions such as unreasonable dismissal, but principals have a range of more subtle powers that can harm their teachers and that have no equivalent in teacher-student interactions; the importance of principal references for other jobs is only one example. Principals have a responsibility to monitor and judge the teaching competence of their staff. This means that if principal-led research is focusing on some aspect of student learning or classroom practice then it can be much more sensitive than teacher-led research in the same area. The reason is that, while once again, the main focus of the research is now the teacher's practice, but the teachers are now the subjects rather than owners of the research.

At the start of this chapter, I excluded such principal research from my definition of practitioner research. I comment though, that an important part of the answer to the problem of potential hurt is, once again, to maximise the extent of shared ownership and agreed problems. Principal-led research, for example, into how information and communication technologies are and are not being used could be framed in a way that leaves teachers vulnerable, e.g., count and hence compare the frequency of ICT use in different classrooms over a year. Low users look bad from this perspective. Alternatively, the research could engage the teachers as genuine collaborators with foci such as the sorts of situations when ICT's were proving useful, barriers to their use and building a culture of sharing (and refining) ideas for use. These foci position a teacher who uses (say) the web for the first time in class as a leader, rather than a trailer.

If principals are researching an aspect of their *own* practice with staff, then the research (that I now do classify as practitioner research) is much less sensitive, for reasons analogous to those discussed under teacher research. A colleague had a recent experience of an application for research by an associate principal who had responsibility for a staff professional development into all the factors that led to professional change or development in a sample of staff. This received a hostile reaction from the ethics committee mainly because of the power issue. There are three reasons why it was much less sensitive than the committee believed. Firstly, the researcher was putting her own practice on the line. Secondly, the practice of external in-service deliverers was an implicit focus of the study. The teachers were positioned as a representative sample; like all teachers, they were exposed to a range of in service interventions such as single sessions at teacher conferences. This meant that non-consenting others (those offering the sessions) had been brought into the research, but in a very low risk way as identification would be unlikely, if not impossible. Thirdly, the researcher, as part of her design, was searching for occasions in which professional development occurred as a result of an (often informal) in-school intervention or action such as one teacher mentoring another or two teachers developing new practice. This meant that the practice of these teachers would be celebrated and affirmed.

Insider-Outsider Research Involving Teachers and Academic Friends

There are two accounts in Zeni's books (Beck *et al.*, 2001; Harris, Lowenstein, & Scott, 2001) of collaborative projects involving school teachers, academic facilitators, district level administrators and (in the latter case) a school principal. Both of these illustrate the peculiarly complex and ethically fraught situations that can arise when a system either imposes or just supports (with funding) a program of teacher action research and then evaluates it at the same time. The teachers, who are receiving system level support, are now likely to be under considerable coercion to participate in this second level of research (the evaluation). If the academic's only role is one of evaluation then as I said in the Introduction, I do not regard the evaluation as a self-study. However, this situation acquires many more shades of grey if the academic also has a facilitating role. There is a high risk of contested loyalties. For example, a teacher, who is one of the teacher researchers but who also has a liaising role with the system level and university collaborators may well be (openly) providing (often informally and anecdotally) data about how things seem to be going with the other teachers. These data can be at least very helpful, and may be essential to sustaining the endeavour. They inform or sensitise the facilitators to problems or barriers and so help the facilitation process. When considered through the lens of evaluation, however, the liasing teacher is telling stories that other teachers may feel leave them vulnerable and not want formally reported. The academic has similar contested loyalties when writing the report. These dilemmas can only be managed, but this management will be made easier if the roles and responsibilities of the various players are carefully thought through in ways sensitive to the potential problems.

A different issue, which was the focus of Chapter 33, concerns who owns the stories that emerge from the research. As more players are added, with different (albeit complementary) roles and motives, issues of what stories should, can and cannot be told and who owns the various stories becomes more complex. For example, an academic who has invested much time and effort in a project has acquired some rights to write about it, particularly about aspects where she/he is an insider player, i.e., where it is *her*/*his* story. What happens if (say) district administrators do not want this story told because they feel it may reflect badly on the district or a teacher believes that some students may be hurt by the report? The project reported by Beck, Freese and Kosnik in Chapter 33 identified and handled the issues that emerged in their project very professionally, but it could easily have had a much less amicable outcome.

Intervention versus Data Collection versus Data Analysis and Reporting in Practitioner Research

Many, perhaps most, of the problems associated with the intersection of the IRB process and practitioner research flow from a failure to consider separately three components of any research proposal: the intervention (i.e., the teaching),

the data collection and the data analysis and reporting. *In educational practitioner research, care should be taken that consent procedures are confined to issues where consent is needed and not confused with areas where it has already been ceded to schools and teachers.* A letter to parents or an equivalent letter to the (adult) students of teacher educators describing the research goals and requesting their consent for their child to 'participate' in the research is misleading. In most cases, the letter is not seeking approval for the student to participate, (the intervention will occur anyway) but for issues involving either the collection or the reporting of data. The failure to think through this issue causes needless complications and difficulties.

Intervention

As has already been argued, many, although certainly not all, of the interventions in teacher and teacher education research projects are not artefacts of the research. To summarize, the research may be investigating long-standing existing practice (much more common in teacher education self-study than teacher research), a change imposed on the researcher or a change made some time earlier, for teaching reasons, whose effects the teacher now wants to document more systematically. Clearly for such projects there *could* not be any consent process associated with the intervention.

There are also many occasions in which some aspects of the intervention are artefacts of the research process – the (teacher) researcher wants to try something 'new.' Again to summarize, before building consent for the innovation into the consent process, it is essential to ask whether or not they could reasonably be argued to belong in the zone of accepted practice. It is also essential to examine whether it is (a) feasible, and (b) not more damaging to ask the teacher to provide an opt-out alternative to the teaching s/he intends. As Hammack argued, this is often not feasible. In Case 2, for example, it would have been impossible (without leaving the room) for a student to avoid being at least present during the discussion. Associated with this question about zone of accepted practice is one that flows from Lee and van den Burg: "Is the teacher meeting his/her ethical obligations to the students?" I agree with Mohr (2001) that in this field of research, the teacher researchers primary obligation must always be to the teaching role. A (teacher) researcher who said, for example, "My experience suggests that learning is degraded in a class of 40 compared to 20, but I want to check this by dividing classes unequally and researching what happens" is not meeting these ethical obligations.

I am making two points in this argument. The first point is that what I define as the intervention does need to be considered in any IRB process. The second point is that cases where the intervention raises any issues related to consent procedures are extremely rare; there are no examples in my personal experience.

One 'risk' that is real in any teaching innovation is that some curriculum 'coverage' may be lost (I will not go into the issue of what is really being 'lost' here). Any time a teacher tries something that is new for him, there is almost a

certainty that he will not do it as efficiently as he will the second and third time he tries it. Teaching is far too complex and multi-faceted to be able to detail, in advance, all the wisdom needed to cope with all possible student reactions and some important aspects of teacher learning must be lived (Mitchell, 2002). This issue is independent of whether or not there is a research agenda associated with the innovation. However, I comment that it does present a strong argument for not designing new interventions that must be implemented in a large, non-decomposable chunk: Only systems do this. I have no experience of a teacher researcher who planned to overturn most of her practice – even if this was all within the zone of accepted practice. All my experiences resemble Case 2. The teacher incrementally and iteratively changes aspects of his practice. My purpose in writing this paragraph is to argue for teacher researchers, who intend new practice, to describe the 'rate' at which it will be introduced and the safeguards they intend to prevent major losses of curriculum coverage. Case 3 provides one example of this.

Case 3: Ian (Year 12)

In 1985, 4 years after the lesson detailed in Case 1, my journey led to PEEL – a project (involving ten teachers) that intended to promote learning that was more intellectually engaged and metacognitive than what was occurring at the time (Baird & Mitchell, 1985; Loughran, 1999). These changes were first researched in lower and middle secondary classes (Baird & Mitchell, 1986). The next year, I had a Year 12 class, working with a typically overcrowded curriculum and towards a highly competitive statewide exam that determined all university entry. I decided to 'dabble' with approaches derived from what I had learnt, but I was conscious that, in a year 12 class, the stakes were much higher in terms of loss of curriculum coverage. After about 4 weeks of incorporating into my previous practice some activities that required more intellectual effort and that promoted reflection on learning, I decided that my students were likely to have built a meaning for my research. I asked them what they thought I was doing and why, and made them (genuine) partners in whether or not 'this' was helping them meet the demands of the year. They had veto power, at least on some of the more obvious ways of promoting metacognition (some of my teacher behaviours such as calling for reasons for tasks or encouraging links with personal life could not be altered).

This case illustrates the arguments of Zeni for ethics issues to be designed as a process, rather than a single event. It also shows (as did Case 1) how informed consent often requires lived experience.

One awkward consequence of the argument that both Zeni and I make about the zone of accepted practice is that the members of an IRB, who lack expertise in school practice, are not well placed to make judgements about what is and is not inside this zone. One suggestion would be that a brief argument be made by the researcher and that this is accompanied by a letter of consent for the

teaching from the school principal (or dean of education in the case when the researcher is a teacher educator).

Data Collection

A significant strength of practitioner research is that so much of the data can be obtained in ways that cause minimal disturbance to the environment being studied (i.e., the research has high ecological validity). This reduces the likelihood of Hawthorne effects.

There are a range of artefacts that will *not* have been created for research purposes that may be used as data by teachers and other educational practitioners. These include students' work, students' grades, class grade averages, patterns or numerical summaries of the performance of a class on set work, summaries of the ideas, explanations or opinions about aspects of the content that the students have brought into the classroom as well as any shifts in these that have occurred during the teaching. Teachers may also ask students to keep some form of learning journal where the students reflect on issues such as what they thought had been the purpose of set tasks and/or what they thought they had learnt. As discussed earlier, teacher education classes are full of these sorts of data. Teachers may create summaries of these for discussion with the class. None of the above artefacts require consent to create and *collect*.

An issue that, from my experience, has been of high concern to IRBs, is the issue of data that has been collected for one purpose (e.g., assessment of students), being used for another (the teacher's research report). The two purposes just listed have been regularly put as an example of the conflict of the teaching and the research roles and the exploitation of students by teachers to gain benefits from research that are of no benefit to the students. I provided arguments against this at several points above, but there is another issue that is relevant to the specific example in the preceding paragraph. If one accepts that there is commonly a convergence of purpose in the teaching and research roles, then using data that has been collected (solely) for a teaching purpose for a research agenda that is aimed at assisting this teaching purpose, involves a low level of ethical conflict. This is very different from using data, collected for one purpose, but which happens to be valuable for research associated with a second unrelated purpose. A teacher who uses students performance data or students' work as research fodder in a project aimed at improving the quality of the students' performance or work can not easily be accused of exploiting his/her access to the data. An English teacher who uses (for example) students' essays that had a focus on family relationships as fodder for research on family relationships (i.e., not for any purpose of teaching about family relationships) is far more open to the charge of exploiting her position.

Case 4

A university professor entered the second session of a class studying Children's Literature carrying a video camera. To a room full of people

who were still strangers to each other, she announced that she intended to conduct action research on the reactions of the class and especially those who were White, Anglo Saxons, to multicultural literature. She stated that she wished to video every class (including this second one) to provide a record of the pattern of student questions and comments. She also wished to make copies of and use as data their reader response journals, as well as other assignments. She then proceeded to hand out consent forms and asked her (adult) students for immediate permission. Many students had no problems, but several exhibited various levels of unease. One objected strongly for several reasons, one being that she felt that her comments, reactions and assignment work would be significantly constrained by concerns about how she was supposed to react.

The video related issues in this case are discussed shortly. I have included this case here as it sits in a tricky position, intermediate between the two uses of student work just described. In this case the students have been positioned as the objects of study with their race and cultural background central to the research focus. It is likely that some reactions and responses will be influenced by the students' knowledge of the research and hence one could argue that the teaching role has been compromised by the research role. On the other hand, one could also argue that the research focus is related to an important aspect of teaching literature in a multi racial society and hence has a purpose that is related to improving the teaching and learning of what was being taught. For me the biggest problem in this case was the timing of the request for consent; the case provides support for Zeni's and van den Burg's arguments for an ongoing ethics process rather than a single event. The class had had no opportunity to build any relationship with the teacher (or each other) and, at the start of the course, would have been very unclear about what might be meant by phrases such as, "the reactions of White Anglos to multicultural literature." The teacher was not intending any change to her teaching and she was going to be reading the learning journals (and hearing students' class contributions) anyway. Much of the anxiety that some of the students felt could have been avoided if the teacher had said nothing about her intended research, waited until some of the issues that were the focus of her research came up in class, demonstrated how she would be dealing with them and then explained her research interests. Consent for recording class comments would now be much more informed.

Case 4 provides an example of another range of artefacts that teacher commonly create as data, that could be labelled summaries or representations of the learning environment. These artefacts generally *have* been created for research purposes, but are records of actions that occurred as a result of the teaching, not of (for example) interviews set up to produce research data, i.e., they are records of actions that would have occurred anyway. As one common example, teacher researchers often keep journals about what was tried and how it went, including unexpected, significant events. Usually, but not always, these records carry very low levels of risk. This is because teacher researchers commonly focus

on the class as the unit of study. This means that their journal entries commonly concentrate on the class, with individual students being positioned as members of a typical class.

This positioning is not always the case however; a teacher (with different research questions) may keep journal records of the behaviours of an identifiable group of students (e.g., Muslim girls) or even of an individual (e.g., an integration student). This will substantially escalate ethical issues associated with *reporting*; the point here is that teachers are always entitled to *collect* such data. Indeed, it is not uncommon for schools to require teachers to covertly document and report on the in-class behaviour of an individual student or peer group (almost always for management reasons). In Case 4, the teacher needed no permission to maintain a journal, written after each class. A second example of a representation of the learning environment would be created by a teacher who is researching the frequency and type of questions that students ask in response to various teaching actions. The teacher is likely to keep a record of these, perhaps using an audiotape. Patterns of many other sorts of student learning behaviours can be similarly tabulated. Once again the collection involves no issues of consent.

Interviews are almost always a different issue. These are not part of most normal classroom practice and require at least informed student assent, not only for ethical reasons, but if they are to provide useful data. Trying to force such assent will destroy the value of the interview. Monosyllabic, closed responses do not provide good data. Typically, a few students do feel uncomfortable about being interviewed and must be allowed to decline.

For understandable reasons, IRBs generally require parental consent for the interviewing of minors as well as for many the gathering of many other data. However, Case 1 provides an example of how the reasons for doing this can be outweighed by the drawbacks. There was an obvious conflict here between the benefits of gaining parental consent and the consequences this would have on achieving the goals of the research. In this particular case, the research findings were intended to directly benefit the students from the homes least likely to respond to requests for written consent and these intended benefits were noticeably reduced by removing input from these students from the data. Moreover, the potential risks to these students were extremely low, I believe non-existent. The focus of the research was the teacher and her practice; the fortune line data was aggregated in a way that made identification of individuals impossible and there were good arguments for this data source to be comprehensive. There were also good arguments for keeping the sample of (assenting) students interviewee's representative of the range of interests and abilities in the class. The case also illustrates the extent to which (Year 7) students commonly can become more informed than their parents about a piece of teacher research.

Conflicting goals result in dilemmas that, by definition, cannot be solved, only managed. This case could have been managed in a more informed manner. It illustrates that a requirement for written parental consent should not be applied invariably and unthinkingly – there are many occasions where students can give assent that is genuinely informed and that does not expose them to risk. An

opt-out (rather than opt-in) letter would have solved most problems. It is not possible to provide hard and fast rules for when parental consent should and should not be mandated. One critical factor is the level and type of risk that the student is likely to be exposed to: What is the student consenting to and how damaging could this be? Another relevant factor is the age of the student and a third is the likely damage to the research of the loss from the sample of students whose parents do not respond to requests for consent. My anecdotal experience and evidence is that the practical difficulties of getting consent forms returned increases both with the age of the student and with the extent to which they come from low socio-economic backgrounds. It is also worth noting that, in my country, medical ethics allow minors to make very serious decisions (e.g., terminate a pregnancy, go onto a form of contraception) without either or both of their parent's consent or knowledge. Once again there are no hard and fast rules possible. Most doctors, it seems, would allow any 16-year-old to make such decisions, but be more cautious about a 14-year-old – the decision turning on the level of risk that the child is currently exposed to. These types of situation are, of course, different in some important ways from those in teacher research; my point is that it is both simplistic and wrong to argue that students cannot make informed decisions about their lives.

Video recording is an area where there is common confusion between issues of data collecting and reporting. Students are highly identifiable on a video. For this reason, if part or all of a video is to be shown to others in any public forum such as a conference, then the students *in the portion being shown*, and perhaps their parents, need to give consent. This is a reporting issue that is separate from the collection issue of making the video. Digital technology means that teachers are making increasing use of videos as part of classroom teaching and assessment. Drama teachers may video informal student performances and involve the class in analysis of what was done. LOTE (Languages Other Than English) teachers commonly video *all* students during activities where the students are speaking in the (foreign) language and use the video to formally grade their students on this skill. The video allows the teacher to re-listen and hence mark more accurately in the way that an essay being marked can be reread. The students have no right of refusal here, provided that the video is not then shown to others. In terms of a teacher *researcher* who is using videos, these may form part of the published data in the video form, in which case consent is required. However, the video may well be no more than a way of recording events for subsequent analysis that will be reported in ways that make identification impossible. A teacher, for example, may be researching the extent to which students seek help from each other before asking him, another example would be a LOTE teacher researching the proportion of time that students talk in the LOTE. In both cases the reporting will involve summaries of the video footage and will not be seen by anyone other than the teacher -who saw the events at the time.

In the second of the above examples, the (video) data collection was clearly part of the teaching of the LOTE. In the first however, as was the situation in Case 4, the data collection is an artefact of the research. The problem with

requiring consent for video recording is that it is difficult, probably impossible, to exclude non-consenters from the recording. This creates a dilemma. One aspect of managing this dilemma is to consider how important it is to video record rather than audio record a class. Case 4 does not provide a strong claim here. A better claim can be made for the example above where the focus on how students seek assistance will not easily be picked up without video footage, particularly if the students are working in groups. In all such cases, it is still important that the students have had adequate opportunity to build a meaning for what the teacher is doing and why. Springing an hitherto unannounced intention to video in lesson two of a course, even with consent forms being scattered around, does not meet this obligation.

Audiotaping a whole class is much less threatening than videotaping it. Students are much less identifiable: most student comments are short and, without an accompanying image, difficult to source for anyone other than the participants in the lesson. Audiotaping a class for discourse analysis is a common requirement in teacher education and the school students are not asked for their consent. I comment that they are always unconcerned about the process. Audiotapes *cannot* be set up to exclude any single student. For this reason, as well as the lower identifiability, I believe that researchers should be not required to gain consent in advance to *collect* data in this way, provided that they can mount a reasonable case that they will be able to provide their students with an acceptable initial explanation of purpose and to enrich this over time. Audiotaping of individual interviews carries much higher perceived risk and the process should always be under the control of the student. Audiotaping the discourse of small groups occupies an intermediate position, but I argue that students again should have control of the taping process. Once again, the real ethical risks are dependent on how the data will be analysed and reported: extended quotes need permission that can only be informed after they have been made.

Some questionnaires and survey instruments also fall into the category of artefacts created solely for research purposes. While there sometimes may be (strong) arguments that consent is impractical or will compromise the research (e.g., if it is essential to sample the whole class), an argument that questionnaires would have been used anyway needs to be well justified. As non-researching teachers often also use questionnaires and surveys as a part of their teaching, it is impossible to set up neat criteria for decision-making here. It depends on what the questionnaire is asking and the extent to which it is connected to the teaching of the content.

Data collection by practitioners who are not researching their own classroom teaching raises some different issues. If the researcher is collecting data in another teacher' classroom or about another teacher's teaching, then (as already argued) that teacher must give consent that is very highly informed.

If the teacher's normal work is not with a class, but rather with students on an individual basis (such as a student welfare coordinator or careers teacher) then these 'interview' events are ones that occur anyway. This means that the

(perhaps sensitive) ethical issues will be to do with data reporting not collection. It is important to realise here that student welfare coordinators (SWC) mainly work with students who have either self-referred or assented to be helped when approached. Sometimes it is important that their parents do not know that their child is being counselled – the child may need protection from the home. Alternatively, the SWC might prefer that parents are informed, but the student has insisted (as is their right) that their parents not be informed about the things that they reveal. In these circumstances, imposing parental consent is out of the question. This does not mean that the research proposal has no IRB hurdles to clear; in this sort of situation, where the data may be very sensitive, the extent of the alignment between the research and teaching purpose is likely to be extremely important.

Finally, my experience suggests that, when the researcher is a principal researching their practice with their teachers, then less of the data collection falls into the category of data that would have been produced anyway and hence will require consent for collection (as well as for reporting).

Data Analysis and Reporting

As argued, most of the ethical issues and dangers associated with practitioner research in education are associated not with whether or not a new intervention should go ahead, nor with whether (much of) the data should be collected, but with whether and how it is to be reported. Put another way, it is almost always analysis and reporting issues that would drive (ethical) decisions about whether or not a proposed practitioner research project should be disallowed and it is these issues that deserve most considerations about restraints and conditions. Three key questions need to be considered in sequence:

1. How potentially damaging are the data and their interpretation?
2. Who can be damaged? And, if damage is a significant possibility.
3. How identifiable will the at-risk individuals be?

As I argued earlier, much data and their interpretations are not sensitive. In particular there is little risk of damage from data from studies where the teacher is, to a considerable degree researching with the students on his or her practice and where the students are positioned as representatives of the range of students present in a typical class in that teacher's practice. I have already discussed a range of other situations where data and their interpretation can be more sensitive; in these cases, issues of identifiability become important.

Central to the issue of identifiability, is whether or not the data will be aggregated – presented as data about a class or group or as data about individuals. Both approaches variously are appropriate depending on the research questions and a range of methodological issues, but aggregated data are always less identifiable and the reporting often involves no issues of either risk or consent. Examples of such data would be class grade averages, many descriptions

of class-wide events and patterns of learning behaviours such student questions, and summaries of questionnaire and survey data.

Non-aggregated data that is likely to be identifiable would include examples of student work and extended quotes from student interviews or learning journals. Consent to being interviewed includes consent for the reporting of interview data and hence needs little further discussion *provided*, of course, that the interviewee retains 'control of the tape recorder' and can put any comment off the record. Students' work that is identifiable (any extended piece of writing, for example is identifiable but a one line response to one of thirty test questions is much less so) should be done with student assent and perhaps parental consent. Most student work sends some messages about the student and we would argue that relying solely on parental consent, to publish anything in *advance* of the work being produced is unfair to the students. It is their work and, in addition to any parental consent, they should have the right, now that they know what their work is and what it demonstrates, to give informed assent to its use in a report. The same issues apply to using video footage as part of a report; consent can only be informed after the video has been made.

Vignettes or cases are another common form of non-aggregated data. These are contextually rich account of specific incidents that the researcher believes represents relevant data. The issue of who owns the story can be tricky in insider research. A teacher or teacher educator who is reporting a vignette of a class where she was a player has some legitimate ownership of the story. Typically the incidents are unpredicted and they vary enormously in both their sensitivity and identifiability. They may be written about learning behaviours of a class in ways that identify no individual or they may describe very sensitive behaviours of an individual in ways readily identifiable if that person or his or her colleagues read it. Because vignettes are totally unpredictable, they can only be handled, during the reporting phase of the research with researchers (and supervisors) being clear on general guidelines: how sensitive is the story, how identifiable are the vulnerable players, how likely are they to read it and, as a consequence, what can and cannot be said.

Individual case studies describing students over an extended period of time are another form of non-aggregated reporting that can be sensitive. Typically it is the interpretation that is sensitive. If vignettes or case studies are both sensitive and identifiable, then it may be appropriate to do a member check with the individual – show them the draft account and ask them whether they are happy with the way they are being portrayed. Van den Burg (2001) describes a detailed and iterative process associated with a self-study of a post graduate course, that enriched his interpretation of the data as well as meeting what he describes as his ethical obligations to the inhabitants of the research. In some cases, however, the act of member checking could be of itself, very damaging. If the vulnerable person has contributed the data from a perspective that is informed about its sensitivity, then the act of checking with them before publication is *not* likely to be a source of hurt. An example would be a student who has contributed searingly personal stories about (say) bullying or sexual activity. There is still a

real risk of hurt from reporting, but not from the researcher presenting the stories back to the student for checking. The situation is very different when the vulnerable person is presented with stories where they are a key and identifiable player, but one where they had no role in either the construction of the stories or in negotiating the values that underlie their construction. An example would be a teacher who agreed to allow data to be collected in his/her classroom without any process of building shared ownership of the process and the relevant definitions of 'good' and 'bad' practice. In this case, the act of presenting the (so far totally confidential) stories for comment can be shattering – more damaging than the effects of subsequent publishing to a wider audience. This last comment is not meant to be an argument for publishing without such a check, rather an argument for seeking to avoid such a situation occurring. In other words, *the question 'How well will the person know what is coming?' is important when looking at intended protocols, in sensitive topic areas, for project design, data analysis and reporting.*

As argued earlier, taking every possibility to involve other teachers in the overall research and in the data analysis generally substantially reduces the risks just mentioned. Certainly any research that involves collaboration with other teachers should involve some checking of data and its interpretation – the teachers will always be identifiable.

Member checks with students about (say) vignettes that describe negative behaviours may not be needed – the risk of identification is very much lower. However, as was also argued earlier, research that involves case studies of students in areas that relate to their *out of class* experiences may be very sensitive. Issues of anonymity are extremely important here, to the extent that, in some cases, the researcher's name may have to be anonymous in any publication to a wider audience.

The most important reason why a teacher researcher would seldom need to conduct member checks with students of *classroom* vignettes, however negatively the students may appear, is that neither the students nor their parents are ever likely to read the published research. In most case they are unlikely to know when or where it will be published and will not have easy access to it – there is a moderate level of technical knowledge required to find a journal article. I am not making any argument for secrecy here; I am merely describing a common reality that is very relevant to considerations of the risks of being hurt by publication. To some extent, the same issues apply to teacher inhabitants of a research project. However teachers are clearly more able to access a publication if they know that it is coming. Hence a double question related to the one above is: *How well will the person know that something is coming and how likely are they to read it?* One consequence of this question is that the issue of whether or not there is going to be an institutional internal publication of the research (i.e., one that all teachers at least will read) becomes important in considering potential harm from reporting.

Linking General Principles to Specific Issues

Using what has come before, I look at seven comments that have been made, in several cases many times, by past ethics committees. Each of these has been a source of frustration and/or friction and, I believe that, at least to some degree, each of them reflect a less than well-informed understanding of educational practitioner research. I start with those that I regard as the least reasonable and informed.

Do Not Treat Students as Guinea Pigs and Expose Them to Untested Teaching Approaches

This sort of comment conflates an untested new teaching approach with untested new medical treatment (see case 2). As discussed earlier, it is also ignorant of the ubiquitous role of innovation in teaching and of the range of variation that exists anyway in teaching practice.

It is Discriminating to Do Something With One Group and Not Give All Groups Access to It

This does raise the question of why one would ever do research if the researcher already knows if, how and why a new approach will be better. It also is ignorant of the extent of variation, even among teachers of the same subject matter.

Do Not Research in Your Own Classroom, Research in Someone Else's

As already noted, this comment ignores the unique advantages of the teacher being the researcher. It also assumes that an outside observer/researcher will have fewer ethical problems than an insider. The new ethical problems that this alternative raises have already been explored. In addition to these arguments, I note that, for a full time teacher, this condition raises huge (generally quite insurmountable) practical issues of time (the research is no longer part of practice) and finding times to be in the other classrooms.

The Teacher Has a Power Relationship Over the Students That Will Lead to Coercion of Students to Participate in the Research

As pointed out earlier, teachers need no special consent and thus do not need to coerce students to try something new, nor to collect many forms of data. Moreover, the sorts of data collection methods that require student assent are very likely to fail to give useful data if there is any perception (let alone reality) of coercion: collecting good interview data, for example, requires students happy to elaborate initial comments. The other relevant issue here has also been mentioned previously: In most classroom research the teacher is, to a significant degree, collaborating with the students and holding personal practice up for their critique.

The School as an Institution May Be Damaged

Sometimes this might be an issue, but this is more likely in research done by outsiders that insiders. It is also an issue that the school (who must consent) is best placed to judge.

Because It Is Their Workplace, Researchers Will Be Biased

This is no different to any other form of bias and is a methodological issue – all research reporting needs to give evidence of what was done to minimise bias. We also reiterate that teachers do not engage in research if they believe their practice is perfect.

Student Participants Will Be Identifiable and Could Be Hurt

As argued above, the risks of this in some forms of practitioner research are very real and considerable care must be given to reporting issues. The degree of aggregation of data is a very important factor here. Also, the data about learning and teaching that emerges in the most common forms of teacher research rarely have a potential for damage. Examples of student work, for example, are almost invariably provided as evidence of either high quality or of growth or improvement.

Linking General Principles to Specific Instances

In this section I illustrate how the preceding arguments may play out with more cases. As with cases 1 to 4, the following four cases have at least some basis in reality.

Case 5: Vivienne

Vivienne is a Physics teacher at a co-ed private school. While doing a M.Ed. subject, she is exposed to accounts from teachers of years 7 – 10 Science who have developed several techniques that have promoted much higher levels of 'reflective' question asking by students: typically these questions have stems such as "What if …, Why does …, If (theory x) is true, then why does (real world event y) occur?' They result in far more links between the school science and outside life. Vivienne decides to adapt these techniques to her Year 11 Physics class and regularly weave them into her teaching. She wants to explore firstly whether and how students can be stimulated to ask such questions, secondly whether this varies with topic and thirdly the extent to which these questions can be used to cover her curriculum. An important part of her intervention is regular, short debrief sessions (with the whole class) where she variously discusses why she valued a particular question or asks the students whether and why they feel their learning was aided.

Her intended data collection include counts (using audiotapes of lessons)

of the frequency of such questions (and hence changes in this area) from her class (including some baseline data) and a teacher journal where it records incidents significant to the research, as well as any changes in the way the students discuss question asking.

Her reporting will include tables of changes in question frequencies over time, across different topics and against different teaching and discussion techniques. It will also include examples and discussion of whether and how the students' questions improved the learning and teaching. Finally it will include some vignettes of class discussion illustrating development (if it occurs) in the students comments about the value, or lack of value of reflective questions. These vignettes will include relevant student comments, typically one or two lines in length.

In this case, the intervention is self evidently within the zone of accepted practice. The data collection will involve merely keeping records of classroom events. The intended reporting involves aggregated data where no student will be identifiable at all and vignettes and comments that will also be very hard to attribute to individual students as well as carrying no apparent risk to the students. If parental consent were sought in this case, it is not clear what they would be consenting to. The only possibility is that their child's questions, or lack of questions, not be included in any of the data summaries. This would immediately render the research invalid; the class was the unit of study here and each student's behaviours will affect the behaviours of others. A confident extrovert who responds quickly to opportunities to pose questions will stimulate others to join in. Ideas bounce around a room with one good question often stimulating a raft of related others. To regard the students as 25 independent and isolated individuals from which any sub-set can be excised is nonsense. In other words, in addition to considering the risks of any proposed research, it is important to consider the consequences of a single 'no' before automatically requiring consent. If the data analysis is either meaningless (as in the above case) or significantly compromised without data from all students, then there need to be strong reasons, based on a real chance of harm, for requiring consent.

The case just discussed would be different, of course, if the teacher wished to complement the aggregated data with interview data about the student's perceptions of the role of questions. While student question asking behaviours are so interdependent that the class is a non-decomposable unit, data on their perceptions requires only a representative sample. Moreover, while the interview data also could be reported in a purely aggregated way, the data collection could be uncomfortable for some students and (at least) informed student assent would be necessary.

Case 6: Mary

Mary runs Social Studies method in a pre-service education course. As part of her teaching, she requires her students to keep a reflective journal focusing on whether, when how and why their views about learning and teaching

evolve during the year. The students maintain this journal through their practicum experiences. Mary sees these journals regularly and responds, sometimes with questions that initiate a written dialogue between her and individual students. These journals are rich with stories and reflections about learning to become a teacher. Mary runs a class debrief after each of the three practicum experiences; in these sessions she has the students focus on occasions when they were and when they were not able to apply ideas from her course in the practicum. She requires her students to write a case based on each of these sorts of experience.

She decides to use these data in a study of the impact of her course on her students when they are in the field. She intends to publish this in a book. She analyses the data from all her students looking for themes and intends to report this analysis using appropriate tables and commentary. However, central to her study will be detailed case studies of four of her students whose experiences she selects as representing the stories she has read. She selects these students after all their accounts were in, seeks their permission to be involved in the study generally and intends two cycles of presenting them with drafts of her stories about them. Many of the stories they tell are common across the whole class, but each of them has had experiences that are unlike any others and sometimes very influential. One of these involves a teacher in a private school whose reputation is based on very high class averages in the competitive year 12 state-wide examinations. Mary's student, Bill, reports in dramatic detail how this teacher engaged in public humiliation of three year 11 students who were planning to take his subject in year 12. The teacher told Bill that he was trying to weed out weak students in order to maintain his, and the school's high average grades. This incident had a massive impact on Bill. He was disgusted at what had happened and devoted the rest of his practicum experiences to searching for ways to build the intellectual self esteem of low achieving students.

This goal had led Bill at his next school to invest a lot of time in Shaun, an aboriginal student (one of only two in the school) who was regarded as being very difficult and very poorly performing. Bill had some noticeable and moving success with Shaun who had broken down with emotion when he had successfully completed a major task for the first time in years. Part of Bill's story includes details of Shaun's dysfunctional family. His aboriginality is an important part of his story and his problems are typical of some of the unique problems that people of that race face in Australia.

Another of Mary's students, Tranh, describes an incident where a student asked her supervising teacher a question that drew on the previous night's television to challenge something the teacher had said. It was the first time Tranh had seen that student show interest or ask a question. The teacher had reacted aggressively, ducking the question and abusing the student for wasting his time watching television. Again this had had a major impact on Tranh.

Mary is not involved in practicum visits and does not know any of the

teachers in these stories. She grapples with what she can and cannot say in her book.

Once again there are no consent issues and no ethical dangers in both the intervention – nothing different is planned – and the data collection – where all data are artefacts of the teaching. The reporting, however, is potentially very damaging. It could be damaging to her students, who will not only know which case study is about them, but will also be able to identify the others from the stories that have been shared publicly in class. Mary's member check will prevent the final public stories being harmful to the student, but the member check itself could be damaging if Mary has a rather different basis for defining a good lesson than one of her students. The student could be hurt by Mary's interpretation in a draft. Mary should have built in ensuring reasonably shared values as part of her selection criteria. Her report could also be very damaging to several non-consenting others, as well as to the school where Bill did his first round. These stories mean that the student teachers will have to be anonymous; this puts the supervising teachers, as well as Shaun, two steps away from Mary. This is a significant safeguard, but the three stories that I have mentioned are so specific that identification is possible, and Mary does not share ownership of these stories. In the case of the first and the third, Bill and Tranh do not share ownership either; they were observers, not players. There are a number of factors here. One is that Mary intends a book (and not a paper in an academic journal) about (her) student teachers in the practicum. This means that there is a greater chance of the research being read by someone in the relevant schools, particularly if the stories are dramatic. Another factor is that the private school is not acting in the best interests of some of their students and could be said to be engaging in deception of prospective parents. Nevertheless, Mary's evidence for this is one anecdote, certainly not enough to name the school. Even if told in general terms, it is so sensitive that it may come to the attention of the school and specific details of the incident may make identification of the teacher and hence school possible. Bill's work with Shaun however, makes much less sense without the first story. Very specific detail (the exact question, TV show and the teacher's actual words) will make Tranh's story more dramatic and effective for (say) future classes that Mary takes. The likelihood of identification is a little lower, because, unlike the first story, there need be no clues as to the type of school.

Bill does share ownership of the story of his work with Shaun. Shaun is highly identifiable if his race is named, as are his parents, who do not figure well. However the fact that they are not education professionals, together with their general pattern of life means that the chances that they would ever be aware of and interested in Mary's book are extremely low. On the other hand, a member check with Shaun, apart from being ethical (he also shares ownership of the story), could be an immensely important and positive event in his life.

Case 6 becomes considerably more complicated if Mary has been a regular visitor to schools during the practicum and built relationships with the supervising teachers and told them of her research. The more Mary involves the supervising teachers, if, for example she wants to gather their perspectives on the

practicum experiences, the more likely they are to read her book and the more rights they gain to have their story told and their perspectives respected. Tranh's story (let alone Bill's) could now be explosive. Bills' (first) story involves what from any perspective is clearly unprofessional behaviour (I comment that it is drawn from a real experience) and the ethical issues are associated with the extent to which Mary should 'blow the whistle' using data that came to her when the school was helping Mary's institution and Bill by providing a placement – a very non trivial issue to those who have to find placements! Tranh's story however (also closely based on fact) is much more a clash of values -some teachers and some cultures are horrified if a student challenges what a teacher says. To engage the supervising teachers in a collaboration involving the practicum experience and hence their roles in this, *without* negotiating some reasonable level of shared values is an extremely high-risk endeavour. There are very strong reasons for such partnerships, however, the problems of building shared goals and values rises extremely rapidly as more types of players based in different sites are added. There is no easy way out of this conundrum, but it is helpful to be aware of when and why it will arise.

Case 7:   Dan

Dan is the head of Social Studies at a rural high school. He is concerned that too much of the assessment at Years 9 and 10 in his Department focuses on low level recall of information rather than higher order thinking skills. He is also concerned that the forms of assessment used are too narrow; excessively privileging students with good writing skills and disadvantaging students who may be better able to demonstrate learning in other ways.

The Department has a common filing cabinet, intended as a resource, where all eight SOSE [Studies of Society and Environment] teachers (including Dan) deposit copies of tests, assignments and other assessment instruments for others to use. Dan decides to analyse all of these using two well known typologies: Bloom's taxonomy of the cognitive domain (exploring his first concern) and, for his second concern, Gardner's theory and description of Multiple Intelligences and their classroom consequences.

Dan also decides to interview, in pairs, a sample of students from across the year level. Each pair will be given some assessment tasks that they have previously completed (though not their own responses to these) and invited to discuss how they tackled them, the thinking that the tasks did and did not stimulate and their general reaction to the task. He intends to use as the interviewer, Sue, a teacher from another school who is on leave. He believes that this person will be less threatening, but have the expertise to follow-up interesting comments. Dan will explain the project to each class and introduce Sue. Sue will seek consenting students from a list that Dan will assemble and monitor as being representative across several dimensions (gender, achievement, confidence etc).

Dan will report his findings as a study of what assessment currently is

occurring in his Department and how the students perceive it. The assessment instrument item data will be summarised in tables against Bloom and Gardner, plus some illustrative examples drawn from the filing cabinet. The student interview data will be reported against whatever recurring themes emerge from analysis but some specific comments about individual assessment instruments also will be included where relevant and useful.

This is a case where the IRB is likely to focus on the possible dangers to the students – which are extremely low and ignore what are very real dangers to the other teachers. This is an extreme case of the students being positioned as collaborators in and not as subjects of the research – the subjects are the other teachers. The facts that the students come from a mix of classes and that their class teachers have no role in selecting them, means that their identity will be very difficult to determine. The teachers, on the other hand will be highly identifiable and many of them are certain to be badly hurt. Dan has begun from a belief, quite likely to be accurate, that there are significant problems in the assessment in his department. However, the other teachers have not been involved in any collaborative process of building shared concerns or values. Moreover, they put their work in the filing cabinet for one purpose (to share ideas) and Dan can be accused of abusing his position by using it for another. Here the research purpose is not well aligned with the basis under which the data was collected. A teacher could very legitimately claim that one of her instruments has been ripped out of context, if analysed in the absence of the totality of what she did with that class, much of which may not be in the filing cabinet. Case 8 provides a deliberately extreme contrast on this issue.

Case 8: Robert

Robert has just been appointed Literacy Coordinator at a secondary school. This is a newly created position, involving responsibility for transition from primary school to secondary school (i.e., moving from Grade 6 to 7). In his enthusiasm, Robert has already organised meetings between Grade 6 and Year 7 teachers at which they have analysed samples of students' writing and discussed differences between primary and secondary school.

Robert has arranged for incoming Grade 6 students to prepare a portfolio consisting of their 'best' pieces of work, as well as a letter in which they introduce themselves to their Year 7 teachers. He has also taken the trouble to interview a small number of incoming students in an effort to better understand their needs and expectations of secondary school.

Robert's school has taken steps to modify their approach towards transition in the light of his interviews with Grade 6 teachers and their students. His school is becoming recognised for its innovative approach to transition, and he has begun to present examples of portfolios at workshops, having received permission from students to show their work to other teachers.

Robert decides that he would like to conduct systematic inquiry into the literacy needs of students during the transition years, and he so commences

a research degree. He plans to interview the students whom he originally interviewed in Grade 6, charting their progress through Year 7, and assessing their writing in comparison with the quality of the work they presented in their portfolios (which the secondary teachers at Robert's school judged to be exceptionally good when compared with the work they usually receive from Year 7s). He then intends to follow them into Year 8, when he will do the same. In addition to the interview data, he plans to collect and photocopy further samples of their written work. Combined with the data he has already gathered prior to their entry into secondary school, the subsequent interviews and work samples should provide a rich picture of the students' literacy development during the transition years.

The aim is to produce a small number of case studies that will show the way students handle the literacy demands associated with transition from primary school to secondary school.

This is a case where the researcher is using data collected previously for what an IRB is likely to criticise as a different purpose. In contrast with Case 7, the purpose of the research is totally consistent with the reasons the work was collected. There is no question that the students and their parents should be asked for consent to the work being used, but this use is likely to be a source of pride for the students. The risks of harm are low. Once again, the focus is on the teaching, in this case the different demands of primary and secondary literacy tasks. Where the research reveals declines in performance, then in order to meet the ethical obligations that Robert has to the students, he will need to select case studies that do not hide any problems he uncovers, indeed that bring them out. But that do so in ways that position the student as coping with different demands and expectations, not as someone incompetent or lazy.

Conclusions and Suggested Guidelines

The Chimera of Universal Principles

This chapter began with frustration concerning decisions of IRBs and with a desire to improve those decisions to make them more informed and, as a consequence, more flexible and reactive to individual cases. This section is intended both to bring together and to build on what has gone before in ways that provide specific guidance to others. How should such a section be framed?

Small (2001), as part of a theme issue of the *Journal of Philosophy of Education* on the ethics of educational research, argues against the notion of searching for a set of fundamental ethical principles from which the specifics of individual decisions can be logically derived. Instead he argues, from the perspective of a philosopher, for a greater concentration on improving the processes by which ethical decisions are made. One argument is that there is no agreement among philosophers on the ways by which ethical principles should be derived. A second is that the idea of exceptionalness principles is nonsensical – they must immediately be accompanied by a body of qualifications that weaken any structure

based on absolutes. A third objection comes from a report (Jonsen & Toulmin, 1988)describing the process by which a major (American) set of official ethical guidelines for research was developed. The document that was produced begins from a set of fundamental principles that then are used to develop more specific applications. This structure, however, was the reverse (according to Jonsen & Toulmin) of how the document was developed. They describe how a national body, carefully selected to represent different stakeholders, began with discussion of individual cases and had little difficulty in reaching agreement on what was ethically appropriate and inappropriate. What they could not agree on was *why* they believed this. As a result, their guiding general principles never led decision-making, rather they were the last thing agreed on, and then only by a process of reaching consensus on what could be described as an acceptable level of vagueness. This leads to what, for this chapter, I regard as Small's most important point. A search for simplifying rules is not only fruitless, it overlooks the importance of every individual researcher supervisor and ethics committee member being familiar with a rich case history that equips them to make ethically sensible decisions about unique and/or unexpected situations. Small argues for a problem-solving rather than a top-down approach to ethics decisions using an ever-expanding set of 'paradigm cases.' I agree.

Ethics as a Process of Managing Dilemmas

Schön (1987) contrasted the (artificial) high ground of well formed but fundamentally unimportant problems that lend themselves to neat investigations and clear solutions with the swamp of real practice with messy, indeterminate, but important problems that defy neat framing and do not result in conclusive solutions. Educational practitioner research is generally up to its neck in Schön's swamp.

I have argued that the great majority of teacher research projects involve little or no risk to students. However, I have also detailed how this is not intended to be a blanket statement. Fundamental to this chapter is the view that these are few, if any invariant rules and that dilemmas are common in this area. The cases illustrate how decision-making often involves managing the dilemmas in an informed way, not applying rigid rules. In order to do this it is essential to be informed about what sorts of risks are real, how high are these risks and, if significant, whether or not there are appropriate strategies to reduce them to (at least) acceptable levels.

The ethics process for practitioner research in education should be based on the assumptions that many outcomes are unknowable at the start and that the capacity for informed consent is often very limited in advance of events. For these reasons the procedure should be seen as a process, not a single event. This process should be guided by the principle of meeting ethical obligations to the inhabitants of the research. The researchers need to be able to demonstrate that they are aware of these obligations, of the sorts of unpredictable outcomes that they may face, the possible ethical implications of these and how they will deal

with them. They should also be required to demonstrate plans to anticipate and avoid problems that are predictable in this area.

The ethics process for both the IRB and the researcher and supervisor involves three, interdependent decisions. Should the research proceed at all; what consent procedures should be used and what protections are needed to minimise risk. It usually will be useful to consider separately three components of an educational practitioner research project: the intervention, the data collection and the data reporting. As I have argued, the risks in this domain are almost always confined to the third of these. I conclude by summarising what I see as the questions determining risk and hence the approval, the consent procedures and the protection features relevant to each of the three components listed above.

Recommended Questions Concerning Interventions

Sometimes the research involves no change at all to the practitioner's practice – they are merely doing a study of what is/is not occurring in their classroom (or equivalent workplace) – hence question 1. Often some aspect of practice *is* intended to be new and question 2 is relevant.

1. *Is the intervention an artefact of the research or something that was going to occur anyway?*
   If the former then:
2. *Is the intervention outside the range of actions from which teachers have professional responsibility for choosing?*
   As discussed at several points above, the answer to this question in all of my experience has been negative. Teachers self-regulate in this area. However it is one (of many) reasons for principal consent as it cannot be answered without rich knowledge of teaching practice.
3. *Does the intervention involve other teachers' practice?*
   If yes, then for the reasons already discussed, a relevant question is –
4. *Is there planning for all participating teachers to develop:*
   a. *an acceptable level of shared ownership of the project and*
   b. *an adequate consensus about what is effective learning and teaching in the areas to be researched.*

I would be very cautious about any project where the answers are yes to 3 and no to 4.

Recommended Questions Concerning Data Collection

Four questions are relevant.

5. *If data collected for a teaching purpose is now being used for a research purpose, are the two purposes related and mutually supporting?*
6. *Which data collection (if any) is outside what would occur as part of normal practice? How sensitive is this likely to be?*
7. *Is there a need for data from all students to be included in the sample?*

Decisions about this question cannot be made without considerations of how the data will be reported.

8. *Is it likely that participants may report something that cannot be kept confidential?*

This is very unlikely in most classroom research, but could be quite possible in the sorts of projects discussed under the heading, 'Research on Students' Out-of-Class Lives'. If so, then the participants need to know this in advance.

Recommended Questions Concerning Data Reporting

As discussed previously, the questions

9. *How potentially damaging are the data and their interpretation?* and
10. *Who can be damaged?*

are important to consider, particularly as the answer to 9 is commonly "not very." In the same two sections, I discussed how in answering these two questions, it is helpful to consider:

11. *To what extent is the teacher researching with students or on students?*
12. *Is the class the unit of study, with students positioned as typical members of a representative group, or are students positioned as individuals or members of identifiable sub-groups?*
    As discussed at several points above, issues of identifiability are commonly the most important in practitioner research. Hence the importance of asking:
13. *To what extent will the data reporting allow individuals to be identified?*
    This is partly answered by –
14. *Will the data be aggregated?*
    Not all data that allow students to be identified are sensitive; students' work often is not. Nevertheless, it important that students agree to the reporting of any extended (and hence identifiable) piece of their work.
    If individuals can be identified *and* if there is real risk of hurt, then there does need to be protection built into the reporting and some things may not be able to be reported, either at all or in more than very generalised forms. Four questions are relevant.
15. *Does the research focus on or include some of the students out of classroom behaviours? If so, how sensitive are these?*
16. *Are non-consenting others appearing as players. If so, how likely are they to be hurt and identified?*
17. *Are consenting others positioned or described in ways they had neither expected nor consented to? If so, how likely are they to be hurt and identified.*
18. *How well will the person know that something is coming and how likely are they to read it?*

Acknowledgement

Note

Student welfare co-ordinators in the Australian system have a very low teaching allotment and spend most of their time counselling and supporting students about what are often very sensitive personal matters.

INTERPRETING THE WHAT, WHY AND HOW OF SELF-STUDY IN TEACHING AND TEACHER EDUCATION*

John Baird
University of Melbourne

Abstract

In this chapter, I attempt to answer the following questions regarding self-study in teaching and teacher education:

- *What* is the nature of self-study?
- *Who* does self-study in teaching and teacher education and *why* do they do it?
- *How* do these people engage in self-study?

I then ask, "What contributions can self-study in teaching and teacher education make to scholarship in education and educational research?"

First, I admit bias centred upon the notion of self. All thinking, feeling and acting in educational research, as with any other human endeavour, has a significant subjective element. The nature, structure and message of this chapter, as with all the other chapters in the volume, reflect the self of each author. In some ways, the writing of the chapter involves a measure of self-study: self-study into the nature of self-study! Thus the consideration below of what self-study is – what distinguishes this field of scholarship – is necessarily imbued with my experiences, beliefs and values.

For all of the questions above, but particularly the first, there is extensive discussion elsewhere in this handbook. In this chapter, I try to infer the nature of the endeavour of self-study from what has been written by the chapter authors in this section. Thus my discussion is limited to my interpretation of Chapters 31 through 37, all set within the context of teaching and teacher education. Two conceptual perspectives, both of which arise from my research, frame my interpretations of the questions above. One perspective links personal and professional thinking, feeling and acting; the

---

*Chapter Consultant: Tom Russell, Queen's University, Canada.

second interprets such thinking, feeling and acting according to the generation of personal *challenge* that comprises both cognitive/metacognitive and affective elements. I introduce these perspectives as I summarise diverse perspectives on the nature of self-study in teaching and teacher education.

The Nature of Self-Study in Teaching and Teacher Education

I begin this section by considering two questions: "What is meant by 'self' in self-study in teaching and teacher education?" and "Is self-study research clearly distinguished from other practitioner-led research endeavours?" Then, I consider the Section 4 authors' foci and purposes for their chapters and summarise, as particular themes, their views on the nature of self-study. Finally, I introduce my first conceptual perspective (on the nature of quality in teaching) and, based on this perspective, I provide my overall summary of the essential nature of self-study.

Some Interpretations of "Self"

There are many ways in which the word "self" in self-study might be interpreted. This interpretation is crucial, as it fundamentally determines the nature of the practice. I consider five possible interpretations of "self" in self-study below. In presenting each interpretation, I make the assumption that the practice of "study" in self-study is a form of research. I turn to the nature of self-study in the next section, and will return to this point then. My five interpretations of "self" in self-study are shown in Table 38.1.

Each of the first three interpretations in Table 38.1 has a clear focus upon the self. The last two do not involve an overt self-study element beyond that which underpins all research and writing. These last two interpretations are a basis for some of the chapters, however. For instance, the chapters by Trumbull, Clift, and Manke devote considerable attention to the nature of, and approaches to, self-study and other educational research done by others. Also, the chapter by Mitchell centres upon ethical considerations related to self-study. In the Trumbull and Clift chapters especially, description of the personal contribution of the author to empirical self-study practice (as it relates to perspectives 1 to 3) remains implicit, for example: "As I have thought about our self-study work and my own work in the self-study community …" (Trumbull, Chapter 31).

Is Self-Study Research Clearly Distinguished from other Teacher-Led Research Endeavours?

The purpose of this handbook is to describe, characterise and critique a body of educational research. As part of this critique, a series of related questions require answers. Indeed, if answers to questions such as those below are not forthcoming, the integrity of the Handbook itself stands in question. The questions include:

Table 38.1. Possible interpretations of "self" in "self-study"

---

1. *Self in teaching.* (The phenomenon is *my teaching*.)
    Studying myself acting as a teacher or teacher educator: my description is of *what I do* as I teach.

2. *Self as teacher.* (The phenomenon is *me as teacher*.)
    Studying myself in the role of a teacher or teacher educator: my description is of *what it is for me to be* a teacher or teacher educator.

3. *Self as researcher of my teaching or of me as a teacher.* (The phenomenon is *me doing self-study*.)
    Studying myself practicing self-study: my description may be either of *what I do as a self-study researcher* or *what it is for me to be a self-study researcher*.

4. *Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices)*. (The phenomenon is of *teaching, teacher education*, or *educational research*.)
    Here self means that I am the one who *does the research* on the nature of these practices as done by others.

5. *Self as researcher of self-study (not expressly of my own self-study)*. (The phenomenon is *self-study*.)
    Here self means that I am the one who *does the research* on the nature and practice of self-study as done by others.

Is self-study as described in this current Handbook really any different from much prior research, or is simply a convenience to gather together diverse research having some common purposes?

Does self-study have a particular basis in scholarship that will generate a contribution to educational knowledge and understanding?

My purpose in this final chapter of this handbook is to consider answers to these questions, taking as evidence information presented in the chapters written in the context of teaching and teacher education. In the heading to this section, I describe "teacher-led research" as a key criterion for positioning self-study within the broader field of educational research. In so doing, I use the term teacher to include both schoolteachers and teacher educators (teachers of teachers). Within the boundaries of teacher-led research, many disparate research endeavours involve teachers focusing upon personal thoughts and actions. To illustrate this diversity, I now consider two types of endeavour that formed the basis of research with which I have been associated.

School-Based, Teacher-Led Collaborative Action Research on Teaching and Learning

An example of this type of research is the *Project for Enhancing Effective Learning* (or "the PEEL project," see Baird, 1998; Baird & White, 1996), a voluntary school-based, teacher-led change initiative that is now in its eighteenth year.

PEEL began in 1985 at one school in Melbourne, Australia with 10 schoolteachers and 2 university teacher educators. In 2003, PEEL continues actively in hundreds of schools in countries around the world. PEEL is distinguished from other in-school professional development initiatives by its unique combination of *focus* (to enhance metacognitive knowledge, awareness and control of pupils for learning, and teachers for teaching) and *method* (of on-going collaborative action research, where teachers (and pupils) reflect and act upon their classroom practices and share and record the outcomes of their efforts). For teachers, this sharing involves regular within-school and between-school teacher group meetings; recording includes production of various publications (including several books), a regular newsletter, and a CD-ROM compilation of effective classroom strategies. PEEL is an established and long-term example of teachers working according to perspective 1 (and, secondarily, perspective 4) above.

Another large Australian research project that illustrated perspective 1 and, consequentially, perspective 4 was a four-year government-funded project, *Teaching and Learning Science in Schools* (TLSS). In TLSS, teachers and pupils worked together to effect improvement in teaching and learning approaches, practices and outcomes by routinely enacting, reviewing and evaluating joint attempts at classroom-based change (Baird, Fensham, Gunstone & White, 1991).

Both PEEL and TLSS involved teachers and pupils reflecting upon what they do, why they do it, and thereby how to improve personal practices and outcomes. In PEEL particularly, teachers are actively engaged in reporting the outcomes of their endeavours. Does either project (and other teacher-led attempts at school-based change) fit within the boundaries of self-study research, and thereby form part of its scholarly base? I return to this question later.

Phenomenological Reflection on What It Is to Be a Teacher

Another field of research is based upon phenomenological reflection where, for instance, a person draws upon his or her lived experience of teaching in order to explore the nature of what it is to teach and to be a teacher (perspective 2 above). This reflection has been structured around the person regularly generating written responses to questions such as "What is it to be a science teacher?" and "What is science teaching?" using solely as a basis for the response one's lived experiences of teaching in the period since these questions were last answered (Baird, Fensham, Gunstone, & White, 1991; Baird, 1999a). In the study cited, this phenomenological reflection occurred for periods up to eighteen months. Once more, this type of research, undertaken nearly 15 years ago, might well be categorised as self-study.

To the preceding two categories of research could be added the extensive literature based upon personal narrative in teaching, directed to understanding personal experiences or their overall nature and, indeed, any sort of continuing self-reflection, at various levels of generality, where a teacher asks questions such as "Why did this happen?" and "What are the implications for me or my teaching?"

This brief description of some examples of research that pre-date the use of

"self-study" as a major educational research field suggests that the two key questions mentioned above have yet to be answered persuasively. Yet self-study is exhorted by the chapter authors as important, in various ways, for personal and professional growth and for educational improvement. For instance, in the chapter he wrote with Terri Austin, Joe Senese develops a series of themes to outline benefits of self-study (which he distinguishes from teacher-research or action-research, an issue I consider below). His themes are that self-study redefines teachers as researchers; redefines teachers as learners; opens the classroom doors; fosters good teaching; nurtures personal and professional growth; reshapes beliefs that produce change; creates partnerships with students; benefits student learning; and values student contributions.

If self-study does all of these things, it is a singularly worthwhile endeavour! Below, I shall consider the purported benefits of self-study in more detail but, before that, it is important to distinguish self-study clearly from such related research initiatives as action research, teacher research and, more generally, reflective professional practice. In order to do this, I consider what the other authors in Section 4 say regarding the nature of self-study, and interpret these views in terms of the content of Table 38.1. First, I summarise the authors' perspectives and purposes for their chapters, and relate these to the different perspectives on self, as discussed earlier. I then outline the authors' views on the nature of self-study.

Authors' Perspectives on Self-Study and Purposes for their Chapters

Below, I summarise in turn the following aspects for each of the chapters in Section 4:

- Chapter focus, in regard to who is engaged in self-study
- Author purposes for the chapter
- My interpretation of the chapter in terms of the five interpretations of self in Table 38.1.

Trumbull – Chapter 31

Chapter focus (those who are engaged in self-study): Teacher educators.

Author purposes for chapter: Trumbull seeks to outline the nature of scholarship for those teacher educators who wish to engage in self-study:

> This chapter links the scholarship on teaching to some central points in the scholarship on research approaches.

> To understand better our work as teacher educators, it is crucial that we consider research and theory that link individuals and context, that remind us that teacher education is not just about changing individuals.

> I have highlighted lines of thought that provide lenses on our work as

teacher educators. Each has implications for our scholarship ... requirements for self-study scholarship in teacher education. (Trumbull, Chapter 31)

Trumbull draws upon her own earlier self-study research (which she does not explicate) and the self-study work of others to consider metaphors for effective teacher education and the implications of these metaphors for "teacher educators' work and how we study it." She considers a variety of issues in making a series of assertions regarding what self-study teacher education researchers should consider in order to improve what they do.

Interpretation of "self" of author (from Table 38.1) for writing the chapter:

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Austin and Senese – Chapter 32

Chapter focus (those who are engaged in self-study): Teachers

Author purposes for chapter:

This chapter defines self-study for classroom teachers and points out potential benefits and the conditions necessary to begin.

In this chapter, Joe and I share our understanding of self-study from our unique teacher's perspectives ... Throughout this chapter we work to define self-study for classroom teachers and, along the way, to define other research terms that may be familiar.

We have had three major purposes in view as we prepared this chapter. First, we wanted to *define self-study for classroom teachers* ... Second, we wanted to *convince teachers to launch into self-study* ... Third, we wanted to *provide information about carrying out self-study in a school setting.* (Austin & Senese, Chapter 32, emphasis in original)

Interpretation of "self" of authors (from Table 38.1) for writing the chapter:

Interpretation 1: Self in teaching. (The phenomenon is my teaching.)

Interpretation 2: Self as teacher. (The phenomenon is me as teacher.)

Interpretation 3: Self as researcher of my teaching or of me as a teacher. (The phenomenon is me doing self-study.)

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Beck, Freese, and Kosnik – Chapter 33

Chapter focus (those who are engaged in self-study): Teacher educators, student teachers, "mentor [school] teachers"

Author purposes for chapter:

> We begin by outlining various dimensions of the self-study approach and then note some of the challenges to implementing this approach in teacher education.

> We highlight four conditions or practices for achieving a self-study approach in the practicum.

> Our concern here is both with the principles of self-study and with their implementation in practice, namely, in the preservice practicum. (Beck, Freese, & Kosnik, Chapter 33)

Interpretation of "self" of authors (from Table 38.1) for writing the chapter:

> Interpretation 3: Self as researcher of my teaching or of me as a teacher. (The phenomenon is me doing self-study.)

> Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

> Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Berry – Chapter 34

Chapter focus (those who are engaged in self-study): Teacher educators

Author purposes for chapter:

> This chapter explores the growth of knowledge of teaching about teaching that has developed through the self-study of teacher education practices ... What happens when teacher educators research their own teaching, and how does this influence their understanding of themselves, their students and the process of teacher education?

> An important purpose of this chapter therefore, is to bring together teacher educators' different accounts of their work to offer possibilities to others also wanting to learn to find their way around in that swamp of practice. Equally important is finding ways to represent these accounts in ways that preserve the complexity and ambiguity of the process of teacher educators'

knowledge development yet, at the same time, are meaningful to the reader. (Berry, Chapter 34)

Interpretation of "self" of author (from Table 38.1) for writing the chapter:

Interpretation 3: Self as researcher of my teaching or of me as a teacher. (The phenomenon is me doing self-study.)

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Clift – Chapter 35

Chapter focus (those who are engaged in self-study): Mainly teacher educators; student teachers

Author purposes for chapter:

In this chapter I do not summarize or review all of the recent research in which self-study is employed as a means of examining teacher education. Instead, I summarize selected peer-reviewed studies as a backdrop from which to examine issues surrounding the conduct of research within one's own classroom, which is embedded within the political, social, and historical context of local departments, campuses, states, and countries.

The first section of this chapter acknowledges the increasing globalization of teacher education (Elliott, 1999; Merryfield, 2002) and provides an overview of some international concerns for and about teacher education programs … The second section of this chapter provides examples of self-studies from many countries that have been published recently in peer-reviewed journals, with two exceptions of book-length descriptions of entire programs. … I wish to emphasize the many ways in which self-study of teacher education has become an important part of accepted scholarly practice. In the final section I speculate on relationships among the questions addressed by the studies in the first section to issues across the wider context of teacher education.

I discuss selected studies from peer-reviewed journals to illustrate the ways in which a space for self-study research has been created within the academy.

I have identified numerous papers that illustrate the variations in self-study research that has been published in peer-reviewed journals beginning in 1995. (Clift, Chapter 35)

Interpretation of "self" of author (from Table 38.1) for writing the chapter:

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Manke – Chapter 36

Chapter focus (those who are engaged in self-study): Administrators in teacher education and teachers with administrative/ leadership responsibilities.

Author purposes for chapter:

The chapter surveys a broad range of studies, primarily from authors [who are administrators or educators with leadership positions] within the Self-Study of Teacher Education Practices Special Interest Group.

The reviewed studies fall naturally into three major categories: self-study by practitioners who become administrators and proceed to apply self-study methodology to their work, self studies at the program level that include reflection on administrative practices, and self-studies that focus on teacher education reform. (Manke, Chapter 36)

Interpretation of "self" of author (from Table 38.1) for writing the chapter:

Interpretation 3: Self as researcher of my teaching or of me as a teacher. (The phenomenon is me doing self-study). (This interpretation is not emphasised.)

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Mitchell – Chapter 37

Chapter focus (those who are engaged in self-study): Teachers and teacher educators.

Author purposes for chapter:

The principal motive for writing this chapter is the persistence of reports of problems that research proposals in this area encounter when submitted to university ethics committees … for approval.

My intention in this chapter is to provide a framework for identifying the ethical issues in self study research by teachers and teacher educators that ought and ought not to be of concern during the review and planning processes.

A main thesis of this chapter is to analyse precisely what it is that does and does not require consent as well as when that consent should be sought. (Mitchell, Chapter 36)

Interpretation of "self" of author (from Table 38.1) for writing the chapter:

Interpretation 3: Self as researcher of my teaching or of me as a teacher. (The phenomenon is me doing self-study.)

Interpretation 4: Self as researcher of teaching, teacher education, or of educational research (but not expressly of me doing these practices). (The phenomenon is of teaching, teacher education, or educational research.)

Interpretation 5: Self as researcher of self-study (not expressly of my own self-study). (The phenomenon is self-study.)

Chapter Authors' Views on the Nature of Self-Study

Multiple Perspectives; Multiple Practices

There are various reasons why the nature of self-study in teaching and teacher education is elusive and ill defined. One reason is simply the recency of the term in educational writings; a more important reason, however, is that the term as currently used embraces a number of related practices associated with different concerns, interests and approaches. In Berry's words, "Still in its infancy, self-study has not yet truly developed as an institutional approach" and "self-study is not a straightforward process" (Berry, Chapter 34). Clift notes that "the field of teacher education research is young and self-study research is even younger" (Clift, Chapter 35).

The scope of self-study in teaching and teacher education considered in this section of the handbook involves practices undertaken by schoolteachers, teacher educators, and educational administrators and leaders. Self-study practitioners do not share common perceptions of nature and purpose. Beck, Freese, and Kosnik comment:

The term "self-study" as employed recently in teacher education refers to a complex set of components and is not easily understood.

There are differences within the self-study movement about the degree to which construction is an individual or social activity.

These, then, are the central components of the self-study approach, as we

understand it. We are aware that significant differences exist among self-study advocates about the precise meaning of the above components and the emphasis to be given to each. (Beck, Freese, & Kosnik, Chapter 33)

In her review of various recent published articles that she includes within the category of self-study, Clift draws attention to its complex and pluralist nature:

> Drawing in part from Schön's ... explication of reflective practice, in part from action research models ... and in part from content area models such as practitioner studies of children's and adolescents' writing and language ... many teacher educators are engaged in forms of self-study. Some of this work is deliberately acknowledged as such, and some of it is not explicitly named as self-study.

> From its inception, the Self-Study of Teacher Education Practices Special Interest Group (S-STEP SIG) of the American Educational Research Association has deliberately embraced a wide range of research foci, multiple methods of data collection and analysis, and alternative representations of members' work. ... Self-study [is] an emerging field.

> In some papers, the researchers explicitly stated that they were engaging in self-study, in others, they did not. In some, impact on practice is specifically discussed; in others, impact is only implied. The duration varies; the focus varies; and the ways in which teacher educator-researchers have attempted to demonstrate trustworthiness or believability also varies. (Clift, Chapter 35)

Multiplicity of interpretation is hardly unique to self-study; similar ambiguity exists for many other concepts and constructs within education. Just ask different educators to define reflection! Next, I attempt to draw commonalities from the different perceptions outlined in the chapters.

Two General Characteristics of Self-Study

Notwithstanding the comments above regarding the multiple perceptions and practices of self-study, two major features appear to be fundamental: an emphasis on self, and collaboration with others. Beck, Freese, and Kosnik highlight this combination of features as follows:

> The self-study approach is *personal* because of its emphasis on the self, narrative inquiry, and participant research. It is *constructivist* because it includes elements of unending inquiry, challenging of prejudice and convention, respect for experience, and personal construction of knowledge. And it is *collaborative* in that it stresses collaboration, community, social construction of knowledge, inclusiveness, and equity. (Beck, Freese, & Kosnik, Chapter 33, emphasis in original)

Emphasis on Self

I assert that three aspects of self generate and characterise self-study research: *for the self*; *of the self*; *by the self*. Beck, Freese, and Kosnik allude to the latter two of these three aspects when they argue that "the term self-study has a strong personal reference: it points both to study *of* the self and study *by* the self" (Beck, Freese, & Kosnik, Chapter 33, emphasis in original).

For the self

Self-study practice seems to require prior identification of problems or concerns that exist *for the self* – that is, problems or concerns experienced by and focused upon by the person.

> An important common element of teacher educators' self-studies is that they begin from inside the practice context, from a real concern, issue or dilemma. The individual nature of pedagogical problems encountered in daily work inevitably leads to the pursuit of different questions about practice and different actions that result from their study. (Berry, Chapter 34)

> In self-study, teacher educators draw from the interplay of theory to practice and of practice to theory in order to confront the relationship between their own practices, connections to their prospective teachers' practices and the ways practice may affect students in schools (Clift, Chapter 35).

> My self-study has focused primarily on naming and understanding the values that underlie the administrative practices that I prefer and choose. (Manke, Chapter 36)

Of the self

A general distinguishing focus of self-study practice is *of the self* – self as teacher (particularly, one's beliefs regarding teaching) and self in teaching (one's teaching practices):

> With the concern to focus on personal practice and experience, teacher educators undertake high quality enquiries, which lead to a better understanding of the complexities of teaching and learning and to better practices. (Trumbull, Chapter 31)

> Self-study encourages me to articulate, examine and, on occasion, re-define the fundamental principles that guide my teaching. (Austin & Senese, Chapter 32)

> [In] self-study … teachers remain learners about themselves as they continue to learn about their students and their practices. (Austin & Senese, Chapter 32)

> An important element of practical knowledge that is inevitably connected

to the practice of self-study is self-knowledge. … Central to this process is developing increased awareness of how one's philosophy of teaching has been informed by the deeply embedded images, models, and conceptions from experiences as a learner … and the impact of these on teaching relationships with others. (Berry, Chapter 34)

I have identified relationships between my teaching practices and my administrative practices. These include the way I model as an administrator the same kinds of values that underlie my modeling of teaching practices in educating future teachers, as well as the understanding of power relations that defines my work as teacher and administrator. (Manke, Chapter 36)

By the self

Clearly, self-study is undertaken *by the self*; the practice is enacted by the teacher or teacher educator. Clift argues the significance of practitioner action within teacher education as follows:

The examination of self and one's own students within the context of a teacher education program is currently one of the most prominent modes of scholarly inquiry addressing questions of the impact of teacher education (Clift, Chapter 35).

Collaboration with Others

As do many of the other authors, Beck, Freese, and Kosnik argue for balancing the practices of self and of others in self-study as follows:

While the term *self*-study might suggest an individualistic approach, in fact the movement emphasizes collaboration to a considerable degree.

It accepts that the views of individuals must be constantly brought into dialogue with the views of others.

The label self-study is used because the absence of the self from academic and professional contexts is a particularly significant and pressing problem; but emphasis on the self is not meant to exclude collaboration, which is also viewed as crucial. Nevertheless, the collaboration in self-study honors the self because it involves personal and emotional expression and not merely intellectual exchange. Beyond collaboration, self-study emphasizes community building in teaching and learning contexts. (Beck, Freese, & Kosnik, Chapter 33, emphasis in original)

In her chapter, Manke refers to several collaborative aspects of self-study:

[Self-study] allows for linkage with the published and presented work of other practitioners, thus alleviating the concern that a field that focuses on *self*-study will be fragmented into as many parts as there are practitioners … Also important to self-study, somewhat surprisingly, is its focus on

collaboration. At first glance, it seems improbable that a field of study that focuses on the self would include collaboration as a vital element.

Collaborative practices may be selected by practitioners who have these concerns, but they also arise naturally in the contexts in which individuals work together in similar roles (as teacher educators and as administrators, for example) and in which individuals learn of others who are engaged in the self-study of similar practices or contexts … practitioners of self-study know that it is rigorous, demanding work, and that collaboration provides support and commitment when other demands call more loudly. (Manke, Chapter 36, emphasis in original)

Berry also acknowledges self-study's "emphasis on teacher educators' collaborative learning about their practice," in part to overcome fragmentation and isolation:

Examining the knowledge arising from self-study is important because if the efforts of individuals are confined solely to their own classrooms and contexts, the problems of teacher education will continue to be tackled individually and in isolation. In self-study, there is also a need to find ways to share what comes to be known in ways that are both accessible to others and that can serve as a useful foundation for the profession. This inevitably involves discussions of the nature of knowledge since self-study seeks to position teacher educators as knowledge producers, and therefore challenges traditional views of knowledge production as external, impersonal and empirically driven. (Berry, Chapter 34)

Berry develops this argument for collaboration by taking an inclusive perspective regarding the nature of "self" in self-study (and thereby acknowledges several of the interpretations of self as outlined in Table 38.1):

While the term 'self-study' seems to suggest an exclusive focus on the teacher educator, the 'self' in self-study encompasses a more diverse variety of selves than the teacher educator alone. Inquiry into the nature of teacher preparation to better understand the experience of teaching prospective teachers can begin from a study of self where 'self' is the teacher educator, or through investigating an aspect of student teachers' experience where 'self' is a student. Alternatively, collaborative conversations with the 'selves' who are colleagues may serve as the starting point for the study of teaching about teaching.

Although the beginning points may be different, the 'selves' are intertwined in such a way that the study of one 'self' inevitably leads to study of an 'other.' For instance, teacher educators who begin by investigating their students' understanding of an aspect of their teacher preparation may be led to apprehend something about the nature of their own actions as a teacher and about the unintended effects of those actions.

In other studies, teacher educators intentionally begin from their students' experiences in order to access understandings of their teaching practice that might otherwise be invisible to them. (Berry, Chapter 34)

Similarly, Clift extends the term self in self-study from a personal to allow a more collaborative construction:

The concept of self within self-study is also varied. Self as being is a topic of study, but so are self as teacher of students, self as learner from students, self as collaborator, and self as a co-construction within collaborative relationships. (Clift, Chapter 35)

This collaborative perspective brings with it the challenge of increased complexity of influence and interpretation. It also brings the challenge of effective communication:

For many teacher educators, the difficulties associated with researching personal practice lie not so much in recognizing the complexities inherent in their work (these they readily see) but in finding ways of representing that complexity to others. (Berry, Chapter 34)

If both of these foci of self and collaboration in self-study are acknowledged, the issue now becomes whether the practice of self-study simply reflects what perceptive, reflective teachers do anyway, or whether self-study requires the teacher to adopt changed perspectives and to learn new skills.

Self-Study: A Qualitative Change in, or a Quantitative Extension of, the Everyday Practices of Teachers?

In this and succeeding sections, I move in the focus of my attention on self-study from the nature of "self" to the nature of "study." In her chapter, Trumbull infers that self-study in teacher education builds upon the common processes of reflection and action undertaken by many teacher educators in order to effect improvement. She also argues that, in their practices, teacher educators "contribute to productive societal change," through assisting in generating change in the practices of others: "They hope to help teachers, both in-service and pre-service, practice differently to ensure that their own pupils will learn more and develop into better people." However, it remains somewhat unclear whether, through self-study, the practices of the teacher educators themselves need undergo extension in scope or a more fundamental change in type:

Teacher educators who do self-study also realize they must continually evaluate both their commitments to produce change and the practices that they use in teacher education. (Trumbull, Chapter 31)

Trumbull relates desirable, and frequently everyday, teacher education practice and self-study:

As we try ways to improve our practice, we look for evidence to evaluate effects of the changes we make.

With the concern to focus on personal practice and experience, teacher educators undertake high quality enquiries, which lead to a better understanding of the complexities of teaching and learning and to better practices. (Trumbull, Chapter 31)

Whether the nature of Trumbull's "high quality enquiries" involved in self-study extend or require change in normal practices, it seems that such enquiries entail additional responsibilities, particularly in attending to the complexities of personal practice, and to evaluating the effects of this practice.

In their joint chapter, Austin and Senese argue that self-study by teachers involves both extension and qualitative change in their classroom practices. These changes are, in part, due to a change in focus of professional attention:

Self-study urges teachers to find their own voices, to improve their practices, to extend their relationships, and to discover and document their potential as leaders of change … Self-study is about who teachers are as well as what they do.

In various ways, all teachers at some level already test out new methods and content by trying them with students. A new curriculum document is an experiment that may seem more acceptable because it was produced by a small group of people and is being "tested" on all students in the relevant jurisdiction. Self-study simply makes this practice more apparent because sharing results puts the issues in front of others.

Self-study also provides a community of critical friends with whom teachers can share their knowledge and new practices which translates into additional benefits for students.

No matter how we explain it, self-study is hard work. It does demand time outside the classroom. It does require new skills that are sometimes perplexing to teachers. We also recognize that self-study revolves around what matters most to us. Self-study inspires us. Self-study is not just what we do; self-study is about who we are. (Austin & Senese, Chapter 32)

In the following sections, I attempt to clarify the range of authors' perceptions of the type of study involved in self-study.

Self-Study and Reflection

As I highlight in this section and the next, there is often perceived overlap between self-study and various practices, including reflection, personal narrative, teacher research and action research. In Austin's words:

I began hearing terms like teacher research, action research, and reflection

used in various ways, so I realized I needed to do my own research on these terms ... Many terms seemed to be used interchangeably. (Austin & Senese, Chapter 32)

Beck, Freese, and Kosnik use self-study to subsume many related practices:

Other terms used to refer to the approach include inquiry, progressive, critical, experiential, inclusive, and social constructivist, each of which has distinct connotations and emphases. (Beck, Freese, & Kosnik, Chapter 33)

This diversity notwithstanding, many authors assign reflection a central role in self-study, as in this excerpt from Berry:

Self-study involves locating one's assumptions about practice through the process of reflection, in order to facilitate the development of phronesis. (Berry, Chapter 34)

Austin considers that reflection occurs through a process of question-asking:

In teacher research, self-study, and action research, reflection is an important element of the study and the role of self-questioning is stressed.

Self-study is based on asking questions – questions asked by myself, by students, by parents, and by colleagues. Self-study requires me to consider those questions and this in turn reshapes my practice. (Austin & Senese, Chapter 32)

In contrast, Senese, her co-author, attempts to distinguish self-study from reflection on the basis of complexity:

Self-study helps me understand myself better as a person and as a teacher, but what distinguishes self-study from reflection is that self-study takes into account, indeed depends upon, the complexities involved in learning and teaching ... The relationships among all the participants and the multiplicity of interdependencies are acknowledged and celebrated in self-study. (Austin & Senese, Chapter 32)

However, it is hard to reconcile this distinction with his argument that, through modelling, teachers should encourage their pupils to reflect:

By their very practice, teachers who conduct self-study encourage their students to be reflective, to gauge their metacognition, and to tap into something deeper than grades or scores. By its very nature, self-study values student contributions because it elevates the role of students. (Austin & Senese, Chapter 32)

Presumably, students are reflecting, while teachers are self-studying. The distinction based upon complexity is unconvincing, especially as Senese then proposes a series of reflective questions to "guide" the process of self-study:

> Its focus, for me, is on what I and my colleagues do, or should do as teacher educators. Its guiding questions include: "What do I actually do as a teacher of teachers and as an investigator of teacher education?", "Why do I do what I do?", "How good is my practice?", "How can I improve?", "How can I inform others about teacher education?", "How can I, my colleagues, and those whom we inform make teacher education better?" (Austin & Senese, Chapter 32)

To attempt to resolve this situation, it seems that the issue lies in the nature and purpose of the reflective questions, rather than the use of reflection, *per se*. Perhaps the last two questions in his list above are the most telling, as he highlights the breadth of purpose of reflection in self-study as leading "to self-improvement for individuals, groups, and institutions."

Using other terms, Beck, Freese, and Kosnik also emphasise the breadth of self-study and its attention to the social and educational milieu of teaching:

> Self-study is also "critical" in that it is applied to all aspects of the educational situation, including accepted goals and ways of doing things, authority structures, prejudices, and inequities.

> It focuses on problems, puzzles, inconsistencies, tensions, and conflicts.

> The self-study movement, in our view, has gone beyond the literal meanings of "self" and "study" to conceptualize an interconnected set of components including study of one's own practice, life history and personal narrative, critical inquiry, constructivist pedagogy, respect for experience, collaboration, community building, and inclusiveness … drawing especially on the insights and practices of such movements as action research, ethnography, social constructivism, feminism, poststructuralism, and postmodernism. (Beck, Freese, & Kosnik, Chapter 33)

For Manke, also, broad reflection is a necessary characteristic of self-study by educational administrators:

> Key themes in administrative self-studies include issues of power (its source, purpose and use), issues of community (its development and purpose), efforts to incorporate social justice in teacher education, and the impact of teacher education reform.

> Fundamental to self-study is the practice of *reflection on context and practice*. Self-study does not simply describe the context in which teacher education practices take place or the practices themselves. The self-study practitioner is one who seeks, through reflection, deeper understanding of context, practice, and their interaction.

> The self-study practitioner must *reflect* on practice, not simply describe it. The self-study practitioner must also reflect on *the context of practice*, a context of which the practitioner's self is a part, but not the whole.

Deer's study was presented under the aegis of the self-study of Teacher Education Practices Special Interest Group at AERA. However, she defines self-study as "working out how to proceed and then reflecting on how my chosen course of action works."

One reason for including it in this chapter is to highlight the contrast between a study like this and the more revealing self-study that actually looks at the self, at one's own beliefs, actions, relationships and the like, in trying to understand events and processes. Without this aspect of self-study, it is difficult to know much about the underlying aspects of actions described and processes used by the administrator. (Manke, Chapter 36, emphasis in original)

Thus it is clear that reflection is perceived as centrally involved in self-study, but it is equally clear that perceptions vary as to the focus, purpose, scope and practice of this reflection. I now turn to research as a key concept for framing reflection in self-study.

Self-Study, Teacher Research and Action Research

Self-study is commonly perceived as involving, in part at least, approaches and processes of educational research. The nature of this relationship is the subject of this section. As described earlier, teacher self-study places clear additional demands upon those of teaching. Mitchell, for example, considers that teacher research extends everyday teaching through changed practices:

Teachers in many systems are at least strongly encouraged and often required to regularly explore, if not develop, new classroom approaches and to share the results of these (including student work) with colleagues.

The issue of when good teaching becomes research is not easy to define … but I agree that teacher research does contain elements of 'something other than normal (teaching) practice'. Cochran-Smith and Lytle (1993) define teacher research as involving systematic, intentional inquiry. As Zeni says, this typically involves "more systematic documentation and data gathering, more self reflection in writing and more audience collaboration, presentation, publication." (Mitchell, Chapter 36)

Several authors emphasise connections among self-study, teacher research and action research. Senese, for example, states: "The methods of self-study and action research, in fact, bear striking similarities, as others have noted" (Austin & Senese, Chapter 32).

If similarities between teacher self-study and educational research exist, these similarities might be interpreted either by viewing self-study as a type of educational research, or as research, among other aspects, constituting a necessary component of self-study. If the former is perceived as the case, the practice of self-study should be evaluated in terms of standard criteria for defining research

and its essential processes (for example, systematic data collection, analysis, interpretation and dissemination). Alternatively, the latter interpretation allows for broader and less prescriptive consideration of self-study approaches and practices.

For instance, Beck, Freese, and Kosnik argue that the relationship between self-study and research may be that self-study is a broad area of professional enquiry in which research has a part:

> Because of the reference to "study" in its name, self-study could be understood just as a research orientation. However, we use the term to refer to a broad approach to teaching and learning that, while including research and reflection as a central dimension, does not necessarily involve formal data gathering. (Beck, Freese, & Kosnik, Chapter 33)

But they also emphasise theory generation as a crucial purpose of self-study, as it is for teacher research:

> Another aspect of the self-study approach is its valuing of experience … Theory is certainly very important to the self-study view, but its generation must be integrated with practice: neither should occur without the other. Also, practitioners, as much as academics, should be seen as generating theory. (Beck, Freese, & Kosnik, Chapter 33)

Austin relates self-study, teacher research and action research in a similar fashion:

> The S-STEP group not only incorporates elements of both teacher researcher and action research, but also moves beyond these two practices. Using a cyclic approach to inquiry, similar to action research, as well as assuming the role of teacher researchers examining their own practices, those involved in S-STEP look beyond the immediate surface of research. A critical element of self-study is the awareness of the underlying values that guide personal teaching practices. (Austin & Senese, Chapter 32)

Her co-author, Senese, distinguishes the practices using a more singular criterion – the explicit emphasis on self in self-study:

> For me, the difference between self-study and action research lies not so much in the methods or even in the purposes of the two approaches. I believe the difference lies in the focus of the two experiences.

> In my mind, action research is more about what a teacher does and not about who a teacher is. When I reframe my research as self-study, I enter through another door, the door of the self. Self-study is much more challenging for me because it requires that I put myself, my beliefs, my assumptions, and my ideologies about teaching (as well as my practice) under scrutiny.

> Action (or teacher) research is not necessarily undertaken so that teachers can understand themselves as persons.

On the other hand, in self-study, the focus of the research *becomes* the person of the teacher: who the teacher is, how the teacher acts, what the teacher says, how the teacher thinks and responds, and how the teacher decides. (Austin & Senese, Chapter 32, emphasis in original)

Later in the chapter, however, Senese is less clear in distinguishing self-study from teacher research:

Knowing themselves as individuals and uncovering their assumptions and beliefs are mandatory for today's teachers. Turning that self-knowledge into best practice for students is obligatory for today's teachers. Self-study, just like teacher research, requires that teachers depend on themselves in their particular situations to collect data about themselves and their practice in systematic ways. These data inform teachers' decisions as they design and execute the best structures for student learning. (Austin & Senese, Chapter 32)

The boundaries between teacher research and teacher self-study are further blurred when, for the purposes of his chapter on ethical issues in self-study, Mitchell collapses the two practices:

In keeping with the focus of this handbook, I try, as far as possible, to restrict myself to 'insider' research. This means that I restrict practitioner research to research done in a practitioner's own workplace that either solely or partly includes those (students in most cases) with whom the practitioner has a direct professional role and responsibility. By far the most common examples of this are classroom teachers researching their own classroom practice with their own students – henceforth referred to as teacher research or teacher self study. (Mitchell, Chapter 36)

In summary, it seems that the "study" in self-study connotes a "broad approach to teaching and learning that … [includes] research and reflection as a central dimension" (Beck, Freese, & Kosnik, Chapter 33), and the "self" in self-study highlights the key focus of this research and reflection.

A View of the Essential Nature of Self-Study in Teaching and Teacher Education

The perspective shown in Figure 38.1 diagrammatically relates three aspects of teaching and being a teacher (Baird, 1999b; Baird, 2003). These aspects involve personal and professional *thinking*, *feeling* and *acting*.

This perspective seeks to define quality in teaching as coherence among the three aspects shown. This coherence is achieved when a teacher is aware of and can defend personal educational beliefs and values, when he or she determines intentions and purposes for personal teaching consistent with these values and

Aspect 1: Personal and Educational Beliefs and Values

Aspect 2: Teaching Intentions and Purposes

Aspect 3: Teaching Approaches and Practices
Figure 38.1.   A perspective regarding quality in teaching.

beliefs, and then enacts classroom teaching approaches and practices that exemplify these beliefs, values, intentions and purposes. Forging coherence among these three aspects requires both reflection and action, with a key professional outcome being that the teacher exhibits metacognitive knowledge, awareness and control of both the nature and process of teaching and of self (as teacher and in teaching). Figure 38.1 provides a framework for interpreting the perceptions of the nature of self-study described in the preceding sections.

Earlier, I raised the issue of whether research such as PEEL and TLSS, which pre-dates "self-study" as a scholarly area of enquiry, could reasonably be included within the self-study area. Elsewhere, I have described both PEEL and TLSS as collaborative action research. My reason for this is that the *research is in the action*, that is, the teacher-researcher learns more *about* teaching (and learning) *by* teaching, in a way that is driven by a process of reflection centred upon the planning, acting and evaluating cycle of action research. The research is collaborative, as these reflections are shared with other teachers and/or other educators in regular group discussions. Collaborative action research involves both consideration of existing practices and search for practices to enhance quality of teaching and learning.

The perspectives outlined in the sections above help to clarify this issue. In terms of Figure 38.1, the nature, purpose and process of action research such as PEEL and TLSS are focused principally upon relationships between Aspects 2 and 3, with commonly less focus upon Aspect 1 and its relationships with the other two aspects. Thus this type of research differs from self-study in neither reflection nor collaboration (as both are crucial in each case), but in the balance of focus of enquiry.

As discussed earlier, self-study is a multiple and diverse cluster of related practices. This multiplicity and diversity is evident in the various possible interpretations of "self" in self-study (Table 38.1). The five interpretations summarised in Table 38.1 will drive differences in research focus, approach and method. For instance, for research consistent with interpretation 1 (where the focus of the study is the phenomenon of *my teaching*), the research will concentrate upon teacher actions, and is likely that this research will exhibit a strong teacher research or action research bias. In comparison, for interpretations 2 (where the phenomenon is *me as teacher*) or 3 (the phenomenon is *me doing self-study*), the

focus is more clearly centred upon personal thinking and feeling. For interpretations 4 (with the phenomenon being *teaching, teacher education*, or *educational research)* and 5 (where the phenomenon is *self-study*), the foci are perspectives, events and activities that extend beyond the researcher's lived experience. Because of this diversity, it is difficult to generalise about differences between self-study and other teacher-led research. In my comments below, therefore, I limit my discussion of self-study to interpretations 1, 2 and 3 only (self in teaching, self as teacher, self as researcher of my teaching or of me as a teacher), singly or in combination. Within these limits, I concur with Senese's emphasis that the core distinguishing feature of the practice of self-study lies not with method but with focus (self). Given this limited scope of interpretation, self-study can be distinguished from action research (and teacher research more generally) by virtue of a more express focus upon aspect 1 of Figure 38.1, and thus of the relationships (and extent of coherence) between aspect 1 and the other two aspects.

An alternative balance of focus among the aspects exists for the teacher-based phenomenological research that I mentioned earlier, and for much teacher research based on narrative. I do not pursue here the often-complex enquiry that underpins phenomenological research; such enquiry is best represented in Figure 38.1 as having aspect 1 as its primary focus. The nature of much phenomenological and narrative research is such that they are seldom characterised by systematic (or cyclical) reflection upon, and manipulation of, the interactions between aspect 1 and the other two aspects.

I represent these comparisons diagrammatically in Figure 38.2. I reiterate that this figure is indicative rather than prescriptive; I freely acknowledge that the multiplicity of perspectives, purposes and processes in each field of enquiry limits the extent to which this figure validly distinguishes within and among research in each field.

I now move from the nature of self-study to a consideration of why people engage in self-study, and some of its major methods.

Why Do Teachers and Teacher Educators Undertake Self-Study?

Here I explore the range of reasons given by the authors as to why they and their colleagues engage in self-study and then interpret these reasons according to my conceptualisation of positive, productive challenge.

Benefits for Teacher Educators

For Clift, the benefits of engaging in self-study are firmly grounded in improvements in personal practice:

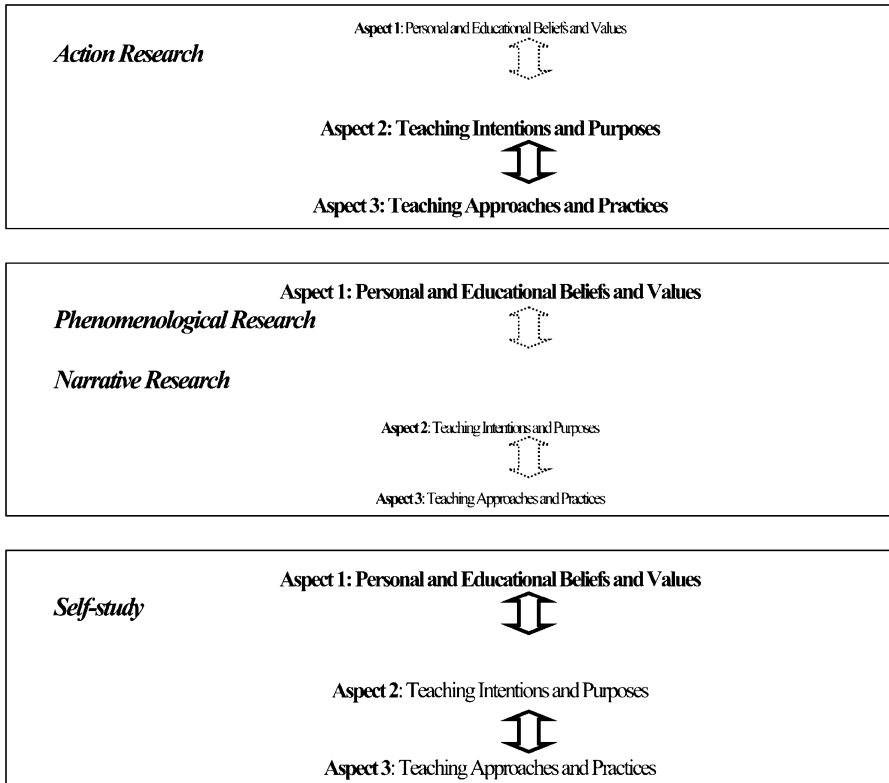
> The related and overlapping purposes of self-study research are to either understand better the effects of one's instruction or to improve a course or a program.


Figure 38.2.   Self-study, action research and teacher phenomenological research.

> The research is important to those who do it because they feel it is making them better teacher educators. (Clift, Chapter 35)

Earlier, I quoted Trumbull's argument that teacher educators engage in self-study because they, "have a deep desire to improve their work, to contribute to the improvement of their students' learning and development and, by doing so, to contribute to productive societal change" (Trumbull, Chapter 31). Thus Trumbull acknowledges wider educational and societal benefits that may result from self-study research.

Similarly, Berry believes that the benefits of self-study extend from a desire to improve personal practice to a commitment to contribute to educational improvement more generally:

> Self-study grew out of teacher educators' concerns for the learning of their student teachers and for the learning of the future students of these student teachers.

> Teacher educators engaging in self-study commonly share a broad motivation to improve the experience of teacher education through improving their own teaching practice. (Berry, Chapter 34)

Berry cites Hamilton and Pinnegar's "levels of concern" to represent this spread of purpose:

> An alternative way of categorising the purposes for self-studies is according to the 'levels of concern' that the study addresses (Hamilton & Pinnegar, 1998). 'Microlevels' are local; they begin from the immediate context of the classroom and involve questions such as, "How do I encourage participation of all students, rather than allowing a few to dominate?" Self-studies that begin from 'macrolevels' are initiated from more global concerns such as, "Can I help promote social justice in schools through my work with student teachers?" (Berry, Chapter 34)

In so doing, Berry reinforces the comments made in "Self-study and Reflection" above regarding the characteristic breadth of purpose of reflection in self-study practice. Berry also identifies particular reasons why teacher educators engage in self-study. Most of these reasons are clearly intrinsically motivated:

> Some teacher educators seek to better understand the various influences that guide their thoughts and actions, so that more developed understanding may lead to more informed practice.

> The desire to investigate practice can also be linked to a personal need to ensure that one's teaching practice is congruent with expectations of student teachers' developing practice.

> Some self-studies are focused more specifically on the influence of a particular approach or task on student teachers' thinking about or approach to practice.

> Teacher educators wanting to make explicit to their student teachers their approaches to learning about teaching may use self-study as a means for so doing. (Berry, Chapter 34)

These types of reasons generate clear intrinsic benefits:

> In fact, what is frequently learnt from self-studies of teacher educators' practice is the importance of acknowledging, living within, and even embracing the ambiguity in one's work. Instead of interpreting the tensions as situations that evoke despair and frustration, and trying to eliminate them from one's work, teacher educators begin to reframe them as elements that are necessary and pleasurable for the growth and learning that they bring. (Berry, Chapter 34)

Berry does, however, include one reason that is driven more by extrinsic motivation:

Some teacher educators seek to find ways of representing their practice to their institution for the purposes of promotion or tenure that are more meaningful than the data that standard teaching evaluations provide.

By choosing to evaluate practice through self-study, teacher educators may be in a better position to more faithfully represent their intentions for practice to others. (Berry, Chapter 34)

Benefits for Classroom Teachers

Austin and Senese believe that, by teachers undertaking self-study, "there is no better way to strengthen teaching practices, to recognize the influence of personal values and beliefs, and to enrich students' learning." Austin uses the term "empowerment" as a key benefit of self-study:

For me, self-study is the single most effective way I can create change, not only in my classroom, but also with other educators in my school district, state, and around the world. Self-study is the all-time "Empowerment Bar" for me.

If I wish to be a credible educator, I need to know why I teach the way I do, how my beliefs influence my actions, and how to best align my beliefs with my practice. Self-study is my vehicle to reach this end.

I have found that when I better understand myself, I can better understand my practice and be a better educator for my students. Through this process, I have gained confidence in explaining my teaching practices to students, parents, and other educators.

I have found that by regularly engaging in self-study, I have become truly empowered. (Austin & Senese, Chapter 32)

Senese agrees with Austin that empowerment is a crucial benefit of self-study for teachers:

In my experience, both teacher research and self-study empower teachers as no other professional development can.

Perhaps the greatest benefit of self-study for teacher-practitioners resides in the personal and professional growth that self-study generates. This does not simply mean that teachers who conduct self-study learn more about themselves as people or as teachers, although that is certainly part of it. It does mean that teachers become better at what they do as teachers because of a deeper understanding of self, both as teachers and also as persons. (Austin & Senese, Chapter 32)

For Senese, the personal benefits of self-study seem to have been powerful and all-encompassing, yet these benefits are subordinate to a greater advantage:

> From my personal experiences, I can state that it has forged my vision of school, shaped my professional growth, inspired my personal view, and activated my personal sense of truth and value … [however] The strongest reason for conducting self-study as a teacher is that self-study has applications that make schools better. If a teacher only conducted self-study to become more inward looking or contemplative, I would know that she or he did not understand the purpose of self-study. (Austin & Senese, Chapter 32)

In the conclusion to their chapter, Austin and Senese propose a range of reasons why teachers should engage in self-study. These reasons centre upon personal enhancement, but with the purpose of more general school-level or system-level improvement:

> The reasons for teachers conducting self-study range from the practical (self-study imparts an endorsement and authority for practice) to the personal (self-study informs teachers about who they are) to the professional (self-study invites teachers to join a community of learners). Self-study urges teachers to find their voices, to deepen and multiply their relationships, to improve their practices, and to discover their capacity as leaders of change. (Austin & Senese, Chapter 32)

Mitchell firmly grounds the benefits for teachers in improved, more satisfying practice:

> Teachers, in my experience, are not drawn to research to make an abstract, generalisable contribution to the knowledge base of education. On the contrary, they are driven by a desire to improve their teaching and their students' learning. In other words it is the teaching role that drives and is always pre-eminent over the research role.

> The primary reward for teacher researchers is that their classroom becomes a better, more satisfying place to work. (Mitchell, Chapter 36)

Benefits for Teacher Professional Preparation

Beck, Freese, and Kosnik describe the benefits of a curriculum for intending teachers that reflects self-study principles:

> In our own preservice programs, we have found that when student teachers experience a practicum designed in accordance with self-study principles, they tend to acquire a greater sense of ownership of their learning. They also obtain support and insights from each other, achieve a more collaborative relationship with their faculty supervisors and mentor teachers, and view the practicum as an opportunity for personal and professional growth rather than as application of pre-determined teaching strategies. As a result, teacher candidates generally experience a high level of satisfaction and

achieve considerable professional learning. (Beck, Freese, & Kosnik, Chapter 33)

Benefits for Educational Administrators and Teacher Leaders

Manke emphasises that self-study by educational administrators may generate deeper self-understanding that, in turn, can be used to address wider educational and societal issues:

> I recognize that self-study can lead to deep self-understanding when it involves reflection on context and practice, review of past reflections, and collaboration with fellow self-study researchers or critical friends.

> This self-understanding can raise and consider critical questions about the ways people in education work together (issues of power and community) and about the goals they set (social justice and teacher education reform, for example) that may be unique to self-study by administrators. (Manke, Chapter 36)

Thus, What Prompts Educators to Do Self-Study?

Bringing together the comments above, certain reasons for why educators engage in self-study are evident. With its focus on self, many of the reasons for doing self-study and many of its benefits centre on self. The reasons for doing self-study mentioned in the preceding quotations include aspects such as addressing personal interests and concerns and a desire to improve personal practice and, thereby, to make schools better.

The benefits of self-study are far-ranging, and they include improved thinking, feeling and acting. *For thinking*, a central benefit is enhanced metacognitive knowledge, evidenced by greater (self) understanding regarding teaching and being a teacher, and improved metacognitive awareness and control of the process of personal teaching. In Austin's words:

> When I look closely enough at my practice, actions, and beliefs to question myself then I am taking charge of my on-going education. When I creatively formulate a plan to gather data to see what is actually happening and then spend the time to openly consider all that is there, then I am enlarging my knowledge. When I include others in my questioning and looking, then I am broadening my perspective and views concerning my questioning. And finally, when I require myself to articulate and record my journey, offer it to others to consider, reconsider my views based on their feedback, then I am sharpening my personal understanding. All of this makes me a better educator. (Austin & Senese, Chapter 32)

For the affective domain, that of feeling, a variety of words are used: confidence, a sense of empowerment, personal and professional growth, a feeling of ownership, satisfaction, and pleasure.

In terms of acting, benefits are described in terms of more desirable and effective practice. Returning to Figure 38.1, self-study provides an opportunity to engage in focussed reflection and action that has the potential to illuminate aspect 1 and to forge coherence between aspect 1 and the two other aspects.

The reasons for doing self-study, with its attendant processes and outcomes, can also be interpreted in terms of my notion of personal, productive *challenge*. I have written about such challenge elsewhere (e.g., Baird, 1994, 1998; Baird & Penna, 1997) and I simply outline it here.

My notion of challenge comprises both a cognitive/metacognitive (thinking) *Demand* component, and an affective (feeling) *Interest/Motivation* component. Productive challenge is generated only when the learner perceives both Demand *and* Interest/Motivation to be at desirable levels. Often, however, one or both of these components is not perceived this way, and the resultant lack of challenge leads to boredom or frustration. Much of the research that led to this conceptualisation of challenge was based on personal challenge for pupils in their learning, but the notion is equally applicable to challenge for teachers in their teaching and in their research. From the accounts above, it seems that many teachers and teacher educators experience positive, productive, personal challenge when doing self-study. Intellectually, there is considerable cognitive and metacognitive demand in the reflection and action that underpin self-study. As importantly, however, self-study generates significant interest and motivation for the participating teachers. As mentioned, most commonly, the motivation to do self-study is intrinsic, as are the benefits that are realised. A sense of enhanced personal competence and control generates the feelings such as the enhanced enjoyment, satisfaction, and sense of empowerment considered above. It should be remembered, however, that practising and advocating self-study in the attempt to present more meaningful evidence of professionalism and scholarship for promotion or tenure procedures also constitutes significant personal challenge, even though in this case the motivation is more extrinsically centred. There is also an enhanced sense of personal challenge when the endeavour is shared with like-minded colleagues in a spirit of shared purpose, and this generates the importance attributed to collaboration.

In summary, therefore, I assert that people invest time and effort in self-study because the practice provides significant personal challenge, while also providing powerful personal benefits that are not achieved through everyday professional practice. Additional benefits, not expressly centred on the individual, can arise from the findings of self-study practice; these benefits extend to the school, educational system, and society more generally. Next, I consider some approaches (both individual and collaborative) used in self-study.

How is Self-Study Enacted?

In this section, I summarise some typical ways to undertake self-study by considering approaches for engaging in self-study and for reporting the outcomes of self-study. I do not attempt to collate *findings* of self-study research, however,

as this type of synthesis has been done well elsewhere in this section. For example, Berry presents diverse findings (expressed as "tensions"), all of which enhance teacher educator knowledge, mainly about desirable and worthwhile teacher educator practices and the correspondence between these practices and underlying beliefs. Clift reviews findings from research studies in teacher education grouped according to different foci ("orientation to practice," "method of teaching and learning," "prospective teachers' actions in field settings," "issues of diversity," "collaboration" and "entire programs"). Also, Manke reviews self-studies in administrative practices in teacher education and organises findings according to the major issues of power, community, social justice, and reform in teacher education and teacher professional development.

Approaches to Doing Self-Study

Trumbull argues for a particular approach to self-study practice: "The approach that I argue is most valuable for self-study of teacher education practices is the constructivist research approach as outlined by Guba and Lincoln (1994)" (Trumbull, Chapter 31). Austin and Senese provide detail of the approaches and methods that they have found productive. They argue for collaboration in practice and in thinking, and for diversity of method:

> My classroom is my laboratory and my students are my research partners. They live my practice. When I step back and offer them a partner role, my ability to see my actions widens and becomes sharper.
>
> Within my classroom, I write a weekly letter to all my parents in which I share not only the events of the week, but also (thanks to confidence from self-study) my thinking about educational issues and my teaching practices.
>
> Anecdotes, opinion surveys, observations, and case studies are all valuable sources of information. Researchers should recognize and acknowledge the authority and limitations of each of these data-collection methods. No one method will suffice. The types of information that teachers collect should be correlated to what they are trying to study. (Austin & Senese, Chapter 32)

Beck, Freese, and Kosnik argue that teacher educators and preservice teachers jointly contribute towards a self-study approach within the preservice teacher education program.

> Not only should the classroom and school settings exhibit a self-study approach, but also the activities in which the student teachers engage during the practicum should allow them to explore and pursue such an approach.
>
> Both university staff and mentor teachers must allow and encourage flexibility with regard to teaching content and method and must foster an experimental, reflective approach. (Beck, Freese, & Kosnik, Chapter 33)

The distinction between the methods that Beck, Freese, and Kosnik consider

and that of self-study itself is not always clear, further than each in its own way contributes to an overall self-study orientation for the program:

> Self-study advocates argue that ... those personally involved in a setting are more likely to understand it; hence participant observation is important for knowledge generation.

> From a self-study point of view it is crucial that student teachers be involved in dialogue about the philosophy of the program ... They should be "co-researchers" in the program.

> Having action research as a major component of a teacher education program can help student teachers adopt an inquiry approach to teaching. ... there is a large component of explicit reflection by faculty and student teachers during the practicum: A major role of the faculty is to promote reflection by the students.

> Both the university staff involved in the program and the mentor teachers have to develop forms of practicum assessment that make the student teachers feel secure in developing a self-study approach to teaching and learning. (Beck, Freese, & Kosnik, Chapter 33)

Berry mentions some approaches that she and others have used to promote self-study in teacher education:

> An important goal for many teacher educators is to help their student teachers become more aware of their processes of pedagogical decision-making, so that they might be more thoughtful about the pedagogical choices they make. One way of helping to work towards this goal is for teacher educators to model their own decision-making processes for their student teachers.

> Berry and Loughran wanted to find ways to help student teachers to see into their practice, and sometimes they did this by confronting their students with problems or possibilities as they were teaching.

> Teacher educators and student teachers using each other as pedagogical sounding boards, sharing personal experiences of teaching in such a way that each can encourage the other to identify and make sense of the knowledge gained through experience. (Berry, Chapter 34)

Clift presents some theoretical conceptualisations that she has found helpful for approaching self-study practice:

> I have found especially useful four prompts from Loughran and Northfield's (1998) framework for the development of self-study practice. The first and second are a focus on the context and nature of one's work as a teacher educator and a commitment to action as a result of one's study. The third and fourth are a commitment to checking data and interpretations with

others and a report of one's work that can be understood by the target audience. Finally, Rearick and Feldman's (1999) framework for action research, which shares many features with self-study research, indicates the importance of attending to theoretical orientations, purposes, and the nature of reflection that guides research intended for use in action settings. (Clift, Chapter 35)

Clift then highlights some considerations related to individual and group-based phenomenological research:

To conduct self-studies, researchers employ predominantly qualitative methods, typically drawing from a variety of data sources within a single study. For researchers working alone, triangulation across sources is often discussed as one means of establishing believability or some sense of validity; for research teams, triangulation is often only one strategy for establishing validity. The teams enable colleagues to collect data for an instructor, to conduct separate initial analyses of data, and to debate with one another over meaning. In some cases the debates seek to achieve consensus. In other cases the debates are published and enable the reader to access multiple viewpoints. It is very clear that self-study researchers are in the process of formulating research methodologies that preserve the valuable insider's view, but that also seek to diminish probabilities that the researchers are seeing what they want to see or that those who are being studied are producing data that are designed to please the researcher/instructor. (Clift, Chapter 35)

In her chapter, Clift reviews various recently-published self-study articles. In these reviews, she summarises many approaches and methods used by self-study researchers. I have not summarised these here, but the orientations outlined above are included. I refer the reader to Clift's chapter for a more detailed account of a range of particular self-study practices. A similar situation exists for Mitchell's chapter; it includes information about many different approaches and methods for undertaking self-study research.

Approaches to Reporting Self-Study

Trumbull argues that case study and narrative should be used to disseminate the richness of self-study findings:

Case study research demands that the research be presented to engage readers in the particulars of the setting and the actors … As teacher educators seeking to improve our own practices and to help others practice differently, we can, and must, write our research so that others can see themselves in that setting and can understand in emotional and practical ways what is going on.

When we communicate our work in case study and rich stories, we can

contribute to others' understandings of the processes of teacher education. It is crucial that we continue to explore how best to provide good case studies that attend to the features of our specific contexts and that help readers gain vicarious experience, experience that can support the development of our own phronesis. (Trumbull, Chapter 31)

Similarly, Beck, Freese, and Kosnik argue that personal narrative is an important means of reflecting upon and reporting self-study:

Personal narrative ... is a component of a self-study approach. Coming to understand one's own life history is essential in grasping what one believes and why and in making appropriate modifications to one's beliefs and practices ... Story is an important means of communicating the knowledge we generate. (Beck, Freese, & Kosnik, Chapter 33)

The Contribution of Self-Study in Teaching and Teacher Education to Educational Scholarship

In this concluding section, I consider authors' views on the place of self-study in the scholarship of education, and then summarise some aspects considered above to provide my view on the current and future contribution of self-study to the field.

Authors' Views on Self-Study and Scholarship in Education

Many of the authors argue strongly that self-study is a powerful practice that can and does generate new understandings and enhanced practices within teaching and teacher education:

Self-study is the most powerful instrument available to us in our efforts to transform teacher education. (Austin & Senese, Chapter 32)

We believe that the self-study approach, which is the focus of this handbook, has the potential to ... significantly enhance the value of the practicum to those learning to teach. (Beck, Freese, & Kosnik, Chapter 33)

The knowledge that directs teacher educators' practice through researching teacher preparation in concert with the needs and concerns of student teachers dramatically shapes that which is helpful and relevant to beginning teachers. The confluence of the knowledge and practice that can inform this relationship is important and is being better understood and articulated through self-study. (Berry, Chapter 34)

In his review of research in education between 1978 and 1999, Zeichner (1999, p. 8) identified the emergence of self-study as "probably the single most significant development ever in the field of teacher education research." (Berry, Chapter 34)

> Teacher educators have learnt a great deal that is worth sharing from the self-study of their practices. Their work makes significant contributions to our understanding of the pedagogy of teacher education. (Berry, Chapter 34)

> Whether individual researchers acknowledge it or not, research reflects the commitments, epistemologies, and values of the researcher(s) and is inextricably bound to histories, to other researchers and to teacher education program participants. In other words, self-study teacher education research can and does have implications for far more than the self who is conducting the study. (Clift, Chapter 35)

> From the studies cited above it is clear that self-study research has become an accepted form of teacher education research within the academy … The field of self-study research is beginning to provide a teacher education database, of sorts – a collection of qualitative, often complex, descriptions of teacher education goals and practices within a course or, increasingly, across a course and a related field experience. (Clift, Chapter 35)

This power of self-study is to provide a means of generating new understandings in a way that, for teachers and teacher educators, is considered more credible, feasible, and potentially fruitful than current practices:

> Self-study is creating a niche in today's educational world because the culture of schooling is undergoing a gradual but significant change. Teachers are no longer content to work in isolation. (Austin & Senese, Chapter 32)

> Teachers (and teacher educators) want, and need, more practically oriented knowledge than what has traditionally been made available through empirically driven research. (Berry, Chapter 34)

> For self-study practitioners, conventional social science methods have been unhelpful for the development of understanding of practice; hence the search for new forms of representation that can capture the complex and personal nature of the knowledge acquired. Self-study has built on this development of alternative approaches to framing knowledge as the need for more appropriate and helpful conceptualizations for researching, understanding and describing teacher educators' work have been sought (Berry, Chapter 34)

> The values and practices held by self-study researchers and the general teacher education communities, both of which have long championed the concept of data-based reflections on practice and who argue that qualitative investigations by "insider" practitioners give us access to knowledge that no other paradigm can or does (Clift, Chapter 35).

Trumbull provides a succinct evaluation of the emerging place of self-study within education, by drawing attention to the need to move from reporting individual studies to positioning theoretical self-study perspectives within the educational research literature:

Teacher educators can do quite personal and local work, greatly improved by collaboration with a critical friend, who can help them grapple with immediate issues. As we call in another, though, we begin to move the work from the immediately personal and to grapple with the demands of more public scholarship, scholarship that must meet accepted requirements for quality. As we think about more public work, sharing with wider audiences who are removed from our immediate contexts, we can turn to the paradigm dialogues in the educational research literature to provide a number of helpful insights to support how we do our research. In thinking about this scholarship, we grapple with some of the issues central in the educational research literature. (Trumbull, Chapter 31)

Clift develops this perspective by arguing that, in order to strengthen its influence within the field of educational scholarship, the focus and context of self-study practice must broaden to encompass more general educational and societal issues:

By focusing on individual instances of teacher education and by neglecting the broader context it appears, perhaps wrongly, that the researchers intend to speak only to themselves and like-minded colleagues … But if self-study research seeks to move beyond the particular and if the researchers seek to have influence beyond self, then we need studies that explore more issues that go beyond a course or a field setting. We need to ask questions that can only be answered across time and across contexts … In summary, the field of self-study research has developed an international cadre of proponents who are engaged in serious and important investigations of teacher education, but who have not yet begun to address their connectedness to the county, the state, the nation, or the world. (Clift, Chapter 35)

As with much of self-study, however, these views are not necessarily held by all. Mitchell, in discussing self-study performed by schoolteachers, asserts:

Hammack (1997) further argues that 'teachers' primary obligations are to their students, while researchers have obligations to the field to which they seek to make a contribution' (p. 250). I agree with both parts of this statement if by 'researcher' one means an outside researcher. Teacher researchers do not position themselves as members of the academy and do not feel such obligations. (Mitchell, Chapter 37)

In summary, the potential of self-study to contribute to scholarship in education is considered promising by virtue of what self-study has to offer practitioner-researchers. Further, many of the chapter authors consider that self-study has already started to position itself within educational research and that this position will strengthen as the focus of self-study findings transcends the specifics of context.

My Views on the Progress of Self-Study within Educational Scholarship

There is no doubt that within educational research there is an emerging field of "self-study," and that this field is gathering momentum in many countries. With increasing self-study research activity and the associated production of conference papers, articles and book chapters, it is timely to consider how the field might progress in regard to the nature and extent of its contribution to scholarship within education and educational research. I now attempt to do this in a way that reflects my self as author, where my interpretation of self (Table 38.1) is interpretation 5: Self as researcher of self-study (not expressly of my own self-study). In doing this, I return progressively to the perspectives used to frame my discussion through the chapter.

There is no one correct way to teach school pupils or intending teachers. There is no one definition of good teaching. The nature of teaching is pluralist and relativist, influenced fundamentally by such specifics as time, purpose, context, and content. One teacher will teach quite differently from another teacher; one teacher will teach quite differently when pursuing different teaching purposes; one teacher will teach quite differently with students of different ages, backgrounds, ethnicities, contexts and aspirations. Notwithstanding this pluralism and relativism, if the teacher is aware of each of the aspects as they relate to his or her personal teaching and strives knowingly for coherence among them, this teacher will be engaged in crucial personal and professional development. This is fundamental self-study. What is constant with self-study research is its greatest contribution to scholarship – this focus on self. Personal experience of attempting to generate insights to inform practice and theory within the complex, ill-defined milieu of factors, variables, and influences that characterise the art and craft of teaching provides a sound basis for authoritative contribution to scholarship.

It is possible that this personal experience – this struggle – will start with primary attention to aspect 3 in Figure 38.1 – teaching approaches and practices – and thus the research undertaken by the teacher could be classified as teacher research or action research (see Figure 38.2). Many research studies, including PEEL, demonstrate persuasively that motivation, momentum, collaboration and dissemination of information occur productively when educators focus upon personal teaching approaches and practices. Much can be and has been learned about the nature and practice of effective teaching, largely measured by the effects of such teaching on students' willingness and ability to learn, through research directed to inducing insights from particulars of personal practices. Teachers in the PEEL project have used this aspect as a significant focus for generating enhanced personal metacognitive awareness and control over practice, and they have demonstrated the power of the intrinsic motivation that derives from such metacognitive advances. So it may be that, for many teachers and teacher educators, focussed attention to this aspect is an important stage in the development of their self-study.

A problem will arise if attention to aspect 3 of Figure 38.1, and even to aspects

2 and 3 taken together, continues to be the pre-eminent focus for research and writing. My argument is that, consistent with the perspective illustrated in Figures 38.1 and 38.2, self-study research and writing should be characterised by a balanced, coherent attention to all three aspects. Thus it may well be that, for many teachers and teacher educators, the journey towards effective and productive self-study that will make a substantial and worthwhile contribution to scholarship may involve initial attention to aspect 3, with emerging understandings of aspects 2 and 1, and then achievement of theoretical and practical coherence encompassing all three aspects. The reflection and action that preference aspect 1 and that expressly link aspect 1 to the other aspects of professional practice will inform and improve personal teaching. With this improvement, significant cognitive/metacognitive, affective and volitional benefits of self-study for the individual teacher-researcher will be realised. It may be, however, that some teachers prefer not to complete this journey, and they may limit their research to aspects of interaction between aspects 2 and 3. If this is the case, the limitation in scope may not limit the extent to which teachers perceive personal, productive challenge in what is done, but it may limit their potential contribution to educational scholarship.

Figures 38.1 and 38.2 inadequately represent the nature, scope, and potential power of self-study for educational improvement. In order to transcend the individualism connoted by these two figures, self-study researchers need to move progressively, with their increasing experience and widening interest, among the different interpretations of self that are outlined in Table 38.1. Many of the authors in this section have moved in this way. Starting perhaps by perceiving self in their research as interpretation 1 (self in teaching) or interpretation 2 (self as teacher), they may move progressively to the other three interpretations and thereby contribute more widely to scholarship in education. In so doing, the nature and extent of their collaboration with colleagues and scholars in the field will change, consistent with their change in focus and the nature of the issues that are the subject of the research.

Guidance and support are crucial for this personal journey of personal and professional change and development, whatever its extent or direction. Many of the chapter authors have emphasised the crucial importance of on-going collaboration among the community of co-researchers and scholars. This collaboration will be continue to be needed in order to guide and sustain both personal development and development of scholarly understandings. Further, self-study researchers require opportunities to consider overarching theoretical and practical perspectives against which to critique and evaluate personal efforts. This handbook provides such an opportunity.

EDITOR BIOGRAPHIES

J. John Loughran is Professor of Curriculum and Professional Practice (Foundation Chair) in the Faculty of Education, Monash University, Australia. He has been actively involved in teacher education for the past decade through his teaching in Science and Teaching and Learning in Pre-service Teacher Education. His research interests include science teacher education, teacher-as-researcher and reflective practice. He is currently chief investigator in an Australian Research Council Discovery Project exploring science teachers' pedagogical content knowledge. He is the Past-President of the Self-study of Teacher Education Practices SIG of AERA and his books include: Developing Reflective Practice; Opening the Classroom Door (with Jeff Northfield); Teaching about Teaching; Improving Teacher Education Practices Through Self-study (co-edited with Tom Russell); Researching Teaching; and, Learning from Teacher Research.

Mary Lynn Hamilton is Associate Professor in the Teaching and Leadership Department at the University of Kansas. Her current research combines her interests in the development of teachers' professional knowledge, issues of social justice, and the self-study of teacher education practices. Some of her recent publications appear in *Teacher Education Quarterly* and the *Journal of Teacher Education*. She also edited the text *Reconceptualizing teaching practice: Self-study in Teacher Education* (Falmer). Currently she serves as the Secretary for Division K and has been the Chair of the Self-Study of Teacher Education Practices SIG within the American Educational Research Association.

Vicki Kubler LaBoskey is a Professor of Education at Mills College in Oakland, California where she directs the elementary portion of the Teachers for Tomorrow's Schools Credential Program and was a recent Trefethen Professor for her contributions to teaching and scholarship. She is the current Chair of the American Education Research Association's Special Interest Group, Self-Study of Teacher Education Practices. She is President Elect of the California Council on the Education of Teachers. She is actively involved in many groups and projects intent on supporting both preservice and inservice teachers in the transformation of their practice and their institutions according to the goals of equity and social justice. Her research interests and publications are primarily in the areas of self-study, critically reflective teaching, and narrative knowing and practice, including the books, *Narrative Inquiry in Practice*, co-edited with Nona Lyons, and *Development of Reflective Practice*, both published by Teachers College Press.

Tom Russell is a professor in the Faculty of Education at Queen's University, Canada. Learning from firsthand experience began for Tom when he taught science as a Peace Corps Volunteer in Nigeria for two years, as an untrained teacher. After Ph.D. studies at the University of Toronto, he helped to develop inservice programs for teachers in Ottawa. Since 1977 he has taught preservice and experienced teachers in degree programs at Queen's University, Kingston, Ontario. Sabbatical leaves in California, England, Australia and New Zealand have provided valuable opportunities to extend his interest in reflective practice, teacher education reform, and the complex processes by which individuals learn to teach. He is co-editor of five books published by RoutledgeFalmer. Self-study of teacher education practices continues to enrich his teaching and research.
AUTHOR BIOGRAPHIES

Jerome S. Allender retired from Temple University but still works with teachers to discover more about the teaching and learning process. *Teacher self: The practice of humanistic education* (2001), his most recent book, is a series of stories written together with students studying the Art and Science of Teaching. This work continues both with colleagues in the American Educational Research Association's Special Interest Group: The Self-Study of Teacher Education Practices and first graders in an elementary classroom as a once-a-week teacher. Living in Philadelphia with his wife, Donna, his time is divided among writing, jazz trumpet, family, and travel.

Terri Austin used her research on constructing learning communities to form the foundation of Chinook Charter school, the first charter school in Alaska. At the present time, she teaches a multi-age group of middle school students. She also teaches literacy classes at the University of Alaska, Fairbanks. As a teacher-researcher, Terri continues to examine her actions and beliefs in order to improve her teaching practice.

John Baird is an Associate Professor and Associate Dean (Research and Graduate Studies) in the Faculty of Education, University of Melbourne. He has taught at university level for over 30 years, initially in science education and then in the fields of teaching, learning, teacher professional development, and school improvement. His current research focuses upon characterising quality and effectiveness in classroom learning and teaching. In learning: promoting effective, purposeful learning by blending thinking (through metacognition), feeling (through motivation and challenge) and acting (through volitional control). In teaching: operationalising good teaching by cohering teacher knowledge, values, and beliefs, teacher intentions and purposes, and teacher approaches and practices.

Lis Bass teaches in and chairs the Reading/Writing department at Camden County College in New Jersey (US). She continually struggles to help the faculty (85 full and part-time teachers) and herself work more effectively with our non-traditional students (working class and poor, African-American, Latino, immigrant, and with special needs). Dr. Bass also works with graduate students from

Rutgers University's and Rowan University's graduate writing program and leads the diversity professional development at the Camden County College teaching/learning center.

Clive Beck is a Professor in the Centre for Teacher Development and the Department of Curriculum, Teaching and Learning at OISE/University of Toronto. He teaches graduate courses on teacher research, teacher development, and school renewal. In the Mid-Town elementary preservice program he teaches social foundations and supervises practice teaching and action research. His books include Educational Philosophy and Theory and Better Schools. His main areas of research are preservice teacher education, induction of new teachers, and social constructivism in teaching and teacher education. He is past-president of the Philosophy of Education Society.

Jennifer Garvey Berger is an Assistant Professor of Initiatives in Educational Transformation, a professional development masters program at George Mason University. Her research focuses on understanding the ways adults grow and change over time and on giving voice to that journey. She is committed to offering teachers professional development opportunities that not only increase their knowledge, but also transform their ability to implement that knowledge in their classrooms and with their colleagues. Jennifer has taught middle and high school English as well as college, graduate school, and professional development courses at Harvard University, Georgetown University, and the Bard Institute of Writing and Thinking. The co-editor of two books, Executive Coaching: Practices and Perspectives (2002, Davies-Black), and Acts of Inquiry in Qualitative Research (2000, Harvard Educational Publishing Group), she has a Doctorate in Learning and Teaching from Harvard University.

Amanda Berry is a Senior Lecturer in Education at Monash University, Australia, where she works mainly in the areas of preservice and inservice science teacher education. Amanda's research focus is the self-study of teaching practice, an interest that began during her career as a high school science teacher, before joining Monash University. She has a keen interest in the collaborative learning about teaching that can take place between teacher education colleagues and in the power of modelling in teaching about teaching.

Françoise Bodone works as a research associate at the Center for Educational Policy Research at the University of Oregon. She is an independent scholar whose current interests include critical pedagogy in action (for example, its applications to current standards-based reform), culture in education, teachers' and students' voices in educational change, and critical qualitative research.

Enora Brown is an Associate Professor in the Social and Cultural Foundations Program in the School of Education at DePaul University. She has investigated the cultural and contextual meanings that African American children

co-construct in their conversations, and has examined the self-constructs that European-American pre-service teachers created in their written self-narratives and their implications for their work as educators, as a way to understand the subjective and material/social relationships that frame processes of identity-construction. Her current work examines the disciplines of developmental psychology and mental health as cultural constructions. She addresses the philosophical and theoretical underpinnings that frame traditional psychological inquiry, and their implications for educational policies and practice, and constructions of racial and social class identities in school contexts.

Robert V. Bullough, Jr. is Associate Director of CITES, the Center for the Improvement of Teacher Education and Schooling, and Professor of Teacher Education, Brigham Young University, Provo, Utah. He is also Emeritus Professor of Educational Studies, University of Utah. His most recent book is *Uncertain Lives: Children of Teachers of Hope* (New York: Teachers College Press).

D. Jean Clandinin is a Professor and Director of the Centre for Research for Teacher Education and Development at the University of Alberta. Together with Michael Connelly, she has co-authored numerous books, book chapters, and refereed journal articles. She has also worked in several alternative programs in preservice teacher education. She won the American Education Research Association Early Career Award, was the recipient of the Canadian Education Association/Whitworth Award for Educational Research, was awarded the University of Alberta Kaplan Award for outstanding research and the American Educational Research Association (Division B: Curriculum Studies) Lifetime Achievement Award. She served as Vice President of the American Educational Research Association (Curriculum Studies).

Anthony Clarke is an Associate Professor at the University of British Columbia with research interests in Teacher Education, Teacher Research, Student Teacher Learning, and the Practicum. He is curious about the nature and substance of Teacher Research and currently involved in a number of experimental projects related to the teaching/learning dynamic associated with school/university partnerships. His most recent book (co-edited with Gaalen Erickson), *Teacher Inquiry: Living the research in everyday practice* (RoutledgeFalmer), offers insights into the world of the teacher researcher.

Renee Tipton Clift is a Professor of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. She received a Ph.D. in Curriculum and Teacher Education from Stanford University in 1984. She currently teaches prospective English teachers and works with doctoral candidates who are interested in conducting research on teaching and teacher education. She also serves as the co-director of the Novice Teacher support Project. Her research interests revolve around three related areas within the field of teacher education: 1) the

cognitive, contextual, and emotional processes that influence the transition from student to teacher; 2) the roles of technology in teaching and teacher education; and, 3) the factors that promote retention in, and satisfaction with, the teaching profession. Professor Clift has twice won the Richard A. Meade award (National Council of Teachers of English, Conference on English Education) for outstanding research on English education. Her current research projects include a study of electronic mentoring via web-based conferencing and a longitudinal study of teacher education graduates who did and did not choose to enter teaching.

Marilyn Cochran-Smith is Professor of Education and the Director of Doctoral Studies in Curriculum and Instruction at the Lynch School of Education at Boston College, where she teaches courses and directs numerous doctoral dissertations. Cochran-Smith is President of the American Educational Research Association (AERA) for 2004–05. She served as AERA Vice President of for Division K (Teaching and Teacher Education), 1998–2000, and Chair of Publications, 2001–2003. She is the editor of *The Journal of Teacher Education*, co-editor of the Teachers College Press series on practitioner inquiry, and a member of the editorial boards for several major education journals. Dr. Cochran-Smith is co-chair of AERA's National Consensus Panel on Teacher Education, a member of the National Academy of Education's Committee on Teacher Education, and a member of the advisory board for the Carnegie Foundation's program to document the scholarship of teaching and learning by K-12 teachers and teacher educators. Several of her recent publications focus on outcomes and research evidence in teacher education as well as on competing agendas for teacher education reform.

Ardra Cole is Professor in the Department of Adult Education and Counselling Psychology at the Ontario Institute for Studies in Education of the University of Toronto, Ontario, Canada and Co-director of the Centre for Arts-informed Research. She was one of the founding members and former chair of the Self-study of Teacher Education Practices Special Interest Group of the American Educational Research Association. She has published widely in the areas of self-study, teacher education, and alternative approaches to researching. *Researching Teaching: Exploring Teacher Development through Reflexive Inquiry* (with J. Gary Knowles) is an articulation of self-study processes.

F. Michael Connelly was the Director of the Centre for Teacher Development at the Ontario Institute for Studies in Education of the University of Toronto (OISE/UT), he is currently Professor Emeritus in the Department of Curriculum, Teaching and Learning (OISE/UT), and since 1998, Director of the joint Hong Kong Institute of Education-OISE/UT doctoral cohort program in teacher development for Hong Kong Institute of Education faculty members. With D, Jean Clandinin he has co-authored numerous books, book chapters, and refereed journal articles. Dr. Connelly was the recipient of the 1987 Outstanding Canadian Curriculum Scholar Award of the Canadian Society for the Study of Education, the 1991 Canadian Education Association/Whitworth Award for Educational

Research, the 1995 Ontario Confederation of University and Faculty Associations (OCUFA) Teaching Award, and the 1999 American Educational Research Association (Division B: Curriculum Studies) Lifetime Achievement Award.

Mary C. Dalmau is an educator with many years of experience in teaching, administration, professional development, school improvement, and educational change. After ten years at the University of Oregon in the western United States, she returned to Australia in 2002 where she now works in teacher education at the Victoria University of Technology and as an educational consultant. Her current interests include the social ecology of action, research and discrimination in education, self-study of teacher education practice, international education, collaborative knowledge creation, and forms of educational research that question stereotypic perceptions and judgments.

Rosebud Elijah is a teacher educator at Hofstra University, New York. Her primary interest is human development in its diversity, especially as it relates to preparing teachers to challenge, support, and extend the growth and development of students. She has a special interest in the development of "voice," as she believes it may be one way of evidencing growth and development.

Gaalen Erickson is a Professor and the Director of the Centre for the Study of Teacher Education at the University of British Columbia. His interests embrace the areas of student and teacher learning specifically in the fields of science education and more generally in teacher education. His most recent book (co-edited with Anthony Clarke), *Teacher Inquiry: Living the research in everyday practice* (RoutledgeFalmer), offers insights into the world of the teacher researcher.

Allan Feldman is Professor of Science Education and Teacher Education at the University of Massachusetts Amherst. He taught middle and high school science and mathematics for seventeen years in public and private schools in New York, New Jersey and Pennsylvania before joining the faculty of the University of Massachusetts. His research centers on gaining a better understanding of what it means to be a teacher and to teach. He has published widely on inservice teacher education and professional development using action research. He coordinates the Secondary Science Teacher Education Program at UMass and teaches the methods course for middle and high school science teachers. Feldman has served as PI of several NSF grants focusing on studying the professional development of K-16 teachers. He has done extensive work in evaluation of educational programs, including two NSF-funded physics curriculum development projects. In 1998 he received the Provost's Award for Distinguished Academic Outreach.

Linda May Fitzgerald is Associate Professor of curriculum and instruction at the University of Northern Iowa and research fellow in the Regents' Center for

Early Developmental Education. She tries to prepare preservice teachers to accept into their early childhood classroom communities a wide variety of children. In addition to self-study of teacher education practice, her current research and writing focuses on the inclusion of individuals with disabilities into everyday settings.

Anne R. Freese is a member of the Department of Curriculum Studies at the University of Hawaii, where she teaches and supervises elementary and secondary inservice and preservice teachers in the Master of Education in Teaching Program. She received the President's Award for Excellence in Teaching at the University of Hawaii in 2000. Prior to teaching at the university, she was the Principal Investigator on a number of projects funded by the U.S. Department of Education and the U.S. Department of Interior to conduct research and evaluation studies on educational programs in the Pacific Islands. For eight years she served as the Director of Education and Training at the Pacific International Center for High Technology Research in Honolulu. Her research interests include teacher education, reflective practice, teacher as researcher, and professional development schools.

Helen Freidus has been a member of the graduate faculty at Bank Street College of Education in New York City since 1991. She currently co-directs the Bank Street Graduate Program in Reading and Literacy. Her research interests are in the areas of reflective portfolios, narrative pedagogy, teacher education, and the career paths of second career teachers. Most recent publications include *Guiding School Change: The Role and Work of Change Agents* (Co-edited with Frances Rust, TC Press, 2001); "Narrative Research in Teacher Education: New Questions, New Practices in Narrative Inquiry in Practice", in *Narrative Inquiry in Practice*, Nona Lyons and Vicki LaBoskey (Eds.) (TC Press, 2001), and "Teachers and Teacher Educators Talking Together" in *Revisiting a Progressive Pedagogy: The Developmental Interaction Approach*, Nancy Nager & Edna Shapiro (Eds.) (SUNY Press, 1999).

Morwenna Griffiths is Professor of Educational Research at Nottingham Trent University. She has previously taught in primary schools in Bristol, and at the University of Isfahan, Iran, at Christ Church College HE in Canterbury, and at Oxford Brookes and Nottingham Universities. One of her central research interests is social justice both in and from educational practices. Her books include *Educational Research for Social Justice: Getting Off the Fence* (Open University, 1998); *Feminisms and the Self: The Web of Identity* (Routledge, 1995); and (with Carol Davies) *In Fairness to Children* (David Fulton, 1995). Her latest book, *Action for Social Justice in Education: Fairly Different* is published by Open University.

Karen Guilfoyle is an Associate Professor in Teacher Education at the University of Idaho. She has been involved in Self-study since beginning her role as a

teacher educator in 1989. Her interests are: critical literacy; qualitative/participatory research; teacher development; and, issues within the Native American community. Karen's research interests include: teacher education; women in academe; Native American education and juvenile justice; connecting theory/practice; and, inquiry-based learning/teaching. Both her teaching and research focuses on issues of equity, diversity, and social justice attempting to "make the world a better place for all people."

Hafdís Guðjónsdóttir is Assistant Professor of Education at the Iceland University of Education (IUE). She worked for twenty-five years as a general classroom teacher and special educator in elementary schools and high schools. Teaching is her primary profession and she emphasizes partnership with teachers through teacher education, school projects, consultancy and research. Her focus is on inclusive practice or school for all, curriculum development, authentic assessments, and mathematics for all students. Her research priorities include teachers, action and self-study. Current research and writing projects include the self-study of framing professional discourse with teachers, effective planning and teaching for all students, and inclusive practices.

Vince Ham is the Director (Research) of Ultralab South. Ultralab is an independent, public good educational research institute based in the UK and New Zealand specialising in research on the application of new technologies in educational contexts. Vince's particular research interests include the identification of quality indicators for the use of ICTs in education, teacher professional development models, and educational research methods.

Mark A. Hicks is Assistant Professor of Initiatives in Educational Transformation Program at George Mason University in Arlington, Virginia. As a philosopher-activist, his scholarship and teaching seeks to surface the assumptions of educational practice in order to transform experiences of teaching and learning. He has a strong interest in matters of identity, cultural studies, philosophy and democratic learning. He is currently writing a book, *Becoming Who I Am Not Yet: Educating for Identity Freedom in Oppressive Contexts*, which addresses how the process of schooling impacts the development of individual identity. He holds a doctorate in philosophy and education from Teachers College, Columbia University where he was the Andrew Mellon Research Fellow.

Garry Hoban is a Senior Lecturer in the Faculty of Education at the University of Wollongong, New South Wales, Australia. He teaches science methods in the elementary program and his research interests focus on long-term professional learning for teachers and reflective practice for preservice students. He has a particular interest in using information and communication technologies so that his preservice students can share views about their learning and for his own self-study. His recent book, *Teacher Learning for Educational Change* is published by Open University Press.

Diane Holt-Reynolds at the time her article (reprinted in this Handbook with permission from the publisher) was an assistant professor at the National Center for Research on Teaching and Learning at Michigan State University. She specialized in preservice teacher learning and literacy at secondary levels. Diane was a founding member of the S-STEP SIG. Her work and her thoughtful, caring approach to students and colleagues will always be remembered. The paper reprinted in this Handbook is included as an illustration of the type of work that was a precursor to the development of Self-study of Teacher Education Practices.

Marilyn Johnston is a Professor in the School of Teaching and Learning at The Ohio State University with interests in teacher education, social studies education, and issues of equity and diversity in all aspects of education and schooling. She was a classroom teacher for 13 years and has published/edited three books: *Contradictions in Collaboration*; *Collaborative Reform and Other Improbable Dreams*; and, *Teaching Together: School/University Collaboration in the Social Studies.*

Ruth G. Kane is Professor of Secondary Education at Massey University in New Zealand. Originally trained as a secondary teacher, Ruth has taught in secondary schools in New Zealand and in Queensland, Australia. Her current research interests include self study of teacher education practice, teacher beliefs, narratives of beginning teachers, and critical examination of the place of social justice in preservice teacher education.

Geert Kelchtermans works at the Center for Educational Policy and Innovation of the University of Leuven (Belgium). His doctoral studies were concerned with teachers' professional development from a narrative-biographical perspective. He teaches different courses in teacher education (practical training), educational policy and school development. His research focuses on teacher lives and development, micropolitics in schools and interpretative methodology (biographical research). He has published in several international journals (in Dutch, French, German and English) and is an Associate Editor for Teaching and Teacher Education.

J. Gary Knowles is Professor in the Department of Adult Education and Counselling Psychology at the Ontario Institute for Studies in Education of the University of Toronto, Ontario, Canada and Co-director of the Centre for Arts-informed Research. He was one of the founding members of the Self-study of Teacher Education Practices Special Interest Group of the American Educational Research Association. He has published widely in the areas of self-study, teacher education, arts-informed approaches to researching, and home education. He recently completed a manuscript on the life of a professor. Recent publications include *Lives in Context: The Art of Life History Research* (with Ardra Cole, published by AltaMira Press).

Fred Korthagen is a Professor of education at the IVLOS Institute of Education at Utrecht University (chair: the pedagogy of teacher education), where he coordinates a research program focused on teachers and their professional development. Part of his teaching includes offering professional development courses for teacher educators. He has published on the promotion of reflection, the relationship between theory and practice, and the relationship between teachers' learning and behaviour. Dr. Korthagen is former president of the Teaching and Teacher Education Division of the Dutch Educational Research Association and his most recent book is *Linking practice and theory, the pedagogy of realistic teacher education.*

Clare Kosnik is an Associate Professor in the Department of Curriculum, Teaching and Learning at the Ontario Institute for Studies in Education, University of Toronto. She is Director of the Elementary Preservice Program and teaches and supervises in the Mid-Town preservice program. Her books include: *Primary Education: Goals, Processes and Practices.* She is Chair-Elect of the Self-Study of Teacher Education Practices Special Interest Group of the American Education Research Association. She was Co-Chair of the Program Committee for the Fourth International Conference on the Self-Study of Teacher Education Practices and she continues to use her research on her program to inform practice and policy.

Frederick French Lighthall roamed and skied the woods, and swam the salt waters of Darien, Connecticut, learned to study at Mount Hermon School in Massachusetts, read history and humanities at Oberlin College, Ohio, and, realizing he wanted to improve how teachers taught, returned to Connecticut for doctoral studies in Educational Psychology at Yale University. After co-authoring with Sarason and others *Test Anxiety in Elementary School Children* (Wiley, 1960), Fred took courses necessary for teacher certification and employment as a fifth grade teacher in Fairfield, Connecticut from which he and his wife, son, and daughter moved to Chicago where Fred joined the faculty of Educational Psychology at The University of Chicago, with colleagues Jackson, Schwab, Dunkel, Thelen, Bloom, and Glidewell. After teaching traditionally for a number of years, Fred concentrated on teaching student teachers while they were doing their apprentice teaching. Telling their day's experiences in teaching led Fred to fashion a curriculum and a pedagogy designed specifically to promote his and his students' systematic reflection on their respective teaching practices.

Mieke Lunenberg is an Associate Professor at the Centre for Educational Training, Assessment and Research of the Vrije Universiteit in Amsterdam, The Netherlands, where she co-ordinates a research program on the professional development of teacher educators. Recent work has appeared in *European Journal of Teaching Education* and *Teaching and Teacher Education.* Dr. Lunenberg is active in the Dutch Educational Research Association.

Nona Lyons is a Visiting Research Scholar at the National University of Ireland, Cork, Ireland. There she is engaged in a university-wide initiative working with faculty who are documenting their teaching through a reflective portfolio process. Results of these efforts by faculty from a variety of disciplines–medicine, public health, arts and sciences, civil and environmental engineering, accounting, economics, etc.–are reported in *Advancing the Scholarship of Teaching and Learning through a Reflective Portfolio Process: The University College Cork Experience*, co-edited by Lyons with Aine Hyland and Norma Ryan. Lyons's current research is focused on how professionals from various disciplines develop as reflective practitioners. Her recent publications include a volume edited with Vicki LaBoskey, *Narrative Inquiry in Practice: Advancing the Knowledge of Teaching* (2002); and, *With Portfolio in Hand: Validating the New Teacher Professionalism* (1998). This work advancing a scholarship of teaching and learning through a reflective portfolio process was initiated by Lyons as a teacher educator at the Harvard Graduate School of Education and, most recently, as Director of Secondary Teacher Education at Dartmouth College.

Susan L. Lytle is currently Associate Professor and Chair of the Language in Education Division, Graduate School of Education, University of Pennsylvania. She is also Director of the Program in Reading/Writing/Literacy and founding Director of the Philadelphia Writing Project. Dr. Lytle has published widely on literacy and urban teacher education. Her research interests include teacher learning and leadership, school-university partnerships, and practitioner inquiry. Her co-authored book, *Inside/Outside: Teacher Research and Knowledge* (Teachers College Press, 1993) received the AACTE Outstanding Professional Writing Award in 1995. Dr. Lytle is co-editor of the Practitioner Inquiry Series of Teachers College Press as well as a past-president of the National Conference on Research in Language and Literacy and the NCTE Assembly on Research.

Mary Phillips Manke is Associate Dean of the College of Education and Professional Studies at the University of Wisconsin-River Falls. Her academic interests include: self-study of her own practices in teacher education as faculty member and administrator; study of self-study methodology; and, study of power relations in and out of classrooms. Her perspectives arise from her background in social foundations of education, and she has published in journals related to that field, including *Educational Studies*, *Educational Foundations*, *Vitae Scholasticae*, and *Multicultural Education*, as well as numerous chapters in edited books.

Geoff Mills is currently a Professor of Education and the Associate Dean and Director of Teacher Education at Southern Oregon University in Ashland, Oregon. A native of Australia, Geoff completed his doctorate at the University of Oregon in 1988 prior to moving to Ashland. His professional interests and teaching responsibilities include: action research; anthropology and education; educational change; and, qualitative research methods. Geoff has co-edited two

books and is the author of *Action Research: A guide for the teacher researcher* (Merrill/Prentice Hall) now in its second edition (2003). Geoff has given invited addresses at conferences in the USA, Canada, Mexico, New Zealand, and his homeland, Australia.

Claudia Mitchell is Professor in the Faculty of Education, McGill University, Montreal, Canada where she conducts research in the areas of childhood and popular culture, arts-based methodologies, teacher identity, girlhood, and youth based approaches to understanding HIV/AIDS focusing in particular on South Africa. She is the co-author of a number of books including: *That's Funny You Don't Look Like a Teacher*; *Reinventing Ourselves as Teachers: Beyond Nostalgia* (both with Sandra Weber); and, *Researching Children's Popular Culture: Childhood as a Cultural Space* (with J. Reid-Walsh). Forthcoming edited books include: *Not Just Any Dress* (with S. Weber); *Just Who Do We Think We Are: Methodologies for Self-Study in Teacher Education* (with K. O'Reilly Scanlon and S. Weber); and, *Seven Going on Seventeen: Girlhood Studies and Tween Culture* (with J.Reid-Walsh).

Ian Mitchell is one of the co-founders of the Project for the Enhancement of Effective Learning (PEEL). Ian spent 23 years as a secondary teacher of chemistry and mathematics from 1975 to 1997. For 14 of those years he lectured half-time in the Faculty of Education at Monash University. This long-term, dual role provided opportunities for extended classroom research that linked theory and practice. In 1998 Ian accepted a full-time lectureship at Monash and has continued his work through his research interest in teacher knowledge and teacher-as-researcher. His most recent book *Learning from Teacher Research* (Loughran, Mitchell & Mitchell) is an edited collection of teacher research drawn from the PAVOT project (Perspective and Voice of the Teacher) which was funded through an Australian Research Council Large Grant and created opportunities for teachers to engage in longitudinal research projects based on their research interests in their classrooms.

Margo Paterson is an Associate Professor in the School of Rehabilitation Therapy at Queen's University, Canada. She works with undergraduate students learning to become occupational therapists (OT's) as well as graduate students doing research degrees in rehabilitation. Her teaching areas are clinical reasoning, communication skills, and qualitative research.

Patricia Cahill Paugh is an Assistant Professor, School of Education, at the University of Massachusetts. Her professional goals include working to promote an equitable education for all students through collaborative work between universities, teachers, and students. Most recently, she has worked on collaborative action research with teachers whose inquiry focus was rethinking the teaching of children who struggle with literacy learning. Her related research and

publication topics include: teacher collaboration; critical literacy; and, progressive literacy practices. Her university teaching has focused on theories of literacy and learning and children's literature. She has an extensive background working as a teacher and curriculum coach in public and private K-12 schools. She is involved as a presenter and author affiliated with the American Educational Research Association and National Council of Teachers of English.

Victoria Perselli is a Senior Lecturer in the school of education at Kingston University, United Kingdom. Her prior research includes a 5-year self-study of her practice as a co-ordinator for special educational needs. Her particular interest lies in the development of new research methods and methodologies, especially the representational and interpretive possibilities of the visual and performance arts. Recent publications include narrative fiction, poetry and dramatisation focusing on themes of equity and diversity in mainstream education.

Stefinee Pinnegar is an Associate Professor of teacher education at Brigham Young University where she teaches secondary methods courses. For the past few years, she has worked with Annela Teemant developing distance education courses for endorsing practicing teachers to work with second language leaners in their regular classrooms. She has most enjoyed the chance to develop Videoethnographies of strong teachers for use with the courses. She continues to be interested in studying the learning to teach process, particularly the development of teacher thinking. Her other research interests include using self-study as a way to understand teaching and becoming a teacher educator. She is interested in self-study research and methodology.

Peggy Placier worked with low income children and youth in education and community programs before attaining her masters in anthropology and doctorate in educational foundations from the University of Arizona. Since 1989 she has worked as a faculty member at the University of Missouri-Columbia, where she teaches the sociology and history of education, as well as education policy studies, to undergraduates and graduate students. Her research interests focus on discourse in education policy processes and teacher education practices. She has collaborated with the Arizona Group for many years on studies of the socialization and political lives of teacher educators. Currently she is at work on studies of the local effects of distribution of comparative school data, the discourse of multicultural teacher education, and fifth grade students' collection of family stories as part of a literacy curriculum.

Anastasia P. Samaras is director and Associate Professor of Initiatives in Educational Transformation Program, a Master's program for practicing teachers at George Mason University, Virginia. Her 32-year strong commitment to children's learning encompasses teaching, researching, and community service in junior and senior high schools, preschools, and universities. Anastasia's Vygotskian-based teaching was the context for her personal history self-study

and book: *Self-Study for Teacher Educators: Crafting a Pedagogy for Educational Change* (2000, Peter Lang). Anastasia's expertise in curriculum and instruction, early childhood education, and self-study of teaching practices, including her own, has led her to fascinating experiences in interdisciplinary teaching as well as appointments with federal agencies, The U.S. Department of State, Head Start, and universities. Her greatest joy has been raising, along with her husband, their three children.

Ann Schulte is an Assistant Professor in the Multiple Subjects program at California State University at Chico. She also teaches Masters courses in curriculum design and instructional theory. Her research interests include multicultural teacher education, action research, self-study, and middle school teacher preparation. A recent publication in Multicultural Perspectives is: *Exploring Race: Teacher Educators Bridge their Personal and Professional Identities.*

Joseph C. Senese has taught junior high and high school English for more than 25 years. For the last 11 years, he has been Assistant Principal for curriculum, instruction, assessment and staff development at Highland Park High School in Highland Park, Illinois. Since initiating the Action Research Laboratory at the school in 1995, he has shared this program of teacher research at local, national, and international conferences. Details are available at the school website, http://www.d113.lake.k12.il.us/hphs/action/table_of_contents.htm. Recipient of the award for Best Research in Staff Development for 1999 from the National Council of Staff Development, Senese has published several articles about the experience of working with and conducting his own action research.

Deborah Tidwell is an Associate Professor in the Department of Curriculum and Instruction at the University of Northern Iowa in Cedar Falls, Iowa, USA. An elementary classroom teacher for eight years, she completed her Doctor of Philosophy degree from the University of Arizona in 1990. Her academic areas include literacy education, assessment and evaluation of literacy, bilingual education and reflective practice. An advocate of theoretically grounded practice, her research has focused on reflection in practice, self-study of teacher education practice in literacy education, and effective literacy instruction for English language learners. In addition to her work in education, Deborah is involved in organic farming where her focus on reflective practice has converged in her work with classroom teachers and organic farmers through examinations of the use of holistic systems.

Deborah Trumbull completed B.S. and M.S. degrees in zoology and taught biological sciences in several community colleges. After more than 10 years of science teaching, she earned the Ph.D. in Educational Psychology at the University of Illinois with a special focus on qualitative methods for program evaluation. She has been at Cornell University for 17 years, where she serves as director of the Cornell Teacher Education program, which prepares secondary

teachers in agricultural science, the sciences, and mathematics. Her research interests focus on the development of science teachers' conceptions of science, teaching and learning.

Jinx Stapleton Watson is an Associate Professor in the School of Information Sciences at the University of Tennessee at Knoxville. She teaches pre-service courses designed to prepare students for careers as teacher-librarians and works with graduate students doing research degrees in library and information sciences. Jinx worked in public schools as a teacher and administrator for nearly thirty years before joining the faculty at the University of Tennessee.

Sandra Weber is Professor of Education and a Fellow of the Simone de Beauvoir Institute at Concordia University. She is the author or coauthor of more than fifty refereed journal articles and book chapters as well as two books published in collaboration with Claudia Mitchell by Falmer Press: *That's Funny You Don't Look Like a Teacher;* and, *Reinventing Ourselves as Teachers: Beyond Nostalgia.* Much of her writing has focused on image-based research methods, the role of popular culture in teacher education, professional identity and self-study, and gender issues related to clothes and the body. In the last six years, her work has increasingly featured the use of drawings, photographs, videotapes, performance, and art installations. Co-founder of the Image and Identity Research Collective, Sandra Weber is currently directing funded research on body, dress, and identity as well as a major project on girls' leisure time use of the internet. Forthcoming edited books include: *Not Just Any Dress: Explorations in Body, Dress, and Identity* (with C. Mitchell); and, *Just Who Do We Think We Are: Methodologies for Self-Study in Teacher Education* (with K. O'Reilly Scanlon and C. Mitchell).

Jack Whitehead joined the Department of Education of the University of Bath in 1973 as a Lecturer in Education. His 30 year research programme has focused on the validation and academic legitimation of the living educational theories of professional educators and other practitioner-reserchers. His publications include: *The Growth of Educational Knowledge* (Hyde publications); and, the award winning web-site http://www.actionresearch.net. The focus of his present research is on multi-media representations of the process of transforming the embodied values of educators into living educational standards of judgment as these are clarified in educational enquiries of the kind: *How do I improve my practice?*

Susan Wilcox is an Associate Professor of adult and higher education at Queen's University, Canada. In the Instructional Development Centre, she works with faculty across the disciplines, helping them make changes that will improve the quality of teaching and learning at the university. In the Faculty of Education, she teaches graduate courses in self-directed and transformative adult learning.

INDEX
