Preface

The present volume is an outgrowth of a Conference on Mathematical Tables held at Cambridge, Mass., on September 15-16, 1954, under the auspices of the National Science Foundation and the Massachusetts Institute of Technology. The purpose of the meeting was to evaluate the need for mathematical tables in the light of the availability of large scale computing machines. It was the consensus of opinion that in spite of the increasing use of the new machines the basic need for tables would continue to exist.

Numerical tables of mathematical functions are in continual demand by scientists and engineers. A greater variety of functions and higher accuracy of tabulation are now required as a result of scientific advances and, especially, of the increasing use of automatic computers. In the latter connection, the tables serve mainly for preliminary surveys of problems before programming for machine operation. For those without easy access to machines, such tables are, of course, indispensable.

Consequently, the Conference recognized that there was a pressing need for a modernized version of the classical tables of functions of Jahnke-Emde. To implement the project, the National Science Foundation requested the National Bureau of Standards to prepare such a volume and established an Ad Hoc Advisory Committee, with Professor Philip M. Morse of the Massachusetts Institute of Technology as chairman, to advise the staff of the National Bureau of Standards during the course of its preparation. In addition to the Chairman, the Committee consisted of A. Erdélyi, M. C. Gray, N. Metropolis, J. B. Rosser, H. C. Thacher, Jr., John Todd, C. B. Tompkins, and J. W. Tukey.

The primary aim has been to include a maximum of useful information within the limits of a moderately large volume, with particular attention to the needs of scientists in all fields. An attempt has been made to cover the entire field of special functions. To carry out the goal set forth by the Ad Hoc Committee, it has been necessary to supplement the tables by including the mathematical properties that are important in computation work, as well as by providing numerical methods which demonstrate the use and extension of the tables.

The Handbook was prepared under the direction of the late Milton Abramowitz, and Irene A. Stegun. Its success has depended greatly upon the cooperation of many mathematicians. Their efforts together with the cooperation of the Ad Hoc Committee are greatly appreciated. The particular contributions of these and other individuals are acknowledged at appropriate places in the text. The sponsorship of the National Science Foundation for the preparation of the material is gratefully recognized.

It is hoped that this volume will not only meet the needs of all table users but will in many cases acquaint its users with new functions.

Preface to the Ninth Printing

The enthusiastic reception accorded the "Handbook of Mathematical Functions" is little short of unprecedented in the long history of mathematical tables that began when John Napier published his tables of logarithms in 1614. Only four and one-half years after the first copy came from the press in 1964, Myron Tribus, the Assistant Secretary of Commerce for Science and Technology, presented the 100,000th copy of the Handbook to Lee A. DuBridge, then Science Advisor to the President. Today, total distribution is approaching the 150,000 mark at a scarcely diminished rate.

The success of the Handbook has not ended our interest in the subject. On the contrary, we continue our close watch over the growing and changing world of computation and to discuss with outside experts and among ourselves the various proposals for possible extension or supplementation of the formulas, methods and tables that make up the Handbook.

In keeping with previous policy, a number of errors discovered since the last printing have been corrected. Aside from this, the mathematical tables and accompanying text are unaltered. However, some noteworthy changes have been made in Chapter 2: Physical Constants and Conversion Factors, pp. 6-8. The table on page 7 has been revised to give the values of physical constants obtained in a recent reevaluation; and pages 6 and 8 have been modified to reflect changes in definition and nomenclature of physical units and in the values adopted for the acceleration due to gravity in the revised Potsdam system.

The record of continuing acceptance of the Handbook, the praise that has come from all quarters, and the fact that it is one of the most-quoted scientific publications in recent years are evidence that the hope expressed by Dr. Astin in his Preface is being amply fulfilled.

Foreword

This volume is the result of the cooperative effort of many persons and a number of organizations. The National Bureau of Standards has long been turning out mathematical tables and has had under consideration, for at least 10 years, the production of a compendium like the present one. During a Conference on Tables, called by the NBS Applied Mathematics Division on May 15, 1952, Dr. Abramowitz of that Division mentioned preliminary plans for such an undertaking, but indicated the need for technical advice and financial support.

The Mathematics Division of the National Research Council has also had an active interest in tables; since 1943 it has published the quarterly journal, "Mathematical Tables and Aids to Computation" (MTAC), editorial supervision being exercised by a Committee of the Division.

Subsequent to the NBS Conference on Tables in 1952 the attention of the National Science Foundation was drawn to the desirability of financing activity in table production. With its support a 2-day Conference on Tables was called at the Massachusetts Institute of Technology on September 15-16, 1954, to discuss the needs for tables of various kinds. Twenty-eight persons attended, representing scientists and engineers using tables as well as table producers. This conference reached consensus on several conclusions and recommendations, which were set forth in the published Report of the Conference. There was general agreement, for example, "that the advent of high-speed computing equipment changed the task of table making but definitely did not remove the need for tables". It was also agreed that "an outstanding need is for a Handbook of Tables for the Occasional Computer, with tables of usually encountered functions and a set of formulas and tables for interpolation and other techniques useful to the occasional computer". The Report suggested that the NBS undertake the production of such a Handbook and that the NSF contribute financial assistance. The Conference elected, from its participants, the following Committee: P. M. Morse (Chairman), M. Abramowitz, J. H. Curtiss, R. W. Hamming, D. H. Lehmer, C. B. Tompkins, J. W. Tukey, to help implement these and other recommendations.

The Bureau of Standards undertook to produce the recommended tables and the National Science Foundation made funds available. To provide technical guidance to the Mathematics Division of the Bureau, which carried out the work, and to provide the NSF with independent judgments on grants for the work, the Conference Committee was reconstituted as the Committee on Revision of Mathematical Tables of the Mathematics Division of the National Research Council. This, after some changes of membership, became the Committee which is signing this Foreword. The present volume is evidence that Conferences can sometimes reach conclusions and that their recommendations sometimes get acted on.

Active work was started at the Bureau in 1956. The overall plan, the selection of authors for the various chapters, and the enthusiasm required to begin the task were contributions of Dr. Abramowitz. Since his untimely death, the effort has continued under the general direction of Irene A. Stegun. The workers at the Bureau and the members of the Committee have had many discussions about content, style and layout. Though many details have had to be argued out as they came up, the basic specifications of the volume have remained the same as were outlined by the Massachusetts Institute of Technology Conference of 1954.

The Committee wishes here to register its commendation of the magnitude and quality of the task carried out by the staff of the NBS Computing Section and their expert collaborators in planning, collecting and editing these Tables, and its appreciation of the willingness with which its various suggestions were incorporated into the plans. We hope this resulting volume will be judged by its users to be a worthy memorial to the vision and industry of its chief architect, Milton Abramowitz. We regret he did not live to see its publication.

Handbook of Mathematical Functions

with

Formulas, Graphs, and Mathematical Tables

Edited by Milton Abramowitz and Irene A. Stegun

1. Introduction

The present Handbook has been designed to provide scientific investigators with a comprehensive and self-contained summary of the mathematical functions that arise in physical and engineering problems. The well-known Tables of Functions by E. Jahnke and F. Emde has been invaluable to workers in these fields in its many editions¹ during the past half-century. The present volume extends the work of these authors by giving more extensive and more accurate numerical tables, and by giving larger collections of mathematical properties of the tabulated functions. The number of functions covered has also been increased.

The classification of functions and organization of the chapters in this Handbook is similar to that of *An Index of Mathematical Tables* by A. Fletcher, J. C. P. Miller, and L. Rosenhead.² In general, the chapters contain numerical tables, graphs, polynomial or rational approximations for automatic computers, and statements of the principal mathematical properties of the tabulated functions, particularly those of computa-

tional importance. Many numerical examples are given to illustrate the use of the tables and also the computation of function values which lie outside their range. At the end of the text in each chapter there is a short bibliography giving books and papers in which proofs of the mathematical properties stated in the chapter may be found. Also listed in the bibliographies are the more important numerical tables. Comprehensive lists of tables are given in the Index mentioned above, and current information on new tables is to be found in the National Research Council quarterly *Mathematics of Computation* (formerly *Mathematical Tables and Other Aids to Computation*).

The mathematical notations used in this Handbook are those commonly adopted in standard texts, particularly *Higher Transcendental Functions*, Volumes 1-3, by A. Erdélyi, W. Magnus, F. Oberhettinger and F. G. Tricomi (McGraw-Hill, 1953-55). Some alternative notations have also been listed. The introduction of new symbols has been kept to a minimum, and an effort has been made to avoid the use of conflicting notation.

2. Accuracy of the Tables

The number of significant figures given in each table has depended to some extent on the number available in existing tabulations. There has been no attempt to make it uniform throughout the Handbook, which would have been a costly and laborious undertaking. In most tables at least five significant figures have been provided, and the tabular intervals have generally been chosen to ensure that linear interpolation will yield four- or five-figure accuracy, which suffices in most physical applications. Users requiring higher

precision in their interpolates may obtain them by use of higher-order interpolation procedures, described below.

In certain tables many-figured function values are given at irregular intervals in the argument. An example is provided by Table 9.4. The purpose of these tables is to furnish "key values" for the checking of programs for automatic computers; no question of interpolation arises.

The maximum end-figure error, or "tolerance" in the tables in this Handbook is $\frac{1}{10}$ of 1 unit everywhere in the case of the elementary functions, and 1 unit in the case of the higher functions except in a few cases where it has been permitted to rise to 2 units.

¹ The most recent, the sixth, with F. Loesch added as co-author, was published in 1960 by McGraw-Hill, U.S.A., and Teubner, Germany.

² The second edition, with L. J. Comrie added as co-author, was published in two volumes in 1962 by Addison-Wesley, U.S.A., and Scientific Computing Service Ltd., Great Britain.

3. Auxiliary Functions and Arguments

One of the objects of this Handbook is to provide tables or computing methods which enable the user to evaluate the tabulated functions over complete ranges of real values of their parameters. In order to achieve this object, frequent use has been made of auxiliary functions to remove the infinite part of the original functions at their singularities, and auxiliary arguments to cope with infinite ranges. An example will make the procedure clear.

The exponential integral of positive argument is given by

$$\begin{aligned}
 \text{Ei}(x) &= \int_{-\infty}^x \frac{e^u}{u} du \\
 &= \gamma + \ln x + \frac{x}{1 \cdot 1!} + \frac{x^2}{2 \cdot 2!} + \frac{x^3}{3 \cdot 3!} + \dots \\
 &\sim \frac{e^x}{x} \left[1 + \frac{1!}{x} + \frac{2!}{x^2} + \frac{3!}{x^3} + \dots \right] (x \rightarrow \infty)
 \end{aligned}$$

The logarithmic singularity precludes direct interpolation near $x=0$. The functions $\text{Ei}(x) - \ln x$ and $x^{-1}[\text{Ei}(x) - \ln x - \gamma]$, however, are well-behaved and readily interpolable in this region. Either will do as an auxiliary function; the latter was in fact selected as it yields slightly higher accuracy when $\text{Ei}(x)$ is recovered. The function $x^{-1}[\text{Ei}(x) - \ln x - \gamma]$ has been tabulated to nine decimals for the range $0 \leq x \leq \frac{1}{2}$. For $\frac{1}{2} \leq x \leq 2$, $\text{Ei}(x)$ is sufficiently well-behaved to admit direct tabulation, but for larger values of x , its exponential character predominates. A smoother and more readily interpolable function for large x is $xe^{-x}\text{Ei}(x)$; this has been tabulated for $2 \leq x \leq 10$. Finally, the range $10 \leq x \leq \infty$ is covered by use of the inverse argument x^{-1} . Twenty-one entries of $xe^{-x}\text{Ei}(x)$, corresponding to $x^{-1} = .1(-.005)0$, suffice to produce an interpolable table.

4. Interpolation

The tables in this Handbook are not provided with differences or other aids to interpolation, because it was felt that the space they require could be better employed by the tabulation of additional functions. Admittedly aids could have been given without consuming extra space by increasing the intervals of tabulation, but this would have conflicted with the requirement that linear interpolation is accurate to four or five figures.

For applications in which linear interpolation is insufficiently accurate it is intended that Lagrange's formula or Aitken's method of iterative linear interpolation³ be used. To help the user, there is a statement at the foot of most tables of the maximum error in a linear interpolate, and the number of function values needed in Lagrange's formula or Aitken's method to interpolate to full tabular accuracy.

As an example, consider the following extract from Table 5.1.

x	$xe^x E_1(x)$	x	$xe^x E_1(x)$
7.5	.89268 7854	8.0	.89823 7113
7.6	.89384 6312	8.1	.89927 7888
7.7	.89497 9666	8.2	.90029 7306
7.8	.89608 8737	8.3	.90129 6073
7.9	.89717 4302	8.4	.90227 4695

[(-6)3
5]

The numbers in the square brackets mean that the maximum error in a linear interpolate is 3×10^{-6} , and that to interpolate to the full tabular accuracy five points must be used in Lagrange's and Aitken's methods.

³ A. C. Aitken, On interpolation by iteration of proportional parts, without the use of differences, Proc. Edinburgh Math. Soc. 3, 56-76 (1932).

Let us suppose that we wish to compute the value of $xe^x E_1(x)$ for $x=7.9527$ from this table. We describe in turn the application of the methods of linear interpolation, Lagrange and Aitken, and of alternative methods based on differences and Taylor's series.

(1) Linear interpolation. The formula for this process is given by

$$f_p = (1-p)f_0 + pf_1$$

where f_0, f_1 are consecutive tabular values of the function, corresponding to arguments x_0, x_1 , respectively; p is the given fraction of the argument interval

$$p = (x - x_0) / (x_1 - x_0)$$

and f_p the required interpolate. In the present instance, we have

$$f_0 = .89717 4302 \quad f_1 = .89823 7113 \quad p = .527$$

The most convenient way to evaluate the formula on a desk calculating machine is to set f_0 and f_1 in turn on the keyboard, and carry out the multiplications by $1-p$ and p cumulatively; a partial check is then provided by the multiplier dial reading unity. We obtain

$$\begin{aligned}
 f_{.527} &= (1-.527)(.89717 4302) + .527(.89823 7113) \\
 &= .89773 4403.
 \end{aligned}$$

Since it is known that there is a possible error of 3×10^{-6} in the linear formula, we round off this result to .89773. The maximum possible error in this answer is composed of the error committed

by the last rounding, that is, $.4403 \times 10^{-5}$, plus 3×10^{-6} , and so certainly cannot exceed $.8 \times 10^{-5}$.

(2) Lagrange's formula. In this example, the relevant formula is the 5-point one, given by

$$f = A_{-2}(p)f_{-2} + A_{-1}(p)f_{-1} + A_0(p)f_0 + A_1(p)f_1 + A_2(p)f_2$$

Tables of the coefficients $A_k(p)$ are given in chapter 25 for the range $p=0(.01)1$. We evaluate the formula for $p=.52, .53$ and $.54$ in turn. Again, in each evaluation we accumulate the $A_k(p)$ in the multiplier register since their sum is unity. We now have the following subtable.

x	$xe^x E_1(x)$		
7.952	.89772 9757	10622	
7.953	.89774 0379	10620	-2
7.954	.89775 0999		

The numbers in the third and fourth columns are the first and second differences of the values of $xe^x E_1(x)$ (see below); the smallness of the second difference provides a check on the three interpolations. The required value is now obtained by linear interpolation:

$$f_p = .3(.89772 9757) + .7(.89774 0379) = .89773 7192.$$

In cases where the correct order of the Lagrange polynomial is not known, one of the preliminary interpolations may have to be performed with polynomials of two or more different orders as a check on their adequacy.

(3) Aitken's method of iterative linear interpolation. The scheme for carrying out this process in the present example is as follows:

n	x_n	$y_n = xe^x E_1(x)$	$y_{0,n}$	$y_{0,1,n}$	$y_{0,1,2,n}$	$y_{0,1,2,3,n}$	$x_n - x$
0	8.0	.89823 7113					.0473
1	7.9	.89717 4302	.89773 44034				-.0527
2	8.1	.89927 7888	.89774 48264	.89773 71499			.1473
3	7.8	.89608 8737	2 90220	2394	.89773 71938		-.1527
4	8.2	.90029 7306	4 98773	1216	16	89773 71930	.2473
5	7.7	.89497 9666	2 35221	2706	43	30	-.2527

Here

$$y_{0,n} = \frac{1}{x_n - x_0} \begin{vmatrix} y_0 & x_0 - x \\ y_n & x_n - x \end{vmatrix}$$

$$y_{0,1,n} = \frac{1}{x_n - x_1} \begin{vmatrix} y_{0,1} & x_1 - x \\ y_n & x_n - x \end{vmatrix}$$

$$y_{0,1,\dots,m-1,n} = \frac{1}{x_n - x_m} \begin{vmatrix} y_{0,1,\dots,m-1} & x_{m-1} - x \\ y_n & x_n - x \end{vmatrix}$$

If the quantities $x_n - x$ and $x_m - x$ are used as multipliers when forming the cross-product on a desk machine, their accumulation $(x_n - x) - (x_m - x)$ in the multiplier register is the divisor to be used at that stage. An extra decimal place is usually carried in the intermediate interpolates to safeguard against accumulation of rounding errors.

The order in which the tabular values are used is immaterial to some extent, but to achieve the maximum rate of convergence and at the same time minimize accumulation of rounding errors, we begin, as in this example, with the tabular argument nearest to the given argument, then take the nearest of the remaining tabular arguments, and so on.

The number of tabular values required to achieve a given precision emerges naturally in the course of the iterations. Thus in the present example six values were used, even though it was known in advance that five would suffice. The extra row confirms the convergence and provides a valuable check.

(4) Difference formulas. We use the central difference notation (chapter 25),

x_0	f_0				
x_1	f_1	$\delta f_{1/2}$			
x_2	f_2	$\delta f_{3/2}$	$\delta^2 f_1$		
x_3	f_3	$\delta f_{5/2}$	$\delta^2 f_2$	$\delta^2 f_{3/2}$	$\delta^4 f_2$
x_4	f_4	$\delta f_{7/2}$	$\delta^2 f_3$	$\delta^2 f_{5/2}$	

Here

$$\begin{aligned} \delta f_{1/2} &= f_1 - f_0, \quad \delta f_{3/2} = f_2 - f_1, \dots, \\ \delta^2 f_1 &= \delta f_{3/2} - \delta f_{1/2} = f_2 - 2f_1 + f_0 \\ \delta^2 f_{3/2} &= \delta^2 f_2 - \delta^2 f_1 = f_3 - 3f_2 + 3f_1 - f_0 \\ \delta^4 f_2 &= \delta^2 f_{5/2} - \delta^2 f_{3/2} = f_4 - 4f_3 + 6f_2 - 4f_1 + f_0 \end{aligned}$$

and so on.

In the present example the relevant part of the difference table is as follows, the differences being written in units of the last decimal place of the function, as is customary. The smallness of the high differences provides a check on the function values

x	$xe^x E_1(x)$	$\delta^2 f$	$\delta^4 f$
7.9	.89717 4302	-2 2754	-34
8.0	.89823 7113	-2 2036	-39

Applying, for example, Everett's interpolation formula

$$f_p = (1-p)f_0 + E_2(p)\delta^2 f_0 + E_4(p)\delta^4 f_0 + \dots + pf_1 + F_2(p)\delta^2 f_1 + F_4(p)\delta^4 f_1 + \dots$$

and taking the numerical values of the interpolation coefficients $E_2(p)$, $E_4(p)$, $F_2(p)$ and $F_4(p)$ from Table 25.1, we find that

$$10^9 f_{.027} = .473(89717\ 4302) + .061196(2\ 2754) - .012(34) \\ + .527(89823\ 7113) + .063439(2\ 2036) - .012(39) \\ = 89773\ 7193.$$

We may notice in passing that Everett's formula shows that the error in a linear interpolate is approximately

$$E_2(p)\delta^2 f_0 + F_2(p)\delta^2 f_1 \approx \frac{1}{2}[E_2(p) + F_2(p)][\delta^2 f_0 + \delta^2 f_1]$$

Since the maximum value of $|E_2(p) + F_2(p)|$ in the range $0 < p < 1$ is $\frac{1}{8}$, the maximum error in a linear interpolate is approximately

$$\frac{1}{16} |\delta^2 f_0 + \delta^2 f_1|, \text{ that is, } \frac{1}{16} |f_2 - f_1 - f_0 + f_{-1}|.$$

(5) Taylor's series. In cases where the successive derivatives of the tabulated function can be computed fairly easily, Taylor's expansion

$$f(x) = f(x_0) + (x - x_0) \frac{f'(x_0)}{1!} + (x - x_0)^2 \frac{f''(x_0)}{2!} \\ + (x - x_0)^3 \frac{f'''(x_0)}{3!} + \dots$$

can be used. We first compute as many of the derivatives $f^{(n)}(x_0)$ as are significant, and then evaluate the series for the given value of x . An advisable check on the computed values of the derivatives is to reproduce the adjacent tabular values by evaluating the series for $x = x_{-1}$ and x_1 .

In the present example, we have

$$f(x) = x e^x E_1(x) \\ f'(x) = (1 + x^{-1})f(x) - 1 \\ f''(x) = (1 + x^{-1})f'(x) - x^{-2}f(x) \\ f'''(x) = (1 + x^{-1})f''(x) - 2x^{-2}f'(x) + 2x^{-3}f(x).$$

With $x_0 = 7.9$ and $x - x_0 = .0527$ our computations are as follows; an extra decimal has been retained in the values of the terms in the series to safeguard against accumulation of rounding errors.

5. Inverse Interpolation

With linear interpolation there is no difference in principle between direct and inverse interpolation. In cases where the linear formula provides an insufficiently accurate answer, two methods are available. We may interpolate directly, for example, by Lagrange's formula to prepare a new table at a fine interval in the neighborhood of the approximate value, and then apply accurate inverse linear interpolation to the subtabulated values. Alternatively, we may use Aitken's method or even possibly the Taylor's series method, with the roles of function and argument interchanged.

It is important to realize that the accuracy of an inverse interpolate may be very different from that of a direct interpolate. This is particularly true in regions where the function is slowly varying, for example, near a maximum or minimum. The maximum precision attainable in an inverse interpolate can be estimated with the aid of the formula

$$\Delta x \approx \Delta f \frac{df}{dx}$$

in which Δf is the maximum possible error in the function values.

Example. Given $x e^x E_1(x) = .9$, find x from the table on page X.

(i) Inverse linear interpolation. The formula for p is

$$p = (f_p - f_0) / (f_1 - f_0).$$

In the present example, we have

$$p = \frac{.9 - .89927\ 7888}{.90029\ 7306 - .89927\ 7888} = \frac{.72\ 2112}{101\ 9418} = .708357.$$

The desired x is therefore

$$x = x_0 + p(x_1 - x_0) = 8.1 + .708357(.1) = 8.17083\ 57$$

To estimate the possible error in this answer, we recall that the maximum error of direct linear interpolation in this table is $\Delta f = 3 \times 10^{-6}$. An approximate value for df/dx is the ratio of the first difference to the argument interval (chapter 25), in this case .010. Hence the maximum error in x is approximately $3 \times 10^{-6} / (.010)$, that is, .0003.

(ii) Subtabulation method. To improve the approximate value of x just obtained, we interpolate directly for $p = .70, .71$ and $.72$ with the aid of Lagrange's 5-point formula,

x	$x e^x E_1(x)$	δ	δ^2
8.170	.89999 3683		
8.171	.90000 3834	1 0151	
8.172	.90001 3983	1 0149	-2

Inverse linear interpolation in the new table gives

$$p = \frac{.9 - .89999\ 3683}{.00001\ 0151} = .6223$$

Hence $x = 8.17062\ 23$.

An estimate of the maximum error in this result is

$$\Delta f \frac{df}{dx} \approx \frac{1 \times 10^{-6}}{.010} = 1 \times 10^{-7}$$

(iii) Aitken's method. This is carried out in the same manner as in direct interpolation.

n	$y_n = xe^x E_1(x)$	x_n	$x_{0,n}$	$x_{0,1,n}$	$x_{0,1,2,n}$	$x_{0,1,2,3,n}$	$y_n - y$
0	.90029 7306	8.2					.00029 7306
1	.89927 7888	8.1	8.17083 5712				-.00072 2112

The estimate of the maximum error in this result is the same as in the subtabulation method. An indication of the error is also provided by the

discrepancy in the highest interpolates, in this case $x_{0,1,2,3,4}$, and $x_{0,1,2,3,5}$.

6. Bivariate Interpolation

Bivariate interpolation is generally most simply performed as a sequence of univariate interpolations. We carry out the interpolation in one direction, by one of the methods already described, for several tabular values of the second argument in the neighborhood of its given value. The interpolates are differenced as a check, and

interpolation is then carried out in the second direction.

An alternative procedure in the case of functions of a complex variable is to use the Taylor's series expansion, provided that successive derivatives of the function can be computed without much difficulty.

7. Generation of Functions from Recurrence Relations

Many of the special mathematical functions which depend on a parameter, called their index, order or degree, satisfy a linear difference equation (or recurrence relation) with respect to this parameter. Examples are furnished by the Legendre function $P_n(x)$, the Bessel function $J_n(x)$ and the exponential integral $E_n(x)$, for which we have the respective recurrence relations

$$(n+1)P_{n+1} - (2n+1)xP_n + nP_{n-1} = 0$$

$$J_{n+1} - \frac{2n}{x}J_n + J_{n-1} = 0$$

$$nE_{n+1} + xE_n = e^{-x}$$

Particularly for automatic work, recurrence relations provide an important and powerful computing tool. If the values of $P_n(x)$ or $J_n(x)$ are known for two consecutive values of n , or $E_n(x)$ is known for one value of n , then the function may be computed for other values of n by successive applications of the relation. Since generation is carried out perforce with rounded values, it is vital to know how errors may be propagated in the recurrence process. If the errors do not grow relative to the size of the wanted function, the process is said to be stable. If, however, the relative errors grow and will eventually overwhelm the wanted function, the process is unstable.

It is important to realize that stability may depend on (i) the particular solution of the difference equation being computed; (ii) the values of x or other parameters in the difference equation;

(iii) the direction in which the recurrence is being applied. Examples are as follows.

Stability—increasing n

$$P_n(x), P_n^*(x)$$

$$Q_n(x), Q_n^*(x) \quad (x < 1)$$

$$Y_n(x), K_n(x)$$

$$J_{-n-\frac{1}{2}}(x), I_{-n-\frac{1}{2}}(x)$$

$$E_n(x) \quad (n < x)$$

Stability—decreasing n

$$P_n(x), P_n^*(x) \quad (x < 1)$$

$$Q_n(x), Q_n^*(x)$$

$$J_n(x), I_n(x)$$

$$J_{n+\frac{1}{2}}(x), I_{n+\frac{1}{2}}(x)$$

$$E_n(x) \quad (n > x)$$

$$F_n(\eta, \rho) \quad (\text{Coulomb wave function})$$

Illustrations of the generation of functions from their recurrence relations are given in the pertinent chapters. It is also shown that even in cases where the recurrence process is unstable, it may still be used when the starting values are known to sufficient accuracy.

Mention must also be made here of a refinement, due to J. C. P. Miller, which enables a recurrence process which is stable for decreasing n to be applied without any knowledge of starting values for large n . Miller's algorithm, which is well-suited to automatic work, is described in **19.28**,

8. Acknowledgments

The production of this volume has been the result of the unrelenting efforts of many persons, all of whose contributions have been instrumental in accomplishing the task. The Editor expresses his thanks to each and every one.

The Ad Hoc Advisory Committee individually and together were instrumental in establishing the basic tenets that served as a guide in the formation of the entire work. In particular, special thanks are due to Professor Philip M. Morse for his continuous encouragement and support. Professors J. Todd and A. Erdélyi, panel members of the Conferences on Tables and members of the Advisory Committee have maintained an undiminished interest, offered many suggestions and carefully read all the chapters.

Irene A. Stegun has served effectively as associate editor, sharing in each stage of the planning of the volume. Without her untiring efforts, completion would never have been possible.

Appreciation is expressed for the generous cooperation of publishers and authors in granting permission for the use of their source material. Acknowledgments for tabular material taken wholly or in part from published works are given on the first page of each table. Myrtle R. Kellington corresponded with authors and publishers to obtain formal permission for including their material, maintained uniformity throughout the

bibliographic references and assisted in preparing the introductory material.

Valuable assistance in the preparation, checking and editing of the tabular material was received from Ruth E. Capuano, Elizabeth F. Godefroy, David S. Liepman, Kermit Nelson, Bertha H. Walter and Ruth Zucker.

Equally important has been the untiring cooperation, assistance, and patience of the members of the NBS staff in handling the myriad of detail necessarily attending the publication of a volume of this magnitude. Especially appreciated have been the helpful discussions and services from the members of the Office of Technical Information in the areas of editorial format, graphic art layout, printing detail, preprinting reproduction needs, as well as attention to promotional detail and financial support. In addition, the clerical and typing staff of the Applied Mathematics Division merit commendation for their efficient and patient production of manuscript copy involving complicated technical notation.

Finally, the continued support of Dr. E. W. Cannon, chief of the Applied Mathematics Division, and the advice of Dr. F. L. Alt, assistant chief, as well as of the many mathematicians in the Division, is gratefully acknowledged.

M. ABRAMOWITZ.

2. Physical Constants and Conversion Factors

The tables in this chapter supply some of the more commonly needed physical constants and conversion factors.

All scientific measurements in the fields of mechanics and heat are based upon four international arbitrarily adopted units, the magnitudes of which are fixed by four agreed on standards:

Length—the meter—fixed by the vacuum wavelength of radiation corresponding to the transition $2P_{10} - 5D_5$ of krypton 86

$$(1 \text{ meter} - 1650763.73\lambda).$$

Mass—the kilogram—fixed by the international kilogram at Sèvres, France.

Time—the second—fixed as $1/31,556,925.9747$ of the tropical year 1900 at 12^h ephemeris time, or the duration of 9,192,631,770 cycles of the hyperfine transition frequency of cesium 133.

Temperature—the degree—fixed on a thermodynamic basis by taking the temperature for the triple point of natural water as 273.16 °K. (The Celsius scale is obtained by adding -273.15 to the Kelvin scale.)

Other units are defined in terms of them by assigning the value unity to the proportionality constant in each defining equation. The entire system, including electricity units, is called the *Système International d'Unités* (SI). Taking the $1/100$ part of the meter as the unit of length and the $1/1000$ part of the kilogram as the unit of mass, similarly, gives

rise to the CGS system, often used in physics and chemistry.

Table 2.1. Common Units and Conversion Factors

Quantity	SI name	CGS name	SI unit/CGS unit
Force, F	newton	dyne	10^5
Energy, W	joule	erg	10^7
Power, P	watt	10^7

The SI unit of electric current is the ampere defined by the equation $2\Gamma_m I_1 I_2 / 4\pi = F$ giving the force in vacuo per unit length between two infinitely long parallel conductors of infinitesimal cross-section. If F is in newtons, and Γ_m has the numerical value $4\pi \times 10^{-7}$, then I_1 and I_2 are in amperes. The customary equations define the other electric and magnetic units of SI such as the volt, ohm, farad, henry, etc. The force between electric charges in a vacuum in this system is given by $Q_1 Q_2 / 4\pi \Gamma_e r^2 = F$, Γ_e having the numerical value $10^7 / 4\pi c^2$ where c is the speed of light in meters per second ($\Gamma_e = 8.854 \times 10^{-12}$).

The CGS unrationalized system is obtained by deleting 4π in the denominators in these equations and expressing F in dynes, and r in centimeters. Setting Γ_m equal to unity defines the CGS unrationalized electromagnetic system (emu), Γ_e then taking the numerical value of $1/c^2$. Setting Γ_e equal to unity defines the CGS unrationalized electrostatic system (esu), Γ_m then taking the numerical value of $1/c^2$.

Table 2.2. Names and Conversion Factors for Electric and Magnetic Units

Quantity	SI name	emu name	esu name	SI unit/emu unit	SI unit/esu unit
Current	ampere	abampere	statampere	10^{-1}	$\sim 3 \times 10^9$
Charge	coulomb	abcoulomb	statcoulomb	10^{-1}	$\sim 3 \times 10^9$
Potential	volt	abvolt	statvolt	10^8	$\sim (1/3) \times 10^{-2}$
Resistance	ohm	abohm	statohm	10^9	$\sim (1/9) \times 10^{-11}$
Inductance	henry	centimeter	-----	10^9	$\sim (1/9) \times 10^{-11}$
Capacitance	farad	-----	centimeter	10^{-9}	$\sim 9 \times 10^{11}$
Magnetizing force	amp. turns/meter	oersted	-----	$4\pi \times 10^{-3*}$	$\sim 3 \times 10^{10*}$
Magnetomotive force	amp. turns	gilbert	-----	$4\pi \times 10^{-1*}$	$\sim 3/10^{10*}$
Magnetic flux	weber	maxwell	-----	10^8	$\sim (1/3) \times 10^{-2}$
Magnetic flux density	tesla	gauss	-----	10^4	$\sim (1/3) \times 10^{-8}$
Electric displacement	-----	-----	-----	10^{-5*}	$\sim 3 \times 10^{10*}$

Example: If the value assigned to a current is 100 amperes its value in abamperes is $100 \times 10^{-1} = 10$.

*Divide this number by 4π if unrationalized system is involved; other numbers are unchanged.

3.8. Algebraic Equations

Solution of Quadratic Equations

3.8.1 Given $az^2 + bz + c = 0$,

$$z_{1,2} = -\left(\frac{b}{2a}\right) \pm \frac{1}{2a} q^{\frac{1}{2}}, \quad q = b^2 - 4ac,$$

$$z_1 + z_2 = -b/a, \quad z_1 z_2 = c/a$$

If $q > 0$, two real roots,
 $q = 0$, two equal roots,
 $q < 0$, pair of complex conjugate roots.

Solution of Cubic Equations

3.8.2 Given $z^3 + a_2 z^2 + a_1 z + a_0 = 0$, let

$$q = \frac{1}{3} a_1 - \frac{1}{9} a_2^2; \quad r = \frac{1}{6} (a_1 a_2 - 3a_0) - \frac{1}{27} a_2^3.$$

If $q^3 + r^2 > 0$, one real root and a pair of complex conjugate roots,

$q^3 + r^2 = 0$, all roots real and at least two are equal,

$q^3 + r^2 < 0$, all roots real (irreducible case).

Let

$$s_1 = [r + (q^3 + r^2)^{\frac{1}{2}}]^{\frac{1}{3}}, \quad s_2 = [r - (q^3 + r^2)^{\frac{1}{2}}]^{\frac{1}{3}}$$

then

$$z_1 = (s_1 + s_2) - \frac{a_2}{3}$$

$$z_2 = -\frac{1}{2} (s_1 + s_2) - \frac{a_2}{3} + \frac{i\sqrt{3}}{2} (s_1 - s_2)$$

$$z_3 = -\frac{1}{2} (s_1 + s_2) - \frac{a_2}{3} - \frac{i\sqrt{3}}{2} (s_1 - s_2).$$

If z_1, z_2, z_3 are the roots of the cubic equation

$$z_1 + z_2 + z_3 = -a_2$$

$$z_1 z_2 + z_1 z_3 + z_2 z_3 = a_1$$

$$z_1 z_2 z_3 = -a_0$$

Solution of Quartic Equations

3.8.3 Given $z^4 + a_3 z^3 + a_2 z^2 + a_1 z + a_0 = 0$, find the real root u_1 of the cubic equation

$$u^3 - a_2 u^2 + (a_1 a_3 - 4a_0)u - (a_1^2 + a_0 a_3^2 - 4a_0 a_2) = 0$$

and determine the four roots of the quartic as solutions of the two quadratic equations

$$v^2 + \left[\frac{a_3}{2} \mp \left(\frac{a_3^2}{4} + u_1 - a_2 \right)^{\frac{1}{2}} \right] v + \frac{u_1}{2} \mp \left[\left(\frac{u_1}{2} \right)^2 - a_0 \right]^{\frac{1}{2}} = 0$$

If all roots of the cubic equation are real, use the value of u_1 which gives real coefficients in the quadratic equation and select signs so that if

$$z^4 + a_3z^3 + a_2z^2 + a_1z + a_0 = (z^2 + p_1z + q_1)(z^2 + p_2z + q_2),$$

then

$$p_1 + p_2 = a_3, p_1p_2 + q_1 + q_2 = a_2, p_1q_2 + p_2q_1 = a_1, q_1q_2 = a_0.$$

If z_1, z_2, z_3, z_4 are the roots,

$$\sum z_i = -a_3, \sum z_i z_j z_k = -a_1,$$

$$\sum z_i z_j = a_2, z_1 z_2 z_3 z_4 = a_0.$$

3.9. Successive Approximation Methods

General Comments

3.9.1 Let $x = x_1$ be an approximation to $x = \xi$ where $f(\xi) = 0$ and both x_1 and ξ are in the interval $a \leq x \leq b$. We define

$$x_{n+1} = x_n + c_n f(x_n) \quad (n = 1, 2, \dots).$$

Then, if $f'(x) \geq 0$ and the constants c_n are negative and bounded, the sequence x_n converges monotonically to the root ξ .

If $c_n = c = \text{constant} < 0$ and $f'(x) > 0$, then the process converges but not necessarily monotonically.

Degree of Convergence of an Approximation Process

3.9.2 Let x_1, x_2, x_3, \dots be an infinite sequence of approximations to a number ξ . Then, if

$$|x_{n+1} - \xi| < A |x_n - \xi|^k, \quad (n = 1, 2, \dots)$$

where A and k are independent of n , the sequence is said to have convergence of at most the k th degree (or order or index) to ξ . If $k = 1$ and $A < 1$ the convergence is linear; if $k = 2$ the convergence is quadratic.

Regula Falsi (False Position)

3.9.3 Given $y = f(x)$ to find ξ such that $f(\xi) = 0$, choose x_0 and x_1 such that $f(x_0)$ and $f(x_1)$ have opposite signs and compute

$$x_2 = x_1 - \frac{(x_1 - x_0)}{(f_1 - f_0)} f_1 = \frac{f_1 x_0 - f_0 x_1}{f_1 - f_0}.$$

Then continue with x_2 and either of x_0 or x_1 for which $f(x_0)$ or $f(x_1)$ is of opposite sign to $f(x_2)$.

Regula falsi is equivalent to inverse linear interpolation.

*See page 11.

Method of Iteration (Successive Substitution)

3.9.4 The iteration scheme $x_{k+1} = F(x_k)$ will converge to a zero of $x = F(x)$ if

$$(1) |F'(x)| \leq q < 1 \text{ for } a \leq x \leq b,$$

$$(2) a \leq x_0 \pm \frac{|F(x_0) - x_0|}{1 - q} \leq b.$$

Newton's Method of Successive Approximations

3.9.5

Newton's Rule

If $x = x_k$ is an approximation to the solution $x = \xi$ of $f(x) = 0$ then the sequence

$$x_{k+1} = x_k - \frac{f(x_k)}{f'(x_k)}$$

will converge quadratically to $x = \xi$: (if instead of the condition (2) above),

(1) *Monotonic convergence*, $f(x_0)f''(x_0) > 0$ and $f'(x), f''(x)$ do not change sign in the interval (x_0, ξ) , or

(2) *Oscillatory convergence*, $f(x_0)f''(x_0) < 0$ and $f'(x), f''(x)$ do not change sign in the interval (x_0, x_1) , $x_0 \leq \xi \leq x_1$.

Newton's Method Applied to Real n th Roots

3.9.6 Given $x^n = N$, if x_k is an approximation $x = N^{1/n}$ then the sequence

$$x_{k+1} = \frac{1}{n} \left[\frac{N}{x_k^{n-1}} + (n-1)x_k \right]$$

will converge quadratically to x .

$$\text{If } n = 2, x_{k+1} = \frac{1}{2} \left(\frac{N}{x_k} + x_k \right),$$

$$\text{If } n = 3, x_{k+1} = \frac{1}{3} \left(\frac{N}{x_k^2} + 2x_k \right).$$

Aitken's δ^2 -Process for Acceleration of Sequences

3.9.7 If x_k, x_{k+1}, x_{k+2} are three successive iterates in a sequence converging with an error which is approximately in geometric progression, then

$$\bar{x}_k = x_k - \frac{(x_k - x_{k+1})^2}{\Delta^2 x_k} = \frac{x_k x_{k+2} - x_{k+1}^2}{\Delta^2 x_k},$$

$$\Delta^2 x_k = x_k - 2x_{k+1} + x_{k+2}$$

is an improved estimate of x . In fact, if $x_k = x + O(\lambda^k)$ then $\bar{x}_k = x + O(\lambda^k)$, $|\lambda| < 1$.

$$= b_0 + \frac{a_1}{b_1 +} \frac{a_2}{b_2 +} \frac{a_3}{b_3 +} \dots$$

If the number of terms is finite, f is called a terminating continued fraction. If the number of terms is infinite, f is called an infinite continued fraction and the terminating fraction

(4)
$$A_n B_{n-1} - A_{n-1} B_n = (-1)^{n-1} \prod_{k=1}^n a_k$$

Numerical Methods

3.11. Use and Extension of the Tables

Example 1. Compute x^{19} and x^{47} for $x=29$ using Table 3.1.

$$x^{19} = x^9 \cdot x^{10}$$

$$= (1.45071 \ 4598 \cdot 10^{13})(4.20707 \ 2333 \cdot 10^{14})$$

$$= 6.10326 \ 1248 \cdot 10^{27}$$

$$x^{47} = (x^{24})^2 / x$$

$$= (1.25184 \ 9008 \cdot 10^{35})^2 / 29$$

$$= 5.40388 \ 2547 \cdot 10^{68}$$

Example 2. Compute $x^{-3/4}$ for $x=9.19826$.

$$(9.19826)^{1/4} = (919.826/100)^{1/4} = (919.826)^{1/4} / 10^{1/4}$$

Linear interpolation in Table 3.1 gives $(919.826)^{1/4} \approx 5.507144$.

By Newton's method for fourth roots with $N=919.826$,

$$\frac{1}{4} \left[\frac{919.826}{(5.507144)^3} + 3(5.507144) \right] = 5.50714 \ 3845$$

Repetition yields the same result. Thus,

$$x^{1/4} = 5.50714 \ 3845 / 10^{1/4} = 1.74151 \ 1796,$$

$$x^{-3/4} = x^{1/4} / x = .18933 \ 05683.$$

3.12. Computing Techniques

Example 3. Solve the quadratic equation $x^2 - 18.2x + .056$ given the coefficients as $18.2 \pm .1$,

*See page 11.

.056 ± .001. From 3.8.1 the solution is

$$x = \frac{1}{2}(18.2 \pm [(18.2)^2 - 4(.056)]^{\frac{1}{2}})$$

$$= \frac{1}{2}(18.2 \pm [331.016]^{\frac{1}{2}}) = \frac{1}{2}(18.2 \pm 18.1939)$$

$$= 18.1969, .003$$

The smaller root may be obtained more accurately from

* $.056/18.1969 = .0031 \pm .0001.$

Example 4. Compute $(-3 + .0076i)^{\frac{1}{2}}$.

From 3.7.26, $(-3 + .0076i)^{\frac{1}{2}} = u + iv$ where

$$u = \frac{y}{2v}, v = \left(\frac{r-x}{2}\right)^{\frac{1}{2}}, r = (x^2 + y^2)^{\frac{1}{2}}$$

Thus

$$r = [(-3)^2 + (.0076)^2]^{\frac{1}{2}} = (9.00005776)^{\frac{1}{2}} = 3.000009627$$

$$v = \left[\frac{3.000009627 - (-3)}{2} \right]^{\frac{1}{2}} = 1.732052196$$

$$u = \frac{y}{2v} = \frac{.0076}{2(1.732052196)} = .00219392926$$

We note that the principal square root has been computed.

Example 5. Solve the cubic equation $x^3 - 18.1x - 34.8 = 0.$

To use Newton's method we first form the table of $f(x) = x^3 - 18.1x - 34.8$

x	$f(x)$
4	-43.2
5	-.3
6	72.6
7	181.5

We obtain by linear inverse interpolation:

$$x_0 = 5 + \frac{0 - (-.3)}{72.6 - (-.3)} = 5.004.$$

Using Newton's method, $f'(x) = 3x^2 - 18.1$ we get

$$x_1 \approx x_0 - f(x_0)/f'(x_0)$$

$$\approx 5.004 - \frac{(-.072159936)}{57.020048} \approx 5.00526.$$

Repetition yields $x_1 = 5.005265097$. Dividing $f(x)$ by $x - 5.005265097$ gives $x^2 + 5.005265097x + 6.95267869$ the zeros of which are $-2.502632549 \pm .83036800i$.

Example 6. Solve the quartic equation

$$x^4 - 2.377524922x^3 + 6.073505741x^2 - 11.17938023x + 9.052655259 = 0.$$

Resolution Into Quadratic Factors

$$(x^2 + p_1x + q_1)(x^2 + p_2x + q_2)$$

by **Inverse Interpolation**

Starting with the trial value $q_1 = 1$ we compute successively

q_1	$q_2 = \frac{a_0}{q_1}$	$p_1 = \frac{a_1 - a_3q_1}{q_2 - q_1}$	$p_2 = a_3 - p_1$	$y(q_1) = \frac{q_1 + q_2 + p_1p_2}{-a_2}$
1	9.053	-1.093	-1.284	5.383
2	4.526	-2.543	.165	.032
2.2	4.115	-3.106	.729	-2.023

We seek that value of q_1 for which $y(q_1) = 0$. Inverse interpolation in $y(q_1)$ gives $y(q_1) \approx 0$ for $q_1 \approx 2.003$. Then,

q_1	q_2	p_1	p_2	$y(q_1)$
2.003	4.520	-2.550	.172	.011

Inverse interpolation between $q_1 = 2.2$ and $q_1 = 2.003$ gives $q_1 = 2.0041$, and thus,

q_1	q_2	p_1	p_2	$y(q_1)$
2.0041	4.517067640	-2.55259257	.17506765	.00078552
2.0042	4.516842260	-2.55282851	.17530358	.00001655
2.0043	4.516616903	-2.55306447	.17553955	-.00075263

Inverse interpolation gives $q_1 = 2.004202152$, and we get finally,

q_1	q_2	p_1	p_2	$y(q_1)$
2.004202152	4.516837410	-2.55283358	.175308659	-.000000011

Double Precision Multiplication and Division on a Desk Calculator

Example 7. Multiply $M=20243\ 97459\ 71664\ 32102$ by $m=69732\ 82428\ 43662\ 95023$ on a $10 \times 10 \times 20$ desk calculating machine.

Let $M_0=20243\ 97459$, $M_1=71664\ 32102$, $m_0=69732\ 82428$, $m_1=43662\ 95023$. Then $Mm=M_0m_010^{20}+(M_0m_1+M_1m_0)10^{10}+M_1m_1$.

(1) Multiply $M_1m_1=31290\ 75681\ 96300\ 28346$ and record the digits 96300 28346 appearing in positions 1 to 10 of the product dial.

(2) Transfer the digits 31290 75681 from positions 11 to 20 of the product dial to positions 1 to 10 of the product dial.

(3) Multiply cumulatively $M_1m_0+M_0m_1+31290\ 75681=58812\ 67160\ 12663\ 25894$ and record the digits 12663 25894 in positions 1 to 10.

(4) Transfer the digits 58812 67160 from positions 11 to 20 to positions 1 to 10.

(5) Multiply cumulatively $M_0m_0+58812\ 67160=14116\ 69523\ 40138\ 17612$. The results as obtained are shown below,

$$\begin{array}{r} 96300\ 28346 \\ 12663\ 25894 \\ \hline 14116\ 69523\ 40138\ 17612 \\ 14116\ 69523\ 40138\ 17612\ 12663\ 25894\ 96300\ 28346 \end{array}$$

If the product Mm is wanted to 20 digits, only the result obtained in step 5 need be recorded. Further, if the allowable error in the 20th place is a unit, the operation M_1m_1 may be omitted. When either of the factors M or m contains less than 20 digits it is convenient to position the numbers as if they both had 20 digits. This multiplication process may be extended to any higher accuracy desired.

Example 8. Divide $N=14116\ 69523\ 40138\ 17612$ by $d=20243\ 97459\ 71664\ 32102$.

Method (1)—*linear interpolation*.

$$N/20243\ 97459 \cdot 10^{10} = .69732\ 82430\ 90519\ 39054$$

$$N/20243\ 97460 \cdot 10^{10} = .69732\ 82427\ 46057\ 26941$$

$$\text{Difference} = 3\ 44462\ 12113.$$

$$\text{Difference} \times .71664\ 32102 = 24685\ 644028 \cdot 10^{-20}$$

(note this is an 11×10 multiplication).

$$\begin{aligned} \text{Quotient} = \\ (69732\ 82430\ 90519\ 39054 - 246856\ 44028) \cdot 10^{-20} \\ = .69732\ 82428\ 43662\ 95026 \end{aligned}$$

There is an error of 3 units in the 20th place due to neglect of the contribution from second differences.

Method (2)—If N and d are numbers each not more than 19 digits let $N=N_1+N_010^9$, $d=d_1+d_010^9$ where N_0 and d_0 contain 10 digits and N_1 and d_1 not more than 9 digits. Then

$$\frac{N}{d} = \frac{N_010^9 + N_1}{d_010^9 + d_1} \approx \frac{1}{d_010^9} \left[N - \frac{N_0d_1}{d_0} \right]$$

Here

$$\begin{aligned} N &= 14116\ 69523\ 40138\ 1761, \\ d &= 20243\ 97459\ 71664\ 3210 \\ N_0 &= 14116\ 69523, \quad d_0 = 20243\ 97459, \\ & \quad d_1 = 71664\ 3210 \end{aligned}$$

- (1) $N_0d_1 = 10116\ 63378\ 42188\ 8830$ (product dial).
- (2) $(N_0d_1)/d_0 = 49973\ 55504$ (quotient dial).
- (3) $N - (N_0d_1)/d_0 = 14116\ 69522\ 90164\ 62106$ (product dial).

(4) $[N - (N_0d_1)/d_0]/d_010^9 = .69732\ 82428$ = first 10 digits of quotient in quotient dial. Remainder $= r = 08839\ 11654$, in positions 1 to 10 of product dial.

(5) $r/(d_010^9) = .43662\ 9502 \cdot 10^{-10}$ = next 9 digits of quotient. $N/d = .69732\ 82428\ 43662\ 9502$. This method may be modified to give the quotient of 20 digit numbers. Method (1) may be extended to quotients of numbers containing more than 20 digits by employing higher order interpolation.

Example 9. Sum the series $S = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ to 5D using the Euler transform.

The sum of the first 8 terms is .634524 to 6D. If $u_n = 1/n$ we get

n	u_n	Δu_n	$\Delta^2 u_n$	$\Delta^3 u_n$	$\Delta^4 u_n$
9	.111111				
		-11111			
10	.100000		2020		
		-9091		-505	
11	.090909		1515		156
		-7576		-349	
12	.083333		1166		
		-6410			
13	.076923				

From 3.6.27 we then obtain

$$\begin{aligned} S &= .634524 + \frac{.111111}{2} - \frac{(-.011111)}{2^2} + \frac{.002020}{2^3} \\ & \quad - \frac{(-.000505)}{2^4} + \frac{.000156}{2^5} \\ &= .634524 + .055556 + .002778 + .000253 \\ & \quad + .000032 + .000005 \\ &= .693148 \\ (S = \ln 2 = .6931472 \text{ to } 7D). \end{aligned}$$

Example 10. Evaluate the integral $\int_0^\infty \frac{\sin x}{x} dx = \frac{\pi}{2}$ to 4D using the Euler transform.

$$\int_0^\infty \frac{\sin x}{x} dx = \sum_{k=0}^\infty \int_{k\pi}^{(k+1)\pi} \frac{\sin x}{x} dx$$

$$= \sum_{k=0}^\infty \int_0^\pi \frac{\sin(k\pi+t)}{k\pi+t} dt = \sum_{k=0}^\infty (-1)^k \int_0^\pi \frac{\sin t}{k\pi+t} dt.$$

Evaluating the integrals in the last sum by numerical integration we get

k	$\int_0^\pi \frac{\sin t}{k\pi+t} dt$				
0	1.85194				
1	.43379				
2	.25661				
3	.18260	Δ	Δ^2	Δ^3	Δ^4
4	.14180				
5	.11593	-2587	799		
6	.09805	-1788	478	-321	153
7	.08495	-1310	310	-168	
8	.07495	-1000			

The sum to $k=3$ is 1.49216. Applying the Euler transform to the remainder we obtain

$$\frac{1}{2} (.14180) - \frac{1}{2^2} (-.02587) + \frac{1}{2^3} (.00799)$$

$$- \frac{1}{2^4} (-.00321) + \frac{1}{2^5} (.00153)$$

$$= .07090 + .00647 + .00100 + .00020$$

$$+ .00005$$

$$= .07862$$

We obtain the value of the integral as 1.57078 as compared with 1.57080.

Example 11. Sum the series $\sum_{k=1}^\infty k^{-2} = \frac{\pi^2}{6}$ using the Euler-Maclaurin summation formula. From 3.6.28 we have for $n = \infty$,

$$\sum_{k=1}^\infty k^{-2} = \sum_{k=1}^{10} k^{-2} + \sum_{k=1}^\infty (k+10)^{-2}$$

$$= \sum_{k=1}^{10} k^{-2} + \int_0^\infty f(k) dk - \frac{1}{2} f_0 - \frac{1}{12} f'_0$$

$$+ \frac{1}{720} f''_0 - \dots$$

where $f(k) = (k+10)^{-2}$. Thus,

$$\sum_{k=1}^\infty k^{-2} = 1.549767731 + .1$$

$$- .005 + .000166667 - .00000333$$

$$= 1.644934065,$$

as compared with $\frac{\pi^2}{6} = 1.644934067$.

Example 12. Compute

$$\arctan x = \frac{x}{1+} \frac{x^2}{3+} \frac{4x^2}{5+} \frac{9x^2}{7+} \dots$$

to 5D for $x = .2$. Here $a_1 = x$, $a_n = (n-1)^2 x^2$ for $n > 1$, $b_0 = 0$, $b_n = 2n-1$, $A_{-1} = 1$, $B_{-1} = 0$, $A_0 = 0$, $B_0 = 1$.

For $n \geq 1$

$$\begin{bmatrix} A_n \\ B_n \end{bmatrix} = \begin{vmatrix} A_{n-1} A_{n-2} \\ B_{n-1} B_{n-2} \end{vmatrix} \begin{bmatrix} 2n-1 \\ (n-1)^2 x^2 \end{bmatrix} \frac{A_0}{B_0} = 0$$

$$\begin{bmatrix} A_1 \\ B_1 \end{bmatrix} = \begin{vmatrix} 0 & 1 \\ 1 & 0 \end{vmatrix} \begin{vmatrix} 1 \\ .2 \end{vmatrix} = \begin{vmatrix} .2 \\ 1 \end{vmatrix} \frac{A_1}{B_1} = .2$$

$$\begin{bmatrix} A_2 \\ B_2 \end{bmatrix} = \begin{vmatrix} .2 & 0 \\ 1 & 1 \end{vmatrix} \begin{vmatrix} 3 \\ .04 \end{vmatrix} = \begin{vmatrix} .6 \\ 3.04 \end{vmatrix} \frac{A_2}{B_2} = .197368$$

$$\begin{bmatrix} A_3 \\ B_3 \end{bmatrix} = \begin{vmatrix} .6 & .2 \\ 3.04 & 1 \end{vmatrix} \begin{vmatrix} 5 \\ .16 \end{vmatrix} = \begin{vmatrix} 3.032 \\ 15.36 \end{vmatrix} \frac{A_3}{B_3} = .197396$$

$$\begin{bmatrix} A_4 \\ B_4 \end{bmatrix} = \begin{vmatrix} 3.032 & .6 \\ 15.36 & 3.04 \end{vmatrix} \begin{vmatrix} 7 \\ .36 \end{vmatrix} = \begin{vmatrix} 21.440 \\ 108.6144 \end{vmatrix} \frac{A_4}{B_4} = .197396$$

Note that in carrying out the recurrence method for computing continued fractions the numerators A_n and the denominators B_n must be used as originally computed. The numerators and denominators obtained by reducing A_n/B_n to lower terms must not be used.

The numbers in square brackets at the bottom of the page mean that the maximum error in a linear interpolate is $a \times 10^{-p}$ (p in parentheses), and that to interpolate to the full tabular accuracy m points must be used in Lagrange's and Aitken's methods for the respective functions $n^{1/2}$.

4.4. Inverse Circular Functions

Definitions

4.4.1

$$\arcsin z = \int_0^z \frac{dt}{(1-t^2)^{\frac{1}{2}}} \quad (z=x+iy)$$

4.4.2

$$\arccos z = \int_z^1 \frac{dt}{(1-t^2)^{\frac{1}{2}}} = \frac{\pi}{2} - \arcsin z$$

4.4.3

$$\arctan z = \int_0^z \frac{dt}{1+t^2}$$

The path of integration must not cross the real axis in the case of 4.4.1 and 4.4.2 and the imaginary axis in the case of 4.4.3 except possibly inside the unit circle. Each function is single-valued and regular in the z -plane cut along the real axis from $-\infty$ to -1 and $+1$ to $+\infty$ in the case of 4.4.1 and 4.4.2 and along the imaginary axis from i to $i\infty$ and $-i$ to $-i\infty$ in the case of 4.4.3.

Inverse circular functions are also written $\arcsin z = \sin^{-1} z$, $\arccos z = \cos^{-1} z$, $\arctan z = \tan^{-1} z$,

When $-1 \leq x \leq 1$, $\arcsin x$ and $\arccos x$ are real and

4.4.4 $-\frac{1}{2}\pi \leq \arcsin x \leq \frac{1}{2}\pi, \quad 0 < \arccos x \leq \pi$

4.4.5 $\arctan z + \operatorname{arccot} z = \pm \frac{1}{2}\pi \begin{matrix} Rz \geq 0 \\ Rz < 0 \end{matrix}$

4.4.6 $\operatorname{arccsc} z = \arcsin 1/z$

4.4.7 $\operatorname{arcsec} z = \arccos 1/z$

4.4.8 $\operatorname{arccot} z = \arctan 1/z$

4.4.9 $\operatorname{arcsec} z + \operatorname{arccsc} z = \frac{1}{2}\pi$

(see 4.3.45)

Numerical Methods

4.7. Use and Extension of the Tables

NOTE: In the examples given it is assumed that the arguments are exact.

Example 1. Computation of Common Logarithms.

To compute common logarithms, the number must be expressed in the form $x \cdot 10^q$, ($1 \leq x < 10$, $-\infty \leq q \leq \infty$). The common logarithm of $x \cdot 10^q$ consists of an integral part which is called the characteristic and a decimal part which is called the mantissa. Table 4.1 gives the common logarithm of x .

x	$x \cdot 10^q$	$\log_{10} x \cdot 10^q$
.009836	$9.836 \cdot 10^{-3}$	$\bar{3}.99281 \, 85 = (-2.00718 \, 15)$
.09836	$9.836 \cdot 10^{-2}$	$\bar{2}.99281 \, 85 = (-1.00718 \, 15)$
.9836	$9.836 \cdot 10^{-1}$	$\bar{1}.99281 \, 85 = (-0.00718 \, 15)$
9.836	$9.836 \cdot 10^0$	0.99281 85
98.36	$9.836 \cdot 10^1$	1.99281 85
983.6	$9.836 \cdot 10^2$	2.99281 85

Interpolation in Table 4.1 between 983 and 984 gives .99281 85 as the mantissa of 9836.

Note that $\bar{3}.99281 \, 85 = -3 + .99281 \, 85$. When q is negative the common logarithm can be expressed in the alternative forms

$\log_{10} (.009836) = \bar{3}.99281 \, 85 = 7.99281 \, 85 - 10$
 $= -2.00718 \, 15.$

The last form is convenient for conversion from common logarithms to natural logarithms.

The inverse of $\log_{10} x$ is called the antilogarithm of x , and is written $\operatorname{antilog} x$ or $\log^{-1} x$. The logarithm of the reciprocal of a number is called the cologarithm, written colog .

Example 2.

Compute $x^{-3/4}$ for $x=9.19826$ to 10D using the Table of Common Logarithms.

From Table 4.1, four-point Lagrangian interpolation gives $\log_{10} (9.19826) = .96370 \, 56812$. Then, $-\frac{3}{4} \log_{10} (x) = -.72277 \, 92609 = 9.27722 \, 07391 - 10$.

Linear inverse interpolation in Table 4.1 yields $\operatorname{antilog} (\bar{1}.27722) = .18933$. For 10 place accuracy subtabulation with 4-point Lagrangian interpolants produces the table

N	$\log_{10} N$	Δ	Δ^2
.18933	.27721 94350	2 29379	
.18934	.27724 23729	2 29366	-13
.18935	.27726 53095		

By linear inverse interpolation

$x^{-3/4} = .18933 \, 05685.$

Example 3.

Convert $\log_{10} x$ to $\ln x$ for $x=.009836$.

Using 4.1.23 and Table 4.1, $\ln (.009836) = \ln 10 \log_{10} (.009836) = 2.30258 \, 5093 (-2.00718 \, 15) = -4.62170 \, 62$.

Example 4.

Compute $\ln x$ for $x=.00278$ to 6D.

Using 4.1.7, 4.1.11 and Table 4.2, $\ln (.00278) = \ln (.278 \cdot 10^{-2}) = \ln (.278) - 2 \ln 10 = -5.885304$.

Linear interpolation between $x=.002$ and $x=.003$ would give $\ln(.00278) = -5.898$. To obtain 5 decimal place accuracy with linear interpolation it is necessary that $x > .175$.

Example 5.

Compute $\ln x$ for $x=1131.718$ to 8D.

Using 4.1.7, 4.1.11 and Table 4.2

$\ln 1131.718 = \ln \left(\frac{1131.718}{1131} \cdot 1131 \right)$
 $= \ln \frac{1131.718}{1131} + \ln 1.131 + \ln 10^3$
 $= \ln (1.00063 \, 4836) + \ln 1.131 + 3 \ln 10.$

*See page 11.

Then from 4.1.24

$$\begin{aligned} \ln 1131.718 &= (.00063 \ 4836) - \frac{1}{2}(.00063 \ 4836)^2 \\ &+ \ln 1.131 + 3 \ln 10 = .00063 \ 4836 - .00000 \ 0202 \\ &+ .12310 \ 2197 + 6.90775 \ 5279 = 7.03149 \ 211. \end{aligned}$$

Example 6.

Compute $\ln x$ working with 16D for
 $x = 1.38967 \ 12458 \ 179231$.

Since $\frac{x}{1.389} = 1.00048 \ 32583 \ 282384 = 1 + a$, using
 4.1.24 and Table 4.2 we compute successively

$$\begin{aligned} a &= .00048 \ 32583 \ 282384 \\ -\frac{a^2}{2} &= \underline{\hspace{1.5cm}} \quad 1167 \ 693059 \\ \frac{a^3}{3} &= \hspace{1.5cm} \quad 376199 \\ -\frac{a^4}{4} &= \underline{\hspace{1.5cm}} \quad 136 \\ \ln(1+a) &= .00048 \ 31415 \ 965388 \\ \ln 1.389 &= \underline{\hspace{1.5cm}} \quad .32858 \ 40637 \ 722067 \\ \ln x &= \underline{\hspace{1.5cm}} \quad .32906 \ 72053 \ 687455. \end{aligned}$$

Example 7.

Compute the principal value of $\ln(\pm 2 \pm 3i)$.
 From 4.1.2, 4.1.3 and Tables 4.2 and 4.14.

$$\begin{aligned} \ln(2+3i) &= \frac{1}{2} \ln(2^2+3^2) + i \arctan \frac{3}{2} \\ &= 1.282475 + i(.982794) \\ \ln(-2+3i) &= \frac{1}{2} \ln 13 + i \left(\pi - \arctan \frac{3}{2} \right) \\ &= 1.282475 + i(2.158799) \\ \ln(-2-3i) &= \frac{1}{2} \ln 13 + i \left(-\pi + \arctan \frac{3}{2} \right) \\ &= 1.282475 - i(2.158799) \\ \ln(2-3i) &= \frac{1}{2} \ln 13 + i \left(-\arctan \frac{3}{2} \right) \\ &= 1.282475 - i(.982794). \end{aligned}$$

Example 8.

Compute $(.227)^{.69}$ to 7D.
 Using 4.2.7 and Tables 4.2 and 4.4,

$$\begin{aligned} (.227)^{.69} &= e^{.69 \ln(.227)} = e^{.69(-1.48280 \ 5282)} \\ &= e^{-1.02313 \ 5631} = .35946 \ 60. \end{aligned}$$

Example 9.

Compute $e^{4.99728 \ 69}$ to 7S.
 Using 4.2.18 and Table 4.4,

$$e^{4.99728 \ 69} = e^{4.9} e^{.09728 \ 69}.$$

Linear interpolation gives $e^{.09728 \ 69} = 1.10217 \ 67$
 with an error of 1×10^{-7} ,

$$e^{4.99728 \ 69} = (134.28978)(1.10217 \ 67) = 148.0111.$$

Example 10.

Compute e^x to 18D for

$$x = .86725 \ 13489 \ 24685 \ 12693.$$

Let $a = x - .867$. Using 4.2.1, compute succes-
 sively

$$\begin{aligned} &1.00000 \ 00000 \ 00000 \ 00000 \\ a &= .00025 \ 13489 \ 24685 \ 12693 \\ \frac{a^2}{2!} &= \hspace{1.5cm} \quad 315 \ 88140 \ 97019 \\ \frac{a^3}{3!} &= \hspace{1.5cm} \quad 2646 \ 54842 \\ \frac{a^4}{4!} &= \underline{\hspace{1.5cm}} \quad 16630 \end{aligned}$$

$$e^a = 1.00025 \ 13805 \ 15472 \ 81184$$

$$e^{.867} = 2.37976 \ 08513 \ 29496 \ 863 \text{ from Table 4.4}$$

$$e^x e^{.867} = e^x = 2.38035 \ 90768 \ 39006 \ 089.$$

Example 11.

Compute e^{648} to 7S.

Let $n = \frac{x}{\ln 10}$ and $d =$ the decimal part of $\frac{x}{\ln 10}$.

Then

$$\begin{aligned} \exp x &= \exp \left(\frac{x}{\ln 10} \ln 10 \right) = \exp [(n+d) \ln 10] \\ &= \exp (\ln 10^n) \exp (d \ln 10) \\ &= 10^n \exp (d \ln 10) \end{aligned}$$

From Table 4.4

$$\begin{aligned} e^{648} &= \exp \left(\frac{648}{\ln 10} \ln 10 \right) = \exp (281.42282 \ 42 \ln 10) \\ &= 10^{281} \exp (.42282 \ 42 \ln 10) = 10^{281} \exp .97358 \ 87 \\ &= 10^{281} (2.647428) = (281) 2.647428. \end{aligned}$$

Example 12.

Compute e^{-x} for $x = .75$ using the expansion in
 Chebyshev polynomials.

Following the procedure in [4.3] we have from 4.2.48

$$e^{-x} = \sum_{k=0}^7 A_k T_k^*(x)$$

* where $T_k^*(x)$ are the Chebyshev polynomials defined in chapter 22. Assuming $b_8 = b_9 = 0$ we generate $b_k, k=7, 6, 5, \dots, 0$ from the recurrence relation

$$b_k = (4x-2)b_{k+1} - b_{k+2} + A_k$$

k	b_k
7	-.00000 0015
6	.00000 0400
5	-.00000 9560
4	.00018 9959
3	-.00300 9164
2	.03550 4993
1	-.27432 7449
0	.33520 2828

since $f(x) = b_0 - (2x-1)b_1,$

$$e^{-.75} = .33520 2828 - (.5)(-.27432 7449) = .47236 6553.$$

Example 13.

Express $38^\circ 42' 32''$ in radians to 6D.

$$\begin{aligned} 1^\circ &= .01745 32925 19943 29577 \text{ r} \\ 1' &= .00029 08882 08665 72159 62 \text{ r} \\ 1'' &= .00000 48481 36811 09535 9936 \text{ r} \end{aligned}$$

Therefore

$$\begin{aligned} 38^\circ &= .66322 51 \text{ r} \\ 42' &= .01221 73 \text{ r} \\ 32'' &= .00015 51 \text{ r} \\ 38^\circ 42' 32'' &= .675598 \text{ r.} \end{aligned}$$

Example 14.

Express $x=1.6789$ radians in degrees, minutes and seconds to the nearest tenth of a second.

From Table 1.1 giving the mathematical constants we have

$$\begin{aligned} 1 \text{ r} &= \frac{180^\circ}{\pi} = 57.29577 95130^\circ \dots \\ 1.6789 \text{ r} &= 96.19388^\circ \\ .19388^\circ \times 60 &= 11.633' \\ .633' \times 60 &= 38.0'' \\ 1.6789 \text{ r} &= 96^\circ 11' 38.0'' \end{aligned}$$

Example 15.

Compute $\sin x$ and $\cos x$ for $x=2.317$ to 7D. From 4.3.44 and Table 4.6

$$\begin{aligned} \sin(2.317) &= \sin(\pi - 2.317) = \sin(.82459 2654) \\ &= .73427 12 \end{aligned}$$

$$\begin{aligned} \cos(2.317) &= \cos(\pi - 2.317) = -\cos(.82459 2654) \\ &= -.67885 60. \end{aligned}$$

Linear interpolation for $x=.82459 2654$ gives an error of 9×10^{-8} .

Example 16.

Compute $\sin x$ for $x=12.867$ to 8D. From 4.3.16 and Tables 4.6 and 4.8

$$\begin{aligned} \sin(12.867) &= \sin 12 \cos .867 + \cos 12 \sin .867 \\ &= .29612 142. \end{aligned}$$

The method of reduction to an angle in the first quadrant which was given in Example 15 may also be used.

Example 17.

Compute $\sin x$ to 19D for

$$x = .86725 13489 24685 12693.$$

Let $\alpha = .867, \beta = x - \alpha$. From 4.3.16 and Table 4.6

$$\begin{aligned} \sin(\alpha + \beta) &= \sin \alpha \cos \beta + \cos \alpha \sin \beta \\ \sin \alpha &= .76239 10208 07866 22598 \\ \cos \alpha &= .64711 66288 94312 75010 \end{aligned}$$

With the series expansions for $\sin \beta$ and $\cos \beta$ we compute successively

$$\begin{array}{r} 1.00000 \quad 00000 \quad 00000 \quad 00000 \\ -\frac{\beta^2}{2!} = - \quad \quad \quad 315 \quad 88140 \quad 97019 \\ \frac{\beta^4}{4!} = \quad \quad \quad \quad \quad \quad \quad \quad \quad 16630 \\ \hline \cos \beta = \quad .99999 \quad 99684 \quad 11859 \quad 19611 \\ \beta = \quad .00025 \quad 13489 \quad 24685 \quad 12693 \\ -\frac{\beta^3}{3!} = - \quad \quad \quad \quad \quad \quad \quad 2646 \quad 54842 \\ \frac{\beta^5}{5!} = \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad 1 \end{array}$$

$$\begin{aligned} \sin \beta &= .00025 13489 22038 57852 \\ \sin \alpha \cos \beta &= .76239 09967 25351 31308 \\ \cos \alpha \sin \beta &= .00016 26520 67105 82436 \\ \hline \sin x &= .76255 36487 92457 1374 \end{aligned}$$

*See page 11.

This procedure is equivalent to interpolation with Taylor's formula 3.6.4.

Example 18.

In the plane triangle ABC , $a=123$, $B=29^\circ 16'$, $c=321$; find A , b .

$$b^2 = a^2 + c^2 - 2ac \cos B = (123)^2 + (321)^2 - 2(123)(321) \cos 29^\circ 16'$$

$$b = 221.99934 \ 00$$

$$\sin A = \frac{a \sin B}{b} = \frac{(123)(.48887 \ 50196)}{221.99934 \ 00} = .27086 \ 39918$$

$$A = 15^\circ 42' 56.469''.$$

Example 19.

In the plane triangle ABC , $a=4$, $b=7$, $c=9$, find A , B , and C .

$$\cos A = \frac{c^2 + b^2 - a^2}{2bc} = \frac{81 + 49 - 16}{2 \cdot 7 \cdot 9} = \frac{114}{126} = .90476 \ 1905$$

$$A = .43997 \ 5954 = 25^\circ 12' 31.6''$$

$$\sin A = .42591 \ 7709$$

$$\sin B = \frac{7(.42591 \ 7709)}{4}, \quad B = .84106 \ 8670 \\ = 48^\circ 11' 22.9''$$

$$\sin C = \frac{9(.42591 \ 7709)}{4}, \quad C = 1.86054 \ 803 \\ = 106^\circ 36' 5.6''$$

where the supplementary angle must be chosen for C . As a check we get $A+B+C=180^\circ 00' .1''$.

Example 20.

Compute $\cot x$ for $x=.4589$ to 6D.

Since $x < .5$, using **Table 4.9** with interpolation in $(x^{-1} - \cot x)$, we find $\frac{1}{.4589} - \cot(.4589) = .155159$. Therefore $\cot(.4589) = 2.179124 - .155159 = 2.023965$.

Example 21.

Compute $\arcsin x$ for $x=.99511$.

For $x > .95$, using **Table 4.14** with interpolation in the auxiliary function $f(x)$ we find

$$\arcsin x = \frac{\pi}{2} - [2(1-x)]^{\frac{1}{2}} f(x)$$

$$\arcsin(.99511) = \frac{\pi}{2} - [2(.00489)]^{\frac{1}{2}} f(.99511) \\ = 1.57079 \ 6327 - (.09889 \ 388252) \\ \quad \quad \quad (1.00040 \ 7951) \\ = 1.47186 \ 2100.$$

Example 22.

Compute $\arctan 20$ and $\operatorname{arccot} 20$ to 9D. Using 4.4.5, 4.4.8, and **Table 4.14** *

$$\arctan 20 = \frac{\pi}{2} - \arctan 1/20 = 1.52083 \ 7931$$

$$\operatorname{arccot} 20 = \frac{\pi}{2} - \arctan 20 = \arctan .05 = .04995 \ 8396.$$

Example 23.

Express $z=3+9i$ in polar form.

$$z = x + iy = re^{i\theta}, \text{ where } r = (x^2 + y^2)^{\frac{1}{2}},$$

$$\theta = \arctan \frac{y}{x} + 2\pi k, \quad k \text{ is an integer. For } k=0,$$

$$r = (3^2 + 9^2)^{\frac{1}{2}} = \sqrt{90} = 9.486833$$

$$\theta = \arctan 9/3 = \arctan 3 = 1.24904 \ 58.$$

Thus $3+9i = 9.486833 \exp(1.24904 \ 58i)$.

Example 24.

Compute $\arctan x$ for $x=1/3$ to 12D.

From 4.4.34 and 4.4.42 we have

$$\begin{aligned} \arctan x &= \arctan(x_0 + h) \\ &= \arctan x_0 + \arctan \frac{h}{1 + x_0 h + x_0^2} \\ &= \arctan x_0 + \left(\frac{h}{1 + x_0 h + x_0^2} \right) - \frac{1}{3} \left(\frac{h}{1 + x_0 h + x_0^2} \right)^3 + \dots \end{aligned}$$

We have

$x = \frac{1}{3} = .33333 \ 33333 \ 33$ so that $h = .00033 \ 33333 \ 33$ and, from **Table 4.14**, $\arctan x_0 = \arctan .333 = .32145 \ 05244 \ 03$. Since $\frac{h}{1 + x_0 h + x_0^2} = .00030 \ 00300 \ 03$ we get

$$\begin{aligned} \arctan x &= .32145 \ 05244 \ 03 + .00030 \ 00300 \ 03 \\ &\quad - .00000 \ 00000 \ 09 \\ &= .32175 \ 05543 \ 97. \end{aligned}$$

If x is given in the form b/a it is convenient to use 4.4.34 in the form

$$\arctan \frac{b}{a} = \arctan x_0 + \arctan \frac{b - ax_0}{a + bx_0}$$

In the present example we get

$$\arctan \frac{1}{3} = \arctan .333 + \arctan \frac{1}{3333}$$

*See page 11.

Example 25.

Compute arcsec 2.8 to 5D.
Using 4.3.45 and Table 4.14

$$\begin{aligned} \operatorname{arcsec} z &= \arcsin \frac{(z^2-1)^{\frac{1}{2}}}{z} \\ \operatorname{arcsec} 2.8 &= \arcsin \frac{[(2.8)^2-1]^{\frac{1}{2}}}{2.8} \\ &= \arcsin .93404\ 97735 \\ &= 1.20559 \end{aligned}$$

or using 4.3.45 and Table 4.14

$$\begin{aligned} \operatorname{arcsec} z &= \arctan (z^2-1)^{\frac{1}{2}} \\ \operatorname{arcsec} 2.8 &= \arctan 2.61533\ 9366 \\ &= \frac{\pi}{2} - \arctan .38235\ 95564, \\ &\hspace{15em} \text{from 4.4.3 and 4.4.8} \\ &= 1.570796 - .365207 \\ &= 1.20559. \end{aligned}$$

Example 26.

Compute arctanh x for $x=.96035$ to 6D.
From 4.6.22 and Table 4.2

$$\begin{aligned} \operatorname{arctanh} .96035 &= \frac{1}{2} \ln \frac{1+.96035}{1-.96035} = \frac{1}{2} \ln \frac{1.96035}{.03965} \\ &= \frac{1}{2} \ln 49.44136\ 191 \\ &= \frac{1}{2}(3.90078\ 7359) = 1.950394. \end{aligned}$$

Example 27.

Compute arccosh x for $x=1.5368$ to 6D.
Using Table 4.17

$$\begin{aligned} \frac{\operatorname{arccosh} x}{(x^2-1)^{\frac{1}{2}}} &= \frac{\operatorname{arccosh} 1.5368}{[(1.5368)^2-1]^{\frac{1}{2}}} = .852346 \\ \operatorname{arccosh} 1.5368 &= (.852346)(1.361754)^{\frac{1}{2}} \\ &= (.852346)(1.166942) \\ &= .994638. \end{aligned}$$

Example 28.

Compute arccosh x for $x=31.2$ to 5D.
Using Tables 4.2 and 4.17 with $1/x=1/31.2$
 $=.03205\ 128205$

$$\begin{aligned} \operatorname{arccosh} 31.2 - \ln 31.2 &= .692886 \\ \operatorname{arccosh} 31.2 &= .692886 + 3.440418 = 4.13330. \end{aligned}$$

$\langle \lambda \rangle$ = nearest integer to λ .

For $\lambda^{-1} > .20$, the maximum error in linear interpolation is $(-4)7$; five-point interpolation gives 5D.

For $\lambda^{-1} \leq .20$,

$$x_1 \approx \frac{1}{\sqrt{\lambda}} \left[1 - \frac{1}{6\lambda} + \frac{11}{360\lambda} 2 - \frac{1}{432\lambda} 3 + \dots \right].$$

5. Exponential Integral and Related Functions

Mathematical Properties

5.1. Exponential Integral

Definitions

$$5.1.1 \quad E_1(z) = \int_z^\infty \frac{e^{-t}}{t} dt \quad (|\arg z| < \pi)$$

$$5.1.2 \quad \text{Ei}(x) = -\int_{-x}^\infty \frac{e^{-t}}{t} dt = \int_{-\infty}^x \frac{e^t}{t} dt \quad (x > 0)$$

$$5.1.3 \quad \text{li}(x) = \int_0^x \frac{dt}{\ln t} = \text{Ei}(\ln x) \quad (x > 1)$$

5.1.4

$$E_n(z) = \int_1^\infty \frac{e^{-zt}}{t^n} dt \quad (n=0, 1, 2, \dots; \Re z > 0)$$

5.1.5

$$\alpha_n(z) = \int_1^\infty t^n e^{-zt} dt \quad (n=0, 1, 2, \dots; \Re z > 0)$$

$$5.1.6 \quad \beta_n(z) = \int_{-1}^1 t^n e^{-zt} dt \quad (n=0, 1, 2, \dots)$$

In 5.1.1 it is assumed that the path of integration excludes the origin and does not cross the negative real axis.

Analytic continuation of the functions in 5.1.1, 5.1.2, and 5.1.4 for $n > 0$ yields multi-valued functions with branch points at $z=0$ and $z=\infty$.³ They are single-valued functions in the z -plane cut along the negative real axis.⁴ The function $\text{li}(z)$, the logarithmic integral, has an additional branch point at $z=1$.

Interrelations

5.1.7

$$E_1(-x \pm i0) = -\text{Ei}(x) \mp i\pi,$$

$$-\text{Ei}(x) = \frac{1}{2}[E_1(-x+i0) + E_1(-x-i0)] \quad (x > 0)$$

³ Some authors [5.14], [5.16] use the entire function $\int_0^z (1-e^{-t})dt/t$ as the basic function and denote it by $\text{Ein}(z)$. We have $\text{Ein}(z) = E_1(z) + \ln z + \gamma$.

⁴ Various authors define the integral $\int_{-\infty}^z (e^t/t)dt$ in the z -plane cut along the positive real axis and denote it also by $\text{Ei}(z)$. For $z=x > 0$ additional notations such as $\overline{\text{Ei}}(x)$ (e.g., in [5.10], [5.25]), $E^*(x)$ (in [5.2]), $\text{Ei}^*(x)$ (in [5.6]) are then used to designate the principal value of the integral. Correspondingly, $E_1(x)$ is often denoted by $-\text{Ei}(-x)$.

Explicit Expressions for $\alpha_n(z)$ and $\beta_n(z)$

$$5.1.8 \quad \alpha_n(z) = n! z^{-n-1} e^{-z} \left(1 + z + \frac{z^2}{2!} + \dots + \frac{z^n}{n!} \right)$$

5.1.9

$$\beta_n(z) = n! z^{-n-1} \left\{ e^z \left[1 - z + \frac{z^2}{2!} - \dots + (-1)^n \frac{z^n}{n!} \right] - e^{-z} \left(1 + z + \frac{z^2}{2!} + \dots + \frac{z^n}{n!} \right) \right\}$$

Numerical Methods

5.3. Use and Extension of the Tables

Example 1. Compute Ci (.25) to 5D. From Tables 5.1 and 4.2 we have

$$\frac{\text{Ci}(.25) - \ln(.25) - \gamma}{(.25)^2} = -.249350,$$

$$\text{Ci}(.25) = (.25)^2(-.249350) + (-1.38629) + .577216 = -.82466.$$

Example 2. Compute Ei (8) to 5S.

From Table 5.1 we have $xe^{-x}\text{Ei}(x) = 1.18185$ for $x=8$. From Table 4.4, $e^8 = 2.98096 \times 10^3$. Thus $\text{Ei}(8) = 440.38$.

Example 3. Compute Si (20) to 5D.

Since $1/20 = .05$ from Table 5.2 we find $f(20) = .049757$, $g(20) = .002464$. From Table 4.3, $\sin 20 = .912945$, $\cos 20 = .408082$. Using 5.2.8

$$\begin{aligned} \text{Si}(20) &= \frac{\pi}{2} - f(20) \cos 20 - g(20) \sin 20 \\ &= 1.570796 - .022555 = 1.54824. \end{aligned}$$

Example 4. Compute $E_n(x)$, $n=1(1)N$, to 5S for $x=1.275$, $N=10$.

If x is less than about five, the recurrence relation 5.1.14 can be used in increasing order of n without serious loss of accuracy.

By quadratic interpolation in Table 5.1 we get $E_1(1.275) = .1408099$, and from Table 4.4, $e^{-1.275} = .2794310$. The recurrence formula 5.1.14 then yields

n	$E_n(1.275)$	$E_n(1.275)$
1	.1408099	6 .0430168
2	.0998984	7 .0374307
3	.0760303	8 .0331009
4	.0608307	9 .0296534
5	.0504679	10 .0268469

Interpolating directly in Table 5.4 for $n=10$ we get $E_{10}(1.275)=.0268470$ as a check.

Example 5. Compute $E_n(x)$, $n=1(1)N$, to 5S for $x=10$, $N=10$.

If, as in this example, x is appreciably larger than five and $N \leq x$, then the recurrence relation 5.1.14 may be safely used in decreasing order of n ([5.5]). From Table 5.5 for $x^{-1}=.1$ we get $(x+10)e^xE_{10}(x)=1.02436$ so that $E_{10}(10)=2.32529 \times 10^{-6}$. Using this as the initial value we obtain column (2).

n	$10^6 E_n(10)$ (1)	$10^6 E_n(10)$ (2)
1	.41570	.41570
2	.38300	.38302
3	.35500	.35488
4	.33000	.33041
5	.31000	.30898
6	.28800	.29005
7	.27667	.27325
8	.25333	.25822
9	.25084	.24472
10	.22573	.23253

From Table 5.2 we get $xe^xE_1(x)=.915633$ so that $E_1(10)=4.15697 \times 10^{-6}$ as a check. Forward recurrence starting with $E_1(10)=4.1570 \times 10^{-6}$ yields the values in column (1). The underlined figures are in error.

Example 6. Compute $E_n(x)$, $n=1(1)N$, to 5S for $x=12.3$, $N=20$.

If N is appreciably larger than x , and x appreciably larger than five, then the recurrence relation 5.1.14 should be used in the backward direction to generate $E_n(x)$ for $n < n_0$, and in the forward direction to generate $E_n(x)$ for $n > n_0$, where $n_0 = \langle x \rangle$.

From 5.1.52, with $n_0=12$, $x=12.3$, we have

$$E_{n_0}(x) = \frac{e^{-12.3}}{24.3} (1 + .02032 - .00043 - .00001) = 1.91038 \times 10^{-7}.$$

Using the recurrence relation 5.1.14, as indicated, we get

n	$10^6 E_n(12.3)$	$10^6 E_n(12.3)$	n
12	.191038	.191038	12
11	.199213	.183498	13
10	.208098	.176516	14
9	.217793	.170042	15
8	.228406	.164015	16
7	.240073	.158397	17
6	.252951	.153144	18
5	.267234	.148226	19
4	.283155	.143608	20
3	.300998		
2	.321117		
1	.343953		

From Tables 5.2 and 5.5 we find $E_1(12.3)=.343953 \times 10^{-6}$, $E_{20}(12.3)=.143609 \times 10^{-6}$ as a check.

Example 7. Compute $\alpha_n(2)$ to 6S for $n=1(1)5$.

The recurrence formula 5.1.15 can be used for all $x > 0$ in increasing order of n without loss of accuracy. From 5.1.25 we have $\alpha_0(2) = \frac{1}{2}e^{-2} = .0676676$, so we get

n	$\alpha_n(2)$
0	.0676676
1	.101501
2	.169169
3	.321421
4	.710510
5	1.84394

Independent calculation with 5.1.8 yields the same result for $\alpha_5(2)$.

The functions $\alpha_0(x)$ and $\alpha_1(x)$ can be obtained from Table 10.8 using 5.1.48, 5.1.49.

Example 8. Compute $\beta_n(x)$, $n=0(1)N$ to 6S for $x=1$, $N=5$.

Use the recurrence relation 5.1.16 in increasing order of n if

$$x > .368N + .184 \ln N + .821$$

and in decreasing order of n otherwise [5.5].

From 5.1.9 with $n=5$ we get $\beta_5(1) = -.324297$ correctly rounded to 6D. Using the recurrence formula 5.1.16 in decreasing order of n and carrying 9D we get the values in column (2).

n	$\beta_n(1)$ (1)	$\beta_n(1)$ (2)
0	2.35040 2	2.35040 2389
1	-.73575 9269	-.73575 8880
2	.87888 3849	.87888 4629
3	-.44950 9722	-.44950 7383
4	.55236 3499	.55237 2854
5	-.32434 3774	-.32429 7

Using forward recurrence instead, starting with

$\beta_0(1)=2 \sinh 1=2.350402$ and again carrying 9D, we obtain column (1). The underlined figures are in error. The above shows that three significant figures are lost in forward recurrence, whereas about three significant figures are gained in backward recurrence!

An alternative procedure is to start with an arbitrary value for n sufficiently large (see also [5.1]). To illustrate, starting with the value zero at $n=11$ we get

n	$\beta_n(1)$	n	$\beta_n(1)$
11	0.	5	-.324297
10	.280560	4	.552373
9	-.206984	3	-.449507
8	.319908	2	.878885
7	-.253812	1	-.735759
6	.404621	0	2.350402

The functions $\beta_0(x)$ and $\beta_1(x)$ can be obtained from Table 10.8 using 5.1.48, 5.1.49.

Example 9. Compute $E_1(z)$ for $z=3.2578+6.8943i$.

From Table 5.6 we have for $z_0=x_0+iy_0=3+7i$
 $z_0 e^{z_0} E_1(z_0) = .934958 + .095598i,$
 $e^{z_0} E_1(z_0) = .059898 - .107895i.$

From Taylor's formula with $f(z)=e^z E_1(z)$ we have

$$f(z) = f(z_0 + \Delta z) = f(z_0) + \frac{f'(z_0)}{1!} \Delta z + \frac{f''(z_0)}{2!} (\Delta z)^2 + \dots$$

with $\Delta z = z - z_0 = .2578 - .1057i$. Thus with 5.1.27 we get

k	$f^{(k)}(z_0)/k!$	$(\Delta z)^k f^{(k)}(z_0)/k!$
0	.059898 - .107895i	.059898 - .107895i
1	.008174 + .012795i	.003460 + .002435i
2	-.001859 + .000155i	-.000094 + .000110i
3	.000088 - .000212i	-.000003 - .000004i

$$f(z) = .063261 - .105354i$$

$$e^{-z} = .031510 - .022075i$$

$$E_1(z) = -.000332 - .004716i$$

Repeating the calculation with $z_0=3+6i$ and $\Delta z = .2578 + .8943i$ we get the same result.

An alternative procedure is to perform bivariate interpolation in the real and imaginary parts of $z e^z E_1(z)$.

Example 10. Compute $E_1(z)$ for $z = -4.2 + 12.7i$.

Using the formula at the bottom of Table 5.6

$$e^z E_1(z) \approx \frac{.711093}{-3.784225 + 12.7i} + \frac{.278518}{-1.90572 + 12.7i} + \frac{.010389}{2.0900 + 12.7i}$$

$$= -.0184106 - .0736698i$$

$$E_1(z) \approx -1.87133 - 4.70540i.$$

Si($n\pi$) are maximum values of Si(x) if $n > 0$ is odd, and minimum values if $n > 0$ is even.

Ci $\left[\left(n + \frac{1}{2} \right) \pi \right]$ are maximum values of Ci(x) if $n > 0$ is even, and minimum values if $n > 0$ is

odd. We have

$$Si(n\pi) \sim \frac{\pi}{2} - \frac{(-1)^n}{n\pi} \left[1 - \frac{2!}{n^2 \pi^2} + \frac{4!}{n^4 \pi^4} - \dots \right] \quad (n \rightarrow \infty)$$

$$Ci \left[\left(n + \frac{1}{2} \right) \pi \right] \sim \frac{(-1)^n}{\left(n + \frac{1}{2} \right) \pi} \left[1 - \frac{2!}{\left(n + \frac{1}{2} \right)^2 \pi^2} + \frac{4!}{\left(n + \frac{1}{2} \right)^4 \pi^4} - \dots \right] \quad (n \rightarrow \infty)$$

6. Gamma Function and Related Functions

Mathematical Properties

6.1. Gamma (Factorial) Function

Euler's Integral

$$6.1.1 \quad \Gamma(z) = \int_0^{\infty} t^{z-1} e^{-t} dt \quad (\Re z > 0)$$

$$= k^z \int_0^{\infty} t^{z-1} e^{-kt} dt \quad (\Re z > 0, \Re k > 0)$$

Euler's Formula

$$6.1.2 \quad \Gamma(z) = \lim_{n \rightarrow \infty} \frac{n! n^z}{z(z+1) \dots (z+n)} \quad (z \neq 0, -1, -2, \dots)$$

Euler's Infinite Product

$$6.1.3 \quad \frac{1}{\Gamma(z)} = z e^{\gamma z} \prod_{n=1}^{\infty} \left[\left(1 + \frac{z}{n}\right) e^{-z/n} \right] \quad (|z| < \infty)$$

$$\gamma = \lim_{m \rightarrow \infty} \left[1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots + \frac{1}{m} - \ln m \right]$$

$$= .57721 56649 \dots$$

γ is known as Euler's constant and is given to 25 decimal places in chapter 1. $\Gamma(z)$ is single valued and analytic over the entire complex plane, save for the points $z = -n$ ($n = 0, 1, 2, \dots$) where it possesses simple poles with residue $(-1)^n/n!$. Its reciprocal $1/\Gamma(z)$ is an entire function possessing simple zeros at the points $z = -n$ ($n = 0, 1, 2, \dots$).

Hankel's Contour Integral

$$6.1.4 \quad \frac{1}{\Gamma(z)} = \frac{i}{2\pi} \int_C (-t)^{-z} e^{-t} dt \quad (|z| < \infty)$$

The path of integration C starts at $+\infty$ on the real axis, circles the origin in the counterclockwise direction and returns to the starting point.

Factorial and Π Notations

$$6.1.5 \quad \Pi(z) = z! = \Gamma(z+1)$$

Integer Values

$$6.1.6 \quad \Gamma(n+1) = 1 \cdot 2 \cdot 3 \dots (n-1)n = n!$$

6.1.7

$$\lim_{z \rightarrow n} \frac{1}{\Gamma(-z)} = 0 = \frac{1}{(-n-1)!} \quad (n = 0, 1, 2, \dots)$$

Fractional Values

$$6.1.8 \quad \Gamma\left(\frac{1}{2}\right) = 2 \int_0^{\infty} e^{-t^2} dt = \pi^{1/2} = 1.77245 38509 \dots = \left(-\frac{1}{2}\right)!$$

—, $y = \Gamma(x)$, - - - - , $y = 1/\Gamma(x)$

$$6.1.9 \quad \Gamma(3/2) = \frac{1}{2} \pi^{1/2} = .88622 69254 \dots = \left(\frac{1}{2}\right)!$$

$$6.1.10 \quad \Gamma\left(n + \frac{1}{2}\right) = \frac{1 \cdot 5 \cdot 9 \cdot 13 \dots (4n-3)}{4^n} \Gamma\left(\frac{1}{2}\right)$$

$$\Gamma\left(\frac{1}{2}\right) = 3.62560 99082 \dots$$

$$6.1.11 \quad \Gamma\left(n + \frac{1}{3}\right) = \frac{1 \cdot 4 \cdot 7 \cdot 10 \dots (3n-2)}{3^n} \Gamma\left(\frac{1}{3}\right)$$

$$\Gamma\left(\frac{1}{3}\right) = 2.67893 85347 \dots$$

$$6.1.12 \quad \Gamma\left(n + \frac{1}{2}\right) = \frac{1 \cdot 3 \cdot 5 \cdot 7 \dots (2n-1)}{2^n} \Gamma\left(\frac{1}{2}\right)$$

$$6.1.13 \quad \Gamma\left(n + \frac{2}{3}\right) = \frac{2 \cdot 5 \cdot 8 \cdot 11 \dots (3n-1)}{3^n} \Gamma\left(\frac{2}{3}\right)$$

$$\Gamma\left(\frac{2}{3}\right) = 1.35411 79394 \dots$$

$$6.1.14 \quad \Gamma\left(n + \frac{3}{4}\right) = \frac{3 \cdot 7 \cdot 11 \cdot 15 \dots (4n-1)}{4^n} \Gamma\left(\frac{3}{4}\right)$$

$$\Gamma\left(\frac{3}{4}\right) = 1.22541 67024 \dots$$

Numerical Methods

6.7. Use and Extension of the Tables

Example 1. Compute $\Gamma(6.38)$ to 8S. Using the recurrence relation 6.1.16 and Table 6.1 we have,

$$\Gamma(6.38) = [(5.38)(4.38)(3.38)(2.38)(1.38)] \Gamma(1.38) = 2.3243671.$$

Example 2. Compute $\ln \Gamma(56.38)$, using Table 6.4 and linear interpolation in f_2 . We have

$$\ln \Gamma(56.38) = (56.38 - \frac{1}{2}) \ln(56.38) - (56.38) + f_2(56.38)$$

The error of linear interpolation in the table of the function f_2 is smaller than 10^{-7} in this region. Hence, $f_2(56.38) = .9204167$ and $\ln \Gamma(56.38) = 169.8549742$.

Direct interpolation in Table 6.4 of $\log_{10} \Gamma(n)$ eliminates the necessity of employing logarithms. However, the error of linear interpolation is .002 so that $\log_{10} \Gamma(n)$ is obtained with a relative error of 10^{-5} .

*See page 11.

Example 3. Compute $\psi(6.38)$ to 8S. Using the recurrence relation 6.3.6 and Table 6.1.

$$\begin{aligned} \psi(6.38) &= \frac{1}{5.38} + \frac{1}{4.38} + \frac{1}{3.38} + \frac{1}{2.38} + \frac{1}{1.38} + \psi(1.38) \\ &= 1.77275\ 59. \end{aligned}$$

Example 4. Compute $\psi(56.38)$. Using Table 6.3 we have $\psi(56.38) = \ln 56.38 - f_3(56.38)$.

The error of linear interpolation in the table of the function f_3 is smaller than 8×10^{-7} in this region. Hence, $f_3(56.38) = .00889\ 53$ and $\psi(56.38) = 4.023219$.

Example 5. Compute $\ln \Gamma(1-i)$. From the reflection principle 6.1.23 and Table 6.7, $\ln \Gamma(1-i) = \overline{\ln \Gamma(1+i)} = -.6509 + .3016i$.

Example 6. Compute $\ln \Gamma(\frac{1}{2} + \frac{1}{2}i)$. Taking the logarithm of the recurrence relation 6.1.15 we have,

$$\begin{aligned} \ln \Gamma(\frac{1}{2} + \frac{1}{2}i) &= \ln \Gamma(\frac{3}{2} + \frac{1}{2}i) - \ln(\frac{1}{2} + \frac{1}{2}i) \\ &= -.23419 + .03467i \\ &\quad - (\frac{1}{2} \ln \frac{1}{2} + i \arctan 1) \\ &= .11239 - .75073i \end{aligned}$$

The logarithms of complex numbers are found from 4.1.2.

Example 7. Compute $\ln \Gamma(3+7i)$ using the duplication formula 6.1.18. Taking the logarithm of 6.1.18, we have

$$\begin{aligned} -\frac{1}{2} \ln 2\pi &= -.91894 \\ (\frac{5}{2} + 7i) \ln 2 &= 1.73287 + 4.85203i \\ \ln \Gamma(\frac{3}{2} + \frac{7}{2}i) &= -3.31598 + 2.32553i \\ \ln \Gamma(2 + \frac{7}{2}i) &= -2.66047 + 2.93869i \\ \ln \Gamma(3+7i) &= -5.16252 + 10.11625i \end{aligned}$$

Example 8. Compute $\ln \Gamma(3+7i)$ to 5D using the asymptotic formula 6.1.41. We have

$$\ln(3+7i) = 2.03022\ 15 + 1.16590\ 45i.$$

Then,

$$\begin{aligned} (2.5+7i) \ln(3+7i) &= -3.0857779 + 17.1263119i \\ -(3+7i) &= -3.0000000 - 7.0000000i \\ \frac{1}{2} \ln(2\pi) &= .9189385 \\ [12(3+7i)]^{-1} &= .0043103 - .0100575i \\ -[360(3+7i)^3]^{-1} &= .0000059 - .0000022i \end{aligned}$$

$$\ln \Gamma(3+7i) = -5.16252 + 10.11625i$$

An infinite series whose general term is a rational function of the index may always be reduced to a finite series of psi and polygamma functions. The method will be illustrated by writing the explicit formula when the denominator contains a triple root.

Let the general term of an infinite series have the form

$$u_n = \frac{p(n)}{d_1(n)d_2(n)d_3(n)}$$

where

$$d_1(n) = (n + \alpha_1)(n + \alpha_2) \dots (n + \alpha_m)$$

$$d_2(n) = (n + \beta_1)^2(n + \beta_2)^2 \dots (n + \beta_r)^2$$

$$d_3(n) = (n + \gamma_1)^3(n + \gamma_2)^3 \dots (n + \gamma_s)^3$$

where $p(n)$ is a polynomial of degree $m + 2r + 3s - 2$ at most and where the constants $\alpha_i, \beta_i,$ and γ_i are distinct. Expand u_n in partial fractions as follows

$$\begin{aligned} u_n &= \sum_{k=1}^m \frac{a_k}{(n + \alpha_k)} + \sum_{k=1}^r \frac{b_{1k}}{(n + \beta_k)} + \frac{b_{2k}}{(n + \beta_k)^2} \\ &\quad + \sum_{k=1}^s \frac{c_{1k}}{(n + \gamma_k)} + \frac{c_{2k}}{(n + \gamma_k)^2} + \frac{c_{3k}}{(n + \gamma_k)^3} \\ \sum_{k=1}^m a_k + \sum_{k=1}^r b_{1k} + \sum_{k=1}^s c_{1k} &= 0. \end{aligned}$$

Then, we may express $\sum_{n=1}^{\infty} u_n$ in terms of the constants appearing in this partial fraction expansion as follows

$$\begin{aligned} \sum_{n=1}^{\infty} u_n &= -\sum_{j=1}^m a_j \psi(1 + \alpha_j) \\ &\quad - \sum_{j=1}^r b_{1j} \psi(1 + \beta_j) + \sum_{j=1}^r b_{2j} \psi'(1 + \beta_j) \\ &\quad - \sum_{j=1}^s c_{1j} \psi(1 + \gamma_j) + \sum_{j=1}^s c_{2j} \psi'(1 + \gamma_j) \\ &\quad - \sum_{j=1}^s \frac{c_{3j}}{2!} \psi''(1 + \gamma_j). \end{aligned}$$

Higher order repetitions in the denominator are handled similarly. If the denominator contains

only simple or double roots, omit the corresponding lines.

Example 9. Find

$$s = \sum_{n=1}^{\infty} \frac{1}{(n+1)(2n+1)(4n+1)}$$

Since

$$\frac{1}{(n+1)(2n+1)(4n+1)} = \frac{\frac{1}{3}}{n+1} - \frac{1}{n+\frac{1}{2}} + \frac{\frac{2}{3}}{n+\frac{1}{4}}$$

we have

$$\alpha_1=1, \alpha_2=\frac{1}{2}, \alpha_3=\frac{1}{4}, a_1=\frac{1}{3}, a_2=-1, a_3=\frac{2}{3}$$

Thus,

$$s = -\frac{1}{3}\psi(2) + \psi(1\frac{1}{2}) - \frac{2}{3}\psi(1\frac{1}{4}) = .047198.$$

Example 10.

Find $s = \sum_{n=1}^{\infty} \frac{1}{n^2(8n+1)^2}$

Since $\frac{1}{n^2(8n+1)^2} = -\frac{16}{n} + \frac{16}{n+\frac{1}{8}} + \frac{1}{n^2} + \frac{1}{(n+\frac{1}{8})^2}$,

we have,

$$\beta_1=0, \beta_2=\frac{1}{8}, b_{11}=-16, b_{12}=16, b_{21}=1, b_{22}=1.$$

Therefore

$$s = 16\psi(1) - 16\psi(1\frac{1}{8}) + \psi'(1) + \psi'(1\frac{1}{8}) = .013499.$$

Example 11.

Evaluate $s = \sum_{n=1}^{\infty} \frac{1}{(n^2+1)(n^2+4)}$ (see also 6.3.13).

We have, $\frac{1}{(n^2+1)(n^2+4)} = \frac{i}{6} \left(\frac{1}{n+i} - \frac{1}{n-i} \right) - \frac{i}{12} \left(\frac{1}{n+2i} - \frac{1}{n-2i} \right)$.

Hence, $a_1 = \frac{i}{6}, a_2 = -\frac{i}{6}, a_3 = -\frac{i}{12}, a_4 = \frac{i}{12}$,

$$\alpha_1=i, \alpha_2=-i, \alpha_3=2i, \alpha_4=-2i,$$

and therefore

$$s = \frac{-i}{6} [\psi(1+i) - \psi(1-i)] + \frac{i}{12} [\psi(1+2i) - \psi(1-2i)].$$

By 6.3.9, this reduces to

$$s = \frac{1}{3} \mathcal{I} \psi(1+i) - \frac{1}{6} \mathcal{I} \psi(1+2i).$$

From Table 6.8, $s = .13876$.

7. Error Function and Fresnel Integrals

Mathematical Properties

7.1. Error Function

Definitions

$$7.1.1 \quad \operatorname{erf} z = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2} dt$$

$$7.1.2 \quad \operatorname{erfc} z = \frac{2}{\sqrt{\pi}} \int_z^\infty e^{-t^2} dt = 1 - \operatorname{erf} z$$

$$7.1.3 \quad w(z) = e^{-z^2} \left(1 + \frac{2i}{\sqrt{\pi}} \int_0^z e^{t^2} dt \right) = e^{-z^2} \operatorname{erfc}(-iz)$$

In 7.1.2 the path of integration is subject to the restriction $\arg t \rightarrow \alpha$ with $|\alpha| < \frac{\pi}{4}$ as $t \rightarrow \infty$ along the path. ($\alpha = \frac{\pi}{4}$ is permissible if $\Re t^2$ remains bounded to the left.)

Integral Representation

$$7.1.4 \quad w(z) = \frac{i}{\pi} \int_{-\infty}^{\infty} \frac{e^{-t^2} dt}{z-t} = \frac{2iz}{\pi} \int_0^{\infty} \frac{e^{-t^2} dt}{z^2-t^2} \quad (\Im z > 0)$$

FIGURE 7.1. $y = e^{-x^p} \int_x^\infty e^{-t^p} dt$.
p=2(1)6

Series Expansions

$$7.1.5 \quad \operatorname{erf} z = \frac{2}{\sqrt{\pi}} \sum_{n=0}^{\infty} \frac{(-1)^n z^{2n+1}}{n!(2n+1)}$$

$$7.1.6 \quad = \frac{2}{\sqrt{\pi}} e^{-z^2} \sum_{n=0}^{\infty} \frac{2^n}{1 \cdot 3 \dots (2n+1)} z^{2n+1}$$

$$7.1.7 \quad = \sqrt{2} \sum_{n=0}^{\infty} (-1)^n [I_{2n+1/2}(z^2) - I_{2n+3/2}(z^2)]$$

$$7.1.8 \quad w(z) = \sum_{n=0}^{\infty} \frac{(iz)^n}{\Gamma\left(\frac{n}{2}+1\right)}$$

For $I_{n-1}(x)$, see chapter 10.

Symmetry Relations

$$7.1.9 \quad \operatorname{erf}(-z) = -\operatorname{erf} z$$

$$7.1.10 \quad \operatorname{erf} \bar{z} = \overline{\operatorname{erf} z}$$

$$7.1.11 \quad w(-z) = 2e^{-z^2} - w(z)$$

$$7.1.12 \quad w(\bar{z}) = \overline{w(-z)}$$

Inequalities [7.11], [7.17]

7.1.13

$$\frac{1}{x + \sqrt{x^2 + 2}} < e^{x^2} \int_x^\infty e^{-t^2} dt \leq \frac{1}{x + \sqrt{x^2 + \frac{4}{\pi}}} \quad (x \geq 0)$$

(For other inequalities see [7.2].)

Continued Fractions

7.1.14

$$2e^{z^2} \int_z^\infty e^{-t^2} dt = \frac{1}{z} - \frac{1/2}{z^2} + \frac{1}{z^3} - \frac{3/2}{z^4} + \frac{2}{z^5} - \dots \quad (\Re z > 0)$$

7.1.15

$$\frac{1}{\sqrt{\pi}} \int_{-\infty}^\infty \frac{e^{-t^2} dt}{z-t} = \frac{1}{z} - \frac{1/2}{z^2} + \frac{1}{z^3} - \frac{3/2}{z^4} + \frac{2}{z^5} - \dots$$

$$= \frac{1}{\sqrt{\pi}} \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{H_k^{(n)}}{z - x_k^{(n)}} \quad (\Im z \neq 0)$$

$x_k^{(n)}$ and $H_k^{(n)}$ are the zeros and weight factors of the Hermite polynomials. For numerical values see chapter 25.

$$F(x) = e^{-x^2} \int_0^x e^{t^2} dt$$

7.1.17 $F(.92413 88730 \dots) = .54104 42246 \dots$

7.1.18 $F(1.50197 52682 \dots) = .42768 66160 \dots$

7.1.20

$$w^{(n+2)}(z) + 2zw^{(n+1)}(z) + 2(n+1)w^{(n)}(z) = 0$$

$$(n=0, 1, 2, \dots)$$

$$w^{(0)}(z) = w(z), \quad w'(z) = -2zw(z) + \frac{2i}{\sqrt{\pi}}$$

(For the Hermite polynomials $H_n(z)$ see chapter 22.)

$$|\theta| < 1 \quad \left(|\arg z| < \frac{\pi}{4}\right)$$

For x real, $R_n(x)$ is less in absolute value than the first neglected term and of the same sign.

7.3.30

$$R_n^{(g)}(z) = (-1)^n \frac{1 \cdot 3 \dots (4n+1)}{(\pi z^2)^{2n}} \theta^{(g)},$$

$$\theta^{(g)} = \frac{1}{\Gamma(2n + \frac{3}{2})} \int_0^{\infty} \frac{e^{-t} t^{2n+\frac{1}{2}}}{1 + \left(\frac{2t}{\pi z^2}\right)^2} dt \quad \left(|\arg z| < \frac{\pi}{4} \right)$$

7.3.31 $|\theta^{(f)}| < 1, |\theta^{(g)}| < 1 \quad \left(|\arg z| \leq \frac{\pi}{8} \right)$

For x real, $R_n^{(f)}(x)$ and $R_n^{(g)}(x)$ are less in absolute value than the first neglected term and of the same sign.

Numerical Methods

7.5. Use and Extension of the Tables

Example 1. Compute $\operatorname{erf} .745$ and $e^{-(.745)^2}$ using Taylor's series.

With the aid of Taylor's theorem and 7.1.19 it can be shown that

$$\operatorname{erf} (x_0 + ph) = \operatorname{erf} x_0 + \frac{2}{\sqrt{\pi}} e^{-x_0^2} ph \left[1 - phx_0 + \frac{1}{3} p^2 h^2 (2x_0^2 - 1) \right] + \epsilon$$

$$e^{-(x_0 + ph)^2} = e^{-x_0^2} \left[1 - 2phx_0 + p^2 h^2 (2x_0^2 - 1) - \frac{2}{3} p^3 h^3 x_0 (2x_0^2 - 3) \right] + \eta$$

where $|\epsilon| < 1.2 \times 10^{-10}$, $|\eta| < 3.2 \times 10^{-10}$ if $h = 10^{-2}$, $|p| \leq \frac{1}{2}$. With $x_0 = .74$, $p = .5$ and using Table 7.1

$$\begin{aligned} \operatorname{erf} .745 &= .70467 80779 + (.5)(.00652 58247) \times \\ & \quad [1 - (.005)(.74) + (.00000 83333)(.0952)] \\ & = .70792 8920 \end{aligned}$$

$$\begin{aligned} e^{-(.745)^2} &= \frac{\sqrt{\pi}}{2} (.65258 24665) [1 - .0074 \\ & \quad + (.000025)(.0952) + (.00000 00833)(.74)(1.9048)] \\ & = .57405 7910. \end{aligned}$$

As a check the computation was repeated with $x_0 = .75$, $p = -.5$.

Example 2. Compute $\operatorname{erfc} x$ to 5S for $x = 4.8$. We have $1/x^2 = .0434028$. With Table 7.2 and linear interpolation in Table 7.3, we obtain

$$\begin{aligned} \operatorname{erfc} 4.8 &= \frac{1}{4.8} (1.11253)(10^{-10})(.552669) \frac{\sqrt{\pi}}{2} \\ & = (1.1352)10^{-11}. \end{aligned}$$

Example 3. Compute $e^{-x^2} \int_0^x e^{t^2} dt$ to 5S for $x=6.5$.

With $1/x^2=.0236686$ and linear interpolation in **Table 7.5**

$$e^{-(6.5)^2} \int_0^{6.5} e^{t^2} dt = (.506143)/(6.5) = .077868.$$

Example 4. Compute $i^2 \operatorname{erfc} 1.72$ using the recurrence relation and **Table 7.1**.

By **7.2.1**, using **Table 7.1**,

$$i^{-1} \operatorname{erfc} 1.72 = .05856 \ 50.$$

Using the recurrence relation **7.2.5** and **Table 7.1**

$$i \operatorname{erfc} 1.72 = -(1.72)(.01499 \ 72) + (.5)(.05856 \ 50) = .0034873$$

$$i^2 \operatorname{erfc} 1.72 = -(86)(.0034873) + (.25)(.01499 \ 72) = .0007502.$$

Note the loss of two significant digits.

Example 5. Compute $i^k \operatorname{erfc} 1.72$ for $k=1, 2, 3$ by backward recurrence.

Let the sequence $w_\mu^m(x)$ ($\mu=m, m-1, \dots, 1, 0, -1$) be generated by backward use of the recurrence relation **7.2.5** starting with $w_{m+2}^m=0, w_{m+1}^m=1$. Then, for any fixed k , (see [7.7]),

$$\lim_{m \rightarrow \infty} \frac{w_k^m(x)}{w_{-1}^m(x)} = \frac{\sqrt{\pi}}{2} e^{x^2} i^k \operatorname{erfc} x \quad (x > 0).$$

With $x=1.72, m=15$ we obtain

μ	$w_\mu^{15}(1.72)$	μ	$w_\mu^{14}(1.72)$	μ	$w_\mu^{13}(1.72)$	μ	$w_\mu^{12}(1.72)$
17	0	12	(3) 2.1011	7	(7) 2.5879	2	(11) 1.2920
16	1	11	(4) 1.3831	6	(8) 1.5569	1	(11) 6.0064
15	3.44	10	(4) 9.8005	5	(8) 8.9787	0	(12) 2.5830
14	(1) 4.3834	9	(5) 6.4143	4	(9) 4.9570	-1	(13) 1.0087
13	(2) 2.5399	8	(6) 4.1666	3	(10) 2.6031		

From **Table 7.1** we have $\frac{2}{\sqrt{\pi}} e^{-(1.72)^2} = .058565$.

Thus,

$$i \operatorname{erfc} 1.72 \approx (.058565)(6.0064 \times 10^{11})/1.0087 \times 10^{13} = 3.4873 \times 10^{-3}$$

$$i^2 \operatorname{erfc} 1.72 \approx (.058565)(1.2920 \times 10^{11})/1.0087 \times 10^{13} = 7.5013 \times 10^{-4}$$

$$i^3 \operatorname{erfc} 1.72 \approx (.058565)(2.6031 \times 10^{10})/1.0087 \times 10^{13} = 1.5114 \times 10^{-4}.$$

Example 6. Compute $C(8.65)$ using **Table 7.8**.

With $x=8.65, 1/x=.115607$ we have from **Table 7.8** by linear interpolation

$$f(8.65) = .036797, \quad g(8.65) = .000159.$$

From **Table 4.6**

$$\sin\left(\frac{\pi}{2} x^2\right) = -.961382, \quad \cos\left(\frac{\pi}{2} x^2\right) = -.275218.$$

Using **7.3.9**

$$C(8.65) = .5 + (.036797)(-.961382) - (.000159)(-.275218) = .46467.$$

Example 7. Compute $S_1(1.1)$ to 10D.

Using **7.3.8** and **7.3.10** we obtain by 6-pt interpolation in **Table 7.8**

$$S_1(1.1) = S\left(1.1 \sqrt{\frac{2}{\pi}}\right) = S(.87767 \ 30169) = .31865 \ 57172.$$

Example 8. Compute $S_2(5.24)$ to 6D.

Enter **Table 7.7** in the column headed by u . Using Aitken's scheme of interpolation

u	$S_2(u)$					
5.20310 58	.43290 06	.03689 42				
5.31808 80	.41573 97	-.07808 80	.42732 63			
5.08938 01	.45093 88	.15061 99	691 63	.42718 63		
5.43432 70	.39999 44	-.19432 70	756 60	6 52	.42717 71	
4.97691 11	.46990 94	.26308 89	674 79	9 39	61	.42717 67

$$S_2(5.24) = .427177$$

Example 9. Compute $S_2(5.24)$ using Taylor's series and **Table 7.8**.

Using **7.3.21** we can write Taylor's series for $f_2(u)$

$$= f\left(\sqrt{\frac{2u}{\pi}}\right) \text{ and } g_2(u) = g\left(\sqrt{\frac{2u}{\pi}}\right) \text{ in the form}$$

$$f_2(u) = c_0 + c_1(u - u_0) + \frac{c_2}{2!}(u - u_0)^2 + \frac{c_3}{3!}(u - u_0)^3 + \dots,$$

$$g_2(u) = -\left[c_1 + c_2(u - u_0) + \frac{c_3}{2!}(u - u_0)^2 + \frac{c_4}{3!}(u - u_0)^3 + \dots \right]$$

where

$$c_0 = f_2(u_0), c_1 = -g_2(u_0),$$

$$c_{k+2} = -c_k + (-1)^k \frac{1 \cdot 3 \dots (2k-1)}{\sqrt{2\pi}u_0(2u_0)^k}$$

$$(k = 0, 1, 2, \dots).$$

Consulting **Table 7.8** we chose $u_0 = 1/.185638 = 5.386819$, thus having $u - u_0 = 5.24 - 5.386819 = -.146819$. From **Table 7.8**

$$f_2(u_0) = .168270, g_2(u_0) = .014483.$$

Hence, applying the series above,

$$f_2(5.24) = .170436, g_2(5.24) = .015030.$$

Using the 4th formula at the bottom of **Table 7.8**

$$S_2(5.24) = .5 - (.170436)(.503471) - (.015030)(-.864012) = .42718.$$

Example 10. Compute $S_2(2)$ using **7.3.16**.

Generating the values of $J_{n+1/2}(2)$ as described in chapter 10 we find

$$S_2(2) = J_{3/2}(2) + J_{7/2}(2) + J_{11/2}(2) + J_{15/2}(2) + \dots = .49129 + .06852 + .00297 + .00006 = .56284.$$

Example 11. Compute $\int_1^\infty \frac{Y_0(t)}{t} dt$ by numerical integration using **Tables 9.1** and **7.8**. [$Y_0(t)$ is the Bessel function of the second kind defined in **9.1.16**.]

We decompose the integral into three parts

$$\int_1^\infty Y_0(t) \frac{dt}{t} = \int_1^{10} Y_0(t) \frac{dt}{t} + \int_{10}^\infty [Y_0(t) - \tilde{Y}_0(t)] \frac{dt}{t} + \int_{10}^\infty \tilde{Y}_0(t) \frac{dt}{t}$$

where

$$\tilde{Y}_0(t) = \left(1 - \frac{9}{128t^2}\right) \frac{\sin\left(t - \frac{\pi}{4}\right)}{\sqrt{\frac{1}{2}\pi t}} - \left(1 - \frac{75}{128t^2}\right) \frac{\cos\left(t - \frac{\pi}{4}\right)}{8t\sqrt{\frac{1}{2}\pi t}}$$

represents the first two terms of the asymptotic expansion **9.2.2**.

By numerical integration, using **Table 9.1**,

$$\int_1^{10} Y_0(t) \frac{dt}{t} = .41826 \ 00.$$

Using the fact that the remainder terms of the asymptotic expansion are less in absolute value than the first neglected terms, we can estimate

$$\left| \int_{10}^\infty [Y_0(t) - \tilde{Y}_0(t)] \frac{dt}{t} \right| \leq \sqrt{\frac{2}{\pi}} \int_{10}^\infty \left[\frac{3^2 \cdot 5^2 \cdot 7^2}{2^{12} \cdot 4!} t^{-11/2} + \frac{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2}{2^{15} \cdot 5!} t^{-13/2} \right] dt = 7.33 \times 10^{-7}.$$

Finally,

$$\int_{10}^\infty \tilde{Y}_0(t) \frac{dt}{t} = \frac{14659}{6720} \sqrt{2} [1 - C_2(10) - S_2(10)] - \frac{5953819 \cos 10 - \sin 10}{2688000 \sqrt{10\pi}} - \frac{23107 \cos 10 + \sin 10}{2150400 \sqrt{10\pi}} = -.02298 \ 78,$$

using **Tables 7.8** and **4.8**. Hence

$$\int_1^\infty Y_0(t) \frac{dt}{t} = .41826 \ 00 - .02298 \ 78 = .39527 \ 22.$$

The answer correct to 8D is .39527 290 (**Table 11.2**).

Example 12. Compute $w(.44 + .67i)$ using bivariate linear interpolation.

By linear interpolation in **Table 7.9** along the x -direction at $y = .6$ and $y = .7$

$$w(.44 + .6i) \approx .6(.522246 + .167880i) + .4(.498591 + .202666i) = .512784 + .181794i$$

$$w(.44 + .7i) \approx .6(.487556 + .147975i) + .4(.467521 + .179123i) = .479542 + .160434i.$$

By linear interpolation along the y -direction at $x = .44$

$$w(.44 + .67i) \approx .3(.512784 + .181794i) + .7(.479542 + .160434i) = .489515 + .166842i.$$

The correct answer is .489557 + .166889i.

Example 13. Compute $\mathcal{R}w(z)$ for $z = .44 + .61i$.

Bivariate linear interpolation, as described in **Example 12**, is most accurate if z lies near the center or along a diagonal of one of the squares of the tabular grid [7.6]. It is not as accurate for z near the midpoint of a side of a square, as in this example. However, we may introduce an auxil-

inary square (see diagram) which contains z close to its center. Bivariate linear interpolation can then be applied within this auxiliary square.

The values of $w(z)$ needed at $z = \zeta_1$, and $z = \zeta_2$ are easily approximated by the average of the four neighboring tabular values. Furthermore the parts to be used are given by

$$\frac{|z_0 - \lambda_1|}{|z_0 - \zeta_1|} = p_1 + p_2, \quad \frac{|z_0 - \lambda_2|}{|z_0 - \zeta_2|} = p_1 - p_2$$

where $z = z_0 + .1(p_1 + ip_2)$. Thus, with $z_0 = .4 + .6i$, $\zeta_1 = .45 + .65i$, $\zeta_2 = .45 + .55i$, $p_1 = .4$, $p_2 = .1$, we get from **Table 7.9**

$$\mathcal{R}w(\zeta_1) \approx \frac{1}{4}(.522246 + .498591 + .487556 + .467521) = .493979$$

$$\mathcal{R}w(\zeta_2) \approx \frac{1}{4}(.522246 + .498591 + .561252 + .533157) = .528812$$

$$\mathcal{R}w(z) \approx [1 - (.4 + .1)]\{[1 - (.4 - .1)].522246 + (.4 - .1).528812\} + (.4 + .1) \times \{[1 - (.4 - .1)] .493979 + (.4 - .1).498591\} = .509789.$$

The correct answer is .509756. Straightforward bivariate interpolation gives .509460.

Example 14. Compute $\mathcal{I}w(.39 + .61i)$ to 6D using Taylor's series.

Let $z = .39 + .61i$, $z_0 = .4 + .6i$. From **7.1.20**, and using **Table 7.9**, we have

$$w(z_0) = .522246 + .167880i$$

$$w'(z_0) = -.21634 + .36738i, \quad z - z_0 = (-1 + i)10^{-2}$$

$$\frac{1}{2}w''(z_0) = -.215 - .185i, \quad (z - z_0)^2 = -2i \times 10^{-4}$$

$$\mathcal{I}w(z) = .167880 - .0021634 - .0036738 + .0000430 = .162086.$$

Example 15. Compute $w(.4 - 1.3i)$.

From **7.1.11**, **7.1.12**

$$w(.4 - 1.3i) = \overline{w(-.4 - 1.3i)} = 2e^{-(.4 - 1.3i)^2} - \overline{w(.4 + 1.3i)}.$$

Using **Tables 7.9**, **4.4** and **4.6**

$$w(.4 - 1.3i) = 4.33342 + 8.04201i.$$

Example 16. Compute $w(7 + 2i)$.

Using the second formula at the end of **Table 7.9**

$$w(7 + 2i) = (-2 + 7i) \left(\frac{.5124242}{44.72474 + 28i} + \frac{.05176536}{42.27525 + 28i} \right) = .021853 + .075010i.$$

Example 17. Compute $\text{erf}(2 + i)$.

From **7.1.3**, **7.1.12** we have

$$\text{erf } z = 1 - e^{-z^2}w(iz) = 1 - e^{v^2 - x^2}(\cos 2xy - i \sin 2xy)\overline{w(y + ix)} \quad (z = x + iy).$$

Using **Tables 7.9**, **4.4**, **4.6**

$$\text{erf}(2 + i) = 1 - e^{-3}(\cos 4 - i \sin 4)\overline{w(1 + 2i)} = 1.003606 - .0112590i.$$

Example 18. Compute $S_1\left(\left(\frac{1}{2} + i\right)\sqrt{2}\right)$.

From **7.3.22**, **7.3.8**, **7.3.18** we have

$$S_1(z) = \frac{1}{2} - \frac{1-i}{4} e^{iz^2}w\left[(1+i)\frac{z}{\sqrt{2}}\right] - \frac{1+i}{4} e^{-iz^2}w\left[(i-1)\frac{z}{\sqrt{2}}\right].$$

Setting $z = \left(\frac{1}{2} + i\right)\sqrt{2}$ and making use of **7.1.11**,

7.1.12, and **Table 7.9**

$$S_1\left(\left(\frac{1}{2} + i\right)\sqrt{2}\right) = -\frac{i}{2} - \frac{1-i}{4} e^{-2} \left(\cos \frac{3}{2} - i \sin \frac{3}{2}\right) \overline{w\left(\frac{1}{2} + \frac{3}{2}i\right)} + \frac{1+i}{4} e^2 \left(\cos \frac{3}{2} + i \sin \frac{3}{2}\right) w\left(\frac{3}{2} + \frac{1}{2}i\right) = -.990734 - .681619i.$$

Example 19. Compute $\int_0^\infty e^{-(1/4)t^2 - 3t} \cos(2t) dt$ using **Table 7.9**.

Setting $b = y + ix$, $c = 0$ in **7.4.2** and using **7.1.3**, **7.1.12** we find

$$\int_0^\infty e^{-at^2 - 2yt} \cos(2xt) dt = \frac{1}{2} \sqrt{\frac{\pi}{a}} \mathcal{R}w\left(\frac{x + iy}{\sqrt{a}}\right) \quad (a > 0, x, y \text{ real}).$$

Hence from **Table 7.9**

$$\int_0^\infty e^{-(1/4)t^2 - 3t} \cos(2t) dt = \sqrt{\pi} \mathcal{R}w(2 + 3i) = .231761.$$

8. Legendre Functions

Mathematical Properties

Notation

The conventions used are $z=x+iy$, x, y real, and in particular, x always means a real number in the interval $-1 \leq x \leq +1$ with $\cos \theta = x$ where θ is likewise a real number; n and m are positive integers or zero; ν and μ are unrestricted except where otherwise indicated.

Other notations are:

$$P_n(x) \text{ for } \frac{n!P_n(x)}{(2n-1)!!}$$

$$P_{nm}(x) \text{ for } (-1)^m P_n^m(x)$$

$$T_n^m(x) \text{ for } (-1)^m P_n^m(x)$$

$$P_n^m(x) \text{ for } (-1)^m \sqrt{\frac{(2n+1)(n-m)!}{2(n+m)!}} P_n^m(x)$$

$$P_\nu^\mu(z) \text{ for } P_\nu^\mu(z), Q_\nu^\mu(z) \text{ for } Q_\nu^\mu(z) \quad (\Re z > 1)$$

$$Q_\nu^\mu(z) \text{ for } e^{i\pi\nu} Q_\nu^\mu(z)$$

$$Q_\nu^\mu(z) \text{ for } \frac{\sin(\nu+\mu)\pi}{\sin \nu\pi} Q_\nu^\mu(z)$$

Various other definitions of the functions occur as well as mixing of definitions.

8.1. Differential Equation

8.1.1

$$(1-z^2) \frac{d^2 w}{dz^2} - 2z \frac{dw}{dz} + [\nu(\nu+1) - \frac{\mu^2}{1-z^2}] w = 0$$

Solutions

(Degree ν and order μ with singularities at $z = \pm 1, \infty$ as ordinary branch points— μ, ν arbitrary complex constants.)

$P_\nu^\mu(z), Q_\nu^\mu(z)$ —Associated Legendre Functions (Spherical Harmonics) of the First and Second Kinds¹

$$|\arg(z \pm 1)| < \pi, \quad |\arg z| < \pi$$

$$(z^2 - 1)^{\frac{1}{2}\mu} = (z-1)^{\frac{1}{2}\mu} (z+1)^{\frac{1}{2}\mu}$$

(For $P_\nu^\mu(z)$, $\mu=0$, Legendre polynomials, see chapter 22.)

8.1.2

$$P_\nu^\mu(z) = \frac{1}{\Gamma(1-\mu)} \left[\frac{z+1}{z-1} \right]^{\frac{1}{2}\mu} F\left(-\nu, \nu+1; 1-\mu; \frac{1-z}{2}\right) \quad (|1-z| < 2)$$

(For $F(a, b; c; z)$ see chapter 15.)

$$8.1.3 \quad Q_\nu^\mu(z) = e^{i\mu\pi} 2^{-\nu-1} \pi^{-\frac{1}{2}} \frac{\Gamma(\nu+\mu+1)}{\Gamma(\nu+\frac{3}{2})} z^{-\nu-\mu-1} (z^2-1)^{\frac{1}{2}\mu} F\left(1+\frac{\nu}{2}+\frac{\mu}{2}, \frac{1}{2}+\frac{\nu}{2}+\frac{\mu}{2}; \nu+\frac{3}{2}; \frac{1}{z^2}\right) \quad (|z| > 1)$$

Alternate Forms

(Additional forms may be obtained by means of the transformation formulas of the hypergeometric function, see [8.1].)

¹ The functions $Y_n^m(\theta, \varphi) = \frac{\cos m\varphi}{\sin m\varphi} P_n^m(\cos \theta)$ called surface harmonics of the first kind, tesseral for $m < n$ and sectoral for $m = n$. With $0 \leq \theta \leq \pi$, $0 \leq \varphi \leq 2\pi$, they are everywhere one valued and continuous functions on the surface of the unit sphere $x^2 + y^2 + z^2 = 1$ where $x = \sin \theta \cos \varphi$, $y = \sin \theta \sin \varphi$ and $z = \cos \theta$.

8.10. Asymptotic Expansions

For fixed z and ν and $\Re \mu \rightarrow \infty$, **8.10.1-8.10.3** are asymptotic expansions if z is not on the real axis between $-\infty$ and -1 and $+\infty$ and $+1$. (Upper or lower signs according as $\Im z \gtrless 0$.)

$$8.10.1 \quad P_\nu^\mu(z) = \frac{\Gamma(\nu+\mu+1) \Gamma(\mu-\nu)}{\pi \Gamma(\mu+1)} \left(\frac{z+1}{z-1} \right)^{\frac{1}{2}\mu} \sin \mu\pi \left[F(-\nu, \nu+1; 1+\mu; \frac{1}{2}+\frac{1}{2}z) - \frac{\sin \nu\pi}{\sin \mu\pi} e^{\mp i\mu\pi} \left(\frac{z-1}{z+1} \right)^\mu F(-\nu, \nu+1; 1+\mu; \frac{1}{2}-\frac{1}{2}z) \right]$$

$$8.10.2 \quad Q_\nu^\mu(z) = \frac{1}{2} e^{i\mu\pi} \frac{\Gamma(\nu+\mu+1)}{\Gamma(\mu+1)} \left(\frac{z+1}{z-1} \right)^{\frac{1}{2}\mu} \Gamma(\mu-\nu) \left[F(-\nu, \nu+1; 1+\mu; \frac{1}{2}+\frac{1}{2}z) - e^{\mp i\mu\pi} \left(\frac{z-1}{z+1} \right)^\mu F(-\nu, \nu+1; 1+\mu; \frac{1}{2}-\frac{1}{2}z) \right]$$

*See page II.

$$8.10.3 \quad Q_{\nu}^{-\mu}(z) = \frac{e^{-i\mu\pi} \csc[\pi(\nu-\mu)]}{2\pi\Gamma(1+\mu)} \left[e^{\mp i\nu\pi} \left(\frac{z+1}{z-1}\right)^{-\frac{1}{2}\mu} F(-\nu, \nu+1; 1+\mu; \frac{1}{2}-\frac{1}{2}z) \right. \\ \left. - \left(\frac{z-1}{z+1}\right)^{-\frac{1}{2}\mu} F(-\nu, \nu+1; 1+\mu; \frac{1}{2}+\frac{1}{2}z) \right]$$

With μ replaced by $-\mu$, 8.1.2 is an asymptotic expansion for $P_{\nu}^{-\mu}(z)$ for fixed z and ν and $\Re \mu \rightarrow \infty$ if z is not on the real axis between $-\infty$ and -1 .

For fixed z and μ and $\Re \nu \rightarrow \infty$, 8.10.4 and 8.10.6 are asymptotic expansions if z is not on the real axis between $-\infty$ and -1 and $+\infty$ and $+1$; 8.10.5 if z is not on the real axis between $-\infty$ and $+1$.

$$8.10.4 \quad P_{\nu}^{\mu}(z) = (2\pi)^{-\frac{1}{2}} (z^2-1)^{-1/4} \frac{\Gamma(\nu+\mu+1)}{\Gamma(\nu+\frac{3}{2})} \left\{ [z+(z^2-1)^{\frac{1}{2}}]^{\nu+\frac{1}{2}} F(\frac{1}{2}+\mu, \frac{1}{2}-\mu; \frac{3}{2}+\nu; \frac{z+(z^2-1)^{\frac{1}{2}}}{2(z^2-1)^{\frac{1}{2}}}) \right. \\ \left. + i e^{-i\mu\pi} [z-(z^2-1)^{\frac{1}{2}}]^{\nu+\frac{1}{2}} F(\frac{1}{2}+\mu, \frac{1}{2}-\mu; \frac{3}{2}+\nu; \frac{-z+(z^2-1)^{\frac{1}{2}}}{2(z^2-1)^{\frac{1}{2}}}) \right\}$$

$$8.10.5 \quad Q_{\nu}^{\mu}(z) = e^{i\mu\pi} (\frac{1}{2}\pi)^{\frac{1}{2}} (z^2-1)^{-1/4} \frac{\Gamma(\nu+\mu+1)}{\Gamma(\nu+\frac{3}{2})} [z-(z^2-1)^{\frac{1}{2}}]^{\nu+\frac{1}{2}} F(\frac{1}{2}+\mu, \frac{1}{2}-\mu; \frac{3}{2}+\nu; \frac{-z+(z^2-1)^{\frac{1}{2}}}{2(z^2-1)^{\frac{1}{2}}})$$

$$8.10.6 \quad Q_{\nu}^{-\mu}(z) = \frac{e^{i\mu\pi} (\frac{1}{2}\pi)^{\frac{1}{2}} (z^2-1)^{-1/4} \Gamma(\mu+\nu)}{\sin[\pi(\mu-\nu)] \Gamma(\frac{1}{2}-\mu)} \left\{ \cos \nu\pi [z+(z^2-1)^{\frac{1}{2}}]^{\nu-\frac{1}{2}} F(\frac{1}{2}+\mu, \frac{1}{2}-\mu; \frac{1}{2}+\nu; \frac{z+(z^2-1)^{\frac{1}{2}}}{2(z^2-1)^{\frac{1}{2}}}) \right. \\ \left. + i e^{i\nu\pi} \cos \mu\pi [z-(z^2-1)^{\frac{1}{2}}]^{\nu-\frac{1}{2}} F(\frac{1}{2}+\mu, \frac{1}{2}-\mu; \frac{1}{2}+\nu; \frac{-z+(z^2-1)^{\frac{1}{2}}}{2(z^2-1)^{\frac{1}{2}}}) \right\}$$

The related asymptotic expansion for $P_{\nu}^{\mu}(z)$ may be derived from 8.10.4 together with 8.2.1.

$$8.10.7 \quad P_{\nu}^{\mu}(\cos \theta) = \frac{\Gamma(\nu+\mu+1)}{\Gamma(\nu+\frac{3}{2})} (\frac{1}{2}\pi \sin \theta)^{-\frac{1}{2}} \cos[(\nu+\frac{1}{2})\theta - \frac{\pi}{4} + \frac{\mu\pi}{2}] + O(\nu^{-1})$$

$$8.10.8 \quad Q_{\nu}^{\mu}(\cos \theta) = \frac{\Gamma(\nu+\mu+1)}{\Gamma(\nu+\frac{3}{2})} \left(\frac{\pi}{2 \sin \theta}\right)^{\frac{1}{2}} \cos[(\nu+\frac{1}{2})\theta + \frac{\pi}{4} + \frac{\mu\pi}{2}] + O(\nu^{-1}) \quad (\epsilon < \theta < \pi - \epsilon, \epsilon > 0)$$

Numerical Methods

8.15. Use and Extension of the Tables

Computation of $P_n(x)$

For all values of x there is very little loss of significant figures (except at zeros) in using the recurrence relation 8.5.3 for increasing values of n .

Example 1. Compute $P_n(x)$ for $x=.31415\ 92654$ and $x=2.6$ for $n=2(1)8$.

n	$P_n(.31415\ 92654)$	$P_n(2.6)$
0	1	1
1	.31415 92654	2.6
2	-.35195 59340	9.64
3	-.39372 32064	40.04
4	.04750 63122	174.952
5	.34184 27517	786.74336
6	.15729 86975	3604.350016
7	-.20123 39354	16729.51005
8	-.25617 29328	78402.55522

Computing $P_8(x)$ using **Table 22.9** carrying ten significant figures, $P_8(.31415\ 92654) = -.25617\ 2933$ and $P_8(2.6) = 78402.55522$.

Computation of $Q_n(x)$

For $x < 1$, use of **8.5.3** for increasing values of n leads to very little loss of significant figures. However, for $x > 1$, the recurrence relation **8.5.3** should be used only for decreasing values of n , after having first obtained Q_n using the formulas in terms of hypergeometric functions.

Example 2. Compute $Q_n(x)$ for $x = .31415\ 92654$ and $n = 0(1)4$.

With the aid of **8.4.2** and **8.4.4** we obtain

n	$Q_n(.31415\ 92654)$
0	.32515 34813
1	-.89785 00212
2	-.58567 85953
3	.29190 60854
4	.59974 26989

Using the results of **Example 1** together with **8.6.19**, we find $Q_4(x) = \frac{1}{2}P_4(x)\ln\left(\frac{1+x}{1-x}\right) - W_3(x)$ where $W_3 = \frac{7}{4}P_3 + \frac{1}{3}P_1$, giving $Q_4(.31415\ 92654) = .59974\ 26989$.

Example 3. Compute $Q_5(x)$ for $x = 2.6$.

Ten terms in the series for $F\left(\frac{\nu+2}{2}, \frac{\nu+1}{2}, \nu+\frac{3}{2}, \frac{1}{z^2}\right)$ of **8.1.3** are necessary to obtain nine significant figures giving $Q_5(2.6) = 4.8182\ 4468 \times 10^{-5}$. Using **8.5.3** with increasing values of n carrying ten significant figures we obtain

n	$Q_n(2.6)$
0	.40546 51081
1	.05420 928
2	.00868 364
3	.00148 95
4	.00026 49
5	.00004 81

where Q_0 and Q_1 are obtained using **8.4.2** and **8.4.4**.

Computation of $P_{\pm\frac{1}{2}}(x)$, $Q_{\pm\frac{1}{2}}(x)$

For all values of x , $P_{\pm\frac{1}{2}}(x)$ and $Q_{\pm\frac{1}{2}}(x)$ are most easily computed by means of **8.13**.

Example 4. Compute $Q_{-\frac{1}{2}}(x)$ for $x = 2.6$.

Using **8.13.3** and interpolating in **Table 17.1** for $K(.5)$, we find

$$\begin{aligned} Q_{-\frac{1}{2}}(2.6) &= \sqrt{\frac{2}{x+1}} K\left(\sqrt{\frac{2}{x+1}}\right) \\ &= (.74535\ 59925)(1.90424\ 1417) \\ &= 1.41933\ 7751. \end{aligned}$$

On the other hand, at least nine terms in the expansion of $F\left(\frac{\nu+2}{2}, \frac{\nu+1}{2}, \nu+\frac{3}{2}, \frac{1}{z^2}\right)$ of **8.1.3** are necessary to obtain comparable accuracy.

9. Bessel Functions of Integer Order

Mathematical Properties

Notation

The tables in this chapter are for Bessel functions of integer order; the text treats general orders. The conventions used are:

$z = x + iy$; x, y real.

n is a positive integer or zero.

ν, μ are unrestricted except where otherwise indicated; ν is supposed real in the sections devoted to Kelvin functions 9.9, 9.10, and 9.11.

The notation used for the Bessel functions is that of Watson [9.15] and the British Association and Royal Society Mathematical Tables. The function $Y_\nu(z)$ is often denoted $N_\nu(z)$ by physicists and European workers.

Other notations are those of:

Aldis, Airey:

$$G_n(z) \text{ for } -\frac{1}{2}\pi Y_n(z), K_n(z) \text{ for } (-)^n K_n(z).$$

Clifford:

$$C_n(x) \text{ for } x^{-1/2} J_n(2\sqrt{x}).$$

Gray, Mathews and MacRobert [9.9]:

$$Y_n(z) \text{ for } \frac{1}{2}\pi Y_n(z) + (\ln 2 - \gamma) J_n(z),$$

$$\bar{Y}_\nu(z) \text{ for } \pi e^{\nu\pi i} \sec(\nu\pi) Y_\nu(z),$$

$$G_\nu(z) \text{ for } \frac{1}{2}\pi i H_\nu^{(1)}(z).$$

Jahnke, Emde and Lösch [9.32]:

$$\Lambda_\nu(z) \text{ for } \Gamma(\nu+1) (\frac{1}{2}z)^{-\nu} J_\nu(z).$$

Jeffreys:

$$H_{s,\nu}(z) \text{ for } H_\nu^{(1)}(z), H_{i,\nu}(z) \text{ for } H_\nu^{(2)}(z),$$

$$Kh_\nu(z) \text{ for } (2/\pi) K_\nu(z).$$

Heine:

$$K_n(z) \text{ for } -\frac{1}{2}\pi Y_n(z).$$

Neumann:

$$Y^n(z) \text{ for } \frac{1}{2}\pi Y_n(z) + (\ln 2 - \gamma) J_n(z).$$

Whittaker and Watson [9.18]:

$$K_\nu(z) \text{ for } \cos(\nu\pi) K_\nu(z).$$

Bessel Functions J and Y

9.1. Definitions and Elementary Properties

Differential Equation

$$9.1.1 \quad z^2 \frac{d^2 w}{dz^2} + z \frac{dw}{dz} + (z^2 - \nu^2)w = 0$$

Solutions are the Bessel functions of the first kind $J_{\pm\nu}(z)$, of the second kind $Y_\nu(z)$ (also called Weber's function) and of the third kind $H_\nu^{(1)}(z), H_\nu^{(2)}(z)$ (also called the Hankel functions). Each is a regular (holomorphic) function of z throughout the z -plane cut along the negative real axis, and for fixed $z (\neq 0)$ each is an entire (integral) function of ν . When $\nu = \pm n, J_\nu(z)$ has no branch point and is an entire (integral) function of z .

Important features of the various solutions are as follows: $J_\nu(z) (\Re \nu \geq 0)$ is bounded as $z \rightarrow 0$ in any bounded range of $\arg z$. $J_\nu(z)$ and $J_{-\nu}(z)$ are linearly independent except when ν is an integer. $J_\nu(z)$ and $Y_\nu(z)$ are linearly independent for all values of ν .

$H_\nu^{(1)}(z)$ tends to zero as $|z| \rightarrow \infty$ in the sector $0 < \arg z < \pi$; $H_\nu^{(2)}(z)$ tends to zero as $|z| \rightarrow \infty$ in the sector $-\pi < \arg z < 0$. For all values of $\nu, H_\nu^{(1)}(z)$ and $H_\nu^{(2)}(z)$ are linearly independent.

Relations Between Solutions

$$9.1.2 \quad Y_\nu(z) = \frac{J_\nu(z) \cos(\nu\pi) - J_{-\nu}(z)}{\sin(\nu\pi)}$$

The right of this equation is replaced by its limiting value if ν is an integer or zero.

9.1.3

$$H_\nu^{(1)}(z) = J_\nu(z) + iY_\nu(z) \\ = i \csc(\nu\pi) \{ e^{-\nu\pi i} J_\nu(z) - J_{-\nu}(z) \}$$

9.1.4

$$H_\nu^{(2)}(z) = J_\nu(z) - iY_\nu(z) \\ = i \csc(\nu\pi) \{ J_{-\nu}(z) - e^{\nu\pi i} J_\nu(z) \}$$

$$9.1.5 \quad J_{-n}(z) = (-)^n J_n(z) \quad Y_{-n}(z) = (-)^n Y_n(z)$$

$$9.1.6 \quad H_{-\nu}^{(1)}(z) = e^{\nu\pi i} H_\nu^{(1)}(z) \quad H_{-\nu}^{(2)}(z) = e^{-\nu\pi i} H_\nu^{(2)}(z)$$

Limiting Forms for Small Arguments

9.1.7

$$J_\nu(z) \sim (\frac{1}{2}z)^\nu / \Gamma(\nu+1) \quad (\nu \neq -1, -2, -3, \dots)$$

Ascending Series

$$9.1.10 \quad J_\nu(z) = (\frac{1}{2}z)^\nu \sum_{k=0}^{\infty} \frac{(-\frac{1}{4}z^2)^k}{k! \Gamma(\nu+k+1)}$$

where $\psi(n)$ is given by 6.3.2.

9.1.70

$J_\nu(z) = \frac{(\frac{1}{2}z)^\nu}{\Gamma(\nu+1)} \lim_{\lambda, \mu \rightarrow \infty} F\left(\lambda, \mu; \nu+1; -\frac{z^2}{4\lambda\mu}\right)$

as $\lambda, \mu \rightarrow \infty$ through real or complex values; z, ν being fixed.

(${}_0F_1$ is the generalized hypergeometric function. For $M(a, b, z)$ and $F(a, b; c; z)$ see chapters 13 and 15.)

Connection With Legendre Functions

If μ and x are fixed and $\nu \rightarrow \infty$ through real positive values

9.1.71

$\lim \{ \nu^\mu P_\nu^{-\mu}(\cos \frac{x}{\nu}) \} = J_\mu(x) \quad (x > 0)$

*See page 11.

9.1.72

$$\lim \{ \nu^\mu Q_\nu^{-\mu} \left(\cos \frac{x}{\nu} \right) \} = -\frac{1}{2} \pi Y_\mu(x) \quad (x > 0)$$

For $P_\nu^{-\mu}$ and $Q_\nu^{-\mu}$, see chapter 8.

Continued Fractions

9.1.73

$$\frac{J_\nu(z)}{J_{\nu-1}(z)} = \frac{1}{2\nu z^{-1} - \frac{1}{2(\nu+1)z^{-1} - \frac{1}{2(\nu+2)z^{-1} - \dots}}}$$

$$= \frac{\frac{1}{2}z/\nu}{1 - \frac{\frac{1}{2}z^2/\{\nu(\nu+1)\}}{1 - \frac{\frac{1}{2}z^2/\{(\nu+1)(\nu+2)\}}{1 - \dots}}}$$

Multiplication Theorem

9.1.74

$$\mathcal{C}_\nu(\lambda z) = \lambda^{\pm \nu} \sum_{k=0}^{\infty} \frac{(\mp)^k (\lambda^2 - 1)^k (\frac{1}{2}z)^k}{k!} \mathcal{C}_{\nu \pm k}(z)$$

($|\lambda^2 - 1| < 1$)

If $\mathcal{C} = J$ and the upper signs are taken, the restriction on λ is unnecessary.

This theorem will furnish expansions of $\mathcal{C}_\nu(re^{i\theta})$ in terms of $\mathcal{C}_{\nu \pm k}(r)$.

Addition Theorems

Neumann's

9.1.75 $\mathcal{C}_\nu(u \pm v) = \sum_{k=-\infty}^{\infty} \mathcal{C}_{\nu \mp k}(u) J_k(v) \quad (|v| < |u|)$

The restriction $|v| < |u|$ is unnecessary when $\mathcal{C} = J$ and ν is an integer or zero. Special cases are

9.1.76 $1 = J_0^2(z) + 2 \sum_{k=1}^{\infty} J_k^2(z)$

9.1.77

$$0 = \sum_{k=0}^{2n} (-)^k J_k(z) J_{2n-k}(z) + 2 \sum_{k=1}^{\infty} J_k(z) J_{2n+k}(z) \quad (n \geq 1)$$

9.1.78

$$J_n(2z) = \sum_{k=0}^n J_k(z) J_{n-k}(z) + 2 \sum_{k=1}^{\infty} (-)^k J_k(z) J_{n+k}(z)$$

Graf's

9.1.79

$$\mathcal{C}_\nu(w) \frac{\cos \nu \chi}{\sin \nu \chi} = \sum_{k=-\infty}^{\infty} \mathcal{C}_{\nu+k}(u) J_k(v) \frac{\cos k \alpha}{\sin k \alpha} \quad (|v e^{\pm i \alpha}| < |u|)$$

Gegenbauer's

9.1.80

$$\frac{\mathcal{C}_\nu(w)}{w^\nu} = 2^\nu \Gamma(\nu) \sum_{k=0}^{\infty} (\nu+k) \frac{\mathcal{C}_{\nu+k}(u)}{u^\nu} \frac{J_{\nu+k}(v)}{v^\nu} C_k^{(\nu)}(\cos \alpha)$$

($\nu \neq 0, -1, \dots, |v e^{\pm i \alpha}| < |u|$)

In 9.1.79 and 9.1.80,

$$w = \sqrt{u^2 + v^2 - 2uv \cos \alpha},$$

$$u - v \cos \alpha = w \cos \chi, \quad v \sin \alpha = w \sin \chi$$

the branches being chosen so that $w \rightarrow u$ and $\chi \rightarrow 0$ as $v \rightarrow 0$. $C_k^{(\nu)}(\cos \alpha)$ is Gegenbauer's polynomial (see chapter 22).

Gegenbauer's addition theorem.

If u, v are real and positive and $0 \leq \alpha \leq \pi$, then w, χ are real and non-negative, and the geometrical relationship of the variables is shown in the diagram.

The restrictions $|v e^{\pm i \alpha}| < |u|$ are unnecessary in 9.1.79 when $\mathcal{C} = J$ and ν is an integer or zero, and in 9.1.80 when $\mathcal{C} = J$.

Degenerate Form ($u = \infty$):

9.1.81

$$e^{i \nu \cos \alpha} = \Gamma(\nu) \left(\frac{1}{2}v\right)^{-\nu} \sum_{k=0}^{\infty} (\nu+k) i^k J_{\nu+k}(v) C_k^{(\nu)}(\cos \alpha)$$

($\nu \neq 0, -1, \dots$)

Neumann's Expansion of an Arbitrary Function in a Series of Bessel Functions

9.1.82 $f(z) = a_0 J_0(z) + 2 \sum_{k=1}^{\infty} a_k J_k(z) \quad (|z| < c)$

where c is the distance of the nearest singularity of $f(z)$ from $z=0$,

9.1.83 $a_k = \frac{1}{2\pi i} \int_{|z|=c'} f(t) O_k(t) dt \quad (0 < c' < c)$

and $O_k(t)$ is Neumann's polynomial. The latter is defined by the generating function

9.1.84

$$\frac{1}{t-z} = J_0(z) O_0(t) + 2 \sum_{k=1}^{\infty} J_k(z) O_k(t) \quad (|z| < |t|)$$

$O_n(t)$ is a polynomial of degree $n+1$ in $1/t$; $O_0(t) = 1/t$,

9.1.85

$$O_n(t) = \frac{1}{4} \sum_{k=0}^{2n} \frac{n(n-k-1)!}{k!} \left(\frac{2}{t}\right)^{n-2k+1} \quad (n=1, 2, \dots)$$

The more general form of expansion

9.1.86 $f(z) = a_0 J_\nu(z) + 2 \sum_{k=1}^{\infty} a_k J_{\nu+k}(z)$

also called a Neumann expansion, is investigated in [9.7] and [9.15] together with further generalizations. Examples of Neumann expansions are 9.1.41 to 9.1.48 and the Addition Theorems. Other examples are

9.1.87

$$\left(\frac{1}{2}z\right)^\nu = \sum_{k=0}^{\infty} \frac{(\nu+2k)\Gamma(\nu+k)}{k!} J_{\nu+2k}(z) \quad (\nu \neq 0, -1, -2, \dots)$$

9.1.88

$$Y_n(z) = -\frac{n!(\frac{1}{2}z)^{-n}}{\pi} \sum_{k=0}^{n-1} \frac{(\frac{1}{2}z)^k J_k(z)}{(n-k)k!} + \frac{2}{\pi} \{ \ln(\frac{1}{2}z) - \psi(n+1) \} J_n(z) - \frac{2}{\pi} \sum_{k=1}^{\infty} (-)^k \frac{(n+2k)J_{n+2k}(z)}{k(n+k)}$$

where $\psi(n)$ is given by 6.3.2.

9.1.89

$$Y_0(z) = \frac{2}{\pi} \{ \ln(\frac{1}{2}z) + \gamma \} J_0(z) - \frac{4}{\pi} \sum_{k=1}^{\infty} (-)^k \frac{J_{2k}(z)}{k}$$

9.2. Asymptotic Expansions for Large Arguments

Principal Asymptotic Forms

When ν is fixed and $|z| \rightarrow \infty$

9.2.1

$$J_\nu(z) = \sqrt{2/(\pi z)} \{ \cos(z - \frac{1}{2}\nu\pi - \frac{1}{4}\pi) + e^{i\mathcal{I}z} O(|z|^{-1}) \} \quad (|\arg z| < \pi)$$

9.2.2

$$Y_\nu(z) = \sqrt{2/(\pi z)} \{ \sin(z - \frac{1}{2}\nu\pi - \frac{1}{4}\pi) + e^{i\mathcal{I}z} O(|z|^{-1}) \} \quad (|\arg z| < \pi)$$

9.2.3

$$H_\nu^{(1)}(z) \sim \sqrt{2/(\pi z)} e^{i(z - \frac{1}{2}\nu\pi - \frac{1}{4}\pi)} \quad (-\pi < \arg z < 2\pi)$$

9.2.4

$$H_\nu^{(2)}(z) \sim \sqrt{2/(\pi z)} e^{-i(z - \frac{1}{2}\nu\pi - \frac{1}{4}\pi)} \quad (-2\pi < \arg z < \pi)$$

Hankel's Asymptotic Expansions

When ν is fixed and $|z| \rightarrow \infty$

9.2.5

$$J_\nu(z) = \sqrt{2/(\pi z)} \{ P(\nu, z) \cos \chi - Q(\nu, z) \sin \chi \} \quad (|\arg z| < \pi)$$

9.2.6

$$Y_\nu(z) = \sqrt{2/(\pi z)} \{ P(\nu, z) \sin \chi + Q(\nu, z) \cos \chi \} \quad (|\arg z| < \pi)$$

9.2.7

$$H_\nu^{(1)}(z) = \sqrt{2/(\pi z)} \{ P(\nu, z) + iQ(\nu, z) \} e^{i\chi} \quad (-\pi < \arg z < 2\pi)$$

9.2.8

$$H_\nu^{(2)}(z) = \sqrt{2/(\pi z)} \{ P(\nu, z) - iQ(\nu, z) \} e^{-i\chi} \quad (-2\pi < \arg z < \pi)$$

where $\chi = z - (\frac{1}{2}\nu + \frac{1}{4})\pi$ and, with $4\nu^2$ denoted by μ ,

9.2.9

$$P(\nu, z) \sim \sum_{k=0}^{\infty} (-)^k \frac{(\nu, 2k)}{(2z)^{2k}} = 1 - \frac{(\mu-1)(\mu-9)}{2!(8z)^2} + \frac{(\mu-1)(\mu-9)(\mu-25)(\mu-49)}{4!(8z)^4} - \dots$$

9.2.10

$$Q(\nu, z) \sim \sum_{k=0}^{\infty} (-)^k \frac{(\nu, 2k+1)}{(2z)^{2k+1}} = \frac{\mu-1}{8z} - \frac{(\mu-1)(\mu-9)(\mu-25)}{3!(8z)^3} + \dots$$

If ν is real and non-negative and z is positive, the remainder after k terms in the expansion of $P(\nu, z)$ does not exceed the $(k+1)$ th term in absolute value and is of the same sign, provided that $k > \frac{1}{2}\nu - \frac{1}{4}$. The same is true of $Q(\nu, z)$ provided that $k > \frac{1}{2}\nu - \frac{3}{4}$.

9.2.13

$$H_\nu^{(1)'}(z) = \sqrt{2/(\pi z)} \{ iR(\nu, z) - S(\nu, z) \} e^{i\chi} \quad (-\pi < \arg z < 2\pi)$$

$$H_\nu^{(2)'}(z) = \sqrt{2/(\pi z)} \{ -iR(\nu, z) - S(\nu, z) \} e^{-i\chi} \quad (-2\pi < \arg z < \pi)$$

9.2.15

$$R(\nu, z) \sim \sum_{k=0}^{\infty} (-)^k \frac{4\nu^2 + 16k^2 - 1}{4\nu^2 - (4k-1)^2} \frac{(\nu, 2k)}{(2z)^{2k}}$$

$$= 1 - \frac{(\mu-1)(\mu+15)}{2!(8z)^2} + \dots$$

9.2.16

$$S(\nu, z) \sim \sum_{k=0}^{\infty} (-)^k \frac{4\nu^2 + 4(2k+1)^2 - 1}{4\nu^2 - (4k+1)^2} \frac{(\nu, 2k+1)}{(2z)^{2k+1}}$$

$$= \frac{\mu+3}{8z} - \frac{(\mu-1)(\mu-9)(\mu+35)}{3!(8z)^3} + \dots$$

Asymptotic Expansions of Modulus and Phase

When ν is fixed, x is large and positive, and $\mu = 4\nu^2$

9.2.28

$$M_\nu^2 \sim \frac{2}{\pi x} \left\{ 1 + \frac{1}{2} \frac{\mu-1}{(2x)^2} + \frac{1 \cdot 3}{2 \cdot 4} \frac{(\mu-1)(\mu-9)}{(2x)^4} \right.$$

$$\theta_\nu \sim x - \left(\frac{1}{2}\nu + \frac{1}{4}\right)\pi + \frac{\mu-1}{2(4x)}$$

$$+ \frac{(\mu-1)(\mu-25)}{6(4x)^3} + \frac{(\mu-1)(\mu^2-114\mu+1073)}{5(4x)^5}$$

$$+ \frac{(\mu-1)(5\mu^3-1535\mu^2+54703\mu-375733)}{14(4x)^7} + \dots$$

9.2.30

$$N_\nu^2 \sim \frac{2}{\pi x} \left\{ 1 - \frac{1}{2} \frac{\mu-3}{(2x)^2} - \frac{1 \cdot 1}{2 \cdot 4} \frac{(\mu-1)(\mu-45)}{(2x)^4} - \dots \right\}$$

The general term in the last expansion is given by

$$\frac{1 \cdot 1 \cdot 3 \dots (2k-3)}{2 \cdot 4 \cdot 6 \dots (2k)}$$

$$+ \frac{\mu^3+185\mu^2-2053\mu+1899}{5(4x)^5} + \dots$$

If $\nu \geq 0$, the remainder after k terms in 9.2.28 does not exceed the $(k+1)$ th term in absolute value and is of the same sign, provided that $k > \nu - \frac{1}{2}$.

Uniform Asymptotic Expansions

These are more powerful than the previous expansions of this section, save for 9.3.31 and 9.3.32, but their coefficients are more complicated. They reduce to 9.3.31 and 9.3.32 when the argument equals the order.

9.3.35

$$J_\nu(\nu z) \sim \left(\frac{4\zeta}{1-z^2} \right)^{1/4} \left\{ \frac{\text{Ai}(\nu^{2/3}\zeta)}{\nu^{1/3}} \sum_{k=0}^{\infty} \frac{a_k(\zeta)}{\nu^{2k}} + \frac{\text{Ai}'(\nu^{2/3}\zeta)}{\nu^{5/3}} \sum_{k=0}^{\infty} \frac{b_k(\zeta)}{\nu^{2k}} \right\}$$

9.3.36

$$Y_\nu(\nu z) \sim -\left(\frac{4\zeta}{1-z^2} \right)^{1/4} \left\{ \frac{\text{Bi}(\nu^{2/3}\zeta)}{\nu^{1/3}} \sum_{k=0}^{\infty} \frac{a_k(\zeta)}{\nu^{2k}} + \frac{\text{Bi}'(\nu^{2/3}\zeta)}{\nu^{5/3}} \sum_{k=0}^{\infty} \frac{b_k(\zeta)}{\nu^{2k}} \right\}$$

9.3.37

$$H_\nu^{(1)}(\nu z) \sim 2e^{-\pi i/3} \left(\frac{4\zeta}{1-z^2} \right)^{1/4} \left\{ \frac{\text{Ai}(e^{2\pi i/3}\nu^{2/3}\zeta)}{\nu^{1/3}} \sum_{k=0}^{\infty} \frac{a_k(\zeta)}{\nu^{2k}} + \frac{e^{2\pi i/3}\text{Ai}'(e^{2\pi i/3}\nu^{2/3}\zeta)}{\nu^{5/3}} \sum_{k=0}^{\infty} \frac{b_k(\zeta)}{\nu^{2k}} \right\}$$

When $\nu \rightarrow +\infty$, these expansions hold uniformly with respect to z in the sector $|\arg z| \leq \pi - \epsilon$, where ϵ is an arbitrary positive number. The corresponding expansion for $H_\nu^{(2)}(\nu z)$ is obtained by changing the sign of i in 9.3.37.

Here

9.3.38

$$\frac{2}{3} \zeta^{3/2} = \int_z^1 \frac{\sqrt{1-t^2}}{t} dt = \ln \frac{1+\sqrt{1-z^2}}{z} - \sqrt{1-z^2}$$

equivalently,

9.3.39

$$\frac{2}{3} (-\zeta)^{3/2} = \int_1^z \frac{\sqrt{t^2-1}}{t} dt = \sqrt{z^2-1} - \arccos\left(\frac{1}{z}\right)$$

the branches being chosen so that ζ is real when z is positive. The coefficients are given by

9.3.40

$$a_k(\zeta) = \sum_{s=0}^{2k} \mu_s \zeta^{-3s/2} u_{2k-s} \{ (1-z^2)^{-1/2} \}$$

$$b_k(\zeta) = -\zeta^{-1/2} \sum_{s=0}^{2k+1} \lambda_s \zeta^{-3s/2} u_{2k-s+1} \{ (1-z^2)^{-1/2} \}$$

where u_k is given by 9.3.9 and 9.3.10, $\lambda_0 = \mu_0 = 1$ and

9.3.41

$$\lambda_s = \frac{(2s+1)(2s+3)\dots(6s-1)}{s!(144)^s}, \quad \mu_s = -\frac{6s+1}{6s-1} \lambda_s$$

Thus $a_0(\zeta) = 1$,

9.3.42

$$b_0(\zeta) = -\frac{5}{48\zeta^2} + \frac{1}{\zeta^{\frac{1}{2}}} \left\{ \frac{5}{24(1-z^2)^{3/2}} - \frac{1}{8(1-z^2)^{\frac{1}{2}}} \right\} \\ = -\frac{5}{48\zeta^2} + \frac{1}{(-\zeta)^{\frac{1}{2}}} \left\{ \frac{5}{24(z^2-1)^{3/2}} + \frac{1}{8(z^2-1)^{\frac{1}{2}}} \right\}$$

Tables of the early coefficients are given below. For more extensive tables of the coefficients and for bounds on the remainder terms in 9.3.35 and 9.3.36 see [9.38].

9.5. Zeros

Real Zeros

When ν is real, the functions $J_\nu(z)$, $J'_\nu(z)$, $Y_\nu(z)$ and $Y'_\nu(z)$ each have an infinite number of real zeros, all of which are simple with the possible exception of $z=0$. For *non-negative* ν the s th positive zeros of these functions are denoted by

$j_{\nu,s}$, $j'_{\nu,s}$, $y_{\nu,s}$ and $y'_{\nu,s}$ respectively, except that $z=0$ is counted as the first zero of $J'_0(z)$. Since $J'_0(z) = -J_1(z)$, it follows that

9.5.1 $j'_{0,1} = 0, \quad j'_{0,s} = j_{1,s-1} \quad (s=2, 3, \dots)$

The zeros interlace according to the inequalities

9.5.2

$$\begin{aligned} j_{\nu,1} & < j'_{\nu+1,1} < j_{\nu,2} < j'_{\nu+1,2} < j_{\nu,3} < \dots \\ y_{\nu,1} & < y'_{\nu+1,1} < y_{\nu,2} < y'_{\nu+1,2} < y_{\nu,3} < \dots \\ \nu \leq j'_{\nu,1} & < y_{\nu,1} < y'_{\nu,1} < j_{\nu,1} < j'_{\nu,2} \\ & < y_{\nu,2} < y'_{\nu,2} < j_{\nu,2} < j'_{\nu,3} < \dots \end{aligned}$$

The positive zeros of any two real distinct cylinder functions of the same order are interlaced, as are the positive zeros of any real cylinder function $\mathcal{C}_\nu(z)$, defined as in 9.1.27, and the contiguous function $\mathcal{C}_{\nu+1}(z)$.

If ρ_ν is a zero of the cylinder function

9.5.3 $\mathcal{C}_\nu(z) = J_\nu(z) \cos(\pi t) + Y_\nu(z) \sin(\pi t)$

where t is a parameter, then

9.5.4 $\mathcal{C}'_\nu(\rho_\nu) = \mathcal{C}_{\nu-1}(\rho_\nu) = -\mathcal{C}_{\nu+1}(\rho_\nu)$

If σ_ν is a zero of $\mathcal{C}'_\nu(z)$ then

9.5.5 $\mathcal{C}_\nu(\sigma_\nu) = \frac{\sigma_\nu}{\nu} \mathcal{C}_{\nu-1}(\sigma_\nu) = \frac{\sigma_\nu}{\nu} \mathcal{C}_{\nu+1}(\sigma_\nu)$

The parameter t may be regarded as a continuous variable and ρ_ν , σ_ν as functions $\rho_\nu(t)$, $\sigma_\nu(t)$ of t . If these functions are fixed by

9.5.6 $\rho_\nu(0) = 0, \quad \sigma_\nu(0) = j'_{\nu,1}$

then

9.5.7

$$j_{\nu,s} = \rho_\nu(s), \quad y_{\nu,s} = \rho_\nu(s - \frac{1}{2}) \quad (s=1, 2, \dots)$$

9.5.8

$$j'_{\nu,s} = \sigma_\nu(s-1), \quad y'_{\nu,s} = \sigma_\nu(s - \frac{1}{2}) \quad (s=1, 2, \dots)$$

9.5.9 $\mathcal{C}'_\nu(\rho_\nu) = \left(\frac{\rho_\nu}{2} \frac{d\rho_\nu}{dt}\right)^{-\frac{1}{2}}, \quad \mathcal{C}_\nu(\sigma_\nu) = \left(\frac{\sigma_\nu^2 - \nu^2}{2\sigma_\nu} \frac{d\sigma_\nu}{dt}\right)^{-\frac{1}{2}}$

Infinite Products

9.5.10 $J_\nu(z) = \frac{(\frac{1}{2}z)^\nu}{\Gamma(\nu+1)} \prod_{s=1}^{\infty} \left(1 - \frac{z^2}{j_{\nu,s}^2}\right)$

9.5.11 $J'_\nu(z) = \frac{(\frac{1}{2}z)^{\nu-1}}{2\Gamma(\nu)} \prod_{s=1}^{\infty} \left(1 - \frac{z^2}{j'_{\nu,s}}\right) \quad (\nu > 0)$

McMahon's Expansions for Large Zeros

When ν is fixed, $s \gg \nu$ and $\mu = 4\nu^2$

9.5.12

$$j_{\nu, s}, y_{\nu, s} \sim \beta - \frac{\mu-1}{8\beta} - \frac{4(\mu-1)(7\mu-31)}{3(8\beta)^3} - \frac{32(\mu-1)(83\mu^2-982\mu+3779)}{15(8\beta)^5} - \frac{64(\mu-1)(6949\mu^3-153855\mu^2+1585743\mu-6277237)}{105(8\beta)^7} \dots$$

where $\beta = (s + \frac{1}{2}\nu - \frac{1}{4})\pi$ for $j_{\nu, s}$, $\beta = (s + \frac{1}{2}\nu - \frac{3}{4})\pi$ for $y_{\nu, s}$. With $\beta = (t + \frac{1}{2}\nu - \frac{1}{4})\pi$, the right of 9.5.12 is the asymptotic expansion of $\rho_\nu(t)$ for large t .

9.5.13

$$j'_{\nu, s}, y'_{\nu, s} \sim \beta' - \frac{\mu+3}{8\beta'} - \frac{4(7\mu^2+82\mu-9)}{3(8\beta')^3} - \frac{32(83\mu^3+2075\mu^2-3039\mu+3537)}{15(8\beta')^5} - \frac{64(6949\mu^4+296492\mu^3-1248002\mu^2+7414380\mu-5853627)}{105(8\beta')^7} \dots$$

where $\beta' = (s + \frac{1}{2}\nu - \frac{3}{4})\pi$ for $j'_{\nu, s}$, $\beta' = (s + \frac{1}{2}\nu - \frac{1}{4})\pi$ for $y'_{\nu, s}$, $\beta' = (t + \frac{1}{2}\nu + \frac{1}{4})\pi$ for $\sigma_\nu(t)$. For higher terms in 9.5.12 and 9.5.13 see [9.4] or [9.40].

Corresponding expansions for $s=2, 3$ are given in [9.40]. These expansions become progressively weaker as s increases; those which follow do not suffer from this defect.

where a_s, a'_s are the s th negative zeros of $Ai(z)$, $Ai'(z)$ (see 10.4), $z = z(\zeta)$ is the inverse function defined implicitly by 9.3.39, and

9.5.26

$$h(\zeta) = \{4\zeta/(1-z^2)\}^{1/2}$$

$$f_1(\zeta) = \frac{1}{2}z(\zeta)\{h(\zeta)\}^2 b_0(\zeta)$$

$$g_1(\zeta) = \frac{1}{2}\zeta^{-1}z(\zeta)\{h(\zeta)\}^2 c_0(\zeta)$$

where $b_0(\zeta), c_0(\zeta)$ appear in 9.3.42 and 9.3.46. Tables of the leading coefficients follow. More extensive tables are given in [9.40].

The expansions of $y_{\nu, s}, Y'_\nu(y_{\nu, s}), y'_{\nu, s}$ and $Y_\nu(y'_{\nu, s})$ corresponding to 9.5.22 to 9.5.25 are obtained by changing the symbols j, J, Ai, Ai', a_s and a'_s to $y, Y, -Bi, -Bi', b_s$ and b'_s respectively.

Complex Zeros of $J_\nu(z)$

When $\nu \geq -1$ the zeros of $J_\nu(z)$ are all real. If $\nu < -1$ and ν is not an integer the number of complex zeros of $J_\nu(z)$ is twice the integer part of $(-\nu)$; if the integer part of $(-\nu)$ is odd two of these zeros lie on the imaginary axis.

If $\nu \geq 0$, all zeros of $J'_\nu(z)$ are real.

Complex Zeros of $Y_\nu(z)$

When ν is real the pattern of the complex zeros of $Y_\nu(z)$ and $Y'_\nu(z)$ depends on the non-integer part of ν . Attention is confined here to the case $\nu = n$, a positive integer or zero.

FIGURE 9.5. Zeros of $Y_n(z)$ and $Y'_n(z)$. . .

$$|\arg z| \leq \pi.$$

Figure 9.5 shows the approximate distribution of the complex zeros of $Y_n(z)$ in the region $|\arg z| \leq \pi$. The figure is symmetrical about the real axis. The two curves on the left extend to infinity, having the asymptotes

$$\mathcal{J}z = \pm \frac{1}{2} \ln 3 = \pm .54931 \dots$$

There are an infinite number of zeros near each of these curves.

The two curves extending from $z = -n$ to $z = n$ and bounding an eye-shaped domain intersect the imaginary axis at the points $\pm i(na+b)$, where

$$a = \sqrt{t_0^2 - 1} = .66274 \dots$$

$$b = \frac{1}{2} \sqrt{1 - t_0^{-2}} \ln 2 = .19146 \dots$$

and $t_0 = 1.19968 \dots$ is the positive root of $\coth t = t$. There are n zeros near each of these curves. Asymptotic expansions of these zeros for large n

are given by the right of 9.5.22 with $\nu = n$ and $\zeta = n^{-2/3}\beta_s$ or $n^{-2/3}\bar{\beta}_s$, where $\beta_s, \bar{\beta}_s$ are the complex zeros of $\text{Bi}(z)$ (see 10.4).

Figure 9.5 is also applicable to the zeros of $Y'_n(z)$. There are again an infinite number near the infinite curves, and n near each of the finite curves. Asymptotic expansions of the latter for large n are given by the right of 9.5.24 with $\nu = n$ and $\zeta = n^{-2/3}\beta'_s$ or $n^{-2/3}\bar{\beta}'_s$; where β'_s and $\bar{\beta}'_s$ are the complex zeros of $\text{Bi}'(z)$.

Numerical values of the three smallest complex zeros of $Y_0(z)$, $Y_1(z)$ and $Y'_1(z)$ in the region $0 < \arg z < \pi$ are given below.

For further details see [9.36] and [9.13]. The latter reference includes tables to facilitate computation.

Complex Zeros of the Hankel Functions

The approximate distribution of the zeros of $H_n^{(1)}(z)$ and its derivative in the region $|\arg z| \leq \pi$ is indicated in a similar manner on Figure 9.6.

FIGURE 9.6. Zeros of $H_n^{(1)}(z)$ and $H_n^{(1)'}(z)$. . .

$$|\arg z| \leq \pi.$$

The asymptote of the solitary infinite curve is given by

$$\mathcal{J}z = -\frac{1}{2} \ln 2 = -.34657 \dots$$

There are n zeros of each function near the finite curve extending from $z=-n$ to $z=n$; the asymptotic expansions of these zeros for large n are given by the right side of 9.5.22 or 9.5.24 with $\nu=n$ and $\zeta=e^{-2\pi i/3}n^{-2/3}a_s$, or $\zeta=e^{-2\pi i/3}n^{-2/3}a'_s$.

Zeros of Cross-Products

If ν is real and λ is positive, the zeros of the function

9.5.27 $J_\nu(z)Y_\nu(\lambda z) - J_\nu(\lambda z)Y_\nu(z)$

are real and simple. If $\lambda > 1$, the asymptotic expansion of the s th zero is

9.5.28 $\beta + \frac{p}{\beta} + \frac{q-p^2}{\beta^3} + \frac{r-4pq+2p^3}{\beta^5} + \dots$

where with $4\nu^2$ denoted by μ ,

9.5.29
$$\beta = s\pi/(\lambda-1)$$

$$p = \frac{\mu-1}{8\lambda}, \quad q = \frac{(\mu-1)(\mu-25)(\lambda^3-1)}{6(4\lambda)^3(\lambda-1)}$$

$$r = \frac{(\mu-1)(\mu^2-114\mu+1073)(\lambda^5-1)}{5(4\lambda)^5(\lambda-1)}$$

The asymptotic expansion of the large positive zeros (not necessarily the s th) of the function

9.5.30 $J'_\nu(z)Y'_\nu(\lambda z) - J'_\nu(\lambda z)Y'_\nu(z)$ ($\lambda > 1$)

is given by 9.5.28 with the same value of β , but instead of 9.5.29 we have

9.5.31
$$p = \frac{\mu+3}{8\lambda}, \quad q = \frac{(\mu^2+46\mu-63)(\lambda^3-1)}{6(4\lambda)^3(\lambda-1)}$$

$$r = \frac{(\mu^3+185\mu^2-2053\mu+1899)(\lambda^5-1)}{5(4\lambda)^5(\lambda-1)}$$

The asymptotic expansion of the large positive zeros of the function

9.5.32 $J'_\nu(z)Y_\nu(\lambda z) - Y'_\nu(z)J_\nu(\lambda z)$

is given by 9.5.28 with

9.5.33

Modified Bessel Functions I and K

9.6. Definitions and Properties

Differential Equation

9.6.1 $z^2 \frac{d^2 w}{dz^2} + z \frac{dw}{dz} - (z^2 + \nu^2)w = 0$

Solutions are $I_{\pm\nu}(z)$ and $K_\nu(z)$. Each is a regular function of z throughout the z -plane cut along the negative real axis, and for fixed z ($\neq 0$) each is an entire function of ν . When $\nu = \pm n$, $I_\nu(z)$ is an entire function of z .

$I_\nu(z)$ ($\Re \nu \geq 0$) is bounded as $z \rightarrow 0$ in any bounded range of $\arg z$. $I_\nu(z)$ and $I_{-\nu}(z)$ are linearly independent except when ν is an integer. $K_\nu(z)$ tends to zero as $|z| \rightarrow \infty$ in the sector $|\arg z| < \frac{1}{2}\pi$, and for all values of ν , $I_\nu(z)$ and $K_\nu(z)$ are linearly independent. $I_\nu(z)$, $K_\nu(z)$ are real and positive when $\nu > -1$ and $z > 0$.

Relations Between Solutions

9.6.2
$$K_\nu(z) = \frac{1}{2}\pi \frac{I_{-\nu}(z) - I_\nu(z)}{\sin(\nu\pi)}$$

The right of this equation is replaced by its limiting value if ν is an integer or zero.

9.6.3

$$I_\nu(z) = e^{-\frac{1}{2}\nu\pi i} J_\nu(ze^{\frac{1}{2}\pi i}) \quad (-\pi < \arg z \leq \frac{1}{2}\pi)$$

$$I_\nu(z) = e^{\frac{3}{2}\nu\pi i/2} J_\nu(ze^{-3\pi i/2}) \quad (\frac{1}{2}\pi < \arg z \leq \pi)$$

9.6.4

$$K_\nu(z) = \frac{1}{2}\pi i e^{\frac{1}{2}\nu\pi i} H_\nu^{(1)}(ze^{\frac{1}{2}\pi i}) \quad (-\pi < \arg z \leq \frac{1}{2}\pi)$$

$$K_\nu(z) = -\frac{1}{2}\pi i e^{-\frac{1}{2}\nu\pi i} H_\nu^{(2)}(ze^{-\frac{1}{2}\pi i}) \quad (-\frac{1}{2}\pi < \arg z \leq \pi)$$

9.6.5

$$Y_\nu(ze^{\frac{1}{2}\pi i}) = e^{\frac{1}{2}(\nu+1)\pi i} I_\nu(z) - (2/\pi) e^{-\frac{1}{2}\nu\pi i} K_\nu(z)$$

$(-\pi < \arg z \leq \frac{1}{2}\pi)$

9.6.6

$$I_{-n}(z) = I_n(z), K_{-n}(z) = K_n(z)$$

Most of the properties of modified Bessel functions can be deduced immediately from those of ordinary Bessel functions by application of these relations.

Zeros

Properties of the zeros of $I_\nu(z)$ and $K_\nu(z)$ may be deduced from those of $J_\nu(z)$ and $H_\nu^{(1)}(z)$ respectively, by application of the transformations 9.6.3 and 9.6.4.

For example, if ν is real the zeros of $I_\nu(z)$ are all complex unless $-2k < \nu < -(2k-1)$ for some positive integer k , in which event $I_\nu(z)$ has two real zeros.

The approximate distribution of the zeros of $K_n(z)$ in the region $-\frac{3}{2}\pi \leq \arg z \leq \frac{1}{2}\pi$ is obtained on rotating Figure 9.6 through an angle $-\frac{1}{2}\pi$ so that the cut lies along the positive imaginary axis. The zeros in the region $-\frac{1}{2}\pi \leq \arg z \leq \frac{3}{2}\pi$ are their conjugates. $K_n(z)$ has no zeros in the region $|\arg z| \leq \frac{1}{2}\pi$; this result remains true when n is replaced by any real number ν .

When ν is fixed, $|z|$ is large and $\mu = 4\nu^2$

9.7.1

$$\begin{aligned} I_\nu(z) \sim \frac{e^z}{\sqrt{2\pi z}} \{ &1 - \frac{\mu-1}{8z} + \frac{(\mu-1)(\mu-9)}{2!(8z)^2} \\ &- \frac{(\mu-1)(\mu-9)(\mu-25)}{3!(8z)^3} + \dots \} \quad (|\arg z| < \frac{1}{2}\pi) \end{aligned}$$

9.7.2

$$K_\nu(z) \sim \sqrt{\frac{\pi}{2z}} e^{-z} \left\{ 1 + \frac{\mu-1}{8z} + \frac{(\mu-1)(\mu-9)}{2!(8z)^2} + \frac{(\mu-1)(\mu-9)(\mu-25)}{3!(8z)^3} + \dots \right\} \quad (|\arg z| < \frac{1}{2}\pi)$$

9.7.3

$$I'_\nu(z) \sim \frac{e^z}{\sqrt{2\pi z}} \left\{ 1 - \frac{\mu+3}{8z} + \frac{(\mu-1)(\mu+15)}{2!(8z)^2} - \frac{(\mu-1)(\mu-9)(\mu+35)}{3!(8z)^3} + \dots \right\} \quad (|\arg z| < \frac{1}{2}\pi)$$

9.7.4

$$K'_\nu(z) \sim -\sqrt{\frac{\pi}{2z}} e^{-z} \left\{ 1 + \frac{\mu+3}{8z} + \frac{(\mu-1)(\mu+15)}{2!(8z)^2} + \frac{(\mu-1)(\mu-9)(\mu+35)}{3!(8z)^3} + \dots \right\} \quad (|\arg z| < \frac{1}{2}\pi)$$

The general terms in the last two expansions can be written down by inspection of 9.2.15 and 9.2.16.

If ν is real and non-negative and z is positive the remainder after k terms in the expansion 9.7.2 does not exceed the $(k+1)$ th term in absolute value and is of the same sign, provided that $k \geq \nu - \frac{1}{2}$.

9.7.5

$$I_\nu(z)K_\nu(z) \sim \frac{1}{2z} \left\{ 1 - \frac{1}{2} \frac{\mu-1}{(2z)^2} + \frac{1 \cdot 3}{2 \cdot 4} \frac{(\mu-1)(\mu-9)}{(2z)^4} - \dots \right\} \quad (|\arg z| < \frac{1}{2}\pi)$$

9.7.6

$$I'_\nu(z)K'_\nu(z) \sim -\frac{1}{2z} \left\{ 1 + \frac{1}{2} \frac{\mu-3}{(2z)^2} - \frac{1 \cdot 1}{2 \cdot 4} \frac{(\mu-1)(\mu-45)}{(2z)^4} + \dots \right\} \quad (|\arg z| < \frac{1}{2}\pi)$$

The general terms can be written down by inspection of 9.2.28 and 9.2.30.

Uniform Asymptotic Expansions for Large Orders

$$9.7.7 \quad I_\nu(\nu z) \sim \frac{1}{\sqrt{2\pi\nu}} \frac{e^{\nu\eta}}{(1+z^2)^{1/4}} \left\{ 1 + \sum_{k=1}^{\infty} \frac{u_k(t)}{\nu^k} \right\}$$

9.7.8

$$K_\nu(\nu z) \sim \sqrt{\frac{\pi}{2\nu}} \frac{e^{-\nu\eta}}{(1+z^2)^{1/4}} \left\{ 1 + \sum_{k=1}^{\infty} (-)^k \frac{u_k(t)}{\nu^k} \right\}$$

$$9.7.9 \quad I'_\nu(\nu z) \sim \frac{1}{\sqrt{2\pi\nu}} \frac{(1+z^2)^{1/4}}{z} e^{\nu\eta} \left\{ 1 + \sum_{k=1}^{\infty} \frac{v_k(t)}{\nu^k} \right\}$$

9.7.10

$$K'_\nu(\nu z) \sim -\sqrt{\frac{\pi}{2\nu}} \frac{(1+z^2)^{1/4}}{z} e^{-\nu\eta} \left\{ 1 + \sum_{k=1}^{\infty} (-)^k \frac{v_k(t)}{\nu^k} \right\}$$

When $\nu \rightarrow +\infty$, these expansions hold uniformly with respect to z in the sector $|\arg z| \leq \frac{1}{2}\pi - \epsilon$, where ϵ is an arbitrary positive number. Here

$$9.7.11 \quad t = 1/\sqrt{1+z^2}, \quad \eta = \sqrt{1+z^2} + \ln \frac{z}{1+\sqrt{1+z^2}}$$

and $u_k(t)$, $v_k(t)$ are given by 9.3.9, 9.3.10, 9.3.13 and 9.3.14. See [9.38] for tables of η , $u_k(t)$, $v_k(t)$, and also for bounds on the remainder terms in 9.7.7 to 9.7.10.

Functions of Negative Argument

In general Kelvin functions have a branch point at $x=0$ and individual functions with arguments $xe^{\pm\pi i}$ are complex. The branch point is absent however in the case of ber_ν and bei_ν , when ν is an integer, and

9.9.13

$$\text{ber}_n(-x) = (-)^n \text{ber}_n x, \quad \text{bei}_n(-x) = (-)^n \text{bei}_n x$$

The terms⁶ in \ker, x and kei, x in equations 9.10.1 and 9.10.2 are asymptotically negligible compared with the other terms, but their inclusion in numerical calculations yields improved accuracy.

The corresponding series for $\text{ber}'_x, \text{bei}'_x, \ker'_x$ and kei'_x can be derived from 9.2.11 and 9.2.13 with $z = xe^{3\pi i/4}$; the extra terms in the expansions of ber'_x and bei'_x are respectively

$$-(1/\pi)\{\sin(2\nu\pi)\ker'_x + \cos(2\nu\pi)\text{kei}'_x\}$$

and

$$(1/\pi)\{\cos(2\nu\pi)\ker'_x - \sin(2\nu\pi)\text{kei}'_x\}.$$

Numerical Methods

9.12. Use and Extension of the Tables

Example 1. To evaluate $J_n(1.55)$, $n=0, 1, 2, \dots$, each to 5 decimals.
 The recurrence relation

$$J_{n-1}(x) + J_{n+1}(x) = (2n/x)J_n(x)$$

can be used to compute $J_0(x), J_1(x), J_2(x), \dots$, successively provided that $n < x$, otherwise severe accumulation of rounding errors will occur. Since, however, $J_n(x)$ is a decreasing function of n when $n > x$, recurrence can always be carried out in the direction of decreasing n .

Inspection of **Table 9.2** shows that $J_n(1.55)$ vanishes to 5 decimals when $n > 7$. Taking arbitrary values zero for J_0 and unity for J_8 , we compute by recurrence the entries in the second column of the following table, rounding off to the nearest integer at each step.

n	<i>Trial values</i>	$J_n(1.55)$
9	0	.00000
8	1	.00000
7	10	.00003
6	89	.00028
5	679	.00211
4	4292	.01331
3	21473	.06661
2	78829	.24453
1	181957	.56442
0	155954	.48376

We normalize the results by use of the equation **9.1.46**, namely

$$J_0(x) + 2J_2(x) + 2J_4(x) + \dots = 1$$

This yields the normalization factor

$$1/322376 = .00000 31019 7$$

and multiplying the trial values by this factor we obtain the required results, given in the third column. As a check we may verify the value of $J_0(1.55)$ by interpolation in **Table 9.1**.

Remarks. (i) In this example it was possible to estimate immediately the value of $n=N$, say, at which to begin the recurrence. This may not always be the case and an arbitrary value of N may have to be taken. The number of correct significant figures in the final values is the same as the number of digits in the respective trial values. If the chosen N is too small the trial values will have too few digits and insufficient accuracy is obtained in the results. The calculation must then be repeated taking a higher value. On the other hand if N were too large unnecessary effort would be expended. This could be offset to some extent by discarding significant figures in the trial values which are in excess of the number of decimals required in J_n .

(ii) If we had required, say, $J_0(1.55)$, $J_1(1.55)$, . . . , $J_{10}(1.55)$, each to 5 significant figures, we would have found the values of $J_{10}(1.55)$ and $J_{11}(1.55)$ to 5 significant figures by interpolation in **Table 9.3** and then computed by recurrence J_9, J_8, \dots, J_0 , no normalization being required.

Alternatively, we could begin the recurrence at a higher value of N and retain only 5 significant figures in the trial values for $n \leq 10$.

(iii) Exactly similar methods can be used to compute the modified Bessel function $I_n(x)$ by means of the relations **9.6.26** and **9.6.36**. If x is large, however, considerable cancellation will take place in using the latter equation, and it is preferable to normalize by means of **9.6.37**.

Example 2. To evaluate $Y_n(1.55)$, $n=0, 1, 2, \dots, 10$, each to 5 significant figures.

The recurrence relation

$$Y_{n-1}(x) + Y_{n+1}(x) = (2n/x)Y_n(x)$$

can be used to compute $Y_n(x)$ in the direction of increasing n both for $n < x$ and $n > x$, because in the latter event $Y_n(x)$ is a numerically increasing function of n .

We therefore compute $Y_0(1.55)$ and $Y_1(1.55)$ by interpolation in **Table 9.1**, generate $Y_2(1.55)$, $Y_3(1.55)$, . . . , $Y_{10}(1.55)$ by recurrence and check $Y_{10}(1.55)$ by interpolation in **Table 9.3**.

n	$Y_n(1.55)$	n	$Y_n(1.55)$
0	+0.40225	6	-1.9917 × 10 ²
1	-0.37970	7	-1.5100 × 10 ³
2	-0.89218	8	-1.3440 × 10 ⁴
3	-1.9227	9	-1.3722 × 10 ⁵
4	-6.5505	10	-1.5801 × 10 ⁶
5	-31.886		

Remarks. (i) An alternative way of computing $Y_0(x)$, should $J_0(x)$, $J_2(x)$, $J_4(x)$, . . . , be available (see **Example 1**), is to use formula **9.1.89**. The other starting value for the recurrence, $Y_1(x)$, can then be found from the Wronskian relation $J_1(x)Y_0(x) - J_0(x)Y_1(x) = 2/(\pi x)$. This is a convenient procedure for use with an automatic computer.

(ii) Similar methods can be used to compute the modified Bessel function $K_n(x)$ by means of the recurrence relation **9.6.26** and the relation **9.6.54**, except that if x is large severe cancellation will occur in the use of **9.6.54** and other methods for evaluating $K_0(x)$ may be preferable, for example, use of the asymptotic expansion **9.7.2** or the polynomial approximation **9.8.6**.

Example 3. To evaluate $J_0(.36)$ and $Y_0(.36)$ each to 5 decimals, using the multiplication theorem.

From **9.1.74** we have

$$\mathcal{C}_0(\lambda z) = \sum_{k=0}^{\infty} a_k \mathcal{C}_k(z), \text{ where } a_k = \frac{(-)^k (\lambda^2 - 1)^k (\frac{1}{2}z)^k}{k!}.$$

We take $z = .4$. Then $\lambda = .9$, $(\lambda^2 - 1)(\frac{1}{2}z) = -.038$, and extracting the necessary values of $J_k(.4)$ and $Y_k(.4)$ from **Tables 9.1** and **9.2**, we compute the required results as follows:

k	a_k	$a_k J_k(.4)$	$a_k Y_k(.4)$
0	+1.0	+ .96040	- .60602
1	+0.038	+ .00745	- .06767
2	+0.7220 × 10 ⁻³	+ .00001	- .00599
3	+0.914 × 10 ⁻⁵		- .00074
4	+0.87 × 10 ⁻⁷		- .00011
5	+0.7 × 10 ⁻⁹		- .00002
		$J_0(.36) = +.96786$	$Y_0(.36) = -.68055$

Remark. This procedure is equivalent to interpolating by means of the Taylor series

$$\mathcal{C}_0(z+h) = \sum_{k=0}^{\infty} \frac{h^k}{k!} \mathcal{C}_0^{(k)}(z)$$

at $z = .4$, and expressing the derivatives $\mathcal{C}_0^{(k)}(z)$ in terms of $\mathcal{C}_k(z)$ by means of the recurrence relations and differential equation for the Bessel functions.

Example 4. To evaluate $J_\nu(x)$, $J'_\nu(x)$, $Y_\nu(x)$ and $Y'_\nu(x)$ for $\nu = 50$, $x = 75$, each to 6 decimals.

We use the asymptotic expansions **9.3.35**, **9.3.36**, **9.3.43**, and **9.3.44**. Here $z = x/\nu = 3/2$. From **9.3.39** we find

$$\frac{2}{3} (-\frac{1}{2})^{3/2} = \frac{1}{2} \sqrt{5} - \arccos \frac{2}{3} = +.2769653.$$

Hence

$$\zeta = -.5567724 \text{ and } \left(\frac{4\zeta}{1-z^2}\right)^{1/4} = +1.155332.$$

Next,

$$\nu^{1/3} = 3.684031, \quad \nu^{2/3}\zeta = -7.556562.$$

Interpolating in Table 10.11, we find that

$$\text{Ai}(\nu^{2/3}\zeta) = +.299953, \quad \text{Ai}'(\nu^{2/3}\zeta) = +.451441,$$

$$\text{Bi}(\nu^{2/3}\zeta) = -.160565, \quad \text{Bi}'(\nu^{2/3}\zeta) = +.819542.$$

As a check on the interpolation, we may verify that $\text{Ai Bi}' - \text{Ai}' \text{Bi} = 1/\pi$.

Interpolating in the table following 9.3.46 we obtain

$$b_0(\zeta) = +.0136, \quad c_0(\zeta) = +.1442.$$

The contributions of the terms involving $a_1(\zeta)$ and $d_1(\zeta)$ are negligible, and substituting in the asymptotic expansions we find that

$$J_{80}(75) = +1.155332(50^{-1/3} \times .299953 + 50^{-5/3} \times .451441 \times .0136) = +.094077,$$

$$J'_{80}(75) = -(4/3)(1.155332)^{-1}(50^{-4/3} \times .299953 \times .1442 + 50^{-2/3} \times .451441) = -.038658,$$

$$Y_{80}(75) = -1.155332(-50^{-1/3} \times .160565 + 50^{-5/3} \times .819542 \times .0136) = +.050335,$$

$$Y'_{80}(75) = +(4/3)(1.155332)^{-1}(-50^{-4/3} \times .160565 \times .1442 + 50^{-2/3} \times .819542) = +.069543.$$

As a check we may verify that

$$JY' - J'Y = 2/(75\pi).$$

Remarks. This example may also be computed using the Debye expansions 9.3.15, 9.3.16, 9.3.19, and 9.3.20. Four terms of each of these series are required, compared with two in the computations above. The closer the argument-order ratio is to unity, the less effective the Debye expansions become. In the neighborhood of unity the expansions 9.3.23, 9.3.24, 9.3.27, and 9.3.28 will furnish results of moderate accuracy; for high-accuracy work the uniform expansions should again be used.

Example 5. To evaluate the 5th positive zero of $J_{10}(x)$ and the corresponding value of $J'_{10}(x)$, each to 5 decimals.

We use the asymptotic expansions 9.5.22 and 9.5.23 setting $\nu=10$, $s=5$. From Table 10.11

we find

$$a_5 = -7.944134, \quad \text{Ai}'(a_5) = +.947336.$$

Hence

$$\zeta = 10^{-2/3}a_5 = .21544347a_5 = -1.7115118.$$

Interpolating in the table following 9.5.26 we obtain

$$z(\zeta) = +2.888631, \quad h(\zeta) = +.98259, \\ f_1(\zeta) = +.0107, \quad F_1(\zeta) = -.001.$$

The bounds given at the foot of the table show that the contributions of higher terms to the asymptotic series are negligible. Hence

$$j_{10,5} = 28.88631 + .0107 + \dots = 28.88738,$$

$$J'_{10}(j_{10,5}) = -\frac{2}{10^{2/3}} \frac{.947336}{2.888631 \times .98259} \\ \times (1 - .0001 + \dots) = -.14381.$$

Example 6. To evaluate the first root of $J_0(x)Y_0(\lambda x) - Y_0(x)J_0(\lambda x) = 0$ for $\lambda = \frac{3}{2}$ to 4 significant figures.

Let $\alpha_\lambda^{(1)}$ denote the root. Direct interpolation in Table 9.7 is impracticable owing to the divergence of the differences. Inspection of 9.5.28 suggests that a smoother function is $(\lambda-1)\alpha_\lambda^{(1)}$. Using Table 9.7 we compute the following values

$1/\lambda$	$(\lambda-1)\alpha_\lambda^{(1)}$	δ	δ^2
0.4	3.110		
		+21	
0.6	3.131		-12
		+9	
0.8	3.140		-7
		+2	
1.0	3.142(π)		

Interpolating for $1/\lambda = .667$, we obtain $(\lambda-1)\alpha_\lambda^{(1)} = 3.134$ and thence the required root $\alpha_{1.5}^{(1)} = 6.268$.

Example 7. To evaluate $\text{ber}_n 1.55$, $\text{bei}_n 1.55$, $n=0, 1, 2, \dots$, each to 5 decimals.

We use the recurrence relation

$$J_{n-1}(xe^{3\pi i/4}) + J_{n+1}(xe^{3\pi i/4}) \\ = -\frac{n\sqrt{2}}{x}(1+i)J_n(xe^{3\pi i/4}),$$

taking arbitrary values zero for $J_0(xe^{3\pi i/4})$ and $1+0i$ for $J_1(xe^{3\pi i/4})$ (see Example 1).

n	Real trial values	Imag. trial values	$\text{ber}_n x$	$\text{bei}_n x$
9	0	0	.00000	.00000
8	+1	0	.00000	.00000
7	-7	-7	-.00002	-.00003
6	-1	+89	-.00003	+.00030
5	+500	-475	+.00181	-.00148
4	-4447	-203	-.01494	-.00180
3	+14989	+17446	+.04614	+.06258
2	+11172	-88578	+.05994	-.29580
1	-197012	+123804	-.69531	+.36781
0	+281539	+155373	+.91004	+.59461
Σ	+106734	+207449	+.30763	+.72619

The values of $\text{ber}_n x$ and $\text{bei}_n x$ are computed by multiplication of the trial values by the normalizing factor

$$1/(294989 - 22011i) = (.337119 + .025155i) \times 10^{-6},$$

obtained from the relation

$$J_0(xe^{3\pi i/4}) + 2J_2(xe^{3\pi i/4}) + 2J_4(xe^{3\pi i/4}) + \dots = 1.$$

Adequate checks are furnished by interpolating in **Table 9.12** for ber 1.55 and bei 1.55, and the use of a simple sum check on the normalization.

Should $\text{ker}_n x$ and $\text{kei}_n x$ be required they can be computed by forward recurrence using formulas **9.9.14**, taking the required starting values for $n=0$ and 1 from **Table 9.12** (see **Example 2**). If an independent check on the recurrence is required the asymptotic expansion **9.10.38** can be used.

For interpolating near $x^{-1}=0$ note that if $f_n(x^{-1})=x^{\frac{1}{2}}e^{-x}I_n(x)$ then $f_n(-x^{-1})=\pi^{-1}x^{\frac{1}{2}}e^xK_n(x)$.

$\langle x \rangle$ = nearest integer to x .

10. Bessel Functions of Fractional Order

Mathematical Properties

10.1. Spherical Bessel Functions

Definitions

Differential Equation

10.1.1

$$z^2 w'' + 2zw' + [z^2 - n(n+1)]w = 0 \quad (n=0, \pm 1, \pm 2, \dots)$$

Particular solutions are the *Spherical Bessel functions of the first kind*

$$j_n(z) = \sqrt{\frac{1}{2}\pi/z} J_{n+\frac{1}{2}}(z),$$

the *Spherical Bessel functions of the second kind*

$$y_n(z) = \sqrt{\frac{1}{2}\pi/z} Y_{n+\frac{1}{2}}(z),$$

and the *Spherical Bessel functions of the third kind*

$$h_n^{(1)}(z) = j_n(z) + iy_n(z) = \sqrt{\frac{1}{2}\pi/z} H_{n+\frac{1}{2}}^{(1)}(z),$$

$$h_n^{(2)}(z) = j_n(z) - iy_n(z) = \sqrt{\frac{1}{2}\pi/z} H_{n+\frac{1}{2}}^{(2)}(z).$$

The pairs $j_n(z)$, $y_n(z)$ and $h_n^{(1)}(z)$, $h_n^{(2)}(z)$ are linearly independent solutions for every n . For general properties see the remarks after 9.1.1.

10.1.3

Zeros and Their Asymptotic Expansions

The zeros of $j_n(x)$ and $y_n(x)$ are the same as the zeros of $J_{n+1/2}(x)$ and $Y_{n+1/2}(x)$ and the formulas for $j_{\nu,s}$ and $y_{\nu,s}$ given in 9.5 are applicable with $\nu = n + \frac{1}{2}$. There are, however, no simple relations connecting the zeros of the derivatives. Accordingly, we now give formulas for $a'_{n,s}, b'_{n,s}$, the s -th positive zero of $j'_n(z), y'_n(z)$, respectively; $z=0$ is counted as the first zero of $j'_0(z)$.

(Tables of $a'_{n,s}, b'_{n,s}, j_n(a'_{n,s}), y_n(b'_{n,s})$ are given in [10.31].)

Elementary Relations

$$f_n(z) = j_n(z) \cos \pi t + y_n(z) \sin \pi t$$

(t a real parameter, $0 \leq t \leq 1$)

If τ_n is a zero of $f_n(z)$ then

10.1.55 $f_n(\tau_n) = [\tau_n/(n+1)] f_{n-1}(\tau_n)$
 (See 10.1.21.)

10.1.56 $= (\tau_n/n) f_{n+1}(\tau_n)$
 (See 10.1.22.)

10.1.57 $= \left\{ \frac{1}{\pi} [\tau_n^2 - n(n+1)] \frac{d\tau_n}{d\tau} \right\}^{-1}$

*See page II.

Complex Zeros of $h_n^{(1)}(z), h_n^{(1)'}(z)$

$h_n^{(1)}(z)$ and $h_n^{(1)}(ze^{2m\pi i})$, m any integer, have the same zeros.

$h_n^{(1)}(z)$ has n zeros, symmetrically distributed with respect to the imaginary axis and lying approximately on the finite arc joining $z=-n$ and $z=n$ shown in Figure 9.6. If n is odd, one zero lies on the imaginary axis.

$h_n^{(1)'}(z)$ has $n+1$ zeros lying approximately on the same curve. If n is even, one zero lies on the imaginary axis.

Particular solutions are the *Modified Spherical Bessel functions of the first kind*,

10.2.2

$$\begin{aligned} \sqrt{\frac{1}{2}\pi/z} I_{n+\frac{1}{2}}(z) &= e^{-n\pi i/2} j_n(ze^{\pi i/2}) & (-\pi < \arg z \leq \frac{1}{2}\pi) \\ &= e^{3n\pi i/2} j_n(ze^{-3\pi i/2}) & (\frac{1}{2}\pi < \arg z \leq \pi) \end{aligned}$$

An equation

$$10.4.106 \quad W'' + a(z, \lambda)W' + b(z, \lambda)W = 0$$

in which λ is a real or complex parameter and, for fixed λ , $a(z, \lambda)$ is analytic in z and $b(z, \lambda)$ is continuous in z in some region of the z -plane, may be reduced by the transformation

$$10.4.107 \quad W(z) = w(z) \exp\left(-\frac{1}{2} \int^z a(t, \lambda) dt\right)$$

to the equation

10.4.108

$$w'' + \varphi(z, \lambda)w = 0$$

$$\varphi(z, \lambda) = b(z, \lambda) - \frac{1}{4} a^2(z, \lambda) - \frac{1}{2} \frac{d}{dz} a(z, \lambda).$$

*See page 11.

If $\varphi(z, \lambda)$ can be written in the form

10.4.109 $\varphi(z, \lambda) = \lambda^2 p(z) + q(z, \lambda)$

where $q(z, \lambda)$ is bounded in a region R of the z -plane, then the zeros of $p(z)$ in R are said to be turning points of the equation **10.4.108**.

The Special Case $w'' + [\lambda^2 z + q(z, \lambda)]w = 0$

Let $\lambda = |\lambda|e^{i\omega}$ vary over a sectorial domain S : $|\lambda| \geq \lambda_0 (> 0)$, $\omega_1 \leq \omega \leq \omega_2$, and suppose that $q(z, \lambda)$ is continuous in z for $|z| < r$ and λ in S , and $q(z, \lambda) \sim \sum_0^n q_n(z)\lambda^{-n}$ as $\lambda \rightarrow \infty$ in S .

Formal Series Solution

10.4.110

$$w(z) = u(z) \sum_0^\infty \varphi_n(z)\lambda^{-n} + \lambda^{-1}u'(z) \sum_0^\infty \psi_n(z)\lambda^{-n}$$

$$u'' + \lambda^2 z u = 0$$

$\varphi_0(z) = c_0, \quad \psi_0(z) = z^{-1}c_1, \quad c_0, c_1$ constants

$\varphi_{n+1}(z) = -\frac{1}{2}\psi'_n(z) - \frac{1}{2}\int_0^z \sum_0^n q_{n-k}(t)\psi_k(t)dt$

$\psi_n(z) = \frac{1}{2}z^{-1} \int_0^z t^{-1} \left[\varphi''_n(t) + \sum_0^n q_{n-k}(t)\varphi_k(t) \right] dt$
 $(n=0, 1, 2, \dots)$

Uniform Asymptotic Expansions of Solutions

For z real, i.e. for the equation

10.4.111 $y'' + [\lambda^2 x + q(x, \lambda)]y = 0$

where x varies in a bounded interval $a \leq x \leq b$ that includes the origin and where, for each fixed λ in S , $q(x, \lambda)$ is continuous in x for $a \leq x \leq b$, the following asymptotic representations hold.

(i) If λ is real and positive, there are solutions $y_0(x), y_1(x)$ such that, uniformly in x on $a \leq x \leq 0$,

10.4.112

$y_0(x) = \text{Ai}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})] \quad (\lambda \rightarrow \infty)$
 $y_1(x) = \text{Bi}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})]$

and, uniformly in x on $0 \leq x \leq b$

10.4.113

$y_0(x) = \text{Ai}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})] + \text{Bi}(-\lambda^{2/3}x)O(\lambda^{-1}),$
 $y_1(x) = \text{Bi}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})] + \text{Ai}(-\lambda^{2/3}x)O(\lambda^{-1})$
 $(\lambda \rightarrow \infty)$

(ii) If $\Re \lambda \geq 0, \Im \lambda \neq 0$, there are solutions $y_0(x), y_1(x)$ such that, uniformly in x on $a \leq x \leq b$,

10.4.114

$y_0(x) = \text{Ai}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})]$
 $y_1(x) = \text{Bi}(-\lambda^{2/3}x)[1 + O(\lambda^{-1})] \quad (|\lambda| \rightarrow \infty)$

For further representations and details, we refer to [10.4].

When z is complex (bounded or unbounded), conditions under which the formal series **10.4.110** yields a uniform asymptotic expansion of a solution are given in [10.12] if $q(z, \lambda)$ is independent of λ and $|\lambda| \rightarrow \infty$ with fixed ω , and in [10.14] if λ lies in any region of the complex plane. Further references are [10.2; 10.9; 10.10].

The General Case $w'' + [\lambda^2 p(z) + q(z, \lambda)]w = 0$

Let $\lambda = |\lambda|e^{i\omega}$ where $|\lambda| \geq \lambda_0 (> 0)$ and $-\pi \leq \omega \leq \pi$; suppose that $p(z)$ is analytic in a region R and has a zero $z = z_0$ in R , and that, for fixed λ , $q(z, \lambda)$ is analytic in z for z in R . The transformation $\xi = \xi(z), v = [p(z)/\xi]^{1/4}w(z)$, where ξ is defined as the (unique) solution of the equation

10.4.115 $\xi \left(\frac{d\xi}{dz} \right)^2 = p(z),$

yields the special case

10.4.116 $\frac{d^2v}{d\xi^2} + [\lambda^2 \xi + f(\xi, \lambda)]v = 0, \quad *$

$f(\xi, \lambda) = \left(\frac{d\xi}{dz} \right)^{-2} q(z, \lambda) - \left(\frac{d\xi}{dz} \right)^{-1} \frac{d^2}{d\xi^2} \left[\left(\frac{d\xi}{dz} \right)^{\frac{1}{2}} \right].$

Example:

Consider the equation

10.4.117 $y'' + [\lambda^2 - (\lambda^2 - \frac{1}{4})x^{-2}]y = 0$

for which the points $x=0, \infty$ are singular points and $x=1$ is a turning point. It has the functions $x^{\frac{1}{2}}J_\lambda(\lambda x), x^{\frac{1}{2}}Y_\lambda(\lambda x)$ as particular solutions (see **9.1.49**).

The equation **10.4.115** becomes

$\xi \left(\frac{d\xi}{dx} \right)^2 = \frac{x^2 - 1}{x^2}$

whence

$\frac{2}{3}(-\xi)^{3/2} = -\sqrt{1-x^2} + \ln x^{-1}(1 + \sqrt{1-x^2}) \quad (0 < x \leq 1)$

$\frac{2}{3}\xi^{3/2} = \sqrt{x^2-1} - \arccos x^{-1} \quad (1 \leq x < \infty).$

Thus

10.4.118 $v(\xi) = \left(\frac{x^2-1}{x^2\xi} \right)^{1/4} y(x)$

*See page II.

satisfies the equation

$$10.4.119 \quad \frac{d^2v}{d\xi^2} + \left[\lambda^2\xi - \frac{5}{16\xi^2} + \frac{\xi^2 x^2(x^2+4)}{4(x^2-1)^3} \right] v = 0$$

which is of the form 10.4.111 with x replaced by ξ and $q(\xi, \lambda)$ independent of λ .

Suppose $\mathcal{R}\lambda \geq 0$, $\mathcal{I}\lambda \neq 0$. By the first equation of 10.4.114 there is a solution $v_0(\xi)$ of 10.4.119, i.e., a solution $y_0(x)$ of 10.4.117 for which the representation

10.4.120

$$v_0(\xi) = \left(\frac{x^2-1}{x^2\xi} \right)^{1/4} y_0(x) = \text{Ai}(-\lambda^{2/3}\xi)[1 + O(\lambda^{-1})]$$

holds uniformly in x on $0 < x < \infty$ as $|\lambda| \rightarrow \infty$.

To identify $y_0(x)$ in terms of $x^{1/2}J_\lambda(\lambda x)$, $x^{1/2}Y_\lambda(\lambda x)$, restrict x to $0 < x \leq b < 1$ so that by 10.4.118 ξ is negative, and replace the Airy function by its asymptotic representation 10.4.59. This yields

10.4.121

$$\begin{aligned} y_0(x) &= \left(\frac{x^2-1}{x^2\xi} \right)^{-1/4} \frac{1}{2} \pi^{-1/2} \lambda^{-1/6} (-\xi)^{1/4} \exp\left(\frac{2}{3}\lambda(-\xi)^{3/2}\right) \\ &\quad [1 + O(\lambda^{-1})] \\ &= \frac{1}{2} \pi^{-1/2} \lambda^{-1/6} \left(\frac{1-x^2}{x^2} \right)^{-1/4} \exp\left(\frac{2}{3}\lambda(-\xi)^{3/2}\right) \\ &\quad [1 + O(\lambda^{-1})] \end{aligned}$$

Let now λ be fixed and $x \rightarrow 0$ in 10.4.121. There results

$$10.4.122 \quad y_0(x) \sim \frac{1}{2} \pi^{-1/2} \lambda^{-1/6} x^{1/2} \left(\frac{1}{2}x\right)^\lambda e^\lambda.$$

On the other hand, $y_0(x)$ is a solution of 10.4.117 and therefore it can be written in the form

$$10.4.123 \quad y_0(x) = x^{1/2} [c_1 J_\lambda(\lambda x) + c_2 Y_\lambda(\lambda x)]$$

where, from 9.1.7 for λ fixed and $x \rightarrow 0$

$$\begin{aligned} J_\lambda(\lambda x) &\sim \frac{(\frac{1}{2}\lambda x)^\lambda}{\Gamma(\lambda+1)}, \\ Y_\lambda(\lambda x) &\sim \frac{(\frac{1}{2}\lambda x)^\lambda}{\Gamma(\lambda+1)} \cot \lambda\pi - \frac{(\frac{1}{2}\lambda x)^{-\lambda}}{\Gamma(1-\lambda)} \csc \lambda\pi. \end{aligned}$$

Thus, letting $x \rightarrow 0$ in 10.4.123 and comparing the resulting relation with 10.4.122 one finds that $c_2 = 0$ and

$$10.4.124 \quad y_0(x) = \frac{1}{2} \pi^{-1/2} \lambda^{-\lambda-1/6} e^\lambda \Gamma(\lambda+1) x^{1/2} J_\lambda(\lambda x).$$

It follows from 10.4.120 that uniformly in x on $0 < x < \infty$

10.4.125

$$\begin{aligned} &J_\lambda(\lambda x) \\ &= \frac{2\pi^{1/2}}{\Gamma(\lambda+1)} \lambda^{\lambda+1/6} e^{-\lambda} \left(\frac{x^2-1}{\xi} \right)^{-1/4} \text{Ai}(-\lambda^{2/3}\xi) [1 + O(\lambda^{-1})] \\ &\quad (|\lambda| \rightarrow \infty) \end{aligned}$$

Numerical Methods

10.5. Use and Extension of the Tables

Spherical Bessel Functions

To compute $j_n(x)$, $y_n(x)$, $n=0, 1, 2$, for values of x outside the range of Table 10.1, use formulas 10.1.11, 10.1.12 and obtain values for the circular functions from Tables 4.6–4.8.

Example 1. Compute $j_1(x)$ for $x=11.425$.

From 10.1.11, $j_1(x) = \frac{\sin x}{x^2} - \frac{\cos x}{x}$. Hence, using Tables 4.6 and 4.8,

$$\begin{aligned} j_1(11.425) &= -\frac{.90920\ 500}{(11.425)^2} - \frac{.41634\ 873}{11.425} \\ &= -.00696\ 54535 - .03644\ 1902 \\ &= -.04340\ 7356. \end{aligned}$$

To compute $j_n(x)$, $11 \leq n \leq 20$, for a value of x within the range of Table 10.3, obtain from Table 10.3, directly or possibly by linear interpolation, $j_{21}(x)$, $j_{20}(x)$ and use these as starting values in the recurrence relation 10.1.19 for decreasing n .

An alternative procedure which often yields better accuracy and which also applies to computations of $j_n(x)$ when both n and x are outside the range of Table 10.1 is the following device essentially due to J. C. P. Miller [9.20].

At some value N larger than the desired value n , assume tentatively $F_{N+1} = 0$, $F_N = 1$ and use recurrence relation 10.1.19 for decreasing N to obtain the sequence F_{N-1}, \dots, F_0 . If N was chosen large enough, each term of this sequence up to F_n is proportional, to a certain number of significant figures, to the corresponding term in the sequence $j_{N-1}(x), \dots, j_0(x)$ of true values. The factor of proportionality, p , may be obtained by comparing, say, F_0 with the true value $j_0(x)$ computed separately. The terms in the sequence pF_0, \dots, pF_n are then accurate to the number of significant figures present in the tentative values. If the accuracy obtained is not sufficient, the process may be repeated by starting from a larger value N .

Example 2. Compute $j_{15}(x)$ for $x=24.6$.
Interpolation in **Table 10.3** yields for $x=24.6$

$$x^{-21}e^{x^2/86}j_{21}(x) = (-28)3.934616$$

$$x^{-20}e^{x^2/82}j_{20}(x) = (-27)9.48683$$

whence

$$j_{21}(24.6) = .05604\ 29, \quad j_{20}(24.6) = .03896\ 98.$$

From the recurrence relation **10.1.19** there results

$$j_{19}(24.6) = .00890\ 67660 \quad [.00890\ 70]$$

$$j_{18}(24.6) = -.02484\ 93173 \quad [-.02485\ 90]$$

$$j_{17}(24.6) = -.04628\ 17554 \quad [-.04628\ 16]$$

$$j_{16}(24.6) = -.04099\ 87086 \quad [-.04099\ 88]$$

$$j_{15}(24.6) = -.00871\ 65122 \quad [-.00871\ 67]$$

For comparison, the correct values are shown in brackets.

To compute $j_{15}(x)$ for $x=24.6$ by Miller's device, take, for example, $N=39$ and assume $F_{40}=0, F_{39}=1$. Using **10.1.19** with decreasing N , i.e., $F_{N-1} = [(2N+1)/x]F_N - F_{N+1}$, $N=39, 38, \dots, 1, 0$, generate the sequence $F_{38}, F_{37}, \dots, F_1, F_0$, compute from **Table 4.6**, $j_0(24.6) = (\sin 24.6)/24.6 = -.02064\ 620296$, and obtain the factor of proportionality

$$p = j_0(24.6)/F_0 = .00000\ 03839\ 17642.$$

The value pF_{15} equals $j_{15}(24.6)$ to 8 decimals. The final part of the computations is shown in the following table, in which the correct values are given for comparison.

It may be observed that the normalization of the sequence F_N, F_{N-1}, \dots, F_0 can also be obtained from formula **10.1.50** by computing the sum $\sigma = \sum_0^N (2k+1)F_k^2$ and finding $p = 1/\sqrt{\sigma}$. This yields, in the case of the example, $p = 1/\sqrt{\sigma} = .00000\ 03839\ 177$.

Modified Spherical Bessel Functions

To compute $\sqrt{\frac{1}{2}\pi/x}I_{n+\frac{1}{2}}(x), \sqrt{\frac{1}{2}\pi/x}K_{n+\frac{1}{2}}(x), n=0, 1, 2, \dots$ for values of x outside the range of **Table 10.8**, use formulas **10.2.13, 10.2.14** together with **10.2.4** and obtain values for the hyperbolic and exponential functions from **Tables 4.4** and **4.15**. In those cases when $\sqrt{\frac{1}{2}\pi/x}I_{n+\frac{1}{2}}(x)$ and $\sqrt{\frac{1}{2}\pi/x}I_{-n-\frac{1}{2}}(x)$ are nearly equal, i.e., when x is sufficiently large, compute $\sqrt{\frac{1}{2}\pi/x}K_{n+\frac{1}{2}}(x)$ from formula **10.2.15**, for which the coefficients $(n + \frac{1}{2}, k)$ are given in **10.1.9**.

Example 3. Compute $\sqrt{\frac{1}{2}\pi/x}I_{5/2}(x), \sqrt{\frac{1}{2}\pi/x}K_{5/2}(x)$ for $x=16.2$.

From **10.2.13**, $\sqrt{\frac{1}{2}\pi/x}I_{5/2}(x) = (3+x^2) \sinh x/x^3 - 3 \cosh x/x^2$; from **Table 4.4**, $\cosh 16.2 = (6)5.4267\ 59950$ and this equals the value of $\sinh 16.2$ to the same number of significant figures. Hence

$$\begin{aligned} \sqrt{\frac{1}{2}\pi/16.2}I_{5/2}(16.2) &= (.06243\ 402371 \\ &\quad - .01143\ 118427)(6)5.4267\ 59950 \\ &= 338814.4594 - 62034.29298 \\ &= 276780.1664. \end{aligned}$$

To compute $\sqrt{\frac{1}{2}\pi/16.2}K_{5/2}(16.2)$ use **10.2.17** and obtain

$$\begin{aligned} \sqrt{\frac{1}{2}\pi/16.2}K_{5/2}(16.2) &= \pi e^{-16.2} \left[\frac{1}{32.4} + \frac{6}{(32.4)^2} + \frac{12}{(32.4)^3} \right] \\ &= (-7)2.8945\ 38069[.036932\ 60400] \\ &= (-8)1.0690\ 28283. \end{aligned}$$

To compute $\sqrt{\frac{1}{2}\pi/x}I_{n+\frac{1}{2}}(x), 3 \leq n \leq 8$, for a value of x within the range of **Table 10.9**, obtain from **Table 10.9**, $\sqrt{\frac{1}{2}\pi/x}I_{19/2}(x), \sqrt{\frac{1}{2}\pi/x}I_{21/2}(x)$ for the desired value of x and use these as starting values in the recurrence relation **10.2.18** for decreasing n .

To compute $\sqrt{\frac{1}{2}\pi/x}K_{n+\frac{1}{2}}(x)$ for some integer n outside the range of **Table 10.9**, obtain from **10.2.15** or from **Table 10.8**, $\sqrt{\frac{1}{2}\pi/x}K_{\frac{1}{2}}(x), \sqrt{\frac{1}{2}\pi/x}K_{3/2}(x)$ for the desired value of x and use these as starting values in the recurrence relation **10.2.18** for increasing n . If x lies within the range of **Table 10.9** and $n > 10$, the recurrence may be started with $\sqrt{\frac{1}{2}\pi/x}K_{19/2}(x), \sqrt{\frac{1}{2}\pi/x}K_{21/2}(x)$ obtained from **Table 10.9**.

Example 4. Compute $\sqrt{\frac{1}{2}\pi/x}K_{11/2}(x)$ for $x=3.6$. Obtain from **Table 10.8** for $x=3.6$

$$\sqrt{\frac{1}{2}\pi/x}K_{1/2}(x) = .01192\ 222$$

$$\sqrt{\frac{1}{2}\pi/x}K_{3/2}(x) = .01523\ 3952$$

The recurrence relation 10.2.18 yields successively

$$\begin{aligned}
 -\sqrt{\frac{1}{2}\pi/3.6}K_{5/2}(3.6) &= -.01192\ 222 \\
 &\quad -\frac{3}{3.6} (.01523\ 3952) \\
 &= -.02461\ 718 \\
 \sqrt{\frac{1}{2}\pi/3.6}K_{7/2}(3.6) &= .01523\ 3952 \\
 &\quad +\frac{5}{3.6} (.02461\ 718) \\
 &= .04942\ 4480 \\
 -\sqrt{\frac{1}{2}\pi/3.6}K_{9/2}(3.6) &= -.02461\ 718 \\
 &\quad -\frac{7}{3.6} (.04942\ 4480) \\
 &= -.12072\ 034 \\
 \sqrt{\frac{1}{2}\pi/3.6}K_{11/2}(3.6) &= .04942\ 4480 \\
 &\quad +\frac{9}{3.6} (.12072\ 034) \\
 &= .35122\ 533.
 \end{aligned}$$

As a check, the recurrence can be carried out until $n=9$ and the value of $\sqrt{\frac{1}{2}\pi/3.6}K_{19/2}(3.6)$ so obtained can be compared with the corresponding value from Table 10.9.

To compute $\sqrt{\frac{1}{2}\pi/x}I_{n+1/2}(x)$ when both n and x are outside the range of Table 10.9, use the device described in [9.20].

Airy Functions

To compute $Ai(x)$, $Bi(x)$ for values of x beyond 1, use auxiliary functions from Table 10.11.

Example 5. Compute $Ai(x)$ for $x=4.5$.

First, for $x=4.5$,

$$\xi = \frac{2}{3}x^{3/2} = 6.36396\ 1029, \quad \xi^{-1} = .15713\ 48403.$$

Hence, from Table 10.11, $f(-\xi) = .55848\ 24$ and thus

$$\begin{aligned}
 Ai(4.5) &= \frac{1}{2}(4.5)^{-1/4}(.55848\ 24) \exp(-6.36396\ 1029) \\
 &= \frac{1}{2}(.68658\ 905)(.55848\ 24)(.00172\ 25302) \\
 &= .00033\ 02503.
 \end{aligned}$$

To compute the zeros c , c' of a solution $y(x)$ of the equation $y'' - xy = 0$ and of its derivative

$y'(x)$, respectively, the following formulas may be used, in which d , d' denote approximations to c , c' and $u = y(d)/y'(d)$, $v = y'(d')/d'^2 y(d')$.

$$\begin{aligned}
 c &= d - u - 2d \frac{u^3}{3!} + 2 \frac{u^4}{4!} - 24d^2 \frac{u^5}{5!} \\
 &\quad + 88d \frac{u^6}{6!} - (88 + 720d^3) \frac{u^7}{7!} \\
 &\quad + 5856d^2 \frac{u^8}{8!} - (16640d + 40320d^4) \frac{u^9}{9!} + \dots \\
 c' &= d' \left\{ 1 - v - \frac{v^2}{2!} - (3 + 2d'^3) \frac{v^3}{3!} - (15 + 10d'^3) \frac{v^4}{4!} \right. \\
 &\quad \left. - (105 + 76d'^3 + 24d'^6) \frac{v^5}{5!} \right. \\
 &\quad \left. - (945 + 756d'^3 + 272d'^6) \frac{v^6}{6!} - \dots \right\} \\
 y'(c) &= y'(d) \left\{ 1 - d \frac{u^2}{2!} + \frac{u^3}{3!} - 3d^2 \frac{u^4}{4!} + 14d \frac{u^5}{5!} \right. \\
 &\quad \left. - (14 + 45d^3) \frac{u^6}{6!} + 471d^2 \frac{u^7}{7!} \right. \\
 &\quad \left. - (1432d + 1575d^4) \frac{u^8}{8!} + \dots \right\} \\
 y(c') &= y(d') \left\{ 1 - d'^2 \frac{v^2}{2!} - d'^3 \frac{v^3}{3!} - (3d'^3 + 3d'^6) \frac{v^4}{4!} \right. \\
 &\quad \left. - (15d'^3 + 14d'^6) \frac{v^5}{5!} \right. \\
 &\quad \left. - (105d'^3 + 101d'^6 + 45d'^4) \frac{v^6}{6!} - \dots \right\}
 \end{aligned}$$

Example 6. Compute the zero of $y(x) = Ai(x) - Bi(x)$ near $d = -.4$.
From Table 10.11,

$$y(-.4) = .02420\ 467, \quad y'(-.4) = -.71276\ 627$$

whence $u = y(-.4)/y'(-.4) = -.03395\ 8776$. From the above formulas

$$\begin{aligned}
 c &= -.4 + .03395\ 8776 - .00000\ 5221 \\
 &\quad + .00000\ 0111 + .00000\ 0001 \\
 &= -.36604\ 6333. \\
 y'(c) &= (-.71276\ 627) \{ 1 + .00023\ 0640 \\
 &\quad - .00000\ 6527 - .00000\ 0027 + .00000\ 0002 \} \\
 &= (-.71276\ 627)(1.00022\ 4088) \\
 &= -.71292\ 599.
 \end{aligned}$$

AIRY FUNCTIONS

Table 10.11

Table with 10 columns: x, Ai(x), Ai'(x), Bi(x), Bi'(x), x, Ai(x), Ai'(x), Bi(x), Bi'(x). It contains numerical values for Airy functions and their derivatives across a range of x values.

AIRY FUNCTIONS—AUXILIARY FUNCTIONS FOR LARGE POSITIVE ARGUMENTS

Table with 12 columns: s^-1, x, f(-s), f(s), g(-s), g(s), s^-1, x, f(-s), f(s), g(-s), g(s). It lists auxiliary functions and their derivatives for large positive arguments.

Ai(x) = -1/2 x^-1/4 e^-xi f(-xi) Bi(x) = x^-1/4 e^xi f(xi) Ai'(x) = -1/2 x^1/4 e^-xi g(-xi) Bi'(x) = x^1/4 e^xi g(xi) xi = 2/3 x^3/2

11. Integrals of Bessel Functions

Mathematical Properties

11.1. Simple Integrals of Bessel Functions

$$\int_0^z t^\mu J_\nu(t) dt$$

11.1.1

$$\int_0^z t^\mu J_\nu(t) dt = \frac{z^\mu \Gamma\left(\frac{\nu+\mu+1}{2}\right)}{\Gamma\left(\frac{\nu-\mu+1}{2}\right)}$$

$$\times \sum_{k=0}^{\infty} \frac{(\nu+2k+1)\Gamma\left(\frac{\nu-\mu+1}{2}+k\right)}{\Gamma\left(\frac{\nu+\mu+3}{2}+k\right)} J_{\nu+2k+1}(z)$$

($\Re(\mu+\nu+1) > 0$)

11.1.2

$$\int_0^z J_\nu(t) dt = 2 \sum_{k=0}^{\infty} J_{\nu+2k+1}(z) \quad (\Re \nu > -1)$$

11.1.3 $\int_0^z J_{2n}(t) dt = \int_0^z J_0(t) dt - 2 \sum_{k=0}^{n-1} J_{2k+1}(z)$

11.1.4 $\int_0^z J_{2n+1}(t) dt = 1 - J_0(z) - 2 \sum_{k=1}^n J_{2k}(z)$

Recurrence Relations

11.1.5

$$\int_0^z J_{n+1}(t) dt = \int_0^z J_{n-1}(t) dt - 2J_n(z) \quad (n > 0)$$

11.1.6 $\int_0^z J_1(t) dt = 1 - J_0(z)$

$$\int J_0(t) dt, \int Y_0(t) dt, \int I_0(t) dt, \int K_0(t) dt$$

11.1.7

$$\int_0^z \mathcal{E}_0(t) dt = x \mathcal{E}_0(x) + \frac{1}{2} \pi x \{ \mathbf{H}_0(x) \mathcal{E}_1(x) - \mathbf{H}_1(x) \mathcal{E}_0(x) \}$$

$$\mathcal{E}_\nu(x) = A J_\nu(x) + B Y_\nu(x), \nu = 0, 1$$

A and B are constants.

11.1.8

$$\int_0^z Z_0(t) dt = x Z_0(x) + \frac{1}{2} \pi x \{ -\mathbf{L}_0(x) Z_1(x) + \mathbf{L}_1(x) Z_0(x) \}$$

$$Z_\nu(x) = A I_\nu(x) + B e^{i\nu\pi} K_\nu(x), \nu = 0, 1$$

A and B are constants.

$\mathbf{H}_\nu(x)$ and $\mathbf{L}_\nu(x)$ are Struve functions (see chapter 12).

11.1.9

$$\int_0^x K_0(t) dt = -\left(\gamma + \ln \frac{x}{2}\right) x \sum_{k=0}^{\infty} \frac{(x/2)^{2k}}{(k!)^2 (2k+1)^2}$$

$$+ x \sum_{k=0}^{\infty} \frac{(x/2)^{2k}}{(k!)^2 (2k+1)^2}$$

$$+ x \sum_{k=1}^{\infty} \frac{(x/2)^{2k}}{(k!)^2 (2k+1)} \left(1 + \frac{1}{2} + \dots + \frac{1}{k}\right)$$

$$\gamma \text{ (Euler's constant)} = .57721\ 56649 \dots$$

In this and all other integrals of 11.1, x is real and positive although all the results remain valid for extended portions of the complex plane unless stated to the contrary.

11.1.10

$$\int_0^{-ix} K_0(t) dt = \frac{\pi}{2} \int_0^x J_0(t) dt + i \frac{\pi}{2} \int_0^x Y_0(t) dt$$

Asymptotic Expansions

11.1.11

$$\int_x^\infty [J_0(t) + iY_0(t)] dt \sim \left(\frac{2}{\pi x}\right)^{\frac{1}{2}} e^{i(x-\pi/4)}$$

$$\times \left[\sum_{k=0}^{\infty} (-)^k a_{2k+1} x^{-2k-1} + i \sum_{k=0}^{\infty} (-)^k a_{2k} x^{-2k} \right]$$

11.1.12 $a_k = \frac{\Gamma(k+\frac{1}{2})}{\Gamma(\frac{1}{2})} \sum_{s=0}^k \frac{\Gamma(s+\frac{1}{2})}{2^s s! \Gamma(\frac{1}{2})}$

11.1.13

$$2(k+1)a_{k+1} = 3 \left(k + \frac{1}{2}\right) \left(k + \frac{5}{6}\right) a_k$$

$$- \left(k + \frac{1}{2}\right)^2 \left(k - \frac{1}{2}\right) a_{k-1}$$

11.1.14 $x^{\frac{1}{2}}e^{-x} \int_0^x I_0(t)dt \sim (2\pi)^{-\frac{1}{2}} \sum_{k=0}^{\infty} a_k x^{-k}$

where the a_k are defined as in 11.1.12.

11.1.15 $x^{\frac{1}{2}}e^x \int_x^{\infty} K_0(t)dt \sim \left(\frac{\pi}{2}\right)^{\frac{1}{2}} \sum_{k=0}^{\infty} (-)^k a_k x^{-k}$

where the a_k are defined as in 11.1.12.

Polynomial Approximations²

11.1.16 $8 \leq x \leq \infty$

$$\int_x^{\infty} [J_0(t) + iY_0(t)]dt = x^{-\frac{1}{2}}e^{i(x-\pi/4)} \left[\sum_{k=0}^7 (-)^k a_k (x/8)^{-2k-1} + i \sum_{k=0}^7 (-)^k b_k (x/8)^{-2k} + \epsilon(x) \right]$$

$|\epsilon(x)| \leq 2 \times 10^{-9}$

provided the following two conditions hold:

1. λ_n is a real zero of

11.4.3 $h_1 \lambda \mathcal{C}_{\nu+1}(\lambda b) - h_2 \mathcal{C}_\nu(\lambda b) = 0$

2. There must exist numbers k_1 and k_2 (both not zero) so that for all n

Numerical Methods

11.5. Use and Extension of the Tables

$$\int_0^x J_0(t) dt, \int_0^x Y_0(t) dt, \int_0^x I_0(t) dt, \int_x^\infty K_0(t) dt$$

For moderate values of x , use 11.1.2 and 11.1.7-11.1.10 as appropriate. For x sufficiently large, use the asymptotic expansions or the polynomial approximations 11.1.11-11.1.18.

Example 1. Compute $\int_0^{3.05} J_0(t) dt$ to 5D.

Using 11.1.2 and interpolating in Tables 9.1 and 9.2, we have

$$\int_0^{3.05} J_0(t) dt = 2[.32019\ 09 + .31783\ 69 + .04611\ 52$$

$$+ .00283\ 19 + .00009\ 72 + .00000\ 21]$$

$$= 1.37415$$

Example 2. Compute $\int_0^{3.05} J_0(t) dt$ to 5D by interpolation of Table 11.1 using Taylor's formula. We have

$$\int_0^{x+h} J_0(t) dt = \int_0^x J_0(t) dt + hJ_0(x) - \frac{h^2}{2} J_1(x)$$

$$+ \frac{h^3}{12} [J_2(x) - J_0(x)] + \frac{h^4}{96} [3J_1(x) - J_3(x)] + \dots$$

Then with $x=3.0$ and $h=.05$,

$$\int_0^{3.05} J_0(t) dt = 1.387567 + (.05)(-.260052)$$

$$- (.00125)(.339059)$$

$$+ (.000010)(.746143) = 1.37415$$

This value is readily checked using $x=-3.1$ and $h=-.05$. Now $|J_0(x)| \leq 1$ for all x and $|J_n(x)| < 2^{-n}$, $n \geq 1$ for all x . In Table 11.1, we can always choose $|h| \leq .05$. Thus if all terms of $O(h^4)$ and higher are neglected, then a bound for the absolute error is $2^4 h^4 / 48 < .2 \cdot 10^{-6}$ for all x if $|h| \leq .05$. Similarly, the absolute error for quadratic interpolation does not exceed

$$h^3(2^3+2)/24 < .2 \cdot 10^{-4}.$$

Example 3. Interpolation of $\int_0^x J_0(t) dt$ using Simpson's rule. We have

$$\int_0^{x+h} J_0(t) dt = \int_0^x J_0(t) dt + \int_x^{x+h} J_0(t) dt$$

$$\int_x^{x+h} J_0(t) dt = \frac{h}{6} \left[J_0(x) + 4J_0\left(x + \frac{h}{2}\right) + J_0(x+h) \right] + R$$

$$R = -\frac{h^5}{2880} J_0^{(4)}(\xi), \quad x < \xi < x+h$$

Now

$$J_0^{(4)}(x) = \frac{1}{8} [J_4(x) - 4J_2(x) + 3J_0(x)]$$

$$|J_0^{(4)}(x)| < \frac{6+5\sqrt{2}}{16} < .82$$

and with $|h| \leq .05$, it follows that

$$|R| < .9 \cdot 10^{-10}$$

Thus if $x=3.0$ and $h=.05$

$$\int_0^{3.05} J_0(t) dt = 1.38756\ 72520 + \frac{(.05)}{6} [-.26005\ 19549$$

$$+ 4(-.26841\ 13883) - .27653\ 49599]$$

$$= 1.37414\ 86481$$

which is correct to 10D. The above procedure gives high accuracy though it may be necessary to interpolate twice in $J_0(x)$ to compute $J_0\left(x+\frac{h}{2}\right)$ and $J_0(x+h)$. A similar technique based on the trapezoidal rule is less accurate, but at most only one interpolation of $J_0(x)$ is required.

Example 4. Compute $\int_0^3 J_0(t)dt$ and $\int_0^3 Y_0(t)dt$ to 5D using the representation in terms of Struve functions and the tables in chapters 9 and 12.

For $x=3$, from **Tables 9.1 and 12.1**

$$\begin{array}{ll} J_0 = -.260052 & J_1 = .339059 \\ Y_0 = .376850 & Y_1 = .324674 \\ H_0 = .574306 & H_1 = 1.020110 \end{array}$$

Using 11.1.7, we have

$$\begin{aligned} \int_0^3 J_0(t)dt &= 3(-.260052) + \frac{3\pi}{2} [(.574306)(.339059) \\ &\quad - (1.020110)(-.260052)] \\ &= 1.38757 \end{aligned}$$

Similarly,

$$\int_0^3 Y_0(t)dt = .19766$$

Using 11.1.8 and **Tables 9.8 and 12.1**, one can compute $\int_0^x I_0(t)dt$ and $\int_0^x K_0(t)dt$.

$$\int_x^\infty \frac{J_0(t)dt}{t}, \int_x^\infty \frac{Y_0(t)dt}{t}, \int_0^x \frac{[I_0(t)-1]dt}{t}, \int_x^\infty \frac{K_0(t)dt}{t}$$

For moderate values of x , use 11.1.19–11.1.23. For x sufficiently large, use the asymptotic expansions or the polynomial approximations 11.1.24–11.1.31.

Repeated Integrals of $J_0(x)$

For moderate values of x and r , use 11.2.4. If $r=1$, see **Example 1**. For moderate values of x , use the recurrence formula 11.2.5. If x is large and $x \gg r$, see the discussion below.

Example 5. Compute $f_{r,0}(x) = f_r(x)$ to 5D for $x=2$ and $r=0(1)5$ using 11.2.6. We have

$$rf_{r+1}(x) = xf_r(x) - (r-1)f_{r-1}(x) + xf_{r-2}(x)$$

$$f_{-1}(x) = -J_1(x), f_0(x) = J_0(x), f_1(x) = \int_0^x J_0(t) dt$$

and the terms on this last line are tabulated. Thus for $x=2$,

$$f_{-1} = -.57672 48, f_0 = .22389 08, f_1 = 1.42577 03$$

The recurrence formula gives

$$f_2 = 2(f_1 + f_{-1}) = 1.69809 10$$

Similarly,

$$f_3 = 1.20909 66, f_4 = .62451 73, f_5 = .25448 17$$

When $x \gg r$, it is convenient to use the auxiliary function

$$g_r(x) = (r-1)!x^{-r+1}f_r(x)$$

This satisfies the recurrence relation

$$\begin{aligned} x^2g_{r+1}(x) &= x^2g_r - (r-1)^2g_{r-1}(x) \\ &\quad + (r-1)(r-2)g_{r-2}(x), r \geq 3 \end{aligned}$$

$$\begin{aligned} g_1(x) &= \int_0^x J_0(t)dt, g_2(x) = g_1(x) - J_1(x) \\ g_3(x) &= [x^2g_2(x) - g_1(x) + xJ_0(x)]/x^2 \end{aligned}$$

Example 6. Compute $g_r(x)$ to 5D for $x=10$ and $r=0(1)6$. We have for $x=10$,

$$J_0 = -.24593 58, J_1 = .04347 27, g_1 = 1.06701 13$$

Thus

$$g_2 = 1.02353 86, g_3 = .98827 49$$

and the forward recurrence formula gives

$$g_4 = .96867 36, g_5 = .94114 12, g_6 = .90474 64$$

For tables of $2^{-r}f_r(x)$, see [11.16].

Repeated Integrals of $K_0(x)$

For moderate values of x , use the recurrence formula 11.2.14 for all r .

Example 7. Compute $Ki_r(x)$ to 5D for $x=2$ and $r=0(1)5$. We have

$$rKi_{r+1}(x) = -xKi_r(x) + (r-1)Ki_{r-1}(x) + xKi_{r-2}(x)$$

$$Ki_{-1}(x) = K_1(x), Ki_0(x) = K_0(x), Ki_1(x) = \int_x^\infty K_0(t)dt$$

and the functions on this last line are tabulated. Thus for $x=2$,

$$K_0 = .11389 39, K_1 = .13986 59, Ki_1 = .09712 06$$

and

$$Ki_2 = -2Ki_1 + 2K_1 = .08549 06$$

Similarly,

$$Ki_3 = .07696 36, Ki_4 = .07043 17, Ki_5 = .06525 22$$

If x/r is not large the formula can still be used provided that the starting values are sufficiently accurate to offset the growth of rounding error.

For tables of $Ki_r(x)$, see [11.11].

$$f_m(x) = x^{-m} \int_0^x t^m K_0(t) dt$$

Now

$$f_0(x) = \int_0^x K_0(t) dt, f_1(x) = [1 - xK_1(x)]/x$$

the latter following from 11.3.27 with $\nu=1$. In 11.3.5, put $a=1, b=-1, p=0$ and $\nu=0$. Let $\mu=m$. Then

$$f_m(x) = [(m-1)^2 f_{m-2}(x) - x^2 K_1(x) - x(m-1)K_0(x)]/x^2 \quad (m > 1)$$

Using tabular values of f_0 and f_1 , one can compute in succession f_2, f_3, \dots provided that m/x is not large.

Example 8. Compute $f_m(x)$ to 5D for $x=5$ and $m=0(1)6$. We have, retaining two additional decimals

$$K_0 = .00369 \ 11 \quad K_1 = .00404 \ 46$$

$$f_0 = 1.56738 \ 74 \quad f_1 = .19595 \ 54$$

Thus

$$f_2 = .05791 \ 27, f_4 = .01458 \ 93, f_6 = .00685 \ 36$$

Similarly starting with f_1 , we can compute f_3 and f_5 .

If $m > x$, employ the recurrence formula in backward form and write

$$f_{m-2}(x) = [x^2 f_m(x) + x^2 K_1(x) + x(m-1)K_0(x)]/(m-1)^2$$

In the latter expression, replace f_m by g_m . Fix x . Take $r > m$ and assume $g_r = 0$. Compute g_{r-2}, g_{r-4} , etc. Then

$$\lim_{r \rightarrow \infty} g_{r-2k}(x) = f_m(x), \quad m = r - 2k$$

Apart from round-off error, the value of r needed to achieve a stated accuracy for given x and m can be determined a priori. Let

$$\epsilon_r = |g_r - f_r|$$

Then

$$\epsilon_{r-2k} = \frac{x^{2k} \epsilon_r}{(r-1)^2 (r-3)^2 \dots (r-2k+1)^2}$$

$$\epsilon_r \leq [x^2 K_1(x) + x(r-1)K_0(x)]/(r-1)^2$$

since for x fixed, $f_r(x)$ is positive and decreases as r increases.

Example 9. Compute $f_m(x)$ to 5D for $x=3$ and $m=0(2)10$. We have

$$K_0 = .03473 \ 95 \quad K_1 = .04015 \ 64$$

If $r=16$,

$$\epsilon_{16} < .86 \cdot 10^{-2} \quad \epsilon_{10} < 1.4 \cdot 10^{-6}$$

Taking $g_{16} = 0$, we compute the following values of $g_{14}, g_{12}, \dots, g_0$ by recurrence. Also recorded are the required values of f_m to 5D.

12. Struve Functions and Related Functions

Mathematical Properties

12.1. Struve Function $\mathbf{H}_\nu(z)$

Differential Equation and General Solution

12.1.1

$$z^2 \frac{d^2 w}{dz^2} + z \frac{dw}{dz} + (z^2 - \nu^2)w = \frac{4(\frac{1}{2}z)^{\nu+1}}{\sqrt{\pi}\Gamma(\nu + \frac{1}{2})}$$

The general solution is

12.1.2 $w = aJ_\nu(z) + bY_\nu(z) + \mathbf{H}_\nu(z)$ (a, b , constants)

where $z^{-\nu}\mathbf{H}_\nu(z)$ is an entire function of z .

Power Series Expansion

12.1.3

$$\mathbf{H}_\nu(z) = (\frac{1}{2}z)^{\nu+1} \sum_{k=0}^{\infty} \frac{(-1)^k (\frac{1}{2}z)^{2k}}{\Gamma(k + \frac{3}{2})\Gamma(k + \nu + \frac{3}{2})}$$

12.1.4 $\mathbf{H}_0(z) = \frac{2}{\pi} \left[z - \frac{z^3}{1^2 \cdot 3^2} + \frac{z^5}{1^2 \cdot 3^2 \cdot 5^2} - \dots \right]$

12.1.5

$$\mathbf{H}_1(z) = \frac{2}{\pi} \left[\frac{z^2}{1^2 \cdot 3} - \frac{z^4}{1^2 \cdot 3^2 \cdot 5} + \frac{z^6}{1^2 \cdot 3^2 \cdot 5^2 \cdot 7} - \dots \right]$$

Integral Representations

If $\Re \nu > -\frac{1}{2}$,

12.1.6

$$\mathbf{H}_\nu(z) = \frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu + \frac{1}{2})} \int_0^1 (1-t^2)^{\nu-\frac{1}{2}} \sin(zt) dt$$

12.1.7 $= \frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu + \frac{1}{2})} \int_0^{\frac{\pi}{2}} \sin(z \cos \theta) \sin^{2\nu} \theta d\theta$

12.1.8 $= Y_\nu(z)$

$$+ \frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu + \frac{1}{2})} \int_0^\infty e^{-zt} (1+t^2)^{\nu-\frac{1}{2}} dt$$

($|\arg z| < \frac{\pi}{2}$)

Recurrence Relations

12.1.9 $\mathbf{H}_{\nu-1} + \mathbf{H}_{\nu+1} = \frac{2\nu}{z} \mathbf{H}_\nu + \frac{(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu + \frac{3}{2})}$

12.1.10 $\mathbf{H}_{\nu-1} - \mathbf{H}_{\nu+1} = 2\mathbf{H}'_\nu - \frac{(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu + \frac{3}{2})}$

12.1.11 $\mathbf{H}'_0 = (2/\pi) - \mathbf{H}_1$

12.1.12 $\frac{d}{dz} (z^\nu \mathbf{H}_\nu) = z^\nu \mathbf{H}_{\nu-1}$

12.1.13 $\frac{d}{dz} (z^{-\nu} \mathbf{H}_\nu) = \frac{1}{\sqrt{\pi} 2^\nu \Gamma(\nu + \frac{3}{2})} - z^{-\nu} \mathbf{H}_{\nu+1}$

12.3.8 $E_0(z) = -H_0(z)$

12.3.9 $E_1(z) = \frac{2}{\pi} - H_1(z)$

Numerical Methods

12.4. Use and Extension of the Tables

Example 1. Compute $L_0(2)$ to 6D. From **Table 12.1** $I_0(2) - L_0(2) = .342152$; from **Table 9.11** we have $I_0(2) = 2.279585$ so that $L_0(2) = 1.937433$.

Example 2. Compute $H_0(10)$ to 6D. From **Table 12.2** for $x^{-1} = .1$, $H_0(10) - Y_0(10) = .063072$; from **Table 9.1** we have $Y_0(10) = .055671$. Thus, $H_0(10) = .118743$.

Example 3. Compute $\int_0^x H_0(t)dt$ for $x=6$ to 5D. Using **Tables 12.2, 11.1** and 4.2, we have $\int_0^6 H_0(t)dt = \int_0^6 Y_0(t)dt + \frac{2}{\pi} \ln 6 + f_1(6)$
 $= -.125951 + (.636620)(1.791759)$
 $+ .816764$
 $= 1.83148$

Example 4. Compute $H_n(x)$ for $x=4$, $-n=0(1)8$ to 6S. From **Table 12.1** we have $H_0(4) = .1350146$, $H_1(4) = 1.0697267$. Using **12.1.9** we find

$H_{-1}(4) = -.433107$	$H_{-5}(4) = .689652$
$H_{-2}(4) = .240694$	$H_{-6}(4) = -1.21906$
$H_{-3}(4) = .152624$	$H_{-7}(4) = 2.82066$
$H_{-4}(4) = -.439789$	$H_{-8}(4) = -8.24933$

Example 5. Compute $H_n(x)$ for $x=4$, $n=0(1)10$ to 7S. Starting with the values of $H_0(4)$ and $H_1(4)$ and using **12.1.9** with forward recurrence, we get

$H_0(4) = .1350146$	$H_6(4) = .0543354$
$H_1(4) = 1.0697267$	$H_7(4) = .0151037$
$H_2(4) = 1.2486751$	$H_8(4) = .0036733$
$H_3(4) = .8580095$	$H_9(4) = .0008002$
$H_4(4) = .4263741$	$H_{10}(4) = .0001825$
$H_5(4) = .1671987$	

We note that for $n > 6$ there is a rapid loss of significant figures. On the other hand using **12.1.3** for $x=4$ we find $H_6(4) = .0007935729$, $H_{10}(4) = .00015447630$ and backward recurrence with **12.1.9** gives

$H_8(4) = .003671495$	$H_3(4) = .8580094$
$H_7(4) = .01510315$	$H_2(4) = 1.2486766$
$H_6(4) = .05433519$	$H_1(4) = 1.0697267$
$H_5(4) = .1671987$	$H_0(4) = .1350146$
$H_4(4) = .4263743$	

Example 6. Compute $L_n(.5)$ for $n=0(1)5$ to 8S. From **12.2.1** we find $L_5(.5) = 9.6307462 \times 10^{-7}$, $L_4(.5) = 2.1212342 \times 10^{-5}$. Then, with **12.2.4** we get

$L_3(.5) = 3.8246503 \times 10^{-4}$	$L_1(.5) = .053942181$
$L_2(.5) = 5.3686734 \times 10^{-3}$	$L_0(.5) = .32724068$

Example 7. Compute $L_n(.5)$ for $-n=0(1)5$ to 6S. From **Tables 12.1** and **9.8** we find $L_0(.5) = .327240$, $L_1(.5) = .053942$. Then employing **12.2.4** with backward recurrence we get

$L_{-1}(.5) = .690562$	$L_{-4}(.5) = -75.1418$
$L_{-2}(.5) = -1.16177$	$L_{-5}(.5) = 1056.92$
$L_{-3}(.5) = 7.43824$	

Example 8. Compute $L_n(x)$ for $x=6$ and $-n=0(1)6$ to 8S. From **Tables 12.2** and **9.8** we find $L_0(6) = 67.124454$, $L_1(6) = 60.725011$. Using **12.2.4** we get

$L_{-1}(6) = 61.361631$	$L_{-4}(6) = 16.626028$
$L_{-2}(6) = 46.776680$	$L_{-5}(6) = 7.984089$
$L_{-3}(6) = 30.159494$	$L_{-6}(6) = 3.32780$

We note that there is no essential loss of accuracy until $n = -6$. However, if further values were necessary the recurrence procedure becomes unstable. To avoid the instability use the methods described in **Examples 5** and **6**.

$$\int_x^\infty \left[\frac{H_0(t) - Y_0(t)}{t} \right] dt = f_3(x)$$

$\langle x \rangle =$ nearest integer to x .

Starting with $H_0(x)$ and $H_1(x)$, recurrence formula 12.1.9 may be used to generate $H_n(x)$ for $n < 0$. As long as $n < x/2$ (approx.), $H_n(x)$ may be generated by forward recurrence. When $n > x/2$, forward recurrence is unstable. To avoid the instability, choose $n > x$, compute $H_k(x)$ and $H_{k+1}(x)$ with 12.1.3, and then use backward recurrence with 12.1.9.

If $n > 0$, $L_n(x)$ must be generated by backward recurrence. If $n < 0$, $L_n(x)$ may be generated by backward recurrence as long as $L_n(x)$ increases. If $n < 0$ and $L_n(x)$ is decreasing, forward recurrence should be used.

13. Confluent Hypergeometric Functions

Mathematical Properties

13.1. Definitions of Kummer and Whittaker Functions

Kummer's Equation

$$13.1.1 \quad z \frac{d^2 w}{dz^2} + (b-z) \frac{dw}{dz} - aw = 0$$

It has a regular singularity at $z=0$ and an irregular singularity at ∞ .

Independent solutions are

Kummer's Function

13.1.2

$$M(a, b, z) = 1 + \frac{az}{b} + \frac{(a)_2 z^2}{(b)_2 2!} + \dots + \frac{(a)_n z^n}{(b)_n n!} + \dots$$

where

$$(a)_n = a(a+1)(a+2) \dots (a+n-1), (a)_0 = 1,$$

and

13.1.3

$$U(a, b, z) = \frac{\pi}{\sin \pi b} \left\{ \frac{M(a, b, z)}{\Gamma(1+a-b)\Gamma(b)} - z^{1-b} \frac{M(1+a-b, 2-b, z)}{\Gamma(a)\Gamma(2-b)} \right\}$$

Parameters

(m, n positive integers)

$$b \neq -n \quad a \neq -m$$

$$b \neq -n \quad a = -m$$

$$b = -n \quad a \neq -m$$

$$b = -n \quad a = -m,$$

$$m > n$$

$$b = -n \quad a = -m,$$

$$m \leq n$$

$U(a, b, z)$ is defined even when $b \rightarrow \pm n$

As $|z| \rightarrow \infty,$

13.1.4

$$M(a, b, z) = \frac{\Gamma(b)}{\Gamma(a)} e^z z^{a-b} [1 + O(|z|^{-1})] \quad (\mathcal{R}z > 0)$$

and

13.1.5

$$M(a, b, z) = \frac{\Gamma(b)}{\Gamma(b-a)} (-z)^{-a} [1 + O(|z|^{-1})] \quad (\mathcal{R}z < 0)$$

$U(a, b, z)$ is a many-valued function. Its principal branch is given by $-\pi < \arg z \leq \pi$.

Logarithmic Solution

13.1.6

$$U(a, n+1, z) = \frac{(-1)^{n+1}}{n! \Gamma(a-n)} \left[M(a, n+1, z) \ln z + \sum_{r=0}^n \frac{(a)_r z^r}{(n+1)_r r!} \{ \psi(a+r) - \psi(1+r) - \psi(1+n+r) \} \right] + \frac{(n-1)!}{\Gamma(a)} z^{-n} M(a-n, 1-n, z)_n$$

for $n=0, 1, 2, \dots$, where the last function is the sum to n terms. It is to be interpreted as zero when $n=0$, and $\psi(a) = \Gamma'(a)/\Gamma(a)$.

$$13.1.7 \quad U(a, 1-n, z) = z^n U(a+n, 1+n, z)$$

As $\mathcal{R}z \rightarrow \infty$

$$13.1.8 \quad U(a, b, z) = z^{-a} [1 + O(|z|^{-1})]$$

Analytic Continuation

13.1.9

$$U(a, b, ze^{\pm \pi i}) = \frac{\pi}{\sin \pi b} e^{-z} \left\{ \frac{M(b-a, b, z)}{\Gamma(1+a-b)\Gamma(b)} - \frac{e^{\pm \pi i(1-b)} z^{1-b} M(1-a, 2-b, z)}{\Gamma(a)\Gamma(2-b)} \right\}$$

where either upper or lower signs are to be taken throughout.

13.1.10

$$U(a, b, ze^{2\pi i n}) = [1 - e^{-2\pi i b n}] \frac{\Gamma(1-b)}{\Gamma(1+a-b)} M(a, b, z) + e^{-2\pi i b n} U(a, b, z)$$

Alternative Notations

$${}_1F_1(a; b; z) \text{ or } \Phi(a; b; z) \text{ for } M(a, b, z)$$

$$z^{-a} {}_2F_0(a, 1+a-b; -1/z) \text{ or } \Psi(a; b; z) \text{ for } U(a, b, z)$$

Complete Solution

$$13.1.11 \quad y = AM(a, b, z) + BU(a, b, z)$$

where A and B are arbitrary constants, $b \neq -n$.

for $|\arg(-z)| < \frac{1}{2}\pi$, $a, b \neq 0, -1, -2, \dots$. The contour must separate the poles of $\Gamma(-s)$ from those of $\Gamma(a+s)$; c is finite.

the upper sign being taken if $-\frac{1}{2}\pi < \arg z < \frac{3}{2}\pi$, the lower sign if $-\frac{3}{2}\pi < \arg z \leq -\frac{1}{2}\pi$.

13.5.2

$$U(a, b, z) = z^{-a} \left\{ \sum_{n=0}^{R-1} \frac{(a)_n (1+a-b)_n}{n!} (-z)^{-n} + O(|z|^{-R}) \right\} \quad \left(-\frac{3}{2}\pi < \arg z < \frac{3}{2}\pi \right)$$

If $\cos^2 \theta = x/(2b - 4a)$ so that $2b - 4a > x > 0$,

13.5.21

$$M(a, b, x) = \Gamma(b) \exp\{(b - 2a) \cos^2 \theta\} [(b - 2a) \cos \theta]^{1-b} [\pi(\frac{1}{2}b - a) \sin 2\theta]^{-1/2} [\sin(a\pi) + \sin\{(\frac{1}{2}b - a)(2\theta - \sin 2\theta) + \frac{1}{4}\pi\}] + O(|\frac{1}{2}b - a|^{-1})$$

13.7. Zeros and Turning Values

If $j_{b-1, r}$ is the r 'th positive zero of $J_{b-1}(x)$, then a first approximation X_0 to the r 'th positive zero of $M(a, b, x)$ is

13.7.1 $X_0 = j_{b-1, r}^2 \{ 1/(2b-4a) + O(1/(\frac{1}{2}b-a)^2) \}$

13.7.2 $X_0 \approx \frac{\pi^2(r + \frac{1}{2}b - \frac{3}{4})^2}{2b-4a}$

A closer approximation is given by

13.7.3 $X_1 = X_0 - M(a, b, X_0) / M'(a, b, X_0)$

For the derivative,

13.7.4

$M'(a, b, X_1) =$

$M'(a, b, X_0) \{ 1 + (b - X_0) \frac{M(a, b, X_0)}{M'(a, b, X_0)} \}$

If X'_0 is the first approximation to a turning value of $M(a, b, x)$, that is, to a zero of $M'(a, b, x)$ then a better approximation is

13.7.5 $X'_1 = X'_0 - \frac{X'_0 M'(a, b, X'_0)}{a M(a, b, X'_0)}$

*See page II.

The self-adjoint equation 13.1.1 can also be written

$$13.7.6 \quad \frac{d}{dz}[z^b e^{-z} \frac{dw}{dz}] = az^{b-1} e^{-z} w$$

The Sonine-Polya Theorem

The maxima and minima of $|w|$ form an increasing or decreasing sequence according as

$$-ax^{2b-1} e^{-2x}$$

is an increasing or decreasing function of x , that is, they form an increasing sequence for $M(a, b, x)$ if $a > 0, x < b - \frac{1}{2}$ or if $a < 0, x > b - \frac{1}{2}$, and a decreasing sequence if $a > 0$ and $x > b - \frac{1}{2}$ or if $a < 0$ and $x < b - \frac{1}{2}$.

The turning values of $|w|$ lie near the curves

13.7.7

$$w = \pm \Gamma(b) \pi^{-1/2} e^{x/2} (\frac{1}{2}bx - ax)^{\frac{1}{2}-b} \{1 - x/(2b - 4a)\}^{-1/4}$$

Numerical Methods

13.8. Use and Extension of the Tables

Calculation of $M(a, b, x)$

Kummer's Transformation

Example 1. Compute $M(.3, .2, -.1)$ to 7S. Using 13.1.27 and Tables 4.4 and 13.1 we have $a = .3, b = .2$ so that

$$M(.3, .2, -.1) = e^{-.1} M(-.1, .2, .1) = .85784 \ 90.$$

Thus 13.1.27 can be used to extend Table 13.1 to negative values of x . Kummer's transformation should also be used when a and b are large and nearly equal, for x large or small.

Example 2. Compute $M(17, 16, 1)$ to 7S. Here $a = 17, b = 16$, and

$$M(17, 16, 1) = e^1 M(-1, 16, -1) = 2.71828 \ 18 \times 1.06250 \ 00 = 2.88817 \ 44.$$

Recurrence Relations

Example 3. Compute $M(-1.3, 1.2, .1)$ to 7S. Using 13.4.1 and Table 13.1 we have $a = -.3, b = .2$ so that

$$M(-1.3, .2, .1) = 2[.7 M(-.3, .2, .1) - .3 M(.7, .2, .1)] = .35821 \ 23.$$

By 13.4.5 when $a = -1.3$ and $b = .2$,

$$M(-1.3, 1.2, .1) = [.26 M(-.3, .2, .1) - .24 M(-1.3, .2, .1)] / .15 = .89241 \ 08.$$

Similarly when $a = -.3$ and $b = .2$

$$M(-.3, 1.2, .1) = .97459 \ 52.$$

Check, by 13.4.6,

$$M(-1.3, 1.2, .1) = [.2 M(-.3, .2, .1) + 1.2 M(-.3, 1.2, .1)] / 1.5 = .89241 \ 08.$$

In this way 13.4.1-13.4.7 can be used together with 13.1.27 to extend Table 13.1 to the range

$$-10 \leq a \leq 10, -10 \leq b \leq 10, -10 \leq x \leq 10.$$

This extension of ten units in any direction is possible with the loss of about 1S. All the recurrence relations are stable except i) if $a < 0, b < 0$ and $|a| > |b|, x > 0$, or ii) $b < a, b < 0, |b - a| > |b|, x < 0$, when the oscillations may become large, especially if $|x|$ also is large.

Neither interpolation nor the use of recurrence relations should be attempted in the strips $b = -n \pm .1$ where the function is very large numerically. In particular $M(a, b, x)$ cannot be evaluated in the neighborhood of the points $a = -m, b = -n, m \leq n$, as near these points small changes in a, b or x can produce very large changes in the numerical value of $M(a, b, x)$.

Example 4. At the point $(-1, -1, x), M(a, b, x)$ is undefined.

When $a = -1, M(-1, b, x) = 1 - \frac{x}{b}$ for all x .

Hence $\lim_{b \rightarrow -1} M(-1, b, x) = 1 + x$. But $M(b, b, x) = e^x$ for all x , when $a = b$. Hence $\lim_{b \rightarrow -1} M(b, b, x) = e^x$.

In the first case $b \rightarrow -1$ along the line $a = -1$, and in the second case $b \rightarrow -1$ along the line $a = b$.

Derivatives

Example 5. To evaluate $M'(-.7, -.6, .5)$ to 7S. By 13.4.8, when $a = -.7$ and $b = -.6$, we have

$$M'(-.7, -.6, .5) = \frac{-.7}{-.6} M(.3, .4, .5) = 1.724128.$$

Asymptotic Formulas

For $x \geq 10, a$ and b small, $M(a, b, x)$ should be evaluated by 13.5.1 using converging factors 13.5.3 and 13.5.4 to improve the accuracy if necessary.

Example 6. Calculate $M(.9, .1, 10)$ to 7S, using 13.5.1.

$$M(.9, .1, 10) = \frac{\Gamma(.1)}{\Gamma(-.8)} e^{.9\pi i 10^{-.9}} \sum_{n=0}^N \frac{(.9)_n (1.8)_n}{n! (-10)^n} + \frac{\Gamma(.1)}{\Gamma(.9)} e^{10i0.8} \sum_{n=0}^N \frac{(-.8)_n (.1)_n}{n! 10^n} + O(10^{-N})$$

$$= -.198(.869) + 1237253(.99190 \ 285) + O(1)$$

$$= 1227235.23 - .17 + O(1)$$

$$= 1227235 + O(1)$$

Check, from Table 13.1, $M(.9, .1, 10) = 1227235$. To evaluate $M(a, b, x)$ with a large, x small and b small or large 13.5.13-14 should be used.

Example 7. Compute $M(-52.5, .1, 1)$ to 3S, using 13.5.14.

$$M(-52.5, .1, 1) = \Gamma(.1) e^{.5} (.05 + 52.5)^{.25 - .05} .5642 \cos [(2 - 4(-52.5))^{.5} - .05\pi + .25\pi]$$

$$[1 + O((.05 + 52.5)^{-.5})] = -16.34 + O(.2)$$

By direct application of a recurrence relation, $M(-52.5, .1, 1)$ has been calculated as -16.447 . To evaluate $M(a, b, x)$ with x, a and/or b large, 13.5.17, 19 or 21 should be tried.

Example 8. Compute $M(-52.5, .1, 1)$ using 13.5.21 to 3S, $\cos \theta = \sqrt{1/210.2}$.

$$M(-52.5, .1, 1) = \Gamma(.1) e^{105.1 \cos^2 \theta} [105.1 \cos \theta]^{1 - .1.5641} 52.55^{-.1} \sin 2\theta^{-.1} [\sin(-52.5\pi) + \sin\{52.55(2\theta - \sin 2\theta) + \frac{1}{2}\pi\}] + O((52.55)^{-1}) = -16.47 + O(.02)$$

A full range of asymptotic formulas to cover all possible cases is not yet known.

Calculation of $U(a, b, x)$

For $-10 \leq x \leq 10, -10 \leq a \leq 10, -10 \leq b \leq 10$ this is possible by 13.1.3, using Table 13.1 and the recurrence relations 13.4.15-20.

Example 9. Compute $U(1.1, .2, 1)$ to 5S. Using Tables 13.1, 4.12 and 6.1 and 13.1.3, we have

$$U(1, .2, 1) = \frac{\pi}{\sin(.2\pi)} \left\{ \frac{M(1, .2, 1)}{\Gamma(.9)\Gamma(.2)} - \frac{M(.9, 1.8, 1)}{\Gamma(.1)\Gamma(1.8)} \right\}$$

$$\text{But } M(.9, 1.8, 1) = .8[M(.9, .8, 1) - M(-.1, .8, 1)] = 1.72329, \text{ using 13.4.4.}$$

Hence

$$U(1, .2, 1) = 5.344799(.371765 - .194486) = .94752.$$

Similarly

$$U(-.9, .2, 1) = .91272.$$

Hence by 13.4.15

$$U(1.1, .2, 1) = [U(1, .2, 1) - U(-.9, .2, 1)] / .09 = .38664.$$

Example 10. To compute $U'(-.9, -.8, 1)$ to 5S. By 13.4.21

$$U'(-.9, -.8, 1) = .9U(1, .2, 1) = (.9)(.94752) = .85276.$$

Asymptotic Formulas

Example 11. To compute $U(1, .1, 100)$ to 5S. By 13.5.2

$$U(1, .1, 100) = \frac{1}{100} \left\{ 1 - \frac{1.9}{100} + \frac{1.9 \ 2.9}{100 \ 100} - \frac{1.9 \ 2.9 \ 3.9}{100 \ 100 \ 100} + O(10^{-9}) \right\}$$

$$= .01 \{ 1 - .019 + .000551 - .000021 + O(10^{-9}) \},$$

$$= .00981 \ 53.$$

Example 12. To evaluate $U(1, .2, .01)$. For x small, 13.5.6-12 should be used.

$$U(1, .2, .01) = \frac{\Gamma(1-.2)}{\Gamma(1.1-.2)} + O((.01)^{1-.2}) = \frac{\Gamma(.8)}{\Gamma(.9)} + O((.01)^{.8}) = 1.09 \text{ to 3S, by 13.5.10.}$$

To evaluate $U(a, b, x)$ with a large, x small and b small or large 13.5.15 or 16 should be used.

To evaluate $U(a, b, x)$ with x, a and/or b large 13.5.18, 20 or 22 should be tried. In all these cases the size of the remainder term is the guide to the number of significant figures obtainable.

Calculation of the Whittaker Functions

Example 13. Compute $M_{.0, -.4}(1)$ and $W_{.0, -.4}(1)$ to 5S. By formulas 13.1.32 and 13.1.33 and Tables 13.1, 4.4

$$M_{.0, -.4}(1) = e^{-.5} M(1, .2, 1) = 1.10622,$$

$$W_{.0, -.4}(1) = e^{-.5} U(1, .2, 1) = .57469.$$

Thus the values of $M_{x,\mu}(x)$ and $W_{x,\mu}(x)$ can always be found if the values of $M(a, b, x)$ and $U(a, b, x)$ are known.

13.9. Calculation of Zeros and Turning Points

Example 14. Compute the smallest positive zero of $M(-4, .6, x)$. This is outside the range of Table 13.2. Using 13.7.2 we have, as a first approximation

$$X_0 = \frac{(.55\pi)^2}{17.2} = .174.$$

Using 13.7.3 we have

$$X_1 = X_0 - M(-4, .6, X_0) / M'(-4, .6, X_0).$$

But, by 13.4.8,

$$M'(-4, .6, X_0) = -(.15)^{-1} M(-3, 1.6, X_0)$$

Hence

$$\begin{aligned} X_1 &= X_0 + .15M(-4, .6, X_0) / M(-3, 1.6, X_0), \\ &= .174 + (.15)(.030004) \\ &= .17850 \text{ as a second approximation.} \end{aligned}$$

If we repeat this calculation, we find that

$$X_2 = X_1 + .0000299 = .1785299 \text{ to 7S.}$$

Calculation of Maxima and Minima

Example 15. Compute the value of x at which $M(-1.8, -.2, x)$ has a turning value. Using 13.4.8 and Table 13.2, we find that $M'(-1.8, -.2, x) = 9M(-.8, .8, x) = 0$ when $x = .9429159$. Also $M''(-1.8, -.2, x) = 9M'(-.8, .8, x) = -9M(.2, 1.8, x)$ and $M(.2, 1.8, .9429159) > 0$. Hence $M(-1.8, -.2, x)$ has a maximum in x when $x = .9429159$.

Example 16. Compute the smallest positive value of x for which $M(-3, .6, x)$ has a turning value, X'_1 . This is outside the range of Table 13.2. Using 13.4.8 we have

$$M'(-3, .6, x) = -3M(-2, 1.6, x) / .6.$$

By 13.7.2 for $M(-2, 1.6, x)$,

$$X_0 = (1.05\pi)^2 / (11.2) = .9715.$$

This is a first approximation to X'_0 for $M(-3, .6, x)$. Using 13.7.5 and 13.4.8 we find a second approximation

$$\begin{aligned} X'_1 &= X'_0 \left[1 - \frac{M'(-3, .6, X'_0)}{-3M(-3, .6, X'_0)} \right] \\ &= X'_0 \left[1 - M(-2, 1.6, X'_0) / .6M(-3, .6, X'_0) \right] \\ &= .9715 \times 1.0163 = .9873 \text{ to 4S.} \end{aligned}$$

This process can be repeated to give as many significant figures as are required.

FIGURE 13.1.

Figure 13.1 shows the curves on which $M(a, b, x) = 0$ in the a, b plane when $x = 1$. The function is positive in the unshaded areas, and negative in the shaded areas. The number in each square gives the number of real positive zeros of $M(a, b, x)$ as a function of x in that square. The vertical boundaries to the left are to be included in each square.

13.10. Graphing $M(a, b, x)$

Example 17. Sketch $M(-4.5, 1, x)$. Firstly, from Figure 13.1 we see that the function has five real positive zeros. From 13.5.1, we find that $M \rightarrow -\infty, M' \rightarrow -\infty$ as $x \rightarrow +\infty$ and that $M \rightarrow +\infty, M' \rightarrow +\infty$ as $x \rightarrow -\infty$. By 13.7.2 we have as first approximations to the zeros, .3, 1.5, 3.7, 6.9, 10.6, and by 13.7.2 and 13.4.8 we find as first approximations to the turning values .9, 2.8, 5.8, 9.9. From 13.7.7, we see that these must lie near the curves

$$y = \pm e^{1/2} (5x)^{-1/2} (1 - x/11)^{-1/2} \pi^{-1/2}.$$

From these facts we can form a rough graph of the behavior of the function, Figure 13.2.

For $0 \leq x \leq 1$, linear interpolation in a , b or x provides 3-4S. Lagrange four-point interpolation gives 7S in a , b or x over most of the table, but the Lagrange six-point formula is needed over the range $1 \leq x \leq 10$. Any interpolation formula can be reapplied to give two dimensional interpolates in a and b , a and x or b and x . This calculation can be checked by being repeated in a different order.

14.1. Differential Equation, Series Expansions

Differential Equation

14.1.1

$$\frac{d^2 w}{d\rho^2} + \left[1 - \frac{2\eta}{\rho} - \frac{L(L+1)}{\rho^2}\right] w = 0$$

($\rho > 0$, $-\infty < \eta < \infty$, L a non-negative integer)

The Coulomb wave equation has a regular singularity at $\rho=0$ with indices $L+1$ and $-L$; it has an irregular singularity at $\rho=\infty$.

General Solution

14.7. Use and Extension of the Tables

In general the tables as presented are not simply interpolable. However, values for $L > 0$ may be obtained with the help of the recurrence relations. The values of $G_L(\eta, \rho)$ may be obtained by applying the recurrence relations in increasing order of L . Forward recurrence may be used for $F_L(\eta, \rho)$ as long as the instability does not produce errors in excess of the accuracy needed. In this case the backwards recurrence scheme (see Example 1) should be used.

Example 1. Compute $F_L(\eta, \rho)$ and $F'_L(\eta, \rho)$ for $\eta=2, \rho=5, L=0(1)5$. Starting with $F_{10}^*=1, F_{11}^*=0$, where $F_L^*=cF'_L$, we compute from 14.2.3 in decreasing order of L :

L	(1) F_L^*	(2) F_L	(3) F_L	(4) F'_L
11	0.			
10	1.			
9	4.49284			
8	17.5225			
7	61.3603			
6	191.238			
5	523.472	.090791	.091	.1043
4	1238.53	.21481	.215	.2030
3	2486.72	.43130	.4313	.3205
2	4158.46	.72124	.72125	.3952
1	5727.97	.99346	.99347	.3709
0	6591.81	1.1433	1.1433	.29380

$F_0/F_0^* = 1.7344 \times 10^{-4} = c^{-1}$.

The values in the second column are obtained from those in the first by multiplying by the normalization constant, F_0/F_0^* where F_0 is the known value obtained from Table 14.1.

Repetition starting with $F_{15}^*=1$ and $F_{16}^*=0$ yields the same results.

In column 3, the results have been given when 14.2.3 is used in increasing order of L .

F'_L (column 4) follows from 14.2.2.

Example 2. Compute $G_L(\eta, \rho)$ and $G'_L(\eta, \rho)$ for $\eta=2, \rho=5, L=1(1)5$.

Using 14.2.2 and $G_0(2, 5) = .79445, G'_0 = -.67049$ from Table 14.1 we find $G_1(2, 5) = 1.0815$. Then by forward recurrence using 14.2.3 we find:

L	G_L	$-G'_L$ *
1	1.0815	.60286
2	1.4969	.56619
3	2.0487	.79597
4	3.0941	1.7318
5	5.6298	4.5493

The values of G'_L are obtained with 14.2.1.

Example 3. Compute $G_0(\eta, \rho)$ for $\eta=2, \rho=2.5$. From Table 14.1, $G_0(2, 2) = 3.5124, G'_0(2, 2) = -2.5554$. Successive differentiation of 14.1.1 for $L=0$ gives

$$\rho \frac{d^{k+2}w}{d\rho^{k+2}} = (2\eta - \rho) \frac{d^k w}{d\rho^k} - k \left\{ \frac{d^{k+1}w}{d\rho^{k+1}} + \frac{d^{k-1}w}{d\rho^{k-1}} \right\}$$

Taylor's expansion is $w(\rho + \Delta\rho) = w(\rho) + (\Delta\rho)w' + \frac{(\Delta\rho)^2}{2!} w'' + \dots$ With $w = G_0(\eta, \rho)$ and $\Delta\rho = .5$ we get:

k	$\frac{d^k G_0}{d\rho^k}$	$\frac{(\Delta\rho)^k}{k!} \frac{d^k G_0}{d\rho^k}$
0	3.5124	3.5124
1	-2.5554	-1.2777
2	3.5124	.43905
3	-6.0678	-.12641
4	12.136	.03160
5	-29.540	-.00769
6	83.352	.00181
7	-268.26	-.00042

$G_0(2, 2.5) = 2.5726$

As a check the result is obtained with $\eta=2, \rho=3, \Delta\rho = -.5$. The derivative $G'_0(\eta, \rho)$ may be obtained using Taylor's formula with $w = G'_0(\eta, \rho)$.

15. Hypergeometric Functions

Mathematical Properties

15.1. Gauss Series, Special Elementary Cases, Special Values of the Argument

Gauss Series

The circle of convergence of the Gauss hypergeometric series

15.1.1

$$F(a, b; c; z) = {}_2F_1(a, b; c; z)$$

$$= F(b, a; c; z) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n}{(c)_n} \frac{z^n}{n!}$$

$$= \frac{\Gamma(c)}{\Gamma(a)\Gamma(b)} \sum_{n=0}^{\infty} \frac{\Gamma(a+n)\Gamma(b+n)}{\Gamma(c+n)} \frac{z^n}{n!}$$

is the unit circle $|z|=1$. The behavior of this series on its circle of convergence is:

- (a) Divergence when $\Re(c-a-b) \leq -1$.
- (b) Absolute convergence when $\Re(c-a-b) > 0$.
- (c) Conditional convergence when $-1 < \Re(c-a-b) \leq 0$; the point $z=1$ is excluded. The Gauss series reduces to a polynomial of degree n in z when a or b is equal to $-n$, ($n=0, 1, 2, \dots$). (For these cases see also 15.4.) The series 15.1.1 is not defined when c is equal to $-m$, ($m=0, 1, 2, \dots$), provided a or b is not a negative integer n with $n < m$. For $c = -m$

15.1.2

$$\lim_{c \rightarrow -m} \frac{1}{\Gamma(c)} F(a, b; c; z) =$$

$$\frac{(a)_{m+1} (b)_{m+1}}{(m+1)!} z^{m+1} F(a+m+1, b+m+1; m+2; z)$$

Special Elementary Cases of Gauss Series

(For cases involving higher functions see 15.4.)

$$15.1.3 \quad F(1, 1; 2; z) = -z^{-1} \ln(1-z) *$$

$$15.1.4 \quad F\left(\frac{1}{2}, 1; \frac{3}{2}; z^2\right) = \frac{1}{2} z^{-1} \ln\left(\frac{1+z}{1-z}\right)$$

$$15.1.5 \quad F\left(\frac{1}{2}, 1; \frac{3}{2}; -z^2\right) = z^{-1} \arctan z$$

15.1.6

$$F\left(\frac{1}{2}, \frac{1}{2}; \frac{3}{2}; z^2\right) = (1-z^2)^{-\frac{1}{2}} F(1, 1; \frac{3}{2}; z^2) = z^{-1} \arcsin z$$

15.1.7

$$F\left(\frac{1}{2}, \frac{1}{2}; \frac{3}{2}; -z^2\right) = (1+z^2)^{-\frac{1}{2}} F(1, 1; \frac{3}{2}; -z^2) \\ = z^{-1} \ln[z + (1+z^2)^{\frac{1}{2}}]$$

$$15.1.8 \quad F(a, b; b; z) = (1-z)^{-a}$$

$$15.1.9 \quad F(a, \frac{1}{2}+a; \frac{1}{2}; z^2) = \frac{1}{2} [(1+z)^{-2a} + (1-z)^{-2a}]$$

15.1.10

$$F(a, \frac{1}{2}+a; \frac{3}{2}; z^2) = \\ \frac{1}{2} z^{-1} (1-2a)^{-1} [(1+z)^{1-2a} - (1-z)^{1-2a}]$$

15.1.11

$$F(-a, a; \frac{1}{2}; -z^2) = \frac{1}{2} \{ [(1+z^2)^{\frac{1}{2}} + z]^{2a} + [(1+z^2)^{\frac{1}{2}} - z]^{2a} \}$$

15.1.12

$$F(a, 1-a; \frac{1}{2}; -z^2) = \\ \frac{1}{2} (1+z^2)^{-\frac{1}{2}} \{ [(1+z^2)^{\frac{1}{2}} + z]^{2a-1} + [(1+z^2)^{\frac{1}{2}} - z]^{2a-1} \}$$

15.1.13

$$F(a, \frac{1}{2}+a; 1+2a; z) = 2^{2a} [1 + (1-z)^{\frac{1}{2}}]^{-2a} \\ = (1-z)^{\frac{1}{2}} F(1+a, \frac{1}{2}+a; 1+2a; z)$$

15.1.14

$$F(a, \frac{1}{2}+a; 2a; z) = 2^{2a-1} (1-z)^{-\frac{1}{2}} [1 + (1-z)^{\frac{1}{2}}]^{1-2a}$$

$$15.1.15 \quad F(a, 1-a; \frac{3}{2}; \sin^2 z) = \frac{\sin[(2a-1)z]}{(2a-1) \sin z}$$

$$15.1.16 \quad F(a, 2-a; \frac{3}{2}; \sin^2 z) = \frac{\sin[(2a-2)z]}{(a-1) \sin(2z)}$$

$$15.1.17 \quad F(-a, a; \frac{1}{2}; \sin^2 z) = \cos(2az)$$

$$15.1.18 \quad F(a, 1-a; \frac{1}{2}; \sin^2 z) = \frac{\cos[(2a-1)z]}{\cos z}$$

$$15.1.19 \quad F(a, \frac{1}{2}+a; \frac{1}{2}; -\tan^2 z) = \cos^{2a} z \cos(2az)$$

Special Values of the Argument

15.1.20

$$F(a, b; c; 1) = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}$$

$$(c \neq 0, -1, -2, \dots, \Re(c-a-b) > 0)$$

*See page II.

15.1.21

$$F(a, b; a-b+1; -1) = 2^{-a} \pi^{\frac{1}{2}} \frac{\Gamma(1+a-b)}{\Gamma(1+\frac{1}{2}a-b)\Gamma(\frac{1}{2}+\frac{1}{2}a)}$$

(1+a-b ≠ 0, -1, -2, ...)

15.1.22

$$F(a, b; a-b+2; -1) = 2^{-a} \pi^{1/2} (b-1)^{-1} \Gamma(a-b+2)$$

Gauss' Relations for Contiguous Functions

The six functions $F(a \pm 1, b; c; z)$, $F(a, b \pm 1; c; z)$, $F(a, b; c \pm 1; z)$ are called contiguous to $F(a, b; c; z)$. Relations between $F(a, b; c; z)$ and

any two contiguous functions have been given by Gauss. By repeated application of these relations the function $F(a+m, b+n; c+l; z)$ with integral $m, n, l(c+l \neq 0, -1, -2, \dots)$ can be expressed as a linear combination of $F(a, b; c; z)$ and one of its contiguous functions with coefficients which are rational functions of a, b, c, z .

15.3. Integral Representations and Transformation Formulas**Integral Representations****15.3.1**

$$F(a, b; c; z) = \\ \frac{\Gamma(c)}{\Gamma(b)\Gamma(c-b)} \int_0^1 t^{b-1}(1-t)^{c-b-1}(1-tz)^{-a} dt \\ (\Re c > \Re b > 0)$$

The integral represents a one valued analytic function in the z -plane cut along the real axis from 1 to ∞ and hence **15.3.1** gives the analytic continuation of **15.1.1**, $F(a, b; c; z)$. Another integral representation is in the form of a Mellin-Barnes integral

$$15.3.2 \quad F(a, b; c; z) = \frac{\Gamma(c)}{2\pi i \Gamma(a)\Gamma(b)} \int_{-i\infty}^{i\infty} \frac{\Gamma(a+s)\Gamma(b+s)\Gamma(-s)}{\Gamma(c+s)} (-z)^s ds$$

$$= \frac{1}{2} i \frac{\Gamma(c)}{\Gamma(a)\Gamma(b)} \int_{-i\infty}^{i\infty} \frac{\Gamma(a+s)\Gamma(b+s)}{\Gamma(1+s)\Gamma(c+s)} \csc(\pi s) (-z)^s ds$$

Here $-\pi < \arg(-z) < \pi$ and the path of integration is chosen such that the poles of $\Gamma(a+s)$ and $\Gamma(b+s)$ i.e. the points $s = -a - n$ and $s = -b - m$ ($n, m = 0, 1, 2, \dots$) respectively, are at its left side and the poles of $\csc(\pi s)$ or $\Gamma(-s)$ i.e. $s = 0, 1, 2, \dots$ are at its right side. The cases in which $-a, -b$ or $-c$ are non-negative integers or $a - b$ equal to an integer are excluded.

Linear Transformation Formulas

From 15.3.1 and 15.3.2 a number of transformation formulas for $F(a, b; c; z)$ can be derived.

$$15.3.3 \quad F(a, b; c; z) = (1-z)^{c-a-b} F(c-a, c-b; c; z)$$

$$15.3.4 \quad = (1-z)^{-a} F\left(a, c-b; c; \frac{z}{z-1}\right)$$

$$15.3.5 \quad = (1-z)^{-b} F\left(b, c-a; c; \frac{z}{z-1}\right)$$

$$15.3.6 \quad = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)} F(a, b; a+b-c+1; 1-z)$$

$$+ (1-z)^{c-a-b} \frac{\Gamma(c)\Gamma(a+b-c)}{\Gamma(a)\Gamma(b)} F(c-a, c-b; c-a-b+1; 1-z) \quad (|\arg(1-z)| < \pi)$$

$$15.3.7 \quad = \frac{\Gamma(c)\Gamma(b-a)}{\Gamma(b)\Gamma(c-a)} (-z)^{-a} F\left(a, 1-c+a; 1-b+a; \frac{1}{z}\right)$$

$$+ \frac{\Gamma(c)\Gamma(a-b)}{\Gamma(a)\Gamma(c-b)} (-z)^{-b} F\left(b, 1-c+b; 1-a+b; \frac{1}{z}\right) \quad (|\arg(-z)| < \pi)$$

$$15.3.8 \quad = (1-z)^{-a} \frac{\Gamma(c)\Gamma(b-a)}{\Gamma(b)\Gamma(c-a)} F\left(a, c-b; a-b+1; \frac{1}{1-z}\right)$$

$$+ (1-z)^{-b} \frac{\Gamma(c)\Gamma(a-b)}{\Gamma(a)\Gamma(c-b)} F\left(b, c-a; b-a+1; \frac{1}{1-z}\right) \quad (|\arg(1-z)| < \pi)$$

$$15.3.9 \quad = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)} z^{-a} F\left(a, a-c+1; a+b-c+1; 1-\frac{1}{z}\right)$$

$$+ \frac{\Gamma(c)\Gamma(a+b-c)}{\Gamma(a)\Gamma(b)} (1-z)^{c-a-b} z^{a-c} F\left(c-a, 1-a; c-a-b+1; 1-\frac{1}{z}\right) \quad (|\arg z| < \pi, |\arg(1-z)| < \pi)$$

Each term of 15.3.6 has a pole when $c = a + b \pm m$, ($m = 0, 1, 2, \dots$); this case is covered by

$$15.3.10 \quad F(a, b; a+b; z) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \sum_{n=0}^{\infty} \frac{(a)_n (b)_n}{(n!)^2} [2\psi(n+1) - \psi(a+n) - \psi(b+n) - \ln(1-z)] (1-z)^n$$

$$(|\arg(1-z)| < \pi, |1-z| < 1)$$

Furthermore for $m = 1, 2, 3, \dots$

$$15.3.11 \quad F(a, b; a+b+m; z) = \frac{\Gamma(m)\Gamma(a+b+m)}{\Gamma(a+m)\Gamma(b+m)} \sum_{n=0}^{m-1} \frac{(a)_n (b)_n}{n!(1-m)_n} (1-z)^n$$

$$- \frac{\Gamma(a+b+m)}{\Gamma(a)\Gamma(b)} (z-1)^m \sum_{n=0}^{\infty} \frac{(a+m)_n (b+m)_n}{n!(n+m)!} (1-z)^n [\ln(1-z) - \psi(n+1) - \psi(n+m+1) + \psi(a+n+m) + \psi(b+n+m)] \quad (|\arg(1-z)| < \pi, |1-z| < 1)$$

$$\begin{aligned}
 15.3.12 \quad F(a, b; a+b-m; z) &= \frac{\Gamma(m)\Gamma(a+b-m)}{\Gamma(a)\Gamma(b)} (1-z)^{-m} \sum_{n=0}^{m-1} \frac{(a-m)_n (b-m)_n}{n!(1-m)_n} (1-z)^n \\
 &\quad - \frac{(-1)^m \Gamma(a+b-m)}{\Gamma(a-m)\Gamma(b-m)} \sum_{n=0}^{\infty} \frac{(a)_n (b)_n}{n!(n+m)!} (1-z)^n [\ln(1-z) - \psi(n+1) \\
 &\quad \quad \quad - \psi(n+m+1) + \psi(a+n) + \psi(b+n)] \\
 &\quad \quad \quad (|\arg(1-z)| < \pi, |1-z| < 1)
 \end{aligned}$$

Similarly each term of 15.3.7 has a pole when $b=a \pm m$ or $b-a = \pm m$ and the case is covered by

$$\begin{aligned}
 15.3.13 \quad F(a, a; c; z) &= \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} (-z)^{-a} \sum_{n=0}^{\infty} \frac{(a)_n (1-c+a)_n}{(n!)^2} z^{-n} [\ln(-z) + 2\psi(n+1) - \psi(a+n) - \psi(c-a-n)] \\
 &\quad (|\arg(-z)| < \pi, |z| > 1, (c-a) \neq 0, \pm 1, \pm 2, \dots)
 \end{aligned}$$

The case $b-a=m$, ($m=1, 2, 3, \dots$) is covered by

$$\begin{aligned}
 15.3.14 \quad F(a, a+m; c; z) &= F(a+m, a; c; z) \\
 &= \frac{\Gamma(c)(-z)^{-a-m}}{\Gamma(a+m)\Gamma(c-a)} \sum_{n=0}^{\infty} \frac{(a)_{n+m} (1-c+a)_{n+m}}{n!(n+m)!} z^{-n} [\ln(-z) + \psi(1+m+n) + \psi(1+n) \\
 &\quad \quad \quad - \psi(a+m+n) - \psi(c-a-m-n)] + (-z)^{-a} \frac{\Gamma(c)}{\Gamma(a+m)} \sum_{n=0}^{m-1} \frac{\Gamma(m-n)(a)_n}{n!\Gamma(c-a-n)} z^{-n} \\
 &\quad \quad \quad (|\arg(-z)| < \pi, |z| > 1, (c-a) \neq 0, \pm 1, \pm 2, \dots)
 \end{aligned}$$

The case $c-a=0, -1, -2, \dots$ becomes elementary, 15.3.3, and the case $c-a=1, 2, 3, \dots$ can be obtained from 15.3.14, by a limiting process (see [15.2]).

Quadratic Transformation Formulas

If, and only if the numbers $\pm(1-c)$, $\pm(a-b)$, $\pm(a+b-c)$ are such, that two of them are equal or one of them is equal to $\frac{1}{2}$, then there exists a quadratic transformation. The basic formulas are due to Kummer [15.7] and a complete list is due to Goursat [15.3]. See also [15.2].

$$15.3.15 \quad F(a, b; 2b; z) = (1-z)^{-1/2} F\left(\frac{1}{2}a, b - \frac{1}{2}a; b + \frac{1}{2}; \frac{z^2}{4z-4}\right)$$

- 15.3.24 $F(a, b; a+b-\frac{1}{2}; z) = (1-z)^{-1} F(2a-1, 2b-1; a+b-\frac{1}{2}; \frac{1}{2}-\frac{1}{2}\sqrt{1-z})$
- 15.3.25 $= (1-z)^{-1} (\frac{1}{2}+\frac{1}{2}\sqrt{1-z})^{1-2a} F(2a-1, a-b+\frac{1}{2}; a+b-\frac{1}{2}; \frac{\sqrt{1-z}-1}{\sqrt{1-z}+1})$

- 15.3.30 $= F(\frac{1}{2}a, \frac{1}{2}b; \frac{1}{2}a+\frac{1}{2}b+\frac{1}{2}; 4z-4z^2)$
- 15.3.31 $F(a, 1-a; c; z) = (1-z)^{c-1} F(\frac{1}{2}c-\frac{1}{2}a, \frac{1}{2}c+\frac{1}{2}a-\frac{1}{2}; c; 4z-4z^2)$

Cubic transformations are listed in [15.2] and [15.3].

In the formulas above, the square roots are defined so that their value is real and positive when $0 \leq z < 1$. All formulas are valid in the neighborhood of $z=0$.

15.4. Special Cases of $F(a, b; c; z)$

Polynomials

When a or b is equal to a negative integer, then

15.4.1 $F(-m, b; c; z) = \sum_{n=0}^m \frac{(-m)_n (b)_n}{(c)_n} \frac{z^n}{n!}$

This formula is also valid when $c = -m-l; m, l = 0, 1, 2, \dots$

15.4.2 $F(-m, b; -m-l; z) = \sum_{n=0}^m \frac{(-m)_n (b)_n}{(-m-l)_n} \frac{z^n}{n!}$

Some particular cases are

- 15.4.3 $F(-n, n; \frac{1}{2}; x) = T_n(1-2x)$
- 15.4.4 $F(-n, n+1; 1; x) = P_n(1-2x)$
- 15.4.5 $F(-n, n+2\alpha; \alpha+\frac{1}{2}; x) = \frac{n!}{(2\alpha)_n} C_n^{(\alpha)}(1-2x)$
- 15.4.6 $F(-n, \alpha+1+\beta+n; \alpha+1; x) = \frac{n!}{(\alpha+1)_n} P_n^{(\alpha, \beta)}(1-2x)$

Here $T_n, P_n, C_n^{(\alpha)}, P_n^{(\alpha, \beta)}$ denote Chebyshev, Legendre's, Gegenbauer's and Jacobi's polynomials respectively (see chapter 22).

Legendre Functions

Legendre functions are connected with those special cases of the hypergeometric function for which a quadratic transformation exists (see 15.3).

- 15.4.7 $F(a, b; 2b; z) = 2^{2b-1} \Gamma(\frac{1}{2}+b) z^{1-b} (1-z)^{1(b-a-1)} P_{a-b-\frac{1}{2}}^{1-b} \left[\left(1-\frac{z}{2}\right) (1-z)^{-1} \right]$
- 15.4.8 $= 2^{2b} \pi^{-1} \frac{\Gamma(\frac{1}{2}+b)}{\Gamma(2b-a)} z^{-b} (1-z)^{1(b-a)} e^{i\pi(a-b)} P_{b-\frac{1}{2}}^{b-a} \left(\frac{2}{z}-1 \right)$
- 15.4.9 $F(a, b; 2b; -z) = 2^{2b} \pi^{-1} \frac{\Gamma(\frac{1}{2}+b)}{\Gamma(a)} z^{-b} (1+z)^{1(b-a)} e^{-i\pi(a-b)} P_{b-\frac{1}{2}}^{a-1} \left(1+\frac{2}{z} \right) \left(|\arg z| < \pi, |\arg(1\pm z)| < \pi \right)$

15.5. The Hypergeometric Differential Equation

The hypergeometric differential equation

$$15.5.1 \quad z(1-z) \frac{d^2 w}{dz^2} + [c - (a+b+1)z] \frac{dw}{dz} - abw = 0$$

has three (regular) singular points $z=0, 1, \infty$. The pairs of exponents at these points are

$$15.5.2 \quad \rho_{1,2}^{(0)}=0, 1-c, \quad \rho_{1,2}^{(1)}=0, c-a-b, \quad \rho_{1,2}^{(\infty)}=a, b$$

respectively. The general theory of differential equations of the Fuchsian type distinguishes between the following cases.

A. None of the numbers $c, c-a-b; a-b$ is equal to an integer. Then two linearly independent solutions of 15.5.1 in the neighborhood of the singular points $0, 1, \infty$ are respectively

$$15.5.3 \quad w_{1(0)}=F(a, b; c; z)=(1-z)^{c-a-b}F(c-a, c-b; c; z)$$

$$15.5.4 \quad w_{2(0)}=z^{1-c}F(a-c+1, b-c+1; 2-c; z)=z^{1-c}(1-z)^{c-a-b}F(1-a, 1-b; 2-c; z)$$

$$15.5.5 \quad w_{1(1)}=F(a, b; a+b+1-c; 1-z)=z^{1-c}F(1+b-c, 1+a-c; a+b+1-c; 1-z)$$

$$15.5.6 \quad w_{2(1)}=(1-z)^{c-a-b}F(c-b, c-a; c-a-b+1; 1-z)=z^{1-c}(1-z)^{c-a-b}F(1-a, 1-b; c-a-b+1; 1-z)$$

$$15.5.7 \quad w_{1(\infty)}=z^{-a}F(a, a-c+1; a-b+1; z^{-1})=z^{b-c}(z-1)^{c-a-b}F(1-b, c-b; a-b+1; z^{-1})$$

$$15.5.8 \quad w_{2(\infty)}=z^{-b}F(b, b-c+1; b-a+1; z^{-1})=z^{a-c}(z-1)^{c-a-b}F(1-a, c-a; b-a+1; z^{-1})$$

The second set of the above expressions is obtained by applying 15.3.3 to the first set.

Another set of representations is obtained by applying 15.3.4 to 15.5.3 through 15.5.8. This gives 15.5.9–15.5.14.

$$15.5.9 \quad w_{1(0)}=(1-z)^{-a}F\left(a, c-b; c; \frac{z}{z-1}\right)=(1-z)^{-b}F\left(b, c-a; c; \frac{z}{z-1}\right)$$

$$15.5.10 \quad w_{2(0)}=z^{1-c}(1-z)^{c-a-1}F\left(a-c+1, 1-b; 2-c; \frac{z}{z-1}\right)=z^{1-c}(1-z)^{c-b-1}F\left(b-c+1, 1-a; 2-c; \frac{z}{z-1}\right)$$

$$15.5.11 \quad w_{1(1)}=z^{-a}F(a, a-c+1; a+b-c+1; 1-z^{-1})=z^{-b}F(b, b-c+1; a+b-c+1; 1-z^{-1})$$

15.5.12

$$w_{2(1)}=z^{a-c}(1-z)^{c-a-b}F(c-a, 1-a; c-a-b+1; 1-z^{-1})=z^{b-c}(1-z)^{c-a-b}F(c-b, 1-b; c-a-b+1; 1-z^{-1})$$

$$15.5.13 \quad w_{1(\infty)}=(z-1)^{-a}F\left(a, c-b; a-b+1; \frac{1}{1-z}\right)=(z-1)^{-b}F\left(b, c-a; b-a+1; \frac{1}{1-z}\right)$$

15.5.14

$$w_{2(\infty)}=z^{1-c}(z-1)^{c-a-1}F\left(a-c+1, 1-b; a-b+1; \frac{1}{1-z}\right)=z^{1-c}(z-1)^{c-b-1}F\left(b-c+1, 1-a; b-a+1; \frac{1}{1-z}\right)$$

15.5.3 to 15.5.14 constitute Kummer's 24 solutions of the hypergeometric equation. The analytic continuation of $w_{1,2(0)}(z)$ can then be obtained by means of 15.3.3 to 15.3.9.

B. One of the numbers $a, b, c-a, c-b$ is an integer. Then one of the hypergeometric series for instance $w_{1,2(0)}$, 15.5.3, 15.5.4 terminates and the corresponding solution is of the form

$$15.5.15 \quad w=z^a(1-z)^b p_n(z)$$

where $p_n(z)$ is a polynomial in z of degree n . This case is referred to as the degenerate case of the hypergeometric differential equation and its solutions are listed and discussed in great detail in [15.2].

C. The number $c-a-b$ is an integer, c nonintegral. Then 15.3.10 to 15.3.12 give the analytic continuation of $w_{1,2(0)}$ into the neighborhood of $z=1$. Similarly 15.3.13 and 15.3.14 give the analytic continuation of $w_{1,2(0)}$ into the neighborhood of $z=\infty$ in case $a-b$ is an integer but not c , subject of course to the further restrictions $c-a=0, \pm 1, \pm 2 \dots$ (For a detailed discussion of all possible cases, see [15.2]).

D. The number $c=1$. Then 15.5.3, 15.5.4 are replaced by

$$15.5.16 \quad w_{1(0)}=F(a, b; 1; z)$$

15.5.17 $w_{2(0)} = F(a, b; 1; z) \ln z + \sum_{n=1}^{\infty} \frac{(a)_n (b)_n}{(n!)^2} z^n [\psi(a+n) - \psi(a) + \psi(b+n) - \psi(b) - 2\psi(n+1) + 2\psi(1)] \quad (|z| < 1)$

E. The number $c = m + 1, m = 1, 2, 3, \dots$. A fundamental system is

15.5.18 $w_{1(0)} = F(a, b; m + 1; z)$

15.5.19 $w_{2(0)} = F(a, b; m + 1; z) \ln z + \sum_{n=1}^{\infty} \frac{(a)_n (b)_n}{(1+m)_n n!} z^n [\psi(a+n) - \psi(a) + \psi(b+n) - \psi(b) - \psi(m+1+n) + \psi(m+1) - \psi(n+1) + \psi(1)] - \sum_{n=1}^m \frac{(n-1)! (-m)_n}{(1-a)_n (1-b)_n} z^{-n} \quad (|z| < 1 \text{ and } a, b \neq 0, 1, 2, \dots, (m-1))$

F. The number $c = 1 - m, m = 1, 2, 3, \dots$. A fundamental system is

15.5.20 $w_{1(0)} = z^m F(a + m, b + m; 1 + m; z)$

15.5.21

$w_{2(0)} = z^m F(a + m, b + m; 1 + m; z) \ln z + z^m \sum_{n=1}^{\infty} z^n \frac{(a+m)_n (b+m)_n}{(1+m)_n n!} [\psi(a+m+n) - \psi(a+m) + \psi(b+m+n) - \psi(b+m) - \psi(m+1+n) + \psi(m+1) - \psi(n+1) + \psi(1)] - \sum_{n=1}^m \frac{(n-1)! (-m)_n}{(1-a-m)_n (1-b-m)_n} z^{m-n} \quad (|z| < 1 \text{ and } a, b \neq 0, -1, -2, \dots, -(m-1))$

15.6. Riemann's Differential Equation

The hypergeometric differential equation 15.5.1 with the (regular) singular points 0, 1, ∞ is a special case of Riemann's differential equation with three (regular) singular points a, b, c

15.6.1

$\frac{d^2 w}{dz^2} + \left[\frac{1-\alpha-\alpha'}{z-a} + \frac{1-\beta-\beta'}{z-b} + \frac{1-\gamma-\gamma'}{z-c} \right] \frac{dw}{dz} + \left[\frac{\alpha\alpha'(a-b)(a-c)}{z-a} + \frac{\beta\beta'(b-c)(b-a)}{z-b} + \frac{\gamma\gamma'(c-a)(c-b)}{z-c} \right] \frac{w}{(z-a)(z-b)(z-c)} = 0$

The pairs of the exponents with respect to the singular points $a; b; c$ are $\alpha, \alpha'; \beta, \beta'; \gamma, \gamma'$ respectively subject to the condition

15.6.2 $\alpha + \alpha' + \beta + \beta' + \gamma + \gamma' = 1$

The complete set of solutions of 15.6.1 is denoted by the symbol

15.6.3 $w = P \begin{Bmatrix} a & b & c & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{Bmatrix}$

Special Cases of Riemann's P Function

(a) The generalized hypergeometric function

15.6.4

$w = P \begin{Bmatrix} 0 & \infty & 1 & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{Bmatrix}$

(b) The hypergeometric function $F(a, b; c; z)$

15.6.5

$w = P \begin{Bmatrix} 0 & \infty & 1 & \\ 0 & a & 0 & z \\ 1-c & b & c-a-b & \end{Bmatrix}$

(c) The Legendre functions $P_\nu^\mu(z), Q_\nu^\mu(z)$

15.6.6

$w = P \begin{Bmatrix} 0 & \infty & 1 & \\ -\frac{1}{2}\nu & \frac{1}{2}\mu & 0 & (1-z^2)^{-1} \\ \frac{1}{2} + \frac{1}{2}\nu & -\frac{1}{2}\mu & \frac{1}{2} & \end{Bmatrix}$

(d) The confluent hypergeometric function

15.6.7

$w = P \begin{Bmatrix} 0 & \infty & c & \\ \frac{1}{2} + u & -c & c-k & z \\ \frac{1}{2} - u & 0 & k & \end{Bmatrix}$

provided $\lim c \rightarrow \infty$.

Transformation Formulas for Riemann's P Function

$$15.6.8 \quad \left(\frac{z-a}{z-b}\right)^k \left(\frac{z-c}{z-b}\right)^l P \left\{ \begin{matrix} a & b & c \\ \alpha & \beta & \gamma \\ \alpha' & \beta' & \gamma' \end{matrix} \middle| z \right\} = P \left\{ \begin{matrix} a & b & c \\ \alpha+k & \beta-k-l & \gamma+l \\ \alpha'+k & \beta'-k-l & \gamma'+l \end{matrix} \middle| z \right\}$$

$$15.6.9 \quad P \left\{ \begin{matrix} a & b & c \\ \alpha & \beta & \gamma \\ \alpha' & \beta' & \gamma' \end{matrix} \middle| z \right\} = P \left\{ \begin{matrix} a_1 & b_1 & c_1 \\ \alpha & \beta & \gamma \\ \alpha' & \beta' & \gamma' \end{matrix} \middle| z_1 \right\}$$

where

$$15.6.10 \quad z = \frac{Az_1+B}{Cz_1+D}, \quad a = \frac{Aa_1+B}{Ca_1+D}, \quad b = \frac{Ab_1+B}{Cb_1+D}, \quad c = \frac{Ac_1+B}{Cc_1+D}$$

and A, B, C, D are arbitrary constants such that $AD-BC \neq 0$.

Riemann's P function reduced to the hypergeometric function is

$$15.6.11 \quad P \left\{ \begin{matrix} a & b & c \\ \alpha & \beta & \gamma \\ \alpha' & \beta' & \gamma' \end{matrix} \middle| z \right\} = \left(\frac{z-a}{z-b}\right)^\alpha \left(\frac{z-c}{z-b}\right)^\gamma P \left\{ \begin{matrix} 0 & \infty & 1 \\ 0 & \alpha+\beta+\gamma & 0 \\ \alpha'-\alpha & \alpha+\beta'+\gamma & \gamma'-\gamma \end{matrix} \middle| \frac{(z-a)(c-b)}{(z-b)(c-a)} \right\}$$

The P function on the right hand side is Gauss' hypergeometric function (see 15.6.5). If it is replaced by Kummer's 24 solutions 15.5.3 to 15.5.14 the complete set of 24 solutions for Riemann's differential equation 15.6.1 is obtained. The first of these solutions is for instance by 15.5.3 and 15.6.5

$$15.6.12 \quad w = \left(\frac{z-a}{z-b}\right)^\alpha \left(\frac{z-c}{z-b}\right)^\gamma F \left[\alpha+\beta+\gamma, \alpha+\beta'+\gamma; 1+\alpha-\alpha'; \frac{(z-a)(c-b)}{(z-b)(c-a)} \right]$$

15.7. Asymptotic Expansions

The behavior of $F(a, b; c; z)$ for large $|z|$ is described by the transformation formulas of 15.3.

For fixed a, b, z and large $|c|$ one has [15.8]

15.7.1

$$F(a, b; c; z) = \sum_{n=0}^m \frac{(a)_n (b)_n z^n}{(c)_n n!} + O(|c|^{-m-1})$$

For fixed $a, c, z, (c \neq 0, -1, -2, \dots, 0 < |z| < 1)$ and large $|b|$ one has [15.2]

15.7.2

$$F(a, b; c; z) = e^{-i\pi a} [\Gamma(c)/\Gamma(c-a)] (bz)^{-a} [1 + O(|bz|^{-1})] + [\Gamma(c)/\Gamma(a)] e^{bz} (bz)^{a-c} [1 + O(|bz|^{-1})] \quad \left(-\frac{3\pi}{2} < \arg(bz) < \frac{1}{2}\pi\right)$$

15.7.3

$$F(a, b; c; z) = e^{i\pi a} [\Gamma(c)/\Gamma(c-a)] (bz)^{-a} [1 + O(|bz|^{-1})] + [\Gamma(c)/\Gamma(a)] e^{bz} (bz)^{a-c} [1 + O(|bz|^{-1})] \quad \left(-\frac{1}{2}\pi < \arg(bz) < \frac{3}{2}\pi\right)$$

For the case when more than one of the parameters are large consult [15.2].

16. Jacobian Elliptic Functions and Theta Functions

Mathematical Properties

Jacobian Elliptic Functions

16.1. Introduction

A doubly periodic meromorphic function is called an *elliptic function*.

Let m, m_1 be numbers such that

$$m + m_1 = 1.$$

We call m the *parameter*, m_1 the *complementary parameter*.

In what follows we shall assume that the parameter m is a real number. Without loss of generality we can then suppose that $0 \leq m \leq 1$ (see 16.10, 16.11).

We define *quarter-periods* K and iK' by

16.1.1

$$K(m) = K = \int_0^{\pi/2} \frac{d\theta}{(1 - m \sin^2 \theta)^{1/2}},$$

$$iK'(m) = iK' = i \int_0^{\pi/2} \frac{d\theta}{(1 - m_1 \sin^2 \theta)^{1/2}}$$

so that K and K' are real numbers. K is called the real, iK' the imaginary quarter-period.

We note that

16.1.2

$$K(m) = K'(m_1) = K'(1 - m).$$

We also note that if any *one* of the numbers $m, m_1, K(m), K'(m), K'(m)/K(m)$ is given, all the rest are determined. Thus K and K' can not both be chosen arbitrarily.

In the Argand diagram denote the points $0, K, K + iK', iK'$ by s, c, d, n respectively. These points are at the vertices of a rectangle. The translations of this rectangle by $\lambda K, \mu iK'$, where λ, μ are given all integral values positive or negative, will lead to the lattice

.s	.c	.s	.c
.n	.d	.n	.d
.s	.c	.s	.c
.n	.d	.n	.d

the pattern being repeated indefinitely on all sides.

Let p, q be any two of the letters s, c, d, n . Then p, q determine in the lattice a minimum rectangle whose sides are of length K and K' and whose vertices s, c, d, n are in counterclockwise order.

Definition

The Jacobian elliptic function $pq u$ is defined by the following three properties.

(i) $pq u$ has a simple zero at p and a simple pole at q .

(ii) The step from p to q is a half-period of $pq u$. Those of the numbers $K, iK', K + iK'$ which differ from this step are only quarter-periods.

(iii) The coefficient of the leading term in the expansion of $pq u$ in ascending powers of u about $u=0$ is unity. With regard to (iii) the leading term is $u, 1/u, 1$ according as $u=0$ is a zero, a pole, or an ordinary point.

Thus the functions with a pole or zero at the origin (i.e., the functions in which one letter is s) are odd, and the others are even.

Should we wish to call explicit attention to the value of the parameter, we write $pq(u|m)$ instead of $pq u$.

The Jacobian elliptic functions can also be defined with respect to certain integrals. Thus if

16.1.3

$$u = \int_0^\varphi \frac{d\theta}{(1 - m \sin^2 \theta)^{1/2}},$$

the angle φ is called the *amplitude*

16.1.4

$$\varphi = \text{am } u$$

and we define

16.1.5

$$\text{sn } u = \sin \varphi, \text{ cn } u = \cos \varphi,$$

$$\text{dn } u = (1 - m \sin^2 \varphi)^{1/2} = \Delta(\varphi).$$

Similarly all the functions $pq u$ can be expressed in terms of φ . This second set of definitions, although seemingly different, is mathematically equivalent to the definition previously given in terms of a lattice. For further explanation of notations, including the interpretation, of such expressions as $\text{sn}(\varphi|\alpha), \text{cn}(u|m), \text{dn}(u, k)$, see 17.2.

16.2. Classification of the Twelve Jacobian Elliptic Functions
According to Poles and Half-Periods

	Pole iK'	Pole $K+iK'$	Pole K	Pole 0	
Half period iK'	$\text{sn } u$	$\text{cd } u$	$\text{dc } u$	$\text{ns } u$	Periods $2iK', 4K+4iK', 4K$
Half period $K+iK'$	$\text{cn } u$	$\text{sd } u$	$\text{nc } u$	$\text{ds } u$	Periods $4iK', 2K+2iK', 4K$
Half period K	$\text{dn } u$	$\text{nd } u$	$\text{sc } u$	$\text{cs } u$	Periods $4iK', 4K+4iK', 2K$

The three functions in a vertical column are *copolar*.

The four functions in a horizontal line are *coperiodic*. Of the periods quoted in the last line of each row only two are independent.

16.3. Relation of the Jacobian Functions to the Copolar Trio $\text{sn } u, \text{cn } u, \text{dn } u$

16.3.1 $\text{cd } u = \frac{\text{cn } u}{\text{dn } u}$ $\text{dc } u = \frac{\text{dn } u}{\text{cn } u}$ $\text{ns } u = \frac{1}{\text{sn } u}$

16.3.2 $\text{sd } u = \frac{\text{sn } u}{\text{dn } u}$ $\text{nc } u = \frac{1}{\text{cn } u}$ $\text{ds } u = \frac{\text{dn } u}{\text{sn } u}$

16.3.3 $\text{nd } u = \frac{1}{\text{dn } u}$ $\text{sc } u = \frac{\text{sn } u}{\text{cn } u}$ $\text{cs } u = \frac{\text{cn } u}{\text{sn } u}$

And generally if p, q, r are any three of the letters s, c, d, n,

16.3.4 $pq u = \frac{pr u}{qr u}$

provided that when two letters are the same, e.g., $pp u$, the corresponding function is put equal to unity.

16.4. Calculation of the Jacobian Functions by Use of the Arithmetic-Geometric Mean (A.G.M.)

For the A.G.M. scale see 17.6.

To calculate $\text{sn}(u|m)$, $\text{cn}(u|m)$, and $\text{dn}(u|m)$ form the A.G.M. scale starting with

16.4.1 $a_0=1, b_0=\sqrt{m_1}, c_0=\sqrt{m},$

terminating at the step N when c_N is negligible to the accuracy required. Find φ_N in degrees where

16.4.2
$$\varphi_N = 2^N a_N u \frac{180^\circ}{\pi}$$

and then compute successively $\varphi_{N-1}, \varphi_{N-2}, \dots, \varphi_1, \varphi_0$ from the recurrence relation

16.4.3
$$\sin(2\varphi_{n-1} - \varphi_n) = \frac{c_n}{a_n} \sin \varphi_n.$$

Then

16.4.4

$\text{sn}(u|m) = \sin \varphi_0, \text{cn}(u|m) = \cos \varphi_0$

$$\text{dn}(u|m) = \frac{\cos \varphi_0}{\cos(\varphi_1 - \varphi_0)}$$

From these all the other functions can be determined.

16.7. Principal Terms

When the elliptic function $pq u$ is expanded in ascending powers of $(u-K_r)$, where K_r is one of $0, K, iK', K+iK'$, the first term of the expansion is called the principal term and has one of the forms $A, B \times (u-K_r), C \div (u-K_r)$ according as K_r is an ordinary point, a zero, or a pole of $pq u$. The following list gives these forms, where \times means that the factor $(u-K_r)$ has to be supplied and \div means that the divisor $(u-K_r)$ has to be supplied.

16.9. Relations Between the Squares of the Functions

16.9.1 $-\text{dn}^2u + m_1 = -m \text{cn}^2u = m \text{sn}^2u - m$

16.9.2 $-m_1 \text{nd}^2u + m_1 = -m m_1 \text{sd}^2u = m \text{cd}^2u - m$

16.9.3 $m_1 \text{sc}^2u + m_1 = m_1 \text{nc}^2u = \text{dc}^2u - m$

16.9.4 $\text{cs}^2u + m_1 = \text{ds}^2u = \text{ns}^2u - m$

In using the above results remember that $m + m_1 = 1$.

If $pq u, rt u$ are any two of the twelve functions, one entry expresses tq^2u in terms of pq^2u and another expresses qt^2u in terms of rt^2u . Since $tq^2u \cdot qt^2u = 1$, we can obtain from the table the bilinear relation between pq^2u and rt^2u . Thus for the functions $cd u, sn u$ we have

16.9.5 $\text{nd}^2u = \frac{1 - m \text{cd}^2u}{m_1}, \text{dn}^2u = 1 - m \text{sn}^2u$

and therefore

16.9.6 $(1 - m \text{cd}^2u)(1 - m \text{sn}^2u) = m_1$.

16.10. Change of Parameter

Negative Parameter

If m is a positive number, let

16.10.1 $\mu = \frac{m}{1+m}, \mu_1 = \frac{1}{1+m}, v = \frac{u}{\mu_1^{\frac{1}{2}}}$ ($0 < \mu < 1$)

16.10.2 $\text{sn}(u|m) = \mu_1^{\frac{1}{2}} \text{sd}(v|\mu)$

16.10.3 $\text{cn}(u|m) = \text{cd}(v|\mu)$

16.10.4 $\text{dn}(u|m) = \text{nd}(v|\mu)$.

16.11. Reciprocal Parameter (Jacobi's Real Transformation)

16.11.1 $m > 0, \mu = m^{-1}, v = um^{1/2}$

16.11.2 $\text{sn}(u|m) = \mu^{1/2} \text{sn}(v|\mu)$

16.11.3 $\text{cn}(u|m) = \text{dn}(v|\mu)$

16.11.4 $\text{dn}(u|m) = \text{cn}(v|\mu)$

Here if $m > 1$ then $m^{-1} = \mu < 1$.

Thus elliptic functions whose parameter is real can be made to depend on elliptic functions whose parameter lies between 0 and 1.

16.12. Descending Landen Transformation (Gauss' Transformation)

To decrease the parameter, let

16.12.1 $\mu = \left(\frac{1 - m_1^{1/2}}{1 + m_1^{1/2}}\right)^2, v = \frac{u}{1 + \mu^{1/2}}$

then

16.12.2 $\text{sn}(u|m) = \frac{(1 + \mu^{1/2}) \text{sn}(v|\mu)}{1 + \mu^{1/2} \text{sn}^2(v|\mu)}$

16.12.3 $\text{cn}(u|m) = \frac{\text{cn}(v|\mu) \text{dn}(v|\mu)}{1 + \mu^{1/2} \text{sn}^2(v|\mu)}$

16.12.4 $\text{dn}(u|m) = \frac{\text{dn}^2(v|\mu) - (1 - \mu^{1/2})}{(1 + \mu^{1/2}) - \text{dn}^2(v|\mu)}$

Note that successive applications can be made conveniently to find $\text{sn}(u|m)$ in terms of $\text{sn}(v|\mu)$ and $\text{dn}(u|m)$ in terms of $\text{dn}(v|\mu)$, but that the calculation of $\text{cn}(u|m)$ requires all three functions.

16.13. Approximation in Terms of Circular Functions

When the parameter m is so small that we may neglect m^2 and higher powers, we have the approximations

16.13.1

$\text{sn}(u|m) \approx \sin u - \frac{1}{4} m(u - \sin u \cos u) \cos u$

16.13.2

$\text{cn}(u|m) \approx \cos u + \frac{1}{4} m(u - \sin u \cos u) \sin u$

16.13.3

$\text{dn}(u|m) \approx 1 - \frac{1}{2} m \sin^2 u$

16.13.4

$\text{am}(u|m) \approx u - \frac{1}{4} m(u - \sin u \cos u)$.

One way of calculating the Jacobian functions is to use Landen's descending transformation to reduce the parameter sufficiently for the above formulae to become applicable. See also 16.14.

16.14. Ascending Landen Transformation

To increase the parameter, let

16.14.1 $\mu = \frac{4m^{1/2}}{(1+m^{1/2})^2}, \mu_1 = \left(\frac{1-m^{1/2}}{1+m^{1/2}}\right)^2, v = \frac{u}{1+\mu_1^{1/2}}$

16.14.2 $\text{sn}(u|m) = (1 + \mu_1^{1/2}) \frac{\text{sn}(v|\mu) \text{cn}(v|\mu)}{\text{dn}(v|\mu)}$

16.14.3 $\text{cn}(u|m) = \frac{1 + \mu_1^{1/2}}{\mu} \frac{\text{dn}^2(v|\mu) - \mu_1^{1/2}}{\text{dn}(v|\mu)}$

16.14.4 $\text{dn}(u|m) = \frac{1 - \mu_1^{1/2}}{\mu} \frac{\text{dn}^2(v|\mu) + \mu_1^{1/2}}{\text{dn}(v|\mu)}$

Note that, when successive applications are to be made, it is simplest to calculate $\text{dn}(u|m)$ since this is expressed always in terms of the same function. The calculation of $\text{cn}(u|m)$ leads to that of $\text{dn}(v|\mu)$.

The calculation of $\text{sn}(u|m)$ necessitates the evaluation of all three functions.

16.15. Approximation in Terms of Hyperbolic Functions

When the parameter m is so close to unity that m_1^2 and higher powers of m_1 can be neglected we have the approximations

16.15.1

$$\text{sn}(u|m) \approx \tanh u + \frac{1}{4} m_1 (\sinh u \cosh u - u) \text{sech}^2 u$$

16.15.2

$$\text{cn}(u|m) \approx \text{sech } u - \frac{1}{4} m_1 (\sinh u \cosh u - u) \tanh u \text{sech } u$$

16.15.3

$$\text{dn}(u|m) \approx \text{sech } u + \frac{1}{4} m_1 (\sinh u \cosh u + u) \tanh u \text{sech } u$$

16.15.4

$$\text{am}(u|m) \approx \text{gd } u + \frac{1}{4} m_1 (\sinh u \cosh u - u) \text{sech } u.$$

Another way of calculating the Jacobian functions is to use Landen's ascending transformation to increase the parameter sufficiently for the above formulae to become applicable. See also 16.13.

16.17. Addition Theorems

16.17.1 $\text{sn}(u+v)$

$$\frac{\text{sn } u \cdot \text{cn } v \cdot \text{dn } v + \text{sn } v \cdot \text{cn } u \cdot \text{dn } u}{1 - m \text{ sn}^2 u \cdot \text{sn}^2 v}$$

16.17.2 $\text{cn}(u+v)$

$$\frac{\text{cn } u \cdot \text{cn } v - \text{sn } u \cdot \text{dn } u \cdot \text{sn } v \cdot \text{dn } v}{1 - m \text{ sn}^2 u \cdot \text{sn}^2 v}$$

16.17.3 $\text{dn}(u+v) = \frac{\text{dn } u \cdot \text{dn } v - m \text{ sn } u \cdot \text{cn } v \cdot \text{sn } v \cdot \text{cn } v}{1 - m \text{ sn}^2 u \cdot \text{sn}^2 v}$

Addition theorems are derivable one from another and are expressible in a great variety of forms. Thus $\text{ns}(u+v)$ comes from $1/\text{sn}(u+v)$ in the form $(1 - m \text{ sn}^2 u \text{ sn}^2 v) / (\text{sn } u \text{ cn } v \text{ dn } v + \text{sn } v \text{ cn } u \text{ dn } u)$ from 16.17.1.

Alternatively $\text{ns}(u+v) = m^{1/2} \text{sn} \{ (iK' - u) - v \}$ which again from 16.17.1 yields the form $(\text{ns } u \text{ cs } v \text{ ds } v - \text{ns } v \text{ cs } u \text{ ds } u) / (\text{ns}^2 u - \text{ns}^2 v)$.

The function $\text{pq}(u+v)$ is a rational function of the four functions $\text{pq } u, \text{pq } v, \text{pq}' u, \text{pq}' v$.

16.18.2 $\text{cn } 2u$

$$\frac{\text{cn}^2 u - \text{sn}^2 u \cdot \text{dn}^2 u}{1 - m \text{ sn}^4 u} = \frac{\text{cn}^2 u - \text{sn}^2 u \cdot \text{dn}^2 u}{\text{cn}^2 u + \text{sn}^2 u \cdot \text{dn}^2 u}$$

16.18.3 $\text{dn } 2u$

$$\frac{\text{dn}^2 u - m \text{ sn}^2 u \cdot \text{cn}^2 u}{1 - m \text{ sn}^4 u} = \frac{\text{dn}^2 u + \text{cn}^2 u (\text{dn}^2 u - 1)}{\text{dn}^2 u - \text{cn}^2 u (\text{dn}^2 u - 1)}$$

16.18.4

$$\frac{1 - \text{cn } 2u}{1 + \text{cn } 2u} = \frac{\text{sn}^2 u \cdot \text{dn}^2 u}{\text{cn}^2 u}$$

16.18.5

$$\frac{1 - \text{dn } 2u}{1 + \text{dn } 2u} = \frac{m \text{ sn}^2 u \cdot \text{cn}^2 u}{\text{dn}^2 u}$$

16.24. Integrals of the Twelve Jacobian Elliptic Functions

16.24.1 $\int \text{sn } u \, du = m^{-1/2} \ln(\text{dn } u - m^{1/2} \text{cn } u)$

16.24.2 $\int \text{cn } u \, du = m^{-1/2} \arccos(\text{dn } u)$

16.24.3 $\int \text{dn } u \, du = \arcsin(\text{sn } u)$

16.24.4 $\int \text{cd } u \, du = m^{-1/2} \ln(\text{nd } u + m^{1/2} \text{sd } u)$

16.24.5 $\int \text{sd } u \, du = (mm_1)^{-1/2} \arcsin(-m^{1/2} \text{cd } u)$

16.24.6 $\int \text{nd } u \, du = m_1^{-1/2} \arccos(\text{cd } u)$

16.24.12 $\int \text{cs } u \, du = \ln(\text{ns } u - \text{ds } u)$

In numerical use of the above table certain restrictions must be put on u in order to keep the arguments of the logarithms positive and to avoid

trouble with many-valued inverse circular functions.

16.25. Notation for the Integrals of the Squares of the Twelve Jacobian Elliptic Functions

16.25.1 $Pq u = \int_0^u pq^2 t dt$ when $q \neq s$

16.25.2 $Ps u = \int_0^u \left(pq^2 t - \frac{1}{t^2} \right) dt - \frac{1}{u}$

Examples

$Cd u = \int_0^u cd^2 t dt$, $Ns u = \int_0^u \left(ns^2 t - \frac{1}{t^2} \right) dt - \frac{1}{u}$

16.26. Integrals in Terms of the Elliptic Integral of the Second Kind (see 17.4)

16.26.2 $mCn u = E(u) - m_1 u$ Pole n

16.26.3 $Dn u = E(u)$

16.26.11 $Ds u = -E(u) + m_1 u - cn u ds u$ Pole s

16.26.12 $Cs u = -E(u) - cn u ds u$

All the above may be expressed in terms of Jacobi's zeta function (see 17.4.27).

$$Z(u) = E(u) - \frac{E}{K} u, \text{ where } E = E(K)$$

16.27. Theta Functions; Expansions in Terms of the Nome q

16.27.1 $\vartheta_1(z, q) = \vartheta_1(z) = 2q^{1/4} \sum_{n=0}^{\infty} (-1)^n q^{n(n+1)} \sin(2n+1)z$

16.27.2 $\vartheta_2(z, q) = \vartheta_2(z) = 2q^{1/4} \sum_{n=0}^{\infty} q^{n(n+1)} \cos(2n+1)z$

16.27.3 $\vartheta_3(z, q) = \vartheta_3(z) = 1 + 2 \sum_{n=1}^{\infty} q^{n^2} \cos 2nz$

16.27.4 $\vartheta_4(z, q) = \vartheta_4(z) = 1 + 2 \sum_{n=1}^{\infty} (-1)^n q^{n^2} \cos 2nz$

Theta functions are important because every one of the Jacobian elliptic functions can be expressed as the ratio of two theta functions. See 16.36.

The notation shows these functions as depending on the variable z and the nome q , $|q| < 1$. In this case, here and elsewhere, the convergence is not dependent on the trigonometrical terms. In their relation to the Jacobian elliptic functions, we note that the nome q is given by

$$q = e^{-\pi K'/K},$$

where K and iK' are the quarter periods. Since $q = q(m)$ is determined when the parameter m is given, we can also regard the theta functions as dependent upon m and then we write

$$\vartheta_a(z, q) = \vartheta_a(z|m), a = 1, 2, 3, 4$$

but when no ambiguity is to be feared, we write $\vartheta_a(z)$ simply.

The above notations are those given in Modern Analysis [16.6].

There is a bewildering variety of notations, for example the function $\vartheta_4(z)$ above is sometimes denoted by $\vartheta_0(z)$ or $\vartheta(z)$; see the table given in Modern Analysis [16.6]. Further the argument $u = 2Kz/\pi$ is frequently used so that in consulting books caution should be exercised.

16.28. Relations Between the Squares of the Theta Functions

16.28.1 $\vartheta_1^2(z)\vartheta_2^2(0) = \vartheta_3^2(z)\vartheta_4^2(0) - \vartheta_2^2(z)\vartheta_3^2(0)$

16.28.2 $\vartheta_2^2(z)\vartheta_4^2(0) = \vartheta_4^2(z)\vartheta_2^2(0) - \vartheta_1^2(z)\vartheta_3^2(0)$

16.28.3 $\vartheta_3^2(z)\vartheta_4^2(0) = \vartheta_4^2(z)\vartheta_3^2(0) - \vartheta_1^2(z)\vartheta_2^2(0)$

16.28.4 $\vartheta_4^2(z)\vartheta_1^2(0) = \vartheta_3^2(z)\vartheta_2^2(0) - \vartheta_2^2(z)\vartheta_3^2(0)$

16.28.5 $\vartheta_2^2(0) + \vartheta_4^2(0) = \vartheta_3^2(0)$

Note also the important relation

16.28.6 $\vartheta_1'(0) = \vartheta_2(0)\vartheta_3(0)\vartheta_4(0)$ or $\vartheta_1' = \vartheta_2\vartheta_3\vartheta_4$

16.30.2

$$\ln \frac{\vartheta_2(\alpha+\beta)}{\vartheta_2(\alpha-\beta)} = \ln \frac{\cos(\alpha+\beta)}{\cos(\alpha-\beta)} + 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \frac{q^{2n}}{1-q^{2n}} \sin 2n\alpha \sin 2n\beta$$

16.30.3

$$\ln \frac{\vartheta_3(\alpha+\beta)}{\vartheta_3(\alpha-\beta)} = 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \frac{q^n}{1-q^{2n}} \sin 2n\alpha \sin 2n\beta$$

The corresponding expressions when $\beta = i\gamma$ are easily deduced by use of the formulae 4.3.55 and 4.3.56.

These functions are defined in terms of Jacobi's theta functions of 16.31 by

16.36.1
$$\vartheta_s(u) = \frac{H(u)}{H'(0)}, \vartheta_c(u) = \frac{H(u+K)}{H(K)}$$

16.36.2
$$\vartheta_d(u) = \frac{\Theta(u+K)}{\Theta(K)}, \vartheta_n(u) = \frac{\Theta(u)}{\Theta(0)}$$

If λ, μ are any integers positive, negative, or zero the points $u_0 + 2\lambda K + 2\mu iK'$ are said to be congruent to u_0 .

$\vartheta_s(u)$ has zeros at the points congruent to 0
 $\vartheta_c(u)$ has zeros at the points congruent to K
 $\vartheta_n(u)$ has zeros at the points congruent to iK'
 $\vartheta_d(u)$ has zeros at the points congruent to $K + iK'$

Thus the suffix secures that the function $\vartheta_p(u)$ has zeros at the points marked p in the introductory diagram in 16.1.2, and the constant by which Jacobi's function is divided secures that the leading coefficient of $\vartheta_p(u)$ at the origin is unity. Therefore the functions have the fundamentally important property that if p, q are any two of the letters s, c, n, d, the Jacobian elliptic function pq u is given by

16.36.3
$$pq u = \frac{\vartheta_p(u)}{\vartheta_q(u)}$$

These functions also have the property

16.36.4
$$m_1^{-1/4} \vartheta_c(K-u) = \vartheta_s(u)$$

16.36.5
$$m_1^{-1/4} \vartheta_d(K-u) = \vartheta_n(u),$$

for complementary arguments u and $K-u$.

In terms of the theta functions defined in 16.27, let $v = \pi u / (2K)$, then

16.36.6
$$\vartheta_s(u) = \frac{2K \vartheta_1(v)}{\vartheta_1'(0)}, \vartheta_c(u) = \frac{\vartheta_2(v)}{\vartheta_2(0)}$$

16.36.7
$$\vartheta_d(u) = \frac{\vartheta_3(v)}{\vartheta_3(0)}, \vartheta_n(u) = \frac{\vartheta_4(v)}{\vartheta_4(0)}$$

16.37. Expression as Infinite Products

$$q = q(m), v = \pi u / (2K)$$

16.37.1

$$\vartheta_3(u) = \left(\frac{16q}{mm_1}\right)^{1/6} \sin v \prod_{n=1}^{\infty} (1 - 2q^{2n} \cos 2v + q^{4n})$$

16.37.2

$$\vartheta_2(u) = \left(\frac{16qm_1^{1/2}}{m}\right)^{1/6} \cos v \prod_{n=1}^{\infty} (1 + 2q^{2n} \cos 2v + q^{4n})$$

16.37.3

$$\vartheta_4(u) = \left(\frac{mm_1}{16q}\right)^{1/12} \prod_{n=1}^{\infty} (1 + 2q^{2n-1} \cos 2v + q^{4n-2})$$

16.37.4

$$\vartheta_n(u) = \left(\frac{m}{16qm_1^2}\right)^{1/12} \prod_{n=1}^{\infty} (1 - 2q^{2n-1} \cos 2v + q^{4n-2})$$

16.38. Expression as Infinite Series

Let $v = \pi u / (2K)$

16.38.1

$$\vartheta_3(u) = \left[\frac{2\pi q^{1/2}}{m^{1/2} m_1^{1/2} K}\right]^{1/2} \sum_{n=0}^{\infty} (-1)^n q^{n(n+1)} \sin (2n+1)v$$

16.38.2

$$\vartheta_2(u) = \left[\frac{2\pi q^{1/2}}{m^{1/2} K}\right]^{1/2} \sum_{n=0}^{\infty} q^{n(n+1)} \cos (2n+1)v$$

16.38.3

$$\vartheta_4(u) = \left[\frac{\pi}{2K}\right]^{1/2} \left\{1 + 2 \sum_{n=1}^{\infty} q^{n^2} \cos 2nv\right\}$$

16.38.4

$$\vartheta_n(u) = \left[\frac{\pi}{2m_1^{1/2} K}\right]^{1/2} \left\{1 + 2 \sum_{n=1}^{\infty} (-1)^n q^{n^2} \cos 2nv\right\}$$

16.38.5

$$(2K/\pi)^{1/2} = 1 + 2q + 2q^4 + 2q^9 + \dots = \vartheta_3(0, q)$$

16.38.6

$$(2K'/\pi)^{1/2} = 1 + 2q_1 + 2q_1^4 + 2q_1^9 + \dots = \vartheta_3(0, q_1)$$

16.38.7

$$(2m^{1/2} K/\pi)^{1/2} = 2q^{1/4} (1 + q^2 + q^6 + q^{12} + q^{20} + \dots)$$

$$= \vartheta_2(0, q)$$

16.38.8

$$(2m_1^{1/2} K/\pi)^{1/2} = 1 - 2q + 2q^4 - 2q^9 + \dots = \vartheta_4(0, q)$$

Numerical Methods

16.39. Use and Extension of the Tables

Example 1. Calculate $nc(1.99650|.64)$ to 4S. From **Table 17.1**, $1.99650 = K + .001$. From the table of principal terms

$$nc u = -m_1^{-1/2} / (u - K) + \dots$$

$$nc(K + .001|.64) = \frac{-(.36)^{-1/2}}{.001} + \dots$$

$$= -\frac{10000}{6} + \dots$$

$$= -1667 + \dots$$

and since the next term is of order .001 this value -1667 is correct to at least 4S.

Example 2. Use the descending Landen transformation to calculate $dn(.20|.19)$ to 6D.

Here $m = .19$, $m_1^{1/2} = .9$ and so from **16.12.1**

$$\mu = \left(\frac{1}{19}\right)^2, 1 + \mu^{1/2} = \frac{20}{19}, v = .19.$$

Also

$$\mu^2 = \left(\frac{1}{19}\right)^4 = 10^{-6} \times 7.67$$

which is negligible.

From **16.12.4**

$$dn(.20|.19) = \frac{dn^2 \left[.19 \left|\left(\frac{1}{19}\right)^2\right] - \left(1 - \frac{1}{19}\right)}{\left(1 + \frac{1}{19}\right) - dn^2 \left[.19 \left|\left(\frac{1}{19}\right)^2\right]}\right.}$$

Now from **16.13.3**

$$dn \left[.19 \left|\left(\frac{1}{19}\right)^2\right] = .999951$$

whence $dn(.20|.19) = .996253$.

Example 3. Use the ascending Landen transformation to calculate $dn(.20|.81)$ to 5D.

From **16.14.1**

$$\mu = \frac{4(.9)}{(1.9)^2} = \frac{360}{361}, \mu_1 = \left(\frac{1}{19}\right)^2$$

$$1 + \mu_1^{1/2} = \frac{20}{19}, v = \frac{19}{20} \times .20 = .19,$$

μ_1^2 is negligible to 4D. Thus

$$\operatorname{dn}(.20|.81) = \frac{19}{20} \times \frac{\operatorname{dn}^2\left(.19 \left| \frac{360}{361} \right.\right) + \frac{1}{19}}{\operatorname{dn}\left(.19 \left| \frac{360}{361} \right.\right)}$$

From 16.15.3

$$\begin{aligned} \operatorname{dn}\left(.19 \left| \frac{360}{361} \right.\right) &= \operatorname{sech}(.19) + \frac{1}{4} \times \frac{1}{361} \tanh .19 \operatorname{sech} .19 \\ &\quad [\sinh .19 \cosh .19 + .19] \\ &= .982218 + \frac{1}{4} \times \frac{1}{361} (.187746)(.982218) \\ &\quad [(.191145)(1.01810) + .19] \\ &= .982218 + \frac{1}{4} \times \frac{1}{361} (.184408)[.384605] \\ &= .982218 + .000049 = .982267. \end{aligned}$$

Thus $\operatorname{dn}(.20|.81) = .98406$.

Example 4. Use the ascending Landen transformation to calculate $\operatorname{cn}(.20|.81)$ to 6D.

Using 16.14.4, we calculate $\operatorname{dn}(.20|.81)$ and deduce $\operatorname{cn}(.20|.81)$ from 16.14.3 settling the sign from Figure 16.1.

As in the preceding example, we reduce the calculation of $\operatorname{dn}(.20|.81)$ to that of $\operatorname{dn}\left(.19 \left| \frac{360}{361} \right.\right)$, when

$$\operatorname{dn}\left(.19 \left| \frac{360}{361} \right.\right) = .982267$$

$$\operatorname{dn}(.20|.81) = .984056$$

$$\operatorname{cn}(.20|.81) = .980278.$$

Example 5. Use the A.G.M. scale to compute $\operatorname{dc}(.672|.36)$ to 4D.

From 16.9.6 we have $\operatorname{dc}^2(.672|.36) = .36 + \frac{.64}{1 - \operatorname{sn}^2(.672|.36)}$. We now calculate $\operatorname{sn}(.672|.36)$ by the method given in 16.4. Form the A.G.M. scale

n	a_n	b_n	c_n	$\frac{c_n}{a_n}$	φ_n	$\sin \varphi_n$	$\sin(2\varphi_{n-1} - \varphi_n)$	$2\varphi_{n-1} - \varphi_n$
0	1	.8	.6	.6	.65546	.60952		
1	.9	.89443	.1	.11111	1.2069	.93452	.10383	.10402
2	.89721	.89721	.00279	.00311	2.4117	.66679	.00207	.00207
3	.89721	.89721	0	0	4.8234	-.99384	0	0

$$\varphi_n = 2^n a_n u \quad \varphi_3 = 2^3 (.89721)(.672) = 4.8234$$

continuing until $c_n = 0$ to 5D.

Then complete as indicated in 16.4 to find φ_0 and so $\operatorname{sn} u$ and hence $\operatorname{dc} u$,

$$\varphi_0 = .65546 \quad \operatorname{sn} u = .60952 \quad \operatorname{dc} u = 1.1740.$$

Example 6. Use the A.G.M. scale to compute $\Theta(.6|.36)$ to 5D.

We use the method explained in 16.32 with $a_0 = 1$, $b_0 = .8$, $c_0 = .6$.

Computing the A.G.M. as explained in 17.6, we find

(For values of a_n , b_n , c_n , see Example 5.)

n	φ_n	$\sin \varphi_n$	$\sin(2\varphi_{n-1} - \varphi_n)$	$2\varphi_{n-1} - \varphi_n$	$\sec(2\varphi_{n-1} - \varphi_n)$	$\frac{1}{2^{n+1}} \ln \sec(2\varphi_{n-1} - \varphi_n)$
0	.58803	.55472				
1	1.0780	.88101	.09789	.09805	1.0048	.00120
2	2.1533	.83509	.00260	.00260	1.	0
3	4.3066	-.91879	0	0	1.	0

and then complete the calculation outlined in 16.32 to give

$$\begin{aligned} \ln \Theta(u|m) &= -.05734 + .02935 + .00120 \\ &= -.02679 \\ \Theta(u|m) &= .97357. \end{aligned}$$

The series expansion for Θ is preferable.

Example 7. Use the q -series to compute $\text{cs}(.53601\ 62|.09)$.

Here we use the series **16.23.12**, $K=1.60804\ 862$, $q=.00589\ 414$, $v=\frac{\pi u}{2K}=\frac{\pi}{6}$ radians or 30° .

Since q^4 is negligible to 8D, we have to 7D $\text{cs}(.53601\ 62|.09)$

$$\begin{aligned} &= \frac{\pi}{2K} \cot 30^\circ - \frac{2\pi}{K} \left\{ \frac{q^2}{1+q^2} \sin 60^\circ \right\} \\ &= (.97683\ 3852)(1.73205\ 081) \\ &\quad - 3.90733\ 541[(.00003\ 4740)(.86602\ 5404)] \\ &= 1.69180\ 83. \end{aligned}$$

Example 8. Use theta functions to compute $\text{sn}(.61802|.5)$ to 5D.

Here $K(\frac{1}{2})=1.85407$

$$\epsilon^\circ = \frac{.61802}{1.85407} \times 90^\circ = 30^\circ$$

$$\sin^2 \alpha = 1/2, \alpha = 45^\circ.$$

Thus

$$\begin{aligned} \text{sn}(.61802|.5) &= \frac{\vartheta_s(30^\circ \setminus 45^\circ)}{\vartheta_n(30^\circ \setminus 45^\circ)} \\ &= \frac{.59128}{1.04729} = .56458 \end{aligned}$$

from **Table 16.1**.

Example 9. Use theta functions to compute $\text{sc}(.61802|.5)$ to 5D.

As in the preceding example

$$\epsilon^\circ = 30^\circ, \alpha^\circ = 45^\circ$$

so that

$$\text{sc}(.61802|.5) = \frac{\vartheta_s(30^\circ \setminus 45^\circ)}{\vartheta_c(30^\circ \setminus 45^\circ)}$$

We use **Table 16.1** to give

$$\vartheta_s(30^\circ \setminus 45^\circ) = .59128$$

$$(\sec 45^\circ)^4 \vartheta_c(30^\circ \setminus 45^\circ) = 1.02796.$$

Therefore

$$\begin{aligned} \text{sc}(.61802|.5) &= \frac{.59128}{1.02796} (\sec 45^\circ)^4 \\ &= .68402. \end{aligned}$$

Example 10. Find $\text{sn}(.75342|.7)$ by inverse interpolation in **Table 17.5**.

This method is explained in chapter 17, **Example 7**.

Example 11. Find u , given that $\text{cs}(u|.5) = .75$. From **16.9.4** we have

$$\text{sn}^2 u = \frac{1}{1 + \text{cs}^2 u}.$$

Thus

$$\text{sn}^2(u|.5) = .64$$

and

$$\text{sn}(u|.5) = .8.$$

We have therefore replaced the problem by that of finding u given $\text{sn}(u|m)$, where m is known.

If $\varphi = \text{am } u$

$$\sin \varphi = \text{sn } u \text{ and so}$$

$$\varphi = .9272952 \text{ radians or } 53.13010^\circ.$$

From **Table 17.5**,

$$u = F(53.13010^\circ \setminus 45^\circ) = .99391.$$

Alternatively, starting with the above value of φ we can use the A.G.M. scale to calculate $F(\varphi \setminus \alpha)$ as explained in **17.6**. This method is to be preferred if more figures are required, or if α differs from a tabular value in **Table 17.5**.

$$\sqrt{\sec \alpha} \vartheta_c(\epsilon_1 \setminus \alpha)$$

$$\epsilon^\circ = \frac{n}{\lambda} 90^\circ$$

$$\epsilon_1^\circ = 90^\circ - \epsilon^\circ$$

$$\alpha = \arcsin \sqrt{m}$$

$$\vartheta_s(n | m) = \vartheta_s(\epsilon^\circ \setminus \alpha^\circ)$$

In calculating elliptic functions from theta functions, when the modular angle exceeds about 60° , use the descending Landen transformation 16.12 to induce dependence on a smaller modular angle.

17. Elliptic Integrals

Mathematical Properties

17.1. Definition of Elliptic Integrals

If $R(x, y)$ is a rational function of x and y , where y^2 is equal to a cubic or quartic polynomial in x , the integral

$$17.1.1 \quad \int R(x, y) dx$$

is called an *elliptic integral*.

The elliptic integral just defined can not, in general, be expressed in terms of elementary functions.

Exceptions to this are

- (i) when $R(x, y)$ contains no odd powers of y .
- (ii) when the polynomial y^2 has a repeated factor.

We therefore exclude these cases.

By substituting for y^2 and denoting by $p_s(x)$ a polynomial in x we get ²

$$R(x, y) = \frac{p_1(x) + yp_2(x)}{p_3(x) + yp_4(x)} \\ = \frac{[p_1(x) + yp_2(x)][p_3(x) - yp_4(x)]y}{\{[p_3(x)]^2 - y^2[p_4(x)]^2\}y} \\ = \frac{p_5(x) + yp_6(x)}{yp_7(x)} = R_1(x) + \frac{R_2(x)}{y}$$

where $R_1(x)$ and $R_2(x)$ are rational functions of x . Hence, by expressing $R_2(x)$ as the sum of a polynomial and partial fractions

$$\int R(x, y) dx = \int R_1(x) dx + \sum_s A_s \int x^s y^{-1} dx \\ + \sum_s B_s \int [(x-c)^s y]^{-1} dx$$

Reduction Formulae

Let

17.1.2

$$y^2 = a_0x^4 + a_1x^3 + a_2x^2 + a_3x + a_4 \quad (|a_0| + |a_1| \neq 0) \\ = b_0(x-c)^4 + b_1(x-c)^3 + b_2(x-c)^2 + b_3(x-c) + b_4 \\ (|b_0| + |b_1| \neq 0)$$

$$17.1.3 \quad I_s = \int x^s y^{-1} dx, \quad J_s = \int [y(x-c)^s]^{-1} dx$$

By integrating the derivatives of yx^s and $y(x-c)^{-s}$ we get the reduction formulae

17.1.4

$$(s+2)a_0I_{s+3} + \frac{1}{2}a_1(2s+3)I_{s+2} + a_2(s+1)I_{s+1} \\ + \frac{1}{2}a_3(2s+1)I_s + sa_4I_{s-1} = x^s y \quad (s=0, 1, 2, \dots)$$

² See [17.7] 22.72.

17.1.5

$$(2-s)b_0J_{s-3} + \frac{1}{2}b_1(3-2s)J_{s-2} + b_2(1-s)J_{s-1} \\ + \frac{1}{2}b_3(1-2s)J_s - sb_4J_{s+1} = y(x-c)^{-s} \\ (s=1, 2, 3, \dots)$$

By means of these reduction formulae and certain transformations (see **Examples 1** and **2**) every elliptic integral can be brought to depend on the integral of a rational function and on three canonical forms for elliptic integrals.

17.2.13
$$= \frac{\pi}{2K(m)} \frac{\vartheta_4'(\pi u/2K)}{\vartheta_4(\pi u/2K)} + \frac{E(m)u}{K(m)}$$

(For theta functions, see chapter 16.)

Elliptic Integral of the Third Kind

17.2.14

$\Pi(n; \varphi \setminus \alpha) = \int_0^\varphi (1 - n \sin^2 \theta)^{-1} [1 - \sin^2 \alpha \sin^2 \theta]^{-1/2} d\theta$

If $x = \operatorname{sn}(u|m)$,

17.2.15

$\Pi(n; u|m) = \int_0^x (1 - nt^2)^{-1} [(1 - t^2)(1 - mt^2)]^{-1/2} dt$

17.2.16
$$= \int_0^u (1 - n \operatorname{sn}^2(w|m))^{-1} dw$$

The Amplitude φ

17.2.17 $\varphi = \operatorname{am} u = \arcsin(\operatorname{sn} u) = \arcsin x$

can be calculated from **Tables 17.5** and **4.14**.

The Parameter m

Dependence on the *parameter* m is denoted by a vertical stroke preceding the parameter, e.g., $F(\varphi|m)$.

Together with the parameter we define the *complementary parameter* m_1 by

17.2.18
$$m + m_1 = 1$$

When the parameter is real, it can always be arranged, see **17.4**, that $0 \leq m \leq 1$.

The Modular Angle α

Dependence on the modular angle α , defined in terms of the parameter by **17.2.1**, is denoted by a backward stroke \setminus preceding the modular angle, thus $E(\varphi \setminus \alpha)$. The *complementary modular angle* is $\pi/2 - \alpha$ or $90^\circ - \alpha$ according to the unit and thus $m_1 = \sin^2(90^\circ - \alpha) = \cos^2 \alpha$.

The Modulus k

In terms of Jacobian elliptic functions (chapter 16), the modulus k and the complementary modulus are defined by

17.2.19 $k = \operatorname{ns}(K + iK'), k' = \operatorname{dn} K$.

They are related to the parameter by $k^2 = m$, $k'^2 = m_1$.

Dependence on the modulus is denoted by a comma preceding it, thus $\Pi(n; u, k)$.

In computation the modulus is of minimal importance, since it is the parameter and its complement which arise naturally. The parameter and the modular angle will be employed in this chapter to the exclusion of the modulus.

The Characteristic n

The elliptic integral of the third kind depends on three variables namely (i) the parameter, (ii) the amplitude, (iii) the characteristic n . When real, the characteristic may be any number in the interval $(-\infty, \infty)$. The properties of the integral depend upon the location of the characteristic in this interval, see **17.7**.

17.3. Complete Elliptic Integrals of the First and Second Kinds

Referred to the canonical forms of **17.2**, the elliptic integrals are said to be *complete* when the amplitude is $\frac{1}{2}\pi$ and so $x=1$. These complete integrals are designated as follows

17.3.1

$$[K(m)] = K = \int_0^1 [(1-t^2)(1-mt^2)]^{-1/2} dt$$

$$= \int_0^{\pi/2} (1 - m \sin^2 \theta)^{-1/2} d\theta$$

17.3.2
$$K = F(\frac{1}{2}\pi|m) = F(\frac{1}{2}\pi \setminus \alpha)$$

17.3.3

$$E[K(m)] = E = \int_0^1 (1-t^2)^{-1/2} (1-mt^2)^{1/2} dt$$

$$= \int_0^{\pi/2} (1 - m \sin^2 \theta)^{1/2} d\theta$$

17.3.4
$$E = E[K(m)] = E(m) = E(\frac{1}{2}\pi \setminus \alpha)$$

We also define

17.3.5

$$K' = K(m_1) = K(1-m) = \int_0^{\pi/2} (1 - m_1 \sin^2 \theta)^{-1/2} d\theta$$

17.3.6
$$K' = F(\frac{1}{2}\pi|m_1) = F(\frac{1}{2}\pi \setminus \frac{1}{2}\pi - \alpha)$$

17.3.7

$$E' = E(m_1) = E(1-m) = \int_0^{\pi/2} (1 - m_1 \sin^2 \theta)^{1/2} d\theta$$

17.3.8
$$E' = E[K(m_1)] = E(m_1) = E(\frac{1}{2}\pi \setminus \frac{1}{2}\pi - \alpha)$$

K and iK' are the "real" and "imaginary" *quarter-periods* of the corresponding Jacobian elliptic functions (see chapter 16).

Numerical Evaluation of Incomplete Integrals of the First and Second Kinds

For the numerical evaluation of an elliptic integral the quartic (or cubic⁴) under the radical should first be expressed in terms of t^2 , see **Examples 1 and 2**. In the resulting quartic there are only six possible sign patterns or combinations of the factors namely

$$\begin{aligned} &(t^2 + a^2)(t^2 + b^2), \quad (a^2 - t^2)(t^2 - b^2), \\ &(a^2 - t^2)(b^2 - t^2), \quad (t^2 - a^2)(t^2 - b^2), \quad (t^2 + a^2)(t^2 - b^2), \\ &\quad (t^2 + a^2)(b^2 - t^2). \end{aligned}$$

The list which follows is then exhaustive for integrals which reduce to $F(\varphi \setminus \alpha)$ or $E(\varphi \setminus \alpha)$.

The value of the elliptic integral of the first kind is also expressed as an *inverse* Jacobian elliptic function. Here, for example, the notation $u = \operatorname{sn}^{-1} x$ means that $x = \operatorname{sn} u$.

The column headed "t substitution" gives the Jacobian elliptic function substitution which is appropriate to reduce every elliptic integral which contains the given quartic.

17.5. Landen's Transformation

Descending Landen Transformation ⁵

Let α_n, α_{n+1} be two modular angles such that

17.5.1 $(1 + \sin \alpha_{n+1})(1 + \cos \alpha_n) = 2 \quad (\alpha_{n+1} < \alpha_n)$

and let φ_n, φ_{n+1} be two corresponding amplitudes such that

17.5.2 $\tan(\varphi_{n+1} - \varphi_n) = \cos \alpha_n \tan \varphi_n \quad (\varphi_{n+1} > \varphi_n)$

⁵ The emphasis here is on the modular angle since this is an argument of the Tables. All formulae concerning Landen's transformation may also be expressed in terms of the modulus $k = m^2 = \sin^2 \alpha$ and its complement $k' = m_1^2 = \cos^2 \alpha$.

Thus the step from n to $n+1$ decreases the modular angle but increases the amplitude. By iterating the process we can descend from a given modular angle to one whose magnitude is negligible, when 17.4.19 becomes applicable.

With $\alpha_0 = \alpha$ we have

17.5.3

$$F(\varphi \setminus \alpha) = (1 + \cos \alpha)^{-1} F(\varphi_1 \setminus \alpha_1) \\ = \frac{1}{2} (1 + \sin \alpha_1) F(\varphi_1 \setminus \alpha_1)$$

17.5.4 $F(\varphi \setminus \alpha) = 2^{-n} \prod_{s=1}^n (1 + \sin \alpha_s) F(\varphi_n \setminus \alpha_n)$

17.5.5 $F(\varphi \setminus \alpha) = \Phi \prod_{s=1}^{\infty} (1 + \sin \alpha_s)$

17.5.6 $\Phi = \lim_{n \rightarrow \infty} \frac{1}{2^n} F(\varphi_n \setminus \alpha_n) = \lim_{n \rightarrow \infty} \frac{\varphi_n}{2^n}$

17.5.7 $K = F(\frac{1}{2}\pi \setminus \alpha) = \frac{1}{2}\pi \prod_{s=1}^{\infty} (1 + \sin \alpha_s)$

17.5.8 $F(\varphi \setminus \alpha) = 2\pi^{-1} K \Phi$

17.5.9

$$E(\varphi \setminus \alpha) = F(\varphi \setminus \alpha) \left[1 - \frac{1}{2} \sin^2 \alpha \left(1 + \frac{1}{2} \sin \alpha_1 \right. \right. \\ \left. \left. + \frac{1}{2^2} \sin \alpha_1 \sin \alpha_2 + \dots \right) \right] + \sin \alpha \left[\frac{1}{2} (\sin \alpha_1)^{1/2} \sin \varphi_1 \right. \\ \left. + \frac{1}{2^2} (\sin \alpha_1 \sin \alpha_2)^{1/2} \sin \varphi_2 + \dots \right]$$

17.5.10

$$E = K \left[1 - \frac{1}{2} \sin^2 \alpha \left(1 + \frac{1}{2} \sin \alpha_1 + \frac{1}{2^2} \sin \alpha_1 \sin \alpha_2 \right. \right. \\ \left. \left. + \frac{1}{2^3} \sin \alpha_1 \sin \alpha_2 \sin \alpha_3 + \dots \right) \right]$$

Ascending Landen Transformation

Let α_n, α_{n+1} be two modular angles such that

17.5.11 $(1 + \sin \alpha_n)(1 + \cos \alpha_{n+1}) = 2 \quad (\alpha_{n+1} > \alpha_n)$

and let φ_n, φ_{n+1} be two corresponding amplitudes such that

17.5.12 $\sin(2\varphi_{n+1} - \varphi_n) = \sin \alpha_n \sin \varphi_n \quad (\varphi_{n+1} < \varphi_n)$

Thus the step from n to $n+1$ increases the modular angle but decreases the amplitude. By iterating the process we can ascend from a given modular angle to one whose difference from a right angle is so small that 17.4.21 becomes applicable.

With $\alpha_0 = \alpha$ we have

17.5.13 $F(\varphi \setminus \alpha) = 2(1 + \sin \alpha)^{-1} F(\varphi_1 \setminus \alpha_1)$

17.5.14 $F(\varphi \setminus \alpha) = 2^n \prod_{s=0}^{n-1} (1 + \sin \alpha_s)^{-1} F(\varphi_n \setminus \alpha_n)$

17.5.15 $F(\varphi \setminus \alpha) = \prod_{s=1}^n (1 + \cos \alpha_s) F(\varphi_n \setminus \alpha_n)$

17.5.16 $F(\varphi \setminus \alpha) = [\csc \alpha \prod_{s=1}^{\infty} \sin \alpha_s]^{\frac{1}{2}} \ln \tan \left(\frac{1}{4}\pi + \frac{1}{2}\Phi \right)$

17.5.17 $\Phi = \lim_{n \rightarrow \infty} \varphi_n$

Neighborhood of a Right Angle (see also 17.4.13)

When both φ and α are near to a right angle, interpolation in the table $F(\varphi \setminus \alpha)$ is difficult. Either Landen's transformation can then be used with advantage to increase the modular angle and decrease the amplitude or vice-versa.

17.6. The Process of the Arithmetic-Geometric Mean

Starting with a given number triple (a_0, b_0, c_0) we proceed to determine number triples $(a_1, b_1, c_1), (a_2, b_2, c_2), \dots, (a_N, b_N, c_N)$ according to the following scheme of arithmetic and geometric means

17.6.1

a_0	b_0	
$a_1 = \frac{1}{2}(a_0 + b_0)$	$b_1 = (a_0 b_0)^{\frac{1}{2}}$	
$a_2 = \frac{1}{2}(a_1 + b_1)$	$b_2 = (a_1 b_1)^{\frac{1}{2}}$	
⋮	⋮	
⋮	⋮	
$a_N = \frac{1}{2}(a_{N-1} + b_{N-1})$	$b_N = (a_{N-1} b_{N-1})^{\frac{1}{2}}$	
		c_0
		$c_1 = \frac{1}{2}(a_0 - b_0)$
		$c_2 = \frac{1}{2}(a_1 - b_1)$
		⋮
		⋮
		$c_N = \frac{1}{2}(a_{N-1} - b_{N-1})$

We stop at the N th step when $a_N = b_N$, i.e., when $c_N = 0$ to the degree of accuracy to which the numbers are required.

To determine the complete elliptic integrals $K(\alpha), E(\alpha)$ we start with

17.6.2 $a_0 = 1, b_0 = \cos \alpha, c_0 = \sin \alpha$

whence

17.6.3 $K(\alpha) = \frac{\pi}{2a_N}$

17.6.4 $\frac{K(\tilde{\alpha}) - E(\alpha)}{K(\alpha)} = \frac{1}{2} [c_0^2 + 2c_1^2 + 2^2c_2^2 + \dots + 2^N c_N^2]$

To determine $K'(\alpha)$, $E'(\alpha)$ we start with

17.6.5 $a'_0 = 1, b'_0 = \sin \alpha, c'_0 = \cos \alpha$

whence

17.6.6 $K'(\alpha) = \frac{\pi}{2a'_N}$

17.6.7

$$\frac{K'(\alpha) - E'(\alpha)}{K'(\alpha)} = \frac{1}{2} [c_0'^2 + 2c_1'^2 + 2^2c_2'^2 + \dots + 2^N c_N'^2]$$

To calculate $F(\varphi \setminus \alpha)$, $E(\varphi \setminus \alpha)$ start from 17.5.2 which corresponds to the descending Landen transformation and determine $\varphi_1, \varphi_2, \dots, \varphi_N$ successively from the relation

17.6.8 $\tan(\varphi_{n+1} - \varphi_n) = (b_n/a_n) \tan \varphi_n, \varphi_0 = \varphi$

Then to the prescribed accuracy

17.6.9 $F(\varphi \setminus \alpha) = \varphi_N / (2^N a_N) \quad *$

17.6.10

$$Z(\varphi \setminus \alpha) = E(\varphi \setminus \alpha) - (E/K)F(\varphi \setminus \alpha)$$

$$\delta_1 = [n(1-n)^{-1}(\sin^2 \alpha - n)^{-1}]^{\frac{1}{2}}$$

17.7.3

$$\Pi(n; \varphi \setminus \alpha) = \delta_1 [-\frac{1}{2} \ln \{\vartheta_4(v+\beta)/\vartheta_4(v-\beta)\}]$$

$$+ v\vartheta_1'(\beta)/\vartheta_1(\beta)]$$

17.7.4

$$\frac{1}{2} \ln \frac{\vartheta_4(v+\beta)}{\vartheta_4(v-\beta)} = 2 \sum_{s=1}^{\infty} s^{-1} q^s (1 - q^{2s})^{-1} \sin 2sv \sin 2s\beta$$

17.7.5

$$\frac{\vartheta_1'(\beta)}{\vartheta_1(\beta)} = \cot \beta + 4 \sum_{s=1}^{\infty} q^{2s} (1 - 2q^{2s} \cos 2\beta + q^{4s})^{-1} \sin 2\beta$$

In the above we can also use Neville's theta functions 16.36.

17.7.6 $\Pi(n \setminus \alpha) = K(\alpha) + \delta_1 K(\alpha) Z(\epsilon \setminus \alpha)$

Case (ii) Hyperbolic Case $n > 1$

The case $n > 1$ can be reduced to the case $0 < N < \sin^2 \alpha$ by writing

17.7.7 $N = n^{-1} \sin^2 \alpha, p_1 = [(n-1)(1-n^{-1} \sin^2 \alpha)]^{\frac{1}{2}}$

17.7.8

$$\begin{aligned} \Pi(n; \varphi \setminus \alpha) &= -\Pi(N; \varphi \setminus \alpha) + F(\varphi \setminus \alpha) \\ &+ \frac{1}{2p_1} \ln [(\Delta(\varphi) + p_1 \tan \varphi)(\Delta(\varphi) - p_1 \tan \varphi)^{-1}] \end{aligned}$$

where $\Delta(\varphi)$ is the delta amplitude, 17.2.4.

17.7.9 $\Pi(n \setminus \alpha) = K(\alpha) - \Pi(N \setminus \alpha)$

Case (iii) Circular Case $\sin^2 \alpha < n < 1$

$$\epsilon = \arcsin[(1-n)/\cos^2 \alpha]^{\frac{1}{2}} \quad 0 \leq \epsilon \leq \frac{1}{2}\pi$$

$$\beta = \frac{1}{2}\pi F(\epsilon \setminus 90^\circ - \alpha) / K(\alpha)$$

$$q = q(\alpha)$$

17.7.10

$$v = \frac{1}{2}\pi F(\varphi \setminus \alpha) / K(\alpha), \delta_2 = [n(1-n)^{-1}(n - \sin^2 \alpha)^{-1}]^{\frac{1}{2}}$$

17.7.11 $\Pi(n; \varphi \setminus \alpha) = \delta_2 (\lambda - 4\mu v)$

17.7.12

$$\begin{aligned} \lambda &= \arctan(\tanh \beta \tan v) \\ &+ 2 \sum_{s=1}^{\infty} (-1)^{s-1} s^{-1} q^{2s} (1 - q^{2s})^{-1} \sin 2sv \sinh 2s\beta \end{aligned}$$

17.7.13

$$\mu = \left[\sum_{s=1}^{\infty} s q^{s^2} \sinh 2s\beta \right] \left[1 + 2 \sum_{s=1}^{\infty} q^{s^2} \cosh 2s\beta \right]^{-1}$$

17.7.14 $\Pi(n \setminus \alpha) = K(\alpha) + \frac{1}{2}\pi \delta_2 [1 - \Lambda_0(\epsilon \setminus \alpha)]$

where Λ_0 is Heuman's Lambda function, 17.4.39.

Numerical Methods

17.8. Use and Extension of the Tables

Example 1. Reduce to canonical form $\int y^{-1} dx$, where

$$y^2 = -3x^4 + 34x^3 - 119x^2 + 172x - 90$$

By inspection or by solving an equation of the fourth degree we find that

$$y^2 = Q_1 Q_2 \text{ where } Q_1 = 3x^2 - 10x + 9, Q_2 = -x^2 + 8x - 10$$

First Method

$Q_1 - \lambda Q_2 = (3 + \lambda)x^2 - (10 + 8\lambda)x + 9 + 10\lambda$ is a perfect square if the discriminant

$$(10 + 8\lambda)^2 - 4(3 + \lambda)(9 + 10\lambda) = 0; \text{ i.e., if } \lambda = -\frac{2}{3} \text{ or } \frac{1}{2}$$

and then

$$Q_1 + \frac{2}{3} Q_2 = \frac{7}{3} (x - 1)^2, Q_1 - \frac{1}{2} Q_2 = \frac{7}{2} (x - 2)^2$$

Solving for Q_1 and Q_2 we get

$$Q_1 = (x - 1)^2 + 2(x - 2)^2, Q_2 = 2(x - 1)^2 - 3(x - 2)^2$$

The substitution $t = (x - 1)/(x - 2)$ then gives

$$\int y^{-1} dx = \pm \int [(t^2 + 2)(2t^2 - 3)]^{-\frac{1}{2}} dt$$

*See page II.

If the quartic $y^2=0$ has four real roots in x (or in the case of a cubic all three roots are real), we must so combine the factors that no root of $Q_1=0$ lies between the roots of $Q_2=0$ and no root of $Q_2=0$ lies between the roots of $Q_1=0$. Provided this condition is observed the method just described will always lead to real values of λ . These values may, however, be irrational.

Second Method

Write

$$t^2 = \frac{Q_1}{Q_2} = \frac{3x^2 - 10x + 9}{-x^2 + 8x - 10}$$

and let the discriminant of $Q_2t^2 - Q_1$ be

$$4T^2 = (8t^2 + 10)^2 - 4(t^2 + 3)(10t^2 + 9) \\ = 4(3t^2 + 2)(2t^2 - 1)$$

Then

$$\int y^{-1} dx = \pm \int T^{-1} dt = \pm \int [(3t^2 + 2)(2t^2 - 1)]^{-1/2} dt$$

This method will succeed if, as here, T^2 as a function of t^2 has real factors. If the coefficients of the given quartic are rational numbers, the factors of T^2 will likewise be rational.

Third Method

Write

$$w = \frac{Q_1}{Q_2} = \frac{3x^2 - 10x + 9}{-x^2 + 8x - 10}$$

and let the discriminant of $Q_2w - Q_1$ be

$$4W = 4(3w + 2)(2w - 1) = 4(Aw^2 + Bw + C)$$

Then if

$$z^2 = W/w \text{ and } Z^2 = (B - z^2)^2 - 4AC = (z^2 - 1)^2 + 48$$

$$\int y^{-1} dx = \pm \int Z^{-1} dz$$

However, in this case the factors of Z are complex and the method fails.

Of the second and third methods one will always succeed where the other fails, and if the coefficients of the given quartic are rational numbers, the factors of T^2 or Z^2 , as the case may be, will be rational.

Example 2. Reduce to canonical form $\int y^{-1} dx$ where $y^2 = x(x-1)(x-2)$.

We use the third method of **Example 1** taking $Q_1 = (x-1)$, $Q_2 = x(x-2)$ and writing

$$w = \frac{Q_1}{Q_2} = \frac{x-1}{x^2-2x}$$

The discriminant of $Q_2w - Q_1 = x^2w - (2w+1)x + 1$ is

$$4W = (2w+1)^2 - 4w = 4w^2 + 1$$

so that

$$W = Aw^2 + Bw + C \text{ where } A=1, B=0, C=\frac{1}{4}$$

and if we write $z^2 = W/w$ and

$$Z^2 = (B - z^2)^2 - 4AC = (z^2)^2 - 1 = (z^2 - 1)(z^2 + 1),$$

$$\int y^{-1} dx = \pm \int [(z^2 - 1)(z^2 + 1)]^{-1/2} dz$$

The first method of **Example 1** fails with the above values of Q_1 and Q_2 since the root of $Q_1=0$ lies between the roots of $Q_2=0$, and we get imaginary values of λ . The method succeeds, however, if we take $Q_1 = x$, $Q_2 = (x-1)(x-2)$, for then the roots of $Q_1=0$ do not lie between those of $Q_2=0$.

Example 3. Find $K(80/81)$.

First Method

Use **17.3.29** with $m = 80/81$, $m_1 = 1/81$, $m_1^{1/2} = 1/9$. Since $[(1 - m_1^{1/2})(1 + m_1^{1/2})^{-1}]^2 = .64$, $K(80/81) = 1.8 K(.64) = 3.59154 \text{ 500 to 8D}$, taking $K(.64)$ from **Table 17.1**.

Second Method

Table 17.4 giving $L(m)$ is useful for computing $K(m)$ when m is near unity or $K'(m)$ when m is near zero.

$$K(80/81) = \frac{1}{\pi} K'(80/81) \ln(16 \times 81) - L(80/81).$$

By interpolation in **Tables 17.1** and **17.4**, since $80/81 = .98765 \text{ 43210}$,

$$K'(80/81) = 1.57567 \text{ 8423}$$

$$L(80/81) = .00311 \text{ 16543}$$

$$K(80/81) = \pi^{-1}(1.57567 \text{ 8423})(7.16703 \text{ 7877})$$

$$= .00311 \text{ 16543}$$

$$= 3.59154 \text{ 5000 to 9D.}$$

Third Method

The polynomial approximation **17.3.34** gives to **8D**

$$K(80/81) = 3.59154 \text{ 501}$$

Fourth Method, Arithmetic-Geometric Mean

Here $\sin^2 \alpha = 80/81$ and we start with

$$a_0 = 1, b_0 = \frac{1}{9}, c_0 = \sqrt{80/81} = .99380 \text{ 79900}$$

giving

n	a_n	b_n	c_n
0	1.00000 00000	.11111 11111	.99380 79900
1	.55555 55555	.33333 33333	.44444 44444
2	.44444 44444	.43033 14829	.11111 11111
3	.43738 79636	.43733 10380	.00705 64808
4	.43735 95008	.43735 94999	.00002 84628
5	.43735 95003	.43735 95003	0

Thus $K(80/81) = \frac{1}{2} \pi a_5^{-1} = 3.59154\ 5001$.

Example 4. Find $E(80/81)$.

First Method

Use 17.3.30 which gives, with $m=80/81$

$$E(80/81) = \frac{10}{9} E(.64) - \frac{1}{5} K(.64) = 1.01910\ 6047$$

taking $E(.64)$ and $K(.64)$ from Table 17.1.

Second Method

Polynomial approximation, 17.3.36 gives $E(80/81) = 1.01910\ 6060$. The last two figures must be dropped to keep within the limit of accuracy of the method.

Third Method

Arithmetic-geometric mean, 17.6. The numbers were calculated in Example 3, fourth method, and we have

$$\frac{K(80/81) - E(80/81)}{K(80/81)} = \frac{1}{2} [c_0^2 + 2c_1^2 + 2^2c_2^2 + \dots + 2^5c_5^2] = \frac{1}{2} [1.43249\ 71298] = .71624\ 85649.$$

Using the value of $K(80/81)$ found in Example 3, fourth method, we have

$$E(80/81) = 1.01910\ 6048\ \text{to } 9D.$$

Example 5. Find q when $m = .9995$. Here $m_1 = .0005$ and so from Table 17.4

$$Q(m) = .06251\ 563013$$

$$q_1 = m_1 Q(m) = .00003\ 12578\ 15.$$

From 17.3.19

$$\ln\left(\frac{1}{q}\right) = \pi^2 / \ln\left(\frac{1}{q_1}\right) = \pi^2 / 10.37324\ 1132 = .95144\ 84701$$

$$q = .38618\ 125.$$

The computation could also be made using common logarithms with the aid of 17.3.20. The point of this procedure is that it enables us to calculate q_1 without the loss of significant figures which would result from direct interpolation in Table 17.1. By this means $\ln(1/q_1)$ can be found without loss of accuracy.

Example 6. Find m to 10D when $K'/K = .25$ and when $K'/K = 3.5$.

From 17.3.15 with $K'/K = .25$ we can write the iteration formula

$$m^{(n+1)} = 1 - 16e^{-4\pi} \exp[-\pi L(m^{(n)})/K'(m^{(n)})].$$

Then by iteration using Tables 17.1 and 17.4

n	$m^{(n)}$
0	1.
1	.99994 42025
2	.99994 42041
3	.99994 42041

Thus $m = .99994\ 42041$.

From 17.3.16 with $K'/K = 3.5$ we can write the iteration formula,

$$m^{(n+1)} = 16e^{-3.5\pi} \exp[-\pi L(m_1^{(n)})/K(m^{(n)})]$$

n	$m^{(n)}$
0	0
1	.(3)26841 25043
2	.(3)26837 65
3	.(3)26837 65

Thus $m = .00026\ 83765$.

The above methods in conjunction with the auxiliary Table 17.4 of $L(m)$ enable us to extend Table 17.3 for $K'/K > 3$, and for $K'/K < .3$.

Example 7. Calculate to 5D the Jacobian elliptic function $\text{sn}(.75342|.7)$ using Table 17.5.

Here

$$m = \sin^2 \alpha = .7, \alpha = 56.789089^\circ.$$

Thus, $\text{sn}(.75342|.7) = \sin \varphi$ where φ is determined from

$$F(\varphi \setminus 56.789089^\circ) = .75342.$$

Inspection of Table 17.5 shows that φ lies between 40° and 45° . We have from the table of $F(\varphi \setminus \alpha)$

$\varphi \backslash \alpha$	56°	58°	60°
35°	.63803	.63945	.64085
40°	.73914	.74138	.74358
45°	.84450	.84788	.85122
50°	.95479	.95974	.96465

From this we form the table of $F(\varphi \setminus 56.789089^\circ)$

φ	F	Δ	Δ_2	Δ_3
35°	.63859	10144		
40°	.74003	10581	437	
45°	.84584	11090	509	72
50°	.95674			

A rough estimate now shows that φ lies between 40° and 41°. We therefore form the following table of $F(\varphi \setminus 56.789089^\circ)$ by direct interpolation in the foregoing table

φ	F
40.0°	.74003
40.5°	.75040
41.0°	.76082

whence by linear inverse interpolation

$$\varphi = 40.5^\circ + .5^\circ \left[\frac{.75342 - .75040}{.76082 - .75040} \right] = 40.6449^\circ$$

and so $\sin \varphi = .65137 = \text{sn}(.75342 | .7)$.

This method of bivariate interpolation is given merely as an illustration. Other more direct methods such as that of the arithmetic-geometric mean described in 17.6 and illustrated for the Jacobian functions in chapter 16 are less laborious.

Example 8. Evaluate

$$\int_2^3 [(2t^2+1)(t^2-2)]^{-1/2} dt.$$

First Method, Bivariate Interpolation

From 17.4.50 we have

$$\sqrt{5} \int_2^3 [(2t^2+1)(t^2-2)]^{-1/2} dt = F(\varphi_1 \setminus \alpha) - F(\varphi_2 \setminus \alpha),$$

where

$$\sin^2 \alpha = \frac{1}{5}, \cos \varphi_1 = \frac{\sqrt{2}}{3}, \cos \varphi_2 = \frac{\sqrt{2}}{2}$$

Thus $\alpha = 26.56505 12^\circ$, $\varphi_1 = 61.87449 43^\circ$, $\varphi_2 = 45^\circ$, $F(\varphi_1 \setminus \alpha) = 1.115921$ and $F(\varphi_2 \setminus \alpha) = .800380$ and therefore the integral is equal to .141114.

Second Method, Numerical Quadrature

Simpson's formula with 11 ordinates and interval .1 gives .141117.

Example 9. Evaluate

$$\int_2^4 [(t^2-2)(t^2-4)]^{-1/2} dt.$$

First Method, Reduction to Standard Form and Bivariate Interpolation

Here we can use 17.4.48 noting that $a^2=4$, $b^2=2$, and that

$$\begin{aligned} \int_2^4 [(t^2-2)(t^2-4)]^{-1/2} dt &= \int_2^\infty - \int_4^\infty \\ &= \frac{1}{2} [F(\varphi_1 \setminus 45^\circ) - F(\varphi_2 \setminus 45^\circ)] \\ &= \frac{1}{2} [1.854075 - .535623] = .659226 \end{aligned}$$

where

$$\sin \varphi_1 = \frac{2}{2}, \sin \varphi_2 = \frac{2}{4}, \sin^2 \alpha = \frac{2}{4}$$

Thus

$$\alpha = 45^\circ, \varphi_1 = 90^\circ, \varphi_2 = 30^\circ.$$

Second Method, Numerical Integration

If we wish to use numerical integration we must observe that the integrand has a singularity at $t=2$ where it behaves like $[8(t-2)]^{-1/2}$.

We remove the singularity at $t=2$, by writing

$$\int_2^4 [(t^2-2)(t^2-4)]^{-1/2} dt = \int_2^4 f(t) dt + \int_2^4 [8(t-2)]^{-1/2} dt$$

where

$$f(t) = [(t^2-2)(t^2-4)]^{-1/2} - [8(t-2)]^{-1/2}.$$

If we define $f(2) = 0$,

$$\int_2^4 f(t) dt$$

can be calculated by numerical quadrature. Also

$$\int_2^4 [8(t-2)]^{-1/2} dt = \left[\frac{1}{\sqrt{2}} (t-2)^{1/2} \right]_2^4 = 1$$

and thus we calculate the integral as

$$1 + \int_2^4 f(t) dt = 1 - .340773 = .659227.$$

Example 10. Evaluate

$$u = \int_{17}^\infty (x^3 - 7x + 6)^{-1/2} dx.$$

$x^3 - 7x + 6 = (x-1)(x-2)(x+3)$ and we use 17.4.65 with $\beta_1=2$, $\beta_2=1$, $\beta_3=-3$,

$$m = \sin^2 \alpha = 4/5, \lambda = \sqrt{5}/2, \cos^2 \varphi = 3/4.$$

Thus $\alpha = 63.434949^\circ$, $\varphi = 30^\circ$ and

$$\begin{aligned} u &= 2(5)^{-1/2} F(30^\circ \backslash 63.434949^\circ) \\ &= 2(5)^{-1/2} (.543604) = .486214 \text{ from Table 17.5.} \end{aligned}$$

The above integral is of the Weierstrass type and in fact $17 = \mathcal{P}(\frac{1}{2}u; 28, -24)$ (see chapter 18).

Example 11. Evaluate

$$\int_0^{2/3} (24 - 12t + 2t^2 - t^3)^{-1/2} dt.$$

We have

$$24 - 12t + 2t^2 - t^3 = -(t-2)(t^2 + 12) = -P(t).$$

There is only one real zero and we therefore use 17.4.74 with $P(t) = t^3 - 2t^2 + 12t - 24$, $\beta = 2$ so that $P'(2) = 16$, $P''(2) = 8$, $\lambda = 2$ and therefore

$$m = \sin^2 \alpha = \frac{1}{4}, \quad \alpha = 30^\circ$$

Therefore the given integral is

$$\int_0^2 - \int_{2/3}^2 = \frac{1}{2} [F(\varphi_1 \backslash 60^\circ) - F(\varphi_2 \backslash 60^\circ)]$$

where

$$\cos \varphi_1 = \frac{1}{3}, \quad \varphi_1 = 70.52877 \ 93^\circ$$

$$\cos \varphi_2 = \frac{1}{2}, \quad \varphi_2 = 60^\circ$$

and the integral $= \frac{1}{2} [1.510344 - 1.212597] = .148874$.

Example 12. Use Landen's transformation to evaluate

$$\int_0^{\pi/2} \left(1 - \frac{1}{4} \sin^2 \theta\right)^{-1/2} d\theta \text{ to 5D.}$$

First Method, Descending Transformation

We use 17.5.1 to give

$$1 + \sin \alpha_1 = \frac{2}{1 + \cos 30^\circ} = 1.071797$$

$$\cos \alpha_1 = [(1 - \sin \alpha_1)(1 + \sin \alpha_1)]^{1/2} = .997419$$

$$1 + \sin \alpha_2 = \frac{2}{1 + \cos \alpha_1} = 1.001292; \cos \alpha_2 = .999999$$

$$1 + \sin \alpha_3 = \frac{2}{1 + \cos \alpha_2} = 1.000000$$

Thus from 17.5.7,

$$\begin{aligned} \text{the integral} &= F(90^\circ \backslash 30^\circ) = \frac{\pi}{2} (1.071797)(1.001292) \\ &= 1.68575 \text{ to 5D.} \end{aligned}$$

Second Method, Ascending Transformation

We use 17.5.11 to give

$$1 + \cos \alpha_{n+1} = 2/(1 + \sin \alpha_n)$$

n	$\cos \alpha_n$	$\sin \alpha_n$
1	.33333 333	.94280 904
2	.02943 725	.99956 663
3	.00021 673	.99999 998

$$\begin{aligned} \sin (2\varphi_1 - 90^\circ) &= \sin 30^\circ, & \varphi_1 &= 60^\circ \\ \sin (2\varphi_2 - \varphi_1) &= \sin \alpha_1 \sin \varphi_1, & \varphi_2 &= 57.367805^\circ \\ \sin (2\varphi_3 - \varphi_2) &= \sin \alpha_2 \sin \varphi_2, & \varphi_3 &= 57.348426^\circ \\ \sin (2\varphi_4 - \varphi_3) &= \sin \alpha_3 \sin \varphi_3, & \varphi_4 &= 57.348425^\circ = \Phi. \end{aligned}$$

From 17.5.16

$$\begin{aligned} F(90^\circ \backslash 30^\circ) &= \frac{2}{1.5} \frac{2}{1.94280 \ 904} \frac{2}{1.99956 \ 663} \\ &= \frac{2}{1.99999 \ 998} \ln \tan \left(45^\circ + \frac{1}{2} \Phi\right) \\ &= 1.37288 \ 050 \ln \tan 73.674213^\circ \\ &= 1.37288 \ 050 (1.22789 \ 30) \end{aligned}$$

$$F(90^\circ \backslash 30^\circ) = 1.68575 \text{ to 5D.}$$

Example 13. Find the value of $F(89.5^\circ \backslash 89.5^\circ)$.

First Method

This is a case where interpolation in Table 17.5 is not possible. We use 17.4.13 which gives

$$F(89.5^\circ \backslash 89.5^\circ) = F(90^\circ \backslash 89.5^\circ) - F(\psi \backslash 89.5^\circ)$$

where

$$\cot \psi = \sin (.5^\circ) \cot (.5^\circ) = \cos (.5^\circ)$$

$$\psi = 45.00109 \ 084^\circ$$

and $F(\psi \backslash 89.5^\circ) = .881390$ from Table 17.5.

$$\begin{aligned} F(90^\circ \backslash 89.5^\circ) &= K(\sin^2 89.5^\circ) = K(.99992 \ 38476) \\ &= 6.12777 \ 88 \end{aligned}$$

Thus $F(89.5^\circ \backslash 89.5^\circ) = 5.246389$.

Second Method

Landen's ascending transformation, 17.5.11, gives

$$\begin{aligned} \cos \alpha_1 &= (1 - \sin 89.5^\circ) / (1 + \sin 89.5^\circ) \\ \sin \alpha_1 &= [(1 - \cos \alpha_1)(1 + \cos \alpha_1)]^{\frac{1}{2}} = .99999 \ 99997 \\ \cos \alpha_2 &= 0 \\ \sin \alpha_2 &= 1. \end{aligned}$$

17.5.12 then gives

$$\begin{aligned} \sin (2\varphi_1 - 89.5^\circ) &= \sin 89.5^\circ \sin 89.5^\circ \\ &= .99992 \ 38476 \end{aligned}$$

$$2\varphi_1 - 89.5^\circ = 89.2929049^\circ, \varphi_1 = 89.39645 \ 245^\circ$$

$$\begin{aligned} \sin (2\varphi_2 - \varphi_1) &= \sin \alpha_1 \sin \varphi_1, \quad \varphi_2 = 89.39645 \ 602^\circ \\ \sin (2\varphi_3 - \varphi_2) &= \sin \varphi_3, \quad \varphi_3 = \varphi_2 = \Phi. \end{aligned}$$

Thus 17.5.16 gives

$$\begin{aligned} F(89.5^\circ \setminus 89.5^\circ) &= \\ \left(\frac{1}{.99996 \ 19231} \right)^{\frac{1}{2}} \ln (\tan 89.69822 \ 801^\circ) &= 5.24640. \end{aligned}$$

Example 14. Evaluate

$$\int_1^2 [(9 - t^2)(16 + t^2)^{\frac{3}{2}}]^{-\frac{1}{2}} dt \text{ to 5D.}$$

From 17.4.51 the given integral

$$= \int_0^2 - \int_0^1 = \frac{1}{80} [E(\varphi_1 \setminus \alpha) - E(\varphi_2 \setminus \alpha)]$$

where

$$\sin \alpha = \frac{3}{8}, \quad \alpha = 36.86990^\circ$$

$$\sin \varphi_1 = \frac{1}{3} \sqrt{5}, \quad \varphi_1 = 48.18968^\circ$$

$$\sin \varphi_2 = \frac{5}{3\sqrt{17}}, \quad \varphi_2 = 23.84264^\circ.$$

By bivariate interpolation in Table 17.6 we find that the given integral

$$= \frac{1}{80} [.80904 - .41192] = .00496.$$

Simpson's rule with 3 ordinates gives

$$\frac{1}{8} [.00504 + .01975 + .005] = .00496.$$

Example 15. Evaluate

$$\begin{aligned} \Pi \left(\frac{1}{16}; 45^\circ \setminus 30^\circ \right) &= \\ \int_0^{\pi/4} (1 - \frac{1}{16} \sin^2 \theta)^{-1} (1 - \frac{1}{4} \sin^2 \theta)^{-\frac{1}{2}} d\theta &\text{ to 6D.} \end{aligned}$$

This is case (i) of integrals of the third kind, $0 < n < \sin^2 \alpha$, 17.7.3

$$n = \frac{1}{16}, \varphi = 45^\circ, \alpha = 30^\circ,$$

$$\epsilon = \arcsin (n / \sin^2 \alpha)^{\frac{1}{2}} = 30^\circ,$$

$$\beta = \frac{1}{2} \pi F(30^\circ \setminus 30^\circ) / K(30^\circ) = .49332 \ 60$$

$$v = \frac{1}{2} \pi F(45^\circ \setminus 30^\circ) / K(30^\circ) = .74951 \ 51,$$

$$\delta_1 = (16/45)^{\frac{1}{2}}$$

and so from 17.7.3

$$\Pi \left(\frac{1}{16}; 45^\circ \setminus 30^\circ \right) =$$

$$(16/45)^{\frac{1}{2}} \left\{ -\frac{1}{2} \ln \frac{\vartheta_4(v + \beta)}{\vartheta_4(v - \beta)} + \frac{\vartheta_1'(\beta)}{\vartheta_1(\beta)} v \right\} \\ q = .01797 \ 24.$$

Using the q -series, 16.27, for the ϑ functions we get

$$\begin{aligned} \Pi \left(\frac{1}{16}; 45^\circ \setminus 30^\circ \right) &= (16/45)^{\frac{1}{2}} \{ -.02995 \ 89 \\ &+ (1.86096 \ 21)(.74951 \ 51) \} = .813845. \end{aligned}$$

Table 17.9 gives .81385 with 4 point Lagrangian interpolation.

Example 16. Evaluate the complete elliptic integral

$$\Pi \left(\frac{1}{8} \setminus 30^\circ \right) \text{ to 6D.}$$

From 17.7.6 we have

$$\Pi \left(\frac{1}{8} \setminus 30^\circ \right) = K(30^\circ) + (16/45)^{1/2} K(\alpha) Z(\epsilon \setminus 30^\circ)$$

where $\epsilon = \arcsin (n / \sin^2 \alpha)^{\frac{1}{2}} = 30^\circ$. Thus using Table 17.7

$$\Pi \left(\frac{1}{8} \setminus 30^\circ \right) = 1.743055.$$

Table 17.9 gives 1.74302 with 5 point Lagrangian interpolation.

Example 17. Evaluate

$$\begin{aligned} \Pi \left(\frac{5}{8}; 45^\circ \setminus 30^\circ \right) &= \\ \int_0^{\pi/4} (1 - \frac{5}{8} \sin^2 \theta)^{-1} (1 - \frac{1}{4} \sin^2 \theta)^{-1/2} d\theta & \\ \text{to 6D.} & \end{aligned}$$

This is case (iii) of integrals of the third kind, $\sin^2 \alpha < n < 1$,

$$n = \frac{5}{8}, \varphi = 45^\circ, \alpha = 30^\circ$$

$$\epsilon = \arcsin [(1-n)/\cos^2 \alpha]^{\frac{1}{2}} = 45^\circ$$

$$\beta = \frac{1}{2}\pi F(45^\circ \setminus 60^\circ)/K(30^\circ) = .79317\ 74$$

$$v = \frac{1}{2}\pi F(45^\circ \setminus 30^\circ)/K(30^\circ) = .74951\ 51$$

$$\delta_2 = (40/9)^{\frac{1}{2}}$$

$$q = .01797\ 24$$

and so from 17.7.11

$$\begin{aligned} \Pi\left(\frac{5}{8}; 45^\circ \setminus 30^\circ\right) &= (40/9)^{1/2}(\lambda - 4\mu v) \\ &= 2.10818\ 51\{.55248\ 32 - 4(.03854\ 26) \\ &\quad (.74951\ 51)\} = .921129. \end{aligned}$$

Table 17.9 gives .92113 with 4 point Lagrangian interpolation.

Example 18. Evaluate the complete elliptic integral

$$\Pi\left(\frac{5}{8} \setminus 30^\circ\right) \text{ to } 5D.$$

From 17.7.14 we have

$$\Pi\left(\frac{5}{8} \setminus 30^\circ\right) = K(30^\circ) + \frac{\pi}{2} \sqrt{\frac{40}{9}} [1 - \Lambda_0(\epsilon \setminus 30^\circ)]$$

where $\epsilon = \arcsin [(1-n)/\cos^2 \alpha]^{\frac{1}{2}} = 45^\circ$. Thus using **Table 17.8**

$$\Pi\left(\frac{5}{8} \setminus 30^\circ\right) = 2.80099.$$

Table 17.9 gives 2.80126 by 6 point Lagrangian interpolation. The discrepancy results from interpolation with respect to n for $\varphi = 90^\circ$ in **Table 17.9**.

Example 19. Evaluate

$$\begin{aligned} \Pi\left(\frac{5}{4}; 45^\circ \setminus 30^\circ\right) \\ = \int_0^{\pi/4} (1 - \frac{5}{4} \sin^2 \theta)^{-1} (1 - \frac{1}{4} \sin^2 \theta)^{-1/2} d\theta \end{aligned}$$

to 5D.

Here $n = \frac{5}{4}$, $\varphi = 45^\circ$, $\alpha = 30^\circ$ and since the characteristic is greater than unity we use 17.7.7

$$N = n^{-1} \sin^2 \alpha = .2, \quad p_1 = (1/5)^{\frac{1}{2}}$$

$$\Pi\left(\frac{5}{4}; 45^\circ \setminus 30^\circ\right) = -\Pi(2; 45^\circ \setminus 30^\circ) + F(45^\circ \setminus 30^\circ)$$

$$+ (\frac{1}{2}\sqrt{5}) \ln \frac{(7/8)^{\frac{1}{2}} + (1/5)^{\frac{1}{2}}}{(7/8)^{\frac{1}{2}} - (1/5)^{\frac{1}{2}}}$$

$$= -.83612 + .80437$$

$$+ \frac{1}{2}\sqrt{5} \ln \frac{\sqrt{35} + \sqrt{8}}{\sqrt{35} - \sqrt{8}}$$

$$= 1.13214.$$

Numerical quadrature gives the same result.

Example 20. Evaluate

$$\begin{aligned} \Pi\left(-\frac{1}{4}; 45^\circ \setminus 30^\circ\right) \\ = \int_0^{\pi/4} (1 + \frac{1}{4} \sin^2 \theta)^{-1} (1 - \frac{1}{4} \sin^2 \theta)^{-1} d\theta \end{aligned}$$

to 5D.

Here the characteristic is negative and we therefore use 17.7.15 with $n = -\frac{1}{4}$, $\sin^2 \alpha = \frac{1}{4}$

$$N = (1-n)^{-1}(\sin^2 \alpha - n) = .4, \quad p_2 = \sqrt{.1}$$

and therefore

$$\begin{aligned} (5/2)^{\frac{1}{2}} \Pi\left(-\frac{1}{4}; 45^\circ \setminus 30^\circ\right) &= (9/40)^{\frac{1}{2}} \Pi\left(\frac{5}{8}; 45^\circ \setminus 30^\circ\right) \\ &+ \frac{1}{2} (5/2)^{\frac{1}{2}} F(45^\circ \setminus 30^\circ) + \arctan (35)^{-1} \end{aligned}$$

Using **Tables 4.14, 17.5, and 17.9** we get

$$\Pi\left(-\frac{1}{4}; 45^\circ \setminus 30^\circ\right) = .76987$$

The table can also be used inversely to find $\varphi = \text{am } u$ where $u = F(\varphi|\alpha)$ and so the Jacobian elliptic functions, for example $\text{sn } u = \sin \varphi$, $\text{cn } u = \cos \varphi$, $\text{dn } u = (1 - \sin^2 \alpha \sin^2 \varphi)^{1/2}$. See Examples 7-11. Compiled from K. Pearson, Tables of the complete and incomplete elliptic integrals, Cambridge Univ. Press, Cambridge, England, 1934 (with permission). Known errors have been corrected.

18. Weierstrass Elliptic and Related Functions

Mathematical Properties

18.1. Definitions, Symbolism, Restrictions and Conventions

An elliptic function is a single-valued doubly periodic function of a single complex variable which is analytic except at poles and whose only singularities in the finite plane are poles. If ω and ω' are a pair of (primitive) half-periods of such a function $f(z)$, then $f(z+2M\omega+2N\omega')=f(z)$, M and N being integers. Thus the study of any such function can be reduced to consideration of its behavior in a *fundamental period parallelogram* (FPP). An elliptic function has a finite number of poles (and the same number of zeros) in a FPP; the number of such poles (zeros) (an irreducible set) is the *order* of the function (poles and zeros are counted according to their multiplicity). All other poles (zeros) are called *congruent* to the irreducible set. The simplest (non-trivial) elliptic functions are of order two. One may choose as the standard function of order two either a function with two simple poles (Jacobi's choice) or one double pole (Weierstrass' choice) in a FPP.

Weierstrass' \mathcal{P} -Function. Let ω, ω' denote a pair of complex numbers with $\mathcal{A}(\omega'/\omega) > 0$. Then $\mathcal{P}(z) = \mathcal{P}(z|\omega, \omega')$ is an elliptic function of order two with periods $2\omega, 2\omega'$ and having a double pole at $z=0$, whose principal part is z^{-2} ; $\mathcal{P}(z) - z^{-2}$ is analytic in a neighborhood of the origin and vanishes at $z=0$.

Weierstrass' ζ -Function $\zeta(z) = \zeta(z|\omega, \omega')$ satisfies the condition $\zeta'(z) = -\mathcal{P}(z)$; further, $\zeta(z)$ has a simple pole at $z=0$ whose principal part is z^{-1} ; $\zeta(z) - z^{-1}$ vanishes at $z=0$ and is analytic in a neighborhood of the origin. $\zeta(z)$ is *NOT* an elliptic function, since it is not periodic. However, it is quasi-periodic (see "period" relations), so reduction to FPP is possible.

Weierstrass' σ -Function $\sigma(z) = \sigma(z|\omega, \omega')$ satisfies the condition $\sigma'(z)/\sigma(z) = \zeta(z)$; further, $\sigma(z)$ is an entire function which vanishes at the origin. Like ζ , it is *NOT* an elliptic function, since it is not periodic. However, it is quasi-periodic (see "period" relations), so reduction to FPP is possible.

Invariants g_2 and g_3

Let $W = 2M\omega + 2N\omega'$, M and N being integers. Then

$$18.1.1 \quad g_2 = 60\Sigma'W^{-4} \text{ and } g_3 = 140\Sigma'W^{-6}$$

are the INVARIANTS, summation being over all pairs M, N except $M=N=0$.

Alternate Symbolism Emphasizing Invariants

$$18.1.2 \quad \mathcal{P}(z) = \mathcal{P}(z; g_2, g_3)$$

$$18.1.3 \quad \mathcal{P}'(z) = \mathcal{P}'(z; g_2, g_3)$$

$$18.1.4 \quad \zeta(z) = \zeta(z; g_2, g_3)$$

$$18.1.5 \quad \sigma(z) = \sigma(z; g_2, g_3)$$

Fundamental Differential Equation, Discriminant and Related Quantities

$$18.1.6 \quad \mathcal{P}''(z) = 4\mathcal{P}^3(z) - g_2\mathcal{P}(z) - g_3$$

$$18.1.7$$

$$= 4(\mathcal{P}(z) - e_1)(\mathcal{P}(z) - e_2)(\mathcal{P}(z) - e_3)$$

$$18.1.8$$

$$\Delta = g_2^3 - 27g_3^2 = 16(e_2 - e_3)^2(e_3 - e_1)^2(e_1 - e_2)^2$$

$$18.1.9$$

$$g_2 = -4(e_1e_2 + e_1e_3 + e_2e_3) = 2(e_1^2 + e_2^2 + e_3^2)$$

$$18.1.10 \quad g_3 = 4e_1e_2e_3 = \frac{4}{3}(e_1^3 + e_2^3 + e_3^3)$$

$$18.1.11 \quad e_1 + e_2 + e_3 = 0$$

$$18.1.12 \quad e_1^4 + e_2^4 + e_3^4 = g_2^2/8$$

$$18.1.13 \quad 4e_i^3 - g_2e_i - g_3 = 0 (i=1, 2, 3)$$

Agreement about Values of Invariants (and Discriminant)

We shall consider, in this chapter, only *real* g_2 and g_3 (this seems to cover most applications)—hence Δ is real. We shall dichotomize most of what follows (either $\Delta > 0$ or $\Delta < 0$). Homogeneity relations 18.2.1–18.2.15 enable a further restriction to non-negative g_3 (except for one case when $\Delta = 0$).

Note on Symbolism for Roots of Complex Numbers and for Conjugate Complex Numbers

In this chapter, $z^{1/n}$ (n a positive integer) is used to denote the principal n th root of z , as in chapter 3; \bar{z} is used to denote the complex conjugate of z .

Fundamental Rectangles

Study of all four functions (\wp, \wp', ζ, σ) can be reduced to consideration of their values in a Fundamental Rectangle including the origin (see 18.2 on homogeneity relations, reduction formulas and processes).

$\Delta > 0$

$\Delta < 0$

Fundamental Rectangle is $\frac{1}{4}$ FPP, which has vertices $0, \omega, \omega_2$ and ω'

Fundamental Rectangle has vertices $0, \omega_2, \omega_2 + \frac{\omega_2'}{2}, \frac{\omega_2'}{2}$

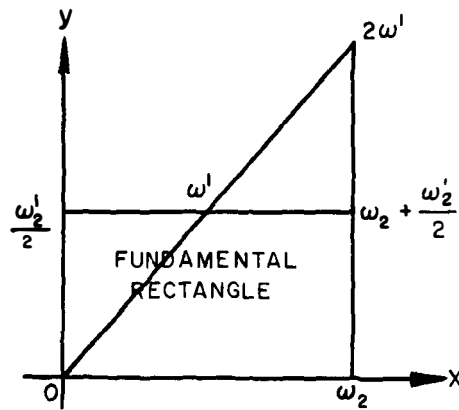

FIGURE 18.2

There is a point on the right boundary of Fundamental Rectangle where $\wp = 0$. Denote it by z_0 .

18.2. Homogeneity Relations, Reduction Formulas and Processes

Homogeneity Relations (Suppose $t \neq 0$)

Note that Period Ratio is preserved.

- 18.2.1 $\mathcal{P}'(tz|t\omega, t\omega') = t^{-3} \mathcal{P}'(z|\omega, \omega')$
- 18.2.2 $\mathcal{P}(tz|t\omega, t\omega') = t^{-2} \mathcal{P}(z|\omega, \omega')$
- 18.2.3 $\zeta(tz|t\omega, t\omega') = t^{-1} \zeta(z|\omega, \omega')$
- 18.2.4 $\sigma(tz|t\omega, t\omega') = t\sigma(z|\omega, \omega')$

- 18.2.6 $g_3(t\omega, t\omega') = t^{-6} g_3(\omega, \omega')$
- 18.2.7 $e_i(t\omega, t\omega') = t^{-2} e_i(\omega, \omega'), i=1, 2, 3$
- 18.2.8 $\Delta(t\omega, t\omega') = t^{-12} \Delta(\omega, \omega')$
- 18.2.9 $H_i(t\omega, t\omega') = t^{-2} H_i(\omega, \omega'), i=1, 2, 3$
(See 18.3)
- 18.2.10 $q(t\omega, t\omega') = q(\omega, \omega')$ (See 18.10)
- 18.2.11 $m(t\omega, t\omega') = m(\omega, \omega')$ (See 18.9)
- 18.2.12 $\mathcal{P}'(tz; t^{-4}g_2, t^{-6}g_3) = t^{-3} \mathcal{P}'(z; g_2, g_3)$
- 18.2.13 $\mathcal{P}(tz; t^{-4}g_2, t^{-6}g_3) = t^{-2} \mathcal{P}(z; g_2, g_3)$
- 18.2.14 $\zeta(tz; t^{-4}g_2, t^{-6}g_3) = t^{-1} \zeta(z; g_2, g_3)$
- 18.2.15 $\sigma(tz; t^{-4}g_2, t^{-6}g_3) = t\sigma(z; g_2, g_3)$

The Case $g_3 < 0$

Put $t=i$ and obtain, e.g.,

18.2.16 $\mathcal{P}(z; g_2, g_3) = -\mathcal{P}(iz; g_2, -g_3)$

Thus the case $g_3 < 0$ can be reduced to one where $g_3 > 0$.

³ NOTES:

1. c_4 - c_{16} were computed and checked independently by D. H. Lehmer; these were double-checked by substituting $g_2=20$, $c_2=28$, $c_3=28$ in values given in [18.10].

2. c_{17} - c_{18} were derived from values in [18.10] by the same substitution. These were checked (numerically) for particular values of g_2 , g_3 .

3. c_{19} is given incorrectly in [18.12] (factor 13 is missing in denominator of third term of bracket); this value was computed independently.

4. No factors of any of the above integers with more than ten digits are known to the author. This is not necessarily true of smaller integers, which have, in many instances, been arranged for convenient use with a desk calculator.

$$w = u + iv$$

$$\Delta > 0$$

$w = \mathcal{P}(z)$ maps the Fundamental Rectangle onto the half-plane $v \leq 0$; if $|\omega'| = \omega(g_3=0)$, the isosceles triangle $0\omega\omega_2$ is mapped onto $u \geq 0, v \leq 0$.

$w = \mathcal{P}'(z)$ maps the Fundamental Rectangle onto the w -plane less quadrant III; if $|\omega'| = \omega$, the triangle $0\omega\omega_2$ is mapped onto $v \geq 0, v \geq u$.

$w = \zeta(z)$ maps the Fundamental Rectangle onto the half-plane $u \geq 0$. If $a \leq 1.9$ (approx.), $v \leq 0$; otherwise the image extends into quadrant I. For very large a , the image has a large area in quadrant I.

$w = \sigma(z)$ maps the Fundamental Rectangle onto quadrant I if $a < 1.9$ (approx.), onto quadrants I and II if $1.9 \leq a < 3.8$ (approx.). For large a , $\arg[\sigma(\omega_2)] \approx \frac{\pi^2 a}{12}$; consequently the image winds around the origin for large a .

Other maps are described in [18.23] arts. 13.7 (square on circle), 13.11 (ring on plane with 2 slits in line) and in [18.24], p. 35 (double half equilateral triangle on half-plane).

$$\Delta < 0$$

$w = \mathcal{P}(z)$ maps the Fundamental Rectangle onto the half-plane $v \leq 0$; if $|\omega'_2| = \omega_2(g_3=0)$, the isosceles triangle $0\omega_2\omega'$ is mapped onto $u \geq 0, v \leq 0$.

$w = \mathcal{P}'(z)$ maps the Fundamental Rectangle onto most of the w -plane less quadrant III; if $|\omega'_2| = \omega_2$, the triangle $0\omega_2\omega'$ is mapped onto $v \geq 0, v \geq u$.

(a =period ratio)

$w = \zeta(z)$ maps the Fundamental Rectangle onto the half-plane $u \geq 0$. The image is mostly in quadrant IV for small a , entirely so for (approx.) $1.3 \leq a \leq 3.8$. For very large a , the image has a large area in quadrant I.

$w = \sigma(z)$ maps the Fundamental Rectangle onto quadrant I if $a < 3.8$ (approx.), onto quadrants I and II if $3.8 \leq a < 7.6$ (approx.). For large a , $\arg\left[\sigma\left(\omega_2 + \frac{\omega'_2}{2}\right)\right] \approx \frac{\pi^2 a}{24}$; consequently the image winds around the origin for large a .

Other maps are described in [18.23] arts. 13.8 (equilateral triangle on half-plane) and 13.9 (isosceles triangle on half-plane).

18.11 Expressing any Elliptic Function in Terms of \mathcal{P} and \mathcal{P}' If $f(z)$ is any elliptic function and $\mathcal{P}(z)$ has same periods, write

18.11.1

$$f(z) = \frac{1}{2}[f(z) + f(-z)] + \frac{1}{2}\{[f(z) - f(-z)]\{\mathcal{P}'(z)\}^{-1}\}\mathcal{P}'(z).$$

Since both brackets represent even elliptic functions, we ask how to express an even elliptic function $g(z)$ (of order $2k$) in terms of $\mathcal{P}(z)$. Because of the evenness, an irreducible set of zeros can be denoted by a_i ($i=1, 2, \dots, k$) and the set of points congruent to $-a_i$ ($i=1, 2, \dots, k$); correspondingly in connection with the poles we consider the points $\pm b_i, i=1, 2, \dots, k$. Then

18.11.2

$$g(z) = A \prod_{i=1}^k \left\{ \frac{\mathcal{P}(z) - \mathcal{P}(a_i)}{\mathcal{P}(z) - \mathcal{P}(b_i)} \right\}, \text{ where } A \text{ is}$$

a constant. If any a_i or b_i is congruent to the origin, the corresponding factor is omitted from the product. Factors corresponding to multiple poles (zeros) are repeated according to the multiplicity.

If $g_2 = 0$ and $g_3 > 0$, homogeneity relations allow us to reduce our considerations of \mathcal{P} to $\mathcal{P}(z; 0, 1)$ (\mathcal{P}' , ζ and σ are handled similarly). Thus $\mathcal{P}(z; 0, g_3) = g_3^{1/3} \mathcal{P}(zg_3^{1/6}; 0, 1)$. The case $g_2 = 0, g_3 = 1$ is called the EQUIANHARMONIC case.

If z is real, ϵz is on $0\omega'$ (Figure 18.11); if ϵz were purely imaginary, z would be on $0z_0$ (Figure 18.11).

18.14. Lemniscatic Case

$(g_2=1, g_3=0)$

If $g_2 > 0$ and $g_3 = 0$, homogeneity relations allow us to reduce our consideration of \mathcal{P} to $\mathcal{P}(z; 1, 0)$ (\mathcal{P}' , ζ and σ are handled similarly). Thus $\mathcal{P}(z; g_2, 0) = g_2^{\frac{1}{2}} \mathcal{P}(zg_2^{\frac{1}{2}}; 1, 0)$. The case $g_2=1, g_3=0$ is called the LEMNISCATIC case.

18.15. Pseudo-Lemniscatic Case

$$(g_2 = -1, g_3 = 0)$$

If $g_2 < 0$ and $g_3 = 0$, homogeneity relations allow us to reduce our consideration of \mathcal{P} to $\mathcal{P}(z; -1, 0)$. Thus

18.15.1 $\mathcal{P}(z; g_2, 0) = |g_2|^{1/2} \mathcal{P}(z|g_2|^{1/4}; -1, 0)$

[\mathcal{P}' , ζ and σ are handled similarly]. Because of its similarity to the lemniscatic case, we refer to the case $g_2 = -1, g_3 = 0$ as the pseudo-lemniscatic case. It plays the same role (period ratio unity) for $\Delta < 0$ as does the lemniscatic case for $\Delta > 0$.

$$\omega_2 = \sqrt{2} \times (\text{real half-period for lemniscatic case}) = \tilde{\omega} \text{ (the Lemniscate Constant—see 18.14.7)}$$

Numerical Methods

18.16. Use and Extension of the Tables

Example 1. Lemniscatic Case

(a) Given $z = x + iy$ in the Fundamental Triangle, find $\mathcal{P}(\mathcal{P}', \zeta, \sigma)$ more accurately than can be done with the maps.

σ —Use Maclaurin series throughout the Fundamental Triangle. Five terms give at least six significant figures, six terms at least ten. \mathcal{P}, ζ —Use Laurent's series directly "near" 0, (if $|z| < 1$, four terms give at least eight significant figures for \mathcal{P} , nine for ζ ; five terms at least ten significant figures for \mathcal{P} , eleven for ζ). Use Taylor's series directly "near" z_0 . Elsewhere (unless approximately seven or eight significant figures are insufficient) use economized polynomials to obtain $\mathcal{P}(x), \mathcal{P}'(x)$ and/or $\zeta(x)$ as appropriate. To get $\mathcal{P}(iy), \mathcal{P}'(iy)$ and/or $\zeta(iy)$, use Laurent's series for "small" y , otherwise use economized polynomials to compute $\mathcal{P}(y), \mathcal{P}'(y)$ and/or $\zeta(y)$, then use complex multiplication to obtain $\mathcal{P}(iy), \mathcal{P}'(iy)$ and/or $\zeta(iy)$. Finally, use appropriate addition formula to get $\mathcal{P}(z)$ and/or $\zeta(z)$.

\mathcal{P}' —Use Laurent's series directly "near" 0 (if $|z| < 1$, four terms give at least six significant figures, five terms at least eight significant figures). Elsewhere, either use economized polynomials and addition formula as for \mathcal{P} and ζ , or get $\mathcal{P}'^2 = 4\mathcal{P}^3 - \mathcal{P}$ and extract appropriate square root ($\mathcal{I}\mathcal{P}' \geq 0$).

(b) Given $\mathcal{P}(\mathcal{P}', \zeta, \sigma)$ corresponding to a point in the Fundamental Triangle, compute z more accurately than can be done with the maps. Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

Example 2. Equianharmonic Case

(a) Given $z = x + iy$ in the Fundamental Triangle, find $\mathcal{P}(\mathcal{P}', \zeta, \sigma)$ more accurately than can be done with the maps.

σ —Use Maclaurin series throughout the Fundamental Triangle. Four terms give at least eleven significant figures, five terms at least twenty one.

\mathcal{P}, ζ —Use Laurent's series directly "near" 0 (if $|z| < 1$, four terms give at least 10S for \mathcal{P} , 11S for ζ ; five terms at least 13S for \mathcal{P} , 14S for ζ). Elsewhere (unless approximately seven or eight significant figures are insufficient) use economized polynomials to obtain $\mathcal{P}(x), \mathcal{P}'(x)$ and/or $\zeta(x)$, as appropriate. To get $\mathcal{P}(iy), \mathcal{P}'(iy)$ and/or $\zeta(iy)$, use Laurent's series. Then use appropriate addition formula to get $\mathcal{P}(z)$ and/or $\zeta(z)$.

\mathcal{P}' —Use Laurent's series directly "near" 0 (if $|z| < 1$, four terms give at least 8S, five terms at least 11S). Elsewhere, either proceed as for \mathcal{P} and ζ , or get $\mathcal{P}'^2 = 4\mathcal{P}^3 - 1$ and extract appropriate square root ($\mathcal{P}' \geq 0$).

(b) Given $\mathcal{P}(\mathcal{P}', \zeta, \sigma)$ corresponding to a point in the Fundamental Triangle, compute z more accurately than can be done with the maps. Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

Example 3. Given period ratio a , find parameters m (of elliptic integrals and Jacobi's functions of chapter 16) and q (of ϑ functions).

m —In both the cases $\Delta > 0$ and $\Delta < 0$, the period ratio is equal to $K'(m)/K(m)$ (see 18.9). Knowing K'/K , if $1 < K'/K \leq 3$, use **Table 17.3** to find m ; if $K'/K > 3$, use the method of **Example 6** in chapter 17. An alternative method is to use **Table 18.3** to obtain the necessary entries, thence use

$$m = (e_2 - e_3)/(e_1 - e_3) \text{ in case } \Delta > 0,$$

$$m = \frac{1}{2} - 3e_2/4H_2 \text{ in case } \Delta < 0.$$

q —In both the cases $\Delta > 0$ and $\Delta < 0$, the period ratio determines the exponent for q [$q = e^{-\pi a}$ if $\Delta > 0$, $q = ie^{-\pi a/2}$ if $\Delta < 0$]. Hence enter **Table 4.16** [$e^{-\pi x}$, $x = 0(.01)1$] and multiply the results as appropriate [e.g., $e^{-4.72\pi} = (e^{-\pi})^4 (e^{-.72\pi})$].

Determination of Values at Half-Periods, Invariants and Related Quantities from Given Periods (Table 18.3)

$\Delta > 0$

Given ω and ω' , form $\omega'/i\omega$ and enter **Table 18.3**. Multiply the results obtained by the appropriate power of ω (see footnotes of **Table 18.3**) to obtain value desired.

Example 4.

Given $\omega = 10$, $\omega' = 11i$, find e_i , g_i , and Δ .

Here $\omega'/i\omega = 1.1$, so that direct reading of **Table 18.3** gives

$$\begin{aligned} e_1(1) &= 1.6843 \ 041 \\ e_2(1) &= -.2166 \ 258 \ (= -e_1 - e_3) \\ e_3(1) &= -1.4676 \ 783 \\ g_2(1) &= 10.0757 \ 7364 \\ g_3(1) &= 2.1420 \ 1000. \end{aligned}$$

Multiplying by appropriate powers of $\omega = 10$ we obtain

$$\begin{aligned} e_1 &= .01684 \ 3041 \\ e_2 &= -.00216 \ 6258 \\ e_3 &= -.01467 \ 6783 \\ g_2 &= 1.0075 \ 77364 \times 10^{-3} \\ g_3 &= 2.1420 \ 1000 \times 10^{-6} \\ \Delta &= 8.9902 \ 3191 \times 10^{-10} \end{aligned}$$

whence

$\Delta < 0$

Given ω_2 and ω_2' , form $\omega_2'/i\omega_2$ and enter **Table 18.3**. Multiply the results obtained by the appropriate power of ω_2 (see footnotes of **Table 18.3**) to obtain value desired.

Example 4.

Given $\omega_2 = 10$, $\omega_2' = 11i$, find e_i , g_i , and Δ .

Here $\omega_2'/i\omega_2 = 1.1$, so that direct reading of **Table 18.3** gives

$$\begin{aligned} e_1(1) &= -.2166 \ 2576 + 3.0842 \ 589i \\ e_2(1) &= .4332 \ 5152 = -2\mathcal{R}(e_1) \\ e_3(1) &= \bar{e}_1(1) \\ g_2(1) &= -37.4874 \ 912 \\ g_3(1) &= 16.5668 \ 099. \end{aligned}$$

Multiplying by appropriate powers of $\omega_2 = 10$ we obtain

$$\begin{aligned} e_1 &= -.00216 \ 62576 + .03084 \ 2589i \\ e_2 &= .00433 \ 25152 \\ e_3 &= \bar{e}_1 \\ g_2 &= -3.7487 \ 4912 \times 10^{-3} \\ g_3 &= 1.6566 \ 8099 \times 10^{-6} \\ \Delta &= -6.0092 \ 019 \times 10^{-8} \end{aligned}$$

whence

Example 5. ($\Delta > 0$)

Given $\omega = 10$, $\omega' = 55i$, find η , η' , $\sigma(\omega)$, $\sigma(\omega')$ and $\sigma(\omega_2)$.

Forming $\omega'/i\omega = 5.5$ and entering **Table 18.3** we obtain $\eta = .82246704$, $\sigma(\omega) = .9604540$. Using Legendre's relation we find $\eta' = \eta\omega' - \pi i/2 = 2.9527723i$. Since interpolation for $\sigma(\omega')$ and $\sigma(\omega + \omega')$ is difficult, use is made of **18.3.15–18.3.17** together with **18.3.4** and **18.3.6**. Values of g_2, g_3 and e_1 can be read directly to eight significant figures and e_3 to about five significant figures giving $g_2 = 8.1174243$, $g_3 = 4.4508759$, $e_1 = 1.6449341$, and $e_3 = -.82247$. Use of **18.3.6** yields $H_3 = .0017469$ and $H_2 = .0017469i$. Application of **18.3.15–18.3.17** yields $\sigma(\omega')/i = .0071177$ and $\sigma(\omega_2) = -.002016 - .01055i$. Multiplying the results obtained by the appropriate powers of ω we obtain $\eta = .082246704$, $\eta' = .29527723i$, $\sigma(\omega) = 9.604540$, $\sigma(\omega') = .071177i$ and $\sigma(\omega_2) = -.02016 - .1055i$.

Example 5. ($\Delta < 0$)

Given $\omega_2 = 1000$, $\omega_2' = 1004i$, find η_2 , η_2' , $\sigma(\omega_2)$, $\sigma(\omega_2')$ and $\sigma(\omega')$.

With $\omega_2'/i\omega_2 = 1.004$, four point interpolation in **Table 18.3** gives $\eta_2 = 1.5626756$, $\eta_2' = -1.5726664i$, $\sigma(\omega_2) = 1.1805028$, $\sigma(\omega_2') = 1.190152i$ and $\sigma(\omega') = .475084 + .476717i$.

Multiplying the results obtained by the appropriate powers of ω_2 gives $\eta_2 = .0015626756$, $\eta_2' = -.0015726664i$, $\sigma(\omega_2) = 1180.5028$, $\sigma(\omega_2') = 1190.152i$ and $\sigma(\omega') = 475.084 + 476.717i$.

Determination of Periods from Given Invariants (Table 18.1.)

$\Delta > 0$

Given $g_2 > 0$ and $g_3 > 0$ such that $\Delta = g_2^3 - 27g_3^2 > 0$ (if $g_3 = 0$, $|\omega'| = \omega$; see lemniscatic case), compute $\bar{g}_2 = g_2g_3^{-2/3}$. From **Table 18.1**, determine $\omega g_3^{1/6}$ and $\omega' g_3^{1/6}$, thence ω and ω' .

Example 6.

Given $g_2 = 10$, $g_3 = 2$, find ω and ω' . With $\bar{g}_2 = g_2g_3^{-2/3} = 6.299605249$, from **Table 18.1** $\omega g_3^{1/6} = 1.1267806$ and $\omega' g_3^{1/6} = 1.2324295i$ whence $\omega = 1.003847$ and $\omega' = 1.097970i$.

Example 7.

Given $g_2 = 8$, $g_3 = 4$, find ω and ω' . With $\bar{g}_2 = g_2g_3^{-2/3} = 3.174802104$, from **Table 18.1** $\omega g_3^{1/6} = 1.2718310$ and $\omega' g_3^{1/6} = 1.8702425i$ whence $\omega = 1.009453$ and $\omega' = 1.484413i$.

$\Delta < 0$

Given g_2 and $g_3 > 0$ such that $\Delta = g_2^3 - 27g_3^2 < 0$ (if $g_3 = 0$, $|\omega_2'| = \omega_2$; see pseudo-lemniscatic case), compute $\bar{g}_2 = g_2g_3^{-2/3}$. From **Table 18.1**, determine $\omega_2 g_3^{1/6}$ and $\omega_2' g_3^{1/6}$, thence ω_2 and ω_2' .

Example 6.

Given $g_2 = -10$, $g_3 = 2$, find ω_2 and ω_2' . With $\bar{g}_2 = g_2g_3^{-2/3} = -10/1.58740105 = -6.2996053$, from **Table 18.1** $\omega_2 g_3^{1/6} = 1.5741349$ and $\omega_2' g_3^{1/6} = 1.7124396i$ whence $\omega_2 = 1.4023948$ and $\omega_2' = 1.5256102i$.

Example 7.

Given $g_2 = 7$, $g_3 = 6$, find ω_2 and ω_2' . With $\bar{g}_2 = g_2g_3^{-2/3} = 7/3.30192725 = 2.119974$, from **Table 18.1** $\omega_2 g_3^{1/6} = 1.3423442$ and $\omega_2' g_3^{1/6} = 3.144114i$ whence $\omega_2 = .99579976$ and $\omega_2' = 2.3324183i$.

Computation of \mathcal{P} , \mathcal{P}' , or ζ for Given z and Arbitrary g_2, g_3

(or arbitrary periods from which g_2 and g_3 can be computed—in any case, periods must be known, at least approximately)

First reduce the problem (if necessary) to computation for a point z in the Fundamental Rectangle by use of appropriate results from **18.2**.

FIGURE 18.16

Method 1 (as accurate as desired)

If both x and y are "small," (point in double-cross hatched region) use Laurent's series in z directly. If either x or y is "large," use Laurent's series on $0x$, then on $0y$ and finally use an addition formula. (For \mathcal{P}' an alternative is to get \mathcal{P} , then compute the appropriate root of $\mathcal{P}'^2=4\mathcal{P}^3-g_2\mathcal{P}-g_3$; see 18.8.)

$$\Delta > 0$$

Method 2 (for \mathcal{P} or \mathcal{P}' only)

Compute $e_i (i=1,2,3)$ (if only g_2, g_3 are given use Table 18.1 to get the periods, then get e_i in Table 18.3; if periods are also given, use Table 18.3 directly). In any case, obtain $m(=[e_2-e_3]/[e_1-e_3])$, thence Jacobi's functions $\text{sn}(z^*|m)$, $\text{cn}(z^*|m)$, $\text{dn}(z^*|m)$, from 16.4 and 16.21 and \mathcal{P} or \mathcal{P}' from 18.9.11-18.9.12.

Method 3 (accuracy limited by Table 4.16 of $e^{-\pi x}$ and by the method of getting periods).

Obtain periods, their ratio a , then $q=e^{-\pi a}$ from Table 4.16. Hence get $\vartheta_i(0), i=2,3,4$ from truncated series 18.10.21-23. Compute appropriate ϑ functions for $z=x$ and for $z=iy$, whence get $\mathcal{P}(x), \mathcal{P}'(x)$ and/or $\zeta(x), \mathcal{P}(iy), \mathcal{P}'(iy)$ and/or $\zeta(iy)$, then use an addition formula (if either x or y is "small", it is probably easier to use Laurent's series).

Example 8. Given $z=.07+.1i, g_2=10, g_3=2$, find \mathcal{P} .

Using Laurent's series directly with

$$\begin{aligned} c_2 &= .5 \\ c_3 &= .07142\ 85714 \\ c_4 &= .08333\ 33333 \\ c_5 &= .00974\ 02597 \\ z^{-2} &= -22.97193\ 820 - 63.06022\ 25i \\ +c_2z^2 &= - .00255\ 000 + .00700\ 00i \\ +c_3z^4 &= - .00001\ 214 - .00001\ 02i \\ +c_4z^6 &= + .00000\ 024 - .00000\ 01i \end{aligned}$$

$$\mathcal{P}(z) = -22.97450\ 010 - 63.05323\ 28i.$$

Example 9. Given $z=15+73i, g_2=8, g_3=4$, find \mathcal{P} . From Example 7, $\omega=1.009453, \omega'=1.484413i$. From Table 18.3, $e_1=1.61803\ 37, e_3=-.99999\ 96$, whence $m=.14589\ 79$. From 18.2.18 with $M=7$ and $N=24, \mathcal{P}(.867658+1.748176i)=\mathcal{P}(15+73i)$. Since z lies in R_2 , by 18.2.31 $\mathcal{P}(15+73i)=\overline{\mathcal{P}}(.867658+1.22065i)$. From 16.4 with $z^*=1.40390+1.97505i, \text{sn}(z^*|m)=2.46550+1.96527i$. Using 18.9.11, $\mathcal{P}(15+73i)=-.57743+.067797i$.

$$\Delta < 0$$

Method 2 (for \mathcal{P} or \mathcal{P}' only)

Compute e_2 and H_2 (if only g_2, g_3 are given, use Table 18.1 to get the periods, then get e_i in Table 18.3; if periods are also given use Table 18.3 directly). In any case, obtain $m(=\frac{1}{2}-3e_2/4H_2)$ thence Jacobi's functions $\text{sn}(z'|m), \text{cn}(z'|m), \text{dn}(z'|m)$, from 16.4 and 16.21 and \mathcal{P} or \mathcal{P}' from 18.9.11-18.9.12.

Method 3 (accuracy limited as in the case $\Delta > 0$).

Obtain periods, their ratio a , thence $q_2=e^{-\pi a/2}$ from Table 4.16. Then proceed as in the case $\Delta > 0$, using corresponding formulas.

Example 8. Given $z=.1+.03i, g_2=-10, g_3=2$, find \mathcal{P} .

Using Laurent's series directly with

$$\begin{aligned} c_2 &= -.5 \\ c_3 &= .07142\ 85714 \\ c_4 &= .80333\ 33333 \\ z^{-2} &= 76.59287\ 938 - 50.50079\ 960i \\ c_2z^2 &= -.00455\ 000 - .00300\ 000i \\ c_3z^4 &= +.00000\ 334 + .00000\ 780i \\ c_4z^6 &= -.00000\ 002 + .00000\ 011i \end{aligned}$$

$$\mathcal{P}(z) = 76.58833\ 270 - 50.50379\ 169i.$$

Example 9. Given $z=1.75+3.6i, g_2=7, g_3=6$, find \mathcal{P} . From Example 7, $\omega_2=.99579\ 98, \omega'_2=2.33241\ 83i$. Using 18.2.18 with $M=1, N=1, \mathcal{P}(1.75+3.6i)=\mathcal{P}(-.24159\ 96-1.064836i)=\mathcal{P}(.24159\ 96+1.0648\ 36i)$. With $\Delta < 0$ from Table 18.3, $e_1=-.81674\ 362+.50120\ 90i, e_2=1.63348\ 724, e_3=-.81674\ 362-.50120\ 90i$ whence $m=.01014\ 3566, H_2^2=1.58144\ 50$, so that $z'=2zH_2^2=.76415\ 29+3.367959i$. From 16.4, $\text{cn}(z'|m)=4.00543\ 66-12.32465\ 69i$. Applying 18.9.11, $\mathcal{P}(1.75+3.6i)=-.960894-.383068i$.

$\Delta > 0$

Example 10. Given $\omega=10$, $\omega'=20i$, find $\zeta(9+19i)$ by use of theta functions, **18.10** and addition formulas.

For the period ratio $a=\omega'/\omega i=2$ with the aid of **Table 4.16**, $q=e^{-2\pi}=0.0186\ 74427$.

Using the truncated approximations **18.10.21-18.10.23** we compute the theta functions for argument zero. Using **16.27.1-16.27.4** we compute the theta functions for arguments v where $z=x$ and $z=iy$. Then, with **18.10.5-18.10.7** together with **18.10.9** and **18.10.18** we obtain $\zeta(9)=.09889\ 5484$, $\zeta(19i)=-.00120\ 0155i$, $\mathcal{P}(9)=.01706\ 9647$, $\mathcal{P}'(9)=-.00125\ 8460$, $\mathcal{P}(19i)=-.00861\ 2615$, $\mathcal{P}'(19i)=-.00003\ 757i$. Using the addition formula **18.4.3**, we obtain $\zeta(9+19i)=.07439\ 49-.00046\ 88i$.

Use of Table 18.2 in Computing \mathcal{P} , \mathcal{P}' , ζ for Special Period Ratios

If the problem is reduced to computing \mathcal{P} , \mathcal{P}' , ζ in the Fundamental Rectangle for the case when the real half-period is unity and pure imaginary half-period is ia , for certain values of a **Table 18.2** may be used. Consider \mathcal{P} as an example. If $|z|$ is "small", then use Laurent's series directly for $\mathcal{P}(z)$ [invariants for use in the series are given in **Table 18.3**].

If x is "large" and y "small" use **Table 18.2** to obtain $x^2\mathcal{P}(x)$ and $x^3\mathcal{P}'(x)$, thence $\mathcal{P}(x)$ and $\mathcal{P}'(x)$; use Laurent's series to obtain $\mathcal{P}(iy)$ and $\mathcal{P}'(iy)$; finally, use addition formula **18.4.1**.

For x "small" and y "large", reverse the procedure. For both x and y "large," use **Table 18.2** to obtain $\mathcal{P}(x)$, $\mathcal{P}'(x)$, $\mathcal{P}(iy)$ and $\mathcal{P}'(iy)$, thence use addition formula **18.4.1**.

Similar procedures apply to \mathcal{P}' or ζ . For \mathcal{P}' , one can also first obtain \mathcal{P} , then compute $\mathcal{P}'^2=4\mathcal{P}^3-g_2\mathcal{P}-g_3$ and extract the appropriate square root (see **18.8** re choice of sign for \mathcal{P}').

 $\Delta > 0$

Example 11. Compute $\mathcal{P}(.8+i)$ when $a=1.2$. Using **Table 18.2** or Laurent's series **18.5.1-4** with $g_2=9.15782\ 851$ and $g_3=3.23761\ 717$ from **Table 18.3**, $\mathcal{P}(.8)=1.92442\ 11$, $\mathcal{P}'(.8)=-2.76522\ 05$, $\mathcal{P}(i)=-1.40258\ 06$ and $\mathcal{P}'(i)=-1.19575\ 58i$. Using the addition formula **18.4.1** $\mathcal{P}(.8+i)=-.381433-.149361i$.

Example 12. Compute $\zeta(.02+3i)$ for $a=4$. Using **Table 18.2** or Laurent's series **18.5.1-5** with

$$g_2=8.11742\ 426$$

$$g_3=4.45087\ 587$$

from **Table 18.3**,

$$\zeta(.02)=49.99999\ 89,$$

$$\mathcal{P}(.02)=2500.00016,$$

$$\mathcal{P}'(.02)=-249999.98376,$$

$$\zeta(3i)=.89635\ 173i,$$

$$\mathcal{P}(3i)=-.82326\ 511,$$

$$\mathcal{P}'(3i)=-.00249\ 829i.$$

Applying the addition formula **18.4.3**, $\zeta(.02+3i)=.016465+.89635i$.

 $\Delta < 0$

Example 10. Given $\omega_2=5$, $\omega'_2=7i$ find $\mathcal{P}'(3+2i)$ by use of theta functions, **18.10** and addition formulas.

With the use of **Table 4.16** and **18.10.2**, $q=ie^{-7\pi}=.11090\ 12784i$.

The theta functions are computed for argument zero using **18.10.21-18.10.23** and the theta functions for arguments v_1 and v_2 corresponding to $z=z_1+z_2$ using **16.27.1-16.27.4**. Using **18.10.5-18.10.6** together with **18.10.10**, we find $\mathcal{P}(3)=.10576\ 946$, $\mathcal{P}(2i)=-.24497\ 773$, $\mathcal{P}'(3)=-.07474140$, $\mathcal{P}'(2i)=-.25576\ 007i$. The addition formula **18.4.1** yields $\mathcal{P}(3+2i)=.01763\ 210-.07769\ 187i$, and **18.4.2** yields $\mathcal{P}'(3+2i)=-.00069\ 182+.04771\ 305i$.

 $\Delta < 0$

Example 11. Compute $\mathcal{P}(.9+.1i)$ for $a=1.05$. Using **Table 18.2** or Laurent's series **18.5.1-4** with $g_2=-42.41653\ 54$ and $g_3=9.92766\ 62$ from **Table 18.3**, $\mathcal{P}(.9)=.34080\ 33$, $\mathcal{P}'(.9)=-2.164801$, $\mathcal{P}(.1i)=-99.97876$, $\mathcal{P}'(.1i)=-2000.4255i$. With the addition formula **18.4.1** $\mathcal{P}(.9+.1i)=.231859-.215149i$.

Example 12. Compute $\mathcal{P}'(.4+.9i)$ for $a=2$. Using **Table 18.2** or Laurent's series **18.5.1-4**, with

$$g_2=4.54009\ 85,$$

$$g_3=8.38537\ 94$$

from **Table 18.3**,

$$\mathcal{P}(.4)=6.29407\ 07,$$

$$\mathcal{P}'(.4)=-30.99041,$$

$$\mathcal{P}(.9i)=-1.225548,$$

$$\mathcal{P}'(.9i)=-3.19127\ 03i.$$

Using the addition formulas **18.4.1-2**,

$$\mathcal{P}'(.4+.9i)=1.10519\ 76-.56489\ 00i.$$

Computation of σ for Given z and Arbitrary g_2 and g_3

(or periods from which g_2 and g_3 can be computed—in any case, periods must be known, at least approximately)

First reduce the problem (if necessary) to computation for a point z in the Fundamental Rectangle (see 18.2). After final reduction let z denote the point obtained.

$$\Delta > 0$$

If $\Re z > \omega/2$ or,

$\Im z > \omega'/2$, use duplication formula

$$\sigma(z) = -\mathcal{P}'(z/2)\sigma^4(z/2),$$

obtaining $\sigma(z/2)$ by use of Maclaurin series for σ and $\mathcal{P}'(z/2)$ by method explained above. Otherwise, simply use Maclaurin series for σ directly.

An alternate method is to use theta functions 18.10 first computing q and $\vartheta_i(0)$, $i=2, 3, 4$.

$$\Delta > 0$$

Example 13. Compute $\sigma(.4+1.3i)$ for $g_2=8$, $g_3=4$. From Example 7, $\omega=1.009453$ and $\omega'=1.484413i$. Since $\Im z > \omega'/2$, the Maclaurin series 18.5.6 is used to obtain $\sigma(z/2)=\sigma(.2+.65i)=.19543\ 86+.64947\ 28i$, the Laurent series 18.5.4 to obtain $\mathcal{P}'(.2+.65i)=5.02253\ 80-3.56066\ 93i$. The duplication formula 18.4.8 gives $\sigma(.4+1.3i)=.278080+1.272785i$.

$$\Delta < 0$$

If $\Re z > \omega_2/2$ or

$\Im z > \omega'_2/4$, use duplication formula as in case $\Delta > 0$. Otherwise, use Maclaurin series for σ directly.

$$\Delta < 0$$

Example 13. Compute $\sigma(.8+.4i)$ for $g_2=7$, $g_3=6$. From Example 7, $\omega_2=.99579\ 976$, $\omega'_2=2.33241\ 83i$. Since $\Re z > \omega_2/2$, the Maclaurin series 18.5.6 is used to obtain $\sigma(z/2)=\sigma(.4+.2i)=.40038\ 019+.19962\ 017i$, the Laurent series 18.5.4 to obtain $\mathcal{P}'(.4+.2i)=-3.70986\ 70+22.218544i$. The duplication formula 18.4.8 gives $\sigma(.8+.4i)=.81465\ 765+.38819\ 473i$.

Given $\sigma(\mathcal{P}, \mathcal{P}', \xi)$ corresponding to a point in the Fundamental Rectangle, as well as g_2 and g_3 or the equivalent, find z .

Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

If the given function does not correspond to a value of z in the Fundamental Rectangle (see Conformal Maps) the problem can always be reduced to this case by the use of appropriate reduction formulas in 18.2. This process is relatively simple for $\mathcal{P}(z)$, more difficult for the other functions (e.g. if $\Delta > 0$ and $\mathcal{P}=a+ib$, where $b > 0$, simply consider $\overline{\mathcal{P}}=a-ib$ and find z_1 in R_1 [Figure 18.1]; then compute $z_2=\overline{z_1}+2\omega'$, the point in R_2 corresponding to the given \mathcal{P}).

$$\Delta > 0$$

Example 14. Given $\mathcal{P}=1-i$, $g_2=10$, $g_3=2$, find z . Using the first three terms of the reversed series 18.5.25 $z_1 \approx .727+.423i$. The Laurent series 18.5.1 gives

$$\begin{aligned} \mathcal{P}(z_1) &= \mathcal{P}(.727+.423i) = .825 - .895i \\ \text{and} \quad \mathcal{P}(z_2) &= \mathcal{P}(.697+.393i) = .938 - 1.038i. \end{aligned}$$

Inverse interpolation gives $z_1^{(1)} = .707+.380i$. Repeated applications of the above procedure yield $z = .706231+.379893i$.

$$\Delta < 0$$

Example 14. Given $\mathcal{P}=1+i$, $g_2=-10$, $g_3=2$, find z . From Example 6, $\omega_2=1.40239\ 48$ and $\omega'_2=1.52561\ 02i$. Since $b > 0$, z exists in R_2 and z is computed with $\overline{\mathcal{P}}$. Using 18.5.25 with $\alpha_2=-1.25$, $\alpha_3=.25$, $u=[(\overline{\mathcal{P}})^{-1}]^{1/2}$ and the coefficients c_n from Example 8

$$\begin{aligned} 2u &= 1.55377\ 3973 + .64359\ 42493i \\ c_2u^5 &= .08044\ 9281 - .19422\ 17466i \\ c_3u^7 &= -.01961\ 9359 + .00812\ 66047i \\ \frac{\alpha_2^2 u^9}{3} &= -.10115\ 7160 - .04190\ 06673i \end{aligned}$$

$\Delta > 0$

Example 15. Given $\zeta = 10 - 15i$, $g_2 = 8$, $g_3 = 4$, find z . Using the reversed series 18.5.40 with

$$\begin{aligned} A_5 &= -.13333\ 333, \\ A_7 &= -.02857\ 14286, \\ u &= .03076\ 923076 + .04615\ 384615i \\ A_5 u^5 &= -.00000\ 001402 + .00000\ 006860i \\ A_7 u^7 &= -.00000\ 000004 - .00000\ 000003i \\ z &= .03076\ 921670 + .04615\ 391472i. \end{aligned}$$

 $\Delta < 0$

Stopping with the term in u^7 , $z_1 \approx .81 + .23i$. Assuming $\Delta z = -.03 - .01i$, using 18.5.1, $\mathcal{P}(.81 + .23i) = .91410\ 95 - .86824\ 37i$, $\mathcal{P}(.78 + .22i) = 1.03191\ 60 - .91795\ 22i$; with inverse interpolation $z_1^{(1)} = .7725 + .2404i$. Repeated applications of inverse interpolation yield $z = .772247 - .239258i$.

Example 15. Given $\sigma = .4 + .1i$, $g_2 = 7$, $g_3 = 6$, find z . Using the reversed series 18.5.70 with $\gamma_2 = .14583$, $\gamma_3 = .05$

$$\begin{aligned} \sigma &= +.40000\ 000 + .10000\ 000i \\ \frac{\gamma_2 \sigma^5}{5} &= +.00011\ 783 + .00032\ 696i \\ \frac{\gamma_3 \sigma^7}{7} &= -.00000\ 208 + .00001\ 432i \\ \frac{3\gamma_2^2 \sigma^9}{14} &= -.00000\ 093 + .00000\ 126i \\ \frac{19\gamma_2 \gamma_3 \sigma^{11}}{55} &= -.00000\ 013 + .00000\ 006i \\ z &= .40011\ 469 + .10034\ 260i \end{aligned}$$

Methods of Computation of \mathcal{P} (\mathcal{P}' , ζ or σ) for Given z and Given g_2, g_3 (or the equivalent), with the Use of Automatic Digital Computing Machinery

(a) Integration of Differential Equation

\mathcal{P} and \mathcal{P}' may be generated for any z close enough to a "known point" z^* ($\mathcal{P}(z^*)$ and $\mathcal{P}'(z^*)$ being given) by integrating $\mathcal{P}'' = 6\mathcal{P}^2 - g_2/2$. A program to do this on SWAC, via a modification of the Hammer-Hollingsworth method (MTAC, July 1955, pp. 92-96) due to Dr. P. Henrici, exists at Numerical Analysis Research, UCLA (code number 00600, written by W. L. Wilson, Jr.). The program has been tested numerically in the equianharmonic case, using integration steps of various sizes. For example, if one starts with $z^* = \omega_2$, using an "integration step" (h, k) , where h and k are respectively the horizontal and vertical components of a step, with (h, k) having one of the six values $(\pm 2h_0, 0)$, $(\pm h_0, \pm k_0)$, $h_0 = \omega_2/2000$, $k_0 = |\omega_2|/2000$, one can expect almost 8S in \mathcal{P} and 7S in \mathcal{P}' after 1000 steps, unless z is too near a pole.

(b) Use of Series

The process of reducing the computation problem to one in which z is in the Fundamental Rectangle can obviously be mechanized. Inside the Fundamental Rectangle the direct use of Laurent's series is appropriate when the period

ratio a is not too large. However, if $a \geq \sqrt{3}$ ($\Delta > 0$) or $a \geq 2\sqrt{3}$ ($\Delta < 0$), the series will diverge at the far corner of the Fundamental Rectangle, so that use may be made of an appropriate duplication formula. Alternatively, one may compute the functions on $0x$ and $0y$, then use an addition formula. Even so, the series will diverge at $z = ia$ if $a \geq 2$ ($\Delta > 0$) and at $z = ia/2$ if $a \geq 4$ ($\Delta < 0$).

For great accuracy, multiple precision operations might be necessary. Double precision floating point mode has been used in a program, written for SWAC, to compute \mathcal{P} , \mathcal{P}' and ζ .

For computation of σ , use of the Maclaurin series throughout the Fundamental Rectangle is probably simplest (series converges for all z).

Mention should be made of the possible use of the series defining the \wp functions. These series converge for all complex v , and the computation of \mathcal{P} , \mathcal{P}' , ζ and σ by 18.10.5-18.10.8 could easily be mechanized. The series involved have the advantage of converging very fast, even in case $\Delta < 0$, where $|q| \leq e^{-\tau/2}$ ($q \leq e^{-\tau}$ if $\Delta > 0$).

Use of Maps

If the problem (of computing \mathcal{P} , \mathcal{P}' , ζ or σ for given z) is reduced to the case where the real half-period is unity and imaginary half-period is one of those used in the maps in 18.8 inspection of the

appropriate figure will give the value of $\mathcal{P}(z)$ [$\zeta(z)$ or $\sigma(z)$] to 2-3S. If \mathcal{P}' is wanted instead, get \mathcal{P} , use 18.6.3 to obtain \mathcal{P}'^2 and select sign (s) of \mathcal{P}' appropriately. (See Conformal Mapping (18.8) for choice of sign of square root of \mathcal{P}'^2).

Computation of z_0

Given g_2, g_3 (or equivalent)

Since $z_0^2 \mathcal{P}(z_0) = 0$, the Laurent's series gives

$$0 = 1 + c_2 u^2 + c_3 u^3 + c_4 u^4 + \dots$$

where $u = z_0^2$. We may solve this equation [by Graeffe's (root-squaring) process or otherwise] for its absolutely smallest root [having found an

approximation to $|z_0|$ by Graeffe's process, we may use the fact that $z_0 = \omega + iy_0 (\Delta > 0)$, $z_0 = \omega_2 + iy_0 (\Delta < 0)$ to obtain an approximation to z_0].

It is noted that y_0/ω is a monotonic decreasing function of (period ratio) $a \geq 1$ for $\Delta > 0$ and

$$[1 \geq y_0/\omega > \frac{2}{\pi} \operatorname{arccosh} \sqrt{3} (\approx .7297)].$$

y_0/ω_2 is a monotonic increasing function of a for $\Delta < 0$ and

$$[0 \leq y_0/\omega_2 < \frac{2}{\pi} \operatorname{arccosh} \sqrt{3}]$$

Further data is available from **Table 18.2** or from Conformal Maps defined by $\mathcal{P}(z)$.

If the real half-period $\neq 1$, see 18.2 Homogeneity Relations. Interpolation with respect to u will, in general, be difficult because of the non-uniform subintervals involved. Aitken's interpolation may be used in this case. As few as 3S may be obtained. For the computation of \wp , \wp' or ζ at $z=r+iy$, an addition formula may be used (18.4 and Examples 11-12).

If the real half-period $\neq 1$, see 18.2 Homogeneity Relations. Interpolation with respect to a will, in general, be difficult because of the non-uniform subintervals involved. Aitken's interpolation may be used in this case. As few as 3S may be obtained. For the computation of \mathcal{P} , \mathcal{P}' or ζ at $z=x+iy$, an addition formula may be used (18.4 and Examples 11-12).

For $\alpha=1$: $g_2=\omega^4$, $g_3=0$, $e_1=\omega^2/2$, $e_3=-\omega^2/2$, $\eta=\pi/4$, $\eta'/i=-\pi/4$.

For $\alpha=\infty$: $g_2=\pi^4/12$, $g_3=\pi^6/216$, $e_1=\pi^2/6$, $e_3=-\pi^2/12$, $\eta=\pi^2/12$, $\eta'/i=\infty$.

($\omega=1.85407\ 4677$ is the real half-period in the Lemniscatic case 18.14.)

For $4<\alpha<\infty$, to obtain η' use Legendre's relation $\eta'=\eta\omega'-\pi i/2$.

To obtain the corresponding values of tabulated quantities when the real half-period $\omega \neq 1$, multiply g_2 by ω^{-4} , g_3 by ω^{-6} , e_i by ω^{-2} and η by ω^{-1} .

For $a=1$: $g_2 = -4\omega^4, g_3 = 0, \mathcal{R}e_1 = 0, \mathcal{I}e_1 = \omega^2, \eta_2 = \pi/2, \eta_2^2/i = -\pi/2$.
 For $a=\infty$: $g_2 = \pi^4/12, g_3 = \pi^6/216, \mathcal{R}e_1 = -\pi^2/12, \mathcal{I}e_1 = 0, \eta_2 = \pi^2/12, \eta_2^2/i = \infty$.
 ($\omega = 1.85407\ 4677$ is the real half-period in the Lemniscatic case 18.14.)
 For $4 < a < \infty$, to obtain η_2^2 use Legendre's relation $\eta_2^2 = \eta_2 \omega_2 - \pi i$.
 To obtain the corresponding values of tabulated quantities when the real half-period $\omega_2 \neq 1$, multiply g_2 by ω_2^{-4} , g_3 by ω_2^{-6} , e_i by ω_2^{-2} and η by ω_2^{-1} .

Other tables of $W(a, x)$ and the tables of $U(a, x)$ and $V(a, x)$ were prepared on EDSAC 2 at the University Mathematical Laboratory, Cambridge, England, using a program prepared by Miss Joan Walsh for solution of general second order linear homogeneous differential equations with quadratic polynomial coefficients. The auxiliary tables were prepared at the Computation Laboratory of the National Bureau of Standards.

19. Parabolic Cylinder Functions

Mathematical Properties

19.1. The Parabolic Cylinder Functions

Introductory

These are solutions of the differential equation

$$19.1.1 \quad \frac{d^2y}{dx^2} + (ax^2 + bx + c)y = 0$$

with two real and distinct standard forms

$$19.1.2 \quad \frac{d^2y}{dx^2} - (\frac{1}{4}x^2 + a)y = 0$$

$$19.1.3 \quad \frac{d^2y}{dx^2} + (\frac{1}{4}x^2 - a)y = 0$$

The functions

19.1.4

$$y(a, x) \quad y(a, -x) \quad y(-a, ix) \quad y(-a, -ix)$$

are all solutions either of 19.1.2 or of 19.1.3 if any one is such a solution.

Replacement of a by $-ia$ and x by $xe^{i\pi}$ converts 19.1.2 into 19.1.3. If $y(a, x)$ is a solution of 19.1.2, then 19.1.3 has solutions:

19.1.5

$$y(-ia, xe^{i\pi}) \quad y(-ia, -xe^{i\pi}) \\ y(ia, -xe^{-i\pi}) \quad y(ia, xe^{-i\pi})$$

Both variable x and the parameter a may take on general complex values in this section and in many subsequent sections. Practical applications appear to be confined to real solutions of real equations; therefore attention is confined to such solutions, and, in general, formulas are given for the two equations 19.1.2 and 19.1.3 independently. The principal computational consequence of the remarks above is that reflection in the y -axis produces an independent solution in almost all cases (Hermite functions provide an exception), so that tables may be confined either to positive x or to a single solution of 19.1.2 or 19.1.3.

The Equation $\frac{d^2y}{dx^2} - (\frac{1}{4}x^2 + a)y = 0$

19.2. Power Series in x

Even and odd solutions of 19.1.2 are given by

19.2.1

$$y_1 = e^{-\frac{1}{2}x^2} M(\frac{1}{2}a + \frac{1}{4}, \frac{1}{2}, \frac{1}{2}x^2) \\ = e^{-\frac{1}{2}x^2} \left\{ 1 + (a + \frac{1}{2}) \frac{x^2}{2!} + (a + \frac{1}{2})(a + \frac{5}{2}) \frac{x^4}{4!} + \dots \right\} \\ = e^{-\frac{1}{2}x^2} {}_1F_1(\frac{1}{2}a + \frac{1}{4}; \frac{1}{2}; \frac{1}{2}x^2)$$

19.2.2

$$y_2 = e^{\frac{1}{2}x^2} M(-\frac{1}{2}a + \frac{1}{4}, \frac{1}{2}, -\frac{1}{2}x^2) \\ = e^{\frac{1}{2}x^2} \left\{ 1 + (a - \frac{1}{2}) \frac{x^2}{2!} + (a - \frac{1}{2})(a - \frac{5}{2}) \frac{x^4}{4!} + \dots \right\}$$

19.2.3

$$y_2 = xe^{-\frac{1}{2}x^2} M(\frac{1}{2}a + \frac{3}{4}, \frac{3}{2}, \frac{1}{2}x^2) \\ = e^{-\frac{1}{2}x^2} \left\{ x + (a + \frac{3}{2}) \frac{x^3}{3!} + (a + \frac{3}{2})(a + \frac{7}{2}) \frac{x^5}{5!} + \dots \right\}$$

19.2.4

$$y_2 = xe^{\frac{1}{2}x^2} M(-\frac{1}{2}a + \frac{3}{4}, \frac{3}{2}, -\frac{1}{2}x^2) \\ = e^{\frac{1}{2}x^2} \left\{ x + (a - \frac{3}{2}) \frac{x^3}{3!} + (a - \frac{3}{2})(a - \frac{7}{2}) \frac{x^5}{5!} + \dots \right\}$$

these series being convergent for all values of x (see chapter 13 for $M(a, c, z)$).

Alternatively,

19.2.5

$$y_1 = 1 + a \frac{x^2}{2!} + (a^2 + \frac{1}{2}) \frac{x^4}{4!} + (a^3 + \frac{7}{2}a) \frac{x^6}{6!} \\ + (a^4 + 11a^2 + \frac{15}{4}) \frac{x^8}{8!} + (a^5 + 25a^3 + \frac{211}{4}a) \frac{x^{10}}{10!} + \dots$$

19.2.6

$$y_2 = x + a \frac{x^3}{3!} + (a^2 + \frac{3}{2}) \frac{x^5}{5!} + (a^3 + \frac{13}{2}a) \frac{x^7}{7!} \\ + (a^4 + 17a^2 + \frac{63}{4}) \frac{x^9}{9!} + (a^5 + 35a^3 + \frac{531}{4}a) \frac{x^{11}}{11!} + \dots$$

in which non-zero coefficients a_n of $x^n/n!$ are connected by

$$19.2.7 \quad a_{n+2} = a \cdot a_n + \frac{1}{4}n(n-1)a_{n-2}$$

19.3. Standard Solutions

These have been chosen to have the asymptotic behavior exhibited in 19.8. The first is Whittaker's function [19.8, 19.9] in a more symmetrical notation.

19.3.1

$$U(a, x) = D_{-a-\frac{1}{2}}(x) = \cos \pi(\frac{1}{4} + \frac{1}{2}a) \cdot Y_1 - \sin \pi(\frac{1}{4} + \frac{1}{2}a) \cdot Y_2$$

19.3.2

$$V(a, x) = \frac{1}{\Gamma(\frac{1}{2}-a)} \{ \sin \pi(\frac{1}{4} + \frac{1}{2}a) \cdot Y_1 + \cos \pi(\frac{1}{4} + \frac{1}{2}a) \cdot Y_2 \}$$

in which

19.3.3 $Y_1 = \frac{1}{\sqrt{\pi}} \frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{1/2}a+1} y_1 = \sqrt{\pi} \frac{\sec \pi(\frac{1}{4} + \frac{1}{2}a)}{2^{1/2}a+1 \Gamma(\frac{3}{4} + \frac{1}{2}a)} y_1$

19.3.4 $Y_2 = \frac{1}{\sqrt{\pi}} \frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)}{2^{1/2}a-1} y_2 = \sqrt{\pi} \frac{\csc \pi(\frac{1}{4} + \frac{1}{2}a)}{2^{1/2}a-1 \Gamma(\frac{1}{4} + \frac{1}{2}a)} y_2$

19.3.5

$$U(a, 0) = \frac{\sqrt{\pi}}{2^{1/2}a+1 \Gamma(\frac{3}{4} + \frac{1}{2}a)}$$

$$U'(a, 0) = -\frac{\sqrt{\pi}}{2^{1/2}a-1 \Gamma(\frac{1}{4} + \frac{1}{2}a)}$$

19.3.6

$$V(a, 0) = \frac{2^{1/2}a+1 \sin \pi(\frac{3}{4} - \frac{1}{2}a)}{\Gamma(\frac{3}{4} - \frac{1}{2}a)}$$

$$V'(a, 0) = \frac{2^{1/2}a+1 \sin \pi(\frac{1}{4} - \frac{1}{2}a)}{\Gamma(\frac{1}{4} - \frac{1}{2}a)}$$

In terms of the more familiar $D_n(x)$ of Whittaker,

19.3.7 $U(a, x) = D_{-a-\frac{1}{2}}(x)$

19.3.8

$$V(a, x) = \frac{1}{\pi} \Gamma(\frac{1}{2}+a) \{ \sin \pi a \cdot D_{-a-\frac{1}{2}}(x) + D_{-a-\frac{1}{2}}(-x) \}$$

19.4. Wronskian and Other Relations

19.4.1 $W\{U, V\} = \sqrt{2/\pi}$

19.4.2

$$\pi V(a, x) = \Gamma(\frac{1}{2}+a) \{ \sin \pi a \cdot U(a, x) + U(a, -x) \}$$

19.4.3

$$\Gamma(\frac{1}{2}+a)U(a, x) = \pi \sec^2 \pi a \{ V(a, -x) - \sin \pi a \cdot V(a, x) \}$$

19.4.4

$$\frac{\Gamma(\frac{1}{4}-\frac{1}{2}a) \cos \pi(\frac{1}{4} + \frac{1}{2}a)}{\sqrt{\pi} 2^{1/2}a-1} y_1 = 2 \sin \pi(\frac{3}{4} + \frac{1}{2}a) \cdot Y_1 = U(a, x) + U(a, -x)$$

19.4.5

$$-\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a) \sin \pi(\frac{1}{4} + \frac{1}{2}a)}{\sqrt{\pi} 2^{1/2}a-1} y_2 = 2 \cos \pi(\frac{3}{4} + \frac{1}{2}a) \cdot Y_2 = U(a, x) - U(a, -x)$$

19.4.6

$$\sqrt{2\pi}U(-a, \pm ix) = \Gamma(\frac{1}{2}+a) \{ e^{-i\pi(1/2+a)} U(a, \pm x) + e^{i\pi(1/2+a)} U(a, \mp x) \}$$

19.4.7

$$\sqrt{2\pi}U(a, \pm x) = \Gamma(\frac{1}{2}-a) \{ e^{-i\pi(1/2-a)} U(-a, \pm ix) + e^{i\pi(1/2-a)} U(-a, \mp ix) \}$$

19.5. Integral Representations

A full treatment is given in [19.11] section 4. Representations are given here for $U(a, z)$ only; others may be derived by use of the relations given in 19.4.

19.5.1 $U(a, z) = \frac{\Gamma(\frac{1}{2}-a)}{2\pi i} e^{-1/2 z^2} \int_{\alpha} e^{zs - 1/2 s^2} s^{a-1/2} ds$

19.5.2 $= \frac{\Gamma(\frac{1}{2}-a)}{2\pi i} e^{1/2 z^2} \int_{\beta} e^{-1/2 t^2} (z+t)^{a-1/2} dt$

where α and β are the contours shown in Figures 19.1 and 19.2.

When $a + 1/2$ is a positive integer these integrals become indeterminate; in this case

19.5.3 $U(a, z) = \frac{1}{\Gamma(\frac{1}{2}+a)} e^{-1/2 z^2} \int_0^{\infty} e^{-zs - 1/2 s^2} s^{a-1/2} ds$

FIGURE 19.1

FIGURE 19.2

$$\begin{aligned}
 19.5.4 \quad U(a, z) &= \frac{1}{\sqrt{2\pi i}} e^{iz^2} \int_{\epsilon} e^{-zs + \frac{1}{2}s^2} s^{-a-\frac{1}{2}} ds \\
 19.5.5 \quad &= \frac{e^{(a-\frac{1}{2})\pi i}}{\sqrt{2\pi i}} e^{iz^2} \int_{\epsilon_3} e^{zs + \frac{1}{2}s^2} s^{-a-\frac{1}{2}} ds \\
 19.5.6 \quad &= \frac{e^{-(a-\frac{1}{2})\pi i}}{\sqrt{2\pi i}} e^{iz^2} \int_{\epsilon_4} e^{zs + \frac{1}{2}s^2} s^{-a-\frac{1}{2}} ds
 \end{aligned}$$

where ϵ , ϵ_3 and ϵ_4 are shown in Figures 19.3 and 19.4.

FIGURE 19.4
 On ϵ_3 $\frac{1}{2}\pi < \arg s < \frac{3}{2}\pi$
 On ϵ_4 $-\frac{3}{2}\pi < \arg s < -\frac{1}{2}\pi$

19.5.7

$$\mathcal{U}(a, z) = \frac{\Gamma(\frac{3}{4} - \frac{1}{2}a)}{2^{1/2} \Gamma(\frac{1}{2} + \frac{1}{2}a)} \int_{\zeta_1} e^{iz^2 t} (1+t)^{1/2} (1-t)^{-1/2} dt$$

19.5.8

$$= \frac{\Gamma(\frac{3}{4} - \frac{1}{2}a)}{2^{1/2} \Gamma(\frac{1}{2} + \frac{1}{2}a)} \int_{\zeta_1} \frac{1}{2} z e^{v(\frac{1}{4}z^2 + v)} t^{1/2} (\frac{1}{4}z^2 - v)^{-1/2} dv$$

19.5.9

$$U(a, z) = \frac{i\Gamma(\frac{1}{4} - \frac{1}{2}a)}{2^{1/2} \Gamma(\frac{1}{2} + \frac{1}{2}a)} \int_{\eta_1} \frac{1}{2} z e^{-iz^2 t} (1+t)^{-1/2} (1-t)^{1/2} dt$$

19.5.10

$$= \frac{i\Gamma(\frac{1}{4} - \frac{1}{2}a)}{2^{1/2} \Gamma(\frac{1}{2} + \frac{1}{2}a)} \int_{\eta_1} e^{-v(\frac{1}{4}z^2 + v)} t^{1/2} (\frac{1}{4}z^2 - v)^{1/2} dv$$

The contour ζ_1 is such that $(\frac{1}{4}z^2 + v)$ goes from $\infty e^{-i\pi}$ to $\infty e^{i\pi}$ while $v = \frac{1}{4}z^2$ is not encircled; $(\frac{1}{4}z^2 - v)^{-1/2}$ has its principal value except possibly in the immediate neighborhood of the branch-point when encirclement is being avoided. Likewise η_1 is such that $(\frac{1}{4}z^2 - v)$ goes from $\infty e^{i\pi}$ to $\infty e^{-i\pi}$ while encirclement of $v = -\frac{1}{4}z^2$ is similarly avoided. The contours (ζ_1) and (η_1) may be obtained from ζ_1 and η_1 by use of the substitution $v = \frac{1}{4}z^2 t$.

The expressions 19.5.7 and 19.5.8 become indeterminate when $a = \frac{3}{2}, \frac{5}{2}, \frac{7}{2}, \dots$; for these values

19.5.11

$$U(a, z) = \frac{1}{\Gamma(\frac{1}{4} + \frac{1}{2}a)} z e^{-iz^2} \int_0^\infty e^{-s} s^{1/2} (z^2 + 2s)^{-1/2} ds$$

Again 19.5.9 and 19.5.10 become indeterminate when $a = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \dots$; for these values

19.5.12

$$U(a, z) = \frac{1}{\Gamma(\frac{3}{4} + \frac{1}{2}a)} e^{-iz^2} \int_0^\infty e^{-s} s^{1/2} (z^2 + 2s)^{-1/2} ds$$

Barnes-Type Integrals

19.5.13

$$U(a, z) = \frac{e^{-iz^2}}{2\pi i} z^{-a-\frac{1}{2}} \int_{-\infty i}^{+\infty i} \frac{\Gamma(s)\Gamma(\frac{1}{2} + a - 2s)}{\Gamma(\frac{1}{2} + a)} (\sqrt{2}z)^{2s} ds \quad (|\arg z| < \frac{3}{4}\pi)$$

where the contour separates the zeros of $\Gamma(s)$ from those of $\Gamma(a + \frac{1}{2} - 2s)$. Similarly

19.5.14

$$V(a, z) = \sqrt{\frac{2}{\pi}} \frac{e^{iz^2}}{2\pi i} z^{a-\frac{1}{2}} \int_{-\infty i}^{+\infty i} \frac{\Gamma(s)\Gamma(\frac{1}{2} - a - 2s)}{\Gamma(\frac{1}{2} - a)} (\sqrt{2}z)^{2s} \cos \pi s ds \quad (|\arg z| < \frac{1}{4}\pi)$$

19.6. Recurrence Relations

19.6.1 $U'(a, x) + \frac{1}{2}xU(a, x) + (a + \frac{1}{2})U(a+1, x) = 0$

19.6.2 $U'(a, x) - \frac{1}{2}xU(a, x) + U(a-1, x) = 0$

19.6.3 $2U'(a, x) + U(a-1, x) + (a + \frac{1}{2})U(a+1, x) = 0$

19.6.4 $xU(a, x) - U(a-1, x) + (a + \frac{1}{2})U(a+1, x) = 0$

These are also satisfied by $\Gamma(\frac{1}{2} - a)V(a, x)$.

19.6.5 $V'(a, x) - \frac{1}{2}xV(a, x) - (a - \frac{1}{2})V(a-1, x) = 0$

19.6.6 $V'(a, x) + \frac{1}{2}xV(a, x) - V(a+1, x) = 0$

19.6.7

$$2V'(a, x) - V(a+1, x) - (a - \frac{1}{2})V(a-1, x) = 0$$

19.6.8

$$xV(a, x) - V(a+1, x) + (a - \frac{1}{2})V(a-1, x) = 0$$

These are also satisfied by $U(a, x)/\Gamma(\frac{1}{2} - a)$

19.6.9 $y_1'(a, x) + \frac{1}{2}xy_1(a, x) = (a + \frac{1}{2})y_2(a+1, x)$

19.6.10 $y_1'(a, x) - \frac{1}{2}xy_1(a, x) = (a - \frac{1}{2})y_2(a-1, x)$

19.6.11 $y_2'(a, x) + \frac{1}{2}xy_2(a, x) = y_1(a+1, x)$

19.6.12 $y_2'(a, x) - \frac{1}{2}xy_2(a, x) = y_1(a-1, x)$

Asymptotic Expansions

19.7. Expressions in Terms of Airy Functions

When a is large and negative, write, for $0 \leq x < \infty$

$$x = 2\sqrt{|a|}\xi \quad t = (4|a|)^{\frac{1}{3}}\tau$$

19.7.1

$$\tau = -(\frac{2}{3}\vartheta_3)^{\frac{1}{3}}$$

$$\vartheta_3 = \frac{1}{2} \int_{\xi}^1 \sqrt{1-s^2} ds = \frac{1}{4} \arccos \xi - \frac{1}{4}\xi\sqrt{1-\xi^2} \quad (\xi \leq 1)$$

19.7.2

$$\tau = +(\frac{2}{3}\vartheta_2)^{\frac{1}{3}}$$

$$\vartheta_2 = \frac{1}{2} \int_1^{\xi} \sqrt{s^2-1} ds = \frac{1}{4}\xi\sqrt{\xi^2-1} - \frac{1}{4} \operatorname{arccosh} \xi \quad (\xi \geq 1)$$

Then for $x \geq 0, a \rightarrow -\infty$

19.7.3

$$U(a, x) \sim 2^{-\frac{1}{2}+i\pi} \Gamma(\frac{1}{4}-\frac{1}{2}a) \left(\frac{t}{\xi^2-1}\right)^{\frac{1}{4}} \operatorname{Ai}(t)$$

19.7.4

$$\Gamma(\frac{1}{2}-a) V(a, x) \sim 2^{-\frac{1}{2}-i\pi} \Gamma(\frac{1}{4}-\frac{1}{2}a) \left(\frac{t}{\xi^2-1}\right)^{\frac{1}{4}} \operatorname{Bi}(t)$$

Table 19.3 gives τ as a function of ξ .
See [19.5] for further developments.

19.8. Expansions for x Large and a Moderate

When $x \gg |a|$

19.8.1

$$U(a, x) \sim e^{-\frac{1}{2}x^2} x^{-a-\frac{1}{2}} \left\{ 1 - \frac{(a+\frac{1}{2})(a+\frac{3}{2})}{2x^2} + \frac{(a+\frac{1}{2})(a+\frac{3}{2})(a+\frac{5}{2})(a+\frac{7}{2})}{2 \cdot 4x^4} - \dots \right\} \quad (x \rightarrow +\infty)$$

19.8.2

$$V(a, x) \sim \sqrt{\frac{2}{\pi}} e^{i\pi/2} x^{a-\frac{1}{2}} \left\{ 1 + \frac{(a-\frac{1}{2})(a-\frac{3}{2})}{2x^2} + \frac{(a-\frac{1}{2})(a-\frac{3}{2})(a-\frac{5}{2})(a-\frac{7}{2})}{2 \cdot 4x^4} + \dots \right\} \quad (x \rightarrow +\infty)$$

These expansions form the basis for the choice of standard solutions in 19.3. The former is valid for complex x , with $|\arg x| < \frac{1}{2}\pi$, in the complete

sense of Watson [19.6], although valid for a wider range of $|\arg x|$ in Poincaré's sense; the second series is completely valid *only for x real and positive*.

19.9. Expansions for a Large With x Moderate

(i) a positive

When $a \gg x^2$, with $p = \sqrt{a}$, then

19.9.1 $U(a, x) = \frac{\sqrt{\pi}}{2^{4a+1} \Gamma(\frac{3}{4} + \frac{1}{2}a)} \exp(-px + v_1)$

19.9.2 $U(a, -x) = \frac{\sqrt{\pi}}{2^{4a+1} \Gamma(\frac{3}{4} + \frac{1}{2}a)} \exp(px + v_2)$

where

19.9.3
$$v_1, v_2 \sim \mp \frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p} - \frac{(\frac{1}{2}x)^2}{(2p)^2} \mp \frac{\frac{1}{2}x - \frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3} + \frac{2(\frac{1}{2}x)^4}{(2p)^4} \pm \frac{(\frac{1}{8}\frac{1}{2}x)^3 - \frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5} + \dots \quad (a \rightarrow +\infty)$$

The upper sign gives the first function, and the lower sign the second function.

(ii) a negative

When $-a \gg x^2$, with $p = \sqrt{-a}$, then

19.9.4

$$U(a, x) + i\Gamma(\frac{1}{2}-a) \cdot V(a, x)$$

$$= \frac{e^{i\pi(4+4a)} \Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{4a+1} \sqrt{\pi}} e^{ipx} \exp(v_7 + iv_8)$$

where

19.9.5

$$v_7 \sim + \frac{(\frac{1}{2}x)^2}{(2p)^2} + \frac{2(\frac{1}{2}x)^4}{(2p)^4} - \frac{9(\frac{1}{2}x)^2 - \frac{1}{8}(\frac{1}{2}x)^6}{(2p)^6} - \dots$$

$$v_8 \sim - \frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p} + \frac{\frac{1}{2}x + \frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3} + \frac{\frac{1}{8}(\frac{1}{2}x)^3 - \frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5} - \dots \quad (a \rightarrow -\infty)$$

Further expansions of a similar type will be found in [19.11].

19.10. Darwin's Expansions

(i) a positive, $x^2 + 4a$ large. Write

19.10.1

$$X = \sqrt{x^2 + 4a}$$

$$\theta = 4a\vartheta_1(x/2\sqrt{a}) = \frac{1}{2} \int_0^x X dx = \frac{1}{4}xX + a \ln \frac{x+X}{2\sqrt{a}}$$

$$= \frac{x}{4} \sqrt{x^2 + 4a} + a \operatorname{arcsinh} \frac{x}{2\sqrt{a}}$$

(see Table 19.3 for ϑ_1), then

$$19.10.2 \quad U(a, x) = \frac{(2\pi)^{1/4}}{\sqrt{\Gamma(\frac{1}{2}+a)}} \exp \{-\theta + v(a, x)\}$$

$$19.10.3 \quad U(a, -x) = \frac{(2\pi)^{1/4}}{\sqrt{\Gamma(\frac{1}{2}+a)}} \exp \{\theta + v(a, -x)\}$$

where

19.10.4

$$v(a, x) \sim -\frac{1}{2} \ln X + \sum_{s=1}^{\infty} (-1)^s d_{3s} / X^{3s} \quad (a > 0, x^2 + 4a \rightarrow +\infty)$$

and d_{3s} is given by 19.10.13.

(ii) a negative, $x^2 + 4a$ large and positive. Write

$$19.10.5 \quad X = \sqrt{x^2 - 4|a|}$$

$$\theta = 4|a|\vartheta_2(x/2\sqrt{|a|}) = \frac{1}{2} \int_{2\sqrt{|a|}}^x X dx = \frac{1}{4} xX + a \ln \frac{x+X}{2\sqrt{|a|}}$$

$$= \frac{1}{4} x\sqrt{x^2 - 4|a|} + a \operatorname{arccosh} \frac{x}{2\sqrt{|a|}}$$

(see Table 19.3 for ϑ_2), then

$$19.10.6 \quad U(a, x) = \frac{\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/4}} \exp \{-\theta + v(a, x)\}$$

19.10.7

$$V(a, x) = \frac{2}{(2\pi)^{1/4} \sqrt{\Gamma(\frac{1}{2}-a)}} \exp \{\theta + v(a, -x)\}$$

where again

19.10.8

$$v(a, x) \sim -\frac{1}{2} \ln X + \sum_{s=1}^{\infty} (-1)^s d_{3s} / X^{3s} \quad (a < 0, x^2 + 4a \rightarrow +\infty)$$

and d_{3s} is given by 19.10.13.

(iii) a large and negative and x moderate. Write

$$19.10.9 \quad Y = \sqrt{4|a| - x^2}$$

$$\theta = 4|a|\vartheta_4(x/2\sqrt{|a|})$$

$$= \frac{1}{2} \int_0^x Y dx = \frac{1}{4} xY + |a| \arcsin \frac{x}{2\sqrt{|a|}}$$

(see Table 19.3 for $\vartheta_4 = \frac{1}{2}\pi - \vartheta_3$), then

19.10.10

$$U(a, x) = \frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/4}} e^{v_r} \cos \left\{ \frac{1}{2}\pi + \frac{1}{2}\pi a + \theta + v_i \right\}$$

19.10.11

$$V(a, x) = \frac{2}{(2\pi)^{1/4} \sqrt{\Gamma(\frac{1}{2}-a)}} e^{v_r} \sin \left\{ \frac{1}{2}\pi + \frac{1}{2}\pi a + \theta + v_i \right\}$$

where

$$19.10.12 \quad v_r \sim -\frac{1}{2} \ln Y - \frac{d_6}{Y^6} + \frac{d_{12}}{Y^{12}} - \dots$$

$$v_i \sim \frac{d_3}{Y^3} - \frac{d_9}{Y^9} + \dots \quad (x^2 + 4a \rightarrow -\infty)$$

In each case the coefficients d_{3r} are given by

19.10.13

$$d_3 = \frac{1}{a} \left(\frac{x^3}{48} + \frac{1}{2} ax \right)$$

$$d_6 = \frac{3}{4} x^2 - 2a$$

$$d_9 = \frac{1}{a^3} \left(-\frac{7}{5760} x^9 - \frac{7}{320} ax^7 - \frac{49}{320} a^2 x^5 + \frac{31}{12} a^3 x^3 - 19a^4 x \right)$$

$$d_{12} = \frac{153}{8} x^4 - 186ax^2 + 80a^2$$

See [19.11] for d_{15}, \dots, d_{24} , and [19.5] for an alternative form.

19.11. Modulus and Phase

When a is negative and $|x| < 2\sqrt{|a|}$, the functions U and V are oscillatory and it is sometimes convenient to write

$$19.11.1 \quad U(a, x) + i\Gamma(\frac{1}{2}-a)V(a, x) = F(a, x)e^{i\chi(a, x)}$$

$$19.11.2 \quad U'(a, x) + i\Gamma(\frac{1}{2}-a)V'(a, x) = -G(a, x)e^{i\psi(a, x)}$$

Then, when $a < 0$ and $|a| \gg x^2$,

19.11.3

$$F = \frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{3a+1}\sqrt{\pi}} e^{v_r}, \quad \chi = (\frac{1}{2}a + \frac{1}{4})\pi + px + v_i$$

where v_r, v_i are given by 19.9.5 and $p = \sqrt{-a}$.

Alternatively, with $p = \sqrt{|a|}$, and again $-a \gg x^2$,

19.11.4

$$F \sim \frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{3a+1}\sqrt{\pi}} \left\{ 1 + \frac{x^2}{(4p)^2} + \frac{\frac{5}{2}x^4}{(4p)^4} + \frac{\frac{15}{2}x^6 - 144x^2}{(4p)^6} + \dots \right\}$$

$$19.11.5 \quad \chi \sim (\frac{1}{2}a + \frac{1}{4})\pi + px \left\{ 1 - \frac{\frac{3}{8}x^2}{(4p)^2} - \frac{\frac{2}{5}x^4 - 16}{(4p)^4} - \frac{\frac{4}{7}x^6 - \frac{2 \cdot 5 \cdot 6}{8}x^2}{(4p)^6} - \dots \right\}$$

$$19.11.6 \quad G \sim \frac{\Gamma(\frac{3}{4} - \frac{1}{2}a)}{2^{1/2} a^{-1/2} \sqrt{\pi}} \left\{ 1 - \frac{x^2}{(4p)^2} - \frac{\frac{3}{8}x^4}{(4p)^4} - \frac{\frac{7}{2}x^6 - 176x^2}{(4p)^6} - \dots \right\}$$

$$19.11.7 \quad \psi \sim (\frac{1}{2}a - \frac{1}{4})\pi + px \left\{ 1 - \frac{\frac{3}{8}x^2}{(4p)^2} - \frac{\frac{2}{5}x^4 + 16}{(4p)^4} - \frac{\frac{4}{7}x^6 + \frac{3 \cdot 2 \cdot 0}{8}x^2}{(4p)^6} - \dots \right\}$$

Again, when $x^2 + 4a$ is large and negative, with $Y = \sqrt{4|a| - x^2}$, then

$$19.11.8 \quad F = \frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/2}} e^{v_r} \quad \chi = \frac{1}{4}\pi + \frac{1}{2}\pi a + \theta + v_i$$

where θ , v_r and v_i are given by 19.10.9 and 19.10.12.

Another form is

$$19.11.9 \quad F \sim \frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/2} \sqrt{Y}} \left(1 + \frac{3}{4Y^4} + \frac{5a}{Y^6} + \frac{621}{32Y^8} + \dots \right) \quad (x^2 + 4a \rightarrow -\infty)$$

$$19.11.10 \quad G \sim \frac{\sqrt{Y} \sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/2}} \left(1 - \frac{5}{4Y^4} - \frac{7a}{Y^6} - \frac{835}{32Y^8} - \dots \right) \quad (x^2 + 4a \rightarrow -\infty)$$

while ψ and χ are connected by

$$19.11.11 \quad \psi - \chi \sim -\frac{1}{2}\pi - \frac{x}{Y^3} \left(1 + \frac{47}{6Y^4} + \frac{214a}{3Y^6} + \frac{14483}{40Y^8} + \dots \right) \quad (x^2 + 4a \rightarrow -\infty)$$

Connections With Other Functions

19.12. Connection With Confluent Hypergeometric Functions (see chapter 13)

$$19.12.1 \quad U(a, \pm x) = \frac{\sqrt{\pi} 2^{-1/2} x^{-1/2}}{\Gamma(\frac{3}{4} + \frac{1}{2}a)} M_{-1/2, -1/2}(\frac{1}{2}x^2) \mp \frac{\sqrt{\pi} 2^{1/2} x^{-1/2}}{\Gamma(\frac{1}{4} + \frac{1}{2}a)} M_{-1/2, 1/2}(\frac{1}{2}x^2)$$

$$19.12.2 \quad U(a, x) = 2^{-1/2} x^{-1/2} W_{-1/2, -1/2}(\frac{1}{2}x^2)$$

19.12.3

$$U(a, \pm x) = \frac{\sqrt{\pi} 2^{-1/2} e^{-1/2 x^2}}{\Gamma(\frac{3}{4} + \frac{1}{2}a)} M(\frac{1}{2}a + \frac{1}{4}, \frac{1}{2}, \frac{1}{2}x^2) \mp \frac{\sqrt{\pi} 2^{1/2} x e^{-1/2 x^2}}{\Gamma(\frac{1}{4} + \frac{1}{2}a)} M(\frac{1}{2}a + \frac{3}{4}, \frac{3}{4}, \frac{1}{2}x^2)$$

19.12.4

$$U(a, x) = 2^{-1/2} e^{-1/2 x^2} U(\frac{1}{2}a + \frac{1}{4}, \frac{1}{2}, \frac{1}{2}x^2) = 2^{-1/2} x e^{-1/2 x^2} U(\frac{1}{2}a + \frac{3}{4}, \frac{3}{4}, \frac{1}{2}x^2)$$

Expressions for $V(a, x)$ may be obtained from these by use of 19.4.2.

19.13. Connection With Hermite Polynomials and Functions

When n is a non-negative integer

19.13.1

$$U(-n - \frac{1}{2}, x) = e^{-1/2 x^2} He_n(x) = 2^{-1/2} e^{-1/2 x^2} H_n(x/\sqrt{2})$$

19.13.2

$$V(n + \frac{1}{2}, x) = \sqrt{2/\pi} e^{1/2 x^2} He_n^*(x) = 2^{-1/2} e^{1/2 x^2} H_n^*(x/\sqrt{2})$$

in which $H_n(x)$ and $He_n(x)$ are Hermite polynomials (see chapter 22) while

$$19.13.3 \quad He_n^*(x) = e^{-1/2 x^2} \frac{d^n}{dx^n} e^{1/2 x^2} = (-i)^n He_n(ix)$$

$$19.13.4 \quad H_n^*(x) = e^{-x^2} \frac{d^n}{dx^n} e^{x^2} = (-i)^n H_n(ix)$$

This gives one elementary solution to 19.1.2 whenever $2a$ is an odd integer, positive or negative.

19.14. Connection With Probability Integrals and Dawson's Integral (see chapter 7)

If, as in [19.10]

$$19.14.1 \quad Hh_{-1}(x) = e^{-1/2 x^2}$$

19.14.2

$$Hh_n(x) = \int_x^\infty Hh_{n-1}(t) dt = (1/n!) \int_x^\infty (t-x)^n e^{-1/2 t^2} dt \quad (n \geq 0)$$

then

$$19.14.3 \quad U(n + \frac{1}{2}, x) = e^{1/2 x^2} Hh_n(x) \quad (n \geq -1)$$

Correspondingly

$$19.14.4 \quad V(\tfrac{1}{2}, x) = \sqrt{2/\pi} e^{x^2}$$

and

19.14.5

$$V(-n - \tfrac{1}{2}, x) = e^{-x^2} \left\{ \int_0^x e^{-t^2} V(-n + \tfrac{1}{2}, t) dt - \frac{\sin \frac{1}{2} n \pi}{2^{1/2} \Gamma(\frac{1}{2} n + 1)} \right\} \quad (n \geq 0)$$

Here $V(-\frac{1}{2}, x)$ is closely related to Dawson's integral

$$\int_0^x e^{t^2} dt$$

These relations give a second solution of 19.1.2 whenever $2a$ is an odd integer, and a second solution is unobtainable from $U(a, x)$ by reflection in the y -axis.

19.15. Explicit Formula in Terms of Bessel Functions When $2a$ Is an Integer

Write

$$19.15.1 \quad I_{-n} - I_n = (2/\pi) \sin n\pi \cdot K_n$$

$$19.15.2 \quad I_{-n} + I_n = \cos n\pi \cdot \mathcal{J}_n$$

where the argument of all modified Bessel functions is $\frac{1}{2}x^2$. Then

$$19.15.3 \quad U(1, x) = 2\pi^{-1/2} (\tfrac{1}{2}x)^{1/2} (-K_{1/2} + K_{3/2})$$

$$19.15.4 \quad U(2, x) = 2 \cdot \frac{2}{3} \pi^{-1/2} (\tfrac{1}{2}x)^{3/2} (2K_{3/2} - 3K_{5/2} + K_{7/2})$$

19.15.5

$$U(3, x) = 2 \cdot \frac{2}{3} \cdot \frac{2}{5} \pi^{-1/2} (\tfrac{1}{2}x)^{5/2} (-5K_{5/2} + 9K_{7/2} - 5K_{9/2} + K_{11/2})$$

$$19.15.6 \quad V(1, x) = \tfrac{1}{2} (\tfrac{1}{2}x)^{1/2} (\mathcal{J}_{1/2} - \mathcal{J}_{3/2})$$

$$19.15.7 \quad V(2, x) = \tfrac{1}{2} (\tfrac{1}{2}x)^{3/2} (2\mathcal{J}_{3/2} - 3\mathcal{J}_{5/2} + \mathcal{J}_{7/2})$$

$$19.15.8 \quad V(3, x) = \tfrac{1}{2} (\tfrac{1}{2}x)^{5/2} (5\mathcal{J}_{5/2} - 9\mathcal{J}_{7/2} + 5\mathcal{J}_{9/2} - \mathcal{J}_{11/2})$$

$$19.15.9 \quad U(0, x) = \pi^{-1/2} (\tfrac{1}{2}x)^{1/2} K_{1/2}$$

$$19.15.10 \quad U(-1, x) = \pi^{-1/2} (\tfrac{1}{2}x)^{1/2} (K_{1/2} + K_{3/2})$$

19.15.11

$$\dot{U}(-2, x) = \pi^{-1/2} (\tfrac{1}{2}x)^{3/2} (2K_{3/2} + 3K_{5/2} - K_{7/2})$$

19.15.12

$$U(-3, x) = \pi^{-1/2} (\tfrac{1}{2}x)^{5/2} (5K_{5/2} + 9K_{7/2} - 5K_{9/2} - K_{11/2})$$

$$19.15.13 \quad V(0, x) = \tfrac{1}{2} (\tfrac{1}{2}x)^{1/2} \mathcal{J}_{1/2}$$

$$19.15.14 \quad V(-1, x) = (\tfrac{1}{2}x)^{3/2} (\mathcal{J}_{3/2} + \mathcal{J}_{5/2})$$

$$19.15.15 \quad V(-2, x) = \frac{2}{3} (\tfrac{1}{2}x)^{5/2} (2\mathcal{J}_{5/2} + 3\mathcal{J}_{7/2} - \mathcal{J}_{9/2})$$

19.15.16

$$V(-3, x) = \frac{2}{3} \cdot \frac{2}{5} (\tfrac{1}{2}x)^{7/2} (5\mathcal{J}_{7/2} + 9\mathcal{J}_{9/2} - 5\mathcal{J}_{11/2} - \mathcal{J}_{13/2})$$

$$19.15.17 \quad U(-\tfrac{1}{2}, x) = \sqrt{2/\pi} (\tfrac{1}{2}x) K_{1/2}$$

$$19.15.18 \quad U(-\tfrac{3}{2}, x) = \sqrt{2/\pi} (\tfrac{1}{2}x)^2 2K_{3/2}$$

$$19.15.19 \quad U(-\tfrac{5}{2}, x) = \sqrt{2/\pi} (\tfrac{1}{2}x)^3 (5K_{5/2} - K_{7/2})$$

$$19.15.20 \quad V(\tfrac{1}{2}, x) = (\tfrac{1}{2}x) (I_{1/2} + I_{-1/2})$$

$$19.15.21 \quad V(\tfrac{3}{2}, x) = (\tfrac{1}{2}x)^2 (2I_{3/2} + 2I_{-3/2})$$

$$19.15.22 \quad V(\tfrac{5}{2}, x) = (\tfrac{1}{2}x)^3 (5I_{5/2} + 5I_{-5/2} - I_{-3/2} - I_{-1/2})$$

The Equation $\frac{d^2y}{dx^2} + \left(\frac{1}{4}x^2 - a\right)y = 0$

19.16. Power Series in x

Even and odd solutions are given by 19.2.1 to 19.2.4 with $-ia$ written for a and $xe^{i\pi}$ for x ; the series involves complex quantities in which the imaginary part of the sum vanishes identically.

Alternatively,

19.16.1

$$y_1 = 1 + a \frac{x^2}{2!} + (a^2 - \tfrac{1}{2}) \frac{x^4}{4!} + (a^3 - \tfrac{7}{2}a) \frac{x^6}{6!} + (a^4 - 11a^2 + \tfrac{15}{4}) \frac{x^8}{8!} + (a^5 - 25a^3 + \tfrac{21}{4}a) \frac{x^{10}}{10!} + \dots$$

19.16.2

$$y_2 = x + a \frac{x^3}{3!} + (a^2 - \tfrac{3}{2}) \frac{x^5}{5!} + (a^3 - \tfrac{13}{2}a) \frac{x^7}{7!} + (a^4 - 17a^2 + \tfrac{63}{4}) \frac{x^9}{9!} + (a^5 - 35a^3 + \tfrac{53}{4}a) \frac{x^{11}}{11!} + \dots$$

in which non-zero coefficients a_n of $x^n/n!$ are connected by

$$19.16.3 \quad a_{n+2} = a \cdot a_n - \frac{1}{4}n(n-1)a_{n-2}$$

19.17. Standard Solutions (see [19.4])

$$19.17.1 \quad W(a, \pm x) = \frac{(\cosh \pi a)^{1/2}}{2\sqrt{\pi}} (G_1 y_1 \mp \sqrt{2} G_3 y_2)$$

$$19.17.2 \quad = 2^{-3/4} \left(\sqrt{\frac{G_1}{G_3}} y_1 \mp \sqrt{\frac{2G_3}{G_1}} y_2 \right)$$

where

$$19.17.3 \quad G_1 = |\Gamma(\tfrac{1}{4} + \tfrac{1}{2}ia)| \quad G_3 = |\Gamma(\tfrac{3}{4} + \tfrac{1}{2}ia)|$$

At $x=0$,

$$19.17.4 \quad W(a, 0) = \frac{1}{2^{\frac{1}{2}} i} \left| \frac{\Gamma(\frac{1}{4} + \frac{1}{2}ia)}{\Gamma(\frac{3}{4} + \frac{1}{2}ia)} \right|^{\frac{1}{2}} = \frac{1}{2^{\frac{1}{2}} i} \sqrt{\frac{G_1}{G_3}}$$

19.17.5

$$W'(a, 0) = -\frac{1}{2^{\frac{1}{2}} i} \left| \frac{\Gamma(\frac{3}{4} + \frac{1}{2}ia)}{\Gamma(\frac{1}{4} + \frac{1}{2}ia)} \right|^{\frac{1}{2}} = -\frac{1}{2^{\frac{1}{2}} i} \sqrt{\frac{G_3}{G_1}}$$

Complex Solutions

$$19.17.7 \quad E^*(a, x) = k^{-\frac{1}{2}} W(a, x) - ik^{\frac{1}{2}} W(a, -x)$$

where

$$19.17.8 \quad k = \sqrt{1 + e^{2\pi a}} - e^{\pi a} \quad 1/k = \sqrt{1 + e^{2\pi a}} + e^{\pi a}$$

In terms of $U(a, x)$ of 19.3,

$$19.17.9 \quad E(a, x) = \sqrt{2} e^{i\pi a + \frac{1}{2}i\pi + \frac{1}{2}i\phi_2} U(ia, x e^{-i\pi})$$

with

$$19.17.10 \quad \phi_2 = \arg \Gamma(\frac{1}{2} + ia)$$

where the branch is defined by $\phi_2=0$ when $a=0$ and by continuity elsewhere.

Also

19.17.11

$$\sqrt{2\pi} U(ia, x e^{-i\pi}) = \Gamma(\frac{1}{2} - ia) \{ e^{i\pi a - \frac{1}{2}i\pi} U(-ia, x e^{i\pi}) + e^{-i\pi a + \frac{1}{2}i\pi} U(-ia, -x e^{i\pi}) \}$$

19.18. Wronskian and Other Relations

$$19.18.2 \quad W\{E(a, x), E^*(a, x)\} = -2i$$

$$19.18.3 \quad \sqrt{1 + e^{2\pi a}} E(a, x) = e^{\pi a} E^*(a, x) + i E^*(a, -x)$$

$$19.18.4 \quad E^*(a, x) = e^{-i(\phi_2 + \frac{1}{2}\pi)} E(-a, ix)$$

19.18.5

$$\sqrt{\Gamma(\frac{1}{2} + ia)} E^*(a, x) = e^{-i\pi} \sqrt{\Gamma(\frac{1}{2} - ia)} E(-a, ix)$$

19.19. Integral Representations

$$W(a, x) + iW(a, -x) \\ = \sqrt{2}W(a, 0) \exp\{v_r + i(px + \frac{1}{4}\pi + v_i)\}$$

where $W(a, 0)$ is given by 19.17.4, and**19.22.5**

$$v_r \sim -\frac{(\frac{1}{2}x)^2}{(2p)^2} + \frac{2(\frac{1}{2}x)^4}{(2p)^4} - \frac{9(\frac{1}{2}x)^2 + \frac{1}{3}(\frac{1}{2}x)^6}{(2p)^6} + \dots \\ v_i \sim \frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p} - \frac{\frac{1}{2}x + \frac{2}{3}(\frac{1}{2}x)^5}{(2p)^3} + \frac{\frac{1}{8}(\frac{1}{2}x)^3 + \frac{4}{3}(\frac{1}{2}x)^7}{(2p)^5} - \dots \\ (a \rightarrow -\infty)$$

Further expansions of a similar type will be found in [19.3].

19.23. Darwin's Expansions(i) a positive, $x^2 - 4a \gg 0$

Write

19.23.1

$$X = \sqrt{x^2 - 4a} \quad \theta = 4a\vartheta_2(x/2\sqrt{a}) = \frac{1}{2} \int_{2\sqrt{a}}^x X dx \\ = \frac{1}{4}xX - a \ln \frac{x+X}{2\sqrt{a}} \\ = \frac{1}{4}x\sqrt{x^2 - 4a} - a \operatorname{arccosh} \frac{x}{2\sqrt{a}}$$

(see Table 19.3 for ϑ_2), then

$$19.23.2 \quad W(a, x) = \sqrt{2k}e^{\vartheta} \cos(\frac{1}{4}\pi + \theta + v_i)$$

$$19.23.3 \quad W(a, -x) = \sqrt{2/k}e^{\vartheta} \sin(\frac{1}{4}\pi + \theta + v_i)$$

where

$$19.23.4 \quad v_r \sim -\frac{1}{2} \ln X - \frac{d_6}{X^6} + \frac{d_{12}}{X^{12}} - \dots$$

$$v_i \sim -\frac{d_3}{X^3} + \frac{d_9}{X^9} - \frac{d_{15}}{X^{15}} + \dots$$

 $(x^2 - 4a \rightarrow \infty)$ and d_{3r} is given by 19.23.12.(ii) a positive, $4a - x^2 \gg 0$

Write

19.23.5

$$Y = \sqrt{4a - x^2} \quad \theta = 4a\vartheta_4(x/2\sqrt{a}) \\ = \frac{1}{2} \int_0^x Y dx = \frac{1}{4}xY + a \arcsin \frac{x}{2\sqrt{a}}$$

(see Table 19.3 for $\vartheta_4 = \frac{1}{8}\pi - \vartheta_3$), then

$$19.23.6 \quad W(a, x) = \exp\{-\theta + v(a, x)\}$$

$$19.23.7 \quad W(a, -x) = \exp\{\theta + v(a, -x)\}$$

where

19.23.8

$$v(a, x) \sim -\frac{1}{2} \ln Y + \frac{d_3}{Y^3} + \frac{d_9}{Y^9} + \frac{d_{15}}{Y^{15}} + \dots \\ (x^2 - 4a \rightarrow -\infty)$$

and d_{3r} is again given by 19.23.12.(iii) a negative, $x^2 - 4a \gg 0$

Write

19.23.9

$$X = \sqrt{x^2 + 4|a|} \quad \theta = 4|a|\vartheta_1(x/2\sqrt{|a|}) = \frac{1}{2} \int_0^x X dx \\ = \frac{1}{4}xX - a \ln \frac{x+X}{2\sqrt{|a|}} \\ = \frac{1}{4}x\sqrt{x^2 + 4|a|} - a \operatorname{arcsinh} \frac{x}{2\sqrt{|a|}}$$

(see Table 19.3 for ϑ_1) then

$$19.23.10 \quad W(a, x) = \sqrt{2k}e^{\vartheta} \cos(\frac{1}{4}\pi + \theta + v_i)$$

$$19.23.11 \quad W(a, -x) = \sqrt{2/k}e^{\vartheta} \sin(\frac{1}{4}\pi + \theta + v_i)$$

where v_r and v_i are again given by 19.23.4. In each case the coefficients d_{3r} are given by

19.23.12

$$d_3 = -\frac{1}{a} \left(\frac{x^3}{48} - \frac{1}{2}ax \right)$$

$$d_6 = \frac{3}{4}x^2 + 2a$$

$$d_9 = \frac{1}{a^3} \left(\frac{7}{5760}x^9 - \frac{7}{320}ax^7 + \frac{49}{320}a^2x^5 + \frac{31}{12}a^3x^3 + 19a^4x \right)$$

$$d_{12} = \frac{153}{8}x^4 + 186ax^2 + 80a^2$$

See [19.11] for d_{15}, \dots, d_{24} , and [19.5] for an alternative form.

19.24. Modulus and Phase

When a is positive, the function $W(a, x)$ is oscillatory when $x < -2\sqrt{a}$ and when $x > 2\sqrt{a}$; when a is negative, the function is oscillatory for all x . In such cases it is sometimes convenient to write

19.24.1

$$k^{-1}W(a, x) + ik^1W(a, -x) = E(a, x) = Fe^{ix} \quad (x > 0)$$

19.24.2

$$k^{-1} \frac{dW(a, x)}{dx} + ik^1 \frac{dW(a, -x)}{dx} = E'(a, x) = -Ge^{i\psi} \quad (x > 0)$$

Then, when $x^2 \gg |a|$,

19.24.3

$$F \sim \sqrt{\frac{2}{x}} \left(1 + \frac{a}{x^2} + \frac{10a^2 - 3}{4x^4} + \frac{30a^3 - 47a}{4x^6} + \dots \right)$$

19.24.4

$$x \sim \frac{1}{4}x^2 - a \ln x + \frac{1}{2}\phi_2 + \frac{1}{4}\pi + \frac{4a^2 - 3}{8x^2} + \frac{4a^3 - 19a}{8x^4} + \dots$$

19.24.5

$$G \sim \sqrt{\frac{x}{2}} \left(1 - \frac{a}{x^2} - \frac{6a^2 - 5}{4x^4} - \frac{14a^3 - 63a}{4x^6} - \dots \right)$$

19.24.6

$$\psi \sim \frac{1}{4}x^2 - a \ln x + \frac{1}{2}\phi_2 - \frac{1}{4}\pi + \frac{4a^2 + 5}{8x^2} + \frac{4a^3 + 29a}{8x^4} + \dots$$

where ϕ_2 is defined by 19.17.10.

When $a < 0$, $|a| \gg x^2$

19.24.7

$$F \sim \sqrt{2}W(a, 0)e^{v_i}$$

where v_i is given by 19.22.5 with $p = \sqrt{-a}$. Also

19.24.8

$$F \sim \frac{1}{\sqrt{p}} \left(1 - \frac{x^2}{(4p)^2} + \frac{\frac{1}{2}x^4 + 8}{(4p)^4} - \frac{\frac{1}{2}x^6 + 152x^2}{(4p)^6} + \dots \right)$$

19.24.9

$$x \sim \frac{1}{4}\pi + px \left(1 + \frac{\frac{2}{3}x^2}{(4p)^2} - \frac{\frac{2}{3}x^4 + 16}{(4p)^4} + \frac{\frac{1}{4}x^6 + \frac{2}{3}\frac{5}{6}x^2}{(4p)^6} - \dots \right)$$

19.24.10

$$G \sim \sqrt{p} \left(1 + \frac{x^2}{(4p)^2} - \frac{\frac{3}{2}x^4 + 8}{(4p)^4} + \frac{\frac{1}{2}x^6 + 168x^2}{(4p)^6} - \dots \right)$$

19.24.11

$$\psi \sim -\frac{1}{4}\pi + px \left(1 + \frac{\frac{2}{3}x^2}{(4p)^2} - \frac{\frac{2}{3}x^4 - 16}{(4p)^4} + \frac{\frac{1}{4}x^6 - \frac{3}{2}\frac{5}{6}x^2}{(4p)^6} - \dots \right)$$

Again, when $a < 0$, $x^2 - 4a \gg 0$, with $X = \sqrt{x^2 + 4|a|}$, then

19.24.12 $F \sim \sqrt{2}e^{v_i}$, $x = \frac{1}{4}\pi + \theta + v_i$

where θ , v_i , and v_i are given by 19.23.4 and 19.23.9.

Another form also when $a > 0$, $x^2 - 4a \rightarrow \infty$ is

19.24.13

$$F \sim \sqrt{\frac{2}{X}} \left(1 - \frac{3}{4X^4} - \frac{5a}{X^6} + \frac{621}{32X^8} + \frac{1371a}{4X^{10}} - \dots \right)$$

19.24.14

$$G \sim \sqrt{\frac{X}{2}} \left(1 + \frac{5}{4X^4} + \frac{7a}{X^6} - \frac{835}{32X^8} - \frac{1729a}{4X^{10}} + \dots \right)$$

while ψ and x are connected by

19.24.15

$$\psi - x \sim -\frac{1}{2}\pi + \frac{x}{X^3} \left(1 - \frac{47}{6X^4} - \frac{214a}{3X^6} + \frac{14483}{40X^8} + \dots \right)$$

19.25. Connections With Other Functions

Connection With Confluent Hypergeometric and Bessel Functions

19.25.1

$$W(a, \pm x) = 2^{-1} \left\{ \sqrt{\frac{G_1}{G_3}} H\left(-\frac{3}{4}, \frac{1}{2}a, \frac{1}{4}x^2\right) \pm \sqrt{\frac{2G_3}{G_1}} xH\left(-\frac{1}{4}, \frac{1}{2}a, \frac{1}{4}x^2\right) \right\}$$

where

19.25.2

$$H(m, n, x) = e^{-ix} F_1(m+1-in; 2m+2; 2ix)$$

19.25.3

$$= e^{-ix} M(m+1-in, 2m+2, 2ix)$$

19.25.4

$$W(0, \pm x) = 2^{-1} \sqrt{\pi x} \{ J_{-\frac{1}{4}}(\frac{1}{4}x^2) \pm J_{\frac{1}{4}}(\frac{1}{4}x^2) \} \quad (x \geq 0)$$

19.25.5

$$\frac{d}{dx} W(0, \pm x) = -2^{-\frac{1}{2}} x \sqrt{\pi x} \{ J_{\frac{1}{2}}(\frac{1}{2}x^2) \pm J_{-\frac{1}{2}}(\frac{1}{2}x^2) \} \quad (x \geq 0)$$

19.26. Zeros

Zeros of solutions $U(a, x)$, $V(a, x)$ of 19.1.2 occur only for $|x| < 2\sqrt{-a}$ when a is negative. A single exceptional zero is possible, for any a , in the general solution; neither $U(a, x)$ nor $V(a, x)$ has such a zero for $x > 0$.

Approximations may be obtained by reverting the series for ψ (or χ for zeros of derivatives) in 19.11, giving ψ (or χ) values that are multiples of $\frac{1}{2}\pi$, odd multiples for $U(a, x)$, even multiples for $V(a, x)$. Writing

$$\alpha = (\frac{1}{2}r - \frac{1}{2}a - \frac{1}{2})\pi$$

as an approximation to a zero of the function, or

$$\beta = (\frac{1}{2}r - \frac{1}{2}a + \frac{1}{2})\pi$$

as an approximation to a zero of the derivative, we obtain for the corresponding zero c or c' , with $-a = p^2$ the expressions

$$19.26.1 \quad c \approx \frac{\alpha}{p} + \frac{2\alpha^3 - 3\alpha}{48p^5} + \frac{52\alpha^5 - 240\alpha^3 + 315\alpha}{7680p^9} + \dots$$

$$19.26.2 \quad c' \approx \frac{\beta}{p} + \frac{2\beta^3 + 3\beta}{48p^5} + \frac{52\beta^5 + 280\beta^3 - 285\beta}{7680p^9} + \dots$$

These expansions, however, are of little value in the neighborhood of the turning point $x = 2\sqrt{-a}$. Here first approximations may be obtained by use of the formulas of 19.7. If a_n (negative) is a zero of $\text{Ai}(t)$, the corresponding zero c of $U(a, x)$ is obtained approximately by solving

19.26.3

$$\vartheta_3 = \frac{1}{4} \{ \arccos \xi - \xi \sqrt{1 - \xi^2} \} = \frac{(-a_n)^{\frac{3}{2}}}{6|a|} \quad c = 2\sqrt{|a|}\xi \quad (a \ll 0)$$

This may be done by inverse use of Table 19.3. For a zero of $V(a, x)$, a_n must be replaced by b_n , a zero of $\text{Bi}(t)$. For further developments see [19.5].

Zeros of solutions $W(a, x)$, $W(a, -x)$ of 19.1.3 occur for $|x| > 2\sqrt{a}$ when a is positive; the general solution may, however, have a single zero between $-2\sqrt{a}$ and $+2\sqrt{a}$. If a is negative, zeros are unrestricted in range.

Approximations may be obtained by reverting the series for ψ (or χ) in 19.24. With $-a = p^2$, $\alpha = (\frac{1}{2}r - \frac{1}{2})\pi$, $\beta = (\frac{1}{2}r + \frac{1}{2})\pi$, $r \geq 0$ being an odd

integer for $W(a, x)$ or its derivative, or an even integer for $W(a, -x)$ or its derivative, the zeros $\pm c$, $\pm c'$ have expansions

$$19.26.4 \quad c \approx \frac{\alpha}{p} - \frac{2\alpha^3 - 3\alpha}{48p^5} + \frac{52\alpha^5 - 240\alpha^3 + 315\alpha}{7680p^9} + \dots$$

$$19.26.5 \quad c' \approx \frac{\beta}{p} - \frac{2\beta^3 + 3\beta}{48p^5} + \frac{52\beta^5 + 280\beta^3 - 285\beta}{7680p^9} + \dots$$

When x is large and a moderate, we may solve inversely the series 19.24.4 or 19.24.6 with $\alpha = \frac{1}{2}(r\pi - \frac{1}{2}\pi - \phi_2)$, $\beta = \frac{1}{2}(r\pi + \frac{1}{2}\pi - \phi_2)$, r odd or even as above; the presence of the logarithm makes it inconvenient to revert formally.

The expansions 19.26.4 and 19.26.5 fail when x is in the neighborhood of $2\sqrt{|a|}$. When a is positive, a zero c of $W(a, -x)$ is obtained approximately by solving

19.26.6

$$\vartheta_2 = \frac{1}{4} \{ \xi \sqrt{\xi^2 - 1} - \text{arccosh } \xi \} = \frac{(-a_n)^{\frac{3}{2}}}{6a} \quad c = 2\sqrt{a}\xi \quad (a \gg 0)$$

with the aid of Table 19.3. For a zero of $W(a, x)$ we replace a_n by b_n . When a is negative we solve, again with the aid of Table 19.3,

19.26.7

$$\vartheta_1 = \frac{1}{4} \{ \xi \sqrt{\xi^2 + 1} + \text{arcsinh } \xi \} = \frac{(n - \frac{1}{2})\pi}{4|a|} \quad c = 2\sqrt{|a|}\xi \quad (-a \gg 0)$$

where $n = 1, 2, 3, \dots$ for an approximate zero of $W(a, -x)$, and $n = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \dots$ for an approximate zero of $W(a, x)$. Further developments are given in [19.5].

Any of the approximations to zeros obtained above may readily be improved as follows:

Let c be a zero of y , and c' a zero of y' , where y is a solution of

$$19.26.8 \quad y'' - Iy = 0$$

Here $I = a \pm \frac{1}{2}x^2$, $I' = \pm \frac{1}{2}x$, $I'' = \pm \frac{1}{2}$; the method is general and the following formulae may be used whenever $I''' = 0$. Then if γ, γ' are approximations to the zeros c, c' and

$$19.26.9 \quad u = y(\gamma)/y'(\gamma) \quad v = y'(\gamma')/I^2y(\gamma')$$

with $I \equiv I(\gamma)$ or $I \equiv I(\gamma')$ respectively, then

19.26.10

$$c \sim \gamma - u - \frac{1}{3}Iu^3 + \frac{1}{12}I'u^4 - (\frac{1}{36}I'' + \frac{1}{3}I^2)u^5 + \frac{1}{60}II'u^6 + \dots$$

19.26.11

$$y'(c) \sim y'(\gamma) \{ 1 - \frac{1}{3}Iu^2 + \frac{1}{6}I'u^3 - (\frac{1}{24}I'' + \frac{1}{3}I^2)u^4 + \frac{7}{36}II'u^5 + \dots \}$$

19.26.12

$$c' \sim \gamma' - Iv - \frac{1}{2}II'v^2 + (\frac{1}{6}I^2I'' - \frac{1}{2}II'^2 - \frac{1}{3}I^4)v^3 + (\frac{5}{12}I^2I'I'' - \frac{5}{6}II'^3 - \frac{5}{12}I^4I')v^4 + \dots$$

19.26.13

$$y(c') \sim y(\gamma') \{ 1 - \frac{1}{2}I^3v^2 - \frac{1}{6}I^3I'v^3 - (\frac{1}{6}I^3I'^2 - \frac{1}{24}I^4I'' + \frac{1}{6}I^6)v^4 + \dots \}$$

The process can be repeated, if necessary, using as many terms at any stage as seems convenient.

Note the relations, holding at zeros,

19.26.14 $U'(a, c) = -\sqrt{2/\pi}V(a, c)$

19.26.15 $V'(a, c') = \sqrt{2/\pi}U(a, c')$

19.26.16 $W'(a, c) = -1/W(a, -c)$

19.26.17

$$W(a, c') = 1 / \left\{ \frac{d}{dx} W(a, -x) \right\}_{x=c'} = -1/W'(a, -c')$$

19.27. Bessel Functions of Order $\pm \frac{1}{4}, \pm \frac{3}{4}$ as Parabolic Cylinder Functions

Most applications of these functions refer to cases where parabolic cylinder functions would be more appropriate. We have

19.27.1 $J_{\pm i}(\frac{1}{4}x^2) = \frac{2^i}{\sqrt{\pi x}} \{ W(0, -x) \mp W(0, x) \}$

19.27.2 $J_{\pm i}(\frac{1}{4}x^2) = \frac{-2^i}{x\sqrt{\pi x}} \{ W(0, x) \pm W(0, -x) \}$

Functions of other orders may be obtained by use of the recurrence relation 10.1.22, which here becomes

19.27.3 $\frac{1}{4}x^2 J_{\nu+1}(\frac{1}{4}x^2) - 2\nu J_{\nu}(\frac{1}{4}x^2) + \frac{1}{4}x^2 J_{\nu-1}(\frac{1}{4}x^2) = 0$

Again

19.27.4 $I_{-i}(\frac{1}{4}x^2) + I_i(\frac{1}{4}x^2) = \frac{2}{\sqrt{x}} V(0, x)$

19.27.5

$$\frac{\sqrt{2}}{\pi} K_i(\frac{1}{4}x^2) = I_{-i}(\frac{1}{4}x^2) - I_i(\frac{1}{4}x^2) = \frac{2}{\sqrt{\pi x}} U(0, x)$$

19.27.6 $I_{-i}(\frac{1}{4}x^2) + I_i(\frac{1}{4}x^2) = -\frac{4}{x\sqrt{x}} \frac{d}{dx} V(0, x)$

19.27.7

$$\frac{\sqrt{2}}{\pi} K_i(\frac{1}{4}x^2) = I_{-i}(\frac{1}{4}x^2) - I_i(\frac{1}{4}x^2) = -\frac{4}{x\sqrt{\pi x}} \frac{d}{dx} U(0, x)$$

As before, Bessel functions of other orders may be obtained by use of the recurrence relation 10.2.23, which here becomes

19.27.8 $\frac{1}{4}x^2 I_{\nu+1}(\frac{1}{4}x^2) + 2\nu I_{\nu}(\frac{1}{4}x^2) - \frac{1}{4}x^2 I_{\nu-1}(\frac{1}{4}x^2) = 0$

19.27.9 $\frac{1}{4}x^2 K_{\nu+1}(\frac{1}{4}x^2) - 2\nu K_{\nu}(\frac{1}{4}x^2) - \frac{1}{4}x^2 K_{\nu-1}(\frac{1}{4}x^2) = 0$

Numerical Methods

19.28. Use and Extension of the Tables

For $U(a, x), V(a, x)$ and $W(a, x)$, interpolation x -wise may be carried out to 5-figure accuracy almost everywhere by using 5-point or 6-point Lagrangian interpolation. For $|a| \leq 1$, comparable accuracy a -wise may be obtained with 5- or 6-point interpolation.

For $|a| > 1$, $U(a, x)$ and $V(a, x)$ may be obtained by use of recurrence relations from two values, possibly obtained by interpolation, with $|a| \leq 1$; such a procedure is not available for $W(a, \pm x)$, $|a| > 1$.

In cases where straightforward use of the a -wise recurrence relation results in loss of accuracy by cancellation of leading digits, it may be worth while to remark that greater accuracy is usually attainable by use of the recurrence relation in the

reverse direction, from arbitrary starting values (often 1 and 0) for two values of a somewhat beyond the last value desired. This is because the recurrence relation is a second order homogeneous linear difference equation, and has two independent solutions. Loss of accuracy by cancellation occurs when the solution desired is diminishing as a varies, while the companion solution is increasing. By reversing the direction of progress in a , the roles of the two solutions are interchanged, and the contribution of the desired solution now increases, while the unwanted solution diminishes to the point of negligibility. By starting sufficiently beyond the last value of a for which the function is desired, we can ensure that the unwanted solution is negligible but, because the starting values were arbitrary, we have an un-

known multiple of the solution desired. The computation is then carried back until a value of a with $|a| \leq 1$ is reached, when the precise multiple that we have of the desired solution may be determined and hence removed throughout. Compare also 9.12, Example 1.

Example 1. Evaluate $U(a, 5)$ for $a=5, 6, 7, \dots$, using 19.6.4.

$$(a + \frac{1}{2})U(a + 1, x) + xU(a, x) - U(a - 1, x) = 0$$

*From tables. +Starting values.

**This value was used to obtain the constant multiplier $\frac{d}{k^*} = \frac{(-6)5.2847}{(12)1.59035} = (-18)3.32298$ for converting the previous column into this one.

The second column shows forward recurrence starting with values at $a=3, 4$ from Table 19.1. Backward recurrence starts with values 0 and 1 at $a=19$ and 18, containing a multiple $kU(a, 5)$ and a subsequently negligible multiple of the other solution $\Gamma(\frac{1}{2}-a)V(a, 5)$. Rounding errors convert $kU(a, x)$ into $k^*U(a, x)$ without affecting the values in the last column. The value of $1/k^*$ is identified from the known value of $U(3, 5)$, and used to obtain the final column by multiplying throughout by $1/k^*$. The improvement in $U(5, 5)$ is evident by comparison with Table 19.1.

Derivatives. These are not tabulated here. Since the functions $U(a, x)$, $V(a, x)$ and $W(a, x)$ satisfy differential equations, values of derivatives are often required.

For all these functions the equation is second order with first derivative absent, so that *second derivatives* may be readily obtained from function values by use of the differential equation.

First derivatives can be obtained for $U(a, x)$ and $V(a, x)$ by applying the appropriate recurrence

relations 19.6.1-2. If less accuracy is needed they can be found by use of mean central differences of $U(a, x)$, $V(a, x)$ and also of $W(a, x)$ with the formula

$$hu' = h \frac{du}{dx} = \mu\delta u - \frac{1}{6}\mu\delta^3 u + \frac{1}{30}\mu\delta^5 u - \dots$$

using $h=.1$; this usually gives a 3- or 4-figure value of du/dx .

If greater accuracy is needed for $dW(a, x)/dx$ it may be obtained by evaluating d^2W/dx^2 with the help of the differential equation satisfied by W and integrating this second derivative numerically. This requires one accurate value of dW/dx to start off the integration; we describe two methods for obtaining this, both making use of the difference between two fairly widely separated values of W , for example, separated by 5 or 10 tabular intervals.

(i) Write f_r, f'_r, f''_r for $W(a, x_0 + rh)$ and its first two derivatives, then f'_0 may be found from

$$hf'_0 = \frac{1}{2n} (f_n - f_{-n}) - \frac{h^2}{2n} \sum_1^{n-1} (n-r)(f'_r - f''_r) - \frac{h^2}{2n} \{ \frac{1}{12} - \frac{1}{24}\delta^2 + \frac{3}{80}\frac{1}{48}\delta^4 - \dots \} (f''_n - f''_{-n}) - h^2 \{ \frac{1}{12}\mu\delta - \frac{1}{720}\mu\delta^3 + \frac{1}{80640}\mu\delta^5 - \dots \} f''_0$$

(ii) Consider a solution y of the differential equation for $W(a, x)$, namely $y'' = (-\frac{1}{4}x^2 + a)y$. If we are given values y and y' at a particular $x=x_0$ and write $T_n = H^n y^{(n)}/n!$, $T_{-1} = T_{-2} = 0$, then we may compute T_2, T_3, T_4, \dots in succession by use of the recurrence relation obtained from the differential equation,

$$T_{n+2} = \frac{H^2}{(n+1)(n+2)} [(-\frac{1}{4}x_0^2 + a)T_n - \frac{1}{2}Hx_0T_{n-1} - \frac{1}{4}H^2T_{n-2}]$$

These are computed, to a fixed number of decimals until they become negligible, thus giving

$$y(x_0 \pm H) = T_0 \pm T_1 + T_2 \pm T_3 + \dots$$

This may be applied, with $H=rh$, h being the tabular interval, and r a small integer, say $r=5$, to the solutions $y=y_1, y=y_2$ having

$$\begin{aligned} y_1(x_0) &= W(a, x_0) & y'_1(x_0) &= W^{*'}(a, x_0) \\ y_2(x_0) &= 0 & y'_2(x_0) &= 1 \end{aligned}$$

in which $W^{*'}(a, x_0)$ is an approximation to $W'(a, x_0)$, not necessarily a good one; it may be

obtained from differences, for example. We thus obtain $y_1(x_0 \pm H)$ and $y_2(x_0 \pm H)$.

Now suppose

$$W'(a, x_0) = W^{*'}(a, x_0) + \lambda$$

then, for all x

$$W(a, x) = y_1(x) + \lambda y_2(x)$$

and in particular

$$W(a, x_0 \pm H) = y_1(x_0 \pm H) + \lambda y_2(x_0 \pm H)$$

The values of $W(a, x_0 \pm H)$ may be read from the tables and two independent estimates of λ obtained, whence

$$W'(a, x_0) = W^{*'}(a, x_0) + \lambda$$

to a suitable accuracy.

Example 2. Evaluate $W'(-3, 1)$ using $r=5$. From **Table 19.2**

$$W(-3, .5) = -.05857 \quad W(-3, 1) = -.61113$$

$$W(-3, 1.5) = -.69502$$

(i) Using the first method

x	$W(-3, x)$	$W''(-3, x)$	δ	δ^2	δ^3
0.4	+0.07298	-0.22186			
0.5	-.05857	+.17937		+131	
0.6	-.18832	.58191			
0.7	-.31226	.97503			
0.8	-.42646	1.34761	34081		
0.9	-.52722	1.68842	29775		-1095
1.0	-.61113	1.98617	24374		-1032
1.1	-.67522	2.22991	17941		
1.2	-.71706	2.40932			
1.3	-.73488	2.51513			
1.4	-.72761	2.53936			
1.5	-.69502	2.47601		-9129	
1.6	-.63774	2.32137			

The fifth decimal in $W''(-3, x)$ is only a guard figure which is hardly needed. Only the differences needed have been computed.

Then

$$\begin{aligned} \frac{1}{r^5} W'(-3, 1) &= \frac{1}{r^5} (-.69502 + .05857) - \frac{1}{1000} (10.38874) \\ &\quad - \frac{1}{1000} \left\{ \frac{1}{r^2} (2.29664) - \frac{1}{240} (-.09260) \right\} \\ &\quad - \frac{1}{100} \left\{ \frac{1}{24} (.54149) - \frac{11}{1440} (-.02127) \right\} \\ &= -.0636450 - .0103887 - .0001918 - .0002272 \\ &= -.0744527 \end{aligned}$$

Thus $W'(-3, 1) = -.74453$. This might have an error up to about $1\frac{1}{2}$ units in the last figure but is, in fact, correct to 5 decimals.

(ii) Using the second method, with

$$y_1(1) = W(-3, 1) = -.61113 \quad \text{to 5 decimals}$$

$$y_1'(1) = -.745 \quad \text{to about 3 decimals}$$

the following values result, with $H=.5$,

	y_1	y_2	$W(-3, x) = y_1 + \lambda y_2$
T_0	-.61113	.0000	At $x=1.5$
T_1	-.37250	+.5000	$x - .695223 + .4323\lambda$
			$= -.69502$
T_2	+.24827 2	.0000	$\lambda = .000203 / .4323$
T_3	+ 5680 9	- 677	$= .000470$
T_4	- 1407 4	- 26	So $W'(-3, 1)$
			$= -.745 + \lambda$
			$= -.744530$
T_5	- 279 3	+ 24	At $x=.5$
T_6	+ 13 4	+ 2	$-.058363 - .4371\lambda$
			$= -.05857$
T_7	+ 5 4		$\lambda = .000207 / .4371$
T_8	+ 5		$= .000474$
$y(1.5)$	-.695223	+.4323	So $W'(-3, 1)$
$y(.5)$	-.058363	-.4371	$= -.745 + \lambda$
			$= -.744526$

Thus $W'(-3, 1) = -.74453$ which is correct to 5 decimals.

Example 3. Evaluate the positive zero of $U(-3, x)$.

We use **19.7.3** to obtain a first approximation, see **19.26.3**. The appropriate zero of $Ai(t)$ is at

$$t = (4|a|)^{1/2} \tau = -2.338$$

whence

$$\tau = -(2.338) \times (12)^{-1} = -.4461$$

Hence, from **Table 19.3**, $\xi = .3990$ and the approximate zero is $x = 2\sqrt{|a|}\xi = 1.382$.

We improve this by using **19.26.10**, but take, for convenience, $x=1.4$ as an approximation, so that the value of U can be read directly from the tables. U' can be obtained as in the section following

Example 1.

We find

$$U(-3, 1.4) = .02627 \quad U'(-3, 1.4) = 2.0637$$

Then **19.26.9** gives

$$u = U/U' = .012730 \quad I = -2.51$$

$$I' = .7 \quad I'' = .5$$

and

$$c = 1.4 - .012730 + .000002 = 1.38727$$

which is correct to 5 decimals, while **19.26.11** gives

$$y'(c) = 2.0637(1 + .000203) = 2.0641$$

compared with the correct value 2.06416.

20. Mathieu Functions

Mathematical Properties

20.1. Mathieu's Equation

Canonical Form of the Differential Equation

$$20.1.1 \quad \frac{d^2y}{dv^2} + (a - 2q \cos 2v)y = 0$$

Mathieu's Modified Differential Equation

$$20.1.2 \quad \frac{d^2f}{du^2} - (a - 2q \cosh 2u)f = 0 \quad (v = iu, y = f)$$

Relation Between Mathieu's Equation and the Wave Equation for the Elliptic Cylinder

The wave equation in Cartesian coordinates is

$$20.1.3 \quad \frac{\partial^2 W}{\partial x^2} + \frac{\partial^2 W}{\partial y^2} + \frac{\partial^2 W}{\partial z^2} + k^2 W = 0$$

A solution W is obtainable by separation of variables in elliptical coordinates. Thus, let

$$x = \rho \cosh u \cos v; \quad y = \rho \sinh u \sin v; \quad z = z;$$

ρ a positive constant; 20.1.3 becomes

$$20.1.4 \quad * \frac{\partial^2 W}{\partial z^2} + \frac{2}{\rho^2 (\cosh 2u - \cos 2v)} \left(\frac{\partial^2 W}{\partial u^2} + \frac{\partial^2 W}{\partial v^2} \right) + k^2 W = 0$$

Assuming a solution of the form

$$W = \varphi(z)f(u)g(v)$$

and substituting the above into 20.1.4 one obtains, after dividing through by W ,

$$\frac{1}{\varphi} \frac{d^2 \varphi}{dz^2} + G = 0$$

where

$$* G = \frac{2}{\rho^2 (\cosh 2u - \cos 2v)} \left\{ \frac{d^2 f}{du^2} \frac{1}{f} + \frac{d^2 g}{dv^2} \frac{1}{g} \right\} + k^2$$

Since z, u, v are independent variables, it follows that

$$20.1.5 \quad \frac{d^2 \varphi}{dz^2} + c\varphi = 0$$

where c is a constant.

Again, from the fact that $G = c$ and that u, v are independent variables, one sets

20.1.6

$$* a = \frac{d^2 f}{du^2} \frac{1}{f} + \frac{(k^2 - c)}{2} \rho^2 \cosh 2u$$

$$a = -\frac{d^2 g}{dv^2} \frac{1}{g} + \frac{(k^2 - c)}{2} \rho^2 \cos 2v$$

where a is a constant. The above are equivalent to 20.1.1 and 20.1.2. The constants c and a are often referred to as *separation constants*, due to the role they play in 20.1.5 and 20.1.6.

For some physically important solutions, the function g must be periodic, of period π or 2π . It can be shown that there exists a countably infinite set of *characteristic values* $a_r(q)$ which yield even periodic solutions of 20.1.1; there is another countably infinite sequence of *characteristic values* $b_r(q)$ which yield odd periodic solutions of 20.1.1.

It is known that there exist periodic solutions of period $k\pi$, where k is any positive integer. In what follows, however, the term *characteristic value* will be reserved for a value associated with solutions of period π or 2π only. These characteristic values are of basic importance to the general theory of the differential equation for arbitrary parameters a and q .

An Algebraic Form of Mathieu's Equation

20.1.7

$$(1-t^2) \frac{d^2 y}{dt^2} - t \frac{dy}{dt} + (a + 2q - 4qt^2)y = 0 \quad (\cos v = t)$$

Relation to Spheroidal Wave Equation

$$20.1.8 \quad (1-t^2) \frac{d^2 y}{dt^2} - 2(b+1)t \frac{dy}{dt} + (c - 4qt^2)y = 0 \quad *$$

Thus, Mathieu's equation is a special case of 20.1.8, with $b = -\frac{1}{2}$, $c = a + 2q$.

20.2. Determination of Characteristic Values

A solution of 20.1.1 with v replaced by z , having period π or 2π is of the form

$$20.2.1 \quad y = \sum_{m=0}^{\infty} (A_m \cos mz + B_m \sin mz)$$

where B_0 can be taken as zero. If the above is substituted into 20.1.1 one obtains

20.2.2

$$\sum_{m=-2}^{\infty} [(a - m^2)A_m - q(A_{m-2} + A_{m+2})] \cos mz + \sum_{m=-1}^{\infty} [(a - m^2)B_m - q(B_{m-2} + B_{m+2})] \sin mz = 0$$

$$A_{-m}, B_{-m} = 0 \quad m > 0$$

*See page II.

Equation 20.2.2 can be reduced to one of four simpler types, given in 20.2.3 and 20.2.4 below

20.2.3 $y_0 = \sum_{m=0}^{\infty} A_{2m+p} \cos(2m+p)z, \quad p=0 \text{ or } 1$

20.2.4 $y_1 = \sum_{m=0}^{\infty} B_{2m+p} \sin(2m+p)z, \quad p=0 \text{ or } 1$

If $p=0$, the solution is of period π ; if $p=1$, the solution is of period 2π .

Recurrence Relations Among the Coefficients

Even solutions of period π :

20.2.5 $aA_0 - qA_2 = 0$

20.2.6 $(a-4)A_2 - q(2A_0 + A_4) = 0$

20.2.7 $(a-m^2)A_m - q(A_{m-2} + A_{m+2}) = 0 \quad (m \geq 3)$

Even solutions of period 2π :

20.2.8 $(a-1)A_1 - q(A_1 + A_3) = 0,$

along with 20.2.7 for $m \geq 3$.

Odd solutions of period π :

20.2.9 $(a-4)B_2 - qB_4 = 0$

* 20.2.10 $(a-m^2)B_m - q(B_{m-2} + B_{m+2}) = 0 \quad (m \geq 3)$

Odd solutions of period 2π :

20.2.11 $(a-1)B_1 + q(B_1 - B_3) = 0,$

along with 20.2.10 for $m \geq 3$.

Let

20.2.12 $Ge_m = A_m/A_{m-2}, \quad Go_m = B_m/B_{m-2};$

$G_m = Ge_m$ or Go_m when the same operations apply to both, and no ambiguity is likely to arise. Further let

20.2.13 $V_m = (a-m^2)/q.$

Equations 20.2.5-20.2.7 are equivalent to

20.2.14 $Ge_2 = V_0; \quad Ge_4 = V_2 - \frac{2}{Ge_2}$

20.2.15 $G_m = 1/(V_m - G_{m+2}) \quad (m \geq 3),$

for even solutions of period π .

Similarly

20.2.16 $V_1 - 1 = Ge_3;$ for even solutions of period 2π , along with 20.2.15

20.2.17 $V_1 + 1 = Go_3,$ for odd solutions of period 2π , along with 20.2.15

20.2.18 $V_2 = Go_4,$ for odd solutions of period π , along with 20.2.15

These three-term recurrence relations among the coefficients indicate that every G_m can be developed into two types of continued fractions. Thus 20.2.15 is equivalent to

20.2.19

$$G_m = \frac{1}{V_m - G_{m+2}} = \frac{1}{V_m - \frac{1}{V_{m+2} - \frac{1}{V_{m+4} - \dots}}} \quad (m \geq 3)$$

20.2.20

$$G_{m+2} = V_m - 1/G_m = V_m - \frac{1}{V_{m-2} - \frac{1}{V_{m-4} - \dots - \frac{\varphi_0}{V_{0+d} + \varphi_1}}} \quad (m \geq 3)$$

where

$\varphi_1 = d = 0; \quad \varphi_0 = 2,$ if $G_{m+2} = A_{2s}/A_{2s-2}$

$\varphi_1 = d = \varphi_0 = 0,$ if $G_{m+2} = B_{2s}/B_{2s-2}$

$\varphi_1 = -1; \quad \varphi_0 = d = 1,$ if $G_{m+2} = A_{2s+1}/A_{2s-1}$

$\varphi_1 = d = \varphi_0 = 1,$ if $G_{m+2} = B_{2s+1}/B_{2s-1}$

The four choices of the parameters φ_1, φ_0, d correspond to the four types of solutions 20.2.3-20.2.4. Hereafter, it will be convenient to separate the characteristic values a into two major subsets:

$a = a_r,$ associated with even periodic solutions

$a = b_r,$ associated with odd periodic solutions

If 20.2.19 is suitably combined with 20.2.13-20.2.18 there result four types of continued fractions, the roots of which yield the required characteristic values

20.2.21 $V_0 - \frac{2}{2 - W_4 - \frac{1}{V_6 - \dots}} = 0 \quad \text{Roots: } a_{2r}$

20.2.22

$$V_1 - 1 - \frac{1}{V_3 - \frac{1}{V_5 - \frac{1}{V_7 - \dots}}} = 0 \quad \text{Roots: } a_{2r+1}$$

20.2.23 $V_2 - \frac{1}{V_4 - \frac{1}{V_6 - \frac{1}{V_8 - \dots}}} = 0 \quad \text{Roots: } b_{2r}$

20.2.24

$$V_1 + 1 - \frac{1}{V_3 - \frac{1}{V_5 - \frac{1}{V_7 - \dots}}} = 0 \quad \text{Roots: } b_{2r+1}$$

If a is a root of 20.2.21-20.2.24, then the corresponding solution exists and is an entire function of z , for general complex values of q .

If q is real, then the Sturmian theory of second order linear differential equations yields the

*See page II.

following:

- (a) For a fixed real q , characteristic values a_r and b_r are real and distinct, if $q \neq 0$; $a_0 < b_1 < a_1 < b_2 < a_2 < \dots$, $q > 0$ and $a_r(q)$, $b_r(q)$ approach r^2 as q approaches zero.
- (b) A solution of 20.1.1 associated with a_r or b_r has r zeros in the interval $0 \leq z < \pi$, (q real).
- (c) The form of 20.2.21 and 20.2.23 shows that if a_{2r} is a root of 20.2.21 and q is different from zero, then a_{2r} cannot be a root of 20.2.23; similarly, no root of 20.2.22 can be a root of 20.2.24 if $q \neq 0$. It may be shown from other considerations that for a given point (a , q) there can be at most one periodic solution of period π or 2π if $q \neq 0$. This no longer holds for solutions of period $s\pi$, $s \geq 3$; for these all solutions are periodic, if one is.

$$a_4(q) = 16 + \frac{q^2}{30} + \frac{433q^4}{864000} - \frac{5701q^6}{2721600000} + \dots$$

$$a_5(-q) = 25 + \frac{q^2}{48} + \frac{11q^4}{774144} - \frac{q^5}{147456}$$

$$b_5(q) = + \frac{37q^6}{891813888} + \dots$$

$$b_6(q) = 36 + \frac{q^2}{70} + \frac{187q^4}{43904000} - \frac{5861633q^6}{92935987200000} + \dots$$

$$a_6(q) = 36 + \frac{q^2}{70} + \frac{187q^4}{43904000} + \frac{6743617q^6}{92935987200000} + \dots$$

For $r \geq 7$, and $|q|$ not too large, a_r is approximately equal to b_r , and the following approximation may be used

20.2.26

$$\left. \begin{matrix} a_r \\ b_r \end{matrix} \right\} = r^2 + \frac{q^2}{2(r^2-1)} + \frac{(5r^2+7)q^4}{32(r^2-1)^3(r^2-4)}$$

$$+ \frac{(9r^4+58r^2+29)q^6}{64(r^2-1)^5(r^2-4)(r^2-9)} + \dots$$

The above expansion is not limited to integral values of r , and it is a very good approximation for r of the form $n + \frac{1}{2}$ where n is an integer. In case of integral values of $r=n$, the series holds only up to terms not involving r^2-n^2 in the denominator. Subsequent terms must be derived specially (as shown by Mathieu). Mulholland and Goldstein [20.38] have computed characteristic values for purely imaginary q and found that a_0 and a_2 have a common real value for $|q|$ in the neighborhood of 1.468; Bouwkamp [20.5] has computed this number as $q_0 = \pm i 1.46876852$ to 8 decimals. For values of $-iq > -iq_0$, a_0 and a_2 are conjugate complex numbers. From equation 20.2.25 it follows that the radius of convergence for the series defining a_0 is no greater than $|q_0|$. It is shown in [20.36], section 2.25 that the radius of convergence for $a_{2n}(q)$, $n \geq 2$ is greater than 3. Furthermore

$$a_r - b_r = O(q^r / r^{r-1}), r \rightarrow \infty.$$

20.3. Floquet's Theorem and Its Consequences

Since the coefficients of Mathieu's equation

20.3.1 $y'' + (a - 2q \cos 2z)y = 0$

are periodic functions of z , it follows from the known theory relating to such equations that there exists a solution of the form

20.3.2 $F_\nu(z) = e^{i\nu z} P(z),$

where ν depends on a and q , and $P(z)$ is a periodic function, of the same period as that of the coefficients in **20.3.1**, namely π . (Floquet's theorem; see [20.16] or [20.22] for its more general form.) The constant ν is called the *characteristic exponent*. Similarly

20.3.3 $F_\nu(-z) = e^{-i\nu z} P(-z)$

satisfies **20.3.1** whenever **20.3.2** does. Both $F_\nu(z)$ and $F_\nu(-z)$ have the property

20.3.4

$$y(z+k\pi) = C^k y(z), \quad y = F_\nu(z) \text{ or } F_\nu(-z),$$

$$C = e^{i\nu\pi} \text{ for } F_\nu(z), \quad C = e^{-i\nu\pi} \text{ for } F_\nu(-z)$$

Solutions having the property **20.3.4** will hereafter be termed *Floquet solutions*. Whenever $F_\nu(z)$ and $F_\nu(-z)$ are linearly independent, the general solution of **20.3.1** can be put into the form

20.3.5 $y = AF_\nu(z) + BF_\nu(-z)$

If $AB \neq 0$, the above solution will *not* be a *Floquet solution*. It will be seen later, from the method for determining ν when a and q are given, that there is some ambiguity in the definition of ν ; namely, ν can be replaced by $\nu + 2k$, where k is an arbitrary integer. This is as it should be, since the addition of the factor $\exp(2ikz)$ in **20.3.2** still leaves a periodic function of period π for the coefficient of $\exp i\nu z$.

It turns out that when a belongs to the set of characteristic values a_r and b_r of **20.2**, then ν is zero or an integer. It is convenient to associate $\nu = r$ with $a_r(q)$, and $\nu = -r$ with $b_r(q)$; see [20.36]. In the special case when ν is an integer, $F_\nu(z)$ is

proportional to $F_\nu(-z)$; the second, independent solution of **20.3.1** then has the form

20.3.6 $y_2 = z c e_\nu(z, q) + \sum_{k=0}^{\infty} d_{2k+p} \sin(2k+p)z,$
associated with $c e_\nu(z, q)$

20.3.7 $y_2 = z s e_\nu(z, q) + \sum_{k=0}^{\infty} f_{2k+p} \cos(2k+p)z,$
associated with $s e_\nu(z, q)$

The coefficients d_{2k+p} and f_{2k+p} depend on the corresponding coefficients A_m and B_m , respectively, of **20.2**, as well as on a and q . See [20.30], section (7.50)-(7.51) and [20.58], section V, for details.

If ν is not an integer, then the Floquet solutions $F_\nu(z)$ and $F_\nu(-z)$ are linearly independent. It is clear that **20.3.2** can be written in the form

20.3.8 $F_\nu(z) = \sum_{k=-\infty}^{\infty} c_{2k} e^{i(\nu+2k)z}.$

From **20.3.8** it follows that if ν is a proper fraction m_1/m_2 , then every solution of **20.3.1** is periodic, and of period at most $2\pi m_2$. This agrees with results already noted in **20.2**; i.e., both independent solutions are periodic, if one is, provided the period is different from π and 2π .

Method of Generating the Characteristic Exponent

Define two linearly independent solutions of **20.3.1**, for fixed a, q by

20.3.9 $y_1(0) = 1; y_1'(0) = 0.$

$y_2(0) = 0; y_2'(0) = 1.$

Then it can be shown that

20.3.10 $\cos \pi\nu - y_1(\pi) = 0$

20.3.11 $\cos \pi\nu - 1 - 2y_1'(\frac{\pi}{2}) y_2(\frac{\pi}{2}) = 0$

Thus ν may be obtained from a knowledge of $y_1(\pi)$ or from a knowledge of both $y_1'(\frac{\pi}{2})$ and $y_2(\frac{\pi}{2})$.

For numerical purposes **20.3.11** may be more desirable because of the shorter range of integration, and hence the lesser accumulation of round-off errors. Either $\nu, -\nu$, or $\pm\nu + 2k$ (k an arbitrary integer) can be taken as the solution of **20.3.11**. Once ν has been fixed, the coefficients of **20.3.8** can be determined, except for an arbitrary multiplier which is independent of z .

The characteristic exponent can also be computed from a continued fraction, in a manner analogous to developments in **20.2**, if a sufficiently close first approximation to ν is available. For

systematic tabulation, this method is considerably faster than the method of numerical integration. Thus, when 20.3.8 is substituted into 20.3.1, there result the following recurrence relations:

$$20.3.12 \quad V_{2n}c_{2n} = c_{2n-2} + c_{2n+2}$$

where

$$20.3.13 \quad V_{2n} = [a - (2n + \nu)^2] / q, \quad -\infty < n < \infty.$$

When ν is complex, the coefficients V_{2n} may also be complex. As in 20.2, it is possible to generate the ratios

$$G_m = c_m / c_{m-2} \text{ and } H_{-m} = c_{-m-2} / c_{-m}$$

from the continued fractions

20.3.14

$$G_m = \frac{1}{V_m - \frac{1}{V_{m+2} - \dots}}, \quad m \geq 0$$

$$H_{-m} = \frac{1}{V_{-m-2} - \frac{1}{V_{-m-4} - \dots}}, \quad m \geq 0.$$

From the form of 20.3.13 and the known properties of continued fractions it is assured that for sufficiently large values of $|m|$ both $|G_m|$ and $|H_{-m}|$ converge. Once values of G_m and H_{-m} are available for some sufficiently large value of m , then the finite number of ratios $G_{m-2}, G_{m-4}, \dots, G_0$ can be computed in turn, if they exist. Similarly for H_{-m+2}, \dots, H_0 . It is easy to show that ν is the correct characteristic exponent, appropriate for the point (a, q) , if and only if $H_0 G_0 = 1$. An iteration technique can be used to improve the value of ν , by the method suggested in [20.3]. One coefficient c_j can be assigned arbitrarily; the rest are then completely determined. After all the c_j become available, a multiplier (depending on q but not on z) can be found to satisfy a prescribed normalization.

It is well known that continued fractions can be converted to determinantal form. Equation 20.3.14 can in fact be written as a determinant with an infinite number of rows—a special case of Hill's determinant. See [20.19], [20.36], [20.15], or [20.30] for details. Although the determinant has actually been used in computations where high-speed computers were available, the direct use of the continued fraction seems much less laborious.

Special Cases (a, q Real)

Corresponding to $q=0, y_1 = \cos \sqrt{a}z, y_2 = \sin \sqrt{a}z$; the Floquet solutions are $\exp(iaz)$ and $\exp(-iaz)$. As a, q vary continuously in the q - a plane, ν describes curves; ν is real when $(q, a), q \geq 0$ lies in the region between $a_r(q)$ and $b_{r+1}(q)$ and

all solutions of 20.1.1 for real z are therefore bounded (stable); ν is complex in regions between b_r and a_r ; in these regions every solution becomes infinite at least once; hence these regions are termed "unstable regions". The characteristic curves a_r , b_r separate the regions of stability. For negative q , the stable regions are between b_{2r+1} and b_{2r+2} , a_{2r} and a_{2r+1} ; the unstable regions are between a_{2r+1} and b_{2r+1} , a_{2r} and b_{2r} .

In some problems solutions are required for real values of z only. In such cases a knowledge of the characteristic exponent ν and the periodic function $P(z)$ is sufficient for the evaluation of the required functions. For complex values of z , however, the series defining $P(z)$ converges slowly. Other solutions will be determined in the next section; they all have the remarkable property that they depend on the same coefficients c_m developed in connection with Floquet's theorem (except for an arbitrary normalization factor).

Expansions for Small q (20.36) chapter 2)

If ν, q are fixed:

20.3.15

$$a = \nu^2 + \frac{q^2}{2(\nu^2-1)} + \frac{(5\nu^2+7)q^4}{32(\nu^2-1)^3(\nu^2-4)} + \frac{(9\nu^4+58\nu^2+29)q^6}{64(\nu^2-1)^5(\nu^2-4)(\nu^2-9)} + \dots (\nu \neq 1, 2, 3).$$

For the coefficients c_2 , of 20.3.8

20.3.16

$$c_2/c_0 = \frac{-q}{4(\nu+1)} - \frac{(\nu^2+4\nu+7)q^3}{128(\nu+1)^3(\nu+2)(\nu-1)} + \dots (\nu \neq 1, 2)$$

$$c_4/c_0 = q^2/32(\nu+1)(\nu+2) + \dots$$

$$c_{2s}/c_0 = (-1)^s q^s \Gamma(\nu+1)/2^{2s} s! \Gamma(\nu+s+1) + \dots$$

20.3.17

$$F_\nu(z) = c_0 \left[e^{i\nu z} - q \left\{ \frac{e^{i(\nu+2)z}}{4(\nu+1)} - \frac{e^{i(\nu-2)z}}{4(\nu-1)} \right\} \right] + \dots (\nu \text{ not an integer})$$

For small values of a

20.3.18

$$\cos \nu\pi = \left(1 - \frac{a\pi^2}{2} + \frac{a^2\pi^4}{24} + \dots \right) - \frac{q^2\pi^2}{4} \left[1 + a \left(1 - \frac{\pi^2}{6} \right) + \dots \right] + q^4 \left(\frac{\pi^4}{96} - \frac{25\pi^2}{256} + \dots \right) + \dots$$

20.4. Other Solutions of Mathieu's Equation

Following Erdélyi [20.14], [20.15], define

20.4.1 $\varphi_k(z) = [e^{i\pi} \cos(z-b)/\cos(z+b)]^{1/2} J_k(f)$

where

20.4.2 $f = 2[q \cos(z-b) \cos(z+b)]^{1/2}$,

and $J_k(f)$ is the Bessel function of order k ; b is a fixed, arbitrary complex number. By using the recurrence relations for Bessel functions the following may be verified:

20.4.3

$$\frac{d^2\varphi_k}{dz^2} - 2q(\cos 2z)\varphi_k + q(\varphi_{k-2} + \varphi_{k+2}) + k^2\varphi_k = 0.$$

It follows that a formal solution of 20.1.1 is given by

20.4.4 $y = \sum_{n=-\infty}^{\infty} c_{2n} \varphi_{2n+\nu}$

where the coefficients c_{2n} are those associated with Floquet's solution. In the above, ν may be complex. Except for the special case when ν is an integer, the following holds:

$$\frac{\varphi_{2n+\nu-2}}{\varphi_{2n+\nu}} \sim \frac{\varphi_{-2n+\nu}}{\varphi_{-2n+\nu+2}} \sim \frac{-4n^2}{q [\cos(z-b)]^2} \quad (n \rightarrow \infty)$$

If ν and n are integers, $J_{-2n+\nu}(f) = (-1)^\nu J_{2n-\nu}(f)$.

$$[\varphi_{2n+\nu}/\varphi_{2n+\nu-2}] \sim -[\cos(z-b)]^2 q/4n^2$$

$$[\varphi_{-2n+\nu}/\varphi_{-2n+\nu+2}] \sim -4n^2/q [\cos(z-b)]^2$$

On the other hand

$$\frac{c_{2n}}{c_{2n-2}} \sim \frac{c_{-2n}}{c_{-2n+2}} \sim \frac{-q}{4n^2} \quad (n \rightarrow \infty)$$

It follows that **20.4.4** converges absolutely and uniformly in every closed region where

$$|\cos(z-b)| > d_1 > 1.$$

There are two such disjoint regions:

(I) $\mathcal{R}(z-b) > d_2 > 0; (|\cos(z-b)| > d_1 > 1)$

(II) $\mathcal{R}(z-b) < -d_2 < 0; (|\cos(z-b)| > d_1 > 1)$

If ν is an integer **20.4.4** converges for all values of z . Various representations are found by specializing b .

20.4.5

If $b=0, y=e^{i\pi\nu/2} \sum_{n=-\infty}^{\infty} c_{2n}(-1)^n J_{2n+\nu}(2\sqrt{q} \cos z)$
 $(|\cos z| > 1, |\arg 2\sqrt{q} \cos z| \leq \pi)$

20.4.6

If $b=\frac{\pi}{2}, y=\sum_{n=-\infty}^{\infty} c_{2n} J_{2n+\nu}(2i\sqrt{q} \sin z)$
 $(|\sin z| > 1, |\arg 2\sqrt{q} \sin z| \leq \pi)$

If $b \rightarrow \infty i, y$ reduces to a multiple of the solution **20.3.8**. The fact that **20.3.8, 20.4.5, and 20.4.6** are special cases of **20.4.4** explains why it is that these apparently dissimilar expansions involve the same set of coefficients c_{2n} .

Since **20.4.4** results from the recurrence properties of Bessel functions, $J_k(f)$ can be replaced by $H_k^{(j)}(f), j=1, 2$, where $H_k^{(j)}$ is the Hankel function, at least formally. Thus let

$$\psi_k^j = [e^{i\pi} \cos(z-b)/\cos(z+b)]^{k/2} H_k^{(j)}(f)$$

where f satisfies **20.4.2**. An examination of the ratios $\psi_{2n+\nu}/\psi_{2n+\nu-2}$ shows that

$$y = \sum_{n=-\infty}^{\infty} c_{2n} \psi_{2n+\nu}^{(j)}$$

will be a solution provided

$$|\cos(z-b)| > 1; |\cos(z+b)| > 1.$$

The above two conditions are necessary even when ν is an integer. Once b is fixed, the regions in which the solutions converge can be readily established.

Following [20.36] let

20.4.7

$$J_\nu(x) = Z_\nu^{(1)}(x); \quad Y_\nu(x) = Z_\nu^{(2)}(x); \\ H_\nu^{(1)}(x) = Z_\nu^{(3)}(x); \quad H_\nu^{(2)}(x) = Z_\nu^{(4)}(x)$$

If z is replaced by $-iz$ in **20.4.5** and **20.4.6** solutions of **20.1.2** are obtained. Thus

20.4.8

$$y_1^{(j)}(z) = \sum_{n=-\infty}^{\infty} c_{2n} (-1)^n Z_{2n+\nu}^{(j)}(2\sqrt{q} \cosh z) \\ (|\cosh z| > 1)$$

20.4.9

$$y_2^{(j)}(z) = \sum_{n=-\infty}^{\infty} c_{2n} Z_{2n+\nu}^{(j)}(2\sqrt{q} \sinh z) \\ (|\sinh z| > 1, j=1, 2, 3, 4)$$

The relation between $y_1^{(j)}(z)$ and $y_2^{(j)}(z)$ can be determined from the asymptotic properties of the Bessel functions for large values of argument. It can be shown that

20.4.10

$$y_1^{(j)}(z)/y_2^{(j)}(z) = [F_\nu(0)/F_\nu(\frac{\pi}{2})] e^{i\nu\pi/2} \quad (\mathcal{R}z > 0).$$

When ν is not an integer, the above solutions do not vanish identically. See **20.6** for integral values of ν .

Solutions Involving Products of Bessel Functions

20.4.11

$$y_3^{(j)}(z) = \frac{1}{c_{2s}} \sum_{n=-\infty}^{\infty} c_{2n} (-1)^n Z_{n+\nu+s}^{(j)}(\sqrt{q} e^{iz}) J_{n-s}(\sqrt{q} e^{-iz}) \\ (j=1, 2, 3, 4)$$

satisfies **20.1.1**, where $Z_n^{(j)}(u)$ is defined in **20.4.7**, the coefficients c_{2n} belong to the Floquet solution, and s is an arbitrary integer, $c_{2s} \neq 0$. The solution converges over the entire complex z -plane if $q \neq 0$. Written with z replaced by $-iz$, one obtains solutions of **20.1.2**.

20.4.12

$$M_j^i(z, q) = \frac{1}{c_{2s}^r} \sum_{n=-\infty}^{\infty} c_{2n}^r (-1)^n Z_{n+\nu+s}^{(j)}(\sqrt{q}e^z) J_{n-s}(\sqrt{q}e^{-z})$$

It can be verified from 20.4.8 and 20.4.12 that

$$20.4.13 \quad \frac{y_1^{(j)}(z)}{M_j^i(z, q)} = F_\nu(0), \quad (\Re z > 0)$$

provided $c_{2s} \neq 0$. If $c_{2s} = 0$, the coefficient of $1/c_{2s}$ in 20.4.11 vanishes identically. For details see [20.43], [20.15], [20.36].

If s is chosen so that $|c_{2s}|$ is the largest coefficient of the set $|c_{2j}|$, then rapid convergence of 20.4.12 is obtained, when $\Re z > 0$. Even then one must be on guard against the possible loss of significant figures in the process of summing the series, especially so when q is large, and $|z|$ small. (If $j \neq 1$, then the phase of the logarithmic terms occurring in 20.4.12 must be defined, to make the functions single-valued.)

20.5. Properties of Orthogonality and Normalization

If $a(\nu+2p, q)$, $a(\nu+2s, q)$ are simple roots of 20.3.10 then

$$20.5.1 \quad \int_0^\pi F_{\nu+2p}(z) F_{\nu+2s}(-z) dz = 0, \text{ if } p \neq s.$$

Define

$$20.5.2 \quad ce_\nu(z, q) = \frac{1}{2} [F_\nu(z) + F_\nu(-z)];$$

$$se_\nu(z, q) = -i \frac{1}{2} [F_\nu(z) - F_\nu(-z)]$$

$ce_\nu(z, q)$, $se_\nu(z, q)$ are thus even and odd functions of z , respectively, for all ν (when not identically zero).

If ν is an integer, then $ce_\nu(z, q)$, $se_\nu(z, q)$ are either Floquet solutions or identically zero. The solutions $ce_r(z, q)$ are associated with a_r ; $se_r(z, q)$ are associated with b_r ; r an integer.

Normalization for Integral Values of ν and Real q

$$20.5.3 \quad \int_0^{2\pi} [ce_r(z, q)]^2 dz = \int_0^{2\pi} [se_r(z, q)]^2 dz = \pi$$

For integral values of ν the summation in 20.3.8 reduces to the simpler forms 20.2.3-20.2.4; on account of 20.5.3, the coefficients A_m and B_m (for all orders r) have the property

20.5.4

$$2A_0^2 + A_2^2 + \dots = A_1^2 + A_3^2 + \dots$$

$$= B_1^2 + B_2^2 + \dots = B_2^2 + B_4^2 + \dots = 1.$$

20.5.5

$$A_0^{2r} = \frac{1}{\pi^2} \int_0^{2\pi} ce_{2r}(z, q) dz; \quad A_n^r = \frac{1}{\pi} \int_0^{2\pi} ce_r(z, q) \cos n z dz$$

$$B_n^r = \frac{1}{\pi} \int_0^{2\pi} se_r(z, q) \sin n z dz \quad n \neq 0$$

For integral values of ν , the functions $ce_r(z, q)$ and $se_r(z, q)$ form a complete orthogonal set for the interval $0 \leq z \leq 2\pi$. Each of the four systems $ce_{2r}(z)$, $ce_{2r+1}(z)$, $se_{2r}(z)$, $se_{2r+1}(z)$ is complete in the smaller interval $0 \leq z \leq \frac{1}{2}\pi$, and each of the systems $ce_r(z)$, $se_r(z)$ is complete in $0 \leq z \leq \pi$.

If q is not real, there exist multiple roots of 20.3.10; for such special values of $a(q)$, the integrals in 20.5.3 vanish, and the normalization is therefore impossible. In applications, the particular normalization adopted is of little importance, except possibly for obtaining quantitative relations between solutions of various types. For this reason the normalization of $F_\nu(z)$, for arbitrary complex values of a, q , will not be specified here. It is worth noting, however, that solutions

$$ace_r(z, q), \quad \beta se_r(z, q)$$

defined so that

$$ace_r(0, q) = 1; \quad \left[\frac{d}{dz} \beta se_r(z, q) \right]_{z=0} = 1$$

are always possible. This normalization has in fact been used in [20.59], and also in [20.58], where the most extensive tabular material is available. The tabulated entries in [20.58] supply the conversion factors $A=1/\alpha$, $B=1/\beta$, along with the coefficients. Thus conversion from one normalization to another is rather easy.

In a similar vein, no general normalization will be imposed on the functions defined in 20.4.8.

20.6. Solutions of Mathieu's Modified Equation 20.1.2 for Integral ν (Radial Solutions)

Solutions of the first kind

20.6.1

$$C ce_{2r+p}(z, q) = ce_{2r+p}(iz, q)$$

associated with a_r

20.6.2 $Se_{2r+p}(z, q) = -ise_{2r+p}(iz, q) = \sum_{k=0}^{\infty} B_{2k+p}^{2r+p}(q) \sinh(2k+p)z$, associated with b ,
 writing $A_{2k+p}^{2r+p}(q) = A_{2k+p}$ for brevity; similarly for B_{2k+p} ; $p=0, 1$,

20.6.3
$$Ce_{2r}(z, q) = \frac{ce_{2r}\left(\frac{\pi}{2}, q\right)}{A_0^{2r}} \sum_{k=0}^{\infty} (-1)^k A_{2k} J_{2k}(2\sqrt{q} \cosh z) = \frac{ce_{2r}(0, q)}{A_0^{2r}} \sum_{k=0}^{\infty} A_{2k} J_{2k}(2\sqrt{q} \sinh z)$$

20.6.4
$$Ce_{2r+1}(z, q) = \frac{ce'_{2r+1}\left(\frac{\pi}{2}, q\right)}{\sqrt{q} A_1^{2r+1}} \sum_{k=0}^{\infty} (-1)^{k+1} A_{2k+1} J_{2k+1}(2\sqrt{q} \cosh z)$$

$$= \frac{ce'_{2r+1}(0, q)}{\sqrt{q} A_1^{2r+1}} \coth z \sum_{k=0}^{\infty} (2k+1) A_{2k+1} J_{2k+1}(2\sqrt{q} \sinh z)$$

20.6.5
$$Se_{2r}(z, q) = \frac{se'_{2r}\left(\frac{\pi}{2}, q\right) \tanh z}{q B_2^{2r}} \sum_{k=1}^{\infty} (-1)^k 2k B_{2k} J_{2k}(2\sqrt{q} \cosh z)$$

$$= \frac{se'_{2r}(0, q)}{q B_2^{2r}} \coth z \sum_{k=1}^{\infty} 2k B_{2k} J_{2k}(2\sqrt{q} \sinh z)$$

20.6.6
$$Se_{2r+1}(z, q) = \frac{se_{2r+1}\left(\frac{\pi}{2}, q\right) \tanh z}{\sqrt{q} B_1^{2r+1}} \sum_{k=0}^{\infty} (-1)^k (2k+1) B_{2k+1} J_{2k+1}(2\sqrt{q} \cosh z)$$

$$= \frac{se'_{2r+1}(0, q)}{\sqrt{q} B_1^{2r+1}} \sum_{k=0}^{\infty} B_{2k+1} J_{2k+1}(2\sqrt{q} \sinh z)$$

See [20.30] for still other forms.

Solutions of the second kind, as well as solutions of the third and fourth kind (analogous to Hankel functions) are obtainable from **20.4.12**.

20.6.7
$$Mc_{2r}^{(j)}(z, q) = \sum_{k=0}^{\infty} (-1)^{r+k} A_{2k}^{2r}(q) [J_{k-s}(u_1) Z_{k+s}^{(j)}(u_2) + J_{k+s}(u_1) Z_{k-s}^{(j)}(u_2)] / \epsilon_s A_{2s}^{2r}$$

 where $\epsilon_0=2, \epsilon_s=1$, for $s=1, 2, \dots$; s arbitrary, associated with a_{2r}

20.6.8
$$Mc_{2r+1}^{(j)}(z, q) = \sum_{k=0}^{\infty} (-1)^{r+k} A_{2k+1}^{2r+1}(q) [J_{k-s}(u_1) Z_{k+s+1}^{(j)}(u_2) + J_{k+s+1}(u_1) Z_{k-s}^{(j)}(u_2)] / A_{2s+1}^{2r+1}$$

 associated with a_{2r+1}

20.6.9
$$Ms_{2r}^{(j)}(z, q) = \sum_{k=1}^{\infty} (-1)^{k+r} B_{2k}^{2r}(q) [J_{k-s}(u_1) Z_{k+s}^{(j)}(u_2) - J_{k+s}(u_1) Z_{k-s}^{(j)}(u_2)] / B_{2s}^{2r}$$
, associated with b_{2r}

20.6.10
$$Ms_{2r+1}^{(j)}(z, q) = \sum_{k=0}^{\infty} (-1)^{k+r} B_{2k+1}^{2r+1}(q) [J_{k-s}(u_1) Z_{k+s+1}^{(j)}(u_2) - J_{k+s+1}(u_1) Z_{k-s}^{(j)}(u_2)] / B_{2s+1}^{2r+1}$$

 associated with b_{2r+1}

where

$$u_1 = \sqrt{q}e^{-z}, u_2 = \sqrt{q}e^z, B_{2s+p}^{2r+p}, A_{2s+p}^{2r+p} \neq 0, p=0, 1.$$

See **20.4.7** for definition of $Z_m^{(j)}(x)$.

Solutions **20.6.7–20.6.10** converge for all values of z , when $q \neq 0$. If $j=2, 3, 4$ the logarithmic terms entering into the Bessel functions $Y_m(u_2)$ must be defined, to make the functions single-valued. This can be accomplished as follows:

Define (as in [20.58])

20.6.11
$$\ln(\sqrt{q}e^z) = \ln(\sqrt{q}) + z$$

See [20.15] and [20.36], section **2.75** for derivation.

Other Expressions for the Radial Functions (Valid Over More Limited Regions)

20.6.12

$$Mc_{2r}^{(j)}(z, q) = [ce_{2r}(0, q)]^{-1} \sum_{k=0}^{\infty} (-1)^{k+r} A_{2k}^{2r}(q) Z_{2k}^{(j)}(2\sqrt{q} \cosh z)$$

$$Mc_{2r+1}^{(j)}(z, q) = [ce_{2r+1}(0, q)]^{-1} \sum_{k=0}^{\infty} (-1)^{k+r} A_{2k+1}^{2r+1}(q) Z_{2k+1}^{(j)}(2\sqrt{q} \cosh z)$$

20.6.13

$$Ms_{2r}^{(j)}(z, q) = [se'_{2r}(0, q)]^{-1} \tanh z \sum_{k=1}^{\infty} (-1)^{k+r} 2k B_{2k}^{2r}(q) Z_{2k}^{(j)}(2\sqrt{q} \cosh z)$$

$$Ms_{2r+1}^{(j)}(z, q) = [se'_{2r+1}(0, q)]^{-1} \tanh z \sum_{k=0}^{\infty} (-1)^{k+r} (2k+1) B_{2k+1}^{2r+1}(q) Z_{2k+1}^{(j)}(2\sqrt{q} \cosh z)$$

Valid for $\Re z > 0$, $|\cosh z| > 1$; if $j=1$, valid for all z . They agree with 20.6.7–20.6.10 if the Bessel functions $Y_m(2q^{\frac{1}{2}} \cosh z)$ are made single-valued in a suitable way. For example, let

$$Y_m(u) = \frac{2}{\pi} (\ln u) J_m(u) + \phi(u)$$

where $\phi(u)$ is single-valued for all finite values of u . With $u = 2q^{\frac{1}{2}} \cosh z$, define

20.6.14

$$\ln(2q^{\frac{1}{2}} \cosh z) = \ln 2q^{\frac{1}{2}} + z + \ln \frac{1}{2}(1 + e^{-2z}) \quad -\frac{\pi}{2} \leq \arg \frac{1}{2}(1 + e^{-2z}) \leq \frac{\pi}{2}$$

(If q is not positive, the phase of $\ln 2q^{\frac{1}{2}}$ must also be specified, although this specification will not affect continuity with respect to z . If $Y_m(u)$ is defined from some other expression, the definition must be compatible with 20.6.14.)

If $j=1$, $Mc_{2r+p}^{(1)}$ and $Ms_{2r+p}^{(1)}$, $p=0, 1$ are solutions of the first kind, proportional to Ce_{2r+p} and Se_{2r+p} respectively.

Thus

20.6.15

$$Ce_{2r}(z, q) = \frac{ce_{2r}\left(\frac{\pi}{2}, q\right) ce_{2r}(0, q)}{(-1)^r A_0^{2r}} Mc_{2r}^{(1)}(z, q)$$

$$Ce_{2r+1}(z, q) = \frac{ce'_{2r+1}\left(\frac{\pi}{2}, q\right) ce_{2r+1}(0, q)}{(-1)^{r+1} \sqrt{q} A_1^{2r+1}} Mc_{2r+1}^{(1)}(z, q)$$

$$Se_{2r}(z, q) = \frac{se'_{2r}(0, q) se_{2r}\left(\frac{\pi}{2}, q\right)}{(-1)^r q B_2^{2r}} Ms_{2r}^{(1)}(z, q)$$

$$Se_{2r+1}(z, q) = \frac{se'_{2r+1}(0, q) se_{2r+1}\left(\frac{\pi}{2}, q\right)}{(-1)^{r+1} \sqrt{q} B_1^{2r+1}} Ms_{2r+1}^{(1)}(z, q)$$

The Mathieu-Hankel functions are

20.6.16

$$M_r^{(3)}(z, q) = M_r^{(1)}(z, q) + iM_r^{(2)}(z, q)$$

$$M_r^{(4)}(z, q) = M_r^{(1)}(z, q) - iM_r^{(2)}(z, q)$$

$$M_r^{(j)} = Mc_r^{(j)} \text{ or } Ms_r^{(j)}.$$

From 20.6.7-20.6.11 and the known properties of Bessel functions one obtains

20.6.17

$$M_{2r+p}^{(2)}(z + in\pi, q) = (-1)^{np} [M_{2r+p}^{(2)}(z, q) + 2niM_{2r+p}^{(1)}(z, q)]$$

$$M_{2r+p}^{(3)}(z + in\pi, q) = (-1)^{np} [M_{2r+p}^{(3)}(z, q) - 2nM_{2r+p}^{(1)}(z, q)]$$

$$M_{2r+p}^{(4)}(z + in\pi, q) = (-1)^{np} [M_{2r+p}^{(4)}(z, q) + 2nM_{2r+p}^{(1)}(z, q)]$$

where $M = Mc$ or Ms throughout any of the above equations.

Other Properties of Characteristic Functions, q Real (Associated With a and b .)

Consider

20.6.18

$$X_1 = Mc_r^{(2)}(z, q) + Mc_r^{(2)}(-z, q);$$

$$X_2 = Ms_r^{(2)}(z, q) - Ms_r^{(2)}(-z, q)$$

Since X_1 is an even solution it must be proportional to $Mc_r^{(1)}(z, q)$; for 20.1.2 admits of only one even solution (aside from an arbitrary constant factor). Similarly, X_2 is proportional to $Ms_r^{(1)}(z, q)$. The proportionality factors can be found by considering values of the functions at $z=0$. Define, therefore,

20.6.19

$$Mc_r^{(2)}(-z, q) = -Mc_r^{(2)}(z, q) - 2f_{*,r} Mc_r^{(1)}(z, q)$$

20.6.20

$$Ms_r^{(2)}(-z, q) = Ms_r^{(2)}(z, q) - 2f_{o,r} Ms_r^{(1)}(z, q)$$

where

20.6.21

$$f_{*,r} = -Mc_r^{(2)}(0, q) / Mc_r^{(1)}(0, q)$$

$$f_{o,r} = \left[\frac{d}{dz} Ms_r^{(2)}(z, q) / \frac{d}{dz} Ms_r^{(1)}(z, q) \right]_{z=0}$$

See [20.58].

In particular the above equations can be used to extend solutions of 20.6.12-20.6.13 when $\Re z < 0$. For although the latter converge for $\Re z < 0$, provided only $|\cosh z| > 1$, they do not represent the same functions as 20.6.9-20.6.10.

20.7. Representations by Integrals and Some Integral Equations

Let

20.7.1
$$G(u) = \oint_C K(u, t) V(t) dt$$

be defined for u in a domain U and let the contour C belong to the region T of the complex t -plane, with $t=\gamma_0$ as the starting point of the contour and $t=\gamma_1$ as its end-point. The kernel $K(u, t)$ and the function $V(t)$ satisfy 20.7.3 and the hypotheses in 20.7.2.

20.7.2 $K(u, t)$ and its first two partial derivatives with respect to u and t are continuous for t on C and u in U ; V and $\frac{dV}{dt}$ are continuous in t .

20.7.3

$$\left[\frac{\partial K}{\partial t} V - \frac{dV}{dt} K \right]_{\gamma_0}^{\gamma_1} = 0; \frac{d^2 V}{dt^2} + (a - 2q \cos 2t) V = 0.$$

If K satisfies

20.7.4
$$\frac{\partial^2 K}{\partial u^2} + \frac{\partial^2 K}{\partial t^2} + 2q(\cosh 2u - \cos 2t) K = 0$$

then $G(u)$ is a solution of Mathieu's modified equation 20.1.2.

If $K(u, t)$ satisfies

20.7.5
$$\frac{\partial^2 K}{\partial u^2} + \frac{\partial^2 K}{\partial t^2} + 2q(\cos 2u - \cos 2t) K = 0$$

then $G(u)$ is a solution of Mathieu's equation 20.1.1, with u replacing v .

Kernels $K_1(z, t)$ and $K_2(z, t)$

20.7.6 $K_1(z, t) = Z_{\nu}^{(j)}(u)[M(z, t)]^{-\nu/2}, \quad (\Re z > 0)$

where

20.7.7 $u = \sqrt{2q(\cosh 2z + \cos 2t)}$

20.7.8 $M(z, t) = \cosh(z + it) / \cosh(z - it)$

To make $M^{-\nu}$ single-valued, define

20.7.9

$$\cosh(z + i\pi) = e^{i\pi} \cosh z$$

$$\cosh(z - i\pi) = e^{-i\pi} \cosh z$$

$$M(z, 0) = 1$$

$$[M(z, \pi)]^{-i\nu} = e^{-i\nu\pi} M(z, 0)$$

Let

20.7.10 $G(z, q) = \frac{1}{\pi} \int_0^\pi K_1(u, t) F_\nu(t) dt, \quad (\Re z > 0)$

where $F_\nu(t)$ is defined in 20.3.8. It may be verified that $K_1 F_\nu$ satisfies 20.7.3, K satisfies 20.7.2 and 20.7.4. Hence G is a solution of 20.1.2 (with z replacing u). It can be shown that K_1 may be replaced by the more general function

20.7.11

$$K_2(z, t) = Z_{\nu+2s}^{(j)}(u)[M(z, t)]^{-i\nu+2s}, \quad s \text{ any integer.}$$

See 20.4.7 for definition of $Z_{\nu+2s}^{(j)}(u)$.

From the known expansions for $Z_{\nu+2s}^{(j)}(u)$ when $\Re z$ is large and positive it may be verified that

20.7.12

$$M_\nu^{(j)}(z, q) =$$

$$\frac{(-1)^s}{\pi c_{2s}} \int_0^\pi Z_{\nu+2s}^{(j)}(u) \left[\frac{\cosh z + it}{\cosh z - it} \right]^{-i\nu-2s} F_\nu(t) dt$$

($\Re z > 0, \Re(\nu + \frac{1}{2}) > 0$)

where $M_\nu^{(j)}(z, q)$ is given by 20.4.12, $s=0, 1, \dots, c_{2s} \neq 0$, and $F_\nu(t)$ is the Floquet solution, 20.3.8.

Kernel $K_3(z, t, a)$

20.7.13 $K_3(z, t, a) = e^{2it\sqrt{q}w}$

where

20.7.14 $w = \cosh z \cos a \cos t + \sinh z \sin a \sin t$

20.7.15 $G(z, q, a) = \frac{1}{\pi} \int_C e^{2it\sqrt{q}w} F_\nu(t) dt$

where $F_\nu(t)$ is the Floquet solution 20.3.8. The path C is chosen so that $G(z, t, a)$ exists, and 20.7.2, 20.7.3 are satisfied. Then it may be verified that $K_3(z, t, a)$, considered as a function of z and t , satisfies 20.7.4; also, considered as a function of a and t , K_3 satisfies 20.7.5. Consequently $G(z, q, a) = Y(z, q)y(a, q)$, where Y and y satisfy 20.1.2 and 20.1.1, respectively.

Choice of Path C . Three paths will be defined:

20.7.16

Path C_3 : from $-d_1 + i\infty$ to $d_2 - i\infty$, d_1, d_2 real

$$-d_1 < \arg[\sqrt{q}\{\cosh(z + ia) \pm 1\}] < \pi - d_1$$

$$-d_2 < \arg[\sqrt{q}\{\cosh(z - ia) \pm 1\}] < \pi - d_2$$

20.7.17

Path C_4 : from $d_2 - i\infty$ to $2\pi + i\infty - d_1$

(same d_1, d_2 as in 20.7.16)

20.7.18

$$F_\nu(a)M_\nu^{(j)}(z, q) = \frac{e^{-i\nu\frac{\pi}{2}}}{\pi} \oint_{C_j} e^{2it\sqrt{q}w} F_\nu(t) dt \quad j=3, 4$$

where $M_\nu^{(j)}(z, q)$ is also given by 20.4.12.

20.7.19 Path C_1 : from $-d_1 + i\infty$ to $2\pi - d_1 + i\infty$

$$F_\nu(a)M_\nu^{(1)}(z, q) = \frac{e^{-i\nu\frac{\pi}{2}}}{2\pi} \oint_{C_1} e^{2it\sqrt{q}w} F_\nu(t) dt$$

See [20.36], section 2.68.

If ν is an integer the paths can be simplified; for in that case $F_\nu(t)$ is periodic and the integrals exist when the path is taken from 0 to 2π . Still further simplifications are possible, if z is also real.

The following are among the more important integral representations for the periodic functions $ce_r(z, q)$, $se_r(z, q)$ and for the associated radial solutions.

Let $r=2s+p$, $p=0$ or 1

20.7.20

$$ce_r(z, q) = \rho_r \int_0^{\pi/2} \cos\left(2\sqrt{q} \cos z \cos t - p\frac{\pi}{2}\right) ce_r(t, q) dt$$

20.7.21 $ce_r(z, q) = \sigma_r \int_0^{\pi/2} \cosh(2\sqrt{q} \sin z \sin t) [(1-p) + p \cos z \cos t] ce_r(t, q) dt$

20.7.22 $se_r(z, q) = \rho_r \int_0^{\pi/2} \sin\left(2\sqrt{q} \cos z \cos t + p \frac{\pi}{2}\right) \sin z \sin t se_r(t, q) dt$

20.7.23 $se_r(z, q) = \sigma_r \int_0^{\pi/2} \sinh(2\sqrt{q} \sin z \sin t) [(1-p) \cos z \cos t + p] se_r(t, q) dt$

where

20.7.24 $\rho_r = \frac{2}{\pi} ce_{2s}\left(\frac{\pi}{2}, q\right) / A_0^{2s}(q); p=0, \rho_r = \frac{-2}{\pi} ce'_{2s+1}\left(\frac{\pi}{2}, q\right) / \sqrt{q} A_1^{2s+1}(q)$ if $p=1$, for functions $ce_r(z, q)$

$\rho_r = \frac{-4}{\pi} se'_{2s}\left(\frac{\pi}{2}, q\right) / \sqrt{q} B_2^{2s}(q); \rho_r = \frac{4}{\pi} se_{2s+1}\left(\frac{\pi}{2}, q\right) / B_1^{2s+1}(q)$, for functions $se_r(z, q)$

$\sigma_r = \frac{2}{\pi} ce_{2s}(0, q) / A_0^{2s}(q)$ if $p=0$; $\sigma_r = \frac{4}{\pi} ce_{2s+1}(0, q) / A_1^{2s+1}(q)$, if $p=1$; associated with functions $ce_r(z, q)$

$\sigma_r = \frac{4}{\pi} se'_{2s}(0, q) / \sqrt{q} B_2^{2s}(q)$, if $p=0$; $\sigma_r = \frac{2}{\pi} se'_{2s+1}(0, q) / \sqrt{q} B_1^{2s+1}(q)$, if $p=1$; associated with $se_r(z, q)$

Integrals Involving Bessel Function Kernels

Let

20.7.25 $u = \sqrt{2q(\cosh 2z + \cos 2t)}$, ($\mathcal{R} \cosh 2z > 1$; if $j=1$, valid also when $z=0$)

20.7.26

$Mc_{2r}^{(j)}(z, q) = \frac{(-1)^r 2}{\pi A_0^{2r}} \int_0^{\frac{\pi}{2}} Z_0^{(j)}(u) ce_{2r}(t, q) dt; Mc_{2r+1}^{(j)}(z, q) = \frac{(-1)^r 8\sqrt{q} \cosh z}{\pi A_1^{2r+1}} \int_0^{\frac{\pi}{2}} \frac{Z_1^{(j)}(u) \cos t}{u} ce_{2r+1}(t, q) dt$

20.7.27

$Ms_{2r}^{(j)}(z, q) = \frac{(-1)^{r+1} 8q \sinh 2z}{\pi B_2^{2r}} \int_0^{\frac{\pi}{2}} \frac{Z_2^{(j)}(u) \sin 2t se_{2r}(t, q) dt}{u^2}$

$Ms_{2r+1}^{(j)}(z, q) = \frac{(-1)^r 8\sqrt{q} \sinh z}{\pi B_1^{2r+1}} \int_0^{\frac{\pi}{2}} \frac{Z_1^{(j)}(u) \sin t se_{2r+1}(t, q) dt}{u}$

In the above the j -convention of 20.4.7 applies and the functions Mc, Ms are defined in 20.5.1-20.5.4. (These solutions are normalized so that they approach the corresponding Bessel-Hankel functions as $\mathcal{R} z \rightarrow \infty$.)

Other Integrals for $Mc^{(1)}(z, q)$ and $Ms^{(1)}(z, q)$

20.7.28 $Mc_r^{(1)}(z, q) = \frac{(-1)^{s2}}{\pi ce_r(0, q)} \int_0^{\frac{\pi}{2}} \cos\left(2\sqrt{q} \cosh z \cos t - p \frac{\pi}{2}\right) ce_r(t, q) dt$

20.7.29 $Mc_r^{(1)}(z, q) = \tau_r \int_0^{\frac{\pi}{2}} [(1-p) + p \cosh z \cos t] \cos(2\sqrt{q} \sinh z \sin t) ce_r(t, q) dt$

$r=2s+p, p=0, 1; \tau_r = \frac{2}{\pi} (-1)^s / ce_{2s}\left(\frac{\pi}{2}, q\right)$, if $p=0$; $\tau_r = \frac{2}{\pi} (-1)^{s+1} 2\sqrt{q} / ce'_{2s+1}\left(\frac{\pi}{2}, q\right)$

20.7.30 $Ms_{2r+1}^{(1)}(z, q) = \frac{2}{\pi} \frac{(-1)^r}{se_{2r+1}\left(\frac{\pi}{2}, q\right)} \int_0^{\frac{\pi}{2}} \sin(2\sqrt{q} \sinh z \sin t) se_{2r+1}(t, q) dt$

20.7.31 $Ms_{2r+1}^{(1)}(z, q) = \frac{4}{\pi} \frac{\sqrt{q} (-1)^r}{se'_{2r+1}(0, q)} \int_0^{\frac{\pi}{2}} \sinh z \sin t \cos(2\sqrt{q} \cosh z \cos t) se_{2r+1}(t, q) dt$

20.7.32 $Ms_{2r}^{(1)}(z, q) = \frac{4}{\pi} \sqrt{q} \frac{(-1)^{r+1}}{se_{2r}(0, q)} \int_0^{\frac{\pi}{2}} \sin(2\sqrt{q} \cosh z \cos t) [\sinh z \sin t se_{2r}(t, q)] dt$

20.7.33 $Ms_{2r}^{(1)}(z, q) = \frac{4}{\pi} \frac{(-1)^r \sqrt{q}}{se'_{2r}\left(\frac{\pi}{2}, q\right)} \int_0^{\frac{\pi}{2}} \sin(2\sqrt{q} \sinh z \sin t) [\cosh z \cos t se_{2r}(t, q)] dt$

Further with $w = \cosh z \cos \alpha \cos t + \sinh z \sin \alpha \sin t$

$$20.7.34 \quad ce_r(\alpha, q) Mc_r^{(1)}(z, q) = \frac{(-1)^s (i)^{-p}}{2\pi} \int_0^{2\pi} e^{2i\sqrt{q}t} w ce_r(t, q) dt$$

$$20.7.35 \quad se_r(\alpha, q) Ms_r^{(1)}(z, q) = \frac{(-1)^s (-i)^p}{2\pi} \int_0^{2\pi} e^{2i\sqrt{q}t} w se_r(t, q) dt.$$

The above can be differentiated with respect to α , and we obtain

$$20.7.36 \quad ce'_r(\alpha, q) Mc_r^{(1)}(z, q) = \frac{(-1)^s (i)^{-p+1} \sqrt{q}}{\pi} \int_0^{2\pi} e^{2i\sqrt{q}t} w \frac{\partial w}{\partial \alpha} ce_r(t, q) dt$$

$$20.7.37 \quad se'_r(\alpha, q) Ms_r^{(1)}(z, q) = \frac{(-1)^{s+p} (-i)^{-p+1} \sqrt{q}}{\pi} \int_0^{2\pi} e^{2i\sqrt{q}t} w \frac{\partial w}{\partial \alpha} se_r(t, q) dt$$

Integrals With Infinite Limits

$$r = 2s + p$$

In 20.7.38–20.7.41 below, z and q are positive.

$$20.7.38 \quad Mc_r^{(1)}(z, q) = \gamma_r \int_0^\infty \sin\left(2\sqrt{q} \cosh z \cosh t + p \frac{\pi}{2}\right) Mc_r^{(1)}(t, q) dt$$

$$\gamma_r = 2ce_{2s}\left(\frac{\pi}{2}, q\right) / \pi A_0^{2s}, \text{ if } p=0 \quad \gamma_r = 2ce'_{2s+1}\left(\frac{\pi}{2}, q\right) / \sqrt{q} \pi A_1^{2s+1}, \text{ if } p=1$$

$$20.7.39 \quad Ms_r^{(1)}(z, q) = \gamma_r \int_0^\infty \sinh z \sinh t \left[\cos\left(2\sqrt{q} \cosh z \cosh t - p \frac{\pi}{2}\right) \right] Ms_r^{(1)}(t, q) dt$$

$$\gamma_r = -4se'_{2s}\left(\frac{\pi}{2}, q\right) / \sqrt{q} \pi B_2^{2s}, \text{ if } p=0 \quad \gamma_r = -4se_{2s+1}\left(\frac{\pi}{2}, q\right) / \pi B_1^{2s+1}, \text{ if } p=1$$

$$20.7.40 \quad Mc_r^{(2)}(z, q) = \gamma_r \int_0^\infty \cos\left(2\sqrt{q} \cosh z \cosh t - p \frac{\pi}{2}\right) Mc_r^{(1)}(t, q) dt$$

$$\gamma_r = -2ce_{2s}\left(\frac{1}{2}\pi, q\right) / \pi A_0^{2s}, \text{ if } p=0 \quad \gamma_r = 2ce'_{2s+1}\left(\frac{1}{2}\pi, q\right) / \pi \sqrt{q} A_1^{2s+1}, \text{ if } p=1$$

$$20.7.41 \quad Ms_r^{(2)}(z, q) = \gamma_r \int_0^\infty \sin\left(2\sqrt{q} \cosh z \cosh t + p \frac{\pi}{2}\right) \sinh z \sinh t Ms_r^{(1)}(t, q) dt$$

$$\gamma_r = -4se'_{2s}\left(\frac{1}{2}\pi, q\right) / \sqrt{q} \pi B_2^{2s}, \text{ if } p=0 \quad \gamma_r = 4se_{2s+1}\left(\frac{1}{2}\pi, q\right) / \pi B_1^{2s+1}, \text{ if } p=1$$

Relations Between Solutions for Parameters q and $-q$

Replacing z by $\frac{1}{2}\pi - z$ in 20.1.1 one obtains

$$20.8.1 \quad y'' + (a + 2q \cos 2z)y = 0$$

Hence if $u(z)$ is a solution of 20.1.1 then $u(\frac{1}{2}\pi - z)$ satisfies 20.8.1. It can be shown that

20.8.2

$$a(-\nu, q) = a(\nu, -q) = a(\nu, q), \nu \text{ not an integer}$$

$$c_{2m}^\nu(-q) = \rho(-1)^m c_{2m}^\nu(q), \nu \text{ not an integer}$$

(c_{2m} defined in 20.3.8) and ρ depending on the normalization;

$$F_\nu(z, -q) = \rho e^{-i\nu\pi/2} F_\nu\left(z + \frac{\pi}{2}, q\right) = \rho e^{i\nu\pi/2} F_\nu\left(z - \frac{\pi}{2}, q\right)$$

20.8.3

$$a_{2r}(-q) = a_{2r}(q); b_{2r}(-q) = b_{2r}(q), \text{ for integral } \nu$$

$$a_{2r+1}(-q) = b_{2r+1}(q), b_{2r+1}(-q) = a_{2r+1}(q)$$

$$se_{2r}(z, -q) = (-1)^{r-1} se_{2r}(\frac{1}{2}\pi - z, q)$$

For the coefficients associated with the above solutions for integral ν :

where $I_m(x), K_m(x)$ are the modified Bessel functions, u_1, u_2 are defined below 20.6.10. Superscripts are omitted, $\epsilon_s = 2$, if $s=0$, $\epsilon_s = 1$ if $s \neq 0$.

Then for functions of first kind:

20.8.10

$$Mc_{2r}^{(1)}(z, -q) = (-1)^r Ie_{2r}(z, q)$$

$$Ms_{2r}^{(1)}(z, -q) = (-1)^r Io_{2r}(z, q)$$

$$Mc_{2r+1}^{(1)}(z, -q) = (-1)^r i Ie_{2r+1}(z, q)$$

$$Ms_{2r+1}^{(1)}(z, -q) = (-1)^r i Io_{2r+1}(z, q)$$

For the Mathieu-Hankel function of first kind:

20.8.11

$$Mc_{2r}^{(3)}(z, -q) = (-1)^{r+1} i \frac{2}{\pi} Ke_{2r}(z, q)$$

$$Ms_{2r}^{(3)}(z, -q) = (-1)^{r+1} i \frac{2}{\pi} Ko_{2r}(z, q)$$

$$Ms_{2r+1}^{(3)}(z, -q) = (-1)^{r+1} \frac{2}{\pi} Ko_{2r+1}(z, q)$$

For $M_r^{(j)}(z, -q)$, $j=2, 4$, one may use the definitions

$$M_r^{(2)} = -i(M_r^{(3)} - M_r^{(1)}); M_r = Mc_r \text{ or } Ms_r$$

also

$$M_r^{(4)}(z, -q) = 2M_r^{(1)}(z, -q) - M_r^{(3)}(z, -q)$$

$$M = Mc \text{ or } Ms; \text{ for real } z, q, M_r^{(j)}(z, -q)$$

are in general complex if $j=2, 4$.

Zeros of the Functions for Real Values of q .

See [20.36], section 2.8 for further results.

Zeros of $ce_r(z, q)$ and $se_r(z, q)$, $Mc_r^{(1)}(z, q)$, $Ms_r^{(1)}(z, q)$.

In $0 \leq z < \pi$, $ce_r(z, q)$ and $se_r(z, q)$ have r real * zeros.

There are complex zeros if $q > 0$.

If $z_0 = x_0 + iy_0$ is any zero of $ce_r(z, q)$, $se_r(z, q)$ in

$$-\frac{\pi}{2} < x_0 < \frac{\pi}{2}, \text{ then } k\pi \pm z_0, k\pi \pm \bar{z}_0$$

are also zeros, k an integer.

*See page II.

In the strip $-\frac{\pi}{2} < x_0 < \frac{\pi}{2}$, the imaginary zeros of $ce_r(z, q)$, $se_r(z, q)$ are the real zeros of $Ce_r(z, q)$, $Se_r(z, q)$, hence also the real zeros of $Mc_r^{(1)}(z, q)$ and $Ms_r^{(1)}(z, q)$, respectively.

For small q , the large zeros of $Ce_r(z, q)$, $Se_r(z, q)$ approach the zeros of $J_r(2\sqrt{q} \cosh z)$.

Tabulation of Zeros

Ince [20.56] tabulates the first "non-trivial" zero (i.e. different from $0, \frac{\pi}{2}, \pi$) for $ce_r(z)$, $se_r(z)$, $r=2(1)5$ and for $se_6(z)$ to within 10^{-4} , for $q=0(1)10(2)40$. He also gives the "turning" points (zeros of the derivative) and also expansions for them for small q . Wiltse and King [20.61, 2] tabulate the first two (non-trivial) zeros of $Mc_r^{(1)}(z, q)$ and $Ms_r^{(1)}(z, q)$ and of their derivatives $r=0, 1, 2$ for 6 or 7 values of q between .25 and 10. The graphs reproduced here indicate their location.

Between two real zeros of $Mc_r^{(1)}(z, q)$, $Ms_r^{(1)}(z, q)$ there is a zero of $Mc_r^{(2)}(z, q)$, $Ms_r^{(2)}(z, q)$, respectively. No tabulation of such zeros exists yet.

Available tables are described in the References.

The most comprehensive tabulation of the characteristic values a_r, b_r (in a somewhat different notation) and of the coefficients proportional to A_m and B_m as defined in 20.5.4 and 20.5.5 can be found in [20.58]. In addition, the table contains certain important "joining factors", with the aid of which it is possible to obtain values of $Mc_r^{(j)}(z, q)$ and $Ms_r^{(j)}(z, q)$ as well as their derivatives, at $x=0$. Values of the functions $ce_r(x, q)$ and $se_r(x, q)$ for orders up to five or six can be found in [20.56]. Tabulations of less extensive character, but important in some aspects, are outlined in the other references cited. In this chapter only representative values of the various functions are given, along with several graphs.

Special Values for Arguments 0 and $\frac{\pi}{2}$

20.8.12

$$ce_{2r}\left(\frac{\pi}{2}, q\right) = (-1)^r g_{e, 2r}(q) A_0^{2r}(q) \sqrt{\frac{\pi}{2}}$$

$$ce'_{2r+1}\left(\frac{\pi}{2}, q\right) = (-1)^{r+1} g_{e, 2r+1}(q) A_1^{2r+1}(q) \sqrt{\frac{\pi}{2} q}$$

$$se'_{2r}\left(\frac{\pi}{2}, q\right) = (-1)^r g_{o, 2r}(q) B_2^{2r}(q) \cdot q \sqrt{\frac{\pi}{2}}$$

$$se_{2r+1}\left(\frac{\pi}{2}, q\right) = (-1)^r g_{o, 2r+1}(q) B_1^{2r+1}(q) \sqrt{\frac{\pi}{2} q}$$

$$Mc_r^{(1)}(0, q) = \sqrt{\frac{2}{\pi}} \frac{1}{g_{e, r}(q)}$$

$$Mc_r^{(2)}(0, q) = -\sqrt{\frac{2}{\pi}} f_{e, r}(q) / g_{e, r}(q)$$

$$\frac{d}{dz} [Mc_r^{(2)}(z, q)]_{z=0} = \sqrt{\frac{2}{\pi}} g_{e, r}(q)$$

$$\frac{d}{dz} [Ms_r^{(1)}(z, q)]_{z=0} = \sqrt{\frac{2}{\pi}} \frac{1}{g_{o, r}(q)}$$

$$\frac{d}{dz} [Ms_r^{(2)}(z, q)]_{z=0} = \sqrt{\frac{2}{\pi}} f_{o, r}(q) / g_{o, r}(q)$$

$$Ms_r^{(2)}(z, q) = -g_{o, r}(q) \sqrt{\frac{2}{\pi}}$$

The functions $f_{o, r}, g_{o, r}, f_{e, r}, g_{e, r}$ are tabulated in [20.58] for $q \leq 25$.

20.9. Asymptotic Representations

The representations given below are applicable to the characteristic solutions, for real values of q , unless otherwise noted. The Floquet exponent ν is defined below, as in [20.36] to be as follows:

In solutions associated with a_r : $\nu = r$

In solutions associated with b_r : $\nu = -r$.

For the functions defined in 20.6.7-20.6.10:

20.9.1

$$\begin{aligned} &Mc_r^{(3)}(z, q) \\ &(-1)^r Ms_r^{(3)}(z, q) \\ &\sim \frac{e^{i(2\sqrt{q} \cosh z - \frac{\pi r}{2} - \frac{\pi}{4})}}{\pi^{\frac{1}{2}} q^{1/4} (\cosh z - \sigma)^{\frac{1}{2}}} \sum_{m=0}^{\infty} \frac{D_m}{[-4i\sqrt{q}(\cosh z - \sigma)]^m} \end{aligned}$$

where $D_{-1} = D_{-2} = 0$; $D_0 = 1$, and the coefficients D_m are obtainable from the following recurrence formula:

20.9.2

$$\begin{aligned} &(m+1)D_{m+1} + \left[\left(m + \frac{1}{2}\right)^2 - \left(m + \frac{1}{4}\right) 8i\sqrt{q} \sigma \right. \\ &\left. + 2q - a \right] D_m + \left(m - \frac{1}{2}\right) [16q(1 - \sigma^2) - 8i\sqrt{q} \sigma m] D_{m-1} \\ &\quad + 4q(2m-3)(2m-1)(1 - \sigma^2) D_{m-2} = 0 \end{aligned}$$

20.9.3

$$\begin{aligned} &Mc_r^{(4)}(z, q) \\ &(-1)^r Ms_r^{(4)}(z, q) \\ &\sim \frac{e^{-i[2\sqrt{q} \cosh z - \frac{1}{2}\pi r - \frac{1}{4}\pi]}}{\pi^{\frac{1}{2}} q^{1/4} (\cosh z - \sigma)^{\frac{1}{2}}} \sum_{m=0}^{\infty} \frac{d_m}{[4i\sqrt{q}(\cosh z - \sigma)]^m} \end{aligned}$$

$d_{-1} = d_{-2} = 0$; $d_0 = 1$, and

20.9.4

$$(m+1)d_{m+1} + \left[\left(m + \frac{1}{2}\right)^2 + \left(m + \frac{1}{4}\right) 8i\sqrt{q}\sigma + 2q - a \right] d_m + \left(m - \frac{1}{2}\right) [16q(1-\sigma^2) + 8i\sqrt{q}\sigma m] d_{m-1} + 4q(2m-3)(2m-1)(1-\sigma^2)d_{m-2} = 0.$$

In the above

$$-2\pi < \arg \sqrt{q} \cosh z < \pi$$

$$|\cosh z - \sigma| > |\sigma \pm 1|, \Re z > 0,$$

but σ is otherwise arbitrary. If $\sigma^2 = 1$, 20.9.2 and 20.9.4 become three-term recurrence relations.

Formulas 20.9.1 and 20.9.3 are valid for arbitrary a, q , provided ν is also known; they give multiples of 20.4.12, normalized so as to approach the corresponding Hankel functions $H_\nu^{(1)}(\sqrt{q}e^z)$, $H_\nu^{(2)}(\sqrt{q}e^z)$, as $z \rightarrow \infty$. See [20.36], section 2.63. The formula is especially useful if $|\cosh z|$ is large and q is not too large; thus if $\sigma = -1$, the absolute ratio of two successive terms in the expansion is essentially

$$\left| \left(\frac{\sqrt{q}}{m} + \frac{m}{4\sqrt{q}} + 2 \right) / (\cosh z + 1) \right|.$$

If a, q, z, ν are real, the real and imaginary components of $Mc_r^{(3)}(z, q)$ are $Mc_r^{(1)}(z, q)$ and $Mc_r^{(2)}(z, q)$, respectively; similarly for the components of $Ms_r^{(3)}(z, q)$. If the parameters are complex

20.9.5 $Mc_r^{(1)}(z, q) = \frac{1}{2} [Mc_r^{(3)}(z, q) + Mc_r^{(4)}(z, q)]$

20.9.6 $Mc_r^{(2)}(z, q) = -\frac{i}{2} [Mc_r^{(3)}(z, q) - Mc_r^{(4)}(z, q)]$

Replacing c by s in the above will yield corresponding relations among $Ms_r^{(j)}(z, q)$.

Formulas in which the parameter a does not enter explicitly:

Goldstein's Expansions

20.9.7

$$Mc_r^{(3)}(z, q) \sim iMs_{r+1}^{(3)}(z, q) \approx [F_0(z) - iF_1(z)]e^{i\pi/4} \pi^{1/2} q^{1/4} (\cosh z)^{1/2}$$

where

20.9.8

$$\phi = 2\sqrt{q} \sinh z - \frac{1}{2} (2r+1) \arctan \sinh z,$$

$$\Re z > 0, q \gg 1, w = 2r+1$$

20.9.9

$$F_0(z) \sim 1 + \frac{w}{8\sqrt{q} \cosh^2 z} + \frac{1}{2048q} \left[\frac{w^4 + 86w^2 + 105}{\cosh^4 z} - \frac{w^4 + 22w^2 + 57}{\cosh^2 z} \right] + \frac{1}{16384q^{3/2}} \left[\frac{-(w^5 + 14w^3 + 33w)}{\cosh^2 z} - \frac{(2w^5 + 124w^3 + 1122w)}{\cosh^4 z} + \frac{3w^5 + 290w^3 + 1627w}{\cosh^6 z} \right] + \dots$$

20.9.10

$$F_1(z) \sim \frac{\sinh z}{\cosh^2 z} \left[\frac{w^2 + 3}{32\sqrt{q}} + \frac{1}{512q} \left(w^3 + 3w + \frac{4w^3 + 44w}{\cosh^2 z} \right) + \frac{1}{16384q^{3/2}} \left\{ \begin{aligned} &5w^4 + 34w^2 + 9 \\ &-\frac{(w^5 - 47w^4 + 667w^2 + 2835)}{12 \cosh^2 z} \\ &+\frac{(w^6 + 505w^4 + 12139w^2 + 10395)}{12 \cosh^4 z} \end{aligned} \right\} \right] + \dots$$

See [20.18] for details and an added term in $q^{-5/2}$; a correction to the latter is noted in [20.58].

The expansions 20.9.7 are especially useful when q is large and z is bounded away from zero. The order of magnitude of $Mc_r^{(j)}(0, q)$ cannot be obtained from the expansion. The expansion can also be used, with some success, for $z = ix$, when q is large, if $|\cos x| \gg \gg 0$; they fail at $x = \frac{1}{2}\pi$. Thus, if q, x are real, one obtains

20.9.11

$$ce_r(x, q) \sim \frac{ce_r(0, q)2^{r-1}}{F_0(0)} \{W_1[P_0(x) - P_1(x)] + W_2[P_0(x) + P_1(x)]\}$$

20.9.12

$$se_{r+1}(x, q) \sim se'_{r+1}(0, q)\tau_{r+1} \{W_1[P_0(x) - P_1(x)] - W_2[P_0(x) + P_1(x)]\}$$

In the above, $P_0(x)$ and $P_1(x)$ are obtainable from $F_0(z), F_1(x)$ in 20.9.9-20.9.10 by replacing $\cosh z$ with $\cos x$ and $\sinh z$ with $\sin x$. Thus $P_0(x) = F_0(ix); P_1(x) = -iF_1(ix)$:

20.9.13

$$W_1 = e^{2\sqrt{q} \sin x} [\cos(\frac{1}{2}x + \frac{1}{4}\pi)]^{2r+1} / (\cos x)^{r+1}$$

$$W_2 = e^{-2\sqrt{q} \sin x} [\sin(\frac{1}{2}x + \frac{1}{4}\pi)]^{2r+1} / (\cos x)^{r+1}$$

20.9.14

$$r_{r+1} \sim 2^{r-1} \sqrt{\left[2\sqrt{q} - \frac{1}{2}w - \frac{(2w^2+3)}{64\sqrt{q}} - \frac{(7w^3+47w)}{1024q} - \dots \right]}$$

See 20.9.23-20.9.24 for expressions relating to $ce_r(0, q)$ and $se'_r(0, q)$. When $|\cos x| > \sqrt{4r+2}/q^{\frac{1}{2}}$, 20.9.11-20.9.12 are useful. The approximations become poorer as r increases.

Expansions in Terms of Parabolic Cylinder Functions

(Good for angles close to $\frac{1}{2}\pi$, for large values of q , especially when $|\cos x| < 2^{\frac{1}{2}}/q^{\frac{1}{2}}$.) Due to Sips [20.44-20.46].

$$20.9.15 \quad ce_r(x, q) \sim C_r[Z_0(\alpha) + Z_1(\alpha)]$$

20.9.16

$$se_{r+1}(x, q) \sim S_r[Z_0(\alpha) - Z_1(\alpha)] \sin x, \quad \alpha = 2q^{\frac{1}{2}} \cos x.$$

$$\text{Let } D_k = D_k(\alpha) = (-1)^k e^{\frac{1}{2}\alpha^2} \frac{d^k}{d\alpha^2} e^{-\frac{1}{2}\alpha^2}.$$

20.9.17

$$Z_0(\alpha) \sim D_r + \frac{1}{4q^{\frac{1}{2}}} \left[-\frac{D_{r+4}}{16} + \frac{3}{2} \binom{r}{4} D_{r-4} \right] \\ + \frac{1}{16q} \left[\frac{D_{r+8}}{512} - \frac{(r+2)D_{r+4}}{16} + \frac{3}{2} (r-1) \binom{r}{4} D_{r-4} \right. \\ \left. + \frac{315}{4} \binom{r}{8} D_{r-8} \right] + \dots$$

20.9.18

$$Z_1(\alpha) \sim \frac{1}{4q^{\frac{1}{2}}} \left[-\frac{1}{4} D_{r+2} - \frac{r(r-1)}{4} D_{r-2} \right] \\ + \frac{1}{16q} \left[\frac{D_{r+6}}{64} + \frac{(r^2-25r-36)}{64} D_{r+2} \right. \\ \left. + \frac{r(r-1)(-r^2-27r+10)}{64} D_{r-2} - \frac{45}{4} \binom{r}{6} D_{r-6} + \dots \right]$$

20.9.19

$$C_r \sim \left(\frac{\pi}{2} \right)^{\frac{1}{2}} q^{\frac{1}{4}} / (r!)^{\frac{1}{2}} \left[1 + \frac{2r+1}{8q^{\frac{1}{2}}} \right. \\ \left. + \frac{r^4+2r^3+263r^2+262r+108}{2048q} + \frac{f_1}{16384q^{\frac{3}{2}}} + \dots \right]^{-\frac{1}{2}} \\ f_1 = 6r^6 + 15r^4 + 1280r^3 + 1905r^2 + 1778r + 572$$

*See page II.

20.9.20

$$S_r \sim \left(\frac{\pi}{2} \right)^{\frac{1}{2}} q^{\frac{1}{4}} / (r!)^{\frac{1}{2}} \left[1 - \frac{2r+1}{8q^{\frac{1}{2}}} \right. \\ \left. + \frac{r^4+2r^3-121r^2-122r-84}{2048q} + \frac{f_2}{16384q^{\frac{3}{2}}} + \dots \right]^{-\frac{1}{2}} \\ f_2 = 2r^6 + 5r^4 - 416r^3 - 629r^2 - 1162r - 476$$

It should be noted that 20.9.15 is also valid as an approximation for $se_{r+1}(x, q)$, but 20.9.16 may give slightly better results. See [20.4.]

Explicit Expansions for Orders 0, 1, to Terms in $q^{-3/2}$ (q Large)20.9.21 For $r=0$:

$$Z_0 \sim D_0 - \frac{D_4}{64\sqrt{q}} + \frac{1}{16q} \left(-\frac{D_4}{8} + \frac{D_8}{512} \right) * \\ + \frac{1}{64q^{3/2}} \left(-\frac{99D_4}{256} + \frac{3D_8}{256} - \frac{D_{12}}{24576} \right) + \dots$$

$$Z_1 \sim \frac{-D_2}{16\sqrt{q}} + \frac{1}{16q} \left(-\frac{9D_2}{16} + \frac{D_6}{64} \right) \\ + \frac{1}{64q^{3/2}} \left(-\frac{61D_2}{32} + \frac{25D_6}{256} - \frac{5D_{10}}{10240} \right) + \dots$$

20.9.22 For $r=1$:

$$Z_0 \sim D_1 - \frac{D_5}{64\sqrt{q}} + \frac{1}{16q} \left(-\frac{3D_5}{16} + \frac{D_9}{512} \right) \\ + \frac{1}{64q^{3/2}} \left(-\frac{207D_5}{256} + \frac{D_9}{64} - \frac{D_{13}}{24576} \right) + \dots$$

$$Z_1 \sim \frac{-D_3}{16\sqrt{q}} + \frac{1}{16q} \left(-\frac{15D_3}{16} + \frac{D_7}{64} \right) \\ + \frac{1}{64q^{3/2}} \left(-\frac{153D_3}{32} + \frac{35D_7}{256} - \frac{D_{11}}{2048} \right) + \dots$$

Formulas Involving $ce_r(0, q)$ and $se_r(0, q)$

20.9.23

$$\frac{ce_0(0, q)}{ce_0(\frac{1}{2}\pi, q)} \sim 2\sqrt{2} e^{-2\sqrt{q}} \left(1 + \frac{1}{16\sqrt{q}} + \frac{9}{256q} + \dots \right) \\ \frac{ce_2(0, q)}{ce_2(\frac{1}{2}\pi, q)} \sim -32q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{1}{16\sqrt{q}} + \frac{29}{128q} + \dots \right)$$

$$\frac{ce_1(0, q)}{ce'_1(\frac{1}{2}\pi, q)} \sim -4\sqrt{2}e^{-2\sqrt{q}} \left(1 + \frac{3}{16\sqrt{q}} + \frac{45}{256q} + \dots\right)$$

$$\frac{ce_3(0, q)}{ce'_3(\frac{1}{2}\pi, q)} \sim \frac{64}{3} q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{3}{16\sqrt{q}} + \frac{47}{128q} + \dots\right)$$

20.9.24

$$\frac{se'_1(0, q)}{se_1(\frac{1}{2}\pi, q)} \sim 4 q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{3}{16\sqrt{q}} - \frac{11}{256q} + \dots\right)$$

$$\frac{se'_3(0, q)}{se_3(\frac{1}{2}\pi, q)} \sim -64 q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{21}{16\sqrt{q}} - \frac{17}{128q} + \dots\right)$$

$$\frac{se'_2(0, q)}{se_2(\frac{1}{2}\pi, q)} \sim -8 q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{9}{16\sqrt{q}} - \frac{39}{256q} + \dots\right)$$

$$\frac{se'_4(0, q)}{se_4(\frac{1}{2}\pi, q)} \sim \frac{128}{3} q\sqrt{2} e^{-2\sqrt{q}} \left(1 - \frac{31}{16\sqrt{q}} - \frac{15}{128q} + \dots\right)$$

For higher orders, these ratios are increasingly more difficult to obtain. One method of estimating values at the origin is to evaluate both **20.9.11** and **20.9.15** for some x where both expansions are satisfactory, and so to use **20.9.11** as a means to solve for $ce_r(0, q)$; similarly for $se'_r(0, q)$.

Other asymptotic expansions, valid over various regions of the complex z -plane, for real values of a, q , have been given by Langer [20.25]. It is not always easy, however, to determine the linear combinations of Langer's solutions which coincide with those defined here.

r_1 and r_2 are the distances to the foci of a family of confocal ellipses and hyperbolas; $2f$ is the distance between foci.

$$21.1.2 \quad a = f\xi, \quad b = f\sqrt{\xi^2 - 1}, \quad e = \frac{f}{a}$$

a = semi-major axis; b = semi-minor axis; e = eccentricity.

21.3. Definition of Oblate Spheroidal Coordinates

If the system of confocal ellipses and hyperbolas referred to in 21.1.3 and 21.1.4 revolves around the minor axis, then

21.5. Wave Equation in Prolate and Oblate Spheroidal Coordinates

Wave Equation in Prolate Spheroidal Coordinates

21.5.1

$$\nabla^2 \Phi + k^2 \Phi = \frac{\partial}{\partial \xi} \left[(\xi^2 - 1) \frac{\partial \Phi}{\partial \xi} \right] + \frac{\partial}{\partial \eta} \left[(1 - \eta^2) \frac{\partial \Phi}{\partial \eta} \right] \\ + \frac{\xi^2 - \eta^2}{(\xi^2 - 1)(1 - \eta^2)} \frac{\partial^2 \Phi}{\partial \phi^2} + c^2 (\xi^2 - \eta^2) \Phi = 0$$

$$\left(c = \frac{1}{2} f k \right)$$

*See page II.

Wave Equation in Oblate Spheroidal Coordinates

21.5.2

$$\nabla^2\Phi+k^2\Phi=\frac{\partial}{\partial\xi}\left[(\xi^2+1)\frac{\partial\Phi}{\partial\xi}\right]+\frac{\partial}{\partial\eta}\left[(1-\eta^2)\frac{\partial\Phi}{\partial\eta}\right]$$

$$+\frac{\xi^2+\eta^2}{(\xi^2+1)(1-\eta^2)}\frac{\partial^2\Phi}{\partial\phi^2}+c^2(\xi^2+\eta^2)\Phi=0$$

$$\left(c=\frac{1}{2}fk\right)$$

21.5.2 may be obtained from 21.5.1 by the transformations

$$\xi\rightarrow\pm i\xi, c\rightarrow\mp ic.$$

21.6. Differential Equations for Radial and Angular Prolate Spheroidal Wave Functions

If in 21.5.1 we put

$$\Phi=R_{mn}(c,\xi)S_{mn}(c,\eta)\frac{\cos}{\sin}m\phi$$

then the "radial solution" $R_{mn}(c,\xi)$ and the "angular solution" $S_{mn}(c,\eta)$ satisfy the differential equations

21.6.1

$$\frac{d}{d\xi}\left[(\xi^2-1)\frac{d}{d\xi}R_{mn}(c,\xi)\right]$$

$$-\left(\lambda_{mn}-c^2\xi^2+\frac{m^2}{\xi^2-1}\right)R_{mn}(c,\xi)=0$$

21.6.2

$$\frac{d}{d\eta}\left[(1-\eta^2)\frac{d}{d\eta}S_{mn}(c,\eta)\right]$$

$$+\left(\lambda_{mn}-c^2\eta^2-\frac{m^2}{1-\eta^2}\right)S_{mn}(c,\eta)=0$$

where the separation constants (or eigenvalues) λ_{mn} are to be determined so that $R_{mn}(c,\xi)$ and $S_{mn}(c,\eta)$ are finite at $\xi=\pm 1$ and $\eta=\pm 1$ respectively.

(21.6.1 and 21.6.2 are identical. Radial and angular prolate spheroidal functions satisfy the same differential equation over different ranges of the variable.)

Differential Equations for Radial and Angular Oblate Spheroidal Functions

21.6.3

$$\frac{d}{d\xi}\left[(\xi^2+1)\frac{d}{d\xi}R_{mn}(c,\xi)\right]$$

$$-\left(\lambda_{mn}-c^2\xi^2-\frac{m^2}{\xi^2+1}\right)R_{mn}(c,\xi)=0$$

21.6.4

$$\frac{d}{d\eta}\left[(1-\eta^2)\frac{d}{d\eta}S_{mn}(c,\eta)\right]$$

$$+\left(\lambda_{mn}+c^2\eta^2-\frac{m^2}{1-\eta^2}\right)S_{mn}(c,\eta)=0$$

(21.6.3 may be obtained from 21.6.1 by the transformations $\xi\rightarrow\pm i\xi, c\rightarrow\mp ic$; 21.6.4 may be obtained from 21.6.2 by the transformation $c\rightarrow\mp ic$.)

21.7. Prolate Angular Functions

21.7.1

$$S_{mn}^{(1)}(c,\eta)=\sum_{r=0,1}^m d_r^{mn}(c)P_{m+r}^m(\eta)$$

=Prolate angular function of the first kind

21.7.2

$$S_{mn}^{(2)}(c,\eta)=\sum_{r=-\infty}^m d_r^{mn}(c)Q_{m+r}^m(\eta)$$

=Prolate angular function of the second kind

($P_n^m(\eta)$ and $Q_n^m(\eta)$ are associated Legendre functions of the first and second kinds respectively. However, for $-1\leq z\leq 1, P_n^m(z)=(1-z^2)^{m/2}d^m P_n(z)/dz^m$ (see 8.6.6). The summation is extended over even values or odd values of r .)

$$\beta_k = (m+k)(m+k+1)$$

$$+\frac{2(m+k)(m+k+1)-2m^2-1}{(2m+2k-1)(2m+2k+3)}c^2$$

$$\gamma_k = \frac{k(k-1)c^2}{(2m+2k-3)(2m+2k-1)}$$

$$U_2(\lambda_{mn})=-\frac{\beta_{r+2}^m}{\gamma_{r+2}^m-\lambda_{mn}}-\frac{\beta_{r+4}^m}{\gamma_{r+4}^m-\lambda_{mn}}-\dots$$

$$\beta_k^m = \frac{k(k-1)(2m+k)(2m+k-1)c^4}{(2m+2k-1)^2(2m+2k+1)(2m+2k-3)}$$

($k\geq 2$)

$$\gamma_k^m = (m+k)(m+k+1)$$

Asymptotic Expansion for λ_{mn}

21.7.6

$$\lambda_{mn}(c) = cq + m^2 - \frac{1}{8}(q^2+5) - \frac{q}{64c}(q^2+11-32m^2) \\ - \frac{1}{1024c^2} [5(q^4+26q^2+21) - 384m^2(q^2+1)] \\ - \frac{1}{c^3} \left[\frac{1}{128^2} (33q^5+1594q^3+5621q) \right. \\ \left. - \frac{m^2}{128} (37q^3+167q) + \frac{m^4}{8} q \right] \\ - \frac{1}{c^4} \left[\frac{1}{256^2} (63q^6+4940q^4+43327q^2+22470) \right. \\ \left. - \frac{m^2}{512} (115q^4+1310q^2+735) + \frac{3m^4}{8} (q^2+1) \right] \\ - \frac{1}{c^5} \left[\frac{1}{1024^2} (527q^7+61529q^5+1043961q^3) \right. \\ \left. + 2241599q - \frac{m^2}{32 \cdot 1024} (5739q^5+127550q^3) \right. \\ \left. + 298951q + \frac{m^4}{512} (355q^3+1505q) - \frac{m^6q}{16} \right] + O(c^{-6}) \\ q = 2(n-m) + 1$$

Refinement of Approximate Values of λ_{mn}

If $\lambda_{mn}^{(1)}$ is an approximation to λ_{mn} obtained either from 21.7.5 or 21.7.6 then

21.7.7

$$\lambda_{mn} = \lambda_{mn}^{(1)} + \delta\lambda_{mn} \\ \delta\lambda_{mn} = \frac{U_1(\lambda_{mn}^{(1)}) + U_2(\lambda_{mn}^{(1)})}{\Delta_1 + \Delta_2} \\ \Delta_1 = 1 + \frac{\beta_r^m}{(N_r^m)^2} + \frac{\beta_r^m \beta_{r-2}^m}{(N_r^m N_{r-2}^m)^2} + \frac{\beta_r^m \beta_{r-2}^m \beta_{r-4}^m}{(N_r^m N_{r-2}^m N_{r-4}^m)^2} + \dots \\ \Delta_2 = \frac{(N_{r+2}^m)^2}{\beta_{r+2}^m} + \frac{(N_{r+2}^m N_{r+4}^m)^2}{\beta_{r+2}^m \beta_{r+4}^m} + \frac{(N_{r+2}^m N_{r+4}^m N_{r+6}^m)^2}{\beta_{r+2}^m \beta_{r+4}^m \beta_{r+6}^m} + \dots \\ N_r^m = \frac{(2m+r)(2m+r-1)c^2}{(2m+2r-1)(2m+2r+1)} \frac{d_r}{d_{r-2}} \quad (r \geq 2) \\ \beta_r^m = \frac{r(r-1)(2m+r)(2m+r-1)c^4}{(2m+2r-1)^2(2m+2r+1)(2m+2r-3)} \quad (r \geq 2)$$

Evaluation of Coefficients

Step 1. Calculate N_r^m 's from

21.7.8

$$N_{r+2}^m = \gamma_r^m - \lambda_{mn} - \frac{\beta_r^m}{N_r^m} \quad (r \geq 2)$$

$$N_2^m = \gamma_0^m - \lambda_{mn}; N_3^m = \gamma_1^m - \lambda_{mn}$$

$$\gamma_r^m = (m+r)(m+r+1)$$

$$+ \frac{1}{2} c^2 \left[1 - \frac{4m^2 - 1}{(2m+2r-1)(2m+2r+3)} \right] \quad (r \geq 0)$$

Step 2. Calculate ratios $\frac{d_0}{d_{2r}}$ and $\frac{d_1}{d_{2p+1}}$ from

21.7.9
$$\frac{d_0}{d_{2r}} = \left(\frac{d_0}{d_2}\right) \left(\frac{d_2}{d_4}\right) \dots \left(\frac{d_{2r-2}}{d_{2r}}\right)$$

21.7.10
$$\frac{d_1}{d_{2p+1}} = \left(\frac{d_1}{d_3}\right) \left(\frac{d_3}{d_5}\right) \dots \left(\frac{d_{2p-1}}{d_{2p+1}}\right)$$

and the formula for N_r^m in 21.7.7.

The coefficients d_r^m are determined to within the arbitrary factor d_0 for r even and d_1 for r odd. The choice of these factors depends on the normalization scheme adopted.

Normalization of Angular Functions

Meixner-Schäpfke Scheme

21.7.11
$$\int_{-1}^1 [S_{mn}(c, \eta)]^2 d\eta = \frac{2}{2n+1} \frac{(n+m)!}{(n-m)!}$$

Stratton-Morse-Chu-Little-Corbato Scheme

21.7.12
$$\sum_{r=0,1}^{\infty} \frac{(r+2m)!}{r!} d_r = \frac{(n+m)!}{(n-m)!}$$

(This normalization has the effect that $S_{mn}(c, \eta) \rightarrow P_n^m(\eta)$ as $\eta \rightarrow 1$.)

Flammer Scheme [21.4]

21.7.13

$$S_{mn}(c, 0) = P_n^m(0) = \frac{(-1)^{\frac{n-m}{2}} (n+m)!}{2^n \left(\frac{n-m}{2}\right)! \left(\frac{n+m}{2}\right)!}$$

($n-m$) even

21.7.14

$$S'_{mn}(c, 0) = P_n^m(0) = \frac{(-1)^{\frac{n-m-1}{2}} (n+m+1)!}{2^n \left(\frac{n-m-1}{2}\right)! \left(\frac{n+m+1}{2}\right)!}$$

($n-m$) odd

The above lead to the following conditions for d_r^m

21.7.15

$$\sum_{r=0}^{\infty} \frac{(-1)^{r/2} (r+2m)!}{2^r \left(\frac{r}{2}\right)! \left(\frac{r+2m}{2}\right)!} d_r^m = \frac{(-1)^{\frac{n-m}{2}} (n+m)!}{2^{n-m} \left(\frac{n-m}{2}\right)! \left(\frac{n+m}{2}\right)!}$$

($n-m$) even

21.7.16

$$\sum_{r=1}^{\infty} \frac{(-1)^{\frac{r-1}{2}} (r+2m+1)!}{2^r \left(\frac{r-1}{2}\right)! \left(\frac{r+2m+1}{2}\right)!} d_r^m = \frac{(-1)^{\frac{n-m-1}{2}} (n+m+1)!}{2^{n-m} \left(\frac{n-m-1}{2}\right)! \left(\frac{n+m+1}{2}\right)!}$$

($n-m$) odd

(The normalization scheme 21.7.13 and 21.7.14 is also used in [21.10].)

Asymptotic Expansions for $S_{mn}(c, \eta)$

21.7.17

$$S_{mn}(c, \eta) = (1-\eta^2)^{\frac{1}{2}} U_{mn}(c, \eta) \quad (c \rightarrow \infty)$$

$$U_{mn}(x) = \sum_{r=-\infty}^{\infty} h_r^l D_{l+r}(x) \quad l = n-m$$

where the $D_r(x)$'s are the parabolic cylinder functions (see chapter 19).

$$D_r(x) = (-1)^r e^{x^2/4} \frac{d^2}{dx^2} e^{-x^2/2} = 2^{-r/2} e^{-x^2/4} H_r \left(\frac{x}{\sqrt{2}} \right)$$

and the $H_r(x)$ are the Hermite polynomials (see chapter 22). (For tables of h_{\pm}^l/h_0^l see [21.4].)

Expansion of $S_{mn}(c, \eta)$ in Powers of η

21.7.18

$$S_{mn}(c, \eta) = (1-\eta^2)^{m/2} \sum_{r=0}^{\infty} p_r^{mn}(c) \eta^r$$

$$(r+1)(r+2)p_{r+2}^{mn}(c) - [r(r+2m+1) + m(m+1) - \lambda_{mn}(c)]p_r^{mn}(c) - c^2 p_{r-2}^{mn}(c) = 0$$

(The derivation of the transcendental equation for λ_{mn} is similar to the derivation of 21.7.4 from 21.7.3.)

Expansion of $S_{mn}(c, \eta)$ in Powers of $(1-\eta^2)$

21.7.19

$$S_{mn}(c, \eta) = (1-\eta^2)^{m/2} \sum_{k=0}^{\infty} c_{2k}^{mn} (1-\eta^2)^k \quad (n-m) \text{ even}$$

21.7.20

$$S_{mn}(c, \eta) = \eta(1-\eta^2)^{m/2} \sum_{k=0}^{\infty} c_{2k}^{mn} (1-\eta^2)^k \quad (n-m) \text{ odd}$$

$$c_{2k}^{mn} = \frac{1}{2^m k! (m+k)!} \sum_{r=k}^{\infty} \frac{(2m+2r)!}{(2r)!} (-r)_k \left(m+r+\frac{1}{2}\right)_k d_{2r}^{mn} \quad (n-m) \text{ even}$$

$$c_{2k}^{mn} = \frac{1}{2^m k! (m+k)!} \sum_{r=k}^{\infty} \frac{(2m+2r+1)!}{(2r+1)!} (-r)_k \left(m+r+\frac{3}{2}\right)_k d_{2r+1}^{mn} \quad (n-m) \text{ odd}$$

$$(\alpha)_k = \alpha(\alpha+1)(\alpha+2) \dots (\alpha+k-1)$$

(The d_r^{mn} 's are the coefficients in 21.7.1.)

Prolate Angular Functions—Second Kind

Expansion 21.7.2 ultimately leads to

21.7.21

$$S_{mn}^{(2)}(c, \eta) = \sum_{r=-2m, -2m+1}^{\infty} d_r^{mn} Q_{m+r}^m(\eta) + \sum_{r=2m+2, 2m+1}^{\infty} d_{r/2}^{mn} P_{r-m-1}^m(\eta)$$

(The coefficients d_r^{mn} are the same as in 21.7.1; the coefficients $d_{r/2}^{mn}$ are tabulated in [21.4].)

(Expressions of $a_k^{\pm r}$ are given in [21.4].)

21.9. Radial Spheroidal Wave Functions

21.9.1

$$R_{mn}^{(p)}(c, \xi) = \left\{ \sum_{r=0,1}^{\infty} \frac{(2m+r)!}{r!} d_r^{mn} \right\}^{-1} \left(\frac{\xi^2-1}{\xi^2} \right)^{m/2} \cdot \sum_{r=0,1}^{\infty} i^{r+m-n} \frac{(2m+r)!}{r!} d_r^{mn} Z_{m+r}^{(p)}(c\xi)^*$$

$$Z_n^{(p)}(z) = \sqrt{\frac{\pi}{2z}} J_{n+\frac{1}{2}}(z) \quad (p=1)$$

$$= \sqrt{\frac{\pi}{2z}} Y_{n+\frac{1}{2}}(z) \quad (p=2)$$

($J_{n+\frac{1}{2}}(z)$ and $Y_{n+\frac{1}{2}}(z)$ are Bessel functions, order $n+\frac{1}{2}$, of the first and second kind respectively (see chapter 10).)

21.9.2
$$R_{mn}^{(3)}(c, \xi) = R_{mn}^{(1)}(c, \xi) + iR_{mn}^{(2)}(c, \xi)$$

21.9.3
$$R_{mn}^{(4)}(c, \xi) = R_{mn}^{(1)}(c, \xi) - iR_{mn}^{(2)}(c, \xi)$$

Asymptotic Behavior of $R_{mn}^{(1)}(c, \xi)$ and $R_{mn}^{(2)}(c, \xi)$

21.9.4
$$R_{mn}^{(1)}(c, \xi) \xrightarrow{c\xi \rightarrow \infty} \frac{1}{c\xi} \cos [c\xi - \frac{1}{2}(n+1)\pi]$$

21.9.5
$$R_{mn}^{(2)}(c, \xi) \xrightarrow{c\xi \rightarrow \infty} \frac{1}{c\xi} \sin [c\xi - \frac{1}{2}(n+1)\pi]$$

* See page 11.

21.10. Joining Factors for Prolate Spheroidal Wave Functions

21.10.1

$$S_{mn}^{(1)}(c, \xi) = \kappa_{mn}^{(1)}(c) R_{mn}^{(1)}(c, \xi)$$

$$\kappa_{mn}^{(1)}(c) = \frac{(2m+1)(n+m)! \sum_{r=0}^{\infty} d_r^{mn}(2m+r)!/r!}{2^{n+m} d_0^{mn}(c) c^m m! \left(\frac{n-m}{2}\right)! \left(\frac{n+m}{2}\right)!} \quad (n-m) \text{ even}$$

$$= \frac{(2m+3)(n+m+1)! \sum_{r=1}^{\infty} d_r^{mn}(2m+r)!/r!}{2^{n+m} d_1^{mn}(c) c^{m+1} m! \left(\frac{n-m-1}{2}\right)! \left(\frac{n+m+1}{2}\right)!} \quad (n-m) \text{ odd}$$

21.10.2

$$S_{mn}^{(2)}(c, \xi) = \kappa_{mn}^{(2)}(c) R_{mn}^{(2)}(c, \xi)$$

$$\kappa_{mn}^{(2)}(c) = \frac{2^{n-m} (2m)! \left(\frac{n-m}{2}\right)! \left(\frac{n+m}{2}\right)! d_{-2m}^{mn}(c)}{(2m-1)m!(n+m)! c^{m-1}} \sum_{r=0}^{\infty} \frac{(2m+r)!}{r!} d_r^{mn}(c) \quad (n-m) \text{ even}$$

$$= \frac{2^{n-m} (2m)! \left(\frac{n-m-1}{2}\right)! \left(\frac{n+m+1}{2}\right)! d_{-2m+1}^{mn}(c)}{(2m-3)(2m-1)m!(n+m+1)! c^{m-2}} \sum_{r=1}^{\infty} \frac{(2m+r)!}{r!} d_r^{mn}(c) \quad (n-m) \text{ odd}$$

(The expression for joining factors appropriate to the oblate case may be obtained from the above formulas by the transformation $c \rightarrow -ic$.)

22. Orthogonal Polynomials

Mathematical Properties

22.1. Definition of Orthogonal Polynomials

A system of polynomials $f_n(x)$, degree $[f_n(x)] = n$, is called orthogonal on the interval $a \leq x \leq b$, with respect to the weight function $w(x)$, if

22.1.1

$$\int_a^b w(x) f_n(x) f_m(x) dx = 0 \quad (n \neq m; n, m = 0, 1, 2, \dots)$$

The weight function $w(x)[w(x) \geq 0]$ determines the system $f_n(x)$ up to a constant factor in each polynomial. The specification of these factors is referred to as standardization. For suitably standardized orthogonal polynomials we set

22.1.2

$$\int_a^b w(x) f_n^2(x) dx = h_n, \quad f_n(x) = k_n x^n + k'_n x^{n-1} + \dots \quad (n = 0, 1, 2, \dots)$$

These polynomials satisfy a number of relationships of the same general form. The most important ones are:

Differential Equation

$$22.1.3 \quad g_2(x) f_n'' + g_1(x) f_n' + a_n f_n = 0$$

where $g_2(x)$, $g_1(x)$ are independent of n and a_n a constant depending only on n .

Recurrence Relation

$$22.1.4 \quad f_{n+1} = (a_n + x b_n) f_n - c_n f_{n-1}$$

where

22.1.5

$$b_n = \frac{k_{n+1}}{k_n}, \quad a_n = b_n \left(\frac{k'_{n+1}}{k_{n+1}} - \frac{k'_n}{k_n} \right), \quad c_n = \frac{k_{n+1} k_{n-1} h_n}{k_n^2 h_{n-1}}$$

Rodrigues' Formula

$$22.1.6 \quad f_n = \frac{1}{e_n w(x)} \frac{d^n}{dx^n} \{ w(x) [g(x)]^n \}$$

where $g(x)$ is a polynomial in x independent of n .

The system $\left\{ \frac{d^n f_n}{dx^n} \right\}$ consists again of orthogonal polynomials.

22.17. Orthogonal Polynomials of a Discrete Variable

In this section some polynomials $f_n(x)$ are listed which are orthogonal with respect to the scalar product

22.17.1 $(f_n, f_m) = \sum_i w^*(x_i) f_n(x_i) f_m(x_i).$

The x_i are the integers in the interval $a \leq x_i \leq b$ and $w^*(x_i)$ is a positive function such that

$\sum_i w^*(x_i)$ is finite. The constant factor which is still free in each polynomial when only the orthogonality condition is given is defined here by the explicit representation (which corresponds to the Rodrigues' formula)

22.17.2 $f_n(x) = \frac{1}{r_n w^*(x)} \Delta^n [w^*(x) g(x, n)]$

where $g(x, n) = g(x)g(x-1) \dots g(x-n+1)$ and $g(x)$ is a polynomial in x independent of n .

Evaluation of an orthogonal polynomial using the explicit representation when the coefficients are not given numerically.

If an isolated value of the orthogonal polynomial $f_n(x)$ is to be computed, use the proper explicit expression rewritten in the form

$$f_n(x) = d_n(x)a_0(x)$$

and generate $a_0(x)$ recursively, where

$$a_{m-1}(x) = 1 - \frac{b_m}{c_m} f(x)a_m(x) \quad (m = n, n-1, \dots, 2, 1, a_n(x) = 1).$$

The $d_n(x)$, b_m , c_m , $f(x)$ for the polynomials of this chapter are listed in the following table:

$f_n(x)$	$d_n(x)$	b_m	c_m	$f(x)$

Evaluation of orthogonal polynomials by means of their recurrence relations

Example 3. Compute $C_n^{(1)}(2.5)$ for $n = 2, 3, 4, 5, 6$.

From **Table 22.2** $C_0^{(1)} = 1$, $C_1^{(1)} = 1.25$ and from **22.7** the recurrence relation is

$$C_{n+1}^{(1)}(2.5) = [5(n + \frac{1}{2})C_n^{(1)}(2.5) - (n - \frac{1}{2})C_{n-1}^{(1)}(2.5)] \frac{1}{n+1}$$

n	2	3	4	5	6
$C_n^{(1)}(2.5)$	3.65625	13.08594	50.87648	207.0649	867.7516

Check: Compute $C_6^{(1)}(2.5)$ by the method of **Example 2**.

Change of Interval of Orthogonality

In some applications it is more convenient to use polynomials orthogonal on the interval $[0, 1]$. One can obtain the new polynomials from the ones given in this chapter by the substitution $x=2\bar{x}-1$. The coefficients of the new polynomial can be computed from the old by the following recursive scheme, provided the standardization is not changed. If

$$f_n(x) = \sum_{m=0}^n a_m x^m, \quad f_n^*(x) = f_n(2x-1) = \sum_{m=0}^n a_m^* x^m$$

then the a_m^* are given recursively by the a_m through the relations

$$a_m^{(j)} = -2a_m^{(j-1)} - a_{m+1}^{(j)}; \quad m=n-1, n-2, \dots, j; \quad j=0, 1, 2, \dots, n$$

$$a_m^{(-1)} = a_m/2, \quad m=0, 1, 2, \dots, n$$

$$a_n^{(j)} = 2^j a_n, \quad j=0, 1, 2, \dots, n \text{ and } a_m^{(m)} = a_m^*; \quad m=0, 1, 2, \dots, n.$$

Example 4. Given $T_5(x) = 5x - 20x^3 + 16x^5$, find $T_5^*(x)$.

$j \backslash m$	5	4	3	2	1	0
-1	$8 = a_5^{(-1)}$	0	$-10 = a_3^{(-1)}$	0	$2.5 = a_1^{(-1)}$	0
0	16	-16	-4	4	1	$-1 = a_0^*$
1	32	-64	56	-48	$50 = a_1^*$	
2	64	-192	304	$-400 = a_2^*$		
3	128	-512	$1120 = a_3^*$			
4	256	$-1280 = a_4^*$				
5	$512 = a_5^*$					

Hence, $T_5^*(x) = 512x^5 - 1280x^4 + 1120x^3 - 400x^2 + 50x - 1$.

22.19. Least Square Approximations

Problem: Given a function $f(x)$ (analytically or in form of a table) in a domain D (which may be a continuous interval or a set of discrete points).² Approximate $f(x)$ by a polynomial $F_n(x)$ of given degree n such that a weighted sum of the squares of the errors in D is least.

Solution: Let $w(x) \geq 0$ be the weight function chosen according to the relative importance of the errors in different parts of D . Let $f_m(x)$ be orthogonal polynomials in D relative to $w(x)$, i.e. $(f_m, f_n) = 0$ for $m \neq n$, where

$$(f, g) = \begin{cases} \int_D w(x)f(x)g(x)dx & \text{if } D \text{ is a continuous interval} \\ \sum_{m=1}^N w(x_m)f(x_m)g(x_m) & \text{if } D \text{ is a set of } N \text{ discrete points } x_m. \end{cases}$$

Then

$$F_n(x) = \sum_{m=0}^n a_m f_m(x)$$

where

$$a_m = (f, f_m) / (f_m, f_m).$$

* ² $f(x)$ has to be square integrable, see e.g. [22.17].

³ See page 11.

D a Continuous Interval

Example 5. Find a least square polynomial of degree 5 for $f(x) = \frac{1}{1+x}$, in the interval $2 \leq x \leq 5$, using the weight function

$$w(x) = \frac{1}{\sqrt{(x-2)(5-x)}}$$

which stresses the importance of the errors at the ends of the interval.

Reduction to interval $[-1, 1]$, $t = \frac{2x-7}{3}$

$$w(x(t)) = \frac{2}{3} \frac{1}{\sqrt{1-t^2}}$$

From 22.2, $f_m(t) = T_m(t)$ and

$$a_m = \frac{4}{3\pi} \int_{-1}^1 \frac{1}{\sqrt{1-t^2}} \frac{1}{t+3} T_m(t) dt \quad (m \neq 0)$$

$$a_0 = \frac{2}{3\pi} \int_{-1}^1 \frac{1}{\sqrt{1-t^2}} \frac{dt}{t+3}$$

Evaluating the integrals numerically we get

$$\frac{1}{1+x} \sim .235703 - .080880T_1\left(\frac{2x-7}{3}\right) + .013876T_2\left(\frac{2x-7}{3}\right) - .002380T_3\left(\frac{2x-7}{3}\right) + .000408T_4\left(\frac{2x-7}{3}\right) - .000070T_5\left(\frac{2x-7}{3}\right)$$

D a Set of Discrete Points

If $x_m = m (m=0, 1, 2, \dots, N)$ and $w(x) = 1$, use the Chebyshev polynomials in the discrete range 22.17. It is convenient to introduce here a slightly different standardization such that

$$f_n(x) = \sum_{m=0}^n (-1)^m \binom{n}{m} \binom{n+m}{m} \frac{x!(N-m)!}{(x-m)!N!}$$

$$(f_n, f_n) = \frac{(N+n+1)!(N-n)!}{(2n+1)(N!)^2}$$

Recurrence relation: $f_0(x) = 1, f_1(x) = 1 - \frac{2x}{N}$

$$(n+1)(N-n)f_{n+1}(x) = (2n+1)(N-2x)f_n(x) - n(N+n+1)f_{n-1}(x)$$

Example 6. Approximate in the least square sense the function $f(x)$ given in the following table by a third degree polynomial.

x	$f(x)$	$\bar{x} = \frac{x-10}{2}$	$f_0(\bar{x})$	$f_1(\bar{x})$	$f_2(\bar{x})$	$f_3(\bar{x})$

16	.2500	3	1	-1/2	-1/2	2
18	.2357	4	1	-1	1	-1

$f_0(\bar{x}) \quad f_1(\bar{x}) \quad f_2(\bar{x}) \quad f_3(\bar{x})$

$$(f_n, f_n) = \sum_{\bar{x}=0}^4 f_n^2(\bar{x})$$

$$a_n = \frac{(f, f_n)}{(f_n, f_n)}$$

.271580 .039940 .0043571 .000310

$$f(x) \sim .27158 + .03994(3.5 - .25x) + .0043571(23.5 - 3.5x + .125x^2) + .00031(266 - 59.8333x + 4.375x^2 - .10417x^3)$$

$$f(x) \sim .59447 - .043658x + .0019009x^2 - .000032292x^3$$

22.20. Economization of Series

Problem: Given $f(x) = \sum_{m=0}^n a_m x^m$ in the interval $-1 \leq x \leq 1$ and $R > 0$. Find $\bar{f}(x) = \sum_{m=0}^N b_m x^m$ with N as small as possible, such that $|\bar{f}(x) - f(x)| < R$.

Solution: Express $f(x)$ in terms of Chebyshev polynomials using Table 22.3,

$$f(x) = \sum_{m=0}^n b_m T_m(x)$$

Then, since $|T_m(x)| \leq 1 (-1 \leq x \leq 1)$

$$\bar{f}(x) = \sum_{m=0}^N b_m T_m(x)$$

within the desired accuracy if

$$\sum_{m=N+1}^n |b_m| < R$$

$\bar{f}(x)$ is evaluated most conveniently by using the recurrence relation (see 22.7).

Example 7. Economize $f(x) = 1 + x/2 + x^2/3 + x^3/4 + x^4/5 + x^5/6$ with $R = .05$.

From **Table 22.3**

$$f(x) = \frac{1}{120} [149T_0(x) + 32T_2(x) + 3T_4(x)]$$

$$+ \frac{1}{96} [76T_1(x) + 11T_3(x) + T_5(x)]$$

so

$$\bar{f}(x) = \frac{1}{120} [149T_0(x) + 32T_2(x)] + \frac{1}{96} [76T_1(x) + 11T_3(x)]$$

since

$$|\bar{f}(x) - f(x)| \leq \frac{1}{40} + \frac{1}{96} < .05$$

Symbolic Operations

23.1.25 $p(B(x)+1) - p(B(x)) = p'(x)$ | $p(E(x)+1) + p(E(x)) = 2p(x)$
 23.1.26 $B_n(x+h) = (B(x)+h)^n \quad n=0, 1, \dots$ | $E_n(x+h) = (E(x)+h)^n \quad n=0, 1, \dots$

Here $p(x)$ denotes a polynomial in x and after expanding we set $\{B(x)\}^n = B_n(x)$ and $\{E(x)\}^n = E_n(x)$.

Relations Between the Polynomials

23.1.27 $E_{n-1}(x) = \frac{2^n}{n} \left\{ B_n\left(\frac{x+1}{2}\right) - B_n\left(\frac{x}{2}\right) \right\}$

23.1.29 $B_n(x) = 2^{-n} \sum_{k=0}^n \binom{n}{k} B_{n-k} E_k(2x) \quad n=0, 1, \dots$

Euler-Maclaurin Formulas

Let $F(x)$ have its first $2n$ derivatives continuous on an interval (a, b) . Divide the interval into m equal parts and let $h=(b-a)/m$. Then for some $\theta, 1 > \theta > 0$, depending on $F^{(2n)}(x)$ on (a, b) , we have

23.1.30 $\sum_{k=0}^m F(a+kh) = \frac{1}{h} \int_a^b F(t) dt + \frac{1}{2} \{ F(b) + F(a) \}$
 $+ \sum_{k=1}^{n-1} \frac{h^{2k-1}}{(2k)!} B_{2k} \{ F^{(2k-1)}(b) - F^{(2k-1)}(a) \}$
 $+ \frac{h^{2n}}{(2n)!} B_{2n} \sum_{k=0}^{m-1} F^{(2n)}(a+kh+\theta h)$

Equivalent to this is

23.1.31 $\frac{1}{h} \int_x^{x+h} F(t) dt = \frac{1}{2} \{ F(x+h) + F(x) \}$
 $- \sum_{k=1}^{n-1} \frac{h^{2k-1}}{(2k)!} B_{2k} \{ F^{(2k-1)}(x+h) - F^{(2k-1)}(x) \}$
 $- \frac{h^{2n}}{(2n)!} B_{2n} F^{(2n)}(x+\theta h) \quad b-h \geq x \geq a$

Let $\hat{B}_n(x) = B_n(x-[x])$. The Euler Summation Formula is

23.1.32 $\sum_{k=0}^{m-1} F(a+kh+\omega h) = \frac{1}{h} \int_a^b F(t) dt$
 $+ \sum_{k=1}^p \frac{h^{k-1}}{k!} B_k(\omega) \{ F^{(k-1)}(b) - F^{(k-1)}(a) \}$
 $- \frac{h^p}{p!} \int_0^1 \hat{B}_p(\omega-t) \left\{ \sum_{k=0}^{m-1} F^{(p)}(a+kh+th) \right\} dt$
 $p \leq 2n, 1 \geq \omega \geq 0$

23.2. Riemann Zeta Function and Other Sums of Reciprocal Powers

23.2.1 $\zeta(s) = \sum_{k=1}^{\infty} k^{-s}$ $\Re s > 1$

23.2.2 $= \prod_p (1 - p^{-s})^{-1}$ $\Re s > 1$

(product over all primes p).

23.2.3
$$= \frac{1}{s-1} + \frac{1}{2} + \sum_{k=1}^n \frac{B_{2k}}{2k} \binom{s+2k-2}{2k-1} - \frac{(s+2n)}{(2n+1)} \int_1^{\infty} \frac{B_{2n+1}(x-[x])}{x^{s+2n+1}} dx$$
 $s \neq 1, n=1, 2, \dots, \Re s > -2n$

* **23.2.4**
$$= -\frac{\Gamma(1-s)}{2\pi i} \int_C \frac{(-z)^{s-1}}{e^z-1} dz$$

23.2.5
$$= \frac{1}{s-1} + \sum_{n=0}^{\infty} \frac{(-1)^n}{n!} \gamma_n (s-1)^n$$

where

$$\gamma_n = \lim_{m \rightarrow \infty} \left\{ \sum_{k=1}^m \frac{(\ln k)^n}{k} - \frac{(\ln m)^{n+1}}{n+1} \right\}$$
 $\Re s > 0$

23.2.6
$$= 2^s \pi^{s-1} \sin\left(\frac{1}{2}\pi s\right) \Gamma(1-s) \zeta(1-s)$$

23.2.7
$$= \frac{1}{\Gamma(s)} \int_0^{\infty} \frac{x^{s-1}}{e^x-1} dx$$
 $\Re s > 1$

23.2.8
$$= \frac{1}{(1-2^{1-s})\Gamma(s)} \int_0^{\infty} \frac{x^{s-1}}{e^x+1} dx$$

23.2.9
$$= \sum_{k=1}^n k^{-s} + (s-1)^{-1} n^{1-s} - s \int_n^{\infty} \frac{x-[x]}{x^{s+1}} dx$$
 $n=1, 2, \dots, \Re s > 0$

23.2.10
$$= \frac{\exp(\ln 2\pi - 1 - \frac{1}{2}\gamma)s}{2(s-1)\Gamma(\frac{1}{2}s+1)} \prod_{\rho} \left(1 - \frac{s}{\rho}\right) e^{\frac{s}{\rho}}$$

product over all zeros ρ of $\zeta(s)$ with $\Re \rho > 0$.

The contour C in the fourth formula starts at infinity on the positive real axis, circles the origin once in the positive direction excluding the points $\pm 2ni\pi$ for $n=1, 2, \dots$, and returns to the starting point. Therefore $\zeta(s)$ is regular for all values of s except for a simple pole at $s=1$ with residue 1.

Special Values

23.2.11 $\zeta(0) = -\frac{1}{2}$

23.2.12 $\zeta(1) = \infty$

23.2.13 $\zeta'(0) = -\frac{1}{2} \ln 2\pi$

23.2.14 $\zeta(-2n) = 0$ $n=1, 2, \dots$

23.2.15 $\zeta(1-2n) = -\frac{B_{2n}}{2n}$ $n=1, 2, \dots$

23.2.16 $\zeta(2n) = \frac{(2\pi)^{2n}}{2(2n)!} |B_{2n}|$ $n=1, 2, \dots$

23.2.17
$$\zeta(2n+1) = \frac{(-1)^{n+1} (2\pi)^{2n+1}}{2(2n+1)!} \int_0^1 B_{2n+1}(x) \cot(\pi x) dx$$
 $n=1, 2, \dots$

Sums of Reciprocal Powers

The sums referred to are

23.2.18 $\zeta(n) = \sum_{k=1}^{\infty} k^{-n}$ $n=2, 3, \dots$

23.2.19
$$\eta(n) = \sum_{k=1}^{\infty} (-1)^{k-1} k^{-n} = (1-2^{1-n})\zeta(n)$$
 $n=1, 2, \dots$

23.2.20
$$\lambda(n) = \sum_{k=0}^{\infty} (2k+1)^{-n} = (1-2^{-n})\zeta(n)$$
 $n=2, 3, \dots$

23.2.21
$$\beta(n) = \sum_{k=0}^{\infty} (-1)^k (2k+1)^{-n}$$
 $n=1, 2, \dots$

These sums can be calculated from the Bernoulli and Euler polynomials by means of the last two formulas for special values of the zeta function (note that $\eta(1) = \ln 2$), and

23.2.22 $\beta(2n+1) = \frac{(\pi/2)^{2n+1}}{2(2n)!} |E_{2n}|$ $n=0, 1, \dots$

23.2.23
$$\beta(2n) = \frac{(-1)^n \pi^{2n}}{4(2n-1)!} \int_0^1 E_{2n-1}(x) \sec(\pi x) dx$$
 $n=1, 2, \dots$

$\beta(2)$ is known as Catalan's constant. Some other special values are

23.2.24 $\zeta(2) = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \dots = \frac{\pi^2}{6}$

23.2.25 $\zeta(4) = 1 + \frac{1}{2^4} + \frac{1}{3^4} + \dots = \frac{\pi^4}{90}$

* See page 11.

$$23.2.26 \quad \eta(2) = 1 - \frac{1}{2^2} + \frac{1}{3^2} - \dots = \frac{\pi^2}{12}$$

$$23.2.27 \quad \eta(4) = 1 - \frac{1}{2^4} + \frac{1}{3^4} - \dots = \frac{7\pi^4}{720}$$

$$23.2.28 \quad \lambda(2) = 1 + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$$

$$23.2.29 \quad \lambda(4) = 1 + \frac{1}{3^4} + \frac{1}{5^4} + \dots = \frac{\pi^4}{96}$$

$$23.2.30 \quad \beta(1) = 1 - \frac{1}{3} + \frac{1}{5} - \dots = \frac{\pi}{4}$$

$$23.2.31 \quad \beta(3) = 1 - \frac{1}{3^3} + \frac{1}{5^3} - \dots = \frac{\pi^3}{32}$$

24. Combinatorial Analysis

Mathematical Properties

In each sub-section of this chapter we use a fixed format which emphasizes the use and methods of extending the accompanying tables. The format follows this form:

I. Definitions

- A. Combinatorial
- B. Generating functions
- C. Closed form

II. Relations

- A. Recurrences
- B. Checks in computing
- C. Basic use in numerical analysis

III. Asymptotic and Special Values

In general the notations used are standard. This includes the difference operator Δ defined on functions of x by $\Delta f(x) = f(x+1) - f(x)$, $\Delta^{n+1}f(x) = \Delta(\Delta^n f(x))$, the Kronecker delta δ_{ij} , the Riemann zeta function $\zeta(s)$ and the greatest common divisor symbol (m, n) . The range of the summands for a summation sign without limits is explained to the right of the formula.

The notations which are not standard are those for the multinomials which are arbitrary shorthand for use in this chapter, and those for the Stirling numbers which have never been standardized. A short table of various notations for these numbers follows:

Notations for the Stirling Numbers

Reference	First Kind	Second Kind
This chapter	$S_n^{(m)}$	$\mathfrak{S}_n^{(m)}$
[24.2] Fort	$S_n^{(m)}$	$\mathcal{P}_n^{(m)}$ *
[24.7] Jordan	S_n^m	\mathfrak{S}_n^m *
[24.10] Moser and Wyman	S_n^m	σ_n^m
[24.9] Milne-Thomson	$\binom{n-1}{m-1} B_{n-m}^{(n)}$	$\binom{n}{m} B_{n-m}^{(-m)}$
[24.15] Riordan	$s(n, m)$	$S(n, m)$
[24.1] Carlitz }	$(-1)^{n-m} S_1(n-1, n-m)$	$S_2(m, n-m)$
[24.3] Gould }		
Miksa	$S(n-m+1, n)$	$m S_n$
(Unpublished tables)		
[24.17] Gupta		$u(n, m)$

We feel that a capital S is natural for Stirling numbers of the first kind; it is infrequently used for other notation in this context. But once it is used we have difficulty finding a suitable symbol for Stirling numbers of the second kind. The numbers are sufficiently important to warrant

a special and easily recognizable symbol, and yet that symbol must be easy to write. We have settled on a script capital \mathfrak{S} without any certainty that we have settled this question permanently.

We feel that the subscript-superscript notation emphasizes the generating functions (which are powers of mutually inverse functions) from which most of the important relations flow.

24.1. Basic Numbers

24.1.1 Binomial Coefficients

I. Definitions

A. $\binom{n}{m}$ is the number of ways of choosing m objects from a collection of n distinct objects without regard to order.

B. Generating functions

$$* (1+x)^n = \sum_{m=0}^n \binom{n}{m} x^m \quad n=0, 1, \dots$$

$$(1-x)^{-m-1} = \sum_{n=m}^{\infty} \binom{n}{m} x^{n-m} \quad |x| < 1$$

C. Closed form

$$\binom{n}{m} = \frac{n!}{m!(n-m)!} = \binom{n}{n-m} \quad n \geq m$$

$$= \frac{n(n-1)\dots(n-m+1)}{m!}$$

II. Relations

A. Recurrences

$$\binom{n+1}{m} = \binom{n}{m} + \binom{n}{m-1} \quad n \geq m \geq 1$$

$$= \binom{n}{m} + \binom{n-1}{m-1} + \dots + \binom{n-m}{0} \quad n \geq m$$

B. Checks

$$\sum_{m=0}^n \binom{r}{m} \binom{s}{n-m} = \binom{r+s}{n} \quad r+s \geq n$$

$$\sum_{m=0}^n (-1)^{n-m} \binom{r}{m} = \binom{r-1}{n} \quad r \geq n+1$$

$$\binom{n}{m} \equiv \binom{n_0}{m_0} \binom{n_1}{m_1} \dots \pmod{p} \quad p \text{ a prime}$$

where

$$n = \sum_{k=0}^{\infty} n_k p^k, \quad m = \sum_{k=0}^{\infty} m_k p^k \quad p > m_k, n_k \geq 0$$

$$\sum_{m=0}^s (-1)^m \binom{n}{m} f(x-m) = \sum_{k=0}^s (-1)^{s-k} \binom{n-k-1}{s-k} \Delta^k f(x-s) \quad s < n$$

C. Numerical analysis

$$\Delta^n f(x) = \sum_{m=0}^n (-1)^{n-m} \binom{n}{m} f(x+m) = \sum_{k=0}^r \binom{r}{k} \Delta^{n+k} f(x-r)$$

III. Special Values

$$\binom{n}{0} = \binom{n}{n} = 1$$

$$\binom{2n}{n} = \frac{2^n(2n-1)(2n-3) \dots 3 \cdot 1}{n!}$$

24.3.4 Primitive Roots

I. Definitions

The integers not exceeding and relatively prime to a fixed integer n form a group; the group is cyclic if and only if $n=2, 4$ or n is of the form p^k or $2p^k$ where p is an odd prime. Then g is a primitive root of n if it generates that group; i.e., if $g, g^2, \dots, g^{\varphi(n)}$ are distinct modulo n . There are $\varphi(\varphi(n))$ primitive roots of n .

II. Relations

A. Recurrences. If g is a primitive root of a prime p and $g^{p-1} \not\equiv 1 \pmod{p^2}$ then g is a primitive root of p^k for all k . If $g^{p-1} \equiv 1 \pmod{p^2}$ then $g+p$ is a primitive root of p^k for all k .

If g is a primitive root of p^k then either g or $g+p^k$, whichever is odd, is a primitive root of $2p^k$.

B. Checks. If g is a primitive root of n then g^k is a primitive root of n if and only if $(k, \varphi(n)) = 1$, and each primitive root of n is of this form.

25. Numerical Interpolation, Differentiation, and Integration

Numerical analysts have a tendency to accumulate a multiplicity of tools each designed for highly specialized operations and each requiring special knowledge to use properly. From the vast stock of formulas available we have culled the present selection. We hope that it will be useful. As with all such compendia, the reader may miss his favorites and find others whose utility he thinks is marginal.

We would have liked to give examples to illuminate the formulas, but this has not been feasible. Numerical analysis is partially a science and partially an art, and short of writing a textbook on the subject it has been impossible to indicate where and under what circumstances the various formulas are useful or accurate, or to elucidate the numerical difficulties to which one might be led by uncritical use. The formulas are therefore issued together with a caveat against their blind application.

Formulas

Notation: Abscissas: $x_0 < x_1 < \dots$; functions: f, g, \dots ; values: $f(x_i) = f_i, f'(x_i) = f'_i, f'', f^{(2)}, \dots$ indicate 1st, 2^d, . . . derivatives. If abscissas are equally spaced, $x_{i+1} - x_i = h$ and $f_p = f(x_0 + ph)$ (p not necessarily integral). R, R_n indicate remainders.

Lagrange Interpolation, Equally Spaced Abscissas

n Point Formula

Subtabulation

Let $f(x)$ be tabulated initially in intervals of width h . It is desired to subtabulate $f(x)$ in intervals of width h/m . Let Δ and $\bar{\Delta}$ designate differences with respect to the original and the final intervals respectively. Thus $\bar{\Delta}_0 = f\left(x_0 + \frac{h}{m}\right) - f(x_0)$. Assuming that the original 5th order differences are zero,

25.2.56

$$\bar{\Delta}_0 = \frac{1}{m} \Delta_0 + \frac{1-m}{2m^2} \Delta_0^2 + \frac{(1-m)(1-2m)}{6m^3} \Delta_0^3 + \frac{(1-m)(1-2m)(1-3m)}{24m^4} \Delta_0^4$$

$$\bar{\Delta}_0^2 = \frac{1}{m^2} \Delta_0^2 + \frac{1-m}{m^3} \Delta_0^3 + \frac{(1-m)(7-11m)}{12m^4} \Delta_0^4$$

$$\bar{\Delta}_0^3 = \frac{1}{m^3} \Delta_0^3 + \frac{3(1-m)}{2m^4} \Delta_0^4$$

$$\bar{\Delta}_0^4 = \frac{1}{m^4} \Delta_0^4$$

From this information we may construct the final tabulation by addition. For $m=10$,

25.2.57

$$\bar{\Delta}_0 = .1\Delta_0 - .045\Delta_0^2 + .0285\Delta_0^3 - .02066\Delta_0^4$$

Modified Trapezoidal Rule

25.4.4

$$\begin{aligned} \int_{x_0}^{x_m} f(x) dx &= h \left[\frac{f_0}{2} + f_1 + \dots + f_{m-1} + \frac{f_m}{2} \right] \\ &\quad + \frac{h}{24} [-f_{-1} + f_1 + f_{m-1} - f_{m+1}] + \frac{11m}{720} h^5 f^{(4)}(\xi) \end{aligned}$$

⁴ For regions, such as the square, cube, cylinder, etc., which are the Cartesian products of lower dimensional regions, one may always develop integration rules by "multiplying together" the lower dimensional rules. Thus if

$$\int_0^1 f(x) dx \approx \sum_{i=1}^n w_i f(x_i)$$

is a one dimensional rule, then

$$\int_0^1 \int_0^1 f(x, y) dx dy \approx \sum_{i,j=1}^n w_i w_j f(x_i, y_j)$$

becomes a two dimensional rule. Such rules are not necessarily the most "economical".

Mathematical Properties³

26.1. Probability Functions: Definitions and Properties

Univariate Cumulative Distribution Functions

A real-valued function $F(x)$ is termed a (univariate) cumulative distribution function (c.d.f.) or simply distribution function if

- i) $F(x)$ is non-decreasing, i.e., $F(x_1) \leq F(x_2)$ for $x_1 \leq x_2$
- ii) $F(x)$ is everywhere continuous from the right, i.e., $F(x) = \lim_{\epsilon \rightarrow 0^+} F(x + \epsilon)$
- iii) $F(-\infty) = 0, F(\infty) = 1$.

The function $F(x)$ signifies the probability of the event " $X \leq x$ " where X is a random variable, i.e., $Pr\{X \leq x\} = F(x)$, and thus describes the c.d.f. of X . The two principal types of distribution functions are termed *discrete* and *continuous*.

Discrete Distributions: Discrete distributions are characterized by the random variable X taking on an enumerable number of values . . . , x_{-1}, x_0, x_1, \dots with point probabilities

$$p_n = Pr\{X = x_n\} \geq 0$$

which need only be subject to the restriction

$$\sum_n p_n = 1.$$

The corresponding distribution function can then be written

$$26.1.1 \quad F(x) = Pr\{X \leq x\} = \sum_{x_n \leq x} p_n$$

³ *Comment on notation and conventions.*

a. We follow the customary convention of denoting a random variable by a capital letter, i.e., X , and using the corresponding lower case letter, i.e., x , for a particular value that the random variable assumes.

b. For statistical applications it is often convenient to have tabulated the "upper tail area," $1 - F(x)$, or the c.d.f. for $|X|$, $F(x) - F(-x)$, instead of simply the c.d.f. $F(x)$. We use the notation P to indicate the c.d.f. of X , $Q = 1 - P$ to indicate the "upper tail area" and $A = P - Q$ to denote the c.d.f. of $|X|$. In particular we use $P(x)$, $Q(x)$, and $A(x)$ to denote the corresponding functions for the normal or Gaussian probability function, see 26.2.2-26.2.4. When these distributions depend on other parameters, say θ_1 and θ_2 , we indicate this by writing $P(x|\theta_1, \theta_2)$, $Q(x|\theta_1, \theta_2)$, or $A(x|\theta_1, \theta_2)$. For example the chi-square distribution 26.4 depends on the parameter ν and the tabulated function is written $Q(\chi^2|\nu)$.

where the summation is over all values of x for which $x_n \leq x$. The set $\{x_n\}$ of values for which $p_n > 0$ is termed the domain of the random variable X . A discrete distribution of a random variable is called a *lattice distribution* if there exist numbers a and $b \neq 0$ such that every possible value of X can be represented in the form $a + bn$ where n takes on only integral values. A summary of some properties of certain discrete distributions is presented in 26.1.19-26.1.24.

Continuous Distributions. Continuous distributions are characterized by $F(x)$ being absolutely continuous. Hence $F(x)$ possesses a derivative $F'(x) = f(x)$ and the c.d.f. can be written

$$26.1.2 \quad F(x) = Pr\{X \leq x\} = \int_{-\infty}^x f(t) dt.$$

The derivative $f(x)$ is termed the *probability density function* (p.d.f.) or *frequency function*, and the values of x for which $f(x) > 0$ make up the domain of the random variable X . A summary of some properties of certain selected continuous distributions is presented in 26.1.25-26.1.34.

Multivariate Probability Functions

The real-valued function $F(x_1, x_2, \dots, x_n)$ defines an n -variate cumulative distribution function if

- i) $F(x_1, x_2, \dots, x_n)$ is a non-decreasing function for each x_i
- ii) $F(x_1, x_2, \dots, x_n)$ is continuous from the right in each x_i ; i.e., $F(x_1, x_2, \dots, x_n) = \lim_{\epsilon \rightarrow 0^+} F(x_1, \dots, x_i + \epsilon, \dots, x_n)$
- iii) $F(x_1, x_2, \dots, x_n) = 0$ when any $x_i = -\infty$; $F(\infty, \infty, \dots, \infty) = 1$.
- iv) $F(x_1, x_2, \dots, x_n)$ assigns nonnegative probability to the event $x_1 < X_1 \leq x_1 + h_1, x_2 < X_2 \leq x_2 + h_2, \dots, x_n < X_n \leq x_n + h_n$ for all x_1, x_2, \dots, x_n and all nonnegative h_1, h_2, \dots, h_n , e.g., for $n=2$, $F(x_1 + h_1, x_2 + h_2) - F(x_1, x_2 + h_2) - F(x_1 + h_1, x_2) + F(x_1, x_2) \geq 0$ and in general for $x_i < X_i \leq x_i + h_i$ ($i=1, 2, \dots, n$), the k th order difference $\Delta_k F(x_1, x_2, \dots, x_n) > 0$ for $k=1, 2, \dots, n$.

*See page 11.

The joint probability of the event $X_1 \leq x_1, X_2 \leq x_2, \dots, X_n \leq x_n$ is $F(x_1, x_2, \dots, x_n)$. Analogous to the one-dimensional case, *discrete* distributions assign all probability to an enumerable set of

vectors (x_1, x_2, \dots, x_n) and *continuous* distributions are characterized by absolute continuity of $F(x_1, x_2, \dots, x_n)$.

Probability Integral with Mean m and Variance σ^2

A random variable X is said to be normally distributed with mean m and variance σ^2 if the probability that X is less than or equal to x is given by

26.2.8

$$Pr\{X \leq x\} = \frac{1}{\sigma\sqrt{2\pi}} \int_{-\infty}^x e^{-\frac{(t-m)^2}{2\sigma^2}} dt$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{(x-m)/\sigma} e^{-t^2/2} dt = P\left(\frac{x-m}{\sigma}\right)$$

The corresponding probability density function is

26.2.9

$$\frac{\partial}{\partial x} P\left(\frac{x-m}{\sigma}\right) = \frac{1}{\sigma} Z\left(\frac{x-m}{\sigma}\right) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-m)^2}{2\sigma^2}}$$

and is symmetric around m , i.e.

$$Z\left(\frac{m+x}{\sigma}\right) = Z\left(\frac{m-x}{\sigma}\right)$$

The inflexion points of the probability density function are at $m \pm \sigma$.

where

$$R_n = (-1)^{n+1} \cdot 3 \dots (2n+1) \int_x^{\infty} \frac{Z(t)}{t^{2n+2}} dt$$

which is less in absolute value than the first neglected term.

where $a_1=1, a_2=1, a_3=5, a_4=9, a_5=129$ and the general term is

$$a_n = c_0 \cdot 3 \dots (2n-1) + 2c_1 \cdot 3 \dots (2n-3) + 2^2 c_2 \cdot 3 \dots (2n-5) + \dots + 2^{n-1} c_{n-1}$$

Numerical Methods

26.8. Methods of Generating Random Numbers and Their Applications ⁹

Random digits are digits generated by repeated independent drawings from the population 0, 1, 2, . . . , 9 where the probability of selecting any digit is one-tenth. This is equivalent to putting 10 balls, numbered from 0 to 9, into an urn and drawing one ball at a time, replacing the ball after each drawing. The recorded set of numbers forms a collection of random digits. Any group of n successive random digits is known as a *random number*.

Several lengthy tables of random digits are available (see references). However, the use of random numbers in electronic computers has resulted in a need for random numbers to be generated in a completely deterministic way. The numbers so generated are termed pseudo-random numbers. The quality of pseudo-random numbers is determined by subjecting the numbers to several statistical tests, see [26.55], [26.56]. The purpose of these statistical tests is to detect any properties of the pseudo-random numbers which are different from the (conceptual) properties of random numbers.

⁹ The authors wish to express their appreciation to Professor J. W. Tukey who made many penetrating and helpful suggestions in this section.

Experience has shown that the congruence method is the most preferable device for generating random numbers on a computer. Let the sequence of pseudo-random numbers be denoted by $\{X_n\}$, $n=0, 1, 2, \dots$. Then the congruence method of generating pseudo-random numbers is

$$X_{n+1} = aX_n + b \pmod{T}$$

where b and T are relatively prime. The choice of T is determined by the capacity and base of the computer; a and b are chosen so that: (1) the resulting sequence $\{X_n\}$ possesses the desired statistical properties of random numbers, (2) the period of the sequence is as long as possible, and (3) the speed of generation is fast. A guide for choosing a and b is to make the correlation between the numbers be near zero, e.g., the correlation between X_n and X_{n+s} is

$$\rho_s = \frac{1 - 6 \frac{b_s}{T} \left(1 - \frac{b_s}{T}\right)}{a_s} + e$$

where

$$a_s = a^s \pmod{T}$$

$$b_s = (1 + a + a^2 + \dots + a^{s-1})b \pmod{T}$$

$$|e| < a_s/T$$

*See page II.

which occur in

$$X_{n+s} = a_s X_n + b_s \pmod{T}$$

When a is chosen so that $a \approx T^{1/2}$, the correlation $\rho_1 \approx T^{-1/2}$.

The sequence defined by the multiplicative congruence method will have a full period of T numbers if

- (i) b is relatively prime to T
- (ii) $a \equiv 1 \pmod{p}$ if p is a prime factor of T
- (iii) $a \equiv 1 \pmod{4}$ if 4 is a factor of T .

Consequently if $T=2^e$, b need only be odd, and

$a \equiv 1 \pmod{4}$. When $T=10^e$, b need only be not divisible by 2 or 5, and $a \equiv 1 \pmod{20}$. The most convenient choices for a are of the form $a=2^s+1$ (for binary computers) and $a=10^s+1$ (for decimal computers). This results in the fastest generation of random numbers as the operations only require a shift operation plus two additions. Also any number can serve as the starting point to generate a sequence of random digits. A good summary of generating pseudo-random numbers is [26.51].

Below are listed various congruence schemes and their properties.

¹⁰ X_0 given is the starting point for random numbers when statistical tests were made.

When the numbers are generated using a congruence scheme, the least significant digits have short periods. Hence the entire word length cannot be used. If one desired random numbers with as many digits as possible, one would have to modify the congruence schemes. One way is to generate the numbers mod $T \pm 1$. This unfortunately reduces the period.

Generation of Random Deviates

Let $\{X\}$ be a generated sequence of independent random numbers having the domain $(0, T)$. Then $\{U\} = \{T^{-1}X\}$ is a sequence of random deviates (numbers) from a uniform distribution on the interval $(0, 1)$. This is usually a necessary preliminary step in the generation of random deviates having a given cumulative distribution function $F(y)$ or probability density function $f(y)$. Below are summarized some general techniques

for producing arbitrary random deviates. (In what follows $\{U\}$ will always denote a sequence of random deviates from a uniform distribution on the interval $(0, 1)$.)

1. Inverse Method

The solutions $\{y\}$ of the equations $\{u=F(y)\}$ form a sequence of independent random deviates with cumulative distribution function $F(y)$. (If $F(y)$ has a discontinuity at $y=y_0$, then whenever u is such that $F(y_0-0) < u < F(y_0)$, select y_0 as the corresponding deviate.) Generally the inverse method is not practical unless the inverse function $y=F^{-1}(u)$ can be obtained explicitly or can be conveniently approximated.

2. Generating a Discrete Random Variable

Let Y be a discrete random variable with point probabilities $p_i = Pr\{Y=y_i\}$ for $i=1, 2, \dots$

*See page 11.

The direct way to generate Y is to generate $\{U\}$ and put $Y=y_1$ if

$$p_1 + p_2 + \dots + p_{i-1} < U < p_1 + p_2 + \dots + p_i.$$

However, this method requires complicated machine programs that take too long.

An alternative way due to Marsaglia [26.53] is simple, fast, and seems to be well suited to high-speed computations. Let p_i for $i=1, 2, \dots, n$ be expressed by k decimal digits as $p_i = .\delta_{i1}\delta_{i2} \dots \delta_{ik}$ where the δ 's are the decimal digits. (If the domain of the random variable is infinite, it is necessary to truncate the probability distribution at p_n .) Define

$$P_0=0, P_r=10^{-r} \sum_{i=1}^n \delta_{ri} \text{ for } r=1, 2, \dots, k, \text{ and}$$

$$\Pi_s = \sum_{r=0}^s 10^r P_r, s=1, 2, \dots, k.$$

Number the computer memory locations by 0, 1, 2, . . . , Π_k-1 . The memory locations are divided into k mutually exclusive sets such that the s th set consists of memory locations $\Pi_{s-1}, \Pi_{s-1}+1, \dots, \Pi_s-1$. The information stored in the memory locations of the s th set consists of y_1 in δ_{s1} locations, y_2 in δ_{s2} locations, . . . , y_n in δ_{sn} locations.

Denote the decimal expansion of the uniform deviates generated by the computer by $u = .d_1d_2d_3 \dots$ and finally let $\sigma\{m\}$ be the contents of memory location m . Then if

$$\sum_{i=0}^{s-1} P_i \leq U < \sum_{i=0}^s P_i$$

put

$$y = a \left\{ d_1d_2 \dots d_s + \Pi_{s-1} - 10^s \sum_{i=1}^{s-1} P_i \right\}.$$

This method is perhaps the best all-around method for generating random deviates from a discrete distribution. In order to illustrate this method consider the problem of generating deviates from the binomial distribution with point probabilities

$$p_i = \binom{n}{i} p^i (1-p)^{n-i}$$

for $n=5$ and $p=.20$. The point probabilities to 4 D are

Value of Random Variable	Point Probabilities
0	$p_0=0.3277$
1	$p_1=.4096$
2	$p_2=.2048$
3	$p_3=.0512$
4	$p_4=.0064$
5	$p_5=.0003$

and thus $P_0=0, P_1=.9, P_2=.07, P_3=.027, P_4=.0030$ from which $\Pi_0=0, \Pi_1=9, \Pi_2=16, \Pi_3=43, \Pi_4=73$. The 73 memory locations are divided into 4 mutually exclusive sets such that

Set	Memory Locations
1	0, 1, . . . , 8
2	9, 10, . . . , 15
3	16, . . . , 42
4	43, . . . , 72

Among the nine memory locations of set 1, zero is stored $\delta_{10}=3$ times, 1 is stored $\delta_{11}=4$ times, 2 is stored $\delta_{12}=2$ times; the seven locations of set 2 store 0 $\delta_{20}=2$ times and 3 $\delta_{23}=5$ times; etc. A summary of the memory locations is set out below:

	Value of Random Variable					
	0	1	2	3	4	5
Frequency (set 1)	3	4	2	0	0	0
Frequency (set 2)	2	0	0	5	0	0
Frequency (set 3)	7	9	4	1	6	0
Frequency (set 4)	7	6	8	2	4	3

Then to generate the random variables if

$0 \leq u < .9$	put	$y = a\{d_1\}$
$.9 \leq u < .97$		$y = a\{d_1d_2 - 81\}$
$.97 \leq u < .997$		$y = a\{d_1d_2d_3 - 954\}$
$.997 \leq u < 1.000$		$y = a\{d_1d_2d_3d_4 - 9927\}$

3. Generating a Continuous Random Variable

The method for generating deviates from a discrete distribution can be adapted to random variables having a continuous distribution. Let $F(y)$ be the cumulative distribution function and assume that the domain of the random variable is (a,b) where the interval is finite. (If the domain is infinite, it must be truncated at (say) the points a and b .) Divide the interval $(b-a)$ into n sub-intervals of length Δ ($n\Delta=b-a$) such that the boundary of the i th interval is (y_{i-1}, y_i) where $y_i = a + i\Delta$ for $i=0, 1, \dots, n$. Now define a discrete distribution having domain

$$\left\{ z_i = \frac{y_i + y_{i-1}}{2} \right\}$$

with point probabilities $p_i = F(y_i) - F(y_{i-1})$. Finally, let W be a random variable having a uniform distribution on $\left(-\frac{\Delta}{2}, \frac{\Delta}{2}\right)$. This can be done by setting $W = \Delta\left(U - \frac{1}{2}\right)$. Then random

deviates from the distribution function $F(y)$, can be generated (approximately) by setting $y = z + w = z + \Delta \left(u - \frac{1}{2} \right)$. This is simply an approximate decomposition of the continuous random variable into the sum of a discrete and continuous random variable. The discrete variable can be generated quickly by the method described previously. The smaller the value of Δ the better will be the approximation. Each number can be generated by using the leading digits of U to generate the discrete random variable Z and the remaining digits forming a uniformly distributed deviate having $(0,1)$ domain.

4. Acceptance-Rejection Methods

In what follows the random variable Y will be assumed to have finite domain (a, b) . If the domain is infinite, it must be truncated for computational purposes at (say) the points a and b . Then the resulting random deviates will only have this truncated domain.

a) Let f be the maximum of $f(y)$. Then the procedure for generating random deviates is: (1) generate a pair of uniform deviates U_1, U_2 ; (2) compute a point $y = a + (b - a)u_2$ in (a, b) ; (3) if $u_1 < f(y)/f$ accept y as the random deviate, otherwise reject the pair (u_1, u_2) and start again. The acceptance ratio of deviates actually produced is $[(b - a)f]^{-1}$. Hence the acceptance ratio decreases as the domain increases. One way to increase the acceptance ratio is to divide the interval (a, b) into mutually exclusive sub-intervals and then carry out the acceptance-rejection process. For this purpose let the interval (a, b) be divided into k sub-intervals such that the end points of the j th interval are (ξ_{j-1}, ξ_j) with $\xi_0 = a, \xi_k = b$ and $\int_{\xi_{j-1}}^{\xi_j} f(y)dy = p_j$; further let the maximum of $f(y)$ in the j th interval be f_j . Then to generate random deviates from $f(y)$, generate n pairs of deviates $(u_{1s}, u_{2s}) s = 1, 2, \dots, n$. Assign $[np_j]$ such pairs to the j th interval and compute $y_j = \xi_{j-1} + (\xi_j - \xi_{j-1})u_{2s}$. If $u_{1s} < f(y_j)/f_j$ accept y_j as a deviate. The acceptance ratio of this method is

$$\sum_{j=1}^k p_j [(\xi_j - \xi_{j-1})f_j]^{-1}$$

b) Let $F(y)$ be such that $f(y) = f_1(y)f_2(y)$ where the domain of y is (a, b) . Let f_1 and f_2 be the maximum of $f_1(y)$ and $f_2(y)$ respectively. Then the procedure for generating random de-

viates having the probability density function $f(y)$ is: (1) generate U_1, U_2, U_3 ; (2) define $z = a + (b - a)u_3$; (3) if both $u_1 < \frac{f_1(z)}{f_1}$ and $u_2 < \frac{f_2(z)}{f_2}$, take z as the random deviate; otherwise take another sample of three uniform deviates. The acceptance ratio of this method is $[(b - a)f_1f_2]^{-1}$ and can be increased by dividing (a, b) into sub-intervals as in the previous case.

c) Let the probability density function of Y be

$$f(y) = \int_{\alpha}^{\beta} g(y, t)dt, (\alpha \leq t \leq \beta), (a \leq y \leq b).$$

Let g be the maximum of $g(y, t)$. Then the procedure for generating random deviates having the probability density function $f(y)$ is: (1) generate U_1, U_2, U_3 ; (2) define $s = \alpha + (\beta - \alpha)u_2$; $z = a + (b - a)u_3$; (3) if $u_1 < \frac{g(z, s)}{g}$, take z as the random deviate; otherwise take another sample of three. The acceptance ratio for this method is $[(b - a)g]^{-1}$ and can be increased by dividing the domain of t and y into sub-domains.

5. Composition Method

Let $g_z(y)$ be a probability density function which depends on the parameter z ; further let $H(z)$ be the cumulative distribution function for z . In order to generate random deviates Y having the frequency function

$$f(y) = \int_{-\infty}^{\infty} g_z(y)dH(z)$$

one draws a deviate having the cumulative distribution function $H(z)$; then draws a second sample having the probability density function $g_z(y)$.

6. Generation of Random Deviates From Well Known Distributions

a. Normal distribution

(1) *Inverse method:* The inverse method depends on having a convenient approximation to the inverse function $x = P^{-1}(u)$ where

$$u = (2\pi)^{-1/2} \int_{-\infty}^x e^{-t^2/2} dt.$$

Two ways of performing this operation are to (i) use **26.2.23** with $t = \left(\ln \frac{1}{u^2} \right)^{1/2}$ or (ii) approximate $x = P^{-1}(u)$ piecewise using Chebyshev polynomials, see [26.54].

(2) *Sum of uniform deviates:* Let U_1, U_2, \dots, U_n be a sequence of n uniform deviates. Then

$$X_n = \left(\sum_{i=1}^n U_i - \frac{n}{2} \right) \left(\frac{n}{12} \right)^{-1/2}$$

will be distributed asymptotically as a normal random deviate. When $n=12$, the maximum errors made in the normal deviate are 9×10^{-3} for $|X| < 2$, 9×10^{-1} for $2 < |X| < 3$. An improvement can be made by taking a polynomial function of X_n (say)

$$X_n^* = X_n \sum_{s=0}^k a_{2s} X_n^{2s}$$

as the normal deviate where a_{2s} are suitable coefficients. These coefficients may be calculated using (say) Chebyshev polynomials or simply by making the asymptotic random deviate agree with the correct normal deviate at certain specified points. When $n=12$, the maximum error in the normal deviate is 8×10^{-4} using the coefficients

$$\begin{aligned} * a_0 &= 9.8746 & * a_6 &= (-7) - 5.102 \\ * a_2 &= (-3)3.9439 & * a_8 &= (-7)1.141 \\ * a_4 &= (-5)7.474 \end{aligned}$$

(3) *Direct method*: Generate a pair of uniform deviates (U_1, U_2) . Then

$$X_1 = (-2 \ln U_1)^{1/2} \cos 2\pi U_2,$$

$X_2 = (-2 \ln U_1)^{1/2} \sin 2\pi U_2$ will be a pair of independent normal random deviates with mean zero and unit variance. This procedure can be modified by calculating $\cos 2\pi U$ and $\sin 2\pi U$ using an acceptance rejection method; e.g., (1) generate (U_1, U_2) ; (2) if $(2U_1 - 1)^2 + (2U_2 - 1)^2 \leq 1$ generate a third uniform deviate U_3 , otherwise reject the pair and start over; (3) calculate $y_1 = (-\ln u_3)^{1/2} \frac{u_1^2 - u_2^2}{u_1^2 + u_2^2}$, $y_2 = \pm 2(-\ln u_3)^{1/2} \frac{u_1 u_2}{u_1^2 + u_2^2}$ (\pm random). Both y_1 and y_2 are the desired random deviates.

(4) *Acceptance-rejection method*: 1) Generate a pair of uniform deviates (U_1, U_2) ; 2) compute $x = -\ln u_1$; 3) if $e^{-x(x-1)^2} \geq u_2$ (or equivalently $(x-1)^2 \leq -2(\ln u_2)$) accept x , otherwise reject the

pair and start over. The quantity will be the required normal deviate with mean zero and unit variance.

b. Bivariate normal distribution

Let $\{X_1, X_2\}$ be a pair of independent normal deviates with mean zero and unit variance. Then $\{X_1, \rho X_1 + (1 - \rho^2)^{1/2} X_2\}$ represent a pair of deviates from a bivariate normal distribution with zero means, unit variances, and correlation coefficient ρ .

c. Exponential distribution

(1) *Inverse method*: Since $F(x) = e^{-x/\theta}$, $X = -\theta \ln U$ will be a deviate from the exponential distribution with parameter θ .

(2) *Acceptance-rejection method*: 1) Generate a pair of independent uniform deviates (U_0, U_1) ; 2) if $U_1 < U_0$ generate a third value U_2 ; 3) if $U_1 + U_2 < U_0$ generate a fourth value U_3 , etc.; 4) continue generating uniform deviates until an n is obtained such that $U_1 + U_2 + \dots + U_{n-1} < U_0 < U_1 + \dots + U_n$; 5) if n is even reject the procedure and start a fresh trial with a new value of U_0 , otherwise if n is odd take $X = \theta U_0$ as the desired deviate; 6) in general if t is the number of trials until an acceptable sequence is obtained $X = \theta(t + U_0)$. The random deviates produced in this way follow an exponential distribution with parameter θ . One can expect to generate approximately six uniform deviates for every exponential deviate.

(3) *Discrete Distribution Method*: Let Y and n be discrete random variables with point probabilities

$$\begin{aligned} * Pr\{Y=r\} &= (e-1)e^{-(r+1)} \quad r=0, 1, 2, \dots \\ Pr\{n=s\} &= [s!(e-1)]^{-1} \quad s=1, 2, 3, \dots \end{aligned}$$

Then $X = Y + \min(U_1, U_2, \dots, U_n)$ will follow an exponential distribution. The average value of n is 1.58 so that one needs, on the average, only 1.58 u 's from which the minimum is selected.

26.9. Use and Extension of the Tables

Use of Probability Function Inequalities

Example 1. Let X be a random variable with finite mean and variance equal to m and σ^2 , respectively. Use the inequalities for probability functions 26.1.37, 40, 41 to place lower bounds on

$$A(t) = F(t) - F(-t) = P \left\{ \frac{|X-m|}{\sigma} \leq t \right\}$$

for $t=1(1)4$.

*See page 11.

Lower bounds on $A(t) = F(t) - F(-t)$				
$t=1$	2	3	4	Remarks
0	.7500	.8889	.9375	no knowledge of $F(t)$; 26.1.37
.5556	.8889	.9506	.9722	$F(t)$ is unimodal and continuous; 26.1.40
0	.8182	.9697	.9912	$F(t)$ is such that $\mu_4=3$; 26.1.41

It is of interest to note that the standard normal distribution is unimodal, has mean zero, unit variance $\mu_4=3$, is continuous, and such that

$$A(t) = P(t) - P(-t) = .6827, .9545, .9973, \text{ and } .9999$$

for $t=1, 2, 3$ and 4 respectively.

Interpolation for $P(x)$ in Table 26.1

Example 2. Compute $P(x)$ for $x=2.576$ to fifteen decimal places using a Taylor expansion.

Writing $x=x_0+\theta$ we have

$$P(x) = P(x_0) + Z(x_0)\theta + Z^{(1)}(x_0)\frac{\theta^2}{2!} + Z^{(2)}(x_0)\frac{\theta^3}{3!} + Z^{(3)}(x_0)\frac{\theta^4}{4!} + \dots$$

Taking $x_0=2.58$ and $\theta=-4 \times 10^{-3}$ we calculate the successive terms to 16D

+.99505	99842	42230	
-	5	72204	6
-		2952	6
-	8	63097	8
-		1439	4
-			9
.99500	24676	84265	7

The result correct to 17D is

$$P(2.576) = .99500 \quad 24676 \quad 84264 \quad 98$$

Calculation for Arbitrary Mean and Variance

Example 3. Find the value to 5D of

$$P\{X \leq .50\} = \frac{1}{2\sqrt{2\pi}} \int_{-\infty}^{.5} e^{-1/2(\frac{t-1}{2})^2} dt$$

using 26.2.8 and Table 26.1.

This represents the probability of the random variable being less than or equal to .5 for a normal distribution with mean $m=1$ and variance $\sigma^2=4$. Using 26.2.8 we have

$$P\{X \leq .5\} = P\left(\frac{.5-1}{2}\right) = P(-.25)$$

Since $P(-x) = 1 - P(x)$, we have

$$P(-.25) = 1 - P(.25) = 1 - .59871 = .40129$$

where a two-term Taylor series was used for interpolation. Note that when interpolating for $P(x)$ for a value of x midway between the tabulated

values we can write $x=x_0+.01$ and a two-term Taylor series is $P(x) = P(x_0) + Z(x_0)10^{-2}$. Thus one need only multiply $Z(x_0)$ by 10^{-2} and add the result to $P(x_0)$.

Calculation of $P(x)$ for x Approximate

Example 4. Using Table 26.1, find $P(x)$ for $x=1.96$, when there is a possible error in x of $\pm 5 \times 10^{-3}$.

This is an example where the argument is only known approximately. The question arises as to how many decimal places one should retain in $P(x)$. If Δx and $\Delta P(x)$ denote the error in x and the resulting error in $P(x)$, respectively, then

$$\Delta P(x) \approx Z(x)\Delta x$$

Hence $\Delta P(1.960) = 3 \times 10^{-4}$ which indicates that $P(1.960)$ need only be calculated to 4D. Therefore $P(1.960) = .9750$.

Inverse Interpolation for $P(x)$

Example 5. Find the value of x for which $P(x) = .97500 \quad 00000 \quad 00000$ using Table 26.1 and determining as many decimal places as is consistent with the tabulated function.

For inverse interpolation the tabulated function $P(x)$ may be regarded as having a possible error of $.5 \times 10^{-15}$. Hence

$$\Delta x \approx \frac{\Delta P(x)}{Z(x)} = \frac{.5 \times 10^{-15}}{Z(x)}$$

Let $P(x_0)$ correspond to the closest tabulated value of $P(x)$. Then a convenient formula for inverse interpolation is

$$x = x_0 + t + \frac{x_0 t^2}{2} + \frac{2x_0^2 + 1}{6} t^3$$

where

$$t = \frac{P(x) - P(x_0)}{Z(x_0)}$$

If only the first two terms (i.e., $x=x_0+t$) are used, the error in x will be bounded by $\frac{x}{8} \times 10^{-4}$ and the true value will always be greater than the value thus calculated.

With respect to this example, $\Delta x \approx 10^{-14}$ and thus the interpolated value of x may be in error by one unit in the fourteenth place. The closest value to $P(x) = .97500 \quad 00000 \quad 00000$ is $P(x_0) = .97500 \quad 21048 \quad 51780$ with $x_0=1.96$. Hence using the preceding inverse interpolation formulas with

$$t = -.00003\ 60167\ 31129$$

and carrying fifteen decimals we have the successive terms

+1.96000	00000	00000
- .00003	60167	31129
+	12	71261
-		68

Edgeworth Asymptotic Expansion

Example 6. Find the Edgeworth asymptotic expansion 26.2.49 for the c.d.f. of chi-square.

Method 1. Expansion for χ^2

Let

$$Q(\chi^2|\nu) = 1 - F(t)$$

where

$$t = \frac{\chi^2 - \nu}{(2\nu)^{1/2}}$$

Since the values of γ_1 and γ_2 26.4.33 are

$$\gamma_1 = 2\sqrt{2/\nu^3}$$

$$\gamma_2 = 12/\nu,$$

we obtain, by using the first two bracketed terms of 26.2.49

$$F(t) \sim P(t) - \frac{1}{\nu^3} \left[\frac{\sqrt{2}}{3} Z^{(2)}(t) \right] + \frac{1}{\nu} \left[\frac{1}{2} Z^{(3)}(t) + \frac{1}{9} Z^{(5)}(t) \right]$$

The Edgeworth expansion is an asymptotic expansion in terms of derivatives of the normal distribution function. It is often possible to transform a random variable so that the distribution of the transformed random variable more closely approximates the normal distribution function than does the distribution of the original random variable. Hence for the same number of terms, greater accuracy may be achieved by using the transformed variable in the expansion. Since the distribution of $\sqrt{2\chi^2}$ is more closely approximated by a normal distribution than χ^2 itself (as judged by a comparison of the values of γ_1 and γ_2), we would expect that the Edgeworth asymptotic expansion of $\sqrt{2\chi^2}$ would be superior to that of χ^2 .

Method 2. Expansion for $\sqrt{2\chi^2}$. Let

$$Q(\chi^2|\nu) = 1 - F(t) = 1 - F\left(\frac{\sqrt{2\chi^2} - (2\nu - 1)^{1/2}}{\left(1 - \frac{1}{4\nu}\right)^{1/2}}\right)$$

where $(2\nu - 1)^{1/2}$ and $1 - \frac{1}{4\nu}$ are the mean and variance to terms of order ν^{-2} of $\sqrt{2\chi^2}$ (see 26.4.34). The values of γ_1 and γ_2 for $\sqrt{2\chi^2}$ are

$$\gamma_1 \approx \frac{1}{\sqrt{2\nu}} \left[1 + \frac{5}{8\nu} \right] \quad \gamma_2 \approx \frac{3}{4\nu^2}$$

Thus we obtain

$$F(t) \sim P(t) - \frac{1}{\nu^3} \left[\frac{\sqrt{2}}{12} \left(1 + \frac{5}{8\nu} \right) Z^{(2)}(t) \right] + \frac{1}{\nu} \left[\frac{1}{32\nu} Z^{(3)}(t) + \frac{1}{144} \left(1 + \frac{5}{8\nu} \right)^2 Z^{(5)}(t) \right]$$

For numerical examples using these expansions see **Example 12.**

Calculation of $L(h, k, \rho)$

Example 7. Find $L(.5, .4, .8)$. Using 26.3.20

$$\sqrt{h^2 - 2\rho hk + k^2} = \sqrt{.09} = .3$$

$$L(.5, .4, .8) = L(.5, 0, 0) + L(.4, 0, -.6)$$

Reference to **Figure 26.2** yields

$$L(.5, 0, 0) + L(.4, 0, -.6) = .16 + .08 = .24$$

The answer to 3D is $L(.5, .4, .8) = .250$.

Calculation of the Bivariate Normal Probability Function

Example 8. Let X and Y follow a bivariate normal distribution with parameters $m_x = 3$, $m_y = 2$, $\sigma_x = 4$, $\sigma_y = 2$, and $\rho = -.125$. Find the value of $P_r\{X \geq 2, Y \geq 4\}$ using 26.3.20 and **Figures 26.2, 26.3.**

Since $P_r\{X \geq h, Y \geq k\} = L\left(\frac{h - m_x}{\sigma_x}, \frac{k - m_y}{\sigma_y}, \rho\right)$ we have $P\{X \geq 2, Y \geq 4\} = L(-.25, 1, -.125)$. Using 26.3.20

$$L(-.25, 1, -.125) = L(-.25, 0, .969) + L(1, 0, .125) - \frac{1}{2}$$

Figure 26.2 only gives values for $h > 0$, however, using the relationship 26.3.3 with $k = 0$, $L(-h, 0, \rho) = \frac{1}{2} - L(h, 0, -\rho)$ and thus $L(-.25, 0, .969) = \frac{1}{2} - L(.25, 0, -.969)$. Therefore $L(-.25, 1, -.125) = -L(.25, 0, -.969) + L(1, 0, .125) = -.01 + .09 = .08$. The answer to 3D is $L(-.25, 1, -.125) = .080$.

Integral of a Bivariate Normal Distribution Over a Polygon

Example 9. Let the random variables X and Y have a bivariate normal distribution with parameters $m_x=5$, $\sigma_x=2$, $m_y=9$, $\sigma_y=4$, and $\rho=.5$. Find the probability that the point (X, Y) be inside the triangle whose vertices are $A=(7, 8)$, $B=(9, 13)$, and $C=(2, 9)$.

When obtaining the integral of a bivariate normal distribution over a polygon, it is first necessary to use 26.3.22 in order to transform the variates so that one deals with a circular normal distribution. The polygon in the region of the transformed variables is then divided into configurations such that the integral over any selected configuration can be easily obtained. Below are listed some of the most useful configurations.

FIGURE 26.5

$$\int_{a_1}^{a_2} \int_{b_1}^{b_2} g(x, y, 0) dx dy = [P(a_2) - P(a_1)] [P(b_2) - P(b_1)]$$

FIGURE 26.6

$$\int_0^\infty \int_0^{ax} g(x, y, 0) dx dy = \frac{\arctan a}{2\pi}$$

FIGURE 26.7

$$\int_0^h \int_0^{\frac{k}{h}x} g(x, y, 0) dx dy = V(h, k)^{11}$$

¹¹ See 26.3.23 for definition of $V(h, k)$.

For the following two configurations we define

$$h = \frac{|t_2 s_1 - t_1 s_2|}{[(s_2 - s_1)^2 + (t_2 - t_1)^2]^{\frac{1}{2}}}$$

$$k_1 = \frac{|s_1(s_2 - s_1) + t_1(t_2 - t_1)|}{[(s_2 - s_1)^2 + (t_2 - t_1)^2]^{\frac{1}{2}}}$$

$$k_2 = \frac{|s_2(s_2 - s_1) + t_2(t_2 - t_1)|}{[(s_2 - s_1)^2 + (t_2 - t_1)^2]^{\frac{1}{2}}}$$

FIGURE 26.8

$$\iint_{\Delta AOB} g(x, y, 0) dx dy = V(h, k_2) - V(h, k_1)$$

FIGURE 26.9

$$\iint_{\Delta AOB} g(x, y, 0) dx dy = V(h, k_2) + V(h, k_1)$$

Using the circularizing transformation 26.3.22 for our example results in

$$s = \frac{1}{\sqrt{3}} \left(\frac{x-5}{2} + \frac{y-9}{4} \right)$$

$$t = -\frac{1}{1} \left(\frac{x-5}{2} - \frac{y-9}{4} \right)$$

The vertices of the triangle in the (s, t) coordinates become $A = (\sqrt{3}/4, -5/4)$, $B = (\sqrt{3}, -1)$ and $C = (-\sqrt{3}/2, 3/2)$. These points are plotted below. From the figure it is seen that the desired probability is the sum of the probabilities that the point having the transformed variables as coordinates is inside the triangles AOB , AOC , and BOC .

FIGURE 26.10

For these three triangles we have

	h	k_1	k_2
ΔAOB	$\frac{2}{7}\sqrt{21}$	$\sqrt{7}/14$	$\frac{4}{7}\sqrt{7}$
ΔAOC	$\frac{1}{74}\sqrt{111}$	$\frac{8}{37}\sqrt{37}$	$\frac{21}{74}\sqrt{37}$
ΔBOC	$\frac{1}{13}\sqrt{39}$	$\frac{7}{13}\sqrt{13}$	$\frac{6}{13}\sqrt{13}$

From the graph it is seen that the probability over AOB may be found in the same manner as that over Figure 26.8, and over AOC and BOC the probabilities may be found as that over Figure 26.9.

Hence

$$\begin{aligned} \iint_{\Delta} g(x, y, .5) dx dy &= \iint_{\Delta ABC} g(s, t, 0) ds dt \\ &= \iint_{\Delta AOB} g(s, t, 0) ds dt + \iint_{\Delta AOC} g(s, t, 0) ds dt \\ &\quad + \iint_{\Delta BOC} g(s, t, 0) ds dt \end{aligned}$$

and consequently using 26.3.23 and Figure 26.2

$$\begin{aligned} \iint_{\Delta AOB} g(s, t, 0) ds dt &= V\left(\frac{2}{7}\sqrt{21}, \frac{4\sqrt{7}}{7}\right) - V\left(\frac{2}{7}\sqrt{21}, \frac{\sqrt{7}}{14}\right) \\ &= \left[\frac{1}{4} + L(1.31, 0, -.76) - L(0, 0, -.76) - \frac{1}{2} Q(1.31)\right] \\ &\quad - \left[\frac{1}{4} + L(1.31, 0, -.14) - L(0, 0, -.14) - \frac{1}{2} Q(1.31)\right] \\ &= L(1.31, 0, -.76) - L(0, 0, -.76) \\ &\quad - L(1.31, 0, -.14) + L(0, 0, -.14) \\ &= .00 - .11 - .04 + .23 = .08 \end{aligned}$$

$$\begin{aligned} \iint_{\Delta AOC} g(s, t, 0) ds dt &= V\left(\frac{\sqrt{111}}{74}, \frac{8\sqrt{37}}{37}\right) + V\left(\frac{\sqrt{111}}{74}, \frac{21\sqrt{37}}{74}\right) \\ &= \left[\frac{1}{4} + L(.14, 0, -.99) - L(0, 0, -.99) - \frac{1}{2} Q(.14)\right] \\ &\quad + \left[\frac{1}{4} + L(.14, 0, -1) - L(0, 0, -1) - \frac{1}{2} Q(.14)\right] \\ &= .01 + .02 = .03 \end{aligned}$$

$$\begin{aligned} \iint_{\Delta BOC} g(s, t, 0) ds dt &= V\left(\frac{\sqrt{39}}{13}, \frac{7\sqrt{13}}{13}\right) + V\left(\frac{\sqrt{39}}{13}, \frac{6\sqrt{13}}{13}\right) \\ &= \left[\frac{1}{4} + L(.48, 0, -.97) - L(0, 0, -.97) - \frac{1}{2} Q(.48)\right] \\ &\quad + \left[\frac{1}{4} + L(.48, 0, -.96) - L(0, 0, -.96) - \frac{1}{2} Q(.48)\right] \\ &= .05 + .04 = .09 \end{aligned}$$

Thus adding all parts, the probability that X and Y are in triangle ABC is $.08 + .03 + .09 = .20$. The answer to 3D is .211.

Calculation of a Circular Normal Distribution Over an Offset Circle

Example 10. Let X and Y have a circular normal distribution with $\sigma = 1000$. Find the probability that the point (X, Y) falls within a circle having a radius equal to 540 whose center is displaced 1210 from the mean of the circular normal distribution.

In units of σ , the radius and displacement from the center are, respectively, $R = \frac{540}{1000} = .54$ and $r = \frac{1210}{1000} = 1.21$. The problem is thus reduced to finding the probability of X and Y falling in a circle of radius $R = .54$ displaced $r = 1.21$ from the center of the distribution where $\sigma = 1$.

Since $R < 1$, the approximation **26.3.25** is used. This results in

$$P(R^2|2, r^2) = \frac{2(.54)^2}{4 + (.54)^2} \exp \frac{-2(1.21)^2}{4 + (.54)^2} = (.1359)e^{-.6823} = .06869$$

The answer to 5D is .06870.

Interpolation for $Q(x^2|\nu)$

Example 11. Find $Q(25.298|20)$ using the interpolation formula given with **Table 26.7**.

Taking $x^2 = 25$, $\theta = .298$ and applying the interpolation formula results in

$$\begin{aligned} Q(25.298|20) &= \frac{1}{8} \{ Q(25|16)\theta^2 + Q(25|18)(4\theta - 2\theta^2) \\ &\quad + Q(25|20)(8 - 4\theta + \theta^2) \} \\ &= \frac{1}{8} \{ (.06982)(.088804) \\ &\quad + (.12492)(1.014392) \\ &\quad + (.20143)(6.896804) \} \\ &= .19027 \end{aligned}$$

A less accurate interpolate may be obtained by setting θ^2 equal to zero in the above formula. This results in the value .19003. The correct value to 6D is $Q(25.298|20) = .190259$.

On the other hand if $x^2 = 25.298$ is assumed to have an error of $\pm 5 \times 10^{-4}$, then how large an error arises in $Q(x^2|\nu)$? Denoting the error in x^2 by Δx^2 and the resulting error in $Q(x^2|\nu)$ by $\Delta Q(x^2|\nu)$, we then have the approximate relationship

$$\Delta Q(x^2|\nu) \approx \frac{\partial Q(x^2|\nu)}{\partial x^2} \Delta x^2$$

Using **26.4.8** we can write

$$\frac{\partial Q(x^2|\nu)}{\partial x^2} = \frac{1}{2} [Q(x^2|\nu - 2) - Q(x^2|\nu)]$$

and

$$\Delta Q(x^2|\nu) \approx \frac{1}{2} [Q(x^2|\nu - 2) - Q(x^2|\nu)] \Delta x^2$$

For practical purposes it is sufficient to evaluate the derivative to one or two significant figures. Consequently we can write

$$\frac{\partial Q(x^2|\nu)}{\partial x^2} \approx \frac{\partial Q(x_0^2|\nu)}{\partial x^2}$$

where x_0^2 is the closest value to x^2 for which Q is tabulated. Hence

$$\Delta Q(x^2|\nu) \approx \frac{1}{2} [Q(x_0^2|\nu - 2) - Q(x_0^2|\nu)] \Delta x^2$$

For this example $\Delta x^2 = \pm 5 \times 10^{-4}$ and $x_0^2 = 25$. This results in

$$\Delta Q(x^2|\nu) = \frac{1}{2} (-.076)(\pm 5)10^{-4} = \pm 2 \times 10^{-5}$$

as the possible error in $Q(x^2|\nu)$.

Calculation of $Q(x^2|\nu)$ Outside the Range of Table 26.7

Example 12. Find the value of $Q(84|72)$.

Since this value is outside the range of **Table 26.7** we can approximate $Q(84|72)$ by (1) using the Edgeworth expansion for $Q(x^2|\nu)$ given in **Example 6**, (2) the cube root approximation **26.4.14**, (3) the improved cube root approximation **26.4.15** or (4) the square root approximation **26.4.13**. The results of using all four methods are presented below:

1. Edgeworth expansion

The successive terms of the Edgeworth expansion for the distribution of chi-square result in

$$\begin{aligned} 1 - Q(84|72) &= .841345 \\ &\quad .000000 \\ &\quad .001120 \\ &\quad \hline &= .842465 \end{aligned}$$

Hence $Q(84|72) = .15754$.

The successive terms of the Edgeworth expansion for the distribution of $\sqrt{2}x^2$ result in

$$\begin{aligned} 1 - Q(84|72) &= .842544 \\ &\quad - .000034 \\ &\quad - .000138 \\ &\quad \hline &= .842372 \end{aligned}$$

Hence $Q(84|72) = .15764$.

2. Cube root approximation 26.4.14

Using the cube root approximation we have

$$Q(84|72) = Q(x)$$

where

$$x = \frac{\left(\frac{84}{72}\right)^{1/3} \left[1 - \frac{2}{9(72)}\right]}{\left[\frac{2}{9(72)}\right]^{1/3}} = 1.0046$$

This results in $Q(84|72) = Q(1.0046) = 1 - P(1.0046) = .15754$.

3. Improved cube root approximation 26.4.15

The improved cube root approximation involves calculating a correction factor h_ν to x . Linearly interpolating for h_{80} (which appears below **26.4.15**) with $x = 1.0046$ results in $h_{80} = -.0006$ and hence

$$h_{72} = \frac{60}{72}(-.0006) = -.00049$$

Thus

$$Q(84|72) = Q(1.0046 - .0005) = Q(1.0041) \\ = 1 - P(1.0041) = .15766$$

4. Square root approximation 26.4.13

Using the square root approximation we have $Q(84|72) = Q(x)$ where

$$x = \sqrt{2(84)} - \sqrt{2(72) - 1} = 1.0032.$$

This results in

$$Q(84|72) = Q(1.0032) = 1 - P(1.0032) = .15788$$

The value correct to 6D is $Q(84|72) = .157653$. Generally the improved cube root approximation will be correct with a maximum error of a few units in the fifth decimal and is recommended for calculations which are outside the range of **Table 26.7**.

Calculation of χ^2 for $Q(\chi^2|\nu)$ Outside the Range of **Table 26.8**

Example 13. Find the value of χ^2 for which $Q(\chi^2|144) = .01$.

Since $\nu = 144$ is outside the range of **Table 26.8**, we can compute it by using (1) the Cornish-Fisher asymptotic expansion **26.2.50**, for χ^2 , (2) the cube approximation **26.4.17**, (3) the improved cube approximation **26.4.18**, or (4) the square approximation **26.4.16**. We shall compute the value by all four methods.

1. Cornish-Fisher asymptotic expansion 26.2.50

The Cornish-Fisher asymptotic expansion for χ^2 with $\nu = 144$ can be written as

$$\chi^2 \sim 144 + 12\sqrt{2}x + 4h_1(x) + \frac{4\sqrt{2}}{12}[3h_2(x) + 2h_{11}(x)] \\ + \frac{8}{12^2}[6h_3(x) + 3h_{12}(x) + 2h_{111}(x)] + \frac{16\sqrt{2}}{12^3}[30h_4(x) \\ + 9h_{22}(x) + 12h_{13}(x) + 6h_{112}(x) + 4h_{1111}(x)]$$

Hence using the auxiliary table following **26.2.51** with $p = .01$ we have

144. 0000
39. 4794
2. 9413
-. 0242
-. 0019
+. 0002
χ ² = 186. 395

2. Cube approximation 26.4.17

Taking $\chi_{.01} = 2.32635$ we have

$$\chi^2 = 144 \left\{ \left[1 - \frac{2}{9(144)} \right] + (2.32635) \sqrt{\frac{2}{9(144)}} \right\}^3 = 186.405$$

3. Improved cube approximation 26.4.18

From the table for h_{60} we obtain using linear interpolation with $x = 2.33$ (approximately)

$$h_{60} = .0012 \text{ and thus } h_{144} = \frac{60}{144}(.0012) = .00049$$

Hence

$$\chi^2 = 144 \left[1 - \frac{2}{9(144)} + (2.32635 - .00049) \sqrt{\frac{2}{9(144)}} \right]^3 = 186.394$$

4. Square approximation 26.4.16

$$\chi^2 = \frac{1}{2} [2.32635 + \sqrt{2(144) - 1}]^2 = 185.616$$

The correct answer to 3D is $\chi^2 = 186.394$. Generally the improved cube approximation will give results correct in the second or third decimal for $\nu > 30$.

Calculation of the Incomplete Gamma Function

Example 14. Find the value of

$$\gamma(2.5, .9) = \int_0^0 t^{1.5} e^{-t} dt$$

making use of **26.4.19** and **Table 26.7**.

Using **26.4.19** we have

$$\gamma(2.5, .9) = \Gamma(2.5)P(1.8|5) = \Gamma(2.5)[1 - Q(1.8|5)]$$

$$\gamma(2.5, .9) = \frac{3}{4}\sqrt{\pi}[1 - .87607] = .16475$$

Poisson Distribution

Example 15. Find the value of m for which

$$\sum_{i=0}^3 e^{-m} \frac{m^i}{i!} = .99$$

using **26.4.21** and **Table 26.8**.

From **Table 26.8** with $\nu = 2c = 8$ and $Q = .99$ we have $\chi^2 = 1.646482$. Hence $m = \chi^2/2 = .823241$.

Inverse of the Incomplete Beta Function

Example 16. Find the value of x for which $I_x(10, 6) = .10$ using **Table 26.9** and **26.5.28**. * Using **26.5.28** we have

*See page II.

$$I_x(10,6) = Q(F|12,20) = .10 \text{ where } x = \frac{20}{20+12F}$$

From **Table 26.9** the upper 10 percent point of F with 12 and 20 degrees of freedom is $F=1.89$. Hence

$$x = \frac{20}{20+12(1.89)} = .469$$

The correct value to 4D is $x=.4683$.

Calculation of $I_x(a, b)$ for a or b Small Integers

Example 17. Calculate $I_{.10}(3, 20)$.

Values of $I_x(a, b)$ for small integral a or b can conveniently be calculated using **26.5.6** or **26.5.7**. Using **26.5.6** we have

$$1 - I_{.90}(20, 3) = \frac{(.9)^{20}}{B(3, 20)} \left\{ \sum_{i=0}^2 (-1)^i \binom{2}{i} \frac{.9^i}{20+i} \right\}$$

$$= \frac{.121576}{.216450 \times 10^{-3}} (.110390 \times 10^{-2}) = .620940$$

Binomial Distribution

Example 18. Find the value of p which satisfies

$$\sum_{s=0}^{20} \binom{50}{s} p^s q^{50-s} = .95, \quad q = 1 - p$$

using **26.5.24** and **Table 26.9**.

* Combining **26.5.24** and **26.5.28** we have

$$\sum_{s=a}^n \binom{n}{s} p^s q^{n-s} = Q(F|v_1, v_2)$$

where

$$v_1 = 2(n - a + 1), v_2 = 2(a), \text{ and } p = \frac{a}{a + (n - a + 1)F}$$

Hence

$$\sum_{s=0}^{20} \binom{50}{s} p^s q^{50-s} = 1 - \sum_{s=21}^{50} \binom{50}{s} p^s q^{50-s}$$

$$= 1 - Q(F|60, 42) = .95$$

Harmonic interpolation on v_2 in the table for which $Q(F|v_1, v_2) = .05$ results in $F=1.624$ for $v_1=60, v_2=42$, and thus $p = \frac{42}{42+60(1.624)} = .301$.

The correct answer to 4D is $p = .3003$.

Approximating the Incomplete Beta Function

Example 19. Find $I_{.60}(16, 10.5)$ using **26.5.21**.

Values of $I_x(a, b)$ can conveniently be calculated with good accuracy using the approximation given by **26.5.20** or **26.5.21**. For this example $(a+b-1)(1-x) = 10.20$ which is greater than .8 and hence **26.5.21** will be used. Thus

$$w_1 = [(10.5)(.60)]^{1/3} = 1.8469, w_2 = [16(.4)]^{1/3} = 1.8566$$

$$y = \frac{3[(1.8469)(.98942) - (1.8566)(.99306)]}{\left[\frac{(1.8469)^2}{10.5} + \frac{(1.8566)^2}{16} \right]^{3/2}} = -.0668$$

and interpolating in **Table 26.1** gives

$$P(-.0668) = 1 - P(.0668) = .47336$$

The answer correct to 5D is $I_{.60}(16, 10.5) = .47332$.

Interpolation for F in Table 26.9

Example 20. Find the value of F for which

$$Q(F|7, 20) = .05 \text{ using Table 26.9.}$$

Interpolation in **Table 26.9** is approximately linear when the reciprocals of the degrees of freedom (v_1, v_2) are used as the interpolating variable. For this example it is only necessary to interpolate with respect to $1/v_1$. Thus linear interpolation on $1/v_1$ results in $F=2.51$ which is the correct interpolate.

Calculation of F for $Q(F|v_1, v_2) > .50$

Example 21. Find the value of F for which $Q(F|4, 8) = .90$ using **26.6.9** and **Table 26.9**.

Table 26.9 only tabulates values of F for which $Q(F|v_1, v_2) = p$ where $p = .500, .250, .100, .050, .025, .010, .005, .001$. However making use of **Table 26.9** we can find the values of F_p for which $p = .75, .9, .95, .975, .99, .995, .999$. For this example we have

$$F_{.90}(4, 8) = \frac{1}{F_{.10}(8, 4)}$$

and referring to the table for which $Q(F|v_1, v_2) = .10$ gives $F_{.10}(8, 4) = 3.95$ and thus $F_{.90}(4, 8) = \frac{1}{3.95} = .253$.

Calculation of $Q(F|v_1, v_2)$ for Small Integral v_1 or v_2

Example 22. Compute $Q(2.5|4, 15)$ using **26.6.4**.

Values of $Q(F|v_1, v_2)$ can be readily computed for small v_1 or v_2 using the expansions **26.6.4** to **26.6.8** inclusive. We have using **26.6.4**

$$x = \frac{15}{15 + 4(2.50)} = .60$$

and

$$Q(2.50|4, 15) = (.6)^{7.5} \left[1 + \frac{15}{2} (.4) \right] = .086735$$

*See page 11.

Approximating $Q(F|\nu_1, \nu_2)$

Example 23. Calculate $Q(1.714|10, 40)$ using 26.6.15.

The approximation given by 26.6.15 will result in a maximum error of .0005. For this example we have

$$x = \frac{(1.714)^{1/3} \left(1 - \frac{2}{9(40)}\right) - \left(1 - \frac{2}{9(10)}\right)}{\left[\frac{2}{9(10)} + (1.714)^{2/3} \frac{2}{9(40)}\right]^{1/2}} = 1.2222$$

Interpolating in Table 26.1 results in

$$Q(1.714|10, 40) \approx Q(1.2222) = 1 - P(1.2222) = .1108$$

The correct value to 5D is $Q(1.714|10, 40) = .11108$.

On the other hand the approximation given by 26.6.14 which is usually less accurate results in

$$x = \frac{\sqrt{[2(40) - 1] \left(\frac{10}{40}\right) (1.714) - \sqrt{2(10) - 1}}}{\sqrt{1 + \frac{10}{40} (1.714)}} = 1.2210$$

and interpolating in Table 26.1 gives

$$Q(1.714|10, 40) \approx Q(1.2210) = 1 - P(1.2210) = .1112$$

Calculation of F Outside the Range of Table 26.9

Example 24. Find the value of F for which $Q(F|10, 20) \approx .0001$ using 26.6.16 and 26.5.22.

For this problem we have $a = \frac{\nu_2}{2} = 10$, $b = \frac{\nu_1}{2} = 5$, $p = .0001$. The value of the normal deviate which cuts off .0001 in the tail of the distribution is

$y = 3.7190$ (i.e., $Q(3.7190) = .0001$). Hence substituting in 26.5.22 gives

$$h = 2 \left[\frac{1}{19} + \frac{1}{9} \right]^{-1} = 12.2143$$

$$\lambda = \frac{3.7190^2 - 3}{6} = 1.8052$$

$$w = 3.7190 \frac{(12.2143 + 1.8052)^{1/2}}{12.2143}$$

$$- \left(\frac{1}{9} - \frac{1}{19} \right) \left[1.8052 + .8333 - \frac{2}{3(12.2143)} \right]$$

$$w = .9889$$

and thus $F \approx e^{2w} = 7.23$. The correct answer is $F = 7.180$.

Approximating the Non-Central F -Distribution

Example 25. Compute $P(3.71|3, 10, 4)$ using the approximation 26.6.27 to the non-central F -distribution.

Using 26.6.27 with $\nu_1 = 3$, $\nu_2 = 10$, $\lambda = 4$, $F' = 3.71$ we have

$$x = \frac{\left[\left(\frac{3}{3+4} \right) (3.71) \right]^{1/3} \left[1 - \frac{2}{9(10)} \right] - \left[1 - \frac{2(3+8)}{9(3+4)^2} \right]}{\left[\frac{2}{9} \frac{3+8}{(3+4)^2} + \frac{2}{9(10)} \left[\left(\frac{3}{3+4} \right) (3.71) \right]^{2/3} \right]^{1/2}} = .675$$

and interpolating in Table 26.1 gives

$$P(3.71|3, 10, 4) \approx P(.675) = .750$$

The exact answer is $P(3.71|3, 10, 4) = .745$.

Linear interpolation yields an error no greater than 5 units in the fifth decimal place.

$$Z(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}x^2} \quad P(x) = 1 - Q(x) = \int_{-\infty}^x Z(t) dt$$

28. Scales of Notation

Representation of Numbers

Any positive real number x can be uniquely represented in the scale of some integer $b > 1$ as

$$x = (A_m \dots A_1 A_0 \cdot a_{-1} a_{-2} \dots)_{(b)},$$

where every A_i and a_{-j} is one of the integers $0, 1, \dots, b-1$, not all A_i, a_{-j} are zero, and $A_m > 0$ if $x \geq 1$. There is a one-to-one correspondence between the number and the sequence

$$x = A_m b^m + \dots + A_1 b + A_0 + \sum_{j=1}^{\infty} a_{-j} b^{-j}$$

where the infinite series converges. The integer b is called the base or radix of the scale.

The sequence for x in the scale of b may terminate, i.e., $a_{-n-1} = a_{-n-2} = \dots = 0$ for some $n \geq 1$ so that

$$x = (A_m \dots A_1 A_0 \cdot a_{-1} a_{-2} \dots a_{-n})_{(b)};$$

then x is said to be a finite b -adic number.

A sequence which does not terminate may have the property that the infinite sequence a_{-1}, a_{-2}, \dots becomes periodic from a certain digit $a_{-n} (n \geq 1)$ on; according as $n=1$ or $n > 1$ the sequence is then said to be pure or mixed recurring.

A sequence which neither terminates nor recurs represents an irrational number.

General Conversion Methods

Any number can be converted from the scale of b to the scale of some integer $\bar{b} \neq b, \bar{b} > 1$, by using arithmetic operations in either the b -scale or the \bar{b} -scale. Accordingly, there are four methods of conversion, depending on whether the number to be converted is an integer or a proper fraction.

Integers $X = (A_m \dots A_1 A_0)_{(b)}$

(I) \bar{b} -scale arithmetic. Convert \bar{b} to the b -scale and define

$$X/\bar{b} = X_1 + \bar{A}'_0/\bar{b},$$

$$X_1/\bar{b} = X_2 + \bar{A}'_1/\bar{b},$$

⋮

$$X_m/\bar{b} = 0 + \bar{A}'_m/\bar{b},$$

where $\bar{A}'_0, \bar{A}'_1, \dots, \bar{A}'_m$ are the remainders and X_1, X_2, \dots, X_m the quotients (in the b -scale) where X, X_1, \dots, X_{m-1} , respectively are divided by \bar{b} in the b -scale. Then convert the remainders to the \bar{b} -scale,

$$(\bar{A}'_0)_{(\bar{b})} = \bar{A}_0, (\bar{A}'_1)_{(\bar{b})} = \bar{A}_1, \dots, (\bar{A}'_m)_{(\bar{b})} = \bar{A}_m$$

and obtain

$$X = (\bar{A}_m \dots \bar{A}_1 \bar{A}_0)_{(\bar{b})}.$$

(II) \bar{b} -scale arithmetic. Convert b and A_0, A_1, \dots, A_m to the \bar{b} -scale and define, using arithmetic operations in the \bar{b} -scale,

$$X_{m-1} = A_m \bar{b} + A_{m-1},$$

$$X_{m-2} = X_{m-1} \bar{b} + A_{m-2},$$

$$X_1 = X_2 \bar{b} + A_1,$$

then

$$X = X_1 \bar{b} + A_0.$$

Proper fractions $x = (0.a_{-1}a_{-2} \dots)_{(b)}$

To convert a proper fraction x , given to n digits in the b -scale, to the scale of $\bar{b} \neq b$ such that inverse conversion from the \bar{b} -scale may yield the same n rounded digits in the b -scale, the representation of x in the \bar{b} -scale must be obtained to \bar{n} rounded digits where \bar{n} satisfies $\bar{b}^{\bar{n}} > b^n$.

(III) \bar{b} -scale arithmetic. Convert \bar{b} to the b -scale and define

$$x\bar{b} = x_1 + \bar{a}'_{-1}$$

$$x_1\bar{b} = x_2 + \bar{a}'_{-2}$$

$$x_{\bar{n}-1}\bar{b} = x_{\bar{n}} + \bar{a}'_{-\bar{n}}$$

where $\bar{a}_{-1}, \bar{a}'_{-2}, \dots, \bar{a}_{-n}$ are the integral parts and x_1, x_2, \dots, x_n the fractional parts (in the b -scale) of the products $x\bar{b}, x_1\bar{b}, \dots, x_{n-1}\bar{b}$, respectively. Then convert the integral parts to the \bar{b} -scale,

$$(\bar{a}'_{-1})_{(\bar{b})} = \bar{a}_{-1}, (\bar{a}'_{-2})_{(\bar{b})} = \bar{a}_{-2}, \dots, (\bar{a}'_{-n})_{(\bar{b})} = \bar{a}_{-n},$$

and obtain

$$x = (0.\bar{a}_{-1}\bar{a}_{-2} \dots \bar{a}_{-n})_{(\bar{b})}.$$

(IV) \bar{b} -scale arithmetic. Convert b and $a_{-1}, a_{-2}, \dots, a_{-n}$ to the \bar{b} -scale and define, using arithmetic operations in the \bar{b} -scale,

$$x_{-n+1} = a_{-n}/b + a_{-n+1},$$

$$x_{-n+2} = x_{-n+1}/b + a_{-n+2},$$

$$x_{-1} = x_2/b + a_{-1};$$

then

$$x = x_{-1}/b.$$

Numerical Methods

The examples are restricted to the scales of 2, 8, 10 because of their importance to electronic computers.

Note that the octal scale is a power of the binary scale. In fact, an octal digit corresponds to a triplet of binary digits. Then, binary arithmetic may be used whenever a number either is to be converted to the octal scale or is given in the octal scale and is to be converted to some other scale.

Decimal	1	2	3	4	5	6	7	8	9	10
Octal	1	2	3	4	5	6	7	10	11	12
Binary	1	10	11	100	101	110	111	1 000	1 001	1 010

Example 1. Convert $X = (1369)_{(10)}$ to the octal scale. By (I) we have $b = 10, \bar{b} = 8_{(10)}$ and so, using decimal arithmetic,

$$1369/8 = 171 + 1/8,$$

$$171/8 = 21 + 3/8,$$

$$21/8 = 2 + 5/8,$$

$$2/8 = 0 + 2/8;$$

then

$$X = (2531)_{(8)}.$$

By (II) we have $b = (12)_{(8)}$ and $A_3 = 1_{(8)}, A_2 = 3_{(8)}, A_1 = 6_{(8)}, A_0 = (11)_{(8)}$. Hence, using octal arithmetic,

$$X_2 = 1 \cdot 12 + 3 = (15)_{(8)},$$

$$X_1 = 15 \cdot 12 + 6 = (210)_{(8)},$$

$$X = 210 \cdot 12 + 11 = (2531)_{(8)}.$$

Using binary arithmetic we have, by (II), $b = (1010)_{(2)}$ and $A_3 = 1_{(2)}, A_2 = (11)_{(2)}, A_1 = (110)_{(2)}, A_0 = (1001)_{(2)}$. Thus

$$X_2 = 1 \cdot 1010 + 11 = (1101)_{(2)},$$

$$X_1 = 1101 \cdot 1010 + 110 = (10 001 000)_{(2)},$$

$$X = 10 001 000 \cdot 1010 + 1001 = (10 101 011 001)_{(2)},$$

whence, on converting to the octal scale,

$$X = (2531)_{(8)}.$$

Example 2. Convert $X = (2531)_{(8)}$ to the decimal scale. By (I) we have $\bar{b} = 10 = (12)_{(8)}$ and hence, using octal arithmetic,

$$2531/12 = 210 + 11/12$$

$$210/12 = 15 + 6/12$$

$$15/12 = 1 + 3/12$$

$$1/12 = 0 + 1/12$$

Thus, converting to the decimal scale,

$$\bar{A}_0 = (11)_{(8)} = 9, \bar{A}_1 = 6_{(8)} = 6, \bar{A}_2 = 3_{(8)} = 3, \bar{A}_3 = 1,$$

and so

$$X = (1369)_{(10)}.$$

By (II) we have $\bar{b} = 10$, and the octal digits of X are unchanged in the decimal scale. Hence, using decimal arithmetic,

$$X_2 = 2 \cdot 8 + 5 = (21)_{(10)},$$

$$X_1 = 21 \cdot 8 + 3 = (171)_{(10)},$$

$$X = 171 \cdot 8 + 1 = (1369)_{(10)}.$$

Using binary arithmetic we have, by (II), $b = 8 = (1000)_{(2)}$ and $A_0 = 1, A_1 = (11)_{(2)}, A_2 = (101)_{(2)}, A_3 = (10)_{(2)}$. Then,

$$X_2 = 10 \cdot 1000 + 101 = (10 101)_{(2)},$$

$$X_1 = 10 101 \cdot 1000 + 11 = (10 101 011)_{(2)},$$

$$X = 10 101 011 \cdot 1000 + 1 = (10 101 011 001)_{(2)},$$

whence, on converting to the decimal scale,

$$X = (1369)_{(10)}.$$

Observe that in both examples above, octal arithmetic is used as an intermediate step to convert according to (II), the given number to the binary scale. If, instead, the given number is first converted to the binary scale, then binary arithmetic may be applied directly to convert, according to (I), the given number from the binary scale to the scale desired.

For example, in converting $X=(2531)_{(8)}$ to the decimal scale, we find first $X=(10101011001)_{(2)}$ and then obtain, using (I) with $\bar{b}=10=(1010)_{(2)}$,

$$\begin{aligned} 10\ 101\ 011\ 001/1010 &= 10\ 001\ 000 + 1001/1010, \\ 10\ 001\ 000/1010 &= 1101 + 110/1010, \\ 1101/1010 &= 1 + 11/1010, \\ 1/1010 &= 0 + 1/1010. \end{aligned}$$

Thus, on converting to the decimal scale,

$$\begin{aligned} A_0 &= (1001)_{(2)} = 9, \quad A_1 = (110)_{(2)} = 6, \\ A_2 &= (11)_{(2)} = 3, \quad A_3 = 1, \end{aligned}$$

whence

$$X = (1369)_{(10)}.$$

Example 3. Convert $x=(0.355)_{(10)}$ to the binary scale.

We first convert to the octal scale, using decimal arithmetic. By (III), we find with $\bar{b}=8$

$$\begin{aligned} (0.355) \cdot 8 &= 2 + 0.840, & (0.080) \cdot 8 &= 0 + 0.640 \\ (0.840) \cdot 8 &= 6 + 0.720, & (0.640) \cdot 8 &= 5 + 0.120 \\ (0.720) \cdot 8 &= 5 + 0.760, & (0.120) \cdot 8 &= 0 + 0.960 \\ (0.760) \cdot 8 &= 6 + 0.080, & (0.960) \cdot 8 &= 7 + 0.680 \end{aligned}$$

whence $x=(0.26560507 \dots)_{(8)}$. Thus, on converting to the binary scale,

$$x = (0.010\ 110\ 101\ 110\ 000\ 101\ 000\ 111 \dots)_{(2)}.$$

In order that inverse conversion of x from the binary to the decimal scale yield again x to the given number n of decimal digits, we must round x in the binary scale to at least \bar{n} digits where \bar{n} is chosen such that $2^{\bar{n}} > 10^n$. As a working rule, we may take $\bar{n} \geq \frac{10}{3}n$. Hence, to obtain $x=(0.355)_{(10)}$ by inverse conversion, x must be rounded in the binary scale to $\bar{n} \geq \frac{10}{3} \cdot 3 = 10$ digits.

Thus,

$$x = (0.010\ 110\ 110\ 0)_{(2)}.$$

To carry out the inverse conversion we can first convert to the octal scale,

$$x = (0.266)_{(8)},$$

and then apply (IV) with $b=8$, using decimal arithmetic:

$$\begin{aligned} x_{-2} &= 6/8 + 6 = 6.75, \\ x_{-1} &= 6.75/8 + 2 = 2.84375, \\ x &= 2.84375/8 = 0.355\ 46875. \end{aligned}$$

Alternatively, we can apply (III) with $\bar{b}=(1010)_{(2)}$, using binary arithmetic:

$$\begin{aligned} (0.010\ 110\ 11) \cdot 1010 &= 11 + (0.100\ 011\ 1), \\ (0.100\ 011\ 1) \cdot 1010 &= 101 + (0.100\ 011), \\ (0.100\ 011) \cdot 1010 &= 101 + (0.011\ 11), \\ (0.011\ 11) \cdot 1010 &= 100 + (0.101\ 1). \end{aligned}$$

Converting the integral parts to the decimal scale, we find

$$\begin{aligned} \bar{a}_{-1} &= (11)_{(2)} = 3, \quad \bar{a}_{-2} = \bar{a}_{-3} = (101)_{(2)} = 5, \\ \bar{a}_{-4} &= (100)_{(2)} = 4, \end{aligned}$$

and thus

$$x = (0.3554)_{(10)}$$

Note that the fractional part in any step is the unconverted remainder. Thus, to round at any step, it is only necessary to ascertain whether the unconverted portion to be neglected is greater or less than $\frac{1}{2}$; i.e., whether, in the binary scale, the first neglected digit is 1 or 0.

Example 4. Convert $x=(3.141593)_{(10)} \cdot 10^{-9}$ to the binary scale.

The desired representation is

$$x = (1.a_{-1}a_{-2} \dots a_{-n})_{(2)} \cdot 2^{-k}$$

where n and k are such that inverse conversion from the binary scale to the decimal scale will produce x to the same given 15 decimal digits. Accordingly, by the rule stated in **Example 3**, n and k are to be chosen so as to satisfy $n+k \geq \frac{10}{3} \cdot 15 = 50$.

From **Table 28.1** we find

$$2^{-29} < (3.141593)_{(10)} \cdot 10^{-9} < 2^{-28}$$

Thus, we must take $k=29$ and, consequently, choose $n > 21$. The conversion on a desk calculator thus proceeds as follows. First, we obtain by use of **Table 28.1**

$$2^{29}x = (1.686\ 629\ 899)_{(10)}$$

Then, for convenience's sake, we convert this number to the octal scale, using the method of **Example 3** and rounding as required, to at least 7 octal (=21 binary) digits. We find

$$2^{29}x = (1.537\ 4337)_{(8)}.$$

Hence

$$x = (1.537\ 433\ 7)_{(8)} \cdot 2^{-29}$$

and, consequently,

$$x = (1.\ 101\ 011\ 111\ 100\ 011\ 011\ 111)_{(2)} \cdot 2^{-29}.$$

To convert x back to the decimal scale we only need to obtain from **Table 28.1** the various powers of 2 which appear in the above representation and sum them. However, since $2^{-m} = 2^{-m+1} - 2^{-m}$ for any real constant m , it is more convenient to reduce first the binary representation of x to the form

$$x = 2^{-28} - 2^{-31} - 2^{-33} - 2^{-39} + 2^{-42} - 2^{-45} - 2^{-50}$$

and then sum these powers of 2. (Note that the number of summands is thereby decreased from 16 to 7.) From **Table 28.1** we have

+2 ⁻²⁸ =	+3.725	290	298	·10 ⁻⁹
-2 ⁻³¹ =	.465	661	287	·10 ⁻⁹
-2 ⁻³³ =	.116	415	322	·10 ⁻⁹
-2 ⁻³⁹ =	.001	818	989	·10 ⁻⁹
+2 ⁻⁴² =	.000	227	374	·10 ⁻⁹
-2 ⁻⁴⁵ =	.000	028	422	·10 ⁻⁹
-2 ⁻⁵⁰ =	.000	000	888	·10 ⁻⁹
$x =$	3.141	592	764	·10 ⁻⁹

Nine decimal digits are used for sufficient accuracy reserve. Hence, rounding to seven significant figures, we find

$$x = (3.141593)_{(10)} \cdot 10^{-9}$$

To convert a number such as

$$x = (\xi)_{(10)} \cdot 10^k$$

to the binary scale, where k is a positive integer so large that **Table 28.1** cannot be used, apply the following device: Compute

$$\log_2 x = \frac{\log_{10} x}{\log_{10} 2} = k + \frac{x_1}{\log_{10} 2}$$

where k is the quotient and x_1 the remainder, the division being carried out in the decimal scale. Then find $\eta = 10^{x_1}$, i.e., $x_1 = \log_{10} \eta$, so that

$$\log_2 x = k + \frac{\log_{10} \eta}{\log_{10} 2} = k + \log_2 \eta$$

whence

$$x = (\eta)_{(10)} 2^k$$

Now convert $(\eta)_{(10)}$ to the binary scale by any of the methods described above.

A similar device may be used to convert to the decimal scale a binary number that is outside the range of **Table 28.1**.

Example 5. Convert $x = (2.773)_{(10)} \cdot 10^{83}$ to the binary scale.

We first compute, using **4.1.19** and **Table 4.1**,

$$\log_2 x = \frac{\log_{10} x}{\log_{10} 2} = \frac{83.44295}{.30103} = 277 + \frac{.05764}{.30103},$$

and find from **Table 4.1**, $.05764 = \log_{10} 1.1419$. Hence

$$\log_2 x = 277 + \frac{\log_{10} 1.1419}{\log_{10} 2} = 277 + \log_2 1.1419$$

and so

$$x = (1.1419)_{(10)} \cdot 2^{277}$$

Now we apply the methods of **Example 3** to obtain $(1.1419)_{(10)} = (1.110516)_{(8)}$ where octal notation is used for the sake of convenience.

To round such that inverse conversion will yield the same decimal digits of x , observe that the last non-zero decimal digit of x is $3 \cdot 10^{80}$. **Table 28.4** shows that $2^{265} < 10^{80} < 2^{266}$. Hence, in the binary scale, x must be a binary integer times 2^{265} ; i.e., $(1.110516)_{(8)}$ must be rounded to 4 octal (=12 binary) digits. As a result,

$$\begin{aligned} x &= (1.1105)_{(8)} \cdot 2^{277} = (11105)_{(8)} \cdot 2^{265} \\ &= (1\ 001\ 001\ 000\ 101)_{(2)} 2^{265} \end{aligned}$$

Conversion back to the decimal scale proceeds as follows, we write

$$\begin{aligned} \log_{10} x &= \log_{10} 2 \log_2 x \\ &= \log_{10} 2 \{ 265 + \log_2 (11105)_{(8)} \} \\ &= \log_{10} 2 \left\{ 265 + \frac{\log_{10} (11105)_{(8)}}{\log_{10} 2} \right\} \\ &= 265 \log_{10} 2 + \log_{10} (11105)_{(8)}. \end{aligned}$$

Hence, converting $(11105)_{(8)}$ to the decimal scale by any of the methods of **Example 2**, we obtain

$$\log_{10} x = 265 \log_{10} 2 + \log_{10} 4677$$

which yields, using **Table 4.1**

$$\log_{10} x = 83.44292$$

Thus, by **Table 4.1**, we find, rounded to four significant figures,

$$x = (2.773)_{(10)} \cdot 10^{83}$$

29. Laplace Transforms

29.1. Definition of the Laplace Transform

One-dimensional Laplace Transform

29.1.1 $f(s) = \mathcal{L}\{F(t)\} = \int_0^{\infty} e^{-st} F(t) dt$

$F(t)$ is a function of the real variable t and s is a complex variable. $F(t)$ is called the original function and $f(s)$ is called the image function. If the integral in 29.1.1 converges for a real $s = s_0$, i.e.,

$$\lim_{\substack{A \rightarrow 0 \\ B \rightarrow \infty}} \int_A^B e^{-st} F(t) dt$$

exists, then it converges for all s with $\Re s > s_0$, and the image function is a single valued analytic

function of s in the half-plane $\Re s > s_0$.

Two-dimensional Laplace Transform

29.1.2 $f(u, v) = \mathcal{L}\{F(x, y)\} = \int_0^{\infty} \int_0^{\infty} e^{-ux - vy} F(x, y) dx dy$

Definition of the Unit Step Function

29.1.3
$$u(t) = \begin{cases} 0 & (t < 0) \\ \frac{1}{2} & (t = 0) \\ 1 & (t > 0) \end{cases}$$

In the following tables the factor $u(t)$ is to be understood as multiplying the original function $F(t)$.

For the definition of the Laplace-Stieltjes transform see [29.7]. In practice, Laplace-Stieltjes transforms are often written as ordinary Laplace transforms involving Dirac's delta function $\delta(t)$. This "function" may formally be considered as

the derivative of the unit step function, $du(t)=\delta(t)dt$, so that $\int_{-\infty}^x du(t) = \int_{-\infty}^x \delta(t)dt = \begin{cases} 0 & (x<0) \\ 1 & (x>0). \end{cases}$ The correspondence 29.4.2, for instance, then assumes the form $e^{-ks} = \int_0^\infty e^{-st}\delta(t-k)dt$.
