# Before You Begin Part I

The puzzles in Part I have been composed to resemble short whodunits. Each puzzle contains some "clues" and it is up to the reader, as "detective," to determine from these "clues" which of the various "suspects" is the "culprit."

The general method for solving these puzzles is as follows:
The question presented at the end of each puzzle contains a condition that must be satisfied by the solution. For example, "Who does not stand guard with Ida?" contains the condition "does not stand guard with Ida."

The "clues," numbered when there are more than one, also contain conditions; these conditions concern the various "suspects." The "detective" must use all of the conditions to determine the unique "culprit" that satisfies the condition contained in the question.

Read each of the puzzles through carefully and try to find the best way to approach it. If you don't know where to start, turn the page and read the hints provided to set you on the right track. These hints are (a) a Solution Scheme, for the reader who needs help in relating the puzzle to its solution, and (b) an Orientation, where it is needed, for the reader who needs help in interpreting the "clues." In addition, each of the first two puzzles is accompanied by a Discussion on how to solve it

Possibly the most useful section for learning to solve logic puzzles successfully is found in the Solutions section in the back of Part I. As you complete a puzzle (or fail to answer it) and read the solution, follow the logical steps which were used to reach the conclusion provided. If you can follow the reasoning which eliminates the impossible choices until only the correct solution remains, then you will acquire the mastery needed to tackle any problem of logical deduction.

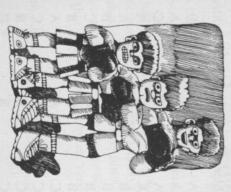

## The Fight

Two of Anthony, Bernard, and Charles are fighting each other.

- [1] The shorter of Anthony and Bernard is the older of the two fighters.
- 2] The younger of Bernard and Charles is the shorter of the two fighters.
- [3] The taller of Anthony and Charles is the younger of the two fighters.

Who is not fighting?

Solution Scheme and Discussion, page 8; Solution, page 92.

#### The Fight

### SOLUTION SCHEME

Make a chart for yourself as follows:

0
der
figh
ter
Yo
gun
er
figh
ter
Ta
ller
fig
hte
50
hor
7
er
er figi
Older fighter Younger fighter Taller fighter Shorter fighter

Write "Anthony," "Bernard," or "Charles" in each box so that no condition is contradicted.

#### DISCUSSION

One could begin to solve this puzzle by making a table with headings as shown in the Solution Scheme and then by writing "A" (for Anthony), "B" (for Bernard), and "C" (for Charles) in as many ways as possible in the table like this:

XII	XI	×	IX	VIII	VII	\ <u>\</u>	<	IV	H	=	-	Case
C	C	C	C	В	В	В	В	A	A	A	Α	Older fighter
В	В	<b>A</b>	A	n	C	A	A	C	С	В	В	Younger fighter
0	В	C	>	В	C	B	A	A	C	<b>A</b>	В	Taller fighter
В	C	A	C	C	В	A	В	0	A	В	A	Shorter fighter.

The next step would be to try to eliminate some cases using each of [1], [2], and [3] in turn: [1] explicitly eliminates cases II and VI, [2] explicitly eliminates cases VII and XI, and [3] explicitly eliminates cases IV and X. Now what? The person who is not fighting can still be either Anthony, Bernard, or Charles.

To get closer to the solution one must discover some *implied* conditions. From [1] it can be implied that Charles is not the older fighter, from [2] it can be implied that Anthony is not the shorter fighter, and from [3] it can be implied that Bernard is not the younger fighter. So [1] eliminates cases IX, X, XI, and XII; [2] eliminates cases I, III, VI, and X; and [3] eliminates cases I, II, XI, and XII.

So, from the earlier explicit conditions and the later implied conditions, the only remaining cases are V and VIII. Now what? The person who is not fighting can still be either Charles or Anthony.

To finally get to the solution, the relative heights of pairs of men can be compared from each of [1], [2], and [3] in turn for each of cases V and VIII. In one of these cases an impossible situation arises, namely, one man is both taller and shorter than another; so the case can be eliminated. From the one case remaining, the person who is not fighting can be determined.

The method just described is a tedious way to go about solving the puzzle because all the cases, twelve in number, are listed. Try to eliminate as many cases as possible before listing those remaining cases which involve more extended reasoning, but be careful that the list contains all those cases not yet eliminated.

See solution on page 92.

# My Secret Word

One of the words listed below is my secret word.

AIM DUE MOD OAT TIE

With this list in front of you, if I were to tell you any one letter of my secret word, then you would be able to tell me the number of vowels in my secret word.

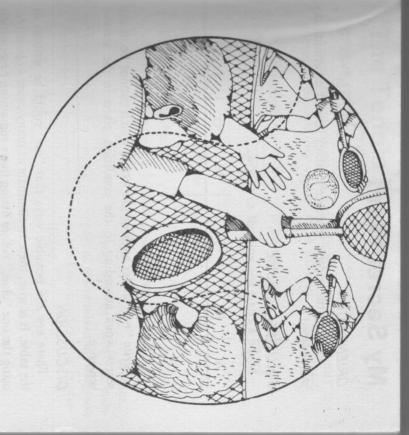

Which word is my secret word?

Orientation, Solution Scheme and Discussion, page 12; Solution, page 93.

# The Tennis Players

Zita, her brother, her daughter, and her son are tennis players. As a game of doubles is about to begin:

- [1] Zita's brother is directly across the net from her daughter.
- [2] Her son is diagonally across the net from the worst player's sibling.

[3] The best player and the worst player are on the same side of the net.

Who is the best player?

Orientation and Solution
Scheme, page 13;
Solution, page 93.

## My Secret Word

#### ORIENTATION

secret word. "Any" in the second sentence enables you to determine my

### SOLUTION SCHEME

Make a chart for yourself as follows:

	146
	-
	1
	02415

secret word according to the condition given in the second Write "no" under each of the letters which cannot be in my

#### DISCUSSION

one case need be listed. involve more extended reasoning. Indeed, it turns out that only using the one "clue," before listing those remaining cases which the table. It is wise, then, to eliminate as many cases as possible, There are 256 possible ways that "no" could be written in

AIM which has two vowels and in MOD which has only one So M, for example, cannot be in my secret word because it is in is contained only in words having the same number of vowels. other words, the "clue" says that each letter of my secret word The Orientation tells the reader how to use the "clue." In

See solution on page 93.

# The Tennis Players

#### ORIENTATION

identical, though they appear to be different at first glance. Certain arrangements of four players on a tennis court are

For example, W X is identical to Y Z

because a rotation of one arrangement results in the other.

### SOLUTION SCHEME

Make a diagram for yourself as follows:

so that no condition is contrapart of the tennis-court diagram "daughter," or "son" in each dicted. Write "Zita," "brother,"

# After-Dinner Drink

Abigail, Bridget, and Claudia often eat dinner out.

- [1] Each orders either coffee or tea after dinner.
- [2] If Abigail orders coffee, then Bridget orders the drink that Claudia orders.
- [3] If Bridget orders coffee, then Abigail orders the drink that Claudia doesn't order.
- [4] If Claudia orders tea, then Abigail orders the drink that Bridget orders.

Who do you know always orders the same drink after dinner?

Orientation and Solution Scheme, page 16;
Solution, page 94.

## **Equal Sums**

D E F G

Each of the digits 1, 2, 3, 4, 5, 6, 7, 8, and 9 is:

- [1] Represented by a different letter in the figure above.
- [2] Positioned in the figure above so that each of A+B+C, C+D+E, E+F+G, and G+H+I is equal to 13.

Which digit does E represent?

Orientation and Solution Scheme, page 17; Solution, page 95.

# After-Dinner Drink

#### ORIENTATION

From "If X orders milk, then Y orders milk" and "X orders milk," the only possible conclusion is "Y orders milk." From "If X orders milk, then Y orders milk" and "Y orders milk," more than one conclusion is possible: either "X orders milk" or "X does not order milk."

### SOLUTION SCHEME

Make a chart for yourself as follows:

Write "coffee" or "tea" in each box in as many ways as possible—crossing off any unused boxes—so that no condition is contradicted.

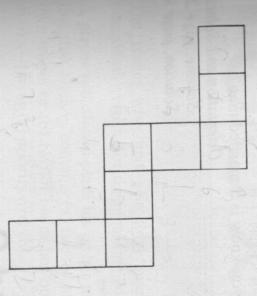

## **Equal Sums**

#### ORIENTATION

A, B, C, and D are respectively and simultaneously interchangeable with I, H, G, and F; only E can be determined with certainty. Each of A, B, D, F, H, and I occurs in only one num; each of C, E, and G occurs in two sums.

#### SOLUTION SCHEME

Make a diagram for yourself as follows:

Write a digit in each box so that no condition is contradicted.

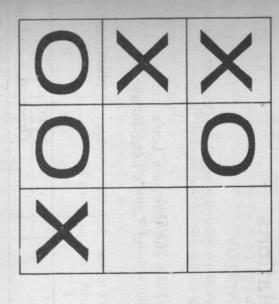

## Relations

Lee, Dale, and Terry are related to each other.

- [1] Among the three are Lee's legal spouse, Dale's sibling, and Terry's sister-in-law.
- [2] Lee's legal spouse and Dale's sibling are of the same sex.

Who do you know is a married man?

Orientation and Solution
Scheme, page 20;
Solution, page 95.

- [2] The player who first gets three marks in a horizontal, vertical, or diagonal line wins.
- [3] A player will always place his or her mark in a line that already contains (a) two of his or her own marks or (b) two of his or her opponent's marks—giving (a) priority over (b).

Only the last mark to be placed in the game shown above is not given.

Which mark—X or O—wins the game?

Orientation and Solution Scheme, page 21; Solution, page 96.

### X and O

The game of Tic-tac-toe is played in a large square divided into nine small squares.

[1] Each of two players in turn places his or her mark—usually X or O—in a small square.

#### Relations

#### ORIENTATION

A person's sister-in-law may be the sister of that person's spouse or the wife of that person's brother.

### SOLUTION SCHEME

Make a chart for yourself as follows:

Lee's spouse Sex M F
Dale's sibling Sex M F
Terry's sister-in-law Sex M

Write "Lee," "Dale," or "Terry" in each box and indicate the sex of each person so that no condition is contradicted.

#### X and O

#### ORIENTATION

To determine which mark is the seventh mark to be placed in the game, you must determine which mark was the sixth mark placed in the game.

### SOLUTION SCHEME

For convenience in discussing the puzzle, the squares can be numbered as follows:

7	4	1
8	5	2
9	6	3

Make a chart for yourself as follows:

The sixth mark placed in the game was in square number:
The sixth mark placed in the game was in square number:  number:

Write the number of a square in each box so that no condition is contradicted.

Hint: "1" in the first box contradicts [3] because the X as a sixth mark would have been placed in square 5.

#### Names

Miss Alden, Miss Brent, Miss Clark, Miss Doyle, and Miss Evans have short first and middle names.

- [1] Four of them have a first or middle name of Fay, three of them have a first or middle name of Gay, two of them have a first or middle name of Kay, and one of them has a first or middle name of May.
- [2] Either Miss Alden and Miss Brent are both named Kay or Miss Clark and Miss Doyle are both named Kay.
- [3] Of Miss Brent and Miss Clark, either both are named Gay or neither is named Gay.
- [4] Miss Doyle and Miss Evans are not both named Fay.

Who is named May?

Solution Scheme, page 24; Solution, page 97.

# **Hockey Scores**

The Angoras, the Bobcats, and the Cougars are hockey teams. In three games the Angoras played against the Bobcats, the Bobcats played against the Cougars, and the Angoras played against the Cougars.

- (II) The three final scores of the games consisted of the numbers 1, 2, 3, 4, 5, and 6.
- [2] The difference between the Angoras' higher score and the Bobcats' higher score was one more than the difference between the Bobcats' lower score and the Cougars' lower score.
- [3] The highest total of a team's two scores was achieved by the team that lost the greatest number of games.

Which team achieved the highest total of its two scores?

Solution Scheme, page 25; Solution, page 98.

# Names Services

### SOLUTION SCHEME

Make a chart for yourself as follows:

Alden	Brent	Clark	Doyle	Evans

Write "Fay," "Gay," "Kay," or "May" in each box so that no condition is contradicted.

## **Hockey Scores**

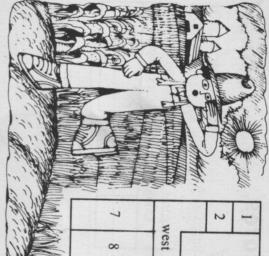

### SOLUTION SCHEME

Make a chart for yourself as follows:

Angoras versus Bobcats
Angoras versus Cougars
Bobcat

Bobcats versus Cougars

Write "1," "2," "3," "4," "5," or "6" in each box so that no condition is contradicted.

# west south 10 south 9 11 12

# The Journey

The plan above shows an arrangement of corn, wheat, and rye fields. Jack is in the middle of one of the fields and has to meet his father in the middle of another field. On his journey from the field he is in to the field his father is in:

- [1] His route takes him continuously through each of five other fields exactly once.
- [2] He (being allergic to rye) avoids going through any part of a rye field.
- [3] He notices no two fields of the same kind border on each other.

Which L-shaped field—east, west, or south—is a rye field?

Orientation and Solution Scheme, page 28; Solution, page 98.

## The Visits

Alma, Bess, Cleo, and Dina visited Edna on Saturday.

[1] The time of each visit was as follows:

Alma at 8 o'clock, Bess at 9 o'clock, Cleo at 10 o'clock, and Dina at 11 o'clock.

- [2] At least one woman visited Edna between Alma and Bess.
- [3] Alma did not visit Edna before both Cleo and Dina.
- [4] Cleo did not visit Edna between Bess and Dina.

Who visited Edna last?

Orientation and Solution Scheme, page 29; Solution, page 99.

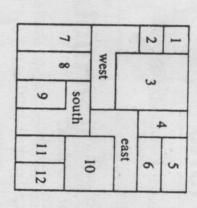

## The Journey

#### ORIENTATION

The total number of fields involved in Jack's journey is seven.

### SOLUTION SCHEME

Make a diagram for yourself as follows:

Assign each field to one of three arbitrary groups by marking like fields with one of three symbols. Find a route involving seven fields and marked with only two kinds of symbols.

#### The Visits

#### ORIENTATION

Each time mentioned may be either A.M. or P.M.

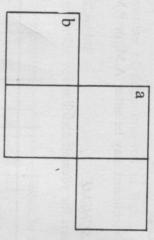

### SOLUTION SCHEME

Make a chart for yourself as follows:

Write "Alma," "Bess," "Cleo," and "Dina" in some order along the top of the chart and the corresponding visiting times—"8," "9," "10," and "11"—below so that no condition to condition and the contradicted.

# A Different Age

The ages of Ambrose, Brandon, and Chester can be related to the diagram above so that when just one digit is written in each box:

- [1] a across is Ambrose's age in years.
- [2] a down is the sum of Ambrose's age and Brandon's age in years.
- [3] b across is the sum of Ambrose's age, Brandon's age, and Chester's age in years.
- [4] Two of Ambrose, Brandon, and Chester are the same age in years.

Who is a different age in years from the other two?

Orientation and Solution
Scheme, page 32;
Solution, page 100.

# The Doctor and the Lawyer

One of Mr. Horton, his wife, their son, and Mr. Horton's mother is a doctor and another is a lawyer.

- [1] If the doctor is younger than the lawyer, then the doctor and the lawyer are not blood relatives.
- 2) If the doctor is a woman, then the doctor and the lawyer are blood relatives.
- [3] If the lawyer is a man, then the doctor is a man.

Whose occupation do you know?

Orientation and Solution Scheme, page 33; Solution, page 101.

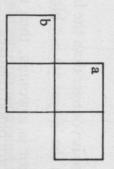

## A Different Age

#### ORIENTATION

The diagram is read like a standard crossword puzzle There are many ways to complete the diagram.

### SOLUTION SCHEME

Make a diagram for yourself as follows:

Write one digit in each box so that no condition is contradicted.

# The Doctor and the Lawyer

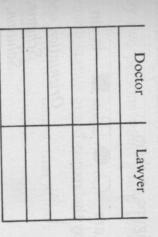

#### ORIENTATION

In each numbered true statement:

Any assumption (an if part of a statement) that makes a conclusion (a then part of a statement) false must be a false mumption; any assumption that does not make a conclusion like may be true or false. "Doctor" and "lawyer" are placeholders for two unknown people; when a conclusion becomes false after substituting an ordered pair of people for "doctor" and "lawyer," the ordered pair must be the wrong

#### SOLUTION SCHEME

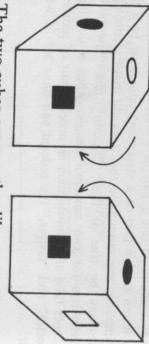

Make a chart for yourself as follows:

Write "Mr. Horton," "wife," "son," or "mother" in each hox in as many ways as possible—crossing off any unused hoxes—so that no condition is contradicted.

# The Two Cubes

Here is a picture of two cubes:

- [1] The two cubes are exactly alike.
- [2] The hidden faces indicated by the arrows have the same figure on them.

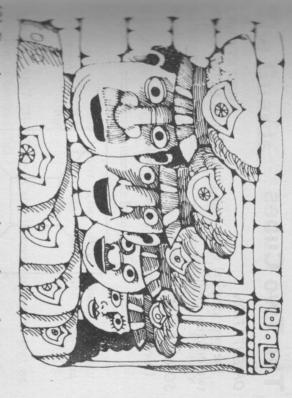

Which figure—○, ●, □, or ■—is on the faces indicated by the arrows?

Orientation and Solution Scheme, page 36; Solution, page 101.

## The Guards

Art, Bob, Cab, and Ida are guards in a museum.

[1] Each of Art, Bob, and Cab stands guard on exactly four days every week.

- [2] Exactly two persons stand guard together every day.
- [1] No person stands guard three days in a row.
- [4] Here is a partial listing that shows when they stand guard every week:

Bob	Art	Sun
?	Cab	Mon
?	Ida	Tues
?	Art	Wed
?	Bob	Thurs
?	Cab	Fri
	Ida	Sat

Who does not stand guard with Ida?

Orientation and Solution Scheme, page 37; Solution, page 102.

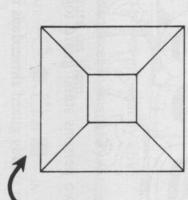

## The Two Cubes

#### ORIENTATION

The two identical cubes may be thought of as one cube in two different positions.

### SOLUTION SCHEME

Draw a multiview cube as shown below.

Place ○, ●, □, or ■
on each face of this multiview
cube and at the arrow (to
indicate the only face not seen)
so that no condition is contradicted.

### The Guards

#### ORIENTATION

"Three days in a row" applies to any sequence of three days including (a) Friday, Saturday, and Sunday and (b) Saturday, sunday, and Monday.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

0	puard	
Bob	Art	Sun
,	Cab	Mon
?	Ida	Tues
?	Art	Wed
		Thurs
?	Cab	Fri
?	Ida	Sat

Write "Art," "Bob," or "Cab" in each column so that no condition is contradicted.

### **Brothers**

Amos, Bert, and Clem are brothers.

- [1] Amos has exactly two brothers with grey eyes.
- [2] Bert has exactly two brothers with grey or hazel
- [3] Clem has exactly two brothers who do not have
- [4] At least one of the three has hazel eyes and at least one of the three has blue eyes.

Whose eyes do you know the color of?

Orientation and Solution Solution, page 103. Scheme, page 40;

# **Equal Products**

9 H

Each of seven digits from 0, 1, 2, 3, 4, 5, 6, 7, 8, and

- III Represented by a different letter in the figure
- Positioned in the figure above so that  $A \times B \times C$ ,  $B \times G \times E$ , and  $D \times E \times F$  are equal.

Which digit does G represent?

Orientation and Solution Solution, page 104. Scheme, page 41;

#### **Brothers**

#### ORIENTATION

The total number of brothers is not given.

### SOLUTION SCHEME

Make a chart for yourself as follows:

		Amos	ЕУ
		Bert	Eye color of
		Clem	IC

Write "grey," "hazel," or "blue" in each box in as many ways as possible—crossing off any unused boxes—so that no condition is contradicted.

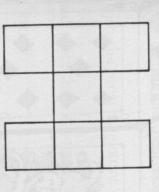

## **Equal Products**

#### ORIENTATION

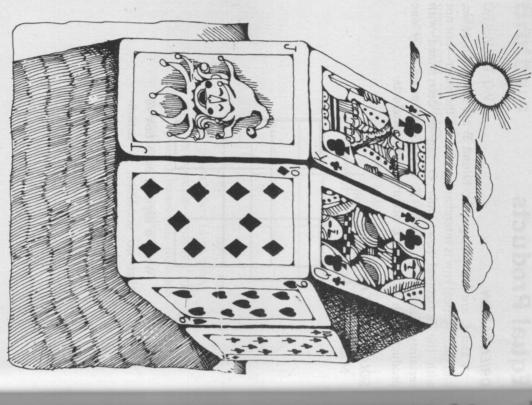

A and C are interchangeable, D and F are interchangeable, and each vertical row is interchangeable with the other—but not with the horizontal row; only G can be determined with not mentanty. Each of A, C, D, F, and G occurs in only one moduct; each of B and E occurs in two products.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Write a digit in each box so that no condition is contradicted.

## The Joker

A total of 21 cards consisting of 4 kings, 4 queens, 1 lacks, 4 tens, 4 nines, and 1 joker were dealt to Alce, Bill, and Carl. Then all jacks, tens, and nines were discarded. At that point:

- The combined hands consisted of 4 kings, 4 queens, and I joker.
- Alec had 2 cards, Bill had 3 cards, and Carl had 4 cards.

The man with the most singletons did not have

M No man had more than 2 kings.

Who had the joker?

Orientation and Solution Scheme, page 44; Solution, page 105.

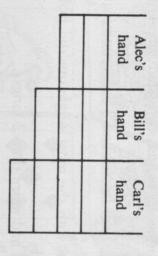

#### The Joker

#### ORIENTATION

A hand contains a singleton when it contains only one king or only one queen or the joker.

### SOLUTION SCHEME

Make a chart for yourself as follows:

condition is contradicted.

Identify the cards in each person's hand so that no

Cards:

4 kings

4 queens 1 joker

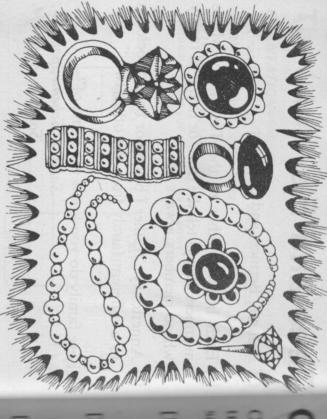

# Tees and Els

- Of Annette, Bernice, and Cynthia:
- [1] Each belongs either to the Tee family whose members always tell the truth or to the El family whose members always lie.
- [2] Annette says "Either I belong or Bernice belongs to a different family from the other two."

Whose family do you know the name of?

Solution Scheme, page 46;

Solution, page 104.

## Tees and Els

SOLUTION SCHEME

Make a chart for yourself as follows:

false	true	If Annette's statement is
		Then Annette belongs to the
		And then Bernice and Cynthia, respectively, may belong to the

Write "Tee family" or "El family" in each box in the first column and "Tee family" or "El family" in as many ordered pairs as possible in each box in the second column so that no condition is contradicted.

# **Outre Ornaments**

Outre Ornaments, Inc. sells baubles, gewgaws, and unkets; while there I spoke to three different unlespeople.

- baubles together with any 5 gewgaws have the same value as any 6 trinkets.
- The second salesperson I talked to told me any 4 baubles together with any 9 trinkets have the same value as any 5 gewgaws.
- The third salesperson I talked to told me any 6 trinkets together with any 3 gewgaws have the same value as any 4 baubles.
- When I bought some of each kind of ornament I found out exactly one of these salespersons was wrong.

Which salesperson was wrong?

Orientation and Solution Scheme, page 48; Solution, page 106.

# **Outre Ornaments**

#### ORIENTATION

The three value equivalents given must be considered in pairs to determine which one value equivalent is false. The false value equivalent leads to two derived value equivalents that are impossible; the two true value equivalents lead to one derived value equivalent that is not impossible.

### SOLUTION SCHEME

Make a chart for yourself as follows:

[3] and [1]	[2] and [3]	[1] and [2]	Conditions
	together with		imply
value as	same	have	

Complete the table with numbers of baubles, gewgaws, and inkets.

## The Widow

Hour women—Anna, Beth, Cass, and Dora—and three men—Earl, Fred, and Gene—play bridge, a unid game for four players.

- [1] The men and women consist of three married couples and a widow.
- purtners in a bridge game.
- [1] No more than one married couple ever plays in the same bridge game.
- (I) One night they played four bridge games in which the partners were as follows:

Anna and Earl versus Beth and Fred
Anna and Gene versus Dora and Fred
Beth and Cass versus Fred and Gene
Cass and Earl versus Dora and Gene

Who is the widow?

Solution Scheme, page 50, Solution, page 106

### The Widow

### SOLUTION SCHEME

Make a chart for yourself as follows:

	Anna	Beth	Cass	Dora
Earl				
Fred				1
Gene	371. 0100	Tieri co		

Place an "X" in each of three boxes to show the three married couples that do not contradict the conditions.

# Yes, Yes, Yes

Here is a list of words:

HOE OAR PAD TOE VAT

- III Each of three logicians was told one letter of a certain word, so that each logician knew only one of the letters and so that no two logicians knew the same letter.
- [2] The logicians were then told their three letters could be arranged to spell one of the words in the list above.
- know which word the letters spell?," first one logician answered "Yes," then another logician answered "Yes," and then the remaining logician answered "Yes."

Which word did the letters spell?

Orientation and Solution Scheme, page 52; Solution, page 107.

## Yes, Yes, Yes

#### ORIENTATION

The second logician used the first logician's answer to the question to answer the question, and the third logician used the first and second logicians' answers to the question to answer the question.

### SOLUTION SCHEME

Make a chart for yourself as follows:

	>	D	E	H	E H O P R T V	P	R	T	
The first logician's letter may be									100000000000000000000000000000000000000
The second logician's letter may be									
The third logician's letter may be									

Put a check in any column that contains a possible letter each logician may have been told—first in the top row, then in the middle row, and then in the bottom row—so that no condition is contradicted.

Hint: The first logician's letter could not be E since this would contradict [3].

# **Speaking of Children**

"We—Aaron, Brian, and Clyde—each have some ohildren.

- (I) Aaron has at least one girl and twice as many boys as girls.
- Brian has at least one girl and three times as many boys as girls.
- (I) Clyde has at least one girl and three more boys than girls.
- Mhen I tell you the number of children we have altogether—a number less than 25—you will know how many children I have, but not how many children each of the others has. Altogether we have . . ."

Who is the speaker?

Orientation and Solution Scheme, page 54; Solution, page 108.

# Speaking of Children

#### ORIENTATION

Some trial and error is necessary in solving this puzzle.

### SOLUTION SCHEME

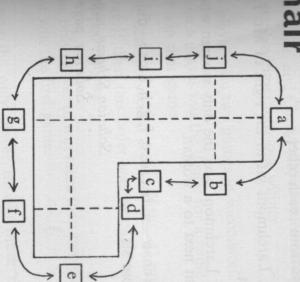

Make a chart for yourself as follows:

Total number of children: \_\_\_\_\_\_Possible numbers of children had by:

		Aaron
		Brian
		Clyde

Write a number in the blank and three numbers in each row of the table in as many ways as possible—crossing off any unused boxes—so that no condition is contradicted.

# Mrs. Larchmont's

Mrs. and Mr. Larchmont invited four married couples to a dinner party. For the party, chairs were placed around an L-shaped table as shown in the diagram.

Mrs. Larchmont arranged the seating so that:

the ends of a two-headed arrow are "next to" each other.)

(continued)

- [2] Every woman sat directly across from a man. Card Games across from" each other.) (Chairs at the ends of a dashed line are "directly
- [3] Mrs. Larchmont sat to the right of Mr. Larchmont.
- [4] Mrs. Larchmont was the only woman who did not sit next to a woman.

Larchmont sit? In which chair—a, b, c, d, e, f, g, h, i, or j—did Mrs.

Solution Scheme, page 58, Solution, page 109.

much game having exactly one winner. Allilian, Blythe, and Cheryl played some card games,

- III No player won two games in succession. When a player was the dealer for a game she did not win that game.
- The deal proceeded from Althea to Blythe to Cheryl; then this order was repeated until they stopped playing.
- In The only player to win more than two games did not win the first game.

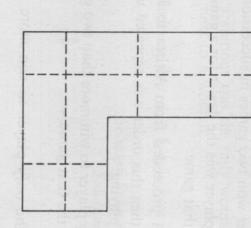

Hames? Who was the only player to win more than two

Solution Scheme, page 59; Solution, page 109.

# Mrs. Larchmont's Chair

SOLUTION SCHEME

Make a diagram for yourself as follows:

Write "X-1," "Y-1," "X-2,"
"Y-2," "X-3," "Y-3," "X-4,"
"Y-4," "X-5," or "Y-5" at each
position of the table (X represents one sex, Y represents the
other sex, and identical numbers
indicate marriage to each other)
and locate Mrs. Larchmont's
chair so that no condition is
contradicted.

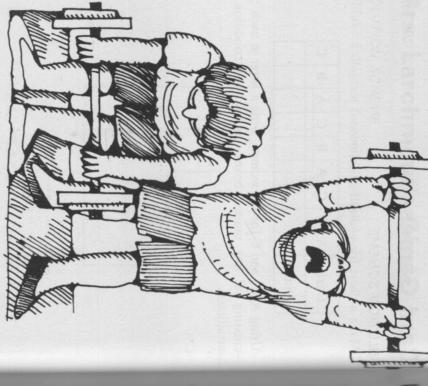

## **Card Games**

SOLUTION SCHEME

Make a chart for yourself as follows:

Winner	Dealer
	>
	В
	0
	A
	В
	C
	A
	В
	0

Using A, B, and C for the women, write a letter in each box crossing off any unused boxes—so that no condition is contradicted.

# **Meeting Day**

Lou, Moe, and Ned were at the Heave Health Club on the same day this month; it was there and then that they met.

[1] Lou, Moe, and Ned each began going to the health club last month.

- 2) One of them goes every 2 days, another one goes every 3 days, and the remaining one goes every 7 days.
- Lou went to the health club for the first time this month on a Monday, Moe went to the health club for the first time this month on a Wednesday, and Ned went to the health club for the first time this month on a Friday.

On which day of this month did Lou, Moe, and Ned

8

## **Meeting Day**

#### ORIENTATION

"Day of this month" is a number from 1 through 31.

### SOLUTION SCHEME

Make a chart for yourself as follows:

Health-club attendance dates this month

Ned's dates	Moe's dates	Lou's dates

Write the days of this month each went to the health club so that no condition is contradicted and so that one date occurs three times.

# The Tournament

Mr. and Mrs. Aye and Mr. and Mrs. Bee competed in a chess tournament. Of the three games played:

- III In only the first game were the two players married to each other.
- [2] The men won two games and the women won one game.
- III The Ayes won more games than the Bees
- M Anyone who lost a game did not play a subsequent game.

Who did not lose a game?

Solution Scheme, page 64; Solution, page 111.

## The Tournament

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Winner

Loser

First game	
Second game	
Third game	0

Write "Mr. Aye," "Mrs. Aye," "Mr. Bee," or "Mrs. Bee" in each box so that no condition is contradicted.

## Long Word

A certain word has thirteen letters.

III Each pair of letters below consists of one letter tout ained in the word and one "other" letter.

- When the letters in the word are put in the proper order and each "other" letter is put beneath each letter in the word, the "other" letters will appear in alphabetical order.
- The word has the same number of letters in common with each of the following words:

TACE QUEST QUICK SWITCH WORLD

What is the word?

Orientation and Solution Scheme, page 66; Solution, page 112.

### Long Word

#### ORIENTATION

Note that if Q is not the last letter in a word, it must followed by U.

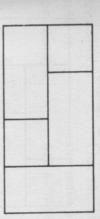

#### SOLUTION SCHEME

Make a chart for yourself as follows:

"Other" letters	Ordered letters of word

Write one letter in each box so that no condition contradicted.

# **Dressing Rooms**

Vera, one of the performers in a play, was murdered in her dressing room. The following facts refer to the dressing rooms shown above. Each of the five performers in the play —Vera, Adam, Babe, Clay, and Dawn—had his or her own dressing room.

- 11) The killer's dressing room and Vera's dressing room border on the same number of rooms.
- [2] Vera's dressing room borders on Adam's dressing room and on Babe's dressing room.
- (I) Clay's dressing room and Dawn's dressing room are the same size.
- | Babe's dressing room does not border on Clay's dressing room.

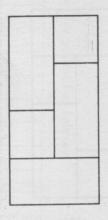

Who killed Vera?

Solution Scheme, page 68; Solution, page 114.

## **Dressing Rooms**

SOLUTION SCHEME

Make a chart for yourself as follows:

Assign each performer his or her dressing room by writing either "Adam," "Babe," "Clay," "Dawn," or "Vera" in each box so that no condition is contradicted.

# **Fathers and Sons**

Statement A:

Both fathers always
tell the truth or
both fathers always

Statement B:
One son always tells
the truth and one
son always lies.

Statement C:

Statement A and

statement B are not

both lies.

Of the statements above and the men who made them:

- made another of the statements, his father made the remaining statement.
- [2] Each father and son mentioned in the statements refers to one of the three men.
- [3] Each man either always tells the truth or always lies.

Which statement—A, B, or C—was made by Gregory?

Orientation and Solution Scheme, page 70; Solution, page 115.

# Fathers and Sons

#### ORIENTATION

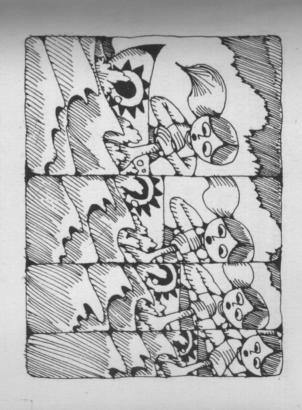

Gregory is the only one of the three who is both a father and son.

### SOLUTION SCHEME

Make a chart for yourself as follows:

Statement C	Statement B	Statement A

Write "true" or "false" for each statement so that no condition is contradicted and so that the truth or falseness of each man's statement is not contradicted.

# Crossing the Lake

Agnes, Becky, Cindy, and Delia crossed a lake in a canoe that held only two persons.

- II] The canoe held two persons on each of three forward trips across the lake and one person on each of two return trips.
- [2] Agnes was unable to paddle when someone else was in the canoe with her.

(continued)

- [3] Becky was unable to paddle when anyone else except Cindy was in the canoe with her.
- [4] Each person paddled continuously for at least one trip.

Who paddled twice?

Orientation and Solution Solution, page 116 Scheme, page 74,

#### [1] Has a "product" that is the same as that for numbers above, this product is $10 \times 21 \times 4 \times 7 \times 5$ . JUDGE; using the correspondence of letters and

- [2] Has no letter in common with JUDGE. conditions above in relation to EDWIN would have been impossible.) (To find a woman whose name satisfied the
- [3] Has no third letter of the alphabet because 3 is his unlucky number.
- | Has its letters in alphabetical order when the first letter and the second letter are interchanged.

What is the name of the judge's wife?

Orientation and Solution Solution, page 117. Scheme, page 75;

# The Judge's Wife

H	H	D	0	В	A
6	5	4	w	2	-
I	F	J	I	F	G
12	1	10	9	00	7
R	0	P	0	Z	Z
18	17	16	15	14	13
×	W	V	U	T	S
	23				
			1	2	Y
					25
-	1				

to a woman whose name: Edwin is a judge and a numerologist. He is married

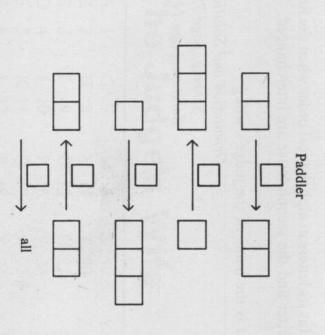

# Crossing the Lake

#### ORIENTATION

The situation is analogous to this simpler situation: P, Q, R, and S wish to cross a lake in a canoe that holds only two persons. So (1) P paddles Q across, (2) P paddles back, (3) P paddles R across, (4) P paddles back, (5) P paddles S across.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Using A, B, C, and D for the women write a letter in each box to show the paddler and the outcome of each crossing so that no condition is contradicted.

## The Judge's Wife

#### ORIENTATION

It is not necessary to multiply the numbers to solve this puzzle; in fact, it is a good idea not to. This puzzle involves a knowledge of women's first names.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

$$0 \times 21 \times 4 \times 7 \times 5 =$$

Write one number in each blank—crossing off any unused blanks and xs—to indicate letters that do not contradict the conditions.

### **Arguments**

One of four people—two men, Aubrey and Burton and two women, Carrie and Denise—was murdered The following facts refer to the people mentioned

- [1] Aubrey's sister argued exactly once with Carrie legal husband after the murder.
- [2] Burton's sister argued twice with the victim's legal spouse after the murder.

Who was the victim?

Orientation and Solution Scheme, page 78 Solution, page 118

- all chips from just one pile.
- [2] That the player who has to take the last chip loses.
- [3] That Amelia now have her turn.

From which pile should Amelia draw in order to win?

Orientation and Solution Scheme, page 79; Solution, page 119.

# The Three Piles

Three piles of chips—pile I consists of one chip pile II consists of two chips, and pile III consists of three chips—are to be used in a game played by Amelia and Beulah. The game requires:

#### Arguments

#### ORIENTATION

After the murder the victim could not have argued with anybody.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Aubrey's sister
Carrie's husband
Burton's sister
Victim's spouse

Write "Aubrey," "Burton," "Carrie," or "Denise" in each box so that no condition is contradicted.

### The Three Piles

#### ORIENTATION

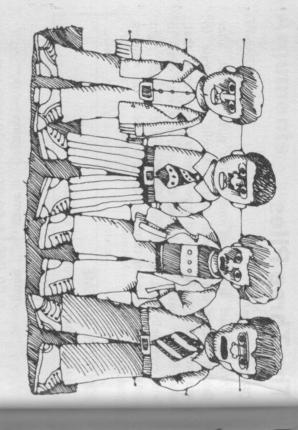

Amelia must draw from one of the piles so that, after houlah makes any allowed draw, Amelia may draw to win eventually; on her second draw Amelia must draw so that, after Beulah makes any allowed draw, Amelia may draw to win eventually; etc. If Amelia doesn't make the one right linuw each time it is her turn, Beulah gets to be in the winning position.

#### **SOLUTION SCHEME**

Make a chart for yourself as follows:

nelia goes	nelia goes	ilah goes	ielia goes	ilah goes	relia goes	game game gan o oo ooo oo oo oo oo	- P
-					1	game ooo	-

Show the chips remaining after each allowed draw so that, after any allowed draw by Beulah, Amelia can always compel houlah to take the last chip. (Cross off any unnecessary "pile" lines.)

## The Line-Up

Four men—Abraham, Barrett, Clinton, and Douglas—are standing in a line-up.

- [1] One man is fair, handsome, and unscarred.
- [2] Two men who are not fair are each standing next to Abraham.
- [3] Barrett is the only man standing next to exactly one handsome man.

(4) Clinton is the only man not standing next to exactly one scarred man.

Who is fair, handsome, and unscarred?

Orientation and Solution Scheme, page 82;

Solution, page 120

### Sum Word

In the addition above, the sum represents a word.

- [1] Each letter represents a different digit.
- [2] No letter represents zero.

What word is represented by 7 2 5 6 1 3?

Orientation and Solution Scheme, page 83; Solution, page 122.

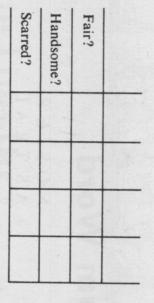

### The Line-Up

#### ORIENTATION

The men are standing in some order such as A B C D or C A D B. Certain orders are equivalent: for example A B C D is equivalent to D C B A; if an onlooker sees the backs of the four men while another onlooker sees their faces, the situation remains unchanged even though the order is reversed for one onlooker.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Write "A" (Abraham), "B" (Barrett), "C" (Clinton), and "D" (Douglas) in some order along the top of the chart and write "yes" or "no" in each box below so that no condition is contradicted.

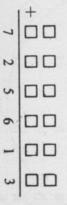

#### Sum Word

#### ORIENTATION

Nine different letters occur in the addition, each one representing a digit other than zero (1, 2, 3, 4, 5, 6, 7, 8, and 9). Name trial and error is necessary in solving this puzzle, but the total and error can be minimized by first considering the left two columns.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Write a digit in each box—to discover its corresponding letter—so that no condition is contradicted.

### The Exam

Five students—Adele, Betty, Carol, Doris, and Ellen—answered five questions on an exam consisting of two multiple-choice (a, b, or c) questions and three true-or-false (t or f) questions.

[1] They answered the questions as follows:

Ellen	Doris	Carol	Betty	Adele	I
c	Ь	а	Ь	a	I
					= .
f	1	1	1	1	Ш
1	1	1	f	1	IV
1	f	f	1	1	<b>V</b>

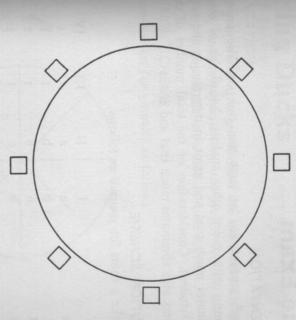

[2] No two students got the same number of correct answers.

Who got the most correct answers?

Orientation and Solution Scheme, page 86; Solution, page 123.

# Sitting Ducks

Mr. and Mrs. Astor, Mr. and Mrs. Blake, Mr. and Mrs. Crane, and Mr. and Mrs. Davis were seated around a table as shown at right. At the table:

- [I] Mrs. Astor was insulted by Mr. Blake who sat next to her on her left.
- [2] Mr. Blake was insulted by Mrs. Crane who sat opposite him across the center of the table.
- Mrs. Crane was insulted by the hostess who was the only person to sit next to each one of a married couple.
- [4] The hostess was insulted by the only person to sit next to each one of two men.

Who insulted the hostess?

Orientation and Solution Scheme, page 87; Solution, page 125.

#### The Exam

#### ORIENTATION

Each student has at least one true or false answer in common with every other student; knowledge of this fact eliminates much trial and error in determining the score of each student. Consideration of the total number of correct answers also eliminates much trial and error.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Ellen	Doris	Carol	Betty	Adele	
c	ь	a	6	a	-
a	c	ь	ь	9	=
f	-	1	1	-	П
1	1	1	f	1	V
-	-	f	-	-	<

Circle the correct answer to each question so that no condition is contradicted.

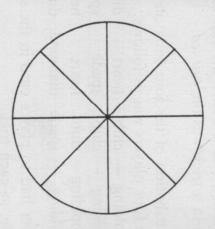

### Sitting Ducks

#### DRIENTATION

The people are arranged around the table in such a way that two men are separated by one person and the members of a married couple are separated by one woman.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

Using the symbols MA for Astor man, WA for Astor woman, etc., place the Astors, Blakes, Cranes, and Davises around the table so that no condition is contradicted.

# The High Suit

Wilson, Xavier, Yoeman, and Zenger were playing a card game in which three cards from each player's holding remained to be played and in which one of four *suits*—clubs, diamonds, hearts, spades—was the *high suit*. The play of four cards, one from each player's holding, was a *trick*; the suit of the card played first in a trick was the *suit led*.

[1] The distribution of the four suits on the cards held by the four players was as follows:

Wilson's holding — club heart diamond
Xavier's holding — club spade spade
Yoeman's holding— club heart heart
Zenger's holding — spade diamond diamond

[2a] A player had to play a card in the suit led, if possible, at each trick.

[2b] If he could not do [2a], he had to play a card in the high suit, if possible.

[2c] If he could not do [2b], he could play any card

B] Each of the remaining three tricks contained in part: the suit card led, just one other card in the same suit, and a card in the high suit which won the trick.

A player who won a trick had to lead at the next trick.

Which suit was the high suit?

Orientation and Solution Scheme, page 90, Solution, page 127

### The High Suit

#### ORIENTATION

The high suit is equivalent to the trump suit used in the play of many card games.

#### SOLUTION SCHEME

Make a chart for yourself as follows:

	Third	Second	First	Remaining tricks
				Wilson's holding
,				Xavier's holding
				Xavier's Yoeman's Zenger's holding holding
				Zenger's holding

Write "C" (club), "D" (diamond), "H" (heart), or "S" (spade) in each box so that no condition is contradicted. Hint:

C S H S be high suit (from [3]) and Yoeman H C H D holding as given in [1] shows Yoeman would have played a heart at the first trick to a spade lead (from [3]) and contradicts [4] because clubs would be high suit and diamonds would be led at the third trick (from [3]).

### Solutions

#### The Fight

Bernard is not the younger fighter. So either: From [1], Charles is not the older fighter. From [3],

younger fighter. Case I. Anthony is the older fighter and Charles is the

younger fighter. Case II. Bernard is the older fighter and Anthony is the

younger fighter. Case III. Bernard is the older fighter and Charles is the

is taller than Anthony for Case III. From [3], Charles is the taller fighter for Case I and Charles

Bernard is shorter than Anthony for Case III. From [1], Bernard is the shorter fighter for Case II and

From [1] and [3], Charles is taller than Bernard for Case III

In summary:

Case II Case III	
Anthony Bernard Bernard	Older fighter
Charles Anthony Charles	Younger fighter
Charles Anthony Charles	Taller fighter
Anthony Bernard Bernard	Shorter fighter

mentioned in the Discussion without considering what those (Note that this reasoning eliminates nine of the twelve cases

nine cases are.)

is the correct one and Charles is not fighting. shorter than Charles; so Case III is eliminated. Then Case I eliminated. From [2], Bernard cannot be both older and From [2], Anthony is not the shorter fighter; so Case I is

is the oldest of the three and Anthony is the youngest) and Then, from [2], Bernard is younger than Charles (so Charles

> fallest of the three). from [3], Anthony is taller than Charles (so Anthony is the

### My Secret Word

word cannot be AIM, DUE, MOD, or OAT. So my secret number of vowels in my secret word is one or two. So none of word is TIE. the letters in MOD is in my secret word. Then my secret MOD, then you would not be able to determine whether the From the "clue": If you were told any one of the letters in

# The Tennis Players

the following ways: From [1], the players must be relatively positioned in one of

	Zita	son		brother	daughter
Audion Journal 1019	brother	daughter	Ia	Zita	son
	son	Zita	I	brother	daughter
Company are observed to	brother	daughter	Ib	son	Zita

Brother is the best player.	Then, from [3]: For ways Ia and IIa	Brother is the worst player's sibling. Zita is the worst player.	Then, from [2]: For ways Ia and IIa
Brother is the best player.	For ways Ib and IIb	Daughter is the worst player's sibling. Son is the worst player,	For ways Ib and IIb

So, in any case, Zita's brother is the best player.

# **After-Dinner Drink**

From [1] and [2] there are six possibilities:

Case VI	Case V	Case IV	Case III	Case II	Case I		
tea	tea	tea	tea	coffee	coffee	Abigail orders	
tea	coffee	tea	coffee	tea	coffee	Bridget	
coffee	tea	tea	coffee	tea	coffee	Claudia	

Then, from [3], Cases I and V are eliminated and, from [4]. Cases II and V are eliminated. So you know Abigail always or ders the same drink (tea) after dinner.

#### **Equal Sums**

One digit must be 9. Then, from [1] and [2], 9 must go with 1 and 3. One digit must be 8. Then, from [1] and [2], 8 must go with either 1 and 4 or 2 and 3. One digit must be 7. Then, from [1] and [2], 7 must go with either 1 and 5 or 2 and 4. One digit must be 6. Then, from [1] and [2], 6 must go with either 2 and 5 or 3 and 4.

From the diagram no digit may be used in more than two nums. From this and the fact that 9 goes with 1 and 3:

Case I. If 8 goes with 1 and 4, then 7 goes with 2 and 4; then 6 goes with 2 and 5.

Case II. If 8 goes with 2 and 3, then 6 goes with 2 and 5; then 7 goes with 1 and 5.

But Case II is impossible because the digit 4 does not occur. So Case I is correct and, from the diagram, E must be 4.

A possible arrangement of the digits is shown below.

931

47

#### Relations

From [1]:

If Lee's spouse is Dale, then Dale's sibling cannot be Lee and must be Terry; then Terry's sister-in-law cannot be Dale and must be Lee.

If Lee's spouse is Terry, then Terry's sister-in-law cannot

be Lee and must be Dale; then Dale's sibling cannot be Terry and must be Lee.

Then, in any case, all three of Lee, Dale and Terry are accounted for and Terry's sister-in-law is a female.

So, from [2], Lee's spouse and Dale's sibling are both males In summary:

Case II	Case I		
Terry	Dale	male	Lee's spouse
Lee	Terry	male	Dale's sibling
Dale	Lee	female	Terry's sister-in-law

Case II is eliminated because Lee and Terry cannot both be males and married to each other. So Case I is the correct one and you know *Dale is a married man*. Lee is a married woman, Dale and Terry are brothers, and Lee is Terry's sister-in-law.

7	4	1
00	5	2
9	6	ω

#### X and O

Let a number in each square as shown indicate the location of a mark. Then, from [3], the seventh mark must be placed in square 5 and, from [2], the seventh mark wins for both X and O. So the sixth mark must have been placed in a line already containing two of the opponent's marks—in either square 7 or square 9; otherwise, either X or O would have been placed in square 5. But, from [3], the sixth mark could not have been placed in square 7 because square 5 would have been the required location for the O in square 7. So the sixth mark was placed in

and, from [2], O wins the game.

From previous reasoning, the fifth mark placed in the game also be determined: O in square 8.

#### Names

From [1] and [4], Miss Alden, Miss Brent, and Miss Clark named Fay. From [1], no one can have more than two of the names; so, from [1] and [2], Kay is distributed only twice with Fay in one of two ways:

		Case I
Kay	Fay	Alden
Kay	Fay	Brent
	Fay	Clark
		Doyle
		Evans

Alden Brent Clark Doyle Evans

Fay Fay Fay

Kay Kay

Then, from [1] and [3], neither Miss Brent nor Miss Clark

named Gay in either case. So—from [1]—Miss Alden,

Miss Doyle, and Miss Evans are named Gay. Then Case I is

		Case II
Gay	Fay	Alden
	Fay	Brent
, and	Fay	Clark
Gay	Kav	Doyle
Gay		Evans

impossible and Case II becomes:

Then, from [1], Miss Evans is named Fay. Then, from [1], Miss Brent is named May.

### **Hockey Scores**

and the teams could not have each lost one game). So the scores achieved by this team is greater than the total of at and did not score 5 and 4 together. The highest total of two team that lost the greatest number of games did not score 6 of games lost the two games it played (there were three losers team scored 5 and 3 for a total of 8. least 7 (6 and at least 1) achieved by some other team. So this From [1] and [3]: The team that lost the greatest number

6 and the 1 were scored by the same team. Let the teams be the 4 score. So the 1 score and the 2 score go together and the Then the 5 score lost to the 6 score and the 3 score lost to

X, Y, and Z temporarily; then in summary:

differ by at least one and at most two. So, from [2], the Angoras differ by at least one and at most two; any two lower scores must be Y, and the Cougars must be X. Then the Cougars score differ by one. So the Angoras must be Z, the Bobcatt two and the Bobcats' lower score and the Cougars' lower higher score and the Bobcats' higher score differ by achieved the highest total of its two scores. From inspection of the team scores, any two higher scores

### The Journey

and south-S, to represent either corn, wheat, or rye. Then of field; these can be assigned letters, such as east-E, west-W E, W, and S can be assigned to the fields surrounding them From [3]: No two of the L-shaped fields are the same kine

> w W field, 5 is an E field, and 12 is an S field. Illernating E and W around the south L-shaped field. Then I illernating E and S around the west L-shaped field, and w alternating W and S around the east L-shaped field

w -	1		×	2E	W
m «	0	west		.38	
8 9	south			01	
S	ıth	E		*	4
E		10W	east	68	5E
12 S	:	8		S	E

In a rye field and the east L-shaped field is a rye field. with L-shaped, 10-W, and 12-S. So, from [2], each E field possible route involves fields 6-S, 4-W, 3-S, west L-shaped, From [1] and [2] and inspection of the plan, the only

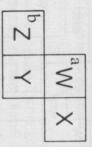

#### The Visits

visited Edna in the morning and at least one woman visited dna in the evening. From [3], Alma did not visit Edna first. o, from [1], the order of the visits must be one of the following: From [1] and any of [2], [3], and [4], at least one woman

- Bess (9), Alma (8), Cleo (10), Dina (11)
- Case II. Bess (9), Cleo (10), Alma (8), Dina (11)
- Case III. Bess (9), Cleo (10), Dina (11), Alma (8)
- Case V. Case IV. Cleo (10), Alma (8), Bess (9), Dina (11) Bess (9), Dina (11), Alma (8), Cleo (10)
- ase VII. Dina (11), Alma (8), Bess (9), Cleo (10) Case VI. Cleo (10), Dina (11), Alma (8), Bess (9)

From [2], Cases I, V, VI, and VII are eliminated. Them from [4], Cases II and III are eliminated. So Case IV is the right one and Cleo visited Edna last.

### A Different Age

Let W, X, Y, and Z represent the four digits as shown in the diagram. Then, from [1] and [2], Ambrose's age is a two-digit number and WX plus Brandon's age equals WY. So Brandon's age must be a one-digit number.

From [3], WY plus Chester's age equals ZY. So Chester's age must end in zero. Then Chester's age must be a two-digit number.

From [4] and the fact that only Brandon's age is a one-digit number, Brandon is a different age in years from the other two.

Because Chester's age ends in zero, Ambrose's age must end in zero. So Ambrose and Chester may each be 10, 20, 30, or 40 and Brandon may be 1, 2, 3, 4, 5, 6, 7, 8, or 9. Of the thirty-six possible ways to complete the diagram, here is one

ь2	
9	a 1
	0

100

# The Doctor and the Lawyer

The two women are not blood relatives. So, from [2], if the loctor is a woman, the lawyer is a man. Then, from [3], the loctor is a man. Because a contradiction arises from assuming the doctor is a woman, the doctor must be a man.

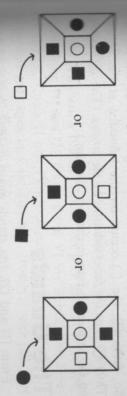

Mr. Horton's son is the youngest of the four and is a blood relative of each of the other three. So, from [1], the doctor is not Mr. Horton's son. Then you know the occupation of Mr. Horton: he is the doctor.

From [1], then, the lawyer cannot be Mr. Horton's mother. No the lawyer is either his wife or his son. (The doctor may be older than the lawyer.) Then you don't know the occupation of unyone else.

### The Two Cubes

From [1] and the pictured cubes, at least one of 
and 
accurs twice.

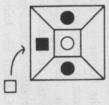

If both occur twice, then the identical cubes look like:

but in each case duplicate faces cannot occur at the arrows, contradicting [2].

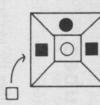

So either only occurs twice or only coccurs twice.

If only occurs twice, then the identical cubes look like is:

But in this case duplicate faces cannot occur at the arrows, contradicting [2].

So only occurs twice and the identical cubes look like this:

In this case the  $\bigcirc$  occurs on the right cube at the arrow. So, from [2], the  $\bigcirc$  occurs on the left cube at the arrow. Thus  $\bigcirc$  is on the faces indicated by the arrows. (The  $\bigcirc$  occurs on the unmarked face in the last diagram.)

#### The Guards

From [1] and [2], Ida stands guard on only two days each week. Then in [4] Ida is not one of the unknown guards and either Bob (Case I) or Cab (Case II) stands guard with Art on Wednesday.

So, using this information and [3] to complete [4] in each use:

Case I. If Bob stands guard on Wednesday, then Art stands murd on Friday. Then Cab stands guard on Thursday and Bob lunds guard on Saturday. Then Art stands guard on Monday. Then Cab stands guard on Tuesday.

Case II. If Cab stands guard on Wednesday, then Art stands murd on Thursday. Then Bob stands guard on Tuesday and riday. Then Art stands guard on Monday. Then Cab stands murd on Saturday.

In either case, Art does not stand guard with Ida

#### Brothers

From [4], six cases are possible:

Case VI	Case V	Case IV		Case II	Case I			
	blue	,	blue	hazel	hazel	Amos	of	Eye color
blue		hazel	hazel		blue	Bert	of	Eye color
hazel	hazel	blue		blue		Clem	of	Eye color

From [1], then, a fourth brother has grey eyes in each case. then: from [1] and [2], Cases I and VI are impossible; from II and [3], Cases II and IV are impossible; from [1] and [3], then has grey eyes in Case III; and, from [1] and [2], Bert may grey eyes in Case V.

Any more than four brothers must also have blue eyes, from

### **Equal Products**

From [1] and [2]: No letter can be 0, 5, or 7. The product for each row, then, is a multiple of 1, 2, 3, 4, 6, 8 and 9. So the smallest possible product is  $8 \times 9$  or 72 and the product is a multiple of 72. But the product cannot be any of  $72 \times 2$ ,  $72 \times 3$ , etc. because it is not possible to get a product larger than 72 three times. So the product is 72.

Then

$$72 = 1 \times 8 \times 9 = 2 \times 36 = 2 \times 4 \times 9 = 3 \times 24 = 3 \times 4 \times 6$$

Because 4 and 9 are used twice (see boxed products), B or E is 4 and the other is 9. So G is 2.

A possible arrangement of digits is:

4 2 9

### Tees and Els

From [1] and [2]:

Case I. If Annette's statement is true, all three cannot be members of the Tee family and Cynthia cannot be the only one of the three who is a member of the El family. So, if Annette's statement is true, either: Annette is the only one of the three who is a member of the Tee family or Bernice is the only one of the three who is a member of the El family.

Case II. If Annette's statement is false, Annette cannot be the only one of the three who is a member of the El family and Bernice cannot be the only one of the three who is a member of the Tee family. So, if Annette's statement is false, of the Tee family one of the three who is a member of the Tee family or all three are members of the El family.

Then: Annette is a member of the Tee family in Case I and Annette is a member of the El family in Case II. Bernice is a member of the El family in Case I and Bernice is a member of the El family in Case II. Cynthia may be a member of either family in Case I and Cynthia may be a member of either family in Case II. So you know only the name of Bernice's family (El).

#### The Joker

From [1] and [3], one man had exactly two singletons: a king and a queen. From [2], Bill cannot have had exactly two singletons. From [1] and [2], Carl cannot have had exactly two singletons unless one of them was the joker. So Alec had the singleton king and the singleton queen.

Then, from [3], each of Bill and Carl cannot have had more than one singleton. If Carl had no singletons, then—from Alec's holding and [1] and [2]—he had two kings and two queens. But then, from [1] and [2], Bill would have had three singletons—contradicting previous reasoning. So Carl had exactly one singleton.

Then—from [1], [2], and [4]—Carl had three queens and a singleton king; if Carl had the joker instead of a singleton king, Bill would have had three kings—contradicting [4]. Then, from the other men's holdings and from [1] and [2], Bill had the joker and two kings.

## **Outre Ornaments**

Let b represent baubles, g represent gewgaws, t represent trinkets, + represent "together with," and = represent "have the same value as." Using [2], substitute 4b+9t for 5g in [1]. Using [3], substitute 6t+3g for 4b in [2]. Using [1], substitute 7b+5g for 6t in [3]. Then simplify. In summary:

Using [2] Simplify
$$[1] 7b+5g=6t \longrightarrow 7b+4b+9t=6t \longrightarrow 11b+9t=6t$$
Using [3] Simplify
$$[2] 4b+9t=5g \longrightarrow 6t+3g+9t=5g \longrightarrow 15t+3g=5g$$

$$[3] 6t+3g=4b \longrightarrow 7b+5g+3g=4b \longrightarrow 7b+8g=4b$$

[1], using [2], is impossible because some baubles and 9 trinkets cannot have the same value as 6 trinkets. [3], using [1], is impossible because some gewgaws and 7 baubles cannot have the same value as 4 baubles. Because only one salesperson was wrong, from [4], neither the second nor the third salesperson was wrong; otherwise, more than one salesperson was wrong. So only the first salesperson was wrong.

One possible price list, from [2] and [3], is: trinket—\$ .80 bauble—\$5.70 gewgaw—\$6.00

#### The Widow

From [1], [2], and [4]:

Either Fred is married to Anna or Fred is married to Cass. If Fred is married to Anna, then Gene is married to Beth or Gene is married to Cass.

If Gene is married to Beth, then Earl is married to Dora.

If Gene is married to Cass, then Earl is married to Beth or Earl is married to Dora.

If Fred is married to Cass, then Gene is married to Beth; then Earl is married to Dora.

In summary, the married couples are either

Case I Case II Case III Case IV

red-Anna Fred-Anna\* Fred-Anna Fred-Cass\*

cene-Beth or Gene-Cass or Gene-Cass\* or Gene-Beth\*

Earl-Dora\* Earl-Dora\*

From [3] and [4], Cases II, III, and IV are impossible insterisks show two couples in one game). So Case I is the correct one and, from [1], Cass is the widow.

### Yes, Yes, Yes

From [1], [2], and [3]: The first logician to answer "Yes" must have been told a letter that occurred only once in the list. So the first logician was told either H, R, P, D, or V. Then the second logician knew the first logician was told either H, R, P, D, or V. So the second logician knew the word was not TOE. Then the second logician knew what the word was if told T or E (some new letter), or if told the second letter of PAD that occurred only once in the list: P or D. The third logician knew the first logician was told either H, R, P, D, or V and knew the second logician was told either T, E, P, or D. So the third logician knew what the word was if told O (some new letter), but would not know what the word was if told A. Then, rather than PAD or VAT, the letters spelled HOE.

# Speaking of Children

From [1], Aaron has at least 3 children and a number of children from this sequence:

3, 6, 9, 12, 15, 18, 21, 24, ...

From [2], Brian has at least 4 children and a number of children from this sequence:

4, 8, 12, 16, 20, 24, . . .

From [3], Clyde has at least 5 children and a number of children from this sequence:

5, 7, 9, 11, 13, 15, 17, 19, 21, 23, . . .

Then the total number of children is at least 12 and, from [4], at most 24. Also: If the total number of children is even, Aaron must have an odd number of children; if the total number of children is odd, Aaron must have an even number of children.

Trial and error reveals the following information. The total number of children cannot be 13 because no three numbers, one from each sequence, can total 13. The total cannot be 12, 14, 15, 16, or 17 because then the number of children each had would be known, contradicting [4]. The total cannot be 18, 20, 21, 22, 23, or 24 because then no number of children could be known for anybody, contradicting [4]. So the total is 19.

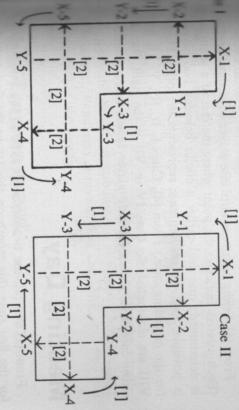

When the total is 19 Aaron must have an even number of children and, from the sequences, this number must not be greater than 19-(4+5) or 10. So Aaron must have 6 children. Then Brian and Clyde together must have 13 children. Then Brian must have either 4 or 8 children. Then: If Brian has 4 children, Clyde has 9 children; if Brian has 8 children, Clyde has 5 children.

So the speaker is Aaron.

# Mrs. Larchmont's Chair

Let X represent one sex, let Y represent the other sex, and place an X in chair a.

Then, from [1], the spouse of the person in chair a is either in hair b—Case I—or in chair j—Case II. Conditions [1] and [2] nun be used alternately to determine the couples (X-1 and Y-1, X-2 and Y-2, etc.) in each case, by beginning at chair a and following the arrows:

In Case I, three members of each sex did not sit next to a member of the same sex; so, from [4], Case I is eliminated. Then Case II is the correct case.

Then, from [4], Mrs. Larchmont sat in either chair i or chair j. then, from [3], Mrs. Larchmont sat in chair j.

#### Card Games

Let A represent Althea, B represent Blythe, and C represent Cheryl. Then, from [1] and [2], the possible sequence of wins is sollows:

Case VIII	Case VII	Case VI	Case V	Case IV	Case III	Case II	Case I	from [3]	Dealers,
В	В	В	В	В	В	В	C*	A	
0	C	C	0	C	0	A*	A	В	
A	A	>	A	A	B*	В	В	C	
В	В	В	В	C*	C	C	C	A	
C	C	C	A*	A	A	A	A	В	
A	A	B*	В	В	В	В	В	0	
В	C*	1	T	C	1	1	0	A	
					4			В	

From [4], listing continues until one player wins three games. (Each asterisk indicates the point where the rest of a sequence is determined; one deal earlier a choice between two players is possible. Each succeeding case represents the other choice for the preceding case.) From [4], Cases I, II, III, V, VI, and VIII are eliminated. So Case IV or VII is the right one. In either case, Cheryl was the only player to win more than two games.

### **Meeting Day**

From [1] and [2], the two-day man went to the health club for the first time this month on the 1st or the 2nd and the three-day man went to the health club for the first time this month on the 1st, 2nd, or 3rd. Then, from [3], the two-day man went on the 1st and the three-day man went on the 3rd. Then—from [1], [2], and [3]—the seven-day man went to the health club for the first time this month on either the 5th or the 6th. In summary, either A or B below is true.

A. Lou went on Monday, the 1st, and every two days thereafter; Moe went on Wednesday, the 3rd, and every three days thereafter; and Ned went on Friday, the 5th, and every seven days thereafter.

B. Moe went on Wednesday, the 1st, and every two days thereafter; Ned went on Friday, the 3rd, and every three days thereafter; and Lou went on Monday, the 6th, and every even days thereafter:

The dates for A and B, then, are as follows (the dates in purentheses depend upon the length of the month):

Lou's dates—1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27 (29), (31)

Moe's dates—3, 6, 9, 12, 15, 18, 21, 24, 27, (30) Ned's dates—5, 12, 19, 26

Moe's dates—1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, (29), (31)

Ned's dates—3, 6, 9, 12, 15, 18, 21, 24, 27, (30) Lou's dates—6, 13, 20, 27

Because the three men were at the health club on the same day this month, possibility A is eliminated. So possibility B is correct. Possibility B reveals that Lou, Moe, and Ned met on the 27th of this month.

### The Tournament

From [2] and [3], either:

I. Mr. Aye won one game, Mrs. Aye won one game, and

Mr. Bee won one game; or III. Mr. Aye won two games and Mrs. Aye won one game; or III. Mr. Aye won two games and Mrs. Bee won one game.

If I is correct, then: From [1] and [4], Mr. Bee beat Mrs. Bee in the first game. Then, from [4], only Mr. Bee could have lost to Mr. Aye or Mrs. Aye in the second game. Then, from [1] and [4], no one could have played against the last winner in the last game. So I is not correct.

Il cannot be correct from [1] and [4].

So III is correct. If Mrs. Bee won the first game, then she beat Mr. Bee in that game, from [1]. But then, from [1] and [4], no one could have played against Mr. Aye in the second game. So Mr. Aye won the first game against Mrs. Aye, from [1]. Then, from [4], Mr. Aye beat Mr. Bee in the second game. Then, from [4], Mrs. Bee beat Mr. Aye in the third game. So only Mrs. Bee did not lbse a game.

#### Long Word

From [3], the number of common letters is at most four. From [1] and QUEST in [3], the number of common letters is at least one—S or T. From [1], from FACE and QUEST in [3], and from the fact that Q cannot occur in the thirteen-letter word without U:

443	<u> </u>	(iii)	<b>5</b>	ت ا	
	2	2	1	4	If the number of common letters is
	Q UEST CF K TS	Q (U) E (S T) (C) F (K) T S	QUEST CFKTS	QUEST CFKTS	then each of these loops contains a common letter
	F A CE U V Q K	F A©E UVQ®	FACE UVQK	FACE UVQK	then each of the loops contains a common letter

3	
ω	ü
QÜEST ©FKTS	QÜEST CFKTS
F A CE	FACE UVQK

A contradiction occurs in (i), (ii), (iv), and (v), so these are liminated.

Then, from (iii) and (vi), A is a common letter.

Then, from [1] and from QUICK in [3]:

If each of these loops contains a common letter	then each of these loops contains a common letter	Possible?
QWEST FACE	Q (()) 1 (C)(K)	no
CF & TS UVQK	©F OQE	
QUEST FACE	Q@I ©K	yes
CF K TS UVQK	©F O QE	

Then I is the third common letter in QUICK.

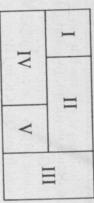

Then, from [I] and [3], the common letters in SWITCH are I, C, and S/T. Then, from [I] and [3], the common letters in WORLD are not W and not O (because I is common); so the common letters in WORLD are R, L, and D.

Ten of the thirteen letters are now known: C, U, E, A, I, R, L, D, P (not H), and B (not W). So, from [1] and [2], twenty-four letters can be arranged thus (the pairs S/T and Y/Z can only go where indicated):

UP RE DI CS AB LY FHJK MOQTVWXZ

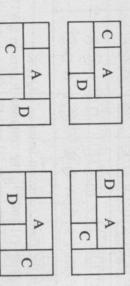

It is now easy to see that: the letters in the pair G/N should be reversed and placed after the pair U/F, the letters in the pair S/T should be reversed, and the word is UNPREDICTABLY.

### **Dressing Rooms**

From [4], neither Babe nor Clay occupies dressing room II, from [1], Vera does not occupy dressing room II. So either Adam or Dawn occupies dressing room II.

Suppose Adam occupies dressing room II; then, from [3], one of the following sets of occupation must exist (A represents Adam, C represents Clay, and D represents Dawn):

But, from [2], each of these sets of occupation is impossible. So Dawn occupies dressing room II. Then, from [3], one of the following sets of occupation must exist:

thut, from [2], the first of these sets is impossible. So the second set is the correct one and, from [2], Vera occupies tressing room IV.

Then, from [4], Babe occupies dressing room I. So Adam occupies dressing room V.

Then, from [1], Adam killed Vera.

### athers and Sons

If statement C is false, statement A and statement B are both mike. But—from [1], [2], and [3]—if statement A is false, undement B or statement C is true (because a false statement A implies one father always tells the truth and one father always lies). So statement C cannot be false and must be true.

Because statement C is true, at least one of statements A and II is true. But—from [1] and [2]—if statement B is true, unterment A or statement C is false. So if statement B is true, unterment A is false.

In summary

atement A	Case I true	Case II false
itement R	false	true
Internent C	true	true

If Case I were the right one, then—from statement A and from [2]—the speakers of statements A and C would both be muthers; and—from statement B and from [2] and [3]—the peakers of statements A and C would both be sons (because a fulse statement B implies both sons always tell the truth or both ons always lie). This situation is impossible from [1] because only Gregory is both a father and a son; so Case I is filminated.

Then Case II is the right one. Then, from statement A and

from [2] and [3], the speaker of statement A is a father; and from statement B and from [2], the speaker of statement A is a son. So, from [1], Gregory made statement A.

# **Crossing the Lake**

From [1], [2], and [4], Agnes paddled on at least one return trip.

The person who paddled twice did not paddle on two forward trips because, from [1], she would then have had to paddle on a return trip, contradicting [4]. So the person who paddled twice paddled on at least one return trip.

In summary, Agnes and the person who paddled twice each paddled on at least one return trip. So Becky, Cindy, and Delia each paddled on one forward trip, from [1] and [4].

Then, from [1] and [3], Cindy was in the canoe when Becky paddled on a forward trip. Because Cindy was in the canoe on two forward trips, she must have paddled on a return trip. So Cindy paddled twice.

Six paddling sequences are possible. To determine an actual sequence of paddlings, Celia's (C) and Agnes' (A) paddlings are listed first, then Becky's (B) paddling, and then Delia's (D) paddling. The sequences are shown below.

## The Judge's Wife

From [1], the name of the judge's wife has a "product" of

$$10 \times 21 \times 4 \times 7 \times 5$$
.

From [2], her name has no G(7) or U(21); so it has N(14) wice. Division by 14 twice leaves  $10 \times 3 \times 5$ .

$$\begin{array}{c|c}
14 & 10 \times 21 \times 4 \times 7 \times 5 \\
14 & 10 \times 21 \times 2 \times 5 \\
\hline
10 \times 3 \times 5
\end{array}$$

From [2], her name has no E(5) or J(10). It cannot have a  $\Gamma(20)$ . It cannot have an  $\Gamma(15)$ ; otherwise, it would have an E(5) or a J(10). So her name has a  $\Upsilon(25)$ . Division by 25 leaves  $2 \times 3$ .

$$\begin{array}{c|c}
25 & 10 \times 3 \times 5 \\
\hline
2 \times 3
\end{array}$$

From [3], her name has an F(6). Division by 6 leaves 1.

In alphabetical order the letters found so far are FNNY and the only other letter her name may contain is A(1). So from [4], the name of the judge's wife is FANNY.

(The W in Edwin is the twenty-third letter of the alphabet and can only be represented as 23×1. So to find a woman whose name satisfied the first two conditions in relation to EDWIN is impossible.)

#### **Arguments**

From [1], Aubrey's sister is either Carrie or Denise.

Suppose Aubrey's sister is Carrie. Then, from [1], Carrie husband is Burton. Then, from [1] and [2], Burton's sister in Denise.

Suppose Aubrey's sister is Denise. Then, from [1], Carrie's husband is either Aubrey or Burton. Suppose Carrie's husband is Aubrey; then, from [2], Burton's sister can be either Carrie or Denise. Suppose Carrie's husband is Burton; then, from [1] and [2], Burton's sister is Denise.

In summary:

	Argue	Arguers in [1]	Argue	Arguers in [2]
	Aubrey's	Carrie's	Burton's	Victim's
	sister	husband	sister	spouse
e I.	Carrie	Burton	Denise	?
e IIa.	Denise	Aubrey	Carrie	?
e IIb.	Denise	Aubrey	Denise	?
e IIc.	Denise	Burton	Denise	?

Case

In Case I, Aubrey must be the victim. Then the victim's legal spouse can only be Denise. This situation is impossible so Case I is eliminated.

In Case IIb, either Burton or Carrie must be the victim. If Burton is the victim, then Burton can have no legal spouse

Unis situation contradicts [2]. If Carrie is the victim, then Denise and Aubrey argued exactly once—from [1]—and wice—from [2]; this situation is impossible. So Case IIb is liminated.

In Case IIc, either Aubrey or Carrie must be the victim. If Aubrey is the victim, then Aubrey can have no legal spouse; this situation contradicts [2]. If Carrie is the victim, then Denise and Burton argued exactly once—from [1]—and twice—from [2]; this situation is impossible. So Case IIc is eliminated.

Then Case IIa is the correct one. Then Burton must be the wetim. From [2], Burton's spouse can only be Denise.

### The Three Piles

In the chart below:

For the first four opening moves by Amelia, only winning moves by Beulah are given for any moves by Amelia after the opening.

For the last opening move by Amelia, any moves by Beulah are given for only winning moves by Amelia.

When two piles have the same number of chips, a removal of some chips from one pile is equivalent to a removal of the number of chips from the other pile.

From [2]:	[II]: (Amelia goes	From Beulah goes	( Amelia goes	From [1] and [3]:
Amelia loses		0	00 00	Amelia takes pile III
Amelia loses		0	0 000	Amelia takes pile II

From [2]:	Amelia goes From Amelia goes [1]: Amelia goes Amelia goes Amelia goes	From [1] and [3]:
Amelia loses		Amelia takes pile I
Amelia loses		Amelia takes one chip from pile III

		-
	From [1]:	
From [2]:	Amelia goes Beulah goes Amelia goes Beulah goes Amelia goes Beulah goes	and [3]:
Amelia wins		
Amelia wins		
Amelia w		

From [1]

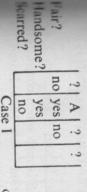

Amelia takes one chip from pile II

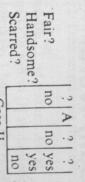

So Amelia should draw one chip from pile II in order to win

### The Line-Up

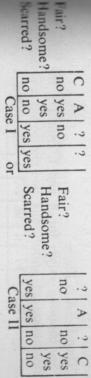

From [2] (A represents Abraham and ? represents in unknown man):

So, from [1], either:

Each of two scarred men cannot be standing next to clinton in either Case I or Case II. So, from [4]. Clinton standing next to no scarred man and each of the other men standing next to exactly one scarred man. Then either crepresents Clinton):

In Case I, Clinton is standing next to exactly one handsome man. So, from [3], Case I is impossible.

Then Case II is the correct one and only Clinton is fair handsome, and unscarred.

In Case II, the man next to Clinton cannot be handsome, from [3]. Then, from [3], the man on the other end from Clinton the other end (from [3]). If Abraham is handsome, Barrett is on the other end (from [3]). If Abraham is not handsome, Barrett and D represents Douglas):

	Scarred?	Handsome?	Pair?	
	yes	no	no	В
Case	yes			A
Ha	no	yes no yes	no	AD
OI	no	yes	no yes	0
	Scarred?	Handsome? no no	Fair?	
_	yes	no	no	D
Case	yes	no	14	A
ase IIb	no	no	no	В
		y	Y	
	00	les	es	0

Abraham may be either fair or not fair.

#### Sum Word

N+A cannot be 7; otherwise, O and S are both 1 which contradicts [1] or one of O and S is zero which contradicts [2]. So N+A is 6 and 1 is carried from O+S. Then, from [1] and [2], the possible digits for N and A are as follows:

Then R+L cannot be 3; otherwise, R and L are 3 and 0 which contradicts [2] or 1 and 2 which contradicts [1]. So R+L is 13.

Then E+A is 10.

So, choosing values for R and L from [1], the table can be continued:

٢	H	A	Z	
7	9	-	5	
6	9	-	S	=:
	1	5	1	E
7	00	2	4	iv
				<
00	6	4	2	≦.
5	6	4	2	vii
	7 6 7 6 8	9 9 - 8 8 6 7 6 7 6 8	1 1 5 2 2 4 9 9 - 8 8 6 7 6 7 6 8	400

Case iii is eliminated from [1].

Then R+I is 15 and not 5, from [2]. So, from [2], Case vi is eliminated and, from [1], Cases i and v are eliminated.

Then continuing the table:

I	R	L	H	A	Z	L
00	7	6	9	-	S	=:
9	6	7	00	2	4	iv
7	00	5	6	4	2	VII

Then S-T is 4 and not 14, from [1]. So, from [1] and [2] case ii is eliminated and O+S is 12. Then continuing the table

0	S	T	I	R	٦	E	A	Z	L
1	-	w	9	6	7	000	2	4	īv
1	w	-	9	6	7	00	2	4	IV.
ī	-	3	7	00	5	6	4	2	VII
9	w	-	7	00	5	6	4	2	Vii

Case iv is eliminated from [1].

So Case vii is the correct one. Substituting the letters for the digits, 7.2 5 6 1 3 is 1 N L E T S.

#### The Exam

From [1], each student has at least one true-false answer n common with every other student. So if one student got five correct answers, then each student got at least one correct inswer. Then, from [2], the number of correct answers must otal 1+2+3+4+5 or 15. Because the maximum number of correct answers is 2 (a or b) +2 (a or b) +4 (t) +4 (t) +3 (t) or 15, from [1], Adele's answers would have to be the five correct ones. But then Betty and Doris would each have exactly two correct answers, and Carol and Ellen would each have exactly three correct answers, contradicting [2]. So no one got five correct answers.

Then, from [2], the number of correct answers must total 0+1+2+3+4 or 10. Then the student who got none correct cannot be Adele, Carol, or Doris because the total number of correct answers cannot be the required 10 when the correct

answers for III and IV are both f; because each f occurs only once, the maximum total possible would be 9. So Betty of Ellen got none correct.

If Betty got none correct, then the correct answers the true-false questions would be: III. f (occurs once), IV (occurs four times), and V. f (occurs twice). Then Carol, Dorlar and Ellen would each have at least two correct answers, Adele would have to be the student with one correct answer IV. t (occurs four times). Adele's and Betty's multiple-choice answers would, then, be incorrect; so the correct multiple choice answers would have to be: I. c (occurs once) and II (occurs once). But, then, the total number of correct answer would not be the required 10: 1 (c) +1 (f) +4 (t) +1 (f) =9. So it is Ellen and not Betty who got no correct answers.

Because Ellen got none correct, the correct answers (or the true-false questions must be: III. t (occurs four times) IV. f (occurs once), and V. f (occurs twice). Then Betty, Carol and Doris each got at least two correct answers; so Adele got one correct answer: III. t (occurs four times). Then Adele and Ellen's multiple-choice answer are incorrect; so the correct multiple-choice answer for I is b (occurs twice) so, because the total number of correct answers is 10, the correct multiple-choice answer for II must be c (occurs once)

In summary, the correct answers in order are: b, c, t, f, f and are shown below in circles.

	→, ( <del>-)</del>	a () c	o Ф	Doris
+ 🕞		7 <b>0</b> 1	Э (Б)	Betty
V	∌≡	а п	a I	Adele

So Doris got the most correct answers.

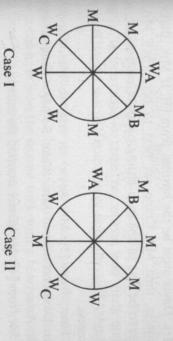

124

### **Sitting Ducks**

From [4], the partial seating arrangement of men and women around the table was either (M represents man and W upresents woman):

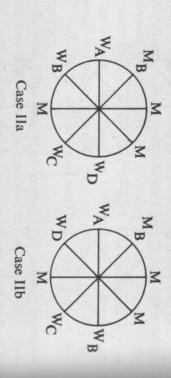

Then, from [1] and [2], either (A represents Astor, B represents Blake, and C represents Crane):

From [3], no man sat next to each one of a married couple; so, in Case I, Mrs. Blake sat opposite Mrs. Astor But, then, no woman can sit next to each one of a married couple as required by [3]; so Case I is eliminated.

Then Case II is the correct case. Then Mrs. Blake and Mrs. Davis were seated in one of the following ways (I) represents Davis):

Then, in Case IIa, Mrs. Astor is the hostess who wan the only person to sit next to each one of a married couple. But either Mr. Astor or Mr. Davis has to be one of the men sitting opposite each other, so that more than one person sat next to each one of a married couple. This situation contradicts [3]; so Case IIa is eliminated.

Then Case IIb is the correct case. Then Mrs. Blake of Mrs. Davis must be the hostess, from [3]. If Mrs. Blake is the hostess, then Mr. Crane sat next to her. Then Mr. Asto has to be one of the men sitting opposite each other, so that more than one person sat next to each one of a married couple. This situation contradicts [3]; so Mrs. Davis is the hostess.

Then, from [3], Mr. Astor sat next to Mrs. Davis while Mr. Davis sat next to Mrs. Blake. So Mr. Crane sat opposite Mr. Astor.

So, from [4], Mr. Crane insulted the hostess

### The High Suit

From [1] and [3], three different suits were led and the high uit was not led.

From [1], [2], and [3]:

- (i) Clubs were not led first.
- (iia) If diamonds were led first, neither clubs nor diamonds is the high suit.
- (iiia) If spades were led first, neither clubs nor hearts nor spades is the high suit.
- (iva) If hearts were led first, neither spades nor hearts is the high suit.

Then—from [1], [3], and [4] and from (iia), (iiia), and (iva) espectively:

- (iib) If diamonds were led first, a club was led second.
- (iiib) If spades were led first, a heart or a club was led second.
- (ivb) If hearts were led first, a spade was led second.

The deductions above produce six possibilities as shown in the table below (C represents clubs, D represents diamonds, H represents hearts, S represents spades, and a circled letter represents the high suit):

	-	П	Ħ	IV	<b>V</b>	V)
Trick	Suits	Suits	Suits	Suits	Suits	Suits
First	DDS	D D(H)	SSD	SSD	н нС	нн
Second	C C(S)	CCH		CCD	S S C	SSD
Third	H H(S)	SSH		HHD	DDC	CC

case I is eliminated because no one could have won the second trick with a spade and led a heart. Case II is eliminated because no one could have won the second trick with a heart and led a spade. Case V is eliminated because Xavier would have led the

spade and both Wilson and Yoeman would have had to play a club. So, in any case, diamonds was the high suit.

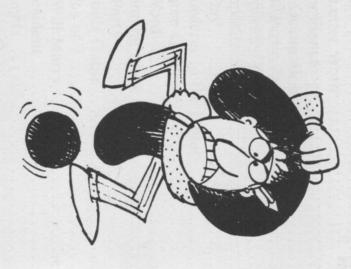

Cases III and IV are eliminated because only Wilson could have led at the second trick after winning the first trick and only Wilson could have led at the third trick after winning the second trick, an impossible situation. Case VI is the only one possible yielding two ways in which the fourth cards could have been played from the holdings; see below (W represents Wilson's holding, X represents Xavier's holding, etc.).

	Second			
0	0	H	w x	Н
S	S	0	×	foldings
0	H	H	×	ngs
0	S	0	7	
Third	Second	First	Trick

The puzzles in Part II have a Solution Scheme for each of M puzzles to help the reader relate the puzzle to its solution. Two other puzzles have no Solution Scheme because of their unusual nature (see Preface); a Hint is offered intead. In addition, each puzzle after the first is given a classification that tells the reader which of five concepts are involved in the puzzle (see Preface).

In general, a solution is reached by reasoning which elimmates the impossible situations until only the correct situation remains.

#### Preface

Most "logic problems" are like this one:

Pam, Ray, Sue, and Tom are an archeologist, a botanist, a chiropractor, and a dentist—though not necessarily in that order. At a party Tom said to the botanist that Sue would be along in a minute, the chiropractor congratulated the dentist on his engagement to Sue, and Pam took a picture of the chiropractor standing next to Ray. What is the occupation of each person?

IIII true. So

With the exception of the first puzzle in Part II, which is a variation on the matching exercise above, none of the puzzles is like that one.

After the first puzzle, each Mind Puzzler involves one or more of the following:

# STATEMENTS THAT MAY BE FALSE

Statements may be false because the people who make them always lie, sometimes lie, lie only at certain times, or alternately tell the truth and lie; they may be false because the people who make them are simply incorrect in what they believe to be true or in what they predict to be true; or they may be false because one of a given number of statements is said to be false, or all but one of a given number of statements are said to be false.

# STATEMENTS BEGINNING WITH "IF"

A statement that contains if has a hypothesis and a conclusion, as in:

If I stay home tonight, then I will watch TV.

The hypothesis is: "If I stay home tonight"
The conclusion is: "then I will watch TV."
What is meant by saying this statement is true?
To answer this question: Suppose I don't stay home tonight. Then I am free to do whatever I want, including watching TV or not watching TV. So a false hypothesis watch make the statement false; that is, the statement is

the statement is true when the hypothesis is false and the conclusion is true

the statement is true when the hypothesis is false and the conclusion is false

Suppose I do stay home tonight. Then, in order for the statement to be true, I must watch TV. Otherwise, the statement is false. So

the statement is true when the hypothesis is true and the conclusion is true

the statement is false when the hypothesis is true and the conclusion is false

A statement that contains a hypothesis and a conclusion can be called a hypothetical statement. When a hypothetical statement is true, you cannot tell whether the hypothesis is true or whether the conclusion is true. However, when a hypothetical statement is false, you know immediately that the hypothesis is true and the conclusion is false. Here is an example of a puzzle containing statements that begin with "if."

- [1] If Natalie is married, then Marlene is not married
- [2] If Natalie is not married, then Loretta is married.
- [3] If Marlene is married, then Loretta is not married

Whose marital status do you know?

SOLUTION: Suppose Marlene is married. Then, from [1], Natalie is not married (otherwise, Marlene is not married) and, from [3], Loretta is not married. Then from [2], Natalie is married (otherwise, Loretta is married). Then Natalie is both married and not married. This situation is impossible. So you know Marlene's marital status: Marlene is not married. Then: if Natalie is not married, then Loretta is married; if Natalie is married, then you don't know whether Loretta is or not. So you know only Marlene's marital status.

"SUSPECTS" ASSOCIATED WITH A STRAIGHT OR A CYCLIC ORDER—
A ONE-DIMENSIONAL ASSOCIATION

Straight orders include: arrival times of people at a mansion, a sequence of eliminated words paralleling a sequence of given information, ages of people, players' turns in a game, tennis-playing abilities of people, west-to-east locations of peoples' apartments, and the order in which entrants finish a race.

Cyclic orders include: a playing arrangement of people around a tennis court, a seating arrangement of people around a table, and days of the week.

A special use of ordering involves someone knowing something from the fact that someone else knows or doesn't know something. Here is an example:

- [1] After being blindfolded and hatted, two men—Xavier and Yoeman—are truthfully told that either they each wear black hats or one wears a black hat and the other wears a red hat.
- [2] After the blindfolds are removed, first Xavier and then Yoeman is asked to name the color of the hat on his head.
- [3] The question is repeated until one man says truthfully that he does not have enough information to know the color of his hat.

Who never knows the color of his hat?

SOLUTION: Suppose Yoeman has a red hat. Then, clares he has a black hat for one of two reasons: (1) doesn't know. Then, from [1] and [2], Yoeman deblack hat. Then from [1] and [2], Xavier declares he situation is impossible. So, from [1], Yoeman has a from [1] and [2], Xavier declares he has a black hat. hat (because Xavier knew his color). From [3], this Then, from [1] and [2], Yoeman declares he has a red color of his (Yoeman's) hat, Xavier never knows the which of the reasons Yoeman had for knowing the he has a black hat. So, because Xavier doesn't know Yoeman sees a red hat on Xavier; (2) Yoeman sees a color of his (Xavier's) hat. Yoeman; because Xavier didn't know, Yoeman knows known the color of his hat if he had seen a red hat on black hat on Xavier and knows that Xavier would have

Two puzzles are of this "unusual nature," as mentioned on page 133.

A TWO-DIMENSIONAL ASSOCIATION OR WITH VARIOUS PARTS OF A REGION-"SUSPECTS" ASSOCIATED BY BLOOD TIES

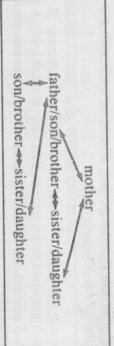

Blood ties include:

aunt are not shown); thus, a two-dimensional picture warious ways (though relationships such as son-in-law iun, and that each person is related to the others in a chart Note that each line in a chart above represents a genera-

noms, a game board, a cross-number diagram, and a layout Regional relationships include faces of a cube, a layout of

# Vera's Preference

Vera prefers her dates to be tall, dark, and hand some.

- [1] Of the preferred traits—tall, dark, and hand some—no two of Adam, Boyd, Cary, and Dirk have the same number.
- [2] Only Adam or Dirk is tall and fair.
- [3] Only Boyd or Cary is short and handsome.
- [4] Adam and Cary are either both tall or both short.
- [5] Boyd and Dirk are either both dark or both fair.

Who is tall, dark, and handsome?

Solution Scheme, page 142

Solution, page 214

# Speaking of Tennis

Four people played a tennis game.

11] The four people were Winifred, her father, her husband, and their daughter.

After the game, one of them spoke truthfully about one time during the game:

- [2] "I was directly across the net from the server's daughter.
- [3] My partner (on the same side of the net as I) was directly across the net from the receiver's father.
- [4] The server was diagonally across the net from the receiver (of course)."

Who spoke?

Classification and Solution Scheme, page 143; Solution, page 214.

### Vera's Preference

#### SOLUTION SCHEME

Make a chart for yourself as follows:

handsome?	dark?	tall?	Is A
			Is Adam Is Boyd Is Cary Is Dirk
			Is Cary
			Is Dirk

Write "yes" or "no" in each box so that no condition is contradicted.

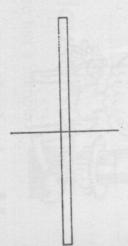

### Speaking of Tennis

#### CLASSIFICATION

#### SOLUTION SCHEME

Make a diagram for yourself as follows:

Write "Winifred," "her father," "her husband," or "heir daughter" in each of the four parts of the tennis court diagram and write "server" or "receiver" in each of two parts so that no condition is contradicted.

## **Getting Married**

Four men—Aaron, Barry, Colin, and David—and four women—Marie, Norma, Olive, and Pearl—attended a wedding.

- [1] One of the four men married one of the four women.
- [2] If Aaron did not get married and if Marie did not get married, then Olive got married.
- [3] If Aaron did not get married and if Norma did not get married, then Barry got married.

- 4] If Barry did not get married and if Olive did not get married, then Colin got married.
- [5] If Colin did not get married and if Norma did not get married, then Marie got married.

Who got married?

Classification and Solution Scheme, page 146; Solution, page 215.

# My House Number

My house has a number.

- [1] If my house number is a multiple of 3  $(0 \times 3, 1 \times 3, 2 \times 3, \text{ etc.})$ , then it is a number from 50 through 59.
- [2] If my house number is not a multiple of 4, then it is a number from 60 through 69.
- [3] If my house number is not a multiple of 6, then it is a number from 70 through 79.

What is my house number?

Classification and Solution Scheme, page 147. Solution, page 216.

Cross off every number that contradicts any condition.

# The Murderer in the Mansion

The owner of the mansion has been murdered! The visitors to the mansion were Allen, Bixby, and Crain.

- [1] The murderer, who was one of the three visitors, arrived at the mansion later than at least one of the other two visitors.
- [2] A detective, who was one of the three visitors, arrived at the mansion earlier than at least one of the other two visitors.
- [3] The detective arrived at the mansion at midnight.

- [4] Neither Allen nor Bixby arrived at the mansion after midnight.
- [5] The earlier arriver of Bixby and Crain was not the detective.
- [6] The later arriver of Allen and Crain was not the murderer.

Who was the murderer?

Classification and Solution Scheme, page 150. Solution, page 216.

### The Cube

Three views of the same cube are shown above

Which of the five letters—E, H, I, N, or S—occurs twice on the cube?

Classification and Solution Scheme, page 151. Solution, page 217.

## Three-Letter Word

Here is a list of words:

INN PEN PET PIE TEE TIE

- [1] Three logicians are told, "I have told each of you one of the three letters in a word listed before you so that the three known letters together spell the word."
- [2] Then they are told, "None of you can tell how many vowels the word has."
- [3] Then they are told, "At this point still none of you can tell how many vowels the word has."
- [4] Then one of the three logicians says he knows what the word is.

What is the word?

Classification and Solution Scheme, page 154, Solution, page 218.

### Esther's Fiancé

Esther is engaged.

- [1] Her fiancé is either Arthur, Barton, Claude, or Dexter.
- [2] Each of the four men and Esther either always tells the truth or always lies.
- [3] Arthur says: "Exactly one of us four men always tells the truth."
- [4] Barton says: "Exactly one of us four men always lies."
- [5] Claude says: "Arthur, or Barton is Esther's fiancé."
- [6] Esther says: "My fiancé and I either both always tell the truth or both always lie."

Who is Esther's fiancé?

# **Family Occupations**

One of four people is a singer and another is a dancer.

- [1] The four people are Mr. Brown, his wife, their son, and their daughter.
- [2] If the singer and the dancer are the same sex, then the dancer is older than the singer.
- [3] If neither the singer nor the dancer is the parent of the other, then the singer is older than the dancer.
- [4] If the singer is a man, then the singer and the dancer are the same age.
- [5] If the singer and the dancer are of opposite sex, then the man is older than the woman.

Whose occupation do you know?

Classification and Solution Scheme, page 158, Solution, page 219.

### A Small Party

"At the party:

- [1] There were 9 men and children.
- [2] There were 2 more women than children.
- possible was 24. (If there were 10 men and 5 women at the party, then there would have been 10 × 5 or 50 man-woman couples possible.)

Of the three groups—men, women, and children—at the party:

- [4] There were 4 of one group.
- [5] There were 6 of one group.
- [6] There were 8 of one group."
- [7] Exactly one of the speaker's statements is false.

Which of [1] through [6] is false?

# Harry Will Marry

Harry will marry April, Bette, or Clare.

- [1] Of April and Bette:
- (a) Either both have hazel eyes or both do not
- (b) One is red-haired and the other is not.
- [2] Of April and Clare:
- (a) Either both are red-haired or both are not
- (b) One is slender and the other is not.
- [3] Of Bette and Clare:
- (a) One has hazel eyes and the other does not
- (b) One is slender and the other is not.
- [4] Of the mentioned characteristics—hazel eyes, red-haired, and slender:
- (a) If any of April, Bette, and Clare has exactly two of these characteristics, then Harry will marry only the woman with the least number of them.
- (b) If any of April, Bette, and Clare has exactly one of these characteristics, then Harry will marry only the woman with the great est number of them.

Who will Harry marry?

Classification and Solution Scheme, page 182, Solution, page 232.

### The President

Aubrey, Blaine, and Curtis live on an island inhabited by three groups: the Truthtellers, the Falsifiers, and the Alternators.

- [1] Each is either a Truthteller who always tells the truth, a Falsifier who always lies, or an Alternator who alternately tells the truth and lies.
- [2] One of the three is President of the island.
- [3] Aubrey says: (a) "The President belongs to a different group from each of the other two of us."
- (b) "Blaine is not the President."
- [4] Blaine says: (a) "The President is a Falsifier."(b) "Aubrey is not the President."
- [5] Curtis says: (a) "Exactly two of us belong to the same group."

  (b) "I am not the President."

Who is the President?

# The Owner of the Table

Six people were seated around a table.

[1] Their chairs were arranged around the rectangular table like this:

- [2] The six people were three women—Althea, Blythe, and Cecile—and three men—Dudley, Edward, and Foster.
- [3] Althea sat opposite Blythe or Dudley.
- [4] Edward sat to the immediate left of Cecile.
- [5] Foster sat to the immediate left of one woman and to the immediate right of another woman.
- [6] The person who owned the table was the only person who sat both opposite a man and to the left of a woman.

Who owned the table?

Classification and Solution Scheme, page 190; Solution, page 237.

### Family Murder

Statement I. I am the mother of the murderer, but not the mother of the victim.

Natement II. I am the mother of the victim, but not the mother of the murderer.

Statement III. I am the same sex as the victim.

Of the statements above and the people who made them:

- [1] Each statement was made by a different one of four people—Alice, her mother, her brother (her mother's son), and her son.
- [2] The one person of these four who made no statement is the victim, murdered by one of the other three.
- [3] Exactly one of the three statements is false.

Who is the murderer?

Then, because it is not a multiple of 3 Note: If the speaker is placed in the upper right instead of server's daughter, AT, ET, IT, OT isnition then, from [2], it cannot be "not a m receiver a multiple of 4. The pres none multiple of 4.

but the corresponding identities of the players remain the same

Getting Married system of [8] bas [8] snort

tive . So, from [2], Allen was the detective. The [3] punk [4] Aaron married Olive. But this situation is impossible, from Suppose Aaron sot married. Then, from [1] and [4].

Suppose Colin got married. Then, from [1] and [3], Colin married Norma. But this situation is impossible, from [1] and [2].

Suppose David got married. Then, from [3] and [4], David married Norma and Olive. But this situation is impossible, from [1].

So, from [1], Barry got married.

From [1] and [2], Barry did not marry Norma. From [1] and [5], Barry did not marry Olive. From [1] and [2] or from [1] and [5], Barry did not marry Pearl.

So, from [1], Barry and Marie got married.

## My House Number

Suppose my house number is a multiple of 3. Then, from [1], it is either 51, 54, or 57. But, from [2], it cannot be any of these numbers because none is a multiple of 4. So my house number is not a multiple of 3.

Then my house number is not a multiple of 6 because a multiple of 6 is a multiple of 3. So, from [3], it is a number from 70 through 79. Then, because it is not a multiple of 3, it is either 70, 71, 73, 74, 76, 77, or 79.

Then, from [2], it cannot be "not a multiple of 4," so it is a multiple of 4. Then my house number is 76, because it is either 70, 71, 73, 74, 76, 77, or 79, and of these only 76 is a multiple of 4.

## The Murderer in the Mansion

From [2] and [3], the detective arrived at midnight and at least one of the three visitors arrived after midnight. Then, from [4], Crain arrived after midnight. So Crain was not the detective. Then, from [4] and [5], Bixby was not the detective. So, from [2], Allen was the detective. Then, from [6],

Crain was not the murderer. Then, from [1] and [4], Allen arrived after Bixby and Allen was the murderer.

In summary: Bixby arrived before midnight; Allen, who was both detective and murderer, arrived at midnight; and Crain arrived after midnight.

#### The Cube

Either S occurs twice or S occurs once on the cube. If S occurs twice on the cube: then, from [2],

Then, from [1], and H would have to be on the

face where E is. This situation is impossible. So S occurs once on the cube. Then, from [2]

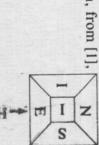

m I

S

Then, from [3], N; then, from [1],

I

S

So I occurs twice on the cube.

Three-Letter Word I restant out for sev rish

From [1] and [2], none of the three logicians was told the In summary: Bixby arrived before midnight: Allen, who

word had one vowel. So the word is not INN or PEN. word had an N; otherwise a logician would know that the

Either 2 occurs twice or 2 occurs once on that I plo ald told the word had an I; otherwise a logician would know the word, now one of four, had two vowels. So the word is not Then, from [1] and [3], none of the three logicians was

remaining words, PET and TEE. So that logician was told must have been told a letter that is in only one of the two the word had a P and the word is PET. Then, from [1] and [4], the logician who knows the word

# Esther's Fiancé H bus 7.111 mont. mont.

the declaration in [3] is false. Then the declaration in [4] is then Claude lied and Dexter is the truth-telling fiance. Then the truth. fiancé always tells the truth. So Esther's fiancé always tells fiancé always tells the truth; if Esther always lies, then her Then, from [1] and [2]: If the declaration in [5] is false. From [2] and [6]: If Esther always tells the truth, then her ace where E is. This situation is impossible.

Then, from [1] and [5], the Brown, respectively, nor Mr. Brown's daughter and Mr. Suppose Case II is true. Then, from [1], [3], and [5], the Suppose Case I is true. Then, from [1] and [2], the dancer So, in either case, you know Mr. Brown's daughter is the

diate left was Mr. Alden and, from [3], Mrs. Crown could Then, from [3], the man who sat on Mrs. Crown range A Small Party on Jesson in this on its even ton From [4], Mrs. Crown could not have

[3] and [4], either (We is Crown woman, MA is Blassodmi Suppose [4] through [6] are all true. Then [1] is false, and [2] and [3] cannot both be true. From [7], this situation is

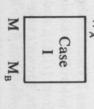

men and 3 women; or (B) there were 3 men and 8 women. 11 men and women. Then, from [3], either: (A) there were 8 through [3] are all true. Then, from [1] and [2], there were So, from [7], one of [4] through [6] is false, and [4]

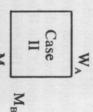

correct. Then [4] and [5] are both false, contradicting [7]. So A is not Suppose A is correct. Then, from [2], there was I child.

Then B is correct. Then, from [2], there were 6 children. Then [4] is false.

## The Separated Couple

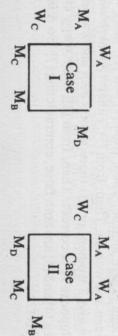

From [1] and [2], either ( $W_A$  is Alden woman, M is man, and  $M_B$  is Brent man):

Then the man sitting across from Mrs. Alden was not Mr. Drake, from [3], and was not Mr. Alden, from [4]. So the man sitting across from Mrs. Alden was Mr. Crown.

Then, from [3], the man who sat on Mrs. Crown's immediate left was Mr. Alden and, from [3], Mrs. Crown could not have sat in chair h in CaseI, nor in chair a or f in Case II. From [4], Mrs. Crown could not have sat in chair b, c, or d in CaseI, nor in chair c or g in Case II. So Mrs. Crown sat either in chair g in Case I or in chair h in Case II. So, from [3] and [4], either (W<sub>C</sub> is Crown woman, M<sub>A</sub> is Alden man, M<sub>C</sub> is Crown man, and M<sub>D</sub> is Drake man):

Then, from [4], Case I is impossible because either the Blakes sat next to each other and the Drakes sat next to each other, or the Blakes sat across from each other. So Case II is the correct one. Then the Crowns did not sit next to each other and, from [4], Mrs. Brent and Mrs. Drake each sat next to her husband.

## The Opposite Sex

From [2] and [3], Marion cannot be an only daughter and have a sister; so Marion is a male. Then, from [3], Marion is Carmen's brother.

From [2], Marion's sister is either Evelyn or Leslie. Suppose Evelyn is Marion's sister; then, from [1], Carmen is Leslie's only son. But, from previous reasoning, Marion is Carmen's brother; so Marion would also be Leslie's son. This situation contradicts [1]. So Leslie, not Evelyn, is Marion's sister.

Then, from [1], Evelyn is Leslie's only son.

It is now known that Marion and Evelyn are males and Leslie is a female. So, from [4], Leslie is the opposite sex from each of the others and Carmen is a male.

In summary: Leslie is a female, Marion and Carmen are her brothers, and Evelyn is her son.

#### Truth Day

From [1], Philip's declarations in [3] and [5] cannot both be false; otherwise he tells the truth on more than one of the days of the week. From [1] and the fact that the declarations in [3] through [5] were made on consecutive days, Philip's declarations in [3] and [5] cannot both be true; otherwise he tells the truth on more than one of the days of the week. So

declaration in [5] is the only true one. [4] mond ment

Of Suppose his declaration in [3] is the only true one? Then, of on his false declaration in [5], he made the declaration in [43] on a Wednesday or a Friday? Then, from [23] his false declaration in [4] was made on a Thursday of a Saturday. This situation is impossible busideside on 1x3n 152 flore.

So his declaration in [5] is the only true one. Then, from his false declaration in [5], he made the declaration in [5] on a Monday or a Tuesday. Then, from [2], his false declaration in [4] was made on a Sunday or a Wonday. His declaration in [4] could not have been made on a Sunday; otherwise his declaration in [4] would be true. So his declaration wise his declaration in [4] would be true. So his declaration in [4] was made on a Monday.

Then, from [2], his true declaration in [5] was made on a Tuesday and Philip tells the trith on fliesday. [3] more remainded in the state of north at hylpy a second remains a fine of the state of north at hylpy a second remains a fine of the state of north at hylpy a second remains a fine of the state of north at hylpy a second remains a fine of the state of the stat

## Cerusen's protification, will sale printing adju-

From [2], there was only one murderer. So either one hypothesis of [4] and [5] is false or both hypotheses in [4] and [5] are false.

Case I Suppose both hypotheses in [4] and [5] are false. Then the murderer and the victim stayed in rooms that bordered on the same number of rooms (from [4]), and that were the same size (from [5]). This situation is impossible, from [1].

Case II. Suppose the hypothesis in [4] is true and the hypothesis in [5] is false. Then the murdered and the victim stayed in rooms that bordered on different numbers of rooms (from [4]), and that were the same size (from [5]). Then from [1] either (a) Arlene or Farley was the victim and the other was the murderer, (b) Brenda or Dame! was the wittin and the other was the murderer, or (c) Cheryl or on selwing the other was the murderer, or (c) Cheryl or on selwing the other was the murderer, or (c) Cheryl or on selwing the other was the murderer.

Emmett was the victim and the other was the murderer.

From [4], a is impossible and, from [3], b and c are impossible and from [3], b and c are impossible and from [3], b and c are impossible and from [3].

Case III. So the hypothesis in [5] is true and the hypothesis in [4] is false. Then the murderer and the victim stayed in rooms that bordered on the same number of rooms from 1), and that were different in size (from [5]). Then, from 1, either: (d) Arlene or Daniel was the victim and the other was the murderer, (e) Brenda or Emmett was the victim and the other was the murderer, or (f) Cheryl or Farley was the victim and the other was the murderer. From [5], f is impossible and, from [3], e is impossible. Then d is correct and, from [5], Daniel was the murderer. So Arlene was the victim.

## The Three Groups, bus 8 to 8 at I not I Rei G

Exactly two of the three hypotheses in [2], [3], and [4] must be false. So, because a hypothetical statement is true when the hypothesis in it is false, at least two of the declarations in [2], [3], and [4] must be true.

Case I. Only the declaration in [2] is false. Then Anita's hypothesis is true and her conclusion is false. Then, from [1], each person is a Normal.

Case II. Only the declaration in [3] is false. Then Beryl's hypothesis is true and her conclusion is false. Then, from hypothesis is true and her conclusion is false. Then, from hypothesis is a Normal. (If Beryl is a Fibber, then someone else must be a Fibber, which is impossible.) Then either Anita and Chloe are both Trusties, Anita is a Trusty and Chloe is a Normal, or Chloe is a Trusty and Anita is a Normal.

Case III. Only the declaration in [4] is false. Then Chloe's hypothesis is true and her conclusion is false. Then from

[1], Chloe is a Normal and either Anita or Beryl is a Fibber This situation is impossible, from [1].

Case IV. The declarations in [2], [3], and [4] are all true. Then, because exactly one of their hypotheses is true, one of their conclusions is true. Then at least one person is a Fibber. This situation is impossible, from [1].

In summary: Anita is a Trusty or a Normal, Beryl is a Normal, and Chloe is a Trusty or a Normal. So you know Beryl's group.

#### Code Word

S must be 1. Then D (under L) is greater than 5. If D is 6, then L is 0; but then A is 0 or 1, which is impossible. If D is 7, then L is 0 and A is 2. If D is 8, then L is 2; then A is 3. If D is 9, then L is 2 or 3 and A is 3 or 4. So either:

<	iv	H	=	-	Case
1	1	1	-	_	S
		9			
		2			
4	4	w	3	2	A

If I was carried from D to E, then N would have to be 9 and D (over A) would have to be 6 more than A. So Case iii is eliminated. Then E (over N) is I more than N. So E is not 0.

E is not 1. If E is 2, then N is 1; so E is not 2. If E is 3, then N is 2; so E is not 3.

So E is greater than 3. Then 1 was carried from L to I (or D - L = 6). So Cases i and iv are eliminated.

If E is 4, then N is 3; so E is not 4. If E is 5, then I is 1; so

E is not 5. If E is 7, then I is 3; so E is not 7. If E is 8, then I is 4; so E is not 8. If E is 9, then N is 8; so E is not 9. So E is

Then I is 2 and N is 5. So Case ii is eliminated (because I is 2) and Case v is the correct one.

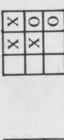

In summary: Case S D L A E I N v 1 9 3 4 6 2 5

Then the word that represents 3651 is LENS.

## The Winning Mark

7 4 5 7 8	-
20 12 1	
	2
9	,,

Let a number in each square as shown indicate the location of a mark. Then, from [3], the seventh mark must be placed in square 3 where, from [2], it wins for X orO; or be placed in square 9 where, from [2], it wins for X. So, from [3], the sixth mark must have been placed in a line already containing two of the opponent's marks: either in square 2 or in square 7; otherwise, either X or O would have been placed in square 3 or X would have been placed in square 9. So before the sixth mark was placed in a square the situation was either:

Case II

Case I

In Case I an X must be the fifth mark, from [I]. But none of the Xs could be the fifth mark because, from [3], as the fifth mark: the X in square 5 would have been placed in square 9, the X in square 7 would have been placed in square 2, and the X in square 8 would have been placed in square 3. So Case I is not the correct situation.

Then Case II is the correct situation and, from [1], O was the fifth mark. Then, from [1], the seventh mark will be O and, from [2], O wins the game.

Which O was the fifth mark can be determined from [3]. As the fifth mark: the O in square 2 would have been placed in square 7 and the O in square 4 would have been placed in square 3. So the fifth mark was the O in square 1.

#### A Big Party

		ь		number n		n		From [1], nu
12	11	oys	of +	mber	+	nen	of -	mber
19	11	girls	+ of $= 17$	number	+	women	of $+$ of $= 14$	number
								So, keeping the spa-

tial relationship indicated, one gets either: 0 + 14

Then, from [2], one compares the product of the top two numbers with the product of the bottom two numbers in each case; the difference between the products should be one of the numbers multiplied to get the smaller product. Trial and error reveals that 9 + 5 is the correct case:  $9 \times 5 = 3 \times 14 + 3$ 

$$3 \times 14 + 3 + + + \\ 3 + 14$$

or  $9 \times 5 = 3 \times 15$ . So the speaker is a girl.

This puzzle can also be solved by using algebra, as follows. Let m be the number of male adults. Then, from [1].

Then, from [2], the speaker is either a (I) man:  $(m+1)\times(14-m) = (12-m)\times(m+5)$  or (II) woman:  $(m)\times(14-m+1) = (12-m)\times(m+5)$  or (III) boy:  $(m)\times(14-m) = (12-m+1)\times(m+5)$  or (IV) girl:  $(m)\times(14-m) = (12-m)\times(m+5+1)$ .

Attempting to solve each equation in turn, one finds that m can be a whole number only in IV:

I. 
$$(m+1) \times (14-m) = (12-m) \times (m+5)$$
  
 $14m-m+14-m^2 = 12m-5m+60-m^2$   
 $13m+14 = 7m+60$   
 $6m = 46$  impossible

II. 
$$(m) \times (15-m) = (12-m) \times (m+5)$$
  
 $15m-m^2 = 12m-5m+60-m^2$   
 $15m = 7m+60$   
 $8m = 60$  impossible

III. 
$$(m) \times (14 - m) = (13 - m) \times (m + 5)$$
  
 $14m - m^2 = 13m - 5m + 65 - m^2$   
 $14m = 8m + 65$   
 $6m = 65$  impossible

IV. 
$$(m) \times (14 - m) = (12 - m) \times (m + 6)$$
  
 $14m - m^2 = 12m - 6m + 72 - m^2$   
 $14m = 6m + 72$   
 $8m = 72$   
 $m = 9$ 

## The Tennis Game

	From [3]:
	better male
poorer Smith	
	Then, from [2],

worst	better male better Jones
poorer Smith	better male
poorer Smith worst	better Jones

	n, from [4], either:
worst poorer male	better male better Jones
worst poorer Smith better female

poorer male	better Jones
Mr. Smith	Mr. Jones
poorer Smith better female Mrs. Smith	Mrs. Jones
better female	better male
Mrs. Smith	Mr. Jones
poorer Smith worst poorer male Mr. Smith	better Jones Mrs. Jones

ble. So Case I is not a correct case. Smith is the poorer Smith player. This situation is impossi-Then, in Case I, Mr. Smith is the worst player and Mrs

Mrs. Smith. So the best player is Mrs. Smith. Jones player is Mrs. Jones, and the better female player is Mr. Smith, the better male player is Mr. Jones, the better Note: If the better male player is placed in the upper right Then Case II is a correct case. Then the worst player is

of the players will be Mrs. Jones | Mr. Jones instead of the upper left of the diagram, then the placement

Mr. Smith | Mrs. Smith

order of playing abilities remains the same

#### Multiples of 7

either 0, 1, 4, 7, or 8. So: numbers, A must be either 0, 2, 4, 7, or 9 and G must be 56, 63, 70, 77, 84, 91, or 98. Then, from [3] and the listed BE, CF, EG, and FG is either 00, 07, 14, 21, 28, 35, 42, 49, From [1] and [2], each number represented by AB, AC

or 8	2 or 9	0 or 7	Then E or	Case III	Case II	Case I	
			Fis	4	2 or 9	0 or 7	>
4	∞ or –	0 or	If G is				Then
Case iii	Case ii	Case i		2 or 9	% Or —	or 0	en B or C is

BE is a multiple of 7. Case I, II, or III must coexist with Case i, ii, or iii so that

00, 07, 70, or 77 occurs twice among AB, AC, EG, and FG This situation is impossible, from [3]. Case I. If B is 0 or 7, then E must be 0 or 7. Then either

to be 4. is impossible because neither Case i, ii, nor iii allows E Case II. If B is 1 or 8, then E must be 4. This situation

Case III. So this case is the correct one. Then B is 2 or 9. Then E is 1 or 8. Then Case iii coexists with Case III.

So A is 4 and G is 4. Then 1 must be carried to G when ADG is divided by 7. So D must be 1 more than 2 which is 3. Then ADG must represent 434.

The coexistence of Cases III and iii results in these four possible arrangements of the digits:

In each arrangement, BDF and CDE are multiples of 7.

### Harry Will Marry

From [1a] and [3a], either (A represents April, B represents Bette, C represents Clare, H represents hazel eyes, h represents no hazel eyes):

Then, from [1b] and [2a], either (R represents red hair, r represents no red hair):

R H H h	Case Ia
H H h	Case Ib
h h H R	Case IIa A B C
r R r	Case IIb

From [2b] and [3b], either: (i) Clare is the only one of the three who is slender, or (ii) Clare is the only one of the three who is not slender. From [4], neither i nor ii is possible in Cases Ia and IIb (one woman cannot have exactly one characteristic at the same time that another woman has exactly two characteristics because Harry will marry only one woman). So, from [4], either (S represents slender, s represents not slender):

S	т	H	A	Ca
SSSs	R	H	В	ise II
s	г	h	C	0
s s s	R	h	A	Ca
s	г	h	В	ise I
S	R	H	0	la

Then, from [4a], Harry will marry Clare in Case Ib and, from [4b], Harry will marry Clare in Case IIa. So, in either case, Harry will marry Clare.

#### The President

Suppose [4a] is true. Then, from [1] and [2], [3b] is true. Then, from [1] and [2], [4b] is true. Then, from [2], Curtis is

the President. Then, from [1], [5a] and [5b] are both false. Then, from [1] and because [5a] is false, [3a] is false. But [3a] cannot be false because the President does belong to a different group from each of the other two (from [1]). So [4a] is not true but false.

With [4a] false, suppose [4b] is true and Blaine is the President. Then, because Blaine is the President, [3b] is false and [5b] is true. Then, because Blaine is the President and is an Alternator (from [1]), [3a] is false. Then [5a] can be neither true nor false. So, with [4b] true; Blaine is not the President.

With [4a] false, suppose [4b] is true and Curtis is the President. Then, because Curtis is the President, [3b] is true and [5b] is false. Then, because [4a] and [5b] are false, [5a] is true. Then, because Blaine and Curtis are both Alternators (from [1]) and Curtis is the President, [3a] is false. Then [5a] is false. Then [5a] is both true and false. This situation is impossible. So, with [4b] true, Curtis is not the President.

Then, with [4a] false, [4b] is not true but false. Then, Aubrey is the President.

Then [4a] and [4b] are false, and [3b] and [5b] are true. Suppose [3a] is false. Then, because there must be another Alternator along with Aubrey, [5a] is false. But [5a] cannot be false. So [3a] is true. Then, because there must not be false. Truthteller, [5a] is false. That [5a] is false is confirmed by the result.

In summary: Aubrey is a Truthteller and the President, Blaine is a Falsifier, and Curtis is an Alternator who first lied and then told the truth.

#### **Apartments**

From [2], there is only one landlord. So no more than one of the conclusions in [3] through [6] is true.

Suppose no conclusion is true in [3] through [6]. Then each hypothesis in [3] through [6] is false. Then, from false hypotheses in [3] and [5], Blake's apartment is between Clark's and Doyle's. Then both hypotheses in [4] and [6], cannot be false. So this situation is impossible.

So exactly one conclusion is true in [3] through [6]. Then, because the other three conclusions are false, the hypotheses associated with the three conclusions are false. Then, because all the hypotheses cannot be false, the hypothesis associated with the true conclusion is true.

Suppose the hypothesis in [3] is the only true hypothesis. Then from [3], Avery lives in apartment a. From [1] and because the hypothesis in [6] is false, this situation is impossible

Suppose the hypothesis in [4] is the only true hypothesis. Then, from [4], Doyle lives in apartment d. From [1] and because the hypothesis in [6] is false, this situation is impossible

Suppose the hypothesis in [6] is the only true hypothesis. Then, from [6], Blake lives in apartment b. Then, from [1] and the false hypotheses in [3] and [5], Avery lives in apartment d. From [1] and because the hypothesis in [4] is false, this situation is impossible.

So the hypothesis in [5] is the only true one. Then, from

[5], Clark is the landlord.

From [5], Clark lives in apartment c. So, from [1] and the false hypotheses in [4] and [6], Blake lives in apartment d. Then, from [1] and the false hypothesis in [6], Doyle lives in apartment a and Avery lives in apartment b. With this arrangement, the hypothesis in [3] is false, as it should be.

## Murderer's Occupation

From [8], as many as fourteen correct choices are possible (only one for occupation, two each for weight and

smoking habits, and three each for the other particulars) and as few as eight correct choices are possible (three for sex and one each for the other particulars) in [1] through [6]. From [7], the number of correct choices is a multiple of six. So the number of correct choices is twelve, each detective getting two. The following reasoning uses [1] through [6].

The murderer could not be both 63 to 66 inches tall and 20 to 30 years old; otherwise, one detective would have gotten three particulars correct, including sex. The murderer could not be neither 63 to 66 inches tall nor 20 to 30 years old; otherwise, the number of correct choices would be less than twelve (one for height, one for age, one for occupation, three for sex, and at most two each for weight and smoking habits). So either the murderer is 63 to 66 inches tall or the murderer is 20 to 30 years old, but not both.

Then (because the murderer is either 63 to 66 inches tall or 20 to 30 years old, but not both) two detectives are correct about the weight—110 to 130 pounds or 130 to 150 pounds—and two detectives are correct about the smoking habits—cigarette smoker or cigar smoker; otherwise, the number of correct choices would be less than twelve (four for height and age, one for occupation, three for sex, and less than four for weight and smoking habits).

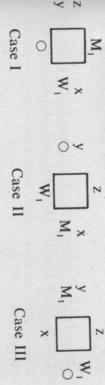

If the murderer is 63 to 66 inches tall, then the murderer cannot be a male; otherwise, the murderer would be a cigarette smoker or a cigar smoker (already established) and some detective would have more than two correct choices. Then the murderer is a female. Using the fact that each detective got two correct choices, one finds: first, the murderer is a cigar smoker; next, the murderer weighs 110 to 130 pounds; next, no correct age choice is possible. So the murderer is not 63 to 66 inches tall.

Then the murderer is 20 to 30 years old. Then the murderer cannot be a male; otherwise, the murderer would

weigh either 110 to 130 pounds or 130 to 150 pounds (already established) and some detective would have more than two correct choices. Then the murderer is a female. Then, from [4], the murderer is a draper and a cigar smoker (no other particulars are left in [4]). Then, from [1], the murderer weighs 110 to 130 pounds (no other particular is left in [1]). Then, from [3], the murderer is 69 to 72 inches tall (no other particular is left in [3]).

## The Owner of the Table

From [1] and [6], either  $(M_1$  is man,  $W_1$  is woman,  $\bigcirc$  is owner of table):

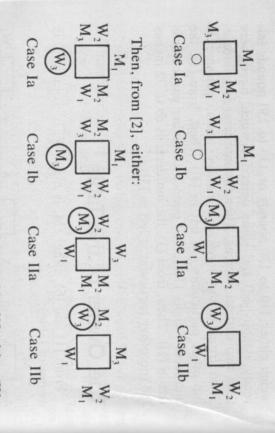

Case I. If x is a man, then y is a man; otherwise z's position contradicts [6]. If x is a woman, then y is a woman; otherwise W<sub>1</sub>'s position contradicts [6].

Case II. If x is a man, then  $\bigcirc$  is a man; otherwise y's position contradicts [6]. If x is a woman, then  $\bigcirc$  is a woman; otherwise  $M_1$ 's position contradicts [6].

Case III. If x is a man, then y is a man; otherwise z's position contradicts [6]. But if x is a man and y is a man, then W<sub>1</sub>'s position contradicts [6], from [2]. So this situation is impossible. If x is a woman, then O is a woman; otherwise M<sub>1</sub>'s position contradicts [6]. But if x is a woman and O is a woman, then x's position contradicts [6], from [2]. So this situation is impossible.

So either (M<sub>1</sub> is first man, M<sub>2</sub> is second man, etc.):

Then, from [5] followed by [4] followed by [2], either ( $W_C$  is Cecile,  $M_D$  is Dudley,  $M_E$  is Edward, and  $M_F$  is Foster):

Then, from [3], Cases Ia, Ib, and IIa are impossible and Case IIb is correct. Then *Cecile owned the table*. From [3], W<sub>1</sub> is Althea; then, from [2], W<sub>2</sub> is Blythe.

#### Family Murder

Suppose Statements I and II are both true. Then, from [1], a different woman made each one. Then, from [1], a

man made Statement III. Then, from [1] and [2], the victim is a man. Then Statement III is true. This situation contradicts [3], so it is impossible. Then, from [3], either Statement I or Statement II is false and Statement III is true.

Suppose the true Statement III was made by a woman. Then, from [1] and [2], Statements I and II were each made by a different man. Then both Statements I and II are false. This situation contradicts [3], so it is impossible. Then the true Statement III was made by a man. Then the victim was a man. Then, from [1] and [2], one of Statements I and II was made by Alice and the other was made by Alice's mother; and either Alice's brother or Alice's son is the victim.

Suppose Statement II is the false statement. (A) If Alice's brother is the victim, Alice's mother could not have made a true Statement I; so Alice's mother made a false Statement II and Alice is the murderer. But then Alice would have to have made a true Statement I. This situation is impossible. (B) If Alice's son is the victim, Alice could not have made a true Statement I; so Alice made a false Statement II and Alice's son is the murderer. This situation is impossible. So, from A and B, Statement II is not the false statement.

Then, from [3], Statement I is the false statement. (C) If Alice's brother is the victim, Alice's mother made a true Statement II. Then Alice is not the murderer and Alice made a false Statement I. Then Alice's son is not the murderer. Then Alice's mother is the murderer. (D) If Alice's son is the victim, Alice made a true Statement II. Then Alice's mother made a false Statement I. Then neither Alice nor Alice's brother is the murderer. Then Alice's mother is

Then, from C and D, Alice's mother is the murderer. (Note: It is not possible to tell who made each statement and who is the victim.)

### The Dart Game

From [1] and [2], any of six values was scored by a dart. Then, from [4], the men either scored two different values each or one man scored only one value.

If the men each scored two different values, then one man scored five 1s, from [1] and [3]. Then, from [1] and [2], each total score ends in 5 because the man who scored the five 1s scored four of a value that ends in 5 or 0. So a second man scored all the 5s (from [5], this man is Arnold) and the third man scored all the 25s. Then Buford could not have scored the five 1s because, from [3], he would have scored four 10s making his total score less than 100; this situation contradicts the assumption started with and [1]. Then Conrad scored the five 1s and his total score was either 205 (five 1s and four 50s) or 405 (five 1s and four 100s), from [1] and [2]. But then Buford, who scored all the 10s (from [5]) and all the 25s (from previous reasoning), could not have scored either total. So each man did not score two different values.

Then one man scored only one value. Then, from [1], [2], and [4], at least five different values were scored. The single value scored by one man could not have been 1 or 100 because a total score of 9 or 900 could not be scored in any other way, from [4]. The single value could not be 5, totaling 45, because at least one 50 or one 100 was scored. The single value could not be 10, totaling 90, because then (from [1] through [4]): there would be no 100s, a second man would have to score one 50 and eight 5s, and the third man would have to score 90 with five 1s and four 25s; this situation is impossible. The single value could not be 50, totaling 450, because (from [1] and [4]) a second man would have some 100s and the total of 450 could not be scored by the third man with only values less than 50. So, from [1], the single value was 25.

Then, from [5], Conrad scored all the 25s. Then, from [3]

the total score of each man was 225. For each man's score to end in 5, one man has to have 25s, a second man has to have 5s, and the third man has to have five 1s (from [1], [3], and [4]). So, from [5], Buford scored five 1s. Then, from [5], Buford scored two 10s and two 10s as well. So Buford scored all the 100s. Then, from [1] and [4], Arnold scored five 5s and four 50s.

#### Hotel Rooms

From [2] through [6]. (X) the man who lied occupied the same size room as another man. From [2] and [7]: (i) If the man who lied occupied a room that bordered on four other rooms, then that room bordered on two rooms occupied by men and two rooms occupied by women. (ii) If the man who lied occupied a room that bordered on three other rooms, then that room bordered on one room occupied by a man and two rooms occupied by women. (iii) If the man who lied occupied a room that bordered on two other rooms, then that room bordered on two other rooms, then

The following reasoning uses [2].

Case I. (a) Suppose the man who lied occupied room C. Then, from i, a woman occupied room A. This situation contradicts X, so it is impossible. (b) Suppose the man who lied occupied room F. Then, from i, a woman occupied room D and, from X, a man occupied room E. Then, from [7], a man occupied room C; otherwise room E, occupied by a man, bordered on two rooms occupied by women, contradicting [7]. Then, from [1], women occupied rooms A and B. But room C, occupied by a man, borders on two rooms occupied by women. This situation contradicts [7], so it is impossible.

Case II. (c) Suppose the man who lied occupied room B. Then, from X, a man occupied room D. Then, from [7], rooms C and E were not both occupied by women; other-

wise room D, occupied by a man, bordered on two rooms occupied by women. So room C or E was occupied by a man, from [1], and rooms A and F were both occupied by women. Then, from [7], room E was not occupied by a man; otherwise room E bordered on two rooms occupied by women, from [1], contradicting [7]. So room E was occupied by a woman. Then room C, occupied by a man, from [1], borders on two rooms occupied by women. This situation contradicts [7], so it is impossible. (d) Suppose the man who lied occupied room E. Then, from X, a man occupied room F. Then, from ii, women occupied rooms C and D. Then room F, occupied by a man, borders on two rooms occupied by women, from [1]. This situation contradicts [7], so it is impossible.

Case III. (e) Suppose the man who lied occupied room D. Then, from iii, women occupied rooms C and E and, from X, a man occupied room B. Then room B, occupied by a man, borders on two rooms occupied by women, from [1]. This situation contradicts [7], so it is impossible. (f) The man who lied, then, occupied room A. Then, from iii, women occupied rooms B and F and, from X, a man occupied room C; from [4], this man was Brian. Then, from [7], room E was not occupied by a man; otherwise room E bordered on two rooms occupied by women, from [1], contradicting [7]. So room E was occupied by a woman. Then room D was occupied by a man, from [1]; from [5], this man was Clyde. So, from [3], Arden lied.

## The Numbered Discs

From [1], [2], and [6], this axiom holds: When a woman saw two 2s on the other two women, she knew she had either a 2 or a 3 on her forehead.

From [1] through [5], as each woman was asked in turn to name the number on her forehead, each woman's reasoning in turn went like this:

First woman: Second woman:

I have a 2 or a 3 [from axiom].

I have a 2 or a 3 [from axiom]. If I have a 2, first woman wouldn't know whether she had a 2 or a 3. If I have a 3, first woman wouldn't know whether she had a 1 or a 2. So I don't know whether I have a 2 or a 3.

Third woman:

I have a 2 or a 3 [from axiom]. If I have a 2, first woman wouldn't know whether she had a 2 or a 3 and second woman wouldn't know whether she had a 2 or a 3. [See above.] If I have a 3, first woman wouldn't know whether she had a 1 or a 2 and second woman wouldn't know whether she had a 1 or a 2; second woman wouldn't know whether she had a 2 or a 3 and if I have a 2, first woman wouldn't know whether she had a 1 or a 2. So I don't know whether I have a 2 or a 3.

First woman:

I have a 2 or a 3. If I have a 3, second woman would know she had a 2: second woman would know she didn't have a 1 because otherwise I would have known I had a 3; second woman would know she didn't have a 3 because the total is 6 or 7. Second woman didn't know she had a 2; so I have a 2.

Second woman: I have a 2 or a 3. If I have a 3, third woman would know she had a 2: third woman would know she didn't have a 1 because otherwise I would have known I had a 3; third woman would know she didn't have a 3 because the total is 6 or 7.

Third woman didn't know she had a 2; so

Third woman:

I have a 2 or a 3. If I have a 2, each of a 2; first woman would know the second above.] If I have a 3, first woman would second time around she had a 2. [See first and second women would know the otherwise I would have known I had a 3. know the first time around she had a 1 or know she had a 2: first woman would she had a 2: second woman would know time around she didn't have a 1 because around]; second woman would know the the first time around she had a 1 or a 2 If I have a 3, second woman would know have a 2 or a 3. had a 3. So I still don't know whether because otherwise I would have known second time around she didn't have a [see third woman's reasoning first time

(At this point no more information can be obtained by the third woman.)

Then the third woman asked failed to name her number.

#### **Finishing First**

Prediction [1] has three first-through-fifth-position entrants, prediction [4] has three first-through-fifth-position entrants, and predictions [1] and [4] have exactly one entrant—Bea—in common. So all five first-through-fifth-position entrants are in [1] and [4], and Bea is one of them.

Then any entrant not in [1] and [4] was not among the first-through-fifth-position entrants. So Hal and Jan are eliminated.

Suppose Don was one of the five first-through-fifth-position entrants. Then, because Hal was not one of the five and from [2], each of Flo, Guy, and Eve was not one of the five. Then, from [5], each of Ada and Cal was one of the five. From [1], this situation is impossible because Bea was one of the five and Don was supposed to be one of the five. So Don was not one of the five.

Then, from [2] and [5], either Ada or Cal was one of the five. Then, from [1], Eve was one of the five because Bea was one of the five and Don was not.

Then, from [2], each of Flo and Guy was not one of the five because Eve was one of the five and each of Hal and Don was not.

Then, from [4], each of Ken and Ida was one of the five because Eve was one of the five and each of Flo and Guy was not.

Then, from [3], Cal was not one of the five because each of Ida and Eve was.

Then, from [1] or [5], Ada was one of the five because six of the eleven entrants have been eliminated.

In summary: Bea, Eve, Ken, Ida, and Ada were the five first-through-fifth-position entrants. So, from [3] and [5], Ada finished fourth. Then, from [1], Bea finished second and Eve finished fifth. Then, from [4], Ken finished third. So *Ida finished first*.

## The Lead in the Play

From [2] and [6], dressing room C bordered on a man's dressing room and a woman's dressing room. So (i) dressing rooms B and D were occupied by a man and a woman. Again, from [2] and [6], dressing room A bordered on a man's dressing room and a woman's dressing room. So (ii)

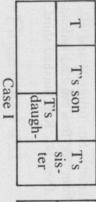

woman. Then, from i and ii, (y) dressing rooms D and E were both occupied by men or both occupied by women. dressing rooms B and E were occupied by a man and a

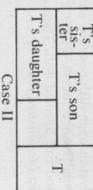

were occupied by a man and a woman. Then, from y and z. siblings of opposite sex in the dressing rooms. Then, from (I) dressing rooms A and C were occupied by a man and a [3], (z) dressing rooms A and C or dressing rooms D and E From [1] and [2], there were two men and two pairs of

dressing rooms D and E were both occupied by women. So, three women and one man being accounted for in I and II From [1], there were only two men; so, from y and I, (II

dressing room B was occupied by a man.

dressing rooms were occupied in one of the following ways them was the lead in the play. Then, from [2] and [5], the his sister occupied dressing rooms A and C, and one of cupied dressing room B; and, from [1] and [3], Tyrone and room B was not Tyrone. Then, from [1], Tyrone's son oc-(T represents Tyrone): Then, from [2] and [5], the man who occupied dressing

case, Tyrone's sister was the lead, from [4]. room E in Case I or dressing room D in Case II. In either his sister. From [1], Tyrone's mother occupied dressing From previous reasoning, the lead was either Tyrone or

### The Center Card

card borders on just four cards. From [2] and [5], each of mid-edge card borders on just three cards, and the center From [1], any corner card borders on just two cards, any

> the queens border on at least five different cards. queens borders on the same jack or two different jacks. So kings borders on a queen: and, from [4] and [5], each of two two aces borders on a queen; from [3] and [5], each of two

a total of five cards: There are three ways for two cards to be bordered on by

Case I • × • • X

> edge card with each of the five cards (dots) bordering on only one of them. The two cards (Xs) are a corner card and a mid-

• × • × Case II

> with one of the five cards (dots) bordering on both of them. The two cards (Xs) are both mid-edge cards

Case II • × •

one of them. mid-edge card bordering on each other with each of the five cards (dots) bordering on only The two cards (Xs) are the center card and a

as two aces (dots) and two kings (dots). two queens could not border on the same jack (dot) as well required by [2]; and Case III does not apply because the apply because no ace (dot) could border on a king (dot) as and two kings (dots) would be necessary; Case II does not apply because two jacks (dots) as well as two aces (dots) If there are only two queens (Xs), then: Case I does not

jacks (Xs): three queens (dots), from [4]; and two kings applies and a jack is in the center. unmarked cards are aces. Then: Case I does not apply, (dots), from [3] and [5]. Then in Cases I, II, and III the from [2]; Case II does not apply, from [3]. So Case III So there are three queens. Then five cards border on two

From previous reasoning, the Xs are jacks and the un-

marked cards are aces (J represents jack and A represents ace):

	•	A
1	J	•
	•	>

Then, because every king borders on a queen (from [3]), the top dot is not a king; so the top dot is a queen. Then, because every ace borders on a king (from [2]), the dots in the second row are kings. Then, because there are three queens, the remaining dots are queens.

#### **Dogs and Cats**

If the conclusion in [2] is true, then the hypothesis in [1] is false; then the declarations in [1] and [2] are both true, contradicting [5]. So (i) the conclusion in [2] is false.

If Angus does not have a dog, then the hypotheses in [1] and [3] are false; then the declarations in [1] and [3] are both true, contradicting [5]. So Angus has a dog. Then, because the conclusion in [2] is false, both Angus and Duane have dogs. So (ii) the hypothesis in [1] is true.

If the conclusion in [3] is true, then the hypothesis in [4] is false; then the declarations in [3] and [4] are both true, contradicting [5]. So (iii) the conclusion in [3] is false.

If Basil does not have a cat, then the hypotheses in [2] and [4] are false; then the declarations in [2] and [4] are both true, contradicting [5]. So Basil has a cat. Then, because the conclusion in [3] is false, both Basil and Duane have cats. So (iv) the hypothesis in [4] is true.

Suppose (X) neither Basil nor Craig has a dog. Then the hypothesis in [3] is false and the conclusion in [4] is true. So the declarations in [3] and [4] are both true, contradicting [5]. So X is not true.

Suppose (Y) Basil has a dog and Craig does not. Then the conclusion in [1] is true and the hypothesis in [3] is false. So the declarations in [1] and [3] are both true, contradicting [5], So Y is not true.

Suppose (Z) Craig has a dog and Basil does not. Then the conclusions in [1] and [4] are true. So the declarations in [1] and [4] are both true, contradicting [5]. So Z is not true.

and [4] are both true, contradicting [5]. So Z is not true. Then (because X, Y, and Z are not true) both Basil and Craig have dogs. Then (v) the conclusion in [1] is false.

Because Basil and Duane both have dogs, (vi) the conclusion in [4] is false.

Because Angus and Craig both have dogs, (vii) the hypothesis in [3] is true.

Then: from ii and v, the declaration in [1] is false, from iii and vii, the declaration in [3] is false; and, from iv and vii, the declaration in [4] is false. So, from [5], the declaration in [2] is true and *Basil is telling the truth*. Then, from i, the hypothesis in [2] is false. Then, because Basil has a cat, Craig does not have a cat.

Whether or not Angus has a cat cannot be determined.

### The Omitted Age

From [1], let the required digits be A, B, C, D, E, F, and G as in

Р	c (	
F	()	
G	D	a A
	E	ь В

Then, from [3], either:

+ AB CDE	ADG	Case I
+BE CDE	ADG	Case II
+CF CDE	ADG	Case III
+FG CDE	ADG	Case IV

Case I. In the middle column, A is 9 or 0. Then, from [2], A is 9. Then C is more than 9 in the left column. This situation is impossible. So Case I is not a correct case.

Case II. B is 9 or 0. Then, from [2], B is 9. Then I was carried from the right column. But G must be 0, so I could not be carried from the right column. This situation is impossible. So Case II is not a correct case.

Case III. In the middle column, C is 9 or 0. Then, from [2], C is 9. But, from [3], AB; so C in CDE could not be

BE CF +FG

greater than 3. This situation is impossible. So Case III is not a correct case.

Case IV. So this case must be a correct case and, from [3], Blanche's age was omitted from a down. F is 9 or 0. Then, from [2], F is 9. Then I was carried from the right column and I was carried from the middle column. Because I was carried from the right column, G is greater than 4. Because I was carried from the middle column, C is I more than A. Because Case IV is correct and from [3], AB Then A is I and C is 2, or A is 2 and C

is 3. But, if A is 2 and C is 3 in the middle column, then A cannot be 2 in ADG. So A is 1 and C is 2. Because F is 9 and G is greater than 4, B + F + G in the right column of AB must be 20 (B + F + G must end in 0).

CF

+FG

Then, because F is 9, B + G is 11. Then, because B + G is 11 and G is greater than 4, B is 6 or less. Because A is 1

and C is 2 and F is 9, A + B + C + F is at least 18; so B is 6 or more. Because B is 6 or less and 6 or more, B is 6. Then, because B + G is 11, G is 5. Then D is 0 in

AB and E is 0 in ADG. Then the completed puzzle is

		+ FG
6 p	c 2	
5	0	a I
	0	b 6

CF CDE

#### The Hats

Of two black hats and two white hats, let X represent one color hat and let Y represent the other color hat. Then from [1], [2], and [6], either:

From [1] and [2], this axiom holds: When a man saw two (a) black (b) white hats on two of the other three men, he knew he wore either a red hat or a (a) white (b) black hat

From [1] through [5], as each man was asked in turn the color of the hat on his head, each man's reasoning in turn went like this (R represents a red hat):

+CF

Case I

First man: I have R or X [from axiom].

Second man: I have R or Y [from axiom]. If I have R, first

man would know he had X [from axiom]; he

didn't know, so I have X.

Fourth man: I have R or X [from axiom]. If I have R,

iom]; he didn't know, so I have Y. second man would know he had Y [from ax-

First man: man knew he had X. If I have X, each of the man would know he had Y because third I have R or X. If I have R, third man would color he had. [See above.] So I still don't third and fourth men would also know what know he had X [from axiom]; then fourth

know whether I have R or X.

Second man: I have R or Y. If I have R, fourth man would didn't know he had X. If I have Y, each of would know he had X because first man know he had Y [from axiom]; and third man what color he had. [See above.] So I still the third and fourth men-would also know don't know whether I have R or Y.

first and second men. So Case I is not possible, from [4].) (At this point no more information can be obtained by the

First man: I have R or Y [from axiom]. I have R or X [from axiom].

Second man: I hird man: man would know he had Y; he didn't know. I have R or Y [from axiom]. If I have R, first

so I have Y.

Fourth man: I have R or X [from axiom]. If I have R. second man would know he had X; he didn't

know, so I have X.

First man: I have R or X. If I have R, fourth man would don't know whether I have R or X. what color he had. [See above.] So I still the third and fourth men would also know didn't know he had Y. If I have X, each of would know he had Y because second man know he had X [from axiom]; and third man

Second man: I have R or Y. If I have R, fourth man would

don't know whether I have R or Y. what color he had. [See above.] So I still he had X [from axiom]. If I have Y, each of the third and fourth men would also know know he had X; and third man would know know he had X because first man didn't

first and second men. So Case II is not possible, from [4].) At this point no more information can be obtained by the

Case III

First man: I have R or X [from axiom].

Second man: I have R or X [from axiom]. If I have R, first didn't know, so I have X. man would know he had X [from axiom]; he

Third man: have R or Y. second man would also know what color he first man didn't know he had X. If I have Y I have R or Y [from axiom]. If I have R, had. [See above.] So I don't know whether I second man would know he had X because

Fourth man: I have R or Y [from axiom]. If I have R, third so I have Y. man would know he had Y; he didn't know.
